RE: Second Quarter 2003 (June 2003) Monitoring Event Letter Report, Site No. 932001
Airco Properties Inc., Witmer Road Landfill, Niagara Falls, New York
EA Project No. 12040.69

Dear Mr. Resh:

EA Engineering, P.C. and its affiliate EA Science and Technology are pleased to provide the Second Quarter 2003 (June 2003) Monitoring Event Letter Report. During December 2000, the post-closure monitoring and facility maintenance program was initiated at the Witmer Road Landfill located in Niagara Falls, New York. Post-closure monitoring and facility maintenance is required by New York State Solid Waste Management Facilities Regulations (6 NYCRR Part 360-2.15[k][4]) and stipulated in Order on Consent No. B9-0470-94-12. The purpose of this monitoring event letter report is to summarize the analytical results of the second quarter 2003 groundwater monitoring event and the engineering inspection of the landfill cover and appurtenances that were completed at this site in June 2003.

OBJECTIVES

In accordance with the Revised Final Post-Closure Monitoring and Facility Maintenance Plan (EA 2001a)¹, environmental monitoring points will be maintained and sampled during the post-closure monitoring period. This includes collection of groundwater, surface water, and leachate samples. The Revised Final Post-Closure Monitoring and Facility Maintenance Plan documents sampling locations and sampling parameters and methods, in addition to other required maintenance activities, such as landfill cap inspections. It is anticipated that within 5 years of the start of post-closure monitoring, this plan will be re-evaluated based on the data collected at the site so that the monitoring plan will be focused to address site-specific issues that may be identified.

The objectives of the Post-Closure Monitoring and Facility Maintenance Program are to:

- Collect representative groundwater and surface water samples in order to monitor any potential leachate migration from the landfill, and to document the effectiveness of the landfill capping system
-
1. EA Engineering P.C. and its Affiliate EA Science and Technology. 2001a. Interim Remedial Measure Report Documenting Closure of the Witmer Road Landfill, Niagara Falls, New York. Appendix A – Revised Final Post-Closure Monitoring and Facility Maintenance Plan. January.

Mr. Michael Resh
BOC Gases
22 August 2003
Page 2

- Evaluate these data to determine whether any potential impacts may be occurring that could affect human health or the environment
- Provide this information to BOC Gases and the New York State Department of Environmental Conservation (NYSDEC).

As noted in the Revised Final Post-Closure Monitoring and Facility Maintenance Plan (EA 2001a), the results of the quarterly sampling events will be summarized in a letter report detailing the findings of the environmental sampling. Monitoring event letter reports will be limited to documenting the results of each sampling event. This letter report summarizes the findings of the 11th post-closure monitoring event completed at this site.

BACKGROUND

The Witmer Road Landfill is part of the Vanadium Corporation of America site that is located in the Town of Niagara Falls, New York (Figure 1). The Vanadium site is approximately 150 acres. This quarterly sampling event focused on the 25-acre Airco parcel operated by the BOC Group. The site contains waste material from the operation of onsite and nearby production facilities.

An Immediate Investigative Work Assignment was conducted by NYSDEC for a portion of the 150-acre parcel in August 1997. Approximately 70 acres from the Niagara Mohawk Power Corporation and New York Power Authority parcel were investigated. During the investigation, NYSDEC determined that the site had been used by Vanadium Corporation of America (the owners of the site from 1924 to 1964) to dispose of wood, brick, ash, lime slag, ferrochromium silicon slag, and ferrochromium silicon dust. According to the Immediate Investigative Work Assignment, much of the surface material consisted of fill, including fly ash, dust, slag, and cinder materials.

Analysis of site groundwater during the Immediate Investigative Work Assignment indicated that surface water and groundwater standards were exceeded for hexavalent chromium and pH. Based on the Immediate Investigative Work Assignment and other investigations, the facility has been listed as a Class 2 Hazardous Waste Site in the New York State Registry of Inactive Hazardous Waste Sites (Site No. 932001). A Class 2 listing indicates a significant threat to public health and the environment, and requires remedial action.

Remedial measures were completed at the Witmer Road Landfill during 2000, which included completion of an impermeable cap and leachate relief system. A complete description of the history of the site, and the construction details of the landfill capping system, can be found in the Interim Remedial Measure Report (EA 2001b)².

² EA Engineering, P.C. and its Affiliate EA Science and Technology. 2001b. Interim Remedial Measure Report Documenting Closure of the Witmer Road Landfill, Niagara Falls, New York. January.

MONITORING EVENT FIELD ACTIVITIES

Monitoring Well Gauging

The site monitoring wells (MW-1B through MW-8B) were gauged prior to sampling on 4 June 2003. The depth to water ranged from 3.29 ft below top of casing (btoc) at MW-6B to 12.21 ft btoc at MW-2B. Gauging data are summarized in the table below:

Monitoring Well	Depth to Water (ft btoc)	Well Elevation (ft MSL)	Water Elevation (ft MSL)
MW-1B	9.61	617.77	608.16
MW-2B	12.21	615.88	603.67
MW-3B	7.87	611.22	603.35
MW-4B	5.72	606.68	600.92
MW-5B	4.41	605.48	601.07
MW-6B	3.29	603.47	600.18
MW-7B	8.56	609.48	600.92
MW-8B	5.52	611.62	606.10

NOTE: MSL = Mean sea level.

An interpretation of the water table surface is illustrated on Figure 2.

Groundwater Sampling Procedures

Monitoring wells were sampled on 4-5 June 2003. Eight groundwater samples were collected from the site monitoring wells. Monitoring wells MW-2B, MW-4B, and MW-5B were purged using dedicated bailers due to slow recharge and limited well volume. These wells were bailed dry and allowed to recharge prior to sample collection. Monitoring wells MW-1B, MW-3B, MW-6B, MW-7B, and MW-8B yielded adequate recharge rates; consequently, 4 well volumes were removed and water quality readings allowed to stabilize prior to sample collection. One leachate sample and one surface water sample were also collected. Samples were submitted to Environmental Laboratory Services of North Syracuse, New York for analysis of phenolics by U.S. Environmental Protection Agency (EPA) Method 420.2, sulfate by EPA Method 375.3, ammonia (expressed as nitrogen) by EPA Method 350.2, and Target Analyte List metals by EPA Series 6010/6020, including hexavalent chromium.

Groundwater sampling results were compared to NYSDEC Ambient Water Quality Standards (AWQS) (NYSDEC 1999)³ and guidance values for Class GA waters. Class GA groundwater is used as a source of drinking water. Leachate samples were compared to NYSDEC AWQS for Class D surface waters. Class D surface waters are used for fishing but are not conducive to fish propagation. If no Class D standards were applicable for a particular compound/analyte, analytical results were compared to the more stringent Class C standards. Class C surface waters are suitable for fishing and fish propagation. Analytical results are summarized on the table provided in Attachment A. Copies of the field notebook, including the results for well gauging, purging, and

3. New York State Department of Environmental Conservation (NYSDEC). 1999. Water Quality Regulations – Surface Water and Groundwater Classifications and Standards New York State Codes, Rules and Regulations Title 6, Chapter X Parts 700-706.

sampling, are provided in Attachment B. Laboratory chain-of-custody records are provided in Attachment C. Laboratory Form I analytical results are included in Attachment D.

ANALYTICAL RESULTS

Based on the analytical results collected during the Fourth Quarter 2000 and First Quarter 2001, NYSDEC approved a reduction in the sampling requirements. As per a letter to NYSDEC dated 5 June 2000, samples were analyzed for water quality parameters (ammonia, phenolics, and sulfate) and total (unfiltered) metals.

Summary tables listing analytical results compared to applicable NYSDEC AWQS are included in Attachment A, and a tag map is provided as Figure 3. Notable results of chemical analyses are as follows.

Metals

Unfiltered metals samples were collected from 8 of 8 site monitoring wells. Notable results included the following:

- Chromium, hexavalent chromium, iron, lead, magnesium, manganese, selenium, and sodium were detected in one or more of the groundwater samples at concentrations in excess of NYSDEC AWQS. Hexavalent chromium was detected in excess of the NYSDEC AWQS in MW-2B, MW-4B, MW-8B, and the leachate sample. Selenium was also detected in excess of the NYSDEC AWQS in MW-8B and the leachate sample.

Water Quality Indicator Parameters

Water quality indicator parameters, including pH, temperature, conductivity, dissolved oxygen, turbidity, and salinity, were measured in the field prior to and during purging, and at the time samples were collected. In addition, water quality parameters, including ammonia (expressed as N), phenolics, and sulfate, were also analyzed by the laboratory. Notable results included the following:

- Sulfate was detected in excess of NYSDEC AWQS in the sample collected from monitoring well MW-8B
- Phenolics were detected in excess of NYSDEC AWQS in samples collected from monitoring wells MW-2B, MW-6B (duplicate sample), and MW-7B
- pH measurements exceeded NYSDEC AWQS in monitoring wells MW-2B, MW-3B, as well as the leachate samples (Attachment B).

Mr. Michael Resh
BOC Gases
22 August 2003
Page 5

LANDFILL INSPECTION

A landfill cap inspection was conducted under the supervision of a New York State licensed Professional Engineer on 4 June 2003. The Landfill Cap Inspection Checklist is provided as Attachment E. No deterioration, damage, or erosion to the landfill cap was noted during the engineering inspection. The access road's stability was in good order; vegetation was observed growing in many areas of the road. A defoliant should be used to remove the vegetation in the roadways. Drainage swales are clear with the exception of 250 linear ft of the southwest swale where soils and vegetation have covered the stone swale. However, the drainage swale at this location is scheduled to be restored to original conditions during the installation of the groundwater collection and treatment system.

If you have any questions regarding the results of this Second Quarter 2003 Monitoring Event, please do not hesitate to contact Charles McLeod at (845) 565-8100, Ext. 1008.

Sincerely,

EA ENGINEERING, P.C.

Landfill Cap Inspection Checklist

LANDFILL CAP INSPECTION CHECKLIST
AIRCO PARCEL, NIAGARA FALLS, NEW YORK

EA Personnel: Kurt Ilker, Chip McLeod, P.E., and Robert Casey
Date: 4 June 2003
Weather: Overcast, light rain, windy, mid-60s

- 1. Inspection of ground surface for exposure of geotextile cover (cap erosion):**
No erosion observed.
- 2. Inspection of ground surface for differential settlement resulting in soil cracking or ponded water:**
One area (50 ft × 50 ft) located at the top and east of the access road that cuts across the center of the landfill; will have a better idea when grass is cut.
- 3. Identification of stressed vegetation:**
Vegetation on landfill (grass), ~1 ft high; no stressed vegetation observed.
- 4. Identification of seeps, rooted vegetation (trees), and/or animal burrows:**
Observed six small rodent burrows in topsoil throughout the site. Rodents are most likely a type of field mouse. Groundwater flow structure located along the southwest side of the landfill.
- 5. Identification of deteriorating equipment (i.e., monitoring wells, fencing, or drainage structures):**
Monitoring wells show some rusting of the steel protective casings. May choose to grind rust, prime, and paint before rust gets too far into the metal.
- 6. Inspection of stormwater drainage swales for erosion, sloughing, or flow-through:**
Drainage swales are clear with the exception of the one located at the southwest edge (approximately 150 linear ft), where soils and vegetation have covered the stone swale. Should be cleaned and new stone installed.
- 7. Inspection of east side of the landfill (Niagara Mohawk Power Corporation parcel) along the intermittent stream for the presence of erosion or sloughing:**
No deficiencies observed.
- 8. Inspection of access roads:**
Access roads were in good shape. Vegetation was observed growing in 30 percent of the road areas. Defoliant should be used to remove the vegetation in the roadways.
