TABLE OF CONTENTS

PROJECT DESCRIPTION

Introduction

The philosophy put forth in this project description is defined in a Block Flow Diagram and four Process and Instrumentation (P&I) Diagrams included in the Attachments to this report. To facilitate interpretation of the P&I Diagrams, the Du Pont Engineering Standard for Instrument Symbols and the Piping Material Specifications (P103B and P101E) are included with the diagrams.

A summary of the design basis for all major equipment included in the treatment facilities follows this project description. Specifications for major equipment are also presented in the Attachments.

Project Objective

The remediation objective is to contain the migration of contaminated ground water in the overburden zone and subsequently treat collected water to reduce the concentration of volatile organics migrating offsite to an acceptable level. Ground water in the overburden zone will be collected by a pumping well system to be installed in both the east and west areas of the plant. The location and flow rates of the pumping wells were determined based on calibrated ground water modeling performed by Woodward-Clyde Consultants. A monitoring program utilizing piezometers within the plant boundaries and around the perimeter will confirm an effective hydraulic gradient to control migration.

Process Description

Ground water from each pumping well will be collected in an aboveground header system and conveyed to the treatment facilities which will utilize steam stripping as the primary method of treatment to remove organic pollutants. The treatment facilities will have a design capacity of 270 gpm. Normal flow to the facilities is estimated to be about 90 gpm. A Block Flow Diagram depicting the treatment system is presented as Drawing No. W965159.

Collection System

Thirty-four (34) pumping wells will be installed to collect ground water and maintain a hydraulic gradient. A diagram for a typical well installation and associated above grade piping and instrumentation is presented as Drawing No. W951176.

On the east plant, 15 pumping wells will be installed along Du Pont Road starting 100 feet east of Gill creek and running eastward at intervals of not more than 90 feet. Each well pump will have a capacity of 10 gpm and discharge into a header running westward along Du Pont Road on existing pipe racks. The header will collect and convey ground water to the treatment facilities located about 700 feet west of Gill Creek on Du Pont Road. Plot Plan Drawing Nos. W941614 and W941615 show the general location of these pumping wells.

On the west plant, 19 pumping wells will be installed generally between new and existing railroad spurs south of Riverside Avenue. The well locations will start near the property line at the west end of the plant and run

eastward at intervals of not more than 90 feet to Gill Creek then turning north paralleling the creek for 400 feet. Again, each well pump will have a capacity of 10 gpm.

The collection header on the west side will generally run on existing pipe racks to the treatment area. In some areas, new pipe supports will be provided to bridge spans to existing racks. Refer to the aforementioned drawings for well locations on the west side.

Installation of the pumping wells will be in accordance with Specification No. 39950-2100-2101 as part of the Scope of Work for Pumping and Monitor Well Installation. Each well will be 36 inches in overall diameter with an inside casing diameter of 20 inches and drilled to bedrock. A level control system in each well will maintain a level sufficient to achieve a hydraulic drawdown to contain ground water. Each well will be equipped with a centrifugal submersible pump in accordance with Specification No. 39950-0900-0902.

Treatment Facilities

Ground water from the 34 pumping wells will be collected in a 140,000 gallon equalization tank. This tank shall be a closed-top vessel vented to atmosphere through carbon canisters. Following equalization, antifoam agent and a scale inhibitor will be metered with the ground water which shall be subsequently preheated and fed to the top of the stripping column. A static mixer will provide in-line mixing of the ground water with the antifoam and scale inhibitor. Equalization and chemical addition facilities are shown on P&I Diagram No. W951177.

The steam stripping process has been sized by computer modeling and augmented by a pilot study. A 3.5 feet diameter packed column with a 30 feet straight-side has been specified. Results of computer modeling indicated that 5 theoretical stages shall be required to adequately reduce the least strippable organic. The height of each theoretical stage has been determined from pilot testing. A packing height of 16 feet of one-inch Pall rings is recommended. The expected influent and effluent characteristics for this steam stripping facility are summarized in the Engineering Report for the Niagara Plant Ground Water Treatment Facilities.

The stripper feed will be contacted countercurrently with low pressure steam. The process shall be controlled by proportioning steam to feed flow rate. Part of the stripper steam along with the stripped organics will go overhead of the column to a condenser specified for a heat duty of 131,000 BTU per hour. Niagara River water shall be utilized as the cooling medium for condensing column overheads. The liquid exiting the condenser will consist of two phases. The heavy organic phase will be decanted and flow to a 300 gallon organics storage tank. This closed-top storage tank will continuously discharge by gravity to a 3,400 gallon tank truck for offsite incineration every 2 to 3 months. The maximum rate of accumulation of organics is expected to be 70 gallons per day. The aqueous phase will flow by gravity to the equalization tank for reprocessing. Any vapor from the condenser and decanter will vent to a secondary condenser and be cooled from 86 to 41°F. Condensibles from the secondary condenser will discharge to the organics storage tank. The stripping column and organics storage facilities are depicted on P&I diagrams numbered W951178 and W951179.

Results of pilot testing indicated the condensed organic phase will be categorized as a Class IB flammable liquid. To minimize any possibility for ignition of the organic vapors, the headspace of the organics storage tank and the tank truck shall be blanketed with nitrogen. As organics are accumulated in the tank truck, the inerted atmosphere will be vented on pressure control to the secondary condenser. Chilled water at 35°F will be supplied to the secondary condenser. Non-condensibles will vent through a flame arrester to a stack 100 feet high.

Secondary containment of the organics will be provided around the stripper, decanter, storage tank and tank truck by curbing. The curbed organics loading area will contain a sump equipped with a vertical centrifugal pump. A portable foam system for fire protection will be provided.

The hot stripper column bottoms will be pumped through the 21 million BTU per hour plate and frame type preheater for heat recovery with the column feed stream. The stripped bottom water will subsequently flow to an existing sewer for release to the Niagara Falls municipal wastewater treatment authority for further treatment of cyanides. The projected effluent concentrations for all organics specified in the Engineering Report were determined by computer simulation to be less than 50 ppb, except tetrahydrothiophene which is less than 350 ppb. This constitutes 90 percent removal for all indicator volatile organics. In the event that treated effluent characteristics do not consistently comply with discharge requirements, the capability to recycle off-spec effluent to the equalization tank will be provided.

Other than non-contact cooling water from the overhead condenser and secondary condenser, no process effluents shall be discharged to any receiving steams or other water bodies. The design cooling water discharge will be approximately 12,500 pounds per hour or 25 gpm released to Gill Creek through existing outfall number 006.

Specifications for all major equipment defined in this description are included in the Attachments. An Equipment Arrangement Plan is also presented as Drawing No. W957143.

Monitoring Program

Thirty-five (35) new piezometers will be installed for use in conjunction with existing monitoring and utility wells to monitor the effective hydraulic gradient within the Niagara plant site. Relative locations of these piezometers are shown on Drawing Nos. W941614 and W941615.

Treated stripper effluent will be continuously monitored for indicator volatile organics via an on-line gas chromatograph prior to release to the municipal wastewater treatment authority. A composite sampler will also be specified for subsequent analyses of the treated effluent stream.

SUMMARY OF DESIGN BASIS FOR TREATMENT FACILITIES

Submersible Well Pumps (EN 880-101-1-1 through 880-134-1-1)

Number:	34
Capacity:	10 gpm
TDH:	107 ft.
Horsepower:	1 1/2
Construction:	Cast Iron

Equalization Tank (EN 880-1-1)

Volume:	140,000 USG
Dimensions:	35 ft. dia. x 22 ft. high
Construction:	Carbon Steel

Feed Pumps (EN 880-3-1, 880-6-1, 880-13-1)

Number:	3
Capacity:	270 gpm
TDH:	159 ft.
Horsepower:	20
Construction:	Ductile Iron

Metering Pumps (EN 880-7-1 and 880-8-1)

Number:	2
Capacity:	2 gph
TDH:	155 ft.
Horsepower:	1/4
Construction:	Stainless Steel

Stripper Column (EN 880-12-1)

Dimensions:	3 1/2 ft. dia. x 30 ft. S.S.
Construction:	Carbon Steel
Operating Temperature:	217°F
Operating Pressure:	1.3 psig
Packing:	16 ft. deep bed of 1 inch slotted 304 SS Pall rings (170 cu.ft.)

Overhead Condenser (EN 880-14-1)

Duty:	131,220 BTU/Hr.
Area:	30 sq. ft. @ 42.77 BTU/Hr. Sq.Ft.-F
Operating Temperature:	Hot Side: 217 → 86°F
	Cold Side: 78 → 90°F
Construction:	Cupronickel tubes/Carbon Steel shell

Decanter (EN 880-14-2)

Volume:	13 USG
Dimensions:	1.5 ft. dia. x 1.5 ft. high
Construction:	Titanium

Organics Storage Tank (EN 880-20-1)

Volume:	300 USG
Dimensions:	4 ft. dia. x 3.5 ft. high
Construction:	Carbon Steel/Epoxy Lined

Organics Storage Tank Tailer

Volume:	3,400 USG
Dimensions:	4 ft. dia. x 37 ft. long
Construction:	300 psig ASME code vessel,
	Carbon Steel/Epoxy Lined
Comment:	Surplus Du Pont Truck Trailer

Feed Preheaters (EN 880-10-1, 880-11-1)

Duty:	10,538,600 BTU/Hr.
Operating Temperature:	Hot Side: 217 → 58°F
	Cold Side: 50 → 208°F
Construction:	Titanium and 316 SS plate/ Carbon Steel frame

Secondary Condenser (EN 880-20-2)

Duty:	2,000 BTU/Hr.
Area:	15 sq. ft.
Operating Temperature:	Hot Side: 86 → 41°F
	Cold Side: 35 → 37°F
Construction:	Carbon Steel shell and tubes

Ice Builder Package (EN 880-20-2-1)

Process Load:	2,000 BTU/Hr.
Outlet Water Temperature:	35°F (max.)

Sump Pump (EN 880-21-1)

Number:	1
Capacity:	100 gpm
TDH:	40 ft.
Horsepower:	2
Construction:	Carbon Steel

TABLE OF CONTENTS

1.00 IDENTIFICATION

1.01 Pumping Wells: EN 880-101-1 through 880-134-1.

1.02 Monitor Wells: EN 880-202-1 through 880-235-1.

2.00 GENERAL

2.01 Contractor shall furnish all labor, supervision, materials, tools, equipment and services necessary for or incidental to the installation of 34 pumping wells and 34 monitor wells in accordance with the attached drawings, specifications, and standards. The general scope of the work follows:

2.02 Thirty-four (34) pumping wells installed to top of bedrock. A schedule of well elevations is included as Attachment A to Specification No. 39950-2100-2101.

2.03 Thirty-four (34) monitor wells (piezometers) installed to top of bedrock. A schedule of piezometer elevations is included as Attachment B to Specification No. 39950-2100-2101.

2.04 Locations for all pumping wells and piezometers are indicated on Drawings Nos. W941614 and W941615 Niagara Remediation Project Plot Plans.

3.00 PUMPING WELLS

3.01 Contractor shall construct 34 well shafts as described in Specification No. 39950-2100-2101 and shown on Detail 1 of Drawing No. W942188 Well Shaft and Piezometer Details.

3.02 Coordinate locations of each well are indicated on Du Pont Drawings Nos. W941614 and W941615.

3.03 Interferences within a 25 ft. by 30 ft. area of each well location are shown on Well Detail Drawings Nos. W951156 through W951161.

3.04 The Contractor is referred to test boring logs included as an attachment to Specification No. 39950-2100-2101 for a generalized nature of the soils encountered at the plant site.

3.05 Each pumping well shall be complete with concrete cap and well cover plate in accordance with Drawing No. W942188.

3.06 Contractor shall install barricades around those wells designated as "guardrail required" in Well Schedule, Attachment A to Specification No. 39950-2100-2101, with guardrails as detailed on Drawing No. W942188.

3.07 Submersible pump within each well and associated piping and instrumentation shall be furnished by Others.

4.00 MONITOR WELLS (PIEZOMETERS)

4.01 Contractor shall construct 34 drilled monitor wells (piezometers) described in Specification No. 39950-2100-2101 and shown on Drawing No. W942188 Well Shaft and Piezometer Details.

4.02 Coordinate locations of each piezometer are indicated on Du Pont Drawings Nos. W941614 and W941615.

4.03 Contractor shall install those wells designated as "flush mount top" in Piezometer Schedule, Attachment B to Specification No. 39950-2100-2101, with cover flush with existing grade as detailed on Drawing No. W942188.

4.04 Piezometer designated WPP-1 (EN 880-201-1) shall be installed by Others.

INSTALLATION OF WELL SHAFTS AND PIEZOMETERS

SPECIFICATION NO. 39950-2100-2101

TABLE OF CONTENTS

INSTALLATION OF WELL SHAFTS AND PIEZOMETERS

SPECIFICATION NO. 39950-2100-2101
PAGE 1 of 8

1.00 GENERAL

1.01 Scope

This specification covers the technical requirements in the furnishing of all labor, supervision, materials, tools, equipment and services necessary for and incidental to the construction of the well shafts and installation of piezometers, including routine inspection and testing, in accordance with the drawings, the requirements of this specification and subject to the general requirements of the contract documents. Work includes the following:

1.01.1 For thirty-four (34) pumping wells:

A. Layout of lines and grades as required to locate and orient the wells.

B. Machine drilling of well shaft excavations through soil/shotrock to bedrock including placing of temporary steel casings.

C. Furnish and place stainless steel well screen and riser pipe.

D. Furnish and place filter material around riser pipe section to elevations shown.

E. Cast-in-place concrete cap and pad, including well cover.

1.01.2 For thirty-four (34) piezometers:

A. Layout of lines and grades as required to locate the piezometers.

B. Machine drilling of piezometer shaft excavations through soil/shotrock to bedrock.

C. Furnish and place stainless steel well screen and riser pipe.

D. Furnish and place sand around well screen and riser pipe to elevations shown.

E. Furnish and place cement and bentonite seal to elevations shown.

F. Cap with concrete plug.

1.02 Definitions

1.02.1 Pumping Well

A 20-inch diameter well utilized to withdraw groundwater.

1.02.2 Piezometer (Monitoring Well)

A 2-inch diameter well utilized to determine the level of the groundwater.

2.00 QUALITY ASSURANCE

2.01 Referenced Standards

Codes, specifications and standards of the issues listed below, but referred to thereafter by basic designation only, form a part of this specification to the extent indicated by the references thereto. In the event of conflicts or discrepancies between this specification and the referenced codes, specifications or standards, the more stringent applicable requirements, as determined by the Owner's representative, shall govern. Subsequent issues or revisions of these documents in effect on the date of the invitation for bids shall apply.

American Welding Society (AWS)

D1.1-82 Structural Welding Code - Steel.

2.02 Subcontractor Qualifications

The work shall be performed by a company experienced in the drilling and installation of well shafts, and who shall furnish evidence of having successfully executed installations of similar systems under similar subsurface conditions. This company shall be referred to hereinafter as the Subcontractor.

2.03 Allowable Tolerances

Any shaft out of center or plumb beyond the tolerance specified shall be corrected as necessary to comply with the tolerances and the Subcontractor shall bear any cost of correction.

A. Cross section of shafts shall be not less than the design drawing dimensions.

B. Pumping well shafts shall be installed with the top location deviating no more than six inches from the design centerline location, but shall be centered within the 36" diameter hole ± 2 inches.

C. Shafts shall be installed plumb within a maximum deviation from vertical of 0.8°.

3.00 JOB CONDITIONS

3.01 Examination of Jobsite

The Subcontractor shall be held to have visited and examined the jobsite to have ascertained the state thereof and any restrictions thereon and taken into consideration all conditions which may affect the completion of the work.

3.02 Subsurface Data

The Subcontractor is referred to available test boring data including boring logs and the nature of soils encountered at the plant site. This report is included as Attachment C and available as a reference to the Subcontractor for use as supplementary information only, and any conclusions drawn therefrom without regard to its limitations shall be at the risk of the Subcontractor.

Boring Logs
Final Report
Geotechnical Investigation
Du Pont Niachlor Facilities
Niagara Falls, New York
Prepared by Woodward-Clyde Consultants
Dated February 26, 1985

4.00 PROTECTION OF EXISTING SERVICE LINES, UTILITIES AND STRUCTURES

4.01 The Subcontractor shall perform the work of the specification in a manner so as to avoid damage to existing plant structures and utilities. Existing utility lines that are to be retained and that are shown on the drawings or otherwise brought to the attention of the Subcontractor prior to commencement of operations shall be protected from damage during excavation and drilling operations, and if damaged shall be repaired by the Subcontractor at no cost to the Owner. In the event that the Subcontractor damages or uncovers any existing utility lines that are not shown, or the locations of which have not been made known to the Subcontractor, report thereof shall be made to the

Owner's representative. If determined that repairs are to be made by the Subcontractor, such repairs will be made by the Subcontractor and paid for by the Owner.

5.00 EQUIPMENT

5.01 Equipment and tools required for the work shall be acceptable to the Owner's representative for the mechanical condition and capacity. Equipment shall be brought to the jobsite in sufficient time to be examined and approved. Equipment shall be maintained in satisfactory working condition until completion of the work and shall be provided in sufficient quantity and capacity to maintain the schedule of the work. Tools and equipment shall be steam cleaned before being brought to the site. Equipment must be cleaned of all soil, water or any excavated material after completing each well, before moving on to the next well.

6.00 MATERIALS OF CONSTRUCTION OF PUMPING WELL SHAFTS

6.01 Temporary Casings

6.01.1 Steel casings having a minimum wall thickness of 1/4". Casings shall be pulled during construction as specified in Sections 7.02.2 and 7.06.3.

6.02 Well Shaft

6.02.1 Well shafts shall consist of Schedule 5 Type 304 stainless steel pipe with stainless steel well screen at bottom. Inside diameter of well screen shall be the same as the pipe ID.

6.03 Filter Material

6.03.1 Filter material shall consist of concrete sand conforming to Section 703-07 of the New York State Department of Transportation Standard Specifications, Construction and Materials, January 2, 1985, which specifies the following gradation:

Sieve Size	Percent Passing By Weight Minimum	Maximum
3/8 inch	100	
No. 4	90	100
No. 8	75	100
No. 16	50	85
No. 30	25	60
No. 50	10	30
No. 100	1	10
No. 200 (Wet)	0	3

6.04 Well Screen

6.04.1 A slotted stainless steel screen, as specified on Drawing No. W942188.

7.00 INSTALLATION OF PUMPING WELL SHAFTS

7.01 General Description

Well shafts shall be produced by any combination of machine drilling, hand excavation and removal of rock at the bottom of each shaft.

7.02 Excavation in Soil

7.02.1 Excavate shafts of the diameter indicated on the drawings into the soil to the bedrock surface at whichever depth encountered.

7.02.2 In drilling shafts, the surrounding soil and earth walls shall be adequately and securely protected against cave-ins, displacement of the surrounding earth and retention of groundwater by means of a 36 inch diameter steel casing. Casings shall be withdrawn as filter material is being placed.

7.03 Disposal of Excavated Material

7.03.1 The Subcontractor shall effectively manage containment of excavated soil and associated groundwater brought to the surface by excavation devices.

7.03.2 Disposal of excavated material shall be as specified in E. I. du Pont de Nemours Site Conditions.

7.04 Water Containment

7.04.1 All groundwater, and wash or cooling water used for drilling shall be contained in the drilling area and returned to the well or removed in accordance with the Du Pont Site Conditions. All water used for drilling shall be clean potable water obtained from an on-plant source designated by Du Pont. The Subcontractor shall be responsible for transporting the water to the drill site in clean containers. Drilling water shall not be recirculated back into the storage container.

Drilling fluids (drilling lubricants) other than water shall not be used.

Controlling and containing run-off from material removed during drilling is also the responsibility of the Subcontractor.

7.05 Removal of Obstructions

1 7.05.1 All rocks, boulders, concrete and masonry substructures or other obstructions below grade which are indicated or suggested on or in reference information available to the Subcontractor at the site, and which interfere with the work, shall be demolished and removed from within the excavation as part of the work under the base bid. Care shall be taken to ensure that the bottom of the well shaft is clear of all excavated rock or other obstructions.

7.05.2 Underground utilities encountered during excavation shall be protected until proper identification is made. If the utilities are abandoned, the interfering positions shall be removed. If the utilities are to remain in service, the Owner's representative will provide for relocation as required at no cost to the Subcontractor.

1 7.05.3 In locations that are close to existing utilities, the Subcontractor shall excavate by hand prior to beginning drilling operations in order to minimize the possibility of damage to the lines. Locations known to be in close proximity to existing service lines are identified with a note in Detail Drawings No. W951156 through W951161 to hand excavate. In no event, shall drilling begin if utility is not visible.

7.05.4 If during the process of excavating shafts any unforeseen obstructions, such as concrete or masonry substructures, or underground utility lines are encountered which are not shown on the drawings or in information available to the Subcontractor, the Subcontractor shall cease work immediately and so inform the Owner's representative.

7.06 Construction of Well Shaft

7.06.1 Bidders shall furnish with their bids a proposed procedure and sequence for excavation and installation of the well.

7.06.2 Filter material, in accordance with Section 6.04 of this specification, shall be placed around the outside of the well screen and riser pipe. Care shall be taken to ensure that the material is brought up equally around the riser pipe, without overspillage inside the pipe. The riser pipe shall be covered while filter material is being placed. Compact the surface of the filter material by gently tamping before casting the concrete cap.

7.06.3 Withdraw the outer temporary casing. As the casing is being withdrawn, at least two (2) feet of filter material shall be maintained above the bottom of the temporary steel casing at all times.

Measure the elevation of top of riser pipe before starting to withdraw the temporary casing. Special care must be taken to assure that the well screen and riser pipe are not lifted as the temporary casing is withdrawn. The maximum allowable tolerance in the vertical upward movement of the top of riser pipe shall be one (1) inch.

As the filter material is placed it shall be probed, as required, to assure that it does not arch between the casing and the riser pipe. (Note: As the casing is being pulled the filter material level may drop rapidly, if there are voids outside of the temporary casing).

7.06.4 The steel casing shall be thoroughly cleaned, inside and out, before re-use.

7.06.5 Complete the well shaft with a cast-in-place concrete cap in accordance with Drawing No. W942188, Detail 5.

7.06.6 Furnish and place a well cover plate in accordance with Drawing No. W942188, Detail 2. Clearly stencil the well number on the cover plate to the well.

7.06.7 Furnish and install well guardrails in accordance with Drawing No. W942188, Detail 6, in locations shown on Drawing Nos. W951156 through W951161 and where indicated on Attachment A to this specification.

8.00 INSTALLATION OF PIEZOMETERS

8.01 An 8" OD x 3 3/4" hollow shaft auger shall be used to bore a well to bedrock. The 2" well screen and riser pipe shall be centered in the hollow shaft and filter sand, etc. poured in as auger is withdrawn, to produce a piezometer as shown on Drawing No. W942188.

8.02 Install 5 feet of 2-inch Schedule 40 stainless steel (Type 304) slotted well screen pipe attached to sufficient 2-inch Schedule 40 carbon steel riser pipe to reach a point 3 feet above ground surface. All steel pipe shall have threaded joints. The slots in the well screen shall be 0.020 inch wide.

8.03 A mixture of cement and bentonite (one part bentonite to 25 parts cement by volume) shall then be tremied around the casing pipe to fill the hole from the top of the bentonite pellets to 8 inches below ground surface.

8.04 Install the concrete plug. Furnish and install a lockable well cap. Bore a 1/8-inch breather hole through the side of the pipe cap. Paint the riser pipe with Dulux® 96Y23663 High Visibility Yellow Machinery Enamel.

8.05 Clearly stencil the well number on the riser pipe and cap.

9.00 INSTALLATION OF PIEZOMETERS - FLUSH MOUNT TOP

9.01 General Description

Piezometers in predetermined locations near roadway or access areas shall be installed with the top flush with grade. These installations are identified in the Piezometer Schedule, Attachment B to this specification, by the remark "flush mount top".

9.02 Construction of Flush Mount Top Piezometers

9.02.1 Furnish and set a 12-inch ID cast iron manhole with watertight, vented lid (by Emco Wheaton) in a concrete seal as indicated on Drawing No. W942188, Detail 4.

9.02.2 Complete the installation by furnishing and installing a lockable well cap for the stainless steel riser pipe and clearly stenciling the well number on the well cap and manhole lid. Bore a 1/8-inch breather hole through the side of the pipe cap.

10.00 INSPECTION

10.01 An inspection program shall be established by the Owner's representative and shall include the following items:

A. Location of riser within shaft.

B. Vertical alignment of riser.

C. Elevation of bedrock and elevation of bottom of well screen and length of screen.

D. Elevation of top of filter sand and volume of sand used.

E. Elevation of top of riser pipe before starting to pull temporary casing.

F. Elevation of top of riser pipe after temporary casing has been removed.

G. Note any problems in removing temporary casing.

H. Actual coordinate location of well.

I. Elevation of ground surface.

J. Witness cleanout of rock or other excavation debris from the bottom of the well shaft.

ATTACHMENT "D"

703-07 CONCRETE SAND

SCOPE. This specification contains the requirements for sand used in Portland Cement concrete.

GENERAL. Materials Specification 703-01, Fine Aggregate, shall apply except as modified herein.

MATERIAL REQUIREMENTS. When dry, the fine aggregate for Portland Cement concrete shall conform to the following gradation requirements:

Sieve Size	Percent Passing By Weight Minimum	Maximum
3/8 inch	100	
No. 4	90	100
No. 8	75	100
No. 16	50	85
No. 30	25	60
No. 50	10	30
No. 100	1	10
No. 200 (Wet)	0	3

Sand manufactured from a carbonate rock, either a limestone or dolomite, by itself will not be permitted in concrete pavement or concrete bridge deck wearing surfaces. However, a blend of manufactured carbonate sand with another sand will be permitted provided that the blended mixture contains at least 40 percent non-carbonate particles in each size fraction coarser than the No. 30 sieve. Non-carbonate particles are defined as those having an acid insoluble content not less than 80 percent.

Test. Test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The provisions of Materials Specification 703-01, Fine Aggregates, shall apply.

SUBMERSIBLE PUMPS

SPECIFICATION NO. 39950-0900-0902

TABLE OF CONTENTS

SUBMERSIBLE PUMPS

SPECIFICATION NO. 39950-0900-0902
Page 1 of 1

1.00 SCOPE

1.01 This specification describes the minimum requirements for the design, manufacture, testing, inspection and delivery of submersible sump pumps.

2.00 REFERENCE STANDARDS

2.01 The following industry, association and government codes and standards shall be followed as applicable to the design, fabrication, assembly and testing of all equipment furnished under this specification:

ANSI - American National Standards Institute.
OSHA - Occupational Safety and Health Act.
NEMA - National Electrical Manufacturers Association.
NEC - National Electric Code.

2.02 The issues or revisions of these documents in effect on the date of inquiry shall apply.

3.00 PERFORMANCE CRITERIA

3.01 Performance of the pumps shall be in accordance with the requirements of the data sheets.

3.02 Pumps shall be non-overloading.

4.00 DESIGN DETAILS

4.01 Pumps shall be submersible type to be located within a 20 inch diameter well along with level instrument stilling tube (supplied by Others) to pump contaminated ground water.

4.02 Impeller shall be threaded on shaft with impeller locknut to prevent backoff. Shaft shall be 300 series stainless steel.

4.03 Casing shall have 300 series stainless steel fasteners.

4.04 Pump shall have single mechanical seal with materials as specified on data sheet.

4.05 Motor shall be provided fully submerged in high grade turbine oil chamber for permanent lubrication of bearings and mechanical seal and efficient heat dissipation. Motor shall have 15 feet of Teflon covered power cord, water and oil resistant with epoxy seal and gland nut at motor end.

4.06 Pumps shall be equipped with permanent lifting eye or similar device.

1.0 IDENTIFICATION

EN Number	Quantity	Description
880-1-1	1	Tank, Equalization/Surge

2.0 SCOPE

This specification defines requirements for the design, fabrication and erection of one field erected storage tank.

3.0 DESCRIPTION

Vertical storage tank, 35'-0" O.D. x 22'-0" high with flat bottom, conical supported roof and constructed of carbon steel. Tank to be furnished complete with all nozzles, internal dip pipes, ladder, platform, etc. all in accordance with Drawing F-25001 and references thereon.

4.0 GENERAL

4.1 All notes, instructions, etc., included on the drawing are made part of this specification. Design, fabrication and inspection shall be in accordance with the current API 650 Standard and Du Pont standards and specifications.

4.2 Design calculations, weld procedures (WSP), and welder qualifications (PQR) shall be furnished along with initial submission of drawings for approval. All thicknesses, reinforcements, supports, etc. shall be verified by calculations. Thickness shown on control drawings shall be considered as minimum.

4.3 Vendor is released to purchase all materials on placement of order.

4.4 Gaskets, bolts and nuts for shell, head, manhole and blind flanges for testing and final shipment shall be furnished and installed by the Vendor.

4.5 Vendor shall identify all subcontractor supplied parts and accessories with manufacturer's name and address and shall submit documentation for Stearns Catalytic and/or Du Pont approval.

4.6 Handrails, cages, ladders and guards to be painted in accordance with Painting System 213X. All coats to be applied at the fabricator's shop. Top coat to be High Vis. Yellow 326-Y-23663.

4.7 Platform support steel to be painted in accordance with Painting System 207V. All coats to be applied at the fabricator's shop. Top coat to be Shale Gray 326-Y-67633.

4.8 Platform grating to be galvanized in accordance with System 170W.

4.9 Water for test and disposal of same shall be the responsibility of others. Test water shall be furnished 700 ft. from the tank(s). Vendor shall run hoses to fill tank from this point. Blanking of all nozzles and test shall be the responsibility of the Vendor. After hydrostatic testing (4 hours) and a suitable time for preload settlement (1 to 6 months), the tank shall be drained to Gill Creek, approximately 700 ft. No water shall be left in tank.

4.10 Tank(s) shall be erected on foundations supplied by others. It shall be the Vendor's responsibility to visit the site and familiarize himself with all conditions prior to submitting proposal.

4.11 Access roads for getting materials and equipment to jobsite will be provided by others.

4.12 Vendor shall furnish all data and drawings as indicated in Paragraph 7.0 and as indicated on the attached "Vendor Data Requirements".

4.13 All tanks are to be tagged with a stainless steel nameplate permanently attached to each tank; data to include: Du Pont EN number, Du Pont order number, tank size and gallonage, and tank materials of construction. This is in addition to any tags required by API codes.

4.14 Exterior surfaces of storage tank to be painted in accordance with Painting System 213X (except the underside of bottom). Prime coat and intermediate coat to be applied at the fabricator's shop. Disregard the reference made in attached SCC Spec. SP-2500-01, Item 12.02, which states sections of field erected tanks shall not be shop primed. Top coat to be applied in the field after tank erection (White 326-Y-67632).

4.15 Tank to be insulated by fabricator after hydrostatic testing.

6.0 INSPECTION

Inspection will be made by Du Pont Quality Assurance Field Representative (QAFR) and inspection procedures are given in the Inspection Planning Data Sheets attached for each vessel. Some of the inspection items that will be checked are noted for each visit. Visit requests are not necessarily in chronological order.

7.0 YOUR QUOTATION MUST STATE YOUR SCHEDULE FOR SUBMITTING DRAWINGS AS FOLLOWS:

Design Approval Drawings in weeks after receipt of order.
Final Drawings in weeks after return of all Design Approval Drawings.

7.1 One reproducible* of Design Approval Drawings required.
One reproducible* of Final Drawings required.

*Two legible copies may be submitted for 8-1/2" x 11" or 11" x 17" drawing.

7.2 All drawings, drawing transmittal letters and correspondence must show the following identification:

Plant:	Niagara
Project:	113592
Du Pont Order No.:	
EN Numbers:	

7.3 The following information is required for approval:

Layout and orientation.	Connection locations and types.
Overall dimensions, weights and materials.	Weld details (WP/PQR).
	Seam locations.
Mounting or foundation dimensions.	Internal details.
	Calculations.
Critical tolerances and finishes.	Nameplate data.

7.4 Design Approval Drawings

These drawings must be submitted before we will release start of fabrication. One print of each drawing will be returned stamped "Approved", "Approved as Noted", or "Not Approved". Fabrication will be released according to a note on the transmittal letter covering the returned prints. Upon receipt of all "Approved" and "Approved as Noted" drawings, vendor shall revise to include all changes and return for our use as Final Drawings. "Not Approved" drawings must be corrected and re-submitted for approval.

7.5 Final Drawings

These drawings are for Du Pont design and construction purposes.

PREPARED BY	DATE	SPECIFICATION NO. SP-2500-01 PAGE 1 of 7	
B. L. Lubliner	8/7/78		
APPROVED BY J. LeCoff	DATE 8/7/78	FABRICATION OF C.S. ATMOSPHERIC STORAGE TANKS	REV. 2

1.00 SCOPE

1.01 This specification, supplemented by tank and standard drawings, covers the design, material, construction, field erection where required, workmanship, fabrication shop procedures, inspection, testing, shop drawings, data reports, etc. for C.S. atmospheric storage tanks to be used for above ground service.

1.02 The tank control drawing and documents referred to thereon are hereby made a part of this specification.

1.03 Where discrepancies exist between the tank control drawings(s) and this specification, the tank control drawing(s) shall be considered as being correct. Where regulatory or industry standard requirements are more stringent than these instructions, the standards shall govern. In any event, all conflicts shall be referred to Purchaser for clarification before proceeding with the procurement or fabrication of the affected parts.

1.04 Deviations from tank control drawing(s) and this specification are permitted only if the Vendor outlines in full detail all such deviations and the reasons therefore in his quotation. Written acceptance of said deviations in the Purchase Order will constitute approval.

2.00 CONSTRUCTION

2.01 Tanks shall be of welded construction.

2.02 All tanks shall be designed, constructed and tested in accordance with the regulatory and industry standards specified on the drawings, specifications, purchase order and any state or local governing laws.

2.03 References to ASME, ANSI, ASTM, API, AWWA or regulatory standards shall mean the latest edition including addenda, supplements and revisions.

2.04 Design criteria for tanks shall comply with the following:

Hydrostatic head due to operating liquid at the high capacity level plus the vapor space design pressure specified on the drawing. Specific gravity of the liquid used for design purposes shall be as noted on the drawing, but not less than 1.0.

2.05 Tank roofs shall be conical where practical. If the Vendor proposes to substitute another type of roof, his quotation shall describe the configuration and reasons for the substitution.

3.00 NOZZLES AND MANWAYS

3.01 All connections are to be flanged unless otherwise specified.

3.02 Flange facing and drilling shall conform to ANSI B16.5. Manways shall conform to API 650.

3.03 When screwed connections are specified, 3000 lb. forged steel full couplings shall be used.

3.04 Nozzles of lined tanks, or vent connections, shall be flush with inside of shell or head.

3.05 Nozzle bolt holes shall straddle the tank 0° - 180° center line or its parallel.

3.06 All manholes, handholes, blanked connections, etc., shall be furnished complete with studs, nuts, gaskets, etc.

4.00 BOLTING

4.01 Manhole and handholes shall have hex head machine bolts and nuts conforming to ASTM A307, Grade B.

4.02 Permanent studs, bolts and nuts shall not be in place during stress relief.

5.00 INSULATION SUPPORTS

5.01 Insulation supports shall be furnished and installed in accordance with the documents listed on the tank control drawing.

5.02 When the tank is to be stress relieved, insulation supports must be welded to the tank prior to stress relieving.

6.00 CORROSION ALLOWANCE

Corrosion allowances specified for various parts of a tank shall be added to the calculated or minimum thickness of the base metal of shells, roofs, roof rafters, bottoms, internal columns, nozzles, manhole necks, manhole covers, handhole covers, blind flanges and on each exposed surface of nonremovable parts including welds. The minimum corroded thickness of nozzle necks shall not be less than the lesser of Schedule 40 pipe thickness or the minimum corroded thickness of the shell or head to which it is attached. In no case shall the uncorroded thickness of flanged nozzle necks be less than specified in API 650.

7.00 WELDING

7.01 The Fabricator shall show evidence that all procedures and welders for work covered by this specification have been qualified in accordance with requirements of ASME Code, Section IX, latest edition. An up-to-date certificate for each welder shall be on file at the work site and available to the Purchaser's Inspector upon request. All weld procedures with qualification test records shall be submitted to the Purchaser and approved prior to the start of any work.

7.02 Impact testing, when necessary, will be identified on the drawing or purchase order.

7.03 Weld seam construction shall be in accordance with API 650 and API 650 Appendix J for field and shop fabrication respectively, except that backing strips, other than those used at seams in flat bottoms of field erected tanks, shall be subsequently removed. If they cannot be removed, approval must be obtained from Purchaser to leave them in place.

7.04 Postweld heat treatment and/or radiographing shall be in accordance with the industry standard or as specified on the drawings.

7.05 Postweld heat treatment procedures shall be submitted to the Purchaser for approval prior to being used.

7.06 Location of spot radiographing will be selected by Purchaser's Inspector.

7.07 The gas metal arc and flux cored arc welding processes shall not be used to weld tanks for low temperature service (below -20°F).

7.08 Machined bevels to form the welding groove are preferred, but smooth, clean, slag-free flame-cut, powder-cut, or arc-scarfed bevels are acceptable.

7.09 Tack welds shall be of the same quality and made by the same process as the rest of the weld or they shall be removed from the weld prior to the completion of the weld.

7.10 Small, sound tack welds which penetrate to the bottom of the welding groove, for a single welded groove, may become a part of the finished weld. Tack welds lacking penetration are not acceptable and must be chipped or ground out. Large tack welds which almost fill the welding groove are not acceptable and must be chipped or ground out.

7.11 The slag shall be cleaned from each weld layer and any visual defects chipped or ground out before the next layer is applied, and the completed weld shall be cleaned of slag.

7.12 Arc-strikes and weld starts shall not be made purposely on the base metal outside the weld groove nor outside an area which will be encompassed by a fillet or socket weld.

7.13 When inadvertent arc-strikes are made on the base metal surface outside the weld area, the arc-strikes shall be removed by grinding or filing and the arc-strike area will be visually examined under 5X magnification or by liquid penetrant examination.

8.00 PREPARATION AND LAYOUT OF PLATES

8.01 The practice of using wide welds to overcome poor fit is not permissible. Accordingly, poor fit-up shall be remedied by suitable means (regrooving, etc.). Except for small cavities, the Vendor shall not correct a plate edge deficiency unless approved by the Purchaser and such welding may be subject to radiographic or other approved methods of examination.

8.02 Fit-up shall be done with jacks and clamps and the Vendor shall not use sledge hammers in fitting-up work except where unavoidable, and then only with flatteners.

9.00 INSPECTION, TESTING AND STAMPING

9.01 Inspection may be made by a representative of Purchaser whose decision as to rejection of material or workmanship for noncompliance with the specification and/or purchase order requirements shall be final.

9.02 Acceptance by the Purchaser's representative shall not relieve the Vendor of his responsibility for such workmanship and materials conforming with the specification and/or purchase order requirements.

9.03 Tanks shall be tested in accordance with the regulatory and industry standards and the test conditions specified on the drawings.

9.04 Radiographic examination, as required by the tank control drawing, shall be accomplished by personnel qualified in accordance with ASME Boiler and Pressure Vessel Code Section V, Article 1. Review of results will be by personnel qualified to levels II or III of STN-TC-1A, Recommended Practice for Nondestructive Testing Personnel Qualification and Certification, Supplement A, Radiographic Testing Method.

10.00 SHOP DETAIL DRAWINGS

10.01 Detail drawings, submitted to Purchaser for approval, shall show the following:

10.01.1 All information given on tank control drawing(s) and applicable parts of documents referenced thereon.

10.01.2 Material specifications (ASTM, etc.) including welding electrodes.

10.01.3 Location and details of all seams and nozzle attachments.

10.01.4 Nozzle identification, using control drawing assigned identification.

10.01.5 Test procedures for tank and lining (if any).

10.01.6 Shipping and/or erected weight.

10.02 Following Purchaser's approval, certified shop drawings shall be submitted. These drawings shall be stamped or labeled on the face of each drawing near the title block with the word "Certified", and with the date and signature of the Fabricator's authorized representative.

10.03 Quantity of approval and certified prints required will be indicated on the purchase order.

11.00 DATA REPORTS

Vendor shall furnish a stress relief graph (where applicable).

12.00 CLEANING AND PAINTING

12.01 Inside and outside of tanks shall be cleaned of rust, loose scale, grease, spatter, etc.

12.02 Tanks shall be painted in accordance with the painting specification referenced on the control drawing. On field erected tanks, the shop fabricated sections shall not be primed. After field welding is completed, the Vendor shall clean all areas, except the underside of flat bottom plates.

12.03 On shop fabricated tanks, the following protective measures shall be observed.

12.03.1 Machined surfaces and threads shall be protected during shipment by application of grease or other suitable compound.

12.03.2 Flange faces shall be protected by wood, masonite, or other commercial type hard cover plates.

12.03.3 Couplings shall be protected by plugs of compatible materials.

12.04 Item number, 0° - 180° center line, shipping weight, and north arrow shall be painted on shop built tanks.

13.00 EXTERNAL CLIPS

13.01 Platform and ladder clips shall be furnished and installed as required by the control drawing.

13.02 When a tank is to be stress relieved, clips must be welded to the tank prior to stress relieving.

13.03 Clips which have a reinforcing pad welded to the shell shall have at least one 1/8" diameter drilled vent hole in the reinforcing pad.

Inspection Activity	Instruction
Qty-Item-No One (1) NOTES: 1.	Tank - Equalization/Surge EN 880-1-1 Inspection

DuPont inspection is required per this Inspection Planning Data Sheet. You will be contacted by a DuPont Quality Assurance Field Representative (QAFR) to schedule inspection visits. In the event that you are not contacted, call (302) 451-0200 at least 5 days before inspection is needed.

When major components or service are obtained from Sub-Vendors, the QAFR will inspect these items at the point of manufacture. It is the Vendor's responsibility to include DuPont inspection and notification requirements in Sub-orders.

The QAFR shall perform and document all inspections. He shall assure that the Vendor documents any non-conformances and he shall notify the cognizant Quality Assurance Engineer (QAE) of the non-conformance. The SCC QAE for this P.O. is W. Lehner at (215) 864-1608.

The Vendor shall assure that applicable documents that require SCC/DuPont approval, as identified in the Purchase Order and Specification(s), have been submitted and "Approved" or "Approved As Noted" before the use of such documents. Submittals shall be made to the SCC Manager of Expediting (E.D. Baldi) as required by Vendor Data Requirements attached to Purchase Order.

	All documentation and equipment tags must be identified with the DuPont Plant location, Project Designation, Purchase Order and EN Numbers. The following documentation is to be provided by the Vendor: 1. Mill Test Report(s) 2. Weld and Welder Qualification Procedure(s) 3. Weld Sample(s)/Coupon(s) 4. NDE Data and Report(s) 5. Hydrostatic Data and Report(s) 6. Nameplate Facsimile
2.	Pre-Fabrication Inspection Meeting The prefab meeting will be initiated by W. Lehner, QAE at (215) 864-1608. The inspection and specification requirements will be reviewed with the vendor's manufacturing and Quality Control personnel. A tentative schedule of future inspection visits will be established.
3.	Inspection Instructions: The QAFR will include, but not be limited to, the following inspections: Preliminary, Intermediate and Final as required by Section 5.
4.	Field Weather Condition(s) No welding below 0° fahrenheit in the rain or in high winds unless adequate protection from the elements is provided. Preheat material when required per the API Code and Vendor's welding procedure(s).
5.	Equalization/Surge Tank Preliminary - Prior to Ship Fabrication
1. Verify	Welding procedure(s) is approved by SCC.
2. Verify	Welder(s) and welding operator(s) are qualified to fabricate the listed item in accordance with the SCC approved Vendor's qualification procedure(s).

3. Verify	Quality control and inspection procedure(s) are employed to assure strong welds.
4. Verify	In-process materials are controlled and identified to provide traceability to the Mill Test Report(s).
5. Verify	Mill Test Report(s), heat number(s) and material for conformance to drawing and specification requirements.
	Intermediate - In Shop Progress
6. Inspect	Weld edge preparation for required weld geometry and are free of grease, grime and paint.
7. Inspect	The general surface(s) for laminations, pits, gouges and undesirable conditions.
8. Verify	Heat number(s) appear on the development shell plate drawing supplied for radiograph record.
9. Inspect	Prefab weldments for weld quality and general workmanship.
10. Verify	Galvanized platform grating is in accordance with the SCC Spec., the DuPont St'd and the DuPont drawing.
11. Witness	Ferrous metal exterior surface(s) preparation, prime and intermediate painting per the DuPont procedure(s) for vessel: cage, guard(s), handrail(s) and ladder; and platform support. Final coat on all except vessel.
	Intermediate - In Progress
12. Witness	Qualified welding operator(s), fit-up and welding practices are in compliance with the SCC approved Vendor's qualification and welding procedure(s).
13. Inspect	Plate edges for gouges or damage from handling, plate thickness and floor plates for flatness.
14. Verify	Plate alignment and fit is in accordance with the applicable code and drawing allowances. Plate offsets must meet the API Code for circumferential and vertical seams as a minimum.

PUMPS - CENTRIFUGAL

SPECIFICATION NO. 39950-0900-0901

TABLE OF CONTENTS

PUMPS - CENTRIFUGAL

SPECIFICATION NO. 39950-0900-0901

1.00 SCOPE

1.01 This specification describes the minimum requirements for the design, manufacture, testing, inspection and delivery of horizontal, end suction, single stage, centerline discharge centrifugal pumps conforming to the requirements of ANSI B73.1.

1.02 Items furnished under this specification are to include pump, shaft seal, seal liquid piping, shaft coupling, coupling guard and driver, all assembled, aligned, and mounted on a common baseplate, ready for installation. For pumps supplied with mechanical seals, the mechanical seal shall be shipped loose and a temporary lip seal shall be installed on the pump.

1.03 The following will be furnished by Others; installation, piping, controls and electrical feeder wiring to motor terminal box.

2.00 REFERENCE STANDARDS

2.01 American National Standard Specification for Horizontal, End Suction Centrifugal Pumps for Chemical Process, ANSI B73.1.

2.02 Occupational Safety and Health Standards of the U.S. Department of Labor (OSHA).

2.03 The issues or revisions of these documents in effect on the date of inquiry shall apply.

3.00 PERFORMANCE CRITERIA

3.01 The performance criteria for the pumps to be furnished under this specification are listed on the vendor proposal data sheet(s).

3.02 The pump impeller furnished shall provide the design head at the design flow rate as stipulated on Line 12 of the data sheet(s). The impeller diameter selected to meet design conditions shall be no smaller than the minimum as shown on the manufacturer's published performance curves. The pump shall be capable of at least 10% head increase at design conditions by installing a larger impeller.

3.03 The differential head generated by all available impeller sizes shall rise continuously from maximum capacity to shut-off. Duplicate pumps shall be capable of stable operation in parallel.

3.04 If feasible, the pump is to be sized for an operating point on the pump curve to the right of the maximum efficiency point on the efficiency curve. Review the resulting operating point relative to the specific pump performance curve, pump design, and pump application as some pumps tend to be susceptible to performance "fall-off" in this area of the curve.

4.00 DESIGN DETAILS

4.01 The American National Standard Specification for Horizontal, End Suction Centrifugal Pumps for Chemical Process, ANSI B73.1 shall govern the design, fabrication, assembly and testing of all equipment furnished under this specification with the exception of the following additions, changes or deletions:

4.01.1 (Modify 4.1.3 to read) Statement. "Pressure-temperature limitations shall be stated by the pump manufacturer on Line 14 of the pump data sheet(s)".

4.01.2 (Change 4.5.4 to read) "Dynamic shaft deflection at the face of the innermost mechanical seal or innermost ring of packing shall not exceed 0.05 mm (0.002 in.). The measurement shall be made at the maximum load and/or shut off condition with a maximum diameter impeller pumping a fluid having either a specific gravity of 1.00 or the design specific gravity, whichever is greater".

4.01.3 (Modify 4.7.1) Design. "Two anti-friction bearing assemblies shall be provided, one assembly free to float within the frame to carry radial thrust only, and the other assembly arranged to carry both radial and axial thrust. The latter assembly shall be a double row ball bearing assembly".

4.01.4 (Change 4.12.1 to read) "All exposed rotating parts shall be protected against accidental personnel contact in accordance with the requirements of OSHA, Paragraphs 1910.212 and 1910.219".

4.01.5 (Modify 4.11 to read) Dimensions. "Pump dimensions shall conform to Fig. 1. Baseplate dimensions shall conform to Fig. 2 and the requirements noted in Paragraph 4.02 of this specification.

4.01.6 (Modify 4.12.4 to read) Tapped Openings. "All tapped openings including those in the mechanical seal gland which may be exposed to the pumped fluid under pressure, shall be plugged with threaded metal plugs. Tapped openings shall have a radius and chamfer applied on the inside surfaces. Plugs normally in contact with the pumped fluid shall be of the same material as the case except that carbon steel plugs may be used in cast iron or ductile iron pumps. Threaded plugs shall not be used in the heating or cooling jackets including glands with heating or cooling passages instead snap-in plugs or waterproof tape shall be used. Threaded plugs shall be non-galling".

4.01.7 (Modify 5.1.2 to read) Flange Loading. "Allowable flange loading imposed by the piping shall be available from pump manufacturer. Loading shall be given for X, Y and Z planes on Line 16 of the pump data sheet(s). The pump manufacturer shall provide the criteria used to establish the flange loads."

4.02 The pump baseplate shall be supplied to allow stilt mounting of the pumps. Design criteria is noted in the following paragraphs.

4.02.1 The pump baseplates shall be sized to accommodate motors of at least one NEMA frame size larger than the motor supplied with the pump. When the motor specified with the pump is the maximum size used with the pumps, no oversizing of pump baseplate is required.

4.02.2 The pump baseplates shall be rigid enough to maintain alignment of the pump to motor shaft with 0.002 inch eccentricity under combined dead weight, full load motor torque and maximum allowable flange loads.

4.02.3 The support lugs for the pump baseplates shall be located as noted below:

If four supports are used, two supports are to be located in the plane of the discharge nozzle, and two supports are to be located as close as possible to the center of gravity of the pump motor.

If six supports are used, four supports will be located as stated above, and the additional two supports are to be located in a plane passing through the pump coupling assembly.

4.02.4 Pump baseplates may be manufactured from cast iron or carbon steel. If cast iron baseplates are selected, grout holes in the baseplate are acceptable. If carbon steel baseplates are selected, there shall be no grout holes in the baseplate.

4.02.5 Drain holes shall be provided in the closed box baseplate design. The drain holes (1/2" diameter) shall be located in the bottom closure plate to prevent trapping of liquids in the baseplate.

4.02.6 The pump baseplate design is affected by the pump size and motor horsepower.

4.02.6.1 Pumps with motors 40 H.P. and below may be furnished with the Vendor's standard baseplate design with support lugs located as noted in Paragraph 4.02.3. The baseplate material may be cast iron or carbon steel.

4.02.6.2 Pumps with motors above 40 H.P. up to and including 75 H.P. shall be furnished with the Vendor's standard carbon steel baseplate modified as noted. A carbon steel plate, 3/4" thick, shall be continuously welded to the bottom of the baseplate to form a rectangular cross section. The plate may be sized to incorporate the support lugs as an integral part of this attachment. Drain holes shall be provided as noted in Paragraph 4.02.5.

4.02.6.3 Pumps with motors 100 H.P. and over shall be furnished with a fabricated steel baseplate. The baseplates shall be designed for each application. Diagonal cross bracing of the baseplate will be required.

As a minimum, the baseplate shall consist of four structural steel channels, C10x25, standing on one flange and welded to form a box. A carbon steel plate, 3/4" thick, shall be welded to the top flange of the channels, and may be sized to provide support lugs as an integral part of the baseplate. Diagonal bracing channels shall be welded to the underside of the steel plate. One brace shall run from one baseplate corner at the pump casing end of the baseplate to a point in the plane of the coupling on the opposite side of the baseplate with the second brace from this point to the opposite corner at the motor end of the baseplate. A steel channel shall be welded to the plate to serve as a motor stand to raise the motor shaft to the same elevation as the pump shaft.

For pumps with motors 150 H.P. and up, the use of four cross braces located as noted above, and the use of the standard steel pump baseplate welded to the 3/4" carbon steel plate shall be considered.

4.02.6.4 Baseplate designs will be reviewed and approved by Purchaser prior to fabrication.

4.02.7 The pump stilts (support legs) shall be stainless steel of the Vendor's standard design. When the pump is subject to thermal expansion, the pump stilts shall be mounted on fixed wear plates. This condition will be noted on the pump data sheet.

4.03 The anticipated seal life for each pump, based on service conditions, shall be provided by the Vendor. This information will be noted on the pump data sheet.

4.04 Pumps which have a mechanical seal specified on the data sheets shall be supplied with a temporary lip seal installed on the pump and the mechanical seal shipped loose. The mechanical seal will be installed by others at the jobsite.

4.05 Mechanical seal chambers shall be designed in accordance with ANSI B73.1, paragraph 4.6.1.1.

4.06 Drill and tap both sides of bearing frame for oiler installation.

4.07 Motors furnished shall conform to Stearns Catalytic specification and data sheet and shall be non-overloading over the entire pump curve using the design impeller diameter and handling the pumpage specified on the data sheet(s).

4.08 Where the data sheet indicates "Seal Recirculation" flow, the fluid from the pump discharge to the seal flush tap shall be provided using rigid metallic tubing. Tubing material shall be compatible with the process fluid as noted on the data sheet. The tubing shall be capable of withstanding the pump design pressure and incorporate the use of a reduced diameter drilling in the seal gland. A radius and chamfer shall be applied to the inside surface of the drilling.

4.09 Equipment shall be painted in accordance with the Du Pont Specification 8572, System 207D.

PUMPS - METERING

SPECIFICATION NO. 39950-0900-0903

TABLE OF CONTENTS

PUMPS - METERING

SPECIFICATION NO. 39950-0900-0903

1.00 SCOPE

1.01 This specification describes the minimum requirements for the design, manufacture, testing and inspection of positive displacement metering pumps conforming to the Hydraulic Institute Standards, Reciprocating Pump Section.

1.02 Items furnished by this specification are to include pump, inlet and outlet check valves, pulsation damper, reciprocating mechanism, coupling, coupling guard, and driver all assembled, aligned and mounted on a common baseplate, ready for installation.

1.03 The following will be furnished by others; installation, piping and electrical feeder wiring to motor terminal box.

2.00 REFERENCE STANDARDS

2.01 Standards of the Hydraulic Institute (HI).

2.02 Occupational Safety and Health Standards of the U.S. Department of Labor (OSHA).

2.03 American Society for Testing and Materials (ASTM).

2.04 American National Standards Institute (ANSI):

ANSI B1.1 Unified Screen Threads.
ANSI B2.1 Pipe Thread (except dry seal).
ANSI B16.5 Steel Pipe Flanges, Flanged Valves and Fittings.

2.05 National Electric Code (NEC).

2.06 The issues or revisions of these documents in effect on the date of inquiry shall apply.

3.00 PERFORMANCE CRITERIA

3.01 The performance criteria for the pumps to be furnished under this specification are listed on the data sheet(s).

3.02

4.00 DESIGN DETAILS

4.01 General Requirements

4.01.1

4.01.2 In the event of conflicts between this specification and the requirements of the attached data sheets, the data sheets shall govern.

4.02 Casing Assembly

4.02.1 Pump pressure bearing parts (liquid cylinder, valve assemblies, etc.) shall be designed and tested for hydrostatic test pressure of 1.5 times the maximum pressure.

4.02.2 Pump liquid cylinder shall be designed to allow maintenance on diaphragm without removing pump from installed location.

4.02.3 All pump lubrication chambers shall be supplied with a tapped drain connection, sealed by a forged or rolled bar stock plug at least equal in strength and in corrosion resistance to the casing material.

4.02.4 Double ball check valves shall be provided on the suction and discharge connections on the pump.

4.02.5 Vendor shall include in his proposal an externally adjustable relief valve for each pump and indicate if relief valve is separate or part of pump assembly.

4.02.6 Relief valve setting is to be a minimum of 10% above the rated head.

4.03 Liquid End Design

4.03.1 A precision ground plunger shall be used with a diaphragm to pump liquid.

4.03.2 The plunger movement will be transmitted to the diaphragm using a hydraulic coupling.

4.03.3 Provisions shall be provided to maintain a consistent volume of fluid free of air and entrained gases in the hydraulic chamber. The hydraulic fluid shall be protected against over pressurization.

4.04 Pump Capacity Control

4.04.1 The pump capacity control shall be accomplished using a method indicated below. The pump shall be capable of flow adjustment during operation.

A. Constant speed drive with manual stroke adjustment.

B. Constant speed drive with automatic stroke adjustment using a pneumatic or electric signal.

C. Variable speed drive with speed controller.

4.04.2 The pump capacity control arrangement shall be noted on the Pump Data Sheet.

4.05 Drive Mechanism

4.05.1 All moving parts in the drive mechanism shall be submerged in lubricating oil.

4.05.2 Oil lubricators shall be provided on the drive mechanism casing and shall have provisions for indicating oil level.

4.05.3 Coupling of the motor to the drive mechanism shall be accomplished using non-lubricated flexible disc couplings.

4.06 Motor Drivers

4.06.1 All electric motors shall be in accordance with the Induction Motor Data Sheet.

4.06.2 The motor shall be non-overloading up to the relief valve setting of the pump.

4.07 Miscellaneous

4.07.1 All exposed moving parts shall be protected against accidental personnel contact in accordance with the requirements of OSHA.

4.07.2 Cast iron baseplates are preferred. Heavy gauge steel baseplates which do not depend upon grouting for strength are acceptable.

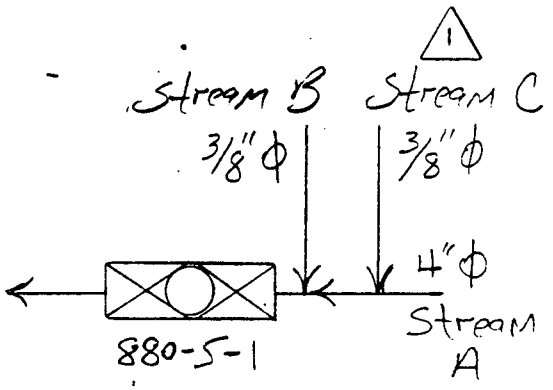
INSTALLATION:



1.0 IDENTIFICATION

EN Number	Quantity	Description
880-12-1	1	Stripping Tower

2.0 SCOPE

This specification defines requirements for the design and fabrication of one stripping tower.

3.0 DESCRIPTION

Stripping tower: Vertical tower, 3'-6" I.D. x 30'-0" TL/TL with ASME ellipsoidal heads and constructed of carbon steel. Design, fabrication and inspection shall be be per current ASME Pressure Vessel Code, Section VIII, Division 1, and Du Pont standards and specifications. Tower to be furnished complete with all nozzles, internal pipes, platforms, ladders, support skirt, and all internals (including packing), all in accordance with Drawing F-05002 and references thereon.

4.0 GENERAL

4.1 All notes, instructions, etc., included on the drawings are made part of this specification. Design, fabrication and inspection shall be in accordance with the current ASME Pressure Vessel Code, Section VIII, Division 1 and Du Pont standards and specifications.

ASME National Board Code stamping is required.

4.2 Calculations, Welding Procedures (WSP) and Welder Qualifications (PQR) shall be furnished along with initial submission of drawings for approval. All thicknesses, reinforcements, supports, etc., shall be verified by calculations. Thicknesses shown on control drawings shall be considered as minimum.

4.3 Du Pont inspection of equipment is required prior to shipment.

4.4 Vendor is released to purchase all materials on placement of order.

4.5 Nozzle bolt holes shall straddle the vessel 0^{o}-180^{o} centerline or its parallel for horizontal nozzles and the vertical centerline for vertical nozzles.

4.6 Gaskets, bolts and nuts for shell, head, manhole and blind flanges shall be furnished by the Vendor.

4.7 Vendor shall identify all subcontractor supplied parts and accessories with manufacturer's name and address and shall submit documentation for Stearns Catalytic and/or Du Pont approval.

4.8 All vessels shall have lifting lugs for handling per Specification SG4C.

4.9 Tower fabricator shall install all internals (excluding packing) in shop to insure proper fit-up and ship them loose for final field installation.

4.10 Vendor shall furnish all data and drawings as indicated in Paragraph 7.0 and as indicated on the attached "Vendor Data Requirements".

4.11 Handrails, cages, ladders and guards to be painted in accordance with Painting System 213X. All coats to be applied at the fabricator's shop. Top coat to be High Vis. Yellow 326-Y-23663.

4.12 Platform support steel to be painted in accordance with Painting System 207V. All coats to be applied at the fabricator's shop. Top coat to be Shale Gray 326-Y-67633.

4.13 Platform grating to be galvanized in accordance with System 170W.

5.0 STANDARDS AND SPECIFICATIONS

Drawings

F-05002 - Rev. A

6.0 INSPECTION

Inspection will be made by Du Pont Quality Assurance Field Representative (QAFR) and inspection procedures are given in the Inspection Planning Data Sheets attached for each vessel. Some of the inspection items that will be checked are noted for each visit. Visit requests are not necessarily in chronological order.

7.0 YOUR QUOTATION MUST STATE YOUR SCHEDULE FOR SUBMITTING DRAWINGS AS FOLLOWS:

Design Approval Drawings in weeks after receipt of order.
Final Drawings in weeks after return of all Design Approval Drawings.

7.1 One reproducible* of Design Approval Drawings required.
One reproducible* of Final Drawings required.

*Two legible copies may be submitted for 8-1/2" x 11" or 11" x 17" drawing.

7.2 All drawings, drawing transmittal letters and correspondence must show the following identification:

Plant: Niagara
Project: 113592
Du Pont Order No.:
EN Numbers:

7.3 The following information is required for approval:

Layout and orientation.	Connection locations and types.
Overall dimensions, weights and materials.	Weld details (WP/PQR).
Mounting or foundation dimensions.	Seam locations.
Critical tolerances and finishes.	Internal details.
	Calculations.
	Nameplate data.

7.4 Design Approval Drawings

These drawings must be submitted before we will release start of fabrication. One print of each drawing will be returned stamped "Approved", "Approved as Noted", or "Not Approved". Fabrication will be released according to a note on the transmittal letter covering the returned prints. Upon receipt of all "Approved" and "Approved as Noted" drawings, vendor shall revise to include all changes and return for our use as Final Drawings. "Not Approved" drawings must be corrected and re-submitted for approval.

7.5 Final Drawings

These drawings are for Du Pont design and construction purposes.

NOTES: 1.	Inspection DuPont inspection is required per this Inspection Planning Data Sheet. You will be contacted by a DuPont Quality Assurance Field Representative (QAFR) to schedule inspection visits. In the event that you are not contacted, call (302) 451-0200 at least 5 days before inspection is needed. When major components or service are obtained from Sub-Vendors, the QAFR will inspect these items at the point of manufacture. It is the Vendor's responsibility to include DuPont inspection and notification requirements in Sub-orders. The QAFR shall perform and document all inspections. He shall assure that the Vendor documents any non-conformances and he shall notify the cognizant Quality Assurance Engineer (QAE) of the non-conformance. The SCC QAE for this P.O. is W. Lehner at (215) 864-1608. The Vendor shall assure that applicable documents that require SCC/ DuPont approval, as identified in the Purchase Order and Specification(s), have been submitted and "Approved" or "Approved As Noted" before the use of such documents. Submittals shall be made to the SCC Manager of Expediting (E.D. Baldi) as required by Vendor Data Requirements attached to Purchase Order.

	All documentation and equipment tags must be identified with the DuPont Plant location, Project Designation, Purchase Order and EN Numbers. The following documentation is to be provided by the Vendor: 1. Procedure(s) 1. Welding 2. Welder Qualification 2. Report(s) 1. Mill Test 2. Manufacturer's Data 3. Inspection Documentation 4. Radiograph Reader Sheet(s) 5. Nameplate(s) Rubbing(s)
2.	Inspection Meeting The QAFR shall visit the Vendor's shop to review the requirements of this Inspection Planning Data Sheet with Vendor shop personnel.
3.	Inspection Instructions: The QAFR will include, but not be limited to, the following inspections: Preliminary, Intermediate and Final as required by Section 4.
4.	Carbon Steel Tank(s) Preliminary - Prior to Fabrication
1. Verify	Welding procedure(s) is approved by SCC.
2. Verify	Welder(s) and welding operator(s) are qualified to fabricate the listed item in accordance with the SCC approved Vendor's welding procedure(s).
3. Verify	Quality control and inspection procedure(s) are employed to assure strong ductile welds.
4. Verify	In-process materials are controlled and identified to provide traceability to the Mill Test Report(s).

SPECIFICATION 39950-0800-0803

PLANT: Niagara
PROJECT: 113592
SPEC.: 02-803
REVISION: A
DATE: 20 January 1987

1.0 IDENTIFICATION

EN Number	Quantity	Description
880-20-1	1	Organics Storage Tank

2.0 SCOPE

This specification defines requirements for the design and fabrication of one storage tank.

3.0 DESCRIPTION

Organics Storage Tank: Vertical vessel, 4'-0" O.D. x 3'-6" TL/TL with ASME torispherical heads and constructed of carbon steel. Design, fabrication and inspection shall be per current ASME Pressure Vessel Code, Section VIII, Division 1, and Du Pont standards and specifications. Vessel to be furnished complete with all nozzles, internal pipes and support legs, all in accordance with Drawing F-08003 and references thereon.

4.0 GENERAL

4.1 All notes, instructions, etc., included on the drawings are made part of this specification. Design, fabrication and inspection shall be in accordance with the current ASME Pressure Vessel Code, Section VIII, Division 1 and Du Pont standards and specifications.

ASME National Board Code stamping is required.

4.2 Calculations, Welding Procedures (WSP) and Welder Qualifications (PQR) shall be furnished along with initial submission of drawings for approval. All thicknesses, reinforcements, supports, etc., shall be verified by calculations. Thicknesses shown on control drawings shall be considered as minimum.

4.3 Du Pont inspection of equipment is required prior to shipment.

4.4 Vendor is released to purchase all materials on placement of order.

4.5 Nozzle bolt holes shall straddle the vessel 0°-180° centerline or its parallel for horizontal nozzles and the vertical centerline for vertical nozzles.

4.6 Gaskets, bolts and nuts for shell, head, manhole and blind flanges shall be furnished by the Vendor.

4.7 Vendor shall identify all subcontractor supplied parts and accessories with manufacturer's name and address and shall submit documentation for Stearns Catalytic and/or Du Pont approval.

4.8 All vessels shall have lifting lugs for handling per Specification SG4C.

4.9 Vendor shall furnish all data and drawings as indicated in Paragraph 7.0 and as indicated on the attached "Vendor Data Requirements".

5.0 STANDARDS AND SPECIFICATIONS

Du Pont Spec. SG1S	-	Fabrication
Du Pont Spec. SU2A	-	Gaskets
Du Pont Spec. SG4C	-	Lifting Lugs
Du Pont Std. G1C	-	Nozzle Construction
Du Pont Std. G10C	-	Manway
Du Pont Std. G15.1C	-	Manway Davit
Du Pont Std. G12D	-	Insul. Supports
Du Pont Std. G6B	-	Structural Leg Supports
Du Pont Spec. 8572 (Sheet #16)	-	Painting System 213X

Drawings

F-08003 - Rev. A

6.0 INSPECTION

Inspection will be made by Du Pont Quality Assurance Field Representative (QAFR) and inspection procedures are given in the Inspection Planning Data Sheets attached for each vessel. Some of the inspection items that will be checked are noted for each visit. Visit requests are not necessarily in chronological order.

7.0 YOUR QUOTATION MUST STATE YOUR SCHEDULE FOR SUBMITTING DRAWINGS AS FOLLOWS:

Design Approval Drawings in weeks after receipt of order.
Final Drawings in weeks after return of all Design Approval Drawings.

7.1 One reproducible* of Design Approval Drawings required.
One reproducible* of Final Drawings required.

*Two legible copies may be submitted for 8-1/2" x 11" or 11" x 17" drawing.

7.2 All drawings, drawing transmittal letters and correspondence must show the following identification:

Plant:	Niagara
Project:	113592
Du Pont Order No.:	
EN Numbers:	880-20-1

7.3 The following information is required for approval:

Layout and orientation.	Connection locations and types.
Overall dimensions, weights and materials.	Weld details (WP/PQR).
	Seam locations.
Mounting or foundation dimensions.	Internal details.
	Calculations.
Critical tolerances and finishes.	Nameplate data.

7.4 Design Approval Drawings

These drawings must be submitted before we will release start of fabrication. One print of each drawing will be returned stamped "Approved", "Approved as Noted", or "Not Approved". Fabrication will be released according to a note on the transmittal letter covering the returned prints. Upon receipt of all "Approved" and "Approved as Noted" drawings, vendor shall revise to include all changes and return for our use as Final Drawings. "Not Approved" drawings must be corrected and re-submitted for approval.

7.5 Final Drawings

These drawings are for Du Pont design and construction purposes.

HEAT EXCHANGER - SHELL AND TUBE SPECIFICATION NO. 39950-0600-0601

TABLE OF CONTENTS

HEAT EXCHANGER - SHELL AND TUBE

SPECIFICATION NO. 39950-0600-0601

1.00 SCOPE

1.01 This specification, plus individual Heat Exchanger Data Sheets, and all references noted thereon, covers the design, material, construction, workmanship, inspection and testing of general service heat exchangers.

1.02 The following will be furnished by others:

A. Installation

B. Foundation and anchor bolts

C. Piping and pipe supports to equipment boundaries

D. Insulation.

2.00 REFERENCE STANDARDS

2.01 The following industry, association and government codes and standards shall be followed as applicable to the design, fabrication, assembly and testing of all equipment furnished under this specification.

American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code:

Section II - Material Specifications
Section V - Non-Destructive Examination
Section VIII - Pressure Vessels
Section IX - Welding & Brazing Qualifications

Tubular Exchanger Manufacturer's Association (TEMA) Standards.

2.02 The issues or revisions of these documents in effect on the date of the Vendor's proposal shall apply. These shall include all code cases, supplements, and addenda.

3.00 PERFORMANCE CRITERIA

3.01 The performance of the unit shall be as described on the attached Heat Exchanger Data Sheet(s).

3.02 Upon award of a purchase order, vendor shall verify the designs specified on the data sheets and guarantee thermal design and pressure drop.

4.00 DESIGN DETAILS

4.01 General Requirements

4.01.1 All process shell and tube heat exchangers shall be designed, constructed, inspected and tested in accordance with this specification including requirements of all references.

4.01.2 In the event of conflicts, the requirements of the data sheets shall govern.

4.01.3 Vendors shall notify the Purchaser of all conflicts and/or deviations from good design practice.

4.01.4 Exchangers shall meet the requirements of TEMA Class "B", Chemical Process Service.

4.01.5 Specified shell sizes are approximate. Vendor shall be responsible for sufficient shell diameter to accommodate number of tubes required as well as impingement plates and inlet and outlet velocity limits.

4.02 Materials

4.02.1 The materials of construction for exchanger components shall be indicated on the data sheets.

4.02.2 Materials shall conform to the specification tabulated in the TEMA standards and subject to use as limited by the ASME Code.

4.02.3 No asbestos or asbestos-containing material shall be used in the exchangers.

4.03 Mechanical

4.03.1 Shell and tube side components shall be designed for the temperatures stated on the data sheets, components subject to both shell and tube side temperatures shall be designed for maximum operating metal temperature plus 50°F.

4.03.2 Exchanger parts normally shall be designed for full design pressures. In the event that differential pressure is permitted for design, the data sheets will so state.

4.03.3 Fixed tube sheet units shall be provided with a shell expansion joint when either of the following conditions would result in over-stressing of components and/or the loosening of the joints between tube and tube sheet:

A. Operating conditions including start-up and shut-down.

B. Failure of one stream.

4.03.4 Flanged and flued type expansion joints are preferred. The expansion joints shall be designed for a minimum of 500 cycles at full temperature and pressure. Vendor shall provide complete expansion joint design with movements peak combined stresses and predicted cycle life for approval prior to material procurement.

4.03.5 Tube bundles and shell sizes shall be standardized for maximum interchangeability within practical limits.

4.03.6 Vendor shall design all tube bundles to preclude flow-induced vibrations or sonic vibrations. Support or baffle plate spacing may be closer than TEMA minimum if necessary to prevent vibrations.

4.03.7 The inner row of U-tubes may be angled to reduce the distance between the inner row of tubes providing continuous cleaning lanes are maintained for square pitch bundles.

4.03.8 When seal or strength welding of the tube-to-tube sheet is specified, the sequence of fabrication shall be: center tube in the tube sheet hole by lightly expanding or drifting, weld, and final roll. The weld shall be examined using the dye penetrant method in accordance with ASME Code Section VIII after the final roll. Where halide or freon leak testing is specified, it shall precede the final roll.

4.03.9 High point vents and low point drains shall be provided on both shell and tube sides. These vents and drains connections shall be 3/4 inch FNPT (minimum). Vertical units shall have a tube sheet vent. The vent hole shall be drilled from the edge of the upper tube sheet through to the shell side of the exchanger. The hole shall be threaded at the tube sheet edge with a 1/4 inch FNPT. Vent and drain connections shall be fitted with non-galling plugs.

4.03.10 All exchangers shall be complete with supports or saddles. Multiple shell units shall be designed for stacking. Shells of lower units shall be designed to preclude distortion or buckling due to the weight of upper shells when in their corroded condition.

4.03.11 Lifting devices shall be furnished in accordance with TEMA Para. G7.2. This shall apply in general to all individual items with a weight in excess of 60 pounds.

4.03.12 Insulation supports shall be furnished if specified on the Heat Exchanger Data Sheet.

4.03.13 Reinforcing pads, when required, shall be made of the same or similar material as the shell and shall be furnished with tapped telltale holes. Where savings may be affected by the use of carbon steel reinforcing pads, alternate quotations may be submitted.

4.03.14 Where feasible, exchanger removable bundles in corrosive service shall be designed for 180° rotation to prolong life.

4.03.15 Removable tube bundles with shell side fouling factors of .0025 or greater shall use a square tube pattern. Pattern shall be rotated for all but boiling service shell side, or condensing tube side. Other services shall use triangular pitch as standard.

4.03.16 Shell baffles shall be notched to permit complete shell drainage.

4.03.17 Bonnet/channel connections shall be located to permit withdrawal of shell body flange studs.

4.04 Thermal

4.04.1 Fouling allowances shown on the data sheet are the minimum acceptable.

4.04.2 For all units, particularly those with extended surface, the tube side fouling factor specified is to be multiplied by the outside surface/inside surface ratio in the calculations of the overall heat transfer rate.

4.04.3 The guaranteed pressure drops shall be stated for clean and fouled conditions.

4.04.4 The number of tubes in any pass shall be plus or minus 10% of the total number of tubes divided by the number of passes.

4.04.5 For exchangers with U-tubes, the bend surface shall not be considered effective when calculating the heat transfer area.

4.04.6 Total amount of heat exchanged shall be as specified on the attached Heat Exchanger Data Sheet(s). The units of heat exchanged are BTU/HR.

4.05 Welding

4.05.1 Vendor shall submit welding procedures for approval prior to start of fabrication. Vendor shall qualify tube-to-tube sheet seal weld and alloy facing weld procedures as well as code required weld procedures. The Vendor shall submit a mockup of tube-to-tube sheet welds and rolls to Du Pont for approval prior to start of fabrication. Refer to inspection brief for details.

4.05.2 Shell radiograph, when required by the ASME Code, shall meet the following minimum requirements:

A. One spot radiograph for each circumferential seam.

B. One spot radiograph for each longitudinal seam.

C. Location of the spot radiographs will be selected by the Purchaser's Inspector or by the Code Agency Inspector.

4.05.3 When the component is other than all carbon steel, that is, all or part alloy steel, non-ferrous metal or composite materials (clad or lined), the Bidder shall furnish full information on the proposed fabrication, qualification of welding procedures, heat treatment, examination of welds, methods and extent of attachment, if requested.

4.05.4 Backing strips must be removed before final assembly.

5.00 INSPECTION

5.01 The Owner/Engineer's inspector shall have free entry to parts and/or areas of the manufacturer's shop where work on the equipment is performed.

5.02 Acceptance by the Owner/Engineer's inspector shall not relieve the manufacturer of responsibility for warranty and performance guarantees.

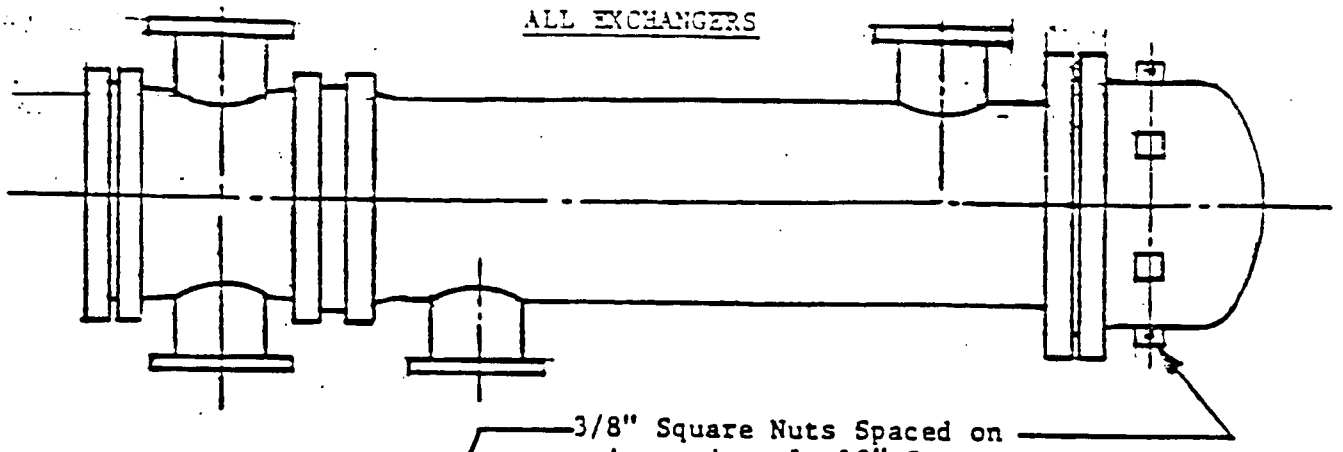
5.03 The Owner/Engineer's inspector will witness hydrostatic tests. Five days notice prior to testing shall be given.

STEARNS CATALYTIC CORP.
ENGINEERING DEPARTMENT

INSULATION SUPPORTS FOR
HEAT EXCHANGERS

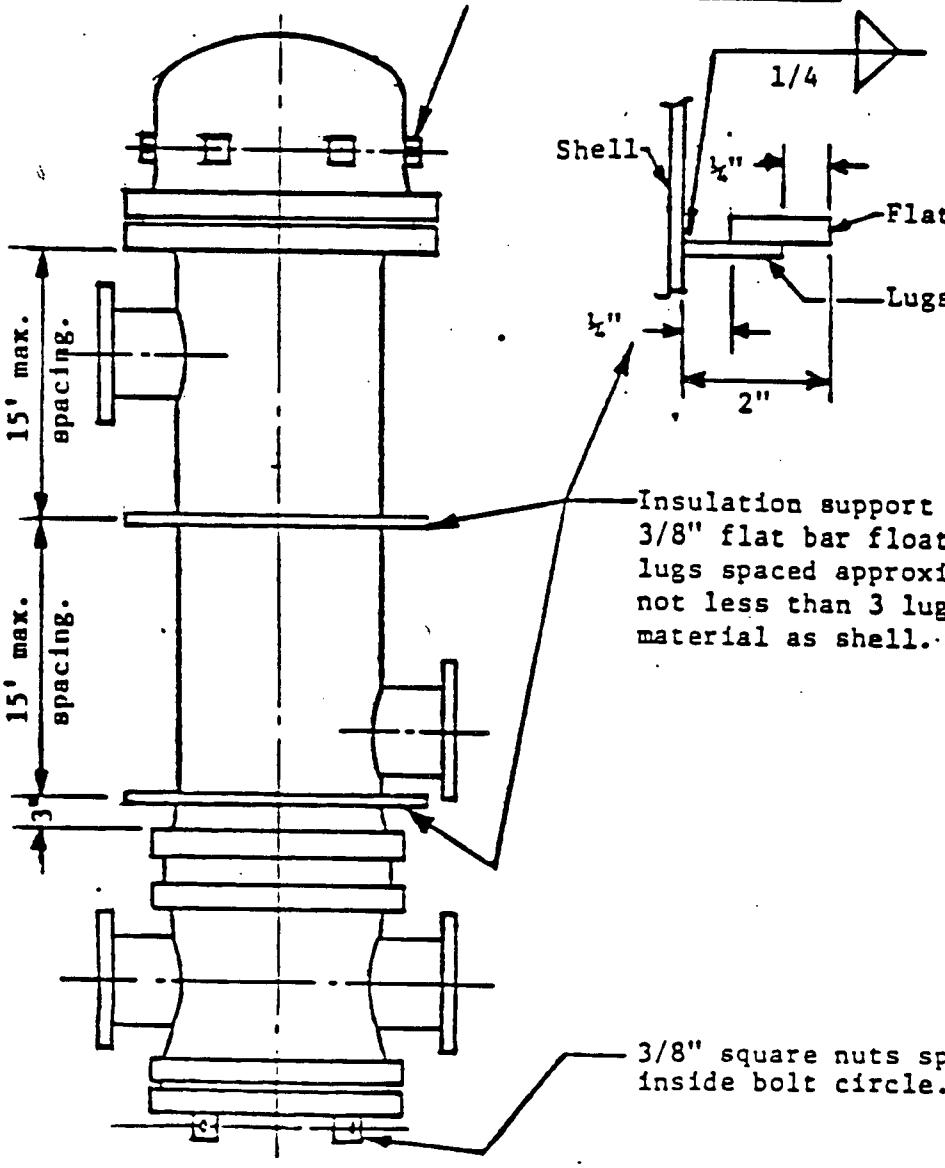
SPECIFICATION SP-2200-S31
Rev.0; dated 11 October 1984

ALL EXCHANGERS



3/8" Square Nuts Spaced on Approximately 12" Centers

VERTICAL EXCHANGERS SIZED 18" O.D. AND LARGER



Insulation support consisting of continuous 3/8" flat bar floating on 3/8" x 3" wide lugs spaced approximately 3'-0" apart, not less than 3 lugs. Make lugs of same material as shell.

3/8" square nuts spaced on 12" centers inside bolt circle.

NOTES: 1.	Inspection DuPont inspection is required per this Inspection Planning Data Sheet. You will be contacted by a DuPont Quality Assurance Field Representative (QAFR) to schedule inspection visits. In the event that you are not contacted, call (302) 451-0200 at least 5 days before inspection is needed. When major components or service are obtained from Sub-Vendors, the QAFR will inspect these items at the point of manufacture. It is the Vendor's responsibility to include DuPont inspection and notification requirements in Sub-orders. The QAFR shall perform and document all inspections. He shall assure that the Vendor documents any non-conformances and he shall notify the cognizant Quality Assurance Engineer (QAE) of the non-conformance. The SCC QAE for this P.O. is W. Lehner at (215) 864-1608. The Vendor shall assure that applicable documents that require SCC/ DuPont approval, as identified in the Purchase Order and Specification(s), have been submitted and "Approved" or "Approved As Noted" before the use of such documents. Submittals shall be made to the SCC Manager of Expediting (E.D. Baldi) as required by Vendor Data Requirements attached to Purchase Order.

Inspection Activity	Instruction
	All documentation and equipment tags must be identified with the DuPont Plant location, Project Designation, Purchase Order and EN Numbers. The following documentation is to be provided by the Vendor: 1. Manufacturers Data Reports 2. Mill Test Reports 3. Nameplate Rubbings 4. Weld Procedure(s) and Welder Qualifications 5. Mock-up Tube to Tubesheet Rolls 6. Radiographic Reader Sheets and Reports 7. Test Results and Report(s) 8. Spare Parts List for DuPont, Niagara
2.	Inspection Meeting The QAFR shall visit the Vendor's shop to review the requirements of this Inspection Planning Data Sheet with Vendor shop personnel.
3.	Inspection Instructions: The QAFR will include, but not be limited to, the following inspections: Preliminary, Intermediate and Final as required by Section 4.
4.	Shell and Tube Heat Exchanger(s) Preliminary - Prior to Fabrication
1. Verify	The submittal of the mock-up tube to tube sheet roll(s) for DuPont approval in accordance with the SCC Spec.
2. Verify	Design calculation(s) and welding procedure(s) have been approved by SCC.
3. Verify	Welder(s) and welding operator(s) are qualified to fabricate the listed item(s) in accordance with the SCC Spec., the ASME Code and the SCC approved Vendor's welding procedure(s).
4. Verify	Quality control and inspection procedure(s) are employed to assure compliance with the SCC Spec.
5. Verify	In process material(s) is controlled and identified to provide traceability to the material documentation.

Item or Service See Sheet 1

Inspection Activity	Instruction
	Intermediate - In Progress
6. Verify	The mock-up tube to tube sheet roll(s) has been approved by DuPont and/or SCC.
7. Verify	The tubes are seamless, cold drawn and heat treated per ASME/ASTM Standard(s). Obtain a certificate of compliance.
8. Verify	The eddy current test has been preformed in accordance with the material (ASME/ASTM) Standard(s). Obtain certified test result(s).
9. Verify	The air-underwater test at 150 psig. has been performed. No leaks allowed. Obtain certified test result(s).
10. Witness	Qualified welding operator(s), fit-up and welding practices are in compliance with the SCC approved Vendor's welding procedure(s).
11. Witness	Fabrication is in accordance with the SCC Spec. and the SCC approved Vendor's drawing(s).
12. Inspect	Welds to assure compliance to the SCC approved Vendor's welding procedure(s). Review the radiographic reader sheet(s).
13. Inspect	Tube sheet drilling, finish and flatness are in accordance with the SCC approved Vendor's drawing(s).
14. Inspect	The shell and tube bundle for general quality of workmanship - no burrs, no sharp edges, clean welds, clean rolls, etc.
15. Inspect	The shell and tube bundle that overall dimensions are in accordance with the SCC Spec. and the SCC approved Vendor's drawing(s).
16. Verify	External bundle and internal shell surfaces are cleaned - free of debris, dirt, oil, etc.
17. Witness	The installation of the tube bundle into the shell. Assure no damage occurs to the shell, baffle(s) and tubes.
18. Witness	The hydrostatic pressure test in accordance with the ASME Code, the SCC Spec. and the SCC approved Vendor's drawing(s).
19. Witness	The air test of the tube bundle. Test shall be in accordance with the DuPont Standard.

1.0 IDENTIFICATION

EN Number	Quantity	Description
880-14-2	1	Decanter

2.0 SCOPE

This specification defines requirements for the design and fabrication of one decanter.

3.0 DESCRIPTION

Vertical vessel, 18" O.D. x 18" TL/TL with ASME torispherical heads and constructed of unalloyed titanium. Design, fabrication and inspection shall be per current ASME Pressure Vessel Code, Section VIII, Division 1 and Du Pont standards and specifications. Vessel to be furnished complete with all nozzles, internal dip pipes and support lugs all in accordance with Drawing F-08004 and references thereon.

4.0 GENERAL

4.1 All notes, instructions, etc., included on the drawings are made part of this specification. Design, fabrication and inspection shall be in accordance with the current ASME Pressure Vessel Code, Section VIII, Division 1 and Du Pont standards and specifications.

ASME National Board Code stamping is not required.

4.2 Calculations, Welding Procedures (WSP) and Welder Qualifications (PQR) shall be furnished along with initial submission of drawings for approval. All thicknesses, reinforcements, supports, etc., shall be verified by calculations. Thicknesses shown on control drawings shall be considered as minimum.

4.3 Du Pont inspection of equipment is required prior to shipment.

4.4 Vendor is released to purchase all materials on placement of order.

4.5 Nozzle bolt holes shall straddle the vessel 0^{o}-180^{o} centerline or its parallel for horizontal nozzles and the vertical centerline for vertical nozzles.

4.6 Gaskets, bolts and nuts for shell, head, manhole and blind flanges shall be furnished by the Vendor.

4.7 Vendor shall identify all subcontractor supplied parts and accessories with manufacturer's name and address and shall submit documentation for Stearns Catalytic and/or Du Pont approval.

4.8 All vessels shall have lifting lugs for handling per Specification SG4C.

4.9 Vendor shall furnish all data and drawings as indicated in Paragraph 7.0 and as indicated on the attached "Vendor Data Requirements".

5.0 STANDARDS AND SPECIFICATIONS

Du Pont Spec. SG16S - Fabrication
Du Pont Spec. SW11N - Material
Du Pont Spec. SU2A - Gaskets
Du Pont Spec. SG4C - Lifting Lugs
Du Pont Std. G1C - Nozzle Construction
Du Pont Std. G12D - Insul. Supports
Du Pont Spec. 8572 (Sheet #16) - Painting System 213X

Drawings

F-08004 - Rev. A

6.0 INSPECTION

Inspection will be made by Du Pont Quality Assurance Field Representative (QAFR) and inspection procedures are given in the Inspection Planning Data Sheets attached for each vessel. Some of the inspection items that will be checked are noted for each visit. Visit requests are not necessarily in chronological order.

7.0 YOUR QUOTATION MUST STATE YOUR SCHEDULE FOR SUBMITTING DRAWINGS AS FOLLOWS:

Design Approval Drawings in weeks after receipt of order.
Final Drawings in weeks after return of all Design Approval Drawings.

7.1 One reproducible* of Design Approval Drawings required.
One reproducible* of Final Drawings required.

*Two legible copies may be submitted for 8-1/2" x 11" or 11" x 17" drawing.

7.2 All drawings, drawing transmittal letters and correspondence must show the following identification:

Plant:	Niagara
Project:	113592
Du Pont Order No.:	
EN Numbers:	

7.3 The following information is required for approval:

Layout and orientation.	Connection locations and types.
Overall dimensions, weights and materials.	Weld details (WP/PQR).
	Seam locations.
Mounting or foundation dimensions.	Internal details.
	Calculations.
Critical tolerances and finishes.	Nameplate data.

7.4 Design Approval Drawings

These drawings must be submitted before we will release start of fabrication. One print of each drawing will be returned stamped "Approved", "Approved as Noted", or "Not Approved". Fabrication will be released according to a note on the transmittal letter covering the returned prints. Upon receipt of all "Approved" and "Approved as Noted" drawings, vendor shall revise to include all changes and return for our use as Final Drawings. "Not Approved" drawings must be corrected and re-submitted for approval.

7.5 Final Drawings

These drawings are for Du Pont design and construction purposes.

Item or Service See Sheet 1

Inspection Activity	Instruction
	All documentation and equipment tags must be identified with the DuPont Plant location, Project Designation, Purchase Order and EN Numbers. The following documentation is to be provided by the Vendor: 1. Procedure(s) 1. Welding 2. Welder Qualification 2. Report(s) 1. Mill Test 2. Manufacturer's Data 3. Inspection Documentation 4. Radiograph Reader Sheet(s) 5. Nameplate Rubbing(s)
2.	Inspection Meeting The QAFR shall visit the Vendor's shop to review the requirements of this Inspection Planning Data Sheet with Vendor shop personnel.
3.	Inspection Instructions: The QAFR will include, but not be limited to, the following inspections: Preliminary, Intermediate and Final as required by Section 4.
4.	Titanium Vessel Preliminary - Prior to Fabrication
1. Verify	Welding procedure(s) is approved by SCC.
2. Verify	Welder(s) and welding operator(s) are qualified to fabricate the listed item in accordance with the SCC approved Vendor's welding procedure(s).
3. Verify	Quality control and inspection procedure(s) are employed to assure strong ductile welds.
4. Verify	In-process materials are controlled and identified to provide traceability to the Mill Test Report(s).

5. Witness	Qualified welding operator(s), fit-up and welding practices are in compliance with the SCC approved Vendor's welding procedure(s).
6. Witness	A fit-up of a circumferential joint and a nozzle joint.
7. Verify	The material is in accordance with the SCC Spec., the DuPont Std. and the SCC approved Vendor's drawing.
8. Witness	Fabrication is in accordance with the SCC Spec., the DuPont Std. and the SCC approved Vendor's drawing(s).
9. Inspect	All connections are in accordance with the SCC Spec. and the SCC approved Vendor's drawing(s).
10. Inspect	All welds to assure compliance to the SCC approved Vendor's welding procedure(s).
11. Inspect	General quality of workmanship - no burrs, no sharp edges, clean welds, etc.
12. Inspect	Overall dimensions are in accordance with the SCC Spec. and the SCC approved Vendor's drawing(s).
13. Witness	Liquid penetrant tests and assure examination is in accordance with the ASME Code and the SCC approved Vendor's drawing(s), as required.
14. Verify	Radiograph reader sheets and assure examination is in accordance with the ASME Code and the SCC approved Vendor's drawing(s).
15. Witness	The hydrostatic test in accordance with the ASME Code and the SCC approved Vendor's drawing(s).
16. Verify	Listed item(s) are drained, dried and cleaned, internally and externally after hydro.

HEAT EXCHANGERS - PLATE TYPE

SPECIFICATION NO. 39950-0600-0602

TABLE OF CONTENTS

HEAT EXCHANGERS - PLATE TYPE

SPECIFICATION NO. 39950-0600-0602
PAGE 1 of 4

1.00 SCOPE

1.01 This specification, plus individual Plate Type Heat Exchanger Data Sheets, and all references noted thereon, covers the design, material, construction, workmanship, inspection and testing of plate type heat exchangers.

1.02 The following will be furnished by others:

A. Installation

B. Foundation and anchor bolts

C. Piping and pipe supports to equipment boundaries

D. Insulation.

2.00 REFERENCE STANDARDS

2.01 The following industry, association and government codes and standards shall be followed as applicable to the design, fabrication, assembly and testing of all equipment furnished under this specification.

American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code:

Section II	-	Material Specifications
Section V	-	Non-Destructive Examination
Section VIII	-	Pressure Vessels, Div. 1
Section IX	-	Welding & Brazing Qualifications

American National Standards Institute (ANSI) Standards:

B16.5	-	Steel Pipe Flanges and Flanged Fittings

2.02 The issues or revisions of these documents in effect on the date of the vendor's proposal shall apply. These shall include all code cases, supplements, and addenda.

3.00 PERFORMANCE CRITERIA

3.01 The performance of the unit shall be as described on the attached Plate Type Heat Exchanger Data Sheet(s).

3.02 Vendor shall guarantee thermal design and pressure drop.

4.00 DESIGN DETAILS

4.01 General Requirements

4.01.1 All heat exchangers shall be designed, constructed, inspected and tested in accordance with this specification including requirements of all references.

4.01.2 In the event of conflicts, the requirements of the data sheets shall govern.

4.02 Materials

4.02.1 The materials of construction for exchanger components shall be indicated on the data sheets.

4.02.2 Materials' use shall be subject to limits of the ASME Code.

4.02.3 No asbestos or asbestos-containing material shall be used in the exchangers.

4.03 Mechanical

4.03.1 End plates, ports, cover plates, and gaskets shall be designed for the temperatures stated on the data sheets. Plates shall be designed for maximum operating metal temperature plus or minus 50°F. Operating conditions shall include:

A. Start up and shutdown.

B. Failure of one stream.

4.03.2 Exchanger parts normally shall be designed for full design pressures. In the event that differential pressure is permitted for design, the data sheets will so state.

4.03.3 Plate heat exchangers shall be of single pass, counter-current flow design to achieve high efficiency, to facilitate access to the plate pack for maintenance and to enable cleaning by backflushing. For non-fouling streams, vendor may quote a multipass design as an alternate, if appreciably more economical, or if operating requirements, i.e. reduced flow, make such design more suitable.

4.03.4 The required additional heat transfer area to provide for a decrease in thermal performance due to fouling shall be as stated on the data sheet.

4.03.5 Total amount of heat exchanged shall be as specified on the attached data sheet(s). The units of heat exchanged are BTU/HR.

4.03.6 Flow area of ports shall be such that the entrance and exit pressure drops are not more than 50% of the total calculated pressure drop.

4.03.7 Plate sizes and patterns shall be standardized for maximum interchangeability within practical limits.

4.03.8 The design of the plate heat exchanger should assure against any hydraulically induced vibrations.

4.03.9 End plates shall be provided at the fixed and movable cover for sealing the first and last flow pass and to provide support to the adjacent plate.

4.03.10 Port holes not feeding passes between plates shall be fully gasketed and vented to the atmosphere.

4.03.11 Plates should be fully supported from the top carrying bar and guided only by the bottom bar, by reinforced slots integral with the plate.

4.03.12 The frame of the plate type heat exchanger shall be designed to permit future installation of a minimum of 20% additional plates.

4.03.13 The movable cover shall be supported from the upper carrying bar by means of roller bearings and guided by the bottom bar.

4.03.14 Units shall be shrouded to provide splash protection. Design shall facilitate easy maintenance and cleaning of the plate type heat exchanger.

4.03.15 Insulation supports shall be furnished if specified on the Heat Exchanger Data Sheet.

4.03.16 Lifting devices shall be furnished to all individual items with a weight in excess of 60 pounds.

4.03.17 Carbon steel ports and covers shall be designed for a minimum corrosion allowance of 1/8 inch. For alloy-lined parts, no corrosion allowance is required on the base metal behind the alloy. Alloy linings shall not be included in strength calculations.

4.03.18 No cold rolled lap joint flanges shall be used. Fabricated and annealed lap joints (stud ends) are acceptable provided that they are fabrication and inspected per ASME Code.

5.00 INSPECTION

5.01 The Owner/Engineer's inspector shall have free entry to parts and/or areas of the manufacturer's shop where work on the equipment is performed.

5.02 Acceptance by the Owner/Engineer's inspector shall not relieve the manufacturer of responsibility for warranty and performance guarantees.

5.03 The Owner/Engineer's inspector shall witness hydrostatic tests. Five days notice prior to testing shall be given.

NOTES: 1.	Inspection DuPont inspection is required per this Inspection Planning Data Sheet. You will be contacted by a DuPont Quality Assurance Field Representative (QAFR) to schedule inspection visits. In the event that you are not contacted, call (302) 451-0200 at least 5 days before inspection is needed. When major components or service are obtained from Sub-Vendors, the QAFR will inspect these items at the point of manufacture. It is the Vendor's responsibility to include DuPont inspection and notification requirements in Sub-orders. The QAFR shall perform and document all inspections. He shall assure that the Vendor documents any non-conformances and he shall notify the cognizant Quality Assurance Engineer (QAE) of the non-conformance. The SCC QAE for this P.O. is W. Lehner at (215) 864-1608. The Vendor shall assure that applicable documents that require SCC/DuPont approval, as identified in the Purchase Order and Specification(s), have been submitted and "Approved" or "Approved As Noted" before the use of such documents. Submittals shall be made to the SCC Manager of Expediting (E.D. Baldi) as required by Vendor Data Requirements attached to Purchase Order.

ICE BUILDER CHILLER

SPECIFICATION NO. 39950-3400-3401

TABLE OF CONTENTS

ICE BUILDER CHILLER

SPECIFICATION NO. 39950-3400-3401
PAGE 1 of 2

1.00 SCOPE

1.01 This specification describes the minimum requirements for the design, fabrication and delivery of a packaged Ice Builder Chiller to provide continuous chilled water for process. Unit shall be located indoors.

1.02 Ice builder shall include tank with insulation, refrigeration coils, baffled water side louvers for agitation, thermal expansion valve, suction line strainer, liquid line dryer, air cooled condensing unit, refrigeration charge, automatic ice thickness control, all mounted, wired, piped and shipped as complete package.

1.03 The following will be furnished by Others:

A. Foundation and anchor bolts.

B. Erection and installation.

C. Chilled water pump and chilled water piping.

D. Compressor motor starter.

E. Power and control wiring to unit.

2.00 REFERENCE STANDARDS

2.01 The following industry, association and government codes and standards shall be followed as applicable to the design, fabrication, assembly and testing of all equipment furnished under this specification.

2.01.1 OSHA - Occupational Safety and Health Act.

2.01.2 ANSI/ASHRAE - 15-78 Safety Code Mechanical Refrigeration.

2.01.3 ANSI - B31.5 Pressure Piping, Refrigeration.

2.01.4 NEMA - National Electrical Manufacturer's Association.

2.01.5 NEC - National Electric Code.

2.01.6 ASME Boiler and Pressure Vessel Code, Section VIII, Unfired Vessels.

2.02 The issues or revisions of these documents in effect on the date of the Vendor's proposal shall apply

3.00 PERFORMANCE CRITERIA

3.01 Ice builder chiller shall be capable of continuous 24 hour per day performance as follows:

Normal Maximum Ice Thickness:	500 Lb.
Refrigerant:	R-12
Chilled Water Flow:	10 GPM
Outlet Water Temperature:	35°F maximum
Process Load:	2,000 Btu/Hr. continuous
Condensing Unit Capacity:	5,500 Btu/Hr. minimum
Design Air Temperature:	90°F
Power Available:	3 Ph/60 Hz/460 Volt - motor 1 Ph/60 Hz/120 Volt - controls

4.00 DESIGN DETAILS

4.01 Cabinet tank shall be constructed of heavy gauge steel, electrically welded.

4.02 Cabinet shall be insulated on sides, ends, and bottom with 2 inch corkboard minimum. Outer jacket clad in embossed sheet aluminum protected by heavy galvanized angle corners with aluminum finish. Top has removable galvanized steel cover.

4.03 Refrigerant coil to be direct expansion serpentine type, downfed, welded to heavy gauge steel plates. Each coil equipped with expansion valve and liquid line filter-dryer. Provide suction line strainer and positive oil return to compressor.

4.04 Refrigerated coil plates shall have welded baffles for extended ice surface buildup and water agitation without mechanical agitation device.

4.05 Air cooled condensing unit shall be mounted on top of cabinet, factory piped and wired. Compressor shall be either serviceable hermetic or open type.

4.06 Compressor operation shall be controlled by automatic ice thickness control, independent of water flow.

4.07 Hand operated ice thickness gauge shall be provided.

4.08 Assembled unit shall prove leak-proof when tested with a suitable leak detector set for high sensitivity and pressure tested at the pressure specified by ANSI/ASHRAE 15-78 Safety Code on the refrigerant side. After pressure test, refrigerant side shall be dehydrated and charged with operating refrigerant and oil charge prior to shipment.

PUMP - VERTICAL SINGLE STAGE SUMP PUMP SPECIFICATION NO. 39950-0900-0904

TABLE OF CONTENTS

PUMP - VERTICAL SINGLE STAGE SUMP PUMP

SPECIFICATION NO. 39950-0900-0904

1.00 SCOPE

1.01 This specification describes the minimum requirements for the design, manufacture, testing, and inspection of a vertical single stage sump pump.

1.02 The following will be furnished by others: installation, piping and electrical feeder wiring to motor terminal box.

2.00 REFERENCE STANDARDS

2.01 Standards of the Hydraulic Institute (HI).

Centrifugal, Rotary, and Reciprocating Pumps.

2.02 American Society for Testing and Materials (ASTM).

2.03 American National Standards Institute (ANSI).

ANSI B2.1	Pipe Thread (except dry seal).
ANSI B16.5	Steel Pipe Flanges, Flanged Valves and Fittings.

2.04 Occupational Safety and Health Standards of the U.S. Department of Labor (OSHA).

2.05 National Electric Code (NEC).

2.06 The issues or revisions of these documents in effect on the date of inquiry shall apply.

3.00 PERFORMANCE CRITERIA

3.01 The performance criteria for the pumps to be furnished under this specification shall be in accordance with the information listed on the Pump Data Sheet(s).

3.02 The pump impeller furnished shall provide the design head at the design flow rate as noted on the Data Sheet(s). The impeller diameter selected to meet the design conditions shall not be smaller than the minimum on the manufacturer's published performance curves. The pump shall be capable of at least a 10% head increase at design conditions by installing a larger impeller.

3.03 The differential head generated by the pump with all available impeller sizes shall rise continuously from maximum capacity to shut-off. Duplicate pumps shall be capable of stable operation in parallel.

3.04 The Vendor shall state in his proposal the minimum submergence and NPSH required by the pump selected for optimum pump performance.

4.00 DESIGN DETAILS

4.01 General Requirements

4.01.1 The equipment shall be of manufacturer's standard construction whenever possible for ease of interchangeability of parts.

4.01.2 The pump suction and discharge nozzles shall be flanged connections with dimensions in accordance with ANSI B16.5 Class 150 steel standards as to bolt circle and number and size of bolts. Flanges shall be flat-faced.

4.01.3 All threaded parts shall conform to ANSI standards.

4.01.4 A lifting ring shall be provided to facilitate handling of equipment in excess of 60 pounds during installation and maintenance.

4.02 Materials

4.02.1 Materials of construction shall be suitable for listed service. See data sheet(s) for additional information.

4.02.2 Properties as defined by the material specification which have been altered during fabrication shall be restored to the requirements of the material specification.

4.03 Specific Requirements

4.03.1 Pump and Column

A. The pump column shall have relief holes to prevent trapping air and liquid under pressure. The column shall be self draining.

B. The pump column shall be flange mounted design to assure good alignment between the pump casing, column and motor.

C. The pump discharge pipe shall extend through the pump mounting plate and have flanged ends in accordance with Paragraph 4.01.2.

D. The pump shall be mounted to a cover plate (baseplate) fabricated to the size and thickness shown on the pump data sheet. The material shall be suitable for service conditions.

E. The pump suction opening shall be on the bottom of the pump casing. The opening shall have a suitable suction strainer to protect the impeller from solids and foreign matter.

F. Shaft seal of type specified on data sheet.

4.03.2 Bearings

A. The top bearing shall be an antifriction type thrust bearing. The bearing shall be capable of withstanding the design radial and axial loads.

B. The top bearing shall be regreaseable type with accessible grease fittings. The bearing housing shall be designed to protect the bearings from water, dust and other contaminants.

C. The top bearing shall have a LIO life of 10,000 hours.

D. The line and foot bearings shall be sleeve bearings. The length of the sleeve guide and bearing shall be a minimum of two and one-half times the pump shaft diameter.

E. The design shall provide for the use of flushing or lubricating liquid between the pump shaft and the line and foot bearings if required.

F. For pump design where the distance from the pump cover plate to the pump suction exceeds 36 inches, a line bearing shall be installed. Maximum span between bearings shall not exceed 36 inches.

4.03.3 Impeller

A. The pump shall have an open impeller.

B. The impeller shall be statically and dynamically balanced.

C. Impeller clearance shall be externally adjustable from the top of the unit, so that the pump does not have to be removed for adjustment.

D. The pump shall be selected so the impeller used is not the maximum size that can be used with the pump (refer to Paragraph 3.02).

4.03.4 Motors

A. The motor shall be supplied in accordance with the Induction Motor Data Sheet and the Motor Specification.

B. The electric motor driver shall be non-overloading for the full performance curve of the pump at the impeller design diameter.

C. The motor mounting bracket shall have tongue and groove machining to insure alignment of the motor and pump shaft.

D. OSHA approved type coupling and shaft guard.

INSTRUMENT SYMBOLS FOR INSTRUMENT DIAGRAMS

INSTRUMENTS ENGINEERING STANDARD

ISSUED	AUG 1946
THIS PAGE REVISED	DEC 1983
STANDARD REAFFIRMED	DEC 1983

R 110 J

Page 1 of 20

1. SCOPE

1.1 The purpose of this standard is to establish a uniform means of designating instruments and instrument systems for measurement and control by the use of symbols and identification numbers.

1.2 The system used by some vendors and contractors differs from this standard and is described in the Instrument Society of America Standard S5.1, "Instrument Symbols and Identification."

1.3 More detailed diagrams may be required for unusual or complex loops. See PR 8 and Design Manual Section 5 for the preparation of Control (Loop) Diagrams.

1.4 Material codes are included as further identification for manual or computer-generated cost estimating. These material codes are related to cost values in an Instrument Unit Library. The Library and procedural information are available from the Business Methods & Investment Division, Louviers Building, Wilmington, Delaware.

2. GENERAL

2.1 An instrument symbol is a graphic representation of the instrument to be used.

2.2 See R111J for symbols used on Instrument Arrangement Drawings.

2.3 The instrument symbol is always identified by an instrument item number as described in R121J, "Instrument Identification System."

2.4 The instrument symbols shown in this standard shall be used on instrument diagrams. Special or functional symbols may be used but they must be explained by legend or note on the drawing.

2.5 Instrument symbols may be drawn with Template D–1, see page 20.

GENERAL

	Process piping
	Instrument transmission line (pneumatic or electronic)
	Electrical interconnection (normally 115 V ac or greater)
	Electrical interlock (system A, interlock 1 of 4)
	Regulated instrument air supply required (20–25 psig only. Any other pressure or supply to be so noted)
	Regulated instrument air supply pressure required other than 20–25 psig. Denote regulated pressure required (50 psig shown)
	Instrument air supply, filter only required
	Electrical power supply required for field-mounted instruments. 115 V ac unless otherwise noted
	Instrument item number ovals
	Example of item number for an instrument located on panelboard 4B

INSTRUMENT SYMBOLS FOR INSTRUMENT DIAGRAMS

GENERAL

New Drawings	The purpose of new drawing symbols is to differentiate between new instruments and existing instruments reused in place or relocated on a new project. These symbols are to be used on both computer and manual diagrams.
	New instrument
	Existing instrument reused in place
 Reloc	Existing instrument relocated
 Was 140PV	Existing, reused in place but given new loop number
 Was 138TV Reloc	Existing, relocated to new service and given new loop number
Existing Drawings Being Reused on a Current Project	When existing drawings are being used for a current project, only the existing instruments being modified on the new project will be changed to reflect the modification
	New instrument. On subsequent project, N and notes will be removed and instrument will then appear as existing
	Existing instrument reused in place
 Reloc	Existing instrument relocated
 Was 140PV	Existing, reused in place but given new loop number
 Was 138TV Reloc	Existing, relocated to new service and given new loop number
	Denotes revision

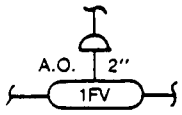
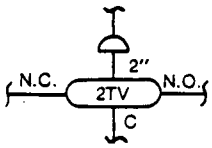
Valves

Control valve, pneumatically operated (action shown air to open)



In	Steel	Stainless Steel
2 and smaller	203A	205A
3	203B	205B
4	203C	205C
6	203D	205D
8	203E	205E
10	203F	205F
12 and up	203G	205G

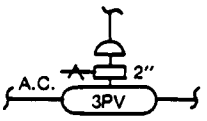
3-port control valve, pneumatically operated. Designations will be shown with no air pressure applied to the diaphragm:
N.C. – Normally closed
N.O. – Normally open
C – Common



In	Steel	Stainless Steel
2 and smaller	220A	Not in library
3	220B	
4	220C	
6 and larger	220D	

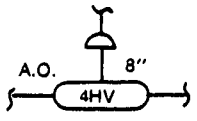
Note: Add prefix "P" for positioner on valve.
Add prefix "W" for I/P on valve.

Control valve, pneumatically operated with positioner (action shown air to close)



In	Steel	Stainless Steel
2 and smaller	P203A	P205A
3	P203B	P205B
4	P203C	P205C
6	P203D	P205D
8	P203E	P205E
10	P203F	P205F
12 and larger	P203G	P205G

Butterfly control valve, pneumatically operated (action shown air to open)



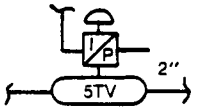
Butterfly

Butterfly valve shown, identify if special.

	6	201A
	8	201B
	10	201C
(In)	12	201D
	16	201E
	20	201F
	24	201G

Note: Add prefix "P" for positioner on valve
Add prefix "W" for I/P on valve.

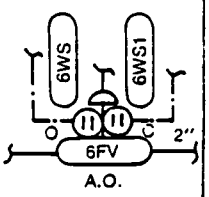
Control valve, pneumatically operated with electro-pneumatic positioner



A.C.

In	Steel	Stainless Steel
2	W203A	W205A
3	W203B	W205B
4	W203C	W205C
6	W203D	W205D
8	W203E	W205E
10	W203F	W205F
12 and up	W203G	W205G

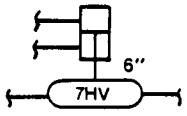
Control valve, pneumatically operated with two electric limit switches
O – Denotes valve fully open
C – Denotes valve fully closed



A.O.

1. When limit switches are mounted by valve manufacturer, use control valve codes plus 365B.
2. When limit switches are mounted by field, use control valve code plus 365A.

Control valve, piston-operated, pneumatic or hyudraulic
on–off shown



Same codes as pneumatically operated control valves, except for special, use 207A.
Note: Add prefix "P" for positioner on valve
Add prefix "W" for I/P on valve.

For additional control valve material codes refer to the Instrument Unit Library.

ANALYZE FOR SAFETY, ECOLOGY, AND MINIMUM ESSENTIAL DESIGN

CRITERIA FOR PUMPING WELL SPACING

1. WELL TO WELL SPACING SHALL BE 75' PREFERRED, 90' MAX.
2. CLEARANCE FROM ANY RAILROAD SPUR CENTER-LINE SHALL BE 8.5'
3. CLEARANCE FROM ANY BUILDING, SUMP, TANK, COLUMN, POLE FOUNDATION OR UNDERGROUND LINES SHALL BE 5' MIN.
4. OVERHEAD CLEARANCES TO PIPE RACKS, ELECTRICAL LINES, ETC. SHALL BE 16' MIN.

NOTES

1. ◆ INDICATES PUMPING WELL LOCATION.
2. ⊕ INDICATES PIEZOMETERS
3. ⊕ INDICATES EXISTING MONITORING OR UTILITY WELLS.
