## **1.0 INTRODUCTION**

Operation of the Love Canal Site (Site) was transferred from the New York State Department of Environmental Conservation (NYSDEC) to Occidental Chemical Corporation (OxyChem) in April, 1995. This report is the first annual report prepared by OxyChem and covers the activities for 1995.

Activities at the Site included:

- i) operation of the barrier drain and treatment system; and
- ii) hydraulic and chemical monitoring (Long-Term Monitoring).

There were no major problems, repairs, or changes, other than the normal maintenance, in the operation of the system. No carbon change-outs were performed by OxyChem. The total volume of groundwater from the Site treated at the Love Canal Leachate Treatment Facility was 3,292,000 gallons which is equal to an average monthly volume of 274,340 gallons.

The 1995 chemical sampling event was performed over a 5-week period from May 1 to June 1, 1995 in which 38 wells were sampled and analyzed for Site-specific parameter. Figure 1.1 shows the wells sampled and Table 1.1 presents a summary of the number and location of detected compounds. The chemical results are presented in Appendix A.

Water levels were measured at six nested piezometer strings in April, June, November, and December 1995. Figures 1.2 to 1.7 show the overburden groundwater flow conditions for June 1995 along the six piezometer strings. The water levels are presented in Appendix B.

The 1995 groundwater levels showed that groundwater gradients were towards the barrier drain. Therefore, the barrier drain is pulling in groundwater from outside the drain and successfully capturing horizontal groundwater flow from the Site. Similar to previous Long-Term Monitoring events which were performed by the NYSDEC, there was

minimal detection of chemicals in the wells sampled in 1995. Chemicals that were detected were at low levels, do not indicate a failure in the barrier drain, and do not pose an immediate threat to groundwater quality. The 1995 chemical analytical results are consistent with previous Long-Term Monitoring analytical results. Therefore, the 1995 results showed no significant change in chemical and hydrological conditions at the Site. The barrier drain is successfully capturing leachate from the Site, and preventing off-Site migration of chemicals. The remediation system is functioning as designed.
