1.0 EXECUTIVE SUMMARY

This report has been prepared by Occidental Chemical Corporation (OxyChem) to describe the Phase I activities performed in support of the characterization of the Love Canal Bagged Wastes currently stored at OxyChem's Niagara Plant in Niagara Falls, New York. The Phase I sampling and analysis program was originally described in the United States Environmental Protection Agency (USEPA)/New York State Department of Environmental Conservation (NYSDEC) approved "Sampling and Analysis Plan (SAP), Love Canal Wastes," dated June 3, 1996.

OxyChem has completed Phase I of the SAP. In accordance with the SAP, the data have been used to eliminate analytical categories which do not exceed the F039 land disposal restriction (LDR) limits for the materials. The Phase I program has identified the analytical parameters and number of samples for Phase II sampling.

A review of the analytical results from Phase I demonstrates that no samples exceeded the LDR limits for volatile organic compounds (VOCs), herbicides, cyanide, or methanol. These parameters will be deleted from any Phase II analyses.

Two samples marginally exceeded the LDR limit for leachable lead. All remaining LDR exceedances were either semi-volatile organic compounds (SVOCs), pesticides/PCBs, or dioxins/furans. The majority of exceedances for SVOCs and pesticides/PCBs were in the creek debris category.

The Phase I results showed that most of the bagged material either met or marginally exceeded the F039 LDR limits. The Phase I results showed that several groups of bags within the categories are candidates for direct landfill disposal, pending acceptable Phase II results. The data showed that the samples from the creek debris category were consistently above the LDR levels, and this group will be incinerated and will not be included in the Phase II sampling. A third category of bag groups were consistently marginally above the 1 ppb level for total dioxins/furans. OxyChem believes that the presence of

low levels of dioxins/furans in these groups does not justify incineration, and requests a variance from the LDRs.

The Phase I results were used to provide the basic characterization data needed to apply the statistical equation in SW-846, Third Edition, Chapter Nine. These equations were established by the EPA to provide a statistical sampling basis for determining how many samples are needed to provide data for compliance with disposal regulations. The method is based on using available characteristic data for a waste (Phase I), and then calculating the number of samples needed to verify compliance with LDRs. The number of samples to be analyzed in Phase II has been determined using these equations with the following exceptions:

- The number of samples required for the haul roads category has been adjusted to eliminate the impact of one outlying data point.
- No Phase II sampling will be conducted for the creek debris category.
- Non-detect data greater than the associated LDRs were not used in the statistical evaluation.

The Phase II sampling program will provide the data which will be used by OxyChem and the receiving disposal facilities to determine which groups of bags can be directly landfilled, which groups of bags require incineration, and which groups may be subject to a variance request to allow direct landfill. Presently, 3,811 of the 14,612 bags will be designated for incineration. Sampling in Phase II should determine whether 4,884 bags meet present LDR criteria to be landfilled under the LDRs and whether another 5,117 bags can be landfilled under a variance to the LDRs.

The proposed regulatory variances are outlined in Section 7.0.

2.0 INTRODUCTION

This report has been prepared by OxyChem to describe the Phase I activities performed in support of the characterization of the Love Canal Bagged Wastes currently stored at OxyChem's Niagara Plant in Niagara Falls, New York. The Phase I sampling and analysis program was originally described in the United States Environmental Protection Agency (USEPA)/New York State Department of Environmental Conservation (NYSDEC) approved "Sampling and Analysis Plan (SAP), Love Canal Wastes," dated June 3, 1996.

The original Love Canal Partial Consent Decree, signed by Judge Curtin in 1989, provided that OxyChem would dispose of the Love Canal remediation wastes by incineration at a thermal destruction unit to be constructed at the Niagara Plant or at alternative thermal destruction facilities approved in advance by the USEPA and NYSDEC. The decree was subsequently modified in 1997 to allow landfilling of certain remediation wastes where chemical levels in the wastes were shown to be less than the LDRs for F039 waste materials using the SW-846 statistical test.

Phase I of the SAP consisted of an initial comprehensive characterization of approximately one percent of the bagged materials. The bags were separated into five categories (creek sediment 1, creek sediment 2, haul roads, creek debris, facility cleanup). Each bag chosen for sampling was analyzed for complete F039 LDR list testing. A summary of the bagged waste identification and Phase I sampling requirements specified in the SAP is presented in Table 2.0.

The Phase I characterization was designed to provide the data needed to determine whether additional statistically based sampling and analysis (Phase II) was needed to determine treatment and disposal in accordance with the LDRs. If all of the samples from a category of waste were below the LDR limits, then the waste could be directly landfilled and no additional sampling and analyses would be needed. If only a metal constituent was above the LDR, then the waste could be stabilized and landfilled. If the mean value of any constituent was above the LDR or if the mean value plus two standard deviations for a constituent was above the LDR, then additional

sampling and analyses (Phase II) would be needed to determine which waste material required incineration or a variance from the F039 LDR regulations, and which waste material could be landfilled. Pages five (5) and six (6) of the SAP present the criteria for the determination of Phase II sampling and analyses requirements.

2.1 PHASE I OBJECTIVES

The Phase I data have been used to define the following:

- i) the preliminary characterization of bags within each category for treatment and/or disposal;
- ii) the number of samples to be collected in Phase II; and
- iii) the parameters to be analyzed for Phase II sampling and analysis.

3.0 SAMPLING PROGRAM

One hundred fifty-four samples (including six field duplicates) were collected and submitted for analysis for the Phase I program. All sampling was performed in accordance with the June 1996 SAP. Sample collection began on September 10, 1996, and concluded on November 15, 1996.

3.1 SAMPLE COLLECTION

A sample collection and analysis summary is provided in Appendix A. A sample from one representative bag was collected in each 100 bag series except for the 11601 to 11700 and 13901 to 14000 bag series in the creek debris category. These bag series could not be located during sample collection and are believed to be buried within the piles. As will be discussed below, the entire creek debris category has been scheduled to be incinerated.

In addition, subsequent investigations indicate that there are approximately 400 more facility cleanup bags than the 607 bags thought present at the time of Phase I sampling. These additional bags will be included in the Phase II sampling.

3.2 SAMPLING PROCEDURE

Pursuant to the approved SAP, the bags were divided into sample groups of 100 bags per waste category according to the bag numbers. One bag within each group of 100 was located for sampling.

Approximately 25 percent of the Love Canal bags were exposed on the surface of the two storage piles in Buildings T-28 and T-29. This 25 percent represents a random selection of the groups and categories which were sampled. Due to accessibility, sample collection started on the lowest tier of bags and proceeded around the outer circumference of the piles. Sampling proceeded to the second tier of bags and continued until enough bags from each group within each category of material were located and sampled.

Grab samples were collected from the bags by opening the bag, inserting a clean polystyrene scoop at least six inches below the surface of the material, and collecting a grab sample. The samples were placed directly into clean sample jars and sealed with teflon-lined caps, and the bags were resealed.

A sample log was used to record pertinent information as samples were collected. The log included the following information: sample date, bag number, sample location in the bag houses, and photoionization detector (PID) reading.

3.3 CHAIN OF CUSTODY FORMS

Chain of custody forms were used to track all samples from the time of sampling to the arrival of samples at the laboratory.

Each shipping container sent to the laboratory contained a chain of custody form. The chain of custody form consisted of four copies which were distributed to the sampler, to the shipper, to the contract laboratory and to the office file. The sampler and shipper maintained their copies while the other two copies were enclosed in a waterproof enclosure within the sample container. The laboratory, upon receiving the samples, completed the remaining copies. The laboratory maintained one copy for their records. The executed original was returned with the data deliverables packages.

Copies of the executed chain of custody forms are located in the quality assurance/quality control (QA/QC) review of the data (see Appendix C).

3.4 SAMPLE CONTAINERS AND HANDLING

All samples were placed in appropriate sample containers, labeled, and properly sealed. The sample labels included bag sample number, place of collection, date and time of collection, and analyses to be performed.

Samples were cushioned within the shipping coolers by the use of bubble pack. Samples were kept cool by the use of plastic bags of ice or cooler packs, as required. Samples were shipped priority overnight by commercial courier on a daily basis to the project laboratory.

Two seals comprised of chain of custody tape were placed over the lid on the front and back of each shipping cooler prior to shipment to secure the lid and provide evidence that the samples had not been tampered with during transportation to the laboratory. Clear tape was placed over the seals to ensure that they were not accidentally broken during shipment.

Upon receipt of the coolers at the laboratory, the coolers were inspected. The condition of the coolers and seals were noted on the chain of custody forms. The laboratory documented the date and time of receipt of the coolers and signed the chain of custody forms.

The laboratory checked the contents of the cooler with those samples listed on the chain of custody forms. If damage or discrepancies were noticed, they were recorded in the remarks column of the chain of custody form, dated and signed. The laboratory project manager then reported the information in the report narrative

4.0 ANALYTICAL PROGRAM

All samples submitted were analyzed for the complete F039 LDR list of parameters. Site specific matrix spike/matrix spike duplicate (MS/MSD) analyses were performed at a minimum frequency of one in twenty samples. All analyses were performed in accordance with the June 1996 SAP.

4.1 LABORATORY ANALYSES

An analytical results summary is provided in Appendix B. All laboratory results were validated and any required sample qualifications have been included in the table. A full discussion of the QA/QC Review can be found in the validation report, located in Appendix C of this report.

Most data were judged to be usable. All non-detect results for tris-(2,3-dibromopropyl)phosphate, 1,4-dioxane, famphur, and isobutyl alcohol were rejected. The compounds are known to perform poorly using the LDR testing methods, and did not meet USEPA Region II Contract Laboratory Protocol (CLP) calibration criteria. Some sample kepone results for the pesticides/PCBs analyses and three sample phenolic compounds results for the SVOCs analyses were also rejected. These results were rejected (denoted by "R" in the results table) due to poor laboratory MS/MSD and/or surrogate spike recoveries.

No samples collected in Phase I exceeded the LDR limits for any of these parameters, so the impact of the rejected data on the program is considered negligible.

4.2 SAMPLE RE-ANALYSIS

Upon a review of the data, two samples were identified as possible outliers based on the results of other samples within the category. The dioxins/furans results for haul roads sample HR-10241 were a magnitude greater than any other haul roads sample, and the sample was collected again on

January 30, 1997, and submitted for dioxins/furans analysis. The dioxins/furans results for creek sediment 1 sample CS-07226 were also significantly greater than any other creek sediment 1 sample within similar bag ranges, and this sample was collected again on February 3, 1997, and submitted for dioxins/furans analysis.

The laboratory results for these samples confirmed the data originally reported, and no further evaluation of the laboratory report was performed.

5.0 DISCUSSION OF RESULTS

A review of the analytical results demonstrates that no samples exceeded the LDR limits for VOCs, herbicides, cyanide, or methanol. These parameters have been deleted from any Phase II analyses. All samples met the LDR limits for toxicity characteristic leaching procedure (TCLP) metals except for two creek sediment 1 samples, which had TCLP lead results marginally above the LDR limit of 0.37 milligrams per liter.

All remaining LDR exceedances were either SVOCs, pesticides/PCBs, or dioxins/furans. A discussion of each individual category follows. Field duplicate results are not included in this discussion. None of the five categories of material met the standard of having a mean value plus two standard deviations below the LDR treatment standards, and, therefore, all categories require further testing in Phase II, must be scheduled for incineration, or must receive a variance from the LDRs, as outlined in Page 6 of the SAP.

5.1 CREEK SEDIMENT 1 (7,232 BAGS)

A summary of the LDR exceedances is presented in Table 5.1. Samples CS-06145 and CS-06471 also exceeded the LDR limit for TCLP lead.

Twenty-eight of the 74 samples collected did not exceed the LDR limits. The majority of the remaining samples exceeded the dioxins/furans LDR limits. All exceedances were minor except for samples CS-00897 and CS-00996, which had elevated total dioxins/furans levels. The category mean value for total tetra-chlorinated dibenzo-p-dioxins (TCDDs) marginally exceeded the LDR limit.

The bag series 1 to 600, 4301 to 5300, and 6401 to 7200 have either no or only one marginal sample LDR exceedance (see Table 5.1). These bag series represent the creek sediment 1 candidates for direct landfill without further treatment, pending acceptable Phase II results. The remaining bag series

are candidates for landfill with a regulatory variance or require treatment prior to disposal.

5.2 CREEK SEDIMENT 2 (1,512 BAGS)

A summary of the LDR exceedances is presented in Table 5.2

Twelve of the 16 samples collected did not exceed the LDR limits. All exceedances for the remaining samples were minor. No category mean value exceeded an LDR limit.

The bag series 8401 to 9495 has no sample LDR exceedances (see Table 5.2). This bag series represents the creek sediment 2 candidates for direct landfill without further treatment, pending acceptable Phase II results. The remaining bag series are candidates for landfill with a regulatory variance or require treatment prior to disposal.

5.3 HAUL ROADS (1,450 BAGS)

A summary of the LDR exceedances is presented in Table 5.3

Eight of the 14 samples collected did not exceed the LDR limits. All exceedances for the remaining samples were minor except for sample HR-10241, which had elevated aldrin and total dioxins/furans levels. No category mean value exceeded an LDR limit.

The bag series 9496 to 10200 had only two minor sample LDR exceedances (see Table 5.3), and represents the haul roads candidates for direct landfill without further treatment, pending acceptable Phase II results. The remaining bag series are candidates for landfill with a regulatory variance or require treatment prior to disposal.

5.4 FACILITY CLEANUP (607 BAGS)

A summary of the LDR exceedances is presented in Table 5.4.

Two of the seven samples did not exceed the LDR limits. All exceedances for the remaining samples were minor. The category mean value for total TCDDs marginally exceeded the LDR limit.

The bag series 14817 to 15000 has no LDR exceedances (see Table 5.4), and represents the facility cleanup candidates with a high probability for direct landfill without further treatment, pending acceptable Phase II results.

The remaining bag series are candidates for landfill with a regulatory variance or require treatment prior to disposal. It is believed that approximately 1000 total bags are present in this category.

5.5 CREEK DEBRIS (3,811 BAGS)

A summary of the LDR exceedances is presented in Table 5.5.

The mean value of this category exceeded the LDR limits for all three regulated total dioxins. The creek debris category exceeded the LDR limits for these dioxin congeners plus various chlorinated benzenes. This waste category was substantially different in that the chemicals present were more diverse and generally higher in concentration than in the other four categories. Based on the differences in analyte LDR exceedances and concentration levels, the creek debris category has been excluded from any proposed regulatory variances and will be incinerated prior to landfill disposal.

6.0 PHASE II SAMPLING

6.1 INTRODUCTION

It is the generator's responsibility under the LDRs to properly classify waste materials and to issue a Land Disposal Certification with waste shipments, showing that the waste meets the LDRs if destined for landfill. The EPA has established a statistical sampling basis for determining how many samples are needed to provide data for compliance with the LDRs. This method is detailed in SW-846, Third Edition, Chapter Nine. The method uses available characteristic data for a waste, and then calculates the number of samples needed to verify compliance with LDRs. The Phase I SAP was designed to provide the basic characterization data needed to apply the equations in SW-846, Third Edition, Chapter Nine, and to determine the sampling frequency needed to verify shipments. The number of samples to be analyzed in Phase II (described below) has been determined using these equations, and the results of the Phase II data will be used to determine which waste material meets the LDRs and can be landfilled. This data will also be used to determine which wastes may be above the LDRs but can be landfilled if a variance from the LDRs is obtained, and which wastes have constituent levels above the LDR or the variance level and therefore require incineration.

In addition to the responsibility of the generator to properly classify the waste for LDR purposes, the receiving landfill also has a responsibility to verify that the material being received meets the LDRs prior to landfilling. The established Waste Analysis Plan (WAP) for the landfill determines the frequency of sampling and analysis required. This frequency will vary by facility and state. The frequency of sampling required can vary from a minimum of once per year per waste stream up to a maximum of one sample for every twenty loads received. In all these cases, the WAPs are based on the assumption that the waste is an on-going process waste stream that may change or vary with time. In the case of this project, however, all of the waste has been bagged and readied for shipment. Further, the initial data shows that the waste does not vary greatly from bag to bag. There is precedent in most states to allow for a special sampling requirement for projects of this type. In most cases the special plans call for following a statistical sampling, similar to the Phase II

program described here. Therefore, it is expected that the data from the Phase II sampling and analysis will be used by both the generator and the receiving landfill to verify LDR compliance, since all of the sampling and analysis will be in accordance with approved SW-846 methods. This combined program approach will expedite the project and eliminate redundant sampling requirements on both ends of the shipments.

6.2 SAMPLING METHOD

All of the Phase II sampling will consist of laboratory composites. The initial sampling was based on the standard LDR grab samples in order to provide basic characterization data. LDR verification data (as generally written into landfill and incineration WAPs) are based on a composite sample taken from several locations in a bulk bin, so that a representative value for the bulk shipment can be obtained. Each sample will consist of grab samples from four individual bags chosen at random from groups within the category. A group will represent a proportion of bags within the category based on the number of Phase II samples required in each category. The individual samples will be laboratory composited into one sample, and the sample will be submitted for analysis. Laboratory compositing can be used in the Phase II sampling because VOCs are no longer part of the analytical program (none were found above the LDRs in any waste samples).

Phase II bag selection will be consistent with the procedures detailed in the SAP (see Section 3.2) and used in the Phase I sampling program. The waste will be divided into the four categories, two from the creek remediation, one from the haul roads, and one from the facility cleanup waste. The Phase I data showed that these categories worked quite well, and segmented the waste as expected in accordance with the way the waste was excavated and bagged. The bags (all have unique numbers) will be divided into Phase II sampling groups by taking the total number of bags and dividing by the number of samples needed for each category of waste. Each of the bags will then be assigned to a Phase II sampling group. No bags sampled in Phase I will be used in Phase II. Four bags will be selected from each Phase II sampling group. The selected bags will be on the edge or surface of the pile. The selected bags will be

opened and a sample obtained. The bags will then be resealed. Samples will be collected using the procedures outlined in the SAP, including the use of appropriate sampling equipment and chain of custody forms. The samples will be submitted to the laboratory for the required analysis.

Each of the four individual grab samples collected within a given number series will be homogenized and composited at the laboratory. Compositing will be accomplished by mixing equal volumes of each of the four bags.

The composite sample will be homogenized by removing any large rocks present in the sample. The sample will be thoroughly mixed in the stainless steel pan using a stainless steel spoon. The sample will be scraped from the sides, corners, and bottom of the pan, rolled to the middle of the pan, and initially mixed. The sample will be quartered and moved to the four corners of the pan. Each quarter of the sample will be mixed individually, and then rolled to the center of the pan and the entire sample mixed again. The mixed sample will be placed directly into a clean sample jar and sealed with a teflon-lined cap. Any remaining sample will be archived for possible future use.

The SAP discusses that Phase II sampling will be accomplished after the bags are staged into shipping groups. OxyChem proposes that Phase II sampling be performed in the same fashion as the Phase I sampling for four reasons. First, the incineration of Durez bagged waste has proceeded more slowly than expected. There is no space reasonably available to accomplish the staging originally contemplated by the SAP and this lack of space will unnecessarily delay Phase II sampling. Second, the Phase I sampling program was very successful in providing data and information regarding the characteristics of the materials in the bags. Third, Phase II sampling now will facilitate review of the LDR variance petition which OxyChem intends to file. Fourth, the movement of the 2½ ton bags contemplated by the SAP is a major engineering project that, by its very nature and under the best safety plans and practices, places workers at risk of injury and could lead to spills or breaks in the bags. OxyChem has also considered whether removing Durez bagged waste and creek debris bags for incineration would open up more bags in the four

categories for sampling. It appears only 25 bags would become available, so this option does not seem to be feasible.

An inspection of the bag houses shows that the most of the Phase II samples required for each category can be obtained without moving many bags from the piles. In some cases, the number of bags exposed on the edge of the piles is large compared to the number of Phase II samples required.

6.3 CALCULATIONS

The statistical calculation used to determine Phase II sampling frequency was equation (8) of Table 9-1 of SW-846 Third Edition, Volume II, November 1986. The mean, variance, and standard deviation were calculated as specified in equations (2a), (3a), and (4) of Table 9-1. A summary of the statistical sampling data from the Phase I analytical results is presented in Table 6.3. Field duplicates were not included in the calculations

6.4 DISCUSSION

A summary of the proposed Phase II sampling program is presented in Table 6.4. The program uses the Phase I statistical data from Table 6.3 with the following exceptions:

- Using Phase I data, the number of samples for the haul roads category showed a requirement of 314 samples, which would mean sampling 1,256 individual bags out of a total of 1,450 bags. This very high sample number, as shown in Table 5.1, is due to one sample (HR-10241), which had a high level of one isomer of dioxin. This high value, compared to all the other data, resulted in an elevated mean and variance for the category. Upon further inspection of the data, it was apparent that this one bag and its sample were not similar to any of the other 13 samples collected and it is considered to be a statistical outlier. If this data point is eliminated from the calculation, the revised statistics showed that 5 samples are required as compared to 314. Overall review of the data with respect to the

consistency of the results and applying reasonable scientific judgment would show that the use of 14 samples (from 56 individual bags) is an appropriate number of samples to characterize this category for disposal.

- Non-detect dioxins/furans results with detection limits greater than the LDR limit were removed from the calculations for Phase II sampling categories.
- Analyses for phenanthrene and fluoranthene were included in the Phase II sampling for the creek sediment 1 category.
- The creek debris category had a high number of samples over the LDR limits and a high variability. This showed a large number of samples would be needed to segment the category and most of the waste would require incineration. Therefore, as stated previously in this report and as outlined in the SAP, no Phase II sampling will be conducted for the creek debris category. Based on the Phase I results, the 3,811 bags in this category are not candidates for landfill disposal without further treatment, and therefore all of the waste in this category will be incinerated prior to landfill disposal.

6.5 ANALYTICAL PROGRAM

Table 6.4 shows the analytical testing which will be performed for each of the waste categories. As outlined in the SAP, constituents for the Phase II analytical program are to be based on those constituents found during the Phase I testing. The analyses shown in Table 6.4 reflect the constituents or groups of constituents that had a mean value or a mean value plus two standard deviations above the LDR limit for that constituent. The semi-volatile compounds phenanthrene and fluoranthene were added to the creek sediment 1 category because they were detected above the LDRs in one analysis. The main constituents requiring analyses are the polychlorinated dibenzo-p-dioxins and the polychlorinated dibenzo-furans. In the case of the creek sediment 1 category, lead was found in two samples which caused the mean value plus two standard deviations to be just above the LDR limit.

Therefore lead will be tested for the creek sediment 1 category. The haul roads and the facility cleanup categories both showed some positive results for certain pesticide compounds. Based on the Phase I data, aldrin will be tested for the haul road category, and BHCs will be analyzed for samples from the facility cleanup category.

All analyses for Phase II testing will be performed using RCRA SW-846 analytical methods with specified QA/QC as stated in the SAP. The RCRA methods are the methods specified in the regulations for determining compliance with the LDRs. Dioxin/furan analysis will be performed using Method 8290 (HRMS). The lead analysis will be performed on a TCLP extract (Method 1311) using Method 6010. The pesticides analysis for aldrin and BHCs will be performed using Method 8081. The semi-volatile analysis for fluoranthene and phenanthrene will be performed using Method 8270. The laboratories performing the analytical work will be Alta Analytical Laboratory, Inc. of El Dorado Hills, California (PCDD/PCDF) and Encotec Laboratory in Ann Arbor, Michigan (all remaining analyses). The laboratories are certified in several states, including Utah.

6.6 STATUS OF PHASE I BAGS SAMPLED

Based on the Phase I results, 50 of the bags sampled from the creek sediment 1, creek sediment 2, haul roads, and facility cleanup categories did not exceed the LDR limits and can be directly landfilled. Of the remaining bags sampled in these categories, 58 samples have marginal LDR exceedances. These bags will be candidates for landfilling if the LDR variance discussed in Section 7.0 is granted. All 3,811 creek debris bags will be incinerated, as will two bags from the creek sediment category and one bag from the haul roads category.

7.0 REGULATORY VARIANCE

7.1 PROPOSED VARIANCE

OxyChem intends to apply for an LDR treatability variance, pursuant to 40 CFR 268.44, for the creek sediment 1, creek sediment 2, haul roads, and facility cleanup categories. The proposed variance would establish alternative treatment standards for dioxins/furans of 10 ppb (see Table 7.1). Materials meeting the alternative standard would be disposed of in a RCRA Subtitle C permitted landfill.

7.2 BASIS AND REASON FOR VARIANCE

The LDR regulations provide that a treatability variance is appropriate when either (1) the waste cannot be treated to the specified level or (2) the treatment technology is not appropriate to the waste (40 C.F.R. § 268.44). The Love Canal bagged waste materials qualify under either criteria. First, the bagged material consists of soil and environmental media, wastes which the Agency has previously stated qualify for a treatability variance. Second, the use of incineration is not appropriate for large volumes of soil and sediment that contain concentrations of organic constituents only marginally above the treatment standard.

A. The EPA Has Created A Presumption That The LDR Treatment Standards Are Not Achievable For These Waste Types.

The EPA's numerical treatment standards are based on the application of Best Demonstrated Available Technology (BDAT) to process wastes. For organic constituents, BDAT is generally incineration. However, the EPA has never determined the numerical treatment standards that would be obtained by applying BDAT to environmental media. Rather, the Agency has determined that:

until specific standards for soils and debris are developed, current BDAT standards are generally inappropriate or unachievable for soil and debris

from CERCLA response actions and RCRA corrective actions and closures. Rather, the EPA presumes that, *because contaminated soil and debris is significantly different from the wastes evaluated in establishing the BDAT standards, it cannot be treated in accordance with those standards, and thus qualifies for a treatability variance from those standards under 40 CFR 268.44. Accordingly, persons seeking a treatability variance from LDR treatment standards for contaminated soil and debris do not need to demonstrate on a case-by-case basis that BDAT standards for prohibited hazardous wastes are inappropriate or not achievable.*

55 Fed. Reg. 8760, 8761 (March 8, 1990) (emphasis added).

The EPA has elaborated on this principle in guidance. "Obtaining a Soil and Debris Treatability Variance for Remedial Actions," OSWER Doc. 9347.3-06FS (Sept. 1990). That guidance provides that for soils containing initial dioxin concentrations less than 500 ppb, alternative treatment standards should be established in the range of .01 to 50 ppb. (Since publication of that guidance, the universal treatment standard for dioxin has been established at 1 ppb.) The Agency has granted a treatability variance for dioxin-containing wastes of 5 ppb at the Vertac Superfund site and has proposed a variance of 50 ppb at Dow Chemical's Midland, Michigan site. (At the Vertac site, the variance was granted in part because of the EPA's finding that the 1 ppb standard could not be met with incineration.) The standard of 10 ppb proposed by OxyChem is well within the range the EPA has indicated is appropriate.

The proposed variance would apply to four waste categories - creek sediment 1, creek sediment 2, haul roads, and facility cleanup. These wastes are similar in both the identity and concentrations of constituents found in the wastes. These wastes are also similar in physical characteristics, being either creek sediment and soil-like material, or soil and debris from the construction activity.

Analyses of samples from these four waste categories showed that much of the waste already meets the LDR treatment standard, while the rest of the waste is only marginally above the limit, specifically, in the range of 1 to 5 ppb. Consistent with the EPA's presumption that contaminated

environmental media should qualify for a treatability variance, these waste categories should be granted a variance.

B. Incineration Is Not Appropriate For These Wastes.

The EPA also has determined that a treatability variance should be granted when use of the treatment technology needed to achieve numerical treatment standards is not appropriate for the waste, even if the numerical standards are technically achievable. 62 Fed. Reg. 26041, 26058-26060 (May 12, 1997). One specific example of a situation where a treatability variance should be granted under this rationale is where "the treatment standard would result in combustion of large amounts of soil or wastewater." *Id.* at 26059. More generally, a treatability variance should be granted where "imposition of BDAT treatment would lead to environmentally counterproductive results." *Id.*

Both of these rationales apply in this case. Holding the Love Canal bagged wastes to the 1 ppb treatment standard for dioxin would require the combustion of massive amounts of soil for the destruction of minuscule amounts of dioxin. Moreover, given the pollutants generated in the incineration process itself, and the minimal (if any) reduction in the risk posed by the wastes, incineration of this material is clearly not appropriate.

The placement of soil materials containing up to 10 ppb of dioxins/furans in a carefully monitored Subtitle C landfill clearly minimizes or eliminates any risk that this small amount of material may have to the environment. In addition, the material has been stabilized, which will tend to render the remaining low level constituents immobile. The EPA itself has recognized that dioxins bind tightly to soils and that soils contaminated with low levels of dioxin pose little risk when properly managed. In the preamble to its proposed rule imposing the LDRs on dioxin wastes, the Agency stated that "Investigations have documented the extreme immobility of TCDD in most soils and its low solubility in water. . . . the other CDDs and CDFs are expected to be immobile in soils and water insoluble." 51 Fed. Reg. 1602, 1731 (Jan. 14, 1986). The Agency stated further that "CDDs and CDFs are not expected to leach into groundwater and percolate through soils if proper precautions are taken to prevent co-disposal with solubilizing agents." *Id.* The Agency has thus

recognized that low concentrations of soil-bound dioxins can be safely managed in an appropriate landfill.

The landfill currently proposed to receive this waste is Laidlaw's Grassy Mountain Landfill in Utah. This landfill is a new facility and is designed to meet or exceed all Subtitle C requirements. The landfill is located in an area with little or no groundwater (semi-arid region) and is isolated from contact with the general population. This facility provides an extremely secure and protective location for the disposal of these waste materials. There is virtually no possibility that the materials in this waste will leach in any significant quantity and even less chance that any leached material would reach the environment. Therefore, given the nature of the waste and the very low levels of constituents, the stabilization treatment achieved, and the design of the landfill cells, land disposal of material with up to 10 ppb dioxins/furans is the appropriate treatment and disposal technology for this waste.

The proposed variance would eliminate the need to incinerate large quantities of materials to destroy minute quantities of dioxins/furans. The incineration of material with virtually no significant organic content will consume a large amount of fuel. The burning of this fuel will generate greenhouse gases such as carbon dioxide, and also increased levels of NOx. Evaluation of multi-media impacts would show that granting this variance would result in a net reduction in total pollutants entering the environment. Because dioxins/furans are relatively immobile in soils, incineration has no net environmental benefit compared to placement of these wastes in a RCRA permitted landfill, and therefore these wastes should be granted a treatability variance.

Moreover, incineration of this material will not significantly reduce the volume of material ultimately landfilled. This is due to the composition of the soils, which generally consist of less than 10 percent organic matter. In fact, when the material is burned with other waste materials in the incinerator, the resulting volume can actually increase if the "mixed residue" (soil and other wastes burned together) requires stabilization prior to being placed in the landfill. In addition, the particulate matter removed in the incinerator gas cleaning train generally is light and fluffy, resulting in a larger

volume than the original soil and debris. Thus, the granting of this variance will result in no significant decrease in the volume of material landfilled and may actually slightly increase the overall volume of waste requiring land disposal.

The proposed variance will have a significant impact on the schedule for completion of this project. Currently, the capacity at the receiving incinerators is the rate limiting step for completion of this project. At the current rate of disposal by incineration, the project will take approximately 4 years to complete. The variance would reduce the amount of material requiring incineration, therefore reducing the total time for project completion by approximately one year. This shorter project schedule would result in material being stored for a shorter period of time at the Niagara Falls location and more timely completion of the total project.

8.0 CONCLUSION

OxyChem has completed Phase I sampling as required by the SAP for the Love Canal Bagged Wastes. In accordance with the SAP, the Phase I data have been used to develop the sampling frequency and analyte list for Phase II of the program.

It is anticipated that the analytical results from the Phase II sampling will provide OxyChem with disposal options similar to the Phase I data for each waste category. A summary of the projected disposal quantities is presented in Table 8.0. Projections for each waste category are in the following sections. In accordance with the Phase I program, each Phase I bag sampled has been used to represent approximately 100 bags. All projections are estimated based on the Phase I data. Actual disposal quantities will be based on the Phase II sample data.

8.1 CREEK SEDIMENT 1 (7,232 BAGS)

Based on the Phase I data and using F039 LDR limits, 2,700 bags are candidates that presently may qualify for direct landfill disposal. If a variance is granted and stabilizing for metals is performed, 7,032 bags are candidates for landfill disposal.

8.2 CREEK SEDIMENT 2 (1,512 BAGS)

Based on the Phase I data and using the F039 LDR limits, 1,195 bags are candidates that presently may qualify for direct landfill disposal. If the variance is granted, 1,412 bags would be candidates to qualify for direct landfill disposal.

8.3 HAUL ROADS (1,450 BAGS)

Based on the Phase I data and using the F039 LDR limits, 805 bags are candidates that presently may qualify for direct landfill disposal. If the variance is granted, 1,050 bags are candidates to qualify for direct landfill disposal.

8.4 FACILITY CLEANUP (607 BAGS)

Based on the Phase I data and using the F039 LDR limits, 184 bags are candidates that presently may qualify for direct landfill disposal. If the variance is granted, 507 bags would be candidates to qualify for direct landfill disposal.

Based on subsequent investigations, there are approximately 1,000 bags in this category.

8.5 CREEK DEBRIS (3,811 BAGS)

Based on the Phase I data, this category does not qualify for direct landfill disposal. This category is clearly different from all other categories in regard to the level and type of chemical presence, and will be incinerated to meet the F039 LDR limits.

Notes:

- (1) The creek debris category has been designated for incineration prior to disposal.
- No values detected above LDR regulatory limits for any individual compound in this category.
- LDR Land Disposal Restriction.
- PCBs Polychlorinated Biphenyls.
- PCDDs Polychlorinated Dibenzo-p-dioxins.
- PCDFs Polychlorinated Dibenzofurans.
- SVOCs Semi-Volatile Organic Compounds.

Total HxCDD	µg/Kg	1.0	0.643	7	0.766	0.586	1.440	2.174	21

Calculations: $n = (t_{2.20} \cdot s^2) / \Delta^2$

Δ = Regulatory Threshold - Mean

n = Number of samples required in Phase II

TABLE 6.4
PHASE II SAMPLING PROGRAM
LOVE CANAL BAGGED WASTES
OCCIDENTAL CHEMICAL CORPORATION
NIAGARA FALLS, NEW YORK

<i>Category</i>	<i>Total Number of Samples in Phase I</i>	<i>Total Number of Samples (1)</i>	<i>Analyses</i>
Creek Sediment 1	74	10 10 1	PCDDs/PCDFs Fluoranthene, Phenanthrene TCLP Lead
Creek Sediment 2	16	4	PCDDs/PCDFs
Haul Roads (2)	14	14 1	PCDDs/PCDFs Aldrin
Facility Cleanup	7	21 2	PCDDs/PCDFs BHCs
Creek Debris (3)	37	763 38 8	PCDDs/PCDFs Aldrin/BHCs SVOCs

Notes:

- (1) Sample numbers based on Phase I results using equation (8) in Table 9-1 of SW-846 Third Edition, Volume II, November 1986. Non-detect values with detection limits greater than the associated land disposal restriction regulatory limit deleted from the calculation.
 - (2) Due to a statistical outlier, Phase I statistics have not been used to determine Phase II sampling frequency (see Section 6.4).
 - (3) This category has been excluded from the Phase II sampling program.
- BHCs Benzene Hexachlorocyclohexanes.
PCDDs Polychlorinated Dibenzo-p-dioxins.
PCDFs Polychlorinated Dibenzofurans.
SVOCs Semi-Volatile Organic Compounds.
TCLP Toxicity Characteristic Leaching Procedure.

1.0 EXECUTIVE SUMMARY

Solid samples of Love Canal waste material were collected from bags stored in buildings located at the Occidental Chemical Corporation (OxyChem) Niagara Plant in Niagara Falls, New York from September 1996 through November 1996. All sampling and analyses were performed in accordance with Phase I of the June 1996 Sampling and Analysis Plan (SAP) approved by the United States Environmental Protection Agency (USEPA). All samples were submitted for F039 Land Disposal Restriction (LDR) list analyses.

Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans (PCDDs/PCDFs), Herbicides, Methanol, and Cyanide

All data were acceptable for their intended use.

Semi-Volatiles

Most data were acceptable for their intended use. The non-detect phenolic compound results were rejected for two samples due to poor surrogate recoveries. A non-detect pentachlorophenol result was rejected for one sample due to poor spike recoveries. All non-detect famphur results were rejected based on poor instrument response at the request of USEPA Region II based on Region II Contract Laboratory Program guidelines.

Pesticides/PCBs

Most data were acceptable for their intended use. Non-detect kepone results were rejected for 41 samples due to poor spike recoveries. All non-detect tris(2,3-dibromopropyl)phosphate results were rejected based on poor instrument response at the request of USEPA Region II based on Region II Contract Laboratory Program guidelines.

Volatiles

Most data were acceptable for their intended use. Non-detect isobutyl alcohol and 1,4-dioxane results were rejected based on poor instrument response at the request of USEPA Region II based on Region II Contract Laboratory Program guidelines.

Conclusion

Based on the assessment and validation of the analytical data provided, these data have been judged acceptable for their intended use with the exceptions and qualifications noted.

2.0 INTRODUCTION

One hundred and fifty four samples (including six field duplicates) were collected in support of Phase I of the SAP for the Love Canal bagged waste materials. The bagged materials are stored at OxyChem's Niagara Plant in Niagara Falls, New York. Sample collection was performed from September 1996 to November 1996. The samples were analyzed by Encotec Laboratory (Encotec) in Ann Arbor, Michigan. All samples were submitted for F039 LDR list analyses.

Copies of the chain of custody forms are included in Attachment A.

Summaries of the analysis program and the analytical results are provided in the Phase I report.

Samples were analyzed in accordance with the methods referenced in Table 1. The Quality Assurance/Quality Control (QA/QC) criteria by which these data have been assessed are outlined in the analytical methods. Additional validation guidance was referenced from the following documents:

- i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review" EPA 5400/R-94/012, February 1994; and
- ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review", EPA-5400/R-94-013, February 1994.

3.0 QA/QC REVIEW

3.1 DISCUSSION

All data were reported with standard SW-846 deliverables. Accompanying raw data was also provided for selected laboratory reports. All PCDD/PCDF analyses were reported with raw data. All calibration results were assessed using the criteria specified in the analytical methods.

3.2 METHOD MODIFICATIONS

Due to chemical interactions associated with the treatment of the waste materials with lime during the bagging process, the procedures for cyanide and TCLP metals required slight modifications. Less sample was used for the cyanide analyses in order to minimize the chemical reactions. For TCLP metals, the samples and extraction fluid were manually stirred for one to two hours in open TCLP vessels in order to evolve the gases. The vessels were then sealed and tumbled for the remaining time required by the method.

The modifications do not affect the usability of the data for the Phase I program.

3.3 HOLDING TIMES

The holding time criteria specified in the analytical methods are noted in Table 1. Table 2 presents a summary of all collection, extraction, and analysis dates. All samples were extracted and analyzed within the recommended holding times. Due to outlying QC analyses, 11 samples submitted for PCDD/PCDF analyses, eight samples submitted for semi-volatile analyses, five samples submitted for pesticide/PCB analyses, 19 samples submitted for herbicide analyses, and 15 samples submitted for cyanide analyses were re-extracted and/or reanalyzed outside of holding times.

As holding time exceedances can introduce a low bias, all associated detected sample results were qualified as estimated. Non-detect sample results were judged acceptable without qualification since no gross holding time exceedances occurred.

All samples were properly transported and stored at 4°C ($\pm 2^\circ\text{C}$).

3.4 INSTRUMENT CALIBRATION

PCDDs/PCDFs

High resolution gas chromatography/low resolution mass spectrometry (HRGC/LRMS) instrumentation was properly tuned prior to sample analysis. Overall, calibration data showed adequate instrument sensitivity and calibration curves showed acceptable linearity. All ion abundance ratios were within the method-specified control limits.

Calibration verification standards were analyzed at the proper frequency and all native and labeled analyte concentrations were acceptable with the exception of the percent difference data for 1,2,3,4,7,8-HxCDD and 1,2,3,7,8,9-HxCDD from the January 7, 1997 calibration verification. These analytes were not detected in the associated samples and data qualification was not required. All ion abundance ratios were within the method-specified control limits for each PCDD/PCDF.

Gas Chromatograph/Mass Spectrometer (GC/MS) - Volatiles, Semi-Volatiles

The GC/MS instrumentation was properly tuned prior to sample analyses. Calibration data showed adequate instrument sensitivity, and calibration curves showed acceptable linearity with the following exceptions:

- i) low instrument response was observed for isobutyl alcohol, 1,4-dioxane, and famphur. All associates sample results were non-detect and were

rejected based on poor instrument response at the request of USEPA Region II based on Region II Contract Laboratory Program guidelines; and

- ii) initial and continuing calibration standard results indicated variability in instrument response for methylene chloride, 1,2-dibromo-3-chloropropane, bromomethane, ethyl acetate, 1,2-dibromoethane, cis-1,3-dichloropropene, diphenylamine, 2,4-dinitrophenol, hexachloropropene, and n-nitrosomethylethyamine. The relative response factors (RRFs) for these compounds were acceptable, indicating adequate sensitivity. Associated sample results were non-detect and would not have been affected by a change in instrument response.

Gas Chromatograph (GC) - Pesticides/PCBs, Herbicides, and TCLP Methanol

All pesticides/PCBs instrument evaluation standards demonstrated acceptable performance. All initial and continuing calibration data for the GC analyses showed adequate instrument sensitivity and linearity with the following exceptions:

- i) continuing calibration standard results indicated slight variability in instrument response for the pesticides analyses. All associated data were non-detect and were judged to be acceptable based on adequate instrument response for the calibration standards; and
- ii) low instrument response, high relative standard deviation (%RSD), and high percent difference (%D) values were reported for the pesticide tris-(2,3-dibromopropyl)phosphate, indicating non-linearity in the calibration curves and variability in the instrument response. The associated sample results were non-detect, and were rejected based on poor instrument response at the request of USEPA Region II based on Region II Contract Laboratory Program guidelines.

Metals - Inductively Coupled Plasma-Atomic Emission Spectrometer (ICP)

Calibration curves and initial calibration verification (ICV) and continuing calibration verification (CCV) standards were analyzed at the proper frequency.

The calibration curves were acceptable and all ICV and CCV recoveries were within the required control limits except for one low silver recovery. All associated sample results were non-detect, and were judged acceptable without qualification based on the marginally low recovery.

Interference check standards were analyzed at the proper frequency; all recoveries were acceptable except for two low thallium recoveries. All associated sample results were non-detect, and were judged acceptable without qualification based on the marginally low recoveries.

Metals - Atomic Absorption Spectrometer (AA)

All calibration curves originally consisted of a blank and six standards. The calibration curves were acceptable and all ICV and CCV recoveries were within the required control limits.

Cyanide

All calibrations were performed as required by the method. Initial and CCV standards were analyzed at the proper frequency and the results were acceptable.

3.5 INTERNAL STANDARD RECOVERIES - GC/MS ANALYSES

The proper internal standard (IS) compounds were added to all samples, blanks, standards, and spike samples prior to volatile and semi-volatile analyses. All IS recoveries evaluated were acceptable.

3.6 INTERNAL STANDARD RECOVERIES - PCDDs/PCDFs

A summary of the internal standard recoveries is presented in Table 3.

The proper internal standard compounds were added to all samples, matrix spike samples, and blanks prior to extraction. Internal standards were used to quantify the 2,3,7,8-substituted PCDDs/PCDFs present in the samples (isotope-dilution mass spectrometry) as well as to determine the overall method efficiency. All internal standard recoveries for the analytes of interest were acceptable.

3.7 CLEANUP STANDARD RECOVERIES - PCDDs/PCDFs

A summary of the cleanup standard recoveries is presented in Table 3.

The proper cleanup standard compound was added to all samples and blanks subsequent to extraction, but prior to fractionation. All recoveries showed acceptable analytical efficiency.

3.8 SURROGATE COMPOUND ANALYSES - ORGANICS

Surrogate were added to all samples, blanks, and QC samples prior to extraction and/or analysis.

A summary of surrogate recoveries is presented in Table 4. Surrogate recoveries met the acceptance criteria with the following exceptions:

- i) low recoveries were reported for five samples for the volatile surrogate compound dibromofluoromethane. Associated detected results were

qualified as estimated; non-detect results were judged acceptable without qualification based on sufficient surrogate recovery;

- ii) the semi-volatile analysis of samples HR-09581 and HR-10059 yielded one extremely low acid/phenol surrogate recovery. All associated results were non-detect and were rejected based on the poor analytical efficiency;
- iii) due to sample matrix interference, no dibutylchloroendate recoveries were reported for four of the pesticide analyses. The alternate surrogate (TCMX) was reported for these analyses and all recoveries were acceptable; and
- iv) due to sample dilution, surrogate recoveries could not be assessed for two samples for semi-volatiles analyses and 19 samples for pesticides/PCBs analyses. Analytical accuracy for these samples was assessed based on spike recoveries (see Sections 3.10 and 3.11).

3.9 METHOD BLANK ANALYSES

Method blanks were analyzed and/or extracted at the proper frequency for all parameters, and the results are summarized in Table 5. All method blank results were non-detect except for methylene chloride, which was detected at low levels in six of the volatile blanks. All associated positive sample results up to ten times the concentrations detected in the blanks were qualified non-detect.

3.10 MATRIX SPIKE/MATRIX SPIKE DUPLICATE ANALYSES

Matrix spikes (MS) were prepared and/or analyzed in duplicate with each batch of samples. A summary of the spike results is presented in Table 6.

All volatile, methanol, and cyanide spike recoveries and relative percent differences (RPDs) demonstrated acceptable analytical accuracy

and precision. The remaining spike recoveries showed acceptable analytical accuracy and precision with the following exceptions:

- i) high lead and mercury RPDs were reported for four matrix spike/matrix spike duplicate (MS/MSD) analyses for metals. The associated sample results were non-detect, and were not impacted by the indicated variability;
- ii) a high 2,4-D RPD was reported for the herbicides MS/MSD analysis of sample CS2-08221. The associated sample result was non-detect and was not impacted by the indicated variability;
- iii) two PCDD/PCDF and several semi-volatiles and pesticides/PCBs MS/MSD analyses resulted in only one outlying recovery. If the RPD for the analysis was acceptable, the associated data were judged acceptable without qualification based on the acceptable recovery of the companion spike;
- iv) high semi-volatile MS/MSD recoveries and RPDs were reported for three samples. All associated detected sample results were qualified as estimated; non-detect results would not be impacted by the indicated high bias and/or variability;
- v) an extremely low pentachlorophenol MS/MSD recovery was reported for sample CS2-08221. The associated sample result was non-detect and was rejected based on the poor recovery;
- vi) a high 2,3,7,8-TCDD RPD was reported for sample CS-05780. The associated sample result was qualified as estimated to reflect the indicated variability; and
- vii) outlying pesticides/PCBs MS/MSD recoveries and RPDs were observed for all sample analyses. Based on overall outlying accuracy and precision data, the qualifiers were applied to all samples in the associated analytical batch as follows:

- a) positive results associated with high MS/MSD recoveries and/or RPDs were qualified as estimated; non-detect data would not be impacted by the indicated high bias and/or variability. In addition, the detected PCB 1254 results associated with the samples were qualified as estimated based on the overall high bias observed in the sample pesticide MS/MSD analyses,
- b) an extremely low kepone MSD recovery and high RPD were reported for sample CS-05780. Associated detected sample results were qualified as estimated. Based on sufficient analyte recovery in the MS, the non-detect data were judged acceptable without qualification,
- c) extremely low kepone MS/MSD recoveries were reported for three samples. All associated sample results were non-detect and were rejected based on the poor recoveries,
- d) a zero percent delta-BHC MS recovery and high RPD were reported for sample FC-14858. All associated detected sample results were qualified as estimated. Based on the acceptable MSD recovery, the MS recovery was considered anomalous and no qualification of the non-detect data was performed,
- e) low methoxychlor MS/MSD recoveries were reported for samples CS2-08221 and FC-14858. All associated sample results were non-detect and were judged acceptable without qualification based on sufficient analyte recoveries, and
- f) a low methoxychlor MSD and high RPD were reported for sample CS-09471. All associated sample results were non-detect and were judged acceptable without qualification based on sufficient analyte recovery.

3.11 BLANK SPIKE/BLANK SPIKE DUPLICATE (BS/BSD) ANALYSES

BS samples were prepared (usually in duplicate) and analyzed with each batch of samples. The results are summarized in Table 7. All BS/BSD analyses for PCDDs/PCDFs, volatiles, methanol, and cyanide were acceptable. All remaining recoveries and RPDs demonstrated acceptable analytical accuracy and precision with the following exceptions:

- i) BS/BSD analyses resulted in only one outlying recovery for many analyses. If the RPD for the analysis was acceptable, the associated data were judged acceptable without qualification based on the acceptable recovery of the companion spike;
- ii) extremely low BSD recoveries and high RPDs were reported for all three herbicides of interest on October 4, 1996. All associated sample results were non-detect. Based on the acceptable BS recoveries, the BSD recoveries were considered anomalous and the data were judged acceptable without qualification;
- iii) low 2,4-D BS/BSD recoveries were reported for the herbicide analysis performed on October 10, 1996. All associated sample results were non-detect, and were judged acceptable without qualification based on sufficient analyte recovery;
- iv) high kepone RPDs were reported for two pesticides/PCBs BS/BSD analyses. All associated sample results were non-detect and were not impacted; and
- v) several semi-volatile BS/BSD recoveries and RPDs were outside of the specified limits. Associated detected data were qualified as estimated. All associated non-detect data were either not impacted or were judged acceptable without qualification based on sufficient analyte recovery.

3.12 ANALYTE IDENTIFICATION AND QUANTITATION

Analyte identification and quantitation was performed according to the methods.

In addition, total PCDD and total PCDF concentrations represent the sum of all analytes which meet the identification criteria and may include non-2,3,7,8-substituted PCDD/PCDF analytes for which the instrument was not calibrated. Total PCDD/PCDF concentrations in these cases are identified in the analytical results summary by the total PCDD/PCDF concentration being greater than the total concentration for the corresponding 2,3,7,8-substituted analyte(s), and should be considered estimated.

3.13 FIELD QA/QC

Field Duplicate Analyses

Six samples were collected in duplicate and submitted to the laboratory for analysis. A comparison of the field duplicate results is presented in Table 8. The results outside of estimated regions of detection showed acceptable analytical and sampling precision.

4.0 CONCLUSION

Based on the assessment and validation of the analytical data provided, these data have been judged acceptable for their intended use with the exceptions and qualifications noted.

CD-14739	11/15/96	-	-	11/27/96	-	-	0

Notes:

- Not Applicable.
LDR Land Disposal Restriction.
PCBs Polychlorinated Biphenyls.
TCLP Toxicity Characteristic Leaching Procedure.
PCDDs Polychlorinated Dibenzo-p-dioxins.
PCDFs Polychlorinated Dibenzofurans.
