270 Michigan Avenue
Buffalo, New York 14203-2999

Subject: Frontier Chemical - Pendleton Site, Pendleton, New York
Order on Consent (#B9-0270-89-05)
Annual Report (Report #17)
Post Closure Operation, Maintenance, and Monitoring Activities,

Dear Mr. Konsella:

In accordance with the approved Pendleton O & M Manual, enclosed is one hard copy and one electronic copy of the 2009 Annual Report on the Post-Closure Operation, Maintenance, and Monitoring of the Closure Components for the Frontier Chemical-Pendleton Site by the Pendleton PRP Group.

If you have any questions regarding the above submittals, please contact me by telephone at 423-336-4587 or by e-mail at mjbellotti@olin.com.

Sincerely,

Pendleton PRP Group

1.0 INTRODUCTION

This report is the17th submittal for the operation, maintenance and monitoring at the Frontier Chemical – Pendleton Site located on Town Line Road in the Town of Pendleton, Niagara County, New York. This report is prepared based upon the New York State Department of Environmental Conservation-approved Operation and Maintenance Manual for this Site prepared by O'Brien & Gere Engineers on behalf of the Frontier Chemical – Pendleton Site PRP Group in 1996.

The Frontier Chemical – Pendleton Site PRP Group is responsible for the operation, maintenance and monitoring of the closure components of the Site. The approved O&M Plan identifies certain tasks that the Frontier Chemical – Pendleton PRP Group will perform related to the Site. The tasks that the Frontier Chemical – Pendleton PRP Group are required to perform are associated with the closure components of the Frontier Chemical – Pendleton Site.

2.0 CONSTRUCTED FEATURES

Constructed features for the Site include the capped area, ground water collection and conveyance system, surface water runoff facilities, constructed wetlands, perimeter and containment berms, and outlet weir, ground water monitoring system, access road, and site security. Each of the construction features is described briefly in the following paragraphs.

- The low-permeability capped system at the Site is a multi-component system designed to isolate the contaminants in the landfill. The 60-mil thick textured high-density polyethylene (HDPE) geomembrane is the component that covers and isolates the contaminants in the landfill. A 2-foot thick soil barrier layer was installed to protect the HPDE geomembrane cover. An 18-inch thick layer of soil barrier protection layer was placed over the HDPE geomembrane to protect the HDPE geomembrane from external forces. A 6-inch thick layer of topsoil was added to bring the soil barrier protection layer to a thickness of 2-feet. The soil barrier protection layer supports the vegetative cover c that minimizes erosion.

- The ground water collection system installed along the southern perimeter of the capped area and eastern edge of Quarry Lake is approximately 1,594 feet in length. The southern perimeter collection system is a perforated 6-inch diameter HDPE pipe approximately 420 feet in length sloped to discharge to manhole MH-1 of the eastern edge of Quarry Lake collection system. The collection system along the eastern edge of Quarry Lake is a perforated 6-inch pipe approximately 1,174 feet in length. The perforated pipe transitions to 6-inch diameter solid HDPE pipe prior to the manhole MH-3 pumping station wet well. A pinch valve is located at the entrance to the wet well. When the pinch valve is in the closed position, ground water will build up in the ground water

collection trench. When the pinch valve is in the normal open position, ground water will flow into the wet well.

- The surface water runoff control facilities at the Site are designed to protect the toe of the capped area from run on and to convey runoff away from the capped area during a 25-year, 24-hour storm or a seasonal thaw event. Runoff from the northern portion of the cap drains directly to the existing wetland areas as sheet flow runoff. Sheet flow runoff from the western half of the cap drains across the western access roads discharging directly into the lake. Sheet flow runoff from the eastern portion of the cap drains across the eastern access road into a storm water ditch.

- Wetlands are constructed in Quarry Lake between the lake and the reconstructed perimeter berm, north of the capped area, and south of the capped area. In addition to direct precipitation, the constructed and existing wetlands receive surface water runoff from the capped area, Quarry Lake, and other areas of the Site.

- The perimeter berm constructed at a top elevation of approximately 580.5 feet and with a slope of 1V:3H provides containment for 25-year, 24-hour event while maintaining two feet of freeboard. The containment berm is constructed along the lakeside of the ground water collection trench at a 1V:3H and supports for the ground water collection system. The outlet weir with a crest elevation ranging from 577.2 feet to 577.5 feet is designed to discharge water from Quarry Lake into the surrounding wetlands when the water surface elevation rises above a crest elevation of 577.2 feet.

- The ground water monitoring system includes ten ground water monitoring wells (URS-14I, URS-14D, URS-9I, URS-9D, 85-5R, URS-5D, 85-7R, URS-7D, 88-12C, and 88-12D), eight piezometers (P-1 through P-8), and one standpipe (SP-1). The ground water monitoring wells are located outside the limits of the capped area and serve to monitor the elevation of the ground water table as well as to collect samples of ground water to be analyzed. Five piezometers are located within the capped area, and three piezometers are located outside the capped area. The standpipe is located within the ground water collection trench. The surface water elevation in Quarry Lake is measured along with water elevations from the eight piezometers, and the standpipe in the collection trench to monitor the establishment of an inward hydraulic gradient at the perimeter of the capped area.

- The access road from Townline Road allows access to the perimeter of the capped area and ground water collection, conveyance and pre-treatment system for inspection and maintenance purposes.

- Site access is controlled by a vehicle access gate at Town Line Road, a vehicle access gate located adjacent to the dry vault, and a perimeter fence around the capped area and pump station. The gates and fence are six-foot

high chain link type with warning signs to discourage trespassers. To maintain the security of the capped area and pump station, the access gates are locked while the Site is unattended.

Operation, maintenance, and monitoring activities to be performed by the Group include:

- Routine inspection and maintenance of constructed features, including the capped area, ground water collection and conveyance system, surface water runoff facilities, constructed wetlands, access road, perimeter and containment berms, and outlet weir.

- Operation and maintenance of the ground water pre-treatment system.

- Performance of a ground water monitoring program to monitor ground water conditions at the site and to verify the inward hydraulic gradient within the capped area.

- Evaluation of operation, maintenance, and monitoring activities and identification of proposed changes to the O&M Manual or site procedures and policies which would provide a safer and/or more cost-effective operation

- Recordkeeping.

3.0 INSPECTION AND MAINTAINENCE OF CAPPED AREA

Routine inspection of the capped area and immediately adjacent areas is performed semi-annually. NYSDEC is informed of the inspections at least one week in advance of the inspections to enable their participation in the inspections. The inspector for the Pendleton PRP Group, Sevenson Environmental Services, Inc. observes the condition of the vegetative cover for areas of settlement, erosion, slope instability, or any other damage to the capped area. If such features are noted, appropriate engineered solutions are implemented. Mowing is performed semi-annually and as required to prevent the establishment of woody plants (trees) that may penetrate the flexible membrane cover. Routine cover inspection will also note any problems with thinning of vegetation. Areas that appear to be thinning out over time will require overseeding to keep the vegetative cover uniform.

Inspections of the capped area and other constructed features using the Semi-Annual Inspection Checklist were conducted two times, during this reporting period. Problem areas noted during these inspections are listed in the following table. Copies of the inspection forms from the two inspections are included in ***Attachment A***.

4.0 GROUNDWATER COLLECTION, CONVEYANCE AND PRE-TREATMENT SYSTEM

Ground water within the capped area flows toward the ground water collection trench. The collected ground water flows by gravity through the collection trench piping to Manhole #3. The level of the collected ground water in Manhole #3 and in the collection trench piping is monitored by instrumentation that activates one of the pre-treatment pumps and initiates the pre-treatment process. The pre-treatment system is installed in the dry vault adjacent to Manhole #3. All ground water from the collection trench piping is filtered and carbon treated prior to discharge to the NCSD #1's interceptor system at Manhole #16.

The ground water collection system is inspected semi-annually for the buildup of hard or soft scale-like deposits. The inspection is performed concurrently with inspection of the capped area. The inspection measures the water levels in the manholes (MH-1, MH-2, and MH-3) and monitoring the flow rate of water being pumped to the pre-treatment system from the wet well (MH-3) to observe if there is any buildup in the ground water collection trench piping. The pinch valve in the wet well is closed and opened during the inspection. The dry vault and wet well components are visually inspected monthly for leakage or corrosion of valves, pipes and appurtenances, and for proper operation. A leak is repaired when found. If a component of the ground water collection, conveyance, or pre-treatment system is found to be damaged or malfunctioning, it is repaired or replaced.

The operation of the pre-treatment system is a process controlled by the quantity of ground water flowing from the landfill into the collection system piping. The ground water collected from inside the capped area is stored in the wet well and collection system piping when the system is not pumping. Two alternating progressive cavity pumps, each with a pumping capacity of 10 gallons per minute, are operated singularly by the ground water level in the wet well, Manhole #3. Water from the pre-treatment system is discharge from the dry vault via a dual contained force main to the Niagara County Sewer District #1 interceptor system at manhole MH-16. The flow rate and volume of ground water pumped from the wet well is measured using a magnetic-type flowmeter. The flowmeter is located downstream of the progressive cavity pumps but prior to the filter and carbon treatment units. The flowmeter is the measurement device used in reporting discharge flow from the Site to MH-16. A sump is installed within the dry vault to recycle spills and leaks inside the dry vault back into the wet well. A sump pump with a float switch pumps spills and leaks from the floor of the dry vault back into the wet well for treatment.

The pre-treatment system was designed for continuous operation capable of treating approximately 15,000 gallons per day at a rate of 10 gallons per minute. The water level sensor in the wet well can be set at various levels but is currently set to activate the pumping system when the wet well sump begins to back up water in the ground water collection piping.

PRE-TREATMENT PROCESSING, AVERAGE FLOW RATE		
PROCESS FLOW RATES	**DESIGN**	**ACTUAL**
Gallons Per Day	15,000	365
Gallons Per Minute	10	0.25

Under current conditions, the pumping system is always on-line but under normal ground water flow rates to the collection trench piping, operates six to eight times per 24-hour period. Each time a pump is activated by the level sensor, approximately 60 gallons of water is pumped into the pre-treatment system. Based upon the volume of the pre-treatment system, it takes at least a day for the ground water to pass through the pre-treatment system and be discharged to Manhole #16. A summary of the pre-treatment flow volume by year is shown in the table below.

PRE-TREATMENT FLOW SUMMARY BY OPERATING YEAR		
DATE	**GALLONS PER YEAR**	**GALLONS PER DAY**
1997	68,557	187
1998	64,935	178
1999	61,187	168
2000	69,998	191
2001	105,524	289
2002	142,068	389
2003	49,616	439
2004	138,285	378
2006	128,798	353
2007	98,355	269
2008	88,710	242
2009 (through April)	44,436	123

Calendar-year flows by day for 1997 through 2008 as well as 2009 through April are presented in ***Attachment B***.

The permit to discharge from the pre-treatment system to Manhole #16 of the Niagara County Sewer District #1 is currently granted by District Permit # 02-11. The permit was renewed, effective August 28, 2008. The current permit is included in ***Attachment C.*** Semi-annual reporting to Niagara County Sewer District #1 includes the volume and chemical characteristics of the water being discharge from the Site. Copies of the semi-annual reports to the Niagara County Sewer District #1 for this reporting period, Reports dated 10/30/08 and 4/21/09, are included in ***Attachment D***.

The performance of the pre-treatment system has met the discharge criteria of the permit since startup in 1997.

Maintenance for the pre-treatment system is recorded in the Pre-Treatment System Operator Log. Information on the Pre-treatment System Operator Log includes the purpose of the visit, local time and conditions, status of the process, details of the visit, planned action, and recommendations to prevent future problems. A log sheet is filled out during each visit to record site conditions and actions taken by the technician. Site visits are normally monthly unless alarm conditions, call by neighbors, data request, etc., require additional visits.

Regular inspections are currently conducted monthly. These inspections are a part of the pre-treatment systems operating log. The Pre-Treatment Operator's Logs for this reporting period are included in ***Attachment E.***

Solids resulting from ground water collection system cleaning and equipment decontamination activities are stored, handled, and disposed of in accordance with the New York State Hazardous Waste Manifest System Regulations 6NYCRR Part 372 and any other applicable local, state, and federal regulations.

5.0 GROUND WATER MONITORING PROGRAM

This Ground Water Monitoring program includes piezometer and monitoring well inspections; hydraulic data for Quarry Lake, the capped area and collection trench, and the ground water wells; and ground water chemistry of the ground water zones. Piezometers (P-1 through P-8), standpipe (SP-1), and ground water monitoring wells (85-5R, URS-5D, 85-7R, URS-7D, URS-9I, URS-9D, 88-12C, 88-12D, URS-14I, and URS-14D) were identified as the monitoring network in the O&M Manual for the Site. The first data collection for O&M was performed in July 24, 1997. The information from each round of data collection is used to evaluate whether or not the landfill cap and ground water collection trench are effectively controlling ground water migration.

The piezometer and monitoring well inspections were conducted per the monitoring well integrity checklists, which are included in ***Attachment F***. During each monitoring event, ground water monitoring wells and piezometers are inspected for signs of damage. If damage is detected, or if routine sampling indicates a problem with one or more of the ground water monitoring wells or piezometers, it is noted in the well integrity checklist. Before any action is taken with the wells, the action will be discussed with the NYSDEC.

Problems noted with the well inspection are listed in the table below

GROUND WATER MONITORING SUMMARY	
WELL TYPE	**PROBLEM**
P1	Well ID tag in need of repair.
P2	Well ID tag in need of repair.
P4	Piezometer is on a slight angle to the cap
P6	Piezometer is on a slight angle to the cap
P7	Well ID tag in need of repair.

A complete round of static ground water elevations was made, per the Field Observation Report. The surface water elevation of Quarry Lake was measured, and the Field Observation Report is included in ***Attachment G.*** Groundwater and Quarry Lake surface water elevations are included in ***Attachment H.*** A well location map is also included in ***Attachment F***.

In April 2009, groundwater samples were obtained from the ten ground water monitoring wells (85-5R, URS-5D, 85-7R, URS-7D, URS-9I, URS-9D, 88-12C, 88-12D, URS-14I, and URS-14D). Purge water generated during this sampling event was contained, passed through a 25-micron bag filter, and discharged into Manhole –3.

Ground water sampling logs are included in ***Attachment I.*** The analytical data report and summary spreadsheet is included on the CD in ***Attachment J.***

The groundwater samples were collected by Sevenson Environmental Services and were analyzed by Life Science Laboratories, formerly O'Brien & Gere Laboratories, Inc. for VOCs using USEPA Method 8260B, inorganics using USEPA Methods 6010B/7470A/7841, and cyanide using EPA Method 9010B/9014.

6.0 EVALUATION OF OPERATION, MAINTENANCE, AND MONITORING ACTIVITIES

The capped area was mowed on a regular basis to prevent establishment of woody vegetation during this reporting period. The capped area functions as designed and complies with the O&M Plan.

The groundwater collection piping and the wet well continued to function without any unresolved problems.

The water level in the wetlands to the north of Quarry Lake is higher than the Quarry Lake outlet weir, at 578.43 ft-msl. The spill level at the outlet weir for Quarry Lake is approximately 578 feet. The weir was constructed to maintain a design water level in Quarry Lake and to provide a discharge point for rainfall runoff from the capped area. The perimeter berm for Quarry Lake is approximately 580.50 feet. Currently, this

elevated water level has not adversely impacted any components of the site. The surface control features function as designed and comply with the O&M Plan.

The water elevation data collected from the piezometers and ground water wells was used to determine whether an inward hydraulic gradient exists was made by comparing water level measurements within the capped area to those measured outside the capped area. This information was also used to determine the ground water flow potential inside the capped area, and to determine whether the ground water collection trench is effectively controlling ground water migration away from the capped area.

An inward hydraulic gradient was established when water levels in piezometers outside of the capped area (P-1, P-5, P-8) and Quarry Lake are higher than water levels in piezometers within the capped area (P-2, P-3, P-4, P-6, P-7). There are four pairs of piezometer placed around the perimeter of the capped landfill to determine attainment of an inward gradient. The progress made by each of the four pairs of piezometers is discussed in the following paragraphs.

The Hydrographs showing groundwater elevation trends are shown in ***Attachment H***. Supporting data are included on the CD in ***Attachment I.***

Levels for piezometer pair, P-1 and P-2, located in the eastern portion of the capped area that borders the abandoned ROW, indicate that an inward gradient has been maintained for this pair of piezometers.

The ground water levels were checked for the piezometer pair, P-5 and P-6, located in the southern portion of the capped area. An inward gradient has been maintained for this pair of piezometers.

The ground water levels were checked for the piezometer pair, P-7 and P-8, located in the northern portion of the capped area. An inward gradient has been maintained for this pair of piezometers.

The ground water elevation in the standpipe (SP-1) in the ground water collection trench is dry, i.e. indicating that it is lower than the surface water elevation of Quarry Lake. This indicates that Quarry Lake is isolated from the capped area.

The ground water elevation data indicate that ground water within the capped area is migrating to the west toward the ground water collection trench. ***Attachment H*** contains a well location map and tabulated groundwater elevations for the April, 2009 monitoring episode.

The access road was inspected at the same frequency as inspection of the final cover for rutting, potholes or settlement. No repairs were needed. The access road functions as designed and complies with the O&M Plan.

The integrity of the six-foot high chain link fence immediately surrounding the capped area and pump station was inspected at the same time as the capped area. The structural integrity of the fencing system was verified. Site security functions as designed and complies with the O&M Plan.

7.0 Conclusions

Based on the data contained in this annual report, the following conclusions are presented:

- The isolation of ground water within the capped area has been established and is being maintained by current operation and maintenance activities.

- The ground water elevation data indicates that ground water within the capped area is migrating to the west toward the ground water collection trench.

- The April 2009 ground water chemistry collected from the monitoring wells is similar to previous sampling events. Volatile organics were generally undetected.

- Review of the ground water elevation data indicate that inward hydraulic gradients were observed between piezometers within the capped area and piezometers outside of the capped area. The absence of VOCs detected at concentrations above the New York State Class GA standards in the monitoring wells surrounding the capped area provide further evidence that contaminants are not migrating from beneath the cap.

Re: PRP Group Industrial Waste Permit
Pendleton (Frontier Chemical) Site

Gentlemen:

Enclosed is a renewed permit for the discharge of contaminated groundwater.

If there are any questions, please feel free to contact me.

Very truly yours,

NIAGARA COUNTY SEWER DISTRICT #1

John T. Timkey
Chief Operator

JTT:ca
Enclosure

MD\Pretreat\PerPendletonSitePRPGrpLtr08

Niagara County Sewer District #1

Industrial Waste Permit

Industrial User: Pendleton Site PRP Group
(Permitee)

Division Name (if Applicable): c/o Olin Corporation

Mailing Address: 3855 Ocoee Street, Suite 200
Street or P.O. Box

Cleveland, TN 37312
City, State and Zip Code

Site Address: Pendleton Site Townline Road
Street Address

Pendleton, New York
City, State

The above Industrial User is authorized to discharge contaminated groundwater to the Niagara County Sewer District #1 sewer system in compliance with the District's Sewer Use Law, Local Law No. 1, Resolution No. 7-94, any applicable provisions of Federal or State law or regulation, and in accordance with discharge points(s), effluent limitations, monitoring requirements, and other conditions set forth herein.

Effective Date: August 28, 2008

Expiration Date: August 28, 2010

(Application for renewal shall be submitted 90 days prior to expiration)

District Permit No. 08-11

Date: 8/19/08 Signed:

Schedule A – Listing of Discharged Wastestreams

Industry Name: Pendleton (Frontier Chemical) Site
Groundwater Remediation

The following wastestreams are discharged to sanitary sewer system tributary of Niagara County Sewer District #1.

Waste-Streams	Nature of Waste	Volume gallons per day	Discharge Point
WS 001	Groundwater Remediation	412 (Avg.)	D 002

PART I – WASTEWATER DISCHARGE LIMITATIONS AND MONITORING REQUIREMENTS

Industry Name: Pendleton (Frontier Chemical) Site
Sample Point: Sample Point A: Groundwater Pump Station Discharge
Description: Contaminated Groundwater
Classification: Non-SIU

Parameter	Discharge Limitations[1]	Monitoring Requirements: Sampling Frequency	Monitoring Requirements: Sample Type
Flow a.) Groundwater Remediation	2500 GPD, Daily Maximum	Continuous	
Pollutants	Discharge Limit		
624	0.100 mg/L (Sum of all EPA 624 cmpds.)	Semi-Annual	24C[2]
Antimony	0.1 mg/L	Semi-Annual	24C
Boron	4.0 mg/L	Semi-Annual	24C
Chromium	5.33 mg/L	Semi-Annual	24C
Cyanide (T)	2.0 mg/L	Semi-Annual	4 Grabs[3]
Total Phenolics (4AAP)	Surveillance Only	Semi-Annual	
Total Suspended Solids	300 mg/L	Semi-Annual	24C

These Limitations shall be effective immediately.

Notes:

(1) All other limitations as set forth in the District's Sewer Use Law shall also apply.

(2) 24-hour composite samples for volatile (624) organics to consist of a minimum of four (4) grabs within a 24-hour period. (See Sampling Measurement & Analytical Guidelines, Section 9, Paragraph 2.)

(3) Cyanide will be analyzed from 4 grabs collected over the 24 hour period using the appropriate containers/preservatives and lab composited.

PART II – SPECIAL CONDITIONS/COMPLIANCE SCHEDULE

1. Compliance Schedules: If additional pretreatment and/or operation and maintenance are required to meet discharge limitation and/or Pretreatment Regulations, the User will immediately advise District of the shortest schedule by which the User provide such additional pretreatment or reduction in flow discharged. The completion date in this schedule shall not be later than the compliance date established for any applicable Pretreatment Regulations.

PART III – REPORTING REQUIREMENTS

1. The Industrial User shall notify the District immediately upon any accidental or slug discharge to the sanitary sewer system. Formal written notification discussing circumstances of the event and remedies to prevent recurrence shall be submitted to the District within 3 days of occurrence.

2. The Industrial User shall notify the District and apply for a revised permit 30 days prior to the introduction of new wastewater or pollutants or any substantial change in the volume or characteristics of the wastewater being introduced into the POTW from the User's industrial processes.

3. Any upset experienced by the Industrial User of its treatment that places it in a temporary state of non-compliance with wastewater discharge limitations contained in this permit or other limitations specified in the District's Sewer Use Law shall be reported to the District within 24 hours of first awareness of the commencement of the upset. A detailed report shall be filed within 5 days.

4. Self-monitoring reports are due at the NCSD #1 office within 30 days from the date of the lab report, but in no case greater than 60 days after the date of sampling. When reporting results, the following information shall be provided:

   a.)
   1. The date, exact place, and time of sampling or measurements;
   2. The individual(s) who performed the sampling or measurements;
   3. The date(s) analyses were performed;
   4. The individual(s) who performed the analyses;
   5. The analytical techniques or methods used;
   6. The results of such analyses

   b.) A copy of the original lab report(s) as provided by the certified testing lab(s), including properly completed chain(s) of custody.

   c.) The original data from the lab report shall be transcribed into a table comparing the permit requirements to the obtained results. In cases where the permit contains requirements for daily maximum and maximum monthly average, columns for both of these shall be included in the table. When a single value applies to both daily max. and max. mo. avg. (because monitoring was only performed once during a month), separate columns shall still be included in the table, clearly indicating that the value is both the daily maximum and the monthly average.

   d.) All daily flows obtained since the previous reporting period, as well as the maximum and average daily flow for each month.

   e.) A certification statement as to whether the Industrial User is in compliance with the permit limitations. If the permit contains limitations for both daily max. and max. mo. avg., the statement must specify whether the User is in compliance with both limitations.

   f.) A certification statement that all normally operated (applicable) processes were operating (and discharging) during the monitoring period. Any processes not in operation shall be cited together with a listing of pollutants which might normally be present in said process discharge.

5. Additional Monitoring by Permittee - If the permittee monitors any pollutants at the location(s) designated herein more frequently than required by this permit, using approved analytical methods as specified herein, the results of such monitoring shall be included in the calculation and reporting of values required under Part I. Such increased frequency shall also be indicated.

PART III – REPORTING REQUIREMENTS (cont'd)

6. All self-monitoring reports prepared shall be submitted to:

John T. Timkey, Chief Operator
Niagara County Sewer District #1 Water Pollution Control Center
7346 Liberty Drive
Niagara Falls, New York 14304

7. Signatory Requirements - All reports required by this permit shall be signed by an authorized representative of the Industrial User.

8. If sampling performed by the Industrial User indicates a violation, the Industrial User is required to repeat the sampling and analysis and submit the results to the District within thirty (30) days after becoming aware of the violation.

   Additionally, applicable quality control is mandatory in cases where the Industrial User is conducting additional self-monitoring as a result of non-compliance. (See Sampling Measurement and Analytical Guidelines, Item #19 "Quality Control.")

9. Toxic Organic Management Plan - For Industrial Users who are required to monitor for Total Toxic Organics (TTO), and who are implementing a District-Approved, Toxic Organic Management Plan in lieu of this monitoring, the following certification shall be included with each self-monitoring report:

   > "Based on my inquiry of the person or persons directly responsible for managing compliance with the permit limitation for total toxic organics, I certify that, to the best of my knowledge and belief, no dumping of concentrated toxic organics into the wastewaters has occurred since filing of the last discharge monitoring report. I further certify that this facility is implementing the toxic organic management plan submitted to the control authority."

PART IV - STANDARD CONDITIONS

1. **PROHIBITED DISCHARGES**

   The Industrial User shall comply with all the general prohibitive discharge standards.

2. **INSPECTION/RIGHT-OF-ENTRY**

   The administrator and/or other duly authorized employees of the District, NYSDEC and/or USEPA, bearing proper credentials and identification, shall be permitted to enter all industrial properties without advance notice for the purpose of inspection, observation, measurement, sampling, monitoring, and testing in accordance with the provisions of its Sewer Use Law. The District shall also have the right to inspect and copy records pertaining to the Industry's self-monitoring procedures.

3. **RECORDS RETENTION**

   The Industrial User shall retain and preserve for no less than (3) years any records, books, documents, memoranda, reports, correspondence, records of calibration and maintenance of instrumentation, recordings from continuous monitoring instrumentation, and any summaries thereof, relating to monitoring, sampling and chemical analysis made by or in behalf of the user in connection with its discharge. All records that pertain to matters that are the subject of special orders, or any other enforcement or litigation activities brought by the District, shall be retained and observed by the Industrial User until all enforcement activities have concluded and all periods of limitation with respect to any and all appeals have expired.

4. **CONFIDENTIAL INFORMATION**

   Except for data determined to be confidential under Section 5.15 of the District's Sewer Use Law, all reports required by this permit shall be available for public inspection at the office of the Pretreatment Administrator, 7346 Liberty Drive, Niagara Falls, New York 14304.

PART IV – STANDARD CONDITIONS (cont'd.)

5. DILUTION

No Industrial User shall increase the use of potable or process water or, in any way, attempt to dilute a discharge as a partial or complete substitute for adequate treatment to achieve compliance with the limitations contained in this permit.

6. PROPER DISPOSAL OF PRETREATMENT SLUDGES AND SPENT CHEMICALS

The disposal of sludges and spent chemicals generated shall be done in a manner such as to prevent the pollutants from such material from entering the NCSD #1 sewer system. Said disposal shall also conform to all applicable State/Federal regulations.

7. REVOCATION OF PERMIT

The permit issued to the Industrial User by the District may be revoked when after inspection, monitoring or analysis, it is determined that the discharge of wastewater to the sanitary sewer is in violation of Federal, State, or local laws, ordinances, or regulations. Additionally, falsification or intentional misrepresentation of data or statements pertaining to the permit application or any other required reporting form, shall be cause for permit revocation, revocation of sewer discharges privileges, and/or imposition of criminal penalties.

8. LIMITATION ON PERMIT TRANSFER

Wastewater discharge permits are issued to a specific user for a specific operation and are not assignable to another user or transferrable to any other location without the prior written approval of the District. Sale of a facility by a User shall obligate the purchaser to seek prior written approval of the District for continued discharge to the sewerage system.

9. PERMIT AVAILABILITY

The original signed permit must be available upon request at all times for review at the Industrial User's address stated on the first page of this permit.

10. MODIFICATION OR REVISION OF THE PERMIT

a. The terms and conditions of this permit may be subject to modification by the District at any time as limitations or requirements, as identified in the District Sewer Use Law, are modified or other just cause exists.

b. This permit may also be modified to incorporate special conditions resulting from the issuance of a special order by NYSDEC or EPA.

c. The terms and conditions may be modified as a result of EPA promulgating a new federal pretreatment standard. If a pretreatment standard or prohibition (including Schedule of Compliance specified in such pretreatment standard or prohibition) is established under Section 807 (b) of the Act for a pollutant which is present, the discharge and such standard or prohibition is more stringent than any limitation for such pollutant in permit, this permit shall be revised or modified in accordance with such pretreatment standard or prohibition.

d. The terms and conditions of this permit shall remain in effect until the permit is terminated or replaced by a subsequent permit.

11. DUTY TO REAPPLY

Within ninety (90) days of the expiration, the User shall reapply for reissuance of the permit. Application forms are available from the District upon request.

12. SEVERABILITY

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

PART IV – STANDARD CONDITIONS (cont'd).

13. **ENFORCEMENT AND PENALTIES**

Any violation of Section 2 or 3 of the Niagara County Sewer Use Law (adopted January 18, 1994) is declared a violation except as otherwise provided by law. Any violation of Section 4, 5 or 6 of the Niagara County Sewer Use Law is thereby a misdemeanor except as otherwise provided by law. A User who is found to have violated any provision of the Niagara County Sewer Use Law (or permits and orders issued thereunder) and/or applicable pretreatment standards and requirements, shall be subject to applicable civil and criminal penalties including but not limited to fines not to exceed five thousand dollars ($5,000) per violation per day for each day on which non-compliance shall occur or continue.

PART V - SPECIFIC CONDITIONS

NONE

NIAGARA COUNTY SEWER DISTRICT #1

SAMPLING MEASUREMENT AND ANALYTICAL GUIDELINES

1. Prior to implementing the self-monitoring sampling and analyses, the Industrial User must submit the following information to the District.

    a. The name(s) and address(es) of the laboratory or laboratories proposed to perform each of the chemical analyses.
    b. A description of the equipment and test methods proposed for the chemical analyses for each parameter.
    c. A list of the lower level of detectability expected for each parameter.
    d. A description of the overall recovery efficiency of the prepared sample, where applicable.
    e. A description of the quality control procedures used by the laboratory or laboratories to ensure reliable test results.
    f. A description of the sample collection point and sample collection procedures.
    g. A description of the compositing technique and equipment.
    h. A description of the sample preservation methods used for each parameter.

2. Before commencement of any sampling or flow monitoring, Niagara County Sewer District #1 Water Pollution Control Center shall be notified in writing at least seventy-two (72) hours in advance by the firm or designee. The District will give a twenty-four (24) hour verbal notification to the firm or District designee of whether split sampling will be initiated.

3. Before sampling is done, the sample points must be approved by the District.

4. All discharge lines from one (1) building, or all discharge lines from only one (1) single process must be sampled at the same time.

5. Sampling record must be used and submitted with monitoring reports. The sampling report shall contain the following minimum information:

    a. Date of each sample day.
    b. Exact location of sampling points – attach drawing for reference.
    c. If done manually, time of each grab sample with sampler's initials each time.
    d. Type of auto-sampler used. Size and type of tubing and sampling interval.
    e. Record all physical observation (sight, smell etc.) of the discharge at start-up, during inspections and changing samples.
    f. Note weather conditions.
    g. Signature of immediate sampling supervisor at the bottom of page.

6. If an auto-sampler is used, new tubing must be at least ¼ I.D. If visibly contaminated after sampling, it must be cleaned with detergent or methanol and deionized water each day. Proper refrigeration of the sample must be maintained during entire sampling period, when necessary. The intake hose velocity must be at least 2.0 f.p.s. with a maximum lift of twenty (20) feet.

7. All sampling shall be taken at the highest velocity, greatest turbulence and center of flow.

8. All sampling must be done on normal work days. If there is a process discharge after normal working hours, sampling must continue until no further discharge.

9. "COMPOSITE SAMPLE" "Composite" shall mean a combination of individual (or continuously taken) samples obtained at regular intervals over the entire discharge day. The volume of each sample shall be proportional to the discharge flow rate, when possible. For a continuous discharge, a minimum of forty-eight (48) individual grab samples (at half hour intervals shall be collected and combined to constitute a twenty-four (24) hour composite sample. For intermittent discharges of less than four hours duration, grab samples shall be taken at a minimum of fifteen (15) minute intervals.

SAMPLING MEASUREMENT AND ANALYTICAL GUIDELINES (cont'd.)

Composite samples for purgeable halocarbons (Method 601/8010), purgeable aromatics (Method 602/8020), acrolein/acrylonitrile (Method 603), volatile organics (Method 624/8240), or cyanide shall be lab composited from grab samples taken at regular intervals over the entire discharge day utilizing the appropriate special sample containers, preservatives and collection techniques. The number of grabs collected is dependent on the length of the sampling period, and shall be determined the following:

For a discharge period of one hour or less, a single grab sample may be collected for analysis of the above parameters.

For a discharge period between one and 24 hours, a minimum of four (4) grabs will be taken at regular intervals and lab composited for analysis of the above parameters.

Proper sample collection containers and techniques must be used.

"SPLIT SAMPLE" - must be done on site with both parties present before preservatives are added.

"DAILY" - each operating day

"DAILY MAXIMUM" - shall mean the highest allowable discharge of a pollutant and/or flow measured during any twenty-four (24) hour sampling period. For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurements, the daily discharge is calculated as the average measurement of the pollutant over the day.

"GRAB" - shall mean an individual sample which is taken from a wastestream on a one (1) time basis with no regard to the flow in the wastestream and without consideration of time.

"MONTHLY" on day each month (the same day each month) and a normal operating day (i.e. the 2nd Tuesday of each month).

"MONTHLY AVERAGE" - discharge limitation means the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month, divided by the number of daily discharges measured during that month.

"WEEKLY" - every seventh day (the same day each week) and a normal operating day.

10. Total water consumption shall be recorded for each day's composite using the water meters. Water consumption method must be explained in report.

11. All discharges shall be flow-monitored whenever possible. If flow monitoring cannot be done, flow determination should be a best practical engineering estimate without being economically burdensome to the firm involved. Results and procedure used to determine flow must be included with the analysis report.

12. **Sample Collection Techniques for Single Discharge Lines**

On single discharge lines (all regulated wastes discharge through one outlet), sample collection for the required parameters will be collected according to the following:

a. The following parameters should only be analyzed on manually taken grab samples:

pH
Temperature
Chlorine Residual
Dissolved Oxygen
Fecal Coliforms

SAMPLING MEASUREMENT AND ANALYTICAL GUIDELINES (cont'd.)

Sample Collection Techniques for Single Discharge Lines (cont'd.)

b. The following parameters should only be analyzed on composite samples made from manually collected grab samples:

Oil and Grease
Purgeable Halocarbons (EPA 601)
Purgeable Aromatics (EPA 602)
Acrolein/Acrylonitrile (EPA 603)
Purgeables (EPA 624)
Cyanide

For a discharge period of one hour or less, a single grab sample may be collected for analysis of the above parameters.

For a discharge period between one and 24 hours, a minimum of four (4) grabs will be taken at regular intervals and lab composited for analysis of the above parameters.

Proper sample collection containers and techniques must be used

c. The following parameters should be analyzed on an automatically collected composite sample or, if an auto sampler is unavailable, a manually collected composite sample:

Metals
Phenol-4AAP
BOD
Total Suspended Solids
Total Phosphorus
TKN/Ammonia
Base/Neutral Acids (EPA 625)
EPA Methods 604-614

(For a continuous discharge, a minimum of forty-eight (48) individual grab samples (at half-hour intervals) shall be collected and combined to constitute a twenty-four (24) hour composite sample. For intermittent discharges of less than four (4) hours duration, grab samples shall be taken at a minimum of fifteen (15) minute intervals.)

13. **Sample Collection Techniques for Multiple Discharge Lines**

For multiple discharge lines (all regulated wastes discharge through more than one outlet), sample collection for the required parameters will be collected according to the following:

a. The following parameters must be analyzed separately from each discharge line's individual grab samples:

pH
Temperature
Chlorine Residual
Dissolved Oxygen
Fecal Coliforms

b. For the following parameters, a composite made from manually collected grab samples must be used. A separate composite must be made from each discharge line. The composites from the different discharge lines cannot be combined for analysis.

Oil and Grease
Purgeable Halocarbons (EPA 601)
Purgeable Aromatics (EPA 602)
Acrolein/Acrylonitrile (EPA 603)
Purgeables (EPA 624)
Cyanide

For a discharge period of one hour or less, a single grab sample may be collected for analysis of the above parameters.

SAMPLING MEASUREMENT AND ANALYTICAL GUIDELINES (cont'd.)

Sample Collection Techniques for Multiple Discharge Lines (cont'd.)

For a discharge period between one hour and 24 hours, a minimum of four (4) grabs will be taken at regular intervals and lab composted for analysis of the above parameters.

Proper sample collection containers and techniques must be used.

c. For the following parameters, composites from each discharge line may be combined proportional to their flow only if physical flow measurement can be done.

Metals
Phenol-4AAP
BOD
Total Suspended Solids
Total Phosphorus
TKN/Ammonia
Base/Neutral Acids (EPA 625)
EPA Methods 604-613

(For a continuous discharge, a minimum of forty-eight (48) individual grab samples (at half-hour intervals) shall be collected from each discharge line and combined to constitute a twenty-four (24) hour composite sample. For intermittent discharges of less than four (4) hours duration, grab samples shall be taken at a minimum of fifteen (15) minute intervals.)

14. A chain of custody log sheet is required to be used for all sampling and analysis of each sample and attached to the report.

15. The handling, storage preservation and analytical procedures for each parameter shall follow Environmental Protection Agency Guidelines published in the Federal Register, pursuant to 40 CFR 136, dated October 26, 1984, or as subsequently revised.

16. The monitoring results report, sampling record(s), and chain of custody log sheet must be sent by the industry to the District and not by the consulting firm.

17. If any exemptions or changes have to be made due to unique situations, the District must be notified immediately for approval. When approved, a written explanation of the change must accompany the analysis sheet.

18. Any split samples that indicate a discrepancy of greater than 20% may be grounds for requiring resampling and analyses.

19. "**QUALITY CONTROL**" - All additional analyses which were run along with self-monitoring samples as a quality control measure, such as field blanks, duplicates or matrix spikes, etc., must be included in the self-monitoring report submitted to the District. Applicable quality control is mandatory in cases where the industrial user is conducting additional self-monitoring as a result of non-compliance.

20. All analyses conducted pursuant to this permit shall be performed by a laboratory certified for said analyses by the New York State Department of Health.

Re: Discharge Monitoring Report: May, 2008 through September, 2008
Groundwater Discharge Through Pre-Treatment System
Pendleton (Frontier Chemical) Site

Dear Mr. Nerone:

Enclosed for your review is the Discharge Monitoring Report for the Pendleton Frontier Chemical site, covering the subject timeframe. Included are

- The analytical results summary from the September, 2008 sampling event for discharge of collected groundwater from the pre-treatment system at the site.
- The analytical laboratory report for the September, 2008 sampling.
- Water discharge volume totals and flow summary sheets.

Results from this sampling event are compared with the Permit (#02-11) requirements on the attached Analytical and Flow Summary sheet.

A review of analytical data indicates that all permit parameters are within permit discharge requirements. A review of the operational records and daily flow data for this timeframe shows no significant operational change.

Please note that this submittal contains flow data for the five months from May-08 through September-08. The previous report consisted of seven months' flow data, to bring the reporting period current with the sampling period. This submittal completes the twelve month timeframe for these two consecutive reports. Future reports will include six months of flow data.

Please contact me with any questions at 423/336-4587. Thank you.

Sincerely,

Michael J. Bellotti

WASTE STREAM TECHNOLOGY, INC.
302 Grote Street
Buffalo, NY 14207
(716) 876-5290

Analytical Data Report
Report Date: 09/22/08
Work Order Number: 8I08003

Prepared For
Mike Belloti
Olin Corporation
1186 Lower River Road
Charleston, TN 37310
Fax: (423) 336-4166

Site: Frontier Pendleton

Enclosed are the results of analyses for samples received by the laboratory on 09/08/08. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Brian S. Schepart, Ph.D., Laboratory Director

Re: Discharge Monitoring Report: October, 2008 through March, 2009
Groundwater Discharge Through Pre-Treatment System
Pendleton (Frontier Chemical) Site

Dear Mr. Nerone:

Enclosed for your review is the Discharge Monitoring Report for the Pendleton Frontier Chemical site, covering the subject timeframe. Included are

- The analytical results summary from the April, 2009 sampling event for discharge of collected groundwater from the pre-treatment system at the site.
- The analytical laboratory report for the April, 2009 sampling.
- Water discharge volume totals and flow summary sheets.

Results from this sampling event are compared with the Permit (#02-11) requirements on the attached Analytical and Flow Summary sheet.

A review of analytical data indicates that all permit parameters are within permit discharge requirements. A review of the operational records and daily flow data for this timeframe shows no significant operational change.

Please contact me with any questions at 423/336-4587. Thank you.

Sincerely,

Michael J. Bellotti
For the Frontier Chemical – Pendleton Site PRP Group

U	Analyte included in the analysis, but not detected at or above the reporting limit.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Item	Details
073008.1	Site was secure upon arrival, system was operational. Changed chart in recorder, changed bag filter bags, tested system, OK.
073108.2	Landfill cap showed new evidence of a gopher hole, further inspection of the spoils of the borough did not reveal any indication that the gopher has burrowed through or compromised the liner or other vital components of the landfill cover. I will eliminate the problem and cover the hole, plant new seed at the next site visit.

FRONTIER CHEMICAL – PENDLETON SITE

Item	Details
080408.1	On site to check out alarm call from Friday night regarding high sump level. Saturday AM the system reported normal status. Today (Monday), the vault looks normal but the floor is damp in some places and wet in others. I believe that due to extremely heavy rains on Friday, that more water was coming in to the sump than the pump could handle, and the high level alarm triggered. Then the back up pump must have kick on too, and cleared out the water in the sump.
	I tested the system while I was there and it seemed to be working properly.

Changed Filter Bags (Check One)	**YES**	X	**TIME**	1530
	NO			

Item	Details
033109.1	Auto dialer was in "Fault" mode. I checked the phone line, it was OK. I rebooted the dialer by shutting it down and then restarting it. The fault light stopped blinking. (Ring/Active light).
033109.2	Ran the system through its testing paces. Changed bags in filters. Changed the chart in the recorder.
033109.3	Site looks good, all secure on arrival and departure. However now that the snow has melted I noticed that the gophers have returned and burroughed back into the "den" that I had filled in and smoked out last fall. There is no indication that the have compromised the liner on the cap, as there is no liner fragments in the spoils of their hole.

MONITORING WELL INTEGRITY CHECKLIST

Site Name: **Frontier Chemical – Pendleton site**

Well Identification: P-1

Inspector: Chris Jones

Date: 09/08/08

WELL SPECIFICATIONS

Protective Casing	X	Above Ground		Flush Mounted
Well Construction	X	PVC		Stainless Steel
Well Diameter	X	2-inch		4-inch
Depth to Ground Water	5.44			
Well Depth	16.45			

WELL INTEGRITY

1. Well identification clearly marked?	Yes	
2. Well covers and locks in good condition and secure?	Yes	
3. Is the well standpipe vertically aligned and secure?	Yes	
4. Is the concrete pad and surface seal in good condition?	Yes	
5. Are soils surrounding the well pad eroded?		No
6. Is the well casing in good condition?	Yes	
7. Is the measuring point on casing well marked?	Yes	
8. Is there standing water in the annular space?		No
9. Is the stand pipe vented at the base to allow drainage?	Yes	
10. Does the total sounded depth correspond to the original well completion depth?		NO
11. Is the access down the well impeded or blocked? Explain.		No

COMMENTS / RECOMMENDATIONS:

Possible silt build up in bottom of well. Well depth was off by .05 foot.

WELL INTEGRITY

1. Well identification clearly marked?	Yes	
2. Well covers and locks in good condition and secure?	Yes	
3. Is the well stand pipe vertically aligned and secure?	YES	
4. Is the concrete pad and surface seal in good condition?		NO
5. Are soils surrounding the well pad eroded?		No
6. Is the well casing in good condition?	Yes	
7. Is the measuring point on casing well marked?	Yes	
8. Is there standing water in the annular space?	Yes	
9. Is the stand pipe vented at the base to allow drainage?		No
10. Does the total sounded depth correspond to the original well completion depth?	Yes	
11. Is the access down the well impeded or blocked? Explain.		NO

COMMENTS / RECOMMENDATIONS:

4. No concrete is visible, the pad is under water and grass.

MONITORING WELL INTEGRITY CHECKLIST

FIELD OBSERVATION REPORT

PROJECT NO.: 94-1014-O REPORT NO.: 09-01 DATE: 4/23/09 PAGE: 1 OF 2

PROJECT: Pendleton – Frontier Chemical Site DAY: Thursday

SUBJECT: Lake Level Survey, Annual Insp. PROJECT TIME: 9:00 am – 11:00 am

CLIENT: Sevenson Environmental Services, Inc. SITE TIME: 9:30 am – 10:30 am

WEATHER: Cool, Overcast (50°F) PHOTOS: Yes X No

- As notified by Mike Walker (Sevenson Environmental), visit the Pendleton site to record the surface water elevation of the lake to coincide with the annual groundwater monitoring and semi-annual site inspection event.
- The Quarry Lake surface water level near the pre-treatment vault is recorded by level survey using the top of the pre-treatment vault benchmark El. 580.50'. The lake water elevation is recorded at El. 578.43'.
- Mike Walker (SES) is on site for the annual groundwater sampling and semi-annual inspection and to provide site access.
- Following are cursory observations made while on site:
  - The capped area is noted to be in generally good condition. The rodent borrow on the lakeside slope above P-4 still appears to be abandoned. Some small rodent burrows are noted towards the southeast end of the capped area on the northeast sideslope above P-7 and smaller new burrows near the north and south ends of the capped area.
  - The overflow weir is inundated with approx. 12"+ of water.
  - There is standing water in the Zone "D" wetlands along the northeast side of the site and at the southwest end of the cap.
  - The site access roads are in generally good condition
  - Observe operation of the pinch valve in the wet well and condition of the pre-treatment vault with Mike Walker
- Leave site at approx. 10:30 am, returning to GGE's Lockport office to prepare this report.

Standard Ground Water Sampling Log

Date	4/22/09		
Site Name	Olin Pendleton Site	Weather	Cloudy 50 F
Location	Pendleton, New York	Well #	88-5R
Project No.	1005	Evacuation Method	Peristaltic pump w/ dedicated tubing
Personnel	M. Walker / C. Jones	Sampling Method	Remove 3x volume and sample

Well Information

Depth of Well*	30.20 Ft	Water Volume/Ft. For:
Depth to Water*	5.70 Ft	__X__ 2" Diameter Well = 0.163 X LWC
Length of Water Column	24.50 Ft	_____ 4" Diameter Well = 0.653 x LWC
Volume of Water in Well	3.92 Gal.(s)	_____ 6" Diameter Well = 1.469 X LWC
3X Volume of Water in Well	12 gal. (s)	Volume removed before sampling ___6 gals.
		Did well go dry? ____yes_____

* Measurements taken from: X Well Casing ☐ Protective Casing ☐ Other (specify)

Instrument Calibration:

pH Buffer Readings		Conductivity Standard Readings	
4.0 Standard	4.10	84 S Standard	---
7.0 Standard	6.96	1413 S Standard	1421
10.0 Standard	---		

Water Parameters

	Gallons Removed	Temperature Readings	PH Readings	Conductivity Readings uS/cm	Turbidity Readings Ntu
Initial	---	9.1	7.33	1536	85
	4	9.6	7.30	1642	58
	2	9.6	7.30	1642	58
	Recharge				
	sample	8.9	7.28	1638	42

Water Sample

Time Collected: 1020

Physical Appearance at Start		Physical Appearance at Sampling	
Color	Clear	Color	Clear
Odor	No	Odor	No
Turbidity (> 100 NTU)	85	Turbidity (>100 NTU)	42
Sheen/Free Product	No	Sheen/Free Product	No

Samples Collected:

Container Size	Container Type	# Collected	Field Filtered	Preservative	Container pH
40 ml	Glass	3	No	1:1 HCL	
Liter	Plastic	1	no	HNO3	
Pint	Plastic	1	No	NaOH	

NOTES: .Bailer would not go down the well. We used the pump and tubing. Well went dry after 6 gallons of purge. We let the well recharge and sampled.
