1.0 Introduction

Aptim Engineering New York, P.C. (APTIM), formerly CB&I Engineering New York, P.C., has prepared this report to present the results of ongoing remedial and groundwater monitoring activities at the former Bell Aerospace Facility in Wheatfield, New York. This report discusses all activities conducted during the 12-month monitoring period from January 1, 2017 through December 31, 2017. This report is submitted in accordance with Textron Inc.'s (Textron) New York State Department of Environmental Conservation (NYSDEC) Order on Consent, Index No. 932052-01-04, effective December 16, 2014. This report discusses existing groundwater quality conditions, reviews annual system maintenance tasks, and presents any proposed changes to the current Groundwater Monitoring Plan and recommendations to optimize the operation of the Off-Site (based on 25 years of operation) and On-Site (based on 23 years of operation) groundwater remedial systems.

The Off-Site System consists of six Zone 1 bedrock groundwater extraction wells (designated EW-1 through EW-6) connected by a subsurface double-containment pipeline that discharges the extracted groundwater to the Niagara County Sewer District (NCSD) Publicly Owned Treatment Works. Figure 1 presents a site layout showing the locations of the extraction wells and the groundwater monitoring points. The Off-Site System has been operating since March 1993. Extraction Well EW-1 was taken out of service in March 1993, based on the hydraulic response observed during startup of the remedial system. Extraction Well EW-6 was taken off line on April 11, 1996 in an attempt to reduce the constituent concentration at the southern boundary of the dissolved phase plume in this area. The cessation of groundwater extraction at EW-6 allowed Extraction Well EW-5 to "draw" the dissolved phase plume boundary (just to the south of EW-6) to the north. Extraction Well EW-5 was taken off line on September 5, 2013 while Extraction Wells EW-2, EW-3, and EW-4 remained operational as part of an extended pilot study requested by the NYSDEC. The NYSDEC's approval of this proposal is included as Appendix A. The purpose of this pilot study was to configure the system to induce the edge of the "plume" in a northerly direction by turning off the southernmost extraction well while demonstrating that three extraction wells can continue to control the plume. The Off-Site System continues to operate in this configuration with the permission of the NYSDEC per the May 23, 2017 letter (Appendix A).

The On-Site System consists of seven Zone 1 bedrock groundwater extraction wells (designated EW-7, EW-8, EW-13, and DW-9 through DW-12) connected by a subsurface double-containment pipeline that delivers the extracted groundwater to the On-Site Treatment Plant. At the treatment plant, dissolved volatile organic compounds (VOCs) are removed using an air stripper to aerate the water prior to being processed through granular activated carbon units. The recovered groundwater is ultimately discharged to the Walmore Road storm sewer under a National Pollution

Discharge Elimination System permit. Figure 1 presents a site layout showing the location of the extraction wells and the groundwater monitoring points.

Construction of the system was initiated on September 20, 1993 and was substantially completed in late 1994. Startup of the system began in April 1995. Extraction Well DW-9 was taken off line on May 26, 1998 to focus remedial efforts on the southern property line of the facility near Wells EW-7 and EW-8. Extraction Well EW-13 was added to the system approximately midway between these wells and was activated on September 25, 1998 in order to form a better hydraulic barrier between Wells EW-7 and EW-8.

Operations of the On-Site Treatment System were suspended on October 30, 2017 for the implementation of the Bioremediation Pilot Study discussed in Section 5.0.

2.0 Field Sampling Activities

2.1 General

APTIM personnel performed field sampling activities according to the procedures detailed in the Groundwater Monitoring Plan for the site. The annual groundwater quality monitoring event typically is conducted in October but was completed in November 2017 due to the activities related to the execution of the approved Bioremediation Pilot Program discussed in Section 5.0. Semiannual groundwater monitoring was performed on April 18, 2017 and November 13 through 16, 2017 for the monitoring wells listed in Table 1 and shown on Figure 1. The following sections provide details of the field activities and procedures associated with the monitoring and gauging program.

2.2 Hydraulic Monitoring

Groundwater elevations were measured at each monitoring well using an electronic oil/water level meter capable of measuring to an accuracy of 0.01 foot to determine the depth to water and total well depth (depth to the bottom) to calculate the height of the water column. Non-aqueous phase liquid was not detected in any of the wells gauged and has not been encountered in over 15 years. A summary of the water level measurements obtained during the April and November 2017 sampling events is presented in Table 2. The groundwater elevation data were used to construct the groundwater contour maps. The groundwater level elevations from the Zone 1 wells for both the On-Site and Off-Site areas are presented on Figures 2 and 3 for the April 2017 event and Figures 4 and 5 for the November 2017 event.

2.2.1 Off-Site System

Groundwater elevation contour maps of the Zone 1 bedrock aquifer in the vicinity of the On-Site and Off-Site systems are presented on Figures 2 and 4. These maps show a consistent and significant overlap of the cones of depression and the contaminant plume in the Off-Site area, which is one of the design goals of the system. The hydraulic response to pumping of the Off-Site System has remained reasonably consistent since system startup in March 1993, although precipitation (especially when heavy or prolonged) has been shown to have an impact on the overall elevation of the cone of depression. Specifically, heavy precipitation events tend to raise the water table elevation in all wells in the Off-Site area. However, an inward hydraulic gradient toward the Off-Site pumping system has always been observed and maintained as specified in the system design goals.

Groundwater flow directions, as shown on Figures 2 and 4, have remained relatively consistent within the developed cone of depression, moving generally toward the operating extraction wells of the Off-Site System. Note that since September 5, 2013, EW-5 has been non-operational as part

of an NYSDEC-approved evaluation regarding the ability of the three northernmost extraction wells to contain the prevailing southerly migration of impacted groundwater. This pilot study has proven to be successful, and the NYSDEC has granted a provisional shutdown of Extraction Well EW-5. The horizontal hydraulic gradient in the area immediately north of the Off-Site System during November 2017 was approximately 0.0089 foot per foot (ft/ft), as determined from water levels recorded in Wells 87-20(1) and EW-2 (Figure 4). This number is generally consistent with the horizontal gradient in this area over the past several years.

The average linear velocity of groundwater can be calculated from hydraulic gradient data. To calculate this velocity (v), the average Zone 1 hydraulic conductivity (K) of 2 x 10^{-3} centimeters per second; an effective porosity (n_e) value of 3 percent, as presented in the Resource Conservation and Recovery Act (RCRA) Facility Investigation for the former Textron facility (Golder, 1991); and the calculated hydraulic gradient (i) between Wells 87-20(1) and EW-2 as recorded during November 2017 were used. The formula is:

$$v = (Ki)/n_e$$

The average linear velocity of groundwater in the area immediately north of the Off-Site System during November 2017 was approximately 1.67 feet per day based on the hydraulic gradient of 0.0089 ft/ft. The flow rates are comparable from year to year and consistent with historic site observations.

2.2.2 On-Site System

While the On-Site System continued to be operational and monitored to maintain the pumping rates of the six extraction wells, the decreasing trends presented show that the overall capture of VOC concentrations was declining and that the recovery system may be reaching asymptotic levels in its current configuration. Figure 5, the Zone 1 semiannual groundwater contour map from November 2017, illustrates the groundwater flow with the treatment system off line. Between January 1 and October 30, 2017, 10,827,175 gallons were processed by the On-Site System resulting in the removal of 142.1 pounds of VOCs or representing approximately 76,000 gallons of water for every pound of VOCs. Alternative remedial technologies were subsequently evaluated to augment and/or replace the existing groundwater extraction and treatment system. The chosen remedy included the use of in situ bioremediation.

Operations of the On-Site System were suspended on October 30, 2017 to initiate the Bioremediation Pilot Study. The use of the proposed in situ remediation technology is anticipated to be a more effective method to reduce the overall VOC concentrations.

All data from 2017 indicate that the desired upward gradients between Zones 3 and 1, and downward gradients between the overburden aquifer and Zone 1, were observed in the On-Site

well clusters measured. A summary of vertical hydraulic gradients between Zones 1 and 3 based on the past year's hydraulic monitoring data is included as Tables 3A and 3B. The data indicate that the hydraulic gradients range from 0.08 to 0.55 ft/ft. Maintenance of this "upward gradient" shows effective containment of the plume within Zone 1 as required in the system design specifications. It should be noted that the November 2017 hydraulic event was completed with the On-Site Treatment System off line with the consent of the NYSDEC. An upward gradient, ranging from 0.08 to 0.37 ft/ft, was maintained with the system off line.

The On-Site groundwater elevation contour map for the Zone 3 bedrock aquifer for November 2017 is included as Figure 6. Groundwater flow in the Zone 3 aquifer is primarily in a southeasterly direction, which is consistent with the observed flow direction. The operation of the treatment system in the Zone 1 aquifer appears to have little influence on the flow direction in the Zone 3 aquifer.

2.3 Groundwater Sampling

2.3.1 General

One supplemental groundwater sampling event was completed proactively by Textron in April 2017 to assess the performance of the Off-Site System pilot test.

The annual groundwater quality monitoring event was conducted between November 13 and 16, 2017. Table 1 lists the monitoring wells, sampling schedule, and analytical methods as required by Order on Consent Index No. 932052-01-04.

APTIM personnel performed field sampling activities according to the procedures detailed in the Groundwater Monitoring Plan. Discussions of the Off-Site and On-Site System operations, groundwater quality, and hydraulic monitoring are included in the respective semiannual reports. The following sections present general trends that have been noted during the past calendar year.

2.3.2 Monitoring and Extraction Well Sampling

Groundwater quality samples were collected from the Off-Site System extraction wells (EW-2, EW-3, EW-4, EW-5, and EW-6) and Monitoring Well 93-03(1) on April 18, 2017. This sampling event was performed to assess the ability of the three northernmost extraction wells to contain the prevailing southerly migration of impacted groundwater. Further discussion regarding the sampling results for this event and the October 2016 monitoring event is included in Section 3.2.

Representative samples were collected from all of the 23 monitoring wells and 12 extraction wells (EW-2, EW-3, EW-4, EW-5, EW-6, EW-7, EW-8, DW-9, DW-10, DW-11, DW-12, and EW-13) during the November 2017 monitoring event. The monitoring locations are shown on Figure 1.

The physical integrity of each location was visually inspected and noted prior to sampling. Each extraction well was inspected prior to entering to ensure that the vault entranceway was free of obstructions. The ambient air inside the vaults was analyzed for lower explosive limit, oxygen deficiency, hydrogen sulfide, and carbon monoxide using a multi-gas meter prior to entry because the vaults are considered to be confined spaces. No readings of an ambient air quality parameter greater than background concentrations (or outside of normal ranges for oxygen) were recorded. Well inspection forms are included as Appendix B.

Water level and total depth measurements were recorded and the volume of standing water in each well was calculated. A minimum of three times the calculated volume was purged from each well or the well was purged until it was deemed "dry" using a submersible pump. All purge water was collected in a 50-gallon drum and transported to Textron's On-Site Treatment Plant for treatment. The submersible pump in each operational extraction well was allowed to operate for at least 5 minutes prior to sample collection to obtain a representative aliquot of groundwater. The dedicated tubing attached to each well's sampling port was purged for approximately 1 minute prior to collection. The offline Extraction Wells (DW-9, DW-10, DW-11, DW-12, EW-7, EW-8, and EW-13) currently have no pumps being rendered inactive as approved by the NYSDEC and were sampled using a dedicated bailer in the same manner as the monitoring wells. The offline Extraction Wells were not purged prior to sampling, per NYSDEC approval, due to the large purge volume that would be required to be manually removed.

Field groundwater quality parameters (i.e., pH, specific conductance, and temperature) were monitored during purging and prior to sampling. These and other field observations were recorded on field sampling forms. The field observations and measurements are summarized on Table 4; the Field Sampling Data Sheets are included as Appendix C.

Immediately following collection, sample vials were placed into a cooler filled with ice to maintain an approximate temperature of 4 degrees Celsius. The samples were transferred under proper chain-of-custody to ALS Environmental, Inc. personnel for transport to their Rochester, New York, laboratory. The chain-of-custody forms are included as Appendix D. The samples were analyzed for VOCs using U.S. Environmental Protection Agency (USEPA) SW-846 Method 8260B.

2.4 Maintenance of Monitoring Points

Monitoring wells are visually inspected and accessed semiannually during the routine hydraulic monitoring events. Annual well inspection checklists are completed for each sampled monitoring well.

None of the monitoring wells required repairs or additional maintenance work during the 2017 calendar year.

Even though all adjacent residences are supplied with public water, some residents have retained private wells for non-potable usage. Textron annually sends letters to private well owners offering to pay for closure of their wells. Letters were sent out via U.S. Postal Service Return Receipt on July 20, 2017. Two letters were returned to sender, while the third letter was delivered but no form was returned to APTIM. Details of this effort were reported to Textron, the New York State Department of Health, and NYSDEC in a letter report dated September 5, 2017.

3.0 Laboratory Analytical Methods and Results

3.1 Analytical Methods

All groundwater samples were analyzed for VOCs via USEPA SW-846 Method 8260B. The complete laboratory analytical report from each sampling point, as well as the associated quality assurance/quality control (QA/QC) data, are included as Appendix E.

3.2 Analytical Results

3.2.1 Off-Site System Efficiency Sampling

Samples were collected from the Off-Site System extraction wells (EW-2, EW-3, EW-4, EW-5, and EW-6) and Monitoring Well 93-03(1) on April 18, 2017. This sampling event was performed to assess the ability of the three northernmost extraction wells to contain the prevailing southerly migration of impacted groundwater. These wells continue to be successful in controlling groundwater migration.

The sample collected from Monitoring Well 93-03(1) had an estimated carbon disulfide concentration of 0.33 micrograms per liter (µg/L), which is below the laboratory method detection limit and New York State Groundwater Quality Standard of 60 µg/L.

The primary contaminant of concern at the site has historically been cis-1,2-dichloroethene, which was not detected in the sample collected from Monitoring Well 93-03(1) during this sampling event.

The results of these sampling events were presented to the NYSDEC in a letter report dated May 17, 2017. The NYSDEC was in agreement with the recommendation that Extraction Well EW-5 remain off line in their response letter of May 23, 2017.

3.2.2 Perfluoroalkyl Substances/1,4-Dioxane Sampling

Per NYSDEC direction (i.e., the April 5, 2017 and June 5, 2017 comment letters), groundwater samples were collected from the designated monitoring wells on October 5, 2017 to determine whether perfluorochemicals (PFCs)/perfluoroalkyl substances (PFAS) and 1-4-dioxane were present in groundwater at the site. Through a miscommunication in the field, a groundwater sample was collected from Monitoring Well 87-14(1) rather than Monitoring Well 87-14(0). A representative groundwater sample was collected from Monitoring Well 87-14(0) on October 26, 2017. Laboratory analysis of the collected samples did not detect any PFCs/PFAS above the current USEPA guidance value of 70 parts per trillion. One groundwater sample, collected from Monitoring Well 87-14(1), did detect 1,4-dioxane above the New York State guidance value of 50 parts per billion. All of the other sampled locations, including Monitoring Well 89-15(1),

which is downgradient of Monitoring Well 87-14(1), reported concentrations significantly below the guidance value.

The results of these sampling events were presented to the NYSDEC in a letter report dated December 14, 2017. At this time, the NYSDEC has not provided comment to the letter report.

3.2.3 Annual Groundwater Sampling

The annual groundwater quality monitoring event is typically conducted in October but was completed in November due to the execution of the Bioremediation Pilot Study. Groundwater samples were collected from 23 locations during the 2017 sampling event. A comparison of these data with the October 2016 groundwater analytical results indicates that 19 sample locations showed a decrease in total VOC (TVOC) concentrations and 4 samples showed an increase in TVOC concentrations. The changes in concentration are presented on a map in Figure 7. A summary of compounds analyzed for the November 2017 monitoring event is included as Table 5, and historical analytical results for each monitoring point are included as Appendix F.

Total VOC concentrations have continued to decrease in most monitoring and extraction wells that have been sampled. TVOC concentrations were calculated by summing the concentrations of all detected compounds for a sample. For the On-Site area, there is an overall decreasing trend in TVOC concentrations since 1993 as illustrated by Figure 8 (the TVOC concentration versus time plot of analytical results from Monitoring Well 89-15(1)). This location showed a significant decrease of 99.9 percent in TVOC concentrations between October 2016 and November 2017; the overall historic trend of groundwater quality concentrations in this monitoring well continues to decline.

The historic trend in TVOC concentrations for the area between the On-Site and Off-Site systems is shown on Figure 9 (TVOC concentration versus time plot of analytical results from Monitoring Well 87-20(1), located north of the Off-Site System). This location shows a 20 percent increase in TVOC concentrations between October 2016 and November 2017. These results are within established historical trends and consistent with concentrations previously observed.

The TVOC concentration versus time plot of analytical results from Extraction Well EW-4 is included as Figure 10. This location shows a 24.5 percent decrease in TVOC concentrations between October 2016 and October 2017; additionally this location shows a 45 percent decrease in TVOC concentrations when compared to the April 2017 analytical results. This location continues to demonstrate a significant decreasing trend since the termination of groundwater recovery from Extraction Well EW-5. When compared to the 2012 TVOC concentration (236 µg/L) prior to the shutdown of EW-5, there has been a 70 percent decrease in TVOCs in this location.

The approximate limit of the dissolved phase plume in the Zone 1 bedrock aquifer (defined as the 1 part per billion isochron line), based upon the groundwater quality monitoring data collected during the October 2017 annual monitoring event, is shown on Figure 11. The extent of the dissolved phase plume in Zone 1 remained stable in size and location between 2016 and 2017, demonstrating that the operation of Extraction Well EW-5 is not necessary for control of the plume.

The extent of the dissolved phase "plume" in the shallow overburden monitoring wells (based upon the groundwater analytical results obtained from the October 2017 annual monitoring event) is shown on Figure 12. The extent of the plume/dissolved phase detections has been significantly reduced in size and concentration since 1990 and continues to be limited primarily to the facility property.

3.3 QA/QC Samples

Two field blanks (BAT-FB-1-171114 and BAT-FB-2-17116) were prepared in the sampling area prior to the start of daily activities. Two blind duplicate samples identified as BAT-DUP-1-171114 (Extraction Well DW-9) and BAT-DUP-2-171115 (Monitoring Well 87-21(1)) were collected. Two matrix spike (MS) and matrix spike duplicate (MSD) samples were also collected from Monitoring Well 93-03(1) and Extraction Well DW-12. Laboratory-supplied trip blanks accompanied all of the samples during transport. All method-specific QA/QC blanks and samples were analyzed for VOCs via USEPA SW-846 Method 8260B.

3.4 Data Review

The data review for this project consisted of verifying that analytical holding times were not exceeded, a review of the data, comparison of the MS/MSD and duplicate results to corresponding monitoring well data, and a review of the QC data.

Duplicates were performed on BAT-DW-9-171114 (Dup 1) and BAT-87-21(1)-171115 (Dup 2). All correlations between the parent and duplicate samples appeared to be within acceptable guidelines. MS/MSDs were performed on BAT-93-03(1)-171115 and BAT-DW-12-171113. All of the percent recoveries for the laboratory control standard were within guidelines. There were no detections in the method blanks. There were detections of chloromethane and bromomethane in the trip blanks; the detections associated with these two compounds are considered to be external contamination. Acetone was detected in both field blank samples. However, acetone is a common laboratory contaminant, and therefore, the detections of acetone are also considered to be external contamination.

All holding and analysis times were met. The data are considered usable.

4.0 Summary of Off-Site and On-Site Extraction System Operations

4.1 Review of Off-Site and On-Site System Operations

4.1.1 Off-Site System

There were no permanent operational changes made to the Off-Site System during the 2017 calendar year. A total of 7,060,065 gallons of groundwater was extracted by the Off-Site System during the 2017 calendar year; the volume of water discharged is measured by using either or the sum of the individual well totalizers or the discharge totalizer at EW-6. Average flow rates varied from a low of 9,370 gallons per day (gpd) recorded in September 2017 to a high of 43,535 gpd recorded for November 2017. The flow rates and total volumes of treated water discussed previously are based on the telemetry information sent from the system and are reported semiannually to the NCSD.

As part of an extended pilot study, Extraction Well EW-5 was taken off line on September 5, 2013. As mentioned previously, the purpose of the pilot study was to attempt to induce the edge of the "plume" in a northern direction by turning off the southernmost extraction well, demonstrating that three extraction wells could maintain plume control in this area. While the extent of the plume remained stable, TVOC concentrations in Extraction Well EW-6 demonstrated an increase between the April and November 2017 sampling events; this increase could be attributed to fluctuations in groundwater elevation and flow rates.

Textron proposes to collect groundwater samples from Extraction Wells EW-2, EW-3, EW-4, EW-5, and EW-6 and Monitoring Well 93-03(1) in April 2018 to continue the evaluation of TVOC concentrations in these locations. The results of the groundwater sampling event and continued operation of the extended pilot test will be discussed with the NYSDEC upon receipt and evaluation of this performance monitoring data.

4.1.2 On-Site System

Operational changes were made to the On-Site System during this reporting period; On-Site System operations were suspended on October 30, 2017 to initiate the Bioremediation Pilot Study discussed in Section 5.0. The purpose in completing this pilot program was to determine if this technology is more effective in reducing VOC concentrations in the Zone 1 aquifer. As discussed previously, groundwater quality data indicate that the groundwater extraction system may have reached the limits of its operational ability. The Treatment Plant is scheduled to remain dormant throughout 2018.

A total of 10,827,175 gallons of groundwater was recovered and treated by the On-Site System between January 1 and October 30, 2017. Daily flow rates varied from an average daily low of 12,179 gpd recorded during February 2017 and an average daily high of 49,013 gpd recorded

during June 2017. These pumping and flow rates are based upon the monthly effluent totalizer readings and are reported monthly to the NYSDEC in the Discharge Monitoring Reports. While operations are suspended due to the Bioremediation Pilot Study, monthly Discharge Monitoring Reports will continue to be electronically submitted showing "no discharge" per NYSDEC directions.

4.1.3 Repairs, Upgrades, and Enhancements to Systems

During the course of operation in 2017, several maintenance and repair events were completed in order to assure that the groundwater extraction systems remained operational.

Water production through the treatment system had been declining at the end of 2016 because of high liquid levels measured in Feed Tank TK-1. This feed tank reached high alarm levels and the treatment system stopped producing water at the beginning of January 2017; it was shut down remotely on January 2 until personnel could visually inspect and assess the problem. On January 5, the water in TK-1 was processed through the system, returning tank levels to normal and the system was restarted. TK-1 continued to accumulate water faster than the discharge rate to the rest of the system. On January 19, 2017, Allied Environmental Services, Inc. (Allied) was on site to clean out sediment and change the feed pump in TK-1, and bypass the carbon units in order to test which system component was limiting the flow rate. It was subsequently determined that the carbon vessels were the limiting factor of the system flow rate. On February 10 and 11, 2017, the carbon vessels were emptied by Evoqua Water Technologies (Evoqua); the carbon was transported under hazardous manifest to Evoqua's regeneration facility.

On February 20, 2017, APTIM personnel restarted the system and the well field. Allied returned to the site to assess system operations and pump functions. The system was restarted without incident. State Pollutant Discharge Elimination System samples representing the January reporting period were collected on February 21, 2017 as discussed in Section 3.2.

On April 10, 2017, APTIM and Allied personnel completed operations and maintenance activities on the Off-Site System extraction wells. These activities included the removal and cleaning the pumps, level sensors, and flow meters.

On June 1, 2017, the On-Site System was shut down for several hours to complete the video inspection of the extraction wells as discussed in Section 5.0.

A leak in the piping at the base of Carbon Vessel A was detected on June 19, 2017. This vessel was isolated, bypassed, and drained.

The On-Site Treatment System was taken off line from September 23 through 25, 2017 because power to the Wheatfield Business Park was suspended while National Grid replaced a power pole along Walmore Road.

Allied personnel mowed the utility right-of-way area of the Off-Site System to maintain access to the extraction wells on September 29, 2017.

Between October 30, 2017 and November 2, 2017, Aztech Environmental and APTIM personnel performed operations and maintenance activities of the Off-Site System, removed equipment from the On-Site extraction wells, and prepared the system for a prolonged dormancy. System components from extraction wells (pumps, flow meters, level sensors) from the now dormant On-Site System were utilized to replace non-operational components in the Off-Site System extraction wells where needed.

4.1.4 Residential Sub-Slab Depressurization System

A sub-slab depressurization system (SSDS) was installed in a residential property at 2260 Cayuga Drive Extension in March 2014. Per the approved Site Management Plan, the SSDS will remain active until such time that the NYSDEC and New York State Department of Health grant permission for termination of its operation. The maintenance of this system is performed on an "as needed" or "on call" basis. Textron verifies the system's operation with the homeowner on an annual basis, on or around March 1. The homeowner notifies Textron of any operational issues with the SSDS. All written correspondence during the 2017 calendar year regarding the system operation have been included as Appendix G.

4.2 Discharge Monitoring

4.2.1 Off-Site System

As specified by Textron's NCSD Industrial Discharge Permit (No. 16-07, effective January 31, 2016), the extracted groundwater from the Off-Site System is required to be monitored for flow daily and sampled and analyzed for VOCs via USEPA Method 624 on a semiannual basis. Results of the sewer discharge monitoring conducted on April 18 and October 5, 2017 indicate that Textron remains in compliance with the NCSD permit. Copies of the letter reports submitted to the NCSD are included as Appendix H.

4.2.2 On-Site System

As required by Textron's National Pollution Discharge Elimination System Permit No. NY0000469, the extracted and treated groundwater discharged to the Walmore Road storm sewer is monitored for VOCs on a monthly basis. The On-Site System had two recordable down time events during this monitoring period. The first was a prolonged event (January 2 through February 20) related to multiple system issues limiting flow. The second down time event was from September 23 through 25, which occurred because National Grid replaced a utility pole along Walmore Road, cutting power to Wheatfield Business Park. Operations of the On-Site Treatment System were suspended on October 30, 2017 to allow for the completion of the Bioremediation

Pilot Study. While operations of the system are suspended, electronic Discharge Monitoring Reports will continue to be submitted noting "No Discharge" during the monitoring period.

4.2.3 Site Inspections

As of the date of this report, APTIM personnel have not been contacted by the Niagara County Department of Health to schedule an annual inspection for 2017.

Ms. Kathleen Emery with the NYSDEC performed a site visit on March 1, 2017 as part of Hazardous Waste Compliance Inspection. Ms. Emery's inspection report of March 3, 2017 stated that there were no violations observed.

4.3 Evaluation

4.3.1 Chemical Data for Off-Site and On-Site Systems

Forty groundwater monitoring events have been performed since the startup of the Off-Site System in 1993; the last 36 events have been completed under the combined Off-Site and On-Site Effectiveness Monitoring Program. During the 2017 annual sampling event, all of the 11 monitoring wells and 12 extraction wells were sampled for VOCs via USEPA SW-846 Method 8260B. The analytical results from this sampling event show concentrations and trends similar to the established historical fluctuations detected during previous events. The analytical results obtained during 2017 show decreases in VOC concentrations in 19 of the 23 sampled locations.

4.3.2 Hydraulic Response for Off-Site and On-Site Systems

Off-Site System

Groundwater elevation contour maps of the Zone 1 bedrock aquifer in the vicinity of the On-Site and Off-Site systems for the April and November 2017 hydraulic monitoring events are presented on Figures 2 and 4, respectively. These maps indicate a consistent and significant overlap of the cone of depression (and the contaminant plume) in the Off-Site area. Groundwater flow direction has remained relatively consistent (toward the operating extraction wells) indicating that the remedial system is controlling groundwater migration in this area.

On-Site System

Field data from the April 2017 hydraulic monitoring event (Table 2) indicate that the desired downward hydraulic gradient between the overburden and Zone 1 is present in all eight of the On-Site well pairs measured (well pairs 87-01, 87-04, 87-10, 87-13, 87-14, 87-15, 87-17, and 87-18). Additionally, field data obtained during the November event indicate that the desired downward gradient between the overburden and Zone 1 is again present in all of the eight On-Site well pairs measured (well pairs 87-04, 87-01, 87-10, 87-13, 87-14, 87-15, 87-17, and 87-18); this downward gradient was maintained with the treatment system off line.

The field data presented in Table 2 also indicate that an upward hydraulic gradient between Zone 3 and Zone 1 is present in all of the well pairs measured (87-02, 87-04, 87-05, 87-13, 87-14, and 87-15) during both the April and November 2017 monitoring events. Tables 3A and 3B present a summary of vertical hydraulic gradients between Zones 1 and 3 from the April and November hydraulic monitoring data, respectively. The field data indicate that gradients range from 0.08 foot to 0.55 foot (upward). Maintenance of this "upward gradient" shows effective containment of the plume within Zone 1; the numbers presented in Table 3B were obtained with the treatment system off line.

4.4 Routine Operational Corrective Measures

Inspection of the On-Site treatment facility was conducted every two weeks between January 1 and December 31, 2017 by APTIM personnel. During these inspections, flow meters were read, routine operations and maintenance activities were performed, equipment was re-set or adjusted as necessary, and any other activity required to maintain system functions was completed. Eight 55-gallon drums of Redux-525™ have been utilized during this monitoring period to reduce the inorganic deposition and biofouling of the air stripper.

Hazardous waste shipments left the facility on February 11, March 3, August 1, October 23, and December 18, 2017.

- February (Manifest No. 010808668 JJK) - 5 bags of spent carbon (8,169 pounds)
- March (Manifest No. 016314128 JJK) - one drum of spent filter socks one drum of tank sediment generated during the cleaning of TK-1
- August (Manifest No. 001508866 PSC) - one drum of spent filter socks
- October (Manifest No. 017482994 JJK) - one drum of spent filter socks
- December (Manifest No. 010957647 FLE) - eight drums of nonhazardous waste soils generated through the installation of the injection wells and four drums of purge water generated during the November groundwater sampling events

5.0 Bioremediation Pilot Study

A bioremediation pilot program was completed at the site during the last quarter of 2017. The purpose of this pilot program was to determine whether this technology would be effective in reducing dissolved VOC concentrations in the Zone 1 aquifer. The operation of the On-Site Groundwater Treatment System was suspended with the initiation of this pilot program.

APTIM personnel collected additional subsurface information between May 22 and June 1, 2017 on the Zone 1 water-bearing unit and the extent of chlorinated VOC-impacted groundwater prior to the development of the Bioremediation Work Plan. The data obtained were used to support the design of the bioremediation scope of work. A summary of the data generated is provided in the following sections. A photographic log of field activities has been provided in Appendix I.

5.1 Historical Data Review and Additional Information

APTIM personnel reviewed available relevant reports provided by the NYSDEC regarding remedial activities completed at neighboring sites to summarize regional and site-specific geological, hydrogeological, and chemical characteristics relevant to the design of an in situ bioremediation technology application. In addition, information regarding the methodologies and efficiency of an in situ bioremediation treatment at an adjacent facility provided additional lines of evidence to aid in the development and evaluation regarding the potential application in similar environmental settings near the site.

Groundwater Sampling Results

Select Zone 1 monitoring wells were sampled for chlorinated VOC analyses using USEPA Method 8260 to develop a data set of current chlorinated VOC concentrations within the area to be targeted by the proposed in situ bioremediation program.

The results of this sampling event were considered to be representative of baseline conditions for the treatment area. Higher concentrations of chlorinated VOCs were found at locations in close proximity to the former Neutralization Pond and decreasing concentrations of chlorinated VOCs were detected in monitoring wells progressing hydraulically downgradient from the former Neutralization Pond.

Additional groundwater samples were collected from selected monitoring wells (Monitoring Wells 87-02(1), 87-02(3), 87-05(1) 87-13(1), and 87-13(3)) in April 2016 to evaluate whether in situ bioaugmentation could address dissolved chlorinated VOCs. These analyses provided additional lines of evidence regarding the presence of naturally occurring complete anaerobic dechlorination as the source of the reduction of trichloroethene to ethane in the groundwater.

Monitoring Well Construction Detail Survey

A survey of existing monitoring wells within Zone 1 was completed to establish the available network of monitoring wells that could be used for monitoring or injection as part of the proposed bioremediation program. A waterproof down-hole camera with LED light was used to view the condition of these monitoring wells and record the depth and length of the screened interval.

Potable Water Injection Tests

On May 30 and 31, 2017, short-term potable water injection tests were completed at four monitoring well locations (87-02(1), 87-04(1), 87-13(1), and 87-14(1)) to evaluate the feasibility of fluid injection and the approximate radius of influence for the design of the bioremediation injection program into the Zone 1 water-bearing unit. The injection tests used approximately 500 gallons of potable water at each of these locations. During the injection, surrounding monitoring wells were observed for changes in water levels resulting from the injection of potable water.

Three of the four locations showed the ability to accept injected water at a minimum rate of 10 gallons per minute. In general, groundwater levels increased in monitoring wells located up to approximately 175 feet from the injection location upon initiation of the injection. Water level increases relative to static water levels were typically most significant in wells located within 100 to 125 feet extending radially from the injection location.

Monitoring Well 87-13(1) did not display the same ability to accept the injected water relative to the other injection test locations. An injection rate of 3.5 gallons per minute was the maximum that could be sustained at this location. However, a radius of influence, as measured by increases in groundwater elevations in surrounding monitoring wells, was still observed at a distance greater than 175 feet as was observed with other inject test locations.

The injection tests were determined to be successful and the data obtained were considered in the designed spacing of injection points and determination of injection volumes.

5.2 Work Plan

Using the data discussed above, a Bioremediation Work Plan was produced and submitted to the NYSDEC for approval on August 14, 2017. The NYSDEC responded with comments and approval on October 3, 2017. NYSDEC requested stipulations that the On-Site Treatment System be able to be reactivated if deemed necessary and requested that Monitoring Wells 87-20(1), 87-21(1), and 87-12(1) be included in the Bioremediation Monitoring Network.

5.3 Implementation of Field Activities

The initiation of field activities in support of the Bioremediation Work Plan began on October 6, 2017 with a utility location survey around the proposed injection wells and sanitary sewer line along Walmore Road.

5.3.1 Injection Well Installation

Five new injection wells designated 17-01(1), 17-02(1), 17-03(1), 17-04(1), and 17-05(1) were installed into the Zone 1 bedrock and one existing location (87-11(1)) was repaired between October 9 and October 19, 2017. The injection points were installed using hollow-stem augers and HQ core drilling techniques under the supervision of an APTIM geologist. The boreholes for each of the proposed injection points were advanced into the bedrock surface using hollow-stem augers. Bedrock was encountered between 13 and 17.5 feet below ground surface (bgs). Once bedrock was encountered, HQ coring drilling methods were utilized to retrieve the bedrock cores. Coring advanced to depths of 32 to 34.5 feet bgs.

The injection points were constructed with a 10-foot 2-inch inside diameter, Schedule 40 polyvinyl chloride (PVC) flush joint, threaded, factory slotted, 0.020-inch screen extending from 22 to 32 feet bgs in 17-04(1) and 17-05(1) and 24 to 34 feet bgs in 17-01(1) and 17-02(1). Injection point 17-03(1) was constructed using 15 feet of screen (extending from 32 feet to 17 feet bgs) because fewer fractures were observed in the Zone 1 bedrock cores at this location. A sand pack filter was installed in the annular space between the borehole wall and the PVC well screen from the terminal depth of 2 feet above the screened zone. A 2-foot-thick bentonite seal was installed using bentonite pellets above the sand filter pack and hydrated with potable water. A concrete mix was placed above the bentonite seal to the ground surface. These injection wells were completed with flush-mounted covers and thermos-type locking caps. Each of the injection points was developed following installation to remove any residual solids from the filter pack and screen. Copies of the drilling logs are included as Appendix J.

All soil waste generated during drilling was placed in U.S. Department of Transportation-approved drums, characterized, and disposed of by Textron's selected waste contractor. All liquids generated were staged by the treatment plant to allow any solids to separate out before introducing the liquid to the system for treatment and discharge.

On October 23, 2017, the five newly installed injection points, repaired location, and four additional locations were professionally surveyed by a New York State licensed surveyor for location and elevation data.

5.3.2 Treatment System Operational Changes

The On-Site Groundwater Treatment System was taken off line at 0945 on October 30, 2017. All of the electronic equipment, including pumps, flow meters, and level sensors, were removed from the six extraction wells. This equipment was staged in the treatment building if needed in the future. In order to maintain the equipment and keep the treatment system in a state of readiness, a recirculation loop was installed. This loops includes Tank 1, bag filters, air stripper, and return line to Tank 1 and is operated with domestic water stored in a holding tank. The system will be run in this loop monthly for 30 minutes to maintain system components.

5.3.3 Baseline Groundwater Samples

Groundwater samples were collected from each of the new injection points as well as baseline groundwater samples for the bioremediation program and submitted for laboratory analysis of chlorinated VOCs using Method 8260B during the week of November 13, 2017. This sampling event was combined with the Annual Groundwater Monitoring Program to maximize resources and minimize costs. Purge water generated during this sampling event was placed in U.S. Department of Transportation-approved drums, characterized, and disposed of by Textron's selected waste contractor.

5.3.4 Application

The injection portion of field activities was completed by Regenesis Remediation Services (RRS) in two phases. The first phase was conducted between November 27 and December 5, 2017 and the second phase was conducted between December 11 and December 20, 2017. A total of 36,000 pounds of 3D Microemulsion® Factory Emulsified (3DME®), 18,000 pounds of Chemical Reducing Solution® (CRS®), and 45 liters of bioaugmentation culture SDC-9™ was injected into 10 locations.

RRS mixed the 3DME® and CRS® with potable water prior to injection into the designated 2-inch wells in the treatment area. The potable water for mixing was provided by the Wheatfield Water Department via a nearby fire hydrant and transported to the RRS trailer using a 2,000-gallon water truck. The mixing solution and water was treated with a sodium bisulfite to remove any dissolved oxygen to keep the solution in an anaerobic state. During the application process, the SDC-9™ culture was "slipped stream injected" to minimize atmospheric exposure. Observed injection pressures ranged from 0 to 50 pounds per square inch and flow rates were maintained between 5 and 16 gallons per minute.

Six of the 11 injection locations received the prescribed amount of material (4,151 total gallons containing 3,272 pounds of 3DME®, 1,636 pounds of CRS®, and 4.1 liters of SDC-9™). Three locations were unable to accept the complete amounts of material due to proximity and "short circuited" into the sanitary sewer line along Walmore Road. During injection at 17-01(1) and 87-04(1), material was observed in the sanitary sewer; the breakthrough continued even at reduce pressures and flow rates, so injection at these locations ceased. Injection was not attempted at 87-10(1) because of these observations. The material that could not be utilized in these three locations was injected into 17-04(1) and 17-02(1) which were selected based on baseline analytical results, position within the plume, and ability to accept the additional material. Table 6 summarizes the material and rates applied at each of the injection locations.

Follow-up groundwater monitoring events will be completed in 2018 to assess the effectiveness of this bioremediation technology.

6.0 Summary

6.1 Hydraulic Monitoring Data

Water level measurements were obtained from all of the monitoring wells and extraction wells in April 2017 and November 2017; measurements are summarized in Table 2. A review of these data indicates that the Off-Site groundwater recovery system is performing as designed and continue to exhibit control over the migration of impacted groundwater.

Extraction Well EW-5 remains off line with the permission of the NYSDEC as discussed earlier. Existing gauging and analytical data indicate that the reconfigured extraction system (EW-2, EW-3, and EW-4) is capable of maintaining control of the plume in this area as shown on Figure 4.

6.2 Laboratory Data

APTIM personnel reviewed the 2017 groundwater monitoring event data by comparing the detected analyte concentrations with available historical data. The results of the November 2017 monitoring event show similar variances in analyte concentrations detected during previous sampling events at the site for both monitoring and extraction wells. Nineteen of the 23 sampled locations showed decreases in TVOC concentrations.

6.3 Off-Site and On-Site System Performance

The Off-Site System has maintained control of the dissolved phase plume. The gradient and size of the capture zone is consistent with the conditions observed during previous monitoring events. The performance of the Off-Site System is acceptable based upon comparison with historic operational data.

Operation of the On-Site Groundwater Treatment System was suspended with the consent of the NYSDEC on October 30, 2017 to implement the Bioremediation Pilot Study. The Treatment Plant is scheduled to remain dormant throughout 2018. Existing groundwater elevations indicate that the aquifers are maintaining a gradient into Zone 1 from both the overburden and Zone 3 with the treatment system off line.

6.4 Recommendations for Future Groundwater Monitoring and System Operations

The performance of the Off-Site System will continue to be monitored. Minor adjustments will be performed to maintain or increase the system's efficiency and productivity and to ensure that it continues to operate at optimal performance levels. Extraction Well EW-5 was taken off line on September 5, 2013; existing data indicate that this configuration has been successful to induce the edge of the dissolved phase "plume" in a northerly direction. While the extent of the plume has remained stable in its new position, TVOC concentrations in Extraction Well EW-6 increased

between the October 2016 and November 2017 sampling events. Textron proposes to collect groundwater samples from Extraction Wells EW-2, EW-3, EW-4, EW-5, and EW-6 and Monitoring Well 93-03(1) in April 2018 to document the TVOC concentrations in these locations and monitor the system's ability to maintain control of the plume. The results of the groundwater sampling event and shutdown of Extraction Well EW-5 will be discussed with the NYSDEC upon receipt and evaluation of these data.

Operation of the On-Site Groundwater Treatment System was suspended with the consent of the NYSDEC on October 30, 2017 to implement the Bioremediation Pilot Study. The Treatment Plant is scheduled to remain dormant throughout 2018.

6.5 Bioremediation Pilot Study

Follow-up groundwater monitoring for the Bioremediation Pilot Study will be completed during 2018 (January, February, March, June, September, and December) as detailed in the Bioremediation Work Plan. The initial results and a 6-month status report will be presented to the NYSDEC during the pilot program. A completion report detailing all phases of work, analytical results, and recommendations for the continuation of the program will be submitted to the NYSDEC at the completion of the 12-month study period.

Notes:

BTOR =	Below top of riser (or measuring point).
MSL =	Mean sea level.
(**)	Water level elevation measured from top of vault grate.
DRY =	No measurable quantity in well at time of measurement.
NG =	Not gauged.
NA =	Data not available.

Table 3A
Summary of Vertical Hydraulic Gradients
April 2017 Hydraulic Monitoring Event
Former Textron Inc.
Wheatfield, New York

Well Name	Top of Riser Elevation (ft MSL)	Water Level (ft BTOR)	Date Measured	Water Level Elevation (ft MSL)	Head Difference Zone 3 - Zone 1 (dH) (ft)	Thickness Zone 2 (dL) (ft)	Verticle Gradient (dH/dL)

NYSDEC Correspondence

Byers, Cecelia

From: Stanley Radon [sfradon@gw.dec.state.ny.us]
Sent: Monday, July 22, 2013 9:42 AM
To: Byers, Cecelia
Cc: Sadowski, Brian; Simpson, Greg - Corporate EHS; Weiss, Dennis
Subject: Re: Textron Wheatfield Response Letter - Prolonged Shutdown of EW-5

Cecelia,

The Department approves of the proposal contained in your July 19, 2013 letter to remove EW-5 from the extraction system until April 2014. The Department looks forward to assessing the results of this study.

Thanks,

Stan

Stan -
Attached is our response letter regarding the prolonged shutdown of extraction well EW-5 submitted on behalf of Textron. Hard copies were sent out via UPS to Brian Sadowski and Dennis Weiss.

Please feel free to contact me at the numbers listed below if you have any questions regarding this response letter.

Thanks,
Cecelia

Mr. Gregory L. Simpson
Senior Project Manager
Textron
40 Westminster Street
Providence, Rhode Island 02903

Dear Mr. Simpson:

Textron, Inc., Wheatfield, Site # 932052
Off-Site System Performance Review

The New York State Department of Environmental Conservation (Department) has reviewed the Off-Site System Performance Review Report (May 17, 2017) for the former Textron facility located in Wheatfield, New York.

The Department agrees with the recommendation that Extraction Well EW-5 remain offline. In the event that future groundwater monitoring indicates that the plume has expanded in a southerly direction, then the Department will request reactivation of EW-5.

Thank you for your continued cooperation regarding the management of this site. If you have any questions, please call me at (716) 851-7220.

Sincerely,

Stanley Radon
Engineering Geologist 2

ALS Environmental, Inc. Analytical Report

January 11, 2018 Service Request No:R1710788

Ms. Cecelia Byers
APTIM, Inc
2790 Mosside Boulevard
Monroeville, PA 15146

Laboratory Results for: Textron Wheatfield

Dear Ms.Byers,

Enclosed are the results of the sample(s) submitted to our laboratory November 13, 2017
For your reference, these analyses have been assigned our service request number **R1710788.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger
Project Manager

Client: APTIM, Inc
Project: Textron Wheatfield 156045
Sample Matrix: Water

Service Request:R1710788
Date Received:11/13/17

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt

Twelve Water samples were received for analysis at ALS Environmental on 11/13-16/2017. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at ≤6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Volatile Organic Analyses:

Method 8260, 11/17/17: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

Approved by _____ Date 1/11/2018

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the ñNotesò column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an ñimmediateò hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (Ó100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Rochester Lab ID # for State Certifications[1]

Connecticut ID # PH0556	Maine ID #NY0032	New Hampshire ID # 294100 A/B
Delaware Approved	New Jersey ID # NY004	
DoD ELAP #65817	New York ID # 10145	Pennsylvania ID# 68-786
Florida ID # E87674	North Carolina #676	Rhode Island ID # 158
		Virginia #460167

[1] Analyses were performed according to our laboratoryôs NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to https://www.alsglobal.com/locations/americas/north-america/usa/new-york/rochester-environmental

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Laboratory Results for: Textron Wheatfield

Dear Ms.Byers,

Enclosed are the results of the sample(s) submitted to our laboratory November 14, 2017
For your reference, these analyses have been assigned our service request number **R1710829.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger
Project Manager

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt

Seventeen Water samples were received for analysis at ALS Environmental on 11/14/2017. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at ≤6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Volatile Organic Analyses:

Method 8260C, 11/21/17 and 11/22/17: The upper control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). Since the exceedance equates to a potential high bias, the data quality was not significantly affected and no further corrective action was taken.

Approved by _____ Date 1/11/2018

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the ñNotesò column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an ñimmediateò hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (Ó100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Rochester Lab ID # for State Certifications[1]

Connecticut ID # PH0556	Maine ID #NY0032	New Hampshire ID # 294100 A/B
Delaware Approved	New Jersey ID # NY004	
DoD ELAP #65817	New York ID # 10145	Pennsylvania ID# 68-786
Florida ID # E87674	North Carolina #676	Rhode Island ID # 158
		Virginia #460167

[1] Analyses were performed according to our laboratoryôs NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to https://www.alsglobal.com/locations/americas/north-america/usa/new-york/rochester-environmental

Laboratory Results for: Textron Wheatfield

Dear Ms.Byers,

Enclosed are the results of the sample(s) submitted to our laboratory November 16, 2017
For your reference, these analyses have been assigned our service request number **R1710944A.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger
Project Manager

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt

Water samples were received for analysis at ALS Environmental on 11/16/2017. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at ≤6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Volatile Organic Analyses:

Method 8260, 11/22/17, 11/27/17: The upper control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). Since the exceedance equates to a potential high bias, the data quality was not significantly affected and no further corrective action was taken.

Method 8260, 11/27/17: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

Cooler Receipt and Preservation Check Form

Project/Client: APTIM Folder Number: ____

Cooler received on 11/16/17 by: [illegible] COURIER: (ALS) UPS FEDEX VELOCITY CLIENT

1	Were Custody seals on outside of cooler?	Y (N)	5a	Perchlorate samples have required headspace?	Y N (NA)
2	Custody papers properly completed (ink, signed)?	(Y) N	5b	Did VOA vials, Alk,or Sulfide have sig* bubbles?	Y (N) NA
3	Did all bottles arrive in good condition (unbroken)?	(Y) N	6	Where did the bottles originate?	(ALS/ROC) CLIENT
4	Circle: (Wet Ice) Dry Ice Gel packs present?	(Y) N	7	Soil VOA received as: Bulk Encore 5035set	(NA)

8. Temperature Readings Date: 11/16/17 Time: 1244 ID: IR#7 (IR#9) From: (Temp Blank) Sample Bottle

Observed Temp (°C)	1.7	0.9					
Correction Factor (°C)	+0.6	+0.6					
Corrected Temp (°C)	2.3	1.5					
Temp from:Type of bottle	Cort Tote	Cort Tote					
Within 0-6°C?	(Y) N	(Y) N	Y N	Y N	Y N	Y N	Y N
If <0°C, were samples frozen?	Y N	Y N	Y N	Y N	Y N	Y N	Y N

If out of Temperature, note packing/ice condition: ____ Ice melted Poorly Packed (described below) Same Day Rule

&Client Approval to Run Samples: ____ Standing Approval Client aware at drop-off Client notified by: ____

All samples held in storage location: R002 by [illegible] on 11/16/17 at 1246
5035 samples placed in storage location: ____ by ____ on ____ at ____

Cooler Breakdown: Date: 11/17/17 Time: 9:30 by: [illegible]

9. Were all bottle labels complete (*i.e.* analysis, preservation, etc.)? (YES) NO
10. Did all bottle labels and tags agree with custody papers? (YES) NO
11. Were correct containers used for the tests indicated? (YES) NO
12. Were 5035 vials acceptable (no extra labels, not leaking)? YES NO (N/A)
13. Air Samples: Cassettes / Tubes Intact Canisters Pressurized Tedlar® Bags Inflated (N/A)

pH	Lot of test paper	Reagent	Preserved? Yes	Preserved? No	Lot Received	Exp	Sample ID	Vol. Added	Lot Added	Final pH
≥12		NaOH								
≤2	201317	HNO_3	x		BDB26154E	9/18				
≤2		H_2SO_4								
<4		$NaHSO_4$								
Residual Chlorine (-)		For CN * Phenol and 522			If +, contact PM to add $Na_2S_2O_3$ (CN), ascorbic (phenol).					
		$Na_2S_2O_3$	-	-						
		ZnAcetate	-	-						
		HCl	**	**						

**Not to be tested before analysis – pH tested and recorded by VOAs on a separate worksheet

Bottle lot numbers: 071017-2AW, 092117-1HY, 100217-1DK, 7-241-002

Explain all Discrepancies/ Other Comments:

CLRES	BULK

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the ñNotesò column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an ñimmediateò hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% (25% for CLP) difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (Ó100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Rochester Lab ID # for State Certifications[1]

Connecticut ID # PH0556	Maine ID #NY0032	New Hampshire ID # 294100 A/B
Delaware Accredited	Nebraska Accredited	
DoD ELAP #65817	New Jersey ID # NY004	Pennsylvania ID# 68-786
Florida ID # E87674	New York ID # 10145	Rhode Island ID # 158
Illinois ID #200047	North Carolina #676	Virginia #460167

[1] Analyses were performed according to our laboratoryôs NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to http://www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads/North-America-Downloads

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

This well was abandoned due to excessive damage in 2010.

This well was not sampled on the following dates: April, July and October 1993; April, July and October 1994; April, July and October 1995; April and July 1996; and January, April, July, and October 1997.

This location is no longer part of the current sampling program.

Greg, good afternoon, I came home this afternoon to hear my D.C. Sump pump in hi level alarm, it was not pumping, also the 120 v pump was not pumping either, I opened a hand hole in the plastic simp cover to see if o could actuate either pumps float, neither would pump, the electric one only hums, I sealed the hand hole back up and called Brundage's to get on the schedule to have the pumps replaced along with the back up battery.
Should I have them contact you for the billing or just have them send the bill to your attention?
Thankyou for you help and attention with this mater.

Regards,
James J.Cody

Greg,

Thank you Greg, I will contact Brundage's and let them know you will be calling them. I will plan to be home Monday at 3:30 pm.

On Thu, Feb 27, 2014 at 1:44 PM, Simpson, Greg - Corporate EHS <gsimpson@textron.com> wrote:

Mr. Cody – This looks fine to me. With your permission, I will coordinate with Brundage on payment (I need to get them setup in my AP System). I also understand that you will be installing a dedicated electrical outlet for the sump pump and you expect this cost to be $200.

Please confirm and I will reach out to Brundage.

Also, I have reached out to Kevin Cronin about next Monday at 3:30 and will let you know when I hear back from him.

Thanks, Greg

RE: Annual electrical reimbursement

Dear Mr. Cody:

I hope that you are doing well. Consistent with our prior agreement, enclosed is a check for $100 to cover an additional year of anticipated electrical charges associated with the sub-slab ventilation system that was installed within your home. I have a reminder on my calendar for next year's payment as well.

Thank you for contacting me about the recent issues with the sump pump. I trust that the repairs were completed to your satisfaction. Please let me know if you notice any more additional issues with the system.

Please feel free to contact me if you have any questions.

Best Regards,

Gregory L. Simpson

Hello Jim.

I hope all is well. Yes, I paid the vendor (Brundage) for the battery replacement back in January. Hopefully the system is working fine now.

The annual utility check is in process. You should see it within 2 weeks.

Please let me know if you have any questions.

Thanks, Greg

Greg,

Good Morning Greg,

I sent you a note back in December about my DC Sump Pump system. Turns out it was a bad battery.

Also, Can you check on the yearly utility check. Perhaps it is already in the mail.

Thank you for looking into this.

Regards,

James J.Cody

Mr. Dan Kummer
Niagara County Sewer District No. 1
7346 Liberty Drive
Niagara Falls, NY 14304-3762

Subject: ***Niagara County Sewer District Discharge Monitoring Semiannual Analytical Results***
Permit No. 16-07
Textron Off-Site Groundwater Extraction System
Textron, Inc., Wheatfield, New York
Sample Dates: April 18-19, 2017

Dear Mr. Kummer:

Enclosed for your review are the semiannual discharge monitoring analytical results generated during the operation of Textron, Inc.'s (Textron) Off-Site Groundwater Extraction System located in Wheatfield, New York. The Off-Site Groundwater Extraction System was brought online in March 1993 and discharges to the Niagara County Sewer District (NCSD) sanitary sewer under Permit No. 16-07. As part of a pilot program with the New York State Department of Environmental Conservation (the Department), Extraction Well EW-5 was taken off line and will remain inactive with the Department's concurrence.

CB&I Environmental & Infrastructure, Inc., on behalf of Textron, collected grab samples of the discharge from Extraction Well EW-6 location between April 18 and 19, 2017 in accordance with NCSD Permit No. 16-07. The field sampling sheets are included as Appendix A. The samples were kept on ice and hand delivered to the ALS Environmental laboratory in Rochester, New York, for analysis of volatile organic compounds via U.S. Environmental Protection Agency (USEPA) Method 624 and low level mercury via USEPA Method 1631E. All sampling and analytical activities were conducted in accordance with the requirements stated in NCSD Permit No. 16-07 and the April 20, 2017 addendum to Permit No. 16-07.

Approximately 4,344,274 gallons of groundwater were extracted by the off-site system and discharged to the NCSD sanitary sewer between November 1, 2016 and May 1, 2017 as calculated through the sum of the individual well totalizers. The monthly discharge flow volumes are detailed on Tables 1 through 6, respectively.

As requested in your April 20, 2016 addendum to Permit No. 16-07, this report includes laboratory analysis of mercury. The low level mercury analytical results are summarized with an estimate of the discharge loading in comparison to the permitted maximum daily discharge loading limits in Table 7. Table 8 contains a summary of the semiannual discharge monitoring analytical data and an estimate of the discharge loading in comparison to the permitted maximum daily discharge loading limits. As illustrated in Tables 7 and 8, the estimated daily discharge loading during the monitoring period did not

exceed the permitted limits and the system remains in compliance with pertinent permits and discharge requirements. The analytical results for the April 2017 sampling event are provided in Appendix B.

Please do not hesitate to contact me at 412.858.3977 should you have any questions regarding this project.

Sincerely,
CB&I Environmental & Infrastructure, Inc.

Table 7
Niagara County Sewer Discharge Monitoring
Off-Site Groundwater Extraction System
Textron, Inc., Wheatfield, New York
Permit No. 16-07
April 18 - 19, 2017
Sample ID: MH No. 9-3

Parameter via USEPA Method 1631E	Reported Concentration (mg/L)	Total Flow (gallons per day)[1]	Discharge Loading Pounds per Day[2]	Discharge Limitation (mg/L)
Mercury, Total	0.0000201	20,904	< 0.0000000035	0.001

Notes:

Total Flow Limit: 200,000 gallons per day (gpd).

< - Not detected at indicated method detection limit.

For calculation purposes, "Not Detected" values are assigned the value of the method detection limit.

[1] Total flow during sampling period was based on the total flow measurements for the sampling date.

[2] Determined as follows: (Concentration in µg/L) x (flow rate in gpd) x (CF)

CF = Conversion Factor 8.3×10^{-9}

Table 8

Laboratory Results for: Textron Wheatfield

Dear Ms.Byers,

Enclosed are the results of the sample(s) submitted to our laboratory April 19, 2017
For your reference, these analyses have been assigned our service request number **R1703440.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger
Project Manager

Sample Matrix: Water

Service Request:R1703440
Date Received:4/19/17

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt

Two Water samples were received for analysis at ALS Environmental on 04/19/2017. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at ≤6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Volatile Organic Analyses:

No significant anomalies were noted with this analysis.

Metals Analyses:

No significant anomalies were noted with this analysis.

Sample Receiving Notes:

Samples were not submitted to the laboratory with Field Blanks as required by EPA Method 1631E (Section 9.4, minimum requirements for the analysis of blanks).

Approved by _____ Date 4/28/2017

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the ñNotesò column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an ñimmediateò hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% (25% for CLP) difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (Ó100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Mr. Dan Kummer
Niagara County Sewer District No. 1
7346 Liberty Drive
Niagara Falls, NY 14304-3762

Subject: ***Niagara County Sewer District Discharge Monitoring***
Semiannual Analytical Results
Permit No. 16-07
Textron Off-Site Groundwater Extraction System
Textron, Inc., Wheatfield, New York
Sample Dates: October 5-6, 2017

Dear Mr. Kummer:

Enclosed for your review are the semiannual discharge monitoring analytical results generated during the operation of Textron, Inc.'s (Textron) Off-Site Groundwater Extraction System located in Wheatfield, New York. The Off-Site Groundwater Extraction System was brought online in March 1993 and discharges to the Niagara County Sewer District (NCSD) sanitary sewer under Permit No. 16-07. As part of a pilot program with the New York State Department of Environmental Conservation (the Department), Extraction Well EW-5 was taken off line and will remain inactive with the Department's concurrence.

Aptim Environmental & Infrastructure, Inc. (APTIM), on behalf of Textron, collected grab samples of the discharge from Extraction Well EW-6 between October 5 and 6, 2017 in accordance with NCSD Permit No. 16-07. The field sampling sheets are included as Appendix A. The samples were kept on ice and hand delivered to the ALS Environmental laboratory in Rochester, New York, for analysis of volatile organic compounds via U.S. Environmental Protection Agency (USEPA) Method 624. All sampling and analytical activities were conducted in accordance with the requirements stated in NCSD Permit No. 16-07 and the April 20, 2016 addendum to Permit No. 16-07. The low level mercury sample was collected during the April 2017 sampling event as required by the Permit addendum.

Approximately 2,108,316 gallons of groundwater were extracted by the off-site system and discharged to the NCSD sanitary sewer between May 1, 2017 and November 1, 2017 as calculated through the sum of the individual well totalizers. The monthly discharge flow volumes are detailed on Tables 1 through 6.

Table 7 contains a summary of the semiannual discharge monitoring analytical data and an estimate of the discharge loading in comparison to the permitted maximum daily discharge loading limits. As illustrated in Table 7, the estimated daily discharge loading during the monitoring period did not exceed the permitted limits and the system remains in compliance with pertinent permits and discharge requirements. The analytical results for the October 2017 sampling event are provided in Appendix B.

Please do not hesitate to contact me at 412.858.3977 should you have any questions regarding this project.

Sincerely,

Cecelia Byers

Table 7
Niagara County Sewer Discharge Monitoring
Off-Site Groundwater Extraction System
Textron, Inc.
Wheatfield, New York
Permit Number: 16-07
October 5 - 6, 2017
Sample ID: MH No. 9-3

Parameter via USEPA Method 624	Reported Concentration (µg/L)	Total Flow (gallons per day)[(1)]	Discharge Loading Pounds per Day[(2)]	Maximum Daily Discharge Loading Limits
Trichloroethene	< 1.0	3,255	2.7163E-05	1.0
1,2-Dichloroethene (Total)	7.4	3,255	0.000201006	2.500
Vinyl Chloride	< 1.0	3,255	< 2.7163E-05	0.4000
Methylene Chloride	< 1.0	3,255	< 2.7163E-05	0.2

Notes:

Total Flow Limit: 200,000 gallons per day (gpd).

< - Not detected at indicated method detection limit.

For calculation purposes, "Not Detected" values are assigned the value of the method detection limit.

(1) Total flow during sampling period was based on the total flow measurements for the sampling date.

(2) Determined as follows: (Concentration in µg/L) x (flow rate in gpd) x (CF)

CF = Conversion Factor 8.3×10^{-9}

Laboratory Results for: Textron Wheatfield Semiannual NCSD

Dear Ms.Byers,

Enclosed are the results of the sample(s) submitted to our laboratory October 06, 2017
For your reference, these analyses have been assigned our service request number **R1709545.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Date Received:10/6/17

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt

Two water samples were received for analysis at ALS Environmental on 10/06/2017. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at ≤6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Volatile Organic Analyses:

No significant anomalies were noted with this analysis.

Sample Receiving Notes:

pH was not performed in the field as recommended by the EPA to meet an "immediate" or 15 minute Holding Time. In addition, pH is a temperature dependent analysis. The temperature of the sample during pH measurement is included as required by the method. Samples analyzed in the laboratory have been flagged with an "H" to indicate the "immediate" holding time has been exceeded.

Approved by _____ Date 10/13/2017

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the ñNotesò column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an ñimmediateò hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% (25% for CLP) difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (Ó100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

[1] Analyses were performed according to our laboratoryôs NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to http://www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads/North-America-Downloads
