Source	Source Purity	Matrix	Standard Concentration
High Purity Metals, Salts or Oxides	99.98+%	HNO_3, 5%	µg/mL ± 0.5% Aluminum 5000 Calcium 5000 Iron 2000 Magnesium 5000

This spectrometric standard solution has been prepared from high-purity reference materials. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water. The reference materials have been assayed by inductively coupled plasma optical emission spectrometry (ICP-OES).

The standard has been prepared gravimetrically by weighing the reference material to 5 significant figures. Volumetric glassware has been calibrated gravimetrically to 5 significant figures. The standard concentration has been verified by ICP-OES against an independent source which is traceable to National Institute of Standards and Technology, Standard Reference Material No. 3100 series.

This standard is valid for one year from the shipping date provided the solution is kept tightly capped and stored under normal laboratory conditions.

Source	Source Purity	Matrix	Standard Concentration
High Purity Metals, Salts or Oxides	99.99+%	HNO_3, 2% + Tr HF	µg/mL ± 0.5% See element list on reverse

This spectrometric standard solution has been prepared from high-purity reference materials. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water. The reference materials have been assayed by inductively coupled plasma optical emission spectrometry (ICP-OES).

The standard has been prepared gravimetrically by weighing the reference material to 5 significant figures. Volumetric glassware has been calibrated gravimetrically to 5 significant figures. The standard concentration has been verified by ICP-OES against an independent source which is traceable to National Institute of Standards and Technology, Standard Reference Material No. 3100 series.

This standard is valid for one year from the shipping date provided the solution is kept tightly capped and stored under normal laboratory conditions.

High Purity Metals, Salts or Oxides	99.99+%	HNO_3, 2% + Tr HF	µg/mL ± 0.5% See element list on reverse

This spectrometric standard solution has been prepared from high-purity reference materials. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water. The reference materials have been assayed by inductively coupled plasma optical emission spectrometry (ICP-OES).

The standard has been prepared gravimetrically by weighing the reference material to 5 significant figures. Volumetric glassware has been calibrated gravimetrically to 5 significant figures. The standard concentration has been verified by ICP-OES against an independent source which is directly traceable to National Institute of Standards and Technology, Standard Reference Material No. 3100 series.

This standard is valid for one year from the shipping date provided the solution is kept tightly capped and stored under normal laboratory conditions.

This spectrometric standard solution has been prepared from high-purity reference materials. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water. The reference materials have been assayed by inductively coupled plasma optical emission spectrometry (ICP-OES).

The standard has been prepared gravimetrically by weighing the reference material to 5 significant figures. Volumetric glassware has been calibrated gravimetrically to 5 significant figures. The standard concentration has been verified by ICP-OES against an independent source which is directly traceable to National Institute of Standards and Technology, Standard Reference Material No. 3100 series.

This standard is valid for one year from the shipping date provided the solution is kept tightly capped and stored under normal laboratory conditions.

HIGH-PURITY STANDARDS

CAT. NO. ANALCS-R

CLP Analyte Standard-Revised

Lot # 0728327

Source	Source Purity	Matrix	Standard Concentration
High Purity Metals, Salts or Oxides	99.99+%	HNO_3, 2% + Tr HF	µg/mL ± 0.5% See element list on reverse

This spectrometric standard solution has been prepared from high-purity reference materials. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water. The reference materials have been assayed by inductively coupled plasma optical emission spectrometry (ICP-OES).

The standard has been prepared gravimetrically by weighing the reference material to 5 significant figures. Volumetric glassware has been calibrated gravimetrically to 5 significant figures. The standard concentration has been verified by ICP-OES against an independent source which is directly traceable to National Institute of Standards and Technology, Standard Reference Material No. 3100 series.

This standard is valid for one year from the shipping date provided the solution is kept tightly capped and stored under normal laboratory conditions.

HIGH-PURITY STANDARDS

Certificate of Analysis

7658-5

Product Description:

Name:	CLP Interference Check Standard 1
Part number:	CLP-INF-1
Lot number:	0805302
Matrix:	5% HNO_3
Purity:	99.98% - 99.999%

Received - 9/16/08
Opened - 9/16/08
Expire - 9/10/09

Certified Values:

Element	(µg/mL)	Element	(µg/mL)	Element	(µg/mL)	Element	(µg/mL)
Al	5000 ± 25	Ca	5000 ± 25	Fe	2000 ± 10	Mg	5000 ± 25

The Certified values are based on gravimetric and volumetric preparation, and verified against SRM 3100 series developed by National Institute of Standards and Technology (NIST) via inductively coupled plasma optical emission spectrometry (ICP-OES) using an internal laboratory developed method. The uncertainty in the certified value is calculated for a 95% confidence interval.

Preparation Information:

The highest purity source materials were purchased from qualified vendors per ISO 9001:2000 guidelines and assayed by ICP-OES for conformity prior to use. This standard was prepared using methods developed at NIST for the preparation of SRM Spectrometric Standard Solutions. Sub-boiling distilled high-purity acid has been used to place the materials in solution and to stabilize the standard. The matrix is as noted above in 18 megaohm deionized water.

Traceability Information:

a. **Analytical Balance Calibration**: All balances are calibrated weekly by and in-house method using NBS weights Inventory No 20231A. The balances are calibrated yearly and the calibration weights are checked biennially by a qualified metrology company with weights traceable to the primary standards developed by NIST.

b. **Volumetric Device Calibration**: The calibration of all volumetric vessels is checked using the NBS 602 method where all vessels are weighed to five significant figures.

c. **Calibration Standards**: The Calibration Standards are directly traceable to SRM 3100 Series Spectrometric Standard Solutions. The traceability of this standard to NIST is maintained through an unbroken chain of comparisons to appropriate standards with suitable procedure and measurement uncertainties. A "second source standard" is used when a NIST SRM is not available.

Packaging and Storage Conditions:

The standard solution is guaranteed to be valid for twelve months from the shipping date, provided the solution is kept tightly capped and stored under normal laboratory conditions.

MDLs are calculated using the method in Appendix B, Part 136, Revision 1.11 of the Federal Register, Volume 49, No. 209, October 1984.

MDL=(S.Dev) x (t-value)

The MDL is a statistical measurement which defines the theoretical minimum concentration of a substance which can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

AccuStandard

The total maximum uncertainty on the certified value(s) is ±2%. See reverse side of certificate for details.

The concentration of the final solution was verified by ICP against NIST SRM# 3133

RESULTS: This solution standard was certified for accuracy of major elemental constituency via methodology traceable to primary or well characterized secondary standards. All trace level elements and impurities were determined via plasma emission spectroscopy on the concentrate.

This standard was prepared gravimetrically to contain the elemental concentrations shown above. Balances, used in the preparation, are calibrated regularly using NIST-traceable weights. All glassware used in preparation is Class A.

We use the highest purity raw materials available, including high purity acids, ASTM type I 18 megohm deionized water, and typically 99.999%+ starting materials to minimize impurity levels in the final solution. All bottles are acid leached and then triple rinsed with deionized water prior to use.

Use good laboratory procedure when diluting this product. Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.

We certify the accuracy of this standard to be ± 0.5% of the stated value until the expiration date listed above, provided it is kept tightly capped and stored under normal laboratory conditions.

We use purified acids, 18 megohm double deionized water, calibrated Class A glassware and the highest purity raw materials available, (typically 99.9999%). We meticulously clean our bottles by acid leaching and then triple rinsing with ASTM Type I water prior to use. NARRATIVE

INTRODUCTION/ANALYTICAL RESULTS

This report summarizes the laboratory results for samples from O'Brien & Gere Engineers, Inc. for the City of Geneva – Market Basket project. Immediately following the narratives are the Work Order Sample Summary and Dates Report.

CONDITION UPON RECEIPT/CHAIN OF CUSTODY

The coolers were received intact. When the coolers were received by the laboratory, the sample custodian(s) opened and inspected the shipments for damage, custody inconsistencies and proper preservation. The chain of custody forms documenting receipt are presented in the chain of custody section. Each sample was assigned a unique laboratory number and a custody file created. The samples were placed in a secured walk-in cooler and signed in and out by the chemists performing the tests. The sign out record, or lab chronicle, is presented in the chain of custody section.

No discrepancies were noted upon receipt. The temperature of the iced cooler was 0.0°C.

METHODOLOGY

The following methods were used to perform the analyses:

PARAMETER	METHOD	REFERENCE
Volatile Organics	SW8260B	1
Semivolatile Organics	SW8270C	1

1) New York State Department of Environmental Conservation Analytical Services Protocol, June 2000.

QUALITY CONTROL

QA/QC results are summarized in the Laboratory Report Package and are also included in the raw data.

RAW DATA

The raw data is organized in the New York State Department of Environmental Conservation Analytical Services Protocol Category B order of data requirements.

NARRATIVE

INTRODUCTION/ANALYTICAL RESULTS
This report summarizes the laboratory results for samples from O'Brien & Gere Engineers, Inc. for the City of Geneva – Market Basket project. Immediately following the narratives are the Work Order Sample Summary and Dates Report.

CONDITION UPON RECEIPT/CHAIN OF CUSTODY
The coolers were received intact. When the coolers were received by the laboratory, the sample custodian(s) opened and inspected the shipments for damage, custody inconsistencies and proper preservation. The chain of custody forms documenting receipt are presented in the chain of custody section. Each sample was assigned a unique laboratory number and a custody file created. The samples were placed in a secured walk-in cooler and signed in and out by the chemists performing the tests. The sign out record, or lab chronicle, is presented in the chain of custody section.

No discrepancies were noted upon receipt. The temperature of the iced cooler was 0.0°C.

METHODOLOGY
The following methods were used to perform the analyses:

PARAMETER	METHOD	REFERENCE
Volatile Organics	SW8260B	1
Semivolatile Organics	SW8270C	1

1) New York State Department of Environmental Conservation Analytical Services Protocol, June 2000.

QUALITY CONTROL
QA/QC results are summarized in the Laboratory Report Package and are also included in the raw data.

RAW DATA
The raw data is organized in the New York State Department of Environmental Conservation Analytical Services Protocol Category B order of data requirements.

MDLs are calculated using the method in Appendix B, Part 136, Revision 1.11 of the Federal Register, Volume 49, No. 209, October 1984.

MDL=(3.Dev) x (t-value)

The GC/MS instrument minimum threshold quantitation level is set to 0.1 ug/L.

The MDL is a statistical measurement which defines the theoretical minimum concentration of a substance which can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

MDL Verifications: * not verified, surrogate no longer utilized.

Copy of Calculations

GC/MS WATER SAMPLE CALCULATIONS

1. Relative Response Factors for GC/MS Volatiles and Semivolatiles

$$RRF = \frac{A_x}{A_{is}} \times \frac{C_{is}}{C_x}$$

Where: A_x = Area of the characteristic ion for the compound to be measured
A_{is} = Area of the characteristic ion for the specific internal standard
C_{is} = Concentration of the internal standard (µg/mL)
C_x = Concentration of the compound to be measured (µg/mL).

2. Relative Standard Deviation

$$\%\,RSD = \frac{SD}{\bar{X}} \times 100$$

Where: RSD = Relative Standard Deviation
SD = Standard Deviation of initial relative response factors (per compound)
$\bar{X}$ = Mean of initial relative response factors (per compound)

3. %Deviation for Continuing Calibration (for quantitation from RF only)

$$\%\,Deviation_{(EPA)} = \frac{RRF_c - \overline{RRF_i}}{RRF_i} \times 100$$

$$\%\,Deviation_{(software)} = \frac{\overline{RRF_i} - RRF_c}{\overline{RRF_i}} \times 100$$

Where: RRF_c = Relative response factor from continuing calibration standard
$\overline{RRF_i}$ = Mean relative response factor from most recent initial calibration meeting technical acceptance criteria

4. %Drift for Continuing Calibration (for quantitation from Curve)

$$\%\,Drift_{(EPA)} = \frac{C_c - C_i}{C_i} \times 100$$

$$\%\,Drift_{(software)} = \frac{C_i - C_c}{C_i} \times 100$$

Where: C_i = Calibration check std concentration (theoretical)
C_c = Measured concentration

5. RRT Deviation

$$\Delta\ RRT = RRT_s - RRT_c\ ,\quad RRT = \frac{RT_s}{RT_i}$$

Where: RRT_s = Relative RT of target compound in sample
RRT_c = RRT of target in continuing calibration standard
RT_s = RT of target compound
RT_i = RT of internal standard

GC/MS WATER SAMPLE CALCULATIONS

6. Final Concentration for GC/MS Volatiles

$$Concentration\ (\mu g/L) = \frac{(A_X)(I_{is})Df}{(A_{is})(RRF)(V_o)}$$

Where: A_X = Area of the characteristic ion for the compound to be measured
A_{is} = Area of the characteristic ion for the specified internal standard
I_{is} = Amount of internal standard added in nanograms
V_o = Volume of water purged (5 to 25 mL)
RRF = Response factor for compound to be measured (average or single point) *
Df = Dilution factor, if applicable

* For compounds calculated using a regression equation for initial calibration, the terms of the equation replace the RRF.

7. Final Concentration for GC/MS Semivolatiles

$$Concentration\ (\mu g/L) = \frac{(A_x)(I_{is})(V_T)(DF)(2.0)}{(A_{is})(RRF)(V_o)(V_i)}$$

Where: RRF, A_x, A_{is}, I_{is} = Same as above
V_o = Volume of water extracted (mL)
V_i = Volume of extract injected (µL)
V_T = Volume of concentrated extract (µL)
Df = Dilution factor
The factor of 2.0 is used to account for the splitting of extracts for the acid and base neutral portions. If only one extraction is performed, this factor is not used.

8. Matrix Spike Recovery for Volatiles and Semivolatiles

$$Recovery\ (\%) = \frac{(SSR) - (SR)}{(SA)} \times 100$$

Where: SSR = Spike sample result
SR = Sample result
SA = Spike added

9. % RPD of Matrix Spike and Matrix Spike Duplicate

$$\%RPD = 100 \times \frac{|S - D|}{((S + D)/2)}$$

Where: S = First Sample Value (Original)
D = Second Sample Value (Duplicate)

10. The Recovery of Reference Sample (LCS) and Surrogate

$$Recovery\ (\%) = \frac{SR}{SA} \times 100$$

Where: SR = Sample results
SA = Sample spike added

11. The calculation of Library Search compounds (TICs) is similar to target compounds except a RRF of 1.0 is assumed.

MDLs are calculated using the method in Appendix B, Part 136, Revision 1.11 of the Federal Register, Volume 49, No. 209, October 1984.

MDL=(S.Dev) x (t-value)

The MDL is a statistical measurement which defines the theoretical minimum concentration of a substance which can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

The GC/MS instrument minimum threshold quantitation level is set to 0.5 (or 1.0 ug/mL) ug/mL of extract (dependant on the initial calibration low standard concentration).

MDL verified (MS/MS6): 2-15-08. * analyte not verified

GC/MS WATER SAMPLE CALCULATIONS

1. Relative Response Factors for GC/MS Volatiles and Semivolatiles

$$RRF = \frac{A_x}{A_{is}} \times \frac{C_{is}}{C_x}$$

Where:
A_x = Area of the characteristic ion for the compound to be measured
A_{is} = Area of the characteristic ion for the specific internal standard
C_{is} = Concentration of the internal standard (µg/mL)
C_x = Concentration of the compound to be measured (µg/mL).

2. Relative Standard Deviation

$$\%\ RSD = \frac{SD}{\bar{X}} \times 100$$

Where:
RSD = Relative Standard Deviation
SD = Standard Deviation of initial relative response factors (per compound)
$\bar{X}$ = Mean of initial relative response factors (per compound)

3. %Deviation for Continuing Calibration (for quantitation from RF only)

$$\%\ Deviation_{(manual)} = \frac{RRF_c - \overline{RRF_i}}{RRF_i} \times 100$$

$$\%\ Deviation_{(software)} = \frac{\overline{RRF_i} - RRF_c}{\overline{RRF_i}} \times 100$$

Where:
RRF_c = Relative response factor from continuing calibration standard
$\overline{RRF_i}$ = Mean relative response factor from most recent initial calibration meeting technical acceptance criteria

4. %Drift for Continuing Calibration (for quantitation from Curve)

$$\%\ Drift_{(manual)} = \frac{C_c - C_t}{C_t} \times 100$$

$$\%\ Drift_{(software)} = \frac{C_t - C_c}{C_t} \times 100$$

Where:
C_t = Calibration check std concentration (theoretical)
C_c = Measured concentration

5. RRT Deviation

$$\Delta\ RRT = RRT_s - RRT_c \quad , \quad RRT = \frac{RT_t}{RT_i}$$

Where:
RRT_s = Relative RT of target compound in sample
RRT_c = RRT of target in continuing calibration standard
RT_t = RT of target compound
RT_i = RT of internal standard

GC/MS WATER SAMPLE CALCULATIONS

6. Final Concentration for GC/MS Volatiles

$$Concentration\ (\mu g/L) = \frac{(A_X)(I_{is})Df}{(A_{is})(RRF)(V_o)}$$

Where:
A_X = Area of the characteristic ion for the compound to be measured
A_{is} = Area of the characteristic ion for the specified internal standard
I_{is} = Amount of internal standard added in nanograms
V_o = Volume of water purged (5 to 25 mL)
RRF = Response factor for compound to be measured (average or single point) *
Df = Dilution factor, if applicable

* For compounds calculated using a regression equation for initial calibration, the terms of the equation replace the RRF.

7. Final Concentration for GC/MS Semivolatiles

$$Concentration\ (\mu g/L) = \frac{(A_x)(I_{is})(V_T)(Df)(2.0)}{(A_{is})(RRF)(V_o)(V_i)}$$

Where:
RRF, A_x, A_{is}, I_{is} = Same as above
V_o = Volume of water extracted (mL)
V_i = Volume of extract injected (µL)
V_T = Volume of concentrated extract (µL)
Df = Dilution factor
The factor of 2.0 is used to account for the splitting of extracts for the acid and base neutral portions. If only one extraction is performed, this factor is not used.

8. Matrix Spike Recovery for Volatiles and Semivolatiles

$$Recovery\ (\%) = \frac{(SSR) - (SR)}{(SA)} \times 100$$

Where:
SSR = Spike sample result
SR = Sample result
SA = Spike added

9. % RPD of Matrix Spike and Matrix Spike Duplicate

$$\%RPD = 100 \times \frac{|S - D|}{((S + D)/2)}$$

Where:
S = First Sample Value (Original)
D = Second Sample Value (Duplicate)

10. The Recovery of Reference Sample (LCS) and Surrogate

$$Recovery\ (\%) = \frac{SR}{SA} \times 100$$

Where:
SR = Sample results
SA = Sample spike added

11. The calculation of Library Search compounds (TICs) is similar to target compounds except a RRF of 1.0 is assumed.
