2.0 INTRODUCTION

In accordance with the request of Mr. Eugene Santacroce, Senior Engineer with the City of Utica (City) - Department of Engineering, Hygeia of New York, Inc. (Hygeia) has performed a limited Phase II Environmental Site Assessment for eight (8) parcels of land located on Whitesboro Street in Utica, Oneida County, New York (Oneida County Tax IDs 318.8-1-48,47,46,45,44,43,42 and 41). For the purposes of this study these parcels have been divided into two (2) separate areas. Area 1 consists of parcels 46 – 48 and Area 2 consists of parcels 41-45.

The site is bounded on the east by Division Street, on the South by Water Street, on the West by a vacant lot owned by National Bldg. & Restoration and on the North by Whitesboro Street. All of the aforementioned lots are owned by the City of Utica except parcel 41, which is owned by Boiler Maker Road Race, Inc. The site is currently unpaved vacant land overgrown with grass and weeds. The total site area covers approximately 1.5 acres of land. According to the United States Geological Survey (USGS) Topographic Map (Utica East, New York Quadrangle), the subject site lies at approximately 420 feet above Mean Sea Level.

The property was occupied by structures from at least the early 1900's until the structures were demolished in 1995 or 1994 after a fire. The area contained industrial operations dating back to the early 1800's likely associated with the Erie Canal, including the Utica Steam Engine and Boiler Works. Former building foundations and demolition debris remains on-site.

Historically Area 1 was occupied by the Horocks Ibbotson & Co. facility from at least 1925 until 1973. Horocks Ibbotson & Co. manufactured fishing rods. Area 1 has been listed as a petroleum spill site in the New York State Department of Environmental Conservation's (NYS DEC) Spills Information Database (spill # 97-09722)

Based on a Phase I Environmental Assessment report completed by Dames & Moore, Inc., (Dames & Moore) commercial buildings were located on the lots to the east of Area 1 (i.e. Area 2). More specifically, the Hotel Dana was located in Area 2 based on a 1925 Sanborn fire insurance map. In Sanborn Fire Insurance Maps for 1950 and 1973 the hotel in Area 2 has been renamed as the Gilbert Hotel and the Center Hotel, respectively.

Dames & Moore also performed a limited Phase II Environmental Investigation in Area 1 from June 24 through July 2, 1997. Soil samples were collected and headspace measurements of volatile organic compounds were performed. The report was unable to conclude that the results were indicative of widespread VOC contamination or isolated releases due to previous manufacturing activities.

Dames & Moore installed a temporary groundwater monitoring well to obtain additional information on the quality of groundwater. Groundwater contaminant concentrations were also described as being below NY State Water standards. The report concluded by recommending

additional exploratory activities in the vicinity of TP-4 to attempt to define the lateral extent of impacts. Dames & Moore also recommended that additional monitoring wells be installed upgradient and downgradient of test pit #4 to evaluate the potential groundwater impact.

2.1 Project Objectives

The project objective was to characterize the extent of petroleum hydrocarbon contamination in the soil and groundwater for Area 1 and to attempt to identify potential sources of hazardous wastes, hazardous substances, and/or chemical or petroleum contamination present Area 2.

3.0 METHODOLOGY

3.1 Test Pits, Soil Borings and Groundwater Monitoring Well Installation

Test pits were excavated by the City of Utica using a rubber tire backhoe. Each test pit was approximately six to eight feet in depth by four feet wide by eight feet long. Test pit contents were visually observed and photographed.

Soil borings were completed using a Geoprobe 5400. Continuous soil samples were collected using direct push technology to advance a four foot long macro-core sampler with disposable 1^{1/8} inch disposable liners. The location and number of borings in Area 1 was chosen based on the results of the previous investigation conducted by Dames and Moore. A rectangular grid was established for borings completed in Area 2.

Temporary groundwater monitoring wells were installed using the aforementioned Geoprobe. Each well consisted of 1 inch diameter, 10 slot PVC screen from 16 feet below grade to 6 feet below grade and 1 inch diameter schedule 40 PVC riser from 6 feet below grade to approximately 2 feet above grade. Each well was back-filled to grade with sand and approximately 6 inches of bentonite. Wells were developed by purging with a ¾ inch polyethylene disposable bailer.

3.2 Soil Sample Collection

3.2.1 Field Screening

Soil samples generated from borings were placed in gallon ziplock bags and allowed to off-gas. After a period of time the headspace was screened using a calibrated Rae Systems Inc. Mini Rae Photoionization Detector Meter with an 11.7eV ultraviolet lamp. Based on the field screening results representative samples were selected for further laboratory analysis.

3.2.2 Collection for Laboratory Analysis

Grab samples were collected from the source area and its perimeter. Soil samples were generally collected from the soil groundwater interface area. Samples were collected essentially in accordance with U.S. Environmental Protection Agency's, Test Methods for Evaluating Solid Waste, Physical / Chemical Methods, SW-846 Third Ed., Field Manual Volume II, Sept. 1986, Rev. 1995.

3.3 Groundwater Sample Collection

Wells established upgradient and down gradient from known areas of contamination were essentially sampled in accordance with U.S. Environmental Protection Agency's, Test Methods for Evaluating Solid Waste, Physical / Chemical Methods, SW-846 Third Ed., Field Manual Volume II, Sept. 1986, Rev. Jan. 1995.

3.4 Laboratory Analysis

All samples collected were analyzed for Volatile and Semi-volatile Organic Compounds by Upstate Laboratories, Inc. in accordance with the Environmental Protection Agency's, Test Methods for Evaluating Solid Waste, Physical / Chemical Methods, SW-846 Third Ed., Laboratory Manual Volume I B, Sept. 1986, Rev. 1995 and N.Y. State Department of Environmental Conservation's Spill Technology and Remediation Series (STARS) Memo #1 Petroleum-Contaminated Soil Guidance Policy, August 1992. The specific reference methods used were 8270 TCLP STARS, 8021 TCLP STARS, 8021 Full Total, 8021 STARS Total and 8270 STARS Total.

4.0 DISCUSSION

All site work was completed in accordance with a Site Specific Health and Safety Plan developed by Hygeia of N. Y. Inc.

4.1.0 Subsurface Investigation

4.1.1 *Soil Boring Installation*

In Area 1, a total of thirteen (13) soil borings (H-1 to H-13) were completed. The initial boring was installed in close proximity to an area with high levels of contamination as established by the previous investigation completed by Dames and Moore. Since the initial investigation established a lack of contamination in Southerly direction from the source, additional borings (i.e. eight) were concentrated in a crossing pattern with 30 foot intervals of separation to the Northeast and Northwest of the source. Four (4) additional borings were installed at the southern extreme of the Dames and Moore investigation to verify the lack of contamination and establish a control for ground water monitoring in an area presumed to be up-gradient from the source. Please refer to Appendix B for the specific locations of all borings completed.

The borings in Area 1 revealed that generally soils in the upper two (2) feet contained dry red/brown/grey fill (i.e. cinders and bricks). From a depth of approximately two (2) feet to seven (7) feet the soil consisted of brown, dry to moist, fine sand and silt with a trace of clay. From approximately seven (7) to twelve (12) feet the soil was a brown, wet, fine to medium sand. The depth to groundwater ranged from approximately 5 feet to approximately 11 feet. No odors or discoloration indicative of a petroleum product spill were observed in the soil samples generated by the borings.

In Area 2, fifteen (15) Geo-probe borings (H-14 to H-28) were completed. Borings were arranged in a 4 x 4 grid with one grid axis progressing from North to South and the other from East to West. Point separation along the east west axis was approximately 50 feet. Point separation along the North-South axis was approximately 45 feet. One location in the northeast

corner of this area was eliminated due to close proximity to a Niagara Mohawk Gas line. Please refer to Appendix B for the specific locations of all borings completed.

Area 2 borings revealed that, generally, soils in the upper four (4) to six (6) feet contained dry red/brown/grey fill (i.e. cinders and bricks). From a depth of approximately six (6) feet to ten (10) feet the soil consisted of brown, dry to wet, fine to medium sand, some silt and a trace of clay. From approximately seven (7) to twelve (12) feet the soil was a brown, wet, fine to medium sand. The depth to groundwater ranged from approximately 7 feet to approximately 11 feet. No odors or discoloration indicative of a petroleum product spill were observed in the soil samples generated by the borings.

Please refer to Appendix C - Field Data for boring logs.

4.1.2 Test Pits

A total of three (3) test pits were excavated in Area 2. Test Pit # 1 was located in the Southeast corner of this area. The soil excavated from this pit consisted of primarily red brick and grayish colored soil or ash with some charred wood. No odors or visual evidence indicative of petroleum or chemical contamination was observed. A concrete slab, which caused refusal of the bucket and termination of the excavation, was noted at a depth of 6 feet.

Test Pit # 2, located in the Northeast corner of Area 2, contained rags, sand, red bricks, ashes, charred wood and other fill materials. No odors or visual evidence indicative of petroleum or chemical contamination was observed. The test pit was terminated at a depth of 8 feet.

Test Pit # 3, located in the center of the western boundary with Area 1, contained red brick, ash sand and silt. No odors or visual evidence indicative of petroleum or chemical contamination was observed. A concrete slab, which caused refusal of the bucket, was noted at a depth of 8 feet, terminating the excavation.

All test pits were immediately backfilled with excavated soil upon completion of the excavation. Please refer to Appendix C for test pit contents logs and photographic documentation.

4.1.2 PID sample screening

Soil obtained from the test borings and test pits was screened in the field for volatile organic compounds (VOC) using a MiniRae PID meter. Background VOC concentrations were measured at 1.9 parts of VOC per million parts of air (PPM) on October 26, 1999 (Area 1) and 1.8 PPM on October 27, 1999 (Area 2). For the most part, PID screenings did not indicate widespread site contamination as can be seen in the following table:

Location	ID	RHD reading (PPM)	Location	ID	RHD reading (PPM)
Area 1	H-1	4.0 - 12.3	Area 2	H-14	2.2 - 2.5
Area 1	H-2	2.8 - 3.1	Area 2	H-15	2.4 - 3.0
Area 1	H-3	3.2 - 5.5	Area 2	H-16	2.5 - 6.3
Area 1	H-4	2.3 - 2.6	Area 2	H-17	2.3 - 2.9
Area 1	H-5	2.3 - 2.6	Area 2	H-18	2.7 - 4.3
Area 1	H-6	1.9 - 2.4	Area 2	H-19	2.8 - 3.9
Area 1	H-7	3.3 - 4.0	Area 2	H-20	3.4 - 4.2
Area 1	H-8	1.9 - 2.2	Area 2	H-21	2.7 - 3.9
Area 1	H-9	2.5 - 3.0	Area 2	H-22	2.4 - 3.1
Area 1	H-10	2.6 - 4.6	Area 2	H-23	2.6 - 3.6
Area 1	H-11	2.5	Area 2	H-24	2.5 - 3.6
Area 1	H-12	2.5 - 2.6	Area 2	H-25	2.1 - 3.2
Area 1	H-13	1.9 - 2.4	Area 2	H-26	2.6 - 2.7
			Area 2	H-27	2.3
			Area 2	H-28	2.7 - 5.1
			Area 2	Test Pit #1	2.3 - 3.5
			Area 2	Test Pit #2	2.1
			Area 2	Test Pit #3	2.1 - 2.4

4.2.0 GROUNDWATER INVESTIGATION

4.2.1 *Groundwater Sampling*

A total of three (3) temporary groundwater monitoring wells were installed in Area 1. These wells were installed in borings H-4, H-5 and H-13. Each well was purged of approximately three well volumes and sampled using $\frac{3}{4}$ inch disposable polyethylene bailers. Recharge time during purging was insignificant. No odors or sheens were observed from groundwater sampled from H-13 or H-4. Groundwater collected from H-5 had a diesel fuel odor and a petroleum product sheen. All groundwater sampled was brown in color and highly turbid.

Groundwater in Area 2 was not sampled since evidence of contamination was not observed during the on-site investigation.

4.2.2 *Site Hydrology*

Based on the borings completed it is estimated that the groundwater surface ranges from 5 to 11 feet below ground surface. Water level measurements conducted show that the relative ground water elevations (note: manhole 1 (MH-1), assigned an elevation of 100 feet, was used as a benchmark) at H-13, H-4 and H-5 are 89.73 feet, 89.21 feet and 89.12 feet, respectively. Consequently, it is apparent that direction of shallow groundwater flow is to the north – northeast. Please refer to Appendix B for the Groundwater Contour and Flow Map.

4.3.0 Analytical Results

4.3.1 Soil Sampling Results

The analytical results for the soil sampling conducted indicate primarily fuel oil contamination in Area 1 and gasoline contamination of Area 2.

More specifically, analysis of the soil sample collected from boring H-1 per EPA reference method 8021 showed a high concentration of naphthalene and styrene (i.e. 14 mg/kg and 4.5 mg/kg, respectively). This is indicative of fuel oil (eg. diesel fuel, kerosene, crude oil). The high concentration of naphthalene and styrene precluded reporting of other compounds more accurately than less than 0.49 mg/kg. This is consistent with the previously conducted Dames and Moore study which showed high concentrations of diesel range organics to the south of this boring.

Analysis of the TCLP extract from soil samples collected from borings H-3 and H-10 via EPA reference method 8270 showed primarily ethylbenzene, toluene and total xylenes contamination. These results are indicative of a gasoline spill that has weathered over time. Analysis of the TCLP extract from soil sample collected from borings H-8 indicated that the soil in this area was essentially uncontaminated by the DEC's STARS target compound list.

Similarly, in Area 2 analysis of the TCLP extract obtained from soil samples collected in borings H15, H19 and H26 showed the presence of primarily ethylbenzene, toluene and total xylenes indicative of a gasoline spill or spills.

4.3.2 Water Sampling Results

Analysis of the water sample collected from the temporary monitoring well installed in boring H-5 showed high levels of n-butylbenzene and naphthalene (i.e. 230 micrograms per liter (ug/liter) and 1,700 ug/l, respectively). The presence of naphthalene in this sample indicates that it is highly probable that the soil contamination observed in the soil sample collected at H-1 as well as the contamination observed in samples previously collected by Dames and Moore has impacted the groundwater. It is apparent that the contamination is moving in a northerly direction since contamination was not observed in water sampled from the temporary well installed at boring H-4 which lies to the northwest of areas of known contamination. Additionally, it is apparent that the contamination is being generated on the site since contamination was not observed in groundwater sampled from the well installed at boring H-13 which is located at the southern extreme of contamination.

5.0 CONCLUSIONS / RECOMMENDATIONS

A fairly well defined area of soil contaminated with a fuel oil has been identified in Area 1. Based on laboratory analysis of the soil samples collected, the soils in this area exceed guidelines established by the NYDEC's Spill Technology and Remediation Series (STARS) Memo #1 Petroleum-Contaminated Soil Guidance Policy which must be satisfied in order for soil to be considered acceptably remediated or not sufficiently contaminated (Please refer to Appendix for A for a summary of analytical results). Additionally, it is apparent that contamination present in

the soil has impacted the groundwater in Area 1. The extent of the groundwater contamination plume could not be determined due to limitation of the project scope but the potential exists that the plume has extended beyond the boundaries of the property. It is recommended that additional investigation be completed to determine the limits of the groundwater contamination plume.

Similarly, in Area 2 it is apparent based on the analytical results of the soil samples collected that the soil contains contaminants indicative of a gasoline spill. Due to the limited number of samples collected it is not clear that the analytical result indicate widespread contamination or isolated releases. Consequently, additional investigation of Area 2 to define the extent of contamination and whether or not such contamination has impacted the groundwater appears to be warranted. Assuming, that contaminated soils identified in this area are related in an area of widespread contamination, a potential extent of contamination based on the analysis of the samples collected was developed to assist in the planning of a remedial response in the absence of additional information. Please refer to Appendix B for a map of contaminated and potentially contaminated soils.

5.1 Estimated Volume of Contaminated Soil

Based on laboratory analysis the soil samples collected it appears the area of contamination in Area 1 is at least 13,216 square feet. Since it is apparent that the contamination has impacted the ground water and because the contamination will primarily float on top of the groundwater the vertical extent of contamination ranges from 5 to 11 feet. Using the maximum vertical extent of contamination with the calculated horizontal area the estimated volume of contaminated soil in Area 1 is 5,384 cubic yards. In Area 2, the estimated volume of potentially contaminated soil was calculated to be 3,654 cubic yards. Please refer to Appendix B for Calculations of Estimated Volume of Contaminated Soil.

The information presented in this report is limited to the investigation conducted and described, and is not necessarily inclusive of all conditions present at the subject site. If you have any questions regarding this report, please contact this office at (315) 733-0191.

dw = Dry weight

KEY PAGE

1 MATRIX INTERFERENCE PRECLUDES LOWER DETECTION LIMITS
2 MATRIX INTERFERENCE
3 PRESENT IN BLANK
4 ANALYSIS NOT PERFORMED BECAUSE OF INSUFFICIENT SAMPLE
5 THE PRESENCE OF OTHER TARGET ANALYTE(S) PRECLUDES LOWER DETECTION LIMITS
6 BLANK CORRECTED
7 HEAD SPACE PRESENT IN SAMPLE
8 QUANTITATION LIMIT IS GREATER THAN THE CALCULATED REGULATORY LEVEL. THE QUANTITATION LIMIT THEREFORE BECOMES THE REGULATORY LEVEL.
9 THE OIL WAS TREATED AS A SOLID AND LEACHED WITH EXTRACTION FLUID
10 ADL (AVERAGE DETECTION LIMITS)
11 PQL (PRACTICAL QUANTITATION LIMITS)
12 SAMPLE ANALYZED OVER HOLDING TIME
13 DISSOLVED VALUE MAY BE HIGHER THAN TOTAL DUE TO CONTAMINATION FROM THE FILTERING PROCEDURE
14 SAMPLED BY ULI
15 DISSOLVED VALUE MAY BE HIGHER THAN TOTAL; HOWEVER, THE VALUES ARE WITHIN EXPERIMENTAL ERROR
16 AN INHIBITORY FACTOR WAS OBSERVED IN THIS ANALYSIS
17 PARAMETER NOT ANALYZED WITHIN 15 MINUTES OF SAMPLING
18 THE SERIAL DILUTION OF THIS SAMPLE SUGGESTS A POSSIBLE PHYSICAL AND/OR CHEMICAL INTERFERENT IN THIS DETERMINATION. THE DATA MAY BE BIASED EITHER HIGH OR LOW.
19 CALCULATION BASED ON DRY WEIGHT
20 INDICATES AN ESTIMATED VALUE, DETECTED BUT BELOW THE PRACTICAL QUANTITATION LIMITS
21 UG/KG AS REC.D / UG/KG DRY WT
22 MG/KG AS REC.D / MG/KG DRY WT
23 INSUFFICIENT SAMPLE PRECLUDES LOWER DETECTION LIMITS
24 SAMPLE DILUTED/BLANK CORRECTED
25 ND (NON-DETECTED)
26 MATRIX INTERFERENCE PRECLUDES LOWER DETECTION LIMITS/BLANK CORRECTED
27 SPIKE RECOVERY ABNORMALLY HIGH/LOW DUE TO MATRIX INTERFERENCE
28 POST-DIGESTION SPIKE FOR FURNACE AA ANALYSIS IS OUTSIDE OF THE CONTROL LIMITS (85-115%); HOWEVER, THE SAMPLE CONCENTRATION IS BELOW THE PQL
29 ANALYZED BY METHOD OF STANDARD ADDITIONS
30 METHOD PERFORMANCE STUDY HAS NOT BEEN COMPLETED/ND (NON-DETECTED)
31 FIELD MEASURED PARAMETER TAKEN BY CLIENT
32 TARGET ANALYTE IS BIODEGRADED AND/OR ENVIRONMENTALLY WEATHERED
33 NON-POTABLE WATER SOURCE
34 VOLATILE ASP CODES

(B) POSSIBLE/PROBABLE BLANK CONTAMINATION (D) ALL COMPOUNDS IDENTIFIED AT A SECONDARY DILUTION FACTOR (J) ESTIMATED VALUE

35 THE HYDROCARBONS DETECTED IN THE SAMPLE DID NOT CROSS-MATCH WITH COMMON PETROLEUM DISTILLATES
36 MATRIX INTERFERENCE CAUSING SPIKES TO RESULT IN LESS THAN 50.0% RECOVERY
37 MILLIGRAMS PER LITER (MG/L) / POUNDS (LBS) PER DAY
38 MILLIGRAMS PER LITER (MG/L) OF RESIDUAL CHLORINE (CL₂) / POUNDS (LBS) PER DAY OF CL₂
39 MICROGRAMS PER LITER (UG/L) / POUNDS (LBS) PER DAY
40 MILLIGRAMS PER LITER (MG/L) LINEAR ALKYL SULFONATE (LAS) / POUNDS (LBS) PER DAY LAS
41 RESULTS ARE REPORTED ON AN AS REC.D BASIS
42 THE SAMPLE WAS ANALYZED ON A TOTAL BASIS; THE TEST RESULT CAN BE COMPARED TO THE TCLP REGULATORY CRITERIA BY DIVIDING THE TEST RESULT BY 20, CREATING A THEORETICAL TCLP VALUE
43 METAL BY CONCENTRATION PROCEDURE
44 POSSIBLE CONTAMINATION FROM FIELD/LABORATORY
