1.0 INTRODUCTION

Galli Engineering, P.C., and its representatives has performed this Phase I Environmental Site Assessment (ESA) of the property located at 403-405 & 413-415 Main Street, Staten Island, New York – Tax Map Designation: Block: C, Lot: 461-463 & 428; herein identified as the "Subject Properties." This Phase I ESA was prepared in accordance with the scope and limitations of ASTM E-1527-21.

1.1 Purpose

The purpose of the ASTM Standard is to define good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA, 42 U.S.C. 9601) and petroleum products. As such, this practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous Property owner, or bona fide prospective purchaser limitations on CERCLA liability (hereinafter, the "landowner liability protections," or "LLPs"): that is, the practice that constitutes "all appropriate inquiry into the previous ownership and uses of the Property consistent with good commercial or customary practice" as defined at 42 U.S.C. 9601(35) (B).

The purpose of this Phase I Environmental Site Assessment is to determine if any type of environmental hazard exists within the Property in question. Environmental hazards include, but are not limited to, improper storage or handling of hazardous or toxic wastes or raw chemicals; underground storage of hazardous materials; asbestos within building materials or structures; and identification of potential off-site sources of hazardous waste contamination, such as industrial facilities or retail petroleum facilities, adjacent to the subject site.

This assessment is intended to satisfy the criteria set forth in the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments, as published in

ASTM E-1527-21. Banks, insurance companies, and prospective Property purchasers require an understanding of existing and past Property conditions and uses in order to assess the potential liabilities associated with a property.

A qualified environmental professional as defined in the ASTM Standard has completed this assessment. The objectives of this Environmental Site Assessment are as follows:

- Establish a basis of understanding of the past and present land uses of the Subject Properties in order to identify potential environmental and/or public health risks.
- Establish a basis of understanding of the past and present surrounding land uses and environmental resources in order to determine their impact on the environmental quality of the Subject Properties.
- Identify any known or potential items in non-compliance with applicable Local, State, or Federal environmental laws and regulations, and subsequently specify how these items can be brought into compliance.
- Identify, to the extent feasible, recognized environmental conditions in connection with the subject and surrounding Property. "Recognized environmental conditions" are defined by ASTM as:

> *"(1) the presence of hazardous substances or petroleum products in, on or at the Subject Properties due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on or at the Subject Properties due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on or at the Subject Properties under conditions that pose a material threat of a future release to the environment. A de minimis condition is not a recognized environmental condition."*

"Historical Environmental Conditions" are defined by ASTM as:

> *"a previous release of hazardous substances or petroleum products affecting the Subject Properties that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities, without subjecting the property to any controls (for example activity and use limitations, or other property use limitations)."*

"Controlled Recognized Environmental Conditions" are defined by ASTM as:

> *"A recognized environmental condition affecting the Subject Properties that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of controls (for example, activity and use limitations or other property use limitations)."*

1.2 Special Terms and Conditions

It is the responsibility of the user(s) of this report (i.e., Rothman Group) to provide certain information utilized in the report. This would include reporting any environmental cleanup liens that are filed or recorded against the site; activity and land use limitations that are in place on the site or that have been filed or recorded in a registry; specialized knowledge or experience of the person seeking to qualify for the "Landowner Liability Protection" (LLP); relationship of the purchase price to the fair market value of the Property if it were not contaminated; commonly known or reasonable ascertainable information about the Property; and the degree of obviousness of the presence or likely presence of contamination at the Property, and the ability to detect the contamination by appropriate investigation.

The level of inquiry is uniform in each Phase I Environmental Site Assessment (ESA); however, the availability of information, relevance, and quality of information can vary. As per ASTM Standards, the "environmental professional is not required to verify independently the information provided, but may rely on information provided unless he or she has actual knowledge that certain information is incorrect or unless it is obvious that certain information is incorrect based on other information obtained in the Phase I ESA or otherwise actually known to the environmental professional." Personnel involved in report preparation will make judgments on the accuracy of user provided information and conduct additional research as necessary in order to meet the requirement of identifying recognized environmental conditions on the Subject Properties.

ASTM refers to a number of standard sources of historic information. Galli Engineering, P.C. and its representatives will seek to research as many sources of historic information as may be available as a means of cross confirmation. However, according to ASTM Standard Practice for Environmental Site Assessments (E-1527-21), "the environmental professional is required to review only record information that is reasonably ascertainable", wherein reasonably ascertainable is defined as information that is (1) publicly available, (2) obtainable from its source within reasonable time and cost constraints, and (3) practically reviewable." ASTM defines reasonable time constraints for providing information as being provided by the source within twenty days of receiving a written request. Practically reviewable means that "the information is provided by the source in a manner and in a form that, upon examination, yield information relevant to the Property without the need for extraordinary analysis of irrelevant data."

Based on ASTM Standards, the Phase I ESA is not intended to include any sampling and analysis of materials associated with the Subject Properties (i.e., soil, water, air, or building materials).

1.3 Limitations and Exceptions

This assessment is dated and is only valid for activities that occurred prior to the date of the site visit. Activities, liabilities, and alterations to the Subject Properties subsequent to the date of the site visit are not included in the assessment. Under the ASTM Standard, this Phase I ESA will remain viable if it was completed no more than 180 days prior to the date of acquisition, or up to one year, if five specific components of the Report have been updated. The five components include interviews, searches for recorded environmental cleanup liens, review of government records, site reconnaissance of the Subject Properties and adjoining properties, and the declaration by the Environmental Professional (EP) responsible for the assessment or update.

This assessment is intended to assess the potential for public health or environmental liabilities based upon examination of the Subject Properties in accordance with ASTM Standards. The ASTM Standards provide specific guidance with regard to radon, asbestos, lead in drinking water, lead-based paint and polychlorinated biphenyls (PCBs). Petroleum products are included in the

scope of practice because they are of concern with respect to many parcels of commercial real estate and current custom and usage is to include an inquiry into the presence of petroleum products when doing an environmental site assessment of commercial real estate. Inclusion of petroleum products within the scope of this practice is not based upon the applicability, if any, of CERCLA to petroleum products. Under the petroleum exclusion of CERCLA (42 U.S.C. 9601 (14)), petroleum and crude oil have been explicitly excluded from the definition of hazardous substances under CERCLA.

Analysis of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) implications with regard to the innocent landowner defense under Superfund finds that naturally occurring radon is not subject to CERCLA liability and is appropriately considered as a non-scope issue. Accordingly, this assessment will only provide general guidance on this issue, and will not involve or recommend air monitoring for radon gas.

Similarly, the ASTM Standards do not recognize liability with regard to asbestos that is part of the building materials of a structure, in accordance with CERCLA innocent landowner defense under Superfund. However, if asbestos containing material was disposed of on a Property, such practice would be subject to Superfund response actions and should be identified consistent with ASTM guidelines. In the interest of serving the client and addressing the needs of the user, this assessment will address observed suspect asbestos containing materials (ACM's) that may pose a health threat. This assessment is not a full asbestos survey as would be required for building demolition, or identification of all possible sources of ACM, regardless of health risk.

Lead in drinking water and lead-based paint are also issues considered to be non-scope under CERCLA innocent landowner defense under Superfund. Lead based paint was in use for many years, and it is likely that many older buildings will have surfaces coated with lead-based paint. As a general rule, painted surfaces should be maintained and ingestion of paint products should be avoided. If on-site disposal of these materials were involved, disclosure of this practice would be subject to the scope of this environmental assessment. Lead in drinking water generally occurs as a result of past use of high lead content solder. Water left stagnant in pipes overnight or longer

may leach lead from these joints and affect drinking water quality. As a general rule, water should run for several minutes in the morning where such plumbing may be present.

This assessment will not identify all potential sources of PCB containing oils. Common sources of these materials include transformers and fluorescent lamp ballasts. Electric service transformers may include ground level or pole-mounted units. These transformers are owned and maintained by regional public utilities. Should a release of the contents occur, the responsible utility company must assume liability regardless of PCB content. Galli Engineering, P.C. and its representatives does not anticipate financial liability to the Subject Properties owner unless the Property owner or occupant causes a release due to gross negligence or willful act. The use of PCBs was banned effective July 1, 1979 under the Toxic Substance Control Act (TSCA), and most transformers containing PCBs have been changed out. Aggressive and destructive testing, which would be required for definitive identification of PCB containing oils, is beyond the scope of this study.

Controlled substances are not included within the scope of this standard. Persons conducting an environmental site assessment as part of an EPA Brownfields Assessment and Characterization Grant awarded under CERCLA 42 U.S.C. 9604(k)(2)(B) must include controlled substances as defined in the Controlled Substances Act (21 U.S.C. 802) within the scope of the assessment investigations to the extent directed in the terms and conditions of the specific grant or cooperative agreement. Additionally, an evaluation of business environmental risk associated with a parcel of commercial real estate may necessitate investigation beyond that identified in this practice.

The accuracy of any assessment is limited to the information available during the time of the site visit; the records, files, and drawings provided by the owner and released by governmental agencies; and the accuracy and completeness of the information provided during interviews.

1.4 Data Gaps

Any data gaps identified herein, as defined by ASTM Practice E 1527-21 § 3.2.19, are not considered to have significantly affected the ability to identify recognized environmental conditions in connection with the Subject Properties and do not alter the conclusions of this report.

1.5 Project Specifications

This assessment was performed in accordance with good commercial and customary practice as defined by the ASTM E-1527-21 Standard Practice for Environmental Site Assessments. Presented herein are the results of the Phase I ESA conducted by Galli Engineering, P.C. and its representatives on the Subject Properties. Galli Engineering, P.C. and its representatives prepared this site assessment under contract with Rothman Group in order to satisfy requirements as stipulated by said user (ASTM E-1527-21).

2.0 SITE CONDITIONS

2.1 Site Description

The Subject Properties is comprised of four separate lots 461, 463, 428, and 429. Lot 461-463 are known as 403-405 Main Street (Subject Properties A) and Lot 428-429 are known as 413-415 Main Street (Subject Properties B). The Subject Propertiesare identified by the Nassau County Tax Map as Section: 5, Block: C, Lots: 461, 463, 428, and 429. Subject Properties A, 403-405 Main Street is comprised of two (2) two-story buildings, a gravel parking area, and a floating dock. Subject Properties B, 413-415 Main Street is comprised of two (2) 1-story buildings, parking lots and a floating dock.

The lots are commercial/office space. Subject Properties A consists of a 0.5-acre parcel. Subject Properties B consists of a 0.75-acre parcel. The surrounding area is densely developed and consists of industrial and commercial uses.

2.2 Subject Properties Reconnaissance

The Subject Properties reconnaissance was conducted by Nicole Goloff, Project Environmental Scientist, on September 11th, 2024. At the time of the survey, the weather was sunny and approximately 80º Fahrenheit.

At the time of assessment, Subject Properties A is currently utilized two two-story buildings, consisting of many units and the boatyard/marina is utilized by Angler. Below a list has been provided by the client:

403	405
Warf Sports	Douglas & James Ice Cream
Fitness Inspired Training	Atlantic Outfitters, LLC
Skinsuit LLC	Gold Coast Chiropractic
Signal 5 Fire Apparatus	ISW/Hair Studio
DB Rejuvenation	Be Fit PT

J. Eaton Garland Design	I and Eye Trading Corp.
Gus Harris	M&M Property Development
Eddie Dibiasi	
Dan Purcell/Leeds Property LLC	
Long Island Boat Rentals	

Subject Properties B is currently utilized by two one-story buildings. Most of building 413 was most recently utilized by “Campbell’s Carpet Store” but is now currently vacant. There are two other units in the building 413. Building 415 was most recently utilized by “Restaurant La Parma” and is now currently vacant. There is a concrete patio in the back of 415.

The area surrounding areas on the lots are surrounded by, gravel parking lots, asphalt parking lots, and there are two floating docks. The buildings located on the Subject Properties are comprised of brick and masonry.

2.3 Methodology and Limiting Conditions

The Subject Properties reconnaissance consisted of visual and/or physical observations of the Subject Properties, adjoining Property as viewed from the Subject Properties boundaries, and the surrounding area based on visual observations made from adjacent public thoroughfares. Building exteriors were observed along the perimeter from the ground, unless described otherwise. Building interiors were observed as they were made safely accessible, unless described otherwise.

2.4 Hazardous Substances and Petroleum Products

The building is heated by electric powdered space heaters and natural gas.

2.5 Underground Storage Tanks (USTs) and Aboveground Storage Tanks (ASTs)

2.5.1 Existing Storage Tanks

Based upon site reconnaissance, interviews, and a review of state and local records, Galli Engineering, P.C. and its representatives did not identify any aboveground or underground fuel tanks on the Subject Properties.

2.5.2 Former Storage Tanks

Based upon site reconnaissance, interviews, and a review of state and local records, Galli Engineering, P.C. and its representatives did not identify former storage tanks located at the Subject Properties.

2.6 Additional Site Conditions

The following is a summary of visual and/or physical observations of the Subject Properties on the day of the site visit. Photographs of pertinent Subject Properties features are presented in Appendix B.

Additional Site Conditions	
Condition	**Identified**
Interior Drains, Trenches, or Sumps	Yes
Interior Stains or Corrosion	Yes
Unusual Odors	No
Interior Pools of Liquid	Yes
Stained Soil or Pavement	Yes
Stressed Vegetation	No
Indications of Solid Waste Disposal	No

Additional Site Conditions	
Condition	**Identified**
Exterior Pits, Ponds, or Lagoons	No
Wastewater or Stormwater Discharge/Disposal	Yes
Oil-Water Separators or Clarifiers	Yes
Septic Systems or Cesspools	Yes
Wells (Drinking Water Wells, Monitoring Wells, Agricultural/Irrigation Wells, or Process Water Wells)	No
Petroleum or Natural Gas Pipelines/Easements	Yes

2.7 Surrounding Property

A due diligence investigation into the potential impacts from off-site sources was conducted. The Subject Properties is located in an area consisting of primarily residential and commercial business development.

Direction	Address	Type
403-405 & 413-415 Main Street		
North	Louie's Prime Steak & Seafood – 395 Main Street	Restaurant
South	Knickerbocker Bay Club – 433 Main Street	Restaurant
West	Forested/Wetland Area Pralls Creek	Forest Waterway

East	Main Street	Roadway
	400 Main Street	Building
	Monika Coiffure Spa Studio – 402 Main Street	Building
	Rlh Management Inc. – 404 Main Street	Building
	2nd Ave	Roadway
	410 Main St	Building
	Spectrum Suds- 416 Main St	Building

Being in a primarily residential and commercial area, the properties in the surrounding areas are not likely to have potential for environmental impact.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

Title records were not available prior to preparation of this assessment.

3.2 Environmental Liens or Activity and Use Limitations

Activity and Use Limitations (AULs) are one indication of past or present release of a hazardous substance or petroleum products. AULs are an explicit recognition by a federal, tribal, state or local regulatory agency that residual levels of hazardous substances or petroleum products may be present on a Property, and that unrestricted use of the Property may not be acceptable. The AUL should provide information on the contaminant(s) of concern, the potential exposure pathway(s) that the AUL is intended to control, the environmental medium that is being controlled, and the expected performance objective(s) of the AUL. AULs are often recorded in land title records. AUL information is contained in the restrictions of record on the title, rather than a typical chain of title.

No Environmental Liens and Activity and Use Limitations were found of record.

4.0 REVIEW OF CORPORATE RECORDS AND REVIEWS

A review of corporate records and personal interviews can provide useful information regarding the processes occurring on the site. Interviews with Subject Properties representatives and review of available documentation have revealed the following information regarding the environmental quality of the Subject Properties.

4.1 Interviews with Past and Present Owners, Operators and Occupants

Interviews with personnel confirmed years of ownership, interior and exterior upgrades, painting, neighboring businesses and information and locations of buildings operational use and physical features.

4.2 Notice of Violation and/or Stop Work Order

No open NYSDEC violations were identified for the Subject Properties.

5.0 GOVERNMENT RECORD INVENTORY

Galli Engineering, P.C. and its representatives requested and reviewed available federal, state, and local regulatory information concerning historical land use and potential environmental issues relating to the Subject Properties. The results of these inquiries and associated records research are discussed in this section.

5.1 Freedom of Information Act Requests

The Freedom of Information Act, (New York Public Officers Law, Article 6, Sections 84-90) provides rights of access to all government documents not exempt from disclosure. Accessible records can include paper documents plus items such as video/audio tape recordings, microfilm and computer files. Galli Engineering, P.C. and its representatives has made written requests for all relevant government documentation so as to identify implicit parameters affecting the environmental quality of the Subject Properties. Typically, government agencies take up to six weeks or more to reply with any findings. Copies of any significant information received after issuance of this report will be forwarded to the client.

5.2 Environmental Database Search

Galli Engineering, P.C. and its representatives retained Environmental Data Resources, Inc. (EDR) to provide a database search of environmental records maintained by Federal and New York State governments. Galli Engineering, P.C. and its representatives examined available environmental database information and records for the Subject Properties and surrounding Property to identify potential environmental impairment with respect to releases, contamination or enforcement actions.

The scope of the database search conducted by EDR is in accordance with ASTM Standard E-1527-21. The specific Federal and State databases searched by EDR are listed below. A

description of these databases can be reviewed on pages GR-1 through GR-31 of the EDR Report. A copy of the EDR Report is provided in Appendix C.

FEDERAL ASTM STANDARD

NPL	National Priority List
Proposed NPL	Proposed National Priority List Sites

EDR Database Search of Subject Properties:

The target property was identified on the RCRA Nongen/NLR, FINDS, ECHO, NY Manifest, ERNS, NY Spills, EDR Hist Auto, FINDS, EDR Hist Auto database of the EDR Radius Map report records.

Typelink Inc, 403 Main Street:

- RCRA/ECHO Listings: The Subject Properties is listed on the RCRA database under EPA ID: NYD986887909 for corrosive waste and silver. No violations were found.
- NY Manifest: The Subject Properties is listed on the NY Manifest database under NY Manifest under EPA ID: NYD986887909, dated 11/13/1990 for 55-gallons of silver.

405 Main Street:

- ERNS Incident Commons: The Subject Properties is listed on the ERNS database under NRC Report #: 656538 when material is releasing from a vessel that was partially submerged, motor oil was leaking from the engine during an equipment failure on 9/11/2003. The action taken place was booms applied, absorbents applied, and removing the vessel from the water.

Inspiration Wharf, 405 Main Street:

- Spills: The Subject Properties is listed on the spills database under spill #0325279 on 9/11/2003 when material was released from a vessel that was partially submerged and motor oil leaked from the engine. The spill was closed on 9/11/2993.
- Spills: The Subject Properties is listed on the spills database under spill #9704344 when an equipment failure caused motor oil to spill in the gravel parking lot. The spill was closed on 12/10/1997.

Marshall A & R Sales LTD, 403 Main Street:

- EDR Hist Auto: The Subject Properties is listed on the EDR Auto Database in 1975 under Marshall A & R Sales LTD, gasoline service station.

Ventura Marina Management Corp, 403-405 Main Street:

- FINDS: The Subject Properties is listed on the FINDS database under registry ID: 110019206018.

Mariner Resource Corporation, 405 Main Street:

- EDR Hist Auto: The Subject Properties is listed on the EDR Hist Auto database from 1997 until 1999 under Mariner Resource Corporation, gasoline service station.

Based upon, the nature of the listings, for the Subject Properties, it is likely that the listings are of a concern.

There were database listings identified at the adjoining or adjacent properties:

397 Main Street:

- Spills: 397 Main Street is located adjoining, cross-gradient to the north of the Subject Properties. It is listed on the spills database under spill #0225209, which occurred on 8/28/2002 when abandoned drums were left on the beach by the restaurant, the sand was discolored around it. The drum was located and the spill was closed on 8/28/24.
- Spill #0703167 occurred on 6/17/2007 when a pole mounted transformer spilled onto the street due to an unknown reason. The spill was cleaned up and closed on 8/2/2007.
- Spill #0205177 occurred on 8/16/2002 when abandoned drums were reported, located, inspected, and closed on 11/7/2011.
- Tanks Nassau: Louie's Shore Restaurant Inc, located at 397 Main Street, permit ended 11/1/1992.
- Nassau County UST: Louie's Restaurant Inc, 397 Main Street is listed under facility ID# 39022 with install dates 2/1/1956, 6/1/1964 and 8/1/1972.

387 Main Street:

- Spills: 387 Main Street is located adjoining, cross-gradient to the north of the Subject Properties, is listed under spill #0703538 due to an equipment failure of soil and dielectric fluid to the soil on 6/26/2007 and was closed on 8/2/2007.

Main Street & Second Avenue:

- Spills: Main Street & Second Avenue is located adjoining, up-gradient to the south of the Subject Properties, is listed under spill #9005625 when diesel and petroleum were reported on the surface water on 8/21/1990. The spill was cleaned and closed on 9/27/1990.

433 Main Street:

- NCFM UST: Knickerbocker Yacht Club is located adjoining, up-gradient to the south of the Subject Properties, is listed under the MCFM UST database under tank location ID: 200448, 10,000,000-gallon tank dated 6/29/1996.
- RCRA-VSQG Listings: 433 Main Street is listed under EPA ID: NYN008021040 as a conditionally exempt small quantity generator in 2009. No violations were found.
- Spills: 433 Main Street is listed under spill #9602277 on 5/17/1996 when upon excavation down to an existing tank, contaminated soil was found, product was spilling onto the ground, contaminated soil was removed and endpoint samples were collected. The spill was closed on 6/15/2005.
- Spills: 433 Main Street is listed under spill #1205511 occurred on 8/31/2012 when underground tanks were found during a demolition with floating product on groundwater. The spill was closed on 10/4/2012.
- UST Finder Release: 433 Main Street is listed under facility ID: NY9602277 on 5/16/1996 and is listed as No Further Action.

421 Main Street:

- RCRA Listings: 421 Main Street is located adjacent, up-gradient to the east of the Subject Properties. It is listed on the RCRA Listings database under EPA ID: NYN008021057, as a conditionally exempt small quantity generator in 2009. No violations were reported.

Main Street and 2nd Avenue:

- Spills: Main Street and 2nd Avenue is located adjacent, up-gradient to the east of the Subject Properties. It is listed on the Spills database under spill #9604430 on 7/3/1996 when a fire at the location caused spillage and material entered storm drains. Unable to recover product from the storm drains but the surface was cleaned up and the spill closed on 8/9/1996.

400 Main Street:

- Spills: 400 Main Street is located adjacent, up-gradient to the east of the Subject Properties. It is listed on the spills database under spill #9101193 on 4/29/1991 when contaminated soil was found, a well was installed and regularly checked and no sheen was ever present in the well. The spill was closed on 4/29/1991.

EDR Database Search of Off-Site Locations:

Review of the EDR database report has revealed the following:

The map findings summary from EDR listed 4 RCRA-RSQG, 1 ERNS, 4 NY SHWS, 12 NY LTanks, 17 NY UST, 1 NY MOSF UST, 6 NY AST, 1 NY MOSF AST, 11 NY Tanks, 1 NY VCP, 1 NY Brownfields, 18 NY Spills, 3 RCRA Nongen/NLR, 1 FUDS, 2 FINDS, 1 ECHO, 3 UST Finder Release, 3 NY Manifest, 3 EDR Hist Auto, and 1 EDR Hist Cleaner.

Lists of Federal RCRA generators

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or

dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 06/03/2024 has revealed that there are 4 RCRA-VSQG sites within approximately 0.25 miles of the target property.

Based on the absence of violations, it is considered unlikely that conditions associated with these sites represent an environmental concern to the Subject Properties.

Lists of state- and tribal hazardous waste facilities

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 08/01/2024 has revealed that there are 4 NY SHWS sites within approximately 1 mile of the target property.

Based on the lack of violations, it is considered unlikely that conditions associated with these sites represent an environmental concern to the Subject Properties.

Lists of state and tribal leaking storage tanks

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 07/30/2024 has revealed that there are

12 NY LTANKS sites within approximately 0.5 miles of the target property.

Remainder of the listings are located in Appendix C. The listings located on the Subject Properties, adjoining and adjacent to the Subject Properties, are considered likely to represent an environmental concern to the Subject Properties.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/03/2024 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

BILL WOLF PETROLEUM EPA ID:: NYR000086736	*80-81 NEW SHORE RD*	*SE 1/8 - 1/4 (0.147 mi.)*	*H42*	*72*

Due to the listing on the Subject Properties, it is considered likely to represent an environmental concern to the Subject Properties.

FUDS: The Listing includes locations of Formerly Used Defense Sites Properties where the US Army Corps Of Engineers is actively working or will take necessary cleanup actions.

A review of the FUDS list, as provided by EDR, and dated 05/13/2024 has revealed that there is 1 FUDS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
GRUMMAN AIRCRAFT		WNW 1/2 - 1 (0.689 mi.)	81	191

Due to the distance, the site is considered unlikely to represent an environmental concern to the Subject Properties.

UST FINDER RELEASE: US EPA's UST Finder data is a national composite of leaking underground storage tanks. This data contains information about, and locations of, leaking underground storage tanks. Data was collected from state sources and standardized into a national profile by EPA's Office of Underground Storage Tanks, Office of Research and Development, and the Association of State and Territorial Solid Waste Management Officials.

A review of the UST FINDER RELEASE list, as provided by EDR, and dated 06/08/2023 has revealed that there are 3 UST FINDER RELEASE sites within approximately 0.5 miles of the target property.

WALT WALTERS SERVICE	*320 MAIN ST*	*NE 1/8 - 1/4 (0.193 mi.)*	*J51*	*95*
EPA ID: NYD986980589				

Due to the lack of violations at the listings, these sites are considered unlikely to represent an environmental concern to the Subject Properties.

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
MESCH JOHN UNIVERSAL	439 MAIN STREET	SE 0 - 1/8 (0.024 mi.)	B23	41

Due to the distance, this site is considered unlikely to represent an environmental concern to the Subject Properties.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
NAM JAMES G	25 3RD AVE	E 0 - 1/8 (0.123 mi.)	F37	58

Due to the lack of violations at the listings, this site is considered unlikely to represent an environmental concern to the Subject Properties.

5.3 Vapor Encroachment Screen

Galli Engineering, P.C. and its representatives conducted a vapor migration screening survey of the Subject Properties. Galli Engineering, P.C. and its representative's observations and review of the environmental database report (cited in Section 5.2) did not identify any conditions on the Subject Properties or on adjoining Property that would indicate a REC relative to vapor migration existing at the Subject Properties.

This vapor migration screening was conducted in accordance with ASTM E1527-21 and is not intended to satisfy the requirements of ASTM E2600-10. The scope of this screening was limited to visual observations and review of the environmental database report and did not include the collection and laboratory analysis of air samples to confirm the presence of airborne contaminants by vapor intrusion.

5.4 Site History

The purpose of reviewing historical use sources is to identify any prior use of the Property or adjoining Property, which could lead to the presence of recognized environmental conditions that may adversely affect the Property. Galli Engineering, P.C. and its representatives retained Environmental Data Resources, Inc. (EDR) to provide available historical information for the Subject Properties. Copies of this historical documentation are provided in Appendix F.

Aerial Photograph Summary

Aerial photographs were available from EDR for the years of 1940 through 2019. Copies of the aerial photographs are included in Appendix E. The following historical information was extracted from the aerial photographs.

Aerial Photograph Summary	
Year	**Observations**
1940-1946	**Subject Properties:** The Subject Properties is depicted as developed with multiple dwellings and a dock.
	Surrounding Area: The area to the north appears to maintain some dwellings, docks, the shoreline and water. The area to the south appears to maintain a building and a dock. The area to the west is water. The area to the east appears to maintain a roadway and multiple dwellings.
1951-1964	**Subject Properties:** The Subject Properties is appears to maintain a dock, three buildings, and a parking lot.
	Surrounding Area: The area to the north appears to maintain docks, two buildings, and a dock parking lot. The area to the south appears to maintain a dock, multiple buildings, and parking lots. The area to the east appears to maintain a roadway and multiple dwellings. The area to the west is water.
1976-2019	**Subject Properties:** The Subject Properties is depicted as having one large building and three smaller buildings, a dock, and parking lot.
	Surrounding Area: The area to the north appears to maintain docks, two buildings, and a dock parking lot. The area to the south appears to maintain a dock, multiple buildings, and parking lots. The area to the east appears to maintain a roadway and multiple dwellings. The area to the west is water.

Sanborn Fire Insurance Maps

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Galli Engineering were identified for the years listed below.

Sanborn Fire Insurance Maps Summary	
Year	**Observations**
1909-1919	**Subject Properties:** The Subject Properties is divided into multiple lots. It is comprised of the following: multiple small storage sheds, pool & tobacco store, restaurant, two offices, Geo. C. McKee Coal Yard, coal bomber, C.W. Copp Lumber Yard, Lumber shed, Lumber piles, and the Bay View Hotel.
	Surrounding Properties: The area to the north is comprised of a shed, boat house, and an auto repair store. The area to the south is comprised of a bath house, Knickerbocker Yacht Club, and the Manhasset Bay. The area to the east is comprised of Broadway or Shore Road, and multiple dwellings. The area to the west is Manhasset Bay.
1925-1931	**Subject Properties:** The Subject Properties is comprised a laundromat, multiple sheds, and a store.
	Surrounding Properties: The area to the north is comprised of a store, automobile garages, and a dance hall. The area to the south is comprised of Knickerbocker Yacht Club, a garage and the Manhasset Bay. The area to the east is comprised of Broadway or Shore Road, and multiple dwellings. The area to the west is Manhasset Bay.
1936-1951	**Subject Properties:** The Subject Properties is divided into multiple lots. The property is comprised of A&R Marshall, Inc. Marine Service & Supplies, multiple boat houses, multiple storage sheds, and two stores.
	Surrounding Properties: The area to the north is comprised of a storage shed, and two stores. The area to the south is comprised of Knickerbocker Yacht Club, an auto repair garage, Peterson's Shipyard and the Manhasset Bay. The area to the east is comprised of Main Street, and multiple dwellings. The area to the west is Manhasset Bay.
	Subject Properties: The Subject Properties is divided into multiple lots. The property is comprised of A&R Marshall, Inc. Marine Service & Supplies, a

1961	boat houses, multiple storage sheds, a restaurant, the Town Dock Theatre and a store.
	Surrounding Properties: The area to the north is comprised of a storage shed, and two stores. The area to the south is comprised of Knickerbocker Yacht Club, an auto repair garage, Peterson's Shipyard and the Manhasset Bay. The area to the east is comprised of Main Street, and multiple dwellings. The area to the west is Manhasset Bay.
1980	**Subject Properties:** The Subject Properties is comprised of A&R Marshall, Inc. Marine Service & Supplies, a boat repair store, a restaurant, and multiple stores.
	Surrounding Properties: The area to the north is comprised of a a commercial business, a store, a pier, and a parking lot. The area to the south is comprised of Knickerbocker Yacht Club, an auto repair garage, multiple boat storage, boat houses, an auto repair shop, a wood pier, and Manhasset Bay. The area to the east is comprised of Main Street, and multiple dwellings. The area to the west is Manhasset Bay.

Topographic Map Summary

USGS Historic Topographic Maps were available from EDR for the years 1897 through 2019. Copies of the Topographic Maps are included in Appendix D. The following historical information was extracted from the Topographic Maps.

Topographic Map Summary	
Year	**Observations**
1897-1900	**Subject Properties:** The Subject Properties is not developed on this map; no distinct structures are depicted.

Topographic Map Summary	
Year	**Observations**
	Adjoining Properties: The Adjoining Properties are developed to the east of the Subject Properties; no distinct structures or other notable features are depicted.
	Surrounding Properties: The surrounding properties are lightly developed on this map; the roadways are visible and no distinct structures or other notable features are depicted.
1947-2019	**Subject Properties:** The Subject Properties is developed with what appears to be a dock; no distinct structures or other notable features are depicted.
	Adjoining Properties: The Adjoining Properties are developed with dwellings and docks; no distinct structures or other notable features are depicted.
	Surrounding Properties: The surrounding properties are developed.

City Directory Image Report

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a Subject Property resulting from past activities. EDR's City Directory includes a search of available city directory data at 5-year intervals (if available).

Property Ownership

Property ownership history was researched through the all available records provided by The EDR-City Directory Image Report, and local and federal environmental databases.

Upon review of local and federal environmental databases, no open violations were recorded for any of the above listed properties associated with their tenants.

6.0 LIMITED SCOPE INVESTIGATION OF POSSIBLE LEAD PAINT

The element lead has no function in the body. It can have poisonous effects on human organs and the nervous system, causing a variety of toxic reactions. Since lead accumulates in the body more rapidly than it can be removed, repeated exposures even to small amounts may produce lead poisoning. In addition, deteriorating lead components may allow lead to become airborne. Threshold limit values have been established at 0.15 mg/m^3 (in air) by the American Conference of Governmental Industrial Hygienists. The regulated concentration of lead detected in paint is defined as above 0.5% lead by weight (or 5,000-ppm) in Title IV of the Toxic Substances Control Act (TSCA). According to interviews with site staff, all buildings had been painted within the last 5 years. Due to the ban on lead-based paints, a lead paint test is not necessary.

7.0 RADON

Radon is a heavy colorless, odorless, radioactive gas formed by the radioactive decay of radium. Radon is associated with specific geologic formations that contain granite, uranium minerals and certain shale and phosphate related minerals. Radon, a gas, can migrate to and accumulate in confined spaces, such as building basements. Continued exposure to radon gas has been associated with increased lung cancer risk and possible genetic damage.

The USEPA has set an action level of 4 pico curies per liter (pCi/L) in air. At concentrations above this level, the USEPA recommends measures to lower the concentrations. A "Map of Radon Zones" indicates the levels of radon concentrations from testing and aerial surveys conducted in all counties in New York State. The Subject Properties is located in Federal EPA Radon Zone 3, which is defined as an area having an indoor radon average of <2.0 pCi/L. A map is included in Appendix E.

In light of this information, and the ASTM guidelines, radon concentrations are not an environmental concern for the Subject Properties.

8.0 ASBESTOS CONTAINING MATERIAL

Asbestos has been linked to various types of lung diseases. Various regulatory agencies have tolerance limits of 1% by weight for asbestos in materials. Any material that contains asbestos levels above this limit may be considered hazardous and may have to be abated.

This Phase I assessment is not a full asbestos survey as would be required for building demolition, or identification of all possible sources of ACM, regardless of health risk. This assessment merely addresses observed suspect asbestos containing materials (ACM's) that may pose a health threat.

Asbestos may be present in some of the roofing, flooring, wall and ceiling materials, caulking/putties, adhesives, spackling compounds, and insulation materials, as well as other building materials that may be used at the Subject Properties. Sampling many of these materials requires techniques that may be destructive to subject facilities, and in the case of roofing material, may void warranties. It is recommended that an asbestos inspection be performed in accordance with all applicable federal, state, and local regulatory requirements prior to renovation, demolition, or other activities that could cause a material disturbance. Any removal or disturbance of ACM or suspect ACM should be performed by properly trained personnel and in compliance with federal, state, and local regulations.

9.0 PROXIMITY OF PROPERTY TO SENSITIVE ECOLOGICAL AREAS

During the site inspection, Galli Engineering, P.C. and its representatives did not identify any ecologically sensitive areas, i.e. wetlands, floodplains, within the subject site. Based on review of the Federal Wetland Inventory, the closest wetland is A 882,492-acre Estuarine and Marine Deepwater habitat, located approximately adjacent to west of the Subject Properties. Based on the distance from the Subject Properties, it is likely for this wetland to affect the Subject Properties.

Therefore, in accordance with the ASTM guidelines and the NYSDEC ecological regulations, ecological areas are not an environmental concern and no restrictions on land development are indicated at the Subject Properties.

10.0 SITE CHARACTERISTICS

10.1 Physiography and Topography

The Subject Properties is located within Sea Cliff, NY. Elevations in the area within a one-mile radius of the Subject Properties is approximately 9 feet above mean sea level.

The U.S.G.S 7.5 Minute (Topographic) Map of Sea Cliff, NY indicates that the elevation of the subject site is approximately 9 feet above mean sea level. The general topographic gradient is to the south/southwest. The approximate geographical location is Latitude: 40.4911 – (40° 49' 11'' N) Longitude -73.4130 – (73° 41' 30'' W).

10.2 Geology

The geology of this section of Nassau County consists of Recent Deposits consisting of the alluvial, shore-line deposits, salt marsh deposits and artificial fill. Upper Pleistocene glacial deposits are glacial till which is composed of unsorted, clay, sand and boulders. The Upper Cretaceous Matawan Group-Magothy Formation consisting of fine to medium sand with some clay. Gravel is common in lower portion. The Lower Cretaceous Raritan Formation consists of an Upper Clay Member and a lower Lloyd Sand Member. The Lloyd Sand Member consists of fine to course, yellow, white and gray sand with some gravel. The Lloyd Sand member unconformably overlays the Paleozoic-Precambrian basement rocks consisting of schist, gneiss and granite.

Major aquifers consist of the Upper Pleistocene Glacial Aquifer, the Upper Cretaceous Magothy Aquifer, and the Lower Cretaceous Lloyd Aquifer.

10.3 Soils

The United States Department of Agriculture (USDA) Soil Conservation Service (SCS) information indicates that the soils on the Subject Properties are described as variable. The soil includes loamy sand, loam, gravelly loam, and stratified gravelly sand. It is identified as Class A, with high infiltration rates and with deep, well and excessively well drained soils with coarse textures.

10.4 Surface and Groundwater Resource

Since shallow groundwater usually follows overall surface topography, it is anticipated that shallow groundwater at the site will tend to flow in a general southern direction. There are surface water features which are located adjoining to the Subject Properties. Manhasset Bay is located within 0 feet to the west of the Subject Properties.

Although no groundwater data is readily available for the target property and vicinity, the general direction of surface and shallow groundwater flow would be influenced towards the south flowing into the Raritan Bay.

The flow of deeper groundwater is influenced by subsurface geology and thus, no reliable conclusions regarding the direction of groundwater flow or quality can be made without a more comprehensive hydrologic analysis.

11.0 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

A Subsoil Investigation was performed by Soil Mechanics Drilling Corp. on May 16, 2024 at 405 Main Street. The document is provided in Appendix F. The report revealed that the site is comprised of mixed soil, rubble fill (concrete, brick, gravel, rock fragments, cinders, ash, glass, wood and other miscellaneous debris extending down from 10 feet to 18 feet.

12.0 CONCLUSIONS AND RECOMMENDATIONS

Conclusions:

Galli Engineering, P.C. and its representatives has performed this Phase I Environmental Site Assessment of the Property located 403-405 and 414-415 Main Street, Port Washington, NY in accordance with the scope and limitations of ASTM E-1527-21. Based upon Galli Engineering, P.C. and its representatives Phase I investigation, upon the visual site inspection observations, two (2) Historical Environmental concerns, one (1) Recognized Environmental Concern, one (1) Area of Concern and one De Minimis Condition at the Subject Properties.

- Historical Recognized Condition: Due to the history of the Subject Properties as provided by the EDR database, lot 461 and 463 were utilized as a coal yard from 1909-1919, a laundromat from 1925-1931, and a boat yard from 1936 until present day. Additionally, there are records of two spills at 405 Main Street (#032579 and #9704344), and listings from 1975, 1997, and 1999 as a Historic Auto. Due to these previous historic activities at the Subject Properties, it is recommended that further investigation, sampling of the soil/groundwater should be performed in order to determine if the environmental quality of the Subject Properties have been impacted.
- Historical Recognized Condition: According to the EDR database, spill #0225209 and #0205177 at 397 Main Street, #9602277 and #1205511 at 433 Main Street, #0703538 at 387 Main Street, #9604430 and #9005625 at Main Street and 2nd Ave, and #9101193 at 400 Main Street have occurred adjoining/adjacent to the Subject Properties. In particular, spill #9602277 and #1205511 (433 Main Street) have been recorded to have impacted the groundwater at the site. Due to its adjoining location to the Subject Properties, it is recommended that the groundwater at the Subject Properties should be investigated/sampled further to determine if the spills have impacted its environmental quality.
- Recognized Environmental Concern: The western portion of lot 461 and 463 are utilized as a boat yard. Upon visual inspection of the area, staining on the soil was observed throughout the yard. Additionally, according to the Subsoil Investigation by Soil Mechanics Drilling Corp., the area is comprised of mixed soil and rubble fill material. Various fill of different materials can cause issues with suspected contamination. It is recommended that further inspection, sampling, of the soil/groundwater and the on-site storm drains in this area be performed in order to determine if the current on-site activities and presence of fill material has impacted the Subject Properties environmental quality.

- Due to the age of the building, built in 1971, asbestos may be present in some of the roofing, flooring, wall and ceiling materials, caulking/putties, adhesives, spackling compounds, and insulation materials, as well as other building materials that may be used at the Subject Properties. Due to age, building materials throughout the building such as flooring tiles, ceiling tiles, etc., may maintain asbestos containing materials. An in-depth visual inspection and sampling of these areas should be conducted by a professional. Any removal or disturbance of ACM or suspect ACM should be performed by properly trained personnel and in compliance with federal, state, and local regulations.

De Minimis Conditions:

- If any equipment that may contain mercury and PCB-containing equipment, such as light fixtures is scheduled to be replaced or removed from the site will be disposed of to comply with all federal, state and local regulations regarding the proper categorization, removal and disposal of equipment.

Galli Engineering, P.C. and its representatives conducted a limited visual screening survey for the presence of asbestos-containing materials (ACM) at the Subject Properties. It is suggested by Galli Engineering, P.C. and its representatives that if the buildings are to undergo major renovation or demolition, an Asbestos Survey should be completed in accordance with the New York State Department of Labor Industrial Code 56. Please note that this survey was limited to visual observations of accessible areas and that the scope of work for this assessment did not include the collection and laboratory analysis of bulk samples of undamaged suspect ACM.

The surrounding Property, commercial and residential in nature, did not exhibit signs of potential for migrating environmental risks from off-site. At this time, Galli Engineering, P.C. and its representatives believe no further additional investigations other than the above mentioned recognized environmental concern are warranted based on the current site operations as well as past historical uses and the condition of adjacent Property.

13.0 LIMITATIONS

The purpose of this investigation was to identify potential sources of contamination at the Property, and to satisfy the all-appropriate inquiry standard set forth in Section 9601 (35-b) of CERCLA. The findings and conclusions set forth in this report are based upon information that was available to Galli Engineering, P.C. and its representatives during its inspection of the Property, and after review of selected records and documents. If new information becomes available concerning the Property after this date, or if the Property is used in a manner other than that which is identified in this report, the findings and conclusions contained herein may have to be modified. Additionally, while this investigation was performed in accordance with good commercial and customary practice and protocols generally accepted within the consulting industry, Galli Engineering, P.C. and its representatives cannot guarantee that the Property is completely free of hazardous substances or other materials or conditions that could subject our client to potential liability. The presence or absence of any such condition can only be confirmed through the collection and analysis of soil and groundwater samples, which was beyond the scope of this investigation.

Future events and/or investigation could change the findings stated herein. Should additional investigations encounter differing conditions, sections of this report may require modification.

I declare that, to the best of my professional knowledge and belief, I meet the definition of environmental professional as defined in §312.10 of 40 CFR 312 and I have the specific qualifications based on education, training, and experience to assess a Property of the nature, history, and setting of the Subject Properties. I have developed and performed all of the appropriate inquiries in conformance with the standards and practices set forth in 40 C FR Part 312.

Galli Engineering, P.C.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA generators

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or

dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 06/03/2024 has revealed that there are 4 RCRA-VSQG sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
MANHASSET BAY SHIPYA EPA ID:: NYN008021057	421 MAIN ST	ESE 0 - 1/8 (0.001 mi.)	B7	21

WALT WALTERS SERVICE EPA ID:: NYD986980589	***320 MAIN ST***	***NE 1/8 - 1/4 (0.193 mi.)***	***J51***	***95***

Lists of state- and tribal hazardous waste facilities

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 08/01/2024 has revealed that there are 4 NY SHWS sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
FORMER THYPIN STEEL Site Code: 544844	5 SAGAMORE HILL DRIV	NNW 1/4 - 1/2 (0.417 mi.)	P73	119
CHEZ VALET DRY CLEAN Site Code: 369213	1 MANORHAVEN BLVD.	NNW 1/2 - 1 (0.930 mi.)	82	191
PLAZA CLEANERS Site Code: 57012 Class Code: Significant threat to the public health or environment - action required.	***966 PORT WASHINGTON***	***E 1/2 - 1 (0.933 mi.)***	***83***	***193***
MUNSEY DRY CLEANER Site Code: 58786 Class Code: Site is properly closed - requires continued management.	***1029 PORT WASHINGTON***	***E 1/2 - 1 (0.946 mi.)***	***84***	***198***

Lists of state and tribal leaking storage tanks

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 07/30/2024 has revealed that there are

EXECUTIVE SUMMARY

12 NY LTANKS sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 17 NY UST sites within approximately 0.25 miles of the target property.

NY MOSF UST: Major Oil Storage Facilities Database. Facilities are licensed pursuant to Article 12 of the Navigation Law, 6 NYCRR Part 610 and 17 NYCRR Part 30. These facilities may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. Includes MOSF's licensed or closed since April 1, 1986, (responsibility was transferred from DOT on October 13, 1985) plus available data obtained from DOT facilities licensed since Article 12 became law on April 1, 1978.

A review of the NY MOSF UST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 NY MOSF UST site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/03/2024 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

MESCH JOHN UNIVERSAL	439 MAIN STREET	SE 0 - 1/8 (0.024 mi.)	B23	41

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	POLE 07/02/19 @18:30 after t/c to BB-primary VP responded. WRS called for cleanup, surface cleanup has been completed, two catch basins pumped out, storm water outfall protected by absorbers. Cleanup has been completed, no further action required. (VP) PER PSEG INCIDENT DESCRIPTION: PSEG pole top transformers (y-bank) leaked approx 30 gals when a tree fell on the pole due to high winds, impacting pavement and 2 storm drains. Storm drains led to Manhasset Bay, no impacts were observed at the outfall. NYSDEC (Mr. Waldi) was onsite. NRC was notified of no waterbody impacts. WRS/W STUBER/R BHATIA RESPONDED
Remarks:	tree fell on pole - into stormdrain with possible discharge to waterway- cleanup pending deactivation

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Site Description: "Location: The site is located at 5 Sagamore Hill Drive in the Village of Manorhaven, Town of North Hempstead, Nassau County and is approximately 11 acres in size. Site Features: Since vacated by the Thypin Steel Company in 1988, there have been no occupants of the site. The existing buildings were demolished in 1990 and the site is currently overgrown with trees and brush. Current Zoning/Use: The site is zoned for residential use, although it is currently vacant. There is a condominium complex and boat marina to the south, Manhasset Bay to the west, residential homes to the north and commercial/industrial facilities to the east of the site. Past Uses of the Site: Historic use of the site dates back to 1916 when the site was occupied by the First Yale Naval Aviation Unit for flight training of U.S. Navy personnel during World War I. Since that time, the site has been occupied by various entities associated with either flight training or the manufacturing of airplanes or airplane parts. The Thypin Steel Company occupied the site from 1958 until 1988. The company occupied the existing buildings for the storage and cutting of steel products. Historic manufacturing activities are viewed as the source of the metal plating waste discovered in on-site soil and volatile organic compounds in groundwater. Site Geology/Hydrogeology: Groundwater occurs approximately eight to ten feet below land surface (bls) depending on seasonal fluctuation. Subsurface soil is composed of fill material and sand to a depth of approximately 20 feet bls. Below that exists the Upper Glacial aquifer which extends to approximately 75 feet bls and is composed of sand, silt and clay with a higher proportion of silt and clay with increasing depth. The groundwater flow direction is to the south/southwest. Operable Units: Operable Unit (OU) Numbers 01 and 02 are the subject of this document. OU-1 consists of the on-site soil, soil vapor and groundwater. OU-2 consists of the soil, soil vapor, groundwater and intertidal sediments off-site. A Site Management Plan has been

FORMER THYPIN STEEL PLANT (Continued) **S121933849**

received, however due to a building moratorium in area of the site by the local municipality, the completion of the project is on hold. "

Env Problem: "Nature and Extent of Contamination: A Remedial Investigation was conducted to delineate the nature and extent of soil, soil gas and groundwater contamination on-site and off-site. The primary contaminants of concern in soil are metals (arsenic, cadmium, chromium, copper, nickel and zinc) and semi-volatile organic compounds (SVOCs) and the primary contaminants of concern in soil gas and groundwater are volatile organic compounds (VOCs) (1,1,1-trichlorethane, tetrachloroethyene and trichloroethene). Prior to Remediation: Soil: Based on soil samples collected from soil borings and test pits in 2000 and 2001, the recommended soil cleanup objectives were exceeded for metals identified in Section 6.1.2, in on-site soil. Arsenic was detected in the range of 1.9 parts per million (ppm) to 36.4 ppm. Cadmium was detected in the range of 0.06 ppm to 192 ppm. Chromium was detected in the range of 0.5 ppm to 33,900 ppm. Copper was detected in the range of 1.0 ppm to 1,620 ppm. Nickel was detected in the range of 1.0 ppm to 223 ppm, and zinc was detected in the range of 2.0 ppm to 81,300 ppm. There were no elevated levels of site related metals or SVOCs detected in off-site soils. Groundwater: The groundwater monitoring well network revealed the presence of volatile organic compounds, identified in Section 6.1.2, in on-site groundwater which exceeded the NYS Groundwater Standards for Class GA Groundwaters. VOC concentrations in on-site groundwater were as high as 8,900 ppb. In November 2005, temporary groundwater monitoring wells constructed off-site downgradient revealed levels sporadically exceeding the groundwater standards in deeper groundwater (35' bls) with concentrations as high as 5,500 ppb. This was indicative of a discrete zone where contaminants are sorbed onto silts and clays. VOC concentrations in shallow groundwater off-site (10 feet to 20 feet bls) were found to be below the groundwater standards. Off-site access issues have restricted re-sampling off-site. Soil Gas: TCE was detected in on-site soil gas at levels from non-detect to 4,200 ug/m3. Additional VOCs (PCE and TCA) were detected in on-site soil gas at far lesser concentrations than TCE. VOC concentrations were not found to be elevated in any of the six off-site soil gas samples except for one sample which detected PCE at 41 ug/m3. A vapor intrusion study was conducted at an off-site condominium complex located south (downgradient) of the site. A sub-slab soil gas and an indoor air sample was collected from the basement of each of the eight condominium buildings in the complex. One ambient air sample was also collected for comparative purposes, PCE ranged from ND to 18 ug/m3 in sub-slab soil gas and 0.81 ug/m3 to 16 ug/m3 in indoor air. TCE ranged from ND to 18 ug/m3 in sub-slab soil gas and ND to 0.97 ug/m3 in indoor air. TCA was ND in sub-slab soil gas in all buildings and ND to 1.3 ug/m3 in indoor air. All three compounds were ND in the ambient air sample. Intertidal sediment sampling was conducted along Manhasset Bay. Sediments were analyzed for the Target Analyte List/Target Compound List. No compounds were detected at levels exceeding the Department's Class A saltwater sediment guidance values. Post Interim Remedial Measure: Soil: With the promulgation of 6NYCRR Part 375 on December 14, 2006, the soil quality data is being compared to the restricted residential use soil cleanup objectives (RRSCOs). Elevated levels of the following SVOCs exists in on-site shallow soils (0-2 feet bls); Benzo(a)anthracene was detected in the range of non-detect (ND) to 7 ppm, the RRSCO is 1 ppm. Benzo(a)pyrene was detected in the range of

FORMER THYPIN STEEL PLANT (Continued) **S121933849**

ND to 5.8 ppm, the RRSCO is 1 ppm. Benzo(b)fluoranthene was detected in the range of ND to 4.7 ppm, the RRSCO is 1 ppm. Benzo(k)fluoranthene was ND to 4.9 ppm, the RRSCO is 3.9 ppm. Chrysene was ND to 7.6 ppm, the RRSCO is 3.9 ppm. Indeno(1,2,3-cd)pyrene was ND to 4.1 ppm, the RRSCO is 0.5 ppm and Dibenz(a,h)anthracene was ND to 2.1 ppm, the RRSCO is 0.33 ppm. Of the 12 surface soil samples (0-2 inches bls) collected and analyzed for metals, there was only one detection of arsenic at 22.6 ppm and copper at 343 ppm which were found to exceed the RRSCO of 16 ppm and 270 ppm, respectively. Groundwater: The groundwater monitoring well network revealed the presence of volatile organic compounds identified in Section 6.1.2 in on-site and off-site groundwater which exceeded the NYS Groundwater Standards for Class GA Groundwaters. VOC concentrations in on-site groundwater are currently as high as 2,900 ppb. However, that is representative of groundwater quality in a discrete silt/clay zone approximately 35' bls where contaminants are sorbed onto organic particles. Under the Department approved Interim Remedial Measure, VOCs in shallow groundwater were remediated using air sparge/soil vapor extraction technology. Total VOC levels in shallow groundwater were reduced from approximately 2,000 ppb to less than 50 ppb. Under the Department approved OU-1 Remedial Action Work Plan, deeper groundwater was remediated utilizing in-situ chemical oxidation (ISCO) injections. Four rounds of ISCO injections were performed into on-site groundwater (Figure 2). Post remedial monitoring revealed VOCs in groundwater have been significantly reduced and in most cases approach SCGs. Sporadic detections of residual VOCs have been discovered bound in the tight silt and clay layers beneath the site. In general, there has been a 90% reduction of VOCs in on-site groundwater. Soil Gas: As a result of the remediation of on-site groundwater, VOC levels in on-site soil gas have diminished by an order of magnitude or more. A site management plan which includes continued monitoring of on-site and off-site groundwater is under review. For additional information see V00336.This site was transitioned from the VCP program."

Health Problem: "People are not drinking contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. People will not come into contact with the contaminated soil unless they perform ground-intrusive work at the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion in any future on-site buildings which are developed and occupied. Environmental sampling indicates that soil vapor intrusion is not a current concern for off-site buildings."

The groundwater flow direction is to the south/southwest. Operable Units: Operable Unit (OU) Numbers 01 and 02 are the subject of this document. OU-1 consists of the on-site soil, soil vapor and groundwater. OU-2 consists of the soil, soil vapor, groundwater and intertidal sediments off-site. Current Status: A No Further Action Decision Document (DD) was signed by the BURA Director, with NYSDOH concurrence. A draft final engineering report has been reviewed and revised but will not be approved until the cover system required by the DD is in place at the site. With the termination of the VCP, the volunteer is transitioning into a generic consent order. A revised draft site management plan is under review. An environmental easement has been filed with the Nassau County Clerk's office. December 2018: The site has been transferred to the State Superfund Program, site #: 130119"

Env Problem: "Nature and Extent of Contamination: A Remedial Investigation was conducted to delineate the nature and extent of soil, soil gas and groundwater contamination on-site and off-site. The primary contaminants of concern in soil are metals (arsenic, cadmium, chromium, copper, nickel and zinc) and semi-volatile organic compounds (SVOCs) and the primary contaminants of concern in soil gas and groundwater are volatile organic compounds (VOCs) (1,1,1-trichlorethane, tetrachloroethyene and trichloroethene). Environmental Interest/Information System:

All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	4/10/23 9:19hrs MH t/c Chris Allen who is code enforcement for Port Washington Pollution Control. Spill was reported on 4/6 in Stop and Shop parking lot. Water with sewage is overflowing out of manhole. Sanitary main line goes out to Shore Road, which has multiple basins leading out to Manhasset Bay. Will send pictures to R1. @9:47 received t/c from Chris Allen. Said there could be cooking grease within the sewage, but isn't sure. He spoke with Shop and Stop Manager who said

LEWIS OIL COMPANY DIV OF GULF OIL CORP (Continued) **1000262290**

plumber will be coming at 1pm. Recommended calling Department of Health. DTW ~14ft Referred to
Water.

Remarks: sanitary sewer. no cleanup. Water leaking from parking lot. has been leaking into storm drain into Manhasset bay.

Environmental Interest/Information System:
The New York Department of Environmental Conservation Facility Information System (FIS) database houses all information about facilities that are regulated or of environmental interest to the state of New York.

LEWIS OIL COMPANY DIV OF GULF OIL CORP (Continued) **1000262290**

The Integrated Compliance Information System (ICIS) provides a database that, when complete, will contain integrated enforcement and compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained in ICIS by EPA in the Regional offices and it at Headquarters. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Updated By:	JBSWARTO
Site Description:	"Location: The Chez Valet Dry Cleaners site is located in a suburban area of Nassau County at 1-3 Manorhaven Boulevard in the Village of Manorhaven, NY. Site Features: The site consists of a one-story structure built in 1926, which covers approximately 6,500 square feet. The northern space presently occupied by a cleaners was occupied by Chez Valet Dry Cleaners and the other two spaces are utilized by a salon and a home design store. A parking lot covers the remaining portions of the property. A residential property abuts the site to the north. Current Zoning/Use(s): The site is zoned for commercial use and can be occupied by three tenants. Historical

CHEZ VALET DRY CLEANERS (Continued) **S108667315**

Use(s): It has been reported that the dry cleaner operated at the complex from the 1970's to 2006. On July 10, 2007, the site was included on New York s Registry of Inactive Hazardous Waste Disposal Sites due to tetrachloroethene (PCE) detections in groundwater (up to 75 parts per billion) and on-site sub-slab soil vapor (up to 39,800 micrograms per cubic meter). In 2009, a remedial investigation was conducted that detected similar levels of PCE in groundwater and soil vapor but did not detect PCE in soils above cleanup objectives. In February 2011, a sub-slab depressurization system/soil vapor extraction system was installed at the site. The system removes PCE from the environment and protects the occupants of the building. A vapor barrier was placed beneath the floor of the dry cleaner during the installation of the system. The Record of Decision, dated March 2011, presented the results from the remedial investigation and selected a remedy, which included continued operation of the system, monitoring groundwater, and implementation of institutional and engineering controls. The system has been shutdown since December 2017 to permit evaluation of site conditions. Recent sampling has determined that PCE concentrations have been reduced to acceptable levels and remedial action objectives indicated in the Record of Decision have been met. Site Geology and Hydrogeology: The geology at the site consists of medium to fine sand to a depth of 11 feet below ground surface. Groundwater is approximately 7 feet below ground surface and flows to the southwest towards Manhasset Bay. "

Env Problem:	"Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminant of concern was tetrachloroethylene (PCE). The selected remedy was performed and met the remediation goals identified in the Record of Decision. "
Health Problem:	"Remedial actions taken at the site have effectively reduced the potential for exposure to site related contaminants. Therefore, this site no longer poses a public health concern."

Region:	1

PLAZA CLEANERS (Continued) **S106434407**

Acres: 0.250
HW Code: 130108
Record Add: 02/21/2001
Record Upd: 02/20/2024
Updated By: JBSWARTO
Site Description: "Location: The Plaza Cleaners site is located in a mixed commercial and residential area at 966 Port Washington Blvd, Port Washington, NY, near the intersection of Main Street and Port Washington Blvd in Nassau County. It is located on Manhasset Neck, which is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Site Features: The site is a one-story concrete building surrounded by parking lot on approximately 0.25 acre lot (OU-1). There is no exposed soil or grass. The Former Munsey Cleaners Site(Site No. 130081) is located approximately 200 feet to the northeast. Current Zoning/Use(s): The site is zoned commercial and is an active dry cleaner. The cleaning process predominately uses a proprietary chemical, but has the capability to use PCE. The downgradient area (i.e., to the west) is zoned residential and commercial. Past Use of the Site: The building on the site was constructed in 1964 for a dry cleaning business and has continually been operated as one. In 1998, a Phase I Environmental Site Assessment indicated Recognized Environmental Conditions associated with an underground storage tank (UST) on-site and the long-term operation of a dry cleaner. Tetrachloroethylene (PCE) was subsequently identified in a floor drain within the building and in sub-slab soils during a Phase II Environmental Audit. In 1998, under the oversight of the Nassau County Department of Health, approximately 103 tons of contaminated soil was excavated and disposed of off-site at a permitted disposal facility. In 1999, an additional 837 tons of contaminated soil from under the west side of the building was removed and disposed of properly. The excavation extended to the water table, however no confirmatory sampling was completed. In 2003, a soil and groundwater investigation was conducted, which revealed PCE in on-site groundwater. Soil borings were drilled around the extent of the former excavation area and identified PCE concentrations below the Unrestricted Soil Cleanup Objectives. In October 2007, the site was listed as Class 2 on the Registry of Inactive Hazardous Waste Disposal Sites in New York State and the site was referred to the State Superfund for completion of the RI/FS. An Air Sparge/Soil Vapor Extraction (AS/SVE) system was installed at the Plaza Cleaners site by the responsible party without Department oversight or approval. This system became operational in May 2012. A fire rendered the SVE/AS system inoperable in 2017. Operable Units: The site was divided into two Operable Units to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 consists of the parcel which includes the the building where dry cleaning operations were conducted. OU-1 addresses contamination on the site. OU2 addresses off-site groundwater and surface water contamination and soil vapor intrusion. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The off-site groundwater plume is a co-mingled plume from both Former Munsey Cleaners and Plaza Cleaners (OU-2). Site Geology and Hydrogeology: The site is underlain by the Upper Glacial Aquifer made up of sand

PLAZA CLEANERS (Continued) **S106434407**

with some gravel. It is situated at an elevation of approximately 125-feet above mean sea level. Regional topography irregularly slopes towards the harbor from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. There are no existing drinking water supply wells at the site, nor is groundwater used for any purpose at the site. Potable water in the area is supplied by the Port Washington Water District whose wells are located in the underlying Upper Glacial Aquifer. The wells are located approximately 3000 feet downgradient of the site, but have not been impacted to date by site-related contamination. Groundwater flow is to the west at a depth of approximately 25 ft below ground surface."

Env Problem: "Nature and Extent of Contamination The main contaminant of concern is tetrachlorethylene (PCE), which is a solvent used in dry cleaning operations. The site is divided into two operable units (OUs). OU1 addresses on-site contamination and OU2 focuses on off-site contamination. Operable Unit 1 (OU1) Soil In 2003, Soil borings were drilled around the extent of the former excavation area and analyzed for VOCs. PCE concentrations were found to be below the unrestricted soil cleanup objective. Soil samples were collected in conjunction with monitoring wells installations. Samples ranged from 5 ft below ground surface (bgs) to 92 ft bgs. As part of the RI, a test pit identified a tank which was found to be an abandoned in-place fuel oil tank. The concentration of PCE found below the tank in the soil was below the unrestricted SCO. There is the potential for additional soil contamination beneath the on-site building as the previous excavation had to be halted due to the instability of the building foundation. Groundwater The groundwater contamination on-site was evaluated by collecting grab samples from the air sparge wells and from MW-3 - screened at the top of the water table. All samples exceeded the groundwater standard of 5 parts per billion for PCE with the highest concentration being 46 ppb and lowest 7.1 ppb. Stormwater/Sediment The stormwater and sediment from an on-site storm drain were also sampled and analyzed due to an anomaly found during the on-site geophysical survey. No PCE was detected. Soil Vapor and Sub-Slab Vapor The soil vapor from the site's soil vapor points was sampled and analyzed. The highest concentrations were seen outside the building footprint in the parking lot situated in the southeastern corner of the site. The lowest were seen in the northeast corner of the site. An outdoor ambient air sample was collected and analyzed for VOCs. The sample did not exceed the air guideline. Operable Unit 2 (OU2) The groundwater contamination plume originates onsite (OU1), co-mingles with the Former Munsey Cleaners site plume and extends into off-site areas. The concentrations of PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. Based on the indoor air and sub-slab sampling results from sixteen off-site properties, six sub-slab depressurization (SSD) systems were installed to address vapor intrusion in ten commercial buildings; and nine residential and commercial properties require annual monitoring. No residential homes included in the sampling programs required the installation of SSD systems. The remediation at OU2 is completed and the annual monitoring of the groundwater, surface water, and indoor air is continuing. "

Health Problem: "Operable Unit 1: Measures are in place to control the potential for

PLAZA CLEANERS (Continued) **S106434407**

coming into contact with residual subsurface soil contamination remaining on the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that has not been affected by this contamination. Volatile organic compounds in contaminated groundwater or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Based on environmental sampling, the potential exists for people to inhale site contaminants in indoor air due to soil vapor intrusion at the on-site building. Operable Unit Two: People are not drinking the contaminated groundwater because the area is served by a public water supply that has not been affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Sub-slab depressurization systems have been installed in six off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. Six additional buildings are monitored to determine if the indoor air quality is being affected by the contamination in soil vapor beneath the buildings to determine if additional actions are needed to address the potential exposures."

DEC Memo: 06/21/13 1215 Hrs (A): Called Biblow- SHE SAID THIS IS A SUPERFUND SITE [#130108- OVERSEEN BY DEC ALBANY], AND THAT SHE REPRESENTED THE RESPONSIBLE PARTY. 06/21/13 1215 Hrs (B): A previously abandoned or previously unknown tank was found, and 1-2 gallon of fuel oil spilled while it was being removed . Endpoint soil samples were taken by BOTH the responsible party and MALCOLM PIRNIE [DEC'S CONSULTANT]. 06/21/13 1215 Hrs (C): She asked whether Spills

PLAZA CLEANERS (Continued) **S106434407**

wished to inspect the site but
said SHE BELIEVED THE EXCAVATION HAD ALREADY BEEN BACKFILLED. Spills informed her we had an
inspector heading to Great Neck who might also be able to inspect this site and asked her to
confirm whether the excavation had been backfilled. DR 06/21/13 1220 Hrs (A): Biblow called- SHE
CONFIRMED THE EXCAVATION HAD BEEN BACKFILLED. 06/21/13 1220 Hrs (B): SHE ALSO SAID THAT THIS WAS
ACTUALLY A 550GAL TANK, that approximately 8cy of soil had been removed, and that the excavation
seemed cleaned of any obviously-contaminated soil. 06/21/13 1220 Hrs (C): Spills directed her to
call back next week to determine whether this unit would require a copy of the tank closure report
or whether Spills would refer the entire matter to the Superfund unit.

Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island

MUNSEY DRY CLEANER (Continued) **S110247366**

Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994. Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the

MUNSEY DRY CLEANER (Continued) **S110247366**

west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the

MUNSEY DRY CLEANER (Continued) **S110247366**

potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water

MUNSEY DRY CLEANER (Continued) **S110247366**

was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.
Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show

MUNSEY DRY CLEANER (Continued) **S110247366**

that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air

MUNSEY DRY CLEANER (Continued) **S110247366**

quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

Site Code: 58786
Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994. Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative

MUNSEY DRY CLEANER (Continued) **S110247366**

reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.
Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination

MUNSEY DRY CLEANER (Continued) **S110247366**

originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was

MUNSEY DRY CLEANER (Continued) **S110247366**

conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and

MUNSEY DRY CLEANER (Continued) **S110247366**

OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994. Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington

Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding

MUNSEY DRY CLEANER (Continued) **S110247366**

the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

Site Code: 58786
Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994. Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December

MUNSEY DRY CLEANER (Continued) **S110247366**

2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.
Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public

MUNSEY DRY CLEANER (Continued) **S110247366**

supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the

MUNSEY DRY CLEANER (Continued) **S110247366**

potential for soil vapor intrusion to impact indoor air quality."

Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.
Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L),

MUNSEY DRY CLEANER (Continued) **S110247366**

the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed

MUNSEY DRY CLEANER (Continued) **S110247366**

	from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."
Health Problem:	"Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994.

MUNSEY DRY CLEANER (Continued) **S110247366**

Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.
Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is

MUNSEY DRY CLEANER (Continued) **S110247366**

tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098

MUNSEY DRY CLEANER (Continued) **S110247366**

micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

MUNSEY DRY CLEANER (Continued) **S110247366**

Site Description: "Site Location: The Site is located at 1029 Port Washington Boulevard in Port Washington, Nassau County, New York. The Site was formerly occupied by Munsey Dry Cleaners. The Site is located in an urban area of Nassau County, NY approximately 5 miles south of the Long Island Expressway in Port Washington. It is located near the intersection of Main Street and Port Washington Blvd. Site Features: The Site which is referred to as OU1 is located in a one-story retail shopping plaza and the first floor of the site is currently occupied by a Real Estate company and the basement is vacant. A sub-slab depressurization system is located in the basement area of the Site. Another site, Plaza Cleaners, is located across from Munsey site and OU2 for both sites addresses the co-mingled groundwater plume from both sites and the soil vapor intrusion study. Current Zoning: The Site is zoned commercial. The off-site area which is referred to as OU2 is mixed residential/commercial. Historic Uses: The Site is a commercial building that was constructed in 1947 and was formerly occupied by, and operated as, a dry cleaners facility until 1994. Tetrachloroethlyene (PCE) was used during dry cleaning operations and appears to have been disposed of in the basement. A soil sample taken by the NYSDEC from a basement sump during the summer of 1994 revealed contamination by the dry cleaning solvent tetrachloroethlyene. A follow-up site inspection and sampling visit by the Nassau County Department of Health confirmed the disposal of tetrachloroethlyene. Samples from the basement s dirt floor, floor drain and the sump were found to contain tetrachloroethlyene as high as 2,200 parts per million (ppm). Operable Units: The site was divided into two Operable Units (OUs) to facilitate remediation. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. OU1 addresses contamination within the boundaries of the Site and consists of a building located in a shopping complex where the dry cleaning operations were conducted. The OU1 ROD was signed in November 2005. The remedy included in the ROD was a No Further Action with the continous operation, maintenance and monitoring of the soil vapor extraction sytem and sub-slab system. OU2 is the area beyond the dry cleaner property where contaminants have migrated from the site. The area consists of the commercial properties and residences extending from the site along the direction of Main Street to the bay. Residual contamination remains in the off-site groundwater, surface water and off-site soil vapor. The OU2 ROD was signed on July 5, 2012. The remedy included in the ROD was a No Further Action with annual monitoring of groundwaer, and surface water, and monitoring of soil vapor intrusion. The ROD also inculdes the operation and maintenance of the sub-slab depressurization systems. Since the OU2 ROD was signed groundwater and surface water was sampled annually and the results show a reduction in contaminant concentrations. The procedure to turn off the existing SVE system at the site (OU1) was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system was required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility.

MUNSEY DRY CLEANER (Continued) **S110247366**

Site Geology and Hydrogeology: The site is situated at an elevation of approximately 125-feet above mean sea level in the Town of North Hempstead in northern Nassau County, Long Island on Manhasset Neck. Manhasset Neck is a 13.4 square mile peninsula that is bounded on the west, north and east by Manhasset Harbor, Long Island Sound and Hempstead Harbor. Regional topography irregularly slopes towards these bodies of water from the higher inland areas, but gently slopes away from the site to the west and more steeply upward from the site to the east. Surface run-off is controlled by gently sloping pavement towards on-site storm drains. The local potable water supply is the underlying groundwater, which is supplied by the Port Washington Water District. Most active public supply wells extract water from deeper aquifers below silt and clay units. Public water supply wells exist approximately 3000 feet downgradient of the site, but have not been impacted by the site-related contaminants."

Env Problem: "Nature and extent of contamination Operable Unit 1 (OU1) The primary contaminant of concern at the site and off-site is tetrachloroethlyene (PCE) which is a compound used in dry cleaning operation. The site is divided into two operable units (OUs). OU1 is addresses on-site contamination and OU2 focuses on off-site contamination. Based on the investigations conducted at the site, a no further action ROD was completed for OU1 in November 2005. The interim remedial measures (IRM) completed for OU1 included the removal of contaminated soil, installation of a soil vapor extraction (SVE) system and sub-slab depressurization (SSD) system. The SVE system was operated until 2013 when it was shutdown with approval from the State. The SSD systems are operated and maintained as part of OU1. Operable Unit 2 (OU2) The groundwater contamination originates from OU1 and extends from the site into off-site areas. The groundwater plume from the nearby Plaza Cleaners site is also extending off-site and co-mingling with the Munsey groundwater plume. The groundwater samples collected in October 2010 from several off-site monitoring wells show that the PCE concentration in shallow wells ranged from non-detect (ND) to 240 micrograms per liter (ug/L), the intermediate wells from ND to 410 ug/L and the deep wells from ND to 290 ug/L. The highest PCE concentration was detected at shallow monitoring well MC-3 which is located approximately 800 feet northwest of the site and the highest concentration detected in intermediate and deep wells in MC-7 which is located approximately 1500 feet south west of the site. The dissolved-phase VOC concentrations of primarily PCE and TCE vary spatially both horizontally and vertically, with a general trend of decreasing concentrations with increasing distance or depth from the site. An underlying, low permeability zone was tentatively identified at well locations across the investigation likely limits deeper downward migration of groundwater contamination. The results of the RI show that the off-site groundwater contaminant concentration is higher closer to the site and tends to drop down in the down-gradient locations. The monitoring wells installed closer to the public supply wells shows contaminant concentration either below the standard or marginally exceeding the standard. The raw water from the public supply wells were sampled two times during the investigation and the site-related contaminants were non-detect in the water. The review of sample results of the raw water to the public supply wells from 2003 through 2011 from the water district show that the site-related contaminants were never detected. Additionally, concentrations of PCE in groundwater monitoring wells installed during the investigation

MUNSEY DRY CLEANER (Continued) **S110247366**

generally show a decreasing trend over time. Analysis of surface water collected at four locations from Baxter Brook northwest of the site indicates that the surface water quality may be affected by the dissolved-phase VOC plume. Baxter Brook s channel intersects the potentiometric surface of shallow groundwater. This suggests Baxter Brook is receiving groundwater along its course, and that the stream can be a discharge point for VOCs within the upper portion of the water table across the investigation area. The October 2010 sampling of surface water samples detected PCE from 5.1 to 6.7 ug/L. A fish and wildlife impact analysis was conducted by the New York State Department of Environmental Conservation Bureau of Habitat regarding the potential impacts of site-related contamination in Baxter Brook would have on fish and wildlife resources. The Bureau of Habitat determined that the contamination in Baxter Brook is not of a concern for fish and wildlife resources. PCE, the primary contaminant present in the sub-slab vapor and indoor air samples, was detected in off-site sub-slab vapor samples at concentrations as high as 61,098 micro gram per cubic meters (ug/m3). The PCE concentration in sub-slab vapor was greater than 1,000 ug/m3 at 14 of the 52 off-site properties where indoor air and/or sub-slab vapor samples were collected. The highest concentrations of PCE were found in sub-slab vapor samples collected from Main Street properties located between Port Washington Boulevard and North Bayles Avenue. This area of Main Street is located west of the site. The concentrations of PCE in indoor air ranged from non-detect to 67 ug/m3 in a sample collected on Port Washington Boulevard during the March 2008 air sampling event. Post Remediation The remediation at OU1 is completed. The procedure to turn off the existing SVE system at the site (OU1)was conducted. The system was turned off after a sampling event was conducted in April 2013. The system was turned on for 48 hours in July to perform another sampling event. On December 2013 based on the results from these two sampling events, the Department determined that the conditions meet the requirements of DER 10, Section 6.4, Remedial Process Closure Requirements and the SVE system was removed from service at the site. The sub-slab depressurization system is required to be operated continuously and will serve to prevent the residual vapor intrusion into the facility. The remediation at OU2 is completed and the annual monitoring of the groundwater and surface water is continuing."

Health Problem: "Remedial actions are complete, and measures are in place to control the potential for coming into contact with any residual contamination at the site. The area is served by a municipal water supply that is not affected by this contamination. People may have incidental contact with surface water contaminants found in Baxter Brook. Volatile organic compounds in soil vapor (air spaces within the soil), may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sub-slab depressurization systems (systems that ventilate/remove the air beneath a building) have been installed in the on-site building and in six off-site locations to prevent the potential for soil vapor intrusion to impact indoor air quality."

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State and tribal institutional control / engineering control registries

RES DECL: Restrictive Declarations Listing

A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA Watch List

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS ATSDR: PFAS Contamination Site Location Listing

PFAS contamination site locations from the Department of Health & Human Services, Center for Disease Control & Prevention. ATSDR is involved at a number of PFAS-related sites, either directly or through assisting state and federal partners. As of now, most sites are related to drinking water contamination connected with PFAS production facilities or fire training areas where aqueous film-forming firefighting foam (AFFF) was regularly used.

PFAS WQP: Ambient Environmental Sampling for PFAS

The Water Quality Portal (WQP) is a part of a modernized repository storing ambient sampling data for all environmental media and tissue samples. A wide range of federal, state, tribal and local governments, academic and non-governmental organizations and individuals submit project details and sampling results to this public repository. The information is commonly used for research and assessments of environmental quality.

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO: Facilities in Industries that May Be Handling PFAS Listing

Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

PFAS ECHO FIRE TRAIN: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PT 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health

Elevation:	0 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	14115954 SEA CLIFF, NY
Version Date:	2019

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

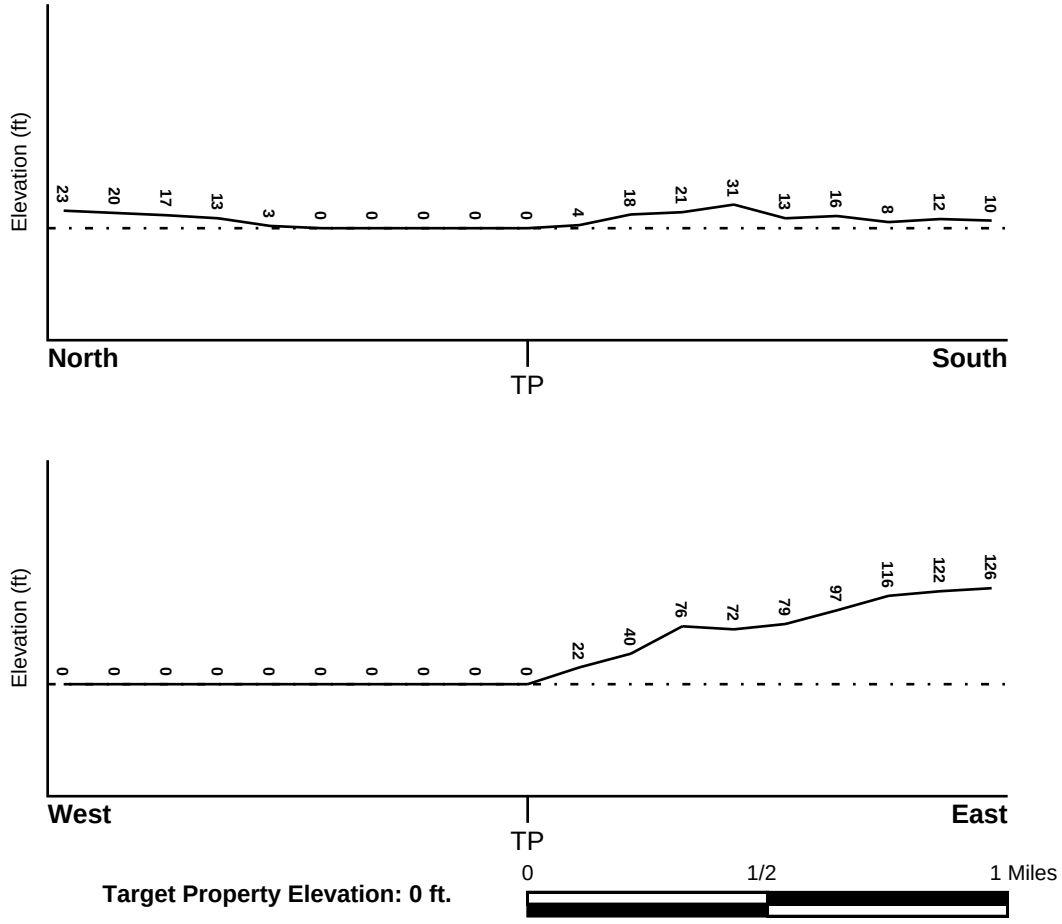
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
36059C0104G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
36059C0102H	FEMA FIRM Flood data

36059C0108G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SEA CLIFF	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Pleistocene
Code:	Qp *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	RIVERHEAD
Soil Surface Texture:	sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: LOW

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	12 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 6.00 Min: 3.60
2	12 inches	27 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 6.00 Min: 3.60
3	27 inches	35 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 6.00 Min: 4.50
4	35 inches	65 inches	stratified	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand.	Max: 20.00 Min: 20.00	Max: 7.30 Min: 4.50

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loam
loamy sand
silt loam
fine sandy loam

Surficial Soil Types: loam
loamy sand
silt loam
fine sandy loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: gravelly - coarse sand
very gravelly - sand
sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

Organization ID:	USGS-NY	Organization Name:	USGS New York Water Science Center
Monitor Location:	N 1483. 1	Type:	Well
Description:	5302	HUC:	02030201
Drainage Area:	Not Reported	Drainage Area Units:	Not Reported
Contrib Drainage Area:	Not Reported	Contrib Drainage Area Unts:	Not Reported
Aquifer:	Not Reported	Formation Type:	Port Washington Confining Unit
Aquifer Type:	Not Reported	Construction Date:	Not Reported
Well Depth:	99	Well Depth Units:	ft
Well Hole Depth:	99	Well Hole Depth Units:	ft

Ground water levels,Number of Measurements: 188

Level reading date:	1997-03-10		
Feet below surface:	Not Reported	Feet to sea level:	8.41
Note:	Water level was affected by tide stage.		
Level reading date:	1996-12-11	Feet below surface:	Not Reported
Feet to sea level:	8.49		
Note:	Water level was affected by tide stage.		
Level reading date:	1996-09-11	Feet below surface:	Not Reported
Feet to sea level:	7.45		
Note:	Water level was affected by tide stage.		
Level reading date:	1996-07-11	Feet below surface:	Not Reported
Feet to sea level:	7.88		
Note:	Water level was affected by tide stage.		
Level reading date:	1996-05-15	Feet below surface:	Not Reported
Feet to sea level:	8.61		
Note:	Water level was affected by tide stage.		
Level reading date:	1996-03-19	Feet below surface:	Not Reported
Feet to sea level:	8.10		
Note:	Water level was affected by tide stage.		
Level reading date:	1996-01-23	Feet below surface:	Not Reported
Feet to sea level:	7.72		
Note:	Water level was affected by tide stage.		
Level reading date:	1995-12-05	Feet below surface:	Not Reported
Feet to sea level:	7.62		
Note:	Water level was affected by tide stage.		
Level reading date:	1995-09-22	Feet below surface:	Not Reported
Feet to sea level:	7.03		
Note:	Water level was affected by tide stage.		
Level reading date:	1995-08-23	Feet below surface:	Not Reported
Feet to sea level:	7.20		
Note:	Water level was affected by tide stage.		
Level reading date:	1995-07-26	Feet below surface:	Not Reported
Feet to sea level:	7.56		
Note:	Water level was affected by tide stage.		

Level reading date:	1995-06-13	Feet below surface:	Not Reported

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

New York Public Water Wells
Source: New York Department of Health
Telephone: 518-458-6731

OTHER STATE DATABASE INFORMATION

Oil and Gas Well Database
Source: Department of Environmental Conservation
Telephone: 518-402-8072
These files contain records, in the database, of wells that have been drilled.

RADON

State Database: NY Radon
Source: Department of Health
Telephone: 518-402-7556
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary faultlines, prepared in 1975 by the United State Geological Survey

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Galli Engineering PC were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, LLC. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. This Report is provided on an "AS IS", "AS AVAILABLE" basis. **NO WARRANTY EXPRESS OR IMPLIED IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, LLC AND ITS SUBSIDIARIES, AFFILIATES AND THIRD PARTY SUPPLIERS DISCLAIM ALL WARRANTIES, OF ANY KIND OR NATURE, EXPRESS OR IMPLIED, ARISING OUT OF OR RELATED TO THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT, INCLUDING WITHOUT LIMITATION, ANY WARRANTIES REGARDING ACCURACY, QUALITY, CORRECTNESS, COMPLETENESS, COMPREHENSIVENESS, SUITABILITY, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, MISAPPROPRIATION, OR OTHERWISE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, LLC OR ITS SUBSIDIARIES, AFFILIATES OR THIRD PARTY SUPPLIERS BE LIABLE TO ANYONE FOR ANY DIRECT, INCIDENTAL, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES OF ANY TYPE OR KIND (INCLUDING BUT NOT LIMITED TO LOSS OF PROFITS, LOSS OF USE, OR LOSS OF DATA), ARISING OUT OF OR IN ANY WAY CONNECTED WITH THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT.** Any analyses, estimates, ratings, environmental risk levels, or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only an assessment performed by a qualified environmental professional can provide findings, opinions or conclusions regarding the environmental risk or conditions in, on or at any property.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

Radon Map

NEW YORK - EPA Map of Radon Zones

http://www.epa.gov/radon/zonemap.html

The purpose of this map is to assist National, State and local organizations to target their resources and to implement radon-resistant building codes.

This map is not intended to determine if a home in a given zone should be tested for radon. Homes with elevated levels of radon have been found in all three zones.

All homes should be tested, regardless of zone designation.

IMPORTANT: Consult the publication entitled "Preliminary Geologic Radon Potential Assessment of New York" (USGS Open-file Report 93-292-B) before using this map. http://energy.cr.usgs.gov/radon/grpinfo.html This document contains information on radon potential variations within counties. EPA also recommends that this map be supplemented with any available local data in order to further understand and predict the radon potential of a specific area.

Re: Inspiration Wharf
405 Main Street
Port Washington, NY
Our Job #24-113

Gentlemen:

Forwarded herewith along with this report is our drawing 24L113.8 illustrating the logs and locations of eight (8) test borings drilled recently at the above referenced site.

The purpose of the subsurface investigation was to determine the nature and extent of the underlying soil deposits as well as the structural engineering and drainage characteristics of the soil as they relate to the proposed on-grade parking and foundation(s) design for the proposed restaurant and two-story mixed-use building at the above referenced site.

A total of eight (8) test borings were drilled using truck-mounted drilling equipment. The borings were advanced using hollow stem auger casing. Sample recovery was obtained using a 2" diameter, 2'0" long split spoon sampler was advanced into the subsurface by the use of an automatic 140 lb. hammer with a 30" drop. From the drops of the hammer, blow counts required to advance the split spoon sampler over each 6" intervals were recorded and is shown on the boring logs. Continuous split spoon sampling was taken for the top generally for the top 6 to 12 feet then every 5 feet thereafter to the final depths of the borings. A written description of the recovered soil samples per our geologist's visual identification of same in accordance with the Unified Soil Classification System (USCS) is also presented on the logs.

The CME automatic hammer operates with an efficiency of approximately 90%. The original conventional use of rope, cathead and drop weight, on the other hand, operates with an efficiency of approximately 60%. As a consequence, the Standard Penetration Test (SPT) results obtained using the CME auto-hammer are on the order of two-thirds the value that would have been obtained had the original rope and cathead method been used. This is significant if you are using design charts for soil strength parameters based

on historical SPT "N" values, now referred to as N_{60}, associated with the rope and cathead method. If so, you should adjust our data accordingly.

EXISTING CONDITIONS

The existing site is located at 405 Main Street in Port Washington New York. The lot is currently being utilized as a boat yard.

PROPOSED CONDITIONS

It is Soil Mechanics understanding based on the limited information provided to our office that a restaurant and two-story building with on-grade parking is being proposed for the site.

Variations in the future structure type and anticipated design loading conditions may change from the criteria assumed in preparation of this report. Soil Mechanics shall be advised of the actual structure proposed for the site along with future loading conditions so that an evaluation can be made to determine if our recommendations presented in this report should be revised.

SUBSURFACE CONDITIONS

Our investigation revealed the areas explored are blanketed by a generally loose to dense mixed soil and rubble Fill containing varying percentages of concrete, brick, Gravel, Rock fragments, cinders, ash, glass, wood and other miscellaneous debris extending down to from 10 feet to as much as 18 feet below existing grade. The surficial soil and rubble Fill is followed, generally, by loose to moderately dense layers of Sand and Silty Sand, soft and compressible layers of Peat and Organic Clayey Silt with a trace of shell fragments over alternating layers of soft to stiff Clay and Silt and moderately dense to dense layers of Silty Clayey Sand and Sandy Silty Clay extending down to from 38 feet to approximately 49 feet below existing grade. The upper soil is underlain, generally, by a dense fine to medium Sand formation containing varying percentages of Silt and a trace of Gravel extending down to the deepest depths drilled.

The soil layers identified under the Unified Soil Classification System (USCS) by our geologist as "SM", "CL", "ML", "OL", "PT" and "SC" exhibits poor drainage characteristics. On the other hand, the material classified as "SP", exhibits good drainage characteristics. This is contingent on the percentages of silt and cohesive soil within these layers. Additionally, note that percolation testing was not included as part of this investigation to confirm infiltration rates.

SOIL MECHANICS DRILLING CORP.
3770 MERRICK ROAD • SEAFORD, L. I., NEW YORK 11783
(516) 221-2333 • FAX (516) 221-0254

GROUNDWATER

Ground water was encountered within the boreholes at depths ranging from 5'0" to 8'5" below existing grade at the time the drilling was done and is under tidal influence due to the site's close proximity to the water.

FROST PROTECTION

Frost penetration in this area is 3 feet. All exterior foundations/footings or pile caps must have a minimum of 3 foot of cover or as directed otherwise by the frost depth of the locality.

SEISMIC CONSIDERATIONS

The seismic provision of the Building Code requires an evaluation of the liquefaction potential of Sand, Silt, and non-cohesive materials below the groundwater table and up to a depth of 50 feet below the ground surface. Based on the Standard Penetration Test (SPT) blow counts, of the loose and soft layers below the groundwater table, Liquefaction may be a problem and, therefore, should be a design consideration. However, this can be addressed by delivering future proposed loads to the more competent underling soil.

A one-hundred (100) foot boring was not performed at the site to confirm the Site Class with certainty. In our opinion however, results from our investigation in conjunction with the site subsurface profiles generated, relatively thick stiff Clays and through extrapolation of the "N" values for the lower material, the soils generated by this investigation indicate that the site characteristics correspond to Site Class "D" in accordance with Section 1613.2.2 of the 2020 Building Code of New York State and Chapter 20 of ASCE 7.

GEOTECHNICAL RECOMMENDATIONS

The conclusions and recommendations presented herein are based on the results of the Subsurface Investigation and the limited information provided to our office regarding the proposed structure(s).

Considering the overall depth of the Fill, Peat and soft Clays and Silts in addition to the relatively shallow depth to the ground water table, it is recommended that any substantial structure planned for this site be supported on deep foundation elements, (i.e. piles),

installed through the upper unsuitable material and into the lower denser Sands. If the existing site conditions can accommodate a pile rig and if dynamic installation of piles is not a concern, then timber and/or steel pipe piles may be an appropriate option.

Assuming a compression load of 25 ton, the anticipated length of pile would be 45' to 55' based upon the information from the soil borings drilled at the site. Pile type, size and capacity are dependent on column/wall loads. An index pile program is always recommended at the start of production pile installation in order to better target the final pile length determination. It is also recommended to pile support future slabs on grade. Drag down (negative skin friction) should also be considered in determining the piles net allowable load capacity.

Load testing requirements shall be confirmed with Chapter 18 of the NYS Building Code and the local building official.

Additionally, based on blows recorded in the denser upper mixed soil and rubble Fill, "spudding" or pre-auguring may be required to facilitate pile penetration through the upper material.

The installation of all piles should be performed by an experienced installer and under the direct supervision of a Professional Engineer. If you wish, we can provide that inspection service.

ADDITIONAL CONSIDERATIONS

The subject site is situated within a developed area. The surrounding area includes structures such as residential and commercial buildings, utilities, roadways, etc. Care should be taken during all earthwork and pile installation operations.

Vibrations induced during construction activities such as with the installation of deep foundation elements, (i.e., piles), may be transmitted to varying distances from the point of generation. It is recommended, due to the proximity of adjacent structures, that vibration monitoring be implemented during pile installation. If you wish, Soil Mechanics can provide that service as well.

LIMITATIONS

The conclusions and recommendations given in this report are based on subsurface conditions observed throughout our field investigation and are based on the project information provided to us. The recommendations given herein are contingent upon one

another and no recommendation should be followed independent of the other. This report has been prepared to assist the Architect and Structural Engineer in the design of the proposed building alterations only. Any differences in the design intent for the building as described herein should be brought to our attention so that we may determine if such changes affect our recommendations. Soil Mechanics Drilling Corp. cannot assume responsibility for use of this report for any areas beyond the limits of this study or for any projects not specifically discussed herein.

The boring logs and soil profiles address subsurface conditions only at the indicated locations. Subsurface conditions between boreholes are inferred and may vary from conditions encountered at the boring locations. Groundwater conditions (when encountered) described refer only to those at the time and location of observation. These conditions may vary seasonally or as the result of construction. The recommendations presented in this report assume that the subsurface conditions do not deviate appreciably from those disclosed by the borings.

Soil samples recovered during drilling operations will be stored in our lab for a period of 30 days after which they will be destroyed. During this period, we will deliver these samples to any prescribed location upon request.

If after you examine the enclosed you have any further questions, please feel free to call and discuss them with us.

Billing is enclosed.

Very truly yours,

SOIL MECHANICS DRILLING CORP.
