15, December 2016

Roger Pine Lettire Construction 334 East 110th Street New York, N.Y. 10029

Re: 255 East 138th Street Bronx, N.Y.

Mr. Pine,

Mercury Tank & Pump Service, Inc. pumped out several underground motor fuel storage tanks at a facility that included the address referenced above. These tanks were pumped out between 27, August and 28, September 2015. This work was performed for Lettire Construction.

Mercury tank subcontracted the trucking and disposal of the liquids extracted from said tanks to Petroleum Tank Cleaners. LTD who transported it to Lorco Petroleum in Elizabeth, New Jersey for disposal.

The dates on which Petroleum Tank Cleaners were on site include 27, August 2015, 01, 09, and 28, September 2015. In total 3,600 gallons of liquids were pumped, removed from the premises and disposed of at Lorco.

Subsequently Petroleum Tank Cleaners has gone out of business and, despite attempts, obtaining copies of the manifests for these movements and disposal have been unsuccessful.

Sincerely,

Mark Salamack, Pres.

Mercury Tank & Pump Service, Inc.

Re: 255 East 138th Street Bronx; Permanent removal of two underground gasoline tanks, each 40" diameter and 50" long.

### **AFFIDAVIT**

In accordance with FC 3404-01 the permanent removal of two underground gasoline tanks, each 40" diameter and 50" long at 221 East 138th Street Bronx has been completed.

- 1) The contents of the tank were completely removed.
- 2) The tanks were thoroughly cleaned and purged of combustible vapors.
- 3) All pipes were removed including fill and vent lines.
- 4) The fill boxes were removed.
- 5) The tanks were removed from the ground and disposed of offsite.
- 6) This work was completed on 29, September 2016.

Sincerely 1	
Way.

OCTOBER 23, 2015 REVISED – OCTOBER 30, 2015

# TECHNICAL MANUAL FOR THE APPLICATION OF OXYGEN RELEASE COMPOUND

Former G & C Services 255 East 138th Street Block 2333, Lot 1 Bronx, New York

October 23, 2015 Revised –October 30, 2015

### 1.0 INTRODUCTION

East 138th Street LLC is enrolled in the New York State Brownfield Cleanup Program (NYS BCP) to remediate a 0.46-acre site located at 255 East 138th Street, Bronx, New York. A Remedial Action Work Plan (RAWP) was prepared for this site and was approved by the New York State Department of Environmental Conservation (NYSDEC) in October 2013. Remediation at the site began in August 2015 and is expected to be completed by December 31, 2015. One (1) of the elements of the selected remedy for the site is to treat the groundwater. This element of the selected remedy includes three (3) components: excavation and off-site removal of source material (non-hazardous petroleum-impacted soils); site-wide dewatering; and, application of an Oxygen Release Compound (ORC) into the subsurface soils beneath the proposed development foundation.

#### 2.0 GROUNDWATER REMEDIATION

Per the NYSDEC-approved RAWP, the three (3) components of the groundwater treatment at the site are excavation and off-site removal of petroleum-impacted soils, site-wide dewatering, and application of ORC into the subsurface soils beneath the proposed development foundation. As of October 23, 2015, approximately 7,300 tons of non-hazardous petroleum-impacted soils have been removed off site to the Clean Earth of Carteret Facility in Carteret, New Jersey. In order to achieve the base depth of excavation, an active site-wide dewatering system has been installed. The appropriate New York City Department of Environmental Protection (NYCDEP) and NYC Department of Transportation (DOT) permits were obtained to

allow the discharge of the dewatering liquids into the sanitary sewer system.

The third component of the groundwater treatment at the site involves the application of Oxygen Release Compound Advanced (ORC Advanced®) Pellets, manufactured by Regenesis, to the open excavation area in the western portion of the site. A brochure of the ORC Advanced® Pellets, prepared by Regenesis, is provided in **Appendix I.** The presence of ORC in the groundwater beneath the site will enhance natural attenuation and expedite the degradation of potential petroleum-related volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) that may exist in the groundwater following the completion of remediation at the site. The accelerated biodegradation process of the petroleum-related VOCs and SVOCs will result from the production of free oxygen from the interaction of ORC Advanced® Pellets and the on-site groundwater. Oxygen is a vital component for microorganisms to break down petroleum-related VOCs and SVOCs into carbon dioxide and water. The ORC Advanced® Pellets also contain micro-nutrients such as nitrogen, phosphorous, and potassium which assist in the biodegradation of petroleum-related VOCs and SVOCs. The application of ORC Advanced® Pellets to the open excavation area is an effective method to address long term groundwater conditions.

### 3.0 APPLICATION METHODS

ORC Advanced® Pellets accelerate natural biodegradation of petroleum hydrocarbons and are easy to use in regards to handling and applying into open excavations. The ORC Advanced® Pellets range from three (3) to 10 millimeters (mm), and the generation of airborne dust during handling and application of the Pellets is very limited.

Per the manufacturer specifications, Regenesis recommends that the amount of ORC to be applied is determined by a rate between 0.1% and 1% of the weight of ORC per the weight of the soil within the treatment zone. This percentage range of ORC weight per soil weight between 0.1% and 1% is calculated to be the most effective for groundwater treatment. Approximately 330.6 pounds of ORC Advanced® Pellets will be applied to the base depth of excavation in the western portion of the site. Calculations and the ORC Advanced® Pellets Application Design Summary is provided as **Table 1.** The approximate application extent of the ORC Advanced® Pellets is shown on **Figure 1.** In the approximate application extent area, ORC Advanced® Pellets can be applied directly to the soil by two methods: via an excavator bucket or

via manual spreading. (See the ORC Advanced® Pellets application instructions, prepared by Regenesis, in **Appendix II**.) The contractor for construction is responsible for applying the ORC Advanced® Pellets to the open excavation areas according to the manufacturer's recommendations. Once the ORC Advanced® Pellets have been applied evenly across the treatment zone via the excavator bucket or manual spreading method, a skilled backhoe operator should thoroughly mix the ORC Advanced® Pellets within the subsurface soils between approximately 15 and 15.5 feet below grade surface (bgs). A cross-sectional detail of the approximate ORC Advanced® Pellets application area is provided as **Figure 2**.

All application methods of the ORC Advanced® Pellets should be performed in compliance with the Site-Specific Health and Safety Plan (HASP) in the NYSDEC-approved RAWP. The safety data sheet for the ORC Advanced® Pellets is provided in **Appendix III.** 

### 4.0 CONCLUSIONS

As part of the selected remedy in the NYSDEC-approved RAWP for the site located at 255 East 138th Street, Bronx, New York, one (1) of the elements is to treat the groundwater at the site. Groundwater treatment at the site includes three (3) components: excavation and off-site removal of source material (non-hazardous petroleum-impacted soils); site-wide dewatering; and, application of an Oxygen Release Compound (ORC) into the subsurface soils beneath the proposed development foundation. Remediation at the site began in August 2015 and is expected to be completed by December 31, 2015. As of October 23, 2015, the site has been undergoing site-wide dewatering and approximately 7,300 tons of non-hazardous petroleum-impacted soils have been removed off site to Clean Earth of Carteret Facility in Carteret, New Jersey. The third component of the groundwater treatment at the site is the application of ORC. Approximately 330.6 pounds of ORC Advanced® Pellets will be applied to the base depth of excavation in the western portion of the site. The ORC Advanced® Pellets will be thoroughly mixed with the subsurface soils. Following the application of the ORC into the subsurface soils, the foundation slab will be installed and the dewatering system will no longer be needed and will be turned off. Then, the groundwater will be rebound to its natural state (i.e., elevation) and interact with the ORC Advanced® Pellets and will begin accelerating the biodegradation process of the potential petroleum-related VOCs and SVOCs that may exist in groundwater following remediation at the site.

### 5.0 CERTIFICATION

I, <u>Ira N. Pierce</u>, certify that I am currently a NYS registered professional engineer and that this Remedial Design was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10)"

# DUST MINIMIZING FORMULATION FOR EXCAVATIONS, TANK PITS AND TRENCHES

FIGURE 1: ORC-A PELLETS ARE APPROXIMATELY 3-10 MM SIZE

DESCRIPTION

ORC Advanced® Pellets (ORC-A Pellets) are a pelletized version of REGENESIS' widely used ORC Advanced and are designed specifically for direct application into excavations, tank pits and trenches. This pelletized, dry application material minimizes airborne dust while eliminating the need for specialized equipment and spray water required for powder-slurry applications. ORC Advanced Pellets are approximately 3-10 mm in size as shown in Figure 1.

FEATURES & BENEFITS

- Optimal for use in excavations, tank pits and trenches where enhanced aerobic bioremediation is appropriate
- Pellet size (3-10 mm) minimizes airborne dust during handling and application of the material
- Dry application form eliminates need for water and equipment required for powder-slurry application types
- Patented technology provides long-term, controlled release oxygen for periods of up to 12 months on a single application
- Unique molecular structure delivers highest amount of active oxygen available, up to 15% by weight
- Contains micro-nutrients including: nitrogen, phosphorus and potassium (N,P,K) which may benefit aerobic microorganisms

UNCTION

The primary function of ORC-A Pellets is to provide a controlled-release oxygen source for the enhanced aerobic bioremediation of petroleum hydrocarbons or other aerobically degradable compounds. This is achieved through the use of patented processes which embed phosphates into the crystalline structure of solid peroxygen molecules. This feature slows the reaction that releases oxygen upon hydration, producing an optimized, controlled-release of oxygen over a period of up to 12 months. ORC-A Pellets deliver up to 15% active oxygen by weight and contain micro-nutrients such as: nitrogen, phosphorus, and potassium (N,P,K) which may be beneficial to aerobic biodegradation processes.

Note: Due to the size of the pellets this material is not recommended or designed for use in direct-injection or fixed well applications.

Advanced Technologies for Contaminated Site Remediation

#### REGENESIS ORC ADVANCED® PELLETS

**Dust Minimizing Formulation for Excavations, Tank Pits and Trenches** 

## PRODUCT APPLICATION INSTRUCTIONS

#### Introduction

The features and benefits of controlled-release, ORC Advanced are posted in other areas (product brochure, <a href="www.regenesis.com">www.regenesis.com</a>, and MSDS). From the field application standpoint, the benefits of ORC Advanced® Pellets (ORC-A Pellets) are in ease of handling and Health & Safety. Pelletized ORC Advanced is much easier to use because it eliminates the need for water and equipment associated with spray application and Health & Safety are dramatically improved by elimination of ORC Advanced dust and associated respiration issues. The later feature makes the material much easier to handle in open-air application approaches such as excavations and trenches.

#### **Design Considerations**

The new configuration of this material does not change the quantity estimated in the design process. The materials' available oxygen is up to 17% by weight and its physical attributes are designed to be easier to handle through the use of a pelletized version of the product and the elimination of the dust associated with dry application of ORC Advanced powder.

#### **Application Methods**

The pelletized form allows the user to simply and easily apply the ORC Advanced in a dry format using existing on-site operations or by manual methods. Some typical methods include:

- Application via the excavator bucket:
  - Simply insert a pre-determined quantity (unit bucket or bag) of ORC-A Pellets into an excavator bucket and use the excavator to mix and distribute the ORC-A Pellets into previously backfilled soil
- Application via manual or mechanical broadcasting/spreaders:
  - Manually or mechanically broadcast/spread pelletized ORC-A Pellets into the excavation at a pre-determined rate per unit of backfill material or per soil lift (as the soil is being backfilled)
  - Follow the manual broadcast step with mechanically mixing the ORC-A Pellets directly into the backfill using the excavator equipment

### **Example Estimates:**

Using an example unit weight of ORC-A Pellets (40 lb. bag)

For a 0.1% weight of ORC-Advanced to backfill:

- o Each 100,000 lbs. of soil
- o Apply 100 lbs. (4 buckets) ORC-A Pellets

#### REGENESIS ORC ADVANCED® PELLETS

**Dust Minimizing Formulation for Excavations, Tank Pits and Trenches** 

## PRODUCT APPLICATION INSTRUCTIONS

For a 0.2% weight of ORC-Advanced to backfill:

- o Each 100,000 lbs. of soil
- o Apply 200 lbs. (approx. 5 bags) ORC-A Pellets

#### **Example Estimates (SI Units):**

Using an example unit weight of ORC-A Pellets (18.1 kg bag)

For a 0.1% weight of ORC-A Pellets to backfill:

- o Each 45 metric tons of soil
- o Apply 45 kg (approx. 3 bags) ORC-A Pellets

For a 0.2% weight of ORC-A Pellets to backfill:

- o Each 90 metric tons of soil
- o Apply 90 kg (approx. 5 bags) ORC-A Pellets

#### 2. Hazard(s) identification

Physical hazards

Oxidizing solids

Category 2

Health hazards

Skin corrosion/irritation

Category 2

Serious eye damage/eye irritation

Category 1

**OSHA** defined hazards

Not classified.

Label elements

Signal word

Danger

**Hazard statement** 

May intensify fire; oxidizer. Causes skin irritation. Causes serious eye damage.

**Precautionary statement** 

Prevention

Keep away from heat. Keep/Store away from clothing/combustible materials. Take any precaution to avoid mixing with combustibles. Wash thoroughly after handling. Wear protective gloves/eye

protection/face protection.

Response

If on skin: Wash with plenty of water. If in eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a poison center/doctor. If skin irritation occurs: Get medical advice/attention. Take off contaminated clothing and wash before reuse. In case of fire: Use appropriate media to extinguish.

Storage

Store away from incompatible materials.

Disposal

Dispose of contents/container in accordance with local/regional/national/international regulations.

Hazard(s) not otherwise classified (HNOC)

None known.

Supplemental information

None.

#### 3. Composition/information on ingredients

#### **Mixtures**

Chemical name	CAS number	%
Calcium hydroxide oxide	682334-66-3	≥85
Calcium hydroxide	1305-62-0	≤15
Dipotassium Phosphate	7758-11-4	<5

Monopotassium Phosphate 7778-77-0 <5

**Composition comments** 

All concentrations are in percent by weight unless otherwise indicated.

#### 4. First-aid measures

Inhalation

Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact

IF ON CLOTHING: rinse immediately contaminated clothing and skin with plenty of water before removing clothes. Rinse skin with water/shower, If skin irritation occurs: Get medical

advice/attention. Wash contaminated clothing before reuse.

Eye contact

Do not rub eyes, Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do, Continue rinsing. Get medical attention immediately.

Ingestion

Never give anything by mouth to a victim who is unconscious or is having convulsions. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed

Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result. Dusts may irritate the respiratory tract, skin and eyes. Skin irritation. May cause redness and pain.

Indication of immediate medical attention and special treatment needed

Provide general supportive measures and treat symptomatically. Keep victim under observation. Symptoms may be delayed.

General information

Take off all contaminated clothing immediately. Contact with combustible material may cause fire. Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves. Wash contaminated clothing before reuse.

#### 5. Fire-fighting measures

Suitable extinguishing media
Unsuitable extinguishing
media

Water spray, fog (flooding amounts). Foam. Dry chemical powder. Carbon dioxide (CO2). None known.

Specific hazards arising from the chemical

Greatly increases the burning rate of combustible materials. Containers may explode when heated. During fire, gases hazardous to health may be formed. Combustion products may include: metal oxides.

Special protective equipment and precautions for firefighters

Self-contained breathing apparatus and full protective clothing must be worn in case of fire.

Fire fighting equipment/instructions Specific methods

General fire hazards

In case of fire and/or explosion do not breathe fumes. Move containers from fire area if you can do so without risk. Use water spray to cool unopened containers.

Cool containers exposed to flames with water until well after the fire is out.

May intensify fire; oxidizer. Contact with combustible material may cause fire.

### 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Keep away from clothing and other combustible materials. Wear appropriate protective equipment and clothing during clean-up. Use a NIOSH/MSHA approved respirator if there is a risk of exposure to dust/fume at levels exceeding the exposure limits. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up

Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Collect dust using a vacuum cleaner equipped with HEPA filter. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Ventilate the contaminated area. Stop the flow of material, if this is without risk. Absorb in vermiculite, dry sand or earth and place into containers.

Large Spills: Sweep up or vacuum up spillage and collect in suitable container for disposal. Shovel the material into waste container. Minimize dust generation and accumulation. Avoid the generation of dusts during clean-up. Following product recovery, flush area with water.

Small Spills: Wipe up with absorbent material (e.g. cloth, fleece). Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. Place all material into loosely covered plastic containers for later disposal. For waste disposal, see section 13 of the SDS. Wear appropriate protective equipment and clothing during clean-up.

**Environmental precautions** 

Avoid discharge into drains, water courses or onto the ground.

#### 7. Handling and storage

Precautions for safe handling

Minimize dust generation and accumulation. Routine housekeeping should be instituted to ensure that dusts do not accumulate on surfaces. Keep away from heat. Provide appropriate exhaust ventilation at places where dust is formed. Keep away from clothing and other combustible materials. Take any precaution to avoid mixing with combustibles. Avoid contact with water and moisture. Do not get this material in contact with eyes. Avoid contact with eyes, skin, and clothing. Avoid prolonged exposure. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities

Keep away from heat. Store in a cool, dry place out of direct sunlight. Store in original tightly closed container. Store in a well-ventilated place. Do not store near combustible materials. Store away from incompatible materials (see Section 10 of the SDS).

#### 8. Exposure controls/personal protection

#### Occupational exposure limits

#### US. OSHA Table Z-1 Limits for Air Contaminants (29 CFR 1910.1000)

Components	Туре	Value	Form
Calcium hydroxide (CAS 1305-62-0)	PEL	5 mg/m3	Respirable fraction.
		15 mg/m3	Total dust.
US. ACGIH Threshold Limit Value	es		
Components	Туре	Value	
Calcium hydroxide (CAS 1305-62-0)	TWA	5 mg/m3	
US. NIOSH: Pocket Guide to Che	mical Hazards		
Components	Туре	Value	
Calcium hydroxide (CAS 1305-62-0)	TWA	5 mg/m3	

Biological limit values

Appropriate engineering controls

No biological exposure limits noted for the ingredient(s).

Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. If engineering measures are not sufficient to maintain concentrations of dust particulates below the Occupational Exposure Limit (OEL), suitable respiratory protection must be worn. If material is ground, cut, or used in any operation which may generate dusts, use appropriate local exhaust ventilation to keep exposures below the recommended exposure limits. Eye wash facilities and emergency shower must be available when handling this product.

#### Individual protection measures, such as personal protective equipment

Eye/face protection

Use dust-tight, unvented chemical safety goggles when there is potential for eye contact.

Skin protection

Hand protection

Wear appropriate chemical resistant gloves. Frequent change is advisable. Recommended gloves

include rubber, neoprene, nitrile or viton.

Other

Wear appropriate chemical resistant clothing.

Respiratory protection

If engineering controls do not maintain airborne concentrations below recommended exposure limits (where applicable) or to an acceptable level (in countries where exposure limits have not been established), an approved respirator must be worn. Recommended use: Wear respirator with

dust filter.

Thermal hazards

Wear appropriate thermal protective clothing, when necessary.

General hygiene considerations

Keep from contact with clothing and other combustible materials. Remove and wash contaminated clothing promptly. Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

#### 9. Physical and chemical properties

#### 11. Toxicological information

#### Information on likely routes of exposure

Inhalation Dust may irritate respiratory system. Prolonged inhalation may be harmful.

Skin contact Causes skin irritation.

Eye contact Causes serious eye damage.

**Ingestion** Ingestion may cause irritation and malaise.

Symptoms related to the physical, chemical and toxicological characteristics

Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result. Dusts may irritate the respiratory

tract, skin and eyes. Skin irritation. May cause redness and pain.

#### Information on toxicological effects

**Acute toxicity** 

Components **Test Results Species** 

Calcium hydroxide (CAS 1305-62-0)

Acute Oral

**Test Results** 

Persistence and degradability

Decomposes in the presence of water. The product contains inorganic compounds which are not

biodegradable.

Bioaccumulative potential

Other adverse effects

The product does not contain any substances expected to be bioaccumulating. This substance has very low solubility in water and low mobility in the environment.

Mobility in soil

None known.

13. Disposal considerations

Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of **Disposal instructions** 

contents/container in accordance with local/regional/national/international regulations.

Local disposal regulations

Dispose in accordance with all applicable regulations.

Hazardous waste code

The waste code should be assigned in discussion between the user, the producer and the waste

disposal company.

Waste from residues / unused

products

Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see:

Disposal instructions).

Contaminated packaging Empty containers should be taken to an approved waste handling site for recycling or disposal.

Since emptied containers may retain product residue, follow label warnings even after container is

emptied.

# CHEMICAL INJECTION PLAN FOR THE NEWLY PROPOSED TRACK 4 RAMP AREA

Former G & C Services 255 East 138th Street Block 2333, Lot 1 Bronx, New York

**FINAL – June 21, 2016** 

#### 1.0 INTRODUCTION

East 138th Street LLC (the "Volunteer") is enrolled in the New York State Brownfield Cleanup Program (NYS BCP) and is currently remediating a 0.46-acre site located at 255 East 138th Street, Bronx, New York. A Remedial Action Work Plan (RAWP) was prepared for this site and was approved by the New York State Department of Environmental Conservation (NYSDEC) on October 16, 2013. Remediation at the site began in August 2015 and is expected to be completed by late Summer 2016. As stated in the NYSDEC-approved RAWP and the Decision Document, dated October 2013, site-wide excavation to 15 feet below grade surface (bgs) and achievement of Track 2 Restricted-Residential Use Soil Cleanup Objectives (SCOs) were proposed. However, NYSDEC issued an Explanation of Significant Difference in September 2015 since a small strip of land along the northern boundary of the site could not be excavated due to structural constraints with the adjacent buildings and a Track 2 Cleanup was no longer possible to be achieved along the northern boundary of the site. Instead, a Track 4 Cleanup was proposed for the area that cannot be excavated.

Additionally, on December 8, 2015, a Formal Dispute Resolution Notice was filed and a request for a Revised Track 4 Remedy in the area of the proposed ramp along the western boundary of the site was issued to NYSDEC. Similar to the northern boundary of the site, extensive soil excavation along the western boundary of the site cannot occur due to structural constraints with the adjacent building located at 243 East 138th Street. Since evidence of petroleum-impacted soil was previously identified during the Remedial Investigation (RI) in this Newly Proposed Track 4 Remedial Area, NYSDEC has determined that the petroleum-impacted soil is "source

material" for the groundwater contamination at the site and requires that this Newly Proposed Track 4 Remedial Area be remediated since extensive soil excavation below the groundwater table is no longer an option. As stated in the NYSDEC-approved RAWP, soil excavation to 15 feet bgs and application of Oxygen Release Compound (ORC) Advanced® Pellets, manufactured by Regenesis, into the excavation bottom of this portion of the site was the original proposed remedy. Instead, it is now proposed that the top six (6) feet of soil along the western boundary of the site will be excavated and removed off-site. Chemical injections will be performed from six (6) feet to 15 feet bgs in a portion of the Newly Proposed Track 4 Ramp Area to address and remediate the "source material" that was previously identified during the RI. Once the "source material" has been remediated as described herein, a remedial composite cover system consisting of a concrete building slab, a Preprufe 300R waterproofing membrane manufactured by Grace, and a concrete rat slab will be installed overlying the residual soils in the entire Newly Proposed Track 4 Remedial Area. A cross-sectional view of the remedial composite cover system is shown on Figure 1.

This Chemical Injection Plan has been prepared to address the "source material" that was previously identified during the RI and serves as an explanation of the elements that will be performed to remediate the entire Newly Proposed Track 4 Remedial Area for this site.

#### 2.0 PROPOSED REMEDY

#### 2.1 CHEMICAL INJECTION EVENT (ISCO #1)

The selected remedy to remediate the "source material" that has been previously identified in the Newly Proposed Track 4 Ramp Area will consist of a single, aggressive In-Situ Chemical Oxidation (ISCO) event which will be performed by Environmental Remediation and Financial Services, LLC (ERFS). The temporary chemical injection event (ISCO #1) will use the On-Contact Remediation Process® which has been designed to break down the organic contamination found both in soil and groundwater. The On-Contact Remediation Process® consists of four stages: the physical delivery stage, the preparation stage, the conversion stage, and the restoration stage.

The physical delivery stage of the remedy will involve the advancement of eight (8) to 10 temporary injection points within an 800-square foot area of the Newly Proposed Track 4 Ramp Area. The treatment area within the Newly Proposed Track 4 Ramp Area and the locations of the temporary injection points are identified on **Figure 2**. Each temporary injection point will be advanced to approximately 15 feet bgs via a Geoprobe® direct push rig. The application depth interval across the 800-square foot treatment area will be from six (6) to 15 feet bgs since this is the approximate depth interval of the "source material" that has been previously identified based on field conditions (photoionization detector [PID] methods, visual, and olfactory evidence). At each temporary injection point, the oxidant will be injected directly into the subsurface as the contractor pulls upward from 15 to 6 feet bgs. No screens will be installed in the temporary injection points. The remaining top six (6) feet of soil within the treatment area will be excavated and removed off-site as part of the Track 4 Remedy.

The preparation stage of the remedy will involve the preparation of the proposed subsurface treatment interval to enable a high efficiency for the conversion of the targeted gasoline-related contaminants into base states or harmless compounds by using a biodegradable mixture of additives. Subsequently, the conversion stage of the remedy will involve the application of oxidizing reagents into the subsurface treatment interval via the temporary direct push injection method. The chemical injection event (ISCO #1) will consist of five (5) days of application;

approximately 1,000 to 2,000 gallons of 3% to 7% ferrous sulfate aqueous solution and 4,000 to 7,000 gallons of hydrogen peroxide aqueous solution will be applied to the treatment area during each day of treatment. The ferrous sulfate aqueous solution will be initially injected to chemically change the groundwater and once the necessary iron concentration is observed based on monitoring data, the hydrogen peroxide aqueous solution will be applied. A high range in volume and concentrations of the oxidizing reagents are initially proposed because the porosity of the soil between six (6) and 15 feet bgs is unknown and the lithological conditions vary drastically throughout the treatment area and are not horizontally continuous. Without knowing the exact porosity that will be encountered during the injections, a range is given so the volume and concentrations of the oxidants can be correctly modified once the field parameters and conditions are known during the initial stages of the injections.

The monitoring well that was installed in the East 138th Street sidewalk, approximately five (5) feet from the property boundary, will be continuously monitored during the injections. Hydrogen peroxide test strips and a U-50 Multi-parameter Water Quality Meter will be used to monitor the groundwater parameters such as temperature, dissolved oxygen, pH, conductivity, and total dissolved solids. These parameters will be used to adjust the volume and concentrations of the oxidizing reagents during the injections. The oxidizing reagents will be mixed on site daily, and the quantity, concentrations, and frequency of the chemicals will vary each day of the treatment and will be reported in the Final Engineering Report (FER) following completion of the treatment. The treatment and chemical design summary is discussed in greater detail in the Remedial Action Workplan, dated March 2016, prepared by ERFS, and provided as **Appendix I.** 

#### 2.2 EVALUATION OF TREATMENT EFFECTIVENESS

As stated in the NYSDEC-approved RAWP, the original remedy proposed to treat the groundwater at the site consisted of three (3) components, which included excavation and off-site disposal of non-hazardous petroleum-impacted soils, site-wide dewatering, and application of ORC Advanced® Pellets, manufactured by Regenesis, into the subsurface soils beneath the proposed development foundation. While some of the soil excavation will occur to a maximum of six (6) feet, due to the structural issues associated with excavating deeper, the proposed chemical injection event is now a new fourth element of the remedy to treat the groundwater at

the site. As required by the NYSDEC-approved RAWP, a reduction in the concentrations of the gasoline-related compounds is the goal that needs to be achieved for this site to earn a certificate of completion by comparing the results of the pre-construction groundwater sample (i.e. before the start of the remediation) and the post-injection groundwater sample.

Prior to the start of remediation at the site, what will be called the pre-construction groundwater sample was collected on August 20, 2015, from a temporary monitoring well that was installed in the East 138th Street sidewalk; the results of the pre-construction groundwater sample are provided as **Table 1.** These results serve as the baseline concentrations for the gasoline-related compounds. Prior to the start of the temporary chemical injection event (ISCO #1), a permanent off-site monitoring well was installed on April 28, 2016 in the East 138th Street sidewalk, approximately five (5) feet from the property boundary. Two (2) to four (4) weeks following the completion of the temporary chemical injection event (ISCO #1), a representative groundwater sample and a trip blank will be collected for Target Compound List (TCL) Volatile Organic Compound (VOC) analysis to determine the effectiveness of the "source material" remediation of the Newly Proposed Track 4 Remedial Area and the treatment of the site groundwater. Prior to collection of the post-injection sample, hydrogen peroxide test strips and monitoring of the dissolved oxygen concentrations in groundwater, via the U-50 Multi-parameter Water Quality Meter, will be conducted to determine if the oxidant is no longer present in the monitoring well. If needed, the post-injection sample will be collected more than four (4) weeks following the completion of chemical injection event (ISCO #1) until typical background groundwater conditions are observed.

If the initial post-injection treatment gasoline-related concentrations in groundwater are less than the pre-construction gasoline-related concentrations in groundwater, groundwater sampling will continue on a quarterly basis until an established decreasing trend is achieved and no evidence of rebounding effects are observed. NYSDEC typically requires at least eight (8) sampling events to confirm a decreasing trend; however, it is anticipated that a decreasing trend in the groundwater concentrations will be achieved based on the results of four (4) quarterly sampling events and a request will be made to NYSDEC to conclude the groundwater sampling, as necessary. If evidence of rebounding is observed in the post-injection quarterly monitoring of the

well, an additional chemical injection event (ISCO #2) will be performed and monitored. However, the remedy will be deemed sufficiently "complete" for purposes of achieving a Certificate of Completion in 2016 if two (2) quarterly rounds of groundwater samples shows decreasing trends even though the monitoring will continue thereafter.

#### 2.3 CHEMICAL INJECTION EVENT (ISCO #2)

If the initial post-injection treatment gasoline-related concentrations in groundwater are not less than the pre-construction gasoline-related concentrations in groundwater or if evidence of rebounding concentrations are observed in the post-injection quarterly monitoring, an additional chemical injection event (ISCO #2) will be performed, as required by NYSDEC. The chemical injection event (ISCO #2) will be performed in the same manner as the first chemical injection event (ISCO #1) using the On-Contact Remediation Process®; however, it is anticipated that the remedy will be performed on a smaller scale. The remedy will consist of the direct push injection method and will consist of the advancement of six (6) to eight (8) temporary injections within the treatment area of the Newly Proposed Track 4 Ramp Area. Each temporary injection point will be advanced to approximately 15 feet bgs via a Geoprobe® direct push rig, and the application depth interval will be from six (6) to 15 feet bgs. At each temporary injection point, the oxidants will be injected directly into the subsurface as the contractor pulls upward from 15 to six (6) feet bgs. No screens will be installed in the temporary injection points and the remaining top six (6) feet of soil within the treatment area will be excavated and removed off-site.

ISCO #2 will consist of three (3) days of application; approximately 1,000 to 2,000 gallons of 3% to 7% ferrous sulfate aqueous solution and 4,000 to 7,000 gallons of hydrogen peroxide aqueous solution will be applied to the treatment area during each day of treatment. A high range in volume and concentrations of the oxidizing reagents are proposed because the porosity of the soil within the treatment interval is unknown at the time of preparation of this plan. The oxidizing reagents will be mixed on site daily and the quantity, concentrations, and frequency of the chemicals will vary each day of the treatment and will be reported in the FER following completion of the treatment. The treatment and chemical design summary for ISCO #2 is discussed in greater detail in the Remedial Action Workplan, dated March 2016, prepared by

ERFS, and provided as **Appendix I.** 

The approach for evaluating the effectiveness of the ISCO #2 injection event will be the same as

mentioned above for ISCO #1. Depending on the results of the hydrogen peroxide test strips and

the dissolved oxygen concentrations in groundwater, via the U-50 Multi-parameter Water

Quality Meter, it is anticipated that two (2) to four (4) weeks following the completion of the

temporary chemical injection event ISCO #2, a representative groundwater sample and a trip

blank will be collected for TCL VOC analysis. If the ISCO #2 post-treatment gasoline-related

concentrations in groundwater are less than the pre-construction gasoline-related concentrations,

groundwater sampling will continue on a quarterly basis until an established decreasing trend is

achieved and no evidence of rebounding effects are observed. It is anticipated that a decreasing

trend in the groundwater concentrations will be achieved based on the results of four (4)

quarterly sampling events and a request will be made to NYSDEC to conclude the groundwater

sampling, as necessary.

If the post-treatment gasoline-related concentrations in groundwater, following chemical

injection event ISCO #2, are not less than the pre-construction gasoline-related concentrations,

then permanent injection infrastructures consisting of permanent vertical and lateral injection

points will be installed and treatment will continue until concentration reductions are observed. If

the permanent vertical and lateral injections need to be installed, an additional explanation of

these procedures will be provided in a separate plan prior to implementation. However, at this

time it is anticipated that ISCO #1 and if needed, ISCO #2, will achieve the required reduction in

8

gasoline-related groundwater concentrations.

Chemical Injection Plan – Track 4 Ramp Area 255 East 138th Street Bronx, New York Brinkerhoff Project No. 10BR188 Final – June 21, 2016

#### 3.0 CONCLUSIONS

On December 8, 2015, a Formal Dispute Resolution Notice was filed and a request for a Revised Track 4 Remedy in the area of the proposed ramp along the western boundary of the site was issued to NYSDEC. Similar to the northern boundary of the site, extensive soil excavation along the western boundary of the site cannot occur due to structural constraints with the adjacent building located at 243 East 138th Street. However, petroleum-impacted soil, determined to be "source material" by NYSDEC, was previously identified and NYSDEC required that this "source material" be remediated. As stated in the NYSDEC-approved RAWP, soil excavation to 15 feet bgs and application of ORC Advanced® Pellets, manufactured by Regenesis, into the excavation bottom was the original proposed remedy for this portion of the site, which could not be feasibly achieved. Therefore, treatment, which is the next remedial methodology in the preferred remedial hierarchy of options was selected.

The new treatment remedy consists of the following since complete excavation is no longer possible: (a) the top six (6) feet of soil in this Newly Proposed Track 4 Remedial Area shall be excavated and removed off-site and (b) a single chemical injection event (ISCO #1) using a mixture of ferrous sulfate and hydrogen peroxide aqueous solutions will be performed as the selected remedy to remediate the petroleum-impacted soil "source material". The remedy will be deemed sufficiently "complete" for purposes of achieving a Certificate of Completion in 2016 if two (2) quarterly rounds of groundwater samples show decreasing trends.

The temporary chemical injection will be performed by ERFS and the groundwater will be monitored for oxidant concentrations and other parameters during the injection. Following the chemical injection event (ISCO #1), groundwater sampling will be performed to determine the effectiveness of the "source material" remediation and the treatment of the site groundwater. If a reduction of the concentrations of gasoline-related compounds is not achieved or if evidence of rebounding concentrations are observed in the post-injection quarterly monitoring, a second temporary chemical injection event (ISCO #2) will be performed. Post-injection groundwater sampling will be completed on a quarterly basis until a decreasing trend is established and no evidence of rebounding effects is achieved. It is anticipated that the decreasing trend in

groundwater concentrations will be achieved in four (4) quarterly post-remedial events; however, if necessary, more rounds will be performed. If a decreasing trend is not established following the temporary chemical injection event (ISCO #2), permanent injection infrastructures may need to be installed, as required by NYSDEC. In addition, as stated above, the remedy will be deemed sufficiently "complete" for purposes of achieving a Certificate of Completion in 2016 if two (2) quarterly rounds of groundwater samples show decreasing trends.

This Chemical Injection Plan has been prepared to address and remediate the "source material" that was previously identified during the RI and serves as an explanation of the elements that will be performed to remediate the entire Newly Proposed Track 4 Remedial Area for this site. Following completion of the "source material" remediation, a composite cover system will be installed overlying the residual soils in the entire Newly Proposed Track 4 Remedial Area.

#### 4.0 CERTIFICATION

I, <u>Ira N. Pierce</u>, certify that I am currently a NYS registered professional engineer and that this Remedial Design was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10)"

Ira N. Pierce,

#### 1.0 INTRODUCTION

Environmental Remediation and Financial Services, LLC (ERFS) has prepared this Remedial Action Workplan (RAW) to address gasoline contamination located at the 255 East 138th property, located in Bronx, New York (the Site). ERFS is submitting this RAW proposing the application of the On-Contact Remediation Process® (On-Contact) to treat the petroleum contamination in-situ.

ERFS' method of remediation is known as the On-Contact Remediation Process®. The On-Contact Process® consists of four stages that can be repeated throughout the project. The four stages are: the physical delivery stage, the preparation stage, the conversion stage, and the restoration stage. Several methods will be used during each of these four stages as the project progresses. The effectiveness of each method will be gauged in the field using real-time field monitoring along with sampling and laboratory analysis. Methods will be adjusted during and between treatment events in an attempt to maximize the effectiveness of each treatment event.

ERFS has submitted a separate letter to the UIC Division at USEPA Region 2 notifying UIC that the injections are planned. This RAW describes the proposed in-situ remediation of petroleum impacted soil and groundwater at the Site. ERFS will remediate impacted soil and groundwater to the site's applicable NYSDEC standards.

#### 2.0 BACKGROUND INFORMATION AND REMEDIATION OVERVIEW

#### 2.1 Background Information

The subject property was formerly developed as two gas stations; #245 East 138th Street (a 2,000 gallon UST, 4 550-gallon USTs and a dispenser island); and #2551 3rd Avenue (11 550-gallon USTs). Prior to 1978, the gas stations were demolished and a filling station was constructed on western portion of the property and a commercial building was constructed in the center of the property.

In 1998, four 550-gallon USTs the 2,000 gallon UST and the pump island were removed. A limited soil excavation was conducted; however residual impacted soil remained on the property. Subsequent monitoring well installation and quarterly groundwater monitoring and sampling was performed from 2004 through 2006. In 2007, the 11 550-gallon USTs and the associated piping were removed from the property. Subsequent soil sampling showed elevated base neutral impacts on the site that were associated with historical fill material that was prevalent on-site and in the surrounding area. In 2011, Brinkerhoff conducted a Phase II throughout the Site which consisted of soil and groundwater sample collection for laboratory analysis. The soil sampling results exceeded the 6 NYCRR Part 375 Cleanup Objectives and the CP-51 Soil Cleanup Levels for Gasoline contaminated soil. The soil sampling results also reported elevated metal concentrations which exceeded the NYSEDC Recommended Soil Cleanup Objectives for The groundwater sampling results exceeded the NYSDEC Restricted Residential Use. Groundwater Standards in monitoring wells MW-2 and TWP-1. Based on Brinkerhoff's 2011 Phase II, additional remediation is necessary at the site.

Currently, a portion of the site has been excavated to an approximate depth of 15 feet below ground surface (bgs). Due to access issues, ERFS has been retained to remediate soil and groundwater impacts in an area that could not be excavated. ERFS' in-situ Treatment Area measures approximately 40 feet long by 20 feet wide with a vertical interval from 6 feet to 15 feet bgs.

#### 2.2 Selection of Remedial Action

Several innovative remedial technologies were evaluated for their ability to remediate impacted soil and groundwater identified at the Site. Treatment technologies were evaluated based on the ability to remediate the underlying soil and groundwater contamination with minimal disruption to the Site. In-situ chemical oxidation using the On-Contact Remediation Process® is proposed to drive the destruction of contaminants in a timely and cost-effective fashion.

#### 3.0 PROPOSED REMEDIAL ACTION WORKPLAN

#### 3.1 Description of the On Contact Remediation Process®

The On-Contact Remediation Process® is a proprietary in-situ technology which involves the application of physical, chemical and biological methods to degrade organic contamination in soil and groundwater into harmless compounds such as carbon dioxide and water. Specifically, the On-Contact Remediation Process® consists of the following four stages; 1) a physical method to enhance the disbursement of Process reagents into the contaminated area, 2) a chemical method involving the injection of a proprietary biodegradable mixture of additives to enhance the availability of target contaminants, 3) a chemical method involving the injection of a proprietary oxidation mixture to degrade target contaminants and 4) a chemical method to complete the degradation process and restore subsurface conditions, if necessary. These stages will be applied through the physical delivery devices described below.

The overall project approach is to apply repeated treatments into the targeted areas and vertical intervals so as to reduce contaminant mass within the impacted volume of soil and groundwater. Treatment effectiveness will be gauged using real-time field monitoring data and interim sampling analytical results. Data collected during the project will be used to adjust the injection details and decision making regarding injection techniques (e.g. installing supplemental injection devices) and reagent formulations (e.g. altering amounts, ratios, concentrations, sequences and frequency of applied remediation reagents).

#### 3.2 Site Specific Design Summary

This section provides an overview of the site specific design based on information obtained during soil and groundwater investigations. More detailed descriptions of the techniques to be used and reagents to be injected are provided in the sections that follow below.

<u>Physical Delivery Stage</u> – ERFS anticipates installing temporary direct push injection points, vertical injection points, and injection laterals during the course of remedial activities. It should be noted that not all injection points will necessarily be installed initially. The location of the proposed infrastructure is illustrated in **Figures 1 and 2.** 

<u>Direct Push Injection</u> – ERFS will utilize a direct push (i.e. Geoprobe) injection method to deliver treatment reagents at targeted depths at any time during the remedial program. Injection points may be clustered closer together in highly impacted areas and may be placed further apart in lesser contaminated areas. Injection point locations will be selected based on site accessibility (i.e. locations of structures, subsurface utilities, and etc. present in within the treatment zone). The location of the proposed infrastructure is illustrated in **Figure 1.** 

<u>Vertical Injection Points (VIPs)</u> – Based on sampling data collected following the direct push injections, residual soil and groundwater impacts may be addressed with vertical injection points.

The vertical injection points will be installed at depths targeting the impacted zone of 6 feet to 15 feet bgs. A figure showing the locations of the proposed vertical injection points is provided as **Figure 2.** 

<u>Injection Laterals (ILs)</u> – Prior to backfilling the excavation area, injection laterals may be placed on the northwestern portion of the excavation, which will extend beneath the Treatment Area. These injection laterals will be installed at varying depth throughout the impacted zone of 6 feet to 15 feet bgs. A figure showing the locations of the proposed injection laterals is provided as **Figure 2.** 

Sequence of Activities – ERFS will follow the sequence below when implementing remediation at the Site:

- Event 1 will be conducted using direct push injections. Event 2 and possibly future events may repeat this effort or a smaller scope (e.g. focused direct push injection in a stubborn area) direct push injection following Event 1.
- Install Structures. Based on interim sampling, ERFS may install injection infrastructure, as needed, following Event 1. Additional injection points may be installed within the Treatment Area, if needed.
- Conduct repeated treatments ERFS may conduct repeated treatment events, as needed.
- Monitoring Monitoring of field parameters will be conducted during each treatment event. Soil and Groundwater sampling will be conducted by Brinkerhoff.
- Once remediation is complete, post-remediation monitoring will be conducted by Triassic.

#### 3.3 Treatment Design/Chemical Treatment

ERFS has conducted numerous treatments of gasoline contamination at similar sites and will use oxidizer blends found to be effective at those sites. ERFS will use the aforementioned injection infrastructure described above to treat impacted soil and groundwater at the Site. Additional information regarding the On-Contact Process description is provided in **Appendix A.** 

ERFS will apply reagents as summarized in the bullets below to achieve remediation goals. The type, quantity, concentration, sequence, and frequency of reagent addition will vary over the course of the project. Estimated volumes and concentrations of reagents that may be used at some or all injection points during each injection event are listed below.

- Ferrous Sulfate Approximately 1,000 to 2,000 gallons of 3% to 7% aqueous solution injected into the Treatment Area during each day of a treatment event.
- Hydrogen peroxide Approximately 4,000 to 7,000 gallons of 3% to 7% aqueous solution injected into the Treatment Area during each day of a treatment event.

ERFS will mobilize all equipment and personnel required to apply the On-Contact Remediation

^{*} The chemicals used for treatment events will be mixed on-site using a potable water supply.

Process® at the Site.

## 3.4 Remedial Monitoring

All remedial monitoring activities will be performed by Brinkerhoff.

### 3.5 Site Health and Safety

A copy of the Health and Safety plan has been prepared and will be on-site during all field activities.

# **APPENDIX A On-Contact Process**

#### ERFS ON-CONTACT PROCESS® DESCRIPTION

The On-Contact Remediation Process® is a proprietary in-situ technology which involves the application of physical, chemical and biological methods to degrade organic contamination in soil and groundwater into harmless compounds such as carbon dioxide and water. Specifically, the On-Contact Remediation Process® consists of the following four stages; 1) a physical method to enhance the disbursement of Process reagents into the contaminated area, 2) a chemical method involving the injection of a proprietary biodegradable mixture of additives to enhance the availability of target contaminants, 3) a chemical method involving the injection of a proprietary oxidation mixture to degrade target contaminants and 4) a chemical method to complete the degradation process and restore subsurface conditions, if necessary. These stages will be applied through the physical delivery devices described below.

The overall project approach is to apply repeated treatments into the targeted areas and vertical intervals so as to reduce contaminant mass within the impacted volume of soil and groundwater. Treatment effectiveness will be gauged using real-time field monitoring data and interim sampling analytical results. Data collected during the project will be used to adjust the injection details and decision making regarding injection techniques (e.g. installing supplemental injection devices) and reagent formulations (e.g. altering amounts, ratios, concentrations, sequences, and frequency of applied remediation reagents).

The remediation techniques described below will be used in varying combinations depending on cleanup progress. Injection methods, chemical reagents, treatment frequency, and monitoring practices may be adjusted throughout the project based on field monitoring, analytical results, and at the discretion of the ERFS project engineer.

#### **Physical Stage**

This stage utilizes multiple possible "Physical Delivery Devices". Most On Contact® sites are treated using a combination of devices to increase the remedial effectiveness.

**Direct Push Injection** involves drilling specialized Geoprobe injection tooling to the targeted depth intervals and then injecting treatment reagents that will break down contaminants in-situ. Direct push injection allows rapid application of a large reagent volume so that significant contaminant reduction can be achieved. Furthermore, direct injection creates subsurface interactions between soils and groundwater such that mixing is promoted leading to better treatment. Direct push injections allow flexibility for injecting into multiple locations and to deliver large volumes of reagents focused into targeted intervals.

This injection method entails the use of a direct push rig to insert a Geoprobe injection tool to the targeted depth for injection. Once the injection tool is driven to the targeted depth, a pressure hose is connected to the drive rods at grade to allow fluid transfer into the injector and then into surrounding soils and groundwater. Direct push injection will allow rapid application of a large reagent volume so that significant contaminant reduction can be realized early in the project. Further, direct injection will have the localized effect of creating a good mixing zone of subsurface soils and groundwater within the injection point radius of influence (ROI) to promote

better contact with contaminants and hence better treatment. Additionally, the injection tool can be moved vertically, if desired, to ensure good vertical treatment along the targeted interval.

The first, and possibly the second, injection events may be conducted using direct push drilling and injection techniques. Additionally, this technique may be used near the end of the project if localized area(s) are found to have residual contamination above cleanup goals and require polishing. Direct push injection use for the second event will be determined based on observations during the first event.

**Geoprobe Direct Push Injection Schematic** 

**Propagations** are replacements for inefficient wells. Propagations are installed using a fracturing like technology to create a disk up to 20 feet across and approximately 2 mm in average thickness. This creates a plane of approximately 1,000 square feet to infiltrate reagents into the subsurface independent of native geological limitations. The final structure of a Propagation can be mapped using transits, sonics and down hole probes. A single Propagation can do the work of multiple injection wells at a fraction of the cost.

Propagations are filled like bladders at low pressure and are used to feed reagents into the groundwater and/or soil. The Propagations can also be converted to piezometers or recovery wells in the future.

Propagations are installed by driving 2-inch diameter, carbon steel threaded pipe sections to the specified treatment interval. Custom adaptors are attached to the lower end of pipe which serves to direct earthen slurry material per design. Once the 2-inch Propagation pipe is installed, approximately one-half to one 55-gallon drum of soil cuttings are generated as the lower end of the drive point is prepared for a sand slurry injection.

A sand slurry is blended and pressurized using a custom injection rig unit and delivered to the Propagation pipe at grade using a high-pressure rubber hose. The rubber hose is attached to the Propagation pipe using a T-fitting equipped with a high-pressure shutdown which is adjusted for each site. Sand slurry is then delivered to the drive point at pressures matching site geology hydraulic fracturing pressure. By controlling flow rate and pressure of the sand slurry, the operator can control the rate of formation and the shape of the Propagation.

Propagation radial influence is verified by reviewing surface deflection readings of pre-surveyed points and the injection pressure/flow log. Surface deflection is measured at multiple points using either a level and transit system or an array of sonic measuring devices and data loggers to accurately measure deflection of the site surface on the order of 1 to 3 mm.

**ERFS Propagation Schematic** 

*Infiltration trenches* are designed to infuse remedial fluids into a given area. Remedial fluids permeate in a "curtain like" motion through the subsurface. Construction generally consists of slotted screen pipe, seated horizontally in the subsurface within a coarse gravel infiltration bed. Access to the pipe is through a vertical riser pipe finished to grade. An infiltration trench allows transfer of reagents directly to the excavation bed and/or contaminated soils.

**Vertical Wells Installed via Direct Push** – are PVC injection points for reagent injection installed using direct push. This method can be used in tandem with the propagations described above. This method of reagent delivery will use vertical wells that will be installed by driving a 3-inch diameter direct push rod, installing a 2-inch diameter, Schedule 40 PVC, screen and riser finished in a flush-mounted manhole. Filter pack sand will be washed around the outside of the

PVC well to a level at least one foot above the top of screen as the drill rods are withdrawn. An approximately 6-inch thick bentonite seal will be formed by pouring in powdered bentonite and hydrating the bentonite thoroughly. The remainder of the borehole will be finished by emplacing a grout-bentonite slurry around the PVC. If this method of reagent delivery is proposed for the Site, ERFS will request a variance to NJDEP regulations pertaining to well installation annular space requirements via the approval of this RAW. The variance request is based on the following considerations:

- Wells are to be used for injection, not for monitoring, so the annular space requirements are not critical to good well performance in this case;
- o Site disruption and schedule the site is an occupied residence with little room for heavy equipment and conventional drilling may be highly disruptive. Direct push wells can be installed in less than half the time and with much less disruption;
- o Soil cuttings and waste minimization hollow stem augered wells would generate several drums of contaminated soil cuttings whereas no cuttings are generated via direct push installation;
- o H&S Personnel Exposure direct push installation will not bring highly contaminated soil and groundwater to the surface in the form of cuttings and wet cuttings, thus minimizing the contact between personnel (who would otherwise need to shovel and sweep contaminated soil) and hazardous materials. Direct push installation also eliminates smearing of deeper impacted soil in the upper soils as occurs with augering.
- o Flexibility a compact direct push rig can maneuver easily and reach locations that a larger conventional rig cannot; and,
- Cost Conventional wells may cost three to four times the cost of installing direct push injection wells.

Supplemental injection points are used to spot treat and/or access areas where other structures are inappropriate. They are used to treat soil and/or groundwater and are generally constructed of 2-inch diameter schedule 40 PVC well screen (typically 5 foot lengths) and solid riser. Boring holes are advanced with a hand auger and 2- inch diameter schedule 40 PVC well screen is inserted into the bore hole. Coarse sand is backfilled around the casing. To create a seal, bentonite is applied from grade to 2 feet bgs, with grout added to grade.

**Programmable Release Processor** (**PRP**) is a physical device installed in a vertical injection well for a "time released" dose of reagents. A PRP is installed in an injection well and maintained during the scheduled injections to supplement the on-site chemistry between injections.

#### **Preparation Stage**

In all On-Contact® designs, subsurface contaminated areas are prepared to enable a high efficiency of contaminated conversion to base states or harmless compounds. To prevent rebound effects after treatment, contaminants adhering to soil particles need to be removed. Low concentration and volume mixtures of catalysts, acids, emulsifiers, co-solvents and/or surfactants are used to enhance the remediation within the influence of the injection infrastructure.

#### **Conversion Stage**

Using oxidizers, reducing compounds and/or transitional compounds specifically configured for the site, contaminants are converted to harmless states "on-contact". One of the major innovations of the On-Contact® process is the use of real-time monitoring equipment electronics to assess the condition and travel of remediation fluids and the real-time survivability of the contaminants.

All On-Contact® chemistry is adjusted on-site. Real-time monitoring allows for tuning of application stages and thus ends the unpredictability of batch in-situ application, especially infiltration through conventional wells. There is no long-term chemical inventory stored at the site. All On-Contact® chemistry is environmentally friendly, and neutralized by water if spilled. Site work is conducted by OSHA certified/ERFS trained technicians and normally requires Level D OSHA personal protective equipment.

#### **Restoration Stage**

When independent testing results conclude the project is completed, a Restoration Stage may be applied to adjust sub-surface conditions, such as pH or iron, if needed.

# APPENDIX B MSDS

1. Product Identification

Synonyms: Ferrous sulphate; iron sulfate; sulfuric acid, iron (2+) salt

(1:1),

CAS No.: 7720-78-7 Anhydrous 7782-63-0 Heptahydrate

17375-41-6 Monohydrate

Molecular Weight: Not applicable to mixtures.

Chemical Formula: FeSO4 . xH2O

 $\hbox{\tt 2. Composition/Information on Ingredients}\\$ 

Ingredient CAS No Percent Hazardous

Ferrous Sulfate 7720-78-7 100% Yes

3. Hazards Identification

# UNIVAR USA INC. ISSUE DATE:2008-05-19 Annotation:

Emergency Overview

WARNING! HARMFUL IF SWALLOWED OR INHALED. CAUSES IRRITATION TO SKIN, EYES AND RESPIRATORY TRACT. AFFECTS THE LIVER.

Potential Health Effects

#### Inhalation:

Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath.

#### Ingestion:

Low toxicity in small quantities but larger dosages may cause nausea, vomiting, diarrhea, and black stool. Pink urine discoloration is a strong indicator of iron poisoning. Liver damage, coma, and death from iron poisoning has been recorded. Smaller doses are much more toxic to children.

#### Skin Contact:

Causes irritation to skin. Symptoms include redness, itching, and pain.

#### Eye Contact:

Causes irritation, redness, and pain.

#### Chronic Exposure:

Severe or chronic ferrous sulfate poisonings may damage blood vessels. Large chronic doses cause rickets in infants. Chronic exposure may cause liver effects. Prolonged exposure of the eyes may cause discoloration.

#### Aggravation of Pre-existing Conditions:

Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.

#### 4. First Aid Measures

#### Inhalation:

Remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

#### Ingestion:

Induce vomiting immediately as directed by medical personnel. Never give anything by mouth to an unconscious person. Get medical attention.

#### Skin Contact:

Immediately flush skin with plenty of soap and water for at least 15 minutes. Remove contaminated clothing and shoes. Get medical attention. Wash clothing before reuse. Thoroughly clean shoes before reuse.

#### Eye Contact:

Immediately flush eyes with plenty of water for at least 15 minutes, lifting

MSDS NO:MZF1804 VERSION:012 2008-10-17

Annotation: lower and upper eyelids occasionally. Get medical attention immediately.

#### 5. Fire Fighting Measures

#### Fire:

Not considered to be a fire hazard.

#### Explosion:

Not considered to be an explosion hazard.

#### Fire Extinguishing Media:

Use any means suitable for extinguishing surrounding fire.

#### Special Information:

Use protective clothing and breathing equipment appropriate for the surrounding fire.

#### 6. Accidental Release Measures

Ventilate area of leak or spill. Wear appropriate personal protective equipment as specified in Section 8. Spills: Pick up and place in a suitable container for reclamation or disposal, using a method that does not generate dust. US Regulations (CERCLA) require reporting spills and releases to soil, water and air in excess of reportable quantities. The toll free number for the US Coast Guard National Response Center is (800) 424-8802.

#### 7. Handling and Storage

Keep in a well closed container stored under cold to warm conditions, 2 to 40 C, (36 to 104F). Protect against physical damage. Isolate from incompatible substances. Containers of this material may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product.

#### 8. Exposure Controls/Personal Protection

Airborne Exposure Limits:

-ACGIH Threshold Limit Value (TLV):

1 mg/m3 (TWA) soluble iron salt as Fe

#### Ventilation System:

A system of local and/or general exhaust is recommended to keep employee exposures below the Airborne Exposure Limits. Local exhaust ventilation is generally preferred because it can control the emissions of the contaminant at its source, preventing dispersion of it into the general work area. Please refer to the ACGIH document, Industrial Ventilation, A Manual of Recommended Practices, most recent edition, for details. Personal Respirators (NIOSH

If the exposure limit is exceeded, a half-face dust/mist respirator may be worn for up to ten times the exposure limit or the maximum use concentration specified by the appropriate regulatory agency or respirator supplier,

Vapor Pressure (mm Hg): No information found.

Evaporation Rate (BuAc=1): No information found.

Annotation:
whichever is lowest. A full-face piece dust/mist respirator may be worn up to 50 times the exposure limit, or the maximum use concentration specified by the appropriate regulatory agency, or respirator supplier, whichever is lowest. For emergencies or instances where the exposure levels are not known, use a full-facepiece positive-pressure, air-supplied respirator. WARNING: Air-purifying respirators do not protect workers in oxygen-deficient atmospheres. Skin Protection: Wear impervious protective clothing, including boots, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact. Eye Protection: Use chemical safety goggles and/or full face shield where dusting or splashing of solutions is possible. Maintain eye wash fountain and quickdrench facilities in work area. 9. Physical and Chemical Properties Appearance: White to slightly yellow tinged powder. Odor: Odorless. Solubility: Soluble in water. Density: No information found. pH: No information found. % Volatiles by volume @ 21C (70F): Boiling Point: Not applicable. Melting Point: 500C (932F) Vapor Density (Air=1): No information found.

# UNIVAR USA INC. ISSUE DATE:2008-05-19 Annotation:

10. Stability and Reactivity

Stability:

Stable under ordinary conditions of use and storage.

Hazardous Decomposition Products:

Burning may produce sulfur oxides.

Hazardous Polymerization:

Will not occur.

Incompatibilities:

Alkalis, soluble carbonates, and oxidizing materials. Reacts in moist air to form ferric sulfate.

Conditions to Avoid:

Moisture.

11. Toxicological Information

Ferrous sulfate heptahydrate: Oral mouse LD50: 1520 mg/kg, investigated as a mutagen.

Ferrous sulfate anhydrous: oral rat LD50: 319 mg/kg; investigated as a mutagen, tumorigen, reproductive effector.

 \Cancer	Lists\	

---NTP Carcinogen---

Ingredient Known Anticipated IARC Category
Ferrous Sulfate (7720-78-7) No No None

12. Ecological Information

Environmental Fate:

No information found.

Environmental Toxicity:

No information found.

#### 13. Disposal Considerations

Whatever cannot be saved for recovery or recycling should be managed in an appropriate and approved waste disposal facility. Processing, use or contamination of this product may change the waste management options. State and local disposal regulations may differ from federal disposal regulations. Dispose of container and unused contents in accordance with federal, state and local requirements.

14. Transport Information

Not regulated.

#### WHMIS:

This MSDS has been prepared according to the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all of the information required by the CPR.

16. Other Information

NFPA Ratings: Health: 1 Flammability: 0 Reactivity: 0

DATE: 11/21/11 COMPANY IDENTITY: Univar USA Inc. PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% PAGE: 1 OF 7

#### SAFETY DATA SHEET

This Safety Data Sheet conforms to ANSI Z400.5, and to the format requirements and the International Chemical Safety Cards of the Global Harmonizing System. THIS SDS COMPLIES WITH 29 CFR 1910.1200 (HAZARD COMMUNICATION STANDARD) IMPORTANT: Read this SDS before handling & disposing of this product. Pass this information on to employees, customers, & users of this product.

#### SECTION 1. IDENTIFICATION OF THE SUBSTANCE OR MIXTURE AND OF THE SUPPLIER

PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40%

SDS NUMBER: CDS1660 NEW MSDS DATE: 11/21/2011 COMPANY IDENTITY: Univar USA Inc.

COMPANY ADDRESS: 17425 NE Union Hill Road

COMPANY CITY: Redmond, WA 98052 COMPANY PHONE: 1-425-889-3400

#### SECTION 2. HAZARDS IDENTIFICATION

#### WARNING!!

Irritating to eyes, respiratory system and skin. R36/37/38 Explosive when mixed with combustible material. R9

**R35** Causes severe burns.

Irritating to the respiratory system. R37

#### SAFETY STATEMENTS:

Ν

RISK STATEMENTS:

S3/9/14/49 Keep only in the original container in a cool, well-ventilated place.

S24/25 Avoid contact with skin and eyes.

#### SEE SECTION 11 FOR OTHER TOXICOLOGICAL INFORMATION (ACUTE & CHRONIC HAZARDS)

#### SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

MATERIAL	CAS#	EINECS#	WT%
Water	7732-18-5	231-791-2	60-80
Hydrogen Peroxide	7722-84-1	231-765-0	20-40

This product contains no EPA Hazardous Air Pollutants (HAP) in amounts > 0.1%.

COMPANY IDENTITY: Univar USA Inc. PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% DATE: 11/21/11 PAGE: 2 OF 7

#### SECTION 4. FIRST AID MEASURES

#### EYE CONTACT:

If this product enters the eyes, open eyes while under gently running water. Use sufficient force to open eyelids. "Roll" eyes to expose more surface. Minimum flushing is for 15 minutes. Seek immediate medical attention.

If the product contaminates the skin, immediately begin decontamination with running water. Minimum flushing is for 15 minutes. Remove contaminated clothing, taking care not to contaminate eyes. If skin becomes irritated and irritation persists, medical attention may be necessary. Wash contaminated clothing before reuse, discard contaminated shoes.

#### **INHALATION:**

After high vapor exposure, remove to fresh air. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. Keep person warm and at rest. breathing is difficult, give oxygen. If breathing has stopped, trained personnel should immediately begin artificial respiration. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband. If the heart has stopped, trained personnel should immediately begin cardiopulmonary resuscitation (CPR). Seek immediate medical attention. In case of inhalation of decomposition products in a fire, symptoms may be delayed. The exposed person may need to be kept under medical surveillance for 48 hours.

#### SWALLOWING:

If swallowed, CALL PHYSICIAN OR POISON CONTROL CENTER FOR MOST CURRENT INFORMATION. If professional advice is not available, give two glasses of water to drink. DO NOT INDUCE VOMITING. Never induce vomiting or give liquids to someone who is unconscious, having convulsions, or unable to swallow. Seek immediate medical attention.

#### NOTES TO PHYSICIAN:

There is no specific antidote. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Any material aspirated during vomiting may cause lung injury. Therefore, emesis should not be induced mechanically or pharmacologically. If it is considered necessary to evacuate the stomach contents, this should be done by means least likely to cause aspiration (such as: Gastric lavage after endotracheal intubation).

Victims of chemical exposure must be taken for medical attention. Rescuers should be taken for medical attention, if necessary. Take a copy of label and SDS to physician or health professional with victim.

#### SECTION 5. FIRE FIGHTING MEASURES

#### FIRE & EXPLOSION PREVENTIVE MEASURES

Isolate from heat, combustibles, alkalies, and reducing agents.

#### EXTINGUISHING MEDIA

Use appropriate extinguishing media.

#### SPECIAL FIRE FIGHTING PROCEDURES

Water spray may be ineffective on fire but can protect fire-fighters & cool closed containers. Use fog nozzles if water is used. Do not enter confined fire-space without full bunker gear. (Helmet with face shield, bunker coats, gloves & rubber boots). Use NIOSH approved positive-pressure self-contained breathing apparatus.

#### UNUSUAL EXPLOSION AND FIRE PROCEDURES

Isolate from oxidizers, heat, & open flame.

Closed containers may explode if exposed to extreme heat.

Applying to hot surfaces requires special precautions.

COMPANY IDENTITY: Univar USA Inc. DATE: 11/21/11 PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% PAGE: 3 OF 7

#### SECTION 6. ACCIDENTAL RELEASE MEASURES

#### SPILL AND LEAK RESPONSE AND ENVIRONMENTAL PRECAUTIONS:

Uncontrolled releases should be responded to by trained personnel using pre-planned procedures. Proper protective equipment should be used. In case of a spill, clear the affected area, protect people, and respond with trained personnel.

#### PERSONAL PROTECTIVE EOUIPMENT

The proper personal protective equipment for incidental releases (such as: 1 Liter of the product released in a well-ventilated area), use impermeable gloves (triple-gloves (rubber gloves and nitrile gloves, over latex gloves), goggles, face shield, and appropriate body protection. In the event of a large release, use impermeable gloves, specific for the material handled, chemically resistant suit and boots, and hard hat. Self-Contained Breathing Apparatus or respirator may be required where engineering controls are not adequate or conditions for potential exposure exist. When respirators are required, select NIOSH/MSHA approved based on actual or potential airborne concentrations in accordance with latest OSHA and/or ANSI recommendations.

#### **ENVIRONMENTAL PRECAUTIONS:**

Stop spill at source. Construct temporary dikes of dirt, sand, or any appropriate readily available material to prevent spreading of the material. Close or cap valves and/or block or plug hole in leaking container and transfer to another container. Keep from entering storm sewers and ditches which lead to waterways, and if necessary, call the local fire or police department for immediate emergency assistance.

#### CONTAINMENT AND CLEAN-UP MEASURES:

Absorb spilled liquid with polypads or other suitable absorbent materials. If necessary, neutralize using suitable buffering material, (acid with soda ash or base with phosphoric acid), and test area with litmus paper to confirm neutralization. Clean up with non-combustible absorbent (such as: sand, soil, and so on). Shovel up and place all spill residue in suitable containers. dispose of at an appropriate waste disposal facility according to current applicable laws and regulations and product characteristics at time of disposal (see Section 13 - Disposal Considerations).

#### SECTION 7. HANDLING AND STORAGE

#### **HANDLING**

Use only with adequate ventilation.

Wear OSHA Standard goggles or face shield. Consult Safety Equipment Supplier. Wear gloves, apron & footwear impervious to this material. Wash clothing before reuse. To minimize static discharge when transferring, ensure electrical continuity by bonding and grounding all equipment. Use an inlet line diameter of at least 3.5 inches (8.9 centimeters) with a maximum flow rate of 1 meter/second.

#### STORAGE

Isolate from combustibles, strong oxidants, reducers, alkalies. Do not store above 49 C/120 F. Keep container closed & upright when not in use to prevent leakage.

#### NONBULK: CONTAINERS:

Store containers in a cool, dry location, away from direct sunlight, sources of intense heat, or where freezing is possible. Material should be stored in secondary containers or in a diked area, as appropriate. Store containers away from incompatible chemicals (see Section 10, Stability and Reactivity). Post warning and "NO SMOKING" signs in storage and use areas, as appropriate. Empty containers should be handled with care. Never store food, feed, or drinking water in containers which held this product.

#### BULK CONTAINERS:

All tanks and pipelines which contain this material must be labeled. Perform routine maintenance on tanks or pipelines which contain this product. Report all leaks immediately to the proper personnel.

COMPANY IDENTITY: Univar USA Inc. DATE: 11/21/11 PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% PAGE: 4 OF 7

#### SECTION 7. HANDLING AND STORAGE (CONTINUED)

#### TANK CAR SHIPMENTS:

Tank cars carrying this product should be loaded and unloaded in strict accordance with tank-car manufacturer's recommendation and all established on-site safety procedures. Appropriate personal protective equipment must be used (see Section 8, Engineering Controls and Personal Protective Equipment.). All loading and unloading equipment must be inspected, prior to each use. Loading and unloading operations must be attended, at all times. Tank cars must be level, brakes must be set or wheels must be locked or blocked prior to loading or unloading. Tank car (for loading) or storage tanks (for unloading) must be verified to be correct for receiving this product and be properly prepared, prior to starting the transfer operations. Hoses must be verified to be in the correct positions, before starting transfer operations. A sample (if required) must be taken and verified (if required) prior to starting transfer operations. All lines must be blown-down and purged before disconnecting them from the tank car or vessel.

#### PROTECTIVE PRACTICES DURING MAINTENANCE OF CONTAMINATED EQUIPMENT:

Follow practices indicated in Section 6 (Accidental Release Measures). Make certain application equipment is locked and tagged-out safely. Always use this product in areas where adequate ventilation is provided. Collect all rinsates and dispose of according to applicable Federal, State, Provincial, or local procedures.

#### SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

MATERIAL	CAS#	EINECS#	TWA (OSHA)	TLV (ACGIH)
Water	7732-18-5	231-791-2	None Known	None Known
Hydrogen Peroxide	7722-84-1	231-765-0	1 ppm	1 ppm

#### RESPIRATORY EXPOSURE CONTROLS

Maintain airborne contaminant concentrations below exposure limits given above. If respiratory protection is needed, use only protection authorized in 29 CFR 1910.134, European Standard EN 149, or applicable State regulations. If adequate ventilation is not available or there is potential for airborne exposure above the exposure limits, a respirator may be worn up to the respirator exposure limitations, check with respirator equipment manufacturer's recommendations/limitations. For a higher level of protection, use positive pressure supplied air respiration protection or Self-Contained Breathing Apparatus or if oxygen levels are below 19.5% or are unknown.

EMERGENCY OR PLANNED ENTRY INTO UNKNOWN CONCENTRATIONS OR IDLH CONDITIONS
Positive pressure, full-face piece Self-Contained Breathing Apparatus; or positive
pressure, full-face piece Self-Contained Breathing Apparatus with an auxilliary positive
pressure Self-Contained Breathing Apparatus.

#### VENTILATION

LOCAL EXHAUST: Necessary MECHANICAL (GENERAL): Necessary SPECIAL: None OTHER: None Please refer to ACGIH document, "Industrial Ventilation, A Manual of Recommended Practices", most recent edition, for details.

#### EYE PROTECTION:

Splash goggles or safety glasses. Face-shields are recommended when the operation can generate splashes, sprays or mists.

#### HAND PROTECTION:

Wear appropriate impervious gloves for routine industrial use. Use impervious gloves for spill response, as stated in Section 6 of this SDS (Accidental Release Measures). NOTICE: The selection of a specific glove for a particular application and duration of use in a workplace should also take into account all relevant workplace factors such as, but not limited to: Other chemicals which may be handled, physical requirements (cut/puncture protection, dexterity, thermal protection), potential body reactions to glove materials, as well as the instructions/specifications provided by the glove supplier.

#### BODY PROTECTION:

Use body protection appropriate for task. Cover-all, rubber aprons, or chemical protective clothing made from impervious materials are generally acceptable, depending on the task.

COMPANY IDENTITY: Univar USA Inc. DATE: 11/21/11 PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% PAGE: 5 OF 7

#### SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION (CONTINUED)

#### WORK & HYGIENIC PRACTICES:

Provide readily accessible eye wash stations & safety showers. Wash at end of each shift & before eating, smoking or using the toilet. Remove clothing that becomes contaminated. Destroy contaminated leather articles. Launder or discard contaminated clothing.

#### SECTION 9. PHYSICAL & CHEMICAL PROPERTIES

```
APPEARANCE:
                                                     Liquid, Water-White

#### **SECTION 10. STABILITY & REACTIVITY**

#### STABILITY

Stable under normal conditions (heat or contamination could cause product to become unstable).

#### CONDITIONS TO AVOID

Isolate from heat, & open flame.

#### MATERIALS TO AVOID

Isolate from dirt, cyanides, combustibles, oxidizers, reducers, alkalies.

# HAZARDOUS DECOMPOSITION PRODUCTS None.

HAZARDOUS POLYMERIZATION Will not occur.

^{*} Using California South Coast Air Quality Management District (SCAQMD) Rule 443.1.

COMPANY IDENTITY: Univar USA Inc.
PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% DATE: 11/21/11 PAGE: 6 OF 7

#### SECTION 11. TOXICOLOGICAL INFORMATION

#### **ACUTE HAZARDS**

EYE & SKIN CONTACT:

Primary irritation to skin, defatting, dermatitis. Primary irritation to eyes, redness, tearing, blurred vision. Liquid can cause eye irritation. Wash thoroughly after handling.

INHALATION:

Anesthetic. Irritates respiratory tract. Acute overexposure can cause serious nervous system depression. Vapor harmful.

SWALLOWING:

Swallowing can cause abdominal irritation, nausea, vomiting & diarrhea.

#### SUBCHRONIC HAZARDS/CONDITIONS AGGRAVATED

CONDITIONS AGGRAVATED

Persons with severe skin, liver or kidney problems should avoid use.

#### CHRONIC HAZARDS

CANCER, REPRODUCTIVE & OTHER CHRONIC HAZARDS: This product has no carcinogens listed by IARC, NTP, NIOSH, OSHA or ACGIH, as of this date, greater or equal to 0.1%.

IRRITANCY OF PRODUCT: This product is irritating to contaminated tissue.

SENSITIZATION TO THE PRODUCT: No component of this product is known to be a sensitizer.

MUTAGENICITY: This product is not reported to produce mutagenic effects in humans.

EMBRYOTOXICITY: This product is not reported to produce embryotoxic effects in humans.

TERATOGENICITY: This product is not reported to produce teratogenic effects in humans.

REPRODUCTIVE TOXICITY: This product is not reported to cause reproductive effects in humans.

A <u>mutagen</u> is a chemical which causes permanent changes to genetic material (DNA) such that the changes will propagate through generational lines. An <a href="mailto:embryotoxin">embryotoxin</a> is a chemical which causes damage to a developing embryo (such as: within the eight weeks of pregnancy in humans), but the damage does not propagate across generational lines. A teratogen is a chemical which causes damage to a developing fetus, but the damage does not propagate across generational lines. A reproductive toxin is any substance which interferes in any way with the reproductive process.

#### MAMMALIAN TOXICITY INFORMATION

No mammalian information is available on this product.

COMPANY IDENTITY: Univar USA Inc. PRODUCT IDENTITY: HYDROGEN PEROXIDE 20-40% DATE: 11/21/11 PAGE: 7 OF 7

#### **SECTION 12. ECOLOGICAL INFORMATION**

AQUATIC ANIMAL INFORMATION:

No aquatic environmental information is available on this product.

MOBILITY IN SOIL

This material is a mobile liquid.

**DEGRADABILITY** 

This product is completely biodegradable.

**ACCUMULATION** 

This product does not accumulate or biomagnify in the environment.

#### SECTION 13. DISPOSAL CONSIDERATIONS

Processing, use or contamination may change the waste management options. Recycle / dispose of observing national, regional, state, provincial and local health, safety & pollution laws. If in doubt, contact appropriate agencies.

#### SECTION 14. TRANSPORT INFORMATION

DOT SHIPPING NAME: UN2014, Hydrogen peroxide, aqueous solutions, 5.1, (8), PG-II

DRUM LABEL: (OXIDIZER), (CORROSIVE)

IATA / ICAO: UN2014, Hydrogen peroxide, aqueous solutions, 5.1, (8), PG-II

IMO / IMDG: UN2014, Hydrogen peroxide, aqueous solutions, 5.1, (8), PG-II

EMERGENCY RESPONSE GUIDEBOOK NUMBER: 140

#### **SECTION 15. REGULATORY INFORMATION**

**EPA REGULATION:** 

SARA SECTION 311/312 HAZARDS: Acute Health

All components of this product are on the TSCA list. This material contains no known products restricted under SARA Title III, Section 313 in amounts greater or equal to 1%.

INTERNATIONAL REGULATIONS

The components of this product are listed on the chemical inventories of the following countries: Australia, Canada, China, Europe (EINECS), Japan, Korea, United Kingdom.

CANADA: WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS)

D2B: Irritating to skin / eyes.

UNIVAR USA INC. ISSUE DATE:2010-11-21 Annotation:

## **Potential Spill Volumes and Rates:**

The following table summarizes potential spill volumes and rates for the treatment chemicals that will be temporarily stored at the Bronx NY Site:

Potential Event	Material Released	Volume Released	Spill Rate
Complete failure of a dilution tank	6% (maximum concentration) solution of hydrogen peroxide or ferrous sulfate	300 to 500 gallons	100 gallons per minute
Overflow of dilution tanks	6% (maximum concentration) solution of hydrogen peroxide or ferrous sulfate	50 to 100 gallons	10 gallons per minute
Complete failure of mixing vessel	<17% solution of hydrogen peroxide <50% solution of ferrous sulfate	20 to 30 gallons	instantaneous
Overflow of mixing vessel during mixing	<17% solution of hydrogen peroxide <50% solution of ferrous sulfate	1-2 gallons	1-2 gallons per event
Puncture of drum containing hydrogen peroxide	34% hydrogen peroxide	55 gallons	10 gallons per minute
Complete failure of ferrous sulfate bag	Dry pellets/granules of ferrous sulfate heptahydrate	50 lbs dry material	instantaneous
Surfacing during reagent injection	<6% (maximum concentration) solution of hydrogen peroxide or ferrous sulfate	100 gallons per point max	10 gallons per minute

#### SPILL PREVENTION AND CONTROL

Mixing, dilution and pumping equipment will be placed or staged within one or more secondary containment devices, capable of holding at least 110% of the entire volume of material being staged. Similar secondary containment will be provided for temporary storage of liquid treatment chemical (34% hydrogen peroxide) and dry treatment chemical (ferrous sulfate heptahydrate).

- **Drum and pallet handling requirements:** Treatment reagents will be delivered to the site by the chemical supplier in a lift-gate-equipped truck. Drums (i.e., containers) will be inspected and bungs checked for tightness prior to handling. Pallet with dry chemical will be inspected for damage or rupture. Containers will be set on the ground and moved into secondary containment devices using a drum dolly. Pallet will be set on ground and bags moved to a separate storage area. For daily operations, containers will be moved to the mixing and dilution area using a drum dolly. Prior to any handling, bungs will be checked for tightness. Bags of dry chemical will be loaded onto ERFS truck and moved to mixing and dilution area.
- **Drum storage secondary containment:** Pre-fabricated, 10 ft by 10 ft, pop-up secondary containment devices capable of accommodating approximately 25, 55-gallon drums of liquid chemical. Multiple secondary containments will be used to provide adequate storage capacity.
- **Signage:** Storage areas will be marked with appropriate NFPA signage for the materials being stored.
- **Surfacing Containment:** Any material that has been injected and then surfaces will be bermed with sand stopping runoff surface flow of material across the site. Once bermed, the material will be reabsorbed into the subsurface or collected using wet vacuums.
- **Footage of containment berms required:** Only around injection surfacing points approximately 5 linear feet each location estimated.
- Segregation of Incompatible Reagents: X yes ____ no
- **Recovered liquid storage requirements:** 100 gallons maximum. Any recovered reagents will be re-used for injection at the site.
- # **Shop Vacs:** <u>2</u> / Power cord: <u>200</u> feet
- **pH meter:** Yes <u>X</u> No_____
- Reagent neutralizer: Water

**Description of where a spill would go:** Spills originating from storage or mixing & dilution areas will be contained within secondary containment facilities. Spills from surfacing events are expected to infiltrate back into the ground.

Describe actions that would be taken in the event of a spill: Liquid reagents will be delivered to the site by the chemical supplier in DOT-approved plastic drums (55-gallon). Containers will be sealed at all times during handling and transportation. Only when containers are located within secondary containment will they be opened for transfer of contents. Similarly, all pumps, mixing vessels and dilution tanks will also be located within secondary containment devices. Any spills involving concentrated reagents would likely occur within the secondary containment and involve less than 10-gallons. In the event of such a spill involving 34% hydrogen peroxide, the substance will be diluted with potable water and

retrieved using wet vacuums. Diluted hydrogen peroxide would be added to dilution tanks for further dilution and used for subsurface injection.

In the event there is a spill of any dry chemical (ferrous sulfate heptahydrate) before it is mixed into solution, ERFS personnel will secure any broken or breached bags of chemical. Refer to ERFS site-specific HASP for description of PPE requirements. Spilled chemical will be swept up into plastic buckets and used to prepare treatment reagent.

Any dilute liquid reagent that enters the secondary containment will be recovered with wet vacuums for use during injection. If dilute liquid reagent is spilled outside of the secondary containment, it will be bermed with sand to prevent surface runoff and allowed to infiltrate into the subsurface or recovered using wet vacuums. If necessary, the dilute reagent can be further diluted with water. Sand will be flushed with water and left on-site.

Re: EP-20 Sidewall Sample – Soil Investigation Letter G&C Services Brownfield Cleanup Program Site BCP Site No. C203057, 255 East 138th Street Block 2333, Lot 1, Bronx, New York Brinkerhoff Project No. 10BR188

Dear Ms. Mecomber:

On June 28th, 2016, the New York City Department of Buildings (NYCDOB) partially rescinded the stop work order at the site, as per the NYCDOB-approved drawings, to allow for work to continue within the vicinity of the adjacent building located at 2557 Third Avenue (Block 2333, Lot 26). This allowed for the removal of the soil berm that was temporarily located along the southern boundary of the adjacent building in the northeast corner of the site. The soil berm was temporarily in place to structurally support the adjacent building and was utilized as a working platform for the horizontal concrete grout injections to be completed.

In response to your letter, dated March 24, 2016, and our conference call held on April 11, 2016, a Soil Investigation was performed following the removal of the soil berm and the Soil Investigation was conducted to determine the soil thickness, if any, between the existing wood lagging and the concrete that was horizontally injected beneath the adjacent building within the area of the EP-20 sidewall sample.

The investigation consisted of inserting a piece of rebar through the spaces between the wood lagging within an approximate five (5) foot radius of the EP-20 sidewall sample location. Concrete was observed directly behind the wood lagging in all areas surrounding the EP-20 sidewall sample location except for a small area (approximately four (4) by four (4) feet) to the southwest. Throughout this small area, approximately one (1) to four (4) inches of soil was observed between the wood lagging and concrete. A plan view of the investigation area is provided as **Figure 1** and a cross-section showing the areas of concrete and soil observed is provided as **Figure 2**.

The one (1) to four (4) inches of soil that was observed to the southwest of EP-20 is most likely residual soil that was left behind from the temporary soil berm that was placed along the southern boundary of the adjacent building.

Ms. Dana Mecomber NYSDEC

Re:

EP-20 Sidewall Sample – Soil Investigation Letter G&C Services Brownfield Cleanup Program Site BCP Site No. C203057, 255 East 138th Street Block 2333, Lot 1, Bronx, New York Brinkerhoff Project No. 10BR188

July 22, 2016 Page 2 of 2

Since concrete has been observed surrounding the entire area of the EP-20 sidewall sample location, the previously identified contamination has been completely immobilized by the concrete grout injections. Based on our calculations, the maximum amount of soil that may exist between the wood lagging and the concrete in the area to the southwest of EP-20 is less than 0.2 cubic yards. Due to the insignificant amount of soil present between the wood lagging and the concrete southwest of EP-20 and since the composite cover system (i.e. concrete slab & waterproofing/vapor barrier membrane) will be installed in this Track 4 Area, no further action is required at this time.

In regards to the western boundary of the adjacent building, lagging installation in this area commenced on July 13th, 2016. However, additional horizontal concrete grout injections are anticipated to occur in this area per the NYCDOB-approved drawings. The same procedures that were performed for investigating and addressing the southern boundary will be performed for the western boundary following the completion of the concrete grout injections. The Soil Investigation will be performed to determine the soil thickness between the wood lagging and the concrete along the western boundary of the adjacent building.

Respectfully submitted,

Ira N. Pierce, P.E.

## LEGEND

- SOLDIER PILE LOCATION

WALER LOCATION

CONCRETE WAS OBSERVED BEHIND THE INSTALLED LAGGING IN THIS AREA.

APPROXIMATELY ~1-4" OF SOIL WAS OBSERVED BETWEEN THE LAGGING AND CONCRETE.

AREA OF LAGGING AND NON-IMPACTED SOIL

EDGE OF SOUTHERN BOUNDARY SIDEWALL (NO SOIL EXISTS)

### NOTES:

- 1. THIS INVESTIGATION EVALUATED THE SIDEWALL WITHIN A ~5' RADIUS OF EP-20. THE AREA WAS EVALUATED BY INSERTING A PIECE OF REBAR BETWEEN THE LAGGING TO DETERMINE THE AMOUNT OF SOIL BETWEEN THE LAGGING AND THE CONCRETE.
- 2. THE SOIL OBSERVED BETWEEN THE LAGGING AND THE CONCRETE IS MOST LIKELY THE RESULT OF THE SOIL BERM THAT WAS PLACED IN FRONT OF THE LAGGING IN ORDER TO HORIZONTALLY INJECT THE GROUT BENEATH THE ADJACENT BUILDING.
- 3. BGS = BELOW SIDEWALK-GRADE SURFACE
- 4. DBSERVATION DEPTHS AND AREAS ARE APPROXIMATE.
