Environmental Interest/Information System:
OSHA ESTABLISHMENT
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was ROMMEL 9/7/06 - Austin - Assigned from Albany to Region 2 staff (Ketani) for review and closure - end 10/6/06 - Raphael Ketani. North Atlantic Energy (718) 991-2106 was making a delivery when the fuel hose cracked. Diesel fuel spilled onto the ground contaminating the soil. The contact at North Atlantic was Joe Mazzelli. Brian Adair of Dairy Land, 1300 Viele Ave., Bronx (718) 842-8700, ext. 189, was the contact for the store. Sweet Claims (insurance) was dispatched for the cleanup. I called up North Atlantic. I spoke to Yvette Alvarez, assistant to Mr. Robert Venutti. She said that North Atlantic was sold by Mr. Venutti (president at that time) and it is now called Heating Oil Partners. She said they will both look into their records

NATIONAL WIRE CORPORATION (Continued) **S103938742**

for the needed documents concerning the spill and cleanup. 10/16/06 - Raphael Ketani. I spoke to Ms. Alvarez and asked her again for documentation regarding the spill. She said she will contact her office manager and see what they can come up with. I called up Mr. Adair and asked him whether he had any documentation. He said he thought North Atlantic had the documentation. He added that he will contact them to get the documentation. 10/17/06 - Raphael Ketani. I made an unanounced site visit today. I met Mr. Adair. He explained that building runs on gas, not oil. He said that the incident happened when a diesel fuel delivery truck was fueling up his Dairy Land delivery trucks and the hose broke and sprung a leak. He showed me the street where this happened. He said the fuel delivery truck would just park and the Dairy Land trucks would pull up to get diesel. I took a picture of the street. It was loaded with parked cars and parked heavy trucks and is used by heavy trucks travelling to a business down the street. There were oil stains all over the street. Based upon the nature of the incident (a fuel delivery truck passing diesel to company trucks), the age of the spill event (6/23/99), the lack of documentation regarding the spill, the probability that years of rain have cleaned away the original spill, and the repeated dropping of oil on the street creating very small stains all over, I am closing the spill case. "

Remarks: "DELIVERY HOSE CRACKED CAUSING SPILL ON TO GROUND-SWEET CLAIMS WERE DISPATCHED FOR CLEANUP."

DEC Memo: "10/13/04 TJD Site was target of inspection by joint DLE/NYPD MARCH detail. Surface spills in yard found in dismantling area. Owner/Operator directed to clean spillage and modify operation to prevent further discharges from dismantling activities. DEC suggested owner research BMP's and Pollution Prevention information from their automotive dismantlers association. Site will be reinspected. 3/15/05 - Austin - Received signed CO - reassigned from DeMeo to Sawyer - end 7/21/05: spoke with Mr Luis the company vis president. He claims the spill had been cleaned up and requested a faxed copy of the spill report. The spill report was faxed to him.(akwa) 7/27/05: Recieved a letter and best managenent practices and storm water pollution prevention plan from Mr Norman Teitler of the NY Towing and Auto Body Association on behalf of Point Wrecking and Salvage Corp. A review of the submitted documents shows that the site has been cleaned and a

Environmental Interest/Information System:

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
OSHA ESTABLISHMENT
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.
HAZARDOUS WASTE BIENNIAL REPORTER
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and

GENERAL GALVANIZING & SUPPLY CO INC (Continued) **1000212435**

it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

City,State,Zip:	BRONX, NY 10474-
Site Code:	58441
HW Code:	V00436
Control Code:	15
Control Type:	ENG
Date Record Added:	03/02/2011
Date Rec Updated:	07/28/2021
Updated By:	RSLEE
Site Description:	"Location: The site is approximately 29 acres in size and lies on the Hunts Point peninsula in the Borough and County of the Bronx. It is located 800 Food Center Drive at the intersection of Food Center Drive/Ryawa Avenue and Halleck Street approximately one mile south of the Bruckner Expressway's Bronx River crossing. The site is bounded to the north by the Hunts Point Cooperative (Meat Market), to the west (across Halleck Street) by the NYC Department of Environmental Protection's Hunts Point Water Pollution Control Plant (Sewage Treatment Plant), to the east by Farragut Street and a property owned by the NYC Department of Sanitation which includes a recycling facility, a salt storage facility and a Marine Transfer Station which has been out of use since 1997, and to the south by the East River. Also to the south, on a barge in the East River, is the NYC Department of Corrections Vernon C. Bain Floating Detention Facility, an 800-bed maximum security facility, and its associated parking lot. Site Features: A 325,000 square foot two-story state-of-the art wholesale seafood distribution facility (the new "Fulton Street Fish Market") was constructed on the site. An asphalt parking

HUNTS POINT FOOD DIST. CTR. (PARCEL B) (Continued) **S105114386**

lot was constructed on most of the remainder of the site. Any open or landscaped areas were demarcated with geotextile fabric and covered with an additional foot of clean soil prior to planting. Current Zoning/Use: The Fulton Street Fish Market is currently open. The site is zoned for business district, light commercial, light industrial, and local service district. Past Use of the Site: Con Edison operated a coal gasification facility at the site from 1925 through the early 1950's. Much of the property was subsequently redeveloped into the Hunts Point Food Distribution Center (HPFDC), a wholesale food complex. Parcel B was historically used for the storage of large quantities of petroleum and tar compounds. Site Geology and Hydrogeology: The southeastern portion of the site is underlain by approximately 2 to 7 feet of fill, consisting of silty sand and gravel with fragments of brick, coal, coke slag and ash. The thickness of fill decreases to the northeast. The fill is underlain by micaceous silty sand and gravel, with intermittent layers of well sorted sand, gravel, and clayey silt. Site groundwater is generally encountered on top of the native clay whose depth varies from 7 to 12 feet below ground surface. The depth to groundwater changes throughout the year. "

Env Problem: "Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete, and the Department issued a Release letter on August 6, 2010. Prior to remediation, the primary contaminants of concern at the site included volatile organic compounds, polyaromatic hydrocarbons (PAHs), cyanide and lead. Coal tar and purifier wastes were also found on-site. Exceedances of standards, criteria and guidance included lead and naphthalene and other PAHs in soil, and benzene, toluene, ethylbenzene and xylenes in groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil and groundwater are contaminated with manufactured gas plant waste. Soils contaminated with coal tar, purifier waster and fuel oil were excavated and disposed of properly. A newly constructed building and pavement minimize the potential for exposure to residually contaminated soil. A soil vapor extraction/air sparge system is in place to remediate on-site contamination. This system, in conjunction with the positive pressure in the building, will minimize the potential for exposures via soil vapor intrusion. Groundwater is not used as a source for drinking water, therefore, exposures via ingestion are unlikely. "

Updated By: RSLEE
Site Code: 58441
Site Description: "Location: The site is approximately 29 acres in size and lies on the Hunts Point peninsula in the Borough and County of the Bronx. It is located 800 Food Center Drive at the intersection of Food Center Drive/Ryawa Avenue and Halleck Street approximately one mile south of the Bruckner Expressway's Bronx River crossing. The site is bounded to the north by the Hunts Point Cooperative (Meat Market), to the west (across Halleck Street) by the NYC Department of Environmental Protection's Hunts Point Water Pollution Control Plant (Sewage Treatment Plant), to the east by Farragut Street and a property owned by the NYC Department of Sanitation which includes a recycling facility, a salt storage facility and a Marine Transfer Station which has been out of use since 1997, and to the south by the East River. Also to the south, on a barge in the East River, is the NYC Department of Corrections Vernon C. Bain Floating Detention Facility, an 800-bed maximum security facility, and its associated parking lot. Site Features: A 325,000 square foot two-story state-of-the art wholesale seafood distribution facility (the new "Fulton Street Fish Market") was constructed on the site. An asphalt parking lot was constructed on most of the remainder of the site. Any open or landscaped areas were demarcated with geotextile fabric and covered with an additional foot of clean soil prior to planting. Current Zoning/Use: The Fulton Street Fish Market is currently open. The site is zoned for business district, light commercial, light industrial, and local service district. Past Use of the Site: Con Edison operated a coal gasification facility at the site from 1925 through the early 1950's. Much of the property was subsequently redeveloped into the

HUNTS POINT FOOD DIST. CTR. (PARCEL B) (Continued) **S105114386**

Hunts Point Food Distribution Center (HPFDC), a wholesale food complex. Parcel B was historically used for the storage of large quantities of petroleum and tar compounds. Site Geology and Hydrogeology: The southeastern portion of the site is underlain by approximately 2 to 7 feet of fill, consisting of silty sand and gravel with fragments of brick, coal, coke slag and ash. The thickness of fill decreases to the northeast. The fill is underlain by micaceous silty sand and gravel, with intermittent layers of well sorted sand, gravel, and clayey silt. Site groundwater is generally encountered on top of the native clay whose depth varies from 7 to 12 feet below ground surface. The depth to groundwater changes throughout the year. "

Env Problem: "Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete, and the Department issued a Release letter on August 6, 2010. Prior to remediation, the primary contaminants of concern at the site included volatile organic compounds, polyaromatic hydrocarbons (PAHs), cyanide and lead. Coal tar and purifier wastes were also found on-site. Exceedances of standards, criteria and guidance included lead and naphthalene and other PAHs in soil, and benzene, toluene, ethylbenzene and xylenes in groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil and groundwater are contaminated with manufactured gas plant waste. Soils contaminated with coal tar, purifier waster and fuel oil were excavated and disposed of properly. A newly constructed building and pavement minimize the potential for exposure to residually contaminated soil. A soil vapor extraction/air sparge system is in place to remediate on-site contamination. This system, in conjunction with the positive pressure in the building, will minimize the potential for exposures via soil vapor intrusion. Groundwater is not used as a source for drinking water, therefore, exposures via ingestion are unlikely. "

Control Type:	ENG
Date Record Added:	02/06/2008
Date Rec Updated:	07/28/2021
Updated By:	RSLEE
Site Description:	"Location: The 7-acre site is located at 155 Food Center Drive in the northern portion of the Hunts Point Food Distribution Center (HPFDC). The HPFDC lies on the Hunts Point peninsula in the South Bronx. The site is bounded to the north by Food Center Drive, to the south by Hunts Point Cooperative Meat Market, and to the west and east by land owned by the City of New York and leased to a food warehouse and distribution center. The main entrance to the site is to the north off of Food Center Drive. Site Features: The site is controlled by a secured gate and perimeter fencing and contain a single building (occupied by the truck maintenance facility) with a footprint located in the northern portion of the site and asphalt parking lot that covers almost the entire remaining site area. A small area, intended to accommodate a building expansion, and located west of the truck maintenance building is not paved. The area is currently covered in gravel with minimal vegetation and is contained within the site fencing. Additionally, adjacent to the southern perimeter of the site there is a small area that is unpaved and is covered with one (1) foot of clean soil cover. This southern area is a New York City Department of Environmental Protection (NYCDEP) easement for the sewer/stormwater system and is also contained within the Baldor fencing. Current Zoning/Use: The property currently serves as a truck maintenance facility, and is zoned for commercial/industrial use. Past Use of the Site: The site was formerly occupied by the Consolidated Edison coal gasification facility, or manufactured gas

155 FOOD CENTER DRIVE (Continued) **S104905149**

plant (MGP) which operated from 1925 through the early 1950s. The coal gasification process has been known to yield large quantities of by-products, including polycyclic aromatic hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compoundds, and various inorganic compounds, such as, iron, lead, copper, zinc, sulfides, cyanides and nitrates. Parcel E, Operable Unit 1 (OU1) is located in the northwestern portion of the HPFDC. A 15,000,000-gallon waterless gas holder and several associated structures and piping were formerly located on the site. Site Geology and Hydrogeology: The site is underlain by an upper layer of fill materials varying in thickness across the site. The fill composition generally consists of mixed soils, structural materials, and remnants of the gasification incineration waste (coal slag). Several areas were found to contain residual petroleum contamination and were predominantly located around the former tank structures. The fill is underlain by silty clay. Groundwater was encountered on top of the clay at depths ranging from approximately five (5) to eight (8) feet below ground surface. Regional groundwater flow is in an easterly direction, towards the Bronx and East Rivers. "

Env Problem: "Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern at the site included volatile organic compounds, polycyclic aromatic hydrocarbons (PAHs) and metals in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial or industrial use. Remaining contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil contaminated with manufactured gas plant waste was excavated and disposed off-site. The site has been covered by buildings and pavement, which will prevent direct contact exposures with residual soil contamination. Groundwater is not used as a source for drinking water, therefore, exposures via ingestion are unlikely. "

Site Code: 58553
Site Description: "Location: The 7-acre site is located at 155 Food Center Drive in the northern portion of the Hunts Point Food Distribution Center (HPFDC). The HPFDC lies on the Hunts Point peninsula in the South Bronx. The site is bounded to the north by Food Center Drive, to the south by Hunts Point Cooperative Meat Market, and to the west and east by land owned by the City of New York and leased to a food warehouse and distribution center. The main entrance to the site is to the north off of Food Center Drive. Site Features: The site is controlled by a secured gate and perimeter fencing and contain a single building (occupied by the truck maintenance facility) with a footprint located in the northern portion of the site and asphalt parking lot that covers almost the entire remaining site area. A small area, intended to accommodate a building expansion, and located west of the truck maintenance building is not paved. The area is currently covered in gravel with minimal vegetation and is contained within the site fencing. Additionally, adjacent to the southern perimeter of the site there is a small area that is unpaved and is covered with one (1) foot of clean soil cover. This southern area is a New York City Department of Environmental Protection (NYCDEP) easement for the sewer/stormwater system and is also contained within the Baldor fencing. Current Zoning/Use: The property currently serves as a truck maintenance facility, and is zoned for commercial/industrial use.

155 FOOD CENTER DRIVE (Continued) **S104905149**

Past Use of the Site: The site was formerly occupied by the Consolidated Edison coal gasification facility, or manufactured gas plant (MGP) which operated from 1925 through the early 1950s. The coal gasification process has been known to yield large quantities of by-products, including polycyclic aromatic hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compoundds, and various inorganic compounds, such as, iron, lead, copper, zinc, sulfides, cyanides and nitrates. Parcel E, Operable Unit 1 (OU1) is located in the northwestern portion of the HPFDC. A 15,000,000-gallon waterless gas holder and several associated structures and piping were formerly located on the site. Site Geology and Hydrogeology: The site is underlain by an upper layer of fill materials varying in thickness across the site. The fill composition generally consists of mixed soils, structural materials, and remnants of the gasification incineration waste (coal slag). Several areas were found to contain residual petroleum contamination and were predominantly located around the former tank structures. The fill is underlain by silty clay. Groundwater was encountered on top of the clay at depths ranging from approximately five (5) to eight (8) feet below ground surface. Regional groundwater flow is in an easterly direction, towards the Bronx and East Rivers. "

Env Problem: "Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern at the site included volatile organic compounds, polycyclic aromatic hydrocarbons (PAHs) and metals in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial or industrial use. Remaining contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil contaminated with manufactured gas plant waste was excavated and disposed off-site. The site has been covered by buildings and pavement, which will prevent direct contact exposures with residual soil contamination. Groundwater is not used as a source for drinking water, therefore, exposures via ingestion are unlikely. "

Record Updated Date:	02/03/2021
Update By:	SMQUANDT
Site Description:	"Location The Site is located in a commercial and industrial area of the Hunts Point section of the Borough of the Bronx. The Site is an approximate 17.25 acre lot within two larger tax lots containing multiple parcels of land and is identified on New York City tax maps as Block 2778, Lot 100 and Block 2775, Lot 279. The Site is bound to the north by a Con Edison Compressor Station in the western portion and by Food Center Drive in the eastern portion, to the east by Food Center Drive, to the south by the Hunts Point Cooperative Market/Nebraskaland and the former Viele Avenue, and to the west by Halleck Street. Site Features The Site is currently occupied by the Baldor Specialty Foods distribution warehouse and parking lot for trucks and tractor-trailers. The eastern portion of Site is capped with asphalt pavement and the refrigerated warehouse. The western portion of Site is uncapped with exposed fill material at the surface

155 FOOD CENTER DRIVE (Continued) **S104905149**

and is being used for temporary truck parking. Between the eastern and western sides of the Site is Site E OU-1, which has been previously remediated and is currently undergoing construction and under a Site Management Plan. The Site is completely surrounded with fencing with one gate opening in the southwestern portion of Site along the former Viele Avenue and at the main Baldor security entrance along Food Center Drive. An additional 60 ft x 60 ft area within the former Site E OU-2 parcel is also considered to be part of the Site at 155 Food Center Drive. Current Zoning and Land Use The Site contains an asphalt paved parking lot and is improved with two buildings as part of the Baldor Foods distribution facility. A portion of the Site is also vacant and unimproved on Block 2775, Lot 279.The Site is currently zoned M3-1 (Manufacturing). Surrounding properties include Viele Avenue, Hunts Point Parcel A-2, Nebraskaland and the Hunts Point Cooperative Market to the south, the Hunts Point Produce Market to the north, Dairlyland and Hunts Point Parcel D to the east, and mixed industrial and parking to the west. Past Use of the Site Historically, the Site was part of the Consolidated Edison Company of New York, Inc. (Con Ed) manufactured gas plant (MGP) that operated from 1926 until the early 1960s. Gas operations included a coke/oven gas plant, a carbureted water gas plant, a light oil plant, and a liquid petroleum production area. In total, approximately 46 buildings or structures existed on the former Con Ed MGP facility that were actively involved in gas production. Site Geology and Hydrogeology The Site incorporates approximately 17.25 acres of fairly level land situated in the City of New York, Bronx County, New York. The Site is mapped on the Central Park, NY and Flushing, NY Quadrangles of the 7.5 Minute Topographic Map, published by the United States Geological Survey (USGS). Review of the topographic map indicates that the Site is located approximately 14 feet above sea level (NAVD 88). The soil stratigraphy of Site typically contains a 1-2 ft thick layer of silty sand underlain by fill material including sand, construction and demolition debris, coal ash, incinerator ash, coal, cinders and material significantly impacted by MGP-related waste. The fill material generally ranges from 5-10 ft thick and is underlain by a native clay layer. Groundwater is encountered approximately 5 below grade on Site. Based on the proximity to the Bronx River groundwater is expected to flow to the southeast. Additional site information can be found under VCP Site Nos. V00414, V00681 and V00682"

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was KOLLEENY In June 2004 during groundwater monitoring, URS detected significant amounts of fresh free product (gasoline) in several wells near the new tanks. A tightness test was performed and the fill line failed. URS implemented IRM to address the free product. In April 2005, URS and Franklin opened the concrete to investigate and found that someone (possibly URS during a soil investigation) had drilled through the line. Franklin repaired the fill line and took two soil samples from beneath the damaged area; results showed only minor soil contamination. URS continued IRM work; by June 2005, minimal product remained in site wells, but there are high levels of dissolved phase groundwater contamination. The residual soil and groundwater contamination caused by this spill will continue to be addressed by URS, under the old spill number for this site: 9810588. This spill is closed to consolidate with that spill. - J. Kolleeny, 9/20/05."

DEC Memo:	"6/8/11-Vought-Primary off hours responder. Note that NO phone notification of this spill was provided by the Hotline and spill noted upon spill review in UIS the next day. Vought called NYSDOS Guttieri (Ph:646-885-4541) and Guttieri not in and number is for NYCDOH Operations. Vought spoke to NYCDOH Kaleed Weller who sent Vought DOS Unusual Occurrence Report via email. Report noted that the incident location was BX-2 Garage and driver was Tracy Townsend from Star Energy. Report also contained vehicle plates and badge numbers of contacts. As per report STAR ENERGY TRANSPORT ARRIVED AT BX-2 TO DELIVER DIESEL FUEL. SUPV. AGAR PRINTED A VEEDER ROOT RECEIPT TO VERIFY HOW MUCH FUEL COULD BE TAKEN. THE 90% ULLAGE WAS 1585 GALLONS. THE VENDOR STATED HE WOULD DELIVER 1000 GALLONS. AFTER THE DELIVERY THE VENDOR SHUT THE PTO OFF ON THE VEHICLE AND WALKED OVER TO DISCONNECT THE HOSE. AS THE VENDOR DISCONNECTED THE HOSE, IT SHOT OFF THE COUPLING AND DIESEL FUEL BEGAN TO SHOOT OUT OF THE FILLPORT COUPLING. SUPV. AGAR IMMEDIATLEY ORDERED S/W RODRIGUEZ TO SHUT DOWN THE PUMPS. SUPV. AGAR NOTIFIED BX BORO SUPT. CIMINO ABOUT THE

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

INCIDENT. SUPT. CIMINO NOTIFIED BOO AND REPORTED TO BX-2 GARAGE. APPROXIMATELY 25 BAGS OF SPEEDY DRY WERE USED TO CONTAIN THE SPILL. ACCORDING TO VEEDER ROOT RECEIPTS, THE SPILL WAS APPROXIMATELY 87 GALLONS. BBM SUPV. TIM SHANNON RESPONDED AT 1600 HRS AND DETERMINED THAT DEPT CONTRACTOR AARCO ENVIRONMENTAL WOULD BE CONTACTED TO HANDLE THE CLEANUP. AARCO RESPONDED TO THE SCENE AT 1832 HRS. THERE WAS NO SEWER CONTAMINATION. EPU OFFICER BRIAN MORGAN AND DEP ANDREW KELLY RESPONDED TO THE SCENE. DEC LORENZO (TICKET #1102617) AND DEP KUMAR (TICKET #185252204) NOTIFIED. (DSNY HAZMAT LOG #15642). THE CLEANUP IS EXPECTED TO BE COMPLETED BY THE END OF THE 1600-2400 SHIFT.
UpDate: AS PER N.B.S. TRIANO ARCO VENDOR RESPONDED TO THE SCENE OF THE SPILL AND COMPLETED THEIR CLEAN UP AT 23:00 HRS (6/7/2011). BX-2 GARAGE DIESEL PUMPS ARE DOWN. BBM WILL BE DISPATCHED THIS MORNING.
Vought inquired to Hotline at to confirmation of identity and contact info for DEC Lorenzo as per report above. Hotline noted that report noted that Regional Spills was contacted and Vought noted NO contact was received. Vought noted as per above report, no spill to sewers and spill cleaned using 25 bags of speedy dry by AARCO Environmental and cleanup completed above by AARCO. Spill closed by Vought."

Remarks: "Vendor delivering fuel to location spilled onto ground. Cleanup is in progress. Caller will advise what fuel was spilled onto when info becomes available."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was KOLLEENY Background: Site initially investigated by LMB/RES, then transferred to K&R/URS. In May 1999 URS submitted ISRP proposing dual-phase extraction systems for north and south areas of site. DEC rejected in Dec. 1999 due to insufficient supporting data. URS then proposed excavation of hot spot soil around well MW-7 in south area, bioventing for soil in north area, and ORC for groundwater. DEC approved soil excav. and ORC, asked for SVE instead of bioventing. URS submitted proposal for SVE and GW P&T systems. DEC approved, but in June 2003 they argued that decreasing GW contam. didn't warrant expense and difficulties of installing SVE and P&T systems with shallow bedrock and excavating soil around active USTs; they proposed ORC socks instead. DEC approved modified plan in Oct. 2003, but then in June 2004 several feet of free product (gasoline) were detected in wells near active gasoline tank. Investigation found that a soil boring had breached fill line to tank. Line was repaired, and URS did vac truck product recovery as IRM. By April 2005, no measurable product remained in wells; absorbent socks were put in wells. GW monitoring and gauging continued on somewhat irregular basis. - J. Kolleeny 01/26/07: Completed review of Dec. 7, 2006 Proposed Remedial Strategy report by URS (in eDocs). Report noted that GW monitoring events in June and August '06 showed worsening dissolved-phase GW contamination; they proposed addressing GW with Chemical Oxidation, plus installing 8 additional wells to help design chem ox injection system, evaluate remedial progress, and fully delineate GW plume. URS also recommended NFA for limited shallow soil contamination around MW-7 in south area. JK sent letter (in eDocs) approving chem ox strategy and additional well installation proposals, and agreed that NFA is warranted for soil around MW-7. In email accompanying letter (in file) noted that due to high levels of GW contamination and fact that new remedial strategy hasn't yet been implemented, priority ranking of this spill is revised from P2 to P1. - J. Kolleeny 08/07/2007: This spill case was transferred to A. Doronova. -AD 08/20/2007: Received a Design Analysis Report. Will review. AD 05/21/2008: Received a phone call from Richard Mayers of Building Maintenance (Departmant of Sanitation), phone: 718-3349137. AD 02/20/2009: Received ecopy of a Report for the period of August - December 2008 via email, prepared by URC. Dl to eDocs. AD 02/23/2009: Received a hard copy of the report. Will review. AD 03/26/2009: Reviewed the System Performance report. Between May 9 and July 9, 2008, Envirotrac installed 40 injection wells at the site. First round of RegenOx injections was completed on August 27, 2008 and the second round on October 17, 2008. During each round, approximately 160 lb of RegenOx and 100 gallins of water were injected into each of

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

the 40 injection wells and monitoring well MW-03. Groundwater samples were collected from monitoring wells prior and after each injection round. On August 13, September 30 and December 11, 2008, URS collected groundwater samples from all of the well in the monitoring program except: MW-25 (had 0.01' of free product) and MW-30 (limited access). With the exception of MW-23 (on 12/11/08) all of the wells exhibited VOCs exeeding NYSDEC GQC. The most significant contamination was detected in wells: MW-3(27,068ppb), MW-27(19,199ppb), and MW-31(43,800ppb). Total VOCs in the remaining wells ranged from 36ppb in MW-02 to 8,949ppb in MW-29. Envirotrac initiated the third round of injections on February 2, 2009. Regenox injection were also made into wells MW-27 and MW-31 (instead IW-10 and IW-11) to assist in reducing dissolved phase concentrations in these monitoring wells. URS will continue quaterly groundwater monitoring while RegenOx injections are ongoing. AD 05/13/2009: Received pdf copy of a System Performance Report for Monitoring Period January through March 2009 via e-mail. DL to eDocs. AD 06/08/2009: Reviewed the System Performance report dated May 6, 2009. It states that on March 5, 2009 URS collected groundwater samples from all of the well in the monitoring program. All of the wells exhibited VOCs exeeding NYSDEC GQC. The most significant contamination was detected in wells: MW-3(19,580ppb), MW-27(24,360ppb), MW-31(15,063ppb) and 21,063ppb in MW-29. Total VOCs in the remaining wells ranged from 20ppb in MW-23 to 2,640ppb in well MW-26. The analytical data since the RegenOx injections show mixed results at individual wells, but the overall average total VOC concentration across the site has decreased. URS will re-evaluate the remedial program considering other oxidants such as - sodium persulfate. URS will continue quaterly groundwater monitoring at the site. No response is needed. AD 08/21/2009: Received a System Performance Report for Monitoring Period April through June 2009. Will review. AD 09/08/2009: Reviewed the System Performance report dated August 14, 2009. It states that on June 16 and July 1, 2009 URS collected groundwater samples from all of the well in the monitoring program. VOCs were below NYSDEC GQC in wells MW-18, MW-30 and MW-31. The most significant contamination was detected in wells: MW-03(13,710ppb), MW-27(44,400ppb from 24,360ppb in last report), and MW-29(16,911 from 21,063ppb in last report). Total VOCs in the remaining wells ranged from 17ppb in MW-05 to 1,783ppb in well MW-26. The analytical data since the RegenOx injections show positive results, with the exeption of well MW-27. The reason for the significant increase in well MW-27 may be due to recent spill #0903339 that was reported on June 22, 2009 and caused by a broken vapor recovery pipe associated with the 4,000-gallon gasoline underground storage tank (UST). It was estimated that 200 gallons of gasoline were released when water entered the tank through the broken pipe and displaced the gasoline. The cause of the spill was confirmed when the north portion of the concrete tank slab and pea gravel were removed to expose the craced piping. The NYC Departement of Sanitation removed all of the fuel from the gasoline UST and it carrently remains off-service. URS will re-evaluate the remedial program considering other oxidants. URS will continue quaterly groundwater monitoring at the site. AD 09/22/2009: The recent spill #0903339 that was reported on June 22, 2009 and caused by a broken vapor recovery pipe associated with the 4,000-gallon gasoline underground storage tank (UST) was closed and consolidated with this spill case. AD 02/12/2010: Received a System Performance Report for

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Monitoring Period November 2009 through January 2010. DL to eDocs. Will review. AD 03/02/2010: Reviewed the System Performance report dated November 24, 2009. It states that on August 13, 2009 URS collected groundwater samples from all of the well in the monitoring program, except MW-3 and MW-25 due to the presemce of product. VOCs were below NYSDEC GQC in wells MW-12, MW-18, and MW-24. Minor contamination was detected in wells: MW-1, MW-2, MW-5, MW-20, MW-23, MW-30, MW-31 and MW-32 where total VOCs ranged from 13ppb in MW-30 to 197ppb in well MW-32. The most significant contamination was detected in wells: MW-26(2,349ppb), MW-27(27,090ppb), MW-28(5,606ppb)and MW-29(15,794). The latest GW analytical data (October 2009)since the RegenOx injections show that the average total VOCs across the site decreased by 36%. URS will re-evaluate the remedial program considering other oxidants. URS will continue quaterly groundwater monitoring at the site. AD 05/20/2010: Received a System Performance Report for Monitoring Period February through April 2010. DL to eDocs. Will review. AD 06/25/2010: Reviewed the System Performance report dated May 20, 2010. On February 17, 2010, URS collected groundwater samples from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in five wells, which include MW-05, MW-12, MW-18, MW-24, and MW-32. Minor contamination was detected in seven wells, including MW-01, MW-02, MW-20, MW-23, MW-25, MW-30 and MW-31, which exhibited total VOC concentrations of 42 ppb, 48 ppb, 294 ppb, 55 ppb, 114 ppb, 6.6 ppb and 2.38 ppb, respectively. The most significant dissolved phase concentrations were detected in wells MW-03 (10,303 ppb), MW-27 (19,769 ppb) and MW-29 (17,287 ppb). Total VOC concentrations in the remaining two wells were 1,112 ppb (MW-26) and 5,842 ppb (MW-28). Despite the release of gasoline reported at the facility in June 2009 (spill #0903339, which was combined with active spill #9810588), the latest analytical data show that the average total VOC concentration across the site decreased by 41% since the RegenOx injections were initiated. Following the 2009 gasoline spill, free product was detected in wells MW-03 and MW-25 and on the top of the exposed gasoline tank. As a result, URS initiated product recovery using the vacuum truck. By October 2009, it was evident that the effort had a positive impact since there was no product in well MW-25 and only 0.01 feet of product in well MW-03. In addition, the top of the tank was dry. As a result, URS reduced the frequency of the site visits to recover free product to quarterly. During the February 2010 sampling event, product was not detected in any of the monitoring wells. At this time, there are no additional RegenOxTM injections scheduled. URS will continue to monitor groundwater quality on a quarterly basis. AD 09/15/2010: Received a System Performance Report for Monitoring Period May 2010 through July 2010. AD 10/15/2010: Reviewed the System Performance report dated August 25, 2010. It states that on May 26, 2010, URS collected groundwater samples from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in five wells, which include MW-12, MW-18, MW-23, MW- 24, and MW-30. Minor contamination was detected in seven wells, including MW-01, MW-02, MW- 05, MW-20, MW-25, MW-31 and MW-32, which exhibited total VOC concentrations of 40 ppb, 64 ppb, 24 ppb, 294 ppb, 46 ppb, 13 ppb and 126 ppb, respectively. The most significant dissolved phase concentrations were detected in wells MW-03 (12,074 ppb), MW-27(25,040 ppb) and MW-29 (13,228 ppb). Total VOC

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

concentrations in the remaining two wells were 1,242 ppb (MW-26) and 4,173 ppb (MW-28). URS states that although groundwater quality at the site has significantly improved because of the RegenOx injections, the concentrations of VOCs in groundwater have stabilized over the last two quarters. Further reduction in VOCs is required to meet cleanup goals for the site. Therefore, URS recommends that an additional three RegenOx injections be implemented at the site. URS will proceed with design and implementation of the RegenOxTM injections upon approval from the NYSDEC. Quarterly monitoring will continue as scheduled. Will approve the recommendation. AD 10/19/2010: Had a quarterly meeting with DDC and URS. Discussed the RegenOx injections for this site. Approved the recommendations. AD 02/14/2011: Received a System Performance Report for Monitoring Period August through November 2010. DL to eDocs. Will review. AD 03/22/2011: Received an e-mail from Kevin Shanahan of URS saying: Ainura, NYSDEC has approved using RegenOx at the Bronx West 2 sanitation garage site to address VOC impacted groundwater. Three rounds of RegenOx injections were completed in 2008 and 2009. The results are favorable and URS notified DEC that we intended to perform additional injections this spring. RegenOx will be injected into 26 injection wells as illustrated in the attached figure (locations are shown in bold). The specific injection well locations target the two groundwater plumes on-site and are identified as: IW-12, IW-14, IW-15, IW-17, IW-24, IW-25, IW-26, IW-27, IW-28, IW-29, IW-30, IW-31, IW-32, IW-33, IW-34, IW-35, IW-39, MW-01, MW-03, MW-04, MW-24, MW-25, MW-26, MW-27, MW-28, and MW-29. The contractor will conduct four separate injection events over the next two to three months. Sincerely, Kevin J. Shanahan Project Manager URS Corporation 77 Goodell Street Buffalo, New York 14203 716-923-1215 03/30/2011: Reviewed the System Performance report dated February 14, 2011. It states that the latest groundwater analytical data was collected on August 31, 2010, from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in 5 (five) wells, which include MW-05, MW-12, MW-18, MW-24, and MW-30. Minor contamination was detected in 5 (five) wells, including MW-01, MW-02, MW-23, MW-31 and MW-32, which exhibited total VOC concentrations of 80 ppb, 25 ppb, 13 ppb, 26 ppb and 156 ppb, respectively. The most significant levels of VOCs were detected in wells MW-03 (36,767 ppb) and MW-27 (32,977) ppb. Total VOC concentrations in the remaining five wells were 558 ppb (MW-20), 303 ppb (MW-25), 1,119 ppb (MW-26), 843 ppb (MW-28), and 1,598 ppb (MW-29). Although groundwater quality at the site has improved because of the RegenOx injections, the concentrations of VOCs in groundwater have not shown significant improvement over the last three quarters. Further reduction in VOCs is required to meet cleanup goals for the site. In the October 19, 2010 quarterly progress meeting, the Department agreed to URS s proposal to complete three additional RegenOx injections at the site. Injections will be implemented under Contract R-78 which is expected to be awarded in the spring of 2011. In the interim, URS plans a limited injection of RegenOxTM into heavily contaminated areas under a change order to remediation contract R-75. Quarterly monitoring will continue as scheduled. AD 06/21/2011: Received a System Performance Report for Monitoring Period November 2010 through January 2011. DL to eDocs. Will review. AD 08/22/2011: Received a System Performance Report for 1st quarter 2011 Monitoring Period. DL to eDocs. Will review. AD 10/20/2011: Reviewed the report. It states

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

that four additional RegenOxTM injection events were implemented in the second quarter of 2011 by Clean Globe Environmental, LLC (CGE). On April 13, 2011, CGE resumed RegenOxTM injections at the site. Injection during these new events is being focused on 26 existing injection wells and monitoring wells previously installed at the site which are located in the most contaminated area of the site. During these injection events, the target injection quantity for each location is approximately 80 pounds of oxidant, 40 pounds of activator and 160 gallons of water. The first injection event employed a pulsed injection technology at each well to aid in the distribution of the RegenOxTM in the subsurface. Further information on the injection events, including the first round of groundwater analytical results following the injections, will be presented in the next monitoring report for the second quarter of 2011. On March 30, 2011, URS collected groundwater samples from 16 of the 17 wells in the monitoring program. Well MW-03 was not sampled due to the presence of free product. The analytical results show that among the 16 wells sampled, VOC concentrations were below the NYSDEC GQC in seven wells: MW-01, MW-05, MW-12, MW-18, MW-24, MW-30 and MW-32. The most significant dissolved phase concentrations were detected in wells MW-27 with 46,115 ppb TVOCs and MW-29 with 24,375 ppb TVOCs. Total VOC concentrations in the remaining wells ranged from below detection to 1,842 ppb. Following the June 2009 gasoline spill at the facility (spill #0903339 which was combined with active spill #9810598), free product was detected in wells MW-03 and MW-25 and on the top of the exposed gasoline tank. As a result, URS conducted three product recovery events in August 2009 using the vacuum truck. By October 2009, it was evident that the effort had a positive impact since there was no product in well MW-25 and only 0.01 feet of product in well MW-03. In addition, the top of the tank was dry. As a result, URS reduced the frequency of the site visits to quarterly. During the most recent quarterly monitoring event (March 2011), product was only detected in well MW-03 (0.01 feet). In addition to implementing the RegenOxTM injections, URS will continue to monitor groundwater quality on a quarterly basis. Based on the petroleum storage tank inventory analysis presented above, and the extent of the groundwater plume, it appears that Tank Nos. 001, 001A, 002, 003, and 004 may potentially be impacting groundwater. Removal of these tanks and any petroleum-impacted soils may prove to be beneficial for on-going site remediation. Unfortunately, the proximity of Tank No. 001 to facility walls and the presence of fuel dispensers over Tank Nos. 001A, 002, 003, and 004 are significant obstacles to tank removal. URS will continue to evaluate the feasibility of removing these tanks as well as the associated benefits. AD 12/13/2011: Received a GW Monitoring Report for 2nd quarter 2011 period. DL to eDocs. Will review. AD 01/27/2012: Reviewed the report. It states that additional RegenOxTM injections proposed by URS for the site were implemented during the second quarter of 2011. CGE completed four rounds of RegenOxTM injections between April 13 and June 7, 2011. Injection during these events was focused at 26 existing injection wells and monitoring wells located in the most contaminated area of the site. All but three of the proposed injection points were at least partially injected during the four events. Only three locations were unsuccessful; injection could not be completed in well MW-24 because the well cover was stuck, well MW-26 because the well was found to be clogged, and in well IW-26 because the RegenOxTM slurry began to daylight through the wall of a nearby office. The

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

actual quantities injected for the first two events achieved 94% and 98% of the target quantities respectively; the last two events achieved 74 and 78% of the target quantities. However, after the first two events, problems with the injected material leaking out from the nearby ramp wall and with daylighting in the sidewalk area appeared to be increasing. URS re-evaluated the injection goals and determined that for some locations, the quantity of injected material should be decreased by half and that several others should be injected by gravity flow only to reduce the pressure. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter GW samples were collected on June 28, 2011. All wells were sampled except for MW-01, MW-24, MW-25, and MW-26. These wells were not sampled because they were still temporarily sealed to prevent daylighting from the nearby RegenOxTM injection activities; these wells will be available for sampling in the next quarter. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC standards in 6 wells: MW-12, MW-18, MW-23, MW-30, MW-31 and MW-32. Well MW-02 contained only MTBE - 15ppb. Well MW-05 contained only benzene at - 1.3ppb. The highest TVOCs were detected in wells MW-27 with 20,908ppb total VOCs and MW-29 with 12,309 ppb total VOCs. Total VOCs in the remaining three wells were 435 ppb in MW-20, 452 ppb in MW-28, and 828 ppb in MW-03. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to a relatively small area in the vicinity of wells MW-26, MW-27, and MW-29. Based on the petroleum storage tank inventory analysis made by URS, and the extent of the groundwater plume, it appears that Tank Nos. 001, 001A, 002, 003, and 004 may potentially be impacting groundwater. Removal of these tanks and any petroleum-impacted soils may prove to be beneficial for on-going site remediation. Unfortunately, the proximity of Tank No. 001 to facility walls and the presence of fuel dispensers over Tank Nos. 001A, 002, 003, and 004 are significant obstacles to tank removal. URS will continue to evaluate the feasibility of removing these tanks, as well as the associated benefits. URS will continue to monitor groundwater quality on a quarterly basis. No additional remedial measures are planned at this time, pending the results and response of the site to the most recent RegenOxTM injections. AD 02/09/2012: Received a GW Monitoring Report for 3rd quarter 2011 period. DL to eDocs. Will review. AD 03/20/2012: Reviewed the report. It states that the third quarter samples were collected on September 28 and 29, 2011. All wells currently in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 3 to 16 feet bgs. The groundwater flow direction is generally to the west. Bedrock is encountered from 2 feet to greater than 24 feet bgs. Product was last detected in March 2011 when 0.01 feet of product was detected in well MW-03. Prior to that random occurrence, no product had been detected since 2009. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC GW standards in 6 wells: MW-12, MW-18, MW-23, MW-24, MW-30, and MW-31. Well MW-01 contained only MTBE above the GQC with a 44 ppb. Well MW-28 contained only benzene at - 6.7 ppb and MTBE at -11 ppb. Well MW-32 contained only benzene at - 10 ppb. The highest TVOCs were detected in 4 wells: MW-05, MW-26, MW-27 and MW-29 with 1,017 ppb, 2,671 ppb, 23,647 ppb, and 21,650 ppb TVOCs, respectively. The most recent groundwater analytical data shows that the dissolved phase

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

contamination persists at the site, but is limited to a relatively small area in the vicinity of wells MW-26, MW-27, and MW-29. As indicated by data, while a few wells in the apparent source area (MW-27 and MW-29) show an increase in dissolved phase contaminant concentrations, overall the groundwater quality at the site shows a significant net contaminant reduction of more than 70%. The two locations showing an increase in concentrations following the injections are likely the result of additional contamination desorbing from the soil as a result of the RegenOx injections. URS states that significant improvement in groundwater quality has occurred after seven RegenOxTM injection events, resulting in a 70% reduction in TVOC concentrations. However, the most contaminated area of the site, measuring approximately 40 feet in diameter, remains at high concentrations. URS will continue to monitor groundwater quality and the effectiveness of the 2011 remediation on a quarterly basis. No additional remedial measures are planned at this time, pending the results and response of the site to the most recent RegenOx injections. AD 05/17/2012: Received 4th QMR for 2011 and 1st QMR for 2012 prepared by URS. DL to eDocs. Will review. AD 06/12/2012: Reviewed the 4th quarter 2011 report. It states that the monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells currently in the monitoring program were sampled during the fourth quarter 2011 sampling event on December 27, 2011. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC GW standards in 5 wells: MW-3, MW-5, MW-18, MW-23 and MW-30. The highest TVOCs were detected in 3 wells: MW-26 (1,334 ppb), MW-27 (26,793 ppb) and MW-29 (5,808 ppb). Moderate levels of VOCs were detected in 6 wells: MW-12 (219ppb), MW-20 (420ppb), MW-24 (345ppb), MW-25 (128ppb), MW-28 (428ppb) and MW-30 (188ppb). Low levels of VOCs detected in 3 wells: MW-1 (13ppb), MW-2 (32ppb) and MW-31 (45ppb). The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, and MW-29. Based on the data, URS states that significant improvement in groundwater quality has occurred after seven RegenOxTM injection events, resulting in a reduction in total VOCs on the order of 70%. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 40 feet in diameter, remain high. URS will continue to monitor groundwater quality and the effectiveness of the 2011 remedial actions on a quarterly basis. AD 06/13/2012: Reviewed the 1st quarter 2012 monitoring report. It states that all 17 wells currently in the monitoring program were sampled during the first quarter 2012 sampling event on March 27, 2012. Depth to groundwater at the site can vary significantly, but typically ranges from 3 to 16 feet bgs. The groundwater flow direction is generally to the west. The analytical data from the sampling event on March 27, 2012 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 7 wells: MW-02, MW-05, MW-12, MW-18, MW-23, MW-30, and MW-31. Only minor VOC contamination was detected in well MW-01 (17 ppb). The total VOCs in the remaining wells ranged from 44 ppb in MW-24 to 27,027 ppb in well MW-27. The following wells indicated increase in VOCs comparing to the December 2011 sampling round: 1. MW-3 - 135 ppb from 4 ppb; 2. MW-25 - 313ppb from 128ppb: 3. MW-27 - 27,027ppb from 26,793ppb; 4. MW-28 - 3,589ppb from 428ppb; 5. MW-29 - 20,523ppb from 5,808ppb (the biggest increase in TVOCs) The following wells indicated decrease in VOCs comparing to the December 2011 sampling

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

round: 1. MW-2 - 13ppb from 32ppb; 2. MW-12 - 3ppb from 219ppb; 3. MW-20 - 262ppb from 420ppb; 4. MW-24 - 43ppb from 345ppb; 5. MW-26 - 1088ppb from 1334ppb; 6. MW-31 - ND from 45ppb; 7. MW-32 - 65ppb from 188ppb. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, MW-28 and MW-29. URS will continue to monitor groundwater quality and the effectiveness of the RegenOx injectioons on a quarterly basis. In addition, URS is currently evaluating the most feasible remedial technology to be implemented at the site in 2012. It is likely that additional RegenOx"! or similar technology will be used at the site to address the remaining areas of groundwater contamination. AD 12/17/2012: Received a GW Monitoring Repoer for 2nd and 3rd quarters of 2012. DL the report to eDocs. Will review. AD 01/29/2013: Reviewed the monitoring report. It states that the analytical data from the most recent sampling event on September 26, 2012 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 9 wells: MW-01, MW-02, MW-05, MW-12, MW-18, MW-23, MW-24, MW-30, and MW-31. Only minor VOC contamination was detected in wells MW-03 and MW-32 with total VOC concentrations of 45 parts per billion (ppb) and 10 ppb, respectively. The total VOC concentrations in the remaining wells ranged from 124 ppb in MW-25 to 25,640 ppb in well MW-27. The TVOCs data (ppb) June 2012 - September 2012: 1. MW-1 - ND - ND; 2. MW-2 - 9ppb - ND; 3. MW-3 - 31.8 ppb - 44.9 ppb; 4. MW-5 - ND - ND; 5. MW-12 - ND - ND; 6. MW-18 - ND - ND; 7. MW-20 - 356ppb - 293ppb; 8. MW-23 - ND - ND; 9. MW-24 - 16ppb - ND; 10. MW-25 - 119ppb - 124ppb; 11. MW-26 - 510ppb - 619ppb; 12. MW-27 - 25,738ppb - 25,640ppb; 13. MW-28 - 48ppb - 3,502ppb; 14. MW-29 - 17,155ppb - 985ppb; 15. MW-30 - ND - ND; 16. MW-31 - ND - ND; 17. MW-32 - 34ppb - 8ppb. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, MW-28 and MW-29. The area of remaining groundwater contamination is defined by monitoring wells MW-26 through MW-29. In the most recent monitoring event, these wells had total VOC concentrations ranging from 620 ppb to 25,640 ppb. URS concludes that significant improvement in groundwater quality has occurred after seven RegenOx injection events, resulting in a reduction in total VOC concentration on the order of 70%. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 60 feet by 30 feet, remain high. Based on the previous success, URS considers additional RegenOx injections to be the most feasible option for additional remedial actions. However, URS intends to further refine the extent/source of the dissolved phase plume and also to evaluate the installation or repair of existing injections wells prior to conducting the injections. During the next quarter, URS will collect analytical data from existing injection wells in order to more clearly define the dissolved phase plume and to allow for the optimum location of future injection wells. Once the results from the additional groundwater samples are available, URS will determine locations for new injection wells and details for the next phase of remedial actions. This information will be submitted to the NYSDEC. However, because this is a continuation of the previously approved RegenOx injections at the site, URS will proceed with the implementation and scheduling of the proposed work once the details of the actions have been determined. URS will continue quarterly GW moitoring at the site. AD 06/27/2013: Received the folowing e-mail from URS: Ainura, We discussed this site during

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

our last meeting. The seven new injection wells have been installed and they are entirely screened in the bedrock zone. You had requested that we forward to you our next Work Order we intend to issue to our contractor for the next several rounds of RegenOx injections. Attached please find Work Order R-84-03 to satisfy this request. Also attached is our latest quarterly monitoring report dated June 5, 2013 which documents the most recent groundwater sampling completed on-site. Figure 5 of that report shows that over the past four quarterly sampling events we have VOCs detected in wells near the entrance of the sanitation garage specifically wells MW-26, MW-27, MW-28, MW-29, and MW-01. As you are aware, the RegenOx has been effective in remediating the groundwater at many areas of the site but we have this one remaining area to address. Therefore, the Work Order is comprised of eight separate injection events at 24 injection wells in this area. We have already procured a contractor to perform this work so please let us know if you have any comments or concerns regarding the scope of work. I will be on vacation until July 8th so please copy Harvey Roberts on your response. Thanks, Kevin J. Shanahan Senior Project Manager URS Corporation 77 Goodell Street Buffalo, New York 14203 kevin.shanahan@urs.com Office: 716-923-1215 Cell: 716-480-7352 DL the report and work plan to eDocs. Will review. AD 07/11/2013: Reviewed the work plan. It states that some site wells continue to exhibit high levels of VOC concentrations. Based on the data, URS recommends performing additional rounds of chemical oxidation, which involves RegenOx injections via twenty four existing injection locations, which also include permanent monitoring wells. The proposed injection locations also include most contaminated site groundwater wells: MW-27, MW-29 and MW-29. Will discuss the plan with J. Kolleeny of DEC. AD 07/15/2013: Discussed the work plan with J. Kolleeny. Issued and sent an approval letter to A. Samani of DDC with the following comments: " Monitoring well MW-27 should be omitted from the proposed direct injections; " If RegenOx application will not be effective in VOCs reductions, alternative remediation technologies should be proposed for the site. DL pdf copy of the letter to eDocs. AD 11/26/2013: Received a GW Monitoring Report for 2nd and 3rd quarters of 2013. DL the report to eDocs. Will review. AD 12/10/2013: Reviewed the monitoring report. It states that on August 14, 2013, CGE implemented the first round of RegenOx injections in the newly-installed wells at the site (IW-41 through IW-47). It should be noted that CGE inadvertently injected RegenOx at well MW-27 consistent with previous injection events. URS has directed CGE to terminate all future injections at this location. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the monitoring program were sampled during the second quarter sampling event on June 24 and 25, 2013 and during the third quarter sampling event on September 23 and 24, 2013. Depth to groundwater at the site vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The TVOCs data (ppb) June 2013 - September 2013: 1. MW-1 - 702 - 2,543; 2. MW-2 - 38 - 25; 3. MW-3 - 12 - 746; 4. MW-5 - 245 - 186; 5. MW-12 - 10 - ND; 6. MW-18 - ND - ND; 7. MW-20 - 428 - 567; 8. MW-23 - ND - ND; 9. MW-24 - ND - ND; 10. MW-25 - 87 - 95; 11. MW-26 - 1,138 - 1,052; 12. MW-27 - 28,473 - 5,557; 13. MW-28 - 339 - ND; 14. MW-29 - 1,789 - ND; 15. MW-30 - 167 - 305; 16. MW-31 - ND - ND; 17. MW-32 - ND - ND. The analytical data from the most recent sampling

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

event in September 2013 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 8 wells: MW-12, MW-18, MW-23, MW-24, MW-28, MW-29, MW-31, and MW-32. Only minor VOC contamination was detected in well MW-02 with a total VOCs of 25 parts per billion (ppb). The highest total VOCs were found in monitoring wells MW-27 with 5,557 ppb, MW-01 with 2,543 ppb, and MW-26 with 1,053 ppb. The total VOC concentrations in the remaining wells ranged from 96 ppb to 746 ppb. There were 5 wells which indicated increase in TVOCs levels (in ppb) from June to September 2013 sampling: MW-1 (from 702 - 2,543), MW-3 (from 12 to 746), well MW-20 (from 428 to 567), well MW-25 (from 87 to 95), and well MW-30 (from 167 to 305). According to the report, the most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to a relatively small area near an entrance ramp in the vicinity of monitoring wells MW-26 through MW-29. Significant improvement in groundwater quality occurred after RegenOx injection events conducted in 2008-2009 and 2011. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 60 feet by 30 feet, remain high. URS recently installed seven new bedrock injection wells and initiated a new round of RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: " Continue the quarterly groundwater monitoring and sampling program. " Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections (not including MW-27). " Install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals requiring DEC approval at this time. AD 06/13/2014: Received a GW Monitoring Report for 4th quarter of 2013 and 1st quarter of 2014. Will review. AD 07/15/2014: Reviewed the monitoring report. It presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the fourth quarter of 2013 and first quarter of 2014 (through March). GW sampling: The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater samples are analyzed for petroleum-related VOCs using USEPA Method SW-846 8260B. On December 16 and 17, 2013, all wells in the monitoring program except for MW?18 were sampled for the fourth quarter 2013 sampling event. Well MW-18 did not contain enough groundwater to collect a sample. All wells in the monitoring program were sampled during the first quarter 2014 sampling event on March 17 and 18, 2014. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, and concrete and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. GW data- December 2013 - March 2014 1. MW-1 - 260 - 1113; 2. MW-2 - 46 - 44; 3. MW-3 - 324 - 758; 4. MW-5 - 352 - 883; 5. MW-12 - ND - ND; 6. MW-18 - ND - ND: 7. MW-20 - 123 - 23 8. MW-23 - ND - ND; 9. MW-24 - ND - ND; 10. MW-25 - 568 - 133; 11. MW-26 - 1224 - 1044; 12. MW-27 - 4147 - 15761; 13. MW-28 - 334 - 458; 14.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-29 - 1520 - 5781; 15. MW-30 - 3027 - 241; 16. MW-31 - ND - ND; 17. MW-32 - ND - ND. The analytical data from the most recent sampling event in March 2014 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-31, and MW-32. Only minor VOC contamination was detected in well MW-02 with a total VOC concentration of 44 parts per billion (ppb) and MW-20 with 23 ppb total VOCs, and only one exceedance of the criteria at each location. The highest total VOC concentrations were found in monitoring wells MW-27 with 15,761 ppb and MW-29 with 5,782 ppb. The total VOC concentrations in the remaining wells ranged from 134 ppb to 1,113 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-26 through MW-30. Conclusions: URS states that significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008?2009, 2011, and 2013. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS will initiate additional RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals requiring DEC approval at this time. AD 10/14/2014: Received a GW Monitoring Report for 2nd and 3rd quarters of 2014. Will review. AD 11/20/2014: Reviewed the report. The report states that URS is currently completing groundwater remediation through chemical oxidation and quarterly groundwater monitoring at the Bronx West 2 site. This report presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the second and third quarters of 2014 (through September). Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The monitoring wells network currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32.The second quarter samples were collected on June 18 and 19, 2014. All wells in the monitoring program were sampled at this event except for MW-30 because it was blocked by a vehicle. The third quarter samples were collected on September 8 and 9, 2014. Well MW-18 was not sampled during this event because it was dry. The analytical data from the most recent sampling event in September 2014 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW?12, MW?23, MW?31, and MW? 32. The highest total VOC concentrations were found in monitoring wells MW?27 with 11,706 parts per billion (ppb), MW?29 with 3,944 ppb, and MW?01 with 1,544 ppb. The total VOC concentrations in the remaining wells ranged from 11 ppb to 733 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

wells MW-01, MW-03, MW-05, and MW-26 through MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of monitoring well MW?20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013; the socks were replaced on May 21, 2014. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. In the year following the installation of the socks, the total VOC concentrations have been lower, ranging from 23 ppb to 296 ppb. URS will continue to replace the ORC socks at this location approximately every six months. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008?2009, 2011, 2013, and 2014. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS will initiate additional RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. No proposals which require DEC approval at this time. AD 03/18/2015: Received a phone call from Mr. Shanahan of URS. He informed that while checking the site wells URS detected a 2.3' of a free product in well MW-01. He asked if a new spill should be reported to DEC. Told him that there is no need for new case. They collected a free product sample for a fingerprint analysis. One active tank is located downgradient of this well. There is no history of a free product in the well. Asked if a product was weathered. Requested to check when last time the tank was tightness tested and suggested to perform IRM in a meantime. Later, received the following e-mail from Mr. Shanahan: Ainura, Shawn Miller our environmental sampling technician was at the Bronx West 2 DSNY sanitation garage yesterday to perform routine groundwater sampling. The site plan and extent of groundwater contamination figures are attached. The site is located at 650 Casanova Street in the Bronx. Shawn detected 2.35 feet of petroleum product at well MW-01 using an oil/water interface probe. This well is near the 4,000-gallon biodiesel UST and dispenser. Product has not been detected at this site since 2004. Surrounding wells were not affected. He collected a product sample for petroleum fingerprint analysis. Shawn indicated that he could not determine if the product was fresh or weathered. Based on our discussions we decided the following: 1.NYSDEC will not open a new spill number since this area is already within the area we are remediating. 2.URS will implement an IRM to address the product (we will recover product with a peristaltic pump and install a petroleum absorbent sock on 3/23/15). 3. Send a follow-up email to you after the IRM work to convey the latest data. 4.Contact DSNY to inquire as to when the biodiesel tank was tested last (we have

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

notified DSNY of the situation yesterday). 5.Document the product discovery and IRM work in our quarterly reports. Thanks, Kevin J. Shanahan Project Manager Direct: 716-923-1215 Cell: 716-480-7352 Note New Email: kevin.shanahan@aecom.com AD 09/09/2015: Received the following e-mail from K. Shanahan: Hi Ainura, We continue to detect free product in well MW-01 during our routine groundwater sampling events. As a result, we have implemented a monthly product recovery program using a peristaltic pump. We notified DSNY of the situation and they had Aarco Environmental perform a tank tightness test. The tank passed the tightness test (see attached report). We will continue to look for a source of the free product. Thanks, Kevin J. Shanahan Project Manager Direct: 716-923-1215 Cell: 716-480-7352 Note New Email: kevin.shanahan@aecom.com 09/17/2015: Received the following e-mail from URS: Document report.sp9810588.20150917.bronx_west2.2ndq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Second Quarter 2015 for the Bronx West 2 Garage site. Please log in to http://ddcreports.ursbufweb.com to view the document. It can be found under the eDocs page. Thank you. Will review. AD 10/16/2015: Reviewed the report. It states that in October 2014, URS issued Scope of Work R-84-13 for the latest round of RegenOx injection events at the site. The scope of work was essentially the same as the 2013 scope of work including a total of eight injection events. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between December 2014 and February 2015. The injection information for this event is included as Attachment A. All target wells were successfully injected according to the plan except for bedrock wells IW-42 and IW-43 which only would accept minimal amounts of product. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter 2015 samples were collected on June 15, 16, and 17, 2015. Well MW-31 was not sampled at this event because it was blocked by a vehicle. Well MW-1 was not sampled during this event because it was found to contain product; the recent product discovery in this well is further discussed below. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in June 2015 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23 and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 12,496 parts per billion (ppb). Other wells with elevated concentrations were MW-29 with 7,374 ppb, MW-30 with 993 ppb, MW-26 with 635 ppb, and MW-05 with 274 ppb. The total VOC concentrations in the remaining wells ranged from 14 ppb to 136 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-26 through MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of monitoring well MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014 and most recently on June 10, 2015. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOC concentrations have generally been lower; only 74.6 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every six months. Based on the fact that relatively little product is being found in well MW-01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted and determine whether any additional action will be required. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008-2009, 2011, 2013, and 2014. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS recently conducted additional RegenOx injections in the area of remaining contamination. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to collect product from monitoring well MW-01. " Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. " Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: " None. AD 12/02/2015: Received the following e-mail from URS: Document report.sp9810588.20151202.bronx_west2.3rdq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Third Quarter 2015 at the Bronx West 2 site. Please log in to http://ddcreports.ursbufweb.com to view the document. It can be found under the eDocs page. Thank you. URS Will review. AD 01/06/2016: Reviewed the report. It states that URS completing groundwater remediation at the Bronx West 2 site through chemical oxidation and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the third quarter of 2015 (through September 2015). GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter 2015 samples were collected on September 8 and 9, 2015. All wells in the monitoring program were sampled at this event except for well MW-01 because it was found to contain product. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in September 2015 show that no VOCs exceed the NYSDEC

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-31 and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 6,428 parts per billion (ppb). Other wells with elevated concentrations were MW-25 with 1,698 ppb, MW-24 with 1,649 ppb, MW-03 with 1,456 ppb, MW-29 with 769 ppb, and MW-30 with 625 ppb. The total VOC concentrations in the remaining wells ranged from 14 ppb to 304 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-24 through MW-30. Site conditions: According to URS, while the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014 and most recently on June 10, 2015. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOC concentrations have generally been lower; only 76 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every six months. Free product: As noted above, free product was found at well MW-01 during the 1st quarter 2015 sampling event; the measured product thickness was 2.35 feet. The last product seen at this location was in 2004. URS notified the DSNY who verified that the adjacent biodiesel UST had passed a tank tightness test on August 11, 2015. URS provided the NYSDEC an electronic file of the tightness test report. URS has implemented a monthly product recovery program. On March 23, 2015 URS returned to remove product and collect a sample for analysis. The product thickness measured on arrival was 2.02 feet. Fingerprint analysis of the sample from MW-01 showed the product most closely resembles Fuel Oil No. 4. However, a weathered No. 2 fuel oil also could be possible. The tanks closest to MW-01 are a closed in-place gasoline tank and an active biodiesel UST. URS checked well MW-01 for product on May 5, 2015; the product thickness measured was 0.07 feet. URS installed a petroleum absorbent sock to continue collecting product from this well. During the June 2015 sampling event, a product thickness of 1.71 feet was measured and approximately 1.75 gallons of product were collected via peristaltic pump. The recent product measurements have been much lower with 0.15 feet of product in July, 0.04 feet of product in August, and 0.67 feet of product in September. An estimated 0.50 gallons of product was collected during the September 2015 event. The total product recovered to date is approximately 3.75 gallons. Based on the fact that relatively little product is being found in well MW-01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted, and determine whether any additional action will be required. Conclusions: URS states that significant improvement in groundwater quality occurred after RegenOx injection events were conducted between 2008 and 2015. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS last conducted RegenOx injections in February 2015. The GW data indicates that the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to collect product from monitoring well MW-01 on a monthly basis. " Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. " Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: " None AD 04/06/2016: Received a following e-mail from URS: Document report.sp9810588.20160406.bronx_west2.4thq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Fourth Quarter 2015 for the Bronx West 2 Sanitation Garage site. Will review. AD 05/09/2016: Reviewed the report. It states that in October 2015, URS performed additional RegenOx injection events at the site. The scope of work was essentially the same as the previous scope of work including a total of eight injection events. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between November 2015 and January 2016. All target wells were successfully injected according to plan except for bedrock wells IW-42 and IW-43 and existing wells MW-01, IW-36, and IW-39 which only would accept minimal amounts of product. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater samples are analyzed for petroleum?related VOCs using USEPA Method SW-846 8260B. The fourth quarter 2015 samples were collected on December 1 and 2, 2015. All wells in the monitoring program were sampled at this event except for well MW-01 because it contained product and well MW-12 because it was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. GW data: The analytical data from the most recent sampling event in December 2015 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-18, MW-23, MW-31 and MW-32. The highest total VOC concentration was found in well MW-27 with 2,823 ppb. Other wells with elevated concentrations were MW-03 with 685 ppb and MW-30 with 546 ppb. The total VOCs in the remaining wells ranged from 8 ppb to 429 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-24 through MW-30. The response to the RegenOx injection events in these wells has been varied. Wells MW-03 and MW-31 show a significant reduction in total VOCs that is directly attributed to the RegenOx injections. In wells MW-27 and MW-29, total VOCs increased after the 2008-2009 injections, but have since decreased significantly following the 2011-2016 injections. Both wells have more variable concentrations

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

but show an overall downward trend. These wells are located closer to the presumed source of the contamination and thus the increases following the RegenOx injections are attributed to additional contamination desorbing from soil as a result of the introduction of an oxidizing compound such as RegenOx. Free Product Recovery: Free product was found at well MW-01 during the first quarter 2015 sampling event; the product thickness measured during the first quarter was 2.35 feet. The last significant product at this location was in 2004. URS notified the DSNY who verified that the adjacent biodiesel UST had passed a tank tightness test on August 11, 2015. URS provided the NYSDEC an electronic file of the tightness test report. URS has implemented a monthly product recovery program. On March 23, 2015 URS returned to remove product and collect a sample for analysis. The product thickness measured on arrival was 2.02 feet. URS was able to collect an estimated total of 1 gallon of product via peristaltic pump. Laboratory fingerprint analysis of the product sample from MW?01 showed the product most closely resembles Fuel Oil No. 4. However, a weathered No. 2 fuel oil also could be possible. The tanks closest to MW?01 are a closed in?place gasoline tank and an active biodiesel UST. URS checked well MW?01 for product on May 5, 2015; the product thickness measured was 0.07 feet. URS installed a petroleum absorbent sock to continue collecting product from this well. During the June 2015 sampling event, a product thickness of 1.71 feet was measured and approximately 1.75 gallons of product were collected via peristaltic pump. The recent product measurements have been much lower with 0.02 feet of product in October, 0.25 feet of product in November, and 0.16 feet of product in December. An estimated 0.25 gallons of product was collected during each event. The total product recovered to date is approximately 4.5 gallons. Based on the fact that relatively little product is being found in well MW?01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted, and determine whether any additional action will be required. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted between 2008 and 2016. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater data, URS recommends the following: Continue the quarterly groundwater monitoring and sampling program. Continue to collect product from monitoring well MW-01 on a monthly basis. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 05/12/2016: Received a following e-mail from URS: Document report.sp9810588.20160512.bronx_west2.1stq2016_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the First Quarter 2016 for Bronx West 02. Will review. AD 06/17/2016: Reviewed the report. This report

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

presents a summary of the site on-going remedial actions, and the groundwater monitoring data for the first quarter of 2016 (through March). The first quarter 2016 sampling event was conducted on March 1 and 2, 2016. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the monitoring program were sampled during this event except for well MW-31 because it was blocked by a vehicle. GW data: The analytical data from the most recent sampling event in March 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-28, and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 5,104 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-26, and MW-30 with 1,527 ppb, 1,022 ppb, and 883 ppb, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 12 ppb to 356 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of well MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014, June 10, 2015, and most recently on December 7, 2015. In the year prior to ORC sock installation, the total VOCs at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOCs have generally been lower; only 62 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every 6 months. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program between 2008 and 2016. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring well MW-01 for product on a monthly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals requiring DEC approval at this time. AD 09/20/2016: Received the following e-mail from URS: Hi Ainura, Attached please find the remediation summary report for the Bronx West 2 Sanitation Garage for the second quarter of 2016. A hard copy will be sent to you by regular mail. Thanks,

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Kevin J. Shanahan Project Manager, Environment Business Unit, Metro New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com Will review. AD 10/13/2016: Reviewed the report. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the second quarter of 2016 (through June). URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter 2016 sampling event was conducted on May 31 and June 1, 2016. All wells in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in May and June 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-03, MW-12, MW-18, MW-23, MW-31, and MW-32. The highest total VOC concentration was found in monitoring well MW?27 with 13,354 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-26, MW-29, and MW-30 with 1,273 ppb, 624 ppb, 701 ppb, and 1,380 ppb, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 11 ppb to 471 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. Free product: The recent product measurements in 2016 have been much lower with 0.14 feet of product in January, and no product detected since. An estimated 0.25 gallons of product was collected during the January event. The total product recovered to date is approximately 4.75 gallons. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program between 2008 and 2016. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring well MW-01 for product on a monthly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 12/20/2016: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2016 Report has been posted to the NYCDDC SharePoint site. Please click here to access the site. https://nycddc.aecomonline.net/SitePages/Home.aspx Please click here to open the file. https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2016-12-20.Bronx_West_2.3rd_Q2016_Monitoring_Rpt.pdf Will

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

review. AD 01/17/2017: Reviewed the report. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the third quarter of 2016 (through September). Remediation: In May 2016, URS issued Scope of Work R-96-05 for additional RegenOx injection events at the site. The scope of work included a total of eight injection events. URS prepared this scope of work to target dissolved phase contamination in the groundwater. For this scope of work, URS included twelve locations not recently injected and removed three of the recent injection locations. Twenty of the injection locations in the most contaminated area were unchanged. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between June and August 2016. All target wells were successfully injected according to plan except for existing well IW-17 which could not be accessed. Several wells were unable to accept the targeted volume of injection due to daylighting. GW sampling: The 3rd quarter 2016 sampling was conducted on September 6 and 7, 2016. All wells in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The analytical data from the sampling event in September 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-12, MW-18, MW-23, MW-31, and MW-32. The highest total VOCs was found in well MW-27 with 2,994 ppb. Other wells with elevated concentrations were MW-01, MW-26, and MW-30 with 671 ppb, 1,084 ppb, and 594 ppb, respectively. The total VOCs in the remaining wells with exceedances of the criteria ranged from 12 ppb to 396 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring well MW?01 for product on a quarterly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 02/09/2017: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2016 Report has been posted to the NYCDDC SharePoint site. Please click here to access the site. https://nycddc.aecomonline.net/SitePages/Home.aspx Please click here to open the file. https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2017-2-8.Bronx_West_2.4th_Q2016_Monitoring_Rpt.pdf Will review. AD 02/10/2017: Got phone call from Kevin Shanahan of URS. They are planning to overdrill well MW-27 due to some obstruction in

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

the well. First they will try to remove the obstruction, and if not successful, will re-install the well. DEC does not have any objections to this plan. AD 03/20/2017: Reviewed the 4th QMR 2016. The report states that URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter 2016 sampling event was conducted on December 5 and 6, 2016. All wells in the monitoring program were sampled during this event except for MW-27 which was obstructed. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in December 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-12, MW-18, MW-23, MW-24, MW-28, MW-31, and MW-32. The highest total VOCs was found in well MW-01 with 909.3 parts per billion (ppb). Other wells with elevated concentrations were MW-03, MW-25, MW-26, MW-29, and MW-30 with 206 ppb, 464 ppb, 339 ppb, 264 ppb, and 426, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 8 ppb to 30 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOCs at wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater; however, additional remedial actions will likely be required to meet remediation objectives. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Remove the obstruction from monitoring well MW-27 or replace the well in kind. Continue to check monitoring well MW-01 for product on a quarterly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. If low total VOC concentrations continue at this location, URS will remove the ORC socks during the next event in May 2017. No proposals which require DEC’s approval were submitted. AD 05/08/2017: Received an e-mail with a link to the 1st QMR 2017 report. Will review. AD 05/18/2017: Reviewed the report. This report presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the first quarter of 2017 (through March). The first quarter 2017 sampling event was conducted on March 6 and 7, 2017. All wells in the monitoring program were sampled during this event except for MW?30 which was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west as shown on Figure 5. The subsurface soils at the site

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. GW data: The analytical data from the most recent sampling event in March 2017 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 6,066 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-25, and MW-26 with 435 ppb, 282 ppb, and 1,061 ppb, respectively. The total VOCs in the eight remaining wells with exceedances of the criteria ranged from 17 ppb to 119 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOC concentrations at monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. This area measures approximately 100 feet by 60 feet as shown on Figure 6. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. In April 2017 URS subcontractor CGE has initiated a 16?week RegenOx injection program to continue remediation of the saturated zone. URS recommends the following: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW?01 and IW?35 for product on a quarterly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals which require DEC's approval. AD 08/14/2017: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. Please click here to open the file on the public server. report.sp9810588.2017-08-14.Bronx_West_2.2nd_Q2017_Monitoring_Rpt.pdf Please click here to open the file on the SharePoint site (requires log in). https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2017-08-14.Bronx_West_2.2nd_Q2017_Monitoring_Rpt.pdf Please click here to access the SharePoint site. https://nycddc.aecomonline.net/ Will review. AD 09/20/2017: Reviewed the report. URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the second quarter of 2017 (through June). Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOC concentrations at monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. This area measures approximately 100 feet by 80 feet. The groundwater monitoring data indicates that the RegenOx injections reducing the dissolved phase concentrations in groundwater. In April 2017, URS subcontractor CGE initiated a 16-week RegenOx injection program to continue remediation of the saturated zone. As of June 2017, CGE has

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

completed 8 of the total 16 injections rounds for the site. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 12/11/2017: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2017-12-11.Bronx_West_2.3rd_Q2017_Monitoring_Rpt.pdf Please click here to access the SharePoint site.
https://nycddc.aecomonline.net/ Will review. AD 01/22/2018: Reviewed the report. It states that significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. The calculation indicates the reduction of total VOCs in groundwater at the site is greater than 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at five monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. This area measures approximately 100 feet by 80 feet. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 RegenOx injection rounds at the site. Future monitoring events will indicate whether additional remedial actions are required to address any remaining dissolved-phase impacts. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to evaluate the monitoring data for the site and determine whether chemical oxidation or other remedial actions are required to address the remaining impacts at the site. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 03/05/2018: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. Please click here to open the file on the public server.

click here to access the SharePoint site. https://nycddc.aecomonline.net/ Uploaded the report. Will review. AD 04/12/2018: Reviewed the Groundwater Monitoring and Remediation Report for the Fourth Quarter 2017. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the fourth quarter of 2017 (through December). The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The quarterly groundwater sampling event was conducted on December 18 and 19, 2017. All wells in the quarterly monitoring program were sampled during this event except well MW-18, which was dry, and MW-30, which was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-25, MW-26, MW-28, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. The calculation presented in Table 4 indicates the reduction of total VOCs in groundwater at the site is nearly 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at five or six monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 RegenOx injection rounds at the site. Future monitoring events will indicate whether additional remedial actions are required to address any remaining dissolved-phase impacts. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to evaluate the monitoring data for the site and determine whether chemical oxidation or other remedial actions are required to address the remaining impacts at the site. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 06/07/2018: Had a web meeting with Kevin Shanahan of URS regarding new remedial approach for the site. Since multiple RenedOx injections were done at the property and VOC levels went down, URS proposes to use ORC sock to polish remaining concentrations in the GW. Looked at the latest VOC numbers and discussed the proposed actions. URS will include this proposal in the next report. They also plan to redevelop the wells before the baseline sampling. AD 07/11/2018: Received the following e-mail from Kevin: Hi Ainura, We are initiating remediation at City properties for Fiscal Year 2019. Could you please review the attached report containing a work plan for bioremediation at Bronx West 2? This is consistent with our discussion during our telephone call on June 7th. Since we have recommended a change in remedial technologies, we would appreciate a letter or e-mail approval of the revised approach.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Thanks, Kevin J. Shanahan Project Manager, Environment Business Unit, Metro New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com Will review. AD 07/12/2018: Reviewed the report and WP. The report states that based on most recent groundwater sampling results, which indicate persisting levels of contamination in some of the site wells, URS recommends bioremediation as a revised remedial strategy to address remaining dissolved-phase VOC impacts at the site via installation of ORC socks at twenty nine (29) existing injection wells. Prior to installation of the ORC socks, URS will redevelop the injection wells and will obtain baseline data of natural attenuation parameters to confirm that the aquifer is amenable to bioremediation. ORC socks will be replaced every six months. Quarterly groundwater monitoring and sampling program will continue at the site. Will issue an approval. AD 07/13/2018: Issued and sent an approval e-mail to Mr. Aliberti. Copied to all parties involved. AD 10/12/2018: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2018 Report has been posted to the NYC DDC SharePoint Site. Please access required files: Please click here to pen the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the file. Will review. AD 10/30/2018: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2018 (through June), and a summary of recent remedial work performed. Free product: The most recent product detection at the site was during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. ORC Sock Installation: In the quarterly report dated June 20, 2018, URS recommended enhanced bioremediation as a remedial strategy to address the remaining dissolved-phase VOC impacts at the site. The NYSDEC approved the recommendation in an email dated July 13, 2018. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018. Significant quantities of silt were removed from the injection wells during the redevelopment. Three of the proposed wells (IW-14, IW-19, and IW-20) were filled with silt or broken and are not useable for the installation of ORC socks. In order to obtain baseline data, URS measured selected natural attenuation parameters on July 30 and 31, 2018 in the monitoring wells located in the target treatment area. Specifically, URS measured dissolved oxygen (DO) concentrations, specific conductivity, pH, and oxidation-reduction potential (ORP) in monitoring wells MW-01, MW-02, MW-03, MW-05, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, and MW-31. The pH range for the GW was in the acceptable range of 6 to 8. A negative ORP value was measured in all wells except MW-28; positive ORP values are required for aerobic degradation. Low DO [less than 1 mg/L] in all of the wells measured indicate anaerobic

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

conditions at the site. It is expected that the addition of oxygen via the ORC socks will create conditions more amenable to bioremediation of the remaining dissolved phase contamination. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells. Four ORC socks were installed into each of the injection wells. The socks are suspended in the injection wells approximately one foot beneath the groundwater surface. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were installed, to measure the GW quality parameters at each wells specified above. The average ORP value at the site increased from -103 mV in July to -62 mV in September, but remained negative. The DO at the site wells remained about the same (0.40 mg/L in July vs. 0.32 mg/L in September). This indicate that the oxygen released by the socks has not yet diffused into the monitoring wells, that the DO is being consumed by the microorganisms, and/or that the DO is being consumed by iron, manganese, and other dissolved metals. The effectiveness of the ORC socks will be evaluated using the quarterly groundwater monitoring program. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. The reduction of total VOCs in groundwater at the site is approximately 96% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs remain elevated t 5 wells in the most contaminated area of the site. This area measures approximately 100 feet by 80 feet. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 rounds of RegenOx injections at the site. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. According to the consultant, chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to install ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, to promote bioremediation of the dissolved phase groundwater contamination in this area. - Remove the silt from well MW-01 to allow for more representative groundwater sampling. Proposals: - None. AD 01/02/2019: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2018 Report has been posted to the NYC DDC SharePoint Site. Will review. AD 02/01/2019: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the third quarter of 2018 (through September), and a summary of recent remedial work performed. Previously, URS recommended enhanced bioremediation as a remedial strategy to address the remaining dissolved-phase VOC impacts at the site through installation of ORC socks at existing injection wells. The NYSDEC approved the recommendation in an email dated July 13, 2018. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018 using a block and surge method. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells as shown on Figure 8. Four ORC socks were installed into each of the injection wells. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were deployed, to measure the above-referenced groundwater quality parameters at each of the monitoring wells specified above. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01. GW sampling: The third quarter groundwater sampling event was conducted on September 24, 2018. All wells in the quarterly monitoring program were sampled during this event. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The analytical data from the sampling event in September 2018 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-03, MW-12, MW-18, MW-23, MW-28, and MW-32. The highest TVOCs were found in wells MW-30 with 1,126 ppb and MW-31 with 1,191 ppb. Total VOCs were also elevated in wells MW-01, MW-05, MW-26, and MW-27, with TVOCs ranging from 222 ppb to 588 ppb. The TVOCs in the 5 remaining wells with exceedances of the criteria were below 100 ppb. The most recent groundwater data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-26, MW-27, MW-29, MW-30, as well as MW-31 located across Casanova Street. Free product: The most recent product detection at the site was during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. In November 2018, the ORC socks were removed and petroleum absorbent socks were installed in IW-35. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. URS recommends the following actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to install ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW- 31, to promote bioremediation of the dissolved phase groundwater contamination in this area. Remove the silt from well MW-01 or

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

install a new well to allow for more representative groundwater sampling. No DEC approval was requested at this time. AD 03/13/2019: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2018 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://protect2.fireeye.com/url?k= 98c6bad2-c4fe1c6f-98c443e7-000babd9fa3f-e3a3b313677f796f&u=https:// nycddc.aecomonline.net/ The Public File Server is at the link below for archived reports: Public Server Directory DL the file. Will review. AD 03/19/2019: Reviewed the 4th quarter 2019 report. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2018 (through December), and a summary of recent remedial work performed. URS planned to install ORS socks into some of the wells. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018 using a block and surge method. Significant quantities of silt were removed from the injection wells during the redevelopment. Three of the proposed wells (IW-14, IW-19, and IW-20) were filled with silt or broken and are not useable for the installation of ORC socks. In order to obtain baseline data, URS measured selected natural attenuation parameters on July 30 and 31, 2018 in the monitoring wells located in the target treatment area. Specifically, URS measured dissolved oxygen (DO) concentrations, specific conductivity, pH, and oxidation-reduction potential (ORP) in monitoring wells MW-01, MW-02, MW-03, MW-05, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, and MW-31. Low concentrations of DO [i.e. less than 1 mg/L] in all of the wells measured, indicate anaerobic conditions at the site. It is expected that the addition of oxygen via the ORC socks will create conditions more amenable to bioremediation of the remaining dissolved-phase contamination. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells. Four ORC socks were installed into each of the injection wells. The socks are suspended in the injection wells approximately one foot beneath the groundwater surface. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were deployed, to measure the above-referenced groundwater quality parameters at each of the monitoring wells specified above. The average ORP value at the site increased from -103 mV in July to -62 mV in September, but remained negative. The DO concentration at the site remained about the same (0.40 mg/L in July vs. 0.32 mg/L in September). These results indicate that the oxygen released by the socks has not yet diffused into the monitoring wells, that the DO is being consumed by the microorganisms, and/or that the DO is being consumed by iron, manganese, and other dissolved metals. The effectiveness of the ORC socks is evaluated using the quarterly groundwater monitoring program. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01 or replace the well. GW sampling: The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the quarterly monitoring program were sampled during this event. The data from the most recent sampling event in December 2018 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-23, MW-28, and MW-32. The highest total VOCs was found in

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

well MW-26, with 1,419 ppb. Total VOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-31, with total VOCs ranging from 193 ppb to 794 ppb. The total VOCs in the 8 remaining wells with exceedances of the criteria were below 100 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, MW-30, as well as MW-31 located across Casanova Street. Free product: Product was detected at the site during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. In November 2018, the ORC socks were removed and a petroleum absorbent sock was installed in IW-35. During the most recent monitoring event in December 2018, the petroleum absorbent sock was observed to be 100% saturated with product and was replaced. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. - Remove the silt from well MW-01 or install a new well to allow for more representative GW sampling. Proposals: - None. AD 06/28/2019: Received the following e-mail from URS: The document Bronx West 2 - 1Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 07/12/2019: Reviewed the report. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the first quarter of 2019 (through March), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to monitor the progress of the remedial actions. The monitoring wells currently included in the monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The first quarter groundwater sampling event was conducted on March 27 and 28, 2019. All wells in the quarterly monitoring program were sampled during this event. The data from the most recent sampling in March 2019 show that the highest TVOCs was found in well MW-26, with 1,087 ppb. Total VOCs were also elevated in wells MW-01, MW-20, MW-27, and MW-30, with total VOCs from 154 ppb to 693 ppb. The total VOCs in 7 wells with exceedances of the criteria were below 100 ppb. No VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-28, and MW-32. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. Conclusions:

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at four wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 09/30/2019: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 10/09/2019: Reviewed the report. It states that URS continues to implement groundwater remediation at the site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2019 (through June), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter groundwater sampling event was conducted on June 24 and 25, 2019. All wells in the quarterly monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in June 2019 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-24, MW-28, and MW-32. The highest TVOCs were found in wells MW-20, MW-26, and MW-27, with 519 ppb, 873 ppb, and 813 ppb, respectively. TVOCs were also elevated in wells MW-01 and MW-30, with TVOCs of 147 ppb and 266 ppb, respectively. The TVOCs in the six other wells with exceedances of the criteria were below 100 ppb. The most recent groundwater data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-26, MW-27, MW-29, and MW-30. The groundwater data indicates that the RegenOx injections reduced the dissolved phase

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at four wells in the most contaminates area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: None. AD 12/06/2019: Received the following email from URS: The document Bronx West 2 - 3Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 12/20/2019: Reviewed the 3rd quarter 2019 report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the third quarter of 2019 (through September), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis. The wells currently included in the program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter groundwater sampling event was conducted on September 24 and 25, 2019. All wells in the program were sampled during this event except for well MW-05, which was blocked by a parked car. Groundwater samples are analyzed for petroleum related VOCs and naphthalene using USEPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The data shows that the groundwater elevation at this site has dropped by an average of 2.8 feet between December 2018 and September 2019. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in September 2019 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-28, and

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-32. The highest TVOCs were found in wells MW-26 and MW-30, with 977 ug/L and 1,056 ug/L, respectively. TVOCs were also elevated in wells MW-01, MW-27, and MW-31, with TVOCs of 116 ug/L, 349 ug/L, and 292 ug/L, respectively. The TVOCs in the six other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation presented in Table 4 indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at five monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 03/02/2020: Received the following email from URS: The document Bronx West 2 - 4Q19 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded document. Will review. AD 03/17/2020: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2019 (through December), and a summary of recent remedial work performed. ORC socks have been used at the site to promote bioremediation at some locations since November 2013 and May 2018, respectively. The ORC socks were replaced in 26 wells in August 2019. Well MW-31 has been covered with concrete and well IW-35 contained product, so no socks were installed at these locations. URS replaced the ORC socks again on February 11 and 12, 2020. Socks were also installed in IW-35 during this event since no

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

product was measured in the well. URS will continue to replace the ORC socks every six months. GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter groundwater sampling event was conducted on December 23 and 24, 2019. All wells in the quarterly monitoring program were sampled during this event except for wells MW-03, MW-24, and MW-30; these wells were sampled on January 9 and 22, 2020. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The analytical data from the most recent sampling event in December 2019 show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-32. The highest total VOCs were found in wells MW-26 and MW-30 with 829 ug/L and 766 ug/L, respectively. Total VOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-31, with total VOCs of 307 ug/L, 179 ug/L, 124 ug/L, and 142 ug/L, respectively. The total VOCs in the seven other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. LNAPL: During the ORC sock installation in August 2019, 0.31 feet of product was measured in IW-35. However, no product was observed in the well during the most recent monitoring event in December 2019 and during the most recent ORC sock installation in February 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at five or six wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 05/07/2020: Received the following email from URS: The document Bronx West 2 - 1Q 2020 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 05/29/2020: Reviewed the report. It presents a brief summary of the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

site history, previous remedial actions, groundwater monitoring data for the first quarter of 2020 (through March), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The first quarter groundwater sampling event was conducted on March 30 and 31, 2020. All wells in the quarterly monitoring program were sampled during this event except for wells MW-12 and MW-30, which could not be accessed due to vehicles parked over the wells. Groundwater samples are analyzed for petroleum-related VOCs and naphthalene using EPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in March 2020 show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-18, MW-23, MW-24, MW-25, and MW-32. The highest total VOCs was found in well MW-26 with 1,439 ug/L. TVOCs were also elevated in wells MW-01, MW-02, MW-03, MW-05, and MW-31, with TVOCs of 160 ug/L, 103 ug/L, 204 ug/L, 301 ug/L, and 375 ug/L, respectively. The tVOCs in the 4 other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26, MW-27, MW-29, and MW-30. Free product: No product has been observed in the well IW-35 since August 2019, including the most recent monitoring event in March 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019 and most recently in February 2020. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 08/10/2020: Received the following email from URS: The document Bronx West 2 - 2Q20 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 09/21/2020: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2020 (through June), and a summary of recent remedial work performed. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter groundwater sampling event was conducted on June 22 and 23, 2020. All wells in the quarterly monitoring program were sampled during this event. The analytical data from the recent sampling show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-24. The highest total VOCs was found in well 26 with 1,340 ug/L. Total VOCs were also elevated in wells MW-01 (283 ug/L), MW-03 (464 ug/L), MW-05 (334 ug/L), MW-29 (138 ug/L), MW-30 (845 ug/L), and MW-31 (325 ug/L). The total VOCs in the six other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26, MW-27, MW-29, and MW-30. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the TVOCs in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019 and most recently in February 2020. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to check all monitoring wells for product on a quarterly basis and recover product if present. " Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: " None. AD 11/27/2020: Received the following email from URS: The document Bronx West 2 - 3Q20 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 12/28/2020: Reviewed the 3rd quarter 2020 report. It states that on September 14 and 15, 2020, URS and AARCO over-drilled and replaced 2-inch monitoring wells MW-26 and MW-30 with 4-inch diameter wells MW-26R and MW-30R. Replacement of these wells was discussed and approved at the semi-annual meeting with the NYSDEC on May 21, 2020. Well construction diagrams for the new wells are included as Attachment D. During the installation of these two wells, it was noted that the steel protective casings of several existing wells located in the north end of the building were potential trip hazards. On November 18 and 19, 2020, URS repaired the steel protective casings of those wells to eliminate potential trip hazards. GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter groundwater sampling event was conducted on September 23 and 24, 2020. All wells in the quarterly monitoring program were sampled during this event except for well MW-01, which was found to contain product. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in September 2020 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, and MW-32. The highest TVOCs was found in well MW-26R with 692 ug/L. TVOCs were also elevated in wells MW-03 (635 ug/L), MW-05 (243 ug/L), and MW-31 (154 ug/L). The total VOCs in the eight other monitoring wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. ORC socks: The ORC socks were replaced most recently on August 24, 2020; URS replaced the ORC socks in the same

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

24 injection wells and two monitoring wells. Well IW-35 contained product during this event, so the ORC socks were removed but not replaced at this location (a petroleum absorbent sock was installed in this well on September 23, 2020). URS will continue to replace the ORC socks every six months. The report states that significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved-phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019, February 2020, and most recently in August 2020. Dissolved-phase concentrations appear to be decreasing further. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. Reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Repair existing monitoring and injection wells that are potential trip hazards. Proposals: None. AD 02/25/2021: Received the following email from URS: The document Bronx West 2 - 4Q 2020 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 03/26/2021: Reviewed the 4th quarter 2020 report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2020 (through December), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter groundwater sampling event was conducted on December 28 and 29, 2020. All wells in the quarterly monitoring program were sampled during this event except for well MW-25, which was found to be damaged. Depth to groundwater at the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The data from the most recent sampling event in December 2020 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-24, and MW-32. The highest total VOCs were found in wells MW-30R with 1,685 ug/L and MW-26R with 1,489 ug/L. Total VOCs were also elevated in wells MW-05 (205 ug/L) and MW-20 (127 ug/L). The total VOCs in 7 other wells with exceedances of the criteria were below 100 ug/L. Conclusions: Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation presented in Table 3 indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Replace damaged well MW-25. Proposals: None. AD 06/15/2021: Received the following email from URS: The document Bronx West 2 - Jan Thru Mar 2021 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 07/01/2021: Reviewed the report. URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from January through March 2021, and a summary of recent remedial work performed. Groundwater Sampling URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently includedin the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The most recent quarterly groundwater sampling event was conducted on March 17 and 18, 2021. All wells in the quarterly monitoring program were sampled during this event except for well MW-25, which was found to be damaged. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the south and west. The analytical data from the most recent sampling event in

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

March 2021 shows that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-28, and MW-32. The highest total VOCs was found in monitoring well MW-26R with 2,406 ug/L. Total VOCs were also somewhat elevated in wells MW-05, MW-20, MW-27, and MW-30 with concentrations ranging from 157 ?g/L to 353 ?g/L. The total VOCs in the four other monitoring wells with exceedances of the criteria were lower with total VOCss ranging from 3 ?g/L to 25 ?g/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. The ORC socks were replaced most recently on March 26 and April 7, 2021; URS replaced the ORC socks in the same 24 injection wells and two monitoring wells for this event. Although no product was detected in monitoring well IW-35 during the most recent monitoring event, no ORC socks were installed at this location due to the occasional detections of free product over the past few years. URS will evaluate whether to install socks at this and other site wells during future ORC sock installation events. URS will continue to replace the ORC socks every six months. Free product: No product was detected in well IW-35 during the most recent monitoring event in March 2021. As with well MW-01, water levels in IW-35 in December 2020 and March 2021 were nearly five feet higher than in September 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 24 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. - Survey riser elevation at replacement well MW-25R. Proposals: - None. AD 08/25/2021: Received the following email from URS: The document Bronx West 2 - April through June 2021 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 09/28/2021: Reviewed the report. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from April through June 2021, and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis. The monitoring wells currently included in the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The most recent quarterly groundwater sampling event was conducted on June 14 and 15, 2021. All wells in the quarterly monitoring program were sampled during this event except for well MW-25R, which was found to contain product. Groundwater samples are analyzed for petroleum related VOCs and naphthalene using USEPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The water levels in June 2021 are on average nearly 4 feet higher than the elevations in June 2020. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in June 2021 shows that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-31, and MW-32. The highest total VOCs was found in well MW-26R with 2,949 ug/L. Total VOCs were also somewhat elevated in wells MW-05, MW-27, and MW-30R ranging from 131 to 438 ?g/L. The total VOCs in the six other wells were lower with total VOCs ranging from 7 ug/L to 70 ug/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. Free product: No product was observed in well MW-01 during the most recent monitoring event in June 2021. No product was detected in well IW-35 during the most recent monitoring event in June 2021. As with well MW-01, significant changes in water levels in well IW-35 may be responsible for the short-term observations of product. A product thickness of 0.16 feet was measured at this newly re-installed well during the June 2021 sampling event. This was the first sampling event following the replacement and development of well MW-25 with well MW-25R in April 2021. A petroleum absorbent sock was installed during this event. Well MW-25 was one of the wells impacted by free product from the 2009 gasoline spill; the product observed is likely a remnant from that event. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The monitoring data indicates that the RegenOx injections reduced the dissolved-phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019, February and August 2020, March/April 2021 and most recently in August 2021. Dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Well MW-26R has been showing a significant increase in total VOCs since being replaced; this may be indicative of a small pocket of soil contamination that was disturbed while over-drilling this well. Free product was also recently found at replacement well MW-25R. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: " Continue the quarterly groundwater monitoring and sampling program. " Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01, MW-25R, and IW-35. " Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 24 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. If dissolved phase groundwater impacts continue to remain elevated or increase at well MW-25R, conduct additional chemical oxidation injections targeting that area of the site. Proposals: " None. AD 09/24/2021: Received the following email from URS: Hi Ainura I hope all is well. The purpose of this e-mail is to let you know about recent free product detections at the Bronx West 2 sanitation garage and our plan to recover the product. Monitoring well MW-25 was damaged and replaced in April 2021 with a new 2-inch diameter well at the same location. Attached is the latest total VOC figure showing where MW-25R is located. As we indicated in our August 25, 2021 report, 0.16 feet of free product was detected in well MW-25R during the June 2021 sampling event. No product was detected during well development. Attached is a table showing water/product levels at this well location for the past 10 years. There was a sheen reported twice in 2012/2013 but no other indication of product. We collected the third quarter groundwater samples this week. The petroleum absorbent sock in well MW-25R was 100% saturated with product and 0.23 feet of product was measured in the well. Our sampling geologist, Shawn Miller, used a peristaltic pump to recover the remaining product and installed a new absorbent sock. Dissolved phase VOCs at well MW-25 were less than 100 ug/L over the past three years. We plan on performing product recovery work at this site on a monthly basis to address this situation. I have requested Shawn to collect a product sample for product identification at the lab. While on-site we will check wells MW-01 and IW-35 for product since both of these wells had product over the past few years. Let me know if you need any additional information. Regards - Kevin J. Shanahan Civil Engineer/Project Manager Associate Vice President Environment Business Unit - Upstate New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com AD 12/17/2021: Received the following email from URS: Hello - The document Bronx West 2 - July through September Report has been posted to the NYCDDC SharePoint O365 Site. The file is attached to this email. AECOM has changed its database operation and now uses Microsoft Office 365 to access the NYCDDC SharePoint site. If you would like to access the O365 SharePoint site, and you have requested access and have activated your account, use this link. https://aecom.sharepoint.com/sites/extranet-nycddc/SitePages/Home.aspx If you have not requested access and activated your account, and would like to access the O365 SharePoint site, please email Lorena.Warix@aecom.com Will review the attached report. AD 01/19/2022: Reviewed the report. it states that AECOM continues to

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from July through September 2021, and a summary of recent remedial work performed. Groundwater Sampling: AECOM collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The wells currently included in the QMP are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater sampling was conducted on September 20 and 21, 2021. All wells were sampled during this event except for well MW-25R, which was found to contain product and well MW-05, which had a vehicle parked over it. AECOM returned to the site on October 6, 2021 and sampled well MW-05. Depth to GW at the site typically ranges from 2 to 16 feet bgs. The water levels in June 2021 were on average nearly 4 feet higher than the elevations in June 2020; the groundwater elevations in September 2021 remained relatively unchanged from June 2021. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the September 2021 sampling shows that no VOCs exceeded the NYSDEC GQCS in wells MW-03, MW-12, MW-18, MW-23, MW-24, MW-28, MW-31, and MW-32. The highest TVOCs was found in well MW-26R with 5,820ug/L. TVOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-30R ranging from 123 to 572 ug/L. Wells MW-02, MW-20, and MW-29 indicated TVOCs ranging from 10 ug/L to 83 ug/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-05, MW-26R, MW-27, MW-29, and MW-30R. Free product: Well MW-25R: A product thickness of 0.16 feet was measured at this newly re-installed well during the June 2021 sampling event. This was the first sampling event following the replacement and development of well MW-25 with well MW-25R in April 2021. A petroleum absorbent sock was installed during this event. During site visit in September 2021, 0.23’ of product was measured in the well and the absorbent sock was 100% saturated with product. An estimated 0.25 gallons of product was removed from the well and the absorbent sock was replaced. Well MW-25 was one of the wells impacted by free product from the 2009 gasoline spill; the product observed is likely a remnant from that event. Due to the product observed in well MW-25R, AECOM increased product recovery monitoring to a monthly basis in November 2021. AECOM will continue to check wells MW-01, MW-26R, and IW-35 for product and conduct product recovery as appropriate. Conclusions: According to the consultant, dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. The reduction of total VOCs in groundwater at the site is approximately 96% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Well MW-26R has been showing a significant increase in total VOCs since being replaced; this may be indicative of a small pocket of soil contamination that was disturbed while over-drilling this well.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Free product was also recently found at replacement well MW-25R. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the recent groundwater data as summarized above, AECOM recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check wells MW-01, MW-26R, and IW-35 for product on a monthly basis and recover product from affected wells. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. If dissolved phase groundwater impacts continue to remain elevated or increase at well MW-26R, conduct additional chemical oxidation injections targeting that area of the site. Proposals: - None. AD"

Spiller Name: J SHAW
Spiller Company: NYC DEPT SANITATION
Spiller Address: 650 CASANOVA ST
Spiller Company: 999
Contact Name: J SHAW
DEC Memo: "Gasoline spilled from a vent line on a tank during an overfill. Area is all cement, no cracks, no impact to the subsurface or to drains. Area was contained and cleanup was completed by a countractor. 7/6/2009 Mr Shaw from sanitation called back to say the spill was actually about 200 gallons and the gasoline poured into the soil. They now need to do a major cleanup - Case transferred to DEC Patel. 07/06/09-Hiralkumar Patel. 10:03 AM:- received call from Mr. Shah. he mentioned that based on veeter-root readings, they are estimating release of about 201 gal of unleaded gasoline. asked Mr. Shah to find out a time period for which veeter-root system shows drop in amount. they tested tank only and found tight. as per Mr. Shah, vent pipe is broken. asked Mr. Shah to perform tightness test for fill, supply and return lines. also asked him to exposed entire length of vent pipe as suspecting leak in subsurface. Mr. Shah asked to send letter to Mr. Mignone. Jay Shah PH. (718) 334-9138 email: jshah@dsny.nyc.gov Al Mignone Deputy Director NYC Dept. of Sanitation Building Maintenance 52-35 58th Street, Room 410 Woodside, NY 11377 Ph. (718) 334-9121 Fax (718) 334-9088 email: amignone@dsny.nyc.gov sent letter to Mr. Mignone requiring submission of cleanup report. letter emailed to Mr. Mignone and Mr. Shah. 07/08/09-Hiralkumar Patel. 12:52 PM:- received call from Mr. Mignone. he mentioned that supply/return lines were tested along with tank and found tight. they found leak in vent line. as per Mr. Mignone, water entered into tank through holes in vent line which cause problem in veeter-root readings. they have excavated partial area along underground vent line and found some contamination. will hire outside contractor. vent pipe found about 1.5 ft bg. asked Mr. Mignone to submit color photographs of open excavation for entire length of underground vent line. also asked him to collect endpoint samples, if deep excavation occurs. will send contractor’s info soon. 08/04/09-Hiralkumar Patel. 3:59 PM:- received letter from Mr. Roberts from URS inclding tank test results and disposal manifests. as per Mr. Roberts, spill was caused by a break in the vapor recovery line of a 4,000 gal gasoline UST. approx. 200 gal of gasoline were release, being replaced by groundwater that had entered the tank through the pipe break. AARCO emptied the tank and removed contaminated fill material. F&N tested gasoline and diesel tank. currently 4,000 gal gaosline tank is filled with water and will remain out of service until the vapor recovery piping is repaired and tested. URS is currently remediating site (under spill #: 9810588) by means of chemical oxidation. URS will sample existing wells in this month and will submit recommendations for future remediation action, if required. Harvey Roberts URS Corp. Ph. (718) 786-3838 Fax (718) 786-3848 email: Harvey_Roberts@URSCorp.com according to tank test result, diesel tank system (including pipes) is tight and gasoline tank only tight. no info about line test for gasoline tank system. 08/05/09-Hiralkumar Patel. 9:00 AM:- spoke with Mr. Roberts at URS. asked him about location of source. Mr. Roberts mentioned that leak was found in vapro recovery pipe on tank and dept. of sanitation excavated about 10 ft by 10 ft area to a depth of abou 2 ft. asked him about line test for gasoline tank. Mr. Roberts doesn’t know about that. 9:08 AM:- spoke with Mr. Mignone. he mentioned that broken elbow was found on vapor recovery line about 10 ft away from tank.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

they removed contaminated soil. asked Mr. Mignone to submit color pics of open excavation, endpoint sample analyticals and scaled site map with sampling lcoations. also asked him to test all lines associated with gasoline tank. 9:33 AM:- sent email to Mr. Mignone with the requirements. email copied to Mr. Roberts.
08/10/09-Hiralkumar Patel. 1:52 PM:- received message from Jane Staten (716-923-1152) from URS. 2:16 PM:- left message for Ms. Staten. 3:11 PM:- received call from Ms. Staten. Ms. Staten mentioned that leak was found in pipe in pea gravel area between the tank and sheeting. contractor removed some pea gravels to expose the pipe. oil was found on water. groundwater at nearby well MW-25 was found at 2.91 ft bg. they will sample monitoring wells on 08/13/09. asked Ms. Staten to send pics of area and brief description about impacted area. 08/12/09-Hiralkumar Patel. 1:16 PM:- received email from Mr. Roberts from URS. Mr. Roberts send three pics but as per Mr. Roberts pics were taken in dark, so groundwater appear darker than it does; a slight sheen was observed on water but no odors. as per Mr. Roberts: after the facility noted increased water in the tank sumps over a period of time, they investigated further. using camera equipment in the piping, Department of Sanitation maintenance personnel were able to locate a damaged portion of the Stage 2 Vapor Recovery Piping (within the area of the tank vault). On June 22, 2009, AARCO Environmental removed approximately 3,200 gallons of water and gasoline from the tank with a vacuum truck. it was surmised that groundwater had entered through the Stage 2 Vapor Recovery piping where it was damaged and was conveyed into the gasoline UST, and displaced the gasoline. this resulted in the spill report of June 22.
the tank has been taken out of service until the issue is resolved.
DOS maintenance personnel removed the concrete tank vault top slab (the northern portion of the tank slab) to expose the damaged piping.
AARCO environmental was on site on June 26, 2009, and they removed pea gravel from within the tank vault to expose the piping.
approximately four cubic yards of pea gravel was removed as contaminated fill, which exposed the piping. DOS capped the damaged piping was capped, and had Fenley & Nicol test both of the tanks for tightness (which they passed). currently the excavation is approximately two feet to three feet below the top of the garage slab. There is groundwater in the bottom of the excavation and it has a slight sheen. will sample all wells and will compare these wells with their quarterly monitoring data to see if there has been any contamination migration or increase as a result of the incident.
08/26/09-Hiralkumar Patel. 7:38 PM:- received email from sanitation with letter report. Sanitation has pumped out tank and tested tank with remote fill line. tank and remote fill line found tight.
currently tank is out of service. URS collected soil and groundwater samples and will send report once sample analyticals available.
09/15/09-Hiralkumar Patel. 3:49 PM:- received email from Ms. Staten with sampling report. URS collected groundwater samples from existing wells. found free product in wells MW-03 and MW-25. URS stated that product in wells is a result of new spill since there was no detectable free product in any of the wells at the site for one year prior to new spill. URS removed free product using vacuum truck. product thickness dropped from 0.73 ft to 0.25 ft in well MW-03 and from 0.23 ft to 0.01 ft in well MW-25. URS requested to combine this case with old case 9810588 (project manager: Ainura Doronova).
09/22/09-Hiralkumar Patel. discussed with DEC Kolleeny. he agreed to refer this case to on-goiing remediation case. case closed. refer to

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"10/29/07 bf: Called Bradley Cohen (212)941-9500. I was patched in to his cell phone by his secretary. He needs to get 3 estimates for the repairs. I confirmed his mailing address and told him that I will be sending him a letter. Sent ttf letter to: Bradley Cohen AAA Maqnagement Corp. 495 Broadway - 6th Floor New York, NY 10012 12/18/07 B. Cohen called and left message yesterday. Pro Test made repairs. Vent line failed. He wanted to know what is required. I called him back today and told him I need letter from pro Test, tightness test and invoice (if available). He said he would be able to them. He will call Pro Test today to request letter. bf 1/2/08 received letter from Robert Urban of Pro Test on 12/24/07. An old suppply and return line was found attached to the tank during excavation. Lines were removed and plugged. Tank was retested and

Update By:	SMQUANDT
Site Description:	"Location The site is located in a commercial and industrial area of the Hunts Point section of the Bronx. The site is an approximate 7.4-acre lot contained within one tax lot identified on New York City tax maps as Block 2780, Lot 73. The site is bounded by the Fulton Fish Market (north and east) and the East River (west and south). Site Features The site is level and paved with asphalt. Attached and anchored off the shoreline of the site is an 800 bed jail barge used by the NYDC as a holding and temporary processing center. Current Zoning and Land Use The site is currently an active New York City Department of Corrections parking lot for the Vernon C. Bain Correctional Facility and is zoned M3-1 (Manufacturing). Past Use of the Site Historically, the Site was part of the Consolidated Edison Company of New York (Con Ed) Manufactured Gas Plant (MGP) that operated from 1926 until the early 1960s. Gas operations included a coke/oven gas plant, a carbureted water gas plant, a light oil plants, and a liquid petroleum production area. In total, approximately 46 buildings or structures existed on the former Con Ed MGP facility that were actively involved in gas production. The facility stopped production in the early 1960s and was demolished in early 1968. Site Hydrogeological Conditions Information from prior investigations in the area, available in historic NYSDEC files, suggests the Site is comprised almost entirely from filled land. The Site stratigraphy consists of a 10 to 15-foot thick layer of fill material. The fill material in this area consists of silt and sand and contains typical historic fill materials like coal, slag, demolition debris, wood as well as MGP residual waste due to the proximity of the site location to the former facility. The fill material closer to the coastline may consist of dredge sands as seen on other parcels and could be up to 30 ft. thick in some areas. The fill material is underlain by a confining, native clay layer which is believed to be the surface of the former tidal wetland and shallow embayment. Much of Hunts Point is similarly filled with this same clay layer immediately beneath it. Based on data collected during the various investigations completed at the former MGP, the water table generally occurs in the shallow subsurface at depths ranging from approximately 2 to 15 feet below ground surface (bgs) across the

VERNON C. BAIN CENTER (Continued) **S105057385**

	former MGP property and approximately 2 to 8 feet bgs on the NYC DOC property. In general, groundwater flow is directed from the upland to the Bronx and East Rivers. However, groundwater flow may be influenced by tidal conditions within the adjacent rivers, and the numerous subsurface utilities in the area may act as preferential pathways for groundwater flow."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was SAWYER 3/1/04 - Sawyer -This was release of between 50-100 gallons of #2 fuel oil that spilled in to the the East River between the Barge at 1 Halleck Street in the Bronx and the shore line. The Barge has a fuel capacity of 85,000 gallons of fuel. The facility is not registered as a PBS facility. The spill was caused by an overfill of the the day tank from one of the two 40,000 gallon main tanks. The plant operator, in the process of transfering 575 gallons of fuel to

VERNON C. BAIN CENTER (Continued) **S105057385**

	the day tank left the tank area to do some boiler work and did not hear the alarm right away. The day tank overfilled and backed out through the vent, a small amount of about 10 gallons was contained in the secondary lip and the rest sprayed down the side of the vessel. The Department of Corrections Assistant Commissioner of Environmental Health Patricia Feeney called in the release and met me at 10:30 am at the Barge. The US Coast Guard aslo had four representatives onsite. Milro Associates were contracted to do the cleanup. When I left on Monday 2:00 pm the spilled fuel that had not gone out into the East River was contained by hard booms and absorbent pads. I talked to BM3 Hawkins of USCG today (3/5) and he notified me that most of the contained product has either been sucked up by the booms or dissipated. 3/19/04 - Sawyer - Closed. "
Remarks:	"about 50 gallons of #2 oil spilled. they think that about 40 gallons went into the bronx river. they have millro associates on the way. the facility made note to the NRC"

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022
Number of Days to Update: 26

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022

Next Scheduled EDR Contact: 07/11/2022
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Next Scheduled EDR Contact: 11/28/2011
Data Release Frequency: No Update Planned

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 05/25/2021
Date Data Arrived at EDR: 06/24/2021

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RES DECL: Restrictive Declarations Listing

A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

Lists of state and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

NYC LEAD 2: Recent Lead Paint Violations
Pursuant to New York City?s Housing Maintenance Code, the Department of Housing Preservation and Development (HPD) issues violations against conditions in rental dwelling units that have been verified to violate the New York City Housing Maintenance Code (HMC) or the New York State Multiple Dwelling Law (MDL). Violations are issued when an inspection verifies that a violation of the HMC or MDL exists. It is closed when the violation is corrected, as observed/verified by HPD or as certified by the landlord.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

East Map:	14115946 FLUSHING, NY
Version Date:	2019

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

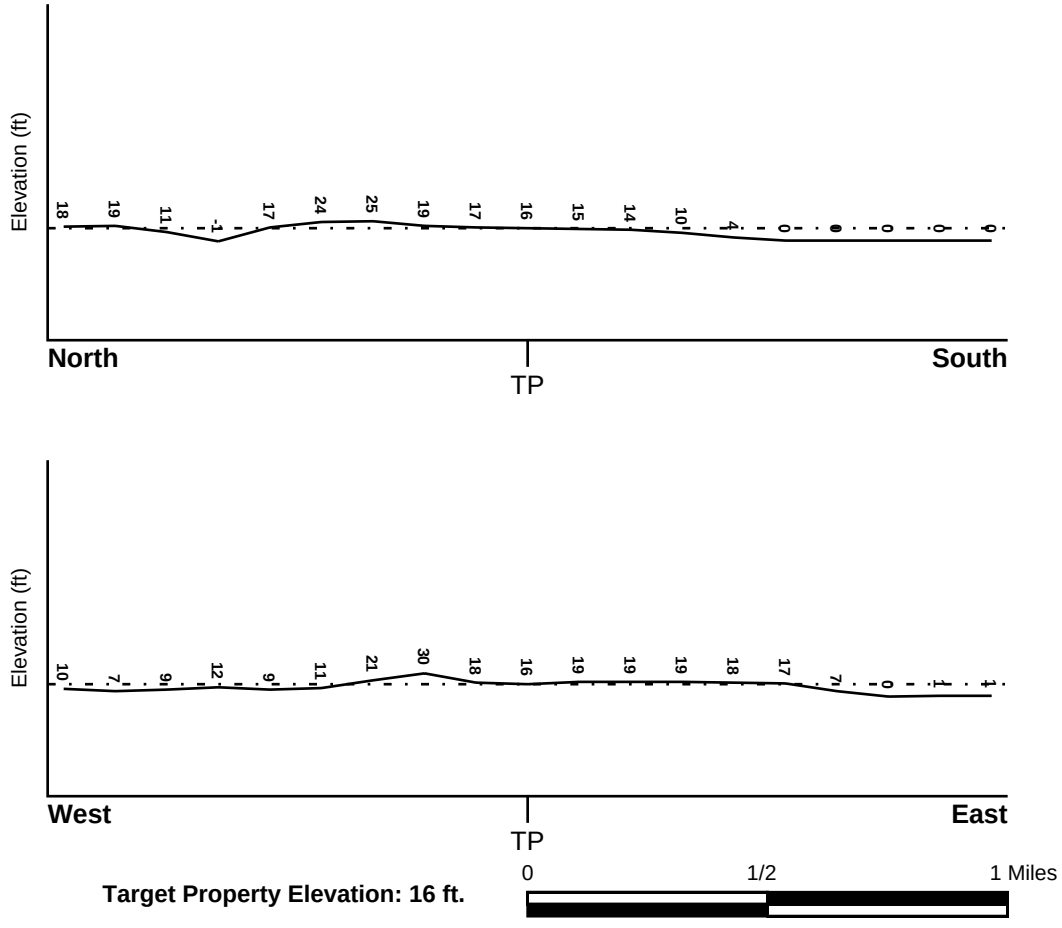
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ESE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 16 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
3604970092F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
3604970084F	FEMA FIRM Flood data

3604970111F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CENTRAL PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT **GEOLOGIC AGE IDENTIFICATION**

Era:	Paleozoic	Category:	Stratified Sequence
System:	Ordovician		
Series:	Middle Ordovician (Mohawkian)		
Code:	O2 *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	URBAN LAND
Soil Surface Texture:	variable
Hydrologic Group:	Not reported
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 10 inches
Depth to Bedrock Max:	> 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy sand
sandy loam
fine sandy loam

Surficial Soil Types: silt loam
loamy sand
sandy loam
fine sandy loam

Shallow Soil Types: sandy loam

Deeper Soil Types: unweathered bedrock
very gravelly - loamy sand
stratified
sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1927 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 200 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

70 West Red Oak Lane
West Harrison, NY 10604
Contact: Sandy Smith

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by CBRE were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

SECTION 1

INTRODUCTION

On behalf of Consolidated Edison Company of New York, Inc. (Con Edison), Parsons has prepared this Alternatives Analysis Report (AAR) for the former Hunts Point Gas Works Halleck Street Sidewalk Area, which is part of the former Hunts Point Gas Works, located in the Bronx, New York (Figure 1). This AAR addresses only the sidewalk and right-of-way of Halleck Street (the "Site"), also known as Hunts Point OU-3 (Figure 2). The purpose of this AAR is to identify an effective and implementable alternative that addresses the manufactured gas plant (MGP)-related impacts present at the Site.

Currently, the former Hunts Point Gas Works property is predominantly owned by the City of New York for use as the Hunts Point Food Distribution Center. The Site includes the street and sidewalk area of Halleck Street, is approximately 2,500 linear feet (ft) in length, and is owned by the City of New York.

Investigation activities previously conducted at the Site were carried out and completed pursuant to the terms of a Voluntary Cleanup Agreement (VCA) between Con Edison and the New York State Department of Environmental Conservation (NYSDEC). The Site transitioned from the VCA to an Order on Consent on July 25, 2018. A Site Characterization (SC) was performed in 2013, and a Site Characterization Report (SCR) for the Site was submitted to NYSDEC in July 2014 (Parsons, 2014). Data contained within the SCR provides the basis for the development of this AAR. This AAR has been prepared in accordance with the requirements set forth in *6 New York Codes, Rules and Regulations Part 375* (6 NYCRR 375) *Environmental Remediation Programs* (NYSDEC, 2006) and the NYSDEC's *Technical Guidance for Site Investigation and Remediation* (DER-10) (NYSDEC, 2010).

1.1 SITE DESCRIPTION AND HISTORY

Historical research was previously conducted and documented in the *Hunts Point Offsite Manufactured Gas Plant Site History Report, Bronx, New York* (Parsons, 2003). Based on this report, the former gas works was owned and/or operated as a MGP and gas holder station by Con Edison between 1926 and 1962. A large gas holder on the northern portion of the Hunts Point Gas Works was used until 1968, after which it was removed from service and demolished.

The City of New York acquired the majority of the former Hunts Point Gas Works property in the late 1960s. The property was then transitioned into warehouse space for a wholesale food cooperative. Reviews of historical aerial photos reveal that Halleck Street was not modified as part of redevelopment. It was extended to the south sometime after 1980 for use as an access road to the current Department of Corrections facility, located at the southwest portion of the Hunts Point Peninsula. The existing zone for the Site based on the New York City Planning Commission Zoning Maps 6c and 6d (Appendix A) is a manufacturing district.

The central portion of the Site is adjacent to Hunts Point Parcel A-2 (the A-2 site) which is in the New York State Brownfields Cleanup Program (BCP) as Site #C203094. The A-2 site contained MGP-related impacts in the form of visual coal tar and purifier waste (GEI, 2018). The

proposed remedy for the A-2 site included remedial excavations, installation of a reactive barrier, in-situ solidification, capping and institutional and engineering controls.

1.2 ALTERNATIVES ANALYSIS REPORT ORGANIZATION

This AAR has been organized in accordance with the *Technical Guidance for Site Investigation and Remediation* (NYSDEC, 2010) (DER-10) as follows:

Section	Purpose
Section 1 – Introduction	Provides definition of the Site, regulatory background, and history of Site use.
Section 2 – Site Investigation Summary	Provides a summary of physical Site conditions and a summary of the previous investigation performed at the Site.
Section 3 – Exposure Assessment	Summarizes exposure pathways as determined following Site investigation activities.
Section 4 – Remedial Goals, SCGs, and Remedial Action Objectives	Identifies remedial goals, standards, criteria, and guidelines, and remedial action objectives selected for the Site.
Section 5 – Description and Evaluation of Remedial Alternatives	Provides evaluation criteria and description of remedial alternatives developed for the Site.
Section 6 – Comparative Analysis of Remedial Alternatives	Provides comparison of each remedial alternative developed for the Site.
Section 7 – Conclusions and Preferred Remedy	Presents the preferred remedy for the Site, as determined based on the comparative analysis.
Section 8 – References	Provides relevant references.

SECTION 2

SITE INVESTIGATION SUMMARY

A SC was conducted at the Site in October and November 2013 to characterize MGP-related impacts to soil and groundwater. Figure 3 depicts the soil boring and monitoring well locations installed at the Site as part of this field effort. The collected data is presented in the SCR (Parsons, 2014) and a summary of the findings is presented in this section.

2.1 TOPOGRAPHY, GEOLOGY AND HYDROGEOLOGY

The 182-acre Former Hunts Point Gas Works is located on a peninsula at the confluence of the Bronx and East Rivers. Hunts Point is a generally flat-lying area near mean sea level, with little topographic relief. The Site is an approximately 2,500-foot linear stretch of Halleck Street, located on the western boundary of the Former Hunts Point Gas Works. The Site has minimal topographic relief, decreasing approximately 10 feet in elevation from the northern to southern boundaries.

The geology and subsurface conditions of the Hunts Point peninsula can vary depending upon the history of localized development. Prior to significant construction and development, Hunts Point was drained by small creeks which emptied to into the Bronx and East Rivers. Subsequent development filled and/or covered the creeks, however shallow groundwater movement may still be influenced by the former channels. Localized groundwater flow may also be influenced by pre-development stream deposits, sewer lines, and abandoned pipelines. Overall, groundwater flows to the south, towards the confluence of the Bronx and East Rivers (Hygienetics, 1997).

Three (3) groundwater monitoring wells were installed during SC field investigation activities. Monitoring wells were installed to depths ranging from 16 to 17 feet below ground surface (bgs), with screened intervals installed across the water table. Depth to groundwater was gauged in on-site groundwater monitoring wells during SC field investigation activities. Groundwater was encountered beneath the Site at 5.6 feet to 12.05 feet bgs and at elevations ranging from 1.56 feet above mean sea level (AMSL) at MW-3 (southern portion of the Site) to 5.09 feet AMSL at MW-2 (central portion of the Site). Groundwater elevations observed during SC activities are summarized on Table 1.

Subsurface geologic conditions at the Site were investigated during the SC field investigation activities, and a total of twelve (12) soil borings were advanced to depths ranging from 15 to 25 feet bgs. Soil borings advanced during the SC determined that the upper 5 to 18 feet contain fill materials (comprised of sand, gravel and cobble with trace amounts of brick, concrete, wood, silt and ash). The majority of fill material present at the Site is underlain by a clay layer with an observed thickness of 1 to 8 feet, the top of which was encountered at depths ranging from 11 to 17.5 feet bgs. Soil boring activities did not extend to materials underlying the clay layer. The northern portion of the Site contains sand deposits ranging from 6 to 13 feet in thickness, with an isolated peat deposit at the base of SB-1 at a depth of 18 feet bgs. Bedrock was not encountered during SC field activities. Soil boring logs generated during the Site Characterization were used to develop the representative cross section A-A' of the Site, as shown on Figure 4.

2.2 SOIL BORING RESULTS

A total of 30 soil samples (including applicable quality control samples) were collected during SC activities and analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), TCL semi-volatile organic compounds (SVOCs), Target Analyte List (TAL) metals, and cyanide. Soil sample analytical results are summarized in Table 2 and presented on Figures 5 and 6. Soil analytical results have been compared to the Unrestricted Soil Cleanup Objectives (USCOs) provided by NYSDEC in 6 NYCRR Part 375 (NYSDEC, 2006). The USCOs assume that there are no imposed restrictions on the use of the Site; however, the Site functions solely as a public sidewalk and right-of-way infrastructure. Therefore, a comparison of soil sample results to the USCOs is conservative.

Photo-ionization detector (PID) readings for soil samples collected during soil boring/monitoring well installations ranged from 0.0 to 1,260 parts per million (ppm) above background. The highest PID reading of 1,260 ppm was observed in soil boring SB-4 at a depth interval of 15 feet to 17 feet bgs, co-located with observations of non-aqueous phase liquid (NAPL). The NAPL-saturated soil was observed between approximately 11 and 17 feet bgs. Staining associated with NAPL was observed within the top 0.5 feet of the clay underlying the NAPL-saturated interval at depths ranging from 17 to 17.5 feet bgs. No NAPL or NAPL staining was observed in the clay from 17.5 bgs to the bottom of the soil boring at 20 feet bgs. PID readings in the remaining eleven (11) soil borings ranged from 0.0 to 10.7 ppm. NAPL was not observed in any location other than SB-4.

A total of sixteen (16) VOCs were detected in soil samples submitted for laboratory analysis. Of these, seven (7) VOCs (acetone, methylene chloride, benzene, ethylbenzene, toluene, m/p-xylene, and o-xylene) were detected at concentrations exceeding their respective USCOs. Acetone, which is considered a common laboratory contaminant, was detected above its USCO in four (4) soil samples [SB-6 (10-15 feet), SB-7 (8-10 feet), SB-8 (15-16 feet), and SB-9 (10-15 feet)]. The remaining six (6) VOCs (methylene chloride, benzene, ethylbenzene, toluene, m/p-xyelene, and o-xylene) were detected above their respective USCOs in only one (1) soil sample [SB-4 (15-17 feet)]. Total VOC concentrations in all soil samples ranged from non-detect to 1,277 ppm, with the maximum concentration observed in soil collected from SB-4 at a depth of 15 to 17 feet bgs. Total VOC concentrations in the remaining twenty-three (23) soil samples ranged from non-detect to 0.195 ppm.

Twenty-nine (29) individual SVOCs were detected in soil samples submitted for laboratory analysis. Of these, fourteen (14) polyaromatic hydrocarbons (PAHs) [acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, flourene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene] were detected at concentrations exceeding their respective USCOs in at least one soil sample. Total SVOC concentrations ranged from 0.44 to 4,635 ppm, with the maximum concentration observed in soil collected from SB-4 at a depth of 15 feet to 17 feet bgs. Total SVOC concentrations in the remaining twenty-three (23) soil samples ranged from 0.44 to 238 ppm. With the exception of SB-4, PAH concentrations detected in soil samples were below the 95th percentile of background soil concentrations detected within soils composed of urban fill material encountered within street excavations within New York City (RETEC, 2007). Overall,

SVOCs exceeding USCOs were detected at nine (9) soil borings: SB-2, SB-3, SB-4, SB-5, SB-6, SB-7, SB-8, SB-89, and SB-10.

A total of twenty-four (24) inorganic constituents were detected in soil samples submitted for laboratory analysis. Twelve (12) of the detected inorganic constituents exceeded their respective USCOs (arsenic, barium, cadmium, copper, chromium, lead, mercury, nickel, selenium, silver, zinc, and cyanide).

2.3 GROUNDWATER SAMPLE RESULTS

A total of four (4) groundwater samples (including applicable quality control samples) were collected in November 2013 as part of SC field investigation activities. Groundwater samples were analyzed for TCL VOCs, TCL SVOCs, TAL metals, and total cyanide. The analytical results for groundwater samples are summarized on Table 3 and Figure 7. For evaluation purposes, analytical results were compared with ambient water quality standards (AWQS) and guidance values contained in NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 (NYSDEC, 1998).

During groundwater sampling activities, each monitoring well was monitored for the presence of NAPL. No NAPL or sheens were observed in any of the wells. Visual descriptions and observations made during the groundwater sampling activities were recorded on groundwater sampling logs, and are included as an attachment to the SCR.

Only one (1) VOC was detected in groundwater samples submitted for laboratory analysis. Methyl tert-butyl ether, which is not a MGP-related compound, was detected below its guidance value in two (2) groundwater samples.

Only one (1) SVOC was detected in groundwater samples submitted for laboratory analysis. Dimethyl phthalate, which is considered a laboratory contaminant, was detected at a concentration below its guidance value in one (1) sample. Seventeen (17) inorganic constituents (aluminum, arsenic, barium, cadmium, calcium, total chromium, iron, lead, magnesium, manganese, nickel, potassium, selenium, sodium, thallium, zinc, and cyanide) were detected in groundwater samples. Of these, eight (8) (barium, iron, lead, magnesium, manganese, sodium, thallium, and cyanide) were detected at concentrations exceeding their respective AWQS and guidance values.

2.4 VISUAL NAPL OBSERVATIONS

During SC soil boring and monitoring well installation activities, boring materials were logged for physical characteristics (e.g., soil type, color, texture, moisture content, etc.), along with physical evidence of any impacted material (e.g., oil-like or tar-like NAPL, staining, sheens, odors, etc). NAPL was observed in soil boring SB-4 from approximately 11 feet to 17 feet bgs. NAPL was not observed in any of the other soil borings. A sample of soil containing NAPL from soil boring SB-4 was collected and submitted to META Environmental, Inc. of Watertown, MA for forensic hydrocarbon fingerprint analysis. The fingerprinting sample was analyzed by Gas Chromatography – Flame Ionization Detector (GC/FID) (EPA 8100M) for fingerprinting and by Chromatography Mass Spectrometry in the Selected Ion Monitoring Mode (GC/MS/SIM) (EPA 8270M) for mono- and polycyclic aromatic hydrocarbons (MAHs and PAHs), alkyl PAH homologues and other selected compounds. Laboratory results indicate that the sample from SB-4 (15-17 feet) contained pyrogenic material and exhibited fluoranthene to pyrene ratios indicative

of tars formed from MGPs utilizing carbureted water gas processes. No additional NAPL was observed in any other soil boring, including the seven (7) soil borings installed to the south of SB-4 in the Site's inferred downgradient groundwater flow direction.

SECTION 3

EXPOSURE ASSESSMENT

The information collected during SC field investigation activities has been used to qualitatively assess potential exposure pathways for the constituents detected at the Site.

Analytical results from soil samples collected during SC activities indicate the presence of possible MGP-related constituents in the soil, primarily at the SB-4 soil boring sample location where MGP-related NAPL was detected. VOCs, PAHs, and inorganic constituents were detected at concentrations exceeding their respective USCOs at the Site in soil ranging from 5 feet to 20 feet bgs. No MGP-related impacts were noted in the top 5 feet of soil.

Groundwater analytical results indicated the presence of inorganic constituents in Site groundwater above their respective AWQS and guidance values. No VOCs or SVOCs, potentially associated with MGP-related impacts, were detected in exceedance of AWQS and GVs in any groundwater sample collected during SC activities.

Based on the results of the SC, the primary contaminants of concern identified by NYSDEC for the Site include PAHs (benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene), and inorganics, namely arsenic, lead, mercury, and cyanide.

The Site is located in a highly urbanized area, zoned for manufacturing purposes, and is currently utilized as a public street and sidewalk area. Therefore, the Site is covered with concrete or asphalt pavement with the exception of limited landscaped areas. Impacted soils on the Site therefore would only be encountered during future intrusive maintenance activities below five (5) feet (e.g., repair of underground utilities); however, it is unlikely that these materials would be encountered during day-to-day activities.

Groundwater at the Site is currently not used for a potable water source, and there are no plans for future use of potable or commercial/industrial groundwater at the Site. The depth to groundwater at the Site is approximately 5 feet to 12 feet bgs. Based on this, there is a limited potential for exposure to groundwater during intrusive subsurface activities at depths of less than 5 feet (e.g., repair of underground utilities) at the Site. Surface water and sediment are not present at the Site.

SECTION 4

REMEDIAL GOALS, SCGS, AND REMEDIAL ACTION OBJECTIVES

4.1 REMEDIAL GOAL

The remedial goal for the Site is to ensure that MGP-related contamination does not present a threat to human health or the environment considering the manner in which the Site is utilized. The goal will be achieved by putting into place a plan to prevent uncontrolled exposure to MGP-impacted soil.

4.2 APPLICABLE STANDARDS, CRITERIA AND GUIDANCE VALUES

NYSDEC *DER-10* includes a complete list of Standards, Criteria and Guidance Values (SCGs). The SCGs for soil and groundwater include the 6 NYCRR Part 375-6 RSCOs for unrestricted use and the NYSDEC *Division of Water Technical and Operational Guidance Series - Water Quality Standards* (*WQS*) - *6 NYCRR 700 to 706* (NYSDEC, 1998). The SCGs for soil and groundwater include the 6 NYCRR Part 375-6 Soil Cleanup Objectives (SCOs) for unrestricted use and protection of groundwater and the NYSDEC *Division of Water Technical and Operational Guidance Series - Water Quality Standards* (*WQS*) – *6 NYCRR 700 to 706* (NYSDEC, 1998) for the Site. The above SCGs represent available criteria and guidance used by the NYSDEC to evaluate soil and groundwater quality. It should be noted, however, that neither the 375-6 SCOs or WQS are directly applicable to the Site groundwater because the local groundwater is not used as a drinking water source, nor will it likely be used in the future due to New York City laws. The 6 NYCRR Part 375-6 SCOs and WQS are provided as SCGs for comparison purposes only.

4.3 REMEDIAL ACTION OBJECTIVES

Remedial Action Objectives (RAOs) are medium-specific objectives which achieve protection of public health and the environment. RAOs were established based on contaminated media, identified contaminants of concern, SCGs, and results of the exposure assessment. SCGs are promulgated requirements and non-promulgated guidance which guide site activities during investigation and remediation. The standards and criteria are set forth in Federal or New York State law and they are either directly applicable or relevant and appropriate to a contaminant, remedial action, location, or other circumstance. Guidance includes non-promulgated criteria which should be considered, for investigation and/or remediation. A series of generic RAOs are identified on the NYSDEC website for use dependent upon site specific conditions, as follows:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation exposure to contaminants volatilizing from soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater contamination.

Groundwater

RAOs for Public Health Protection

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of volatiles, from contaminated groundwater.

RAOs for Environmental Protection

- Restore groundwater aquifer to pre-disposal/pre-release conditions, to the extent practicable.
- Prevent the discharge of contaminants to surface water.
- Remove the source of groundwater or surface water contamination.

Soil Vapor

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at the Site.

After evaluating the nature and extent of contamination, NYSDEC has identified the following Site-specific RAOs:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

SECTION 5

DEVELOPMENT AND EVALUATION OF REMEDIAL ALTERNATIVES

This section describes the remedial action alternatives for the Site and evaluates them against criterion included in DER-10.

5.1 PRELIMINARY SCREENING OF REMEDIAL ALTERNATIVES

As part of the remedial action selection process for the Site, a preliminary screening was performed to reduce the number of remedial technologies potentially applicable with respect to technical implementability. Technical implementability was determined by using the known Site conditions and investigation results to screen out technologies that cannot be effectively implemented at the Site.

The results of the preliminary screening for remedial technologies to address MGP-related impacts at the Site are presented on Table 4. Following preliminary screening, a summary of Site-specific remedial alternatives was developed for submittal to NYSDEC and was subsequently approved on August 27, 2019. The remedial alternatives summary is presented on Table 5. Based on preliminary screening, the types of remedial technologies listed below were identified as applicable technologies to retain for further evaluation:

- Institutional controls and engineering controls (ICs/ECs);
- *In-situ* stabilization and solidification (ISS) of MGP-impacted soils, and
- Excavation and off-site disposal and treatment of MGP-impacted soils.

The identification of alternatives using retained remedial technologies took into consideration the limitations posed by Site conditions, property access and the practical use of equipment. Based upon Site investigations, only isolated NAPL was observed in soil boring SB-4, and not in any of the other soil borings. Additionally, MGP-related impacts above their respective SCOs were detected below surficial soils at deeper than five feet bgs and NAPL was encountered between 11 and 17 feet of depth.

5.2 DEVELOPMENT OF REMEDIAL ALTERNATIVES

The Site is located within a public sidewalk area and active right-of-way and is essentially surrounded by off-site properties. In addition, the active right-of-way contains subsurface utilities and is heavily used by local commercial businesses resulting in space constraints. While considering the above Site challenges and risks, Con Edison has evaluated the following four remedial alternatives consistent with Table 5:

- Alternative 1 – No Action.
- Alternative 2 – Institutional and Engineering Controls.
- Alternative 3A – *In-Situ* Stabilization/Solidification of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 3B – Excavation of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 4 – Removal of Delineated MGP-impacted Site Soils Above USCOs.

5.3 EVALUATION CRITERIA

In accordance with 6 NYCRR 375-1.8(f) and in conjunction with the additional guidance provided in DER-10 subsection 4.2 (b) through (j), the remedial alternatives identified above are evaluated in subsequent sections with respect to the following nine evaluation criteria:

1. Overall protection of public health and the environment
2. Compliance with remedial goals, RAOs, and applicable SCGs
3. Long-term effectiveness and permanence
4. Reduction of toxicity, mobility or volume
5. Short-term impacts and effectiveness
6. Implementability
7. Cost-effectiveness
8. Land Use
9. Community Acceptance

5.3.1 Overall Protection of Public Health and the Environment

This threshold criterion is an assessment of whether the remedial alternative meets requirements that are protective of human health and the environment. Overall protection of human health and the environment considers how the proposed remedial alternative prevents or mitigates potential risks. This evaluation also considers the ability of the remedial alternative to meet the RAOs.

5.3.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

As per 6 NYCRR Part 375 and DER-10 subsection 4.2(c), this threshold criterion conforms to officially promulgated standards and criteria that are either directly applicable, or that are not directly applicable but are relevant and appropriate, unless good cause exists why conformity should be dispensed with.

Such good cause is defined in both 6 NYCRR Part 375 and DER-10. DER-10 subsection 4.2(c) specifically states that good cause exists if any of the following are present:

- The proposed action is only part of a complete program or project that will, as a whole, conform to such standard or criterion upon completion;
- Conformity to such standard or criterion will result in greater risk to the public health and the environment than alternatives;
- Conformity to such standard or criterion is technically impracticable from an engineering or scientific perspective; or
- The program or project will attain a level of performance that is equivalent to that required by the standard or criterion through the use of another method or approach.

The RAO for the Site, detailed in Section 4.3, was identified based upon the SCGs applicable to the current, intended, and reasonably anticipated future use of the Site.

Included in 6 NYCRR Part 375 are SCOs that are chemical-specific SCGs and are based on current Site use and zoning. As such, they are appropriate and relevant to the Site. The soil analytical data collected during SC activities were compared to SCOs for unrestricted use. However, this comparison is conservative given that the Site is used for commercial purposes.

Chemical-specific SCGs appropriate for comparison to groundwater analytical data collected at the Site are presented in 6 NYCRR Parts 700 to 706 and in TOGs. However, these criteria are conservative as local groundwater is not used as a drinking water source, nor will it likely be used as such in the future.

5.3.3 Long-Term Effectiveness and Permanence

This criterion addresses the performance of a remedial alternative in terms of its permanence and the quantity/nature of waste or residuals remaining at the Site after implementation. An evaluation is made on the extent and effectiveness of controls required to manage residuals remaining at the Site and engineering and institutional controls necessary for the remedy to remain effective. The factors that are evaluated include permanence of the remedial alternative, magnitude of the remaining risk, adequacy of controls used to manage residual contamination, and the reliability of controls used to manage residual contamination.

5.3.4 Reduction of Toxicity, Mobility or Volume

This criterion assesses the remedial alternative's use of technologies that permanently and significantly reduce toxicity, mobility, or volume of the contamination as their principal element to the extent possible. Preference is given to remedies that permanently or significantly reduce the toxicity, mobility, or volume of the contamination at the Site.

5.3.5 Short-Term Impacts and Effectiveness

This criterion assesses the effects of the remedial alternative during the construction and implementation phase with respect to the effect on human health and the environment. The factors that are assessed include protection of the workers and the community at the Site and adjacent properties during the implementation of the remedial action, environmental impacts that result from the remedial action and the time required until the RAO is achieved.

5.3.6 Implementability

This criterion addresses the technical and administrative feasibility of implementing the remedial alternative and the availability of various services and materials required during implementation of the remedial action for the Site. The evaluation includes the feasibility of construction and operation, the reliability of the technology, the ease of undertaking additional remedial action, monitoring considerations, activities needed to coordinate with regulatory agencies, availability of adequate equipment, services and materials, off-site treatment, impacts to nearby utilities and structures, and storage and disposal services.

5.3.7 Cost-effectiveness

This criterion is an evaluation of the overall cost effectiveness of the remedial alternative. Cost estimates associated with alternatives include direct capital costs (e.g., equipment, labor and materials), indirect capital costs (e.g., permitting, engineering and design and contingencies), and costs associated with operation and maintenance (e.g., Site cover inspections). Total costs for a

remedial alternative are developed based on a 30-year present worth analysis of operation and maintenance, and the combined direct and indirection capital costs.

5.3.8 Land Use

This criterion addresses the current, intended, and reasonably anticipated future land use of the Site. 6 NYCRR 375 subchapter 1.8(f)9 requires that land use criterion be considered.

5.3.9 Community Acceptance

Concerns of the state and the community will be addressed separately in accordance with a Citizen Participation Plan (CPP) and requirements outlined in DER-10's citizen participation section. This criterion is evaluated, after the public review of the remedy selection process, as part of the final NYSDEC selection/approval of a remedy for the Site.

5.4 ALTERNATIVE 1 – NO ACTION

No action would be taken under this alternative to remediate MGP-related impacts. The "No Action" alternative serves as a baseline for comparison of overall effectiveness to other remedial alternatives.

5.4.1 Overall Protection of Public Health and the Environment

This alternative would not remove MGP or non-MGP impacted soils from the Site. Although there is no current pathway for exposure to impacted soils or groundwater during day-to-day operations, non-routine activities (e.g., intrusive activities associated with new construction or maintenance of an underground utility or structure) or a change in Site use could create an exposure pathway and potential unacceptable risks.

5.4.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals, RAO specified for the development of this AAR, and applicable SCGs would not be met under this alternative.

5.4.3 Long-Term Effectiveness and Permanence

This alternative would not be sufficient as an effective long-term remedy, as no remedial action would be performed.

5.4.4 Reduction of Toxicity, Mobility or Volume

This alternative does not address toxicity, mobility, or volume of MGP-related impacts to Site soils, and would not meet the remedial goal or RAO specified for the Site.

5.4.5 Short-Term Impacts and Effectiveness

No short-term impacts are introduced with this alternative, as no remedial action would be performed.

5.4.6 Implementability

This alternative does not require the implementation of any remedial activities and is therefore technically and administratively implementable.

5.4.7 Cost-effectiveness

There would be no costs associated with this alternative.

5.4.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.5 ALTERNATIVE 2 – INSTITUTIONAL AND ENGINEERING CONTROLS

This remedial alternative would consist of the development and implementation of a long-term inspection and monitoring program, engineering controls and institutional controls to avoid the creation of a completed exposure pathway.

This remedial alternative would involve the following major components:

- Engineering controls – The existing pavement, sidewalks and vegetative areas will serve as the cover system. The majority of the Site's existing cover consists of pavement and sidewalks with a few vegetative areas (e.g., around planted trees), and
- Institutional controls – The institutional controls may be in the form of a deed restriction that: (i) requires the remedial party or Site owner to complete and submit to the NYSDEC a periodic certification of the institutional and engineering controls in accordance with Part 375-1.8(h)(3); (ii) allows the use and development of the property for commercial and industrial uses as defined by Part 375-1.8(g), although land use is subject to local zoning laws; and (iii) requires compliance with the NYSDEC-approved Site Management Plan.

This alternative would utilize the existing cover system at the Site, and include land use restrictions through an environmental easement, enforcement and permit controls, annual monitoring of Site conditions, and informational devices.

Since this remedial alternative does not address Site soils that exceed USCOs, institutional controls and engineering controls will be the primary function of the remedial alternative to manage the long-term effectiveness for the remedy. To facilitate these institutional and engineering controls, a Site Management Plan (SMP) would be developed. The SMP will identify the implementation procedures required for institutional and engineering controls at the Site.

The purpose of the SMP is to provide:

- A description of the institutional and engineering controls for the Site;
- The basic operation and intended role of each implemented institutional and engineering control;
- A description of the features that should be evaluated during each periodic inspection and compliance certification period;
- A description of plans and procedures to be followed for implementation of institutional and engineering controls, such as the implementation of an Excavation Plan for the safe handling of MGP-impacted soils that may be present at depths greater than five (5) feet bgs that could be exposed during maintenance, redevelopment or subsurface utility repair/relocation;

- Any other provisions necessary to identify or establish methods for implementing the institutional and engineering controls required by the selected remedy, as determined by the NYSDEC, and
- A description of the reporting requirements for these controls.

The SMP will be developed for the boundaries of the Site shown on Figure 2. At a minimum, the SMP will include following items:

- The notification requirements for future soil disturbance activities that will encounter MGP-impacted materials that may be present at depths greater than five (5) feet bgs including subsurface utility line repair/relocation and new construction;
- Soil Excavation and Handling Plan;
- A flow chart showing guidelines for intrusive activities;
- Requirements for evaluation of the need for additional investigation or further delineation based on accessibility due to new site construction or changes in site use, and
- Requirements for annual inspections and certifications in accordance with DER-10.

In accordance with DER-10 Section 6.3 and 6 NYCRR Part 375-1.8(h)(3), a Periodic Review Report (PRR) will be submitted to the NYSDEC to document the efficacy of the institutional controls described in the SMP. The PRR will be signed by a professional engineer or other qualified environmental professional. If changes are noted, the PRR will include documentation explaining why the certification cannot be rendered and a statement of proposed corrective measures with a proposed schedule for implementing the corrective action.

5.5.1 Overall Protection of Public Health and the Environment

Although there is no current pathway for exposure to impacted soils or groundwater during day-to-day operations, non-routine activities (e.g., intrusive activities associated with new construction or maintenance of an underground utility or structure) or a change in Site use could create an exposure pathway and potential unacceptable risks. Therefore, in accordance with DER-10 and to protect public health and the environment, institutional and engineering controls will be established to mitigate risks associated with these soils and groundwater. Such controls would be facilitated by the development of an SMP which would identify the implementation procedures required for institutional and engineering controls at the Site. Assuming this is the case, this alternative would be protective of human health. However, MGP-impacted material would be left on-site which has the potential to adversely impact the environment. Based on data collected to date, the MGP-impacted material is not creating adverse impacts.

5.5.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.5.3 Long-Term Effectiveness and Permanence

The long-term effectiveness of the remedy would be reliant on institutional and engineering controls. Annual inspections of the cover system would be required to ensure it continues to prevent direct contact and exposure to MGP-related impacts during day to day use of the Site. In the event of intrusive activities that extend to depths that would come in contact with MGP-impacted materials, a SMP will be utilized in order for work to be carried out in controlled manner. As long as the institutional and engineering controls are maintained, the remedial alternative would be effective long term.

5.5.4 Reduction of Toxicity, Mobility or Volume

Since the proposed remedial alternative does not involve intrusive activities, and instead utilizes the current asphalt, concrete and existing cover at the Site, there is no immediate reduction in the toxicity, mobility, or volume of MGP-impacted materials.

5.5.5 Short-Term Impacts and Effectiveness

No short-term risks are introduced with the implementation of this remedial alternative as it does not include construction activities that would adversely impact local businesses and the community. Property owners would be required to adhere to institutional controls and land use agreements.

5.5.6 Implementability

Considering a cover system is already in place at the Site, there are no challenges associated with utilizing the cover system. The engineering and institutional controls associated with SMP, as well as necessary coordination with the City of New York, have been implemented successfully on similar sites.

5.5.7 Cost-effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $1,162,000. Capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.5.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.6 ALTERNATIVE 3A – IN-SITU STABILIZATION OF NAPL-IMPACTED MATERIAL IN THE VICINITY OF SOIL BORING SB-4

This remedial alternative would involve the following major components:

- Removal and disposal of surface material in the vicinity of SB-4 to the extent necessary to allow for swelling associated with *In-Situ* Stabilization/Solidification (ISS) reagent;
- ISS of NAPL-impacted soils in the vicinity of SB-4, and
- Establishment of institutional and engineering controls for remaining Site contamination.

Implementation of ISS within the vicinity of SB-4 would involve the mixing of NAPL-impacted material to the underlying clay layer, with mixing continuing approximately 2 feet into the clay. The mixing depth in the area is estimated to be 19 feet bgs. The lateral extents of NAPL present within the subsurface have not been determined, and therefore the potential volume of impacted soil subject to ISS is unknown. Potential preliminary ISS boundaries are depicted on Figure 8.

Prior to the implementation of ISS, shallow subsurface obstructions and utilities would need to be addressed. As the Site is located within a sidewalk area and public right-of-way, underground utilities are present near or within the proposed ISS area. A detailed utility survey would need to be performed to determine the exact locations of subsurface utilities (either active or inactive) that are present near or within the proposed ISS area, and measures taken to address these utilities (e.g., removal, permanent relocation, or temporary re-routing).

Volume expansion occurs during the implementation of ISS due to swelling of the reagent. Some surface soils would require removal to maintain the current grade elevation subsequent to ISS treatment. The bulking factor of the ISS reagent is typically 20 to 30 percent and would be more accurately estimated for the Site during a treatability study. Removal of surface material would proceed to the depth necessary to account for swelling, or one foot above the water table (to provide adequate ground support for mixing equipment), whichever is shallower. Additional material, grout, or soil cuttings brought to the surface during mixing would require handling and off-site treatment/disposal. This material could also be sampled, analyzed, and re-used on-site below the Site cover and demarcation layer, provided it is below applicable SCOs.

Performance goals for ISS are determined during the remedial design based on the results of a treatability test. The effectiveness of ISS implementation is measured after the solidified material has cured. Post cure samples are collected and tested for a number of various physical and chemical tests, most commonly the permeability and unconfined compressive strength (UCS).

Treatability testing is typically required to determine the best Site-specific reagent addition. Cement-based mix designs are most commonly used for ISS application, however a variety of additives such as fly ash, hydrated lime, and bentonite can also be used to meet specific project requirements. Results from the treatability study generate bulking (volume expansion), unconfined compressive strength, permeability, and leachability of the solidified material. In addition, the potential volatilization and release of impacts during soil mixing, heat of hydration and curing can be evaluated during the treatability study.

Following implementation of ISS, a demarcation layer and cap will be installed over the treated area. The cap design will be consistent with the future use plans for the Site. The purpose of the cap is to minimize groundwater infiltration and potential disturbance of the solidified/stabilized materials.

This alternative would also require the implementation of institutional and engineering controls for remaining contamination at the Site. As previously mentioned, the Site is currently covered with either concrete or asphalt pavement, and only soil for surface landscaping is exposed. Portions of the Site subject to remedial action would likely be restored in kind. The cover system would remain intact in portions of the Site in which no intrusive remedial activities are conducted. As per DER-10, a SMP (as detailed in Section 5.5) would be prepared to specify the methods

necessary to ensure compliance with the institutional and engineering controls for the Site. This would include inspections to verify the Site use has not changed and that the potential for direct contact with the remaining contamination has not been created.

5.6.1 Overall Protection of Public Health and the Environment

Alternative 3A is protective of human health and the environment through the solidification/stabilization of NAPL-impacted soil, the maintenance of a cover system across the Site, the implementation of institutional and engineering controls to address contaminated soils remaining at the Site.

5.6.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through the implementation of ISS within the vicinity of SB-4, maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed following implementation of the remedial action, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.6.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. No direct exposure pathways would exist due to the presence of a cover system across the Site. In addition, the institutional controls, including the SMP, would prevent exposure to the ISS monolith and any remaining contamination that is present on Site (e.g., the remaining portions of the Halleck Street area).

5.6.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would treat and solidify approximately 4,400 cubic yards of NAPL-impacted soils in the area depicted on Figure 8, which would reduce the toxicity and mobility of MGP-related constituents in the subsurface at the Site.

5.6.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that approximately 200 truckloads of material would be transported from the Site as a result of pre-excavation clearances as well as removal of swell associated with ISS. An additionally estimated 100 truckloads of material would be transported to the Site for receiving reagent, backfilling, and placement of the final surface cover. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

The potential exists for adverse impacts to adjacent utilities and the roadway due injected reagents and vibration from construction activities.

It is expected that approximately one month would be required to implement this remedial alternative. During this time, access to the eastern portion of the sidewalk area and the eastern

portion of the Halleck Street right-of-way in the vicinity of the remedial area would be restricted. This alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

The effectiveness of this remedy will be dependent on the extent of NAPL-impacted soils in proximity of SB-4. Should NAPL-impacted soils extend beyond the Site boundaries or further into Halleck Street, this alternative would not be effective in treating all NAPL-impacted soils. Additionally, there is a potential for off-site migration of ISS reagents, if pressurized technologies (e.g., jet grouting) are used.

5.6.6 Implementability

The ISS technology has been implemented on several former MGP sites located in New York State, including the New York City area. However, this alternative is not readily implementable at this Site. The challenges associated with the implementability of ISS techniques are primarily associated with the potential presence of subsurface obstructions and adjacent utilities. As discussed above, the nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the implementation of ISS. In addition, buried utilities are present within or adjacent to the ISS target area. A subsurface utility survey would need to be conducted to determine if utilities are present, and if so, whether they can be temporarily or permanently re-routed. The presence of subsurface utilities and non-uniform subsurface materials (fill) may prevent ISS reagents from reaching targeted areas when utilizing certain ISS methods (e.g., jet grouting) due to the presence of preferential pathways. Once subsurface obstructions and utilities are addressed, mixing of subsurface materials and reagents is expected to be consistent and acceptable.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and aquifer properties. A pre-design investigation (PDI) would need to be conducted to delineate the nature and extent of the NAPL present within the vicinity of SB-4. A treatability study would be conducted in order to develop the necessary reagent mixture to be used at the Site. In addition, the potential presence of purifier waste and the effect of ISS reagent materials on cyanide bound to Site soils will need to be evaluated.

5.6.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $5,571,000. The primary capital costs associated with this alternative are the handling and transportation of material excavated to account for reagent swell, purchase, transport and installation of backfill and cap material, ISS reagent, and mobilization and setup. The primary indirect capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.6.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.7 ALTERNATIVE 3B – EXCAVATION OF NAPL-IMPACTED MATERIAL IN THE VICINITY OF SB-4

This remedial alternative would involve the following major components:

- Removal and disposal of MGP-impacted soils containing NAPL to a depth of approximately 19 feet bgs in the vicinity of SB-4;
- Backfilling of excavation area with certified clean material and Site restoration, and
- Establishment of institutional and engineering controls for remaining Site contamination.

Based on the SC investigation conducted at the Site, the estimated conceptual remediation area for MGP-impacted soils containing NAPL is depicted on Figure 8. A conceptual depth of 19 feet bgs has been selected based on observations during SC activities. Prior to the initiation of remedial activities, a PDI would need to be performed in order to distinguish the geotechnical properties of the proposed remediation area, and to further delineate subsurface NAPL in the vicinity of SB-4.

In order to remove NAPL-impacted materials to a depth of 19 feet bgs, excavation shoring/bracing systems would be installed around the perimeter of the remediation area, which would be determined based on the results of a PDI program. Furthermore, additional data collected during the PDI would be utilized to determine the type of shoring system that would be feasible at the Site. The potential presence of significant obstructions in the subsurface may dictate the use of soldier pile and lagging systems. This process involves drilling through obstructions in the subsurface to install soldier piles, followed by excavation to install the lagging as the excavation progresses.

As with Alternative 3A, the presence of public right-of-ways (Halleck Street and the sidewalk areas), as well as underground utilities in the vicinity of the SB-4 excavation area are expected to pose a challenge during the implementation of this remedy and will require further evaluation. Shored excavations have the potential to cause ground movements which could potentially be damaging to the adjacent roadway and underground utilities. A utility study would need to be performed and a determination would be made as to whether or not they could be supported. Underground utilities that could not be supported would need to be permanently or temporarily relocated. In addition, excavations within the public right-of-ways would require approval from the City of New York to open the roadway, as well as re-routing of vehicular and pedestrian traffic on Halleck Street.

Since the remedial excavation depths would extend below the Site's water table, a temporary dewatering system would be required, and generated construction water would require either on-site treatment or off-site disposal for this alternative. If a permeable shoring system such as soldier pile and lagging were utilized dewatering would need to be continuous, and the volume of water removed could be significant. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. If groundwater is treated on-site

through the duration of excavation activities, permitting would be required in order to discharge to storm and/or sanitary sewers.

This alternative would also require the implementation of institutional and engineering controls for remaining contamination at the Site. As previously mentioned, the Site is currently covered with either concrete or asphalt pavement and only limited surface soil for landscaping purposes. Portions of the Site subject to remedial action would likely be restored in kind. The cover system would remain intact in portions of the Site in which no intrusive remedial activities are conducted. As per DER-10, a SMP (as detailed in Section 5.5) would be prepared to specify the methods necessary to ensure compliance with the institutional and engineering controls for the Site. This would include inspections to verify the Site use has not changed and that the potential for direct contact with the remaining contamination has not been created.

5.7.1 Overall Protection of Public Health and the Environment

Alternative 3B is protective of human health and the environment through the removal of NAPL-impacted soils, the maintenance of the cover system across the remaining portion of the Site, and the implementation of institutional and engineering controls to address remaining MGP-impacted soils at the Site.

5.7.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through the excavation of MGP-related source material within the vicinity of SB-4, maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed following implementation of the remedial action, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.7.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. MGP-related source material would be removed from within the vicinity of SB-4. No direct exposure pathways would exist due to the presence of a cover system across the remaining portions of the Site. In addition, the institutional controls, including the SMP, would prevent exposure to the any remaining MGP-impacted materials that may be present on Site.

5.7.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would remove MGP-related source material from the area in the vicinity of SB-4, which would reduce the overall volume of MGP-impacted materials at the Site.

5.7.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that 410 truckloads of material would be transported from the Site as a result of excavation activities, and an additional 410 truckloads of

material would be transported to the Site for backfilling and surface repairs. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

Remedial action in the vicinity of SB-4 involving excavations would require the closure of portions of Halleck Street and adjacent sidewalk areas, with each requiring re-routing. Underground utilities in the vicinity of the excavation area requiring relocation would potentially result in service interruption during relocation. Excavation and dewatering activities would be required under this alternative. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. Discharge of treated construction water could potentially result in flooding of storm and sanitary sewers if discharged during periods of elevated flow rates (e.g., storm events).

The potential exists for adverse impacts to adjacent utilities and the roadway due to dewatering of Site soils and vibration from construction activities.

It is expected that approximately six to eight weeks would be required to implement this remedial alternative. During this time, access to the eastern portion of the sidewalk area and the eastern portion of the Halleck Street right-of-way in the vicinity of the remedial area would be restricted. This alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

The effectiveness of this remedy will be dependent on the extent of NAPL-impacted soils in proximity to SB-4. Should NAPL-impacted soils extend beyond the Site boundaries or further into Halleck Street, this alternative may not be effective in treating all NAPL-impacted soils in proximity to SB-4. In addition, the potential exists for certified clean material brought on-site to backfill the excavation to potentially become contaminated by adjacent MGP-related impacts.

5.7.6 Implementability

The challenges associated with the implementability of this alternative at the Site are primarily associated excavation dewatering, the potential presence of subsurface obstructions, and the location within and adjacent to public right-of-ways, and overall this alternative is not readily implementable at this Site. As the excavation would extend to depths beneath the water table, the volume of water that would require removal, treatment, and discharge is anticipated to be significant. The nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the design of the shoring system and implementation of the excavation. In addition, a subsurface utility survey would need to be conducted to determine the locations of nearby utilities and whether they can be temporarily or permanently re-routed.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and

aquifer properties. A PDI would need to be conducted to delineate the nature and extent of the NAPL present within the vicinity of SB-4.

5.7.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $5,331,000. The primary capital costs associated with this alternative are the excavation shoring and bracing systems, temporary dewatering and treatment systems, transportation and disposal of impacted materials, and purchase, transport and installation of backfill material. The primary indirect capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.7.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.8 ALTERNATIVE 4 – REMOVAL OF DELINEATED MGP-IMPACTED SITE SOILS ABOVE USCOS

This remedial alternative would involve the following major components:

- Removal and disposal of MGP-impacted soils observed in exceedance of USCOs, and
- Backfilling of excavation area with certified clean material and Site restoration.

Under this alternative, all Site soils in exceedance of applicable USCOs based on the SC investigation results would be excavated and transported off-site for disposal. Based on the SC investigation conducted at the Site, the estimated conceptual remediation areas for MGP-impacted soils are depicted on Figure 9. Excavation depths would range from 12 to 19 feet bgs. Prior to the initiation of remedial activities, a PDI would need to be performed in order to distinguish the geotechnical properties of the proposed remediation area, and to further delineate the nature and extent of MGP-related impacts to soils resulting in exceedances of USCOs.

Excavation under this alternative would likely be implemented via a series of separate excavations to various target depths, dependent upon the depth to clay, and the depth of MGP-related impacts within a given area. Significant excavation shoring/bracing systems would be installed around the perimeter of each excavation within the remediation area, as determined by the results of the PDI. While PDI data would be utilized to determine the type of shoring system utilized, it is assumed that extensive subsurface obstructions are present across the entire Site, and therefore soldier pile and lagging systems would likely be utilized within each excavation area. As such, a dewatering system and water treatment system, as well as necessary discharge permitting, would be required under this alternative. As the portions of the Site in which remedial excavations would be implemented occupies approximately 1,700 linear feet along Halleck Street, significant infrastructure pertaining to any dewatering and treatment system would be required. Following implementation, each excavation would be backfilled with certified clean material, and the Site surfaces would be restored in-kind.

5.8.1 Overall Protection of Public Health and the Environment

This alternative is protective of human health and the environment through the removal of MGP-impacted soils where exceedances of USCOs are observed.

5.8.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals, RAO specified for the development of this AAR, and applicable SCGs would be met under this alternative. The RAO would be met through the excavation of MGP-impacted soils throughout the Site.

5.8.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. Delineated MGP-related source material and other MGP-impacted soils would be removed from the Site. No direct exposure pathways would exist due to the presence of a cover system across the remaining portions of the Site.

5.8.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would remove delineated MGP-related source material and MGP-impacted soils throughout the Site, greatly reducing the volume of MGP-related impacts. Therefore, there would be an immediate and significant reduction in the toxicity and mobility of MGP-related impacts.

5.8.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that 2,600 truckloads of material would be transported from the Site as a result of excavation activities, and an additional 2,600 truckloads of material would be transported to the Site for backfilling and surface repairs. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

Excavations along Halleck Street would require the closure of portions of the right-of-way and adjacent sidewalk areas, with each requiring re-routing. Buried utilities in the vicinity of the excavation area requiring relocation would potentially result in service interruption during relocation. Excavation and dewatering activities would be required under this alternative. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. Discharge of treated construction water could potentially result in flooding of storm and sanitary sewers if discharged during periods of elevated flow rates (e.g., storm events).

The potential exists for adverse impacts to adjacent utilities, buildings, and the roadway due to dewatering of Site soils and vibration from construction activities.

It is expected that approximately 22 to 26 months would be required to implement this remedial alternative. During this time, access to the portions of the sidewalk area and the portions of the Halleck Street right-of-way in the vicinity of the active excavations would be restricted. However, excavations would likely be sequenced, and therefore disruptions and closures would be isolated to specific areas during implementation. Overall, this alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

5.8.6 Implementability

The challenges associated with the implementability of this alternative are primarily associated with excavation dewatering, the potential presence of subsurface obstructions, subsurface utilities and traffic within to public right-of-ways, and overall this alternative is not readily implementable at this Site. As the excavation would extend to depths beneath the water table, the volume of water that would require removal, treatment, and discharge is anticipated to be highly significant. The nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the design of the shoring system and implementation of the excavation. In addition, underground utilities are present within or adjacent to the remedial excavation areas. Therefore, a subsurface utility survey would need to be conducted to determine the locations of nearby utilities and whether they can be temporarily or permanently re-routed.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation and PDI would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and aquifer properties.

5.8.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $28,469,000. The primary capital costs associated with this alternative are the excavation shoring and bracing systems, temporary dewatering and treatment systems, transportation and disposal of impacted materials, and purchase, transport and installation of backfill material. The primary indirect capital costs associated with this alternative include coordination with the City of New York, and field surveys.

5.8.8 Land Use

The remedial alternative is consistent with the current use of the Site.

SECTION 6

COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES

6.1 COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES

Four alternatives were developed and evaluated in Section 5 to assess the relative merits of each for addressing MGP-related impacts at the Site. A relative comparison of the alternatives for each of the evaluation criteria is presented below. The purpose of the analyses was to identify the advantages and disadvantages of each alternative relative to the other so that key comparisons can be made.

6.1.1 Overall Protection of Public Health and the Environment

Alternatives 1 does not take any action to address MGP-related impacts at the Site. Alternative 2 does not employ any intrusive activities to address MGP-related impacts at the Site. Alternatives 2 through 4 are protective of public health through the implementation of engineering and institutional controls. Alternatives 3A and 3B address MGP-impacts at the Site by immobilizing or removing NAPL-impacted soils in vicinity of SB-4 and Alternative 4 addresses MGP-impacts at the Site by removing delineated MGP-impacted soils exceeding USCOs in Site areas where excavation is deemed feasible and practicable.

Alternatives 2, 3A, and 3B share the development and use of a SMP, since under these alternatives MGP-impacted materials would remain on the Site.

6.1.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

Alternative 1 would not achieve remedial goals or the Site-specific RAO. Alternatives 2 through 4 would achieve the remedial goals and the Site-specific RAO.

Alternative 2 would achieve the RAO through the implementation of engineering and institutional controls. Alternative 3A would achieve the RAO through implementation of ISS in the vicinity of SB-4, and engineering and institutional controls. Alternative 3B would achieve the RAO through excavation of MGP-related source materials in the vicinity of SB-4, and engineering and institutional controls. Alternative 4 would achieve the RAO through excavation of MGP-impacted soils throughout the Site.

Compliance with SCGs would not be achieved by Alternatives 2, 3A, and 3B but will be addressed by engineering and institutional controls. Alternative 4 would achieve compliance with applicable SCGs.

6.1.3 Long-Term Effectiveness and Permanence

Alternatives 2, 3A, and 3B would be considered effective in the long-term through the implementation of engineering and institutional controls in order to address remaining MGP-impacted materials at the Site. Alternative 4 would be considered permanent and effective long-term through the removal and disposal of MGP-impacted soils throughout the Site.

6.1.4 Reduction of Toxicity, Mobility or Volume

Alternatives 1 and 2 do not provide a direct reduction in the toxicity, mobility, or volume of the MGP-related impacts on the Site.

Alternatives 3A and 3B would reduce the toxicity, mobility, and volume of MGP-impacted materials via the immobilization or removal of NAPL-impacted soils in the vicinity of SB-4. However, the effectiveness of ISS reagent materials on Site soils will need to be evaluated. Additionally, MGP-impacted soils would remain on-site in areas outside of the vicinity of SB-4.

Alternative 4 would reduce the toxicity, mobility, and volume of delineated MGP-impacted materials over the entire Site via excavation and off-site disposal of soils.

6.1.5 Short-Term Impacts and Effectiveness

Under Alternative 1, no action would be taken and therefore would incur no short-term impacts.

Under Alternative 2, no intrusive action would be implemented. Therefore, there would be no significant short-term impacts or disruptions to local businesses.

Alternatives 3A, 3B and 4 would include short-term risks of exposure and safety concerns associated with the implementation of each remedial action. These alternatives would result in associated truck traffic, noise, road, and sidewalk closures. These impacts would be significantly greater under Alternative 4.

Due to the intrusive activities associated with Alternatives 3A, 3B, and 4, odor and dust may be issues that would affect the community in the short-term. Alternatives 3A, 3B and 4 would require restricted access to Halleck Street and the associated sidewalk area, with Alternative 4 having the greatest impact to local businesses.

6.1.6 Implementability

Alternative 1 is readily implementable, as no remedial construction activities would be conducted, and therefore no significant challenges are posed.

Alternative 2 is readily implementable, as the cover system is already in place at the Site, and there are no challenges associated with its utilization. The engineering and institutional controls associated with a SMP have been implemented successfully on similar sites. Most pertinent to this alternative are the activities required to coordinate with New York City and New York State regulatory bodies in establishing institutional controls.

Alternatives 3A and 3B are not readily implementable and will require the need for PDI activities such as a geotechnical investigation, structural evaluations/preconstruction surveys of adjacent utilities and infrastructure and approvals/permits from local government agencies. In addition, Alternative 3A would require that a treatability study and an evaluation of the potential presence of purifier waste and the effect of ISS reagent materials on cyanide bound to Site soils to be completed during the PDI program. Alternative 3B would require an evaluation of dewatering and construction water treatment methods.

Alternative 4 is not readily implementable, and would have significant implementability challenges associated with adverse impacts to local businesses, on-site space constraints, existing

utilities and infrastructure, subsurface obstructions and would require the need for PDI activities such as a geotechnical investigation, evaluation of dewatering and treatment methods, structural evaluation/pre-construction surveys of adjacent buildings and infrastructure and approvals/permits from local government agencies.

6.1.7 Cost-Effectiveness

The cost effectiveness of each remedial alternative is summarized as follows:

Alternative	Estimated Capital Cost	Estimated Cost of O&M	Estimated Total Cost
Alternative 1	$0	$0	$0
Alternative 2	$244,000	$918,000	$1,162,000
Alternative 3A	$4,653,000	$918,000	$5,571,000
Alternative 3B	$4,413,000	$918,000	$5,331,000
Alternative 4	$28,469,000	$0	$28,469,000

Estimated costs are based on a 30-year present worth and the breakdown of these estimated costs for each remedial alternative is provided as Appendix B.

6.1.8 Land Use

None of the analyzed alternatives would change the current land use of the Site.

6.1.9 Community Acceptance

Concerns of the state and the community will be addressed separately in accordance with a CPP and requirements outlined in DER-10's citizen participation section.

SECTION 7

CONCLUSIONS AND PREFERRED REMEDY

7.1 CONCLUSIONS

The following conclusions have been made based upon the results of the SC and subsequent alternative analysis:

- The primary constituents of concern at the Site consist of PAHs and inorganics, namely arsenic, lead, mercury, and cyanide;
- NAPL was encountered in one soil boring (SB-4) during field investigation activities;
- MGP-related impacts in excess of USCOs were encountered in Site soils;
- There is no current pathway for human exposure to impacted soils during day-to-day Site operations. However, exposure to MGP-impacted materials may be possible during intrusive activities (e.g., repair of underground utilities and structures).

Based on the findings of the SC, the following Site-specific RAO was identified by the NYSDEC:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

Based on the findings of the SC and the Site-specific RAO identified by the NYSDEC, the following alternatives were developed for the Site:

- Alternative 1 – No Action.
- Alternative 2 – Institutional and Engineering Controls.
- Alternative 3A – ISS of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 3B – Excavation of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 4 – Removal of Delineated MGP-impacted Site Soils Above USCOs.

The Site presents significant challenges for any alternative in which intrusive methods are employed (e.g., ISS or targeted excavations), as the Site is an active sidewalk area and public right-of-way (Halleck Street). Further, any intrusive activity would require approval from the City of New York as vehicular and pedestrian traffic would need to be re-routed, an extensive subsurface utility inventory would need to be performed, and a significant PDI program would need to be conducted under each intrusive alternative. Additional challenges are posed for excavation-based Alternatives 3B and 4, as excavations would extend beyond the groundwater table and likely require significant dewatering, treatment, and discharge infrastructure.

7.2 PREFFERED REMEDY

An extensive evaluation of remedial alternatives has been conducted for the Site while considering the challenges associated with existing utilities and infrastructure, adjacent buildings and structures, subsurface obstructions, Site geology, etc.

Most importantly, this alternatives analysis evaluated short-term impacts to the local community, interruptions to local businesses, and interruptions within the public sidewalk areas and active right-of-ways. Short-term term impacts to the community and public infrastructure would be significant under Alternatives 3A, 3B, and 4, as they include varying degrees of remedial construction activities.

In addition, the effectiveness of Alternatives 3A and 3B would be dependent on the extent of NAPL-impacted soils in proximity to SB-4. Should NAPL-impacted soils extend beyond the Site boundaries, these alternatives would not be effective in treating all NAPL-impacted soils in proximity to SB-4.

Alternative 4 would have significant implementability challenges and short term impacts associated with local businesses, on-site space constraints, existing utilities and infrastructure, subsurface obstructions and would require the need for substantial engineering evaluations (i.e., geotechnical investigations, dewatering and treatment methods, structural evaluations/pre-construction surveys of adjacent buildings and infrastructure, etc.) and would require approvals/permits from local government agencies. In addition, certified clean material brought on-site to backfill remedial excavations may potentially become contaminated by off-site MGP-related impacts.

Based on the above, Alternative 2 (Institutional and Engineering Controls) is the preferred remedy for the Site, and includes the following:

- Utilization of the Site's existing cover system as an engineering control, and
- Preparation of a SMP that will identify the implementation procedures required for institutional and engineering controls at the Site.

Alternative 2 would achieve established remedial goals, achieve the RAO for public health protection in soil identified by the NYSDEC, and would be compliant with SCGs through the implementation of engineering and institutional controls without resulting in significant interruptions to local businesses and adverse impacts to the local community.

Table 4
Preliminary Screening of Alternatives
Hunts Point Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Remedial Alternative	Technology	Process	Applicability
No Action		Does not include any remedial activities or institutional controls	***Retained***
Limited Action	Institutional Controls	Site Management Plan	***Retained***
	Engineering Controls	Maintenance and monitoring of cover systems (i.e., asphalt in parking areas, concrete under the building structure, and fill meeting CSCOs/top soil in landscaped areas)	***Retained***
Containment	Barrier Wall	Lateral containment of the MGP impacts migrating off-site.	***Not Retained***
Removal	Excavation and Off-Site Disposal and Treatment	Removal of MGP-impacted soil material for off-site disposal and treatment.	***Retained***
	Free Product Recovery	Removal of DNAPL from MGP-impacted soil via pumping from recovery wells	***Retained***
In-Situ Physical/Chemical Treatment	*In Situ* Stabilization/Solidification (ISS) via augers or excavator	Mixing contaminated soils with cementitious grout rendering contaminant constituents immoble due to the reduction in hydraulic conductivity.	***Retained***
	In Situ Stabilization/Solidification (ISS) - via jet grouting	Mixing contaminated soils with cementitious grout rendering contaminant constituents immoble due to the reduction in hydraulic conductivity.	***Not Retained***
	In situ Thermal Treatment (TSTD/ISTT)	Electro resistant heating for removal of MGP impacts	***Not Retained***
	In Situ Chemical Oxidation (ISCO)	Injection of strong oxidants at high concentrations to destroy organic contaminants.	***Not Retained***
	Surfactant Aided ISCO	Injection of surfactants to loosen the bonds of hydrocarbons and reduce the contaminant mass.	***Not Retained***
	Enhanced Bioremediation (EB)	Nitrate, oxygen release compound or percarbonate is injected to enhance the microbial activity. If necessary, nutrients will be injected as needed.	***Not Retained***

"Retained" indicates that the technology is technically capable of meeting the Remedial Action Objectives by itself or in combination with other technologies.

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Remedial Action Objectives (RAOs): 1. *Prevent ingestion/direct contact with contaminated soil.* [(1)]					
Alternative 1	**No Action** No remedial activities would be completed under this alternative to address MGP-related impacts at the Site. The "No Action" alternative serves as a baseline for comparison of the overall effectiveness of other remedial alternatives.	Implementable This alternative does not require implementation of any remedial activities, therefore; the alternative is technically and administratively implementable.	Not effective This alternative does not address toxicity, mobility, or volume of MGP-related impacts to Site soils, and would not meet the RAOs established for the Site.	None Since no remedial action would be implemented under this alternative, there would be no short-term potential adverse impacts or risks posed to the property owners or the surrounding community.	Low
Alternative 2	**Institutional Controls (ICs)/Engineering Controls (ECs)** This alternative would utilize the existing cover system at the Site and include land use restrictions through an environmental easement, enforcement and permit controls, annual monitoring of Site conditions, and informational devices. ICs/ECs would be summarized in a Site Management Plan and would be utilized to limit permissible site uses, specify monitoring requirements, and to establish health and safety requirements to be followed during subsurface activities that could result in worker exposure to MGP-impacted materials.	Implementable Requires development of a Site Management Plan, negotiation with the City of New York, and the implementation of an inspection program.	Effective Implementation of this alternative would achieve the Site RAO.	Limited Requires property owners' adherence to ICs and land use agreements.	Low
Alternative 3	**Remediation of Source Material in the Vicinity of Soil Boring SB-4** Comparison of the following remedial alternatives: 3A: In-Situ Stabilization and Solidification (ISS) of Source Material in the Vicinity of SB-4 3B: Excavation of Source Material in the Vicinity of SB-4	See Alternatives 3A and 3B for specific implementability.	Both alternatives, combined with ECs and ICs, would achieve the Site RAO.	Yes. See Alternatives 3A and 3B for specific short-term adverse impacts.	3A: High 3B: High

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Alternative 3A	**ISS of Source Material in the Vicinity of Soil Boring SB-4 and ICs/ECs** This alternative would consist of auger or bucket mixing methods to solidfy source material observed at 11 to 19 feet below ground surface (bgs) in the vicinity of SB-4. Following completion of ISS activities, ICs/ECs would be implemented per Alternative 2. This remedial alternative would include: ▪ Mobilization of ISS equipment to the Site; ▪ Relocation of utilities within the treatment area (if any); ▪ Removal of shallow soils and obstructions within the treatment area; ▪ ISS via auger or bucket mixing; ▪ Installation of demarcation layer, backfill with clean fill material and Site restoration; and ▪ Implementation of ICs/ECs per Alternative 2.	Not Readily Implementable ▪ Would require approval from the City of New York to open the road, as well as re-route vehicular and pedestrian traffic on Halleck Street; ▪ Would require a Pre-Design Investigation (PDI) to gather geotechnical information and further delineate the source material in the vicinity of SB-4; ▪ Would require a Treatability Study to determine viable reagent mixtures and assess reagent reaction with the characteristics of subsurface soils; ▪ Would require a subsurface utility inventory to determine utilities in the area; ▪ The presence of non-uniform subsurface material (fill) may prevent sufficient advancement of ISS equipment (auger or bucket based); and ▪ The presence of subsurface utilities and non-uniform subsurface materials (fill) may prevent reagents from reaching targeted areas when utilizing certain methods (e.g., jet grouting) due to the presence of preferential pathways.	Effective This alternative would reduce the volume of source material within the vincinty of SB-4. When combined with Alternative 2, the Site RAO would be achieved.	Yes ▪ Closures and/or modifications to streets and sidewalks areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Increased noise due to operation of heavy equipment; ▪ Potential for adverse impacts to adjacent utilities due to injected reagents; and ▪ Potential for off-site migration of injected reagents.	HIgh
Alternative 3B	**Excavation of Source Material in the Vicinity of SB-4** This remedial alternative would include: ▪ Installation of a shoring system to support targeted excavation activities to depths of approximately 19 feet bgs; ▪ Removal of source material to a depth of approximately 19 feet bgs within the vicinity of SB-4; ▪ Backfilling of the excavation area with certified clean material and Site restoration; ▪ Implementation of ICs/ECs per Alternative 2.	Not Readily Implementable ▪ Would require approval from the City of New York to open the road, as well as re-route vehicular and pedestrian traffic on Halleck Street; ▪ Would require a (PDI) to gather geotechnical information and further delineate the source material in the vicinity of SB-4; ▪ Would require a subsurface utility inventory to determine utilities in the area and their ability to be supported during the excavation, or permanently/temporarily re-routed; ▪ Since the water table is shallower than 19 feet bgs, a de-watering design would be necessary to de-water, treat, and discharge groundwater during the excavation; and ▪ Would require all necessary permits for discharge of treated water to storm sewer and/or sanitary sewers.	Effective This alternative would reduce the volume of source material within the vincinty of SB-4. When combined with Alternative 2, the Site RAO would be achieved.	Yes ▪ Closures and/or modifications to streets and sidewalk areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Potential interruption of utility services in the vicinity of the excavation area during utility relocation activities; ▪ Increased noise in vicinity of excavation area due to active construction and water treatment activities; ▪ Potential for adverse impacts to adjacent utilities and roadway due to dewatering of Site soils and vibrations from construction activities; ▪ Potential flooding of storm or sanity sewers if treated groundwater is discharged during periods of elevated flow rates (e.g., storm events); and ▪ Would require a large construction footprint to accomodate de-watering equipment.	High

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Alternative 4	**Removal of MGP-impacted Site Soils to Below Applicable Soil Guidance Values Throughout the Site** This alternative would include the removal of subsurface soils throughout the Site observed to contain MGP-related impacts in exceedance of applicable soil guidance values for the Site. This remedial alternative would include: ▪ Installation of shoring systems or sloping back excavations to support excavation activities throughout the Site; ▪ Removal of MGP-impacted Site soils at various depths ranging from 5 ft bgs to 19 ft bgs; and ▪ Backfilling of excavation areas with certified clean material and Site restoration.	Not Readily Implementable ▪ An extensive PDI program would be required to further delineate MGP-impacted soils throughout the Site. In addition, the collection of geotechnical information on subsurface soils will be required. ▪ Removal of Site soils from depth would necessitate the extensive closure of street and sidewalk public right-of-ways, and therefore would require approval from the City of New York for the extended closure of portions of Halleck Street. Re-routing of vehicular and pedestrian traffic would be required. ▪ A study on the underground utilities in the vicinity of the excavation areas would need to be completed to determine if adjacent utilities could be supported during excavation activities, or if they would need to be permanently/temporarily re-routed. ▪ The presence of fill materials composed of various debris and gravel/cobbles would limit the options for the installation of excavation support systems (e.g., sheet pile walls). ▪ Since the water table is shallower than 19 feet bgs, a de-watering design would be necessary to de-water, treat, and discharge groundwater during the excavation; and ▪ Would require all necessary permits for discharge of treated water to storm sewer and/or sanitary sewers.	Effective This alternative would reduce the volume of MGP-related impacts observed at the Site, and the Site RAO would be achieved.	Yes ▪ Significant disruption due to closures and/or modifications to streets and sidewalk areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Potential interruption of utility services in the vicinity of the excavation area(s) during utility relocation activities; ▪ Increased noise in vicinity of excavation area(s) due to active construction and water treatment activities; ▪ Significant potential for adverse impacts to adjacent utilities and roadways due to dewatering of Site soils and vibrations from construction activities over potentially expansive excavation areas; ▪ Potential flooding of storm or sanity sewers if treated groundwater is discharged during periods of elevated flow rates (e.g., storm events); and ▪ Would require a large construction footprint to accomodate de-watering equipment, which would potentially need to be relocated multiple times.	Significantly High

Notes:
1 - As per the 9/23/14 NYSDEC approval letter of the Halleck Street Sidewalk Area Site Characterization Report, this is the site-specific RAO that has been identified by the NYSDEC.

NOTE: Where no dimensions for zoning district boundaries appear on the zoning maps, such dimensions are determined in Article VII, Chapter 6 (Location of District Boundaries) of the Zoning Resolution.

ZONING MAP

THE NEW YORK CITY PLANNING COMMISSION

Major Zoning Classifications:

The number(s) and/or letter(s) that follows an **R, C** or **M** District designation indicates use, bulk and other controls as described in the text of the Zoning Resolution.

R – RESIDENTIAL DISTRICT

C – COMMERCIAL DISTRICT

M – MANUFACTURING DISTRICT

SPECIAL PURPOSE DISTRICT
The letter(s) within the shaded area designates the special purpose district as described in the text of the Zoning Resolution.

AREA(S) REZONED

Effective Date(s) of Rezoning:

05-28-1964 CP-18356

Special Requirements:

For a list of lots subject to CEQR environmental requirements, see APPENDIX C.

For a list of lots subject to "D" restrictive declarations, see APPENDIX D.

For Inclusionary Housing designated areas on this map, see APPENDIX F.

APPENDIX B

REMEDIAL ALTERNATIVE COST ESTIMATES

Remedial Alternative Cost Estimates
Alternative 2 - Institutional and Engineering Controls
Halleck Street Sidewalk Area
Bronx, NY

Item No.	Item Description	Estimated Quantity	Unit of Measure	Unit Cost (Material, E□uipment, Labor)	Estimated Cost
A	**ESTABLISHMENT OF INSTITUTIONAL CONTROLS**				
1	Preparation of Site Management Plan (SMP)	1	LS	□50,000	□50,000
2	Establish Institutional Controls	1	LS	□100,000	□100,000
3	Field Surveys	1	LS	□45,000	□45,000
B	**OPERATION AND MAINTENANCE COST**				
4	Periodic Review of SMP Requirements with NYC	1	Annually	□25,000	□25,000
5	Annual Inspections of ICs/ECs and Reporting	1	Per Event	□20,000	□20,000
				Subtotal Annual O□M Costs	□45,000
				Present Worth (30 years 4.5□)□	16.3
				Present Worth O□M Costs	□734,000
				Contingency for O□M Costs (25□)	□184,000
				Estimated Total O&M Costs	**□□18,000**
				Subtotal Capital Costs	□195,000
				Contingency for Capital Costs (25□)	□49,000
				Estimated Total Capital Costs	**□244,000**
				TOTAL ESTIMATED COSTS	**□1,162,000**

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 2 - Cost Specific Assumptions

1) Costs for SMP preparation assumes utilizing the NYSDEC template.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.

□□ Present worth factor calculated using Civil Engineering Reference Manual by Michael Lindeburg.

Remedial Alternative Cost Estimates
Alternative 3A - In-Situ Stabili□ation of NAPL-impacted Material in the Vicinity of SB-4
Halleck Street Sidewalk Area
Bronx, NY

Item No.	Item Description	Estimated Quantity	Unit of Measure	Unit Cost (Material, E□uipment, Labor)	Estimated Cost
A	**PRE-DESIGN INVESTIGATION PROGRAM**				
1	Preparation of NYSDEC Submittals	1	LS	□60,000	□60,000
2	Delineation Borings, Treatability Study and Utility Survey	1	LS	□200,000	□200,000
B	**ACCESS AGREEMENTS, SUBMITTALS, ICs**				
3	Permitting/Access Agreements	1	LS	□50,000	□50,000
4	Preparation of NYSDEC Submittals	1	Each	□250,000	□250,000
5	Field Surveys	1	LS	□45,000	□45,000
6	Establish Institutional Controls	1	LS	□100,000	□100,000
7	Traffic Control Plans for NYC	1	LS	□75,000	□75,000

24	Periodic Review of SMP Requirements with NYC	1	Annually	□25,000	□25,000
25	Annual Inspections of ICs/ECs and Reporting	1	Per Event	□20,000	□20,000
				Subtotal Annual O□M Costs	□45,000
				Present Worth (30 years 4.5□)□	16.3
				Present Worth O□M Costs	□734,000
				Contingency for O□M Costs (25□)	□184,000
				Estimated Total O&M Costs	**□□18,000**
				Subtotal of Capital Costs	□3,102,000
				Engineering Field Support (10□)	□310,000
				Bonds and Insurance (7□)	□217,000
				Testing and Inspection (3□)	□93,000
				Total Capital Costs	□3,722,000
				Contingency for Capital Costs (25□)	□931,000
				Estimated Total Capital Costs	**□4,6□3,000**
				TOTAL ESTIMATED COST	**□□,□71,000**

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 3a - Cost Specific Assumptions

1) Costs for PDI submittals for the NYSDEC based on preparation of letter work plans for delineation borings and treatability study.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) Costs for NYC requirements for traffic control plans and required traffic controls cannot be determined at this time and an allowance has been included.
5) Costs based on remedial construction duration of 4 weeks.
6) Costs for remedial excavations based on 1,200 in-place cubic yards.
7) Costs for ISS based on 4,400 in-place cubic yards and assumes no obstructions would be encountered.
8) Disposal costs for excavated soils based on 1,200 in-place cubic yards.
9) Disposal costs for ISS swell based on 30□ of total ISS volume or 1,320 cubic yards.
10) Costs for construction fluids disposal, stakeholder requirements, soil erosion control, etc. cannot be determined at this time and allowances have been included.
11) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.
12) Costs for post-excavation sampling and laboratory analyses are assumed to be not required.

□□ Present worth factor calculated using Civil Engineering Reference Manual by Michael Lindeburg.

				Contingency for Capital Costs (25□)	□883,000
				Estimated Total Capital Costs	**□4,413,000**
				TOTAL ESTIMATED COST	**□□,331,000**

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 3b - Cost Specific Assumptions

1) Costs for PDI submittals for the NYSDEC based on preparation of letter work plan for delineation borings.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) Costs for NYC requirements for traffic control plans and required traffic controls cannot be determined at this time and an allowance has been included.
5) Costs based on remedial construction duration of 6 weeks.
6) Costs for excavation shoring based on 9,000 vertical SF and actual shoring system will be determined during engineering design.
7) Costs for remedial excavations based on 5,500 in-place cubic yards.
8) Costs for excavation dewatering, treatment and discharge cannot be determined at this time and dewatering system needs to be designed. As such, a monthly allowance has been included.
9) Disposal costs for excavated soils based on 5,500 in-place cubic yards.
10) Costs for construction fluids disposal, stakeholder requirements, soil erosion controls, etc. cannot be determined at this time and allowances have been included.
11) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.
12) Costs for post-excavation sampling and laboratory analyses are assumed to be not required.

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 4 - Cost Specific Assumptions

1) Costs for PDI submittals for the NYSDEC based on preparation of work plan for delineation borings.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) Costs for NYC requirements for traffic control plans and required traffic controls cannot be determined at this time and an allowance has been included.
5) Costs based on remedial construction duration of 24 months.
6) Costs for excavation shoring based on 45,000 vertical SF and actual shoring system will be determined during engineering design.
7) Costs for remedial excavations based on 34,500 in-place cubic yards.
8) Costs for excavation dewatering, treatment and discharge cannot be determined at this time and dewatering system needs to be designed. As such, a monthly allowance has been included.
9) Disposal costs for excavated soils based on 34,500 in-place cubic yards.
10) Costs for construction fluids disposal, stakeholder requirements, soil erosion controls, etc. cannot be determined at this time and allowances have been included.
11) Costs for post-excavation sampling and laboratory analyses are assumed to be not required.

□□ Present worth factor calculated using Civil Engineering Reference Manual by Michael Lindeburg.

Experience

Mr. Strother has approximately three years of experience on projects throughout the country in the environmental assessment and consulting industry. He has conducted Environmental Site Assessments (ESAs) for a wide range of local and national clients including banks, agency lenders, investment banks, property development companies and individual owners. The properties he has evaluated have included multifamily residential, retail, office, industrial, partially-constructed buildings, active SHWS, BCP, RCRA, and LUST sites, and undeveloped vacant land. In addition, Mr. Strother has performed numerous Limited Site Inspections (LSIs), Design Visits, and Phase I reports for the telecom industry.

Mr. Strother has performed approximately two-hundred Phase I ESAs in accordance with ASTM Standards and other client-specific scopes of works, and has assisted on over two hundred more ESAs throughout the United States and Canada. His environmental background includes detailed understanding of the risks associated with hazardous and regulated material storage, use, generation and disposal, above ground and underground storage tanks, polychlorinated biphenyls (PCBs), radon, asbestos-containing materials (ACM), lead-based paint (LBP), mold, and other regulated substances. Other skills include data collection from municipal, state, federal, and general research sources; on-site sampling procedures for radon, ACM, and LBP, the ability to extract site pertinent data from various environmental reports/facility records; and preparation and documentation of due diligence reports.

maria.sinnamon@cbre.com

70 West Red Oak Lane
White Plains, NY 10604

Experience

Maria Sinnamon is a Project Management Director of the Valuation & Advisory Services within the New York region. Ms. Sinnamon has over 13 years of consulting experience in the environmental industry. She has broad experience gained by completing and managing numerous Phase I Environmental Site Assessments (ESAs) on a wide range of retail, office, industrial and multifamily properties in the United States. She is experienced in nationwide project mobilization and research for Phase I and II ESAs, Site Transaction Screenings, Records Search with Risk Assessments, historical land use research and the review of government maintained databases and reports.

Ms. Sinnamon conducted and managed thousands of assessments for a wide range of local and national clients, including real estate owners, investors, and lending institutions in accordance with the applicable American Society for Testing and Materials (ASTM) Standards and Guidelines, United States Environmental Protection Agency (EPA) All Appropriate Inquiry rules, Fannie Mae Delegated Underwriting Standards, Freddie Mac guidelines, and other specific scopes of work. She is a qualified environmental professional under ASTM E 1527-13.

Ms. Sinnamon's environmental background includes a detailed understanding of the risks associated with hazardous and regulated materials storage, use, generation and disposal, aboveground and underground storage tanks, asbestos-containing materials (ACM), lead-based paint (LBP), microbial growth and radon.

INNOVATIVE AFFORDABLE ENVIRONMENTAL SOLUTIONS

RACHEL ATAMAN, PG
PRESIDENT

SUMMARY OF EXPERIENCE

Having worked in the environmental field since 2003, I have a vast understating of the Environmental world in New York State. I have worked on multiple projects ranging from Phase I ESAs, Phase II ESAs, Mold Investigations to New York State Brownfield Cleanup Projects. Additionally, I have worked closely with clients to meet their specific project needs such as deadlines, project grants and program requirements. Using my vast experience I also assisted clients in cost estimates for future investigations or remediations.

RELEVANT PROJECT EXPERIENCE

- Recently completed the investigation and Remedial Design for a 3-story building on Moffat Street in Brooklyn. The investigation included the installation and sampling of a series of soil probes, monitoring wells and soil vapor probes. The remedial design included the excavation and property disposal of soils within the foundation and the installation of a vapor barrier beneath the foundation. The Investigation and Remedial Design were approved by the New York City Office of Environmental Projection since the site is going through a zoning variance.
- Was instrumental in entering the first site (Pelham Parkway) into New York City Brownfield Cleanup program (BCP) and bringing Mayor Bloomberg to the Site to announce the start of the City's BCP. I then managed the environmental requirements of the site including City Environmental Quality Review, Phase I ESAs, Site Investigations, Remedial Action Work Plans and the Site Remedation during development.
- Managed a large variety of New York City Brownfield Cleanup Projects including the preparation of the Site Investigation Work Plans, implementation of the fieldwork, the preparation of Site Investigation Report and Remediation Action Plans. Also successfully managed the implementation of Remedial Action Plans during fieldwork. On a site location on North 8th Street in Brooklyn, New York, supervised the removal of 10,000 tons of contaminated soil and the installation of a vapor barrier and sub-slab depressurization system.
- Knowledgeable in the characterization of soil for disposal. On a NYC BCP site located on Third Avenue in the Bronx I successfully investigated and managed the disposal of over 2,000 tons of hazardous soil.
- Successfully investigated and managed the closure of hundreds of NYSDEC Spill Sites. For example she recently completely the closusre of a Spill on Anthony Avenue by investigating soils and determining a subsurface impact was not identified. Additionally, successfully remediated a site on Burnside Avenue in Inwood through the removal of three underground storage tanks (USTs), over 100 tons of petroleum contaminated soil, the injection of Oxygen Releasing Compounds (ORC) and the performance of monthly monitoring and quarterly sampling of

groundwater over a 2 year period. The remediation was successful in reducing the levels of contamination in groundwater and the NYSDEC Spill number was closed.

- Supervised the removal of four underground storage tanks for the Rockland County Sewer District and continue to work with the RCSD on the update of the Sewer Plants from underground storage tanks to above ground storage tanks.
- Performed hundreds of Phase I ESA site inspections and has reviewed and written hundreds of Phase I ESAs as well. Based upon the results of the Phase I ESA, determined the proper scope of work for the Phase II ESAs, prepared Phase II ESA scopes of work and proposals and then properly implemented the Phase II ESA.

Technical Responsibilities:
Coordinates work with regulatory agencies and organizes project schedules with clients, project geologists, and field managers.
Phase I and Phase II Environmental Site Assessments
Design and Management of Site Investigations
"E"-Designations
Site Supervision and Remediation
Environmental Assessment Statements
Mold testing
Air Quality/control
Technical review of assessment reports, remedial action plans, mold investigations
Remedial Action:
Implemented numerous Remedial Action Plans. Supervised the construction and managed the operation of numerous hydrocarbon and chlorinated solvent remediation systems for soil and groundwater.

SDG Comments

August 14, 2022

SDG I.D.: GCL99172

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Environmental Laboratories, Inc.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B □ Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B □ Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B□□ Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B□□ Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B □ Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
B □ Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Blank	Blk RL	LCS %	LCSD %	LCS RPD	MS %	MSD %	MS RPD	% Rec Limits	% RPD Limits

Comment:

The Low Level MS/MSD are not reported for this batch.

Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

l = This parameter is outside laboratory LCS/LCSD specified recovery limits.
m = This parameter is outside laboratory MS/MSD specified recovery limits.
r = This parameter is outside laboratory RPD specified recovery limits.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

RPD - Relative Percent Difference
LCS - Laboratory Control Sample
LCSD - Laboratory Control Sample Duplicate
MS - Matrix Spike
MS Dup - Matrix Spike Duplicate
NC - No Criteria
Intf - Interference

Phoenix Laboratories does not assume responsibility for the data contained in this exceedance report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

Analysis Comments

August 14, 2022 SDG I.D.: GCL99172

The following analysis comments are made regarding exceptions to criteria not already noted in the Analysis Report or QA/QC Report:

SVOA Narration

CHEM22 08/08/22-1: CL99172, CL99173, CL99174, CL99175, CL99176, CL99177

The following Initial Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.084 (0.1)
The following Initial Calibration compounds did not meet minimum response factors: None.

The following Continuing Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.087 (0.1)
The following Continuing Calibration compounds did not meet minimum response factors: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40.

VOA Narration

CHEM26 08/10/22-1: CL99172

The following Initial Calibration compounds did not meet RSD criteria: Bromoform 27 (20), Methylene chloride 32 (20), trans-1,3-Dichloropropene 23 (20), trans-1,4-dichloro-2-butene 36 (20)
The following Initial Calibration compounds did not meet maximum RSD criteria: None.

The following Continuing Calibration compounds did not meet deviation criteria: Methylene chloride 34 L (30)
The following Continuing Calibration compounds did not meet Maximum deviation criteria: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40.

CHEM31 08/07/22-1: CL99172, CL99173, CL99174, CL99175, CL99176, CL99177

The following Initial Calibration compounds did not meet RSD criteria: 1,2,3-Trichlorobenzene 21 (20), 1,2-Dibromo-3-chloropropane 31 (20), Bromoform 29 (20), Dibromochloromethane 22 (20), Methylene chloride 24 (20), Naphthalene 38 (20), trans-1,3-Dichloropropene 25 (20), trans-1,4-dichloro-2-butene 38 (20)
The following Initial Calibration compounds did not meet maximum RSD criteria: None.
The following Initial Calibration compounds did not meet recommended response factors: 1,2-Dibromo-3-chloropropane 0.048 (0.05), Acetone 0.084 (0.1), Bromoform 0.092 (0.1), Tetrachloroethene 0.141 (0.2), Trichloroethene 0.186 (0.2)
The following Initial Calibration compounds did not meet minimum response factors: 1,2-Dibromo-3-chloropropane 0.048 (0.05)

The following Continuing Calibration compounds did not meet deviation criteria: 1,2-Dibromo-3-chloropropane 31 H (30), Bromoform 33 H (30), Naphthalene 32 H (30), trans-1,4-dichloro-2-butene 37 H (30)
The following Continuing Calibration compounds did not meet Maximum deviation criteria: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40.

Sample ID□s: CL□□162 - CL□□171

This laboratory is in compliance with the NELAC re□uirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory. This report is incomplete unless all pages indicated in the pagination at the bottom of the page are included.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you are the client above and have any □uestions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200. The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Sincerely yours,

Phyllis Shiller
Laboratory Director

SDG Comments

August 15, 2022

SDG I.D.: GCL99162

8260 Volatile Organics:
1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/ECD method 504 or 8011 to achieve this criteria.

SIM Analysis:
The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level cannot be achieved.

Sample(s) required a dilution for Volatiles due to the presence of target and/or non-target compounds. This resulted in elevated reporting limits that exceed the requested criteria for one or more analytes.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the presence of non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the presence of non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Results are reported on an □as received□□basis, and are not corrected for dry weight.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
3 □ This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

Semi-Volatile Comment:
One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
3 □ This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the large amount of sediment in the sample vial.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the large amount of sediment in the sample vial.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
3 □ This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

Semi-Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

Volatile Comment:
Elevated reporting limits for volatiles due to the large amount of sediment in the sample vial.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Parameter	Result	RL/ PQL	Units	Dilution	Date/Time	By	Reference

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.
3 □ This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

Volatile Comment:
Elevated reporting limits for volatiles due to the large amount of sediment in the sample vial.

Volatile Comment:
To achieve client's objectives, where the lowest calibration standard or LOD justifies lowering the RL/PQL, the RL/PQL of some compounds have been lowered to meet criteria.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Comment:

The MSD is not reported for this LL soil batch.

Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

QA/QC Batch 636524H (ug/kg), QC Sample No: CL98942 50X (CL99162 (50X) , CL99163 (50X))

Comment:

A LCS and LCS Duplicate were performed instead of a matrix spike and matrix spike duplicate.

Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

l = This parameter is outside laboratory LCS/LCSD specified recovery limits.
m = This parameter is outside laboratory MS/MSD specified recovery limits.
r = This parameter is outside laboratory RPD specified recovery limits.
s = This parameter is outside laboratory Blank Surrogate specified recovery limits.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

RPD - Relative Percent Difference
LCS - Laboratory Control Sample
LCSD - Laboratory Control Sample Duplicate
MS - Matrix Spike
MS Dup - Matrix Spike Duplicate
NC - No Criteria
Intf - Interference

Phoenix Laboratories does not assume responsibility for the data contained in this exceedance report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

Analysis Comments

August 15, 2022 SDG I.D.: GCL99162

The following analysis comments are made regarding exceptions to criteria not already noted in the Analysis Report or QA/QC Report:

SVOA Narration

CHEM1 08/0/22-2: CL99166

For 8270 full list, the DDT breakdown and pentachlorophenol benzidine peak tailing were evaluated in the DFTPP tune and were found to be in control.
For 8270 BN list, benzidine peak tailing was evaluated in the DFTPP tune and was found to be in control.

The following Initial Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.087 (0.1), Hexachlorobenzene 0.093 (0.1)
The following Initial Calibration compounds did not meet minimum response factors: None.

The following Continuing Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.088 (0.1)
The following Continuing Calibration compounds did not meet minimum response factors: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

CHEM28 08/0/22-1: CL99162, CL99163, CL99164, CL99165

For 8270 full list, the DDT breakdown and pentachlorophenol benzidine peak tailing were evaluated in the DFTPP tune and were found to be in control.
For 8270 BN list, benzidine peak tailing was evaluated in the DFTPP tune and was found to be in control.

The following Initial Calibration compounds did not meet recommended response factors: Hexachlorobenzene 0.076 (0.1)
The following Initial Calibration compounds did not meet minimum response factors: None.

The following Continuing Calibration compounds did not meet recommended response factors: Hexachlorobenzene 0.086 (0.1)
The following Continuing Calibration compounds did not meet minimum response factors: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

CHEM36 08/10/22-1: CL99167, CL99168, CL99169, CL99170, CL99171

The following Initial Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.064 (0.1)
The following Initial Calibration compounds did not meet minimum response factors: None.

The following Continuing Calibration compounds did not meet recommended response factors: 2-Nitrophenol 0.069 (0.1)
The following Continuing Calibration compounds did not meet minimum response factors: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

SVOASIM Narration

CHEM2 08/10/22-1: CL99167, CL99168, CL99169, CL99170, CL99171

For 8270 BN list, benzidine peak tailing was evaluated in the DFTPP tune and was found to be in control.

The following Continuing Calibration compounds did not meet deviation criteria: 2,4,6-Tribromophenol 36 H (30)
The following Continuing Calibration compounds did not meet Maximum deviation criteria: None.

VOA Narration

Analysis Comments

August 15, 2022 SDG I.D.: GCL99162

The following Initial Calibration compounds did not meet RSD criteria: Methylene chloride 22 (20)
The following Initial Calibration compounds did not meet maximum RSD criteria: None.
The following Initial Calibration compounds did not meet recommended response factors: Acetone 0.078 (0.1), Tetrachloroethene 0.173 (0.2)
The following Initial Calibration compounds did not meet minimum response factors: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

CHEM26 08/0/22-1: CL99164, CL99165

The following Initial Calibration compounds did not meet RSD criteria: Bromoform 27 (20), Methylene chloride 32 (20), trans-1,3-Dichloropropene 23 (20), trans-1,4-dichloro-2-butene 36 (20)
The following Initial Calibration compounds did not meet maximum RSD criteria: None.

The following Continuing Calibration compounds did not meet deviation criteria: trans-1,4-dichloro-2-butene 37 H (30)
The following Continuing Calibration compounds did not meet Maximum deviation criteria: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

CHEM31 08/07/22-1: CL99162, CL99163, CL99166

The following Initial Calibration compounds did not meet RSD criteria: 1,2,3-Trichlorobenzene 21 (20), 1,2-Dibromo-3-chloropropane 31 (20), Bromoform 29 (20), Dibromochloromethane 22 (20), Methylene chloride 24 (20), Naphthalene 38 (20), trans-1,3-Dichloropropene 25 (20), trans-1,4-dichloro-2-butene 38 (20)
The following Initial Calibration compounds did not meet maximum RSD criteria: None.
The following Initial Calibration compounds did not meet recommended response factors: 1,2-Dibromo-3-chloropropane 0.048 (0.05), Acetone 0.084 (0.1), Bromoform 0.092 (0.1), Tetrachloroethene 0.141 (0.2), Trichloroethene 0.186 (0.2)
The following Initial Calibration compounds did not meet minimum response factors: 1,2-Dibromo-3-chloropropane 0.048 (0.05)

The following Continuing Calibration compounds did not meet deviation criteria: 1,2-Dibromo-3-chloropropane 31 H (30), Bromoform 33 H (30), Naphthalene 32 H (30), trans-1,4-dichloro-2-butene 37 H (30)
The following Continuing Calibration compounds did not meet Maximum deviation criteria: None.

Up to eight compounds can be outside of ICAL RSD criteria and up to sixteen compounds can be outside of CCAL Dev criteria if less than 40 .

PHOENIX
Environmental Laboratories, Inc.

Thursday, August 11, 2022

Attn: Rachel Ataman
Touchstone Environmental Geology, PC
1□1□ Middle Country Road
Centereach, NY 11720

Project ID: **220330 DRAKE PARK S**
SDG ID: **GCL□□178**
Sample ID□s: CL□□178 - CL□□184

This laboratory is in compliance with the NELAC re□uirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory. This report is incomplete unless all pages indicated in the pagination at the bottom of the page are included.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you are the client above and have any □uestions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200. The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Sincerely yours,

Phyllis Shiller
Laboratory Director

Comments:

Elevated reporting limits have been reported due to the presence of reported target compounds in the TO15 list above the calibration. Sample was run at an initial dilution.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Elevated reporting limits have been reported due to the presence of reported target compounds in the TO15 list above the calibration. Sample was run at an initial dilution.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Elevated reporting limits have been reported due to the presence of reported target compounds in the TO15 list above the calibration. Sample was run at an initial dilution.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.

Parameter	ppbv Result	ppbv RL	ug/m3 Result	ug/m3 RL	Date/Time	By	Dilution

1 □ This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected at RL/PQL
BRL=Below Reporting Level L=Biased Low
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Elevated reporting limits have been reported due to the presence of reported target compounds in the TO15 list above the calibration. Sample was run at an initial dilution.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Phoenix Laboratories does not assume responsibility for the data contained in this exceedance report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

NYS DOH Soil Vapor/Indoor Air Matrices

Soil Vapor/Indoor Air Matrix A

May 2017

Analytes Assigned:
Trichloroethene (TCE), *cis*-1,2-Dichloroethene (*c*12-DCE), 1,1-Dichloroethene (11-DCE), Carbon Tetrachloride

	INDOOR AIR CONCENTRATION of COMPOUND (mcg/m^3)		
SUB-SLAB VAPOR CONCENTRATION of COMPOUND (mcg/m^3)	< 0.2	0.2 to < 1	1 and above
< 6	1. No further action	2. No Further Action	3. IDENTIFY SOURCE(S) and RESAMPLE or MITIGATE
6 to < 60	4. No further action	5. MONITOR	6. MITIGATE
60 and above	7. MITIGATE	8. MITIGATE	9. MITIGATE

No further action: No additional actions are recommended to address human exposures.

Identify Source(s) and Resample or Mitigate: We recommend that reasonable and practical actions be taken to identify the source(s) affecting the indoor air quality and that actions be implemented to reduce indoor air concentrations to within background ranges. For example, if an indoor or outdoor air source is identified, we recommend the appropriate party implement actions to reduce the levels. In the event that indoor or outdoor sources are not readily identified or confirmed, resampling (which might include additional sub-slab vapor and indoor air sampling locations) is recommended to demonstrate that SVI mitigation actions are not needed. Based on the information available, mitigation might also be recommended when soil vapor intrusion cannot be ruled out.

Monitor: We recommend monitoring (sampling on a recurring basis), including but not necessarily limited to sub-slab vapor, basement air and outdoor air sampling, to determine whether concentrations in the indoor air or sub-slab vapor have changed and/or to evaluate temporal influences. Monitoring might also be recommended to determine whether existing building conditions (e.g., positive pressure heating, ventilation and air-conditioning systems) are maintaining the desired mitigation endpoint and to determine whether changes are needed. The type and frequency of monitoring is determined based on site-, building- and analyte-specific information, taking into account applicable environmental data and building operating conditions. Monitoring is an interim measure required to evaluate exposures related to soil vapor intrusion until contaminated environmental media are remediated.

Mitigate: We recommend mitigation to minimize current or potential exposures associated with soil vapor intrusion. The most common mitigation methods are sealing preferential pathways in conjunction with installing a sub-slab depressurization system and changing the pressurization of the building in conjunction with monitoring. The type, or combination of types, of mitigation is determined on a building-specific basis, taking into account building construction and operating conditions. Mitigation is considered a temporary measure implemented to address exposures related to soil vapor intrusion until contaminated environmental media are remediated.

These general recommendations are made with consideration being given to the additional notes on page 2.

ADDITIONAL NOTES FOR MATRIX A

This matrix summarizes actions recommended to address current and potential exposures related to soil vapor intrusion. To use the matrix appropriately as a tool in the decision-making process, the following should be noted:

[1] The matrix is generic. As such, it may be appropriate to modify a recommended action to accommodate analyte-specific, building-specific conditions (e.g., dirt floor in basement, crawl spaces, thick slabs, current occupancy, etc.), and/or factors provided in Section 3.2 of the guidance (e.g., current land use, environmental conditions, etc.). For example, collection of additional samples may be recommended when the matrix indicates "no further action" for a particular building, but the results of adjacent buildings (especially sub-slab vapor results) indicate a need to take actions to address exposures related to soil vapor intrusion. Mitigation might be recommended when the results of multiple contaminants indicate monitoring is recommended. Proactive actions may be proposed at any time. For example, the party implementing the actions may decide to install sub-slab depressurization systems on buildings where the matrix indicates "no further action" or "monitoring." Such an action might be undertaken for reasons other than public health (e.g., seeking community acceptance, reducing costs, etc.). However, actions implemented *in lieu* of sampling will typically be expected to be captured in the final engineering report and site management plan, and might not rule out the need for post-implementation sampling (e.g., to document effectiveness or to support terminating the action).

[2] Actions provided in the matrix are specific to addressing human exposures. Implementation of these actions does not preclude investigating possible sources of soil vapor contamination, nor does it preclude remediating contaminated soil vapor or the source of soil vapor contamination.

[3] Appropriate care should be taken during all aspects of sample collection to ensure that high quality data are obtained. Since the data are being used in the decision-making process, the laboratory analyzing the environmental samples must have current Environmental Laboratory Approval Program (ELAP) certification for the appropriate analyte and environmental matrix combinations. Furthermore, samples should be analyzed by methods that can achieve a minimum reporting limit of 0.20 microgram per cubic meter for indoor and outdoor air samples. For sub-slab vapor samples and dirt floor soil vapor samples, a minimum reporting limit of 1 microgram per cubic meter is recommended.

[4] Sub-slab vapor and indoor air samples are typically collected when the likelihood of soil vapor intrusion is considered to be the greatest (i.e., worst-case conditions). If samples are collected at other times (typically, samples collected outside of the heating season), then resampling during worst-case conditions might be appropriate to verify that actions taken to address exposures related to soil vapor intrusion are protective of human health.

[5] When current exposures are attributed to sources other than soil vapor intrusion, the agencies should be given documentation (e.g., applicable environmental data, completed indoor air sampling questionnaire, digital photographs, etc.) to support a proposed action other than that provided in the matrix box and to support agency assessment and follow-up.

[6] The party responsible for implementing the recommended actions will differ depending upon several factors, including but not limited to the following: the identified source of the volatile chemicals, the environmental remediation program, and analyte-specific, site-specific and building-specific factors.

Soil Vapor/Indoor Air Matrix B

May 2017

Analytes Assigned:
Tetrachloroethene (PCE), 1,1,1-Trichloroethane (111-TCA), Methylene Chloride

	INDOOR AIR CONCENTRATION of COMPOUND (mcg/m^3)		
SUB-SLAB VAPOR CONCENTRATION of COMPOUND (mcg/m^3)	< 3	3 to < 10	10 and above
< 100	1. No further action	2. No Further Action	3. IDENTIFY SOURCE(S) and RESAMPLE or MITIGATE
100 to < 1,000	4. No further action	5. MONITOR	6. MITIGATE
1,000 and above	7. MITIGATE	8. MITIGATE	9. MITIGATE

No further action: No additional actions are recommended to address human exposures.

Identify Source(s) and Resample or Mitigate: We recommend that reasonable and practical actions be taken to identify the source(s) affecting the indoor air quality and that actions be implemented to reduce indoor air concentrations to within background ranges. For example, if an indoor or outdoor air source is identified, we recommend the appropriate party implement actions to reduce the levels. In the event that indoor or outdoor sources are not readily identified or confirmed, resampling (which might include additional sub-slab vapor and indoor air sampling locations) is recommended to demonstrate that SVI mitigation actions are not needed. Based on the information available, mitigation might also be recommended when soil vapor intrusion cannot be ruled out.

Monitor: We recommend monitoring (sampling on a recurring basis), including but not necessarily limited to sub-slab vapor, basement air and outdoor air sampling, to determine whether concentrations in the indoor air or sub-slab vapor have changed and/or to evaluate temporal influences. Monitoring might also be recommended to determine whether existing building conditions (e.g., positive pressure heating, ventilation and air-conditioning systems) are maintaining the desired mitigation endpoint and to determine whether changes are needed. The type and frequency of monitoring is determined based on site-, building- and analyte-specific information, taking into account applicable environmental data and building operating conditions. Monitoring is an interim measure required to evaluate exposures related to soil vapor intrusion until contaminated environmental media are remediated.

Mitigate: We recommend mitigation to minimize current or potential exposures associated with soil vapor intrusion. The most common mitigation methods are sealing preferential pathways in conjunction with installing a sub-slab depressurization system and changing the pressurization of the building in conjunction with monitoring. The type, or combination of types, of mitigation is determined on a building-specific basis, taking into account building construction and operating conditions. Mitigation is considered a temporary measure implemented to address exposures related to soil vapor intrusion until contaminated environmental media are remediated.

These general recommendations are made with consideration being given to the additional notes on page 2.

ADDITIONAL NOTES FOR MATRIX B

This matrix summarizes actions recommended to address current and potential exposures related to soil vapor intrusion. To use the matrix appropriately as a tool in the decision-making process, the following should be noted:

[1] The matrix is generic. As such, it may be appropriate to modify a recommended action to accommodate analyte-specific, building-specific conditions (e.g., dirt floor in basement, crawl spaces, thick slabs, current occupancy, etc.), and/or factors provided in Section 3.2 of the guidance (e.g., current land use, environmental conditions, etc.). For example, collection of additional samples may be recommended when the matrix indicates "no further action" for a particular building, but the results of adjacent buildings (especially sub-slab vapor results) indicate a need to take actions to address exposures related to soil vapor intrusion. Mitigation might be recommended when the results of multiple contaminants indicate monitoring is recommended. Proactive actions may be proposed at any time. For example, the party implementing the actions may decide to install sub-slab depressurization systems on buildings where the matrix indicates "no further action" or "monitoring." Such an action might be undertaken for reasons other than public health (e.g., seeking community acceptance, reducing costs, etc.). However, actions implemented *in lieu* of sampling will typically be expected to be captured in the final engineering report and site management plan, and might not rule out the need for post-implementation sampling (e.g., to document effectiveness or to support terminating the action).

[2] Actions provided in the matrix are specific to addressing human exposures. Implementation of these actions does not preclude investigating possible sources of soil vapor contamination, nor does it preclude remediating contaminated soil vapor or the source of soil vapor contamination.

[3] Appropriate care should be taken during all aspects of sample collection to ensure that high quality data are obtained. Since the data are being used in the decision-making process, the laboratory analyzing the environmental samples must have current Environmental Laboratory Approval Program (ELAP) certification for the appropriate analyte and environmental matrix combinations. Furthermore, samples should be analyzed by methods that can achieve a minimum reporting limit of 1 microgram per cubic meter for indoor and outdoor air samples. For sub-slab vapor samples and dirt floor soil vapor samples, a minimum reporting limit of 1 microgram per cubic meter is recommended.

[4] Sub-slab vapor and indoor air samples are typically collected when the likelihood of soil vapor intrusion is considered to be the greatest (i.e., worst-case conditions). If samples are collected at other times (typically, samples collected outside of the heating season), then resampling during worst-case conditions might be appropriate to verify that actions taken to address exposures related to soil vapor intrusion are protective of human health.

[5] When current exposures are attributed to sources other than soil vapor intrusion, the agencies should be given documentation (e.g., applicable environmental data, completed indoor air sampling questionnaire, digital photographs, etc.) to support a proposed action other than that provided in the matrix box and to support agency assessment and follow-up.

[6] The party responsible for implementing the recommended actions will differ depending upon several factors, including but not limited to the following: the identified source of the volatile chemicals, the environmental remediation program, and analyte-specific, site-specific and building-specific factors.

Vinyl Chloride

	INDOOR AIR CONCENTRATION of COMPOUND (mcg/m^3)	
SUB-SLAB VAPOR CONCENTRATION of COMPOUND (mcg/m^3)	< 0.2	0.2 and above
< 6	1. No further action	2. IDENTIFY SOURCE(S) and RESAMPLE or MITIGATE
6 to < 60	3. MONITOR	4. MITIGATE
60 and above	5. MITIGATE	6. MITIGATE

No further action: No additional actions are recommended to address human exposures.

Identify Source(s) and Resample or Mitigate: We recommend that reasonable and practical actions be taken to identify the source(s) affecting the indoor air quality and that actions be implemented to reduce indoor air concentrations to within background ranges. For example, if an indoor or outdoor air source is identified, we recommend the appropriate party implement actions to reduce the levels. In the event that indoor or outdoor sources are not readily identified or confirmed, resampling (which might include additional sub-slab vapor and indoor air sampling locations) is recommended to demonstrate that SVI mitigation actions are not needed. Based on the information available, mitigation might also be recommended when soil vapor intrusion cannot be ruled out.

Monitor: We recommend monitoring (sampling on a recurring basis), including but not necessarily limited to sub-slab vapor, basement air and outdoor air sampling, to determine whether concentrations in the indoor air or sub-slab vapor have changed and/or to evaluate temporal influences. Monitoring might also be recommended to determine whether existing building conditions (e.g., positive pressure heating, ventilation and air-conditioning systems) are maintaining the desired mitigation endpoint and to determine whether changes are needed. The type and frequency of monitoring is determined based on site-, building- and analyte-specific information, taking into account applicable environmental data and building operating conditions. Monitoring is an interim measure required to evaluate exposures related to soil vapor intrusion until contaminated environmental media are remediated.

Mitigate: We recommend mitigation to minimize current or potential exposures associated with soil vapor intrusion. The most common mitigation methods are sealing preferential pathways in conjunction with installing a sub-slab depressurization system and changing the pressurization of the building in conjunction with monitoring. The type, or combination of types, of mitigation is determined on a building-specific basis, taking into account building construction and operating conditions. Mitigation is considered a temporary measure implemented to address exposures related to soil vapor intrusion until contaminated environmental media are remediated.

These general recommendations are made with consideration being given to the additional notes on page 2.

ADDITIONAL NOTES FOR MATRIX C

This matrix summarizes actions recommended to address current and potential exposures related to soil vapor intrusion. To use the matrix appropriately as a tool in the decision-making process, the following should be noted:

[1] The matrix is generic. As such, it may be appropriate to modify a recommended action to accommodate analyte-specific, building-specific conditions (e.g., dirt floor in basement, crawl spaces, thick slabs, current occupancy, etc.), and/or factors provided in Section 3.2 of the guidance (e.g., current land use, environmental conditions, etc.). For example, collection of additional samples may be recommended when the matrix indicates "no further action" for a particular building, but the results of adjacent buildings (especially sub-slab vapor results) indicate a need to take actions to address exposures related to soil vapor intrusion. Mitigation might be recommended when the results of multiple contaminants indicate monitoring is recommended. Proactive actions may be proposed at any time. For example, the party implementing the actions may decide to install sub-slab depressurization systems on buildings where the matrix indicates "no further action" or "monitoring." Such an action might be undertaken for reasons other than public health (e.g., seeking community acceptance, reducing costs, etc.). However, actions implemented *in lieu* of sampling will typically be expected to be captured in the final engineering report and site management plan, and might not rule out the need for post-implementation sampling (e.g., to document effectiveness or to support terminating the action).

[2] Actions provided in the matrix are specific to addressing human exposures. Implementation of these actions does not preclude investigating possible sources of soil vapor contamination, nor does it preclude remediating contaminated soil vapor or the source of soil vapor contamination.

[3] Appropriate care should be taken during all aspects of sample collection to ensure that high quality data are obtained. Since the data are being used in the decision-making process, the laboratory analyzing the environmental samples must have current Environmental Laboratory Approval Program (ELAP) certification for the appropriate analyte and environmental matrix combinations. Furthermore, samples should be analyzed by methods that can achieve a minimum reporting limit of 0.20 microgram per cubic meter for indoor and outdoor air samples. For sub-slab vapor samples and dirt floor soil vapor samples, a minimum reporting limit of 1 microgram per cubic meter is recommended.

[4] Sub-slab vapor and indoor air samples are typically collected when the likelihood of soil vapor intrusion is considered to be the greatest (i.e., worst-case conditions). If samples are collected at other times (typically, samples collected outside of the heating season), then resampling during worst-case conditions might be appropriate to verify that actions taken to address exposures related to soil vapor intrusion are protective of human health.

[5] When current exposures are attributed to sources other than soil vapor intrusion, the agencies should be given documentation (e.g., applicable environmental data, completed indoor air sampling questionnaire, digital photographs, etc.) to support a proposed action other than that provided in the matrix box and to support agency assessment and follow-up.

[6] The party responsible for implementing the recommended actions will differ depending upon several factors, including but not limited to the following: the identified source of the volatile chemicals, the environmental remediation program, and analyte-specific, site-specific and building-specific factors.
