Site Description: "Location: The Hunts Point Food Distribution Center (HPFDC) lies on the Hunts Point peninsula in the South Bronx and is comprised of several separate parcels listed as A through F. Parcel A is divided into two operable units: Operable Unit 1 (OU1) and Operable Unit 2 (OU2). OU2, which is located directly to the west of OU1, is approximately 3.2 acres in size. To the west, OU2 is bounded by Halleck Street, to the north by Viele Avenue, and to the south by Food Center Drive. Site Features: OU1 is primarily covered with asphalt. OU2 is undeveloped. Current Zoning/Use: OU1 and OU2 are both zoned for commercial use. OU1 is currently used as a parking lot and OU2 is undeveloped and vacant. Past Use of the Site: The Site was formerly part of a complex used by the Consolidated Edison for a coal gasification facility (coking station) which was constructed between 1924 and 1932, and operated until the early 1950s. The gasification process has been known to yield large quantities of by-products including Polycyclic Aromatic Hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compounds, and various inorganic compounds such as iron, lead, copper, zinc, sulfides, cyanides and nitrates. Site Geology and Hydrogeology: The soil stratigraphy varies across the HPFDC as a result of previous filling activities. Typically, a 1- to 2-foot thick layer of sandy topsoil/fill overlays fill material that consistently includes soil, construction and demolition debris, ash, cinders, residual coal, and material that is moderately to significantly impacted by Manufactured Gas Plant (MGP) waste (coal tar and purifier waste). The underlying MGP fill layer varies in thickness across the site, but is generally 5 to 7 feet thick. Underlying the MGP fill layer is a native clay layer. Site groundwater was generally encountered on top of the native clay whose depth varies from 7 to 12 feet below ground surface. The depth to groundwater changes throughout the year. The Voluntary Cleanup Agreement for OU2 was terminated on 2/12/18. OU2 was transitioned into the Brownfield Cleanup Program (BCP) under BCP No. C203094. "
Env Problem: "Nature and Extent of Contamination: Prior to remediation: For OU1 and OU2: Based upon investigations conducted to date, the primary contaminants of concern known at this time include polyaromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, xylenes (BTEX), and metals. Investigations have indicated soil and groundwater contamination due to the presence of coal tar. Exceedances of standards, criteria and guidance include PAHs and BTEX in groundwater, and PAHs, copper and zinc in soil. For OU1 only: Remediation of OU1 is complete. Remedial actions have successfully achieved soil cleanup objectives for commercial and industrial uses. Residual contamination in the soil and groundwater is being managed under an Interim Site Management Plan. The Voluntary Cleanup

HUNTS POINT FOOD DISTR CTR (PARCEL A) (Continued) **S112138649**

	Agreement for OU2 was terminated on 2/12/18. OU2 was transitioned into the Brownfield Cleanup Program (BCP) under BCP No. C203094. "
Health Problem:	"Remedial actions are complete and measure are in place to control the potential for coming in contact with residual contamination remaining at the site."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was KOLLEENY In June 2004 during groundwater monitoring, URS detected significant amounts of fresh free product (gasoline) in several wells near the new tanks. A tightness test was performed and the fill line failed. URS implemented IRM to address the free product. In April 2005, URS and Franklin opened the concrete to investigate and found that someone (possibly URS during a soil investigation) had drilled through the line. Franklin repaired the fill line and took two soil samples from beneath the damaged area; results showed only minor soil contamination. URS continued IRM work; by June 2005, minimal product remained in site wells, but there are high levels of dissolved phase groundwater contamination. The residual soil and groundwater contamination caused by this spill will continue to be addressed by URS, under the old spill number for this site: 9810588. This spill is

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

closed to consolidate with that spill. - J. Kolleeny, 9/20/05."

Contact Name:	FRANK GUTTIERI
DEC Memo:	"6/8/11-Vought-Primary off hours responder. Note that NO phone notification of this spill was provided by the Hotline and spill noted upon spill review in UIS the next day. Vought called NYSDOS Guttieri (Ph:646-885-4541) and Guttieri not in and number is for NYCDOH Operations. Vought spoke to NYCDOH Kaleed Weller who sent Vought DOS Unusual Occurrence Report via email. Report noted that the incident location was BX-2 Garage and driver was Tracy Townsend from Star Energy. Report also contained vehicle plates and badge numbers of contacts. As per report STAR ENERGY TRANSPORT ARRIVED AT BX-2 TO DELIVER DIESEL FUEL. SUPV. AGAR PRINTED A VEEDER ROOT RECEIPT TO VERIFY HOW MUCH FUEL COULD BE TAKEN. THE 90% ULLAGE WAS 1585 GALLONS. THE VENDOR STATED HE WOULD DELIVER 1000 GALLONS. AFTER THE DELIVERY

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

THE VENDOR SHUT THE PTO OFF ON THE VEHICLE AND WALKED OVER TO DISCONNECT THE HOSE. AS THE VENDOR DISCONNECTED THE HOSE, IT SHOT OFF THE COUPLING AND DIESEL FUEL BEGAN TO SHOOT OUT OF THE FILLPORT COUPLING. SUPV. AGAR IMMEDIATLEY ORDERED S/W RODRIGUEZ TO SHUT DOWN THE PUMPS. SUPV. AGAR NOTIFIED BX BORO SUPT. CIMINO ABOUT THE INCIDENT. SUPT. CIMINO NOTIFIED BOO AND REPORTED TO BX-2 GARAGE. APPROXIMATELY 25 BAGS OF SPEEDY DRY WERE USED TO CONTAIN THE SPILL. ACCORDING TO VEEDER ROOT RECEIPTS, THE SPILL WAS APPROXIMATELY 87 GALLONS. BBM SUPV. TIM SHANNON RESPONDED AT 1600 HRS AND DETERMINED THAT DEPT CONTRACTOR AARCO ENVIRONMENTAL WOULD BE CONTACTED TO HANDLE THE CLEANUP. AARCO RESPONDED TO THE SCENE AT 1832 HRS. THERE WAS NO SEWER CONTAMINATION. EPU OFFICER BRIAN MORGAN AND DEP ANDREW KELLY RESPONDED TO THE SCENE. DEC LORENZO (TICKET #1102617) AND DEP KUMAR (TICKET #185252204) NOTIFIED. (DSNY HAZMAT LOG #15642). THE CLEANUP IS EXPECTED TO BE COMPLETED BY THE END OF THE 1600-2400 SHIFT. UpDate: AS PER N.B.S. TRIANO ARCO VENDOR RESPONDED TO THE SCENE OF THE SPILL AND COMPLETED THEIR CLEAN UP AT 23:00 HRS (6/7/2011). BX-2 GARAGE DIESEL PUMPS ARE DOWN. BBM WILL BE DISPATCHED THIS MORNING. Vought inquired to Hotline at to confirmation of identity and contact info for DEC Lorenzo as per report above. Hotline noted that report noted that Regional Spills was contacted and Vought noted NO contact was received. Vought noted as per above report, no spill to sewers and spill cleaned using 25 bags of speedy dry by AARCO Environmental and cleanup completed above by AARCO. Spill closed by Vought."

Remarks: "Vendor delivering fuel to location spilled onto ground. Cleanup is in progress. Caller will advise what fuel was spilled onto when info becomes available."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was KOLLEENY Background: Site initially investigated by LMB/RES, then transferred to K&R/URS. In May 1999 URS submitted ISRP proposing dual-phase extraction systems for north and south areas of site. DEC rejected in Dec. 1999 due to insufficient supporting data. URS then proposed excavation of hot spot soil around well MW-7 in south area, bioventing for soil in north area, and ORC for groundwater. DEC approved soil excav. and ORC, asked for SVE instead of bioventing. URS submitted proposal for SVE and GW P&T systems. DEC approved, but in June 2003 they argued that decreasing GW contam. didn't warrant expense and difficulties of installing SVE and P&T systems with shallow bedrock and excavating soil around active USTs; they proposed ORC socks instead. DEC approved modified plan in Oct. 2003, but then in June 2004 several feet of free product (gasoline) were detected in wells near active gasoline tank. Investigation found that a soil boring had breached fill line to tank. Line was repaired, and URS did vac truck product recovery as IRM. By April 2005, no measurable product remained in wells; absorbent socks were put in wells. GW monitoring and gauging continued on somewhat irregular basis. - J. Kolleeny 01/26/07: Completed review of Dec. 7, 2006 Proposed Remedial Strategy report by URS (in eDocs). Report noted that GW monitoring events in June and August '06 showed worsening dissolved-phase GW contamination; they proposed addressing GW with Chemical Oxidation, plus installing 8 additional wells to help design chem ox injection system, evaluate remedial progress, and fully delineate GW plume. URS also recommended NFA for limited shallow soil contamination around MW-7 in south area. JK sent letter (in eDocs) approving chem ox strategy and additional well installation proposals, and agreed that NFA is warranted for soil around MW-7. In email accompanying letter (in file) noted that due to high levels of GW contamination and fact that new remedial strategy hasn't yet been implemented, priority ranking of this spill is revised from P2 to P1. - J. Kolleeny 08/07/2007: This spill case was transferred to A. Doronova. -AD 08/20/2007: Received a Design Analysis Report. Will review. AD 05/21/2008: Received a phone call from Richard Mayers of Building Maintenance (Departmant of Sanitation), phone: 718-3349137. AD 02/20/2009: Received ecopy of a Report for the period of August - December 2008 via email, prepared by URC. Dl to eDocs. AD 02/23/2009: Received a hard copy of the report. Will review. AD 03/26/2009:

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Reviewed the System Performance report. Between May 9 and July 9, 2008, Envirotrac installed 40 injection wells at the site. First round of RegenOx injections was completed on August 27, 2008 and the second round on October 17, 2008. During each round, approximately 160 lb of RegenOx and 100 gallins of water were injected into each of the 40 injection wells and monitoring well MW-03. Groundwater samples were collected from monitoring wells prior and after each injection round. On August 13, September 30 and December 11, 2008, URS collected groundwater samples from all of the well in the monitoring program except: MW-25 (had 0.01' of free product) and MW-30 (limited access). With the exception of MW-23 (on 12/11/08) all of the wells exhibited VOCs exeeding NYSDEC GQC. The most significant contamination was detected in wells: MW-3(27,068ppb), MW-27(19,199ppb), and MW-31(43,800ppb). Total VOCs in the remaining wells ranged from 36ppb in MW-02 to 8,949ppb in MW-29. Envirotrac initiated the third round of injections on February 2, 2009. Regenox injection were also made into wells MW-27 and MW-31 (instead IW-10 and IW-11) to assist in reducing dissolved phase concentrations in these monitoring wells. URS will continue quaterly groundwater monitoring while RegenOx injections are ongoing. AD 05/13/2009: Received pdf copy of a System Performance Report for Monitoring Period January through March 2009 via e-mail. DL to eDocs. AD 06/08/2009: Reviewed the System Performance report dated May 6, 2009. It states that on March 5, 2009 URS collected groundwater samples from all of the well in the monitoring program. All of the wells exhibited VOCs exeeding NYSDEC GQC. The most significant contamination was detected in wells: MW-3(19,580ppb), MW-27(24,360ppb), MW-31(15,063ppb) and 21,063ppb in MW-29. Total VOCs in the remaining wells ranged from 20ppb in MW-23 to 2,640ppb in well MW-26. The analytical data since the RegenOx injections show mixed results at individual wells, but the overall average total VOC concentration across the site has decreased. URS will re-evaluate the remedial program considering other oxidants such as - sodium persulfate. URS will continue quaterly groundwater monitoring at the site. No response is needed. AD 08/21/2009: Received a System Performance Report for Monitoring Period April through June 2009. Will review. AD 09/08/2009: Reviewed the System Performance report dated August 14, 2009. It states that on June 16 and July 1, 2009 URS collected groundwater samples from all of the well in the monitoring program. VOCs were below NYSDEC GQC in wells MW-18, MW-30 and MW-31. The most significant contamination was detected in wells: MW-03(13,710ppb), MW-27(44,400ppb from 24,360ppb in last report), and MW-29(16,911 from 21,063ppb in last report). Total VOCs in the remaining wells ranged from 17ppb in MW-05 to 1,783ppb in well MW-26. The analytical data since the RegenOx injections show positive results, with the exeption of well MW-27. The reason for the significant increase in well MW-27 may be due to recent spill #0903339 that was reported on June 22, 2009 and caused by a broken vapor recovery pipe associated with the 4,000-gallon gasoline underground storage tank (UST). It was estimated that 200 gallons of gasoline were released when water entered the tank through the broken pipe and displaced the gasoline. The cause of the spill was confirmed when the north portion of the concrete tank slab and pea gravel were removed to expose the craced piping. The NYC Departement of Sanitation removed all of the fuel from the gasoline UST and it carrently remains off-service. URS will re-evaluate the remedial program considering other oxidants. URS will continue quaterly

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

groundwater monitoring at the site. AD 09/22/2009: The recent spill #0903339 that was reported on June 22, 2009 and caused by a broken vapor recovery pipe associated with the 4,000-gallon gasoline underground storage tank (UST) was closed and consolidated with this spill case. AD 02/12/2010: Received a System Performance Report for Monitoring Period November 2009 through January 2010. DL to eDocs. Will review. AD 03/02/2010: Reviewed the System Performance report dated November 24, 2009. It states that on August 13, 2009 URS collected groundwater samples from all of the well in the monitoring program, except MW-3 and MW-25 due to the presemce of product. VOCs were below NYSDEC GQC in wells MW-12, MW-18, and MW-24. Minor contamination was detected in wells: MW-1, MW-2, MW-5, MW-20, MW-23, MW-30, MW-31 and MW-32 where total VOCs ranged from 13ppb in MW-30 to 197ppb in well MW-32. The most significant contamination was detected in wells: MW-26(2,349ppb), MW-27(27,090ppb), MW-28(5,606ppb)and MW-29(15,794). The latest GW analytical data (October 2009)since the RegenOx injections show that the average total VOCs across the site decreased by 36%. URS will re-evaluate the remedial program considering other oxidants. URS will continue quaterly groundwater monitoring at the site. AD 05/20/2010: Received a System Performance Report for Monitoring Period February through April 2010. DL to eDocs. Will review. AD 06/25/2010: Reviewed the System Performance report dated May 20, 2010. On February 17, 2010, URS collected groundwater samples from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in five wells, which include MW-05, MW-12, MW-18, MW-24, and MW-32. Minor contamination was detected in seven wells, including MW-01, MW-02, MW-20, MW-23, MW-25, MW-30 and MW-31, which exhibited total VOC concentrations of 42 ppb, 48 ppb, 294 ppb, 55 ppb, 114 ppb, 6.6 ppb and 2.38 ppb, respectively. The most significant dissolved phase concentrations were detected in wells MW-03 (10,303 ppb), MW-27 (19,769 ppb) and MW-29 (17,287 ppb). Total VOC concentrations in the remaining two wells were 1,112 ppb (MW-26) and 5,842 ppb (MW-28). Despite the release of gasoline reported at the facility in June 2009 (spill #0903339, which was combined with active spill #9810588), the latest analytical data show that the average total VOC concentration across the site decreased by 41% since the RegenOx injections were initiated. Following the 2009 gasoline spill, free product was detected in wells MW-03 and MW-25 and on the top of the exposed gasoline tank. As a result, URS initiated product recovery using the vacuum truck. By October 2009, it was evident that the effort had a positive impact since there was no product in well MW-25 and only 0.01 feet of product in well MW-03. In addition, the top of the tank was dry. As a result, URS reduced the frequency of the site visits to recover free product to quarterly. During the February 2010 sampling event, product was not detected in any of the monitoring wells. At this time, there are no additional RegenOxTM injections scheduled. URS will continue to monitor groundwater quality on a quarterly basis. AD 09/15/2010: Received a System Performance Report for Monitoring Period May 2010 through July 2010. AD 10/15/2010: Reviewed the System Performance report dated August 25, 2010. It states that on May 26, 2010, URS collected groundwater samples from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in five wells, which include MW-12, MW-18, MW-23, MW- 24, and MW-30. Minor contamination was detected in seven wells,

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

including MW-01, MW-02, MW- 05, MW-20, MW-25, MW-31 and MW-32, which exhibited total VOC concentrations of 40 ppb, 64 ppb, 24 ppb, 294 ppb, 46 ppb, 13 ppb and 126 ppb, respectively. The most significant dissolved phase concentrations were detected in wells MW-03 (12,074 ppb), MW-27(25,040 ppb) and MW-29 (13,228 ppb). Total VOC concentrations in the remaining two wells were 1,242 ppb (MW-26) and 4,173 ppb (MW-28). URS states that although groundwater quality at the site has significantly improved because of the RegenOx injections, the concentrations of VOCs in groundwater have stabilized over the last two quarters. Further reduction in VOCs is required to meet cleanup goals for the site. Therefore, URS recommends that an additional three RegenOx injections be implemented at the site. URS will proceed with design and implementation of the RegenOxTM injections upon approval from the NYSDEC. Quarterly monitoring will continue as scheduled. Will approve the recommendation. AD 10/19/2010: Had a quarterly meeting with DDC and URS. Discussed the RegenOx injections for this site. Approved the recommendations. AD 02/14/2011: Received a System Performance Report for Monitoring Period August through November 2010. DL to eDocs. Will review. AD 03/22/2011: Received an e-mail from Kevin Shanahan of URS saying: Ainura, NYSDEC has approved using RegenOx at the Bronx West 2 sanitation garage site to address VOC impacted groundwater. Three rounds of RegenOx injections were completed in 2008 and 2009. The results are favorable and URS notified DEC that we intended to perform additional injections this spring. RegenOx will be injected into 26 injection wells as illustrated in the attached figure (locations are shown in bold). The specific injection well locations target the two groundwater plumes on-site and are identified as: IW-12, IW-14, IW-15, IW-17, IW-24, IW-25, IW-26, IW-27, IW-28, IW-29, IW-30, IW-31, IW-32, IW-33, IW-34, IW-35, IW-39, MW-01, MW-03, MW-04, MW-24, MW-25, MW-26, MW-27, MW-28, and MW-29. The contractor will conduct four separate injection events over the next two to three months. Sincerely, Kevin J. Shanahan Project Manager URS Corporation 77 Goodell Street Buffalo, New York 14203 716-923-1215 03/30/2011: Reviewed the System Performance report dated February 14, 2011. It states that the latest groundwater analytical data was collected on August 31, 2010, from all of the wells in the monitoring program. The analytical results showed that among the 17 wells sampled, VOCs were below the NYSDEC Groundwater Quality Criteria in 5 (five) wells, which include MW-05, MW-12, MW-18, MW-24, and MW-30. Minor contamination was detected in 5 (five) wells, including MW-01, MW-02, MW-23, MW-31 and MW-32, which exhibited total VOC concentrations of 80 ppb, 25 ppb, 13 ppb, 26 ppb and 156 ppb, respectively. The most significant levels of VOCs were detected in wells MW-03 (36,767 ppb) and MW-27 (32,977) ppb. Total VOC concentrations in the remaining five wells were 558 ppb (MW-20), 303 ppb (MW-25), 1,119 ppb (MW-26), 843 ppb (MW-28), and 1,598 ppb (MW-29). Although groundwater quality at the site has improved because of the RegenOx injections, the concentrations of VOCs in groundwater have not shown significant improvement over the last three quarters. Further reduction in VOCs is required to meet cleanup goals for the site. In the October 19, 2010 quarterly progress meeting, the Department agreed to URS s proposal to complete three additional RegenOx injections at the site. Injections will be implemented under Contract R-78 which is expected to be awarded in the spring of 2011. In the interim, URS plans a limited injection of RegenOxTM into heavily contaminated areas under a change order to remediation contract R-75. Quarterly monitoring

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

will continue as scheduled. AD 06/21/2011: Received a System Performance Report for Monitoring Period November 2010 through January 2011. DL to eDocs. Will review. AD 08/22/2011: Received a System Performance Report for 1st quarter 2011 Monitoring Period. DL to eDocs. Will review. AD 10/20/2011: Reviewed the report. It states that four additional RegenOxTM injection events were implemented in the second quarter of 2011 by Clean Globe Environmental, LLC (CGE). On April 13, 2011, CGE resumed RegenOxTM injections at the site. Injection during these new events is being focused on 26 existing injection wells and monitoring wells previously installed at the site which are located in the most contaminated area of the site. During these injection events, the target injection quantity for each location is approximately 80 pounds of oxidant, 40 pounds of activator and 160 gallons of water. The first injection event employed a pulsed injection technology at each well to aid in the distribution of the RegenOxTM in the subsurface. Further information on the injection events, including the first round of groundwater analytical results following the injections, will be presented in the next monitoring report for the second quarter of 2011. On March 30, 2011, URS collected groundwater samples from 16 of the 17 wells in the monitoring program. Well MW-03 was not sampled due to the presence of free product. The analytical results show that among the 16 wells sampled, VOC concentrations were below the NYSDEC GQC in seven wells: MW-01, MW-05, MW-12, MW-18, MW-24, MW-30 and MW-32. The most significant dissolved phase concentrations were detected in wells MW-27 with 46,115 ppb TVOCs and MW-29 with 24,375 ppb TVOCs. Total VOC concentrations in the remaining wells ranged from below detection to 1,842 ppb. Following the June 2009 gasoline spill at the facility (spill #0903339 which was combined with active spill #9810598), free product was detected in wells MW-03 and MW-25 and on the top of the exposed gasoline tank. As a result, URS conducted three product recovery events in August 2009 using the vacuum truck. By October 2009, it was evident that the effort had a positive impact since there was no product in well MW-25 and only 0.01 feet of product in well MW-03. In addition, the top of the tank was dry. As a result, URS reduced the frequency of the site visits to quarterly. During the most recent quarterly monitoring event (March 2011), product was only detected in well MW-03 (0.01 feet). In addition to implementing the RegenOxTM injections, URS will continue to monitor groundwater quality on a quarterly basis. Based on the petroleum storage tank inventory analysis presented above, and the extent of the groundwater plume, it appears that Tank Nos. 001, 001A, 002, 003, and 004 may potentially be impacting groundwater. Removal of these tanks and any petroleum-impacted soils may prove to be beneficial for on-going site remediation. Unfortunately, the proximity of Tank No. 001 to facility walls and the presence of fuel dispensers over Tank Nos. 001A, 002, 003, and 004 are significant obstacles to tank removal. URS will continue to evaluate the feasibility of removing these tanks as well as the associated benefits. AD 12/13/2011: Received a GW Monitoring Report for 2nd quarter 2011 period. DL to eDocs. Will review. AD 01/27/2012: Reviewed the report. It states that additional RegenOxTM injections proposed by URS for the site were implemented during the second quarter of 2011. CGE completed four rounds of RegenOxTM injections between April 13 and June 7, 2011. Injection during these events was focused at 26 existing injection wells and monitoring wells located in the most contaminated area of the site. All but three of the proposed injection points were

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

at least partially injected during the four events. Only three locations were unsuccessful; injection could not be completed in well MW-24 because the well cover was stuck, well MW-26 because the well was found to be clogged, and in well IW-26 because the RegenOxTM slurry began to daylight through the wall of a nearby office. The actual quantities injected for the first two events achieved 94% and 98% of the target quantities respectively; the last two events achieved 74 and 78% of the target quantities. However, after the first two events, problems with the injected material leaking out from the nearby ramp wall and with daylighting in the sidewalk area appeared to be increasing. URS re-evaluated the injection goals and determined that for some locations, the quantity of injected material should be decreased by half and that several others should be injected by gravity flow only to reduce the pressure. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter GW samples were collected on June 28, 2011. All wells were sampled except for MW-01, MW-24, MW-25, and MW-26. These wells were not sampled because they were still temporarily sealed to prevent daylighting from the nearby RegenOxTM injection activities; these wells will be available for sampling in the next quarter. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC standards in 6 wells: MW-12, MW-18, MW-23, MW-30, MW-31 and MW-32. Well MW-02 contained only MTBE - 15ppb. Well MW-05 contained only benzene at - 1.3ppb. The highest TVOCs were detected in wells MW-27 with 20,908ppb total VOCs and MW-29 with 12,309 ppb total VOCs. Total VOCs in the remaining three wells were 435 ppb in MW-20, 452 ppb in MW-28, and 828 ppb in MW-03. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to a relatively small area in the vicinity of wells MW-26, MW-27, and MW-29. Based on the petroleum storage tank inventory analysis made by URS, and the extent of the groundwater plume, it appears that Tank Nos. 001, 001A, 002, 003, and 004 may potentially be impacting groundwater. Removal of these tanks and any petroleum-impacted soils may prove to be beneficial for on-going site remediation. Unfortunately, the proximity of Tank No. 001 to facility walls and the presence of fuel dispensers over Tank Nos. 001A, 002, 003, and 004 are significant obstacles to tank removal. URS will continue to evaluate the feasibility of removing these tanks, as well as the associated benefits. URS will continue to monitor groundwater quality on a quarterly basis. No additional remedial measures are planned at this time, pending the results and response of the site to the most recent RegenOxTM injections. AD 02/09/2012: Received a GW Monitoring Report for 3rd quarter 2011 period. DL to eDocs. Will review. AD 03/20/2012: Reviewed the report. It states that the third quarter samples were collected on September 28 and 29, 2011. All wells currently in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 3 to 16 feet bgs. The groundwater flow direction is generally to the west. Bedrock is encountered from 2 feet to greater than 24 feet bgs. Product was last detected in March 2011 when 0.01 feet of product was detected in well MW-03. Prior to that random occurrence, no product had been detected since 2009. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC GW standards in 6 wells: MW-12, MW-18, MW-23, MW-24, MW-30, and MW-31. Well MW-01 contained only MTBE above the GQC with a 44 ppb. Well

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-28 contained only benzene at - 6.7 ppb and MTBE at -11 ppb. Well MW-32 contained only benzene at - 10 ppb. The highest TVOCs were detected in 4 wells: MW-05, MW-26, MW-27 and MW-29 with 1,017 ppb, 2,671 ppb, 23,647 ppb, and 21,650 ppb TVOCs, respectively. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to a relatively small area in the vicinity of wells MW-26, MW-27, and MW-29. As indicated by data, while a few wells in the apparent source area (MW-27 and MW-29) show an increase in dissolved phase contaminant concentrations, overall the groundwater quality at the site shows a significant net contaminant reduction of more than 70%. The two locations showing an increase in concentrations following the injections are likely the result of additional contamination desorbing from the soil as a result of the RegenOx injections. URS states that significant improvement in groundwater quality has occurred after seven RegenOxTM injection events, resulting in a 70% reduction in TVOC concentrations. However, the most contaminated area of the site, measuring approximately 40 feet in diameter, remains at high concentrations. URS will continue to monitor groundwater quality and the effectiveness of the 2011 remediation on a quarterly basis. No additional remedial measures are planned at this time, pending the results and response of the site to the most recent RegenOx injections. AD 05/17/2012: Received 4th QMR for 2011 and 1st QMR for 2012 prepared by URS. DL to eDocs. Will review. AD 06/12/2012: Reviewed the 4th quarter 2011 report. It states that the monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells currently in the monitoring program were sampled during the fourth quarter 2011 sampling event on December 27, 2011. The analytical data from this sampling event showed that no VOCs exceeded the NYSDEC GW standards in 5 wells: MW-3, MW-5, MW-18, MW-23 and MW-30. The highest TVOCs were detected in 3 wells: MW-26 (1,334 ppb), MW-27 (26,793 ppb) and MW-29 (5,808 ppb). Moderate levels of VOCs were detected in 6 wells: MW-12 (219ppb), MW-20 (420ppb), MW-24 (345ppb), MW-25 (128ppb), MW-28 (428ppb) and MW-30 (188ppb). Low levels of VOCs detected in 3 wells: MW-1 (13ppb), MW-2 (32ppb) and MW-31 (45ppb). The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, and MW-29. Based on the data, URS states that significant improvement in groundwater quality has occurred after seven RegenOxTM injection events, resulting in a reduction in total VOCs on the order of 70%. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 40 feet in diameter, remain high. URS will continue to monitor groundwater quality and the effectiveness of the 2011 remedial actions on a quarterly basis. AD 06/13/2012: Reviewed the 1st quarter 2012 monitoring report. It states that all 17 wells currently in the monitoring program were sampled during the first quarter 2012 sampling event on March 27, 2012. Depth to groundwater at the site can vary significantly, but typically ranges from 3 to 16 feet bgs. The groundwater flow direction is generally to the west. The analytical data from the sampling event on March 27, 2012 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 7 wells: MW-02, MW-05, MW-12, MW-18, MW-23, MW-30, and MW-31. Only minor VOC contamination was detected in well MW-01 (17 ppb). The total VOCs in the remaining wells ranged from 44 ppb in MW-24 to 27,027 ppb in well MW-27. The following wells indicated increase in

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

VOCs comparing to the December 2011 sampling round: 1. MW-3 - 135 ppb from 4 ppb; 2. MW-25 - 313ppb from 128ppb: 3. MW-27 - 27,027ppb from 26,793ppb; 4. MW-28 - 3,589ppb from 428ppb; 5. MW-29 - 20,523ppb from 5,808ppb (the biggest increase in TVOCs) The following wells indicated decrease in VOCs comparing to the December 2011 sampling round: 1. MW-2 - 13ppb from 32ppb; 2. MW-12 - 3ppb from 219ppb; 3. MW-20 - 262ppb from 420ppb; 4. MW-24 - 43ppb from 345ppb; 5. MW-26 - 1088ppb from 1334ppb; 6. MW-31 - ND from 45ppb; 7. MW-32 - 65ppb from 188ppb. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, MW-28 and MW-29. URS will continue to monitor groundwater quality and the effectiveness of the RegenOx injectioons on a quarterly basis. In addition, URS is currently evaluating the most feasible remedial technology to be implemented at the site in 2012. It is likely that additional RegenOx"! or similar technology will be used at the site to address the remaining areas of groundwater contamination. AD 12/17/2012: Received a GW Monitoring Repoer for 2nd and 3rd quarters of 2012. DL the report to eDocs. Will review. AD 01/29/2013: Reviewed the monitoring report. It states that the analytical data from the most recent sampling event on September 26, 2012 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 9 wells: MW-01, MW-02, MW-05, MW-12, MW-18, MW-23, MW-24, MW-30, and MW-31. Only minor VOC contamination was detected in wells MW-03 and MW-32 with total VOC concentrations of 45 parts per billion (ppb) and 10 ppb, respectively. The total VOC concentrations in the remaining wells ranged from 124 ppb in MW-25 to 25,640 ppb in well MW-27. The TVOCs data (ppb) June 2012 - September 2012: 1. MW-1 - ND - ND; 2. MW-2 - 9ppb - ND; 3. MW-3 - 31.8 ppb - 44.9 ppb; 4. MW-5 - ND - ND; 5. MW-12 - ND - ND; 6. MW-18 - ND - ND; 7. MW-20 - 356ppb - 293ppb; 8. MW-23 - ND - ND; 9. MW-24 - 16ppb - ND; 10. MW-25 - 119ppb - 124ppb; 11. MW-26 - 510ppb - 619ppb; 12. MW-27 - 25,738ppb - 25,640ppb; 13. MW-28 - 48ppb - 3,502ppb; 14. MW-29 - 17,155ppb - 985ppb; 15. MW-30 - ND - ND; 16. MW-31 - ND - ND; 17. MW-32 - 34ppb - 8ppb. The most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to area in the vicinity of wells MW-26, MW-27, MW-28 and MW-29. The area of remaining groundwater contamination is defined by monitoring wells MW-26 through MW-29. In the most recent monitoring event, these wells had total VOC concentrations ranging from 620 ppb to 25,640 ppb. URS concludes that significant improvement in groundwater quality has occurred after seven RegenOx injection events, resulting in a reduction in total VOC concentration on the order of 70%. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 60 feet by 30 feet, remain high. Based on the previous success, URS considers additional RegenOx injections to be the most feasible option for additional remedial actions. However, URS intends to further refine the extent/source of the dissolved phase plume and also to evaluate the installation or repair of existing injections wells prior to conducting the injections. During the next quarter, URS will collect analytical data from existing injection wells in order to more clearly define the dissolved phase plume and to allow for the optimum location of future injection wells. Once the results from the additional groundwater samples are available, URS will determine locations for new injection wells and details for the next phase of remedial actions. This information will be submitted to the NYSDEC. However, because this is a continuation

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

of the previously approved RegenOx injections at the site, URS will proceed with the implementation and scheduling of the proposed work once the details of the actions have been determined. URS will continue quarterly GW moitoring at the site. AD 06/27/2013: Received the folowing e-mail from URS: Ainura, We discussed this site during our last meeting. The seven new injection wells have been installed and they are entirely screened in the bedrock zone. You had requested that we forward to you our next Work Order we intend to issue to our contractor for the next several rounds of RegenOx injections. Attached please find Work Order R-84-03 to satisfy this request. Also attached is our latest quarterly monitoring report dated June 5, 2013 which documents the most recent groundwater sampling completed on-site. Figure 5 of that report shows that over the past four quarterly sampling events we have VOCs detected in wells near the entrance of the sanitation garage specifically wells MW-26, MW-27, MW-28, MW-29, and MW-01. As you are aware, the RegenOx has been effective in remediating the groundwater at many areas of the site but we have this one remaining area to address. Therefore, the Work Order is comprised of eight separate injection events at 24 injection wells in this area. We have already procured a contractor to perform this work so please let us know if you have any comments or concerns regarding the scope of work. I will be on vacation until July 8th so please copy Harvey Roberts on your response. Thanks, Kevin J. Shanahan Senior Project Manager URS Corporation 77 Goodell Street Buffalo, New York 14203 kevin.shanahan@urs.com Office: 716-923-1215 Cell: 716-480-7352 DL the report and work plan to eDocs. Will review. AD 07/11/2013: Reviewed the work plan. It states that some site wells continue to exhibit high levels of VOC concentrations. Based on the data, URS recommends performing additional rounds of chemical oxidation, which involves RegenOx injections via twenty four existing injection locations, which also include permanent monitoring wells. The proposed injection locations also include most contaminated site groundwater wells: MW-27, MW-29 and MW-29. Will discuss the plan with J. Kolleeny of DEC. AD 07/15/2013: Discussed the work plan with J. Kolleeny. Issued and sent an approval letter to A. Samani of DDC with the following comments: " Monitoring well MW-27 should be omitted from the proposed direct injections; " If RegenOx application will not be effective in VOCs reductions, alternative remediation technologies should be proposed for the site. DL pdf copy of the letter to eDocs. AD 11/26/2013: Received a GW Monitoring Report for 2nd and 3rd quarters of 2013. DL the report to eDocs. Will review. AD 12/10/2013: Reviewed the monitoring report. It states that on August 14, 2013, CGE implemented the first round of RegenOx injections in the newly-installed wells at the site (IW-41 through IW-47). It should be noted that CGE inadvertently injected RegenOx at well MW-27 consistent with previous injection events. URS has directed CGE to terminate all future injections at this location. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the monitoring program were sampled during the second quarter sampling event on June 24 and 25, 2013 and during the third quarter sampling event on September 23 and 24, 2013. Depth to groundwater at the site vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The TVOCs data (ppb) June 2013 - September 2013: 1. MW-1 - 702 - 2,543; 2. MW-2 - 38 - 25; 3. MW-3 - 12 - 746; 4. MW-5 - 245 -

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

186; 5. MW-12 - 10 - ND; 6. MW-18 - ND - ND; 7. MW-20 - 428 - 567; 8. MW-23 - ND - ND; 9. MW-24 - ND - ND; 10. MW-25 - 87 - 95; 11. MW-26 - 1,138 - 1,052; 12. MW-27 - 28,473 - 5,557; 13. MW-28 - 339 - ND; 14. MW-29 - 1,789 - ND; 15. MW-30 - 167 - 305; 16. MW-31 - ND - ND; 17. MW-32 - ND - ND. The analytical data from the most recent sampling event in September 2013 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in 8 wells: MW-12, MW-18, MW-23, MW-24, MW-28, MW-29, MW-31, and MW-32. Only minor VOC contamination was detected in well MW-02 with a total VOCs of 25 parts per billion (ppb). The highest total VOCs were found in monitoring wells MW-27 with 5,557 ppb, MW-01 with 2,543 ppb, and MW-26 with 1,053 ppb. The total VOC concentrations in the remaining wells ranged from 96 ppb to 746 ppb. There were 5 wells which indicated increase in TVOCs levels (in ppb) from June to September 2013 sampling: MW-1 (from 702 - 2,543), MW-3 (from 12 to 746), well MW-20 (from 428 to 567), well MW-25 (from 87 to 95), and well MW-30 (from 167 to 305). According to the report, the most recent groundwater analytical data shows that the dissolved phase contamination persists at the site, but is limited to a relatively small area near an entrance ramp in the vicinity of monitoring wells MW-26 through MW-29. Significant improvement in groundwater quality occurred after RegenOx injection events conducted in 2008-2009 and 2011. However, the VOC concentrations at the most contaminated area of the site, measuring approximately 60 feet by 30 feet, remain high. URS recently installed seven new bedrock injection wells and initiated a new round of RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: " Continue the quarterly groundwater monitoring and sampling program. " Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections (not including MW-27). " Install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals requiring DEC approval at this time. AD 06/13/2014: Received a GW Monitoring Report for 4th quarter of 2013 and 1st quarter of 2014. Will review. AD 07/15/2014: Reviewed the monitoring report. It presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the fourth quarter of 2013 and first quarter of 2014 (through March). GW sampling: The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater samples are analyzed for petroleum-related VOCs using USEPA Method SW-846 8260B. On December 16 and 17, 2013, all wells in the monitoring program except for MW?18 were sampled for the fourth quarter 2013 sampling event. Well MW-18 did not contain enough groundwater to collect a sample. All wells in the monitoring program were sampled during the first quarter 2014 sampling event on March 17 and 18, 2014. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, and concrete and brick fragments. Bedrock is encountered anywhere from 2 feet to

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

greater than 24 feet bgs. GW data- December 2013 - March 2014 1. MW-1 - 260 - 1113; 2. MW-2 - 46 - 44; 3. MW-3 - 324 - 758; 4. MW-5 - 352 - 883; 5. MW-12 - ND - ND; 6. MW-18 - ND - ND: 7. MW-20 - 123 - 23 8. MW-23 - ND - ND; 9. MW-24 - ND - ND; 10. MW-25 - 568 - 133; 11. MW-26 - 1224 - 1044; 12. MW-27 - 4147 - 15761; 13. MW-28 - 334 - 458; 14. MW-29 - 1520 - 5781; 15. MW-30 - 3027 - 241; 16. MW-31 - ND - ND; 17. MW-32 - ND - ND. The analytical data from the most recent sampling event in March 2014 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-31, and MW-32. Only minor VOC contamination was detected in well MW-02 with a total VOC concentration of 44 parts per billion (ppb) and MW-20 with 23 ppb total VOCs, and only one exceedance of the criteria at each location. The highest total VOC concentrations were found in monitoring wells MW-27 with 15,761 ppb and MW-29 with 5,782 ppb. The total VOC concentrations in the remaining wells ranged from 134 ppb to 1,113 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-26 through MW-30. Conclusions: URS states that significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008?2009, 2011, and 2013. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS will initiate additional RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals requiring DEC approval at this time. AD 10/14/2014: Received a GW Monitoring Report for 2nd and 3rd quarters of 2014. Will review. AD 11/20/2014: Reviewed the report. The report states that URS is currently completing groundwater remediation through chemical oxidation and quarterly groundwater monitoring at the Bronx West 2 site. This report presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the second and third quarters of 2014 (through September). Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The monitoring wells network currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32.The second quarter samples were collected on June 18 and 19, 2014. All wells in the monitoring program were sampled at this event except for MW-30 because it was blocked by a vehicle. The third quarter samples were collected on September 8 and 9, 2014. Well MW-18 was not sampled during this event because it was dry. The analytical data from the most recent sampling event in September 2014 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW?12, MW?23, MW?31, and MW? 32. The highest total VOC concentrations were found in monitoring wells MW?27 with 11,706 parts per billion (ppb), MW?29

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

with 3,944 ppb, and MW?01 with 1,544 ppb. The total VOC concentrations in the remaining wells ranged from 11 ppb to 733 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-26 through MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of monitoring well MW?20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013; the socks were replaced on May 21, 2014. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. In the year following the installation of the socks, the total VOC concentrations have been lower, ranging from 23 ppb to 296 ppb. URS will continue to replace the ORC socks at this location approximately every six months. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008?2009, 2011, 2013, and 2014. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS will initiate additional RegenOx injections in the area of remaining contamination. The most recent round of groundwater monitoring data indicates that the latest RegenOx injections are further reducing the dissolved phase concentrations in the groundwater. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. No proposals which require DEC approval at this time. AD 03/18/2015: Received a phone call from Mr. Shanahan of URS. He informed that while checking the site wells URS detected a 2.3’ of a free product in well MW-01. He asked if a new spill should be reported to DEC. Told him that there is no need for new case. They collected a free product sample for a fingerprint analysis. One active tank is located downgradient of this well. There is no history of a free product in the well. Asked if a product was weathered. Requested to check when last time the tank was tightness tested and suggested to perform IRM in a meantime. Later, received the following e-mail from Mr. Shanahan: Ainura, Shawn Miller our environmental sampling technician was at the Bronx West 2 DSNY sanitation garage yesterday to perform routine groundwater sampling. The site plan and extent of groundwater contamination figures are attached. The site is located at 650 Casanova Street in the Bronx. Shawn detected 2.35 feet of petroleum product at well MW-01 using an oil/water interface probe. This well is near the 4,000-gallon biodiesel UST and dispenser. Product has not been detected at this site since 2004. Surrounding wells were not affected. He collected a product sample for petroleum fingerprint analysis. Shawn indicated that he could not determine if the product was fresh or weathered. Based on our discussions we decided the following: 1.NYSDEC will not open a new spill number since this area is already within the area we

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

are remediating. 2.URS will implement an IRM to address the product (we will recover product with a peristaltic pump and install a petroleum absorbent sock on 3/23/15). 3. Send a follow-up email to you after the IRM work to convey the latest data. 4.Contact DSNY to inquire as to when the biodiesel tank was tested last (we have notified DSNY of the situation yesterday). 5.Document the product discovery and IRM work in our quarterly reports. Thanks, Kevin J. Shanahan Project Manager Direct: 716-923-1215 Cell: 716-480-7352 Note New Email: kevin.shanahan@aecom.com AD 09/09/2015: Received the following e-mail from K. Shanahan: Hi Ainura, We continue to detect free product in well MW-01 during our routine groundwater sampling events. As a result, we have implemented a monthly product recovery program using a peristaltic pump. We notified DSNY of the situation and they had Aarco Environmental perform a tank tightness test. The tank passed the tightness test (see attached report). We will continue to look for a source of the free product. Thanks, Kevin J. Shanahan Project Manager Direct: 716-923-1215 Cell: 716-480-7352 Note New Email: kevin.shanahan@aecom.com 09/17/2015: Received the following e-mail from URS: Document report.sp9810588.20150917.bronx_west2.2ndq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Second Quarter 2015 for the Bronx West 2 Garage site. Please log in to http://ddcreports.ursbufweb.com to view the document. It can be found under the eDocs page. Thank you. Will review. AD 10/16/2015: Reviewed the report. It states that in October 2014, URS issued Scope of Work R-84-13 for the latest round of RegenOx injection events at the site. The scope of work was essentially the same as the 2013 scope of work including a total of eight injection events. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between December 2014 and February 2015. The injection information for this event is included as Attachment A. All target wells were successfully injected according to the plan except for bedrock wells IW-42 and IW-43 which only would accept minimal amounts of product. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter 2015 samples were collected on June 15, 16, and 17, 2015. Well MW-31 was not sampled at this event because it was blocked by a vehicle. Well MW-1 was not sampled during this event because it was found to contain product; the recent product discovery in this well is further discussed below. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in June 2015 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23 and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 12,496 parts per billion (ppb). Other wells with elevated concentrations were MW-29 with 7,374 ppb, MW-30 with 993 ppb, MW-26 with 635 ppb, and MW-05 with 274 ppb. The total VOC concentrations in the remaining wells ranged from 14 ppb to 136 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the vicinity of the north entrance ramp in the vicinity of monitoring wells MW-01, MW-03,

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-05, and MW-26 through MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of monitoring well MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014 and most recently on June 10, 2015. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOC concentrations have generally been lower; only 74.6 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every six months. Based on the fact that relatively little product is being found in well MW-01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted and determine whether any additional action will be required. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted in 2008-2009, 2011, 2013, and 2014. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS recently conducted additional RegenOx injections in the area of remaining contamination. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to collect product from monitoring well MW-01. " Continue the use of chemical oxidation to remediate the dissolved phase impacts via additional RegenOx injections. " Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: " None. AD 12/02/2015: Received the following e-mail from URS: Document report.sp9810588.20151202.bronx_west2.3rdq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Third Quarter 2015 at the Bronx West 2 site. Please log in to http://ddcreports.ursbufweb.com to view the document. It can be found under the eDocs page. Thank you. URS Will review. AD 01/06/2016: Reviewed the report. It states that URS completing groundwater remediation at the Bronx West 2 site through chemical oxidation and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the third quarter of 2015 (through September 2015). GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter 2015 samples were collected on September 8 and 9, 2015. All wells in the monitoring program were sampled at this event except for

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

well MW-01 because it was found to contain product. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in September 2015 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-31 and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 6,428 parts per billion (ppb). Other wells with elevated concentrations were MW-25 with 1,698 ppb, MW-24 with 1,649 ppb, MW-03 with 1,456 ppb, MW-29 with 769 ppb, and MW-30 with 625 ppb. The total VOC concentrations in the remaining wells ranged from 14 ppb to 304 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-24 through MW-30. Site conditions: According to URS, while the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014 and most recently on June 10, 2015. In the year prior to ORC sock installation, the total VOC concentration at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOC concentrations have generally been lower; only 76 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every six months. Free product: As noted above, free product was found at well MW-01 during the 1st quarter 2015 sampling event; the measured product thickness was 2.35 feet. The last product seen at this location was in 2004. URS notified the DSNY who verified that the adjacent biodiesel UST had passed a tank tightness test on August 11, 2015. URS provided the NYSDEC an electronic file of the tightness test report. URS has implemented a monthly product recovery program. On March 23, 2015 URS returned to remove product and collect a sample for analysis. The product thickness measured on arrival was 2.02 feet. Fingerprint analysis of the sample from MW-01 showed the product most closely resembles Fuel Oil No. 4. However, a weathered No. 2 fuel oil also could be possible. The tanks closest to MW-01 are a closed in-place gasoline tank and an active biodiesel UST. URS checked well MW-01 for product on May 5, 2015; the product thickness measured was 0.07 feet. URS installed a petroleum absorbent sock to continue collecting product from this well. During the June 2015 sampling event, a product thickness of 1.71 feet was measured and approximately 1.75 gallons of product were collected via peristaltic pump. The recent product measurements have been much lower with 0.15 feet of product in July, 0.04 feet of product in August, and 0.67 feet of product in September. An estimated 0.50 gallons of product was collected during the September 2015 event. The total product recovered to date is approximately 3.75 gallons. Based on the fact that relatively little product is being found in well MW-01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted, and determine whether any additional action will be required. Conclusions: URS states that

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

significant improvement in groundwater quality occurred after RegenOx injection events were conducted between 2008 and 2015. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain high. URS last conducted RegenOx injections in February 2015. The GW data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to collect product from monitoring well MW-01 on a monthly basis. " Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. " Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: " None AD 04/06/2016: Received a following e-mail from URS: Document report.sp9810588.20160406.bronx_west2.4thq2015_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the Fourth Quarter 2015 for the Bronx West 2 Sanitation Garage site. Will review. AD 05/09/2016: Reviewed the report. It states that in October 2015, URS performed additional RegenOx injection events at the site. The scope of work was essentially the same as the previous scope of work including a total of eight injection events. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between November 2015 and January 2016. All target wells were successfully injected according to plan except for bedrock wells IW-42 and IW-43 and existing wells MW-01, IW-36, and IW-39 which only would accept minimal amounts of product. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater samples are analyzed for petroleum?related VOCs using USEPA Method SW-846 8260B. The fourth quarter 2015 samples were collected on December 1 and 2, 2015. All wells in the monitoring program were sampled at this event except for well MW-01 because it contained product and well MW-12 because it was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. GW data: The analytical data from the most recent sampling event in December 2015 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-18, MW-23, MW-31 and MW-32. The highest total VOC concentration was found in well MW-27 with 2,823 ppb. Other wells with elevated concentrations were MW-03 with 685 ppb and MW-30 with 546 ppb. The total VOCs in the remaining wells ranged from 8 ppb to 429 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, and MW-24 through MW-30. The response to the RegenOx injection events in these wells

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

has been varied. Wells MW-03 and MW-31 show a significant reduction in total VOCs that is directly attributed to the RegenOx injections. In wells MW-27 and MW-29, total VOCs increased after the 2008-2009 injections, but have since decreased significantly following the 2011-2016 injections. Both wells have more variable concentrations but show an overall downward trend. These wells are located closer to the presumed source of the contamination and thus the increases following the RegenOx injections are attributed to additional contamination desorbing from soil as a result of the introduction of an oxidizing compound such as RegenOx. Free Product Recovery: Free product was found at well MW-01 during the first quarter 2015 sampling event; the product thickness measured during the first quarter was 2.35 feet. The last significant product at this location was in 2004. URS notified the DSNY who verified that the adjacent biodiesel UST had passed a tank tightness test on August 11, 2015. URS provided the NYSDEC an electronic file of the tightness test report. URS has implemented a monthly product recovery program. On March 23, 2015 URS returned to remove product and collect a sample for analysis. The product thickness measured on arrival was 2.02 feet. URS was able to collect an estimated total of 1 gallon of product via peristaltic pump. Laboratory fingerprint analysis of the product sample from MW?01 showed the product most closely resembles Fuel Oil No. 4. However, a weathered No. 2 fuel oil also could be possible. The tanks closest to MW?01 are a closed in?place gasoline tank and an active biodiesel UST. URS checked well MW?01 for product on May 5, 2015; the product thickness measured was 0.07 feet. URS installed a petroleum absorbent sock to continue collecting product from this well. During the June 2015 sampling event, a product thickness of 1.71 feet was measured and approximately 1.75 gallons of product were collected via peristaltic pump. The recent product measurements have been much lower with 0.02 feet of product in October, 0.25 feet of product in November, and 0.16 feet of product in December. An estimated 0.25 gallons of product was collected during each event. The total product recovered to date is approximately 4.5 gallons. Based on the fact that relatively little product is being found in well MW?01 after only a few collection events, it is possible that the product was a remnant of a previous spill at the site and not a new spill. URS will continue to collect product from this location as warranted, and determine whether any additional action will be required. Conclusions: Significant improvement in groundwater quality occurred after RegenOx injection events were conducted between 2008 and 2016. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater data, URS recommends the following: Continue the quarterly groundwater monitoring and sampling program. Continue to collect product from monitoring well MW-01 on a monthly basis. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 05/12/2016: Received a following e-mail from URS:

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Document report.sp9810588.20160512.bronx_west2.1stq2016_monitoring_rpt.pdf has been uploaded. This document is described as: Groundwater Monitoring and Remediation Summary Report for the First Quarter 2016 for Bronx West 02. Will review. AD 06/17/2016: Reviewed the report. This report presents a summary of the site on-going remedial actions, and the groundwater monitoring data for the first quarter of 2016 (through March). The first quarter 2016 sampling event was conducted on March 1 and 2, 2016. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the monitoring program were sampled during this event except for well MW-31 because it was blocked by a vehicle. GW data: The analytical data from the most recent sampling event in March 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-28, and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 5,104 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-26, and MW-30 with 1,527 ppb, 1,022 ppb, and 883 ppb, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 12 ppb to 356 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. While the RegenOx injections are proving successful at and around the source area, a small remnant of the dissolved phase contamination remains in the vicinity of well MW-20, located approximately 260 feet downgradient from the site on Tiffany Street. Because this well is located far outside the zone where the current RegenOx injections are effective, URS installed ORC socks at this location to promote bioremediation on November 26, 2013. The socks were replaced on May 21, 2014, December 3, 2014, June 10, 2015, and most recently on December 7, 2015. In the year prior to ORC sock installation, the total VOCs at this well ranged from 279 ppb to 567 ppb. Following the installation of the socks, the total VOCs have generally been lower; only 62 ppb was detected in the most recent sampling event. URS will continue to replace the ORC socks at this location approximately every 6 months. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program between 2008 and 2016. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring well MW-01 for product on a monthly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

contamination in this area. There are no proposals requiring DEC approval at this time. AD 09/20/2016: Received the following e-mail from URS: Hi Ainura, Attached please find the remediation summary report for the Bronx West 2 Sanitation Garage for the second quarter of 2016. A hard copy will be sent to you by regular mail. Thanks, Kevin J. Shanahan Project Manager, Environment Business Unit, Metro New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com Will review. AD 10/13/2016: Reviewed the report. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the second quarter of 2016 (through June). URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter 2016 sampling event was conducted on May 31 and June 1, 2016. All wells in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in May and June 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-03, MW-12, MW-18, MW-23, MW-31, and MW-32. The highest total VOC concentration was found in monitoring well MW?27 with 13,354 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-26, MW-29, and MW-30 with 1,273 ppb, 624 ppb, 701 ppb, and 1,380 ppb, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 11 ppb to 471 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. Free product: The recent product measurements in 2016 have been much lower with 0.14 feet of product in January, and no product detected since. An estimated 0.25 gallons of product was collected during the January event. The total product recovered to date is approximately 4.75 gallons. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program between 2008 and 2016. The VOC concentrations at monitoring wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring well MW-01 for product on a monthly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 12/20/2016: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2016 Report has been posted to the NYCDDC

SharePoint site. Please click here to access the site. https://nycddc.aecomonline.net/SitePages/Home.aspx Please click here to open the file. https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2016-12-20.Bronx_West_2.3rd_Q2016_Monitoring_Rpt.pdf Will review. AD 01/17/2017: Reviewed the report. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the third quarter of 2016 (through September). Remediation: In May 2016, URS issued Scope of Work R-96-05 for additional RegenOx injection events at the site. The scope of work included a total of eight injection events. URS prepared this scope of work to target dissolved phase contamination in the groundwater. For this scope of work, URS included twelve locations not recently injected and removed three of the recent injection locations. Twenty of the injection locations in the most contaminated area were unchanged. CGE implemented the eight rounds of RegenOx injections in accordance with the scope of work between June and August 2016. All target wells were successfully injected according to plan except for existing well IW-17 which could not be accessed. Several wells were unable to accept the targeted volume of injection due to daylighting. GW sampling: The 3rd quarter 2016 sampling was conducted on September 6 and 7, 2016. All wells in the monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. The analytical data from the sampling event in September 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-12, MW-18, MW-23, MW-31, and MW-32. The highest total VOCs was found in well MW-27 with 2,994 ppb. Other wells with elevated concentrations were MW-01, MW-26, and MW-30 with 671 ppb, 1,084 ppb, and 594 ppb, respectively. The total VOCs in the remaining wells with exceedances of the criteria ranged from 12 ppb to 396 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-05, MW-24, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOCs at wells in the most contaminated area of the site, measuring approximately 60 feet by 90 feet, remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in the groundwater; however, additional remedial actions likely will be required in the future. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring well MW?01 for product on a quarterly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 02/09/2017: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2016 Report has been posted to the NYCDDC SharePoint site. Please click here to access the site. https://nycddc.aecomonline.net/SitePages/Home.aspx Please click here

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

to open the file. https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2017-2-8.Bronx_West_2.4th_Q2016_Monitoring_Rpt.pdf Will review. AD 02/10/2017: Got phone call from Kevin Shanahan of URS. They are planning to overdrill well MW-27 due to some obstruction in the well. First they will try to remove the obstruction, and if not successful, will re-install the well. DEC does not have any objections to this plan. AD 03/20/2017: Reviewed the 4th QMR 2016. The report states that URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter 2016 sampling event was conducted on December 5 and 6, 2016. All wells in the monitoring program were sampled during this event except for MW-27 which was obstructed. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west. GW data: The analytical data from the most recent sampling event in December 2016 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-02, MW-12, MW-18, MW-23, MW-24, MW-28, MW-31, and MW-32. The highest total VOCs was found in well MW-01 with 909.3 parts per billion (ppb). Other wells with elevated concentrations were MW-03, MW-25, MW-26, MW-29, and MW-30 with 206 ppb, 464 ppb, 339 ppb, 264 ppb, and 426, respectively. The total VOC concentrations in the remaining wells with exceedances of the criteria ranged from 8 ppb to 30 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOCs at wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater; however, additional remedial actions will likely be required to meet remediation objectives. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Remove the obstruction from monitoring well MW-27 or replace the well in kind. Continue to check monitoring well MW-01 for product on a quarterly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. If low total VOC concentrations continue at this location, URS will remove the ORC socks during the next event in May 2017. No proposals which require DEC’s approval were submitted. AD 05/08/2017: Received an e-mail with a link to the 1st QMR 2017 report. Will review. AD 05/18/2017: Reviewed the report. This report presents a brief summary of the site history, previous and on?going remedial actions, and the groundwater monitoring data for the first quarter of 2017 (through March). The first quarter 2017 sampling event was conducted on March 6 and 7,

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

2017. All wells in the monitoring program were sampled during this event except for MW?30 which was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the west as shown on Figure 5. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. GW data: The analytical data from the most recent sampling event in March 2017 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-32. The highest total VOC concentration was found in monitoring well MW-27 with 6,066 parts per billion (ppb). Other wells with elevated concentrations were MW-01, MW-25, and MW-26 with 435 ppb, 282 ppb, and 1,061 ppb, respectively. The total VOCs in the eight remaining wells with exceedances of the criteria ranged from 17 ppb to 119 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-25, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOC concentrations at monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. This area measures approximately 100 feet by 60 feet as shown on Figure 6. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. In April 2017 URS subcontractor CGE has initiated a 16?week RegenOx injection program to continue remediation of the saturated zone. URS recommends the following: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW?01 and IW?35 for product on a quarterly basis; recover product if present. Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. Continue to install ORC socks in monitoring well MW?20 to promote bioremediation of the dissolved phase groundwater contamination in this area. There are no proposals which require DEC’s approval. AD 08/14/2017: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. Please click here to open the file on the public server. report.sp9810588.2017-08-14.Bronx_West_2.2nd_Q2017_Monitoring_Rpt.pdf Please click here to open the file on the SharePoint site (requires log in). https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report. sp9810588.2017-08-14.Bronx_West_2.2nd_Q2017_Monitoring_Rpt.pdf Please click here to access the SharePoint site. https://nycddc.aecomonline.net/ Will review. AD 09/20/2017: Reviewed the report. URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the second quarter of 2017 (through June). Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The VOC concentrations at monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

This area measures approximately 100 feet by 80 feet. The groundwater monitoring data indicates that the RegenOx injections reducing the dissolved phase concentrations in groundwater. In April 2017, URS subcontractor CGE initiated a 16-week RegenOx injection program to continue remediation of the saturated zone. As of June 2017, CGE has completed 8 of the total 16 injections rounds for the site. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue the use of chemical oxidation to remediate the dissolved phase VOC impacts via additional RegenOx injections. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 12/11/2017: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. Please click here to open the file on the public server.

https://nycddc.aecomonline.net/ Will review. AD 01/22/2018: Reviewed the report. It states that significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. The calculation indicates the reduction of total VOCs in groundwater at the site is greater than 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at five monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. This area measures approximately 100 feet by 80 feet. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 RegenOx injection rounds at the site. Future monitoring events will indicate whether additional remedial actions are required to address any remaining dissolved-phase impacts. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to evaluate the monitoring data for the site and determine whether chemical oxidation or other remedial actions are required to address the remaining impacts at the site. Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: None. AD 03/05/2018: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2017 Report has been posted to the NYCDDC SharePoint site and copied to the public file store. report.sp9810588.2018-03-05.Bronx_West_2.4th_Q2017_Monitoring_Rpt.pdf Please click here to open the file on the SharePoint site (requires log in). https://nycddc.aecomonline.net/All_Reports/Bronx%20West%202/report.sp9810588.2018-03-05.Bronx_West_2.4th_Q2017_Monitoring_Rpt.pdf Please click here to access the SharePoint site. https://nycddc.aecomonline.net/ Uploaded the report. Will review. AD 04/12/2018: Reviewed the Groundwater Monitoring and Remediation Report for the Fourth Quarter 2017. This report presents a brief summary of the site history, previous and on-going remedial actions, and the groundwater monitoring data for the fourth quarter of 2017 (through December). The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The quarterly groundwater sampling event was conducted on December 18 and 19, 2017. All wells in the quarterly monitoring program were sampled during this event except well MW-18, which was dry, and MW-30, which was blocked by a vehicle. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-25, MW-26, MW-28, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections are reducing the dissolved phase concentrations in groundwater. The calculation presented in Table 4 indicates the reduction of total VOCs in groundwater at the site is nearly 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at five or six monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 RegenOx injection rounds at the site. Future monitoring events will indicate whether additional remedial actions are required to address any remaining dissolved-phase impacts. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to evaluate the monitoring data for the site and determine whether chemical oxidation or other remedial actions are required to address the remaining impacts at the site. - Continue to install ORC socks in monitoring well MW-20 to promote bioremediation of the dissolved phase groundwater contamination in this area. Proposals: - None. AD 06/07/2018: Had a web meeting with Kevin Shanahan of URS regarding new remedial approach for the site. Since multiple RenedOx injections were done at the property and VOC levels went down, URS proposes to use ORC sock to polish remaining concentrations in the GW. Looked at the latest VOC numbers and discussed the proposed actions. URS will include this proposal in the next report. They also plan to redevelop the wells before the baseline sampling. AD 07/11/2018: Received the following e-mail from Kevin: Hi Ainura, We are initiating remediation at City properties

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

for Fiscal Year 2019. Could you please review the attached report containing a work plan for bioremediation at Bronx West 2? This is consistent with our discussion during our telephone call on June 7th. Since we have recommended a change in remedial technologies, we would appreciate a letter or e-mail approval of the revised approach. Thanks, Kevin J. Shanahan Project Manager, Environment Business Unit, Metro New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com Will review. AD 07/12/2018: Reviewed the report and WP. The report states that based on most recent groundwater sampling results, which indicate persisting levels of contamination in some of the site wells, URS recommends bioremediation as a revised remedial strategy to address remaining dissolved-phase VOC impacts at the site via installation of ORC socks at twenty nine (29) existing injection wells. Prior to installation of the ORC socks, URS will redevelop the injection wells and will obtain baseline data of natural attenuation parameters to confirm that the aquifer is amenable to bioremediation. ORC socks will be replaced every six months. Quarterly groundwater monitoring and sampling program will continue at the site. Will issue an approval. AD 07/13/2018: Issued and sent an approval e-mail to Mr. Aliberti. Copied to all parties involved. AD 10/12/2018: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2018 Report has been posted to the NYC DDC SharePoint Site. Please access required files: Please click here to pen the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the file. Will review. AD 10/30/2018: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2018 (through June), and a summary of recent remedial work performed. Free product: The most recent product detection at the site was during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. ORC Sock Installation: In the quarterly report dated June 20, 2018, URS recommended enhanced bioremediation as a remedial strategy to address the remaining dissolved-phase VOC impacts at the site. The NYSDEC approved the recommendation in an email dated July 13, 2018. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018. Significant quantities of silt were removed from the injection wells during the redevelopment. Three of the proposed wells (IW-14, IW-19, and IW-20) were filled with silt or broken and are not useable for the installation of ORC socks. In order to obtain baseline data, URS measured selected natural attenuation parameters on July 30 and 31, 2018 in the monitoring wells located in the target treatment area. Specifically, URS measured dissolved oxygen (DO) concentrations, specific conductivity, pH, and oxidation-reduction potential (ORP) in monitoring wells

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-01, MW-02, MW-03, MW-05, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, and MW-31. The pH range for the GW was in the acceptable range of 6 to 8. A negative ORP value was measured in all wells except MW-28; positive ORP values are required for aerobic degradation. Low DO [less than 1 mg/L] in all of the wells measured indicate anaerobic conditions at the site. It is expected that the addition of oxygen via the ORC socks will create conditions more amenable to bioremediation of the remaining dissolved phase contamination. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells. Four ORC socks were installed into each of the injection wells. The socks are suspended in the injection wells approximately one foot beneath the groundwater surface. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were installed, to measure the GW quality parameters at each wells specified above. The average ORP value at the site increased from -103 mV in July to -62 mV in September, but remained negative. The DO at the site wells remained about the same (0.40 mg/L in July vs. 0.32 mg/L in September). This indicate that the oxygen released by the socks has not yet diffused into the monitoring wells, that the DO is being consumed by the microorganisms, and/or that the DO is being consumed by iron, manganese, and other dissolved metals. The effectiveness of the ORC socks will be evaluated using the quarterly groundwater monitoring program. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. The reduction of total VOCs in groundwater at the site is approximately 96% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs remain elevated t 5 wells in the most contaminated area of the site. This area measures approximately 100 feet by 80 feet. In April 2017, URS subcontractor CGE initiated a RegenOx injection program to continue remediation of the saturated zone. Between April and September 2017, CGE completed 16 rounds of RegenOx injections at the site. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. According to the consultant, chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to install ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, to promote bioremediation of the dissolved phase groundwater contamination in this area. - Remove the silt from well MW-01 to allow for more representative groundwater sampling. Proposals: - None. AD 01/02/2019: Received the following e-mail from URS: The document Bronx West 2 - 3Q 2018 Report has been posted to the NYC DDC SharePoint Site. Please access required files: Please click here to pen the file on the Public Server: Public Folder File Link (no

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory DL the report. Will review. AD 02/01/2019: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the third quarter of 2018 (through September), and a summary of recent remedial work performed. Previously, URS recommended enhanced bioremediation as a remedial strategy to address the remaining dissolved-phase VOC impacts at the site through installation of ORC socks at existing injection wells. The NYSDEC approved the recommendation in an email dated July 13, 2018. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018 using a block and surge method. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells as shown on Figure 8. Four ORC socks were installed into each of the injection wells. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were deployed, to measure the above-referenced groundwater quality parameters at each of the monitoring wells specified above. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01. GW sampling: The third quarter groundwater sampling event was conducted on September 24, 2018. All wells in the quarterly monitoring program were sampled during this event. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The analytical data from the sampling event in September 2018 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-03, MW-12, MW-18, MW-23, MW-28, and MW-32. The highest TVOCs were found in wells MW-30 with 1,126 ppb and MW-31 with 1,191 ppb. Total VOCs were also elevated in wells MW-01, MW-05, MW-26, and MW-27, with TVOCs ranging from 222 ppb to 588 ppb. The TVOCs in the 5 remaining wells with exceedances of the criteria were below 100 ppb. The most recent groundwater data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-26, MW-27, MW-29, MW-30, as well as MW-31 located across Casanova Street. Free product: The most recent product detection at the site was during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. In November 2018, the ORC socks were removed and petroleum absorbent socks were installed in IW-35. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. URS recommends the following actions: Continue the quarterly groundwater monitoring and sampling program.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to install ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW- 31, to promote bioremediation of the dissolved phase groundwater contamination in this area. Remove the silt from well MW-01 or install a new well to allow for more representative groundwater sampling. No DEC approval was requested at this time. AD 03/13/2019: Received the following e-mail from URS: The document Bronx West 2 - 4Q 2018 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://protect2.fireeye.com/url?k= 98c6bad2-c4fe1c6f-98c443e7-000babd9fa3f-e3a3b313677f796f&u=https:// nycddc.aecomonline.net/ The Public File Server is at the link below for archived reports: Public Server Directory DL the file. Will review. AD 03/19/2019: Reviewed the 4th quarter 2019 report. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2018 (through December), and a summary of recent remedial work performed. URS planned to install ORS socks into some of the wells. Prior to installation of the ORC socks, URS redeveloped the injection wells between July 26 and 31, 2018 using a block and surge method. Significant quantities of silt were removed from the injection wells during the redevelopment. Three of the proposed wells (IW-14, IW-19, and IW-20) were filled with silt or broken and are not useable for the installation of ORC socks. In order to obtain baseline data, URS measured selected natural attenuation parameters on July 30 and 31, 2018 in the monitoring wells located in the target treatment area. Specifically, URS measured dissolved oxygen (DO) concentrations, specific conductivity, pH, and oxidation-reduction potential (ORP) in monitoring wells MW-01, MW-02, MW-03, MW-05, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, and MW-31. Low concentrations of DO [i.e. less than 1 mg/L] in all of the wells measured, indicate anaerobic conditions at the site. It is expected that the addition of oxygen via the ORC socks will create conditions more amenable to bioremediation of the remaining dissolved-phase contamination. On August 20 and 21, 2018, URS installed ORC socks in 26 injection wells. Four ORC socks were installed into each of the injection wells. The socks are suspended in the injection wells approximately one foot beneath the groundwater surface. URS returned to the site on September 10 and 11, 2018, approximately three weeks after the ORC socks were deployed, to measure the above-referenced groundwater quality parameters at each of the monitoring wells specified above. The average ORP value at the site increased from -103 mV in July to -62 mV in September, but remained negative. The DO concentration at the site remained about the same (0.40 mg/L in July vs. 0.32 mg/L in September). These results indicate that the oxygen released by the socks has not yet diffused into the monitoring wells, that the DO is being consumed by the microorganisms, and/or that the DO is being consumed by iron, manganese, and other dissolved metals. The effectiveness of the ORC socks is evaluated using the quarterly groundwater monitoring program. ORC socks will be replaced every six months or until a revised remedial strategy is approved by the NYSDEC. URS will also attempt to remove silt from well MW-01 or replace the well. GW sampling: The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02,

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. All wells in the quarterly monitoring program were sampled during this event. The data from the most recent sampling event in December 2018 show that no VOCs exceed the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-23, MW-28, and MW-32. The highest total VOCs was found in well MW-26, with 1,419 ppb. Total VOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-31, with total VOCs ranging from 193 ppb to 794 ppb. The total VOCs in the 8 remaining wells with exceedances of the criteria were below 100 ppb. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, MW-30, as well as MW-31 located across Casanova Street. Free product: Product was detected at the site during the injection well redevelopment in March 2017; 0.33 feet of product was detected in IW-35, which is located approximately 9 feet west of MW-01. The free product was manually collected from the well. Subsequent monitoring of IW-35 in March and June 2018 showed no product; however, 0.16 feet of product was measured during the installation of ORC socks in IW-35 in August 2018. In November 2018, the ORC socks were removed and a petroleum absorbent sock was installed in IW-35. During the most recent monitoring event in December 2018, the petroleum absorbent sock was observed to be 100% saturated with product and was replaced. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. - Remove the silt from well MW-01 or install a new well to allow for more representative GW sampling. Proposals: - None. AD 06/28/2019: Received the following e-mail from URS: The document Bronx West 2 - 1Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 07/12/2019: Reviewed the report. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the first quarter of 2019 (through March), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to monitor the progress of the remedial actions. The monitoring wells currently included in the monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The first quarter groundwater sampling event was conducted on March 27 and 28, 2019. All wells in the quarterly monitoring program were sampled during this event. The data from the most recent sampling in March 2019 show that the highest TVOCs was found in well MW-26, with 1,087 ppb. Total VOCs were also elevated in wells MW-01, MW-20, MW-27, and MW-30, with total VOCs from 154 ppb to 693 ppb. The total VOCs in 7 wells with exceedances of the criteria were below 100 ppb. No VOCs exceed the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-28, and MW-32. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. Conclusions: Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at four wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 09/30/2019: Received the following e-mail from URS: The document Bronx West 2 - 2Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 10/09/2019: Reviewed the report. It states that URS continues to implement groundwater remediation at the site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2019 (through June), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter groundwater sampling event was conducted on June 24 and 25, 2019. All wells in the quarterly monitoring program were sampled during this event. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in June 2019 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-24, MW-28, and MW-32. The highest TVOCs were found in wells MW-20, MW-26, and MW-27, with 519 ppb, 873 ppb, and 813 ppb, respectively. TVOCs were also elevated in wells MW-01 and MW-30, with TVOCs of 147 ppb and 266 ppb, respectively. The TVOCs in the six other wells with exceedances

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

of the criteria were below 100 ppb. The most recent groundwater data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-26, MW-27, MW-29, and MW-30. The groundwater data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at four wells in the most contaminates area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check monitoring wells MW-01 and IW-35 for product on a quarterly basis; recover product if present. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: None. AD 12/06/2019: Received the following email from URS: The document Bronx West 2 - 3Q 2019 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 12/20/2019: Reviewed the 3rd quarter 2019 report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the third quarter of 2019 (through September), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis. The wells currently included in the program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter groundwater sampling event was conducted on September 24 and 25, 2019. All wells in the program were sampled during this event except for well MW-05, which was blocked by a parked car. Groundwater samples are analyzed for petroleum related VOCs and naphthalene using USEPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The data shows that the groundwater elevation at this site has dropped by an average of 2.8 feet between December 2018 and September 2019. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in September 2019 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-28, and MW-32. The highest TVOCs were found in wells MW-26 and MW-30, with 977 ug/L and 1,056 ug/L, respectively. TVOCs were also elevated in wells MW-01, MW-27, and MW-31, with TVOCs of 116 ug/L, 349 ug/L, and 292 ug/L, respectively. The TVOCs in the six other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. Conclusions: Significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation presented in Table 4 indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at five monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 03/02/2020: Received the following email from URS: The document Bronx West 2 - 4Q19 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded document. Will review. AD 03/17/2020: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2019 (through December), and a summary of recent remedial work performed. ORC socks have been used at the site to promote bioremediation at some locations since

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

November 2013 and May 2018, respectively. The ORC socks were replaced in 26 wells in August 2019. Well MW-31 has been covered with concrete and well IW-35 contained product, so no socks were installed at these locations. URS replaced the ORC socks again on February 11 and 12, 2020. Socks were also installed in IW-35 during this event since no product was measured in the well. URS will continue to replace the ORC socks every six months. GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter groundwater sampling event was conducted on December 23 and 24, 2019. All wells in the quarterly monitoring program were sampled during this event except for wells MW-03, MW-24, and MW-30; these wells were sampled on January 9 and 22, 2020. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The analytical data from the most recent sampling event in December 2019 show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-32. The highest total VOCs were found in wells MW-26 and MW-30 with 829 ug/L and 766 ug/L, respectively. Total VOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-31, with total VOCs of 307 ug/L, 179 ug/L, 124 ug/L, and 142 ug/L, respectively. The total VOCs in the seven other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-26, MW-27, MW-29, and MW-30. LNAPL: During the ORC sock installation in August 2019, 0.31 feet of product was measured in IW-35. However, no product was observed in the well during the most recent monitoring event in December 2019 and during the most recent ORC sock installation in February 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation indicates the reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at five or six wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 05/07/2020: Received the following email from URS: The document Bronx West 2 - 1Q 2020 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the

Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 05/29/2020: Reviewed the report. It presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the first quarter of 2020 (through March), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The first quarter groundwater sampling event was conducted on March 30 and 31, 2020. All wells in the quarterly monitoring program were sampled during this event except for wells MW-12 and MW-30, which could not be accessed due to vehicles parked over the wells. Groundwater samples are analyzed for petroleum-related VOCs and naphthalene using EPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in March 2020 show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-18, MW-23, MW-24, MW-25, and MW-32. The highest total VOCs was found in well MW-26 with 1,439 ug/L. TVOCs were also elevated in wells MW-01, MW-02, MW-03, MW-05, and MW-31, with TVOCs of 160 ug/L, 103 ug/L, 204 ug/L, 301 ug/L, and 375 ug/L, respectively. The tVOCs in the 4 other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26, MW-27, MW-29, and MW-30. Free product: No product has been observed in the well IW-35 since August 2019, including the most recent monitoring event in March 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019 and most recently in February 2020. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product if present. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 26 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: - None. AD 08/10/2020: Received the following email from URS: The document Bronx West 2 - 2Q20 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 09/21/2020: Reviewed the report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the second quarter of 2020 (through June), and a summary of recent remedial work performed. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The second quarter groundwater sampling event was conducted on June 22 and 23, 2020. All wells in the quarterly monitoring program were sampled during this event. The analytical data from the recent sampling show that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, and MW-24. The highest total VOCs was found in well 26 with 1,340 ug/L. Total VOCs were also elevated in wells MW-01 (283 ug/L), MW-03 (464 ug/L), MW-05 (334 ug/L), MW-29 (138 ug/L), MW-30 (845 ug/L), and MW-31 (325 ug/L). The total VOCs in the six other wells with exceedances of the criteria were below 100 ug/L. The most recent groundwater analytical data shows that dissolved phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26, MW-27, MW-29, and MW-30. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the TVOCs in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019 and most recently in

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

February 2020. Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: " Continue the quarterly groundwater monitoring and sampling program. " Continue to check all monitoring wells for product on a quarterly basis and recover product if present. " Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Proposals: " None. AD 11/27/2020: Received the following email from URS: The document Bronx West 2 - 3Q20 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Uploaded the report. Will review. AD 12/28/2020: Reviewed the 3rd quarter 2020 report. It states that on September 14 and 15, 2020, URS and AARCO over-drilled and replaced 2-inch monitoring wells MW-26 and MW-30 with 4-inch diameter wells MW-26R and MW-30R. Replacement of these wells was discussed and approved at the semi-annual meeting with the NYSDEC on May 21, 2020. Well construction diagrams for the new wells are included as Attachment D. During the installation of these two wells, it was noted that the steel protective casings of several existing wells located in the north end of the building were potential trip hazards. On November 18 and 19, 2020, URS repaired the steel protective casings of those wells to eliminate potential trip hazards. GW sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The third quarter groundwater sampling event was conducted on September 23 and 24, 2020. All wells in the quarterly monitoring program were sampled during this event except for well MW-01, which was found to contain product. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in September 2020 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, and MW-32. The highest TVOCs was found in well MW-26R with 692 ug/L. TVOCs were also elevated in wells MW-03 (635 ug/L), MW-05 (243 ug/L), and MW-31 (154 ug/L). The total VOCs in the eight other monitoring wells with exceedances of the criteria were below 100 ug/L. The most recent

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. ORC socks: The ORC socks were replaced most recently on August 24, 2020; URS replaced the ORC socks in the same 24 injection wells and two monitoring wells. Well IW-35 contained product during this event, so the ORC socks were removed but not replaced at this location (a petroleum absorbent sock was installed in this well on September 23, 2020). URS will continue to replace the ORC socks every six months. The report states that significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The groundwater monitoring data indicates that the RegenOx injections reduced the dissolved-phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many monitoring well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019, February 2020, and most recently in August 2020. Dissolved-phase concentrations appear to be decreasing further. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. Reduction of total VOCs in groundwater at the site is approximately 99% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Repair existing monitoring and injection wells that are potential trip hazards. Proposals: None. AD 02/25/2021: Received the following email from URS: The document Bronx West 2 - 4Q 2020 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 03/26/2021: Reviewed the 4th quarter 2020 report. It states that URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the fourth quarter of 2020 (through December), and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently included in the quarterly monitoring

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The fourth quarter groundwater sampling event was conducted on December 28 and 29, 2020. All wells in the quarterly monitoring program were sampled during this event except for well MW-25, which was found to be damaged. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The data from the most recent sampling event in December 2020 show that no VOCs exceeded the NYSDEC GQC in wells MW-12, MW-18, MW-23, MW-24, and MW-32. The highest total VOCs were found in wells MW-30R with 1,685 ug/L and MW-26R with 1,489 ug/L. Total VOCs were also elevated in wells MW-05 (205 ug/L) and MW-20 (127 ug/L). The total VOCs in 7 other wells with exceedances of the criteria were below 100 ug/L. Conclusions: Dissolved-phase concentrations appear to be decreasing further following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The calculation presented in Table 3 indicates the reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: Actions: Continue the quarterly groundwater monitoring and sampling program. Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. Replace damaged well MW-25. Proposals: None. AD 06/15/2021: Received the following email from URS: The document Bronx West 2 - Jan Thru Mar 2021 has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 07/01/2021: Reviewed the report. URS continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from January through March 2021, and a summary of recent remedial work performed. Groundwater Sampling URS collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The monitoring wells currently includedin the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The most recent quarterly groundwater sampling event was conducted on March 17 and 18, 2021. All wells in the

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

quarterly monitoring program were sampled during this event except for well MW-25, which was found to be damaged. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet bgs. The groundwater flow direction is generally to the south and west. The analytical data from the most recent sampling event in March 2021 shows that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-28, and MW-32. The highest total VOCs was found in monitoring well MW-26R with 2,406 ug/L. Total VOCs were also somewhat elevated in wells MW-05, MW-20, MW-27, and MW-30 with concentrations ranging from 157 ?g/L to 353 ?g/L. The total VOCs in the four other monitoring wells with exceedances of the criteria were lower with total VOCss ranging from 3 ?g/L to 25 ?g/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. The ORC socks were replaced most recently on March 26 and April 7, 2021; URS replaced the ORC socks in the same 24 injection wells and two monitoring wells for this event. Although no product was detected in monitoring well IW-35 during the most recent monitoring event, no ORC socks were installed at this location due to the occasional detections of free product over the past few years. URS will evaluate whether to install socks at this and other site wells during future ORC sock installation events. URS will continue to replace the ORC socks every six months. Free product: No product was detected in well IW-35 during the most recent monitoring event in March 2021. As with well MW-01, water levels in IW-35 in December 2020 and March 2021 were nearly five feet higher than in September 2020. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOC concentrations at a few monitoring wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01 and IW-35. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 24 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. - Survey riser elevation at replacement well MW-25R. Proposals: - None. AD 08/25/2021: Received the following email from URS: The document Bronx West 2 - April through June 2021 Report has been posted to the NYC DDC SharePoint site. Please access required files: Please click here to open the file on the Public Server: Public Folder File Link (no password required) Please click here to access the SharePoint Site: https://nycddc.aecomonline.net The Public File Server is at the link below for archived reports: Public Server Directory Will review. AD 09/28/2021: Reviewed the report. This

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from April through June 2021, and a summary of recent remedial work performed. Groundwater Sampling: URS collects groundwater samples on a quarterly basis. The monitoring wells currently included in the quarterly monitoring program are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. The most recent quarterly groundwater sampling event was conducted on June 14 and 15, 2021. All wells in the quarterly monitoring program were sampled during this event except for well MW-25R, which was found to contain product. Groundwater samples are analyzed for petroleum related VOCs and naphthalene using USEPA Method SW-846 8260B. Depth to groundwater at the site can vary significantly, but typically ranges from 2 to 16 feet below ground surface (bgs). The water levels in June 2021 are on average nearly 4 feet higher than the elevations in June 2020. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the most recent sampling event in June 2021 shows that no VOCs exceeded the NYSDEC Groundwater Quality Criteria in wells MW-12, MW-18, MW-23, MW-24, MW-31, and MW-32. The highest total VOCs was found in well MW-26R with 2,949 ug/L. Total VOCs were also somewhat elevated in wells MW-05, MW-27, and MW-30R ranging from 131 to 438 ?g/L. The total VOCs in the six other wells were lower with total VOCs ranging from 7 ug/L to 70 ug/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of monitoring wells MW-01, MW-03, MW-26R, MW-27, MW-29, and MW-30R. Free product: No product was observed in well MW-01 during the most recent monitoring event in June 2021. No product was detected in well IW-35 during the most recent monitoring event in June 2021. As with well MW-01, significant changes in water levels in well IW-35 may be responsible for the short-term observations of product. A product thickness of 0.16 feet was measured at this newly re-installed well during the June 2021 sampling event. This was the first sampling event following the replacement and development of well MW-25 with well MW-25R in April 2021. A petroleum absorbent sock was installed during this event. Well MW-25 was one of the wells impacted by free product from the 2009 gasoline spill; the product observed is likely a remnant from that event. URS will continue to check all monitoring wells and IW-35 for product on a quarterly basis and conduct product recovery as appropriate. Conclusions: According to the consultant, significant improvement in groundwater quality has occurred since implementing the RegenOx injection program in 2008. The monitoring data indicates that the RegenOx injections reduced the dissolved-phase concentrations in groundwater. Recent groundwater sampling data show lower dissolved-phase impacts at many well locations. Chemical oxidation becomes less effective as a treatment technology at lower concentrations. Therefore, URS installed ORC socks in 26 injection wells in August 2018 to promote bioremediation for the remaining dissolved-phase contamination at the site. The ORC socks were replaced in February and August 2019, February and August 2020, March/April 2021 and most recently in August 2021. Dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. Monitoring of the indicator

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

parameters shows that the groundwater conditions are becoming more favorable for enhanced bioremediation. The reduction of total VOCs in groundwater at the site is approximately 98% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event indicates that the VOCs at a few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Well MW-26R has been showing a significant increase in total VOCs since being replaced; this may be indicative of a small pocket of soil contamination that was disturbed while over-drilling this well. Free product was also recently found at replacement well MW-25R. Based on the current status of the site, the previous remedial actions, and the most recent groundwater monitoring data as summarized above, URS recommends the following: " Continue the quarterly groundwater monitoring and sampling program. " Continue to check all monitoring wells for product on a quarterly basis and recover product from affected wells including MW-01, MW-25R, and IW-35. " Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 24 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. If dissolved phase groundwater impacts continue to remain elevated or increase at well MW-25R, conduct additional chemical oxidation injections targeting that area of the site. Proposals: " None. AD 09/24/2021: Received the following email from URS: Hi Ainura I hope all is well. The purpose of this e-mail is to let you know about recent free product detections at the Bronx West 2 sanitation garage and our plan to recover the product. Monitoring well MW-25 was damaged and replaced in April 2021 with a new 2-inch diameter well at the same location. Attached is the latest total VOC figure showing where MW-25R is located. As we indicated in our August 25, 2021 report, 0.16 feet of free product was detected in well MW-25R during the June 2021 sampling event. No product was detected during well development. Attached is a table showing water/product levels at this well location for the past 10 years. There was a sheen reported twice in 2012/2013 but no other indication of product. We collected the third quarter groundwater samples this week. The petroleum absorbent sock in well MW-25R was 100% saturated with product and 0.23 feet of product was measured in the well. Our sampling geologist, Shawn Miller, used a peristaltic pump to recover the remaining product and installed a new absorbent sock. Dissolved phase VOCs at well MW-25 were less than 100 ug/L over the past three years. We plan on performing product recovery work at this site on a monthly basis to address this situation. I have requested Shawn to collect a product sample for product identification at the lab. While on-site we will check wells MW-01 and IW-35 for product since both of these wells had product over the past few years. Let me know if you need any additional information. Regards - Kevin J. Shanahan Civil Engineer/Project Manager Associate Vice President Environment Business Unit - Upstate New York Direct 716-923-1215 Cell 716-480-7352 kevin.shanahan@aecom.com AD 12/17/2021: Received the following email from URS: Hello - The document Bronx West 2 - July through September Report has been posted to the NYCDDC SharePoint O365 Site. The file is attached to this email. AECOM has changed its database operation and now uses Microsoft Office 365 to access the NYCDDC SharePoint site. If you would like to access the O365 SharePoint site, and you have requested access and have activated your account, use this link.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

https://aecom.sharepoint.com/sites/extranet-nycddc/SitePages/Home.aspx If you have not requested access and activated your account, and would like to access the O365 SharePoint site, please email Lorena.Warix@aecom.com Will review the attached report. AD 01/19/2022: Reviewed the report. it states that AECOM continues to implement groundwater remediation at the Bronx West 2 site through chemical oxidation, enhanced bioremediation, and quarterly groundwater monitoring. This report presents a brief summary of the site history, previous remedial actions, groundwater monitoring data for the period from July through September 2021, and a summary of recent remedial work performed. Groundwater Sampling: AECOM collects groundwater samples on a quarterly basis to measure contaminant concentrations in the groundwater and monitor the progress of the remedial actions. The wells currently included in the QMP are: MW-01, MW-02, MW-03, MW-05, MW-12, MW-18, MW-20, and MW-23 through MW-32. Groundwater sampling was conducted on September 20 and 21, 2021. All wells were sampled during this event except for well MW-25R, which was found to contain product and well MW-05, which had a vehicle parked over it. AECOM returned to the site on October 6, 2021 and sampled well MW-05. Depth to GW at the site typically ranges from 2 to 16 feet bgs. The water levels in June 2021 were on average nearly 4 feet higher than the elevations in June 2020; the groundwater elevations in September 2021 remained relatively unchanged from June 2021. The groundwater flow direction is generally to the south and west. The subsurface soils at the site consist of fine to coarse sand, silt and gravel overlain by fill consisting of sand, pebbles, concrete, and brick fragments. Bedrock is encountered anywhere from 2 feet to greater than 24 feet bgs. The analytical data from the September 2021 sampling shows that no VOCs exceeded the NYSDEC GQCS in wells MW-03, MW-12, MW-18, MW-23, MW-24, MW-28, MW-31, and MW-32. The highest TVOCs was found in well MW-26R with 5,820ug/L. TVOCs were also elevated in wells MW-01, MW-05, MW-27, and MW-30R ranging from 123 to 572 ug/L. Wells MW-02, MW-20, and MW-29 indicated TVOCs ranging from 10 ug/L to 83 ug/L. The most recent groundwater analytical data shows that dissolved-phase contamination persists at the site, but is limited to the north entrance ramp area in the vicinity of wells MW-01, MW-05, MW-26R, MW-27, MW-29, and MW-30R. Free product: Well MW-25R: A product thickness of 0.16 feet was measured at this newly re-installed well during the June 2021 sampling event. This was the first sampling event following the replacement and development of well MW-25 with well MW-25R in April 2021. A petroleum absorbent sock was installed during this event. During site visit in September 2021, 0.23' of product was measured in the well and the absorbent sock was 100% saturated with product. An estimated 0.25 gallons of product was removed from the well and the absorbent sock was replaced. Well MW-25 was one of the wells impacted by free product from the 2009 gasoline spill; the product observed is likely a remnant from that event. Due to the product observed in well MW-25R, AECOM increased product recovery monitoring to a monthly basis in November 2021. AECOM will continue to check wells MW-01, MW-26R, and IW-35 for product and conduct product recovery as appropriate. Conclusions: According to the consultant, dissolved-phase concentrations continue to decrease following the implementation of enhanced bioremediation in August 2018. The reduction of total VOCs in groundwater at the site is approximately 96% compared to data collected prior to remediation by chemical oxidation. However, data from the most recent monitoring event

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

indicates that the VOCs at few wells in the most contaminated area of the site remain above levels necessary to petition for spill closure. Well MW-26R has been showing a significant increase in total VOCs since being replaced; this may be indicative of a small pocket of soil contamination that was disturbed while over-drilling this well. Free product was also recently found at replacement well MW-25R. Actions and Proposals: Based on the current status of the site, the previous remedial actions, and the recent groundwater data as summarized above, AECOM recommends the following: Actions: - Continue the quarterly groundwater monitoring and sampling program. - Continue to check wells MW-01, MW-26R, and IW-35 for product on a monthly basis and recover product from affected wells. - Continue to promote bioremediation of the dissolved-phase groundwater contamination through replacement of the ORC socks in 25 injection wells, as well as monitoring wells MW-20 and MW-31, every six months. If dissolved phase groundwater impacts continue to remain elevated or increase at well MW-26R, conduct additional chemical oxidation injections targeting that area of the site. Proposals: - None. DEC Memo:	"Gasoline spilled from a vent line on a tank during an overfill. Area is all cement, no cracks, no impact to the subsurface or to drains. Area was contained and cleanup was completed by a countractor. 7/6/2009 Mr Shaw from sanitation called back to say the spill was actually about 200 gallons and the gasoline poured into the soil. They now need to do a major cleanup - Case transferred to DEC Patel. 07/06/09-Hiralkumar Patel. 10:03 AM:- received call from Mr. Shah. he mentioned that based on veeter-root readings, they are estimating release of about 201 gal of unleaded gasoline. asked Mr. Shah to find out a time period for which veeter-root system shows drop in amount. they tested tank only and found tight. as per Mr. Shah, vent pipe is broken. asked Mr. Shah to perform tightness test for fill, supply and return lines. also asked him to exposed entire length of vent pipe as suspecting leak in subsurface. Mr. Shah asked to send letter to Mr. Mignone. Jay Shah PH. (718) 334-9138 email: jshah@dsny.nyc.gov Al Mignone Deputy Director NYC Dept. of Sanitation Building Maintenance 52-35 58th Street, Room 410 Woodside, NY 11377 Ph. (718) 334-9121 Fax (718) 334-9088 email: amignone@dsny.nyc.gov sent letter to Mr. Mignone requiring submission of cleanup report. letter emailed to Mr. Mignone and Mr. Shah. 07/08/09-Hiralkumar Patel. 12:52 PM:- received call from Mr. Mignone. he mentioned that supply/return lines were tested along with tank and found tight. they found leak in vent line. as per Mr. Mignone, water entered into tank through holes in vent line which cause problem in veeter-root readings. they have excavated partial area along underground vent line and found some contamination. will hire outside contractor. vent pipe found about 1.5 ft bg. asked Mr. Mignone to submit color photographs of open excavation for entire length of underground vent line. also asked him to collect endpoint samples, if deep excavation occurs. will send contractor's info soon. 08/04/09-Hiralkumar Patel. 3:59 PM:- received letter from Mr. Roberts from URS inclding tank test results and disposal manifests. as per Mr. Roberts, spill was caused by a break in the vapor recovery line of a 4,000 gal gasoline UST. approx. 200 gal of gasoline were release, being replaced by groundwater that had entered the tank through the pipe break. AARCO emptied the tank and removed contaminated fill material. F&N tested gasoline and diesel tank. currently 4,000 gal gaosline tank is filled with water and will remain out of service until the vapor recovery piping is repaired and tested. URS is currently remediating site (under spill #: 9810588) by means of chemical oxidation. URS will sample existing wells in this month and will submit recommendations for future remediation action, if required. Harvey Roberts URS Corp. Ph. (718) 786-3838 Fax (718) 786-3848 email: Harvey_Roberts@URSCorp.com according to tank test result, diesel tank system (including pipes) is tight and gasoline tank only tight. no info about line test for gasoline tank system. 08/05/09-Hiralkumar Patel. 9:00 AM:- spoke with Mr. Roberts at URS. asked him about location of source. Mr. Roberts mentioned that leak

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

was found in vapro recovery pipe on tank and dept. of sanitation excavated about 10 ft by 10 ft area to a depth of abou 2 ft. asked him about line test for gasoline tank. Mr. Roberts doesn't know about that. 9:08 AM:- spoke with Mr. Mignone. he mentioned that broken elbow was found on vapor recovery line about 10 ft away from tank. they removed contaminated soil. asked Mr. Mignone to submit color pics of open excavation, endpoint sample analyticals and scaled site map with sampling lcoations. also asked him to test all lines associated with gasoline tank. 9:33 AM:- sent email to Mr. Mignone with the requirements. email copied to Mr. Roberts.
08/10/09-Hiralkumar Patel. 1:52 PM:- received message from Jane Staten (716-923-1152) from URS. 2:16 PM:- left message for Ms. Staten. 3:11 PM:- received call from Ms. Staten. Ms. Staten mentioned that leak was found in pipe in pea gravel area between the tank and sheeting. contractor removed some pea gravels to expose the pipe. oil was found on water. groundwater at nearby well MW-25 was found at 2.91 ft bg. they will sample monitoring wells on 08/13/09. asked Ms. Staten to send pics of area and brief description about impacted area. 08/12/09-Hiralkumar Patel. 1:16 PM:- received email from Mr. Roberts from URS. Mr. Roberts send three pics but as per Mr. Roberts pics were taken in dark, so groundwater appear darker than it does; a slight sheen was observed on water but no odors. as per Mr. Roberts: after the facility noted increased water in the tank sumps over a period of time, they investigated further. using camera equipment in the piping, Department of Sanitation maintenance personnel were able to locate a damaged portion of the Stage 2 Vapor Recovery Piping (within the area of the tank vault). On June 22, 2009, AARCO Environmental removed approximately 3,200 gallons of water and gasoline from the tank with a vacuum truck. it was surmised that groundwater had entered through the Stage 2 Vapor Recovery piping where it was damaged and was conveyed into the gasoline UST, and displaced the gasoline. this resulted in the spill report of June 22. the tank has been taken out of service until the issue is resolved. DOS maintenance personnel removed the concrete tank vault top slab (the northern portion of the tank slab) to expose the damaged piping. AARCO environmental was on site on June 26, 2009, and they removed pea gravel from within the tank vault to expose the piping. approximately four cubic yards of pea gravel was removed as contaminated fill, which exposed the piping. DOS capped the damaged piping was capped, and had Fenley & Nicol test both of the tanks for tightness (which they passed). currently the excavation is approximately two feet to three feet below the top of the garage slab. There is groundwater in the bottom of the excavation and it has a slight sheen. will sample all wells and will compare these wells with their quarterly monitoring data to see if there has been any contamination migration or increase as a result of the incident.
08/26/09-Hiralkumar Patel. 7:38 PM:- received email from sanitation with letter report. Sanitation has pumped out tank and tested tank with remote fill line. tank and remote fill line found tight.
currently tank is out of service. URS collected soil and groundwater samples and will send report once sample analyticals available.
09/15/09-Hiralkumar Patel. 3:49 PM:- received email from Ms. Staten with sampling report. URS collected groundwater samples from existing wells. found free product in wells MW-03 and MW-25. URS stated that product in wells is a result of new spill since there was no detectable free product in any of the wells at the site for one year prior to new spill. URS removed free product using vacuum truck.

BRONX WEST 02 DOS -DDC (Continued) **S109826846**

product thickness dropped from 0.73 ft to 0.25 ft in well MW-03 and from 0.23 ft to 0.01 ft in well MW-25. URS requested to combine this case with old case 9810588 (project manager: Ainura Doronova). 09/22/09-Hiralkumar Patel. discussed with DEC Kolleeny. he agreed to refer this case to on-goiing remediation case. case closed. refer to spill #: 9810588."

Updated By:	RSLEE
Site Description:	"Location: The Hunts Point Perimeter Site is located along the eastern and southeastern portions of the roadway known as Food Center Drive within the Hunts Point Food Distribution Center (HPFDC). The HPFDC lies on the Hunts Point peninsula in the South Bronx. Site Features: The site is an active mapped roundway situated along the perimeter of the HPFDC. Current Zoning/Use: The site is an active mapped roadway and is zoned for commercial/industrial use. Historical Use: Ths site was part of the former Con Ed Hunts Point Manufactured Gas Plant (MGP), also known as the Hunts Point Coking Station. The initial coke oven plant at the facility was constructed in 1924 through 1926 and had a capacity of 20 million cubic feet of gas per day. The gas produced was used as a primary source of energy for lighting and heating. Another battery of coke ovens was installed in

HUNTS PT. FDC PERIMETER (Continued) **S105857223**

1931, increasing gas production capacity by 10 million cubic feet per day. A carburetted water gas plant was added in 1932, adding 30 million cubic feet per day to the capacity. The MGP included 46 buildings or structures and was devoted entirely to the manufacture of gas and its associated by-products, including coal tars, cyanide-contaminated purifier waste, sludges and oils. This manufacturing process has led to site contamination. The structures included two gas holders. The MGP operated into the 1950s. Much of the property was subsequently redeveloped into the HPFDC, a wholesale food complex. Site Geology and Hydrogeology: The soil stratigraphy varies across the MGP site and is influenced by historic filling activities. Historic fill material such as coal, slag, ash, and wood intermingled with sand and gravel and dredged sediment is present across the former MGP property. Underlying the fill unit in the eastern portion of the site is a mixture of clayey silt, sand and gravel which has been described as poorly sorted outwash deposits. A silty clay unit, described as meadowmat underlies the outwash deposits with the thickest intervals in the western portion of the former MGP. The water table generally occurs in the shallow subsurface at depths ranging from approximately 8 to 10 feet below ground surface. In general, groundwater flow is directed from the upland to the East and Bronx Rivers. However, groundwater flow may be influenced by tidal conditions with the adjacent rivers and the numerous subsurface utilities in the area. "

Env Problem:	"Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete and involved the excavation and off-site disposal of approximately 17,500 tons of material contaminated with coal tar and purifier waste. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), and purifier waste (cyanide) in soil, and PAHs, benzene, toluene, ethylbenzene and xylenes (BTEX), and cyanide in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted commercial/industrial uses. Remaining contamination in soil and groundwater is being managed under a Site Management Plan. "
Health Problem:	"This site consists of a portion of Food Center Drive where a natural gas pipeline, known as the Eastchester Extension Project, was installed. Soil contaminated with coal tar has been excavated and disposed of properly. Exposures are not expected since the site is paved."

Site Description:	"Location: The Hunts Point Perimeter Site is located along the eastern and southeastern portions of the roadway known as Food Center Drive within the Hunts Point Food Distribution Center (HPFDC). The HPFDC lies on the Hunts Point peninsula in the South Bronx. Site Features: The site is an active mapped roundway situated along the perimeter of the HPFDC. Current Zoning/Use: The site is an active

HUNTS PT. FDC PERIMETER (Continued) **S105857223**

mapped roadway and is zoned for commercial/industrial use. Historical Use: Ths site was part of the former Con Ed Hunts Point Manufactured Gas Plant (MGP), also known as the Hunts Point Coking Station. The initial coke oven plant at the facility was constructed in 1924 through 1926 and had a capacity of 20 million cubic feet of gas per day. The gas produced was used as a primary source of energy for lighting and heating. Another battery of coke ovens was installed in 1931, increasing gas production capacity by 10 million cubic feet per day. A carburetted water gas plant was added in 1932, adding 30 million cubic feet per day to the capacity. The MGP included 46 buildings or structures and was devoted entirely to the manufacture of gas and its associated by-products, including coal tars, cyanide-contaminated purifier waste, sludges and oils. This manufacturing process has led to site contamination. The structures included two gas holders. The MGP operated into the 1950s. Much of the property was subsequently redeveloped into the HPFDC, a wholesale food complex. Site Geology and Hydrogeology: The soil stratigraphy varies across the MGP site and is influenced by historic filling activities. Historic fill material such as coal, slag, ash, and wood intermingled with sand and gravel and dredged sediment is present across the former MGP property. Underlying the fill unit in the eastern portion of the site is a mixture of clayey silt, sand and gravel which has been described as poorly sorted outwash deposits. A silty clay unit, described as meadowmat underlies the outwash deposits with the thickest intervals in the western portion of the former MGP. The water table generally occurs in the shallow subsurface at depths ranging from approximately 8 to 10 feet below ground surface. In general, groundwater flow is directed from the upland to the East and Bronx Rivers. However, groundwater flow may be influenced by tidal conditions with the adjacent rivers and the numerous subsurface utilities in the area. "

Env Problem: "Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete and involved the excavation and off-site disposal of approximately 17,500 tons of material contaminated with coal tar and purifier waste. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), and purifier waste (cyanide) in soil, and PAHs, benzene, toluene, ethylbenzene and xylenes (BTEX), and cyanide in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted commercial/industrial uses. Remaining contamination in soil and groundwater is being managed under a Site Management Plan. "

Health Problem: "This site consists of a portion of Food Center Drive where a natural gas pipeline, known as the Eastchester Extension Project, was installed. Soil contaminated with coal tar has been excavated and disposed of properly. Exposures are not expected since the site is paved."

	ground surface. In general, groundwater flow is directed from the upland to the East and Bronx Rivers. However, groundwater flow may be influenced by tidal conditions with the adjacent rivers and the numerous subsurface utilities in the area. "
Env Problem:	"Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete and involved the excavation and off-site disposal of approximately 17,500 tons of material contaminated with coal tar and purifier waste. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), and purifier waste (cyanide) in soil, and PAHs, benzene, toluene, ethylbenzene and xylenes (BTEX), and cyanide in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted commercial/industrial uses. Remaining contamination in soil and groundwater is being managed under a Site Management Plan. "
Health Problem:	"This site consists of a portion of Food Center Drive where a natural gas pipeline, known as the Eastchester Extension Project, was installed. Soil contaminated with coal tar has been excavated and disposed of properly. Exposures are not expected since the site is paved."

Site Description: "Location: The Hunts Point Perimeter Site is located along the eastern and southeastern portions of the roadway known as Food Center Drive within the Hunts Point Food Distribution Center (HPFDC). The HPFDC lies on the Hunts Point peninsula in the South Bronx. Site Features: The site is an active mapped roundway situated along the perimeter of the HPFDC. Current Zoning/Use: The site is an active mapped roadway and is zoned for commercial/industrial use. Historical Use: Ths site was part of the former Con Ed Hunts Point Manufactured Gas Plant (MGP), also known as the Hunts Point Coking Station. The initial coke oven plant at the facility was constructed in 1924 through 1926 and had a capacity of 20 million cubic feet of gas per day. The gas produced was used as a primary source of energy for lighting and heating. Another battery of coke ovens was installed in 1931, increasing gas production capacity by 10 million cubic feet per day. A carburetted water gas plant was added in 1932, adding 30 million cubic feet per day to the capacity. The MGP included 46 buildings or structures and was devoted entirely to the manufacture of gas and its associated by-products, including coal tars, cyanide-contaminated purifier waste, sludges and oils. This manufacturing process has led to site contamination. The structures included two gas holders. The MGP operated into the 1950s. Much of the property was subsequently redeveloped into the HPFDC, a wholesale food complex. Site Geology and Hydrogeology: The soil stratigraphy varies across the MGP site and is influenced by historic filling

HUNTS PT. FDC PERIMETER (Continued) **S105857223**

	activities. Historic fill material such as coal, slag, ash, and wood intermingled with sand and gravel and dredged sediment is present across the former MGP property. Underlying the fill unit in the eastern portion of the site is a mixture of clayey silt, sand and gravel which has been described as poorly sorted outwash deposits. A silty clay unit, described as meadowmat underlies the outwash deposits with the thickest intervals in the western portion of the former MGP. The water table generally occurs in the shallow subsurface at depths ranging from approximately 8 to 10 feet below ground surface. In general, groundwater flow is directed from the upland to the East and Bronx Rivers. However, groundwater flow may be influenced by tidal conditions with the adjacent rivers and the numerous subsurface utilities in the area. "
Env Problem:	"Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete and involved the excavation and off-site disposal of approximately 17,500 tons of material contaminated with coal tar and purifier waste. Site Description:	"Location: The 3.5-acre site is located near the intersection of Halleck Street, East Bay Avenue and Hunts Point Avenue at 332 Old Hunts Point Avenue in the Borough and County of the Bronx. Site Features: The main site features include buildings, above-ground piping, and various underground natural gas and water pipelines associated with the metering and regulating station at the Con Edison Gas Compressor Station site. A chain-link fence surrounds the site, with access through a security gate located on Halleck Street. Current Zoning/Use: The site is currently active and is zoned for industrial use. Nearby properties include municipal and private solid waste facilities, sewage treatment plants, auto service/wrecking establishments, and manufacturing facilities. Historical Uses: Between 1924 and the early 1960s, the site was part of the grounds of Con Edison's former Hunts Point Gas Works - a coal and carburetted

CONSOLIDATED EDISON (Continued) **S105684655**

water gas manufactured gas plant (MGP) complex that encompassed more than 200 acres. Insurance maps indicate that former MGP gas manufacturing or storage structures were not present on the site property. However, several MGP-related structures including a large 15,000,000 cubic foot waterless gasholder, pump tanks, filters, a waste oil tank, and a tar separator were located on the adjacent property to the east of the site. A former Con Edison substation and associated structures were located on the adjacent property to the south of the site. An August 2002 Preliminary Site Assessment performed by Con Edison showed that on-site soils were contaminated with semi-volatile organic compounds, primarily polyaromatic hydrocarbons (PAHs), and volatile organic compounds such as benzene, as well as copper, lead and zinc at levels above regulatory guidelines. The groundwater was found to contain carcinogenic PAHs as well as some metals including iron, lead, and manganese at levels above NYSDEC Class GA groundwater standards. In order to more adequately assess the extent of contamination in on-site soils and groundwater, the NYSDEC requested that Con Edison perform additional site investigation under the Voluntary Cleanup Program pursuant to a Voluntary Cleanup Agreement which was executed between the NYSDEC and Con Edison on October 17, 2002. Site Geology and Hydrogeology: The site is underlain by approximately 3 to 11 feet of fill material, consisting of sand, gravel, coal ash/cinders, and debris (wood, bricks, glass, etc.). In general, the fill is underlain by a layer of sand and gravel, which in turn is underlain by clay. The thickness of the clay ranges from approximately 4 feet in the southwestern portion of the site to 13 feet in the southeastern portion of the site. A deeper sand layer is located beneath the clay at depths ranging from approximately 11 feet below ground surface (bgs). Bedrock is encountered beneath the deeper sand layer in the southeastern portion of the property at approximately 27 feet bgs. Shallow groundwater has been encountered within fill materials on the eastern portion of the site at depths between 2 and 5 feet bgs. This shallow water appears to be perched within the fill and sand materials above the clay. The depth of the shallow perched water increases towards the western portion of the site. A deeper water-bearing zone exists within the deeper sand layer where groundwater is located at 10 to 15 feet bgs. The groundwater flows in a southwesterly direction. "

Env Problem: "Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), benzene, copper, lead, and zinc in soil, and PAHs, iron, lead and manganese in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Remaining contamination in soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil and groundwater are contaminated with manufactured gas plant waste. Soil contaminated with polycyclic aromatic hydrocarbons and coal tar has been excavated and removed from the site. Soil, gravel cover and a fence will prevent exposure to residually contaminated soil. The area is served by public water, therefore, exposures via ingestion are not expected. "

Site Code: 57554
Site Description: "Location: The 3.5-acre site is located near the intersection of Halleck Street, East Bay Avenue and Hunts Point Avenue at 332 Old Hunts Point Avenue in the Borough and County of the Bronx. Site Features: The main site features include buildings, above-ground piping, and various underground natural gas and water pipelines associated with the metering and regulating station at the Con Edison Gas Compressor Station site. A chain-link fence surrounds the site, with access through a security gate located on Halleck Street. Current Zoning/Use: The site is currently active and is zoned for industrial use. Nearby properties include municipal and private solid waste facilities, sewage treatment plants, auto service/wrecking establishments, and manufacturing facilities. Historical Uses: Between 1924 and the early 1960s, the site was part of the grounds of Con Edison's former Hunts Point Gas Works - a coal and carburetted water gas manufactured gas plant (MGP) complex that encompassed more than 200 acres. Insurance maps indicate that former MGP gas manufacturing or storage structures were not present on the site property. However, several MGP-related structures including a large 15,000,000 cubic foot waterless gasholder, pump tanks, filters, a waste oil tank, and a tar separator were located on the adjacent property to the east of the site. A former Con Edison substation and associated structures were located on the adjacent property to the south of the site. An August 2002 Preliminary Site Assessment

CONSOLIDATED EDISON (Continued) **S105684655**

performed by Con Edison showed that on-site soils were contaminated with semi-volatile organic compounds, primarily polyaromatic hydrocarbons (PAHs), and volatile organic compounds such as benzene, as well as copper, lead and zinc at levels above regulatory guidelines. The groundwater was found to contain carcinogenic PAHs as well as some metals including iron, lead, and manganese at levels above NYSDEC Class GA groundwater standards. In order to more adequately assess the extent of contamination in on-site soils and groundwater, the NYSDEC requested that Con Edison perform additional site investigation under the Voluntary Cleanup Program pursuant to a Voluntary Cleanup Agreement which was executed between the NYSDEC and Con Edison on October 17, 2002. Site Geology and Hydrogeology: The site is underlain by approximately 3 to 11 feet of fill material, consisting of sand, gravel, coal ash/cinders, and debris (wood, bricks, glass, etc.). In general, the fill is underlain by a layer of sand and gravel, which in turn is underlain by clay. The thickness of the clay ranges from approximately 4 feet in the southwestern portion of the site to 13 feet in the southeastern portion of the site. A deeper sand layer is located beneath the clay at depths ranging from approximately 11 feet below ground surface (bgs). Bedrock is encountered beneath the deeper sand layer in the southeastern portion of the property at approximately 27 feet bgs. Shallow groundwater has been encountered within fill materials on the eastern portion of the site at depths between 2 and 5 feet bgs. This shallow water appears to be perched within the fill and sand materials above the clay. The depth of the shallow perched water increases towards the western portion of the site. A deeper water-bearing zone exists within the deeper sand layer where groundwater is located at 10 to 15 feet bgs. The groundwater flows in a southwesterly direction. "

Env Problem: "Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), benzene, copper, lead, and zinc in soil, and PAHs, iron, lead and manganese in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Remaining contamination in soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Soil and groundwater are contaminated with manufactured gas plant waste. Soil contaminated with polycyclic aromatic hydrocarbons and coal tar has been excavated and removed from the site. Soil, gravel cover and a fence will prevent exposure to residually contaminated soil. The area is served by public water, therefore, exposures via ingestion are not expected. "

Name: CE - GAS COMPRESSOR STATION
Address: FOOD CENTER DRIVE
City,State,Zip: BRONX, NY 10474-
Program Type: VCP
Site Code: 57554
HW Code: V00605
Site Class: C
SWIS: 301
Region: 2
Town: New York City
Acres: 3.500
Date Record Added: 08/09/2002
Date Record Updated: 02/04/2021
Updated By: SMQUANDT
Site Description: "Location: The 3.5-acre site is located near the intersection of Halleck Street, East Bay Avenue and Hunts Point Avenue at 332 Old Hunts Point Avenue in the Borough and County of the Bronx. Site Features: The main site features include buildings, above-ground piping, and various underground natural gas and water pipelines associated with the metering and regulating station at the Con Edison Gas Compressor Station site. A chain-link fence surrounds the site, with access through a security gate located on Halleck Street. Current Zoning/Use: The site is currently active and is zoned for industrial use. Nearby properties include municipal and private solid waste facilities, sewage treatment plants, auto service/wrecking establishments, and manufacturing facilities. Historical Uses: Between 1924 and the early 1960s, the site was part of the grounds of Con Edison's former Hunts Point Gas Works - a coal and carburetted water gas manufactured gas plant (MGP) complex that encompassed more than 200 acres. Insurance maps indicate that former MGP gas manufacturing or storage structures were not present on the site property. However, several MGP-related structures including a large 15,000,000 cubic foot waterless gasholder, pump tanks, filters, a waste oil tank, and a tar separator were located on the adjacent property to the east of the site. A former Con Edison substation and associated structures were located on the adjacent property to the south of the site. An August 2002 Preliminary Site Assessment performed by Con Edison showed that on-site soils were contaminated with semi-volatile organic compounds, primarily polyaromatic hydrocarbons (PAHs), and volatile organic compounds such as benzene, as well as copper, lead and zinc at levels above regulatory guidelines. The groundwater was found to contain carcinogenic PAHs as

CONSOLIDATED EDISON (Continued) **S105684655**

well as some metals including iron, lead, and manganese at levels above NYSDEC Class GA groundwater standards. In order to more adequately assess the extent of contamination in on-site soils and groundwater, the NYSDEC requested that Con Edison perform additional site investigation under the Voluntary Cleanup Program pursuant to a Voluntary Cleanup Agreement which was executed between the NYSDEC and Con Edison on October 17, 2002. Site Geology and Hydrogeology: The site is underlain by approximately 3 to 11 feet of fill material, consisting of sand, gravel, coal ash/cinders, and debris (wood, bricks, glass, etc.). In general, the fill is underlain by a layer of sand and gravel, which in turn is underlain by clay. The thickness of the clay ranges from approximately 4 feet in the southwestern portion of the site to 13 feet in the southeastern portion of the site. A deeper sand layer is located beneath the clay at depths ranging from approximately 11 feet below ground surface (bgs). Bedrock is encountered beneath the deeper sand layer in the southeastern portion of the property at approximately 27 feet bgs. Shallow groundwater has been encountered within fill materials on the eastern portion of the site at depths between 2 and 5 feet bgs. This shallow water appears to be perched within the fill and sand materials above the clay. The depth of the shallow perched water increases towards the western portion of the site. A deeper water-bearing zone exists within the deeper sand layer where groundwater is located at 10 to 15 feet bgs. The groundwater flows in a southwesterly direction. "

Env Problem:	"Nature and Extent of Contamination: Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern at the site included polyaromatic hydrocarbons (PAHs), benzene, copper, lead, and zinc in soil, and PAHs, iron, lead and manganese in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Remaining contamination in soil and groundwater is being managed under a Site Management Plan."
Health Problem:	"Soil and groundwater are contaminated with manufactured gas plant waste. Soil contaminated with polycyclic aromatic hydrocarbons and coal tar has been excavated and removed from the site. Soil, gravel cover and a fence will prevent exposure to residually contaminated soil. The area is served by public water, therefore, exposures via ingestion are not expected. "

Updated By:	BXANDERS
Site Description:	"Location: Parcel E, OU2 is located within the Hunts Point Food Distribution Center (HPFDC) which lies on the Hunts Point peninsula in the South Bronx. The 3.69-acre site is an L-shaped portion of land located in the northwestern portion of the HPFDC in NYSDEC Region 2, Bronx County. It is bounded to the north by Food Center Drive (formerly East Bay Avenue), to the west by Halleck Street, to the east by Hunt Point Parcel EOU1 (Site No. V00414), and to the south by the Con Edison Gas Compressor Station Easement Area, the Con Edison Gas Compressor Station Site (Site No. V00605), and the Meat Market portion of the HPFDC. The HPFDC was the former location of the Con Edison Hunts Point Manufactured Gas Plant (MGP), also known as the Hunts Point Coking Station. Current Zoning/Uses: The Site is currently inactive, and is zoned for business district, light commercial, light industrial, and local service district uses. Historical Uses: While the Site is currently inactive, the Con Edison MGP (coal gasification facility) operated from 1925 through the early 1950s. The Site is located generally upgradient of the main MGP facility, but on-site contamination appears to be associated with the gasification process which is known to have yielded large quantities of contaminants including polycyclic aromatic hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compounds, and various inorganic compounds such as iron, lead, copper, zinc, sulfides, cyanides and nitrates. A Remedial Investigation was completed in 2006. An Interim Remedial Measure Work Plan for the limited excavation of coal tar and purifier waste hot spots on the site was approved on January 16, 2008 and will be implemented as part of the final remedy for this site. Site Geology and Hydrogeology: The soil stratigraphy varies across the HPFDC as a

CONSOLIDATED EDISON (Continued) **S105684655**

result of previous filling activities. Typically, a 1- to 2-foot thick layer of sandy topsoil/fill overlays fill material that consistently includes soil, construction and demolition debris, ash, cinders, residual coal, and material that is moderately to significantly impacted by MGP waste (coal tar and purifier waste). The underlying MGP fill layer varies in thickness across the site, but is generally 5 to 7 feet thick. Underlying the MGP fill layer is a native clay layer. Site groundwater was generally encountered on top of the native clay whose depth varies from 7 to 12 feet below ground surface. The depth to groundwater changes throughout the year. The VCA for this site was terminated on 2/12/18 and the site was transitioned into the Brownfield Cleanup Program under BCP Site No. C203095."

Env Problem: "Nature and Extent of Contamination: The primary contaminants of concern at the site include benzene, naphthalene, polyaromatic hydrocarbons (PAHs), arsenic and cyanide. Investigations conducted at the site indicate subsurface soil contamination associated with historic on-site manufactured gas plant operations. The underlying groundwater, on the other hand, does not appear to be significantly impacted. The subsurface soils exceeded soils guidance values for benzene, naphthalene, PAHs, arsenic and cyanide. The VCA for this site was terminated on 2/12/18 and the site was transitioned into the Brownfield Cleanup Program under BCP Site No. C203095."

Health Problem: "The site is completely fenced, which restricts public access. However, persons who enter the site could contact contaminants in the soil by walking on the site, digging or otherwise disturbing the soil. Contaminated groundwater at the site is not used for drinking or other purposes and the area is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no occupied buildings on the site. A vapor barrier and passive sub-slab depressurization system (systems that ventilate/remove the air beneath the building) will be installed in future on-site buildings to prevent soil vapor intrusion from occurring."

Site Description:	"Location: The 6-acre Site is located in the northwestern portion of the Hunts Point Food Distribution Center (HPFDC) in NYSDEC Region 2, Bronx County. It is bounded to the north by the Con Ed Gas Compressor Station Site, Site #V00605, to the west by Halleck Street, to the east by Hunts Point Parcel EOU2, Site #V00681, and to the south by Hunts Point Parcel A, Site #V00233. Site Features: There are

CONSOLIDATED EDISON (Continued) **S105684655**

currently no structures on the Site. The land is flat and graded. The western portion of the Site is covered with approximately 6 inches or more of gravel and vegetation. The central portion of the Site contains a vegetated area, and the eastern portion of the Site contains a large concrete pad which is surrounded by a nearly finished concrete foundation wall on the north, west and east sides. Current Zoning/Uses: The Site is currently inactive and zoned for commercial use. The surrounding parcels within the HPFDC are used for a combination of commercial and heavy manufacturing uses. Past Use of the Site: Contamination exists on the Site due to the historical occupancy of the HPFDC by the Consolidated Edison coal gasification facility or Manufactured Gas Plant (MGP) which operated from 1925 through the early 1950s. The MGP process has been known to yield large quantities of by-products including Polycyclic Aromatic Hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compounds, and various inorganic compounds such as iron, lead, copper, zinc, sulfides, cyanides and nitrates. The site is located upgradient of the former location of the main MGP facility, and, therefore, does not appear to be significantly impacted by MGP wastes. Site Geology and Hydrogeology: Generally, a 6-inch to 1.5-foot gravel layer overlays most of the Site. Under the gravel is a 2.5 to 5-foot thick layer of fill containing brown sand/silt which is underlain by 2 to 6 feet fill primarily consisting of coal ash. Below the coal ash layer is the native clay layer which appears at various depths Below the Ground Surface (bgs). On-site groundwater flows towards the east in the general direction of the Bronx River, and is typically encountered just above the clay layer at a depth of approximately 7 to 12 feet bgs. The VCA for this site was terminated on 2/12/18. This site was transitioned into the Brownfield Cleanup Program (BCP) and is included under BCP Site No. C203098."

Env Problem: "Nature and Extent of Contamination: Based on the Remedial Investigation, the primary contaminants of concern at the site include polychlorinated biphenyls (PCBs), methyl tert-butyl ether (MTBE), benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chrysene. Groundwater - MTBE was found in groundwater at concentrations exceeding the groundwater standard (10 parts per billion [ppb]), with a maximum concentration of 370 ppb which was found in piezometer PZ-2. The MTBE concentration level in PZ-2 appears to be an isolated area of contamination. Its origin is not known but it does not appear to be on-site. All soil samples collected near this location did not show any detectable levels of MTBE or related compounds. Soils - Concentrations of PCBs found in surface soils on-site (as high as 15 parts per million [ppm]) exceeded the Track 2 soil cleanup objective (SCO) for commercial use (1 ppm). Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and chrysene were found in on-site soils at levels slightly above the Track 2 SCO for commercial use. Soil Vapor - The soil vapor samples were collected in February 2005, prior to the October 2006 Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, so the sampling procedures used may not be consistent with what is included in the October 2006 Final Guidance. The February 2005 soil vapor results indicated that volatile organic compound (VOC) concentrations were very low in each sample with a maximum concentration of 51 g/m3 of benzene in one sample. The VCA for this site was terminated on 2/12/18. The site was transitioned into the Brownfield Cleanup Program (BCP) and is included under the

CONSOLIDATED EDISON (Continued) **S105684655**

	BCP Site No. C203098."
Health Problem:	"The site is completely fenced, which restricts public access. However, persons who enter the site could contact contaminants in the soil by digging or otherwise disturbing the soil. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern."

Updated By:	BXANDERS
Site Description:	"Location: Parcel D is a 9-acre site located in the northeastern portion of the Hunts Point Food Distribution Center (HPFDC) which lies on the Hunts Point peninsula in the South Bronx. It is bounded to the north by the New York City Terminal Market, to the south by Krasdale Food Industries, to the west by Food Center Drive, and to the east by the Bronx River. Site Features: The site is relatively level with some debris piles located sporadically across the site. Most of the site is vegetated with small brush and trees with the exception of a large area devoid of vegetation near the center of the site. The area devoid of vegetation has purifier waste exposed at the surface. Upon entering the area which is devoid of vegation, the sulfuric odor characteristic of purifier waste is immediately noticeable. Current Zoning/Uses: The site is currently inactive and zoned for commercial use. The surrounding parcels within the HPFDC are used for a combination of commercial and heavy manufacturing uses. Historical Uses: Contamination exists on the site due to the historical occupancy of the HPFDC by the Consolidated Edison coal gasification facility (coking station) or manufactured gas plant (MGP)which was constructed between 1924 and 1932, and operated until the early 1960s. Much of the property was subsequently developed into the HPFDC, a wholesale food complex. Site Geology and Hydrogeology: The Site is relatively flat with a slight surface topography change, lowering the site to the east (adjacent to the Bronx River). A significant portion of the Site falls within the FEMA AE flood zone and a very small portion along the south east corner is within the VE flood zone. Based on historic aerial photos dating back to 1928, the site appears to be filled with man-made materials, waste from the former manufactured gas plant and other material that appears to have originated from dredging operations. The MGP waste consists mainly of material that clearly resembles purifier bed material. This purifier waste extends from the surface to a maximum depth of approximately 16

CONSOLIDATED EDISON (Continued) **S105684655**

feet with some deposits as thick as 15 feet. Much of the waste is obvious and can be clearly seen at the surface where no vegetation has grown since it was deposited. The material exhibits a clearly acrid or sulfurous odor when approached and the surface blue color is clearly differentiated from other fill areas. Other areas also contain coal tar and other waste material. Depth to groundwater varies across the site but in general the overall gradient is believed to be toward the Bronx River as this is the base of the drainage basin. A large stone rip rap bulkhead exists along the River s edge. There are no construction documents available for the bulkhead but it does not appear to prevent water from moving inward at high tide or back during low tide or storm events. There is a consistent layer of clay beneath the fill material across the site which has been observed several feet below the water table. This clay layer is believed to be part of reason for the fluctuating groundwater contours in the area, as it helps promote more horizontal flow through the site. Bedrock has not been encountered in the investigation but is expected to be at depths greater than 50 ft below grade beneath the site. The Voluntary Cleanup Agreement for this site was terminated on 2/12/18. This site has transitioned into the Brownfield Cleanup Program (BCP) under BCP Site No. C203100."

Env Problem: "Nature and Extent of Contamination: The primary contaminants of concern at the site known at this time include volatile organic compounds, semi-volatile organic compounds including polyaromatic hydrocarbons (PAHs)and metals. The completed investigation indicates the presence of groundwater and soil contamination. Exceedances of standards, criteria and guidance include benzene, naphthalene, arsenic, chromium, lead, manganese and selenium in groundwater, and benzene, PAHs, and cyanide in soil. The Voluntary Cleanup Agreement for this site was terminated on 2/12/18. This site has transitioned into the Brownfield Cleanup Program (BCP) under BCP Site No. C203100."
Not reported

Health Problem: "Soil and groundwater are contaminated with manufactured gas plant waste including purifier waste and coal tar. Groundwater is not used as a source for drinking water, therefore, expsoures are not expected. Currently, there is a potential for expsosure to contaminated soil, however, it is a commercial/industrial area and public exposures are unlikely. The proposed remedy includes removal of coal tar boils and purifier waste. In addition, new construction and an associated parking lot will prevent exposure to residual soil contamination ."

Updated By:	BXANDERS
Site Description:	"Location: Site F is a 2.16-acre site is located within a parcel leased and operated by Krasdale Foods. The Krasdale parcel is located at 400 Food Center Drive, in the southeastern section of the Hunts Point Food Distribution Center (HPFDC) in NYSDEC Region 2, Bronx County. It is bounded to the north by Krasdale Food's distribution warehouse, to the west by Food Center Drive and railroad spur, to the east by Krasdale Food's tractor-trailer parking and the Bronx River, and to the south by Krasdale Food's tractor-trailer parking and the HPFDC Site C (Greenway), Site No. V00412. Site Features: The site is relatively level and vegetated with tall grass and weeds. A large area of purifier waste, measuring approximately 75 by 90 feet is exposed at the ground surface near the northwest corner and the central portion of the site. There are also several smaller purifier waste areas near the northeast portion of the site. At the southeast corner of the site there are several areas with purifier waste mixed with asphalt debris. A large elevated mound of slag is situated near the center of the site, and several asphalt piles are located near the east side of the site. In addition, there are also patches of stressed vegetation or areas devoid of vegetation across the site. The stressed vegetation appears to be associated with the purifier

CONSOLIDATED EDISON (Continued) **S105684655**

waste and slag areas. Current Zoning/Uses: The site is currently undeveloped (open and unused) and zoned for commercial use. The remainder of the Krasdale parcel is developed and is the location for one of Krasdale's warehouse and office facilities as well as vehicle storage and staging for wholesale food distribution. The surrounding parcels within the HPFDC are used for a combination of commercial and heavy manufacturing uses. Historical Uses: Contamination exists on the site due to the historical occupancy of the HPFDC by the Consolidated Edison coal gasification facility or manufactured gas plant (MGP) which operated from 1925 through the early 1950s. Based on reviews of historic photographs, prior to development, Site F appears to be located under water within a triangular-shaped inlet from the Bronx River. Site F remained this way unti the MGP facility was modified and upgraded to produce carburetted water gas from coke resulting in a significant expansion. 1951 and 1954 photos show the MGP facility covering the entire Hunts Point peninsula with the Parcel F area being used for coal storage. The gasification process has been known to yield large quantities of by-products including polycyclic aromatic hydrocarbons (PAHs), light aromatic hydrocarbons, phenolic compounds, miscellaneous organic compounds, and various inorganic compounds such as iron, lead, copper, zinc, sulfides, cyanides and nitrates. The US Army Corps of Engineers constructed the existing stone bulkhead between 1966 and 1974. Along the 1966 shoreline, an area approximately 100 feet wide appears to have been filled to bridge the gap between the historic bulkhead and new bulkhead. In November 1969, a lease was signed with K.F.I. Food Distributors, Inc. (K.F.I.), an affiliate of Krasdale Foods, the current lessee. The original leased parcel was 10.13 acres, and did not include Site F. A building was later constructed on the Krasdale parcel. In 1979, the leased parcel was expanded to include a total of 16.92 acres, incorporating the 2.16-acre Site F parcel into the lease. While the Krasdale Foods buildings have been expanded, Site F was never developed. Site Geology and Hydrogeology: Generally the surface of Site F consists of fill composed of a silty sand and containing coal, ash and slag. Additionally there are a number of areas where purifier waste is visible at the surface. The thickness of the surface fill layer varies extending to a depth of 3 to 11 feet bgs with an average thickness of approximately 5.5 feet. Underlying the surface fill is a purifier waste deposit consisting of blue/green stained woodchips and sand. The purifier waste deposit appears to be present over the entire footprint of the site and extends from 3 to 17 feet bgs with an average thickness of approximately 6.3 feet thick. A consistent olive-green silty clay was encountered immediately beneath the purifier waste deposit. The clay was observed between 10 and 20 feet below the current ground surface. It appears to extended beyond the boundaries of Site F with an average thickness of approximately 3 feet. Clay was encountered below all areas containing purifier bed material. A sand unit with discrete, discontinuous silt lenses lies immediately beneath the clay. This layer was shown to extend from approximately 17 to 45 feet bgs. The sand layer thickness varies from 26 to 28 feet with and average thickness of approximately 27 feet. Bedrock underlies the sand unit. Within the Site F parcel, groundwater is approximately 4 feet bgs and ranges from 4.3 to 3.4 feet above mean sea level (amsl). The water levels drop off to approximate mean sea level towards the east, adjacent to the Bronx River. Groundwater across the Site F parcel is relatively flat and appears to flow radially to the east and south

CONSOLIDATED EDISON (Continued) **S105684655**

(to the Bronx River). The average horizontal gradient across the entire site was determined to be approximately 0.004 feet/feet. Tidal influence was observed in deep monitoring wells to the east of the historical bulkhead indicating that the sand fill to the east of Site F parcel is hydraulically connected to the Bronx River. Tidal influence was not observed in the shallower fill/purifier waste deposit indicating that the portion of the Site F parcel west of the former bulkhead has a limited hydraulic connection to the Bronx River. The Voluntary Cleanup Agreement for this site was terminated on 2/12/18 and it was transitioned into the Brownfield Cleanup Program (BCP). It is now included under BCP Site No. C203101. "

Env Problem: "Prior to Completion of Remediation Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern at the site known at this time include cyanide, carbon disulfide, naphthalene and polyaromatic hydrocarbons (PAHs). The investigations indicated the presence of groundwater, as well as subsurface soil contamination associated with historic manufactured gas plant operations. Naphthalene, carbon disulfide and cyanide were detected in groundwater at maximum concentrations of 2,300 ppb, 16,000 ppb, and 10,300 ppb, respectively. The groundwater standard for each of these constituents is 10 ppb, 50 ppb, and 200 ppb, respectively. Due to the presence of purifier waste across a major portion of the site, concentrations of cyanide found on-site (as high as 1,620 ppm)significantly exceeded the soil cleanup objective (SCO) for the protection of groundwater (40 ppm). In addition, due to the presence of coal tar in on-site soils, the concentration of PAHs found on-site mostly exceeded the SCO for Track 2 commercial use, particularly along the northern property boundary. The Voluntary Cleanup Agreement for this site was terminated on 2/12/18 and it was transitioned into the Brownfield Cleanup Program (BCP). This site is now included under BCP No C203101. "

Health Problem: "Persons who enter the site could contact contaminants in the soil by walking on the soil, or digging or otherwise disturbing the soil. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Breathing site contaminants in indoor air due to soil vapor intrusion does not represent a concern for this site in its current condition because there is no on-site building. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site development and for current off-site buildings."

Update By:	SMQUANDT
Site Description:	"Location: The Site is located in a commercial and industrial area of the Hunts Point section of the Bronx. The Site is an approximate 18.9735 acre area within a larger tax lot containing multiple parcels of land and is identified on New York City tax maps as Block 2781, Lot 500. The Site is bound to the north by the Hunts Point Parcel D, to the east by the Bronx River, to the south by a portion of the South Bronx Greenway and Anheuser-Busch, and to the west by the railroad right-of-way and Food Center Drive. Site Features: The original Hunts Point Parcel F was a 2.2-acre rectangular area located immediately south of the Krasdale warehouse, and is undeveloped, relatively level and vegetated with tall grass and weeds. Previous investigations indicated that purifier waste extends to the south and east of Hunts Point Parcel F, thus the metes and bounds of the area to be remediated were expanded. The additional portion of Hunts Point Parcel F includes all areas under the current Krasdale Foods lease that serves to house a warehouse and parking area. Current Zoning and Land Use: The Site is currently zoned M3-1(Manufacturing). The original Hunts Point Parcel F is a vacant, undeveloped parcel of land within the larger Krasdale facility. The expanded Hunts Point Parcel F that was included as part of the BCP application encompasses the entire improved area containing the Krasdale food distribution

400 FOOD CENTER DRIVE (Continued) **S116296738**

warehouse and parking lot. Surrounding properties include the Anheuser-Busch distribution center to the south, the Hunts Point Cooperative Market to the west, a vacant lot (Hunts Point Parcel D) to the north, and the Bronx River to the west. Past Use of the Site Historically, the Site was part of the Consolidated Edison Company of New York, Inc. (Con Ed) manufactured gas plant (MGP) that operated from 1926 until the early 1960s. Gas operations included a coke/oven gas plant, a carbureted water gas plant, a light oil plant, and a liquid petroleum production area. In total, approximately 46 buildings or structures existed on the former Con Ed MGP facility that were actively involved in gas production. Site Geology and Hydrogeology: The Site incorporates approximately 18.9735 acres of fairly level land situated on the Hunts Point peninsula in the South Bronx, NY. The Site is located approximately 12 feet above sea level (NAVD 88). The soil stratigraphy of Site typically contains a 5 ft overburden fill layer of silty sand with gravel, coal and ash material underlain by MGP-related waste (purifier waste and minimal coal tar). The waste material generally ranges from 5-10 ft thick mostly containing purifier waste and is underlain by a native intermediate clay layer. The clay unit is further underlain by 5-10 ft of alluvial type deposits. A dense till reaching 20 ft in thickness is present just above bedrock. Groundwater at Site is located approximately 4 ft below ground surface. Based on the proximity to the Bronx River, groundwater is expected to flow to the east. Additional site information can be found under VCP Site No. V00554, Operable Unit 1"

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/27/2022

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

SPILLS: Spills Information Database

Data collected on spills reported to NYSDEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

Data Release Frequency: Varies

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

Date of Government Version: 01/01/2002

SPILLS 90: SPILLS90 data from FirstSearch

Spills 90 includes those spill and release records available exclusively from FirstSearch databases. Typically, they may include chemical, oil and/or hazardous substance spills recorded after 1990. Duplicate records that are already included in EDR incident and release records are not included in Spills 90.

Date of Government Version: 12/14/2012

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

NYC LEAD 2: Recent Lead Paint Violations
Pursuant to New York City?s Housing Maintenance Code, the Department of Housing Preservation and Development (HPD) issues violations against conditions in rental dwelling units that have been verified to violate the New York City Housing Maintenance Code (HMC) or the New York State Multiple Dwelling Law (MDL). Violations are issued when an inspection verifies that a violation of the HMC or MDL exists. It is closed when the violation is corrected, as observed/verified by HPD or as certified by the landlord.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991

Version Date:	2019

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

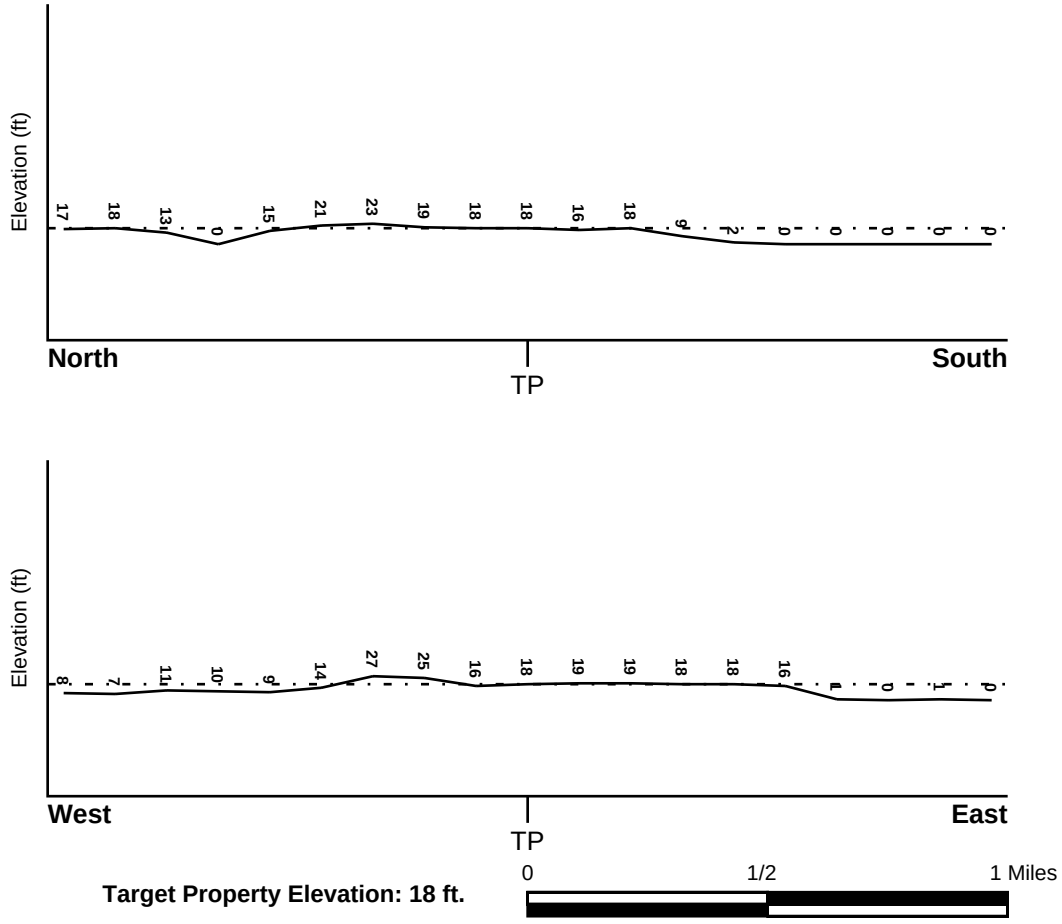
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ESE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
3604970092F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type

3604970111F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CENTRAL PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Paleozoic
System:	Ordovician
Series:	Middle Ordovician (Mohawkian)
Code:	O2 *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy sand
sandy loam
fine sandy loam

Surficial Soil Types: silt loam
loamy sand
sandy loam
fine sandy loam

Shallow Soil Types: sandy loam

Deeper Soil Types: unweathered bedrock
very gravelly - loamy sand
stratified
sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

New York Public Water Wells
Source: New York Department of Health
Telephone: 518-458-6731

OTHER STATE DATABASE INFORMATION

Oil and Gas Well Database
Source: Department of Environmental Conservation
Telephone: 518-402-8072
These files contain records, in the database, of wells that have been drilled.

RADON

State Database: NY Radon
Source: Department of Health
Telephone: 518-402-7556
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary faultlines, prepared in 1975 by the United State Geological Survey

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1927 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 200 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

West Harrison, NY 10604
Contact: Sandy Smith

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by CBRE were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Form 35-3038-13041 114

DEPARTMENT OF HOUSING AND BUILDINGS

BOROUGH OF BRONX , CITY OF NEW YORK

No.

Date

CERTIFICATE OF OCCUPANCY

(Standard form adopted by the Board of Standards and Appeals and issued pursuant to Section 646 of the New York Charter, and Sections C.26-181.0 to C26-187.0 inclusive Administrative Code 2.1.3.1. to 2.1.3.7. Building Code.)

This certificate supersedes C. O. No. N.B. 2247/27

To the owner or owners of the building or premises:

THIS CERTIFIES that the ~~new~~ altered ~~existing~~ building—premises located at

1379 East Bay Ave. N/W cor. of Hunts Point Ave.

Block 2772-B Lot 219-231

, conforms substantially to the approved plans and specifications, and to the requirements of the building code and all other laws and ordinances, and of the rules and regulations of the Board of Standards and Appeals, applicable to a building of its class and kind at the time the permit was issued; and

CERTIFIES FURTHER that, any provisions of Section 646F of the New York Charter have been complied with as certified by a report of the Fire Commissioner to the Borough Superintendent.

~~New Building~~ No.— Alt. 230/41 Construction classification— non-fireproof

Occupancy classification—Commercial . Height 1 stories, 16'00" feet.

Date of completion—July 25, 1946 . Located in Unrestricted Use District.

Area Class 2 . Height Zone at time of issuance of permit

This certificate is issued subject to the limitations hereinafter specified and to the following resolutions of the Board of Standards and Appeals: (Calendar numbers to be inserted here)

PERMISSIBLE USE AND OCCUPANCY

STORY	LIVE LOADS Lbs per Sq Ft	PERSONS ACCOMMODATED MALE	FEMALE	TOTAL	USE
Cellar	on earth				Boiler room
First	on earth	30	5	35	Machine Shop

NOTE: Fire Department permit M-9841 issued 2/11/47 for a 1,080 gallon Fuel Oil Installation.

Borough Superintendent.

NO CHANGES OF USE OR OCCUPANCY NOT CONSISTENT WITH THIS CERTIFICATE SHALL BE MADE UNLESS FIRST APPROVED BY THE BOROUGH SUPERINTENDENT

Unless an approval for the same has been obtained from the Borough Superintendent, no change or rearrangement in the structural parts of the building, or affecting the light and ventilation of any part thereof, or in the exit facilities, shall be made; no enlargement, whether by extending on any side or by increasing in height shall be made; nor shall the building be moved from one location or position to another; nor shall there by any reduction or diminution of the area of the lot or plot on which the building is located.

The building or any part thereof shall not be used for any purpose other than that for which it is certified.

The superimposed, uniformly distributed loads, or concentrated loads producing the same stresses in the construction in any story shall not exceed the live loads specified on reverse side; the number of persons of either sex in any story shall not exceed that specified when sex is indicated, nor shall the aggregate number of persons in any story exceed the specified total; and the use to which any story may be put shall be restricted to that fixed by this certificate except as specifically stated.

This certificate does not in any way relieve the owner or owners or any other person or persons in possession or control of the building, or any part thereof from obtaining such other permits, licenses or approvals as may be prescribed by law for the uses or purposes for which the building is designed or intended, nor from obtaining the special certificates required for the use and operation of elevators; nor from the installation of fire alarm systems where required by law; nor from complying with any lawful order for additional fire extinguishing appliances under the discretionary powers of the fire commissioner; nor from complying with any lawful order issued with the object of maintaining the building in a safe or lawful condition; nor from complying with any authorized direction to remove encroachments into a public highway or other public place, whether attached to or part of the building or not.

If this certificate is marked "Temporary", it is applicable only to those parts of the building indicated on its face, and certifies to the legal use and occupancy of only such parts of the building; it is subject to all the provisions and conditions applying to a final or permanent certificate; it is not applicable to any building under the jurisdiction of the Housing Division unless it is also approved and endorsed by them, and it must be replaced by a full certificate at the date of expiration.

If this certificate is for an existing building, erected prior to March 14, 1916, it has been duly inspected and it has been found to have been occupied or arranged to be occupied prior to March 14, 1916, as noted on the reverse side, and that on information and belief, since that date there has been no alteration or conversion to a use that changed its classification as defined in the Building Code, or that would necessitate compliance with some special requirement or with the State Labor Law or any other law or ordinance; that there are no notices of violations or orders pending in the Department of Housing and Buildings at this time; that Section 646F of the New York City Charter has been complied with as certified by a report of the Fire Commissioner to the Borough Superintendent, and that, so long as the building is not altered, except by permission of the Borough Superintendent, the existing use and occupancy may be continued.

"§ 646 F. No certificate of occupancy shall be issued for any building, structure, enclosure, place or premises wherein containers for combustibles, chemicals, explosives, inflammables and other dangerous substances, articles, compounds or mixtures are stored, or wherein automatic or other fire alarm systems or fire extinguishing equipment are required by law to be or are installed, until the fire commissioner has tested and approved and has certified his approval in writing of the installation of such containers, systems or equipment to the Borough Superintendent of the borough in which the installation has been made. Such approval shall be noted on the certificate of occupancy."

Additional copies of this certificate will be furnished to persons having an interest in the building or premises, upon payment of a fee of fifty cents per copy.

EJScreen EJ Indexes

Twelve environmental justice (EJ) indexes of EJScreen, EPA's screening tool for EJ concerns. EPA uses these indexes to identify geographic areas that may warrant further consideration or analysis for potential EJ concerns. The index values below are for the Census block group or 1-mile maximum (US or State) in which the facility is located. Note that use of these indexes does not designate an area as an "EJ community" or "EJ facility." EJScreen provides screening level indicators, not a determination of the existence or absence of EJ concerns. For more information, see the EJScreen home page.

Show EJ Indexes calculated based on: Census Block Group - US

Census Block Group EJ Indexes (percentile)	
Particulate Matter 2.5	86.3

Demographic Profile of Surrounding Area (1 mile)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 U.S. Census and 2015 - 2019 American Community Survey (ACS) 5-year Summary and are accurate to the extent that the facility latitude and longitude listed below are correct. EPA's spatial processing methodology considers the overlap between the selected radii and the census blocks (for U.S. Census demographics) and census block groups (for ACS demographics) in determining the demographics surrounding the facility. For more detail about this methodology, see the DFR Data Dictionary.

General Statistics (U.S. Census)

SECTION 1

INTRODUCTION

On behalf of Consolidated Edison Company of New York, Inc. (Con Edison), Parsons has prepared this Alternatives Analysis Report (AAR) for the former Hunts Point Gas Works Halleck Street Sidewalk Area, which is part of the former Hunts Point Gas Works, located in the Bronx, New York (Figure 1). This AAR addresses only the sidewalk and right-of-way of Halleck Street (the "Site"), also known as Hunts Point OU-3 (Figure 2). The purpose of this AAR is to identify an effective and implementable alternative that addresses the manufactured gas plant (MGP)-related impacts present at the Site.

Currently, the former Hunts Point Gas Works property is predominantly owned by the City of New York for use as the Hunts Point Food Distribution Center. The Site includes the street and sidewalk area of Halleck Street, is approximately 2,500 linear feet (ft) in length, and is owned by the City of New York.

Investigation activities previously conducted at the Site were carried out and completed pursuant to the terms of a Voluntary Cleanup Agreement (VCA) between Con Edison and the New York State Department of Environmental Conservation (NYSDEC). The Site transitioned from the VCA to an Order on Consent on July 25, 2018. A Site Characterization (SC) was performed in 2013, and a Site Characterization Report (SCR) for the Site was submitted to NYSDEC in July 2014 (Parsons, 2014). Data contained within the SCR provides the basis for the development of this AAR. This AAR has been prepared in accordance with the requirements set forth in *6 New York Codes, Rules and Regulations Part 375* (6 NYCRR 375) *Environmental Remediation Programs* (NYSDEC, 2006) and the NYSDEC's *Technical Guidance for Site Investigation and Remediation* (DER-10) (NYSDEC, 2010).

1.1 SITE DESCRIPTION AND HISTORY

Historical research was previously conducted and documented in the *Hunts Point Offsite Manufactured Gas Plant Site History Report, Bronx, New York* (Parsons, 2003). Based on this report, the former gas works was owned and/or operated as a MGP and gas holder station by Con Edison between 1926 and 1962. A large gas holder on the northern portion of the Hunts Point Gas Works was used until 1968, after which it was removed from service and demolished.

The City of New York acquired the majority of the former Hunts Point Gas Works property in the late 1960s. The property was then transitioned into warehouse space for a wholesale food cooperative. Reviews of historical aerial photos reveal that Halleck Street was not modified as part of redevelopment. It was extended to the south sometime after 1980 for use as an access road to the current Department of Corrections facility, located at the southwest portion of the Hunts Point Peninsula. The existing zone for the Site based on the New York City Planning Commission Zoning Maps 6c and 6d (Appendix A) is a manufacturing district.

The central portion of the Site is adjacent to Hunts Point Parcel A-2 (the A-2 site) which is in the New York State Brownfields Cleanup Program (BCP) as Site #C203094. The A-2 site contained MGP-related impacts in the form of visual coal tar and purifier waste (GEI, 2018). The

proposed remedy for the A-2 site included remedial excavations, installation of a reactive barrier, in-situ solidification, capping and institutional and engineering controls.

1.2 ALTERNATIVES ANALYSIS REPORT ORGANIZATION

This AAR has been organized in accordance with the *Technical Guidance for Site Investigation and Remediation* (NYSDEC, 2010) (DER-10) as follows:

Section	Purpose
Section 1 – Introduction	Provides definition of the Site, regulatory background, and history of Site use.
Section 2 – Site Investigation Summary	Provides a summary of physical Site conditions and a summary of the previous investigation performed at the Site.
Section 3 – Exposure Assessment	Summarizes exposure pathways as determined following Site investigation activities.
Section 4 – Remedial Goals, SCGs, and Remedial Action Objectives	Identifies remedial goals, standards, criteria, and guidelines, and remedial action objectives selected for the Site.
Section 5 – Description and Evaluation of Remedial Alternatives	Provides evaluation criteria and description of remedial alternatives developed for the Site.
Section 6 – Comparative Analysis of Remedial Alternatives	Provides comparison of each remedial alternative developed for the Site.
Section 7 – Conclusions and Preferred Remedy	Presents the preferred remedy for the Site, as determined based on the comparative analysis.
Section 8 – References	Provides relevant references.

SECTION 2

SITE INVESTIGATION SUMMARY

A SC was conducted at the Site in October and November 2013 to characterize MGP-related impacts to soil and groundwater. Figure 3 depicts the soil boring and monitoring well locations installed at the Site as part of this field effort. The collected data is presented in the SCR (Parsons, 2014) and a summary of the findings is presented in this section.

2.1 TOPOGRAPHY, GEOLOGY AND HYDROGEOLOGY

The 182-acre Former Hunts Point Gas Works is located on a peninsula at the confluence of the Bronx and East Rivers. Hunts Point is a generally flat-lying area near mean sea level, with little topographic relief. The Site is an approximately 2,500-foot linear stretch of Halleck Street, located on the western boundary of the Former Hunts Point Gas Works. The Site has minimal topographic relief, decreasing approximately 10 feet in elevation from the northern to southern boundaries.

The geology and subsurface conditions of the Hunts Point peninsula can vary depending upon the history of localized development. Prior to significant construction and development, Hunts Point was drained by small creeks which emptied to into the Bronx and East Rivers. Subsequent development filled and/or covered the creeks, however shallow groundwater movement may still be influenced by the former channels. Localized groundwater flow may also be influenced by pre-development stream deposits, sewer lines, and abandoned pipelines. Overall, groundwater flows to the south, towards the confluence of the Bronx and East Rivers (Hygienetics, 1997).

Three (3) groundwater monitoring wells were installed during SC field investigation activities. Monitoring wells were installed to depths ranging from 16 to 17 feet below ground surface (bgs), with screened intervals installed across the water table. Depth to groundwater was gauged in on-site groundwater monitoring wells during SC field investigation activities. Groundwater was encountered beneath the Site at 5.6 feet to 12.05 feet bgs and at elevations ranging from 1.56 feet above mean sea level (AMSL) at MW-3 (southern portion of the Site) to 5.09 feet AMSL at MW-2 (central portion of the Site). Groundwater elevations observed during SC activities are summarized on Table 1.

Subsurface geologic conditions at the Site were investigated during the SC field investigation activities, and a total of twelve (12) soil borings were advanced to depths ranging from 15 to 25 feet bgs. Soil borings advanced during the SC determined that the upper 5 to 18 feet contain fill materials (comprised of sand, gravel and cobble with trace amounts of brick, concrete, wood, silt and ash). The majority of fill material present at the Site is underlain by a clay layer with an observed thickness of 1 to 8 feet, the top of which was encountered at depths ranging from 11 to 17.5 feet bgs. Soil boring activities did not extend to materials underlying the clay layer. The northern portion of the Site contains sand deposits ranging from 6 to 13 feet in thickness, with an isolated peat deposit at the base of SB-1 at a depth of 18 feet bgs. Bedrock was not encountered during SC field activities. Soil boring logs generated during the Site Characterization were used to develop the representative cross section A-A' of the Site, as shown on Figure 4.

2.2 SOIL BORING RESULTS

A total of 30 soil samples (including applicable quality control samples) were collected during SC activities and analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), TCL semi-volatile organic compounds (SVOCs), Target Analyte List (TAL) metals, and cyanide. Soil sample analytical results are summarized in Table 2 and presented on Figures 5 and 6. Soil analytical results have been compared to the Unrestricted Soil Cleanup Objectives (USCOs) provided by NYSDEC in 6 NYCRR Part 375 (NYSDEC, 2006). The USCOs assume that there are no imposed restrictions on the use of the Site; however, the Site functions solely as a public sidewalk and right-of-way infrastructure. Therefore, a comparison of soil sample results to the USCOs is conservative.

Photo-ionization detector (PID) readings for soil samples collected during soil boring/monitoring well installations ranged from 0.0 to 1,260 parts per million (ppm) above background. The highest PID reading of 1,260 ppm was observed in soil boring SB-4 at a depth interval of 15 feet to 17 feet bgs, co-located with observations of non-aqueous phase liquid (NAPL). The NAPL-saturated soil was observed between approximately 11 and 17 feet bgs. Staining associated with NAPL was observed within the top 0.5 feet of the clay underlying the NAPL-saturated interval at depths ranging from 17 to 17.5 feet bgs. No NAPL or NAPL staining was observed in the clay from 17.5 bgs to the bottom of the soil boring at 20 feet bgs. PID readings in the remaining eleven (11) soil borings ranged from 0.0 to 10.7 ppm. NAPL was not observed in any location other than SB-4.

A total of sixteen (16) VOCs were detected in soil samples submitted for laboratory analysis. Of these, seven (7) VOCs (acetone, methylene chloride, benzene, ethylbenzene, toluene, m/p-xylene, and o-xylene) were detected at concentrations exceeding their respective USCOs. Acetone, which is considered a common laboratory contaminant, was detected above its USCO in four (4) soil samples [SB-6 (10-15 feet), SB-7 (8-10 feet), SB-8 (15-16 feet), and SB-9 (10-15 feet)]. The remaining six (6) VOCs (methylene chloride, benzene, ethylbenzene, toluene, m/p-xyelene, and o-xylene) were detected above their respective USCOs in only one (1) soil sample [SB-4 (15-17 feet)]. Total VOC concentrations in all soil samples ranged from non-detect to 1,277 ppm, with the maximum concentration observed in soil collected from SB-4 at a depth of 15 to 17 feet bgs. Total VOC concentrations in the remaining twenty-three (23) soil samples ranged from non-detect to 0.195 ppm.

Twenty-nine (29) individual SVOCs were detected in soil samples submitted for laboratory analysis. Of these, fourteen (14) polyaromatic hydrocarbons (PAHs) [acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, flourene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene] were detected at concentrations exceeding their respective USCOs in at least one soil sample. Total SVOC concentrations ranged from 0.44 to 4,635 ppm, with the maximum concentration observed in soil collected from SB-4 at a depth of 15 feet to 17 feet bgs. Total SVOC concentrations in the remaining twenty-three (23) soil samples ranged from 0.44 to 238 ppm. With the exception of SB-4, PAH concentrations detected in soil samples were below the 95th percentile of background soil concentrations detected within soils composed of urban fill material encountered within street excavations within New York City (RETEC, 2007). Overall,

SVOCs exceeding USCOs were detected at nine (9) soil borings: SB-2, SB-3, SB-4, SB-5, SB-6, SB-7, SB-8, SB-89, and SB-10.

A total of twenty-four (24) inorganic constituents were detected in soil samples submitted for laboratory analysis. Twelve (12) of the detected inorganic constituents exceeded their respective USCOs (arsenic, barium, cadmium, copper, chromium, lead, mercury, nickel, selenium, silver, zinc, and cyanide).

2.3 GROUNDWATER SAMPLE RESULTS

A total of four (4) groundwater samples (including applicable quality control samples) were collected in November 2013 as part of SC field investigation activities. Groundwater samples were analyzed for TCL VOCs, TCL SVOCs, TAL metals, and total cyanide. The analytical results for groundwater samples are summarized on Table 3 and Figure 7. For evaluation purposes, analytical results were compared with ambient water quality standards (AWQS) and guidance values contained in NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 (NYSDEC, 1998).

During groundwater sampling activities, each monitoring well was monitored for the presence of NAPL. No NAPL or sheens were observed in any of the wells. Visual descriptions and observations made during the groundwater sampling activities were recorded on groundwater sampling logs, and are included as an attachment to the SCR.

Only one (1) VOC was detected in groundwater samples submitted for laboratory analysis. Methyl tert-butyl ether, which is not a MGP-related compound, was detected below its guidance value in two (2) groundwater samples.

Only one (1) SVOC was detected in groundwater samples submitted for laboratory analysis. Dimethyl phthalate, which is considered a laboratory contaminant, was detected at a concentration below its guidance value in one (1) sample. Seventeen (17) inorganic constituents (aluminum, arsenic, barium, cadmium, calcium, total chromium, iron, lead, magnesium, manganese, nickel, potassium, selenium, sodium, thallium, zinc, and cyanide) were detected in groundwater samples. Of these, eight (8) (barium, iron, lead, magnesium, manganese, sodium, thallium, and cyanide) were detected at concentrations exceeding their respective AWQS and guidance values.

2.4 VISUAL NAPL OBSERVATIONS

During SC soil boring and monitoring well installation activities, boring materials were logged for physical characteristics (e.g., soil type, color, texture, moisture content, etc.), along with physical evidence of any impacted material (e.g., oil-like or tar-like NAPL, staining, sheens, odors, etc). NAPL was observed in soil boring SB-4 from approximately 11 feet to 17 feet bgs. NAPL was not observed in any of the other soil borings. A sample of soil containing NAPL from soil boring SB-4 was collected and submitted to META Environmental, Inc. of Watertown, MA for forensic hydrocarbon fingerprint analysis. The fingerprinting sample was analyzed by Gas Chromatography – Flame Ionization Detector (GC/FID) (EPA 8100M) for fingerprinting and by Chromatography Mass Spectrometry in the Selected Ion Monitoring Mode (GC/MS/SIM) (EPA 8270M) for mono- and polycyclic aromatic hydrocarbons (MAHs and PAHs), alkyl PAH homologues and other selected compounds. Laboratory results indicate that the sample from SB-4 (15-17 feet) contained pyrogenic material and exhibited fluoranthene to pyrene ratios indicative

of tars formed from MGPs utilizing carbureted water gas processes. No additional NAPL was observed in any other soil boring, including the seven (7) soil borings installed to the south of SB-4 in the Site's inferred downgradient groundwater flow direction.

SECTION 3

EXPOSURE ASSESSMENT

The information collected during SC field investigation activities has been used to qualitatively assess potential exposure pathways for the constituents detected at the Site.

Analytical results from soil samples collected during SC activities indicate the presence of possible MGP-related constituents in the soil, primarily at the SB-4 soil boring sample location where MGP-related NAPL was detected. VOCs, PAHs, and inorganic constituents were detected at concentrations exceeding their respective USCOs at the Site in soil ranging from 5 feet to 20 feet bgs. No MGP-related impacts were noted in the top 5 feet of soil.

Groundwater analytical results indicated the presence of inorganic constituents in Site groundwater above their respective AWQS and guidance values. No VOCs or SVOCs, potentially associated with MGP-related impacts, were detected in exceedance of AWQS and GVs in any groundwater sample collected during SC activities.

Based on the results of the SC, the primary contaminants of concern identified by NYSDEC for the Site include PAHs (benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene), and inorganics, namely arsenic, lead, mercury, and cyanide.

The Site is located in a highly urbanized area, zoned for manufacturing purposes, and is currently utilized as a public street and sidewalk area. Therefore, the Site is covered with concrete or asphalt pavement with the exception of limited landscaped areas. Impacted soils on the Site therefore would only be encountered during future intrusive maintenance activities below five (5) feet (e.g., repair of underground utilities); however, it is unlikely that these materials would be encountered during day-to-day activities.

Groundwater at the Site is currently not used for a potable water source, and there are no plans for future use of potable or commercial/industrial groundwater at the Site. The depth to groundwater at the Site is approximately 5 feet to 12 feet bgs. Based on this, there is a limited potential for exposure to groundwater during intrusive subsurface activities at depths of less than 5 feet (e.g., repair of underground utilities) at the Site. Surface water and sediment are not present at the Site.

SECTION 4

REMEDIAL GOALS, SCGS, AND REMEDIAL ACTION OBJECTIVES

4.1 REMEDIAL GOAL

The remedial goal for the Site is to ensure that MGP-related contamination does not present a threat to human health or the environment considering the manner in which the Site is utilized. The goal will be achieved by putting into place a plan to prevent uncontrolled exposure to MGP-impacted soil.

4.2 APPLICABLE STANDARDS, CRITERIA AND GUIDANCE VALUES

NYSDEC *DER-10* includes a complete list of Standards, Criteria and Guidance Values (SCGs). The SCGs for soil and groundwater include the 6 NYCRR Part 375-6 RSCOs for unrestricted use and the NYSDEC *Division of Water Technical and Operational Guidance Series - Water Quality Standards* (*WQS*) - *6 NYCRR 700 to 706* (NYSDEC, 1998). The SCGs for soil and groundwater include the 6 NYCRR Part 375-6 Soil Cleanup Objectives (SCOs) for unrestricted use and protection of groundwater and the NYSDEC *Division of Water Technical and Operational Guidance Series - Water Quality Standards* (*WQS*) – *6 NYCRR 700 to 706* (NYSDEC, 1998) for the Site. The above SCGs represent available criteria and guidance used by the NYSDEC to evaluate soil and groundwater quality. It should be noted, however, that neither the 375-6 SCOs or WQS are directly applicable to the Site groundwater because the local groundwater is not used as a drinking water source, nor will it likely be used in the future due to New York City laws. The 6 NYCRR Part 375-6 SCOs and WQS are provided as SCGs for comparison purposes only.

4.3 REMEDIAL ACTION OBJECTIVES

Remedial Action Objectives (RAOs) are medium-specific objectives which achieve protection of public health and the environment. RAOs were established based on contaminated media, identified contaminants of concern, SCGs, and results of the exposure assessment. SCGs are promulgated requirements and non-promulgated guidance which guide site activities during investigation and remediation. The standards and criteria are set forth in Federal or New York State law and they are either directly applicable or relevant and appropriate to a contaminant, remedial action, location, or other circumstance. Guidance includes non-promulgated criteria which should be considered, for investigation and/or remediation. A series of generic RAOs are identified on the NYSDEC website for use dependent upon site specific conditions, as follows:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation exposure to contaminants volatilizing from soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater contamination.

Groundwater

RAOs for Public Health Protection

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of volatiles, from contaminated groundwater.

RAOs for Environmental Protection

- Restore groundwater aquifer to pre-disposal/pre-release conditions, to the extent practicable.
- Prevent the discharge of contaminants to surface water.
- Remove the source of groundwater or surface water contamination.

Soil Vapor

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at the Site.

After evaluating the nature and extent of contamination, NYSDEC has identified the following Site-specific RAOs:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

SECTION 5

DEVELOPMENT AND EVALUATION OF REMEDIAL ALTERNATIVES

This section describes the remedial action alternatives for the Site and evaluates them against criterion included in DER-10.

5.1 PRELIMINARY SCREENING OF REMEDIAL ALTERNATIVES

As part of the remedial action selection process for the Site, a preliminary screening was performed to reduce the number of remedial technologies potentially applicable with respect to technical implementability. Technical implementability was determined by using the known Site conditions and investigation results to screen out technologies that cannot be effectively implemented at the Site.

The results of the preliminary screening for remedial technologies to address MGP-related impacts at the Site are presented on Table 4. Following preliminary screening, a summary of Site-specific remedial alternatives was developed for submittal to NYSDEC and was subsequently approved on August 27, 2019. The remedial alternatives summary is presented on Table 5. Based on preliminary screening, the types of remedial technologies listed below were identified as applicable technologies to retain for further evaluation:

- Institutional controls and engineering controls (ICs/ECs);
- *In-situ* stabilization and solidification (ISS) of MGP-impacted soils, and
- Excavation and off-site disposal and treatment of MGP-impacted soils.

The identification of alternatives using retained remedial technologies took into consideration the limitations posed by Site conditions, property access and the practical use of equipment. Based upon Site investigations, only isolated NAPL was observed in soil boring SB-4, and not in any of the other soil borings. Additionally, MGP-related impacts above their respective SCOs were detected below surficial soils at deeper than five feet bgs and NAPL was encountered between 11 and 17 feet of depth.

5.2 DEVELOPMENT OF REMEDIAL ALTERNATIVES

The Site is located within a public sidewalk area and active right-of-way and is essentially surrounded by off-site properties. In addition, the active right-of-way contains subsurface utilities and is heavily used by local commercial businesses resulting in space constraints. While considering the above Site challenges and risks, Con Edison has evaluated the following four remedial alternatives consistent with Table 5:

- Alternative 1 – No Action.
- Alternative 2 – Institutional and Engineering Controls.
- Alternative 3A – *In-Situ* Stabilization/Solidification of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 3B – Excavation of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 4 – Removal of Delineated MGP-impacted Site Soils Above USCOs.

5.3 EVALUATION CRITERIA

In accordance with 6 NYCRR 375-1.8(f) and in conjunction with the additional guidance provided in DER-10 subsection 4.2 (b) through (j), the remedial alternatives identified above are evaluated in subsequent sections with respect to the following nine evaluation criteria:

1. Overall protection of public health and the environment
2. Compliance with remedial goals, RAOs, and applicable SCGs
3. Long-term effectiveness and permanence
4. Reduction of toxicity, mobility or volume
5. Short-term impacts and effectiveness
6. Implementability
7. Cost-effectiveness
8. Land Use
9. Community Acceptance

5.3.1 Overall Protection of Public Health and the Environment

This threshold criterion is an assessment of whether the remedial alternative meets requirements that are protective of human health and the environment. Overall protection of human health and the environment considers how the proposed remedial alternative prevents or mitigates potential risks. This evaluation also considers the ability of the remedial alternative to meet the RAOs.

5.3.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

As per 6 NYCRR Part 375 and DER-10 subsection 4.2(c), this threshold criterion conforms to officially promulgated standards and criteria that are either directly applicable, or that are not directly applicable but are relevant and appropriate, unless good cause exists why conformity should be dispensed with.

Such good cause is defined in both 6 NYCRR Part 375 and DER-10. DER-10 subsection 4.2(c) specifically states that good cause exists if any of the following are present:

- The proposed action is only part of a complete program or project that will, as a whole, conform to such standard or criterion upon completion;
- Conformity to such standard or criterion will result in greater risk to the public health and the environment than alternatives;
- Conformity to such standard or criterion is technically impracticable from an engineering or scientific perspective; or
- The program or project will attain a level of performance that is equivalent to that required by the standard or criterion through the use of another method or approach.

The RAO for the Site, detailed in Section 4.3, was identified based upon the SCGs applicable to the current, intended, and reasonably anticipated future use of the Site.

Included in 6 NYCRR Part 375 are SCOs that are chemical-specific SCGs and are based on current Site use and zoning. As such, they are appropriate and relevant to the Site. The soil analytical data collected during SC activities were compared to SCOs for unrestricted use. However, this comparison is conservative given that the Site is used for commercial purposes.

Chemical-specific SCGs appropriate for comparison to groundwater analytical data collected at the Site are presented in 6 NYCRR Parts 700 to 706 and in TOGs. However, these criteria are conservative as local groundwater is not used as a drinking water source, nor will it likely be used as such in the future.

5.3.3 Long-Term Effectiveness and Permanence

This criterion addresses the performance of a remedial alternative in terms of its permanence and the quantity/nature of waste or residuals remaining at the Site after implementation. An evaluation is made on the extent and effectiveness of controls required to manage residuals remaining at the Site and engineering and institutional controls necessary for the remedy to remain effective. The factors that are evaluated include permanence of the remedial alternative, magnitude of the remaining risk, adequacy of controls used to manage residual contamination, and the reliability of controls used to manage residual contamination.

5.3.4 Reduction of Toxicity, Mobility or Volume

This criterion assesses the remedial alternative's use of technologies that permanently and significantly reduce toxicity, mobility, or volume of the contamination as their principal element to the extent possible. Preference is given to remedies that permanently or significantly reduce the toxicity, mobility, or volume of the contamination at the Site.

5.3.5 Short-Term Impacts and Effectiveness

This criterion assesses the effects of the remedial alternative during the construction and implementation phase with respect to the effect on human health and the environment. The factors that are assessed include protection of the workers and the community at the Site and adjacent properties during the implementation of the remedial action, environmental impacts that result from the remedial action and the time required until the RAO is achieved.

5.3.6 Implementability

This criterion addresses the technical and administrative feasibility of implementing the remedial alternative and the availability of various services and materials required during implementation of the remedial action for the Site. The evaluation includes the feasibility of construction and operation, the reliability of the technology, the ease of undertaking additional remedial action, monitoring considerations, activities needed to coordinate with regulatory agencies, availability of adequate equipment, services and materials, off-site treatment, impacts to nearby utilities and structures, and storage and disposal services.

5.3.7 Cost-effectiveness

This criterion is an evaluation of the overall cost effectiveness of the remedial alternative. Cost estimates associated with alternatives include direct capital costs (e.g., equipment, labor and materials), indirect capital costs (e.g., permitting, engineering and design and contingencies), and costs associated with operation and maintenance (e.g., Site cover inspections). Total costs for a

remedial alternative are developed based on a 30-year present worth analysis of operation and maintenance, and the combined direct and indirection capital costs.

5.3.8 Land Use

This criterion addresses the current, intended, and reasonably anticipated future land use of the Site. 6 NYCRR 375 subchapter 1.8(f)9 requires that land use criterion be considered.

5.3.9 Community Acceptance

Concerns of the state and the community will be addressed separately in accordance with a Citizen Participation Plan (CPP) and requirements outlined in DER-10's citizen participation section. This criterion is evaluated, after the public review of the remedy selection process, as part of the final NYSDEC selection/approval of a remedy for the Site.

5.4 ALTERNATIVE 1 – NO ACTION

No action would be taken under this alternative to remediate MGP-related impacts. The "No Action" alternative serves as a baseline for comparison of overall effectiveness to other remedial alternatives.

5.4.1 Overall Protection of Public Health and the Environment

This alternative would not remove MGP or non-MGP impacted soils from the Site. Although there is no current pathway for exposure to impacted soils or groundwater during day-to-day operations, non-routine activities (e.g., intrusive activities associated with new construction or maintenance of an underground utility or structure) or a change in Site use could create an exposure pathway and potential unacceptable risks.

5.4.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals, RAO specified for the development of this AAR, and applicable SCGs would not be met under this alternative.

5.4.3 Long-Term Effectiveness and Permanence

This alternative would not be sufficient as an effective long-term remedy, as no remedial action would be performed.

5.4.4 Reduction of Toxicity, Mobility or Volume

This alternative does not address toxicity, mobility, or volume of MGP-related impacts to Site soils, and would not meet the remedial goal or RAO specified for the Site.

5.4.5 Short-Term Impacts and Effectiveness

No short-term impacts are introduced with this alternative, as no remedial action would be performed.

5.4.6 Implementability

This alternative does not require the implementation of any remedial activities and is therefore technically and administratively implementable.

5.4.7 Cost-effectiveness

There would be no costs associated with this alternative.

5.4.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.5 ALTERNATIVE 2 – INSTITUTIONAL AND ENGINEERING CONTROLS

This remedial alternative would consist of the development and implementation of a long-term inspection and monitoring program, engineering controls and institutional controls to avoid the creation of a completed exposure pathway.

This remedial alternative would involve the following major components:

- Engineering controls – The existing pavement, sidewalks and vegetative areas will serve as the cover system. The majority of the Site's existing cover consists of pavement and sidewalks with a few vegetative areas (e.g., around planted trees), and
- Institutional controls – The institutional controls may be in the form of a deed restriction that: (i) requires the remedial party or Site owner to complete and submit to the NYSDEC a periodic certification of the institutional and engineering controls in accordance with Part 375-1.8(h)(3); (ii) allows the use and development of the property for commercial and industrial uses as defined by Part 375-1.8(g), although land use is subject to local zoning laws; and (iii) requires compliance with the NYSDEC-approved Site Management Plan.

This alternative would utilize the existing cover system at the Site, and include land use restrictions through an environmental easement, enforcement and permit controls, annual monitoring of Site conditions, and informational devices.

Since this remedial alternative does not address Site soils that exceed USCOs, institutional controls and engineering controls will be the primary function of the remedial alternative to manage the long-term effectiveness for the remedy. To facilitate these institutional and engineering controls, a Site Management Plan (SMP) would be developed. The SMP will identify the implementation procedures required for institutional and engineering controls at the Site.

The purpose of the SMP is to provide:

- A description of the institutional and engineering controls for the Site;
- The basic operation and intended role of each implemented institutional and engineering control;
- A description of the features that should be evaluated during each periodic inspection and compliance certification period;
- A description of plans and procedures to be followed for implementation of institutional and engineering controls, such as the implementation of an Excavation Plan for the safe handling of MGP-impacted soils that may be present at depths greater than five (5) feet bgs that could be exposed during maintenance, redevelopment or subsurface utility repair/relocation;

- Any other provisions necessary to identify or establish methods for implementing the institutional and engineering controls required by the selected remedy, as determined by the NYSDEC, and
- A description of the reporting requirements for these controls.

The SMP will be developed for the boundaries of the Site shown on Figure 2. At a minimum, the SMP will include following items:

- The notification requirements for future soil disturbance activities that will encounter MGP-impacted materials that may be present at depths greater than five (5) feet bgs including subsurface utility line repair/relocation and new construction;
- Soil Excavation and Handling Plan;
- A flow chart showing guidelines for intrusive activities;
- Requirements for evaluation of the need for additional investigation or further delineation based on accessibility due to new site construction or changes in site use, and
- Requirements for annual inspections and certifications in accordance with DER-10.

In accordance with DER-10 Section 6.3 and 6 NYCRR Part 375-1.8(h)(3), a Periodic Review Report (PRR) will be submitted to the NYSDEC to document the efficacy of the institutional controls described in the SMP. The PRR will be signed by a professional engineer or other qualified environmental professional. If changes are noted, the PRR will include documentation explaining why the certification cannot be rendered and a statement of proposed corrective measures with a proposed schedule for implementing the corrective action.

5.5.1 Overall Protection of Public Health and the Environment

Although there is no current pathway for exposure to impacted soils or groundwater during day-to-day operations, non-routine activities (e.g., intrusive activities associated with new construction or maintenance of an underground utility or structure) or a change in Site use could create an exposure pathway and potential unacceptable risks. Therefore, in accordance with DER-10 and to protect public health and the environment, institutional and engineering controls will be established to mitigate risks associated with these soils and groundwater. Such controls would be facilitated by the development of an SMP which would identify the implementation procedures required for institutional and engineering controls at the Site. Assuming this is the case, this alternative would be protective of human health. However, MGP-impacted material would be left on-site which has the potential to adversely impact the environment. Based on data collected to date, the MGP-impacted material is not creating adverse impacts.

5.5.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.5.3 Long-Term Effectiveness and Permanence

The long-term effectiveness of the remedy would be reliant on institutional and engineering controls. Annual inspections of the cover system would be required to ensure it continues to prevent direct contact and exposure to MGP-related impacts during day to day use of the Site. In the event of intrusive activities that extend to depths that would come in contact with MGP-impacted materials, a SMP will be utilized in order for work to be carried out in controlled manner. As long as the institutional and engineering controls are maintained, the remedial alternative would be effective long term.

5.5.4 Reduction of Toxicity, Mobility or Volume

Since the proposed remedial alternative does not involve intrusive activities, and instead utilizes the current asphalt, concrete and existing cover at the Site, there is no immediate reduction in the toxicity, mobility, or volume of MGP-impacted materials.

5.5.5 Short-Term Impacts and Effectiveness

No short-term risks are introduced with the implementation of this remedial alternative as it does not include construction activities that would adversely impact local businesses and the community. Property owners would be required to adhere to institutional controls and land use agreements.

5.5.6 Implementability

Considering a cover system is already in place at the Site, there are no challenges associated with utilizing the cover system. The engineering and institutional controls associated with SMP, as well as necessary coordination with the City of New York, have been implemented successfully on similar sites.

5.5.7 Cost-effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $1,162,000. Capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.5.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.6 ALTERNATIVE 3A – IN-SITU STABILIZATION OF NAPL-IMPACTED MATERIAL IN THE VICINITY OF SOIL BORING SB-4

This remedial alternative would involve the following major components:

- Removal and disposal of surface material in the vicinity of SB-4 to the extent necessary to allow for swelling associated with *In-Situ* Stabilization/Solidification (ISS) reagent;
- ISS of NAPL-impacted soils in the vicinity of SB-4, and
- Establishment of institutional and engineering controls for remaining Site contamination.

Implementation of ISS within the vicinity of SB-4 would involve the mixing of NAPL-impacted material to the underlying clay layer, with mixing continuing approximately 2 feet into the clay. The mixing depth in the area is estimated to be 19 feet bgs. The lateral extents of NAPL present within the subsurface have not been determined, and therefore the potential volume of impacted soil subject to ISS is unknown. Potential preliminary ISS boundaries are depicted on Figure 8.

Prior to the implementation of ISS, shallow subsurface obstructions and utilities would need to be addressed. As the Site is located within a sidewalk area and public right-of-way, underground utilities are present near or within the proposed ISS area. A detailed utility survey would need to be performed to determine the exact locations of subsurface utilities (either active or inactive) that are present near or within the proposed ISS area, and measures taken to address these utilities (e.g., removal, permanent relocation, or temporary re-routing).

Volume expansion occurs during the implementation of ISS due to swelling of the reagent. Some surface soils would require removal to maintain the current grade elevation subsequent to ISS treatment. The bulking factor of the ISS reagent is typically 20 to 30 percent and would be more accurately estimated for the Site during a treatability study. Removal of surface material would proceed to the depth necessary to account for swelling, or one foot above the water table (to provide adequate ground support for mixing equipment), whichever is shallower. Additional material, grout, or soil cuttings brought to the surface during mixing would require handling and off-site treatment/disposal. This material could also be sampled, analyzed, and re-used on-site below the Site cover and demarcation layer, provided it is below applicable SCOs.

Performance goals for ISS are determined during the remedial design based on the results of a treatability test. The effectiveness of ISS implementation is measured after the solidified material has cured. Post cure samples are collected and tested for a number of various physical and chemical tests, most commonly the permeability and unconfined compressive strength (UCS).

Treatability testing is typically required to determine the best Site-specific reagent addition. Cement-based mix designs are most commonly used for ISS application, however a variety of additives such as fly ash, hydrated lime, and bentonite can also be used to meet specific project requirements. Results from the treatability study generate bulking (volume expansion), unconfined compressive strength, permeability, and leachability of the solidified material. In addition, the potential volatilization and release of impacts during soil mixing, heat of hydration and curing can be evaluated during the treatability study.

Following implementation of ISS, a demarcation layer and cap will be installed over the treated area. The cap design will be consistent with the future use plans for the Site. The purpose of the cap is to minimize groundwater infiltration and potential disturbance of the solidified/stabilized materials.

This alternative would also require the implementation of institutional and engineering controls for remaining contamination at the Site. As previously mentioned, the Site is currently covered with either concrete or asphalt pavement, and only soil for surface landscaping is exposed. Portions of the Site subject to remedial action would likely be restored in kind. The cover system would remain intact in portions of the Site in which no intrusive remedial activities are conducted. As per DER-10, a SMP (as detailed in Section 5.5) would be prepared to specify the methods

necessary to ensure compliance with the institutional and engineering controls for the Site. This would include inspections to verify the Site use has not changed and that the potential for direct contact with the remaining contamination has not been created.

5.6.1 Overall Protection of Public Health and the Environment

Alternative 3A is protective of human health and the environment through the solidification/stabilization of NAPL-impacted soil, the maintenance of a cover system across the Site, the implementation of institutional and engineering controls to address contaminated soils remaining at the Site.

5.6.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through the implementation of ISS within the vicinity of SB-4, maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed following implementation of the remedial action, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.6.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. No direct exposure pathways would exist due to the presence of a cover system across the Site. In addition, the institutional controls, including the SMP, would prevent exposure to the ISS monolith and any remaining contamination that is present on Site (e.g., the remaining portions of the Halleck Street area).

5.6.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would treat and solidify approximately 4,400 cubic yards of NAPL-impacted soils in the area depicted on Figure 8, which would reduce the toxicity and mobility of MGP-related constituents in the subsurface at the Site.

5.6.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that approximately 200 truckloads of material would be transported from the Site as a result of pre-excavation clearances as well as removal of swell associated with ISS. An additionally estimated 100 truckloads of material would be transported to the Site for receiving reagent, backfilling, and placement of the final surface cover. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

The potential exists for adverse impacts to adjacent utilities and the roadway due injected reagents and vibration from construction activities.

It is expected that approximately one month would be required to implement this remedial alternative. During this time, access to the eastern portion of the sidewalk area and the eastern

portion of the Halleck Street right-of-way in the vicinity of the remedial area would be restricted. This alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

The effectiveness of this remedy will be dependent on the extent of NAPL-impacted soils in proximity of SB-4. Should NAPL-impacted soils extend beyond the Site boundaries or further into Halleck Street, this alternative would not be effective in treating all NAPL-impacted soils. Additionally, there is a potential for off-site migration of ISS reagents, if pressurized technologies (e.g., jet grouting) are used.

5.6.6 Implementability

The ISS technology has been implemented on several former MGP sites located in New York State, including the New York City area. However, this alternative is not readily implementable at this Site. The challenges associated with the implementability of ISS techniques are primarily associated with the potential presence of subsurface obstructions and adjacent utilities. As discussed above, the nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the implementation of ISS. In addition, buried utilities are present within or adjacent to the ISS target area. A subsurface utility survey would need to be conducted to determine if utilities are present, and if so, whether they can be temporarily or permanently re-routed. The presence of subsurface utilities and non-uniform subsurface materials (fill) may prevent ISS reagents from reaching targeted areas when utilizing certain ISS methods (e.g., jet grouting) due to the presence of preferential pathways. Once subsurface obstructions and utilities are addressed, mixing of subsurface materials and reagents is expected to be consistent and acceptable.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and aquifer properties. A pre-design investigation (PDI) would need to be conducted to delineate the nature and extent of the NAPL present within the vicinity of SB-4. A treatability study would be conducted in order to develop the necessary reagent mixture to be used at the Site. In addition, the potential presence of purifier waste and the effect of ISS reagent materials on cyanide bound to Site soils will need to be evaluated.

5.6.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $5,571,000. The primary capital costs associated with this alternative are the handling and transportation of material excavated to account for reagent swell, purchase, transport and installation of backfill and cap material, ISS reagent, and mobilization and setup. The primary indirect capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.6.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.7 ALTERNATIVE 3B – EXCAVATION OF NAPL-IMPACTED MATERIAL IN THE VICINITY OF SB-4

This remedial alternative would involve the following major components:

- Removal and disposal of MGP-impacted soils containing NAPL to a depth of approximately 19 feet bgs in the vicinity of SB-4;
- Backfilling of excavation area with certified clean material and Site restoration, and
- Establishment of institutional and engineering controls for remaining Site contamination.

Based on the SC investigation conducted at the Site, the estimated conceptual remediation area for MGP-impacted soils containing NAPL is depicted on Figure 8. A conceptual depth of 19 feet bgs has been selected based on observations during SC activities. Prior to the initiation of remedial activities, a PDI would need to be performed in order to distinguish the geotechnical properties of the proposed remediation area, and to further delineate subsurface NAPL in the vicinity of SB-4.

In order to remove NAPL-impacted materials to a depth of 19 feet bgs, excavation shoring/bracing systems would be installed around the perimeter of the remediation area, which would be determined based on the results of a PDI program. Furthermore, additional data collected during the PDI would be utilized to determine the type of shoring system that would be feasible at the Site. The potential presence of significant obstructions in the subsurface may dictate the use of soldier pile and lagging systems. This process involves drilling through obstructions in the subsurface to install soldier piles, followed by excavation to install the lagging as the excavation progresses.

As with Alternative 3A, the presence of public right-of-ways (Halleck Street and the sidewalk areas), as well as underground utilities in the vicinity of the SB-4 excavation area are expected to pose a challenge during the implementation of this remedy and will require further evaluation. Shored excavations have the potential to cause ground movements which could potentially be damaging to the adjacent roadway and underground utilities. A utility study would need to be performed and a determination would be made as to whether or not they could be supported. Underground utilities that could not be supported would need to be permanently or temporarily relocated. In addition, excavations within the public right-of-ways would require approval from the City of New York to open the roadway, as well as re-routing of vehicular and pedestrian traffic on Halleck Street.

Since the remedial excavation depths would extend below the Site's water table, a temporary dewatering system would be required, and generated construction water would require either on-site treatment or off-site disposal for this alternative. If a permeable shoring system such as soldier pile and lagging were utilized dewatering would need to be continuous, and the volume of water removed could be significant. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. If groundwater is treated on-site

through the duration of excavation activities, permitting would be required in order to discharge to storm and/or sanitary sewers.

This alternative would also require the implementation of institutional and engineering controls for remaining contamination at the Site. As previously mentioned, the Site is currently covered with either concrete or asphalt pavement and only limited surface soil for landscaping purposes. Portions of the Site subject to remedial action would likely be restored in kind. The cover system would remain intact in portions of the Site in which no intrusive remedial activities are conducted. As per DER-10, a SMP (as detailed in Section 5.5) would be prepared to specify the methods necessary to ensure compliance with the institutional and engineering controls for the Site. This would include inspections to verify the Site use has not changed and that the potential for direct contact with the remaining contamination has not been created.

5.7.1 Overall Protection of Public Health and the Environment

Alternative 3B is protective of human health and the environment through the removal of NAPL-impacted soils, the maintenance of the cover system across the remaining portion of the Site, and the implementation of institutional and engineering controls to address remaining MGP-impacted soils at the Site.

5.7.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals and the RAO specified for the development of this AAR would be met under this alternative. The RAO would be met through the excavation of MGP-related source material within the vicinity of SB-4, maintenance of the existing Site cover and implementation of institutional controls. A SMP would be employed following implementation of the remedial action, wherein future exposure to MGP-impacted materials through intrusive activities (e.g., underground utility maintenance) will be under controlled conditions, reducing potential risks to workers and the community.

The applicable chemical-specific SCGs would not be met under this alternative as MGP-impacted materials would remain on-site but will be addressed by a SMP.

5.7.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. MGP-related source material would be removed from within the vicinity of SB-4. No direct exposure pathways would exist due to the presence of a cover system across the remaining portions of the Site. In addition, the institutional controls, including the SMP, would prevent exposure to the any remaining MGP-impacted materials that may be present on Site.

5.7.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would remove MGP-related source material from the area in the vicinity of SB-4, which would reduce the overall volume of MGP-impacted materials at the Site.

5.7.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that 410 truckloads of material would be transported from the Site as a result of excavation activities, and an additional 410 truckloads of

material would be transported to the Site for backfilling and surface repairs. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

Remedial action in the vicinity of SB-4 involving excavations would require the closure of portions of Halleck Street and adjacent sidewalk areas, with each requiring re-routing. Underground utilities in the vicinity of the excavation area requiring relocation would potentially result in service interruption during relocation. Excavation and dewatering activities would be required under this alternative. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. Discharge of treated construction water could potentially result in flooding of storm and sanitary sewers if discharged during periods of elevated flow rates (e.g., storm events).

The potential exists for adverse impacts to adjacent utilities and the roadway due to dewatering of Site soils and vibration from construction activities.

It is expected that approximately six to eight weeks would be required to implement this remedial alternative. During this time, access to the eastern portion of the sidewalk area and the eastern portion of the Halleck Street right-of-way in the vicinity of the remedial area would be restricted. This alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

The effectiveness of this remedy will be dependent on the extent of NAPL-impacted soils in proximity to SB-4. Should NAPL-impacted soils extend beyond the Site boundaries or further into Halleck Street, this alternative may not be effective in treating all NAPL-impacted soils in proximity to SB-4. In addition, the potential exists for certified clean material brought on-site to backfill the excavation to potentially become contaminated by adjacent MGP-related impacts.

5.7.6 Implementability

The challenges associated with the implementability of this alternative at the Site are primarily associated excavation dewatering, the potential presence of subsurface obstructions, and the location within and adjacent to public right-of-ways, and overall this alternative is not readily implementable at this Site. As the excavation would extend to depths beneath the water table, the volume of water that would require removal, treatment, and discharge is anticipated to be significant. The nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the design of the shoring system and implementation of the excavation. In addition, a subsurface utility survey would need to be conducted to determine the locations of nearby utilities and whether they can be temporarily or permanently re-routed.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and

aquifer properties. A PDI would need to be conducted to delineate the nature and extent of the NAPL present within the vicinity of SB-4.

5.7.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $5,331,000. The primary capital costs associated with this alternative are the excavation shoring and bracing systems, temporary dewatering and treatment systems, transportation and disposal of impacted materials, and purchase, transport and installation of backfill material. The primary indirect capital costs associated with this alternative include coordination with the City of New York, the preparation of a SMP, field surveys, initiation of an annual Site inspection program, and the establishment of institutional controls at the Site.

5.7.8 Land Use

The remedial alternative is consistent with the current use of the Site.

5.8 ALTERNATIVE 4 – REMOVAL OF DELINEATED MGP-IMPACTED SITE SOILS ABOVE USCOS

This remedial alternative would involve the following major components:

- Removal and disposal of MGP-impacted soils observed in exceedance of USCOs, and
- Backfilling of excavation area with certified clean material and Site restoration.

Under this alternative, all Site soils in exceedance of applicable USCOs based on the SC investigation results would be excavated and transported off-site for disposal. Based on the SC investigation conducted at the Site, the estimated conceptual remediation areas for MGP-impacted soils are depicted on Figure 9. Excavation depths would range from 12 to 19 feet bgs. Prior to the initiation of remedial activities, a PDI would need to be performed in order to distinguish the geotechnical properties of the proposed remediation area, and to further delineate the nature and extent of MGP-related impacts to soils resulting in exceedances of USCOs.

Excavation under this alternative would likely be implemented via a series of separate excavations to various target depths, dependent upon the depth to clay, and the depth of MGP-related impacts within a given area. Significant excavation shoring/bracing systems would be installed around the perimeter of each excavation within the remediation area, as determined by the results of the PDI. While PDI data would be utilized to determine the type of shoring system utilized, it is assumed that extensive subsurface obstructions are present across the entire Site, and therefore soldier pile and lagging systems would likely be utilized within each excavation area. As such, a dewatering system and water treatment system, as well as necessary discharge permitting, would be required under this alternative. As the portions of the Site in which remedial excavations would be implemented occupies approximately 1,700 linear feet along Halleck Street, significant infrastructure pertaining to any dewatering and treatment system would be required. Following implementation, each excavation would be backfilled with certified clean material, and the Site surfaces would be restored in-kind.

5.8.1 Overall Protection of Public Health and the Environment

This alternative is protective of human health and the environment through the removal of MGP-impacted soils where exceedances of USCOs are observed.

5.8.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

The remedial goals, RAO specified for the development of this AAR, and applicable SCGs would be met under this alternative. The RAO would be met through the excavation of MGP-impacted soils throughout the Site.

5.8.3 Long-Term Effectiveness and Permanence

This alternative would be effective long-term and permanent. Delineated MGP-related source material and other MGP-impacted soils would be removed from the Site. No direct exposure pathways would exist due to the presence of a cover system across the remaining portions of the Site.

5.8.4 Reduction of Toxicity, Mobility or Volume

Implementation of this remedial alternative would remove delineated MGP-related source material and MGP-impacted soils throughout the Site, greatly reducing the volume of MGP-related impacts. Therefore, there would be an immediate and significant reduction in the toxicity and mobility of MGP-related impacts.

5.8.5 Short-Term Impacts and Effectiveness

The major short-term impact for this alternative is the significant disruptions to ongoing businesses and the local community. It is estimated that 2,600 truckloads of material would be transported from the Site as a result of excavation activities, and an additional 2,600 truckloads of material would be transported to the Site for backfilling and surface repairs. There are short-term risks of exposure and safety concerns associated with this alternative including increased truck traffic, noise, and dust and odors during the implementation of the remedial action and construction-related health and safety issues.

Excavations along Halleck Street would require the closure of portions of the right-of-way and adjacent sidewalk areas, with each requiring re-routing. Buried utilities in the vicinity of the excavation area requiring relocation would potentially result in service interruption during relocation. Excavation and dewatering activities would be required under this alternative. The necessary storage tanks and/or groundwater treatment equipment would require a significant area of the Site for staging. Discharge of treated construction water could potentially result in flooding of storm and sanitary sewers if discharged during periods of elevated flow rates (e.g., storm events).

The potential exists for adverse impacts to adjacent utilities, buildings, and the roadway due to dewatering of Site soils and vibration from construction activities.

It is expected that approximately 22 to 26 months would be required to implement this remedial alternative. During this time, access to the portions of the sidewalk area and the portions of the Halleck Street right-of-way in the vicinity of the active excavations would be restricted. However, excavations would likely be sequenced, and therefore disruptions and closures would be isolated to specific areas during implementation. Overall, this alternative would result in lane closures and the re-routing of both pedestrian and vehicle traffic.

5.8.6 Implementability

The challenges associated with the implementability of this alternative are primarily associated with excavation dewatering, the potential presence of subsurface obstructions, subsurface utilities and traffic within to public right-of-ways, and overall this alternative is not readily implementable at this Site. As the excavation would extend to depths beneath the water table, the volume of water that would require removal, treatment, and discharge is anticipated to be highly significant. The nature of the fill material at the Site suggests that the subsurface contains obstructions that would need to be addressed prior to the design of the shoring system and implementation of the excavation. In addition, underground utilities are present within or adjacent to the remedial excavation areas. Therefore, a subsurface utility survey would need to be conducted to determine the locations of nearby utilities and whether they can be temporarily or permanently re-routed.

This alternative would require approval from the City of New York to open the roadway, as well as re-route vehicular and pedestrian traffic on Halleck Street.

A detailed engineering evaluation and PDI would be conducted during the remedial design to develop the construction details of this remedial alternative. The engineering evaluation would consider the delineated remediation areas, building records on adjacent properties, all adjacent utilities, geotechnical properties of the subsurface stratigraphy and materials, subsurface obstructions, and aquifer properties.

5.8.7 Cost-Effectiveness

The total estimated 30-year present worth cost for this alternative is approximately $28,469,000. The primary capital costs associated with this alternative are the excavation shoring and bracing systems, temporary dewatering and treatment systems, transportation and disposal of impacted materials, and purchase, transport and installation of backfill material. The primary indirect capital costs associated with this alternative include coordination with the City of New York, and field surveys.

5.8.8 Land Use

The remedial alternative is consistent with the current use of the Site.

SECTION 6

COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES

6.1 COMPARATIVE ANALYSIS OF REMEDIAL ALTERNATIVES

Four alternatives were developed and evaluated in Section 5 to assess the relative merits of each for addressing MGP-related impacts at the Site. A relative comparison of the alternatives for each of the evaluation criteria is presented below. The purpose of the analyses was to identify the advantages and disadvantages of each alternative relative to the other so that key comparisons can be made.

6.1.1 Overall Protection of Public Health and the Environment

Alternatives 1 does not take any action to address MGP-related impacts at the Site. Alternative 2 does not employ any intrusive activities to address MGP-related impacts at the Site. Alternatives 2 through 4 are protective of public health through the implementation of engineering and institutional controls. Alternatives 3A and 3B address MGP-impacts at the Site by immobilizing or removing NAPL-impacted soils in vicinity of SB-4 and Alternative 4 addresses MGP-impacts at the Site by removing delineated MGP-impacted soils exceeding USCOs in Site areas where excavation is deemed feasible and practicable.

Alternatives 2, 3A, and 3B share the development and use of a SMP, since under these alternatives MGP-impacted materials would remain on the Site.

6.1.2 Compliance with Remedial Goals, RAOs, and Applicable SCGs

Alternative 1 would not achieve remedial goals or the Site-specific RAO. Alternatives 2 through 4 would achieve the remedial goals and the Site-specific RAO.

Alternative 2 would achieve the RAO through the implementation of engineering and institutional controls. Alternative 3A would achieve the RAO through implementation of ISS in the vicinity of SB-4, and engineering and institutional controls. Alternative 3B would achieve the RAO through excavation of MGP-related source materials in the vicinity of SB-4, and engineering and institutional controls. Alternative 4 would achieve the RAO through excavation of MGP-impacted soils throughout the Site.

Compliance with SCGs would not be achieved by Alternatives 2, 3A, and 3B but will be addressed by engineering and institutional controls. Alternative 4 would achieve compliance with applicable SCGs.

6.1.3 Long-Term Effectiveness and Permanence

Alternatives 2, 3A, and 3B would be considered effective in the long-term through the implementation of engineering and institutional controls in order to address remaining MGP-impacted materials at the Site. Alternative 4 would be considered permanent and effective long-term through the removal and disposal of MGP-impacted soils throughout the Site.

6.1.4 Reduction of Toxicity, Mobility or Volume

Alternatives 1 and 2 do not provide a direct reduction in the toxicity, mobility, or volume of the MGP-related impacts on the Site.

Alternatives 3A and 3B would reduce the toxicity, mobility, and volume of MGP-impacted materials via the immobilization or removal of NAPL-impacted soils in the vicinity of SB-4. However, the effectiveness of ISS reagent materials on Site soils will need to be evaluated. Additionally, MGP-impacted soils would remain on-site in areas outside of the vicinity of SB-4.

Alternative 4 would reduce the toxicity, mobility, and volume of delineated MGP-impacted materials over the entire Site via excavation and off-site disposal of soils.

6.1.5 Short-Term Impacts and Effectiveness

Under Alternative 1, no action would be taken and therefore would incur no short-term impacts.

Under Alternative 2, no intrusive action would be implemented. Therefore, there would be no significant short-term impacts or disruptions to local businesses.

Alternatives 3A, 3B and 4 would include short-term risks of exposure and safety concerns associated with the implementation of each remedial action. These alternatives would result in associated truck traffic, noise, road, and sidewalk closures. These impacts would be significantly greater under Alternative 4.

Due to the intrusive activities associated with Alternatives 3A, 3B, and 4, odor and dust may be issues that would affect the community in the short-term. Alternatives 3A, 3B and 4 would require restricted access to Halleck Street and the associated sidewalk area, with Alternative 4 having the greatest impact to local businesses.

6.1.6 Implementability

Alternative 1 is readily implementable, as no remedial construction activities would be conducted, and therefore no significant challenges are posed.

Alternative 2 is readily implementable, as the cover system is already in place at the Site, and there are no challenges associated with its utilization. The engineering and institutional controls associated with a SMP have been implemented successfully on similar sites. Most pertinent to this alternative are the activities required to coordinate with New York City and New York State regulatory bodies in establishing institutional controls.

Alternatives 3A and 3B are not readily implementable and will require the need for PDI activities such as a geotechnical investigation, structural evaluations/preconstruction surveys of adjacent utilities and infrastructure and approvals/permits from local government agencies. In addition, Alternative 3A would require that a treatability study and an evaluation of the potential presence of purifier waste and the effect of ISS reagent materials on cyanide bound to Site soils to be completed during the PDI program. Alternative 3B would require an evaluation of dewatering and construction water treatment methods.

Alternative 4 is not readily implementable, and would have significant implementability challenges associated with adverse impacts to local businesses, on-site space constraints, existing

utilities and infrastructure, subsurface obstructions and would require the need for PDI activities such as a geotechnical investigation, evaluation of dewatering and treatment methods, structural evaluation/pre-construction surveys of adjacent buildings and infrastructure and approvals/permits from local government agencies.

6.1.7 Cost-Effectiveness

The cost effectiveness of each remedial alternative is summarized as follows:

Alternative	Estimated Capital Cost	Estimated Cost of O&M	Estimated Total Cost
Alternative 1	$0	$0	$0
Alternative 2	$244,000	$918,000	$1,162,000
Alternative 3A	$4,653,000	$918,000	$5,571,000
Alternative 3B	$4,413,000	$918,000	$5,331,000
Alternative 4	$28,469,000	$0	$28,469,000

Estimated costs are based on a 30-year present worth and the breakdown of these estimated costs for each remedial alternative is provided as Appendix B.

6.1.8 Land Use

None of the analyzed alternatives would change the current land use of the Site.

6.1.9 Community Acceptance

Concerns of the state and the community will be addressed separately in accordance with a CPP and requirements outlined in DER-10's citizen participation section.

SECTION 7

CONCLUSIONS AND PREFERRED REMEDY

7.1 CONCLUSIONS

The following conclusions have been made based upon the results of the SC and subsequent alternative analysis:

- The primary constituents of concern at the Site consist of PAHs and inorganics, namely arsenic, lead, mercury, and cyanide;
- NAPL was encountered in one soil boring (SB-4) during field investigation activities;
- MGP-related impacts in excess of USCOs were encountered in Site soils;
- There is no current pathway for human exposure to impacted soils during day-to-day Site operations. However, exposure to MGP-impacted materials may be possible during intrusive activities (e.g., repair of underground utilities and structures).

Based on the findings of the SC, the following Site-specific RAO was identified by the NYSDEC:

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

Based on the findings of the SC and the Site-specific RAO identified by the NYSDEC, the following alternatives were developed for the Site:

- Alternative 1 – No Action.
- Alternative 2 – Institutional and Engineering Controls.
- Alternative 3A – ISS of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 3B – Excavation of NAPL-impacted Material in the Vicinity of SB-4.
- Alternative 4 – Removal of Delineated MGP-impacted Site Soils Above USCOs.

The Site presents significant challenges for any alternative in which intrusive methods are employed (e.g., ISS or targeted excavations), as the Site is an active sidewalk area and public right-of-way (Halleck Street). Further, any intrusive activity would require approval from the City of New York as vehicular and pedestrian traffic would need to be re-routed, an extensive subsurface utility inventory would need to be performed, and a significant PDI program would need to be conducted under each intrusive alternative. Additional challenges are posed for excavation-based Alternatives 3B and 4, as excavations would extend beyond the groundwater table and likely require significant dewatering, treatment, and discharge infrastructure.

7.2 PREFFERED REMEDY

An extensive evaluation of remedial alternatives has been conducted for the Site while considering the challenges associated with existing utilities and infrastructure, adjacent buildings and structures, subsurface obstructions, Site geology, etc.

Most importantly, this alternatives analysis evaluated short-term impacts to the local community, interruptions to local businesses, and interruptions within the public sidewalk areas and active right-of-ways. Short-term term impacts to the community and public infrastructure would be significant under Alternatives 3A, 3B, and 4, as they include varying degrees of remedial construction activities.

In addition, the effectiveness of Alternatives 3A and 3B would be dependent on the extent of NAPL-impacted soils in proximity to SB-4. Should NAPL-impacted soils extend beyond the Site boundaries, these alternatives would not be effective in treating all NAPL-impacted soils in proximity to SB-4.

Alternative 4 would have significant implementability challenges and short term impacts associated with local businesses, on-site space constraints, existing utilities and infrastructure, subsurface obstructions and would require the need for substantial engineering evaluations (i.e., geotechnical investigations, dewatering and treatment methods, structural evaluations/pre-construction surveys of adjacent buildings and infrastructure, etc.) and would require approvals/permits from local government agencies. In addition, certified clean material brought on-site to backfill remedial excavations may potentially become contaminated by off-site MGP-related impacts.

Based on the above, Alternative 2 (Institutional and Engineering Controls) is the preferred remedy for the Site, and includes the following:

- Utilization of the Site's existing cover system as an engineering control, and
- Preparation of a SMP that will identify the implementation procedures required for institutional and engineering controls at the Site.

Alternative 2 would achieve established remedial goals, achieve the RAO for public health protection in soil identified by the NYSDEC, and would be compliant with SCGs through the implementation of engineering and institutional controls without resulting in significant interruptions to local businesses and adverse impacts to the local community.

Notes:
(1) 6NYCRR Part 375 Environmental Remediation Programs (December 14, 2006)
(2) NS indicates no cleanup objective or background level is available.
(3) ND indicates compound was not detected.
(4) J indicates an estimated concentration.
(5) Shaded values exceed 6NYCRR Part 375 Unrestricted Use Soil Cleanup Objectives.
(6) NA indicates compound was not analyzed.
(7) R indicates rejected value

Notes:
(1) 6NYCRR Part 375 Environmental Remediation Programs (December 14, 2006)
(2) NS indicates no cleanup objective or background level is available.
(3) ND indicates compound was not detected.
(4) J indicates an estimated concentration.
(5) Shaded values exceed 6NYCRR Part 375 Unrestricted Use Soil Cleanup Objectives.
(6) NA indicates compound was not analyzed.
(7) R indicates rejected value

Table 4
Preliminary Screening of Alternatives
Hunts Point Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Remedial Alternative	Technology	Process	Applicability
No Action		Does not include any remedial activities or institutional controls	***Retained***
Limited Action	Institutional Controls	Site Management Plan	***Retained***
	Engineering Controls	Maintenance and monitoring of cover systems (i.e., asphalt in parking areas, concrete under the building structure, and fill meeting CSCOs/top soil in landscaped areas)	***Retained***
Containment	Barrier Wall	Lateral containment of the MGP impacts migrating off-site.	***Not Retained***
Removal	Excavation and Off-Site Disposal and Treatment	Removal of MGP-impacted soil material for off-site disposal and treatment.	***Retained***
	Free Product Recovery	Removal of DNAPL from MGP-impacted soil via pumping from recovery wells	***Retained***
In-Situ Physical/Chemical Treatment	*In Situ* Stabilization/Solidification (ISS) via augers or excavator	Mixing contaminated soils with cementitious grout rendering contaminant constituents immoble due to the reduction in hydraulic conductivity.	***Retained***
	In Situ Stabilization/Solidification (ISS) - via jet grouting	Mixing contaminated soils with cementitious grout rendering contaminant constituents immoble due to the reduction in hydraulic conductivity.	***Not Retained***
	In situ Thermal Treatment (TSTD/ISTT)	Electro resistant heating for removal of MGP impacts	***Not Retained***
	In Situ Chemical Oxidation (ISCO)	Injection of strong oxidants at high concentrations to destroy organic contaminants.	***Not Retained***
	Surfactant Aided ISCO	Injection of surfactants to loosen the bonds of hydrocarbons and reduce the contaminant mass.	***Not Retained***
	Enhanced Bioremediation (EB)	Nitrate, oxygen release compound or percarbonate is injected to enhance the microbial activity. If necessary, nutrients will be injected as needed.	***Not Retained***

"Retained" indicates that the technology is technically capable of meeting the Remedial Action Objectives by itself or in combination with other technologies.

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Remedial Action Objectives (RAOs): 1. *Prevent ingestion/direct contact with contaminated soil.* [(1)]					
Alternative 1	**No Action** No remedial activities would be completed under this alternative to address MGP-related impacts at the Site. The "No Action" alternative serves as a baseline for comparison of the overall effectiveness of other remedial alternatives.	Implementable This alternative does not require implementation of any remedial activities, therefore; the alternative is technically and administratively implementable.	Not effective This alternative does not address toxicity, mobility, or volume of MGP-related impacts to Site soils, and would not meet the RAOs established for the Site.	None Since no remedial action would be implemented under this alternative, there would be no short-term potential adverse impacts or risks posed to the property owners or the surrounding community.	Low
Alternative 2	**Institutional Controls (ICs)/Engineering Controls (ECs)** This alternative would utilize the existing cover system at the Site and include land use restrictions through an environmental easement, enforcement and permit controls, annual monitoring of Site conditions, and informational devices. ICs/ECs would be summarized in a Site Management Plan and would be utilized to limit permissible site uses, specify monitoring requirements, and to establish health and safety requirements to be followed during subsurface activities that could result in worker exposure to MGP-impacted materials.	Implementable Requires development of a Site Management Plan, negotiation with the City of New York, and the implementation of an inspection program.	Effective Implementation of this alternative would achieve the Site RAO.	Limited Requires property owners' adherence to ICs and land use agreements.	Low
Alternative 3	**Remediation of Source Material in the Vicinity of Soil Boring SB-4** Comparison of the following remedial alternatives: 3A: In-Situ Stabilization and Solidification (ISS) of Source Material in the Vicinity of SB-4 3B: Excavation of Source Material in the Vicinity of SB-4	See Alternatives 3A and 3B for specific implementability.	Both alternatives, combined with ECs and ICs, would achieve the Site RAO.	Yes. See Alternatives 3A and 3B for specific short-term adverse impacts.	3A: High 3B: High

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Alternative 3A	**ISS of Source Material in the Vicinity of Soil Boring SB-4 and ICs/ECs** This alternative would consist of auger or bucket mixing methods to solidfy source material observed at 11 to 19 feet below ground surface (bgs) in the vicinity of SB-4. Following completion of ISS activities, ICs/ECs would be implemented per Alternative 2. This remedial alternative would include: ▪ Mobilization of ISS equipment to the Site; ▪ Relocation of utilities within the treatment area (if any); ▪ Removal of shallow soils and obstructions within the treatment area; ▪ ISS via auger or bucket mixing; ▪ Installation of demarcation layer, backfill with clean fill material and Site restoration; and ▪ Implementation of ICs/ECs per Alternative 2.	Not Readily Implementable ▪ Would require approval from the City of New York to open the road, as well as re-route vehicular and pedestrian traffic on Halleck Street; ▪ Would require a Pre-Design Investigation (PDI) to gather geotechnical information and further delineate the source material in the vicinity of SB-4; ▪ Would require a Treatability Study to determine viable reagent mixtures and assess reagent reaction with the characteristics of subsurface soils; ▪ Would require a subsurface utility inventory to determine utilities in the area; ▪ The presence of non-uniform subsurface material (fill) may prevent sufficient advancement of ISS equipment (auger or bucket based); and ▪ The presence of subsurface utilities and non-uniform subsurface materials (fill) may prevent reagents from reaching targeted areas when utilizing certain methods (e.g., jet grouting) due to the presence of preferential pathways.	Effective This alternative would reduce the volume of source material within the vincinty of SB-4. When combined with Alternative 2, the Site RAO would be achieved.	Yes ▪ Closures and/or modifications to streets and sidewalks areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Increased noise due to operation of heavy equipment; ▪ Potential for adverse impacts to adjacent utilities due to injected reagents; and ▪ Potential for off-site migration of injected reagents.	HIgh
Alternative 3B	**Excavation of Source Material in the Vicinity of SB-4** This remedial alternative would include: ▪ Installation of a shoring system to support targeted excavation activities to depths of approximately 19 feet bgs; ▪ Removal of source material to a depth of approximately 19 feet bgs within the vicinity of SB-4; ▪ Backfilling of the excavation area with certified clean material and Site restoration; ▪ Implementation of ICs/ECs per Alternative 2.	Not Readily Implementable ▪ Would require approval from the City of New York to open the road, as well as re-route vehicular and pedestrian traffic on Halleck Street; ▪ Would require a (PDI) to gather geotechnical information and further delineate the source material in the vicinity of SB-4; ▪ Would require a subsurface utility inventory to determine utilities in the area and their ability to be supported during the excavation, or permanently/temporarily re-routed; ▪ Since the water table is shallower than 19 feet bgs, a de-watering design would be necessary to de-water, treat, and discharge groundwater during the excavation; and ▪ Would require all necessary permits for discharge of treated water to storm sewer and/or sanitary sewers.	Effective This alternative would reduce the volume of source material within the vincinty of SB-4. When combined with Alternative 2, the Site RAO would be achieved.	Yes ▪ Closures and/or modifications to streets and sidewalk areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Potential interruption of utility services in the vicinity of the excavation area during utility relocation activities; ▪ Increased noise in vicinity of excavation area due to active construction and water treatment activities; ▪ Potential for adverse impacts to adjacent utilities and roadway due to dewatering of Site soils and vibrations from construction activities; ▪ Potential flooding of storm or sanity sewers if treated groundwater is discharged during periods of elevated flow rates (e.g., storm events); and ▪ Would require a large construction footprint to accomodate de-watering equipment.	High

Table 5
Summary of Soil Remedial Alternatives Retained for Detailed Analysis
Halleck Street Sidewalk Area - Alternatives Analysis Report
Consolidated Edison Company of New York

Soil Remedial Alternatives		Evaluation Criteria			
		Implementability	Effectiveness	Short-Term Impacts	Relative Cost
Alternative 4	**Removal of MGP-impacted Site Soils to Below Applicable Soil Guidance Values Throughout the Site** This alternative would include the removal of subsurface soils throughout the Site observed to contain MGP-related impacts in exceedance of applicable soil guidance values for the Site. This remedial alternative would include: ▪ Installation of shoring systems or sloping back excavations to support excavation activities throughout the Site; ▪ Removal of MGP-impacted Site soils at various depths ranging from 5 ft bgs to 19 ft bgs; and ▪ Backfilling of excavation areas with certified clean material and Site restoration.	Not Readily Implementable ▪ An extensive PDI program would be required to further delineate MGP-impacted soils throughout the Site. In addition, the collection of geotechnical information on subsurface soils will be required. ▪ Removal of Site soils from depth would necessitate the extensive closure of street and sidewalk public right-of-ways, and therefore would require approval from the City of New York for the extended closure of portions of Halleck Street. Re-routing of vehicular and pedestrian traffic would be required. ▪ A study on the underground utilities in the vicinity of the excavation areas would need to be completed to determine if adjacent utilities could be supported during excavation activities, or if they would need to be permanently/temporarily re-routed. ▪ The presence of fill materials composed of various debris and gravel/cobbles would limit the options for the installation of excavation support systems (e.g., sheet pile walls). ▪ Since the water table is shallower than 19 feet bgs, a de-watering design would be necessary to de-water, treat, and discharge groundwater during the excavation; and ▪ Would require all necessary permits for discharge of treated water to storm sewer and/or sanitary sewers.	Effective This alternative would reduce the volume of MGP-related impacts observed at the Site, and the Site RAO would be achieved.	Yes ▪ Significant disruption due to closures and/or modifications to streets and sidewalk areas along Halleck Street; ▪ Increased truck traffic along Halleck Street; ▪ Potential interruption of utility services in the vicinity of the excavation area(s) during utility relocation activities; ▪ Increased noise in vicinity of excavation area(s) due to active construction and water treatment activities; ▪ Significant potential for adverse impacts to adjacent utilities and roadways due to dewatering of Site soils and vibrations from construction activities over potentially expansive excavation areas; ▪ Potential flooding of storm or sanity sewers if treated groundwater is discharged during periods of elevated flow rates (e.g., storm events); and ▪ Would require a large construction footprint to accomodate de-watering equipment, which would potentially need to be relocated multiple times.	Significantly High

Notes:
1 - As per the 9/23/14 NYSDEC approval letter of the Halleck Street Sidewalk Area Site Characterization Report, this is the site-specific RAO that has been identified by the NYSDEC.

NOTE: Where no dimensions for zoning district boundaries appear on the zoning maps, such dimensions are determined in Article VII, Chapter 6 (Location of District Boundaries) of the Zoning Resolution.

ZONING MAP

THE NEW YORK CITY PLANNING COMMISSION

Major Zoning Classifications:

The number(s) and/or letter(s) that follows an **R, C** or **M** District designation indicates use, bulk and other controls as described in the text of the Zoning Resolution.

R – RESIDENTIAL DISTRICT

C – COMMERCIAL DISTRICT

M – MANUFACTURING DISTRICT

SPECIAL PURPOSE DISTRICT
The letter(s) within the shaded area designates the special purpose district as described in the text of the Zoning Resolution.

AREA(S) REZONED

Effective Date(s) of Rezoning:

05-28-1964 CP-18356

Special Requirements:

For a list of lots subject to CEQR environmental requirements, see APPENDIX C.

For a list of lots subject to "D" restrictive declarations, see APPENDIX D.

For Inclusionary Housing designated areas on this map, see APPENDIX F.

APPENDIX B

REMEDIAL ALTERNATIVE COST ESTIMATES

Remedial Alternative Cost Estimates
Alternative 2 - Institutional and Engineering Controls
Halleck Street Sidewalk Area
Bronx, NY

Item No.	Item Description	Estimated Quantity	Unit of Measure	Unit Cost (Material, E□uipment, Labor)	Estimated Cost
A	**ESTABLISHMENT OF INSTITUTIONAL CONTROLS**				
1	Preparation of Site Management Plan (SMP)	1	LS	□50,000	□50,000
2	Establish Institutional Controls	1	LS	□100,000	□100,000
3	Field Surveys	1	LS	□45,000	□45,000
B	**OPERATION AND MAINTENANCE COST**				
4	Periodic Review of SMP Requirements with NYC	1	Annually	□25,000	□25,000
5	Annual Inspections of ICs/ECs and Reporting	1	Per Event	□20,000	□20,000
				Subtotal Annual O□M Costs	□45,000
				Present Worth (30 years 4.5□)□	16.3
				Present Worth O□M Costs	□734,000
				Contingency for O□M Costs (25□)	□184,000
				Estimated Total O&M Costs	**□□18,000**
				Subtotal Capital Costs	□195,000
				Contingency for Capital Costs (25□)	□49,000
				Estimated Total Capital Costs	**□244,000**
				TOTAL ESTIMATED COSTS	**□1,162,000**

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 2 - Cost Specific Assumptions

1) Costs for SMP preparation assumes utilizing the NYSDEC template.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.

□□ Present worth factor calculated using Civil Engineering Reference Manual by Michael Lindeburg.

Remedial Alternative Cost Estimates
Alternative 3A - In-Situ Stabili□ation of NAPL-impacted Material in the Vicinity of SB-4
Halleck Street Sidewalk Area
Bronx, NY

Item No.	Item Description	Estimated Quantity	Unit of Measure	Unit Cost (Material, E□uipment, Labor)	Estimated Cost
A	**PRE-DESIGN INVESTIGATION PROGRAM**				
1	Preparation of NYSDEC Submittals	1	LS	□60,000	□60,000
2	Delineation Borings, Treatability Study and Utility Survey	1	LS	□200,000	□200,000
B	**ACCESS AGREEMENTS, SUBMITTALS, ICs**				
3	Permitting/Access Agreements	1	LS	□50,000	□50,000
4	Preparation of NYSDEC Submittals	1	Each	□250,000	□250,000
5	Field Surveys	1	LS	□45,000	□45,000
6	Establish Institutional Controls	1	LS	□100,000	□100,000
7	Traffic Control Plans for NYC	1	LS	□75,000	□75,000
C	**REMEDIAL CONSTRUCTION**				
8	Mobilization - Excavation and ISS	1	Each	□150,000	□150,000
9	Site Preparation and Soil Erosion Controls	1	Each	□60,000	□60,000
10	Traffic Controls	20	Day	□2,500	□50,000
11	Soil Mixing and Reagents	4400	CY	□350	□1,540,000
12	Pre-Excavation and Surface Soils	1200	CY	□40	□48,000
13	Transport and Disposal of Excavated Soils	1200	CY	□70	□84,000
14	Transport and Disposal of ISS Swell (at 30□ of ISS volume)	1320	CY	□70	□92,400
15	Backfill to Grade	1200	CY	□30	□36,000
16	Odor Control	4	W□	□3,500	□14,000
17	Site Surveying	4	W□	□5,000	□20,000
18	Perimeter Air and Vibration Monitoring	4	W□	□5,000	□20,000
E	**WASTE DISPOSAL**				
19	Disposal of Construction Fluids	10000	Gal	□1	□10,000
20	Miscellaneous Waste	1	LS	□10,000	□10,000
F	**CONSTRUCTION OVERSIGHT**				
21	Contractor Site Management	4	W□	□20,000	□80,000
G	**SITE RESTORATION**				
22	Restoration of Sidewalk	4000	SF	□7	□28,000
23	Asphalt Pavement - 6 inch	4000	SF	□20	□80,000
H	**OPERATION AND MAINTENANCE COST**				
24	Periodic Review of SMP Requirements with NYC	1	Annually	□25,000	□25,000
25	Annual Inspections of ICs/ECs and Reporting	1	Per Event	□20,000	□20,000
				Subtotal Annual O□M Costs	□45,000
				Present Worth (30 years 4.5□)□	16.3
				Present Worth O□M Costs	□734,000
				Contingency for O□M Costs (25□)	□184,000
				Estimated Total O&M Costs	**□□18,000**
				Subtotal of Capital Costs	□3,102,000
				Engineering Field Support (10□)	□310,000
				Bonds and Insurance (7□)	□217,000
				Testing and Inspection (3□)	□93,000
				Total Capital Costs	□3,722,000
				Contingency for Capital Costs (25□)	□931,000
				Estimated Total Capital Costs	**□4,6□3,000**
				TOTAL ESTIMATED COST	**□□,□71,000**

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 3a - Cost Specific Assumptions

1) Costs for PDI submittals for the NYSDEC based on preparation of letter work plans for delineation borings and treatability study.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) Costs for NYC requirements for traffic control plans and required traffic controls cannot be determined at this time and an allowance has been included.
5) Costs based on remedial construction duration of 4 weeks.
6) Costs for remedial excavations based on 1,200 in-place cubic yards.
7) Costs for ISS based on 4,400 in-place cubic yards and assumes no obstructions would be encountered.
8) Disposal costs for excavated soils based on 1,200 in-place cubic yards.
9) Disposal costs for ISS swell based on 30□ of total ISS volume or 1,320 cubic yards.
10) Costs for construction fluids disposal, stakeholder requirements, soil erosion control, etc. cannot be determined at this time and allowances have been included.
11) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.
12) Costs for post-excavation sampling and laboratory analyses are assumed to be not required.

□□ Present worth factor calculated using Civil Engineering Reference Manual by Michael Lindeburg.

GENERAL ASSUMPTIONS

1. These Rough Order of Magnitude cost estimates are conceptual and are to be used only for planning purposes only.
2. Suitability of the evaluated remedial alternatives is dependent on a variety of factors including actual site conditions, engineering/constructability analyses, project-specific effectiveness, implementability and cost.
3. These cost estimates are subject to change based on additional information generated during supplemental field investigations, pre-design investigation activities, remedial design, and constructibility reviews.
4. Parsons has assumed 30 years of O□M for the engineering control. The annual monitoring report would include evaluation of ICs/ECs and notifications to NYSDEC, NYSDOH and property owners to demonstrate that the controls are being maintained and remain effective.
5. Development of costs assumes that work is being performed in Level D personal protective equipment.

Alternative 3b - Cost Specific Assumptions

1) Costs for PDI submittals for the NYSDEC based on preparation of letter work plan for delineation borings.
2) Costs for establishing institutional controls cannot be determined at this time and an allowance has been included.
3) Costs for field surveys include visual observations of existing cover systems and professional surveying.
4) Costs for NYC requirements for traffic control plans and required traffic controls cannot be determined at this time and an allowance has been included.
5) Costs based on remedial construction duration of 6 weeks.
6) Costs for excavation shoring based on 9,000 vertical SF and actual shoring system will be determined during engineering design.
7) Costs for remedial excavations based on 5,500 in-place cubic yards.
8) Costs for excavation dewatering, treatment and discharge cannot be determined at this time and dewatering system needs to be designed. As such, a monthly allowance has been included.
9) Disposal costs for excavated soils based on 5,500 in-place cubic yards.
10) Costs for construction fluids disposal, stakeholder requirements, soil erosion controls, etc. cannot be determined at this time and allowances have been included.
11) It is anticipated that the NYC will contact Con Ed periodically regarding questions on the SMP. Those costs cannot be determined at this time and an annual allowance has been included.
12) Costs for post-excavation sampling and laboratory analyses are assumed to be not required.

- ReadyCap Commercial, LLC
- Deutsche Bank

Experience

Mr. Strother has approximately three years of experience on projects throughout the country in the environmental assessment and consulting industry. He has conducted Environmental Site Assessments (ESAs) for a wide range of local and national clients including banks, agency lenders, investment banks, property development companies and individual owners. The properties he has evaluated have included multifamily residential, retail, office, industrial, partially-constructed buildings, active SHWS, BCP, RCRA, and LUST sites, and undeveloped vacant land. In addition, Mr. Strother has performed numerous Limited Site Inspections (LSIs), Design Visits, and Phase I reports for the telecom industry.

Mr. Strother has performed approximately two-hundred Phase I ESAs in accordance with ASTM Standards and other client-specific scopes of works, and has assisted on over two hundred more ESAs throughout the United States and Canada. His environmental background includes detailed understanding of the risks associated with hazardous and regulated material storage, use, generation and disposal, above ground and underground storage tanks, polychlorinated biphenyls (PCBs), radon, asbestos-containing materials (ACM), lead-based paint (LBP), mold, and other regulated substances. Other skills include data collection from municipal, state, federal, and general research sources; on-site sampling procedures for radon, ACM, and LBP, the ability to extract site pertinent data from various environmental reports/facility records; and preparation and documentation of due diligence reports.

Maria Sinnamon

Project Management Director, White Plains, NY

T 914 612 3828
maria.sinnamon@cbre.com

70 West Red Oak Lane
White Plains, NY 10604

Experience

Maria Sinnamon is a Project Management Director of the Valuation & Advisory Services within the New York region. Ms. Sinnamon has over 13 years of consulting experience in the environmental industry. She has broad experience gained by completing and managing numerous Phase I Environmental Site Assessments (ESAs) on a wide range of retail, office, industrial and multifamily properties in the United States. She is experienced in nationwide project mobilization and research for Phase I and II ESAs, Site Transaction Screenings, Records Search with Risk Assessments, historical land use research and the review of government maintained databases and reports.

Ms. Sinnamon conducted and managed thousands of assessments for a wide range of local and national clients, including real estate owners, investors, and lending institutions in accordance with the applicable American Society for Testing and Materials (ASTM) Standards and Guidelines, United States Environmental Protection Agency (EPA) All Appropriate Inquiry rules, Fannie Mae Delegated Underwriting Standards, Freddie Mac guidelines, and other specific scopes of work. She is a qualified environmental professional under ASTM E 1527-13.

Ms. Sinnamon's environmental background includes a detailed understanding of the risks associated with hazardous and regulated materials storage, use, generation and disposal, aboveground and underground storage tanks, asbestos-containing materials (ACM), lead-based paint (LBP), microbial growth and radon.

Re: Historical Records and Environmental Database Review Report
1360 Drake Park South
Bronx, New York 10474
CBRE Project No.: CB22US068649-2

Dear Mr. Victor:

CBRE, Inc., a Delaware Corporation (CBRE), is pleased to submit this Historical Records and Environmental Database Review on the above-referenced property on behalf of Castellan Real Estate Partners.

We appreciate the opportunity to assist Castellan Real Estate Partners and want you to know your business and trust in CBRE is appreciated.

Please contact Maria Sinnamon at 914-740-1975 or by email at maria.sinnamon@cbre.com should you have any questions or comments.

Sincerely,

CBRE, Inc. – Assessment and Consulting Services

Robert Strother
Sr. Environmental Site Assessor

Maria Sinnamon, EP
Environmental Site Assessment Reviewer

1.0 SCOPE OF REVIEW

CBRE was retained by Castellan Real Estate Partners to review readily available topographic maps, Sanborn Maps, aerial photographs, and city directories to identify previous activities of environmental concern to the Subject Property (1360 Drake Park South, Bronx, New York). In addition, CBRE was retained to review readily available environmental databases maintained by Federal, Tribal, State, and local agencies within the approximate minimum search distances as described by the American Society for Testing and Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* Designation: E 1527-13. CBRE reviewed each environmental database to determine if listed sites represent a material adverse environmental impact to the Subject Property. No site visit or observations were conducted as part of this review and, as such, CBRE makes no representations with respect to environmental conditions at the property which are not identified within the historical records and databases reviewed.

A copy of the regulatory database and the historical records provided by Environmental Data Resources, Inc. (EDR) is attached.

2.0 REGULATORY RECORDS

2.1 Regulatory Database

The Regulatory Database Report documents the listing of sites identified on federal, state, and local (when applicable) standard source environmental databases within the approximate minimum search distance (AMSD) specified by ASTM Standard Practice for Environmental Site Assessments E 1527-13. A copy of the Regulatory Database Report is in the Appendices and is used to identify recognized environmental conditions (RECs) in connection with the Subject Property. The listings serve to identify the known indications of the storage, use, generation, disposal, or release of hazardous substances at the Subject Property and the potential for contaminants to migrate onto the Subject Property from off-site sources in groundwater, or soil in the form of liquids or vapor.

The following table lists the number of sites as categorized by the regulatory database within the prescribed AMSD.

Database Reviewed	AMSD (Miles)	Subject Property	Adjoining	Surrounding	Total
Federal NPL Site List	1.00				0
Federal SEMS Sites	0.50				0
SEMS-ARCHIVE (No Further Action) Sites	0.50				0
Federal RCRIS TSD Sites	0.50				0
Federal RCRIS Generators Sites	Subject Property / Adjoining				0

Database Reviewed	AMSD (Miles)	Subject Property	Adjoining	Surrounding	Total
Federal CORRACTS Site	1.00			✔	1
Federal ERNS Site	Subject Property				0
Federal IC/EC Registries	Subject Property				0
Federal FINDS Site	Subject Property				0
State and Tribal Equivalent NPL	1.0			✔	1
State and Tribal Lists of SEMS Equivalent Sites (former Equivalent CERCLIS)	0.50				0
State and Tribal Landfills or Solid Waste Sites	0.50			✔	75
State and Tribal Registered UST/ AST Site Facility List	Subject Property / Adjoining	✔	✔		2
State and Tribal Leaking UST/Spill (LUST) List	0.50		✔	✔	113
State and Tribal IC/EC Registries	Subject Property				0
State and Tribal Voluntary Cleanup Sites	0.50			✔	3
State and Tribal Brownfields Sites	0.50			✔	3
Other Regulatory Databases	Subject Property / Adjoining				0

Discussion of Orphan Sites

The regulatory database identified 11 "Orphan Sites." Orphan Sites are those sites that could not be mapped or "geocoded" due to inadequate address information. CBRE attempted to locate these sites via a review of street maps. Based on the information reviewed by CBRE, one Orphan Site was identified within the AMSD. The remaining listings were situated outside their respective AMSDs.

2.2 Subject Property Listings and Findings

The Subject Property was identified on the UST database:

Underground Storage Tank (UST)

The Subject Property at 1360 Drake Park South is registered with the New York State Department of Environmental Conservation (NYSDEC) as a Petroleum Bulk Storage (PBS) site under Facility ID: 2-610413. According to the database, this registration has an Unregulated/ Closed status that expired on December 18, 2010. The facility was formerly served by one,

5,000-gallon, steel, No. 2 fuel oil, underground storage tank (UST) that was installed in 1954 and closed-in-place on January 8, 2007. No secondary containment or leak detection equipment was noted on the tank. This tank is not listed on other environmental databases indicative of contamination such as the leaking underground storage tank list or the inventory of State Hazardous Waste Sites. Nevertheless, it may be prudent to obtain and review the tank closure report to review the Subject Property's subsurface conditions at the time of closure.

2.3 Adjoining and Surrounding Property Listings and Findings

CBRE considered the following factors to determine if sites on the list have a likelihood to represent an environmental concern to the Subject Property:

- The regulatory status and specific database listing on which the site is identified.
- The topographic position, direction, and distance of the identified site relative to the Subject Property.
- Local soil conditions in the Subject Property area.
- The known or inferred groundwater flow direction in the Subject Property area.
- Surface and subsurface obstructions and preferential pathways (e.g., buildings, roads, sewers, utility service lines, rivers, lakes, and ditches) between the identified site and the Subject Property.

Adjoining Property Listings and Findings

432 Drakes Avenue (East-Adjacent)

A commercial building on the east-adjacent lot was identified on the Spills database by the EDR report. Based on the address, this listing was likely misplotted and non located on the adjacent property. Spill No. 98011951 occurred on May 14, 1998 when a caller reported that contaminated soil was observed during the removal of a 3,000-gallon UST. The tank contained No. 2 and No. 6 fuel oil land contamination may have been related to a historic paint factory. No further information is provided; however, this incident was granted a Case Closed status by the NYSDEC on March 3, 2003. Based on regulatory closure and downgradient hydrogeological position, this listing is not suspected to represent a REC to the Subject Property at this time.

401 Hunts Point Avenue (Southeast-Adjacent)

Finance Associates Inc at 401 Hunts Point Avenue is registered with the New York State Department of Environmental Conservation (NYSDEC) as a Petroleum Bulk Storage (PBS) site under Facility ID: 2-284858. According to the database, this registration has an Unregulated/ Closed status that expired on September 19, 1992. The facility was formerly served by two ASTs:

- One, 1,080-gallon, steel, No. 2 fuel oil AT was installed at an unreported date and converted to non-regulated use on August 1, 1996. No secondary containment was provided and leak detection was provided by a groundwater well.

- One, 5,000-galllon, steel, No. 2 fuel oil AST was installed at an unreported date and closed at an unreported date. No secondary containment was provided and leak detection was provided by a groundwater well.

Neither of the two ASTs were included on the LUST/Spills database; however, an unreported underground storage tank (UST) was reported as a tank test failure, discussed below.

Spill No. 0607462 occurred at the Center Sheet Metal facility at 401 Hunt Point Avenue on September 29, 2006. An underground storage tank failed a tightness test. The UST was closed-in-place, but no closure report was submitted to the DEC. According to a correspondence with Eastmond, no indication of contamination was present at the time of closure. This incident was closed on September 12, 2007. Based on the lack of any documented release of petroleum, it is not suspected that this listing represents a REC to the Subject Property.

Longfellow and East Bay Avenue (Southwest-Adjacent)

Spill No. 0406285 occurred on September 8, 2004 when an abandoned drum was observed at the intersection of East Bay Avenue and Longfellow Street. One 55-gallon drum was discovered during a drum run. No actual spill took place. This incident was granted a Case Closed status on December 14, 2004. Given the case details and regulatory closure, this listing is not suspected to represent a REC to the Subject Property.

Longfellow and Drake Park South (Northwest-Adjacent)

Spill No. 0704046 occurred on July 10, 2007 when abandoned drums were observed at the intersection of East Bay Avenue and Longfellow Street. Two 55-gallon drum was discovered during a drum run, which had been knocked over. Approximately 170 gallons of a black sludgy petroleum was released. The material was contained with saw dust and removed by the Department of Sanitation. This incident was granted a Case Closed status on August 9, 2007. Based on the regulatory status and surficial nature of the spill, it is not suspected of representing a REC to the Subject Property.

Surrounding Property Listings and Findings

CE Hunts Point MGP Off-Site (350' Southeast)

Several parcels and operable units within the food center located to the southeast across Halleck Street were identified as the site of 18 VCP and Brownfield listings. Based on the size of the property at 182 acres, remediation was divided into multiple operable units, of which the only site relevant to the Subject Property is the off-site investigation conducted along Halleck Street. Currently, the former Hunts Point Gas Works property is predominantly owned by the City of New York for use as the Hunts Point Food Distribution Center. Historically, the site was a manufactured gas plant and gas holder station active between 1926 until demolition in 1968. Throughout the Hunts Point property, visible coal tar and purifier wastes were present in the soil

According to a report titled *Alternatives Analysis Report for the Former Hunts Point Gas Works, Halleck Street Sidewalk Area*, dated January 2021, three groundwater monitoring wells and 30 soil samples were performed along Halleck Street.

Soil sampling discovered 16 VOCs, with seven above soil cleanup objectives, and 29 SVOCs were encountered, of which 14 were above criteria. LNAPL was encountered in boring SB-4. In addition, 24 inorganics were detected, of which 12 metals were above standards.

Groundwater samples were collected from four wells. Depth to groundwater was encountered between 5.6 feet to 12.05 feet. No evidence of NAPL or sheens were observed. One VOC, Methyl tert-butyl ether, and one SVOC, Dimethyl Phthalate, were encountered, but were below AWQS. In addition, 17 inorganic constituents were detected, of which eight metals (barium, iron, lead, magnesium, manganese, sodium, thallium, and cyanide) were above standards. Groundwater generally flows to the south towards the confluence of the Bronx and East Rivers.

According to the site map, the two the sampling points situated closest to the Subject Property, at the corner of Food Center Drive and Halleck Street and west of the Con Edison compressor station, were either non-detect of below applicable regulatory criteria for VOCs and SVOCs, but were above standards for several metals. There is currently no pathway to human exposure to impacted soils, and remedial activities would be restricted by the active sidewalk and public right-of-way. As such, the remedy selected by this report was to install institutional and engineering controls at the site and perform long-term inspection and monitoring of the site.

The groundwater sampling from 2014 indicates that no VOCs or SVOCs are likely migrating towards the Subject Property, but metals may be present in regional groundwater.

For all remaining sites, given a variety of factors including intervening distance, groundwater flow, the farthest known extent to the contamination, and/or regulatory status, the sites in the surrounding area identified during CBRE's regulatory database review are not considered a REC to the Subject Property.

3.0 HISTORICAL USE

Subject Property Summary Findings

Historical information pertaining to the Subject Property is available as far back as 1896, at which time the site consisted of vacant land. The original portion of the Subject Property was constructed in 1951, and by 1954 an expansion in the center area and a parking/storage lot on the western edge of the property were built. The Subject Property was identified as a metal shop since at least 1977. No directory listings are available to indicate what was present from 1951 to 1977.

There is the potential for the historical on-site industrial operations (metal shop operations) to have impacted the subsurface with oils and solvents and as such the historical usage represents a REC to the Subject Property.

Adjoining and Surrounding Property Summary Findings

Circa 1896, the surrounding area consisted of vacant land. By 1901, a cemetery was present on the north-adjacent lot. By the 1920s, a manufactured gas plant was present to the far east. By 1950, multiple industrial properties, commercial buildings, and storage lots were constructed. In the 1960s, the gas plant was razed to build the existing distribution complex. By 1977, commercial and industrial development expanded throughout the surrounding area, the Terminal Market was present to the northeast, and auto wreckers and used car lots were depicted to the south. Please refer to Section 2.3 for discussion of the nearby manufactured gas plant.

Sources of Historical Information

The following table summarizes the time interval and sources of information reviewed to determine the historical use of the Subject Property, as well as the adjoining and surrounding area.

3.1 Topographic Maps

CBRE reviewed the historic USGS *Central Park, NY* 7.5 Minute Series topographic map of the Subject Property area provided by EDR, dated 2019. The topographic map only depicts contours, roadways, waterbodies, and the locations of schools. Individual structures are not depicted.

3.2 Fire Insurance Maps

CBRE requested that EDR conduct a search for Sanborn Maps of the Subject Property and vicinity. The following maps were provided and are included in the Appendices of this report:

Sanborn Maps		
Year	**Subject Property**	**Adjacent and Surrounding Properties**
1896	Depicted as vacant land.	Consists of vacant land with planned roads throughout.
1901	Similar to the previous Sanborn map.	To the northwest is a cemetery.
1915	Similar to the previous Sanborn map.	The cemetery to the northwest is now a park.
1928	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1950	Similar to the previous Sanborn map.	Multiple commercial and industrial properties and storage yards have been constructed throughout the surrounding area. An adjacent property is a sheet metal manufacturer. To the northeast across Hunters Point is a chemical manufacturer.

Sanborn Maps		
Year	**Subject Property**	**Adjacent and Surrounding Properties**
1977	The eastern portion of the Subject Property is improved with a metal shop constructed in 1951, the center portion is an expansion constructed in 1954, and the western edge of the property is a parking and storage lot.	Commercial and industrial development has expanded throughout the surrounding area. A city block farther northeast has been redeveloped into the Terminal Market. East-adjacent buildings include a warehouse and commercial building. Farther east is a used cars lot. The south-adjacent properties are a warehouse and a woodworking facility and manufacturer of metal and wood cabinets. Farther south are an auto parts facility, commercial structures, a storage yard, junk yards and auto wrecking facilities.
1978	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1979	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1980	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1981	Similar to the previous Sanborn map.	To the south is a junk yard.
1983	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1985	Similar to the previous Sanborn map.	The former used car lot to the east is now a commercial building.
1986	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1989	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1991	Similar to the previous Sanborn map.	The commercial building to the east has been razed.
1992	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1993	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1994	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1995	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
1996	Similar to the previous Sanborn map.	The west-adjacent property on Longfellow is an auto repair shop.
1998	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2001	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2002	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2003	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.

Sanborn Maps		
Year	**Subject Property**	**Adjacent and Surrounding Properties**
2004	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2005	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2006	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.
2007	Similar to the previous Sanborn map.	Similar to the previous Sanborn map.

Commercial and industrial development have been present since at least 1950 and expanded in the 1970s. Multiple adjacent and surrounding sites were identified on regulatory databases, discussed above.

3.3 Aerial Photographs

Inasmuch as the Subject Property has been sufficiently covered by other standard historic information sources and the Subject Property is located in a dense urban area, aerial photographs were not consulted as part of this assessment.

3.4 City Directories

A historical City Directory Abstract provided by EDR was reviewed to assess the presence of historical occupants with potentially adverse environmental operations or conditions at the Subject Property and vicinity. The years and associated general uses and/or operations are summarized in the following table.

City Directory Abstracts		
Year	**Subject Property**	**Adjoining/Surrounding Properties**
1927	No Listings	No Listings
1931	No Listings	No Listings
1940	No Listings	No Listings
1949	No Listings	No Listings
1956	No Listings	No Listings
1961	No Listings	No Listings
1965	No Listings	Wm H Roper (420 Longfellow Avenue)
1971	No Listings	No Listings
1976	No Listings	No Listings
1983	No Listings	No Listings
1993	No Listings	No Listings
1994	No Listings	No Listings

City Directory Abstracts		
Year	**Subject Property**	**Adjoining/Surrounding Properties**
1999	No Listings	No Listings

2004	No Listings	No Listings
2005	No Listings	No Listings
2009	No Listings	No Listings
2014	No Listings	No Listings
2017	No Listings	No Listings

A review of City Directory Abstracts did not identify environmental concerns to the Subject Property.

4.0 FINDINGS AND CONCLUSIONS

Historical information pertaining to the Subject Property is available as far back as 1896, at which time the site consisted of vacant land. The original portion of the Subject Property was constructed in 1951, and by 1954 an expansion in the center area and a parking/storage lot on the western edge of the property were built. The Subject Property was identified as a metal shop since at least 1977. No directory listings are available to indicate what was present from 1951 to 1977.

The following REC was identified:

- **Regional Groundwater Contamination:**

  The Subject Property operated as an unidentified industrial property since the 1950s, a metal shop since 1977 and a sheet metal manufacturer at present. In addition, nearby industrial properties, such as sheet metal manufacturers, junk yards, and garages, have been present since at least 1927, and auto wrecking facilities were noted since the 1970s. The distribution facility to the southeast was a manufactured gas plant from the 1920s to 1960s. These former operations likely used oils and solvents in the course of their typical operations. There is the potential for the improper usage, storage, handling, and disposal of these chemicals to have impacted the subsurface. Furthermore, several of these activities took place during a period of time prior to regulatory oversight of hazardous chemicals, and as such, it is unlikely that any spills or contamination conditions would have been recorded on any applicable databases.

  According to a report titled *Alternatives Analysis Report for the Former Hunts Point Gas Works, Halleck Street Sidewalk Area*, dated January 2021, three groundwater monitoring wells and 30 soil samples were performed along Halleck Street, the area of the former MGP closest to the Subject Property. The groundwater sampling from 2014 indicates that no VOCs or SVOCs are likely migrating towards the Subject Property, but metals may

be present. At minimum, metals are present in a well near the Subject Property above standards. Based on close proximity to the former MGP, long-term industrial uses of the Subject Property and surrounding area, and lack of any on-site sampling data to rule out a concern, this regional groundwater contamination represents a REC to the Subject Property.

CBRE recommends that a subsurface investigation be conducted to determine if the historical on-site and adjacent uses have impacted the subsurface.

One Other Environmental Concern (OEC) was identified on the Subject Property:

- **Closed-in-Place UST:**

The Subject Property at 1360 Drake Park South is registered with the New York State Department of Environmental Conservation (NYSDEC) as a Petroleum Bulk Storage (PBS) site under Facility ID: 2-610413. According to the database, this registration has an Unregulated/Closed status that expired on December 18, 2010. The facility was formerly served by one, 5,000-gallon, steel, No. 2 fuel oil, underground storage tank (UST) that was installed in 1954 and closed-in-place on January 8, 2007. No secondary containment or leak detection equipment was noted on the tank. This tank is not listed on other environmental databases indicative of contamination such as the leaking underground storage tank list or the inventory of State Hazardous Waste Sites. Nevertheless, it may be prudent to obtain and review the tank closure report to review the Subject Property's subsurface conditions at the time of closure.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 02/28/2022 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 02/28/2022 has revealed that there are 6 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 02/28/2022 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 02/28/2022 has revealed that there are 4 RCRA-VSQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

Lists of state- and tribal hazardous waste facilities

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 02/08/2022 has revealed that there is 1 NY SHWS site within approximately 1 mile of the target property.

972-976 LEGGETT AVEN Site Code: 538071	972-976 LEGGETT AVEN	WNW 1/2 - 1 (0.977 mi.)	302	881

Lists of state and tribal landfills and solid waste disposal facilities

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 12/21/2021 has revealed that there are 75 NY SWF/LF sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Lists of state and tribal leaking storage tanks

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 03/15/2022 has revealed that there are 22 NY LTANKS sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 13 NY UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

NY CBS UST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS UST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 NY CBS UST site within approximately 0.25 miles of the target property.

NY MOSF UST: Major Oil Storage Facilities Database. Facilities are licensed pursuant to Article 12 of the Navigation Law, 6 NYCRR Part 610 and 17 NYCRR Part 30. These facilities may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. Includes MOSF's licensed or closed since April 1, 1986, (responsibility was transferred from DOT on October 13, 1985) plus available data obtained from DOT facilities licensed since Article 12 became law on April 1, 1978.

A review of the NY MOSF UST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 NY MOSF UST site within approximately 0.5 miles of the target property.

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 NY CBS AST site within approximately 0.25 miles of the target property.

NY MOSF AST: Major Oil Storage Facilities Database. Facilities are licensed pursuant to Article 12 of the Navigation Law, 6 NYCRR Part 610 and 17 NYCRR Part 30. These facilities may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. Includes MOSF's licensed or closed since April 1, 1986, (responsibility was transferred from DOT on October 13, 1985) plus available data obtained from DOT facilities licensed since Article 12 became law on April 1, 1978.

A review of the NY MOSF AST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 NY MOSF AST site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 02/28/2022 has revealed that there are 35 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 3 EDR MGP sites within approximately 1 mile of the target property.

CON EDISON - HUNTS P	BETWEEN BRONX RIVER,	SE 1/2 - 1 (0.539 mi.)	300	850

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 6 EDR Hist Auto sites within approximately 0.125 miles of the target property.

DEC Memo:	"2/1/07 spoke with spill caller Mark Califano of Galli Engineering. Galli is the contractor for the owner of the site. (631)271-9292. The site is the former location of an organized crime sting operation for used auto parts. there are 3 tanks on-site: 2 x 5K and 1 x 3K. One 5K and the 3K failed the test. A-1 Crown did the testing for Galli. Tank failure was due to an above liquid leak. All three tanks are presumed unregistered. Property owner plans on closing the the two tanks that failed. Told him tanks would need to be registered and, if applicable, closed. ttf letter sent to Mr. Califano at: Galli Engineering, P.C. 734 Walt Whitman Road, Suite 402A Melville, NY 11747 bf 2/26/07 On 2/16/06, DEC received a Tank Removal Protocol prepared by Galli Engineering. bf 5/15/07 On 4/18/07 DEC received letter from Michael Tavakolian, Project Engineer for galli Engineering. letter was not on company letterhead and was not signed. Letter states that there were only 2 tanks uncovered and not 3 and that they were O/W separators and not tanks. bf 4/9/08 On 4/7/08, received message from Megan Baruso of Galli Engineering (631)271-9292. She wanted to know what needs to be done to close the spill. I called and left her a voice mail message indicating that I need a response to the ttf letter. bf 8/17/12 Spill re-assigned to T. Demeo as per RSE. bf 2/12/15 TJD Spill reassigned from DeMeo to Patel 03/18/15-Hiralkumar Patel. alternate address: 349 Longfellow Ave, 300 Longfellow Ave, 1341-1359 Viele Avenue, 301 Whittier Street no other spills found. PBS #: 2-610530. as per PBS record, the site has/had following tanks: - one (1) 1,500 gal diesel AST on saddles, in-service, installed in Jul. 2012 - one (1) 275 gal waste oil AST on saddles, in-service, installed in Jun 2007 - one (1) 5,000 gal gasoline UST, removed in Apr. 2007 - one (1) 2,000 gal gasoline UST, removed in Apr. 2007 - one (1) 1,000 gal gasoline UST, removed in

NEW YORK RECYCLING VENTURES (Continued) **S108467637**

Apr. 2007 as per NYC DOB record, a permit was approved on 06/06/2007 for installation of: - two solid/oil separators - two oil/water separators - two detention tanks - two trench drains as per NYC DOB record, a permit was approved on 07/02/1998 for installation of 10,000 gal fuel oil UST. PBS registration does not include 10,000 gal fuel oil UST. ---------- review of available documents: *-*-*-*

Contact Name:	TIM BIERCZ
DEC Memo:	"4/2/2021 - Feng - Desk Duty in office. Spoke to Tim Biercz of Vertex Engineering. They are removing a 10,000-gallon #2 heating oil UST. It is uncovered today and impacted soil is found. The tank is out of the ground already. Vertex is screening the soil. the tank is located outside the building. The building has been demolished already and right now they are removing the tank. They have done a Phase 2 previously. 2 soil borings were installed around the tank and no exceedance was found. They will remove the soil as much as possible and will be segregated on sheeting. Endpoint samples will be collected, i.e. 1 in 30 feet. Groundwater is encountered, so

NEW YORK RECYCLING VENTURES INC (Continued) **1010329058**

groundwater sample will be collected too. There is a sheen on water and does not look like from the groundwater, but rather resolved from the soil. When uncovered, they found a pipe that has no cap, maybe that's the source. His staff will be onsite today. I informed him that the spill will be assigned to Harmandeep Sekhon. PBS 2-610530 Tim Biercz Vertex Engineering 732-690-3083 TBiercz@VertexEng.com Vertex Personnel onsite: Gene 908-442-0126 Discussed with Harmandeep Sekhon and spill is assigned to him for follow up. 5/14/21 - Sekhon Closure report submitted for departmental review. DECDOCS No VOCs were identified in exceedance of the CP-51 Soil Cleanup Objectives (SCOs); Review of the SVOC results identified benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene in slight exceedance of the CP-51 SCOs in four of the six end-point samples. It should be noted that during the UST removal activities and Phase II LSI at the Subject Property, VERTEX identified the visual presence of site-wide fill material (silt and sand with rock, brick, coal ash, concrete, asphalt, and wood) at depths ranging from 0.5 to 15.0 feet bgs. The Streamlining Site Cleanup in New York City document, prepared by the USEPA and New York City Office of Environmental Remediation (OER) and dated August 2010, identified PAHs, including those compounds listed above, as contaminants typically found in historically fill material. Review of the post-excavation soil and groundwater analytical results identified that there are no significant petroleum impacts remaining at the Subject Property. No VOCs exceeding the SCOs were identified in soil and only 1,2,4,5-tetramethylbenzene was identified in groundwater exceeding the AWQS and/or Class GA. The low-level PAH detections in soil and groundwater are consistent with the concentrations identified in the site-wide fill material. The Subject Property is currently being redeveloped as a parking lot for a distribution tenant, and the area of the former UST will be capped with asphalt. Based upon submitted report, case closed."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was FOLEY Con Ed e2mis #144452: Entered by D.McKenna 96143: On 8/7/02 at 19:00 L.Attard # 38102 reported that M.Feimer doing a inspection at the Hunts Point Compressor Station at 332 Hunts Point Ave Bronx discover 1 oz of lubricating oil(that was in a fine mist) on bluestone and on the inlet pipe at the compressor station. The spill was contained to the bluestone and did not enter any sewers, waterways or subsurface structures and there was no fire or smoke involved with the spill. The cleanup is in progress and they are investigating at this time to determine the source of the oil. 18:15 L.Attard called and reported that the cleanup was completed as of this time. 09/02/0 Logger L. Jones Report updated to reflect the following: (1) The spill occurred because the gas turbine began to leak through the seals. The system has a vent blow out line that blew the excess lube oil out. (2) The manufacture was contacted and the seals were reconditioned/repaired. It is no longer leaking. (3) Clean up completed by removing the blue stones that the lube oil sprayed onto. There was no contamination of the soil beneath the blue stone. Clean up was performed by LNG personnel. (4) Spill did not impact sewers or waterways. (5) No sample was done. (6) Lube oil sprayed on to blue stone."
Remarks:	"1 qt lube oil spilled to bluestone and at inlet pipe clean up in progress - unk exact source yet con ed #144452"

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was FOLEY Con Ed e2mis #147385: EH&S Sorvillo reported a 10 gallon antifreeze (50/50 mix) spill to the Gas ERC. The antifreeze spilled onto bluestone. Gas Operations was draining out the fluid which was used yesterday to hydrostatically pressure test a 24 main. Correction: The antifreeze was an 8:1 water to antifreeze mixture. M&CS was making a cut on a 225' section of 24 gas main that had been previously hydrostatic tested and drained (3 weeks ago). There was containment (10 gallon capacity kiddie pool type plastic bin) under the cut location. The residual antifreeze was being collected in the containment but it overflowed causing another 10 gallons to overflow onto the bluestone. On 04-MAR-2003, DEP Keith Williams requested a copy of Con Edison's permit to discharge ethylene glycol to the sewer. The permit was faxed to ERT Daughtrey to submit to the DEP. M&CS Supervisor Ray Korcynski (#47152) supervised the clean-up on 04-MAR-2003. M&CS mechanics Patterson (#51055) and Heyward (#81917) performed the clean-up. 3 55-gallon drums of antifreeze spill clean-up material ws generated. 1-08-04 - the anitfreeze spilled was residual water mixture was due to the required hydrostatic pressure test of the 24 gas main (see above). The fluid overfilled the containment, kiddie pool. There were no repairs made to the gas main. This section of pipe was welded to complete the tie in to the live seciton of the facility main. This fluid was RESIDUAL product. There was no additional fluid in the pipe which was tested. The cleaned up was completed and the soil/bluestone was diposed of. "
Remarks:	"MATERIAL WAS SPILLED AS IT WAS BEING DRAINED FRM HIGH PRESSURE GAS

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was FOLEY Con Ed e2mis #148071: Louis Grazia # 01899 reports about 5 Gals of oil from the gas turbine spilled onto bluestone. He had the area roped off. Cleanup is pending. 20:21 Lima Jones reports Miller Environmental was called to do the clean up. 21:53 Ed Jakubowski # 71449 reports tha Clean Habors will be responding to do the clean up some time before 23:00 HRS. Jim Stone # 14282 will be the clean up supervisor. 02:42 4/25/03 Jim Stone reports clean up complete. April

CONSOLIDATED EDISON (Continued) **S104652955**

30, 2003 Entered by Edwin P. Jakubowski, # 71449 On 04/24/03 at approximately 1915 hrs Engineer Anthony Messina, # 78093 and LNG Supervisor Louis Digrazia, # 01899 noticed in the station separator area, that the fence, piping and bluestone under the Solar gas turbine compressor unit vent lines were wet with oil. Louis Digrazia call the Bronx Gas ERC and reported the incident. He also notified LNG Superintendent Howard Goldberg, # 38524, LNG Engineer Edwin Jakubowski, # 71449 and Gas Ops Environmental personnel Lima Jones, # 13917. Edwin Jakubowski called Miller Environmental and received an answering machine. At 2050 hrs Edwin called Clean Harbors. Clean Harbors acknowledged that they would respond to the spill. At 2030 hrs LNG Supervisor James Stone, # 14282 relieved Louis Digrazia. At 2345 hrs Clean Harbors arrived on site. The location and nature of the spill was shown to Clean Harbors foreman Felix Delgado. A job briefing was held among Clean Harbors and Con Edison personnel. On 04/25 at 0115 hrs Clean Harbors began clean up wiping down all fencing and piping and excavating bluestone and soil into 8 drums. At 0225 hrs Clean Harbors completed the clean up. At 0235 hrs Clean Harbors completed their paperwork and departed the site. James Stone called and updated the Bronx Gas ERC. At 0250 hrs James Stone departed the site. The Chem Lab sampled the excavated material on April 28th. Analysis is pending. Solar, the manufacturer of the gas turbine compressor unit was contacted. Solar had previously replaced seals on the compressor. Oil in a seal vent line went unnoticed and was pushed out the vent line with the operation of the seal and lube oil systems. Solar rechecked and inspected the seals. They confirmed that no 5 Amount % Contnd % Cleaned % Recycld Soil/Bluestone Environmental Medium Impacted GAL UOM OIL AND GREASE Substance, Material Property oil was passing the seals. The vent lines were drained and wiped of any oil. As a precaution the outlet of the vent lines were wrapped with oil absorbent pads. Plastic was placed on the ground below the vent lines. Solar will perform a visual inspection when the unit is returned to service. Inputted Louis Digrazia and James Stone into the Event Involved Person field. Michael Grazia, # 16040 in this field is incorrect as is Louis Grazia on the 1st line of the Event Detail Description. It should be Louis Digrazia. Logger Chris McCallion (86578) 19-MAY-2003 10:10 - Reviewed incident. Changed Opn Status to -CLODE . DEC Memo:	"e2mis 153119 On April 28, 2004 at 14:50 hours, LNG Plant Supervisor Louis Digrazia #01899 reports that at 14:40 hours, 5 gallons of gas condensate spilled onto bluestone from the Gas Condensate Tank at the Hunts Point Compressor Station in the Bronx. Digrazia stated the gas condensate has PCBs and it blew out of the vent of the condensate tank while tank was running. The tank is shut down and the area is barricaded off. Digrazia stated they are arranging for a contractor to perform the cleanup. Gas EH&S Lima Jones #13917 was notified at 15:00 hours and Gas EH&S Victor Basso #52420 is on location at 15:25 hours. There was no smoke or fire associated with this spill and the spill did not enter any sewers, waterways, or subsurface structures. Update 4/29/04 DEC staff (Arakhan) met with Vic Basso and Ken Heyman Jr. at the spill location @ 10:45 AM. Con Ed contractor, Clean Harbors, had excavated all visibly contaminated soil and was waiting for Chem Lab to take end-point samples. Con Ed staff stated that spill occurred when system was started up for seasonal gas flow reversal. No condensate was noted in the sight glass of the condensate tank prior to start-up. It was assumed that water/condensate had accumulated in a low spot of the line next to the condensate removal system over the winter when the system was not operational. Update 5/4/04 End point soil sampling showed that all results were within TAGM 4046 limits for subsurface soils. Wipe sampling results showed cleanup achieved < 100 ug/ 100 sq cm for restricted access areas."
Remarks:	"GAS CONDENSATE SPILLED ONTO BLUESTONE FROM THE GAS CONDENSATE TANK."

DEC Memo:	"e2mis 147941 Phil Masso reported an 8 oz spill on concrete at the Hunts Point Compressor Station. The fluid may contain PCB and it came out of a 24 ball valve. The spill is contained on the concrete.... 10:40 Lima Jones reported there is no liquid left in the valve to take a sample. Area will be handled as having over 500 PPM PCB. Pressure Control will double wash area and the Chem Lab will be on location at aprox. 13:30 to take wipe samples. 11:47 EH&S Sorvillo reported clean up complete, Chem Lab still needs to take wipe samples. Logger Kerri-Ann Southwell #11722 4/16/03 15:00 hrs Update: Myself and Vicky Sorvillo arrived on location at approximately 11:15 hrs. Met with Phil Masso, Ronnie Jackson (10375) and Felix Elias (14268). Spoke to Ronnie and Felix they said they were there to replace, block and bleed suction valve (POV-601). Put down pads, opened valve with pad on it, no liquids came out, then removed valve. Then proceeded to remove elbow under valve and thats when liquids came out. Liquids went onto sorbent pads and concrete pad. No bluestone affected. Cleaned up with pads and then triple-washed with simple green and pads. Double-bagged all waste, PPE and pads. Also got some paint chips with clean-up. Approximately, 13:30 hrs. Jose Burgos/Chem Lab came to location. He took 5 wipes samples on concrete pad (grid) and also took one soaked pad for PCB analysis. Below are the results from the Hunts Pt spill. The first result is from a soaked sorbent pad used in the clean up. It had a total PCB result of 189 ppm (oil). Therefore, disposal of waste materials will be based on it. The following 5 results are from wipe samples taken after triple washing the concrete pad. All results for PCBs less than 10 ug/100 cm^2, no further clean up required."
Remarks:	"Above material discovered spilled at above location. Amount is reported as being 8 ounces. Sample to be taken and cleanup is pending results. Con Ed not available."

Tank Info:

Tank Number:	001
Tank Id:	36056
Material Code:	0001
Common Name of Substance:	#2 Fuel Oil (On-Site Consumption)

Equipment Records:

	J00 - Dispenser - None
	C01 - Pipe Location - Aboveground
	K00 - Spill Prevention - None
	D01 - Pipe Type - Steel/Carbon Steel/Iron
	A00 - Tank Internal Protection - None
	B01 - Tank External Protection - Painted/Asphalt Coating
	E00 - Piping Secondary Containment - None
	H00 - Tank Leak Detection - None
	G00 - Tank Secondary Containment - None
	F00 - Pipe External Protection - None
	L00 - Piping Leak Detection - None
	I05 - Overfill - Vent Whistle
Tank Location:	Aboveground - contact with soil.... Tank bottom rests on soil, allowing no visual inspection.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Closed - In Place
Pipe Model:	Not reported
Install Date:	08/31/1997
Capacity Gallons:	2020
Tightness Test Method:	NN
Date Test:	Not reported
Next Test Date:	Not reported
Date Tank Closed:	10/18/2010

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was M TIBBE 6/30/05 Remediation of the site (Hunts Point Parcel E,OU1)was carried under the Voluntary Cleanup Program. Between 5/2/00 to 5/8/00, the volunteer removed 427 tons of contaminated soil from the site for off-site disposal. In addition, 2,052 gallons of wastewater was removed from the site for off-site disposal. The NYSDEC determined that the remediation of the site successfully implemented, and that no further remedial action by the volunteer was required. Subsequently, the NYSDEC issued an Assignable Release and Covenant Not to Sue in a letter to the volunteer dated 8/25/03. Based on the foregoing, this spill was closed out on 6/30/05. "

DEC Memo:	"E2MIS 149265 13-JUL-2003 21:40 FOD Senior Field Operator T. Murphy 08409 reports finding 2 ounces of dielectric fluid leaked from joint on feeder 4X46 onto concrete in walk-in vault 2887 when on location to place a primary ground. No smoke or fire is/was invovled and no sewers, waterways or private property affected. Supervisor in route to ID leaking joint and joint will be wrapped. Flush crew in route to assist in cleanup. Cleanup in progress. 13-JUL-2003 23:00 Spill changed from 2 hour DeMinimus to reportable. Flush crew was delayed in assisting with cleanup and cleanup will go past the 2 hour requirement. Joint to be permanently repaired during outage. Leaking joint is on feeder 4x46 which is out for repairs. Joint will be repaired by midnight emergency trouble shooters. Walter Hedeman 84455 13-JUL-2003 23:20 Environmental Flush Mech A Guarino reports cleanup complete. Area was triple washed and rinsed and joint was wrapped. Cleanup completed 23:20. 1 bag of assumed 50-499 ppm PCB generated and will be transported to Van Nest S/C and placed in the temp hazardous waste storage area. Joint to be repaired tonight (7/13/03). 14-jul-2003 05:14 Permanent repairs complete 7/14/03 as per Feeder control."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was SUN 03/15/01 Reassigned from O'Dowd to Tipple. 04/12/04 TRANSFERRED FROM TIPPLE TO SUN. 12/20/05 - Obligado - transferr from Sun to Obligado 1/30/06 - Obligado - File Review. Underground Storage Tank (UST) Closure and Site Assessment Report, submitted by Whitestone Associates, January 19, 2001. Reports closure of 3 4000 gallon diesel fuel USTs. Evidence of contamination detected. Sheen was detected on the surface of watertable. 217 tons of obviously impacted soils wre removed from the excavation. Upon excavation PID responses still evident, which were attributed to regional soil conditions (former coal gas site surrounding the property) Soil endpoints showed benzene (up to 21.7 ppb)and napthalene (up to 2190 ppb) impacts. Report recomends NFA based on regional soil conditions. 2/15/06 - Obligado - Meeting with Koon and Joe Sun - need GW samples 12/23/09 - Obligado - Reviewed file and discussed with DEC Tibbe. Additional investigation is required. The UST Closure report was prepared by Whitestone Associates for the Great Atlantic and Pacific Tea Company, Inc (A&P). Shopwell, Inc. is the operator listed on the PBS, however, it is believed Shopwell was acquired by A&P. I contacted the A&P corporate office in Monvale NJ, and was directed to a David O'Sullivan (201) 571 8279, who handles environmental concerns. I left a message on his voice mail to call back the DEC. 1/4/09 - Obligado - Sent letter to A&P requiring Investigation Work Plan within 30 days. Cc to Whitestone. 2/24/10 - Obligado - The past weeks Mr. Sullivan and I have missed each other several times via phone. I have left sevarl messages on his voice mail and he on mine. Do to difficulty in contacting him I left a message on his voice mail notifying him that the spill case was still open and the DEC had reviewed the Whitestone report and additional investigation is requried before the Department could close this spill. I asked him to have his environmental consultant contact me directly. Mr. Sullivan called me back shortly after. We dicussed the issue of the trench with free product that was dug at the adjacent site and the possibilyt that the impacts observed at the UST excavation may be a result of the adjacent MGP site. While

FRESH TOWN (Continued) **S104508851**

I said that might be a possibiliyt, the Department needs additional data to support this claim, and a work plan for at least 3 borings/monitoring wells should be submitted. He suggested doing some sort of fingerprint analayis, and I had no objection. He said he will contact Whitestone and they will contact me. Additionally, he was concerned that the site has been redeveloped and would have access issues. He will contact the property owner to see if there would be access issues. He will call me back. 5/7/10 - Obligado - I spoke with Richard Sweddog (631) 218 0612 from Kleinfelder. He was hired by A&P to do the investigation. He said I should receive the investigation work plan shortly. 6/17/10- Obligado - I reviewed the work plan and the workplan addendum. The plan proposes installing 3 wells in the former UST area. Soil samples and ground water samples will be collected for VOCs and SVOCs. The work plan is acceptable. I sent a work plan approval letter via email. 12/20/10 - Obligado - Reviewed Site Investigation Report. While the spill is listed under 1400 East Bay Ave, the adress for the report is 155 Food Center Drive. ACRIS confirms this is the correct address. 3 monitoring wells are installed and 6 soil samples are collected. Only gw exceedences are 1.3 ug/L benzene and 22.8 ug/L napthalene. All other constituents below gw standards. Soil clean-up objectsives below part 375 SCOs. Ronnie Lee, who is the project manager for the adjacent VCP site, confirmed contamiantion levels are similar to those of adjacent site which had large fuel holding tanks and had contaminated soil and ground water, and the contamination resembled a #2 fuel oil. AFter discussion with DEC O'Connell this spill is closed. "

Remarks: "caller discovered soil contamination while doing tank removal - caller believes there is a problem with pump island"

Tank Info:

Tank Number:	001
Tank Id:	287861

Equipment Records:

J02 - Dispenser - Suction Dispenser
G10 - Tank Secondary Containment - Impervious Underlayment
K00 - Spill Prevention - None
A00 - Tank Internal Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating
I00 - Overfill - None
E00 - Piping Secondary Containment - None
C00 - Pipe Location - No Piping
F00 - Pipe External Protection - None
L00 - Piping Leak Detection - None
G01 - Tank Secondary Containment - Diking (Aboveground)
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
D00 - Pipe Type - No Piping

Tank Location:	Aboveground - contact with impervious barrier... Tank bottom rests on impervious barrier, allowing visual indication of leaks.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	In Service
Pipe Model:	Not reported
Install Date:	08/01/2020
Capacity Gallons:	275
Tightness Test Method:	-
Date Test:	Not reported

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

FINDS:
Registry ID: 110004319577

Click Here:

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
Registry ID: 110055165912

Click Here:

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Tank Info:

Tank Number:	001
Tank Id:	181565
Material Code:	0022
Common Name of Substance:	Waste Oil/Used Oil

Equipment Records:

	H02 - Tank Leak Detection - Interstitial - Manual Monitoring
	C01 - Pipe Location - Aboveground
	J00 - Dispenser - None
	K00 - Spill Prevention - None
	B01 - Tank External Protection - Painted/Asphalt Coating
	D01 - Pipe Type - Steel/Carbon Steel/Iron
	F01 - Pipe External Protection - Painted/Asphalt Coating
Tank Location:	Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	In Service
Pipe Model:	Not reported
Install Date:	01/24/2005
Capacity Gallons:	160
Tightness Test Method:	NN
Date Test:	Not reported
Next Test Date:	Not reported
Date Tank Closed:	Not reported
Register:	True
Modified By:	CGFREEDM
Last Modified:	04/14/2017
Material Name:	waste oil/used oil

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo: "Prior to Sept, 2004 data translation this spill Lead_DEC Field was KRIMGOLD 2/11/2004 Sangesland spoke to homeowner (Mr.Danna) who says he has spoken to the bus company manager several times over the last few months about oil coming under the fence into his yard. Sangesland spoke to bus company manager: Ramon Rodriguez - Advance Bus 718-589-0015. Mr. Rodriguez says that he will walk over to the problem area and fix it. He was also asked to dig out any problem area on Mr. Danna's property. Manager Ramon Rodriguez Advance Transit Bus Company Inc. 1310 Oakpoint Ave Bronx, NY 10474 Sent Contaminated Soil Letter - response due date 4/12/2004 2/17/2004 Received the return receipt signed by Ramon Rodriguez. 3/18/04. J.Krimgold spoke to Frank Galdun 917-207-9540 (GFE,LLC) a consultant to Advance Transit Bus Co. He informed that Trade-Winds was hired to clean up. They are tentatively scheduled to begin on 3/24/04. 3/24/04. Mr. F Galdum called and reported that excavation has been completed. A report will be submitted to the DEC on 4/2/04. YK. 4/29/04. J.Krimgold has reviewed a letter report submitted by Galdun Frankel Environmental dated April 14, 2004. According to the report, contaminated soil associated with a release of diesel fuel has been excavated and properly disposed. Post-excavation samples show contaminant levels marginally exceed TAGM levels but most probably due to a historic fill background at the site. NFA letter."

Remarks: "there is a bus company next door to Mr. Curmo and he is noticing oil is leaking from the bus garage to his property. he wants something done."

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	"+Prior to Sept, 2004 data translation this spill Lead_DEC Field was DEMEO 5/6/2004 DeMeo on site - Tank Test Letter was sent by Sangesland to the owner giving 10 days to conduct the tank test. 5/6/04 TJD Site was the target of joint NYPD/DLE investigation. Warrant executed on the property 5/6/04. At the time of the warrant execution Demeo required property owner (John Chiatterino) to retain a private contractor to empty all unregistered tanks which contained regulated fluids. RP retained Safety Clean to perform the required pumpouts. Three sump pits and an underground tank were emptied during the operation. Safety Clean removed approximately 2,500 gallons and subbed to Miller Environmental to remove another 5,900 gallons. Owner was required to test tank. PTC was retained to perform the tighness test on 5/7/04. Tipple from DEC onsite to witness test. Test not performed as no manway cover was in place to seal tank for testing. PTC will return week of 5/10 to perform test. Subsurface investigation of soils/groundwater around tank, other other underground structures and in other Areas of Concern inside yard is required. 2/8/05 TJD Initial investigation has been performed by Berninger Environmental (631) 589-6521. Awaiting report of findings and the installation of a minimum of 3 groundwater monitoring wells. Significant soil/groundwater contamination has been identified which require remedial action. RP/consultant must submit a remedial action plan for DEC review and approval. Cause of contamination is suspected to be caused by a leaking undrerground oil water seperator and years of improper waste fluid disposal to ground surface. 2/23/05 - Austin - project transferred from Demeo to Tipple 9/23/05 - Raphael Ketani. There is no PBS case. I contacted Adam Libuser of Miller Environmental. He said that his company was under contract to Safety Clean and had done some clean outs of some pits. However, they had no other involvement. I contacted the last environmental company that was involved with the project. I spoke to Walter Berninger of Berninger Environmental. He said that his company did 4 borings on the site and found extensive contamination. So his company did more

BRONX AUTO VENTURE (Continued) **S106009095**

borings. However, there has been no work since then. He said that he wasn't paid by Bronx Auto. Mr. Berninger said that everything is at a standstill. 10/17/05 - Raphael Ketani. I reviewed the August 2004 and the February 2005 Subsurface Investigation Reports. Clearly the soil needs to be removed and the water remediated. The February 2005 report mentions that they plan to inject ORC in order to clean up the water. However, since the consulting company hasn't been paid, things are not happening. I will send out a contaminated soil letter to Mr. Chiapperino ordering him to remediate the site. 10/27/05 - Raphael Ketani. I received a voice-mail on 10/25 from Stanley Zimer, the attorney for Bronx Auto ((914) 948-4800). I tried returning the call, but he wasn't available. So I left a voice-mail messaage. Yesterday, I received a call from Jeff Locke of the NYSAG office (212) 416-6118; FAX (212) 416-8026; e-mail Jeffrey.Locke@oag.state.ny.us). Mr. Zimer called me back regarding the October 17, 2005 letter that I had sent to Mr. Chiapperino. He asked what it was about. I told him that I wanted the cleanup of the soil and water to proceed. He asked about the 11/16/02 reference to a spill at the site. I told him that this date was the one on the initial spill report. I told him it referred to an oil/water separator. He said that what happened was that one line had clogged and overflowed. Mr. Zimer added that the line had been cleared afterwards and everything was fine. He said that he would talk to his client and get the ball rolling, again to start the remediation. 1/6/06 - Raphael Ketani. Meeting was held between Walter Berninger and Jill Haimson of Berninger Environmental and myself. Not much was discussed. Mr. Berninger is not the consultant on this project, but was involved earlier. He will try to get them to hire his company for more environmental work. 1/9/06 - Raphael Ketani. I called Mr. Zimer and asked him what was happening at the site. He said that he would find out and give me a call at the end of the day. Mr. Zimer called me back and said that he contacted the client, Bronx Auto Venture, and they told him that soil was dug up and a monitoring well installed by Berninger some time ago. He added that Bronx Auto paid Berninger for all of the contracted work. He will get me more information and call back tomorrow. 2/8/06 - Raphael Ketani. Bronx Auto Venture was convicted last week under the Environmental Conservation Law as a felony. They had discharged 1500 gals. of gasoline and antifreeze onto the ground. I will call Berninger Environmental and find out how much it will cost to do the remediation work to clean up the site. It is not known whether any remediation had been done since 1/9/06, and whether they had put in a monitoring well. 2/9/06 - Raphael Ketani. I tried calling Berninger Environmental, but could only leave a voice message. 2/10/06 - Raphael Ketani. I received an e-mail today from Walter Berninger of Berninger Environmental. He wrote: Regarding the Bronx Auto Venture I have no idea what you have in your files regarding that project, but , here is a quick review of what needs to be performed. Installation of a monitoring well network, a site survey to plot the groundwater flow direction. Either removal or abandonment of the existing Oil/Water separator and associated piping. Removal of contaminated soils around the separator to get as much source contamination out of the ground as possible so it does not continue to load to groundwater or treatment in place with vapor extraction system or systems. Groundwater treatment using Oxygen Release Compound or iSOC Gas inFusion units Monthly monitoring and quarterly sampling and testing to determine the affects of the remedial action. A ball park figure for the items mentioned above is between $ 50,000.00 to $ 75,000.00.

BRONX AUTO VENTURE (Continued) **S106009095**

3/2/06 - Raphael Ketani. I received the following e-mail today from Walter Berninger of BEI: Bronx Auto Venture I have spoken to the assistant attorney generals office regarding this site and costs for cleanup etc. In fact I maybe asked to go to court on the states behalf on this project. I believe nothing is going to get done or started until it is resolved in court. 6/21/06 - Raphael Ketani. I received and e-mail today from Walter Berninger of BEI: Raphael, Good morning ! It has been some time but, I am at the time table that it takes my clients to move and make decisions. I don't know if you are involved with the Bronx Auto Venture but, we have been retained. I don't know any time frame if one exists to perform various tasks like additional investigation, well installation, flow direction and groundwater remedial action. Walter Berninger 8/18/06 - Raphael Ketani. I sent an e-mail to Walter Berninger of Berninger Environmental asking what progress is being made regarding cleaning up the site. 8/21/06 - Raphael Ketani. Today I received the following e-mail from Walter Berninger: Raphael, Bronx Auto Venture; To start with I provided a cost estimate may be half a year ago. This estimate for for additional investigation, installation of wells, survey and remedial action of existing groundwater contamination was required as a result of his legal action. The estimate was signed but required a retainer to begin work, which has never arrived and nothing has moved forward. I thought the owner was doing jail time. Either way I think it was just for his court dates the estimate and I have no idea when or if anything will ever happen. I will not perform any services without payments up front due to poor payments in the past. Walter Berninger 9/26/06 - Raphael Ketani. Mr. Berninger e-mailed me today. He wrote that nothing is happening with the site. 11/14/06 - Raphael Ketani. Today, I received the following e-mail from Mr. Berninger: Raphael Ketani, Good morning ! Bronx Auto Venture: Nothing is or as happened in years. I guess he doesn't think he has to do anything. 11/27/06 - Raphael Ketani. Today I was informed by Ryan Piper, Region 2 Spill Prevention and Response, that an ECO was looking for me on 11/24/06 regarding how much it would cost to clean up the site. Mr. Piper said that he told the officer it would cost about $250,000. 1/30/07 - Raphael Ketani. I haven't heard anything from Mr. Locke regarding the site and the beginning of cleaning up the spilled products. So I tried to call him, but could only leave a message. 9/27/07 - Raphael Ketani. Presently, the owners are in jail. There is money in escrow for cleaning up the site. I haven't heard anything regarding the site in a long time. The site is still dirty. 10/15/07 - Raphael Ketani. Today I received the following e-mail from Walter Berninger of Berninger Environmental (631) 589-6521: I am checking to see if you are still the project manger for this project. We have finally heard from John the owner (I think he was in jail for a while) received a check and are scheduling to go back next week with some continued investigation, followed after that with the installation of wells and then some remedial action. If you are still involved we will be on-site next week Monday October 22, 2007, and will make sure you are copied on all reports and services we provide. Walter Berninger 10/22/07 - Raphael Ketani. I made an unannounced site visit. I met David Kahn of Preferred Environmental and John Chiapperino, the owner of Bronx Auto. The site looked fairly organized. Most of the pavement was black from previous oil spills, but nothing was wet. Mr. Chiapperino said that they don't take engines anymore or transmissions anymore, just empty car bodies. I saw 4 engines on a rack on site, but there was nothing dripping from

BRONX AUTO VENTURE (Continued) **S106009095**

them. The pavement is 4 to 6 feet thick, according to Mr. Chiapperino. Berninger's crew was having a hard time getting through the concrete for the first well they were installing, but they just managed to do it. The pavement on site is a random patchwork of poured concrete with no particular pattern or design. Cracks were visible, but it could not be determined whether any of them connected to the soil below. Some cracks looked simply like the boundary between two sections of irregularly poured concrete. Others looked like they died out horizontally. I took six pictures. I asked Mr. Kahn to make sure that DEC gets a report of the groundwater analyticals for all 5 new wells that were planned. He said that DEC will get the results. There was nothing much else to see, so I left. 12/11/07 - Raphael Ketani. I tried to reach Mr. Berninger, but could only speak to the receptionist. She just took a message. Later, I contacted Mr. Berninger. He said that the borings were finished, the water samples were sent off and the analyticals returned, and that Berninger will soon send DEC the analytical results and a plan for installing groundwater monitoring wells. 1/14/08 - Raphael Ketani. Today I received the report from Berninger Environmental, Inc. dated 1/9/08 describing the results of the groundwater sampling for wells GP-14 to GP-17. I began my review of this document and the signed Order on Consent, the 2/9/05 Subsurface Investigation Report, and the 8/20/04 Subsurface Investigation Report. 1/17/08 - Raphael Ketani. I finished my review of the various reports and Order on Consent and concluded that extensive soil and groundwater remediation was needed in the vicinity of the drains, their associated piping, and the oil water separator. I wrote a letter to this effect to Mr. Chiapperino and Mr. Berninger and added that the drains and piping must be repaired and/or replaced. The letter was e-mailed to Randall Austin, Chief of the Spills Unit, for his review. 1/24/08 - Raphael Ketani. Mr. Austin finished his review of the letter and it was sent out today. 3/28/08 - Raphael Ketani. I contacted Mr. Berninger (631) 589-6521. He said that Mr. Chiapperino told him that he filled in the drains and piping with cement and that Eastmond came over and dug out some contaminated soil. Mr. Berninger claimed that Mr. Chiapperino sent him some pictures and receipts. However, Mr. Berninger told him and me that Berninger Environmental can't verify this work as they weren't there. 4/10/08 - Raphael Ketani. I wrote a letter to be sent to Bronx Auto stating that the January 9, 2008 investigation was inadequate to delineate the extent of the contamination off-site and, therefore, the Department was disapproving the report. The letter also stated that they were in violation of item #2 of the Corrective Action Plan in the Order on Consent because of this failure to submit a delineation report. The letter requested that they do the delineation as soon as possible. 4/17/08 - Raphael Ketani. Mr. Berninger e-mailed me yesterday that he would like to have a site meeting to scope out the work that needs to be done. I left him a message today with the days that I am available. 4/23/08 - Raphael Ketani. Tim Demeo, EEI of Region 1 DEC, e-mailed me the following with a set of pictures: I believe there is a field report documenting some soil excavation and well installation performed by Eastmond & Sons. I do have a few pictures from a site inspection on 8/18/04. To the best of my memory, a limited amount of source soils were excavated along the south side of building stucture. GW was exposed and floating product was observed. A large diameter well was installed. I do not recall receiving any monitoring or product recovery data following installation. If any submissions were made

BRONX AUTO VENTURE (Continued) **S106009095**

they should be in the file. 4/29/08 - Raphael Ketani. The site meeting took place as scheduled. At the meeting were Mr. Chiapperino, Mr. Berninger, Mr. Norman Teitler, head of the New York Towing, Auto Body and Salvage Association (718) 492-6464, and myself. We briefly discussed the reason for the meeting. Mr. Chiapperino mentioned that Eastmond had cleaned out, and abandoned the oil/water separator several years ago. He also stated that the drains had been filled with cement. Then we went to the sidewalk just outside the western boundary to the site. I told Mr. Berninger and Mr. Chiapperino that the DEC wanted monitoring wells installed offsite in the downgradient groundwater flow direction. Mr. Berninger proposed installing four wells in the sidewalk just outside the site and three wells across the street. Mr. Chiapperino agreed to the work. We returned to Bronx Auto's office and Mr. Berninger stated that he will soon send a proposal to DEC. With that the meeting ended. 5/8/08 - Raphael Ketani. Today I received an e-mail from Mr. Berninger containing a short letter and two figures regarding the site. The letter described a plan to install 5 wells onsite, 4 wells just outside the eastern boundary of the site, and 3 wells on the eastern side of Halleck Street (total 12 additional wells). The letter stated that groundwater samples would be collected and tested for VOCs and SVOCs. The downgradient wells would be sampled at discrete intervals within the water table. The letter also stated that Eastmond would be hired to properly clean out and abandon in place the 8,000 gal. oil/water separator tank. It was also stated that treatment solutions would be pumped down specific wells in order to reduce the groundwater contamination. I wrote a response letter which included the information and directions in the DEC 1/24/08 letter, and which included a response to the Berninger Environmental 5/7/08 investigation and remediation plan. 5/21/08 - Raphael Ketani. Yesterday, Mr. Berninger sent me an e-mail in response to DEC's 5/9/08 letter to Mr. Chiapperino and Berninger Environmental. The e-mail was long. So I printed it out and reviewed it. In the e-mail, Mr. Berninger stated that the tank couldn't be removed because it is under a large building where Mr. Chiapperino stores his liquids for disposal and because he can't dispose of soils with lots of liquids in them. Instead, he wants to install a vapor extraction system around the tank and get rid of the contamination that way. He stated that he will add a well at GP-8 and at GP-12. He said that he didn't see DEC's approval of the plan to install wells off site along Halleck Street. I wrote a response letter to Mr. Chiapperino and Mr. Berninger stating that they can design a remediation plan to treat the contaminated soil around and under the tank, as well as under the southeast third of the property. I added that he doesn't need to put in a well next to GP-8 if it is still useable. Also, a well is needed across the street from GP-12, not next to it. I made it clear in the letter that DEC approves of the plan to put wells off site along Halleck Street and their positions. The letter went out today. 6/3/08 - Raphael Ketani. Mr. Berninger sent me a letter via e-mail in which he asked for an extension of the RAP submission date to 6/30/08. I sent him a response granting him the extension. 6/20/08 - Raphael Ketani. I received a call from Bill Schlageter from Preferred Environmental called yesterday (917) 715-0752. He said that his company is doing the water sampling for Berninger Environmental at the site, but the recovery is very slow. He said that, right now, they've only recovered enough for the VOCs. He asked what he should do. I left a message suggesting redeveloping the wells and waiting

BRONX AUTO VENTURE (Continued) **S106009095**

two weeks to sample for SVOCs, or using a remote collection system that can sample over the course of 24 hours. 6/25/08 - Raphael Ketani. Mr. Chiapperino called. He said that Berninger did the soil borings last week and that the oil water separator tank was sampled for characterization. He said that the tank will be emptied out next. I told him to have a representative from Berninger there to observe the emptying, cleaning out, and examination of the tank. He said he will do this. 7/8/08 - Raphael Ketani. I received the June 30, 2008 Remedial Work Plan (RWP) from Berninger Environmental on July 3, 2008. The Remedial Work Plan involves installing 4 SVES wells around the oil water separator tank, installing 3 Mirco-Bac solution injection wells in the area of groundwater treatment, and 6 additional monitoring wells as depicted in Figure 2 of the RWP. The Micro-Bac solution will be used to treat both the soil and groundwater. I gave conditional approval of the RWP, and stated that if the treatment systems do not achieve their goals of contaminant reduction in the soil and groundwater, then expansion of the systems and/or more treatment may be necessary. 7/23/08 - Raphael Ketani. Today I received the 7/21/08 Off-Site Groundwater Investigation report from Berninger Environmental. I reviewed the report. It consisted of 2 pages of text, a table with the groundwater analytical hits from two sampling levels, a couple of site pictures, and the raw analytical data. There were several low level exceedences for the off-site water samples, except for acetone at the deeper level (22' to 26'). This was 4800 ppb. It exists by itself in the analyses and is probably a laboratory artifact. The oil water separator failure impacted only GP-19. They want to install 2 permanent wells. One next to GP-19 and one between GP-23 and GP-24. The permanent well locations seem reasonable. I wrote to Mr. Berninger that the Department was approving the report and the locations for the permanent wells. However, I wrote that a groundwater elevation and flow map was needed to the nearest hundreth of a foot. 8/11/08 - Raphael Ketani. Mr. Berninger sent me an informational e-mail regarding the site: First project; Bronx Auto Venture Update on Progress: All the monitoring wells have been installed, the Vapor Extraction Wells are installed, tomorrow the tank is being emptied and cleaned to get ready for filling in with a concrete slurry. BEI will have a supervisor on-site to both witness and document the tank work. While on site a survey team will be perform a survey of the wells to produce a groundwater gradient map. The supervisor will also be determining the piping layout of the VES system which will follow starting next week. Walter Berninger 9/15/08 - Raphael Ketani. I spoke to Mr. Berninger (631) 589-6521 today. He said that they installed all of the wells, including the VES wells, did the water table elevation survey, and sampled the wells. DEC will get a report soon. A.L. Eastmond came and pumped liquid out of the oil water separator tank. Then Safety Clean was contacted to abandon the tank - which hasn't happened yet. Mr. Berninger said that he is owed some money for all of the work. 10/28/08 - Raphael Ketani. I contacted Mr. Berninger regarding progress at the site. He said that the oil/water separator tank has been cleaned out, but there was sludge at the bottom. When the sludge was tested, it was found to be high in lead. Eastmond was going to remove the sludge and dispose of it, but Mr. Chiapperino didn't like the price for disposal. So Mr. Berninger contacted Cardinal Tank and they disposed of the sludge and prepared the tank for abandonment in place. Mr. Berninger added that the VES system is complete, but he is waiting on the blowers. 11/18/08 -

BRONX AUTO VENTURE (Continued) **S106009095**

Raphael Ketani. Mr. Berninger sent me an e-mail. He said that all of Berninger Environmental's work has been completed. The VES system is now operational. Anthony Lara of Cardinal Tank told him that they are just about ready to do the oil water separator tank abandonment. 12/19/08 - Raphael Ketani. I received an e-mail today from Mr. Berninger. He wrote that the VES system has been operational for a month and they will be doing the first stack emission test in January. They will also be installing the bacteria in January if the groundwater temperature stays above 55 degrees Fahrenheit. Lastly, he wrote that he left a message for Anthony from Cardinal Tank regarding progress with the tank abandonment. 1/20/09 - Raphael Ketani. Today I received the December 2008 Monthly Monitoring Report from Berninger Environmental Inc. 1/28/09 - Raphael Ketani. I finished my review of the report. There was one vapor hit for the SVE system. This was methylene chloride, which is often a lab contaminant. I had no comments. I e-mailed Mr. Berninger requesting information about groundwater sampling and flow direction, confirmatory soil sampling results, manifests for all liquids and sludge removed, tank abandonment, and general project progress. 2/11/09 - Raphael Ketani. I reviewed the January 2009 Monitoring Report from Berninger Environmental. The report contained the DTW measurements for wells MW-1 to MW-6. It also contained the analytical results for one soil VES stack sample. The sample had hits of 7.4 ppbv m,p xylene, and 41 ppbv of n-amyl acetate, but nothing else. I had no comments. I sent an e-mail to Mr. Berninger (631) 589-6521 asking him when DEC will get the 9/15/08 groundwater sampling results and when the next groundwater sampling round will take place. Mr. Berninger e-mailed me back. He said that Cardinal Tank will abandon the oil-water separator on 2/12/09. Berninger Environmental will have a supervisor on site to monitor the work. A report regarding the abandonment will be submitted to DEC. The 9/15/08 groundwater results will be sent to DEC. The VES system has been operational for two months. However, the bacteria have not been added to the soil due to the groundwater temperature this time of year. 2/13/09 - Raphael Ketani. Anthony Lara called and said that they are just about finished drumming the solids from the oil-water separator. He said that they will have about 70 to 80 drums of material to ship out. They will slurry fill the tank either this monday or teusday. I asked Mr. Lara to send the manifests for all of the material that is shipped out. He said he will. 3/6/09 - Raphael Ketani. I received the February 2009 Monthly Monitoring Report from Berninger Environmental. The report concerned the analytical results for one VES stack sample taken 2/12/09. I reviewed the report and found that all the analytes were non-detect, except for a low hit of toluene and methlyene chloride (a cleaning agent). However, the groundwater analytical results still haven't been submitted for 9/15/08 or later. I e-mailed Mr. Berninger again that the results need to be submitted. 3/09/09 - Raphael Ketani. Mr. Berninger e-mailed me and said that he will look into why DEC has not received any of the groundwater results for the on site wells. 3/12/09 - Raphael Ketani. I spoke to Mr. Berninger. He said that the oil-water separator tank was abandoned in place and 65 drums of sludge from the tank were removed. He said that he is waiting on the manifests for the sludge. The next round of groundwater sampling will take place at the end of March 2009. He said that DEC should get the September 2008 and the March 2009 results. He added that the groundwater temperature was taken and the temperature is between 55 degrees fahrenheit and 59 degrees fahrenheit. So conditions are good

BRONX AUTO VENTURE (Continued) **S106009095**

for bacterial activity. Therefore, he will order the bacterial treatment solution, the nutrients for the bacteria and the oxygen supplement chemical. 3/16/09 - Raphael Ketani. Mr. Berninger sent me the following e-mail: This morning I researched our files and this is what I have and what we have performed. July and August 2008 is the time frame that we installed all the wells. In October 2008 we installed the Vapor Extraction and in December we started monthly monitoring and this March will be the first quarterly sampling and testing event. February 2009 is when Cardinal Tank abandoned the tank. So I don't see any groundwater testing performed in 9/15/2008, and am puzzled as you have such a specific date. As you may be aware we have always had problems with John getting paid so I have not done anything more then required. If you thought we were testing after well installations then that was not done and mostly due to getting money. To resolve this please understand we are now current and on a regular schedule with the monthly monitoring and Stack testing with quarterly sampling and testing. 4/7/09 - Raphael Ketani. Today I received the March 2009 Groundwater Monitoring Report from Berninger Environmental. I reviewed the report and had no comments. 4/8/09 - Raphael Ketani. Today I received the March 2009 Quarterly Groundwater Monitoring Report from Berninger Environmental. I reviewed the report for the VES emission results and the results from water samples taken from wells MW-1 to MW-4. All of the results were completely non-detect with only very low hits for methylene chloride and MTBE in several instances. 5/11/09 - Raphael Ketani. Today I received the April 2009 Monthly Groundwater Monitoring Report from Berninger Environmental. I reviewed the report and had no comments. 6/3/09 - Raphael Ketani. Today I received the May 2009 Monthly Monitoring Report dated 5/31/09 by e-mail. I reviewed the report. It consisted of groundwater level determinations and the taking of a vapor sample from the VES. The vapor sample was completely non-detect. I drafted a letter to Christine Berninger requesting that submit the following: 1) confirmatory soil sample results for the oil water separator, and manifests for the liquid and the sludge 2) groundwater samples for GP-7 to GP-14 as this hasn't been done since 2004 and 2007 3) results of product surveys for the on site wells and a report of the total liquids collected With approval by Randall Austin, Chief of the Spills Unit, I sent a letter to Ms. Berninger regarding the three items above. 6/5/09 - Raphael Ketani. Today I received the May 2009 Monthly Monitoring Report dated 5/31/09 with the original signatures. I E-doc'd the report and then filed it. 6/12/09 - Raphael Ketani. Mr. Berninger sent me an e-mail stating that he is working on a response to DEC's 6/3/09 letter. 6/17/09 - Raphael Ketani. I spoke to Mr. Berninger today. He said that he is still getting all of the receipts and manifests for the oil water separator tank sludge removal. He will talk to the consultant to find out why there have been no groundwater samples for GP-7 and GP-14. Though, as far as he knows, these were geoprobe borings, not wells. There is sheen on some wells and a type of sock is in each well to absorb what oil they can. However, the sheen is too thin and discontinuous to measure. He asked why confirmatory samples were necessary. I told him that when a treatment solution is used, you want to take confirmatory samples to see whether the bugs or chemicals did the job of breaking down the oil. 6/30/09 - Raphael Ketani. Mr. Berninger sent me an e-mail containing a copy of the manifest for the oil water separator tank sludge and the contaminated soil around it. He also sent me a letter dated 6/30/09 in response to DEC's 6/3/09 letter. I reviewed Mr.

BRONX AUTO VENTURE (Continued) **S106009095**

Berninger's response letter and he appears to have responded adequately to my three points of concern. 7/2/09 - Raphael Ketani. Today I received the June 2009 Monthly Report by e-mail. I reviewed the report. Bacteria (6 gals. each) and nutrients (25 gals. each) were injected into MW-5 and MW-6 on May 20. The analytical results for MW-1 to MW-4 were almost entirely non-detect. MW-5 had many gasoline component and breakdown product analyte hits, including MTBE. The highest hit was 370 ppb for m,p xylene. MW-6 had many gasoline component and breakdown product analyte hits, including MTBE. The highest hits were 400 ppb each for 1,2,4-trimethylbenzene and ethylbenzene. The VES stack emissions were almost completely non-detect. Otherwise, there was nothing else to note in the report. 8/5/09 - Raphael Ketani. I received the July 2009 Monthly Report by e-mail. I reviewed the report and noted that only MTBE was detected in an air sample from the VES system. Otherwise, there was nothing to note. 9/2/09 - Raphael Ketani. I received the Berninger August 2009 Monthly Report by e-mail. I reviewed the report and noted that only MTBE was detected in the air sample from the VES system. Otherwise, there was nothing to note. The next groundwater sampling round is in September 2009. 10/9/09 - Raphael Ketani. Today I received the September 2009 Monitoring Report with the analyticals for the groundwater samples collected on 9/17/09. A review of the quarterly analyte summary tables shows that the September results were below TAGM or non-detect for samples from wells MW-2 to MW-4. The sample from well MW-1 had 38 ppb of MTBE, but was otherwise below TAGM. Wells MW-5 and MW-6 had elevated hits for benzene, BTEX (94 ppb and 737 ppb, respectively), and MTBE. The sample from MW-6 also had a hit of 600 ppb 1,2,4-trimethylbenzene. The VES stack sample analysis showed 9.1 ppbv for MTBE and 27 ppbv for methylene chloride, but everything else was non-detect. I sent Tina Berninger of Berninger Environmental an e-mail requesting that groundwater, and any product that is present, be collected from MW-6. 10/15/09 - Raphael Ketani. Mr. Berninger sent me an e-mail on 10/13/09 in response to my 10/9/09 e-mail to Tina Berninger. The contents of his e-mail and my response back are listed below: Good morning Walter: Well, it's not just the possibility of oil moving off site that deeply concerns DEC, but also the presence of highly contaminated water moving off site. It the soil is badly contaminated in the location of MW-6, then it may never clean up without soil excavation. Analyte concentrations in the hundreds of ppb are still too high. Go ahead and inject another portion of treatment solution and let's see whether the analytical results drop again. Walter Berninger 10/13/2009 9:12 AM Raphael, Christine forwarded me your e-mail regarding the Bronx Auto project. I reviewed the laboratory spread sheet regarding MW-6 and see that in less than six months we have reduced the oily sheen that we present in March 2009, to low thousands by June 2009 to now high hundreds. To begin as no oil or petroleum exists in the well or any other wells product recovery would not be required but, I will make sure that another application of bacteria and nutrients is applied to both MW-6 with a little also in MW-5 to make sure it continue to clean. Please let me know if this meets with your approval. 10/29/09 - Raphael Ketani. I sent Mr. Berninger (631) 589-6521 an e-mail inquiring as to whether there have been any changes or progress at the site. He responded that the additional portions of treatment solution had been put in MW-5 and MW-6. 11/6/09 - Raphael Ketani. I received the October 2009 monthly monitoring report. I reviewed the report. There still are low hits of MTBE and methylene chloride in the extracted

BRONX AUTO VENTURE (Continued) **S106009095**

vapors from the SVE system. I had no comments. 12/02/09 - Raphael Ketani. I spoke to Justin at BEI. He said that they are putting together the November 2009 monthly. Otherwise, nothing is happening. The next round of groundwater samples will be taken during December. Christine sent me the November 2009 Monthly Report. I reviewed it and had no comments. 1/6/10 - Raphael Ketani. I received the December 2009 Quarterly Monitoring Report from Christine by e-mail. No product was seen in the monitoring wells. Six groundwater samples were collected and one VES sample. The results for the sample from the VES system were entirely non-detect, except for one glassware cleaning chemical hit. The results for the groundwater samples from wells MW-1 to MW-4 were very low for this round. However, the sample from MW-5 had many high hits up to 46,000 ppb of 1,2,4-tetramethylbenzene. The sample from MW-6 had many high hits up to 750 ppb of 1,2,4-trimethylbenzene. 1/8/10 - Raphael Ketani. Mr. Berninger sent me an update e-mail. He wrote that the top to MW-5 was broken off and rain water made its way into the well. He added that BEI will fix the tops of the wells so that they are easier to see, and so this problem doesn't happen again. 2/9/10 - Raphael Ketani. I received the January 2010 Monitoring Report. I reviewed the report, but had no comments. 2/10/10 - Raphael Ketani. Mr. Berninger sent me the following e-mail: In January we installed stub up manholes on the two trouble wells to make sure no surface waters could affect the wells and applied some more bacteria and nutrients. The next round of test results should again see the concentration decreasing. But we are keeping on top of this project and John is paying. 3/4/10 - Raphael Ketani. Today I received the February 2010 Monitoring Report from Berninger Environmental Inc. I reviewed the document and had no comments. 4/7/10 - Raphael Ketani. Today I received the March 2010 Monitoring Report from Berninger Environmental Inc. I reviewed the document. The concentration for benzene was 3600 ppb for the sample from MW-5. The total BTEX was 232,000 ppb. It was not clear why the concentrations had increased so much. The other 5 samples were either non-detect or of low enough concentrations so as not to be a concern. This seemed strange as MW-4 and MW-6 were down gradient from MW-5. I sent a response e-mail to Berninger Environment requesting some clarification regarding the increase. 5/7/10 - Raphael Ketani. Today I received the April 2010 Monitoring Report from Berninger Environmental Inc. I reviewed the document. The groundwater elevations suggest that there is a general flow to the east-southeast, and that there is an anomylous depression in the water table on site with a high point right next to it. I sent an e-mail to Mr. Berninger requesting a possible explanation. Mr. Berninger responded back by stating the following: We have realized this problem and its due to our installation of above ground stub ups to keep any surface liquids from entering the wells. We now have to remeasure to allow for these higher stub ups and will correct. 5/13/10 - Raphael Ketani. I made an unannounced site visit and met Mr. Chiapperino. The weather was bright sun with a clear sky. The temperature was in the high sixties. It had rained the night before. I asked Mr. Chiapperino for a tour of the site. He agreed and we walked the entire site. There were many puddles on top of the concrete surface, but they only had rain water. At the car cutting area of the site (the northeast corner in front of the garage), I saw some small pools of antifreeze and oil. Mr. Chiapperino explained that the spillage happens when they are cutting up the cars. He said that they drain the engines and the transmissions, but a little oil

BRONX AUTO VENTURE (Continued) **S106009095**

and antifreeze still manages to spill out. He added that they put lots of Speedi Dri down to absorb the liquids. I commented that the spillage wasn't significant, but that they should keep an eye on it. Next, we went to the location of the oil water separator. I saw two large concrete patches where they had cut through the concrete surface in order to get inside the holding tank and clean it out. The area looked clean. Lastly, we walked to the engine storage area in the southeast corner of the site. There, I saw many engines which were sitting on a number of large, heavy gauge, steel sheets. Some of the sheets had holes in them. Oil had drained from some of the engines. A pool of oil had formed on top of one of the sheets. Some oil had flowed onto the concrete surface and had formed small pools. I told Mr. Chiapperino that this needed to be cleaned up immediately. He ordered two of his workers to put down Speedi Dri, which they did. I told Mr. Chiapperino that storing the engines on these open sheets was not a good idea. I told him that the engines needed to be covered so that the rain can't wash oil out of them or onto the concrete surface. I also added that there needed to be some type of drip pans under the engines to catch any spilled oil. He said that this sounded like a good idea and that he will put a tarp over the engines. He commented that they collect the spilled oil every day with the Speedi Dri. I told him that many junk yards have racks on which they store the engines. The racks have covers to prevent the rain from washing oil out of the engines and they have drip pans on the bottom to catch the oil. I suggested that he get some racks and try this. Mr. Chiapperino said that he may. After this, I told him that I had seen everything that I wanted to. I added that I will let Mr. Berninger (631) 589-6521 know what I saw. He said that would be alright. I sent an e-mail to Mr. Berninger explaining what I had seen. I asked him to work out something with Mr. Chiapperino regarding the oil and antifreeze spillage. 6/9/10 - Raphael Ketani. Today I received the May 2010 Monitoring Report from Berninger Environmental Inc. I reviewed the document. Again, the groundwater elevations suggest that there is an anomylous depression in the water table on site with a high point right next to it. I sent an e-mail to Mr. Berninger telling him that the well tops still need to be surveyed. 7/12/10 - Raphael Ketani. I sent Mr. Berninger and e-mail requesting updated information regardng the project and remediation progress. 7/13/10 - Raphael Ketani. I received the June 2010 Quarterly Monitoring Report from Chrisitne Berninger of BEI. I reviewed the report. The groundwater flow direction is due south. This round of groundwater sampling showed that there is still very high groundwater contamination at MW-5 (96,900 ppb of BTEX) and elevated contamination at MW-6 (729 ppb of BTEX, 57 ppb of MTBE). I e-mailed Ms. Berninger that BEI must find a means of addressing the continuing elevated contamination. 8/9/10 - Raphael Ketani. I received the July 2010 Monitoring Report from BEI. I reviewed the report and had no comments. 9/3/10 - Raphael Ketani. I received the August 2010 Monitoring Report from BEI. I reviewed the report and had no comments. 10/6/10 - Raphael Ketani. Today I received the September 2010 quarterly Monitoring Report. Samples from wells MW-2 to MW-4 were completely non-detect. Only 38 ppb of MTBE was detected in the sample from MW-1. The sample from MW-6 had 110 ppb of benzene and 159 ppb of BTEX. Product suddenly appeared at MW-5. This is the well closest to the former location of the oil water separator holding tank. Previous to this sampling round, the groundwater concentrations of benzene and BTEX were very high. However, they were dropping

BRONX AUTO VENTURE (Continued) **S106009095**

dramatically. It is not explained why the product suddenly appeared. I sent Mr. Berninger an e-mail and asked him what had changed at MW-5 that caused the product to appear. 10/18/10 - Raphael Ketani. Mr. Berninger responded back by e-mail. He said that product appeared only during that month in MW-5. He said that more treatment solution was put down the well. Mr. Chiapperino had the product put into a drum and carted away with the other waste liquids. 11/05/10 - Raphael Ketani. Today I received the October 2010 Monitoring Report. It made no mention of the sudden appearance of product in MW-5. However, there was no product in any of the wells during October. I finished my review of the report and had no comments. 12/3/10 - Raphael Ketani. Today I received the November 2010 Monitoring Report. There was no product in any of the wells during October. I finished my review of the report and had no comments. 1/7/11 - Raphael Ketani. I received the December 2010 Quarterly Monitoring Report. The wells were gauged on December 6, 2010. No product was detected. MTBE continues to be present in MW-1 at concentrations that are a little above TAGM limits. There still were low hits for BTEX, benzene and MTBE above the TAGM limits at MW-5. MW-6 had hits for the same parameters, but they were much lower than those belonging to the samples from the September quarterly sampling. 2/7/11 - Raphael Ketani. I received the January 2011 Monitoring Report. It contained only depth to groundwater and dissolved oxygen data. I had no comments. 3/4/11 - Raphael Ketani. I received the February 2011 Monitoring Report. The only item of note was that MW-5 was missing. I sent an e-mail to Mr. Berninger requesting an explanation regarding what happened to the well and to reinstall the well. 3/7/11 - Raphael Ketani. Mr. Berninger sent me an e-mail today. He stated that the junk yard had gone out of business and now the site has a tenant who is parking cars there. However, the tenant made an entrance from the east side of the property and subsequently took out MW-5. Mr. Berninger said that he will tell Mr. Chiapperino that he has to replace the well. 3/22/11 - Raphael Ketani. Mr. Berninger sent me an e-mail that they found MW-5 and raised the stickup so that new manholes could be installed. They also repaired MW-4. They told the person who parks the cars to allow access for sampling the wells. Also, Mr. Chiapperino is 400 days overdue in his payments. So nothing is taking place. 4/1/11 - Raphael Ketani. I received the March 2011 Quarterly Monitoring Report. I reviewed the data and had no comments. 4/19/11 - Raphael Ketani. Mr. Berninger sent me an e-mail that he had not received any more money from Mr. Chiapperino for the work that had been performed to date. He stated that BEI was owed a lot of money and Mr. Chiapperino had stated to him that the money is coming. However, no checks had been received. So all further work has stopped. 4/20/11 - Raphael Ketani. I contacted Stanley Zimer, the attorney for Bronx Auto (631) 414-7730, regarding the lack of progress at the site and Mr. Chiapperino's failure to pay BEI additional money for the work. Mr. Zimer said that Mr. Chiapperino (516) 903-6165 was no longer his client. However, Andrew Greene (914) 948-4800), his former partner, may be able to help. Mr. Zimer said that Mr. Greene will call me. 4/26/11 - Raphael Ketani. Mr. Berninger sent me an e-mail that he just received another check from Mr. Chiapperino. However, it is a small check. So no work will take place and he will put a lien on the property. 4/28/11 - Raphael Ketani. A letter was sent to Mr. Chiapperino stating that he was in violation of the Order on Consent. He was not complying with item #3 of the CAP - Operation, Monitoring and Maintenance Plan. The letter also stated

BRONX AUTO VENTURE (Continued) **S106009095**

that if he did not comply, then he will be subject to fines and penalties. 5/9/11 - Raphael Ketani. Today I received the green return card from Bronx Auto Venture. It had an illegible signature on the back indicating that the card had been received. 5/25/11 - Raphael Ketani. I spoke to Mr. Berninger (631) 589-6521 regarding groundwater monitoring and the soil vapor extraction system. Mr. Berninger said that no groundwater monitoring is taking place right now as Mr. Chiapperino still owes lots of money. Mr. Berninger said that he is paying BEI small amounts in the hundreds of dollars, but, at this rate, it will take him months to catch up. I told Mr. Berninger that this will result in the loss of monitoring time. Mr. Berninger agreed. I told Mr. Berninger that the DEC has not seen SVE results in the monthly and quarterly reports in a long time. Mr. Berninger said that the SVE system had not been operating for about 2 years. I asked him why, then, did the reports continue to list the system as operational month after month. Mr. Berninger apologized and said that he will correct this mistake. I asked him why the system was not working. Mr. Berninger said that the system caught fire years ago when the site caught fire and was never repaired or replaced. Mr. Chiapperino didn't want to spend the money to repair or replace it. Lastly, I told Mr. Berninger that the only place where I saw that BEI would do monthly and quarterly monitoring reporting was in the 6/30/08 work plan (larger version). Mr. Berninger said that this monitoring was listed at the end of the work plan. I looked in the E-docs and found that the Department had approved the 6/30/08 work plan via a letter to Mr. Berninger dated 7/8/08. 7/22/11 - Raphael Ketani. I tried to contact Mr. Berninger (631) 589-6521 regarding the resumption of groundwater sampling and SVE system operation. However, I was told that he wouldn't be in until monday, 7/25/11. So I just left a message. 7/25/11 - Raphael Ketani. Mr. Berninger sent me an e-mail update regarding the site. Mr. Chiapperino is making small payments to BEI for what he still owes. He still owes a lot of money to BEI and Mr. Berninger stated that no work will take place until the debt is resolved. 9/12/11 - Raphael Ketani. I sent an e-mail to Mr. Berninger asking whether work had resumed at the site. 9/13/11 - Raphael Ketani. Mr. Berninger responded by e-mail and stated that Mr. Chiapperino is making payments, but he has not paid even half of what he owes. So no work is taking place right now. 12/2/11 - Raphael Ketani. Mr. Berninger sent me an e-mail. Mr. Chiapperino has not been making payments to BEI since August 2011. Mr. Chiapperino states that he will pay, but doesn't send any money. Both of his attorneys will not work for him anymore. I responded back to Mr. Berninger that I will pass his e-mail along to Mr. Urda. 4/5/13 - Raphael Ketani. I spoke to Mr. Berninger (631) 589-6521 regarding any progress at the site. He told me that there has been no well monitoring and no product collection and no other work since early 2011. Mr. Chiapperino hasn't paid BEI the large amount of money he owes. So no work will be performed by BEI. Mr. Berninger said that, as far as he knew, no one was providing consulting services to Bronx Auto Venture. He had asked Mr. Chiapperino years ago to have one of the yard workers do some of the product collection from the wells in order to save Mr. Chiapperino some money. However, Mr. Chiapperino never complied. Mr. Berninger said that, when last he had checked years ago, there was product in some of the wells and that the SVE system had been smashed by some mobile equipment that was used on the site and was never repaired. I told Mr. Berninger that the last report I had received was the March 2011 document. Mr. Berninger confirmed

BRONX AUTO VENTURE (Continued) **S106009095**

that this was the last report that had been sent. 6/6/13 - Raphael Ketani. Mr. Berninger sent me an e-mail stating that he recently met Mr. Chiapperino and his lawyer. He said that Mr. Chiapperino told him that he was going to pay Mr. Berninger. Mr. Berninger wasn't sure, but he told Mr. Chiapperino that he wanted all of the money that he was owed. Both the SVE and well array need to be put back into shape. As Mr. Chiapperino is not on a schedule with the DEC, it remains to be seen whether any work takes place. 8/8/13 - Raphael Ketani. Today I received the executed Order on Consent which was signed by Mr. Chiapperino. It was signed (executed) by the director, Venetia Lannon, on 8/6/13. 8/9/13 - Raphael Ketani. Mr. Berninger sent me an e-mail today. He stated that Mr. Chiapperino's attorney, Ken Reiss, called him earlier in the week and asked why no work was taking place. Mr. Berninger explained that he hadn't been paid to do any work. Mr. Berninger sent Mr. Reiss another e-mail yesterday and will call Mr. Chiapperino today. Later, I received another e-mail from Mr. Berninger. He stated that Mr. Chiapperino had made a direct deposit into Mr. Berninger's bank account. Sixty five percent of the money owed was deposited. Mr. Chiapperino stated that he will give Mr. Berninger the rest of the money soon. So, Mr. Berninger wrote that Berninger Environmental will go out to the site this month to assess the situation, and if the wells are functional, restart the monitoring. 9/9/13 - Raphael Ketani. I received the August 2013 Monitoring Report dated 8/31/13. The report contained gauging data. Only well MW-5, which was near the former location of the oil/water storage UST, contained product. The thickness of the product was 1.36 feet. Well MW-4 and the SVE system had been destroyed. I accepted the report and sent Mr. Berninger an e-mail stating that the State wanted well MW-4 replaced and the SVE system re-installed. 9/27/13 - Raphael Ketani. Mr. Berninger sent me an e-mail today. He stated that Mr. Chiapperino has not sent the rest of the money he owes for the work that took place. Also, he is not answering phone messages or faxes. So he is unreachable. I responded to Mr. Berninger and told him that there is an Order with Mr. Chiapperino and that I will notify our attorney, Mr. Urda, regarding the failure to comply. 10/31/13 - Raphael Ketani. I sent an e-mail to Mr. Berninger regarding whether there had been any progress at Bronx Auto Venture. Shortly afterwards, Mr. Berninger sent me the following e-mail: I am now paid in full as of Friday 10/25/13. Its been busy since Friday but I can now finalize my quote to Mr. Chiapperino for the well replacement and just about replacement of a complete VES as my supervisor stated he was not able to find anything still existing at the site during our one visit. We will also put his site now back on our schedule for monitoring and sampling once the well gets installed. I responded back by stating that the State wanted quarterly reports containing the following: 3 months of groundwater gauging data - with monthly totals for the gallons of product recovered; quarterly groundwater analytical results; groundwater elevations; the latest groundwater flow direction map; SVE system reconstruction updates - and eventually 3 months of effluent results; and any other pertinent information such as disposal manifests, well purging sheets, etc. 11/11/13 - Raphael Ketani. Mr. Berninger sent me an e-mail confirming the requirements of the DEC regarding groundwater monitoring. However, he wrote that the SVE is completely gone and so BEI would have to start at the very beginning with rebuilding the system. He also wrote that the last stack results report from 12/7/09 showed no emissions (I reviewd the analytical report and Mr. Berninger was

BRONX AUTO VENTURE (Continued) **S106009095**

correct). So, he would like to just re-install MW-4 and go with monthly gauging and quarterly sampling and the respective reporting. I responded by e-mail that the SVE system didn't need to be rebuilt and that only groundwater monitoring should take place. 1/10/14 - Raphael Ketani. I reviewed the December 2013 Monthly Monitoring Report. The monitoring well array still consists of wells MW-1 to MW-6. Groundwater flow was due south to the bay. Product was found in MW-4 and MW-5. A total of 4 gallons of product was collected during this month. These wells, along with MW-6, are in the vicinity of the closed in place oil water separator. The report was deficient. MW-4 had not been surveyed for the groundwater elevation. There was no date for conducting the first quarter 2014 groundwater sampling round. The fonts for the map were too small for MW-1 to MW-3. I sent Mr. Berninger an e-mail indicating these deficiencies. 1/20/14 - Raphael Ketani. Tina Berninger of BEI sent me a revised December 2013 report with larger fonts for wells MW-1 to MW-3 and the next groundwater sampling date as March 2013. Walter Berninger sent me an e-mail stating that well MW-4 will be surveyed for the groundwater elevation. 4/8/14 - Raphael Ketani. I reviewed the January, February and March 2014 Monthly Reports. On 1/10/14, the wells were gauged. Only wells MW-4 and MW-5 had product. The amounts were 0.34' and 0.30', respectively. On 2/10/14, the wells were again gauged. Only MW-4 and MW-5 had product. The thicknesses were 0.21' and 0.22', respectively. On 3/13/14, the 6 wells were gauged. MW-4 had 0.82' of product and MW-5 had 0.44' of product. The sudden increase in thickness may have been due to the continuing drop in water table elevation. Back during January, the water depth was measured as 7.35' and 9.42' for MW-4 and MW-5, respectively. However, by March, the water table had dropped to 8.45' below grade in MW-4 and 10.19' below grade in MW-5. Instead of the water table traping the oil in the pores and channels above, the oil is allowed to flow out on its own. According to the figure included with the March 2014 report, the location of the product appears as a small, elongate pool oriented east-west. Groundwater samples were taken on 3/13/14 from wells MW-1 to MW-3 and MW-6 for benzene, BTEX and MTBE. The results were almost entirely non-detect. 5/5/14 - Raphael Ketani. I sent an e-mail to Mr. Berninger (631) 589-6521 requesting an update regarding remediation progress at the site. Mr. Berninger responded to my e-mail. He stated that BEI is still working at the site. There is additional information regarding the work that has taken place. However, Mr. Berninger will have to go through his documents in order to provide the DEC with a report. 5/7/14 - Raphael Ketani. Chris Rizzo (212) 238-8677 (rizzo@clm.com) called and left a message today. However, I was out of the office. 5/8/14 - Raphael Ketani. I tried to return Mr. Rizzo's call, but I could only leave a message. Mr. Rizzo called again. He said that he was the lawyer for a client who wanted to lease the site. He asked about the site environmental conditions. I explained them to him, including the presence of contaminated soil around the closed oil water separator tank. I asked Mr. Rizzo what type of development his client was considering. Mr. Rizzo said that his client wasn't definite on the manner of construction. I asked whether this may be a building. He said that it may be a 1 story commercial building. I told Mr. Rizzo that if there are going to be footings in the vicinity of the UST, then the DEC would require that his client excavate the contaminated soil that is there. Mr. Rizzo said, in such a case, his client might not lease the site. He asked whether this would be a requirement if his client built a small

BRONX AUTO VENTURE (Continued) **S106009095**

building away from the tank. I told him that we would not require excavation as the future use of the site is commercial/industrial and the groundwater contamination is not high in concentration. Mr. Rizzo asked what the future plans for the environmental work are. I told him that groundwater monitoring, groundwater sampling and analysis and product collection will continue for the foreseeable future. After this, the conversation ended. Later, Mr. Rizzo sent me an e-mail stating that his client also wanted to lease the property at 509 Halleck Street, Bronx. Drake Street and Halleck Street run parallel to each other. Drake demarks the western border and Halleck demarks the eastern border. 5/12/14 - Raphael Ketani. I sent Mr. Rizzo a copy of the Order that he had requested. 5/28/14 - Raphael Ketani. Representatives from Dual Fuel contacted Venetia Lannon, Director of Region 2, reqarding the site and requested a meeting. An e-mail was sent to Mr. Berninger stating that the spill case had come to the attention of Ms. Lannon through contact with representatives of Dual Fuel. Also, I wrote that the DEC was requiring the submission of a work plan describing a more efficient means of collecting product from MW-4 and MW-5 as the presence of oil in these wells has persisted. I set a deadline of June 27, 2014 for submission of the work plan. Also, I stated that the DEC needed more documentation regarding the abandonment of the oil water separator holding tank (i.e. fully signed manifests, pictures, official letters from A.L. Eastmond and Cardinal Tank regarding the work). I set a deadline of June 13, 2014 for the receipt of the documentation. Lastly, I stated that staff from the PBS Unit had informed me that Bronx Auto Venture was in violation of 6NYCRR Part 612 - Registration of Petroleum Facilities as the holding tank had never been registered. Mr. Berninger responded back stating that he had forwarded the Department's e-mail to Mr. Chiapperino. 5/29/14 - Raphael Ketani. Mr. Berninger sent me an e-mail that Mr. Chiapperino (Steelman.Johnny@gmail.com) is late on his payments again and is not communicating, either. Therefore, Mr. Berninger will not conduct any work at the site. So, the e-mail that was sent to Mr. Berninger yesterday was sent to Mr. Chiapperino directly. 5/30/14 - Raphael Ketani. Mr. Berninger (631) 589-6521 sent me an e-mail today. Mr. Chiapperino contacted him and requested his help in resolving the issues of collecting the free product, submitting the tank closure documentation and registering the holding tank. Mr. Berninger told him that he will help him once he gets caught up on his invoices. 6/11/14 - Raphael Ketani. A meeting took place today with representatives of the company Dual Fuel. This meeting was arranged by Venetia Lannon, Director of Region 2, to discuss the proposed use of the site by Dual Fuel. In attendance were Steven Schwarzbaum (914) 979-1264 of Dual Fuel, Christopher Rizzo (his attorney) of Carter Ledyard & Milburn LLP (212) 238-8677, Venetia Lannon and myself. Mr. Rizzo mentioned that DualFuel planned to lease the site from Mr. Chiapperino. A compressed natural gas manufacturing facility would be constructed on the site and a convenience store. Mr. Schwarzbaum stated that he had tried to get some Bronx Auto Venture files from Mr. Chiapperino, but he was uncooperative. Vehicles would be converted from oil to natural gas. Mr. Rizzo stated that there is a blanket E-designation for the entire Hunts Point area of the Bronx. He wasn't sure why this was done. I stated that I didn't know either and that I found this designation strange as the entire Hunts Point area is an industrial-commercial area and will stay that way for the foreseeable future. Mr. Rizzo stated that DualFuel didn't want to do

BRONX AUTO VENTURE (Continued) **S106009095**

an extensive Phase II or extensive remediation of the site. I stated that groundwater monitoring and product collection were taking place monthly and would continue to do so for the foreseeable future. At this point, I handed Mr. Rizzo and Mr. Schwarzbaum copies of the latest groundwater monitoring report. The report showed that there was a small, but thick pool of product around the oil water separator holding tank. The report also showed that only 3 gallons of product was being collected monthly. Ms. Lannon asked whether this low amount was real. I said that it was and that groundwater monitoring would have to continue for many years before completely removing the product. A sub-discussion then ensued regarding completely remediating the site. Mr. Schwarzbaum stated that they would work out a plan with Mr. Chiapperino for deducting the cost of monthly monitoring from their rent payments. I responded that it would be cheaper in the long run to just dig out the tank and contaminated soil and get this over with. Mr. Rizzo asked how deep the tank might be buried. I told him that I estimated the bottom of the tank at 8 feet below grade. I added that the contaminated soil was about 5 to 8 feet down, also. Mr. Rizzo said that the convenience store would be constructed right in the northeast corner of the site and a little north of the oil water separator holding tank. He added that they would bring in a backhoe and dig 4 feet down in order to construct the store. I told Mr. Rizzo and Mr. Schwarzbaum that since they would mobilize a backhoe to the site and dig, it would be a simple matter to use the same backhoe to dig out the tank. They would save on mobilization cost. Mr. Rizzo commented that they were going to take down the building that was over the holding tank. I responded by saying that Mr. Chiapperino had told his consultant that the cost of taking down the building was the only thing holding him up from digging out the tank. I suggested that they get together with Mr. Chiapperino and see whether they can split the cost of remediating the tank and the contaminated soil. I also suggested that they try applying for the Brownfield Cleanup Program. Mr. Rizzo stated that they looked into this, but the timing wasn't right. DualFuel wants to start plant operation by April 2015 - allowing for only a short legal schedule for the lease and construction. Mr. Schwarzbaum stated that he had already contacted Baldorf and Anheiser-Busch, amongst others, and they were interested in converting their trucks to gas. However, they wouldn't do so unless the DualFuel plant was up and running. Ms. Lannon asked whether they had contacted Dan Walsh of the NYC OER concerning whether they can help with their brownfield program. Mr. Rizzo said that they hadn't. Mr. Schwarzbaum stated that they had applied for a NYSERDA grant for $500,000. He added that the compressed natural gas plant would be in the one million to two million dollar range. After this, the meeting ended. Later, I met with Jane O'Connell of the Superfund/Brownfield Unit. I asked her whether DualFuel could apply to the Brownfield Cleanup Program. She asked whether this was an active spill site. I told her it was. She then asked whether there was an Order on Consent. I told her there were two active ones. Ms. O'Connell then said that because there were Orders for the spill case, DualFuel could not apply to the BCP.
6/23/14 - Raphael Ketani. A conference call took place this morning between John Urda, assistant regional attorney for Region 2, Christopher Rizzo, attorney for Dual Fuel, and myself. The conference call took place in order to discuss Bronx Auto Venture and the development of the site by Dual Fuel. Mr. Rizzo stated that his client was willing to remove the oil water separator UST and the

BRONX AUTO VENTURE (Continued) **S106009095**

contaminated soil around it, but was concerned about there being extensive contaminated soil around UST and, thus, the project would become a big, expensive undertaking. He asked whether the old Phase II reports were still valid. Mr. Urda said that the DEC case manager believed that they were. Then, Mr. Rizzo asked whether the DEC thought that the waste oil had spread beyond the site. I explained that there are two wells next to the UST with a little product on the water table and one well next to the tank which has never had product. So, the DEC believed that the oil which is present is not migrating and is just around the UST. Mr. Urda told Mr. Rizzo that Dual Fuel was not under any obligation to do the remediation as there is an Order on Consent with Mr. Chiapperino and so he is the one who is responsible for the remediation of the spill. Mr. Urda also stated that his client could make an agreement with Mr. Chiapperino to have him pay for finishing the excavating that would remove any additional contaminated soil. I also offered to be at the site during the excavating in order to assure his client when the work had removed the entirety of the contaminated soil. Mr. Rizzo stated that he will talk to his client about the conversation that took place today. 6/24/14 - Raphael Ketani. I sent an e-mail to Mr. Berninger (631) 589-6521 requesting an update regarding progress at the site. Later, Mr. Berninger responded by e-mail that Mr. Chiapperino was paid up in full. Thursday Mr. Berninger has a meeting scheduled with James Lee (attorney) to discuss what would be involved in the purchase of Bronx Auto Venture. Mr. Berninger stated that he was not sure if he wanted to continue working for Mr. Chiapperino due to the difficulty in getting him to pay his bills. Mr. Berninger added that he had also talked with Chris Teto at Enviro-Waste about vacuuming the wells with product. He hoped that this would start very soon. I asked Mr. Berninger to continue with the product collection and well monitoring. 7/1/14 - Raphael Ketani. Mr. Berninger sent me an e-mail today stating that work had started again. However, he wasn't sure who he was working for since he met with a representative from Mestousis Enterprises who stated they are buying the property or going into a long time lease. However, his group wants to remove the separator. Then, yesterday, Mike from Dual Fuel called Mr. Berninger and said that they are involved. 7/14/14 - Raphael Ketani. Today I received a letter from Mr. Berninger stating that he had sold his company to WRS Environmental Services, Inc., 17 Old Dock Road, Yaphank, NY, 11980. The general office phone number will stay as (631) 589-6521 until a new number is established. Mr. Berninger and his company will continue to service the same clients as before. 8/28/14 - Raphael Ketani. I received an e-mail from Mr. Berninger. He stated that Mr. Chiapperino is again refusing to pay him the money he is owed. Mr. Chiapperino is claiming that the new owners or lessees will pay his debts and cleanup the site. However, this is not certain at this time. Mr. Berninger stated that he has stopped providing service to Mr. Chiapperino permanently. I forwarded the e-mail to Mr. Urda of DEC Region 2 legal. 9/10/14 - Raphael Ketani. As work had again stopped with no other contractor appearing to take over the job, I sent a letter to Mr. Chiapperino (via certified and e-mail) stating that he was in violation of the two Orders on Consent regarding his failure to continue the groundwater gauging, product collection, quarterly groundwater analysis and quarterly report submission. I set a date of 9/23/14 for him to submit proof to the Department that the work had resumed or else legal action will be taken. 9/19/14 - Raphael Ketani. An attorney named James Lee (347)

BRONX AUTO VENTURE (Continued) **S106009095**

590-3900 called today. He left a message stating that the Bronx Auto Venture property had been sold and that he represented the new client. He had a letter in his hand addressed to Mr. Chiapperino and wondered what it meant. I called Mr. Lee back. He said that Point H Realty Corp. bought the property and closed on 8/20/14. He added that they are working with BEI to finish remediation. He asked what needed to be done to remediate the site. I told him that the oil-water storage tank had to be cleaned out and removed, the contaminated soil in the tank grave and the sidewalls had to be dug out and any free product and contaminated groundwater had to be collected. Mr. Lee said that he understood. 9/24/14 - Raphael Ketani. Today I received the green return card for the letter dated 9/10/14 that I had sent to Mr. Chiapperino which stated that he was in violation of the two Orders. 12/1/14 - Raphael Ketani. I called Mr. Lee (347) 590-3900 (attorney for Point H) regarding the remediation work that was supposed to be done by Point H Realty Corp. I told him that the Department had not received any remediation or progress reports describing the performing of remedial activities. I asked him whether Point H was doing the work. I also asked him whether he was still their attorney. He said that he was and that he will contact Point H. He said that they have an environmental company on board to do the work. I told him that I knew that BEI was still involved, but that I was told by Mr. Berninger that he had sold the company and was not going to do much environmental work anymore. Mr. Lee stated that the work will get done and that he will call Point H. I asked him to provide me the telephone number for Point H and a contact there. Mr. Lee said that he is the contact and that he will take care of things. I ended the conversation by stating that not having received the reports meant to the Department that the work was not taking place. Therefore, this was a failure to clean up the spill and a violation of the Navigation Laws which could result in fines of $37,500/day per violation. Mr. Lee said that he understood and the conversation ended. 12/2/14 - Raphael Ketani. Mr. Berninger sent me the following email: While away for the Thanksgiving weekend a James Lee (attorney) called on behalf of a Peter Mestousis with Point H Realty Corp located at 411 Bryant Ave., Bronx, 10474. I had sent to this Peter and James back in June 2014 a quote for services and again to update quote yet nothing signed to date. I spoke with James this morning and once again revised quote requesting a signed quote and retainer. When and if I get retained I will let you know, however, these people aren t taking over John C responsibility only hiring to do monthly and quarterly services. Not holding my breath but will keep you updated. 12/16/14 - Raphael Ketani. I contacted Mr. Lee (347) 590-3900 (attorney for Point H Realty Corp) regarding progress at the site. He said that Mr. Berninger had been retained and that this happened this past week. I told Mr. Lee that I had recently been in touch with Mr. Berninger and he stated only routine monthly and quarterly monitoring was planned. I added that removal of the oil-water holding tank and the contaminated soil was also supposed to take place. Mr. Lee stated that it was his understanding that this was also going to be done. He asked that I verify this by contacting Mr. Berninger. Later, I sent an email to Mr. Berninger asking him what the work plan was going to be for the site and whether it included removal of the oil-water holding tank and the contaminated soil. Mr. Berninger (631) 589-6521/wberninger@wrses.com responded by email: I was off for a long weekend upstate and upon return received a retainer check from Point H. Realty Corp., Mr. Peter Mestousis, and I have also been in

BRONX AUTO VENTURE (Continued) **S106009095**

touch with Mr. James Lee Esq. Based on receipt of that retainer we are ready to again start monthly visits and quarterly sampling and testing. Based on the time of this month and present commitments we are expecting to resume these services the first of the new year. If it is determined any free phase product still exists, vacuum truck visits will be arranged. Once we have performed that site visit and assess the sites current condition along with our review of laboratory results we will begin to plan on a schedule dependent of winter weather conditions for the removal of the source of contamination the Oil/Water Separator and any contaminated soils present. 2/12/15 - Raphael Ketani. I reviewed the Berninger Environmental Inc. January 2015 Monitoring Report dated 1/31/15. Site monitoring took place on 1/9/15. Product was found in MW-4 (3/4) and MW-5 (1/2) and was bailed. Two gallons of mixed liquid was recovered. Wells MW-1 to 3 and 6 were sampled on 1/9/15. All of the sample results were either entirely non-detect or almost entirely non-detect for VOCs. The work was performed for Point H. Realty Corp., the new client. 2/16/15 - Raphael Ketani. Mr. Berninger sent me an email stating that Point H. Realty plans on removing the oil/water separator tank as soon as the weather improves, probably in mid April when the snow and ice are all gone. Mr. Berninger also stated he told Point H. Realty that BEI will need to perform oversight to document the work. 6/9/15 - Raphael Ketani. Today I received a phone call from Mr. Berninger ((631) 589-6521/wberninger@wrses.com) regarding activity at the site. He said that the tenant was going to remove the oil-water separator and do the excavation work. However, the tenant did not know where the tank was or that the tank needed to be registered. Mr. Berninger also informed me that James Lee (347) 590-3900 (jameslee416@yahoo.com) is the attorney for Point H, the tenant. The Point H representative is Peter Mestousis at pmwaves@aol.com. 6/10/15 - Raphael Ketani. I sent an email to Mr. Lee and Mr. Mestousis informing them that the DEC wanted to know the status of the oil-water separator and contaminated soil removal. I added that they are free to conduct the work on their own. However, they will be taking on the liability. If the tank is not registered and the soil contamination is not removed completely and the work is not done in accordance with the NYS environmental laws and regulations, then Point H will held liable by the DEC for the spill and may possibly be subject to fines and legal action. Lastly, I told them that the DEC must receive a remediation report which conforms to standard environmental reporting. If the DEC does not receive this report, then we do not have the documentation and data necessary to close the spill case. 6/15/15 - Raphael Ketani. I was informed by an email dated 6/12/15 from Mr. Berninger that the excavation work was going to start on 6/15/15. So, today, I sent Mr. Berninger an email stating that the excavator operator should follow the soil contamination and dig out as much as is possible without damaging the sidewalk and the foundation of the building next door or creating unstable conditions for these structures. After this, I tried to contact Mr. Berninger by phone, but I could only reach his assistant, Justin Halpin. Mr. Halpin told me that the work had been postponed to tomorrow because of the rain last night. I told him to keep me posted. 6/17/15 - Raphael Ketani. Mr. Berninger (631) 589-6521/wberninger@wrses.com sent me the following email today: The oil/water separator have been located in the original area we advised however, the top of the tank is 8 feet down below grade. It is encased in concrete sides and bottom and I have advised them this

BRONX AUTO VENTURE (Continued) **S106009095**

concrete vault has to be removed for soil sampling on the sides and the bottom. I don t think they are going to like that much but it has to be done. How else will be able to determine the amount of contamination that is present and removal source materials which is remedial action. Again just providing an update. Second they stated to me they had plans which turns out to be nothing more than a drawing of this tank. I am awaiting authorization from them to look into and resolve the tank registration. Later, a conference call took place between Mr. Lee (347) 590-3900 , Mr. Mestousis, Mr. Berninger and myself regarding how to proceed regarding the remediation of the spill. Mr. Mestousis did most of the talking. According to him, the tank was 5,000 gallons in capacity. The top of the tank was about 5 or 6 feet bgs. The bottom was about 8 feet bgs. He said that they completely removed the UST and found a tar like sludge at the bottom of the vault. This sludge was collected. Then they tried to break up the vault and made cracks in the bottom. Groundwater started coming in. Mr. Mestousis said that they wanted to break up the vault completely, but it was massive. The walls at the top were 5 feet thick. He didn't know why this was. Mr. Berninger said that the massive amount of concrete poured to make the vault was because a lot of weight was needed to hold the UST down as it was sitting at least partly in groundwater. Mr. Mestousis suggested doing vacuum events to collect the oil and water. I told him to make vertical cuts in the vault walls all around in order to let the oil and water come in on its own. Mr. Mestousis said that this sounded like a good idea. Mr. Berninger told him to start the cuts at about 10 or 11 feet bgs because this is where the water table is and the oil is floating on the water table. This way, he will get both the oil and water. Otherwise, if the cuts are too low, he will get only water. Mr. Berninger said that they will make vertical holes in each vault wall. With this, the conversation ended. 6/19/15 - Raphael Ketani. Today I received the following email update from Mr. Berninger: Just a little update since our conference call. We have assisted in getting 3 to 4 holes through the concrete walls which are just about 4 feet thick. Both oil and water are running into the vault. We are not on-site today, but work continues with a man installing additional holes on three sides of the vault. They are also trying to find longer mason bits 4 to 5 feet long due to thickness. But it s working. Peter has a guy to remove the oily water and I instructed him we need those disposal receipts. We will be going back Monday morning to confirm the progress of additional holes, product thickness in wells and what if any additional work is required to get as much of this oil off the groundwater. 6/22/15 - Raphael Ketani. The subject of the ownership of the former Bronx Auto Venture site came up today. For the record and as per the property database ACRIS, Drake Avenue Realty sold the property to Point H Realty Corp. (411 Bryant Avenue, Bronx, 10474). The date of the deed is 8/20/14. 6/23/15 - Raphael Ketani. Today I received the following email from Mr. Berninger: Some good news is yesterday during our site visit we checked the monitoring wells that had Free phase product and they no longer have any product. Our recommendation to Peter the Owner is allow this to continue using this tank vault to recover the petroleum. I am also continuing to work on resolving the oil/water separator with Leszek sending him drawing of the unit so he can determine if it is to be registered and a fee. 6/24/15 - Raphael Ketani. Mr. Berninger sent Mr. Zielinski the plans for the oil water separator. After reviewing the plans, Mr. Zielinski responded to Mr. Berninger's inquiry regarding whether the

BRONX AUTO VENTURE (Continued) **S106009095**

oil water separator had to be registered with the DEC. Mr. Zielinski stated that the oil water separator did not need to be registered, but the 3000 gal. tank must be registered. 6/29/15 - Raphael Ketani. Justin Halperin (631) 589-6521, Mr. Berninger's assistant, called me today. He said that Mr. Lee (the attorney for Point H Realty) had called wanting to know how things are to proceed now that the tank is out. I told Mr. Halperin that the vault should be left open and that the oil floating on the water in the vault should be collected. I added that this should take place as many times as necessary in order to collect all of the oil. Mr. Halperin said that this sounded good. I told him that if the vault is filled, then it will be very difficult to collect the oil from the wells. Once the oil is completely collected, then the vault can be filled in. I told Mr. Halperin that groundwater sampling should take place a month or two after the vault is filled in and to wait on groundwater sampling for now. Mr. Halperin said that this was fine and he will just leave the vault open and collect the oil. With this, the conversation ended. 7/1/15 - Raphael Ketani. Mr. Lee (347) 590-3900 sent me an email stating that Point H had been issued three tickets by Officer Carlos Saavedra of the NYC DOB (212) 393-2972. The tickets were issued on 6/25/15 as a result of his inspection of the site and finding that Point H did not have a DOB confirmation number for doing the tank removal work (they should have called (212) 393-2590) and because they did not have a protective fence separating the work site from the sidewalk (the vault is 80' long, 7' wide and 15' deep). Officer Saavedra issued a Full Stop Work Order. Mr. Lee wanted me to get the tickets cancelled. I spoke to Officer Saavedra and told him that the DEC had required the removal of the oil-water separator and the collection of the oil on the water table by allowing it to come into the empty vault. I added that the vault needed to be left open so that the oil could continue to be collected. Otherwise, it may run under someone else's property. Officer Saavedra stated that he had no objection to the continued collection of the oil. However, he had to issue the violations because, as he stated, anyone could have walked through the unprotected side of the property from the sidewalk and could have fallen into the vault. Officer Saavedra stated that he understood what I was saying, but that he will not excuse the tickets and someone will have to appear in court. He added that he will send me pictures of the site so that I can see what the situation looks like. I relayed the information to Mr. Lee through an email. I told him that if someone puts up a fence and goes to court with pictures of the new fence, then, maybe, the tickets will be cancelled or the fines will be reduced. 7/8/15 - Raphael Ketani. Mr. Berninger [(631) 589-6521/wberninger@wrses.com] sent me the following email this morning: This Monday we were again on-site to do quarterly sampling and testing now that the wells don t have any more floating product. During that visit we noticed the excavation has been back filled and were never notified. We have no idea if oil or even water was continuing to come into the vault although my guys did inform me it all slowed down.This morning I am sending James Lee an e-mail asking about the back filling, where are all the picture Peter Stated he had, the disposal receipts for the oil and water etc. Following the receipt of this email, I sent Mr. Lee (347) 590-3900 an email stating that the Department was very concerned that the fill was placed while oil was still floating on the water. Thus, there is now contaminated fill in the vault. I also stated that the Department was now requiring the installation of wells for monitoring and collecting the

BRONX AUTO VENTURE (Continued) **S106009095**

oil. I added that if it is not done, then the Department may take legal action. 7/9/15 - Raphael Ketani. I received an email from Mr. Berninger today. In his email, he stated that he had received a call from Mr. Lee. Mr. Lee explained that they had backfilled the vault. Mr. Berninger explained that they (Mr. Lee and Point H) thought they had to because that was what the DOB wanted. According to Mr. Berninger, this was despite my previous email to Mr. Lee stating that I had talked to the DOB officer and he had said that oil collection could still continue with the open vault. Mr. Berninger added that they told him additional holes were made in the vault walls in order to make sure that there was no more oil underground. They claimed that only water entered the vault. Mr. Lee told Mr. Berninger that they had installed a well in the vault in order to check on the presence of any oil. However, he told him that it was a solid piece of 6 inch PVC piping. Mr. Berninger will check the pipe and see whether he can install a 4 inch well inside. Also, the bottom of the vault had been filled with concrete. Lastly, Mr. Berninger stated that groundwater samples were collected from the wells outside the vault on Monday, June 6th. Later, Mr. Berninger sent me another email stating that he had been sent one receipt for total liquids collection from the vault. He is expecting more receipts and will send them to me. 7/10/15 - Raphael Ketani. Mr. Berninger [(631) 589-6521/wberninger@wrses.com] sent me an email today. In his email, he explained that he had one of his assistants visit the site and check on the well in the backfilled vault. Mr. Berninger said that it had been filled with soil to within 3 feet of the ground surface. So, it wasn't a viable well. Mr. Berninger suggested installing a 2 inch well inside the PVC riser to the bottom of the vault. I told him by email that this sounded like a good idea and to do it. 7/14/15 - Raphael Ketani. Mr. Berninger sent me an email today. He stated that his workers reported to him that the well that was supposedly installed in the former tank vault IS NOT IN THE VAULT. It is an existing well located outside the vault and is full of backfill. I sent an email to Mr. Lee (jameslee416@yahoo.com) informing him that the DEC was requiring that this well be redrilled/replaced, along with installing a well in the vault. If his client doesn't want to do this, I added, then the DEC will reinstall the well and install the vault well. After this, I wrote, the Office of the Attorney General will be notified and they will sue Point H for backpayment. 7/28/15 - Raphael Ketani. Mr. Berninger sent me an email stating that Point H Realty has failed to send him a check for the work that had been conducted by WRS Environmental Services. As such all consulting work at the site has stopped. Neither has Mr. Berninger received transportation receipts for the oil and water which was allegedly collected before the vault was filled in. This has been the situation for over two weeks. I responded by email to Mr. Berninger and stated that if he does not receive his check in 2 or so weeks, then he should let me know. At that point, I wrote, the DEC will send Point H Realty a Stipulaton Agreement. 8/3/15 - Raphael Ketani. Rachel Ataman from Hydro Tech (631) 462-5866 (rataman@htecorp.info) called today. She said that Hydro Tech is taking over the remediation of the site from Mr. Berninger. She will send the DEC a map showing where they will install monitoring wells. I told her a short version of the remediation history for the site. Also, I informed her that the Department never received any disposal tickets for liquids removed from the site. So we don't know whether the oil floating on the water table was ever collected. Ms. Ataman stated that she understood the

BRONX AUTO VENTURE (Continued) **S106009095**

situation. 8/4/15 - Raphael Ketani. Today I received a copy of a letter dated 7/31/15 that Mr. Lee had sent to Mr. Berninger. In the letter, Mr. Lee stated that he is canceling the services of WRS. 8/18/15 - Raphael Ketani. I received a call today from Erica Johnston of HydroTech (ejohnston@htecorp.info). She said that she is the new case manager for the project. Ms. Johnston asked for the latest report concerning the site. I sent it to her by email. She commented that they intend to submit a work plan to do a subsurface investigation. I told her that the Department only needs HydroTech to replace any damaged wells, replace the well in the filled vault, collect any oil in the vault wells and take two rounds of groundwater samples to begin with. Ms. Johnston said that she will relay this information to her supervisor, Ms. Ataman. 9/22/15 - Raphael Ketani. I reviewed the Hydro Tech Environmental Corp. Phase II Focused Subsurface Investigation Report dated 9/9/15. One soil boring, SP-1, was conducted to the south of the former oil water separator location and sampled to 16 feet bgs. It was made into a 1 inch diameter well and designated as MW-7. An attempt was made to gauge and sample the previous 6 on site wells on 8/21/15. MW-6 was filled with debris and not functional. MW-4 and MW-5 were found to have product. The product thicknesses were 0.03' and 0.05', respectively. The depth to water at MW-4 was determined to be 7.70'. The analyzed soil sample for SP-1 was taken from the 2' to 4' interval. The VOCs were entirely non-detect. The SVOC results were low in concentration and typical of historical fill. Groundwater samples were taken only from MW-1 to MW-3 and MW-7. The VOC results were mostly non-detect with hits for MTBE up to 88 ppb. The sample from MW-7 had 39 ppb benzene, 35 ppb ethylbenzene, 41 ppb toluene and 73 ppb total xylenes. The SVOC results were almost entirely non-detect and those results that were present were indicative of historical fill. I approved the report and the recommendation to perform VEFR events at MW-4 and MW-5. I also requested the submission of monthly monitoring reports containing product thickness data, groundwater elevation data, the amount in gallons of product collected during that month for each well and cumulative collection amounts for each well. I also added that each report must have a groundwater flow map. 1/14/16 - Raphael Ketani. As there have been no communications nor submissions from Mr. Lee or Ms. Johnston in at least 3 months, I sent an email to Mr. Lee and Ms. Johnston stating that unless the VEFR reports were received by January 29, 2016, legal action and fines can and may be instituted by the Department. 1/20/16 - Raphael Ketani. I spoke to Ms. Johnston (631) 462-5866 (ejohnston@htecorp.info) today regarding progress at the site. She said that Hydro Tech was at the site on 1/18/16 in order to gauge the wells and collect product, but she discovered that the owner had hand bailed the wells with product and had put the liquid into 2 drums. Each drum was about three quarters full. I asked Ms. Johnston how much oil was collected in total. She said that she didn't know. I told her that she should bring an interface meter with her the next time that she goes to the site and determine the total amount of product collected. She said that she will do this. I added that the DEC needs to have a record of the volume of product collected in order to see whether this work should continue and whether remediation is nearing completion. Ms. Johnston said that the DEC will get manifests showing the amount of product in the drums. She asked whether the DEC wanted Hydro Tech to do groundwater collecting for analysis. I told her that the next sampling can take place during early spring, but the DEC would like monthly monitoring

BRONX AUTO VENTURE (Continued) **S106009095**

and gauging. She said that she will do this. 2/5/16 - Raphael Ketani. I contacted Ms. Johnston and asked her when the next gauging event will take place and when the DEC will receive a report. Ms. Johnston stated that Hydro Tech did not have a contract right now and so she will need to speak with her supervisor, Rachel Ataman, to see what they can do about the gauging and product collection. 2/9/16 - Raphael Ketani. I received an email from Ms. Johnston (631) 462-5866 (ejohnston@hydrotechenvironmental.com) today. She stated that Mr. Lee said he will be contracting Hydro Tech for future work. Hydro Tech's plan is to go the site this month to monitor. Groundwater samples will be collected during March. Once there, they will also determine the amount of product in the drums so they can have an idea regarding how much product was removed from the Site. Ms. Johnston will prepare a monitoring/sampling letter report and submit it during March. I wrote back that this would be fine. 3/4/16 - Raphael Ketani. Ms. Johnston sent me the gauging summary tables for January and February 2016. MW-6 had been destroyed and was not replaced. Product was not seen in the other 6 wells. However, the amount of product was gauged in two 55 gallon drums. One drum didn't have product and the other had 0.5 inches of product. The depth to groundwater varied from 9.30 feet to 6.61 feet during January and from 8.70 feet to 6.00 feet during February. Ms. Johnston wrote that she will return to the site in two weeks in order to monitor and sample the wells. After this, a formal report will be prepared and submitted to the DEC. 5/26/16 - Raphael Ketani. As there have been no report submissions nor any updates from HydroTech or Mr. Lee in over 2 months regarding remedial work at the site, I sent them an email threatening possible fines and legal action if the required reports or an update are not received by June 1, 2016. 5/27/16 - Raphael Ketani. Mr. Lee (347) 590-3900 sent me the Hydro Tech 4/29/16 Quarterly Sampling Report for the period January to March 2016. Groundwater monitoring took place on 1/16/16, 2/25/16 and 3/16/16. On 1/16/16, groundwater was from 6' to 9.3' below grade. MW-4 (20 feet southwest and downgradient of the former waste oil UST location) had 0.05' of product on 3/16/16. Groundwater was sampled on 3/16/16 at MW-1 to 3, 5 and 7. The analytical results for the samples from MW-1 and MW-2 were essentially non-detect for the VOCs and the SVOCs. The samples from MW-3 and MW-7 were almost entirely non-detect for VOCs, except for 10 ppb and 3.4 ppb of benzene, respectively, some hits below the TOGS 1.1.1 standards and some low exceedences of the TOGS standards. The SVOC results for these 2 samples were almost entirely non-detect. MW-5 (15 feet to the west of the former waste oil UST location) had 120 ppb of benzene, 12 low hits and 5 low to moderate exceedences of the TOGS standards to 58 ppb. The SVOC results were all non-detect except for a low naphthalene exceedence. As per his request in his email today, I called Mr. Lee to discuss the latest analytical results and the presence of oil in MW-4. I told him that Hydro Tech should continue to collect the oil as they find it from monitoring event to monitoring event. I also told him that the his benzene concentration of 120 ppb was problematic. I added that the benzene concentration had to drop significantly before DEC could close the spill case. I told Mr. Lee that Hydro Tech and Point H should still aim for the TOGS 1.1.1 standards. Mr. Lee asked why they must do this when they will build only a warehouse on the site and the Bronx Market area is already contaminated. I told him that remediation projects must always try to reduce the contaminant concentrations to those that are protective of the groundwater - it doesn't matter what you are going

BRONX AUTO VENTURE (Continued) **S106009095**

to build on the property. Mr. Lee stated that he understood. He also asked whether I could see that the contaminant concentrations are reducing. I told him that I cannot. I added that Hydro Tech needs to put together historical groundwater analyte concentration tables and historical product thickness tables so that I can see any falling trends. I told him that this would be very helpful and that these tables can be sent before the next monitoring event. Mr. Lee stated that he will have Hydro Tech do this. With that, the conversation ended. Later, I sent Mr. Lee an email stating that the Department would like to receive the historical groundwater analyte concentration and oil thickness tables. 6/24/16 - Raphael Ketani. Adam Nasiatka of Hydro Tech Environmental [ANasiatka@hydrotechenvironmental.com/(631) 462-5866] sent me the historical product thickness table for MW-4 and MW-5 as requested. I reviewed the table and noted the decreasing thickness trends for both wells. On 3/16/16, MW-4 had 0.05 feet of product and MW-5 did not have product. 6/29/16 - Raphael Ketani. Mr. Lee called me today regarding the product thickness in MW-4. [He had called via phone number (347) 590-3899, Alternative Energy] He asked whether the case could be closed given the lack of product in the other wells and only 0.05 feet of product in MW-4. I told him that 0.05 feet of product may sound like very little, but all of the product should be removed. He asked whether a long term trend of decreasing product thickness in MW-4 would be sufficient to close the spill case. I told him that if the product thickness decreases to 0.04 feet, then this WOULD NOT be a sufficient reduction for closure. I added that the DEC needed enough data to show a long term trend. I told Mr. Lee that he needed to contact Hydro Tech and have them figure out a way to reduce the amount of product in the subsurface. He said he will do this. With that, the conversation ended. 8/23/16 - Raphael Ketani. Ms. Johnston (631) 462-5866 (ejohnston@htecorp.info) sent me the Hydro Tech 8/16/16 Hydro Tech July 2016 Monthly Status Report as an attachment to her email dated 8/22/16. Groundwater monitoring took place on 7/5/16, 7/13/16, 7/19/16 and 7/26/16 at wells MW-4 and MW-5. Product and contaminated groundwater were removed by VEFRing. A sheen was seen in the wells on 7/5/16 and a total of 3 gallons of liquid was removed. On 7/13/16, product was encountered in both wells. Product thickness ranged from 0.10 feet in MW-4 to 0.20 feet in MW-5. A total of 3 gallons of liquid was removed during this event. On 7/19/16, no product was seen in the wells. On 7/26/16, product was encountered in both wells. MW-4 had 0.02 feet of product and MW-5 had 0.01 feet of product. A total of 3 gallons of liquid was removed from the wells. In her email, Ms. Johnston stated that the owner is anxious to develop the site and wishes to close out the spill ASAP. I spoke to Ms. Johnston by phone today regarding what type of property development Point H is planning on. She stated that Point H had not spoken to her regarding what type of facility or structure they had planned for the site. I told her that the Department wanted to know whether the development would be slab on grade or whether they will dig out the former junk yard. I added that if they intend to drive piles, then this will loose up the soil and free up product that is trapped. Then, there will be thicker product in the wells and they will be back to square one. Ms. Johnston said she understood and stated that she will find out for me. Mr. Lee (347) 590-3900 and Peter Mestousis called me in the afternoon regarding the development of the site. They explained that a 1 story warehouse will be built slab on grade on the site. Mr. Mestousis stated that there was a

BRONX AUTO VENTURE (Continued) **S106009095**

height restriction in the Hunters Point commercial/industrial area such that only 1 story buildings could be built. I asked Mr. Mestousis what happened to the natural gas powered vehicle refueling facility that had been planned. He said that this project had fallen through. So there will be just a warehouse. Mr. Lee stated that there had been an agreement with the DEC that if the product thicknesses showed a downward trend, then the spill case would be closed. I told Mr. Lee that there wasn't a trend and that the thicknesses seemed to be going up and down for some time now. I added that the DEC will have to look at the groundwater analyte concentrations in the case file and the recorded product thicknesses in order to see whether the spill case can be closed. I also stated that the analyte concentrations from past results were not too high for closure. However, staff at the Department will need to discuss this case and come to a decision as to whether all the subsurface site conditions allow for the spill case to be closed. Mr. Lee reminded me that the source of the contamination had been removed. I told him that I remembered that the oil-water separator holding tank had been removed. I told both of them that I will let them know the Department's decision by, the very latest, the close of business today. Mr. Lee and Mr. Mestousis said that this was acceptable. With that, the phone call ended. I reviewed the case file today. The information contained in the file indicated that: 1) the latest groundwater analyses demonstrated the presence of low concentrations of individual VOC contaminants 2) the main source of the contamination (the oil-water separator holding tank) had been removed 3) the thicknesses of the product in wells MW-4 and MW-5 during 2016 has generally varied from not present to about 0.05 4) the site was located in a commercial/industrial area where surface and subsurface conditions are not clean and junk yards are present upgradient 5) the future development of the site would be as a warehouse 6) there were no sensitive receptors. Given all of the above, I determined that any residual contamination was not a threat to the public or the environment. Therefore, I closed the spill case effective 8/23/16. 8/24/16 - Raphael Ketani. I sent a Spill Closure Letter to Mr. Mestousis at Point H Realty Corp."

Remarks: "AUTOMOTIME WASTE FLUIDS BEING DISCHARGED FROM UNDER CAR CRUSHER. mATERIAL IS MIGRATING OFF-SITE @DRAKE STREET. dURING AND AFTER RAIN EVENTS STORMWATER CONTAMINATED WITH WASTE FLUIDS IS BEING DISCHARGED TO DIRECTLY ONTO DRAKE STREET."

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"Fuel oil truck parked on a property was vandilized and lost several hundred gallons onto cement, soil & into sewers. Ryan Piper responded to the site. 1/18/06- DEC Piper performed site visit w/ DEC PAtel. DEC Piper spoke w/ Greg Torres. (manager)of Salem Truck. As per conversation, during morning inspection of yard, diesel was observed in yard. He traced it to a Northatlantic energy tanker which has been sitting idle for approx 5-6 months. Due to open valve, diesel was leaking. Worker in yard closed valve and spill was stopped. As per inspection approx 250 gallons of Diesel released to surface. Surface consisted of concrete and soil patches. Due to heavy rains, large ponds of oil/water on property. Oil traveled north on property along east side. Weep holes existed on cement wall where some oil discharged to the sewer. DEP notified. (Keith Williams to respond. USCG (Steve Lucarino- 718.354.4121 or cell 917. 597 6423.) arrived on site and along w/ DEC performed SCAT activies along shoreline to ensure that there was no discharge to the river. No petroleum was identified by DEC and USCG. USCG requested call back if oil was observed entering river. DEC Piper met w/ Royal Envioronmental (Marc Tschantre) to discuss cleanup. Surface spill will be cleaned up

CON EDISON (Continued) **S107522080**

today. Removal of contaminated soil to be completed under fair weather conditions. 1/19/06- DEC Piper mailed CSL to Northatlantic. Royal Env. will notify DEC of date of excavation work to inspect. 1/25/06- DEC Piper performed inspection of excavation. Due to a dead battery, the tanker that had leaked was not able to be moved. Royal Env. dug test pit to the north side of the tanker. Saturated soil was observed ~18 bgs. Since the truck was unable to be moved, RToyal scratched the surface of all loose contaminated roadway. Asphalt was present beneath loose surface. Petro rep and owner of property on site. Due to larger amounts of soil needed to be excavated, Royal Env. will return Friday, Jan 27th. to remove additional soils. 3/13/06- DEC Piper placed call into Royal Env., to get update. Last visit revealed soil pile in back left of lot. Needs to be removed. 6/28/06- DEC Piper drove by site., contamianted soil pile was removed though DEPT has NOT received disposal manifest as of today. Spill has been cleaned up. CLosed. E-doc disposal manifest when received. 6/29/06- DEC Piper received documentation of cleanup. CLosed."

Remarks: "loks like someone either tried to steal or just plain vandilize: about 300 gallons could be..."

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
AIR SYNTHETIC MINOR
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was SANGESLAND 11/6/2000 Sangesland made a site visit. Sunny day and a walk of the perimeter (sidewalk) showed no sign of major spillage (area is an industrial zone with many junk yards around). Met with John Chiapperino Manager of A&M Auto Wrecking. A&M Auto Wreckers 1360 Randall Ave. Bronx, NY 10474 A&M was given a written order to provide the following in 30 days: 1)Provide a copy of the NYSDEC PBS certificate for a buried underground waste oil storage tank. Manager says he has one, a call to PBS showed nothing in the computer. Sangesland mailed a blank copy of the PBS form to Carman at A&M. 2)Provide a copy of the DEP approved rainwater runoff/separator system documentation. Manager says a separator system was installed in approx 1990 to handle rain water runoff and direct it to the city sewers. 11/16/2000 Mr. Chiapperino submitted a package of information on this site. 1) A PBS application for a buried 3200 gal Waste Oil Tank. 2) Drawings and specifications for a McTighe Industries Model OWS-8000-Single Wall Parallel Corrugated Plate Oil Water Separator. Copies of bills indicate this separator was installed in Oct 1991. Drawings show 3 Storm water storage wells on the paved yard which are piped into the buried separator. From the separator, water is transfered under the office building into the existing city sewer connection. Spill Closed 11/16/2000"
Remarks:	"CALLER STATES THAT THE OWNER IS LETTING THE ABOVE MATERIAL FLOW ONTO THE STREET AND DOWN INTO A SEWER.HE ALSO STATES THE MATERIAL IS CAUSING DAMAGE TO THE BLACKTOP.COMPLAINT STATES THE BUSINESS HAS NO SEPERATORS FOR THE MATERIAL."

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Tank Info:

Tank Number:	001
Tank Id:	26879
Material Code:	0001
Common Name of Substance:	#2 Fuel Oil (On-Site Consumption)

Equipment Records:

I04 - Overfill - Product Level Gauge (A/G)
A00 - Tank Internal Protection - None
D01 - Pipe Type - Steel/Carbon Steel/Iron
B00 - Tank External Protection - None
H00 - Tank Leak Detection - None
L09 - Piping Leak Detection - Exempt Suction Piping
C00 - Pipe Location - No Piping
F00 - Pipe External Protection - None
G00 - Tank Secondary Containment - None
J02 - Dispenser - Suction Dispenser

Tank Location:	Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Tank Converted to Non-Regulated Use
Pipe Model:	Not reported
Install Date:	12/01/1973
Capacity Gallons:	3000
Tightness Test Method:	NN

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"10/13/04 TJD Site was target of inspection during a joint DLE/NYPD MARCh detail. Yard was found to have an unregistered 275 gallon UST containing unknown product and surface spills in yard. Demeo directed operator to empty UST and clean surface spillage. Action representatives contacted and requested a reinspect as tank was removed and surface spills cleaned. On 10/18, reinspection perfomed, UST was removed and excavation was clean. Liquid petroleum was removed from the area of previous surface spills but area still not completely clean. Action representatives were directed to scrape the area to concrete. 11/2/04 TJD Final inspection. Housekeeping was addressed. Areas with previous surface spillage were scraped to concrete. No further action required. Spill closed. "

Click Here:

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

LARAS TRUCK (Continued) **1001119270**

corrective action activities required under RCRA.
