Updated By: WYZHENG
Site Code: 443691
Site Description: "Location: The site is approximate 1.8 acres, located at 285 East 138th Street in the Bronx. The Site is bordered on the west by the 3rd Avenues, to the north by East 139th St., to the east by residential buildings and the NYC Police Department 40th Precinct, and to the south by East 138th St. Properties surrounding the site are primarily residential, with some commercial and industrial uses. Site Features: The Site is currently occupied by a 7-story residential building, a 12-story building with commercial space on the first floor, and a 8-story residential building. These buildings are home for low-income senior citizens. Historical Uses: Former uses on the Site include a gasoline filling station with five 550-gallon underground storage tanks (USTs), which has operated on the southwest corner of the property for at least 40 years prior to 1968. A parking garage and auto repair facility with 2 USTs occupied the north-central part of the site from at least 1935 through 1978. A metal work shop was located on the southeast portion of the site from 1951 through 1978, and a mattress manufacturing factory was located on the northwest part of the site from 1944 through 1978. Geology and Hydrogeology: The 2011 remedial investigation (RI), revealed soils consisting mainly of clayey sands to silt mixtures in the 20-25 feet bg drilled borings. Refusal was encountered in one of the soil borings (SB-01) at 20 feet below ground surface (bgs). All other borings were completed to 25 feet bgs without encountering bedrock. On-Site groundwater levels measured over the course of the RI project confirm the depth to groundwater to be in the range of approximately 13 to 17 feet bgs with flow toward the southwest. "
Env Problem: "Nature and Extent of Contamination: Prior to Remediation - Based on the investigations conducted to date, known contaminants including chlorinated solvents, semi-volatile organic compounds (SVOCs), metals, pesticides and other volatile organic compounds (VOCs) were present in the subsurface. These contaminants are impacting soil, groundwater, and soil vapor. Previous investigations included a Phase I Environmental Site Assessment and a Remedial Investigation. Soil - The concentrations of metals (barium, copper, mercury, lead and zinc), 4,4 -DDT, toluene, ethylbenzene and PAHs exceeded the UUSCOs in the samples collected from 0 to 10 feet in four borings installed

BORINQUEN COURT (Continued) **S116041516**

across the Site (SB-04, SB-08 and SB-09). The concentrations of 4,4 -DDE, 4,4 -DDT, lead and PAHs exceeded UUSCOs in the 10-20 foot interval in only three borings (SB-04, SB-06 and SB-10). Ethylbenzene ranged from 0 to 1.4 ppm (restricted residential SCO of 41 ppm, Groundwater Protection SCO of 1 ppm) and toluene ranged from 0 to 1.1 ppm (restricted residential SCO of 100 ppm). Groundwater - VOCs detected in groundwater samples collected were tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cis-DCE), ethylbenzene, meta- (m)/para- (p) xylene and isopropylbenzene. PCE ranged from 0 to 19 ppb, TCE ranged from 0 to 25 ppb, cis-1,2-DCE ranged from 22 to 43 ppb, m/p-xylenes ranged from 0 to 19 ppb, and propylbenzene ranged from 0 to 11 ppb. Soil Vapor - PCE was detected in three out of the four soil vapor samples and TCE was detected in only one sample at 2 ug/ m3. PCE ranged from 0 to 75 ug/ m3. Based on this data, soil vapor intrusion into on-site buildings is not occurring and no mitigation was necessary. Post-Remediation - Remediation at the site is complete. Residual contamination in soil and groundwater is being managed under a Site Management Plan. Residual contamination in the soil, groundwater, and sediment is being managed under a Site Management Plan. The Certificate of Completion was issued on December 19, 2013."

Health Problem: "Measures are in place to control the potential for coming in contact with subsurface soil and groundwater remaining on the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination."

City,State,Zip:	BRONX, NY 10454
Site Code:	410705
HW Code:	C203047
Control Code:	15
Control Type:	ENG
Date Record Added:	06/25/2012
Date Rec Updated:	06/06/2024
Updated By:	STROBERT
Site Description:	"LOCATION: The site is located in an urban industrialized section of the south Bronx at the intersection of 3rd Avenue and the Major Deegan Expressway (I-87) between 135th Street and 136th Street. It is located approximately 1000 feet east of the Harlem River. The property consists of Section 9, Block 2320, Lot 11 of tax map 20902, and is 0.214 acres in size. SITE FEATURES: Prior to remediation, the site was vacant with remnants of paved areas remaining from a former gasoline station. Currently the site is a four-story hotel. CURRENT ZONING AND LAND USE(S): The site is zoned commercial. As noted above, a hotel has been constructed. PAST USE OF THE SITE: The site was a gasoline filling station from the 1950 s until approximately 1989. Releases of petroleum products to the environment resulted in the site contamination. SITE GEOLOGY AND HYDROGEOLOGY: The site is approximately 15 feet above mean sea level. The nearest surface water body is the Harlem River, approximately 1000 west of the site. Groundwater was encountered from 7 to 10 feet below ground surface and was found to flow in a south-southwesterly direction towards the Harlem River. "
Env Problem:	"Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were petroleum-related compounds in site soils and groundwater. Remedial actions have successfully achieved the protection of groundwater soil cleanup objectives which are more than sufficient for the site s commercial use. Quarterly groundwater monitoring conducted thus far suggests that contaminated soil removal as well as groundwater treatment via in-situ chemical oxidation (ISCO) and enhanced fluid recovery (EFR) have had a positive effect towards achieving the groundwater remedial goals, and if continued, will be effective in achieving the remedial goals over time. Water quality parameters measured in the field during the monitoring events [dissolved oxygen (DO), oxidation reduction potential (ORP), and pH] are indicative of sustained desorption and oxidation, suggesting that additional ISCO and/or EFR events would be effective in further reducing residual groundwater contaminant levels. Based on these conditions, ISCO and EFR treatments will be continued as necessary during post- remedial site management. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."
Health Problem:	"Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. "

Updated By: STROBERT
Site Code: 410705
Site Description: "LOCATION: The site is located in an urban industrialized section of the south Bronx at the intersection of 3rd Avenue and the Major Deegan Expressway (I-87) between 135th Street and 136th Street. It is located approximately 1000 feet east of the Harlem River. The property consists of Section 9, Block 2320, Lot 11 of tax map 20902, and is 0.214 acres in size. SITE FEATURES: Prior to remediation, the site was vacant with remnants of paved areas remaining from a former gasoline station. Currently the site is a four-story hotel. CURRENT ZONING AND LAND USE(S): The site is zoned commercial. As noted above, a hotel has been constructed. PAST USE OF THE SITE: The site was a gasoline filling station from the 1950 s until approximately 1989. Releases of petroleum products to the environment resulted in the site contamination. SITE GEOLOGY AND HYDROGEOLOGY: The site is approximately 15 feet above mean sea level. The nearest surface water body is the Harlem River, approximately 1000 west of the site.

2477 THIRD AVENUE PROPERTY (Continued) **S109580082**

Groundwater was encountered from 7 to 10 feet below ground surface and was found to flow in a south-southwesterly direction towards the Harlem River. "

Env Problem: "Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were petroleum-related compounds in site soils and groundwater. Remedial actions have successfully achieved the protection of groundwater soil cleanup objectives which are more than sufficient for the site s commercial use. Quarterly groundwater monitoring conducted thus far suggests that contaminated soil removal as well as groundwater treatment via in-situ chemical oxidation (ISCO) and enhanced fluid recovery (EFR) have had a positive effect towards achieving the groundwater remedial goals, and if continued, will be effective in achieving the remedial goals over time. Water quality parameters measured in the field during the monitoring events [dissolved oxygen (DO), oxidation reduction potential (ORP), and pH] are indicative of sustained desorption and oxidation, suggesting that additional ISCO and/or EFR events would be effective in further reducing residual groundwater contaminant levels. Based on these conditions, ISCO and EFR treatments will be continued as necessary during post- remedial site management. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. "

Dt rec updated:	06/06/2024
Updated By:	STROBERT
Site Code:	410705
Site Description:	"LOCATION: The site is located in an urban industrialized section of the south Bronx at the intersection of 3rd Avenue and the Major Deegan Expressway (I-87) between 135th Street and 136th Street. It is located approximately 1000 feet east of the Harlem River. The property consists of Section 9, Block 2320, Lot 11 of tax map 20902, and is 0.214 acres in size. SITE FEATURES: Prior to remediation, the site was vacant with remnants of paved areas remaining from a former gasoline station. Currently the site is a four-story hotel. CURRENT ZONING AND LAND USE(S): The site is zoned commercial. As noted above, a hotel has been constructed. PAST USE OF THE SITE: The site was a gasoline filling station from the 1950 s until approximately 1989. Releases of petroleum products to the environment resulted in the site contamination. SITE GEOLOGY AND HYDROGEOLOGY: The site is approximately 15 feet above mean sea level. The nearest surface water body is the Harlem River, approximately 1000 west of the site. Groundwater was encountered from 7 to 10 feet below ground surface and was found to flow in a south-southwesterly direction towards the Harlem River. "
Env Problem:	"Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were petroleum-related compounds in site soils and groundwater. Remedial actions have successfully achieved the protection of groundwater soil cleanup objectives which are more than sufficient for the site s commercial use. Quarterly groundwater monitoring conducted thus far suggests that contaminated soil removal as well as groundwater treatment via in-situ chemical oxidation (ISCO) and enhanced fluid recovery (EFR) have had a positive effect towards achieving the groundwater remedial goals, and if continued, will be effective in achieving the remedial goals over time. Water quality parameters measured in the field during the monitoring events [dissolved oxygen (DO), oxidation reduction potential (ORP), and pH] are indicative of sustained desorption and oxidation, suggesting that additional ISCO and/or EFR events would be effective in further reducing residual groundwater contaminant levels. Based on these conditions, ISCO and EFR treatments will be continued as necessary during post- remedial site management. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."
Health Problem:	"Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. "

DEC Memo:	9/26/12 TJD File review. NYCDOS (Al Mignone) has provided required documentation in support of spill closure relating to reported tank test failure. System failed initial system test (Dry as a Bone)on 7/17/12 - reported as a dry leak. Tank alone was retested on 7/23/12 and passed. Failure determined to be associated with a failed vent pipe which was replaced 9/11/12 by Windmill Tank Service. Additionally threads on interstial space access bung on tank top were also determined to be contributing to an air leak and were repaired by maufacturer (Highland Tank) on 9/11/12. Following repairs entire tank system was retested by AARCO on 9/13/12 and passed. No further action is required. Spill closed.

DEC Memo:	DEMEO needs to send a TTF letter to Sanitation) 8/9/12-Vought-Notes above by DEC Sangesland. Vought primary off-hours responder. Vought noted PBS #2-455660 for site also listed as 125 East 149th Street. As primary off-hours responder, Vought called TJ O'Connor (Dry As A Bone Ph:516-678-5115) to see if failure was wet or dry leak and left message on voicemail to return call as soon as possible. Vought called Al Mignone (Ph:646-235-3183) for more information and left message to return call. Vought called PBS contact: NYC Dept. of Sanitation 125 Worth Street Room 823B New York, NY 10013 Attn: M. Bonacorsa Ph:(646)885-4874 Fax:(212)442-8624 or (212)442-8625 Bonacorsa retired from NYCDOS as per receptionist and letter should be sent to Mr. Chingas. Vought sent out TTF letter to above address and faxed letter as well. Vought sent out letter to NYCDOS Chingas and added copy to e-docs and left Demeo copy as well. 9/18/12 TJD File review. NYSDOS (Al Mignone) has provided copies of initial failing tank test report performed on 8/8/12 (Dry as a Bone) and a

NYCDOS TANK TEST FAILURE (Continued) **S112148870**

subsequent passing tank test report performed on 8/13/12 (AARCO). Initial failed test was reported as a dry leak. NYCDOS reports no repairs were made to system and was retested by another contractor and passed. Testing reports and e-mail correspondence have been uploaded to E-DOCS. No further action is required.

SHWS:

Name:	2350 FIFTH AVE., NEW YORK (AKA, PS 141)
Address:	2340 & 2350 FIFTH AVENUE
City,State,Zip:	NEW YORK, NY 10037
Program:	HW
Site Code:	57691
Classification:	Site is properly closed - requires continued management.
Region:	2
Acres:	1.543
HW Code:	231004
Record Add:	11/18/1999
Record Upd:	02/14/2023
Updated By:	AAOBLIGA
Site Description:	"Location: The site is located on the west side of Fifth Avenue between 141st Street and 142nd Street in the borough of Manhattan, City and State of New York. Site Features: The site is approximately 1.54 acres, and is entirely occupied by a building. The building is comprised of three connected sections: a two-story section along Fifth Avenue, a three-story section in the center, and a one-story section to the west. Surrounding the site are high-rise residential buildings to the west, south, and southeast of the site. The Harlem River Drive is to the east/northeast, and a National Guard Armory occupies the block immediately to the north. Current Zoning/Use: The site is owned by 2350 Fifth Avenue Corporation. It is zoned for light manufacturing (M1-1). The Harlem River is located approximately 200 to 300 feet east of the site. Following completion of remediation, the site is currently occupied by a self-storage facility and a charter school. Past Use of the Site: Based on historical Sanborn

2350 FIFTH AVENUE CORP (Continued) **1000108749**

fire insurance maps, the site and the surrounding area were in the process of being filled in between 1860 and 1893, and as of 1909 it was mostly vacant or occupied by a contractor s yard. The existing building was originally constructed as a Borden Company ice cream factory: the three-story section in 1923; the two-story section in 1932; and the one-story section in 1950. The floor slab in the one-story (western) section included layers of insulating materials for refrigeration. The area surrounding the site was mostly occupied by garages, auto repair shops, and light manufacturing in the 1930s through the 1950s, with the exception of the block directly north of the site, where the Fifth Avenue Armory was constructed between 1921 and 1933. The residential development, which occupies the area to the south and west of the site, was constructed between 1957 and 1959. From 1970 to 1994 the site was occupied by an industrial laundry and dry cleaning operation which utilized tetrachloroethylene (PCE or perc) as a cleaning solvent. The dry cleaning operation utilized both first-generation and second-generation dry-cleaning machines. The majority of PCE released was associated with the first generation machine use, which involved more handling of PCE than the later machines. The dry cleaning facility operated as registered hazardous waste handler with U.S. Environmental Protection Agency (EPA), ID number NYD071026173. Between 1995 and 1996, most of the ground floor of the building, with the exception of the far western portion, was renovated for use as a New York City public school. The central and eastern portions of the building were occupied by P.S. 141 for a period in the fall of 1997, and were later used by a church for services, offices, and classes. The church vacated the building in December 2004. The remainder of the central and western portion of the building was renovated in 2001 for use as a self storage facility, and in 2006 the self storage facility expanded into the former school portion of the building. Currently the site is use for self storage facility and for art studio space. Site Geology and Hydrogeology: Groundwater in the vicinity of the site is divided into two apparently semi-confined aquifers. The presence of a clay layer acts as an aquitard/aquiclude separating the aquifer into a shallow aquifer above the clay and deeper aquifer below the clay. The groundwater surface in the shallow aquifer is irregular and approximately six to ten feet below grade. Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the Site Management Plan. "

Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying

2350 FIFTH AVENUE CORP (Continued) **1000108749**

buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Site-related contaminants were historically found in the indoor air of the on-site building at concentrations exceeding NYSDOH's air guidelines. To minimize the potential for the inhalation of site-related contaminants, a sub-slab depressurization system was installed beneath the building. Environmental sampling indicates soil vapor intrusion is not a concern for off-site buildings. "

Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the Site Management Plan. "

Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Site-related contaminants were historically found in the indoor air of the on-site building at concentrations exceeding NYSDOH's air guidelines. To minimize the potential for the inhalation of site-related contaminants, a sub-slab depressurization system was installed beneath the building. Environmental sampling indicates soil vapor intrusion is not a concern for off-site buildings. "

Site Description: "Location: The site is located on the west side of Fifth Avenue between 141st Street and 142nd Street in the borough of Manhattan, City and State of New York. Site Features: The site is approximately 1.54 acres, and is entirely occupied by a building. The building is comprised of three connected sections: a two-story section along Fifth Avenue, a three-story section in the center, and a one-story section to the west. Surrounding the site are high-rise residential buildings to the west, south, and southeast of the site. The Harlem River Drive is to the east/northeast, and a National Guard Armory occupies the block immediately to the north. Current Zoning/Use: The site is owned by 2350 Fifth Avenue Corporation. It is zoned for light manufacturing (M1-1). The Harlem River is located approximately 200 to 300 feet east of the site. Following completion of remediation, the site is currently occupied by a self-storage facility and a charter school. Past Use of the Site: Based on historical Sanborn fire insurance maps, the site and the surrounding area were in the process of being filled in between 1860 and 1893, and as of 1909 it was mostly vacant or occupied by a contractor s yard. The existing building was originally constructed as a Borden Company ice cream factory: the three-story section in 1923; the two-story section in 1932; and the one-story section in 1950. The floor slab in the one-story (western) section included layers of insulating materials for refrigeration. The area surrounding the site was mostly occupied by garages, auto repair shops, and light manufacturing in the 1930s through the 1950s, with the exception of the block directly north of the site, where the Fifth Avenue Armory was constructed between 1921 and 1933. The residential development, which occupies the area to the south and west of the site, was constructed between 1957 and 1959. From 1970 to 1994 the site was occupied by an industrial laundry and dry cleaning operation which utilized tetrachloroethylene (PCE or perc) as a cleaning solvent. The dry cleaning operation utilized both first-generation and second-generation dry-cleaning machines. The majority of PCE released was associated with the first generation machine use, which involved more handling of PCE than the later machines. The dry cleaning facility operated as registered hazardous waste handler with U.S. Environmental Protection Agency (EPA), ID number NYD071026173. Between 1995 and 1996, most of the ground floor of the building, with the exception of the far western portion, was renovated for use as a New York City public school. The central and eastern portions of the building were occupied by P.S. 141 for a period in the fall of 1997, and were later used by a church for services, offices, and classes. The church vacated the building in December 2004. The remainder of the central and western portion of the building was renovated in 2001 for use as a self storage facility, and in 2006 the self storage facility expanded into the former school portion of the building. Currently the site is use for self storage facility and for art studio space. Site Geology and Hydrogeology: Groundwater in the vicinity of the site is divided into two apparently semi-confined aquifers. The presence of a clay layer acts as an aquitard/aquiclude separating the aquifer into a shallow

2350 FIFTH AVENUE CORP (Continued) **1000108749**

aquifer above the clay and deeper aquifer below the clay. The groundwater surface in the shallow aquifer is irregular and approximately six to ten feet below grade. Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the Site Management Plan. "

Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. Site Code: 57691
Site Description: "Location: The site is located on the west side of Fifth Avenue between 141st Street and 142nd Street in the borough of Manhattan, City and State of New York. Site Features: The site is approximately 1.54 acres, and is entirely occupied by a building. The building is comprised of three connected sections: a two-story section along Fifth Avenue, a three-story section in the center, and a one-story section to the west. Surrounding the site are high-rise residential buildings to the west, south, and southeast of the site. The Harlem River Drive is to the east/northeast, and a National Guard Armory occupies the block immediately to the north. Current Zoning/Use: The site is owned by 2350 Fifth Avenue Corporation. It is zoned for light manufacturing (M1-1). The Harlem River is located approximately 200 to 300 feet east of the site. Following completion of remediation, the site is currently occupied by a self-storage facility and a charter school. Past Use of the Site: Based on historical Sanborn fire insurance maps, the site and the surrounding area were in the process of being filled in between 1860 and 1893, and as of 1909 it was mostly vacant or occupied by a contractor s yard. The existing building was originally constructed as a Borden Company ice cream factory: the three-story section in 1923; the two-story section in 1932; and the one-story section in 1950. The floor slab in the one-story (western) section included layers of insulating materials for refrigeration. The area surrounding the site was mostly occupied by garages, auto repair shops, and light manufacturing in the 1930s through the 1950s, with the exception of the block directly north of the site, where the Fifth Avenue Armory was constructed between 1921

2350 FIFTH AVENUE CORP (Continued) **1000108749**

and 1933. The residential development, which occupies the area to the south and west of the site, was constructed between 1957 and 1959. From 1970 to 1994 the site was occupied by an industrial laundry and dry cleaning operation which utilized tetrachloroethylene (PCE or perc) as a cleaning solvent. The dry cleaning operation utilized both first-generation and second-generation dry-cleaning machines. The majority of PCE released was associated with the first generation machine use, which involved more handling of PCE than the later machines. The dry cleaning facility operated as registered hazardous waste handler with U.S. Environmental Protection Agency (EPA), ID number NYD071026173. Between 1995 and 1996, most of the ground floor of the building, with the exception of the far western portion, was renovated for use as a New York City public school. The central and eastern portions of the building were occupied by P.S. 141 for a period in the fall of 1997, and were later used by a church for services, offices, and classes. The church vacated the building in December 2004. The remainder of the central and western portion of the building was renovated in 2001 for use as a self storage facility, and in 2006 the self storage facility expanded into the former school portion of the building. Currently the site is use for self storage facility and for art studio space. Site Geology and Hydrogeology: Groundwater in the vicinity of the site is divided into two apparently semi-confined aquifers. The presence of a clay layer acts as an aquitard/aquiclude separating the aquifer into a shallow aquifer above the clay and deeper aquifer below the clay. The groundwater surface in the shallow aquifer is irregular and approximately six to ten feet below grade. Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the Site Management Plan. "

Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Site-related contaminants were historically found in the indoor air of the on-site building at concentrations exceeding NYSDOH's air guidelines. To minimize the potential for the inhalation of site-related contaminants, a sub-slab depressurization system was installed beneath the building. Environmental sampling indicates soil vapor intrusion is not a concern for off-site buildings. "

Site Code: 57691
Site Description: "Location: The site is located on the west side of Fifth Avenue between 141st Street and 142nd Street in the borough of Manhattan, City and State of New York. Site Features: The site is approximately 1.54 acres, and is entirely occupied by a building. The building is comprised of three connected sections: a two-story section along Fifth Avenue, a three-story section in the center, and a one-story section to the west. Surrounding the site are high-rise residential buildings to the west, south, and southeast of the site. The Harlem River Drive is to the east/northeast, and a National Guard Armory occupies the block immediately to the north. Current Zoning/Use: The site is owned by 2350 Fifth Avenue Corporation. It is zoned for light manufacturing (M1-1). The Harlem River is located approximately 200 to 300 feet east of the site. Following completion of remediation, the site is currently occupied by a self-storage facility and a charter school. Past Use of the Site: Based on historical Sanborn fire insurance maps, the site and the surrounding area were in the process of being filled in between 1860 and 1893, and as of 1909 it

2350 FIFTH AVENUE CORP (Continued) **1000108749**

was mostly vacant or occupied by a contractor s yard. The existing building was originally constructed as a Borden Company ice cream factory: the three-story section in 1923; the two-story section in 1932; and the one-story section in 1950. The floor slab in the one-story (western) section included layers of insulating materials for refrigeration. The area surrounding the site was mostly occupied by garages, auto repair shops, and light manufacturing in the 1930s through the 1950s, with the exception of the block directly north of the site, where the Fifth Avenue Armory was constructed between 1921 and 1933. The residential development, which occupies the area to the south and west of the site, was constructed between 1957 and 1959. From 1970 to 1994 the site was occupied by an industrial laundry and dry cleaning operation which utilized tetrachloroethylene (PCE or perc) as a cleaning solvent. The dry cleaning operation utilized both first-generation and second-generation dry-cleaning machines. The majority of PCE released was associated with the first generation machine use, which involved more handling of PCE than the later machines. The dry cleaning facility operated as registered hazardous waste handler with U.S. Environmental Protection Agency (EPA), ID number NYD071026173. Between 1995 and 1996, most of the ground floor of the building, with the exception of the far western portion, was renovated for use as a New York City public school. The central and eastern portions of the building were occupied by P.S. 141 for a period in the fall of 1997, and were later used by a church for services, offices, and classes. The church vacated the building in December 2004. The remainder of the central and western portion of the building was renovated in 2001 for use as a self storage facility, and in 2006 the self storage facility expanded into the former school portion of the building. Currently the site is use for self storage facility and for art studio space. Site Geology and Hydrogeology: Groundwater in the vicinity of the site is divided into two apparently semi-confined aquifers. The presence of a clay layer acts as an aquitard/aquiclude separating the aquifer into a shallow aquifer above the clay and deeper aquifer below the clay. The groundwater surface in the shallow aquifer is irregular and approximately six to ten feet below grade. Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the Site Management Plan. "

Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the

2350 FIFTH AVENUE CORP (Continued) **1000108749**

indoor air of buildings, is referred to as soil vapor intrusion. Site-related contaminants were historically found in the indoor air of the on-site building at concentrations exceeding NYSDOH's air guidelines. To minimize the potential for the inhalation of site-related contaminants, a sub-slab depressurization system was installed beneath the building. Environmental sampling indicates soil vapor intrusion is not a concern for off-site buildings. "

Site Code: 57691
Site Description: "Location: The site is located on the west side of Fifth Avenue between 141st Street and 142nd Street in the borough of Manhattan, City and State of New York. Site Features: The site is approximately 1.54 acres, and is entirely occupied by a building. The building is comprised of three connected sections: a two-story section along Fifth Avenue, a three-story section in the center, and a one-story section to the west. Surrounding the site are high-rise residential buildings to the west, south, and southeast of the site. The Harlem

2350 FIFTH AVENUE CORP (Continued) **1000108749**

River Drive is to the east/northeast, and a National Guard Armory occupies the block immediately to the north. Current Zoning/Use: The site is owned by 2350 Fifth Avenue Corporation. It is zoned for light manufacturing (M1-1). The Harlem River is located approximately 200 to 300 feet east of the site. Following completion of remediation, the site is currently occupied by a self-storage facility and a charter school. Past Use of the Site: Based on historical Sanborn fire insurance maps, the site and the surrounding area were in the process of being filled in between 1860 and 1893, and as of 1909 it was mostly vacant or occupied by a contractor s yard. The existing building was originally constructed as a Borden Company ice cream factory: the three-story section in 1923; the two-story section in 1932; and the one-story section in 1950. The floor slab in the one-story (western) section included layers of insulating materials for refrigeration. The area surrounding the site was mostly occupied by garages, auto repair shops, and light manufacturing in the 1930s through the 1950s, with the exception of the block directly north of the site, where the Fifth Avenue Armory was constructed between 1921 and 1933. The residential development, which occupies the area to the south and west of the site, was constructed between 1957 and 1959. From 1970 to 1994 the site was occupied by an industrial laundry and dry cleaning operation which utilized tetrachloroethylene (PCE or perc) as a cleaning solvent. The dry cleaning operation utilized both first-generation and second-generation dry-cleaning machines. The majority of PCE released was associated with the first generation machine use, which involved more handling of PCE than the later machines. The dry cleaning facility operated as registered hazardous waste handler with U.S. Environmental Protection Agency (EPA), ID number NYD071026173. Between 1995 and 1996, most of the ground floor of the building, with the exception of the far western portion, was renovated for use as a New York City public school. The central and eastern portions of the building were occupied by P.S. 141 for a period in the fall of 1997, and were later used by a church for services, offices, and classes. The church vacated the building in December 2004. The remainder of the central and western portion of the building was renovated in 2001 for use as a self storage facility, and in 2006 the self storage facility expanded into the former school portion of the building. Currently the site is use for self storage facility and for art studio space. Site Geology and Hydrogeology: Groundwater in the vicinity of the site is divided into two apparently semi-confined aquifers. The presence of a clay layer acts as an aquitard/aquiclude separating the aquifer into a shallow aquifer above the clay and deeper aquifer below the clay. The groundwater surface in the shallow aquifer is irregular and approximately six to ten feet below grade. Measurements of groundwater elevation indicated varying horizontal flow directions: generally northward towards West 142nd Street and eastward along 142nd Street towards the Harlem River. "

Env Problem: "Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were tetrachloroethene (PCE) and its breakdown products [trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), vinyl chloride (VC)] in soil, groundwater and soil vapor and sub-slab insulation material. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil, groundwater, soil vapor and sub-slab insulation material is being managed under the

2350 FIFTH AVENUE CORP (Continued) **1000108749**

Site Management Plan. "
Health Problem: "People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Direct contact with contaminated soil is unlikely since it is located under pavement and the on-site building. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Site-related contaminants were historically found in the indoor air of the on-site building at concentrations exceeding NYSDOH's air guidelines. To minimize the potential for the inhalation of site-related contaminants, a sub-slab depressurization system was installed beneath the building. Environmental sampling indicates soil vapor intrusion is not a concern for off-site buildings. "

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Updated By: KMFORSTE
Site Code: 520537
Site Description: "Location: The 1.112-acre site is located in an urban area of the Bronx, NY. The property is located approximately 250 feet northwest of the intersection of East 135th Street and 3rd Avenue. Site Features: The property is occupied by a residential and commercial building. The Harlem River is located approximately 500 feet to the southwest. Current Zoning and Land Use: Two 25-story mixed residential and commercial use towers were constructed on the site. The site is zoned as a M1-3/R8 district for mixed-use high-density residential, commercial, and light manufacturing uses. The surrounding land use is primarily commercial, including warehouses to the northwest, and commercial office space to the southeast. The site formerly consisted of Lot 60 and 160, but the lots were merged into one Lot, 160. Past Use of the Site: Prior site uses include a railroad freight yard, coal yard, warehousing, and various industrial uses (some of which included oil storage). Most recently it was used for vehicle storage (parking). Historic fill is also present at the site. Some soil remediation of volatile organic compounds (VOCs), semi-VOCs (SVOCs) and metals occurred in 1999 under the Petroleum Spills Program (Spill #0001384) and resulted in removal of an abandoned underground storage tank. Site Geology and Hydrogeology: The stratigraphy of the site, from the surface to approximately 16 feet below grade, is classified as fill consisting of a mixture of gravel, sand, rocks and apparent construction debris. The water table at the site ranges from approximately 9 feet to 12 feet below grade. Groundwater flow is towards the north northwest, in the direction of the Harlem River."
Env Problem: "Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals and poly-cyclic aromatic hydrocarbons related to the presence of historic fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil is being managed under a Site Management Plan. "
Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with remaining contamination at the site. "

Site Code: 520537
Site Description: "Location: The 1.112-acre site is located in an urban area of the Bronx, NY. The property is located approximately 250 feet northwest of the intersection of East 135th Street and 3rd Avenue. Site Features: The property is occupied by a residential and commercial building. The Harlem River is located approximately 500 feet to the southwest. Current Zoning and Land Use: Two 25-story mixed residential and commercial use towers were constructed on the site. The site is zoned as a M1-3/R8 district for mixed-use high-density residential, commercial, and light manufacturing uses. The

198 EAST 135TH STREET (Continued) **S127750731**

surrounding land use is primarily commercial, including warehouses to the northwest, and commercial office space to the southeast. The site formerly consisted of Lot 60 and 160, but the lots were merged into one Lot, 160. Past Use of the Site: Prior site uses include a railroad freight yard, coal yard, warehousing, and various industrial uses (some of which included oil storage). Most recently it was used for vehicle storage (parking). Historic fill is also present at the site. Some soil remediation of volatile organic compounds (VOCs), semi-VOCs (SVOCs) and metals occurred in 1999 under the Petroleum Spills Program (Spill #0001384) and resulted in removal of an abandoned underground storage tank. Site Geology and Hydrogeology: The stratigraphy of the site, from the surface to approximately 16 feet below grade, is classified as fill consisting of a mixture of gravel, sand, rocks and apparent construction debris. The water table at the site ranges from approximately 9 feet to 12 feet below grade. Groundwater flow is towards the north northwest, in the direction of the Harlem River."

Env Problem: "Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals and poly-cyclic aromatic hydrocarbons related to the presence of historic fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil is being managed under a Site Management Plan. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with remaining contamination at the site. "

BROWNFIELDS:
Name: 198 EAST 135TH STREET
Address: 228 EAST 135TH STREET
City,State,Zip: BRONX, NY 10451
Program: BCP
Site Code: 520537
Acres: 1.112
HW Code: C203084
SWIS: 0301
Town: New York City
Record Added Date: 01/05/2016
Record Updated Date: 08/15/2023
Update By: SMQUANDT
Site Description: "Location: The 1.112-acre site is located in an urban area of the Bronx, NY. The property is located approximately 250 feet northwest of the intersection of East 135th Street and 3rd Avenue. Site Features: The property is occupied by a residential and commercial building. The Harlem River is located approximately 500 feet to the southwest. Current Zoning and Land Use: Two 25-story mixed residential and commercial use towers were constructed on the site. The site is zoned as a M1-3/R8 district for mixed-use high-density residential, commercial, and light manufacturing uses. The surrounding land use is primarily commercial, including warehouses to

198 EAST 135TH STREET (Continued) **S127750687**

	the northwest, and commercial office space to the southeast. The site formerly consisted of Lot 60 and 160, but the lots were merged into one Lot, 160. Past Use of the Site: Prior site uses include a railroad freight yard, coal yard, warehousing, and various industrial uses (some of which included oil storage). Most recently it was used for vehicle storage (parking). Historic fill is also present at the site. Some soil remediation of volatile organic compounds (VOCs), semi-VOCs (SVOCs) and metals occurred in 1999 under the Petroleum Spills Program (Spill #0001384) and resulted in removal of an abandoned underground storage tank. Site Geology and Hydrogeology: The stratigraphy of the site, from the surface to approximately 16 feet below grade, is classified as fill consisting of a mixture of gravel, sand, rocks and apparent construction debris. The water table at the site ranges from approximately 9 feet to 12 feet below grade. Groundwater flow is towards the north northwest, in the direction of the Harlem River."
Env Problem:	"Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals and poly-cyclic aromatic hydrocarbons related to the presence of historic fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in soil is being managed under a Site Management Plan. "
Health Problem:	"Remedial actions are complete and measures are in place to control the potential for coming in contact with remaining contamination at the site. "

BROWNFIELDS:

Name:	580 GERARD FORMER POST OFFICE VEHICLE REPAIR SHOP
Address:	580 GERARD AVENUE
City,State,Zip:	BRONX, NY 10451
Program:	BCP
Site Code:	610854
Acres:	0.716
HW Code:	C203142
SWIS:	0301
Town:	New York City
Record Added Date:	09/02/2020
Record Updated Date:	05/29/2021
Update By:	JHOCONNE
Site Description:	"Site Location: The site is located at 580 Gerard Avenue, Bronx, New York 10451. The site is located in a mixed industrial, commercial and residential neighborhood. There are several BCP sites Gerard Avenue in close proximity to this Site. Site Features: The site is currently occupied by a vacant single-story approximately 31,000 sq. ft which served as a U.S. Postal Service vehicle maintenance garage building. The site is not located in a flood zone. The closest waterbody is the Harlem River, which is located about 0.21 miles away (about 1,120 feet). Current Zoning and Land Use: The site is currently located in an R7A District with a C2-4 Commercial Overlay District. The

US POSTAL SERVICE - VMF (Continued) **1000349040**

surrounding properties include, to the north, a single-story warehouse/garage building; to the west (across Gerard Avenue), a two-story mixed-use building used as a storage facility and its associated parking lot; to the south (across 150th Street), a single-story warehouse/garage building; and to the east, a small garage and residential buildings. Past Use of the Site: From 1908 until on or about 1950 the site was vacant until the current on-site building was constructed circa 1950 for use as a vehicle maintenance and storage facility for the U.S. Post Office. The Post Office was the tenant from 1950 until circa 2000. From circa 2001 through 2007, the building was utilized for automotive service, vehicle repair and parking. After 2007, the project site was occupied by a construction company for general office use and storage, but as of 2011, the building was vacant. The Site was listed in the New York State Department of Environmental Conservation Petroleum Bulk Storage (PBS) database under Facility Identification Numbers 2-333212 and 2-476021 and the Spills database under Spill Incident Numbers 9213223 and 9007668. In addition, the Post Office was a listed RCRA facility at this Site under RCRA Facility ID NY5180010451 large quantity generator. The Post Office, was listed as a small quantity generator under RCRA Facility ID NYD982727885 at this Site from 1992 until 2009, even though the Post Office vacated in about 2000-2001. Finally, a tenant named Autorama Enterprises of Bronx, using the 610 Gerard Avenue address, was listed as a RCRA Facility at the Site under ID NYR000100255. There following spill numbers are associated with this Site: Closed Spill Incident Number 9007668 This spill pertains to a tank test failure of a 3,000-gallon fuel oil tank that occurred on October 13, 1990. There is a note in the spill file that groundwater was impacted. See Exhibit M including spill file record. Closed Spill Incident Number 9213223 This spill incident is related to gasoline found during the excavation of gasoline tanks that occurred on February 27, 1993. This spill incident indicates that nine 550-gallon gasoline USTs were removed in 1993. Concurrently, 22 tons of contaminated soil had also been reportedly excavated and removed. Allegedly, the subsurface investigation showed no visual or olfactory evidence of contamination. Soil analysis showed non-detect for VOCs and PAH levels were consistent with obvious fill material. However, groundwater analysis showed non-detect/trace PAHs and VOCs. This spill incident was closed on May 11, 2001. Closed Spill Incident Number 1205845 This spill occurred when it was reported that approximately two gallons of heating oil residual/staining was noted next to the fill port area on the east side of the building. Site Geology and Hydrogeology: The general elevation for the area where the site is located is between approximately 20-30 feet above mean sea-level. The groundwater flow direction was presumed to be the southerly direction toward the Harlem River. The soil composition in the eight (8) subsurface soil borings was similar in nature, with predominantly fine to medium-grained sand and fill material along with some silt found to exist from the surface to terminus of the borings. Groundwater was encountered in two (2) borings at approximately 23 feet below land surface (bls). "

Env Problem: "Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available."

Health Problem: "Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available."

Remarks:	caller states that he was contacted by the homeowner regarding oil that had been dumped out of the temporary tank into a pit on the ground. They had initially indicated that it was inside the premises. When they had pumped out the tank on the 11th they had placed 20 gallons from the temporary tanks into the main tank. caller states that on July 9th abc tank had installed 2 new 275gallon tanks into the oil room and had done all new piping as well and they disonnected and drained oil from temp tank into a pit located at the base of the alley way drain

Latitude:	40.8108191
Longitude:	-73.9244894
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was TIPPLE 5/19/03 - ROSSAN, DDO - Called Mr. Kieth Bartley, who confirmed that contaminated soil letter should be sent to: ATT: Mr. Kieth Bartley c/o USA Tanks Plant Maintenance 206 Grandview Avenue Staten Island, NY 10303 5/22/03 TIPPLE UPDATING/ SITE VISIT ON THE 16TH REVEALED OIL FROM RUPTURED TANK ON TANK ROOM FLOOR, SEAPING THROUGH THE SUBSURFACE INTO THE BOILER ROOM, SUMP IN BOILER ROOM FLOOR, DRAIN IN WALKWAY OUTSIDE BASEMENT DOOR, BELOW VENT/FILL LINE SATURATING BRICK STEPS AND WALKWAY DOWN TO BASEMENT DOOR, AND HAD BEEN TRACKED THROUGHOUT THE AREA. A SUBSEQUENT VISIT 5/19 REVEALS THAT OIL WAS STILL DRAINING OUT OF THE SATURATED SOILS INTO THE BOILER ROOM, AND ONLY THE BEGINNINGS OF A SURFACE CLEANUP HAD OCCURED TO DATE. 7/16/2003Tipple updating// spills # 02-00169 and 03-03928 at this address closed and referred to this spill # contaminated soil letter sent to both property owner: Estate of Michael McSherry 3616 Route 94 Chester, NY 10918-1149 and Management Company Classic Realty- John Gubias 3600 Feildston Rd Bronx, NY 10463----718-601-5858 7/15 site visit revealed oil still seeping into sump and along the wall in the boiler room. The walkway sump with soil walls was full of fresh oil, stairs in the walkway and laid up stone foundation wall between the tank room and the walkway were still contaminated with a coating of oil. The new surface spill appeared to be impacting the walkway outside the basement door and the soil walled sump in the walkway. 5/5/04: Tipple sent a letter requesting cleanup details and documentation. certified mail # 7001 0360 0000 8150 4272 11/30/04: Sent letter requesting documentation of work 05/19/06: This spill is transferred from Mr.Koon to Q.Abidi. Called Keith Bartley at (917)669-1093. Left message to call me back. 06/23/06: Contacted to Kristen at (718)981-5710 she told temporary tank set

(Continued) **S105998994**

there. Mr.Keith Bartley didn't do
the complete job for this spill. She will find out the information
about the spill and she will
call me back. -QA 08/30/06: Called Keith Bartley and left message to
call me back. -QA 09/11/06:
Contacted Mr. Keith Bartley(917)669-1093 he said that he will send
closing confirmation letter very
soon. -QA 10/10/06: Mr. John Herbig (Intech Environmental)called me
and said he is going to take
soil samples from the basement after chemical analysis he will send me
the report for closing the
spill. -QA 10/19/06: Talked to John Herbig he said he has collected
soil samples from the basement
and sent to chemical lab for analysis as soon as he will get the
report he will send it to me. -QA
10/26/06: Contacted Mr. John Herbig he said that he received lab
results of soil samples he will
fax it to me. -QA 11/13/06: Mr. John Herbig (impact Environmental)
called me and said soil sample
report has come from the lab. He will mail me the report in a week.
-QA 11/16/06: Mr. John Herbig
called me and said that he has mailed me the soil sample report in
couple of days I will receive
that. The soil sample data which he faxed me is not readable. i am
waiting to receive his mail. -QA
11/27/06: Reviewed the Investigation Summary Report dated November 16,
2006 [in eDocs]. The report
presents soil sample results which indicate that a release of
petroleum has occurred and soil
contamination present at the site. The Department requires additional
investigation to determine if
there has been an impact to groundwater and to fully delineate soil
and groundwater contamination.
Sent a letter to Mr. Morris Arlos (owner) to prepare a Work Plan for
additional investigation and
submit it to Department within 30 days. -QA 12/14/06: Received letter
from Mr. Kevin Kleaka,
Project Manager (Impact Environmental) that additional investigation
activities are not possible in
the basement of the building due to limited place. He is going to
break the concrete of the
basement to excavate the contaminated soil. Additional soil samples
will be taken at the site after
excavation and removal of the contaminated soil to demonstrate the
effectiveness of the remedial
activities. -QA 12/20/06: Called Mr. Kevin Kleaka (Consultant and
Project Manager) at (631)269-8800
and said to make two temporary well at the side walk of 262 Alexander
Avenue to check the potential
impact of groundwater. Before that we will not review any remedial
plan. -QA 01/08/077: Received
phone call from John Herbig of Impact Envt'l, regarding DEC's request
for two groundwater samples
in sidewalk outside site building; he noted there is already a well in
sidewalk related to
investigations at 40th Police Precinct, across Alexander Ave. from
site. He asked if it would be

(Continued) **S105998994**

acceptable to just sample that well, rather than installing two new wells in sidewalk. After
reviewing location of existing well (MW-5 from 40th Precinct investigations) which is
west-northwest of ASTs in basement of site bldg, and location of soil sample with TAGM exceedance
for VOCs, SP-2, and considering that URS has established local groundwater flow direction at 40th
Pct. is to west-northwest, J. Kolleeny told Mr. Herbig that sampling of well MW-5 would be
acceptable to evaluate impacts to groundwater from this spill. After sampling well, Impact Envt'l
can prepare a remedial action plan. - J. Kolleeny 01/11/07: Talked to Mr. John Herbig at
(631)774-5597, received his fax regarding groundwater sample results. MTBE is high. [Only compound
greatly exceeding its GW std. was MTBE, suggesting main impact to GW is from 40th Police Precinct
across street to west.] Now Impact environmental can submit remedial action plan to DEC regarding
this spill. -QA 02/05/07: Called Mr. John Herbig (631)774-5597 and reminded him to send electronic
version single Pdf file for both the reports, Investigation Summary report and Corrected Action
Plan. After receiving that we will approve your plan. -QA 02/07/07: Reviewed the corrective Action
Plan dated January 29, 2007 for this site, submitted by impact environmental. The report proposes
excavation of an area of residual soil contamination beneath the basement floor at the site,
followed by collection of end-point soil samples. The corrective Action plan is approved. Letter
mailed out to responsible party. -QA 05/09/07: Called Mr. John Herbig (631)774-5597 and discussed
regarding spill. He said that at this site owner is waiting when all tenants will be relocated then
work will be started at this site. -QA 12/04/2007: This spill case was transferred to A. Doronova.
AD 12/06/2007: Called and spoke to Mr. John Herbig of Impact Env. regarding remedial action plan
implementation. He told me that First Alexander LLC was potential buyer and that this company is no
longer involved with this property, and due that RAP was not implemented at the site. Called to
Building Management (718) 601-5858 of this property. Spoke with a manager. He told that First
Alexander LLC is the current owner of this site. This company bought the property approximately one
year ago. Now this property under new contract for sale. Received a call from Mr. Morris Arlos -
the owner of First Alexander LLC. He confirmed that this property is now under contract. The
closing is scheduled on the beginning of January 2008. The new owner - Galaxy was informed about
the spill case and agreed to do site remediation, according to Mr.Morris Arlos. Contact person for
the Galaxy - Richard Sica, phone: (718) 601-7000. Will contact Galaxy

after January 10, 2008. AD
12/07/2007: Spoke to Mr. Sica. His company is aware of the spill and remedial action plan. He will
contact us after site purchase to discuss further actions. AD
02/14/2008: Spoke with Mr. Sica
regarding the site. He told me that the closing was moved on early March. AD 04/21/2008: Called and
left a message to Building Management. AD 08/07/2008: Called and left a message to R. Sica of
Gallaxy. AD 11/04/2008: Called and left a message to R. Sica. and to Building Management. AD
12/08/2008: Looked in the ACRIS database, the property now belongs to The Community Preservation
Corp. (CPC). Called and spoke with Kristy Seyfert of CPC, phone: 212-869-5300, fax: (212)659-0102.
She confirmed that CPC owns the property. She asked me to sent them an official letter and NYSDEC
Spill report. AD 12/18/2008: Sent a letter to CPC with a request to prepare and submit a RAP to DEC
till January 29, 2009. Faxed a copies of the letter and NYSDEC Spill report to Ms. Seyfert. DL PDF
copy to eDocs. AD 02/19/2009: Called and left a message to Ms. Seyfert of CPC regarding past due of
RAP submission. Later receved a phone call from K. Seyfert. She said that she did not received the
letters. Sent these letters again via fax and e-mail: From: Ainura Doronova
[mailto:axdorono@gw.dec.state.ny.us] Sent: Thursday, February 19, 2009 3:26 PM To: Kristy Seyfert
<kseyfert@communityp.com Subject: 2515 Seventh Ave., New York NYSDEC Spill No. 0401623 and
262Alexander Ave., Bronx NYSDEC Spill No. 0301707 Dear Ms. Seyfert: Attached please find copies of
the letters, regarding above-referenced sites, which were sent to you previously, but were not
received by your company according to your statement. Please be advised that response is time
sensitive. To receive a deadline postponement you should submit an official request. Sincerely,
Ainura Doronova Environmental Engineer later received an e-mail from her saying: Thank you I am in
receipt of the attachment and will address the situation ASAP. Kristy Seyfert Loan Analyst The

response from Ms. Belli of CPC. Called and left a message to Ms. Belli again. AD 12/09/2009: Called
and again could not reach Ms. Belli or Ms. Seyfert. Will send Remediation Needed Letter to Mr. John
McCarthy - vice president of CPC. AD 12/14/2009: Issued and sent Remediation needed Letter to Mr.
McCarthy of CPC. Response is due January 25, 2010. DL pdf copy to eDocs. AD 02/2010: Did not
receive any response. AD 09/12/2011: Was forwarded an e-mail from Nick Recchia regarding
implementation of the 2007 RAP.: Dear Mr. Paul John. Our client is ready to implement the approved
corrective action plan which was approved in 2007 and is attached. The contractor will have the
area of excavation open for DEC inspection this Wed. 9/14/2011. We would like to move forward in
closing this spill case file upon your inspection and reviews ASAP. If you could have someone
available to inspect the excavation this Wednesday it would be appreciated I will be on site to
collect endpoint soil samples. If you can give me a specific time to meet and co-ordinate for the
inspection that would be great. My contact information is below. My cell phone # is 516-395-8763.
Sincerely Yours, Nicholas J. Recchia, C.P.G. Vice President, Senior Hydrogeologist EEA Inc. 55
Hilton Avenue, Garden City, NY 11530 Phone: (516) 746-4400 Fax (516) 746-4432
nrecchia@eeaconsultants.com Called and spoke with Mr. Recchia of EEA. EEA will overlook the
remedial excavation in the basement of the building and will collect a post-excavation endpoint
soil samples. Discussed this site with J. Kolleeny of DEC. It was decided that EEA can proceed with
RAP implementation. Decision on a closure of the spill will be made based on the results of
end-point soil samples. AD 09/13/2011: Received an e-mail from Mr. Recchia saying: Ainura. The
client contact is Telly Zervoudis. Please advise us ASAP we would like to move forward with closing
out this spill. Thanks. Galaxy General Contracting 3152 Albany Cresent Bronx, NY 10463
Tzervoudis@galaxygc.com Nicholas J. Recchia, C.P.G. Vice President, Senior Hydrogeologist Called
and left a message to Mr. Recchia of EEA. Later spoke with him regarding RAP implementation. He
said that removal of contaminated soil will start tomorrow, and he expects that collection of
endpoint samples will be in a few days. Requested him to notify DEC about date of sampling. AD
09/14/2011: Received an e-mail from Mr. Recchia saying: Ainura, EEA is performing the remedial
action to excavate and remove soils as per the approved RAP. We anticipate collecting endpoint soil
samples tomorrow. EEA will prepare a full report of remedial action activities, endpoint sample
data, site photos, etc. signed and sealed by our engineer. Sincerely

(Continued) **S105998994**

Yours, Nicholas J. Recchia,
C.P.G. Vice President, Senior Hydrogeologist Called and informed Mr. Recchia that I cannot visit
the site on Thursday, September 15, 2011, due to the previously scheduled meeting. Requested to
take a pictures of the excavation, document all activities and to take PID readings. AD 09/27/2011:
Received an e-mail from N. Recchia saying: Ainura, Hope all is well. I was hoping you could help us
out here by taking a quick look at the endpoint results from the excavation. Our client wants to
backfill ASAP because it is in the building and they had to shore up the walls. All endpoint
samples were collected from the sidewalls of the excavation. The bottom of the excavation was
bedrock at a depth of 2 to 2 feet below floor grade. I reviewed the results and it appears that all
samples are below the new CP-51 Soil Cleanup Policy which replaces TAGM. I included a photo of the
excavation. I apologize for not having a table or drawing ready for you at this time but we want to
backfill this ASAP. I will prepare a full report and send it to you next week. Thanks for your
help. Nicholas J. Recchia, C.P.G. Vice President, Senior Hydrogeologist Looked at the submitted
data. No exeedances of VOCs or SVOCs levels were detected in all six endpoint soil samples. Asked
Mr. Recchia to submit a sketch of the excavation with locations of the soil samples. Later received
the requested sketch. Approved the backfill of the excavation. AD 10/17/2011: received an e-mail
from Mr. Recchia saying: Ainura, Attached please find our final remedial action report for this
property. Please review and let me know the spill status. Thanks you. Nicholas J. Recchia, C.P.G.
Vice President, Senior Hydrogeologist EEA Inc. DL the report to eDocs. Will review. AD 10/26/2011:
Reviewed the report. It states that EEA performed remedial excavation of contaminated soils in the
vicinity of the former AST s area. A total of 14.4 tons of contaminates soil was removed off-site.
Post-excavation end-point soil samples were collected on September 15, 2011 from 6 sidewalls
locations. No bottom soil samples were collected due to presence of a shallow bedrock, which was
found at a depth of 1.5’ to 2.8’ below the basement floor level. According to the analytical data,
no VOCs or SVOCs were detected above NYSDEC standards. Based on the result, EEA concludes that
contamination was removed and recommends spill case closure. The submitted site map is different
from site maps presented by previous consultant. To clarify this difference with Mr. Recchia. Will
discuss spill closure request with J. Kolleeny of DEC. AD 10/27/2011: Discussed the site with J.
Kolleeny. To ask MR. Recchia if there are any sumps in the basement to be checked for presence of

(Continued) **S105998994**

LNAPL or product sheen. AD 10/28/2011: Called and spoke with Mr. Recchia. Requested to clarify
excavation location on the site map, and info on sumps. Sent him an e-mail with an attached site
plan saying: Mr. Recchia: Could you please verify location of the excavation completed by EEA on
this site plan? Also, if there are any sumps in the basement they should be checked for presence of
LNAPL or product sheen. AD 01/03/2011: Received an e-mail from Mr. Recchia saying: Ainura, Sorry
for the confusion. Our drawing is somewhat misleading I can see your concern and confusion. I have
revised our drawing and it is in the area of the former AST's and SP-2 area. We didn't focus on the
whole basement location in our drawing only the former tank area and area around SP-2. Sorry for
the confusion. I have revised the drawing. I hope this helps. EEA did not observe any basement
sumps in the building. Sincerely, Nicholas J. Recchia, C.P.G. Vice President, Senior Hydrogeologist
Reviewed the submitted site map. Soil was excavated in the area of the former AST's and soil boring
SP-2 area. DL the revised site map to eDocs. Will issue a closure approval letter. AD 11/04/2011:
Sent a Spill Closure approval letter to Telly Zervoudis of Galaxy General Contracting Corp. at 3152
Albany Crescent, Bronx, NY 10463 via e-mail: Tzervoudis@galaxygc.com. DL pdf copy of the letter to
eDocs. Case closed. AD

DEC Memo:	12/4/14- Spoke to Ray Lara from PTC. He said they cleaned and emptied he tank. They tested the tank and failed. They are going to perform the isolation test. 2/20/15-Mark Salamack from PTC sent an email dated 2/9/15 with the following information. The one on Lenox Avenue and the one on 5th Avenue are both in the same complex called the Savoy...whose main address is 45 West 139th Street in Manhattan...these are both above ground tanks that were tested when they went from #6 oil to #2 oil...both had a problem with the way an electronic gauge was connected on top of each tank...there was no contamination or spilled oil in either case...they have both been retested and passed the tightness tests...as we have not been paid yet for the job we have not sent anything to you to get the spill #s closed. Based on the information that the gauge was repaired, there was no contamination or spill in this site and the tank system was retested and past the test this spill is closed

Update By:	AMSERVIS
Site Description:	"Location: The site is located within an urban area at 2455 and 2457 Third Avenue, Bronx, NY. The approximately 19,900 square-foot (0.45 acres) site is identified on the Bronx County Tax Map as Block 2319, Lots 38 and 39. The site is bounded by East 135th Street/the Major Deegan Expressway followed by a hotel to the northeast, Third Avenue/Third Avenue Bridge ramp followed by commercial buildings to the southeast, a mixed-use commercial/residential building to the southwest, and a parking lot and an active construction site to the

2455 THIRD AVENUE (Continued) **S125465258**

northwest. Site Features: The site is undergoing redevelopment. Current Zoning and Land Use: This site is currently vacant and is zoned M1-3/R8, which allows for light manufacturing and high density residential commercial district. The adjoining parcels and surrounding area are used for industrial/manufacturing, and commercial purposes. Past Use of the Site: Historical site use includes multiple two- and three-story residential and commercial buildings on the site (1891), a carpet storage facility on the southern part of the site (1908), and a rail yard (1935 - 1951). The site was an asphalt-paved lot in 1995. In 1998, a one-story building of unknown use was present on the southeastern part of the site, with parking located on the northeastern portion of the site. From 2006 to 2017, the site contained a building on the southwestern part of the site occupied by Bridge Building Supply. The site is currently vacant and is covered by the concrete slab of the recently demolished warehouse as well as a concrete-paved lot. Site Geology and Hydrogeology: The site is underlain by fill material predominantly consisting of brown, fine-grained sand with varying amounts of silt, gravel, tile, metal, concrete, brick, glass, wood, and slag. The fill was observed to depths varying between about 6 and 9.5 feet below ground surface (bgs). Historic fill is generally underlain by fine-grained sands with varying amounts of silt, clay, organic material, and gravel. In the western portion of the site, historic fill is underlain by a 1- to 5- foot thick clay/peat layer with organic material (between 8 and 16 feet bgs) followed by sand. Bedrock was not encountered during the previous site investigations. Groundwater is present at depths of approximately 8 feet below grade surface at the site. Groundwater flows to the west. "

Env Problem:	"Remediation at the site is completed. Prior to remediation, the primary contaminants of concern include SVOCs and metals in soil. Remaining contamination will be managed under a Site Management Plan. "
Health Problem:	"Remedial actions are complete and measures are in place to prevent people from coming in contact with residual site contamination."

101 EAST 150TH STREET (Continued) **S129283531**

Update By: AAOBLIGA
Site Description: "Site Location and Site Features: The current owner, 586 River Ave., LLC (the Requestor), proposes to redevelop the property located at 101 East 150th Street in the Borough of the Bronx (the Site) with a new building for a 2,400-student charter school. Alternate addresses for the Site include 586 River Avenue, 580 River Avenue and 595 Gerard Avenue. The Site has coordinates of Latitude - 40 49 15 , Longitude - 73 55 45 based on the World Geodetic System of 1984 (WGS84) standard. The Site is comprised of one New York City (NYC) tax lot (Bronx Block 2354, Lot 1) and is 99,109 square feet (approximately 2.27 acres) in area and is bound to the north by a NYC-owned surface parking lot (151 Street Lot South), to the east by Gerard Avenue, to the south by East 150th Street, and to the west by River Avenue. The Site is currently occupied by a 2-story warehouse with cellar that has a building footprint of 30,345-square feet on the southern portion of the property. The cellar and first floors are used as a self-storage facility, operated by Treasure Island Storage. The second floor is occupied by a school (the New York City Children s Center, also known as P.723XatBronx Children s School). The northern portion of the property is a parking lot for the building and parking area for buses and delivery trucks. The parking lot is approximately 68,628 square feet, 69% of the lot area. Current Zoning and Land Use: The Site is located in the Lower Concourse neighborhood of Bronx, New York in an area zoned for light manufacturing (M1-2) use and is comprised of a rectangular-shaped parcel identified as Block 2354, Lot 1 on the NYC Department of Finance (DOF) Tax Map. The Site is located in a mixed industrial, commercial, and residential neighborhood. The nearest residential properties are located approximately 50 feet to the south (across East 150th Street) and 150 feet to the east (along Walton Avenue). The boundaries of the Site correspond to the current tax map boundaries. The Site is currently being occupied by a commercial self-storage facility and a school as tenants of the former owner (580 Gerard LLC). The school is operating pursuant to a special permit issued by the BSA in 2004 (BSA Cal. No 05-04-BZ). The new use for the site, which will require the removal of the existing building and the construction of a new building, will be as a 2,400-student K-12 charter school, a use that would require a new special permit from the BSA. A school is a permitted use in the zoning district but requires the issuance of a special permit by the New York City Board of Standards and Appeals (BSA). Past Use of the Site: Records from 1891 through the early-1900s, show the Site as athletic fields. By the late-1900s, the Site was used as a lumber storage yard. By early 1930s until 1950, the Site was used as an athletic field / recreational facility with a club house. In 1952, the building occupying the southern portion of the Site was constructed. The rest of the property was used as athletic fields and then later converted into a parking area for the building. The 2-story building with a cellar first used by a shoe factory (National Shoes) as office and warehouse (from ca 1952 to 1981) and an electronic parts manufacturer (Welbilt Electronic Die Corp/Wedtech) (from ca 1984 to ca 1990s). By 2001, the property was foreclosed, and ownership was transferred to Marty and Dorothy Silverman Foundation, and eventually donated to the St. Luke s Roosevelt Hospital Center. The property was then sold to Gerard Avenue LLC, which began converting it to a self-storage facility (American Storage). In 2003, the NYC DOB granted a change of use of the building s cellar and ground floor from electronic part manufacturing to commercial

101 EAST 150TH STREET (Continued) **S129283531**

self-storage use; and the change of use of second floor of the property from office spaces to classrooms and instructional spaces. In 2019, the Site was sold to 580 Gerard LLC (Treasure Island Storage), which continued the self-storage and school operations at the property. The northern portion of the Site is used for parking. The Requestor purchased the Site from 580 Gerard LLC on December 29, 2021 (ACRIS document ID 2022011200728001). Neither the Requestor, nor Success Academy Charter Schools is owned by or in any way affiliated with any of the prior owners or operators of the Site. No previous remedial activities have been implemented at the Site. Site Geology and Hydrogeology: According to the 1992 USGS publication Bedrock and Engineering Geologic Maps of Bronx County and Parts of New York and Queens Counties (Baskerville 1992), Bronx County is underlain by high grade metamorphic bedrock consisting of a sequence of Cambrian and Ordovician gneiss, schistose-gneiss, and marble. The bedrock beneath the Site is expected to be the Inwood Marble, (white calcite-dolomite) interlayered with units of Walloomsac and Manhattan Schists. The Geotechnical Engineering Report by GZA, dated April 15, 2022 observed bedrock between 50 feet and almost 100 feet below ground surface with an average depth of approximately 70 feet. The eastern portion of the Site along the Gerard Avenue is at an elevation (EL) corresponding to EL +23 to EL +27 feet North American Vertical Datum of 1988 (NAVD88). The topography along River Avenue is lower and ranges between EL +15 and EL +21 feet. The Parking area is cut down from the adjacent street elevations and ranges between EL +8 and EL +12 feet. Regionally, the topography slopes westward down to approximately EL +8 feet. The nearest water body is the Harlem River located 750 feet west of the Site. The GZA Geotechnical Engineering Report identified fill material, consisting of fine to coarse sand containing up to 35 percent gravel, up to 35 percent silt or clayey silt, and varying amounts of brick, glass, or concrete fragments (Fill) was encountered below the surface cover at each boring across the entire Site. The bottom of the Fill layer ranged between EL +0.5 and EL +9 feet across the Site. During the geotechnical study, groundwater levels in an observation well were measured between 8.9 and 9.1 feet below the parking area grade, which corresponds to approximately EL +2.8 and EL +3.0 feet. The anticipated groundwater flow direction is west towards the Harlem River. "

Env Problem:

"Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, poly-chlorinated biphenyls (PCBs), metals and per- and polyfluoroalkyl substances (PFAS). Soil vapor was analyzed for VOCs. Soil Several VOCs were detected in soil 3-12 feet below grade surface (bgs) above the Protection of Groundwater soil cleanup objectives (PGSCO) and Residential SCO (RRSCO). 1,2,4-trimethylebenzene was detected at a maximum concentration of 150 parts per million, or ppm (PGSCO value of 3.6 ppm and RSCO value of 47 ppm), 1,3,5-trimethylebenzene was detected at a maximum concentration of 59 ppm (PGSCO value of 52 ppm and RSCO value of 47 ppm), trichloroethene (TCE) was detected at a maximum concentration of 150 ppm (PGSCO value of 0.47 ppm and RSCO value of 10 ppm), tetrachloroethene (PCE) was detected at a maximum concentration of 12 ppm (PGSCO value of 1.3 ppm and RSCO value of 5.5 ppm), and cis-1,2-dichloroethene was detected at a maximum concentration of 11 ppm (PGSCO value of 0.25 ppm and RSCO value of 29 ppm). Several SVOCs such as benzo(a)anthracene was detected at a maximum concentration of 17 ppm (PGSCO value of 1.7 ppm and RSCO value of 1 ppm),

101 EAST 150TH STREET (Continued) **S129283531**

benzo(a)pyrene maximum concentration of 17 ppm (RSCO value of 1 ppm and PGSCO value of 1.7 ppm), and benzo(b)fluoranthene maximum concentration of 14 ppm (RSCO value of 1 ppm and PGSCO value of 1.7 ppm). Metals such as lead was detected at a maximum concentration of 1,030 ppm (PGSCO value of 450 ppm and RSCO value of 400 ppm). No Polychlorinated biphenyls (PCBs) were detected at concentrations exceeding the RSCOs. No pesticides were detected at concentrations exceeding the RSCOs. Regarding PFAS, perfluorooctanesulfonic acid (PFOS) was detected at a maximum concentration of 0.00159 ppm exceeding the protection of groundwater value of 0.00037 ppm, but below the residential value of 0.0088 ppm. Groundwater - Several petroleum VOCs were detected in groundwater monitoring wells. 1,2,4-trimethylebenzene was detected at a maximum concentration of 1,900 parts per billion (ppb) exceeding Ambient Water Quality Standards (AWQS) of 5 ppb. 1,3,5-trimethylebenzene was detected at a maximum concentration of 820 ppb (AWQS of 5 ppb). Ethylbenzene was detected at a maximum concentration of 290 ppb (AWQS of 5 ppb). 1,1,1-Trichloroethane was detected at a maximum concentration of 10 ppb (AWQS of 5 ppb). Cis-1,2-Dichloroethene was detected at a maximum concentration of 9.4 ppb (AWQS of 5 ppb). Trichloroethene (TCE) was detected at a maximum concentration of 31 ppb (AWQS of 5 ppb). Two SVOCs, benzo(a)anthracene was detected at a maximum concentration of 0.05 ppb (AWQS value of 0.002 ppb) and naphthalene was detected at a maximum concentration of 290 ppb (AWQS of 10 ppb). Dissolved metals are consistent with urban background concentrations. No Polychlorinated biphenyls (PCBs) were detected exceeding their respective AWQS. Regarding pesticides, dieldrin was detected at a maximum concentration of 0.008 ppb exceeding their respective AWQS of 0.004 ppb. Regarding PFAS, PFOS was detected at a maximum concentration of 30.9 parts per trillion (ppt) and perfluorooctanoic acid (PFOA) at a maximum concentration of 48.1 ppt, which exceed the NYSDOH maximum contaminant level (MCL), or drinking water standard of 10 ppt each. Soil Vapor - Several chlorinated VOCs were detected in soil vapor and indoor air samples. 1,1,1-Trichloroethane was detected in soil vapor samples at a maximum concentration of 52,200 micrograms per cubic meter (ug/m3). 1,1-Dichloroethane was detected in soil vapor samples at a maximum concentration of 68,400 ug/m3. Cis-1,2-dicholorethene was detected in soil vapor samples at a maximum concentration of 218,000 ug/m3. Trichloroethene (TCE) was detected in soil vapor samples at a maximum concentration of 59,700 ug/m3 and in indoor air samples at a maximum concentration of 0.81 ug/m3. Tetrachloroethene (PCE) was detected in soil vapor samples at a maximum concentration of 23,300 ug/m3 and in indoor air samples at a maximum concentration of 62.5 ug/m3. "

Health Problem: "Since the site is covered with pavement and a building, people will not come into direct contact with contaminated soil or contaminated groundwater unless they dig below the surface. The area is served by a public water supply that is not affected by the groundwater contamination. Volatile organic compounds in soil vapor (air spaces within the soil) may move into buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The building on the site is currently occupied and actions are needed to address indoor air impacts due to soil vapor intrusion. Also, the potential exists for the inhalation of site contaminants due to soil vapor intrusion both off-site and for any future on-site redevelopment. "

Site Description:	"Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling

BRONX POINT (Continued) **S127480939**

facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "

Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm

BRONX POINT (Continued) **S127480939**

(RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem:	"Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is

BRONX POINT (Continued) **S127480939**

0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

Date Rec Updated: 07/31/2024
Updated By: YXPALUMB
Site Description: "Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "
Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations

BRONX POINT (Continued) **S127480939**

include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air

BRONX POINT (Continued) **S127480939**

samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "
Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

Site Code: 577942
Site Description: "Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "
Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved

BRONX POINT (Continued) **S127480939**

soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in

These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but

BRONX POINT (Continued) **S127480939**

these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

Site Code: 577942
Site Description: "Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site

BRONX POINT (Continued) **S127480939**

soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "

Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002

BRONX POINT (Continued) **S127480939**

ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic

BRONX POINT (Continued) **S127480939**

acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

Site Code: 577942
Site Description: "Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under

BRONX POINT (Continued) **S127480939**

construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "

Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or

BRONX POINT (Continued) **S127480939**

herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

BRONX POINT (Continued) **S127480939**

naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

SWIS: 0301
Town: New York City
Record Added Date: 10/05/2018
Record Updated Date: 01/13/2023
Update By: AAOBLIGA
Site Description: "Location: The site is located at 575 Exterior Street and identified on the Tax Map as Block 2356, Lots 2,10 and part of 6 in the West Concourse neighborhood of the Bronx, NY. The site is about 194,772 square feet (4.471 acres) and bounded by Mill Pond Park to the north; the elevated Major Deegan Expressway and Exterior Street to the east; East 149th Street/145th Street Bridge followed by a recycling facility to the south; and a railroad right-of-way followed by the Harlem River to the west. Site Features: The site is currently comprised of the proposed 23-story tower development under construction. Current Zoning and Land Use: The site is currently under construction and located in a R7-2 (residential)/C2-5 (commercial) mixed-use district and is within the Special Harlem River Waterfront District. The adjoining parcels are used for commercial and light industrial purposes, with the surrounding area generally consisting of residential, commercial, light industrial, and institutional (schools and churches) use. Past Use of the Site: Historic operations at the site include a lumberyard and sawmill (1891-1908), a machine shop (1908), a coal yard (1908-1935), a New York Edison Company facility (1922), and a railroad freight yard (1908-1980). From 1980 the site was vacant until remedial construction started in 2021. Records indicate that from about 1977 through 2007 three buildings were located on the eastern side of the site, which were then demolished. Site Geology and Hydrogeology: Site soils consist of historic fill in the top 24 feet, underlain by alternating layers of clay, silt, sand and bedrock. Bedrock is present at depths ranging from about 67 feet below ground surface (ft-bgs) to 78 ft-bgs, sloping from east to west. Groundwater is present at depths of about 6 to 13 ft-bgs and flows north/north west towards the Harlem River. "
Env Problem: "Post-Remediation: Remediation of the site is complete. Prior to remediation the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) associated with visually petroleum-impacted soil and historic fill and also metals primarily found in historic fill. Two volatile organic compounds (VOCs) were detected at concentrations exceeding ambient water quality standards and soil vapor exhibited elevated levels of contamination from chlorinated VOCs (CVOCs). Remedial actions have successfully achieved soil cleanup objectives for restricted residential use under a track 4 cleanup which included excavation, a site cover, ISCO treatment of the groundwater and sub-slab depressurization to mitigate soil vapor impacts. Remaining contamination in soil, groundwater and soil vapor is being managed under a Site Management Plan. Prior to Remediation: Soil and groundwater were analyzed for (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), pesticides, and emerging contaminants (ECs). Based upon investigations conducted, the primary contaminants of concern include petroleum-related SVOCs and metals in soil, and petroleum-related SVOCs in groundwater. Soil - No VOCs were detected above the restricted residential use soil cleanup objectives (RRSCOs). Eight SVOCs, mainly PAHs, were detected at concentrations above the RRSCOs in 29 soil borings. These PAHs were associated with visually

BRONX POINT (Continued) **S127480939**

petroleum-impacted soil and in historic fill collected at depths from 0 to 24 feet below ground surface (bgs). The maximum concentrations include benzo(a)anthracene at 16.6 parts per million (ppm) (RRSCO is 1 ppm), benzo(a)pyrene at 17.5 ppm (RRSCO is 1 ppm), benzo(b)fluoranthene at 14.1 ppm (RRSCO is 1 ppm), benzo(k)fluoranthene at 12 ppm (RRSCO is 3.9 ppm), chrysene at 14.2 ppm (RRSCO is 3.9ppm), dibenzo(a,h)anthracene at 3.43 ppm (RRSCO is 0.33 ppm), indeno(1,2,3-cd)pyrene at 9.98 ppm (RRSCO of 0.5 ppm), and naphthalene at 14.40 ppm (RRSCO is 100 ppm). Several metals were detected at concentrations above the RRSCOs in soil, including arsenic at 41.9 ppm (RRSCO is 16 ppm), barium at 2,710 ppm (RRSCO is 400 ppm), cadmium at 6 ppm (RRSCO is 4.3 ppm), cyanide at 1,290 ppm (RRSCO is 27 ppm), lead at 6,600 ppm (RRSCO is 400 ppm), and mercury at 24.6 ppm (RRSCO is 0.81 ppm). They were primarily found in historic fill at depths from 0 to 24 feet bgs. No PCBs, pesticides or herbicides were detected above RRSCOs. No standards currently exist in New York State for 1,4-dioxane or per- and polyfluoroalkyl substances (PFAS) in soil, so soil sample concentrations were compared to NYSDEC screening values of 0.1 ppm for 1,4-dioxane and 1 part per billion (ppb) for PFAS. 1,4-dioxane was not detected in soil samples. One or more of eight individual PFAS compounds were detected in 18 of 22 soil samples analyzed for PFAS. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected above the NYSDEC PFAS screening value of 1 ppb at a maximum concentration of 5.39 ppb. Data does not indicate any off-site impacts in soil related to this site. Groundwater - One VOC, 1,2,4-trimethylbenzene, was detected at a concentration above the ambient water quality standards (AWQS) of 5 parts per billion (ppb) at a concentration of 7.57 ppb. Seven PAHs namely, benzo(a)anthracene at 1.32 ppb (AWQS is 0.002 ppb), benzo(a)pyrene at 1.52 ppb (AWQS is non-detect), benzo(b)fluoranthene at 1.21 ppb (AWQS is 0.002 ppb), benzo(k)fluoranthene at 1.3 ppb (AWQS is 0.002 ppb), chrysene at 1.39 ppb (AWQS is 0.002 ppb), indeno(1,2,3-cd)pyrene at 0.871 ppb (AWQS is 0.002 ppb), and naphthalene at 14.2 ppb (AWQS is 10 ppb) were detected in nine monitoring wells. Iron, magnesium, manganese, selenium and sodium were the only metals detected above AWQS, but these are associated with the site s proximity to saline surface water. Levels of PFOS and/or PFOA was detected above the NYSDEC screening level of 10 ppt in all groundwater wells with PFOS at a maximum concentration of 86.9 parts per trillion (ppt) and PFOA at 45.7 ppt. 1,4-dioxane was detected above the NYSDEC screening level of 1 ppb in one groundwater sample collected from monitoring well MW06 at 2.2 ppb. Data does not indicate any off-site impacts in groundwater related to this site. Data does not indicate that the site is a possible source of PFOS or PFOA contamination. Soil Vapor - Chlorinated VOCs including tetrachloroethene (PCE) and vinyl chloride were detected in soil-vapor samples. PCE was detected at a maximum concentration of 7.3 micrograms per cubic meter (g/m3). Vinyl chloride was detected at a maximum concentration of 60 g/m3. As no occupied structures exist at the site, no subslab or indoor air samples were taken. Data does not indicate any off-site impacts in soil vapor related to this site. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with remaining contamination."

DEC Memo:	4/1/21-Zhune- Woo Kim sent the following email- I am looping in the NYSDEC BCP team. We called in a spill because petroleum-impacted water and petroleum sludge was released onto soil and groundwater during the removal of underground storage tanks. These tanks were identified during the excavation of a petroleum hotspot and will be decommissioned by an FDNY-certified contractor. The spill will be remediated under the NYSDEC Brownfield Cleanup Program. The NYSDEC project manager is Shaun Bollers, who has been cc d in this response.
Remarks:	2 USTs discovered during excavation of site. Contained and cleanup is pending.

DEC Memo: 12/07/05: This spill transferred from J.Kolleeny to S.Kraszewski.

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

09/23/10: J.Kann - spill
transferred from K. Tang to J.Kann. 5/29/12: J.kann - since little is known about this facility, a
P0 priority was assigned. 10/23/13: J.Kann - a work plan was submitted and edoced under 9005760.
01/07/14: J.Kann - revised IWP approved on 12/23/13. There was some confusion between the two
Mitchell Houses. The revised IWP only covers Alexander Avenue. SIR due 6/23/14. Site included in
the multi site stip sent to NYCHA today. 12/12/14: J.Kann - SIR submitted to DEC on 10/15/14 after
an approved extension. The report was reviewed and it required revisions due to the confusion of
the two Mitchell houses. The revised report was email to the Department on 12/11/14. Six soil
borings were advanced and three wells were installed. Results of the twelve soil samples collected
for analysis of VOCs and SVOCs yielded no exceedences of CP-51. All groundwater concentrations were
below TOGS 1.1.1. NFA. Spill closed.

Remarks: CALLER WAS REMOVING TOPSOIL TO REMOVE TANKS AND REALIZED SOIL WAS CONTAMINATED. CONTRACT WORK WAS STOPPED UNTIL DEC NOTIFIED.

DEC Memo:	12/23/22 - Kim - I received a follow-up call from Ryan McPherson with NYCHA. NYCHA crew responded to the site to clean up the heating oil that seeped up from the leaking fill line. Remediation work will be scheduled for next week. 12/27/22 - Kim - I received a follow up email from NYCHA McPherson that the initial remediation at the Mitchel spill # 2207895 was done on 12/23/22. Remediation pressure washed and vacuumed all affected areas. Areas where soil was impacted was covered in a plastic tarp and staked to prevent additional infiltration. The area to be soft dug was approximately 10ft by 50ft by 1ft. Photos after work done on 12/23/22 were received via email. 4/4/23 - Kim - NYCHA McPherson submitted soil sampling data on 3/31/23. Soil data shows one exceedance of Unrestricted Use Soil Cleanup Objectives in sample M3 with Total Xylenes at 730ug/kg (Unrestricted Use SCO at 260ug/kg) but below Residential Restricted Use SCO at 100,000ug/kg. Gross contamination from the spilled oil was removed. No further remediation is required. Spill case closed. 11/14/23 - Kim - Spill case reopened based on oil found in basement sump at Mitchel Houses that was reported in Spill 2300847. Further information required regarding remediation work done in response to the spill and the condition of the fill line.

DEC Memo:	5/1/23 - Kim - Desk Duty - I called McPherson with NYCHA. An unknown oil was found in the ejector pit in the afternoon and the ejector pit sump was shut off to prevent discharge. NYCHA described the oil as being golden-brown in color and the oil did not have a fuel odor. It is possibly hydraulic oil from an unknown source. NYCHA checked the elevator shafts and did not find any spilled oil or liquids. NYCHA collected a sample of the oil for ID. NYCHA is using a vacuum truck to remove the unknown oil from the ejector pit. NYCHA was not sure how much oil was in the ejector pit as over 1,000gal was pumped out and there was more liquid that needed to be pumped out. The unknown oil was found following a significant rain event over the weekend. NYCHA is investigating the spill and the source of the unknown oil. 5/2/23 - Kim - Scheduled site visit with NYCHA McPherson. Oil was still coming into the basement at 205 Alexander Ave. The oil appeared to be mostly clear on top of water and there was not a noticeable sheen. Location of oil impacted sump

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

and monitoring well are on the southern side of 205 Alexander Ave. The oil did not give off the odor of No. 2 Fuel Oil. I discussed my observations with DEC Austin and this unknown oil could be hydraulic oil or dielectric feeder oil. Based on Spills Database, a Con Ed Feeder appears to have been located on E 138th St in the Bronx north of this spill site. In the Spills Database, I found older Con Ed spills in the area, but I did not find a recent feeder leak. 5/4/23 - Kim - I received a follow up email from NYCHA McPherson that the sample went in 5/3/23 with a 5-day TAT. On 5/3/23, 205 Alexander was still getting the same flow of oil in the basement as on 5/2/23. 5/17/23 - Kim - I received a copy of the lab report from NYCHA McPherson which found the sample contained 120,000mg/L of Gasoline Range Hydrocarbons and 910,000mg/kg of Unidentified TPH. The TPH sample results included the comment that Petroleum hydrocarbon chromatogram most closely resembles diesel fuel / fuel #2. I called NYCHA McPherson and he stated that there was still oil coming into the basement. NYCHA is currently using engineering controls (absorbent pads to prevent oil from discharging with water from the basement ejector pit but it was ineffective as most of the oil is floating on top of the flowing water) and is planning to schedule the final cleanup using a vac truck when the flow of oil subsides. I contacted Con Ed and this does not appear to be from a recent feeder leak. I asked Con Ed to check into this possibly being a dielectric fluid spill. Con Ed responded that Con Ed STO only has solid dielectric feeder 12 blocks away and there are no oil filled feeders near the spill location; Con Ed Electric Operations has not reported any distribution issues in the area. 6/6/23 - Kim - See spills on E 138th St in the Bronx in the vicinity of the Mitchel Houses and reported within the last 10 years listed below: Spill 2207895: Reported 12/23/22 as a spill from the NYCHA UST fill line. NYCHA crew responded to the site, cleaned up the heating oil that seeped up from the leaking fill line, and covered the area with poly. Remediation work to hand dig the fill line was completed and endpoint soil samples were completed 2/24/23 indicating that the contaminated soil was removed. Spill 1809262: EMIS 270019. Excavation on 3rd Ave and E 138th St located around the corner 0.2mi from 205 Alexander. Con Ed reportedly found lube oil; Sample 18-08700-001 contained less than 2.00ppm PCB but Sample 18-08700-003 contained 12.00ppm PCB. Spill 1707595: 255 E 138th St located around the corner 0.2mi from 205 Alexander. Con Ed reported finding cable oil contaminated soils while excavating in the street, 44 tons of soil and liquids was removed. Closed 3/15/19.

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

Previous spills in the vicinity
and reported within the last 15 years include: Spill 1101731: Con Ed Vault at 206 E 138th St
located 0.25mi from 205 Alexander. Con Ed reportedly found lube oil in a vault at 206 E 138th St.
Spill 0890203: Con Ed Manhole in front of 285 E 138th St located around the corner 0.2mi from 205
Alexander. Con Ed found 2pt of oil from uncapped cable ends. Spill 0814310: Park Ave & E 138th
located 0.3mi from 205 Alexander. Limited information in Spill Report. Con Ed Equipment failure,
Utility Conduit, Dielectric fluid... Prior, 15.3 years ago, Spill 0710643 at 220 E 138th St.
Vacant/commercial lot removed four 550gal USTs Based on the history of reported spills on E 138th
St, it appears that there have been prior excavations and underground structures where prior spills
of Con Ed dielectric cable oil and spills from unknown sources of lubricating oil were found.
6/12/23 - Kim - On 6/8/23, I met NYCHA McPherson on site and we grabbed a sample of the unknown oil
from the monitoring well located next to the UST at 205 Alexander Ave. From a visual inspection of
the sample, the liquid was black to dark brown in color and appears amber when held up to the
light. The liquid also appeared to have low viscosity in comparison to known petroleum product
samples, less viscous than dielectric oil, and most similar in viscosity to diesel or no. 2 fuel
oil. Based on this visual inspection and the odor of the collected sample, this unknown oil appears
to be weathered No. 2 fuel oil. 6/22/23 - Kim - I contacted Ryan with NYCHA who reported that
recently NYCHA has intermittently observed oil in the basement sump of 205 Alexander Ave. Ryan will
have the active, in-use UST system tightness tested as requested by DEC. 7/13/23 - Kim - Site
history: Spill 2207895 - On 12/23/22, NYCHA reported an overfill of the tank system that spilled
onto the grass surface and was cleaned up. The majority of impacted soil was removed and disposed
of by NYCHA. Residual contamination based on endpoint soil samples collected 2/24/23 only had minor
exceedances of SCOs. The spill site is registered under PBS 2-473243. The Mitchel Houses have 3 in
service USTs, 3 closed and removed tanks (closed 7/1/98), and 1 tank closed in place (5/1/98). The
3 in service USTs were installed 7/1/98, contain no. 2 fuel oil in double-walled fiberglass coated
steel tanks with leak detection (interstitial electronic monitoring, auto tank gauge), overfill
protection (high level alarm, automatic shut-off), suction dispenser, underground/on-ground piping,
flexible piping, etc. Nearby sites searched by using UIS (E 138TH ST, E 137TH ST, 3RD AVE- LINCOLN
AVE/ALEXANDER AVE/ WILLIS AVE, E 136TH ST, E 135TH ST) and DECinfo Locator. Groundwater in the area

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

generally flows to the west-southwest, i.e. potential off-site source of oil is to the east-northeast (based on information from BCP C203056 and C203057 files). PBS 2-197637 St. Jerome Church at 230 Alexander Ave 0.1mi NE from 205 Alexander. PBS Registration Expired 7/20/2007. Tank in service 3,000gal containing no. 2 fuel oil. PBS 2-218421 270 Alexander Ave HDFC 0.1mi N from 205 Alexander. PBS Registration current and expires 6/26/2027. 1 Tank in service, 1,800gal steel AST-contact w/soil containing no. 2 fuel oil. PBS 2-342807 40 PCT at 257 Alexander Ave 0.1mi N from 205 Alexander. PBS Registration current and expires 12/14/27. 2 Tanks in service, 550gal and 2,400gal containing no. 2 fuel oil. PBS 2-482595 Westbury Ct. East 138th St. Corp. at 361 E 138th St 0.14mi NE from 205 Alexander. PBS Registration Unregulated/closed. PBS 2-473332 416 E 137th St NYCHA Mitchel Houses Management Office 0.2mi E from 205 Alexander. In other directions: PBS 2-351679 P.S. 154 - Bronx X154 at 333 E 135th St 0.1mi SE from 205 Alexander. PBS Registration current and expires 6/28/2023. 2 Tanks in service, 7,500gal each, containing no. 4 fuel oil. PBS 2-607817 Los Peguero Repair Shop at 209 E 138th St 0.3mi NW from 205 Alexander. Four tanks no. 001, 200, 300, 400 were closed in place. Tank 1 remains in service and contains 250gal of waste oil/used oil. PBS 2-318825 220 E 138th St 0.3mi W from 205 Alexander. Four 550gal tanks that contained gasoline were removed. Tank 001 that contained 3,000gal of no. 2 fuel oil was closed in place. BCP sites BCP C203056 Borinquen Court 271 - 285 E. 138th St located to the north of the site. Groundwater is approximately 15 feet below surface grade at the Site and flows to the west-southwest. Track 4: Restricted use with site specific soil cleanup objectives. From Work Plan.BCP.C203056.2020-11-02.Revised SMP, Based on the surveyed well elevations and the depth to water measurements recorded during prior investigations, groundwater is approximately 15 feet below surface grade at the Site and flows to the west-southwest. Hydrogeological evaluations completed during prior monitoring at the Site indicated a groundwater flow direction to the southwest in the overburden aquifer. Groundwater elevation data and groundwater monitoring well construction logs are available in prior reports including the RIR, FER, and subsequent investigations completed by AKRF in 2015 and 2016. BCP C203057 Former G & C Services 255 East 138th St located 0.19mi to the northwest of the site. From DecDocs file Work_plan.BCP.C203057.2018-02-13.SMP_revised_February_2018.pdf Section 2.2.3 Hydrogeology, Depth to groundwater varies across the Site between approximately 4.75 and 6.5 feet below grade surface,

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

according to the RIR prepared by Brinkerhoff in May 2013. The inferred groundwater direction is
towards the west to southwest. SSF N 203051 Rider Ave Gas Station 0.2mi northwest. BCP C203047 2477
3rd Avenue Property 0.19mi west. 7/11/23 - Kim - Follow up with PBS 2-197637 St. Jerome Church at
230 Alexander Ave 0.1mi NE from 205 Alexander. PBS Registration Expired 7/20/2007. PBS record
indicates tank was in service 3,000gal steel UST containing no. 2 fuel oil. Based on proximity and
the expired registration, this tank may have spilled oil. Further, groundwater flow direction to
the southwest in the overburden aquifer would suggest that the source of oil is likely to the
northeast. 8/17/23 - Kim - Joint inspection with DEC Zielinski performed on 8/10. 3 PBS facilities
- there were violations of PBS regulations but no clear source of the spill impacting 205 Alexander
Ave. PBS 2-218421 270 Alexander Ave HDFC had 1 tank in service. This facility did not appear to be
the source of oil but there appeared to be some oil present floating on water in a floor drain in
the basement. PBS 2-342807 40 PCT at 257 Alexander Ave had 2 Tanks in service, 550gal and 2,400gal
containing no. 2 fuel oil and did not appear to be the source of oil. PBS 2-197637 St. Jerome
Church at 230 Alexander Ave had 2 tanks; one of these tanks was not registered with PBS. There was
also some oil present in the basement boiler room sump pit. PBS is requiring the facility to
perform a tank tightness test; records must be submitted to DEC by 9/14/23 - NOV letter dated
8/15/23 sent by PBS. An additional inspection was performed at 269 Alexander Ave, a residential
building that appeared to be unoccupied currently and under construction. The building had an
unregistered tank with a capacity greater than 1,100gal. PBS will be requiring the respondent to
perform a tank tightness test - correspondence pending additional information requested by PBS.
10/31/23 - Kim - Ryan McPherson reported that 205 Alexander Ave reported finding some oil in the
basement sump. Absorbent pads will be used to remove as much oil as possible. The monitoring well
located next to the UST at 205 Alexander Ave that had product previously had one inch of oil on
water today. The source of the spill remains unknown. 11/3/23 - Ye - Received an update from Ryan
that oil was found again in the sump (second time this week, becoming a nuisance). They say it's
been tested and not their oil because it's golden brown and not dyed. Said I will update the notes
and DEC Kim, who can follow up next week. 11/7/23 - Kim - I searched for spills in the Bronx in the
vicinity of the Mitchel Houses and reported from 11/6/23 to 10/18/22 and found 5 spills: 2207895 -
see above... Reported 12/23/22 as a spill from the NYCHA UST fill

MITCHELL HOUSES -NYCHA (Continued) **S103036974**

line. NYCHA crew responded to the
site, cleaned up the heating oil that seeped up from the leaking fill
line, and covered the area
with poly. Remediation work to hand dig the fill line was completed
and endpoint soil samples were
completed 2/24/23 indicating that the contaminated soil was removed.
2303264 - Reported 7/19/23 at
NYCDOE school, PBS#2-351679, TTF 7,500gal AST due to dry leak in vent
line. 2302112 - 2300733
2208631 11/9/23 - Kim - Note 269 Alexander Ave registered the
abandoned tank under PBS 2-613487. I
performed a site visit on 11/8/23 and met with NYCHA McPherson and his
crew. Using an interface
probe NYCHA confirmed that there was oil in the monitoring well by
their UST. We inspected the
basement and saw that there was a sheen on the water in the basement
floor drain and odors of a
degraded petroleum spill but there was no free product. Prior to my
site visit, NYCHA employees
stated that there have been globules of oil on water and petroleum
odors following rain events.
After discussing next steps with NYCHA, we investigated the
surrounding area north-northeast of 205
Alexander and found some monitoring wells on the sidewalks that can be
sampled to track down the
source of the spill. 11/22/23 - Kim - I met onsite with Ryan McPherson
and NYCHA personnel in the
morning after a rain event yesterday. Using an interface probe NYCHA
checked the monitoring well by
their UST and measured 6in of oil present. In the basement floor
drain, there was a nonrecoverable
sheen on the water and barely a detectable petroleum odor. NYCHA used
the interface probe to check
the monitoring wells in the sidewalk on Alexander Ave in front of the
police precinct at 257
Alexander Ave, in front of 261 Alexander Ave, 269 Alexander Ave, and
across the street in the
sidewalk in front of 262 Alexander Ave. Only water was detected. No
other reports of oil have been
received since oil was found in the basement floor drain at 205
Alexander. Based on the information
available, there has not been evidence of an offsite source of the
oil. The source of the oil is
possibly an old spill from the building's own UST system. I
recommended that NYCHA collect oil in
the monitoring well by their UST using absorbent socks and mitigating
indoor air quality concerns
using ventilation fan and/or an air scrubber. 7/18/24 - Kim - Proposed
sample and well locations
submitted by NYCHA McPherson. I called NYCHA McPherson and suggested
that the well locations
include one to the southwest as that is presumably the general
direction to the closest surface
waterbody, the Harlem River. New proposal pending submission.

Remarks: cleanup pending. drain in basement

DEC Memo:	1/20/2005 - Sangesland spoke to Housing Authority Rep. He said the overfill spill came out the stick line from a buried tank. It overflowed the cement pad and poured over an area about 6 ft wide and 18 ft long on the soil down to a retaining wall where it pooled. Housing Authority says they will excavate the area Soon No outside contractor was called. Housing Authority says they will do the cleanup themselves. 11/2/05: This spill transferred from J.Kolleeny to S.Kraszewski 01/26/06: This spill transferred from S.Kraszewaski to Q.Abidi 03/29/06: This

Update By:	BXANDERS
Site Description:	"Location: The Site is located in an urban area in the Mott Haven section of the Bronx and is comprised of approximately 47.411 square foot (sf) irregularly (rectanuglar?) shaped lot. The site includes all of Block 2309 Lot 12 and a portion of Lot 1 and has 75 feet of frontage along Bruckner Boulevard and approximately 300 (360?) feet of frontage along E. 134th Street. Site Features: The site is currently vacant. Current Zoning/Use: The site is zoned M1-2/R6A

FORMER MANUFACTURING PLANT (Continued) **S117936672**

	residential/commercial and is currently vacant, though part is used as a parking lot by the adjacnet building. Historical Use: The subject property was historically used as a piano factory, woodworking factory and marble factory (1890s through 1920s), and a revolving door factory and window and door factory (1940s through 2007). Site Geology and Hydrogeology: Subsurface soils at the site consist of historic fill materials to a depth of approximately 5 to 10 feet below grade. Silty sand is present immediately below this layer to a depth of 15 feet. The depth to bedrock is anticipated at approximately 20 to 30 feet below land surface. Groundwater at the Site is present under water table conditions at a depth of approximately 10 feet below grade. Based on regional water table elevation maps, groundwater flow is expected to be southwest toward the Harlem River."
Env Problem:	"Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available."

SWIS:	0301
Town:	New York City
Record Added Date:	03/24/2020
Record Updated Date:	01/19/2024
Update By:	HMDUDEK
Site Description:	"Location: The 0.57-acre site is located at 2413 Third Avenue, in the Port Morris Harlem Riverfront section of the Bronx. The site occupies a portion of Block 2319, Lot 109. The site is located west of the intersection of Third Avenue and Bruckner Boulevard and is bounded by a self-storage facility to the north; light industrial and commercial buildings, a dog park, and an access roadway to the northeast; Third Avenue and the Third Avenue Bridge overpass to the southeast; and a residential construction project to the west. Site Features: The site contains a multi-story residential building with parking below the building. Current Zoning and Land Use: The site is located in the Special Harlem River Waterfront Zoning District. The site is zoned M1-3/R8. A multi-story residential building is being built on the site. Past Use of the Site: By the late 1897, a 6-story building was constructed and used for unspecified manufacturing through the 1920s. Starting in the 1930s the building was used for storage; it was used for storage through the early 2000s. A 1-story building occupied the northern portion of the lot by at least the 1920s. This building was used for automobile repair, unspecified manufacturing, and lubrication oil storage through the early 2000s when the building was demolished. The southeastern portion of the site was occupied by a 2-story building used as a manufacturing facility by at least the

2413 THIRD AVENUE (Continued) **S126369660**

1920s and used for manufacturing and a chemical laboratory. The 2-story building was demolished by 1984. A freight railway easement transected the site between 1935 and 1951. Site Geology and Hydrogeology: The site was excavated to between 10-26 feet below ground surface. The building is underlain by native silty and clayey sands and clay with varying amounts of peat and shells. Bedrock was not encountered during site investigation and minimum expected depth to bedrock is 50 feet. Groundwater was encountered between about 7 and 8.5 feet bgs. Inferred groundwater flow is to the southwest towards the Harlem River. Based on proximity to the Harlem River estuary, groundwater elevations across the site may be subject to tidal fluctuations. "

Env Problem:	"Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were polycyclic aromatic hydrocarbons (PAHs) and metals in soils; PAHs in groundwater; Chlorinated volatile organic compounds (CVOCs) and petroleum products in soil vapor. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. "
Health Problem:	"The site has been remediated and the potential for people to come in contact with site contamination was addressed by the remedy."

DEC Memo:	4/29/08 Received letter from Stuart Schwartz, of SNS Energy Distribution Corp., on 4/28/08. Tank was excavated and isolated and retested. Isolation revealed leak was at vent line. No contaminated soil associated with this spill. Tank retested on 4/25/08 and passed. They are waiting for authorization from owner to replace all piping and will retest. bf 5/1/08 bf: sent ttf letter to: Urbanization Maria Lopez Housing 580 White Plains Road, 6th Floor Tarrytown, NY 10591 Sent copy to: Stuart N. Schwartz, Chief Executive officer SNS Energy Corporation 221 Broadway, Suite 205 Amityville, NY 11701 6/4/08 On 6/3/08, received fax of letter dated 5/23/08 from Stuart Schwartz of SNS Energy. All oil distribution piping at the site was replaced even though only the vent line failed. Tightness test was done 5/22/08 and passed. I called Mr. Schwartz (631)691-1700 and left message with secretary to call me back. When he calls back I will request another letter regarding contamination, if any, and the tank test is deficient because of gw determination. bf 6/10/08 On 6/9/08, received

(Continued) **S109064253**

revised tank test report. Report is satisfactory. Need letter regarding contamination. Called him at (631)926-2196 and left message requesting letter. bf 6/11/08 Yesterday, received fax from S. Schwartz stating no oil contamination found and piping was replaced due to its age. NFA. bf

DEC Memo:	Tank is UNDER 1080 gal - non PBS. They did not have an exact size. There is no visible spill at this site, only a TTF. 8/05/2015: Rashad Spill transferred from Sangesland to Rashad as per RSE. 8/13/2015: Rashad Per NYC building records 308 Willis Ave has no alternate address. No PBS records or additional spill reports found. No documents found in D2. According to building records the owner is: Willis Bricks LLC C/O Express Fine Jewlery 55 West 47th Street - Suite 340 New York, NY 10036 8/18/2015: Rashad Email sent to Abraham from NYC tank testing: After reviewing the spill report for 308 Willis Ave, Bronx NY, spill#1006590 dated 9/17/2010, I would like to request the following information: Tank test failure report. Test results for supply/return and vent/fill lines. Property owners information. 8/24/2015: Rashad Received email from Goldie with tank test failure report. Report indicates ullage (dry) portion of leak. Letter attached also states This letter is to certify that on September 3, 2010 New York City Tank Testing isolated, tested and

UNKNOWN - TTF (Continued) **S110541017**

reconnected the vent line at the above mentioned premises. The results are as follows: The vent line had a gross failure. Recommendations: At the current time NYC Tank Testing recommends uncovering the top of tank and isolating all necessary lines. Documents uploaded to D2. 12/7/2016: Rashad Spill will be administratively closed as per tank test failure guidance document for TTF greater then 5 years old. Leak was a dry leak and according to tank test documents, failure was in vent line, not tank. Spill administratively closed.

Remarks: tank test failure, no other info known

DEC Memo:	12/12/05: This spill transferred from J.Kolleeny to S.Kraszewski. 07/28/06: Two 25K USTs installed in 1948 that stored #4/#6 oil were closed-removed in 1996. One 30K UST that stores #2 oil was installed in 1997 and is currently in service. Soil contamination was encountered during tank replacement. 4 MWs were installed in 1996 and is currently bailing oil/water. NYCHA recommends that a site assessment be performed. - SK 9/26/06: This spill was transferred from S.Kraszewski to J. Kann. -JK 12/12/12: J.Kann - the IWP was received in May 2009. The plan and historic files were reviewed. Based on the review, comments were sent to NYCHA on 12/12/12 (edoced). 3/5/13: J.Kann - revised IWP (Addendum letter and Figure 3) recvd on 2/11/13. Information reviewed and found acceptable. Pointed out in an email to NYCHA that the locations identified in the Addendum letter and revised Figure 3 are correct (however, the text of Section 3.2 of the IWP was not revised to reflect the change). SIR due 9/5/13. 12/2/13: J.Kann - stip sent to nycha on 10/30. Signed stip rcvd 12/2 and forwarded to legal. 1/28/14: J.kann - approved modifications to IWP after discussion/email with/from consultant (edoced) 2/06/14: J.Kann- visited site today. Borings were advanced in the sidewalk. Stained soils noted at the groundwater interface and collected for analysis. Historical data shows not product or contamination downgradient of the site (across Madison Avenue). Additional drilling will be performed on Monday 2/10/14. 3/5/14: J.Kann- rcvd RIR on 3/5/14. Reviewed the RIR. Concurred with recommendations. Sent and email to NYCHA. Quarterly monitoring should commence and a 2014 2nd quarter monitoring report is due on July 31, 2014. A RAP is due on 9/5/2014 7/23/14: J.Kann - reviewed RAP. VEFR is proposed in two wells containing product. Monitoring over 6 months. NYCHA needs to install 4 or 6 inch well in sidewalk after scaffolding over sidewalk is removed. email sent to NYCHA on 7/24/14. 5/12/17: J.kann - visited site today. Wells did not contain product. Boiler room walls clean. Given the minimal impacts previously noted and limited to weathered 6 oil, tanks removed over 15 years ago and no dissolved phase in gw, spill closed. Possible weathered 6 oil contaminated soils

LINCOLN HOUSES -NYCHA (Continued) **S100167943**

	at groundwater interface, so contaminated spill clause included in closure letter. Spill closed.
Remarks:	TANKS BEING REMOVED - CONTAMINATED SOIL FOUND

DEC Memo:	8/13/14- Ahmed - Spoke to Ryan (203-784-3069). As per him, the site used to be a gas station, they

2401 THIRD AVENUE (Continued) **S117269407**

did some Phase II investigation ans result showed elevated concenteation at groundwater sample
taken from a downgradient well from a former gasolene tank. they will do some supplemental
investigation. Ask him to contact DEC Demeo as he will manage the spill. Assigned to Tim Demeo.
8/15/14 - Obligado - I received a call from Ryan who requested to update some information. The site
was never a gas station. It was a commercial facility with a gasoline tank for site operations.
10/26/18 - Austin - Spill transferred from Tim DeMeo to Prat Lakhani - end 12/23/20 - A COC was
executed by DER on 12/23/20 under BCP site no. C203052. A Track 4 Residential Residential cleanup
was achieved.

Remarks: Samples showing traces of gas in soil. Tank may be still in the ground. Further investigation to take place.

Control Type:	ENG
Date Record Added:	09/04/2020
Date Rec Updated:	10/25/2022
Updated By:	WYZHENG
Site Description:	"Location: The site is located in an urban area in the Bronx and is comprised of a single irregularly shaped tax parcel covering approximately 1.4 acres. The lot is bordered to the northwest and northeast by commercial properties, to the southeast by the Third Avenue Bridge and to the southwest by the Harlem River. Site Features: The site formerly housed a vacant 19,450 square foot one-story commercial building (no basement) constructed in 1931, which was surrounded by asphalt, concrete and cobblestone-paved exterior driving/storage areas. In January 2017 the building was demolished. The site is currently undergoing redevelopment. Current Zoning and Land Use: The site is zoned as M1-3/R8 residential/ commercial (a Special Mixed Use District). The parcels adjacent to the northwest and northeast are currently used for commercial and industrial purposes. Past Use of the Site: The site was historically used for manufacturing purposes since at least 1891: J.L. Mott Iron Works (1891-1922), Hydraulic Steel Company (1922-1935), General Builders Supply Corporation (1935-1968), Brill Equipment Company (1949-1956), US Gear Manufacturing Company (1965-1971), Ohio Gasket Manufacturing Corporation (1971), and Mugler Inc. (since 1965). The site has been vacant since October of 2014. Site Geology and Hydrogeology: Subsurface soils at the site consist of fill materials and silty-sand to a depth of approximately 5 feet below grade. A silty clay was present below this layer to a depth of 15 feet closer to the River. Further inland a medium to coarse sand was encountered beneath the fill to a depth of approximately 15 feet. Groundwater depth ranges from five to seven feet below grade and flows to the southwest towards the Harlem River. "
Env Problem:	"Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs) and metals in soil and petroleum-related volatile organic compounds (VOCs) in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan. Prior to Completion of Remediation: Soil and groundwater samples were analyzed for VOCs, SVOCs, metals, polychlorinated biphenyls (PCBs), and pesticides. Soil vapor samples were analyzed for VOCs. Based upon the subsurface investigations conducted to date, the contaminants of concern for the site include petroleum-related VOCs, SVOCs and metals. Soil - A total of 34 soil samples were collected from 23 soil borings. VOCs were not reported above 6 NYCRR Part 375.6 restricted residential soil cleanup objectives (RRSCOs) in any of the samples. Several SVOCs exceeded

FORMER MUGLER SHORING INC. (Continued) **S117936658**

their RRSCOs including indeno(1,2,3-cd)pyrene (up to a maximum concentration of 0.82 parts per million (ppm) compared to the RRSCO of 0.5 ppm), benzo(a)anthracene (1.6 ppm compared to the RRSCO of 1 ppm) and benzo(a)pyrene (1.3 ppm compared to the RRSCO of 1 ppm). Most of these exceedances were from samples collected from a depth of 0 to 2 feet, however one exceedance was from a sample collected from a depth of 6-8 feet. Arsenic (up to a maximum concentration of 33.5 ppm compared to the RRSCO of 16 ppm) and lead (2,280 ppm compared to the RRSCO of 400 ppm) exceeded their respective RRSCOs. These metal exceedances were found in one sample collected at a depth of 5 to 7 feet. Data does not indicate any off-site impacts in soil related to this site. Groundwater - A total of 12 groundwater samples (one sample from each of 12 groundwater monitoring wells) were analyzed during the RI. Only two VOCs were detected in four of the samples. These are MTBE (up to a maximum concentration of 100 parts per billion (ppb) compared to the ambient water quality standard (AWQS) of 10 ppb) and methyl chloride also known as chloromethane (39 ppb compared to the AWQS of 5 ppb). SVOCs were detected in only one of the 12 samples. Analytical data for SVOCs indicated detections above the AWQS guidance values for following compounds in that one sample: benz(a)anthracene (up to a maximum concentration of 0.03 ppb compared to the AWQS of 0.002 ppb) and benzo(a)pyrene (0.03 ppb compared to the AWQS of ND). Data does not indicate any off-site impacts in groundwater related to this site. Soil Vapor - Eight soil vapor samples and five sub-slab vapor samples were collected from the site. Heptane and hexane were reported at elevated concentrations in some of the soil vapor samples with the highest concentrations reported in SG5 as 3330 and 6200 g/m3, respectively. The location of SG5 is close to the location of one of the suspected Underground Storage Tanks (USTs). Data does not indicate any off-site impacts in soil vapor related to this site. Special Resources Impacted/Threatened - Due to the proximity of the Site to the Harlem River, a Fish and Wildlife Resource Impact Analysis (FWRIA) was also conducted. Based on the nature and location of the contamination at the site, with limited impact to subsurface soils and groundwater and no evidence of migration / discharge of contaminants to the River, there are no expected adverse impacts to River. "

Health Problem:	"Remedial actions are complete and measures are in place to prevent people from coming in contact with residual site contamination."

Site Code: 507623
Site Description: "Location: The site is located in an urban area in the Bronx and is comprised of a single irregularly shaped tax parcel covering approximately 1.4 acres. The lot is bordered to the northwest and northeast by commercial properties, to the southeast by the Third Avenue Bridge and to the southwest by the Harlem River. Site Features: The site formerly housed a vacant 19,450 square foot one-story commercial building (no basement) constructed in 1931, which was surrounded by asphalt, concrete and cobblestone-paved exterior driving/storage areas. In January 2017 the building was demolished. The site is currently undergoing redevelopment. Current Zoning and Land Use: The site is zoned as M1-3/R8 residential/ commercial (a Special Mixed Use District). The parcels adjacent to the northwest and northeast are currently used for commercial and industrial purposes. Past Use of the Site: The site was historically used for manufacturing purposes since at least 1891: J.L. Mott Iron Works (1891-1922), Hydraulic Steel Company (1922-1935), General Builders Supply Corporation (1935-1968), Brill Equipment Company (1949-1956), US Gear Manufacturing Company (1965-1971), Ohio Gasket Manufacturing Corporation (1971), and Mugler Inc. (since 1965). The site has been vacant since October of 2014. Site Geology and Hydrogeology: Subsurface soils at the site consist of fill materials and silty-sand to a depth of approximately 5 feet below grade. A silty clay was present below this layer to a depth of 15 feet closer to the River. Further inland a medium to coarse sand was encountered beneath the fill to a depth of approximately 15 feet. Groundwater depth ranges from five to seven feet below grade and flows to the southwest towards the Harlem River. "
Env Problem: "Post-Remediation: Remediation at the site is complete. Prior to

FORMER MUGLER SHORING INC. (Continued) **S117936658**

remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs) and metals in soil and petroleum-related volatile organic compounds (VOCs) in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan. Prior to Completion of Remediation: Soil and groundwater samples were analyzed for VOCs, SVOCs, metals, polychlorinated biphenyls (PCBs), and pesticides. Soil vapor samples were analyzed for VOCs. Based upon the subsurface investigations conducted to date, the contaminants of concern for the site include petroleum-related VOCs, SVOCs and metals. Soil - A total of 34 soil samples were collected from 23 soil borings. VOCs were not reported above 6 NYCRR Part 375.6 restricted residential soil cleanup objectives (RRSCOs) in any of the samples. Several SVOCs exceeded their RRSCOs including indeno(1,2,3-cd)pyrene (up to a maximum concentration of 0.82 parts per million (ppm) compared to the RRSCO of 0.5 ppm), benzo(a)anthracene (1.6 ppm compared to the RRSCO of 1 ppm) and benzo(a)pyrene (1.3 ppm compared to the RRSCO of 1 ppm). Most of these exceedances were from samples collected from a depth of 0 to 2 feet, however one exceedance was from a sample collected from a depth of 6-8 feet. Arsenic (up to a maximum concentration of 33.5 ppm compared to the RRSCO of 16 ppm) and lead (2,280 ppm compared to the RRSCO of 400 ppm) exceeded their respective RRSCOs. These metal exceedances were found in one sample collected at a depth of 5 to 7 feet. Data does not indicate any off-site impacts in soil related to this site. Groundwater - A total of 12 groundwater samples (one sample from each of 12 groundwater monitoring wells) were analyzed during the RI. Only two VOCs were detected in four of the samples. These are MTBE (up to a maximum concentration of 100 parts per billion (ppb) compared to the ambient water quality standard (AWQS) of 10 ppb) and methyl chloride also known as chloromethane (39 ppb compared to the AWQS of 5 ppb). SVOCs were detected in only one of the 12 samples. Analytical data for SVOCs indicated detections above the AWQS guidance values for following compounds in that one sample: benz(a)anthracene (up to a maximum concentration of 0.03 ppb compared to the AWQS of 0.002 ppb) and benzo(a)pyrene (0.03 ppb compared to the AWQS of ND). Data does not indicate any off-site impacts in groundwater related to this site. Soil Vapor - Eight soil vapor samples and five sub-slab vapor samples were collected from the site. Heptane and hexane were reported at elevated concentrations in some of the soil vapor samples with the highest concentrations reported in SG5 as 3330 and 6200 g/m3, respectively. The location of SG5 is close to the location of one of the suspected Underground Storage Tanks (USTs). Data does not indicate any off-site impacts in soil vapor related to this site. Special Resources Impacted/Threatened - Due to the proximity of the Site to the Harlem River, a Fish and Wildlife Resource Impact Analysis (FWRIA) was also conducted. Based on the nature and location of the contamination at the site, with limited impact to subsurface soils and groundwater and no evidence of migration / discharge of contaminants to the River, there are no expected adverse impacts to River. "

Health Problem: "Remedial actions are complete and measures are in place to prevent people from coming in contact with residual site contamination."

	related to this site. Special Resources Impacted/Threatened - Due to the proximity of the Site to the Harlem River, a Fish and Wildlife Resource Impact Analysis (FWRIA) was also conducted. Based on the nature and location of the contamination at the site, with limited impact to subsurface soils and groundwater and no evidence of migration / discharge of contaminants to the River, there are no expected adverse impacts to River. "
Health Problem:	"Remedial actions are complete and measures are in place to prevent people from coming in contact with residual site contamination."

City,State,Zip: BRONX, NY 10451
Site Code: 507623
Control Name: Landuse Restriction
HW Code: C203052
Control Code: 25
Control Type: INST
Dt record added: 09/04/2020
Dt rec updated: 10/25/2022
Updated By: WYZHENG
Site Code: 507623
Site Description: "Location: The site is located in an urban area in the Bronx and is comprised of a single irregularly shaped tax parcel covering approximately 1.4 acres. The lot is bordered to the northwest and northeast by commercial properties, to the southeast by the Third Avenue Bridge and to the southwest by the Harlem River. Site Features: The site formerly housed a vacant 19,450 square foot one-story commercial building (no basement) constructed in 1931, which was surrounded by asphalt, concrete and cobblestone-paved exterior driving/storage areas. In January 2017 the building was demolished. The site is currently undergoing redevelopment. Current Zoning and Land Use: The site is zoned as M1-3/R8 residential/ commercial (a Special Mixed Use District). The parcels adjacent to the northwest and northeast are currently used for commercial and industrial purposes. Past Use of the Site: The site was historically used for manufacturing purposes since at least 1891: J.L. Mott Iron Works (1891-1922), Hydraulic Steel Company (1922-1935), General Builders Supply Corporation (1935-1968), Brill Equipment Company (1949-1956), US Gear Manufacturing Company (1965-1971), Ohio Gasket Manufacturing Corporation (1971), and Mugler Inc. (since 1965). The site has been vacant since October of 2014. Site Geology and Hydrogeology: Subsurface soils at the site consist of fill materials and silty-sand to a depth of approximately 5 feet below grade. A silty clay was present below this layer to a depth of 15 feet closer to the River. Further inland a medium to coarse sand was encountered beneath the fill to a depth of approximately 15 feet. Groundwater depth ranges from five to seven feet below grade and flows to the southwest towards the Harlem River. "
Env Problem: "Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs) and metals in soil and petroleum-related volatile organic compounds (VOCs) in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan. Prior to Completion of Remediation: Soil and groundwater samples were analyzed for VOCs, SVOCs, metals, polychlorinated biphenyls (PCBs), and pesticides. Soil vapor samples were analyzed for VOCs. Based upon the subsurface

FORMER MUGLER SHORING INC. (Continued) **S117936658**

investigations conducted to date, the contaminants of concern for the site include petroleum-related VOCs, SVOCs and metals. Soil - A total of 34 soil samples were collected from 23 soil borings. VOCs were not reported above 6 NYCRR Part 375.6 restricted residential soil cleanup objectives (RRSCOs) in any of the samples. Several SVOCs exceeded their RRSCOs including indeno(1,2,3-cd)pyrene (up to a maximum concentration of 0.82 parts per million (ppm) compared to the RRSCO of 0.5 ppm), benzo(a)anthracene (1.6 ppm compared to the RRSCO of 1 ppm) and benzo(a)pyrene (1.3 ppm compared to the RRSCO of 1 ppm). Most of these exceedances were from samples collected from a depth of 0 to 2 feet, however one exceedance was from a sample collected from a depth of 6-8 feet. Arsenic (up to a maximum concentration of 33.5 ppm compared to the RRSCO of 16 ppm) and lead (2,280 ppm compared to the RRSCO of 400 ppm) exceeded their respective RRSCOs. These metal exceedances were found in one sample collected at a depth of 5 to 7 feet. Data does not indicate any off-site impacts in soil related to this site. Groundwater - A total of 12 groundwater samples (one sample from each of 12 groundwater monitoring wells) were analyzed during the RI. Only two VOCs were detected in four of the samples. These are MTBE (up to a maximum concentration of 100 parts per billion (ppb) compared to the ambient water quality standard (AWQS) of 10 ppb) and methyl chloride also known as chloromethane (39 ppb compared to the AWQS of 5 ppb). SVOCs were detected in only one of the 12 samples. Analytical data for SVOCs indicated detections above the AWQS guidance values for following compounds in that one sample: benz(a)anthracene (up to a maximum concentration of 0.03 ppb compared to the AWQS of 0.002 ppb) and benzo(a)pyrene (0.03 ppb compared to the AWQS of ND). Data does not indicate any off-site impacts in groundwater related to this site. Soil Vapor - Eight soil vapor samples and five sub-slab vapor samples were collected from the site. Heptane and hexane were reported at elevated concentrations in some of the soil vapor samples with the highest concentrations reported in SG5 as 3330 and 6200 g/m3, respectively. The location of SG5 is close to the location of one of the suspected Underground Storage Tanks (USTs). Data does not indicate any off-site impacts in soil vapor related to this site. Special Resources Impacted/Threatened - Due to the proximity of the Site to the Harlem River, a Fish and Wildlife Resource Impact Analysis (FWRIA) was also conducted. Based on the nature and location of the contamination at the site, with limited impact to subsurface soils and groundwater and no evidence of migration / discharge of contaminants to the River, there are no expected adverse impacts to River. These metal exceedances were found in one sample collected at a depth of 5 to 7 feet. Data does not indicate any off-site impacts in soil related to this site. Groundwater - A total of 12 groundwater samples (one sample from each of 12 groundwater monitoring wells) were analyzed during the RI. Only two VOCs were detected in four of the samples. These are MTBE (up to a maximum concentration of 100 parts per billion (ppb) compared to the ambient water quality standard (AWQS) of 10 ppb) and methyl chloride also known as chloromethane (39 ppb compared to the AWQS of 5 ppb). SVOCs were detected in only one of the 12 samples. Analytical data for SVOCs indicated detections above the AWQS guidance values for following compounds in that one sample: benz(a)anthracene (up to a maximum concentration of 0.03 ppb compared to the AWQS of 0.002 ppb) and benzo(a)pyrene (0.03 ppb compared to the AWQS of ND). Data does not indicate any off-site impacts in groundwater related to this site. Soil Vapor - Eight soil vapor samples and five sub-slab vapor samples were collected from the site. Heptane and hexane were reported at elevated concentrations in some of the soil vapor samples with the highest concentrations reported in SG5 as 3330 and 6200 g/m3, respectively. The location of SG5 is close to the location of one of the suspected Underground Storage Tanks (USTs). Data does not indicate any off-site impacts in soil vapor related to this site. Special Resources Impacted/Threatened - Due to the proximity of the Site to the Harlem River, a Fish and Wildlife Resource Impact Analysis (FWRIA) was also conducted. Based on the nature and location of the contamination at the site, with limited impact to subsurface soils and groundwater and no evidence of migration / discharge of contaminants to the River, there are no expected adverse impacts to River. "

Health Problem: "Remedial actions are complete and measures are in place to prevent

DEC Memo:	9/14/ 17- DEC Piper spoke with Sam at Metro. Leak is a dry leak. Tester is in field. They will contact him, get details and update me when done. 2/2 - Spill Transferred to Central Office. 5/8/18 - Spoke with Isaac he stated that he is currently looking for a tank company to replace tank. Pipe broke during the winter and the heating system has not run since. 8/6/18 - Site inspected, no evidence of a release, no odors, tank is currently not in use. Site closed not meeting standards due to no environmental data or removal. RJW
Remarks:	it was a 1000 gallon tank it is in a concrete base.

BROWNFIELDS:

Name:	BETANCES VI
Address:	472-474 WILLIS AVENUE
City,State,Zip:	BRONX, NY 10455
Program:	BCP
Site Code:	584018
Acres:	0.230
HW Code:	C203122
SWIS:	0301
Town:	New York City
Record Added Date:	03/07/2019
Record Updated Date:	12/30/2022
Update By:	AMSERVIS
Site Description:	"Location: The 0.23-acre site is located at 472-474 Willis Avenue and is designated as Tax Block 2291, Lot 101. The site is bounded by Willis Avenue to the west, 146th Street to the south, and residential apartment buildings to the east and north. Site Features: Remedial action has been completed and the site is currently undergoing redevelopment. Current Zoning and Land Use: The site is zoned R6 (residential), with C1-4 (commercial) overlay and is currently used for commercial purposes. Past Use of the Site: City Directory listings identified automotive repair facilities at 474 Willis Avenue and 472 Willis Avenue, and manufacturing and/or equipment servicing facilities at 402 East 147th Street, a historical address associated with the Site. A 1958 Certificate of Occupancy indicated on-site use of fuel-oil. Site Geology and Hydrogeology: Subsurface soils encountered at the site during the installation of the soil borings generally consisted of variable texture fill materials (unsorted sands with brick, rock, gravel and other debris) overlying brown, sorted sands. Groundwater was encountered at depths ranging between 12 to 15 feet below surface grade. Based on information gathered during the remedial investigation, shallow groundwater flow in the vicinity of the property is to the south. There are no surface water bodies or regulated wetlands on the property. "
Env Problem:	"Remediation at the site is complete. Prior to remediation, the primary contaminants of concern for the site included SVOCs and metals in soil. Remedial actions have successfully achieved soil cleanup objectives for residential use. "
Health Problem:	"Remedial actions are complete and the remedy addressed all identified site contamination so no exposures are expected."

DEC Memo:	Roux Associates called saying they are working this project. They seem to know what to do, so no CSL was sent. 12/14/06 Rahman- William Holubowich is the contact person with Roux Assoc.They are currently preparing the Phase II report, will send to DEC along with Phase I shortly. 01/18/07 Rahman-Phase II report by Roux Associates referenced the presence of a gasoline tank and pump back in 1950's.Currently, there are no active USTs present at the site.Roux Associate collected six soil samples and three ground water samples from the site.Soil and ground water samples from the loading dock area, where the potential gasoline UST was reportedly located,indicated the presence of VOCs associated with gasoline.GW sample one contained Ethylbenzene 23 ug/l, Xylenes 120ug/l, Benzene 4 ug/l.Soil samples SB-2 and SB-3 contained Xylenes @8300 ug/l and 46,000 ug/l rspectively.As per the report, there is no off site migration of the contaminants.Contamination is localized in loading dock area.Roux Associate recommended installation of three groundwater monitoring wells and quarterly groundwater sampling and reporting for one year to evaluate groundwater quality.If a reduction in VOC is not identified, alternative approach will be evaluated to treat groundwater. 07/10/08 Final closure report from Roux Associates. Roux Associate

(Continued) **S108296712**

injected ORC to enhance the
biodegradation of the VOCs in the vicinity of GW-1, as per the previous RAP.The ORC slurry was
injected via 12 temporary injections points.The lab result shows that in situ remediation has
significantly reduced the concentrations of BTEX by an average of 92%.The final concentration of
VOCs are: Benzene 0.69 ug/l ,Toluene 34 ug/l,Ethylbenzene 220 ug/l, Xylenes 1,800 ug/l.Roux
opinioned that ground water at that site does not pose any threat to public health or
environment.Spill can be closed.(sr)

DEC Memo:	03/28/17 - Lakhani The property is an OER E designation/VCP site (15CVCP082X). There is an existing 5-story building on the property. The consultant, Brinckerhoff Environmental, is working on the commercial redevelopment of the site. They were excavating to perform repairs on the sewer line and encountered stained soils. PID readings were recorded up to 600ppm and odors are present. 10 cu. yds. of soil was excavated and stockpiled and waste class sampled. One (1) sample was taken from the east sidewall of the excavation and two (2) were taken from the bottom of the excavation. The north and west walls are brick as the excavation is along the property boundary. The south wall of the excavation does not exist as this excavation extended into an older, neighboring onsite excavation. Excavation was completed to 6’bg. Groundwater is to 10’-12’bg. A former gasoline UST was removed in the 1980-1990s which was located 15’-20’ east of the excavation. PBS #2-610419 CSL sent to Sean Harrison of Brinkerhoff Environmental and property owner at: Bruckner Associates, Inc. 20 Bruckner Blvd Bronx, NY 10454 4/16/17-Sean Harrison from Brinkerhoff sent the following email. The post-excavation sample results table has been uploaded to EPIC. Sample PE-1 detected several petroleum-related semi-volatile organic compounds (SVOCs) and volatile organic compounds (VOCs) exceeding the NYSDEC CP-51 Soil Cleanup Levels. The area surrounding PE-1 will be excavated further and the soil will be added to the existing stockpile of impacted-material. Following the additional excavation, we will collect another sample to confirm removal of soil contamination. Additionally, we have received the waste characterization data for the stockpiled material and we re currently coordinating disposal. We will forward you the facility approval letter once it s been received. On April 28, 2017, GDI Construction, LLC performed additional remedial excavation within the voconity of the PE_1 sqample location. The contractor hand-excavated the area surrounding PE_1 from Six (6) to eight (8)feet bgs and the excavated soil was added to the existing stockpile of petroleum-impacted soils and was properly covered with polyethylene sheeting and anchored. Following the excavation, Brinkerhoff screened the subsurface and no remaining petroleum impacts were identified based on visual, olfactory, and PID screening methods. one (1) post-excavation base

(Continued) **S108296712**

sample, identified as PE-1A, was collected at eight (8) to 8.5 feet bgs and was submitted for analysis of TLC, VOCs, SVOCS. Based on the analytical results, no compounds were detected at concentrations above the NYSDEC CP-51 SCLs in post-excavation sample PE-1. The entire site will be covered with a 20 -mil vapor block plus vapor barrier membrane and a concrete slab. Based on the analytical result this spill is closed.

Remarks: investigation underway

Updated By:	MOBARRIE
Site Description:	"The site location is currently described as the inersection of Concourse Village West and East 156th Street, Bronx because no source area has yet been identified. According to historic information and Sanborn maps, the MGP had been had been a small facility located on a former rail yard, the Former Metro North Property BCP# C203030 that served the rail yard. Groundwater data show elevated concentrations of MGP related contaminates such as naphthalene migrating from off-site toward the Former Metro North Site. It appears that there is an MGP waste disposal area contributing to the groundwater contamination. The objective of the preliminary site assessment (PSA) is to locate the source of the groundwater contamination determine if a remedy is necessary and feasible, if so, is a remedial investigation necessary. The site did not qualify for addition to the Registry of Inactive Hazardous Waste Sites."

Region:	2
Acres:	Not reported
HW Code:	231009
Record Add:	02/06/2003
Record Upd:	06/14/2006
Updated By:	DMMOLOUG
Site Description:	"The former Film Storage Warehouse is approximately 0.25 acres and is located at 203-209 West 146th St. in Manhattan. The property is located on the north site of West 146th St. between Adam Clayton Powell Jr. Boulevard and Fredrick Douglass Boulevard. The site is bounded on the north and west by residential buildings, and on the east by commercial buildings with residences on the upper floors. The former warehouse site has been unoccupied for over 50 years and is currently vacant. A site investigation was funded by EPA as a targeted site assessment. A Site Investigation Report was approved in November 2004. The site did not qualify for addition to the Registry of Inactive Hazardous Waste Disposal sites."
Env Problem:	"Several contaminants were detected in soils including semivolatile compounds, (primarily polyaromatic hydrocarbons)and several metals. Most of the soil contamination appears to be related to historic fill material. The building interior also has debris piles containing asbestos and lead (from insulation and lead paint, respectively). Soil vapor beneath the building contains volatile organic compounds above expected background concentrations."

FORMER MELROSE AVENUE DRY CLEANER
753 MELROSE AVENUE
BRONX, NY 10451

NY SHWS **S113916992**
N/A

Relative:
Higher

Actual:
34 ft.

SHWS:
Name: FORMER MELROSE AVENUE DRY CLEANER
Address: 753 MELROSE AVENUE
City,State,Zip: BRONX, NY 10451
Program: HW
Site Code: 57014
Classification: Significant threat to the public health or environment - action required.
Region: 2
Acres: 0.066
HW Code: 203009
Record Add: 02/21/2001
Record Upd: 02/06/2024
Updated By: BWRUNG
Site Description: "Location: The Former Melrose Avenue Dry Cleaner site is located in an urban area at 753 Melrose Avenue in the Melrose section of the Bronx and consists of a 0.066-acre parcel denoted as Block 2403, Lot 31 on the New York City tax map. The site is located on the west side of Melrose Avenue between East 156th and East 157th Streets. Site Features: The site is a vacant lot covered with crushed stone and is surrounded with a chain-link fence. The site is bordered to the north by a community garden, to the east by Melrose Avenue, to the south by a six-story apartment building, and to the west by the Public School (P.S.) 29 Ballfield. Current Zoning and Land Use: The site is zoned R6 for residential use. There are no buildings on the site, and the property is not currently in use. Past Use of the Site: Records show the site was utilized as a store and dwelling as early as 1909. Circa 1946, the site was developed with a single structure. The site was occupied by a dry cleaner during the 1950s, with storage tanks at the rear of the building. The site structure was demolished in 1968 and the site has been vacant/abandoned ever since. Use of the site as a dry cleaner has resulted in contaminated groundwater and soil vapor at the site and down gradient of the site to the south. Site Geology and Hydrogeology: The site is underlain by a fill unit extending 5 to 7 feet below ground surface (bgs), a native fine-medium sand unit with some silt present at depths of 5 to 28 feet bgs, and bedrock (Inwood marble) present at depths 11 to 28 feet below grade. Groundwater is approximately 16 to 19 feet bgs in the vicinity of the site. In some areas, the groundwater is below the surface of bedrock. Groundwater on-site flows southeast towards Melrose Avenue, and then to the south towards the East River (approximately 7,000 feet south of the site) along a former stream bed. "
Env Problem: "Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, and metals. Groundwater samples were also analyzed for emerging contaminants. Soil vapor samples were analyzed for VOCs. Based upon investigations conducted to date, the primary contaminants of concern for the site include VOCs in groundwater and soil vapor. Soil: Soil samples were collected from various depths throughout the site. Soil sampling analytical results did not indicate detection of any contaminants above residential soil cleanup objectives in any of the soil samples. There were no detections of SVOCs and PCBs above unrestricted use soil

FORMER MELROSE AVENUE DRY CLEANER (Continued) **S113916992**

cleanup objectives (UUSCOs). One metal and one pesticide were detected above their respective UUSCOs in site soils. Copper was detected at a maximum concentration of 60 parts per million (ppm), exceeding the UUSCO of 50 ppm. 4-4'-DDT, was detected at a maximum concentration of 0.0088 ppm, exceeding the UUSCO of 0.0033 ppm. The VOC tetrachloroethene (PCE) was detected at a maximum concentration of 0.16 ppm, below the UUSCO of 1.3 ppm. No other VOCs were detected in the soil samples collected from on-site soil borings. Data does not indicate any off-site impacts in soil related to this site. Groundwater: There were no detections of SVOCs, PCBs or pesticides above Technical Operation and Guidance Series Ambient Water Quality Standards (AWQS) in on-site or off-site groundwater. VOCs were detected in on-site groundwater at concentrations below AWQS and off-site groundwater at concentration above AWQS. VOCs detected at concentrations exceeding the AWQS in off-site groundwater include acetone at a maximum concentration of 390 parts per billion, or ppb (AWQS is 50 ppb), chloroform at a maximum concentration of 8.4 ppb (AWQS is 7 ppb), cis-1,2-dichloroethylene at a maximum concentration of 45 ppb (AWQS 5 ppb), tetrachloroethylene (PCE) at a maximum concentration of 660 ppb (AWQS 5 ppb), and trichloroethylene (TCE) at a maximum concentration of 6.4 ppb (AWQS 5 ppb). VOC exceedances of AWQS extend off-site approximately 700 feet to the south of the site. Metals were detected in on-site groundwater at concentrations below AWQS and off-site groundwater at concentration above AWQS. Metals that were detected in off-site groundwater samples at concentrations exceeding AWQS included iron at a maximum concentration of 7.1 ppb (AWQS 0.3 ppb), magnesium at a maximum concentration of 120 ppb (AWQS 35 ppb), manganese at a maximum concentration of 5.6 ppb (AWQS 0.3 ppb), and sodium at a maximum concentration of 240 ppb (AWQS 20 ppb). The metals observed above AWQS in groundwater are commonly associated with naturally occurring phenomenon. PFAS compounds were detected in on-site groundwater at concentrations below their maximum contaminant level, or MCL (water quality standard), and in off-site groundwater at concentration above their maximum contaminant level. The PFAS perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) were detected in off-site groundwater samples at concentrations exceeding their MCL of 10 ppt each at maximum concentrations of 23 and 24 ppt, respectively. Data does indicate off-site impacts in groundwater related to this site. Soil Vapor, Sub-Slab Soil Vapor and Indoor Air: Soil vapor samples were collected at off-site locations near properties underlain by PCE contamination in groundwater. 1,1,1-TCA was detected at a maximum concentration of 10 micrograms per cubic meter (ug/m3), PCE was detected at a maximum concentration of 840 ug/m3, TCE was detected at a maximum concentration of 14 ug/m3, and carbon tetrachloride was detected at a maximum concentration of 1.6 ug/m3. PCE detections in soil vapor extend approximately 700 feet to the south and southeast of the site. An off-site soil vapor intrusion investigation was performed in March of 2017. Sub-slab soil vapor and indoor air samples were taken in off-site structures where access was granted to determine if soil vapor intrusion exposures were present. Sub-slab soil vapor and indoor air concentrations for PCE at the NYPD Police Service Area (PSA) 7 to the south of the site indicated soil vapor intrusion mitigation was necessary. A sub-slab depressurization system (SSDS) was installed at the NYPD PSA 7 building in 2019 to mitigate soil vapor intrusion. No actions were needed to address soil vapor intrusion at the other structures sampled. Significant Threat: The

FORMER MELROSE AVENUE DRY CLEANER (Continued) **S113916992**

site was determined to pose a significant environmental threat on November 19, 2013. This determination was based on the property's past use as a dry cleaner, which contaminated groundwater beneath the site and down gradient of the site with PCE. The site was also determined to be a significant threat to public health due to the concentrations of PCE detected in on-site and off-site groundwater and soil vapor, in conjunction with the proximity of these concentrations to occupied structures. "

Health Problem: "People will not come in contact with site contamination in soil because on-site soil is not contaminated. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in soil vapor (air spaces within the soil) may move into buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because there is no on-site building, inhalation of site contaminants in indoor air due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site development. A subslab depressurization system has been installed at an off-site building to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building. Soil vapor intrusion evaluations with actions taken as needed to address exposures are recommended for other off-site buildings, including those buildings where testing has previously been declined by owners or whose owners did not respond to sampling requests. "

DEC Memo:	5/30/14-Zhune spoke to Brian Turchetta from ALC Environmental. He said they were doing phase I. They found a mix of oil and water all over the basement. Brian said as per the property owner there was a AST and is no longer in the site. He said that he is working for a potential byer. b.turchetta@alcenvironmental.com 8/5/14-Zhune spoke to Brian Turcetta from ALC Environmental and he said that they perfomed a Phase I during June at this site. Based on the findings, they recommended that the owner perform a subsurface investigation, but they have not heard from the owner. I called Fred Dilmanian (Owner) and he said that he is very concerned about the spill. He called his insurance company to see if the remediation is covered under his insurance. He asked me to call him by the end of August when he will let me know which company he will

407 EAST 158TH STREET (Continued) **S117267188**

hire. Fred Dilmanian
516-637-0901 9/29/14-Zhune spoke to Fred. He said Eastern Environmental is in the process to clean
the basement. Eastern Environmental- Jim 631-727-2700 3/10/15-James Mulvey sent the phase I Report
prepared by ALC Environmental and dated June 25, 2014. 3/30/15-James Mulvey sent the Limited
Subsurface Investigation dated March 16, 2015. The report stated that the NYSDCE was contacted to
report a fuel oil spill. According to the phase I, free floating product was floating in the
flooded basement at the time the inspection was completed. Eastern installed three soil borings in
the basement. Based on the depth of minimal impacted soil extending to less than 2' below grade,
there is no treat to the groundwater. The soil analytical result indicated no detected VOCs and
SVOCs in sample SB-1 and sample SB-2. Sample SB-3 indicated the following VOCs 1,2,4
Trimethylbenzene 2600 ug/kg, 1,3,5 Trimethylbenzene 980 ug/kg, o-xylene 1000 ug/kg and P-&m-xylene
1000 ug/kg. above the NYSDEC CP-51 unrestricted residential soil cleanup guidance. 10/8/15-James
Mulvey sent the Additional Limited Subsurface Investigation dated October 5, 2015. Eastern
conducted a second subsurface investigation at this site. the objective was to determine whether
the subject site's underlying soil in the basement of the property has been adversely impacted by
fuel oil release that was identified during a site visit for Phase I. On August 29,2014 Eastern
removed a total of 150 gallons of oil/water mix from the basement. On September 24, 2015 Eastern
installed five (5) soil borings in the basement of the site to determine the vertical delineation
of the fuel oil release in the underlying soils beneath the basement concrete floor. The Soil
samples submitted for analysis were from 2'-4' depth. The soil analytical results indicated no
detectable VOCs, SVOCs for all five (5) samples. 10/15/15-Zhune sent the following email to James
Mulvey Can you show borings #1, #2, #3 from Subsurface Investigation dated 3/16/15 in the site map
of the additional Limited subsurface Investigation dated 9/25/15. Please explain how you delineated
Boring # 3 from Subsurface Investigation 3/16/15. I need a scale site plan. 10/20/15-James Mulvey
sent the following email The original borings were delineated from 0 -2 below grade And that sample
from boring #3 was from 0 -1 below grade, The new borings were delineated from 0 -4 below grade.
1/14/16-Zhune sent the following email to James Mulvey I reviewed this case with my supervisor,
Jeff (copied above), and the soil analytical results for SB-3 show soils remaining at the site are
above CP-51 Unrestricted Soil Cleanup Objectives (SCOs). Despite the lack of vertical delineation

407 EAST 158TH STREET (Continued) **S117267188**

at SB-3, the Department is willing to close the spill upon submission of a a letter describing how
further contamination delineation is not feasible as per CP-51 Commissioners Policy (please refer
to the definition of feasible in the guidance). You may obtain the guidance at
http://www.dec.ny.gov/regulations/2393.html . The Department is also willing to close this site due
to the dominance of xylenes and trimethylbenzene indicating that is an older spill. 1/3/16 @
4:52pm-James Mulvey sent the following email if the NYSDEC is willing to close the spill file based
on the dominance of xylenes and trimethylbenzene indicating that is an older spill , please close
the spill for the property owner. 1/3/16 @ 5:12pm-James Mulvey sent the following email remember
that SB-3 was impacted at the shallow depths, it was clean at deeper depths, no need to further
delineate vertically . Based on the email sent by James on 1/3/16 @ 5:12pm this spill is closed.

Remarks: Caller advised aprx 5 gal of oil spilled onto concrete beasement floor. CLean up is pending.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/22/2024

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

EPA WATCH LIST: EPA Watch List

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAIN: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PT 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

AQUEOUS FOAM NRC: Aqueous Foam Related Incidents Listing

The National Response Center (NRC) serves as an emergency call center that fields initial reports for pollution and railroad incidents and forwards that information to appropriate federal/state agencies for response. The spreadsheets posted to the NRC website contain initial incident data that has not been validated or investigated by a federal/state response agency. Response center calls from 1990 to the most recent complete calendar year where there was indication of Aqueous Film Forming Foam (AFFF) usage are included in this dataset. NRC calls may reference AFFF usage in the ?Material Involved? or ?Incident Description? fields.

UST FINDER RELEASE: UST Finder Releases Database
US EPA's UST Finder data is a national composite of leaking underground storage tanks. This data contains information about, and locations of, leaking underground storage tanks. Data was collected from state sources and standardized into a national profile by EPA's Office of Underground Storage Tanks, Office of Research and Development, and the Association of State and Territorial Solid Waste Management Officials.

Date of Government Version: 06/08/2023

Data Release Frequency: Semi-Annually

UST FINDER: UST Finder Database
EPA developed UST Finder, a web map application containing a comprehensive, state-sourced national map of underground storage tank (UST) and leaking UST (LUST) data. It provides the attributes and locations of active and closed USTs, UST facilities, and LUST sites from states and from Tribal lands and US territories . UST Finder contains information about proximity of UST facilities and LUST sites to: surface and groundwater public drinking water protection areas; estimated number of private domestic wells and number of people living nearby; and flooding and wildfires.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

UTM Y (Meters):	4518560.5
Elevation:	32 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	14115942 CENTRAL PARK, NY
Version Date:	2019

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

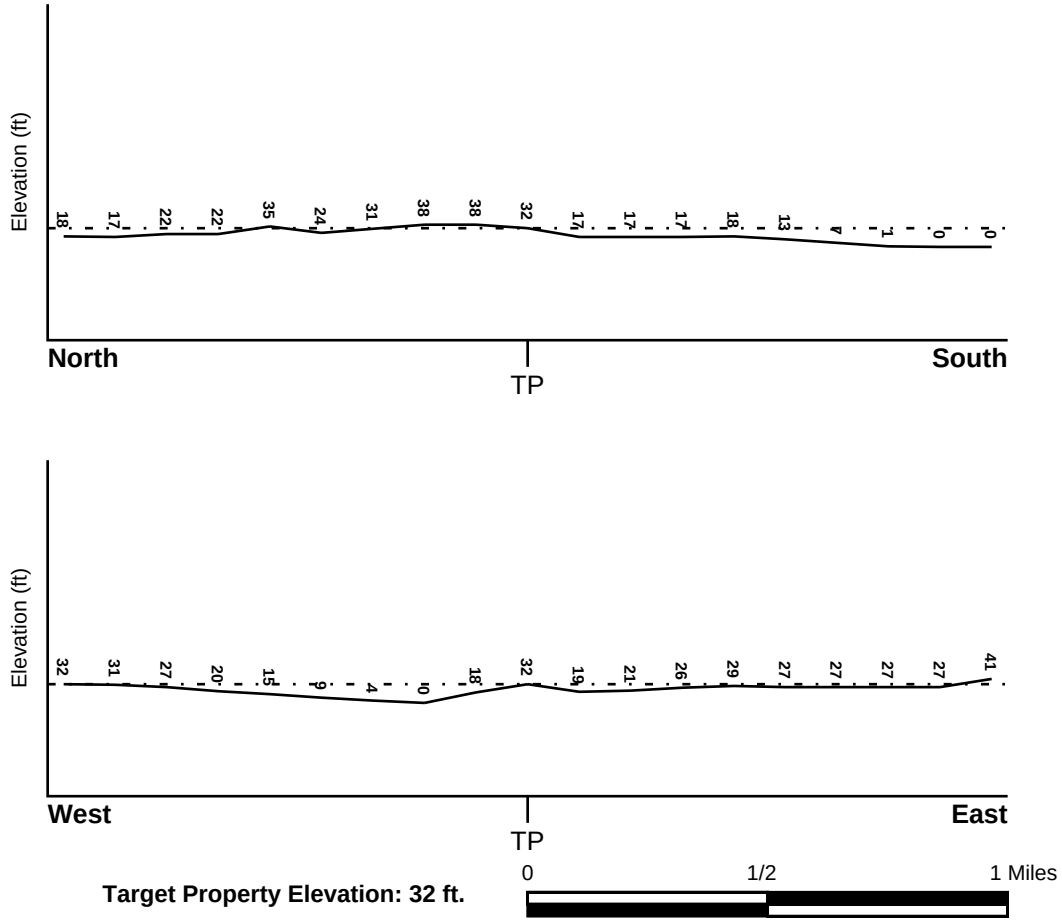
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
3604970083F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
3604970079F	FEMA FIRM Flood data

3604970091F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CENTRAL PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT **GEOLOGIC AGE IDENTIFICATION**

Era:	Paleozoic	Category:	Stratified Sequence
System:	Ordovicias		
Series:	Lower Ordovician and Cambrian carbonate rocks		
Code:	OC *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy sand
sandy loam
fine sandy loam

Surficial Soil Types: silt loam
loamy sand
sandy loam
fine sandy loam

Shallow Soil Types: sandy loam

Deeper Soil Types: unweathered bedrock
very gravelly - loamy sand
stratified
sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Dear Mr. Simmel:
Nova Geophysical Services (NOVA) is pleased to provide the findings of the geophysical engineering survey (GES) at the above referenced project site: 338 Grand Concourse, Bronx, NY (the "Site").

INTRODUCTION TO GEOPHYSICAL ENGINEERING SURVEY (GES)

NOVA performed a geophysical engineering survey (GES) consisting of a Ground Penetrating Radar (GPR) and Electromagnetic (EM) survey at the site. The purpose of this survey is to locate and identify utilities, underground storage tanks (USTs) and other substructures in the vicinity of proposed construction areas on October 17th, 2024.

The equipment selected for this investigation was a Sensors and Software Noggin 250 MHz ground penetrating radar (GPR) with a shielded antenna and a RadioDetection RD7100 Electromagnetic utility locator. A GPR system consists of a radar control unit, control cable, and transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulse into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

A typical electromagnetic (EM) utility locating system consists of a transmitter unit and a receiver unit. The receiver unit can be used independently of the transmitter unit in order to detect utility lines with an inherent EM signature (electric utility lines, water lines, etc.). If needed a current at a specific frequency can also be placed on a utility that is being located. This can be done via the transmitter unit by either direct connection or induction via an EM field varying at specific frequency. The receiver unit is then set to the selected frequency and the electromagnetic field created by the current running through the utility can be located allowing the utility to be marked.

GEOPHYSICAL METHODS

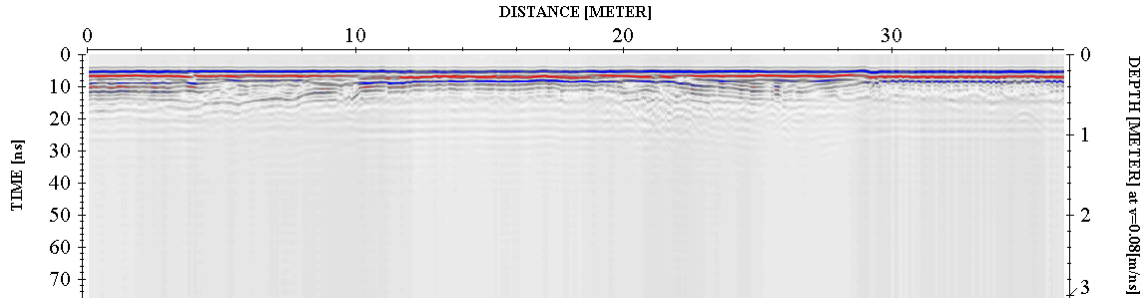
The project site was screened using GPR to search the specified area and inspected for reflections, which could be indicative of substructures and utilities within the subsurface. An EM utility locator was used to help determine the locations of utilities within the survey area.

EM data was collected and interpreted on site and suspected utilities marked as needed. GPR data profiles were collected for the areas of the Site specified by the client and processed as specified below.

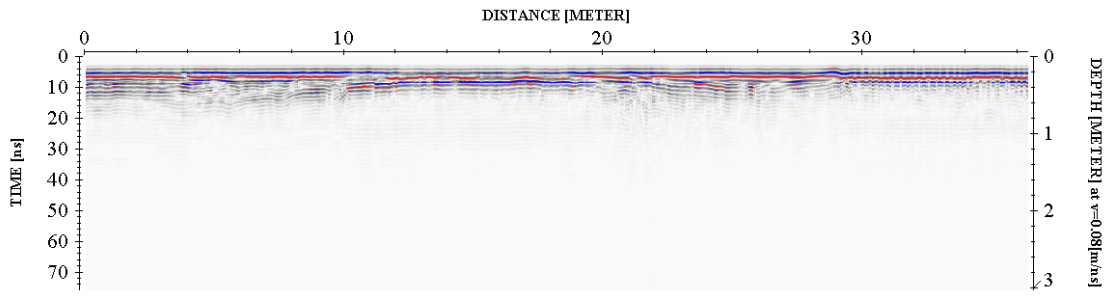
DATA PROCESSING

To improve the quality of the results and to better identify anomalies NOVA processed the collected data. The processing workflow is briefly described in this section.

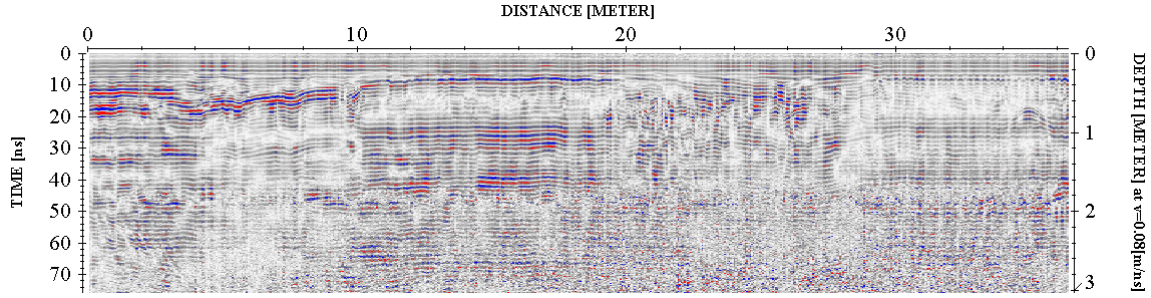
Step 1. Import Raw RAMAC data to standard processing format



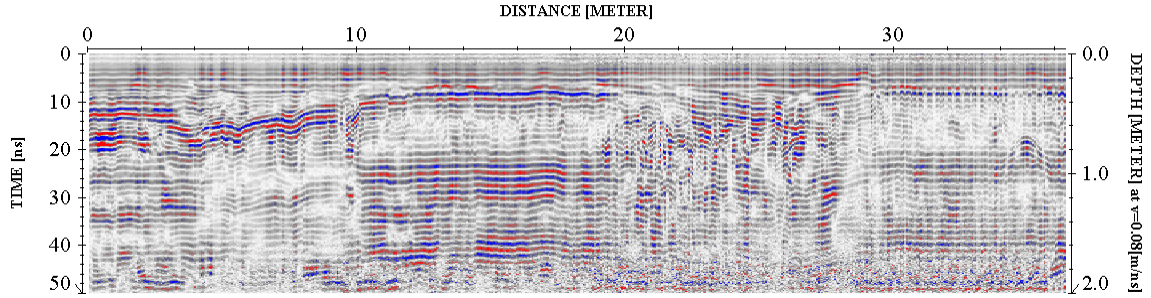
Step 2. Remove instrument noise *(dewow)*



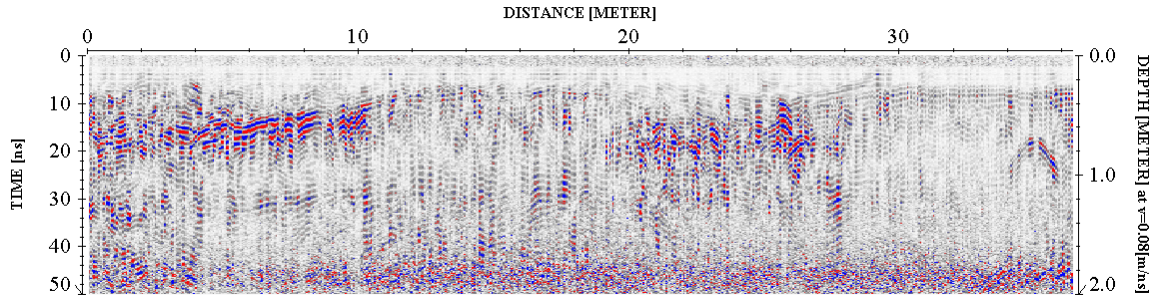
Step 3. Correct for attenuation losses *(energy decay function)*



Step 4. Remove static from bottom of profile *(time cut)*



Step 5. Mute horizontal ringing/noise *(subtracting average)*



The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and represents the subsurface anomalies much more accurately.

PHYSICAL SETTINGS

NOVA observed the following physical conditions at the time of the survey.

Weather: Sunny

Temperature: 55° F

Surface: Concrete/ Pavement

Survey Parameters: A GPR grid scan was conducted within the survey areas as shown on the survey plan. The approximate line spacing of the grid survey was approximately 5'. Additional GPR data was collected over features of interest.

Limitations: The geophysical noise level (GNL) at the site was high due to being in an urban environment.

RESULTS

The results of the geophysical engineering survey (GES) identified the following at the project site:

- Anomalies resembling potential subsurface utilities (such as electric, water, sewer, gas, and communication) were identified. The approximate locations are shown in the survey plan.
- All main utilities entered the repair shop from Grand Concourse.
- The GES identified and extensive linear anomaly within the survey area, the exact nature of this anomaly is unknown.
- The GES identified a geophysical anomaly in the southeast corner of the survey area.
- NOVA cleared and marked all proposed boring locations.

If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

NOVA Geophysical Services

Levent Eskicakit, P.G., E.P.
Project Manager

Appendix	Title
A	Field Forms

1. Introduction

This Field Sampling Plan (FSP) has been prepared as a component of the Remedial Investigation Work Plan (RIWP) for the proposed Brownfield Cleanup Program (BCP) site located at 338-344 Grand Concourse, Bronx, New York (Site). This document was prepared to establish field procedures for field data collection to be performed in support of the RIWP for the Site.

The RIWP includes this FSP, a Quality Assurance Project Plan (QAPP), a Health and Safety Plan (HASP), and a Community Air Monitoring Plan (CAMP), which are included as part of this plan by reference.

The standard operating procedures (SOPs) included as components of this plan will provide the procedures necessary to meet the project objectives. The SOPs will be used as a reference for the methods to be employed for field sample collection and handling and the management of field data collected in the execution of the approved RIWP. The SOPs include numerous methods to execute the tasks of the RIWP. The Project Manager will select the appropriate method as required by field conditions and/or the objective of the respective project task at the time of sample collection. Field procedures will be conducted in general accordance with the New York State Department of Conservation (NYSDEC) Technical Guidance for Site Investigation and Remediation (Division of Environmental Remediation [DER]-10) and the "Sampling, Analysis and Assessment of Per- and Polyfluoroalkyl Substances (PFAS) under NYSDEC Part 375 Remedial Program" when applicable.

2. Field Program

This FSP provides the general purpose of sampling as well as procedural information. The RIWP contains the details on sampling and analysis (locations, depths, frequency, analyte lists, etc.).

The field program has been designed to acquire the necessary data to comply with the RIWP, and includes the following tasks:

- Soil sampling;
- Groundwater sampling;
- Soil vapor sampling; and
- Sampling of investigation-derived waste (IDW) as needed for disposal.

A Limited Phase II Environmental Site Investigation (ESI) was performed at the Site in October 2024 to investigate the anticipated contaminants of concern identified based on the Site's current and former uses. While the limited sampling event provided preliminary Site characterization data, it did not fully determine the nature and extent of contamination at the Site. The Site characterization also did not identify a source of contamination on the Site; therefore, additional targeted soil, groundwater, and soil vapor sampling is proposed.

The SOPs presented herein may be changed, as required, dependent on Site conditions, or equipment limitations, at the time of sample collection. If the procedures employed differ from the SOP, the deviations will be documented in the associated sampling report.

3. Utility Clearance

Invasive remedial activities such as excavation or remedial construction activities require the location of underground utilities prior to initiating work. Such clearance is sound practice in that it minimizes the potential for damage to underground facilities and more importantly, is protective of the health and safety of personnel. Under no circumstances will invasive activities be allowed to proceed without obtaining proper utility clearance by the appropriate public agencies and/or private entities. This clearance requirement applies to all work on both public and private property, whether located in a dense urban area or a seemingly out-of-the-way rural location.

The drilling contractor performing the work will be responsible for obtaining utility clearance.

Utility clearance is required by law, and obtaining clearance includes contacting a public or private central clearance agency via a "one-call" telephone service and providing the proposed exploration location information. It is important to note that public utility agencies may not, and usually do not, have information regarding utility locations on private property.

Before beginning subsurface work at any proposed exploration locations, it is critical that all readily available information on underground utilities and structures be obtained. This includes publicly available information, as well as information in the possession of private landowners. Any drawings obtained must be reviewed in detail for information pertaining to underground utilities.

Using the information obtained, the site should be viewed in detail for physical evidence of buried lines or structures, including pavement cuts and patches, variation in or lack of vegetation, variations in grading, etc. Care must also be taken to avoid overhead utilities as well. Presence of surface elements of buried utilities should be documented, such as manholes, gas or water service valves, catch basins, monuments, or other evidence.

Overhead utility lines must be considered when choosing exploration and excavation locations. Most states require a minimum of 10 feet (ft) of clearance between equipment and energized wires. Such separation requirements may also be voltage-based and may vary depending on state or municipality regulations. In evaluating clearance from overhead lines, the same restrictions may apply to "drops," or wires on a utility pole connecting overhead and underground lines.

Using the information obtained and observations made, proposed exploration or construction locations should be marked in the field. Marking locations can be accomplished using spray paint on the ground, stakes, or other means. All markings of proposed locations should be made in white, in accordance with the generally accepted universal color code for facilities identification (American Public Works Association [APWA] American National Standards Institute [ANSI] Z535.1):

- White: Proposed Excavation or Drilling Location
- Pink: Temporary Survey Markings
- Red: Electrical Power Lines, Cables, Conduit, and Lighting Cables
- Yellow: Gas, Oil, Steam, Petroleum, or Gaseous Materials
- Orange: Communication, Alarm or Signal Lines, Cables, or Conduits
- Blue: Potable Water

- Purple: Reclaimed Water, Irrigation and Slurry Lines
- Green: Sewers and Drain Lines

To effectively evaluate the proposed locations with these entities, detailed, accurate measurements between the proposed locations and existing surface features should be obtained. Such features can be buildings, street intersections, utility poles, guardrails, etc.

Obtaining the utility clearance generally involves the designated "one-call" underground facilities protection organization for the area and the landowner and one or both following entities:

- A third-party utility locator company will be utilized to locate underground utilities outside of the public right-of-way; and/or
- "Soft dig" excavation techniques to confirm or deny the presence of underground utilities in the area.

The proposed locations should be evaluated in light of information available for existing underground facilities. The detailed measurement information described above will be required by the "one call" agency. The owners of the applicable, participating underground utilities are obligated to mark their respective facilities at the site in the colors described above. Utility stake-out activities will typically not commence for approximately 72 hours after the initial request is made.

The public and private utility entities generally only mark the locations of their respective underground facilities within public rights-of-way. Determination of the locations of these facilities on private property will be the responsibility of the property owner or Contractor. If available information does not contain sufficient detail to locate underground facilities with a reasonable amount of confidence, alternate measures may be appropriate, as described below. In some cases, the memory of a long-time employee of a facility on private property may be the best or only source of information. It is incumbent on the Consultant or Contractor to exercise caution and use good judgement when faced with uncertainty.

Note: It is important to note that not all utilities are participants in the "one-call" agency or process. As such, inquiries must be made with the "one-call" agency to determine which entities do not participate, so they can be contacted independently.

Most utility stakeouts have a limited time period for which they remain valid, typically two to three weeks. It is critical that this time period be considered to prevent expiration of clearance prior to completion of the invasive activities, and the need to repeat the stake-out process.

Care must be exercised to document receipt of notice from the involved agencies of the presence or absence of utilities in the vicinity of the proposed locations.

Most agencies will generally provide a telephone or fax communication indicating the lack of facilities in the project area. If contact is not made by all of the agencies identified by the "one-call" process, do not assume that such utilities are not present. Re-contact the "one-call" agency to determine the status.

For complicated sites with multiple proposed locations and multiple utilities, it is advisable to arrange an on-site meeting with utility representatives. This will minimize the potential for miscommunication amongst the involved parties.

Completion of the utility stake-out process is not a guarantee that underground facilities will not be encountered in excavations or boreholes; in fact, most “one-call” agencies and individual utilities do not offer guarantees, nor do they accept liability for damage that might occur. In areas outside the public right-of-way, a utility locating service may be utilized to locate underground utilities. It is advisable that any invasive activities proceed with extreme caution in the upper 4 to 5 ft in the event the clearance has failed to identify an existing facility. This may necessitate hand excavation or probing to confirm the potential presence of shallow utilities. If uncertainty exists for any given utility, extra activities can be initiated to solve utility clearance concerns. These options include:

- Screening the proposed work areas with utility locating devices and/or hiring a utility locating service to perform this task.
- Hand digging, augering, or probing to expose or reveal shallow utilities and confirm presence and location. In northern climates, this may require advancing to below the frost line, typically at least 4 ft.
- Using “soft dig” techniques that utilize specialized tools and compressed air to excavate soils and locate utilities. This technique is effective in locating utilities to a depth of 4 to 5 ft.

Equipment/Materials:

- White Spray paint;
- Wooden stakes, painted white or containing white flagging;
- Color-code key; and
- Available drawings.

4. Field Data Recording

This procedure describes the protocol for documenting the investigation activities in the field. Field data serves as the cornerstone for an environmental project, not only for site characterization but for additional phases of investigation or remedial design. Producing defensible data includes proper and appropriate recording of field data as it is obtained in a manner to preserve the information for future use. This procedure provides guidelines for accurate, thorough collection and preservation of written and electronic field data.

Field data to be recorded during the project generally includes, but is not limited to, the following:

- General field observations;
- Numeric field measurements and instrument readings;
- Quantity estimates;
- Sample locations and corresponding sample numbers;
- Relevant comments and details pertaining to the samples collected;
- Documentation of activities, procedures, and progress achieved;
- Contractor pay item quantities;
- Weather conditions;
- A listing of personnel involved in site-related activities;
- A log of conversations, site meetings, and other communications; and
- Field decisions and pertinent information associated with the decisions.

4.1 WRITTEN FIELD DATA

Written field data will be collected using a standardized, pre-printed field log form. In general, use of a field log form is preferable as it prompts field personnel to make appropriate observations and record data in a standardized format. This promotes completeness and consistency from one person to the next. Otherwise, electronic data collection using a handheld device produces equal completeness and consistency using a preformatted log form.

In the absence of an appropriate pre-printed form, the data should be recorded in an organized and structured manner in a dedicated project field logbook. Logbooks must be hardcover and bound so that pages cannot be added or removed and should be made from high-grade 50 percent rag paper with a water-resistant surface.

The following are guidelines for use of field log forms and logbooks:

1. Information must be factual and complete.
2. All entries will be made in black indelible ink with a ballpoint pen and will be written legibly. Do not use “rollerball” or felt tip-style pens, since the water-soluble ink can run or smear in the presence of moisture.
3. Field log forms should be consecutively numbered.

4. Each day's work must start a new form/page.
5. At the end of each day, the current logbook page or forms must be signed and dated by the field personnel making the entries.
6. Make data entries immediately upon obtaining the data. Do not make temporary notes in other locations for later transfer; this only increases the potential for error or loss of data.
7. Entry errors are to be crossed out with a single line and initialed by the person making the correction.
8. Do not leave blanks on log forms, if no entry is applicable for a given data field, indicate so with "NA" or a dash ("--").
9. At the earliest practical time, photocopies or typed versions of log forms and logbook pages should be made and placed in the project file as a backup in the event the book or forms are lost or damaged.
10. Logbooks should be dedicated to one project only, i.e., do not record data from multiple projects in one logbook.

4.2 ELECTRONIC DATA

Electronic data recording involves the electronic measurement of field information through the use of monitoring instruments, sensors, gauges, and equipment controls. The following is a list of guidelines for proper recording and management of electronic field data:

1. Field data management should follow requirements of a project-specific data management plan (DMP), if applicable.
2. Use only instruments that have been calibrated in accordance with manufacturer's recommendations.
3. Usage of instruments, controls, and computers for the purpose of obtaining field data should only be performed by personnel properly trained and experienced in the use of the equipment and software.
4. Use only fully licensed software on personal computers and laptops.
5. Loss of electronic files may mean loss of irreplaceable data. Every effort should be made to back up electronic files obtained in the field as soon as practical. A backup file placed on the file server will minimize the potential for loss.
6. Electronic files, once transferred from field instruments or laptops to office computers, should be protected, if possible, to prevent unwanted or inadvertent manipulation or modification of data. Several levels of protection are usually available for spreadsheets, including making a file "read-only" or assigning a password to access the file.
7. Protect CDs from exposure to moisture, excessive heat or cold, magnetic fields, or other potentially damaging conditions.
8. Remote monitoring is often used to obtain stored electronic data from site environmental systems. A thorough discussion of this type of electronic field data recording is beyond the scope of this Section. Such on-site systems are generally capable of storing a limited amount of data as a comma-delimited or spreadsheet file. Users must remotely access the monitoring equipment files via modem or other access and download the data. In order to minimize the potential for loss

of data, access and downloading of data should be performed frequently enough to ensure the data storage capacity of the remote equipment is not exceeded.

Equipment/Materials:

- Appropriate field log forms, or iPad® or equivalent with preformatted log forms.
- Indelible ballpoint pen (do not use “rollerball” or felt-tip style pens);
- Straight edge;
- Pocket calculator; and
- Laptop computer (if required).

5. Aquifer Characterization

This procedure describes measurement of water levels in groundwater monitoring.

A synoptic gauging round will be completed to obtain water levels in monitoring wells. Water levels will be acquired in a manner that provides accurate data that can be used to calculate vertical and horizontal hydraulic gradients and other hydrogeologic parameters. Accuracy in obtaining the measurements is critical to ensure the usability of the data.

5.1 PROCEDURE

In order to provide reliable data, water level monitoring events should be collected over as short a period of time as practical. Barometric pressure can affect groundwater levels and, therefore, observation of significant weather changes during the period of water level measurements must be noted. Rainfall events and groundwater pumping can also affect groundwater level measurements. Personnel collecting water level data must note if any of these controls are in effect during the groundwater level collection period. Due to possible changes during the groundwater level collection period, it is imperative that the time of data collection at each station be accurately recorded. Water levels will also be collected prior to any sample collection that day.

The depth to groundwater will be measured with an electronic depth-indicating probe. Prior to obtaining a measurement, a fixed reference point on the well casing will be established for each well to be measured. Unless otherwise established, the reference point is typically established and marked on the north side of the well casing. Do not use protective casings or flush-mounted road boxes as a reference, due to the potential for damage or settlement. The elevation of the reference point shall be obtained by accepted surveying methods, to the nearest 0.01 ft.

The water level probe will be lowered into the well until the meter indicates (via indicator light or tone) the water is reached. The probe will be raised above water level and slowly lowered again until water is indicated. The cable will be held against the side of the inner protective casing at the point designated for water level measurements and a depth reading taken. This procedure will be followed three times or until a consistent value is obtained. The value will be recorded to the nearest 0.01 ft on the Groundwater Level Monitoring Report form.

Upon completion, the probe will be raised to the surface and together with the amount of cable that entered the well casing, will be decontaminated in accordance with methods described in Equipment Decontamination Procedure.

Equipment/Materials:

- Battery-operated, non-stretch electronic water level probe with permanent markings at 0.01-ft increments, such as the Solinst Model 101 or equivalent.
- The calibrated cable on the depth indicator will be checked against a surveyor's steel tape once per quarter year. A new cable will be installed if the cable has changed by more than 0.01 percent (0.01 ft for a 100-ft cable). See also the Field Instruments – Use and Calibration Procedure.
- Groundwater Level Monitoring Report form.

6. Sample Collection for Laboratory Analysis

6.1 SOIL SAMPLE COLLECTION FOR LABORATORY ANALYSIS

The following procedure is an introduction to soil sampling techniques and an outline of field staff responsibilities. All samples will be collected with dedicated sampling equipment.

6.1.1 Preparatory Requirements

Prior to the beginning of any remedial investigation or remedial measures activities, staff must attend a project briefing for the purpose of reviewing the project work plan; site and utility plans; drawings; applicable regulations; sampling location, depth, and criteria; site contacts; and other related documents. Health and safety concerns will be documented in a site-specific HASP.

A file folder for the field activities should be created and maintained such that all relevant documents and log forms likely to be useful for the completion of field activities by others are readily available in the event of personnel changes.

6.1.2 Soil Classification

The stratigraphic log is a factual description of the soil at the borehole location and is relied upon to interpret the soil characteristics and their influence and significance in the subsurface environment. The accuracy of the stratigraphic log is to be verified by the person responsible for interpreting subsurface conditions. An accurate description of the soil stratigraphy is essential for a reasonable understanding of the subsurface conditions. Confirmation of the field description by examination of representative soil samples by the project geologist, hydrogeologist, or geotechnical engineer (whenever practicable) is recommended.

The ability to describe and classify soil correctly is a skill that is learned from a person with experience and by systematic training and comparison of laboratory results to field descriptions.

6.1.2.1 Data Recording

Several methods for classifying and describing soils or unconsolidated sediments are in relatively widespread use. The Unified Soil Classification System (USCS) is the most common. With the USCS, a soil is first classified according to whether it is predominantly coarse-grained or fine-grained.

The description of fill soil is similar to that of natural undisturbed soil except that it is identified as fill and not classified by USCS group, relative density, or consistency. Those logging soils must attempt to distinguish between soils that have been placed (i.e., fill) and not naturally present; or soils that have been naturally present but disturbed (i.e., disturbed native).

It is necessary to identify and group soil samples consistently to determine the subsurface pattern or changes and non-conformities in soil stratigraphy in the field at the time of drilling. The stratigraphy in each borehole during drilling is to be compared to the stratigraphy found at the previously completed boreholes to ensure that patterns or changes in soil stratigraphy are noted and that consistent terminology is used.

Visual examination, physical observations, and manual tests (adapted from ASTM International [ASTM] D2488, visual-manual procedures) are used to classify and group soil samples in the field and are summarized in this subsection. ASTM D2488 should be reviewed for detailed explanations of the procedures. Visual-manual procedures used for soil identification and classification include:

- Visual determination of grain size, soil gradation, and percentage fines;
- Dry strength, dilatancy, toughness, and plasticity (thread or ribbon test) tests for identification of inorganic fine-grained soil (e.g., CL, CH, ML, or MH); and
- Soil compressive strength and consistency estimates based on thumb indent and pocket penetrometer (preferred) methods.

Soil characteristics like plasticity, strength, and dilatancy should be determined using the H & A of New York Engineering and Geology, LLP (Haley & Aldrich of New York) Soil Identification Field Form.

6.1.2.2 Field Sample Screening

Upon the collection of soil samples, the soil is screened with a photoionization detector (PID) for the presence of organic vapor. This is accomplished by running the PID across the soil sample. The highest reading and sustained readings are recorded.

Note: The PID measurement must be done upwind of the excavating equipment or any running engines so that exhaust fumes will not affect the measurements.

Another method of field screening is headspace measurements. This consists of placing a portion of the soil sample in a sealable glass jar, placing aluminum foil over the jar top, and tightening the lid. Alternatively, plastic sealable bags may be utilized for field screens in lieu of glass containers. The jar should only be partially filled. Shake the jar and set aside for at least 30 minutes. After the sample has equilibrated, the lid of the jar can be opened; the foil is punctured with the PID probe and the air (headspace) above the soil sample is monitored. This headspace reading on the field form or in the field book is recorded. All headspace measurements must be completed under similar conditions to allow comparability of results. Soil classification and PID readings will be recorded in the daily field report.

Equipment/Materials:

- Pocket knife or small spatula;
- Small handheld lens;
- Stratigraphic Log (Overburden) (Form 2001);
- Tape measure; and
- When sampling for PFAS, acceptable materials for sampling include stainless steel, high-density polyethylene (HDPE), polyvinyl chloride (PVC), silicone, acetate, and polypropylene.

6.1.3 Soil Sampling

Soil samples will be collected from acetate liners installed by a track-mounted direct-push drill rig (Geoprobe®) operated by a licensed operator. Soil samples will be collected using a stainless-steel trowel or sampling spoon into laboratory-provided sample containers. If it is necessary to relocate any proposed

sampling location due to terrain, utilities, access, etc., the Project Manager must be notified, and an alternate location will be selected.

Prior to use and between each sampling location at an environmental site, the sampling equipment must be decontaminated. All decontamination must be conducted in accordance with the project-specific plans or the methods presented in SOP 7.0.

6.1.4 Sampling Techniques

The following procedure describes typical soil sample collection methods for submission of samples to a laboratory for chemical analysis. The primary goal of soil sampling is to collect representative samples for examination and chemical analysis (if required).

Environmental soil samples obtained for chemical analyses are collected with special attention given to the rationale behind determining the precise zone to sample, the specifics of the method of soil extraction, and the requisite decontamination procedures. Preservation, handling, and glassware for environmental soil samples vary considerably depending upon several factors including the analytical method to be conducted and the analytical laboratory being used.

Soil sampling for PFAS will be performed in accordance with the NYSDEC-issued "Sampling, Analysis and Assessment of PFAS under NYSDEC Part 375 Remedial Programs" (April 2023).

6.1.4.1 Grab Versus Composite Samples

A grab sample is collected to identify and quantify conditions at a specific location or interval. The sample is comprised of the minimum amount of soil necessary to make up the volume of sample dictated by the required sample analyses. Composite samples may be obtained from several locations or along a linear trend (in a test pit or excavation). Sampling may occur within or across stratification.

6.2 GROUNDWATER SAMPLE COLLECTION FOR LABORATORY ANALYSIS

The following section describes two techniques for groundwater sampling: "Low-Stress/Low-Flow Methods" and "Typical Sampling Methods."

"Low-Stress/Low-Flow" methods will be employed when collecting groundwater samples for the evaluation of volatile constituents (i.e., dissolved oxygen [DO]) or in fine-grained formations where sediment/colloid transport is possible. Analyses typically sensitive to colloidal transport issues include polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and metals.

The "Typical Sampling Methods" will be employed where the collection of parameters less sensitive to turbidity/sediment issues are being collected (general chemistry, pesticides, and other semi-volatile organic compounds [SVOCs]).

NOTE: If non-aqueous phase liquids (NAPL) (light or dense) are detected in a monitoring well, groundwater sample collection will not be conducted, and the Project Manager must be contacted to determine a course of action.

6.2.1 Preparatory Requirements

- Verify well identification and location using borehole log details and location layout figures. Note the condition of the well and record any necessary repair work required.
- Prior to opening the well cap, measure the breathing space above the well casing with a handheld organic vapor analyzer to establish baseline breathing space volatile organic compound (VOC) levels. Repeat this measurement once the well cap is opened. If either of these measurements exceeds the air quality criteria in the HASP, field personnel should adjust their personal protective equipment (PPE) accordingly.
- Prior to commencing the groundwater purging/sampling, a water level must be obtained to determine the well volume for hydraulic purposes. In some settings, it may be necessary to allow the water level time to equilibrate. This condition exists if a water-tight seal exists at the well cap and the water level has fluctuated above the top of screen, creating a vacuum or pressurized area in this air space. Three water level checks will verify static water level conditions have been achieved.
- Calculate the volume of water in the well. Typically, overburden well volumes consider only the quantity of water standing in the well screen and riser; bedrock well volumes are calculated on the quantity of water within the open core hole and within the overburden casing.

6.2.2 Well Development

Well development is completed to remove fine-grained materials from the well but in such a manner as to not introduce fines from the formation into the sand pack. Well development continues until the well responds to water level changes in the formation (i.e., a good hydraulic connection is established between the well and formation) and the well produces clear, sediment-free water to the extent practical.

- Attach appropriate pump and lower tubing into well.
- Gauge well and calculate one well volume. Turn on pump. If well runs dry, shut off pump and allow to recover.
- Surging will be performed by raising and lowering the pump several times to pull fine-grained material from the well. Periodically measure turbidity level using a La Motte turbidity reader.
- The second and third steps will be repeated until turbidity is less than 50 nephelometric turbidity units (NTUs) or when 10 well volumes have been removed.
- All water generated during cleaning and development procedures will be collected and contained on site in 55-gallon drums for future analysis and appropriate disposal.

Equipment:

- Appropriate health and safety equipment;
- Knife;
- Power source (generator);
- Field book;
- Well Development Form (Form 3006);
- Well keys;

- Graduated pails;
- Pump and tubing;
- Cleaning supplies (including non-phosphate soap, buckets, brushes, laboratory-supplied distilled/deionized water, tap water, cleaning solvent, aluminum foil, plastic sheeting, etc.); and
- Water level meter.

6.2.3 Well Purging and Stabilization Monitoring (Low-Stress/Low-Flow Method)

The preferred method for groundwater sampling will be the low-stress/low-flow method described below.

- Slowly lower the pump, safety cable, tubing, and electrical lines into the well to the depth specified by the project requirements. The pump intake must be at the midpoint of the well screen to prevent disturbance and resuspension of any sediment in the screen base.
- Before starting the pump, measure the water level again with the pump in the well leaving the water level measuring device in the well when completed.
- Purge the well at 100 to a maximum of 500 milliliters per minute (mL/min). During purging, the water level should be monitored approximately every five minutes, or as appropriate. A steady flow rate should be maintained that results in a drawdown of 0.3 ft or less. The rate of pumping should not exceed the natural flow rate conditions of the well. Care should be taken to maintain pump suction and to avoid entrainment of air in the tubing. Record adjustments made to the pumping rates and water levels immediately after each adjustment.
- During the purging of the well, monitor and record the field indicator parameters (pH, temperature, conductivity, oxidation-reduction [redox] potential [ORP], DO, and turbidity) approximately every five minutes. Stabilization is considered to be achieved when the final groundwater flow rate is achieved, and three consecutive readings for each parameter are within the following limits:
  - pH: 0.1 pH units of the average value of the three readings;
  - Temperature: 3 percent of the average value of the three readings;
  - Conductivity: 0.005 milliSiemens per centimeter (mS/cm) of the average value of the three readings for conductivity less than 1 mS/cm and 0.01 mS/cm of the average value of the three readings for conductivity greater than 1 mS/cm;
  - ORP: 10 millivolts (mV) of the average value of the three readings;
  - DO: 10 percent of the average value of the three readings; and
  - Turbidity: 10 percent of the average value of the three readings, or a final value of less than 50 NTU.
- The pump must not be removed from the well between purging and sampling.

6.2.4 Sampling Techniques

- If an alternate pump is utilized, the first pump discharge volumes should be discarded to allow the equipment a period of acclimation to the groundwater.

- Samples are collected directly from the pump with the groundwater being discharged directly into the appropriate sample container. Avoid handling the interior of the bottle or bottle cap and don new gloves for each well sampled to avoid contamination of the sample.
- Order of sample collection:
  - PFAS
  - VOCs
  - 1,4-dioxane
  - SVOCs
  - Total Analyte List (TAL) metals
  - PCBs and pesticides
- No sampling equipment components or sample containers should come in contact with aluminum foil, low-density polyethylene, glass, or polytetrafluoroethylene (PTFE, Teflon™) materials including plumbers' tape and sample bottle cap liners with a PTFE layer.
- For low-stress/low-flow sampling, samples should be collected at a flow rate between 100 and 500 mL/min and such that the drawdown of the water level within the well does not exceed the maximum allowable drawdown of 0.3 ft.
- The pumping rate used to collect a sample for VOC should not exceed 100 mL/min. Samples should be transferred directly to the final 40-mL glass vials completely full and topped with a Teflon™ cap. Once capped, the vial must be inverted and tapped to check for headspace/air presence (bubbles). If air is present, the sample will be discarded and recollected until free of air.
- Groundwater sampling for PFAS will be performed in accordance with the NYSDEC-issued "Sampling, Analysis and Assessment of PFAS under NYSDEC Part 375 Remedial Programs" (April 2023).
- All samples must be labeled with:
  - Unique sample IDs
  - Date and time
  - Parameters to be analyzed
  - Project Reference ID
  - Sampler's initials
- Labels should be written in indelible ink and secured to the bottle with clear tape.

Equipment/Materials:

- pH meter, conductivity meter, DO meter, ORP meter, nephelometer, temperature gauge;
- Field filtration units (if required);
- Purging/sampling equipment;
- Peristaltic pump;
- Water level probe;

- Sampling materials (containers, logbook/forms, coolers, chain of custody [COC]);
- Work Plan;
- HASP; and
- When sampling for PFAS, acceptable materials for sampling include stainless steel, HDPE, PVC, silicone, acetate, and polypropylene.

Note: Peristaltic pump use for VOC collection is not acceptable on NYSDEC/U.S. Environmental Protection Agency (EPA)/Resource Conservation and Recovery Act (RCRA) sites; this technique has gained acceptance in select areas where it is permissible to collect VOCs using a peristaltic pump at a low flow rate (e.g., Michigan).

Note: 1,4-dioxane and PFAS purge and sample techniques will be conducted following the NYSDEC guidance documents (see Appendix C of the RIWP). Acceptable groundwater pumps include a stainless-steel inertia pump with HDPE tubing, a peristaltic pump equipped with HDPE tubing and silicone tubing, and a stainless-steel bailer with a stainless-steel ball or bladder pump (identified as PFAS-free) with HDPE tubing.

Field Notes:

- Field notes must document all the events, equipment used, and measurements collected during the sampling activities. Section 2.0 describes the data/recording procedure for field activities.
- The logbook should document the following for each well sampled:
  - Identification of well;
  - Well depth;
  - Static water level depth and measurement technique;
  - Sounded well depth;
  - Presence of immiscible layers and detection/collection method;
  - Well yield – high or low;
  - Purge volume and pumping rate;
  - Time well purged;
  - Measured field parameters;
  - Purge/sampling device used;
  - Well sampling sequence;
  - Sampling appearance;
  - Sample odors;
  - Sample volume;
  - Types of sample containers and sample identification;
  - Preservative(s) used;
  - Parameters requested for analysis;

- Field analysis data and method(s);
- Sample distribution and transporter;
- Laboratory shipped to;
- COC number for shipment to laboratory;
- Field observations on sampling event;
- Name collector(s);
- Climatic conditions including air temperature; and
- Problems encountered and any deviations made from the established sampling protocol.

A standard log form for documentation and reporting groundwater purging and sampling events is presented on the Groundwater Sampling Record, Low-Flow Groundwater Sampling Form, and Low-Flow Monitored Natural Attenuation (MNA) Field Sampling Form. Refer to Appendix A for example field forms.

Groundwater/Decon Fluid Disposal:

- Groundwater disposal methods will vary on a case-by-case basis but may range from:
  - Off-site treatment at private treatment/disposal facilities or public-owned treatment facilities;
  - On-site treatment at facility-operated facilities; and
  - Direct discharge to the surrounding ground surface, allowing groundwater infiltration to the underlying subsurface regime.
- Decontamination fluids should be segregated and collected separately from wash waters/groundwater containers.

6.3 SOIL VAPOR SAMPLING

The following procedure is an introduction to soil vapor sampling techniques and an outline of field staff responsibilities.

6.3.1 Preparatory Requirements

Prior to collecting the field sample, ensure the stainless-steel soil vapor probe has been installed to the desired depth and sealed completely to the surface using a material such as bentonite. As part of the vapor intrusion evaluation, a tracer gas should be used in accordance with New York State Department of Health (NYSDOH) protocols to serve as a quality assurance/quality control (QA/QC) device to verify the integrity of the soil vapor probe seal. A container (box, plastic pail, etc.) will serve to keep the tracer gas in contact with the probe during testing. A portable monitoring device will be used to analyze a sample of soil vapor for the tracer gas prior to sampling. If the tracer sample results show a significant presence of the tracer, the probe seals will be adjusted to prevent infiltration. At the conclusion of the sampling round, tracer monitoring should be performed a second time to confirm the integrity of the probe seals.

6.3.2 Sampling Techniques

Samples will be collected in appropriately sized Summa canisters that have been certified clean by the laboratory and samples will be analyzed by using EPA Method TO-15. Flow rate for both purging and

sampling will not exceed 0.2 liters per minute (L/min). One to three implant volumes shall be purged prior to the collection of any soil gas samples. A sample log sheet will be maintained summarizing sample identification, date and time of sample collection, sampling depth, identity of samplers, sampling methods and devices, soil vapor purge volumes, volume of the soil vapor extracted, vacuum of canisters before and after the samples are collected, apparent moisture content of the sampling zone, and COC protocols.

6.4 SAMPLE HANDLING AND SHIPPING

Sample management is the continuous care given to each sample from the point of collection to receipt at the analytical laboratory. Good sample management ensures that samples are properly recorded, properly labeled, and not lost, broken, or exposed to conditions which may affect the sample's integrity.

All sample submissions must be accompanied with a COC document to record sample collection and submission. Personnel performing sampling tasks must check the sample preparation and preservation requirements to ensure compliance with the QAPP.

The following sections provide the minimum standards for sample management.

6.4.1 Sample Handling

Prior to entering the field area where sampling is to be conducted, especially at sites with defined exclusion zones, the sampler should ensure that all materials necessary to complete the sampling are on hand. If samples must be maintained at a specified temperature after collection, dedicated coolers and ice must be available for use. Conversely, when sampling in cold weather, proper protection of water samples, trip blanks, and field blanks must be considered. Sample preservation will involve pH adjustment, cooling to 4 degrees Celsius (°C), and sample filtration and preservation.

6.4.2 Sample Labeling

Samples must be properly labeled immediately upon collection.

Note that the data shown on the sample label are the minimum data required. The sample label data requirements are listed below for clarity.

- Project name;
- Sample name/number/unique identifier;
- Sampler's initials;
- Date of sample collection;
- Time of sample collection;
- Analysis required; and
- Preservatives.

To ensure that samples are not confused, a clear notation should be made on the container with a permanent marker. If the containers are too soiled for marking, the container can be put into a “Zip Lock” bag which can then be labeled.

All sample names will be as follows:

- Sample unique identifier: Enter the sample name or number. There should be NO slashes, spaces, or periods in the date.
- Date: Enter the six-digit date when the sample was collected. Note that for one-digit days, months, and/or years, add zeros so that the format is MMDDYY (050210). There should be NO slashes, dashes, or periods in the date.

The QA/QC samples will be numbered consecutively as collected with a sample name, date, and number of samples collected throughout the day (i.e., when multiple QA/QC samples are collected in one day). Examples of this naming convention are as follows:

Sample Name:	Comments
TB-050202-0001	TRIP BLANK
TB-050202-0002	TRIP BLANK
FD-050202-0001	FIELD DUPLICATE
FD-050202-0002	FIELD DUPLICATE

NOTE: The QA/QC Sample # resets to 0001 EACH DAY, this will avoid having to look back to the previous day for the correct sequential number.

6.4.3 Field Code

The field code will be written in the "Comments" field on the chain of custody for EVERY sample but will not be a part of the actual sample name. Enter the one/two-character code for the type of sample (must be in CAPITALS):

N	Normal Field Sample
FD	Field Duplicate (note sample number [i.e., 0001] substituted for time)
TB	Trip Blank (note sample number [i.e., 0001] substituted for time)
EB	Equipment Blank (note sample number [i.e., 0001] substituted for time)
FB	Field Blank (note sample number [i.e., 0001] substituted for time)
KD	Known Duplicate
FS	Field Spike Sample
MS	Matrix Spike Sample (note on "Comments" field of COC – laboratory to spike matrix)
MD	Matrix Spike Duplicate Sample (note on "Comments" field of COC – laboratory to spike matrix)
RM	Reference Material

The sample labeling – both chain and sample bottles must be EXACTLY as detailed above. In addition, the Field Sample Key for each sample collected must be filled out.

6.4.4 Packaging

Sample container preparation and packing for shipment should be completed in a well-organized and clean area, free of any potential cross contamination. The following is a list of standard guidelines which must be followed when packing samples for shipment.

- Double bag ice in "Zip Lock" bags.

- Double check to ensure trip and temperature blanks have been included for all shipments containing VOCs, or where otherwise specified in the QAPP.
- Enclose the COC form in a "Zip Lock" bag.
- Ensure custody seals (two, minimum) are placed on each cooler. Coolers with hinged lids should have both seals placed on the opening edge of the lid. Coolers with "free" lids should have seals placed on opposite diagonal corners of the lid. Place clear tape over custody seals.
- Containers should be wiped clean of all debris/water using paper towels (paper towels must be disposed of with other contaminated materials).
- Clear, wide packing tape should be placed over the sample label for protection.
- Do not bulk pack. Each sample must be individually padded.
- Large glass containers (1 liter and up) require much more space between containers.
- Ice is not a packing material due to the reduction in volume when it melts.

Note: Never store sterile sample containers in enclosures containing equipment which use any form of fuel or volatile petroleum-based product. When conducting sampling in freezing conditions at sites without a heated storage area (free of potential cross contaminants), unused trip blanks should be isolated from coolers immediately after receipt. Trip blanks should be double-bagged and kept from freezing.

6.4.5 Chain of Custody Records

COC forms will be completed for all samples collected. The form documents the transfer of sample containers. The COC record, completed at the time of sampling, will contain, but not be limited to, the sample number, date and time of sampling, and the name of the sampler. The COC document will be signed and dated by the sampler when transferring the samples.

Each sample cooler being shipped to the laboratory will contain a COC form. The cooler will be sealed properly for shipment. The laboratory will maintain a copy for their records. One copy will be returned with the data deliverables package.

The following list provides guidance for the completion and handling of all COCs:

- COCs used should be a Haley & Aldrich of New York standard form or supplied by the analytical laboratory.
- COCs must be completed in black ballpoint ink only.
- COCs must be completed neatly using printed text.
- If a simple mistake is made, cross out the error with a single line and initial and date the correction.
- Each separate sample entry must be sequentially numbered.
- If numerous repetitive entries must be made in the same column, place a continuous vertical arrow between the first entry and the next different entry.
- When more than one COC form is used for a single shipment, each form must be consecutively numbered using the "Page ___ of ___" format.
- If necessary, place additional instructions directly onto the COC in the Comment section. Do not enclose separate instructions.

- Include a contact name and phone number on the COC in case there is a problem with the shipment.
- Before using an acronym on a COC, clearly define the full interpretation of your designation [i.e., polychlorinated biphenyls (PCBs)].

6.4.6 Shipment

Prior to the start of the field sampling, the carrier should be contacted to determine if pickup will be at the field site location. If pick-up is not available at the site, the nearest pick-up or drop-off location should be determined. Sample shipments must not be left at unsecured drop locations.

Copies of all shipment manifests must be maintained in the field file.

7. Field Instruments – Use and Calibration

A significant number of field activities involve usage of electronic instruments to monitor for environmental conditions and health and safety purposes. It is imperative the instruments are used and maintained properly to optimize their performance and minimize the potential for inaccuracies in the data obtained. This section provides guidance on the usage, maintenance, and calibration of electronic field equipment.

- All monitoring equipment will be in proper working order and operated in accordance with manufacturer's recommendations.
- Field personnel will be responsible for ensuring that the equipment is maintained and calibrated in the field in accordance with manufacturer's recommendations.
- Instruments will be operated only by personnel trained in the proper usage and calibration.
- Personnel must be aware of the range of conditions such as temperature and humidity for instrument operation. Usage of instruments in conditions outside these ranges will only proceed with the approval of the Project Manager and/or Health and Safety Officer as appropriate.
- Instruments that contain radioactive source material, such as x-ray fluorescence (XRF) analyzers or moisture-density gauges require specific transportation, handling, and usage procedures that are generally associated with a license from the Nuclear Regulatory Commission (NRC) or an NRC-Agreement State. Under no circumstance will operation of such instruments be allowed on site unless by properly authorized and trained personnel, using the proper personal dosimetry badges or monitoring instruments.

7.1 GENERAL PROCEDURE DISCUSSION

Care must be taken to minimize the potential for transfer of contaminated materials to the ground or onto other materials. Regardless of the size or nature of the equipment being decontaminated, the process will utilize a series of steps that involve removal of gross material (dirt, grease, oil, etc.), washing with a detergent, and multiple rinsing steps. In lieu of a series of washes and rinse steps, steam cleaning with low-volume, high-pressure equipment (i.e., steam cleaner) is acceptable.

Exploration equipment, and all monitoring equipment in contact with the sampling media must be decontaminated prior to initiating site activities, in between exploration locations to minimize cross-contamination, and prior to mobilizing off site after completion of site work.

The following specific decontamination procedure is recommended for sampling equipment and tools:

- Brush loose soil off equipment;
- Wash equipment with laboratory-grade detergent (i.e., Alconox or equivalent);
- Rinse with tap water;
- Rinse equipment with distilled water;
- Allow water to evaporate before reusing equipment; and
- Wrap equipment in aluminum foil when not being used.

7.2 DECONTAMINATION OF MONITORING EQUIPMENT

Because monitoring equipment is difficult to decontaminate, care should be exercised to prevent contamination. Sensitive monitoring instruments should be protected when they are at risk of exposure to contaminants. This may include enclosing them in plastic bags allowing an opening for the sample intake. Ventilation ports should not be covered.

If contamination does occur, decontamination of the equipment will be required; however, immersion in decontamination fluids is not possible. As such, care must be taken to wipe the instruments down with detergent-wetted wipes or sponges, and then with de-ionized water-wetted wipes or sponges.

7.3 DISPOSAL OF WASH SOLUTIONS AND CONTAMINATED EQUIPMENT

All contaminated wash water, rinses, solids, and materials used in the decontamination process that cannot be effectively decontaminated (such as polyethylene sheeting) will be containerized and disposed of in accordance with applicable regulations. All containers will be labeled with an indelible marker as to contents and date of placement in the container, and any appropriate stickers required (such as PCBs). Storage of decontamination wastes on site will not exceed 90 days under any circumstances.

Equipment/Materials:

Decontamination equipment and solutions are generally selected based on ease of decontamination and disposability.

- Polyethylene sheeting;
- Metal racks to hold equipment;
- Soft-bristle scrub brushes or long-handle brushes for removing gross contamination and scrubbing with wash solutions;
- Large, galvanized wash tubs, stock tanks, or wading pools for wash and rinse solutions;
- Plastic buckets or garden sprayers for rinse solutions;
- Large plastic garbage cans or other similar containers lined with plastic bags can be used to store contaminated clothing; and
- Contaminated liquids and solids should be segregated and containerized in New York State Department of Transportation (NYSDOT)-approved plastic or metal drums, appropriate for off-site shipping/disposal if necessary.

8. Investigation-Derived Waste Disposal

8.1 RATIONALE/ASSUMPTIONS

This procedure applies to the disposition of investigation-derived waste (IDW) including soils and/or groundwater. IDW is dealt with the following "Best Management Practices" and is not considered a listed waste due to the lack of generator knowledge concerning the chemical source, chemical origin, and timing of chemical introduction to the subsurface.

Consequently, waste sampling and characterization is performed to determine if the wastes exhibit a characteristic of hazardous waste. The disposal of soil cuttings, test pit soils and/or purged groundwater will be reviewed on a case-by-case basis prior to initiation of field activities. Two scenarios typically exist:

- When no information is available in the area of activity or investigation, and impacted media/soils are identified. Activities such as new construction and /or maintenance below grade may encounter environmental conditions that were unknown.
- Disposal Required/Containerization Required – When sufficient site information regarding the investigative site conditions warrant that all materials handled will be contained and disposed.

If a known listed hazardous and/or characteristically hazardous waste/contaminated environmental media is being handled, then handling must be performed in accordance with RCRA Subtitle C (reference 2, Part V, Section 1(a),(b),(c)).

The following outlines the waste characterization procedures to be employed when IDW disposal is required.

The following procedure describes the techniques for characterization of IDW for disposal purposes. IDW may consist of soil cuttings (augering, boring, well installation soils, test pit soils), rock core or rock flour (from coring, reaming operations), groundwater (from well development, purging and sampling activities), decontamination fluids, PPE, and disposal equipment (DE).

8.2 PROCEDURE

The procedures for handling and characterization of field activity-generated wastes are:

A.) Soil Cuttings - Soils removed from boring activities will be contained within an approved container, suitable for transportation and disposal.

- Once placed into the approved container, any free liquids (i.e., groundwater) will be removed for disposal as waste fluids or solidified within the approved container using a solidification agent such as Speedy Dri (or equivalent).
- Contained soils will be screened for the presence of VOCs using a PID; this data will be logged for future reference.

- Once screened, full, and closed, the container will be labeled and placed into the container storage area. At a minimum, the following information will be shown on each container label: date of filling/generation, site name, source of soils (i.e., borehole or well), and contact.
- Prior to container closure, representative samples from the containers will be collected for waste characterization purposes and submitted to the project laboratory.
- Typically, at a location where an undetermined site-specific parameter group exists, sampling and analysis may consist of the full RCRA Waste Characterization (ignitability, corrosivity, reactivity, toxicity), or a subset of the above based upon data collected, historical information, and generator knowledge.

B.) Groundwater - purging, and sampling groundwater, which requires disposal, will be contained.

- Containment may be performed in 55-gallon drums, tanks suitable for temporary storage (i.e., Nalgene tanks 500 to 1,000 gallons) or if large volumes of groundwater are anticipated, tanker trailer (5,000 to 10,000 gallons ±), or drilling "Frac" tanks may be utilized (20,000 gallons ±). In all cases, the container/tank used for groundwater storage must be clean before use such that cross contamination does not occur.

C.) Decon Waters/Decon Fluids - Decon waters and/or fluids will be segregated, contained, and disposed accordingly.

- Decon waters may be disposed of with the containerized groundwater once analytical results have been acquired.

D.) PPE/DE – A number of disposal options exists for spent PPE/DE generated from investigation tasks. The options typically employed are:

- Immediately disposed of within on-site dumpster/municipal trash; or
- If known to be contaminated with RCRA hazardous waste, dispose off-site at an RCRA Subtitle C facility.
- Spent Solvent/Acid Rinses - The need for sampling must be determined in consultation with the waste management organization handling the materials. If known that only the solvent and/or acids are present, then direct disposal/treatment using media-specific options may be possible without sampling (i.e., incineration).
- PPE/DE – Typically not sampled and included with the disposal of the solid wastes.

Equipment/Materials:

- Sample spoons, trier, auger;
- Sample mixing bowl;
- Sampling bailer, or pump; and
- Sample glassware.

1. Project Description

This Quality Assurance Project Plan (QAPP) presents the organization, objectives, planned activities, and specific quality assurance/quality control (QA/QC) procedures associated with the investigation activity for a Remedial Investigation (RI) at 338-344 Grand Concourse, Bronx, New York (Site). Protocols for sample collection, sample handling and storage, chain of custody (COC) procedures, and laboratory and field analyses are specifically described or referenced to related investigation documents.

This QAPP addresses the QA/QC elements in the U.S. Environmental Protection Agency (EPA) QAPP policy and other relevant guidance documents.

1.1 INTRODUCTION

The approximately 10,900-square-foot (sq-ft) Site, addressed 338-344 Grand Concourse and identified as Block 2341, Lots 34 and 37 on the New York City Tax Map, is located in an urban area of the Mott Haven neighborhood of Bronx, New York, and consists of a vacant, one-story commercial building (Lot 34) and a one-story commercial building currently operating as an automotive body repair shop (Lot 37).

This QAPP has been prepared on behalf of Manhattan Management LLC (Manhattan Management). The QAPP is a component of the Remedial Investigation Work Plan (RIWP) that also includes field sampling procedures and the Health and Safety Plan (HASP).

1.1.1 Project Objectives

The primary objectives for data collection activities include:

- Determine the nature and extent of contamination in environmental media (soil, groundwater, and soil vapor) at the Site.
- Collect sufficient data for applicable contaminated media to evaluate the risk to human health and the environment, if any, associated with the contamination.

Associated specific objectives for field and laboratory data collection are discussed in Section 1.4 of this plan.

1.2 SITE DESCRIPTION AND SITE HISTORY

The general Site description and Site history are provided in the RIWP appended to the Brownfield Cleanup Program application for the Site and incorporated herein by reference.

1.3 PROJECT OBJECTIVES AND INTENDED DATA USE

1.3.1 Target Parameter List

The investigative program includes the sampling and analysis of environmental media for the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), metals, pesticides, and/or per- and polyfluoroalkyl substances (PFAS) constituents based on historical Site operations at the Site. The field and laboratory parameters are summarized below.

1.3.1.1 Field Parameters

Concurrent with sample collection, several field parameters will be determined by the field sampling personnel. For soils and solid matrices, these field parameters will include visual observations, odor identification, and VOC screening using handheld monitoring equipment.

For aqueous groundwater samples, the following parameters will be determined with field testing equipment, including, but not limited to pH, specific conductivity, temperature, turbidity, dissolved oxygen (DO), and/or oxidation/reduction potential (ORP). During the collection of groundwater samples, pH, specific conductivity, temperature, DO, and ORP will be measured until stabilized, or if parameters do not stabilize after two hours, a minimum of three times the well volume will be purged prior to sampling.

1.3.1.2 Laboratory Parameters

The laboratory parameters for soil include:

- Target Compound List (TCL) VOCs using EPA Method 8260;
- TCL SVOCs using EPA Method 8270;
- Total Analyte List (TAL) Metals using EPA Methods 6010/7471;
- TCL Pesticides using EPA Method 8081;
- PCBs using EPA Method 8082;
- PFAS using EPA Method 1633A; and
- 1,4-dioxane using EPA Method 8270.

The laboratory parameters for groundwater include:

- TCL VOCs using EPA Method 8260;
- TCL SVOCs using EPA Method 8270;
- Total Metals using EPA Methods 6010/7470;
- Dissolved Metals using EPA Methods 6010/7470;
- PCBs using EPA Method 8082;
- Pesticides using EPA Method 8081;
- PFAS using EPA Method 1633A; and
- 1,4-dioxane using EPA Method 8270 SIM.

Note: PFAS will be collected in accordance with the New York State Department of Environmental Conservation (NYSDEC), Division of Environmental Remediation (DER), "Sampling, Analysis and Assessment of Per- and PFAS under NYSDEC Part 375 Remedial Program," April 2023. PFAS analysis in soil and groundwater will be analyzed for the 40 compounds as referenced in Attachment A. PFAS analysis will be performed using EPA Method 1633A with a reporting limit of 2 nanograms per liter (ng/L).

The analytical laboratory parameters for soil vapor samples include:

- VOCs using EPA Method TO-15.

Laboratory parameters for disposal samples will be determined by the disposal facility after an approved facility has been determined.

1.4 SAMPLING LOCATIONS

The RIWP provides a summary and rationale for the sample locations at the Site. It is possible, however, that depending on the nature of encountered field conditions, sampling locations may change. The person responsible for making such decisions will be the QA Officer whose responsibilities are described in Section 2 of this QAPP. Any change in the sampling strategy will only be implemented after approval from the Project Manager.

2. Project Organization and Responsibilities

This section defines the roles and responsibilities of the individuals who will perform the RIWP monitoring activities. A New York State Department of Health (NYSDOH)-certified analytical laboratory will perform the analyses of environmental samples collected at the Site.

2.1 PROJECT TEAM

The following project personnel are anticipated for oversight of the RIWP implementation. Project team resumes are included in Attachment A.

NYSDEC Case Manager	Nour Haredy
NYSDOH Case Manager	Ben Caligiuri
Qualified Environmental Professional (QEP)	Mari Cate Conlon
Project Manager	Matthew Levy
Haley & Aldrich of New York* Health and Safety Director	Brian Fitzpatrick, CHMM
Health and Safety Officer (HSO)	Brian Ferguson
QA Officer	Nicole Mooney
Third-Party Validator	Katherine Miller

**H & A of New York Engineering and Geology, LLP (Haley & Aldrich of New York)*

2.2 MANAGEMENT RESPONSIBILITIES

The Project Manager is responsible for managing the implementation of the RIWP and monitoring and coordinating the collection of data. The Project Manager is responsible for technical QC and project oversight. The Project Manager's responsibilities include the following:

- Acquire and apply technical and corporate resources as needed to ensure performance within budget and schedule restraints;
- Review work performed to ensure quality, responsiveness, and timeliness;
- Communicate with the client point of contact concerning the progress of the monitoring activities;
- Assure corrective actions are taken for deficiencies cited during audits of RIWP monitoring activities; and
- Assure compliance with the Site HASP.

2.3 QA RESPONSIBILITIES

The QA team will consist of a QA Officer and the Data Validation Staff. QA responsibilities are described as follows:

2.3.1 QA Officer

The QA Officer reports directly to the Project Manager and will be responsible for overseeing the review of field and laboratory data. Additional responsibilities include the following:

- Assure the application and effectiveness of the QAPP by the analytical laboratory and the project staff;
- Provide input to the Project Manager as to corrective actions that may be required as a result of the above-mentioned evaluations; and
- Prepare and/or review data validation and audit reports.

The QA Officer will be assisted by the Data Validation Staff in the evaluation and validation of field and laboratory-generated data.

2.3.2 Data Validation Staff

The Data Validation Staff will be independent of the laboratory and familiar with the analytical procedures performed. The validation will include a review of each validation criterion as prescribed by the guidelines presented in Section 9.2 of this document and be presented in a Data Usability Summary Report (DUSR) for submittal to the QA Officer.

2.4 LABORATORY RESPONSIBILITIES

The Environmental Laboratory Accreditation Program (ELAP)-approved laboratory to be used will be Alpha Analytical Inc. (Alpha), located in Westborough, Massachusetts. Laboratory services in support of the RIWP monitoring include the following personnel:

2.4.1 Laboratory Project Manager

The Laboratory Project Manager will report directly to the QA Officer and Project Manager and will be responsible for ensuring all resources of the laboratory are available on an as-required basis. The Laboratory Project Manager will also be responsible for the approval of the final analytical reports and adhering to the QAPP.

2.4.2 Laboratory QA Officer

The Laboratory QA Officer will have sole responsibility for the review and validation of the analytical laboratory data generated as part of the investigation. The Laboratory QA Officer will also define appropriate QA procedures, overview QA/QC documentation, and perform audits.

2.4.3 Laboratory Sample Custodian

The Laboratory Sample Custodian will report to the Laboratory Operations Manager and will be responsible for the following:

- Receive and inspect the incoming sample containers;
- Record the condition of the incoming sample containers;
- Sign appropriate documents;
- Verify COC and its correctness;
- Notify the Project Manager and Operations Manager of sample receipt and inspection;

- Assign a unique identification number and enter each into the sample receiving log;
- Initiate transfer of samples to laboratory analytical sections; and
- Control and monitor access/storage of samples and extracts.

2.4.4 Laboratory Technical Personnel

The Laboratory Technical Personnel will have the primary responsibility for the performance of sample analysis and the execution of the QA procedures developed to determine the data quality. These activities will include the proper preparation and analysis of the project samples in accordance with the laboratory's Quality Assurance Manual (QAM) and associated Standard Operating Procedures (SOPs).

2.5 FIELD RESPONSIBILITIES

2.5.1 Field Coordinator

The Field Coordinator is responsible for the overall operation of the field team and reports directly to the Project Manager. The Field Coordinator works with the project HSO to conduct operations in compliance with the project HASP. The Field Coordinator will facilitate communication and coordinate efforts between the Project Manager and the field team members.

Other responsibilities include the following:

- Develop and implement field-related work plans, ensuring schedule compliance, and adhering to management-developed project requirements;
- Coordinate and manage field staff;
- Perform field system audits;
- Oversee QC for technical data provided by the field staff;
- Prepare and approve text and graphics required for field team efforts;
- Coordinate and oversee technical efforts of subcontractors assisting the field team;
- Identify problems in the field, resolve difficulties in consultation with the Project QA Officer and Project Manager, and implement and document corrective action procedures; and
- Participate in preparation of the final reports.

2.5.2 Field Team Personnel

Field Team Personnel will be responsible for the following:

- Perform field activities as detailed in the RIWP and in compliance with the Field Sampling Plan (FSP; Appendix C of the RIWP) and QAPP.
- Immediately report any accidents and/or unsafe conditions to the Site HSO and take reasonable precautions to prevent injury.

3. Sampling Procedures

The FSP in Appendix C of the RIWP provides the SOPs for sampling required by the RIWP. Sampling will be conducted in general accordance with the NYSDEC Technical Guidance for Site Investigation and Remediation (DER-10) and the "Sampling, Analysis and Assessment of PFAS under NYSDEC Part 375 Remedial Program" (April 2023) when applicable. Proposed sample locations are shown on Figure 2 of the RIWP.

3.1 SAMPLE CONTAINERS

Sample containers for each sampling task will be provided by the laboratory performing the analysis. The containers will be cleaned by the manufacturer to meet or exceed the analyte specifications established in the EPA's "Specifications and Guidance for Obtaining Contaminant-Free Sample Containers," April 1992, OSWER Directive #9240.0-0.5A.

Certificates of analysis for each lot of sample containers used during the sampling program will be maintained by the laboratory and will be available upon request. The appropriate sample containers, preservation method, maximum holding times, and shipping information for each target parameter and sampling task are provided in Table I.

3.2 SAMPLE LABELING

Each sample will be labeled with a unique sample identifier that will facilitate tracking and cross-referencing of sample information. Field blanks and field duplicate samples also will be numbered with a unique sample identifier to prevent analytical bias of field QC samples.

Refer to the FSP (Appendix C of the RIWP) for the sample labeling procedures.

3.3 FIELD QC SAMPLE COLLECTION

3.3.1 Field Duplicate Sample Collection

3.3.1.1 Water Samples

Field duplicate samples will be collected by filling the parent sample containers to the proper level and sealing and then repeated for the duplicate set of sample containers.

- The samples are properly labeled as specified in Section 3.2.
- Steps 1 through 4 are repeated for the bottles for each analysis. The samples are collected in order of decreasing analyte volatility as detailed in the FSP provided as Appendix C of the RIWP.
- COC documents are executed.
- The samples will be handled as specified in Table I.

3.3.1.2 Soil Samples

Soil field duplicates will be collected as specified in the following procedure:

- Soils will be sampling directly from acetate liners.
- Soil for VOC analysis will be removed from the sampling device as specified in the FSP provided as Appendix C of the RIWP.
- Soil for non-VOC analysis will be removed from the sampling device and collected into clean laboratory-provided containers.

3.4 GENERAL DECONTAMINATION PROCEDURES

Care must be taken to minimize the potential for transfer of contaminated materials to the ground or onto other materials. Regardless of the size or nature of the equipment being decontaminated, the process will utilize a series of steps that involve removal of gross material (dirt, grease, oil, etc.), washing with a detergent, and multiple rinsing steps. In lieu of a series of washes and rinse steps, steam cleaning with low-volume, high-pressure equipment (i.e., steam cleaner) is acceptable.

Exploration equipment and all monitoring equipment in contact with the sampling media must be decontaminated prior to initiating site activities, in between exploration locations to minimize cross-contamination, and prior to mobilizing off site after completion of site work.

The following specific decontamination procedure is recommended for sampling equipment and tools:

- Brush loose soil off equipment;
- Wash equipment with laboratory-grade detergent (i.e., Alconox or equivalent);
- Rinse with tap water;
- Rinse equipment with distilled water;
- Allow water to evaporate before reusing equipment; and
- Wrap equipment in aluminum foil when not being used.

4. Custody Procedures

Custody is one of several factors necessary for the admissibility of environmental data as evidence in a court of law. Custody procedures help to satisfy the two major requirements for admissibility: relevance and authenticity. Sample custody is addressed in three parts: field sample collection, laboratory analysis, and final project files. Final evidence files, including all originals of laboratory reports, are maintained under document control in a secure area.

Custody of a sample begins when it is collected by or transferred to an individual and ends when that individual relinquishes or disposes of the sample. A sample is under custody if:

- The item is in actual possession of a person;
- The item is in the view of the person after being in actual possession of the person;
- The item was in actual possession and subsequently stored to prevent tampering; or
- The item is in a designated and identified secure area.

4.1 FIELD CUSTODY PROCEDURES

Field personnel will be required to keep written records of field activities on applicable pre-printed field forms, in a bound field notebook, or in an electronic format. The records provide the means of recording data collecting activities. Non-electronic records will be written legibly in ink and will contain pertinent field data and observations. Written entry errors or changes will be crossed out with a single line, dated, and initialed by the person making the correction. The records will be periodically reviewed by the Field Coordinator.

Each title page will include the field member's name, project name, project start date, project end date, and unique page number.

The beginning of each entry in the record will contain the following information:

- Date;
- Start time;
- Weather;
- Names of field personnel (including subcontractors);
- Level of personal protection used at the Site; and
- Names of all visitors and the purpose of their visit.

For each measurement and sample collected, the following information will be recorded:

- Detailed description of sample location;
- Equipment used to collect sample or make measurement, and the date equipment was calibrated;
- Time sample was collected;
- Description of the sample conditions;

- Depth sample was collected (if applicable);
- Volume and number of containers filled with the sample; and
- Sampler's identification.

4.1.1 Field Procedures

The data quality can be affected by sample collection activities. If the integrity of collected samples is questionable, the data, regardless of its analytical quality, will also be questionable. The following procedure describes the process to maintain the integrity of the samples:

- Upon collection, samples are placed in the proper containers. In general, samples collected for organic analysis will be placed in pre-cleaned glass containers and samples collected for inorganic analysis will be placed in pre-cleaned plastic (polyethylene) bottles. Refer to the FSP in Appendix C of the RIWP for sample packaging procedures.
- Samples will be assigned a unique sample number and will be affixed to a sample label affixed to the sample container. Refer to the FSP in Appendix C of the RIWP for sample labeling procedures.
- Samples will be properly and appropriately preserved by field personnel in order to minimize loss of the constituent(s) of interest due to physical, chemical, or biological mechanisms.
- Appropriate volumes will be collected to ensure that the appropriate reporting limits can be successfully achieved and that the required QC sample analyses can be performed.

4.1.2 Transfer of Custody and Shipment Procedures

- A COC record will be completed at the time of sample collection and will accompany each shipment identifying the contents of the shipment. The COC record will accompany the samples to the laboratory. The field personnel collecting the samples will be responsible for the custody of the samples until the samples are relinquished to the laboratory. Sample transfer will require the individuals relinquishing and receiving the samples to sign, date, and note the time of sample transfer on the COC record.
- Samples will be shipped or delivered in a timely fashion to the laboratory so that holding times and/or analysis times as prescribed by the methodology can be met.
- Soil and groundwater samples will also be transported in containers (coolers) packed with ice. Samples will be packaged for shipment and shipped to the appropriate laboratory for analysis. The samples will be packed to prevent breakage and movement during shipping. The number of coolers must be written on the COC. Samples in polyethylene containers will be placed upright directly in the sample cooler and limited to one layer of samples per cooler. Additional bubble wrap or packaging material will be added to fill the cooler. Shipping containers may be secured with strapping tape and/or custody tape for shipment to the laboratory.
- When samples are split with a regulatory agency and Site representatives, a separate COC will be prepared and marked to indicate with whom the samples are shared. The person relinquishing the samples to the regulatory agency or the Site will require the representative's signature acknowledging sample receipt.
- If samples are sent by a commercial carrier, a bill of lading will be used. A copy of the bill of lading will be retained as part of the permanent record. Commercial carriers will not sign the custody

record as long as the custody record is sealed inside the sample cooler and the custody tape remains intact.

- Samples will be picked up by a laboratory courier or transported to the laboratory the same day they are collected (and never longer than a one-day delay) unless collected on a weekend or holiday. In these cases, the samples will be stored in a secure location until delivery to the laboratory. Additional ice will be added to the cooler as needed to maintain proper preservation temperatures.

4.2 LABORATORY COC PROCEDURES

A full-time Sample Custodian will be assigned the responsibility of sample control. It will be the responsibility of the Sample Custodian to receive all incoming samples. Once received, the custodian will document that the custody tape on the coolers is unbroken, that each sample is received in good condition (i.e., unbroken, cooled, etc.), that the associated paperwork, such as COC forms have been completed, and will sign the COC forms. In special cases, the custodian will document from appropriate sub-samples that the COC with proper preservation has been accomplished. The custodian will also document that sufficient sample volume has been received to complete the analytical program. The Sample Custodian will then place the samples into secure, limited-access storage (refrigerated storage, if required). The Sample Custodian will assign a unique number to each incoming sample for use in the laboratory. The unique number will then be entered into the sample-receiving log with the verified time and date of receipt also noted.

Consistent with the analyses requested on the COC form, analyses by the laboratory's analysts will begin in accordance with the appropriate methodologies. Samples will be removed from secure storage with internal COC sign-out procedures followed.

4.3 STORAGE OF SAMPLES

Sample containers with volume remaining will be returned to secure and limited-access storage. Upon completion of all laboratory analyses for each sample submittal and generation of the laboratory report, samples will be stored by the Sample Custodian. The length of time that samples are held will be at least 30 days after reports have been submitted. Disposal of remaining samples will be completed in compliance with all federal, state, and local requirements.

4.4 FINAL PROJECT FILES CUSTODY PROCEDURES

The final project files will be the central repository for all documents with information relevant to sampling and analysis activities as described in this QAPP. The Haley & Aldrich of New York Project Manager will be the custodian of the project file. The project files including all relevant records, reports, logs, field notebooks, pictures, subcontractor reports, and data reviews will be maintained in a secured, limited-access area and under the custody of the Project Director or their designee.

The final project file will include the following:

- Project plans and drawings;
- Field data records;
- Sample identification documents and soil boring/monitoring well logs;

- All COC documentation;
- Correspondence;
- References, literature;
- Laboratory data deliverables;
- Data validation and assessment reports;
- Progress reports, QA reports; and
- A final report.

The laboratory will be responsible for maintaining analytical logbooks, laboratory data, and sample COC documents, both hard copy and electronic. Raw laboratory data files and copies of hard copy reports will be inventoried and maintained by the laboratory for a period of six years at which time the laboratory will contact the QA Officer regarding the disposition of the project-related files.

5. Calibration Procedures and Frequency

This section describes procedures for maintaining the accuracy of all the instruments and measurement equipment, which will be used for conducting field tests and laboratory analyses. These instruments and equipment will be calibrated prior to each use or according to a periodic schedule.

5.1 FIELD INSTRUMENT CALIBRATION PROCEDURES

Field instruments will be used for real-time sample measurement during the sampling of all media and for health and safety monitoring, as described in the HASP. On-site air monitoring for health and safety purposes may be accomplished using a vapor detection device, such as a photoionization detector (PID).

Field instruments will be calibrated prior to use and the calibration will be verified, after a minimum, at the beginning of the day and/or the middle of the day.

Satisfactory completion of the pre-operation inspection will be noted on the Field Sampling Record, along with results of each field measurement.

5.2 LABORATORY INSTRUMENT CALIBRATION PROCEDURES

Calibration procedures for a specific laboratory instrument will consist of initial calibration, initial calibration verification, and continuing calibration verification. The Laboratory SOPs present the specific calibration procedures for each method of analysis. The SOP for each analysis performed in the laboratory describes calibration procedures, their frequency, acceptance criteria, and the conditions that will require calibration. In all cases, the initial calibration will be verified using an independently prepared calibration verification solution.

The use of materials of known purity and quality will be utilized for the analysis of environmental samples. The laboratory will carefully monitor the preparation and use of reference materials including solutions, standards, and reagents through well-documented procedures.

All solid chemicals and acids/bases used by the laboratory will be rated as “reagent grade” or better. All gases will be “high” purity or better. All Standard Reference Materials (SRMs) or Performance Evaluation (PE) materials will be obtained from approved vendors of the National Institute of Standards and Technology (NIST, formerly National Bureau of Standards), the EPA Environmental Monitoring Support Laboratories (EMSL), or reliable Cooperative Research and Development Agreement (CRADA)-certified commercial sources.

All materials including standards or standard solutions will be dated upon receipt, and will be identified by material name, lot number, purity or concentration, supplier, receipt/preparation date, recipient/preparer’s name, expiration date, and all other pertinent information.

6. Analytical Procedures

Analytical procedures to be utilized for the analysis of environmental samples will be based on referenced EPA analytical protocols and/or project-specific SOPs.

6.1 FIELD ANALYTICAL PROCEDURES

Field analytical procedures include the measurement of pH, temperature, ORP, DO, and specific conductivity during sampling of groundwater, and the qualitative measurement of VOCs during the collection of soil samples.

6.2 LABORATORY ANALYTICAL PROCEDURES

Laboratory analyses will be based on the EPA methodology requirements promulgated in:

- "Test Methods for Evaluating Solid Waste," SW-846 EPA, Office of Solid Waste, and promulgated updates, 1986.

6.2.1 List of Project Target Compounds and Laboratory Detection Limits

The method detection limits (MDLs) studies are performed by the laboratories in accordance with the procedures established in the Code of Federal Regulations, Title 40, Part 136.

Laboratory parameters for soil samples are listed in the RIWP. Laboratory parameters for disposal samples will be determined by the disposal facility after an approved facility has been determined.

6.2.2 List of Method-Specific QC Criteria

The laboratory SOPs include a section that presents the minimum QC requirements for the project analyses. Section 7.0 references the frequency of the associated QC samples for each sampling effort and matrix.

7. Internal Quality Control Checks

This section presents the internal QC checks that will be employed for field and laboratory measurements.

7.1 FIELD QUALITY CONTROL

Field QC is monitored and enforced by equipment calibration checks, QC samples, a review of QA/QC concerns in the field, and any corrective action(s) required. Haley & Aldrich of New York personnel familiar with the field protocols will perform these tasks. Compliance QC checks will be implemented during the investigations.

Field sampling precision, accuracy, and overall data quality will be evaluated using trip blanks, field blanks, equipment rinsate blanks, and potentially field duplicates and Matrix Spike (MS)/Matrix Spike Duplicates (MSDs) as necessary that are outlined in Table II.

7.1.1 Field Blanks

Internal QC checks will include analysis of field blanks to validate equipment cleanliness. Whenever possible, dedicated equipment will be employed to reduce the possibility of cross-contamination of samples.

7.1.2 Trip Blanks

Trip blanks will be prepared by the project laboratory using ASTM International (ASTM) Type II or equivalent water placed within pre-cleaned 40-milliliter (mL) VOC vials equipped with Teflon™ septa. Trip blanks will accompany each sample delivery group (SDG) of environmental samples collected for analysis of VOCs.

Trip blank samples will be placed in each cooler that stores and transports project samples that are to be analyzed for VOCs.

7.1.3 Equipment Blanks

Equipment blanks are prepared by pouring analyte-free water into, over, or pumped through the sampling device, collected in a sample container, and transported to the laboratory for analysis in the same manner as the environmental samples. Equipment blanks are used to assess the effectiveness of equipment decontamination procedures. One equipment blank sample per type of sampling equipment utilized may be collected at the initiation of each sampling event or when deemed necessary.

7.2 LABORATORY PROCEDURES

Procedures which contribute to maintenance of overall laboratory QA/QC include appropriately cleaned sample containers, proper sample identification and logging, applicable sample preservation, storage, and analysis within prescribed holding times, and use of controlled materials.

7.2.1 Field Duplicate Samples

The precision or reproducibility of the data generated will be monitored through the use of field duplicate samples. Field duplicate analysis will be performed at a frequency of one in 20 project samples.

Precision will be measured in terms of the absolute value of the relative percent difference (RPD) as expressed by the following equation:

RPD = [|R1-R2|/[(R1+R2)/2]] X 100%

Acceptance criteria for duplicate analyses performed on solid matrices will be 100 percent, air matrices will be 35 percent, and aqueous matrices will be 35 percent (or the absolute difference rule was satisfied if detects were less than five times the Reporting Limit (RL) for solid and aqueous matrices only). RPD values outside these limits will require an evaluation of the sampling and/or analysis procedures by the project QA Officer and/or Laboratory QA Director. Corrective actions may include re-analysis of additional sample aliquots and/or qualification of the data for use.

7.2.2 Matrix Spike Samples

Five percent of each project sample matrix for each analytical method performed will be spiked with known concentrations of the specific target compounds/analytes.

The amount of the compound recovered from the sample compared to the amount added will be expressed as a percent recovery. The percent recovery of an analyte is an indication of the accuracy of an analysis within the Site-specific sample matrix. Percent recovery will be calculated for MS/MSD samples using the following equation.

$$\%\ Recovery = \frac{Spiked\ Sample - Background}{Known\ Value\ of\ Spike} x\,100\%$$

If the QC value falls outside the control limits (Upper Control Limit [UCL] or Lower Control Limit [LCL]) due to sample matrix effects, the results will be reported with appropriate data qualifiers. To determine the effect a non-compliant MS recovery has on the reported results, the recovery data will be evaluated as part of the validation process.

7.2.3 Laboratory Control Sample Analyses

The laboratory will perform Laboratory Control Sample (LCS) analyses prepared from SRMs. The SRMs will be supplied from an independent manufacturer and traceable to NIST materials with known concentrations of each target analyte to be determined by the analytical methods performed. In cases where an independently supplied SRM is not available, the LCS may be prepared by the laboratory from a reagent lot other than that used for instrument calibration.

The laboratory will evaluate LCS analyses in terms of percent recovery using the most recent laboratory-generated control limits.

LCS recoveries that do not meet acceptance criteria will be deemed invalid. Analysis of project samples will cease until an acceptable LCS analysis has been performed. If sample analysis is performed in association with an out-of-control LCS sample analysis, the data will be deemed invalid.

Corrective actions will be initiated by the Haley & Aldrich of New York QA Officer and/or Laboratory QA Officer to investigate the problem. After the problem has been identified and corrected, the solution will be noted in the instrument run logbook and re-analysis of project samples will be performed, if possible.

The analytical anomaly will be noted in the SDG Case Narrative and reviewed by the Data Validator. The Data Validator will confirm that appropriate corrective actions were implemented and recommend the applicable use of the affected data.

7.2.4 Surrogate Compound Recoveries

For VOCs, surrogates will be added to each sample prior to analysis to establish purge and trap efficiency.

The recovery of surrogate compounds will be monitored by laboratory personnel to assess possible Site-specific matrix effects on instrument performance.

For SVOC analyses, surrogates will be added to the raw sample to assess extraction efficiency.

Method-specific QC limits are provided in the attached laboratory method SOPs. Surrogate compound recoveries that do not fall within accepted QC limits for the analytical methodology performed will have the analytical results flagged with data qualifiers as appropriate by the laboratory and will not be noted in the laboratory report Case Narrative.

To ascertain the effect non-compliant surrogate compound recoveries may have on the reported results, the recovery data will be evaluated as part of the validation process. The Data Validator will provide recommendations for corrective actions including but not limited to additional data qualification.

7.2.5 Laboratory Method Blank Analyses

Method blank sample analysis will be performed as part of each analytical batch for each methodology performed. If target compounds are detected in the method blank samples, the reported results will be flagged by the laboratory in accordance with SOPs. The Data Validator will provide recommendations for corrective actions including but not limited to additional data qualification.

8. Data Quality Objectives

Sampling that will be performed as described in the RIWP is designed to produce data of the quality necessary to achieve the minimum standard requirements of the field and laboratory analytical objectives described below. These data are being obtained with the primary objective to assess levels of contaminants of concern associated with the Site.

The overall project data quality objective (DQO) is to implement procedures for field data collection, sample collection, handling, and laboratory analysis and reporting that achieve the project objectives. The following section is a general discussion of the criteria that will be used to measure achievement of the project DQO.

8.1 PRECISION

8.1.1 Definition

Precision is defined as a quantitative measure of the degree to which two or more measurements are in agreement. Precision will be determined by collecting and analyzing field duplicate samples and by creating and analyzing laboratory duplicates from one or more of the field samples. The overall precision of measurement data is a mixture of sampling and analytical factors. The analytical results from the field duplicate samples will provide data on sampling precision. The results from duplicate samples created by the laboratory will provide data on analytical precision. The measurement of precision will be stated in terms of RPD. RPD is defined as the absolute difference of duplicate measurements divided by the mean of these analyses normalized to percentage.

8.1.2 Field Precision Sample Objectives

Field precision will be assessed through collection and measurement of field duplicate samples at a rate of one duplicate per 20 investigative samples. The RPD criteria for the project field duplicate samples will be +/- 100 percent for soil, +/- 35 percent for groundwater for parameters of analysis detected at concentrations greater than five times the laboratory RL, and +/- 35 percent for air for parameters of analysis detected at any concentration.

8.1.3 Laboratory Precision Sample Objectives

Laboratory precision will be assessed through the analysis of LCS and laboratory control duplicate samples (LCSD) and MS/MSD samples for groundwater and soil samples and the analysis of laboratory duplicate samples for air and soil vapor samples. Air and soil vapor laboratory duplicate sample analyses will be performed by analyzing the same Summa canister twice. The RPD criteria for the air/soil vapor laboratory duplicate samples will be +/- 35 percent for parameters of analysis detected at any concentration.

8.2 ACCURACY

8.2.1 Definition

Accuracy relates to the bias in a measurement system. Bias is the difference between the observed and the "true" value. Sources of error are the sampling process, field contamination, preservation techniques, sample handling, sample matrix, sample preparation, and analytical procedure limitations.

8.2.2 Field Accuracy Objectives

Sampling bias will be assessed by evaluating the results of field equipment rinse and trip blanks. Equipment rinse and trip blanks will be collected as appropriate based on sampling and analytical methods for each sampling effort.

If non-dedicated sampling equipment is used, equipment rinse blanks will be collected by passing ASTM Type II water over and/or through the respective sampling equipment utilized during each sampling effort. One equipment rinse blank will be collected for each type of non-dedicated sampling equipment used for the sampling effort. Equipment rinse blanks will be analyzed for each target parameter for the respective sampling effort for which environmental media have been collected. (Note: If dedicated or disposable sampling equipment is used, equipment rinse samples will not be collected as part of that field effort.)

Trip blank samples will be prepared by the laboratory and provided with each shipping container that includes containers for the collection of groundwater samples for the analysis of VOCs. Trip blank samples will be analyzed for each VOC for which groundwater samples have been collected for analysis.

8.3 LABORATORY ACCURACY OBJECTIVES

Analytical bias will be assessed through the use of LCS and Site-specific MS sample analyses. LCS analyses will be performed with each analytical batch of project samples to determine the accuracy of the analytical system.

One set of MS/MSD analyses will be performed with each batch of 20 project samples collected for analysis to assess the accuracy of the identification and quantification of analytes within the Site-specific sample matrices. Additional sample volume will be collected at sample locations selected for the preparation of MS/MSD samples so that the standard laboratory RLs are achieved.

The accuracy of analyses that include a sample extraction procedure will be evaluated through the use of system monitoring or surrogate compounds. Surrogate compounds will be added to each sample, standard, blank, and QC sample prior to sample preparation and analysis. Surrogate compound percent recoveries will provide information on the effect of the sample matrix on the accuracy of the analyses.

8.4 REPRESENTATIVENESS

8.4.1 Definition

Representativeness expresses the degree to which sample data represent a characteristic of a population, a parameter variation at a sampling point, or an environmental condition. Representativeness is a qualitative parameter that is dependent upon the design of the sampling program. The representativeness criterion is satisfied through the proper selection of sampling locations, the quantity of samples, and the use of appropriate procedures to collect and analyze the samples.

8.4.2 Measures to Ensure Representativeness of Field Data

Representativeness will be addressed by prescribing sampling techniques and the rationale used to select sampling locations. Sampling locations may be biased (based on existing data, instrument surveys, observations, etc.) or unbiased (completely random or stratified-random approaches).

8.5 COMPLETENESS

8.5.1 Definition

Completeness is a measure of the amount of valid (usable) data obtained from a measuring system compared to the total amount anticipated to be obtained. The completeness goal for all data uses is that a sufficient amount of valid data be generated so that determinations can be made related to the intended data use with a sufficient degree of confidence. Valid data are determined by independent confirmation of compliance with method-specific and project-specific DQOs. The calculation of data set completeness will be performed by the following equation.

$$\frac{Number\ of\ Valid\ Sample\ Results}{Total\ Number\ of\ Samples\ Planned}\ X\ 100 = \%\ Complete$$

8.5.2 Field Completeness Objectives

Completeness is a measure of the amount of valid measurements obtained from measurements taken in this project versus the number planned. Field completeness objective for this project will be greater than 90 percent.

8.5.3 Laboratory Completeness Objectives

Laboratory data completeness objective is a measure of the amount of valid data obtained from laboratory measurements. The evaluation of the data completeness will be performed at the conclusion of each sampling and analysis effort. Corrective actions such as revised sample handling procedures will be implemented if problems are noted.

The completeness of the data generated will be determined by comparing the amount of valid data, based on independent validation, with the total laboratory data set. The completeness goal will be greater than 90 percent.

8.6 COMPARABILITY

8.6.1 Definition

Comparability is a qualitative parameter expressing the confidence with which one data set can be compared to another.

8.6.2 Measures to Ensure Comparability of Laboratory Data

Comparability of laboratory data will be measured from the analysis of SRMs obtained from either EPA CRADA suppliers or the NIST. The reported analytical data will also be presented in standard units of mass of contaminant within a known volume of environmental media. The standard units for various sample matrices are as follows:

- Solid Matrices – micrograms per kilogram (µg/kg) for PFAS analyses, milligrams per kilogram (mg/kg) of media (Dry Weight).
- Aqueous Matrices – nanograms per liter (ng/L) for PFAS analyses, micrograms per liter (µg/L) of media for organic analyses, and milligrams per liter (mg/L) for inorganic analyses.
- Air Matrices - micrograms per cubic meter ($\mu g/m^3$) for organic analyses.

8.7 LEVEL OF QUALITY CONTROL EFFORT

If non-dedicated sampling equipment is used, equipment rinse blanks will be prepared by field personnel and submitted for analysis of target parameters. Equipment rinse blank samples will be analyzed to check for potential cross-contamination between sampling locations that may be introduced during the investigation. One equipment rinse blank will be collected per sampling event to the extent that non-dedicated sampling equipment is used.

If necessary, a separate equipment rinse blank sample will be collected for PFAS to assess potential contamination introduced from utilized equipment. (Note: If dedicated or disposable sampling equipment is used, equipment rinse samples will not be collected as part of that field effort.)

Trip blanks will be used to assess the potential for contamination during sample storage and shipment. Trip blanks will be provided with the sample containers to be used for the collection of groundwater samples for the analysis of VOCs. Trip blanks will be preserved and handled in the same manner as the project samples. One trip blank will be included along with each shipping container containing project samples to be analyzed for VOCs.

Method blank samples will be prepared by the laboratory and analyzed concurrently with all project samples to assess potential contamination introduced during the analytical process.

Field duplicate samples will be collected and analyzed to determine sampling and analytical reproducibility. One field duplicate will be collected for every 20 or fewer investigative samples collected for off-site laboratory analysis.

MS will provide information to assess the precision and accuracy of the analysis of the target parameters within the environmental media collected. One MS/MSD will be collected for every 20 or fewer investigative samples per sample matrix.

(Note: Soil MS/MSD samples require triple sample volume for VOCs only. Aqueous MS/MSD samples require triple the normal sample volume for VOC analysis and double the volume for the remaining parameters.)

9. Data Reduction, Validation, and Reporting

All data generated through field activities or by the laboratory operation shall be reduced and validated prior to reporting in accordance with the following procedures:

9.1 DATA REDUCTION

9.1.1 Field Data Reduction Procedures

Field data reduction procedures will be minimal in scope compared to those implemented in the laboratory setting. Only direct read instrumentation will be employed in the field. The pH, conductivity, temperature, turbidity, and PID readings collected in the field will be generated from direct read instruments following calibration per manufacturer's recommendations. The data will be written into field logbooks immediately after measurements are taken. If errors are made, data will be legibly crossed out, initialed and dated by the field member, and corrected in a space adjacent to the original entry. Later, when the results forms required for this study are being filled out, the Project Coordinator will review the forms to determine whether any transcription errors have been made by the field crew.

9.1.2 Laboratory Data Reduction Procedures

Laboratory data reduction procedures are provided by the appropriate chapter of EPA's "Test Methods for Evaluating Solid Waste," SW-846, Third Edition. Errors will be noted and corrections made with the original notations will be crossed out legibly. Analytical results for soil samples will be calculated and reported on a dry weight basis.

9.1.3 Quality Control Data

QC data (e.g., laboratory duplicates, surrogates, MS, and MSD) will be compared to the method acceptance criteria or laboratory acceptance criteria when no method criteria are available. Data determined to be acceptable will be entered into the laboratory information management system. Data summaries will be sent to the Laboratory QA Officer for review. If approved, data are logged into the project database format.

Unacceptable data will be appropriately qualified in the project report. Case Narratives will be prepared which will include information concerning data that fell outside acceptance limits and any other anomalous conditions encountered during sample analysis.

9.2 DATA VALIDATION

Data validation procedures of the analytical data will be performed by the Haley & Aldrich of New York QA Officer or designee using the following documents as guidance for the review process:

- "U.S. EPA National Functional Guidelines for Organic Data Review," "Analysis of Volatile Organic Compounds in Air Contained in Canisters by Method TO-15," "Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances Under NYSDEC's Part 375 Remedial Programs," and the "U.S. EPA National Functional Guidelines for Inorganic Data Review."

- The specific data qualifiers used will be applied to the reported results as presented and defined in the EPA National Functional Guidelines. Validation will be performed by qualified personnel at the direction of the Haley & Aldrich of New York QA Officer. Tier 1 data validation (the equivalent of EPA's Stage 2A validation) will be performed to evaluate data quality.
- The completeness of each data package will be evaluated by the Data Validator. Completeness checks will be administered on all data to determine that the deliverables are consistent with the NYSDEC Analytical Services Protocol (ASP) Category A and Category B data package requirements. The validator will determine whether the required items are present and request copies of missing deliverables (if necessary) from the laboratory.

9.3 DATA REPORTING

Data reporting procedures will be carried out for field and laboratory operations as indicated below:

- Field Data Reporting: Field data reporting will be conducted principally through the transmission of report sheets containing tabulated results of measurements made in the field and documentation of field calibration activities.
- Laboratory Data Reporting: The laboratory data reporting package will enable data validation based on the protocols described above. The final laboratory data report format will include the QA/QC sample analysis deliverables to enable the development of a DUSR based on NYSDEC DER-10, Appendix 2B.

10. Performance and System Audits

A performance audit is an independently obtained quantitative comparison with data routinely obtained in the field or the laboratory. Performance audits include two separate, independent parts: internal and external audits.

10.1 FIELD PERFORMANCE AND SYSTEM AUDITS

10.1.1 Internal Field Audit Responsibilities

Internal audits of field activities will be initiated at the discretion of the Project Manager and will include the review of sampling and field measurements. The audits will verify that all procedures are being followed. Internal field audits will be conducted periodically during the project. The audits will include an examination of the following:

- Field sampling records, screening results, instrument operating records;
- Sample collection;
- Handling and packaging in compliance with procedures;
- Maintenance of QA procedures; and,
- COC reports.

Follow-up audits will be conducted to correct deficiencies and to verify that procedures are maintained throughout the investigation.

10.1.2 External Field Audit Responsibilities

External audits may be conducted by the Project Coordinator at any time during the field operations. These audits may or may not be announced and are at the discretion of the NYSDEC. The external field audits can include (but are not limited to) the following:

- Sampling equipment decontamination procedures;
- Sample bottle preparation procedures;
- Sampling procedures;
- Examination of HASPs;
- Procedures for verification of field duplicates; and
- Field screening practices.

10.2 LABORATORY PERFORMANCE AND SYSTEM AUDITS

10.2.1 Internal Laboratory Audit Responsibilities

The laboratory system audits are typically conducted by the Laboratory QA Officer or designee on an annual basis. The system audit will include an examination of laboratory documentation including sample

receiving logs, sample storage, COC procedures, sample preparation and analysis, and instrument operating records.

At the conclusion of internal system audits, reports will be provided to the laboratory's operating divisions for appropriate comment and remedial/corrective action where necessary. Records of audits and corrective actions will be maintained by the Laboratory QA Officer.

10.2.2 External Laboratory Audit Responsibilities

External audits will be conducted as required by the NYSDEC, NYSDOH, or designee. External audits may include any of the following:

- Review of laboratory analytical procedures;
- Laboratory on-site visits; and
- Submission of performance evaluation samples for analysis.

An audit may consist of but not limited to:

- Sample receipt procedures;
- Custody, sample security, and log-in procedures;
- Review of instrument calibration logs;
- Review of QA procedures;
- Review of logbooks;
- Review of analytical SOPs; and
- Personnel interviews.

A review of a data package from samples recently analyzed by the laboratory can include (but not be limited to) the following:

- Comparison of resulting data to the SOP or method;
- Verification of initial and continuing calibrations within control limits;
- Verification of surrogate recoveries and instrument timing results;
- Review of extended quantitation reports for comparisons of library spectra to instrument spectra, where applicable; and
- Assurance that samples are run within holding times.

11. Preventive Maintenance

11.1 FIELD INSTRUMENT PREVENTIVE MAINTENANCE

The field equipment preventive maintenance program is designed to ensure the effective completion of the sampling effort and to minimize equipment downtime. Program implementation is concentrated in three areas:

- Maintenance responsibilities;
- Maintenance schedules; and
- Inventory of critical spare parts and equipment.

The maintenance responsibilities for field equipment will be assigned to the task leaders in charge of specific field operations. Field personnel will be responsible for daily field checks and calibrations and for reporting any problems with the equipment. The maintenance schedule will follow the manufacturer's recommendations. In addition, the field personnel will be responsible for determining that an inventory of spare parts will be maintained with the field equipment. The inventory will primarily contain parts that are subject to frequent failure, have limited useful lifetimes, and/or cannot be obtained in a timely manner.

11.2 LABORATORY INSTRUMENT PREVENTIVE MAINTENANCE

Analytical instruments at the laboratory will undergo routine and/or preventive maintenance. The extent of the preventive maintenance will be a function of the complexity of the equipment.

Generally, annual preventive maintenance service will involve cleaning, adjusting, inspecting, and testing procedures designed to deduce instrument failure and/or extend useful instrument life. Between visits, routine operator maintenance and cleaning will be performed according to manufacturer's specifications by laboratory personnel.

12. Quality Assurance Reports and Corrective Actions

Critically important to the successful implementation of the QAPP is a reporting system that provides the means by which the program can be reviewed, problems identified, and programmatic changes made to improve the plan.

QA reports to management can include:

- Audit reports, internal and external audits with responses;
- Performance evaluation sample results, internal and external sources; and
- QA/QC exception reports/corrective actions.

QA/QC corrective action reports will be prepared by the Haley & Aldrich of New York QA Officer when appropriate and presented to the project and/or laboratory management personnel so that performance criteria can be monitored for all analyses from each analytical department. The updated trend/QA charts prepared by the laboratory QA personnel will be distributed and reviewed by various levels of laboratory management.

Program activities are properly assessed using a review and evaluation process of field QA/QC forms, nonconformance reports (NCR) and subsequent corrective actions, internal peer review, and laboratory oversight. This process ensures this QAPP is adhered to, the quality of the data is adequate, and corrective actions, when needed, are implemented effectively and in a timely manner.

Any project team member can initiate the field corrective action process by identifying a problem, acting to eliminate the problem, documenting the corrective action, monitoring the effectiveness of the corrective action, and verifying the problem has been eliminated. Some examples of corrective actions for field measurements may include the following:

- Repetition of a measurement to check for error;
- Checking all proper adjustments for ambient conditions such as temperature;
- Checking batteries;
- Checking calibrations;
- Recalibration;
- Replacing instruments or measurement devices;
- Stop work (if necessary);
- Revising information submitted on COC forms; and
- Amending of sampling procedures or Work Plans.

Technical staff and project personnel are responsible for reporting all technical or QA nonconformances or suspected deficiencies of any activity or issued document by reporting the situation to the Haley & Aldrich of New York QA Officer on an NCR. The Haley & Aldrich of New York Project Manager, in coordination with the Haley & Aldrich of New York QA Officer, is responsible for assessing the suspected difficulty and its impact on the data quality in consultation with the Haley & Aldrich of New York Program

Manager. A corrective action decision, if necessary, will be determined by the Haley & Aldrich of New York Project Manager and QA Officer and implemented by the PM. The Haley & Aldrich PM has the authority to initiate stop work orders, if necessary, and is responsible for initiating a corrective action for a nonconformance, which may include the following actions:

- Evaluating all reported nonconformances;
- Determining disposition or action to be taken;
- Maintaining a log of nonconformances; and
- Reviewing nonconformance reports and corrective actions taken.

TABLES

TABLE I
SUMMARY OF ANALYSIS METHOD, PRESERVATION METHOD, HOLDING TIME, SAMPLE SIZE REQUIREMENTS, AND SAMPLE CONTAINERS
338-344 GRAND CONCOURSE
BRONX, NEW YORK

Analysis/Method[3]	Sample Type	Preservation	Holding Time	Volume/Weight	Container[4]
Volatile Organic Compounds/8260	Soil	1 - 1 Vial MeOH/2 Vial Water, Cool, 4 ± 2 °C	14 days[1]	120 mL	3 - 40ml glass vials
Semivolatile Organic Compounds/8270	Soil	Cool, 4 ± 2 °C	14 days extraction / 40 days analysis	250 mL	1 - 8 oz Glass
Pesticides/8081	Soil	Cool, 4 ± 2 °C	14 days extraction / 40 days analysis	250 mL	1 - 4 oz Glass
Polychlorinated Biphenyls/8082	Soil	Cool, 4 ± 2 °C	14 days extraction / 40 days analysis	250 mL	1 - 4 oz Glass
TAL Metals/6010, 7471	Soil	Cool, 4 ± 2 °C	180 days	60 mL	1 - 4 oz Glass
PFAS/1633A	Soil	Cool, 4 ± 2 °C	28 days extraction / 40 days analysis	To be determined by laboratory	1 - HDPE container
1,4-Dioxane/8270	Soil	Cool, 4 ± 2 °C	14 days extraction / 40 days analysis	250 mL	1 - 8 oz Glass
Volatile Organic Compounds/8260	Groundwater	HCl, Cool, 4 ± 2 °C	14 days	120 mL	3 - 40 mL glass vials
Semivolatile Organic Compounds/8270	Groundwater	Cool, 4 ± 2 °C	7 days extraction / 40 days analysis	500 mL	2 - 250 mL amber glass
Polychlorinated Biphenyls/8082	Groundwater	Cool, 4 ± 2 °C	365 days	2000 mL	2 - 1000 mL amber glass
Pesticides/8081	Groundwater	Cool, 4 ± 2 °C	7 days	3000 mL	2 - 500 mL amber glass
Total and Dissolved Metals/6010, 7470	Groundwater	HNO_3; Cool, 4 ± 2 °C	180 days, except Mercury - 28 days	500 mL	2 - 500 mL plastic bottle
PFAS/1633A	Groundwater	H2O Cool, 4 ± 2 °C	28 days extraction / 28 days analysis	To be determined by laboratory	2 - HDPE container
1,4-Dioxane/8270SIM	Groundwater	Cool, 4 ± 2 °C	7 days extraction / 40 days analysis	500 mL	1 - 500 mL plastic bottle
Volatile Organic Compounds/TO-15	Soil Vapor	N/A	30 days	2.7 - 6 L	1 - 2.7 L Summa Canister

Notes:

1. Terracores and encores must be frozen within 48 hours of collection

2. Refer to text for additional information.

3. Equivalent method can be used.

4. Volume may vary by laboratory and/or equivalent method.

TABLE II
LABORATORY AND FIELD QUALITY CONTROL OBJECTIVES
338-344 GRAND CONCOURSE
BRONX, NEW YORK

Quality Control Sample/Process Assessed	Measurement Quality Indicator	Frequency	Acceptance Criteria	Corrective Action
LABORATORY QA/QC				
Method Blank	Accuracy and Representativeness	1 per analytical batch of 20 samples	No target analyte above one-tenth the amount in any sample	Reanalyze blank and samples. Qualify as necessary.
LCS or LCS/LCSD	Accuracy or Accuracy and Precision	1 per analytical batch of 20 samples	Method Specific Criteria per lab SOP or NYSDEC's Part 375 Remedial Programs	Re-prepare and reanalyze blank and samples. Qualify as necessary.
MS/MSD	Accuracy and Precision	1 per analytical batch of 20 samples	Method Specific Criteria per lab SOP or NYSDEC's Part 375 Remedial Programs	Qualify as necessary.
Laboratory Duplicate	Precision	1 per analytical batch of 20 samples	RPD <20% (or absolute difference <5x RL)	Qualify as necessary.
Surrogate	Accuracy	Each sample	Method Specific Criteria per lab SOP or NYSDEC's Part 375 Remedial Programs	Re-extract and reanalyze. Qualify as necessary.
FIELD QA/QC				
Trip Blank	Accuracy	1 per cooler when submitting samples for volatile analysis	No target analyte above one-tenth the amount in any sample	Qualify as necessary
Field Blank	Accuracy	As necessary	No target analyte above one-tenth the amount in any sample	Qualify as necessary
Equipment Rinse Blank	Accuracy	As necessary	No target analyte above one-tenth the amount in any sample	Qualify as necessary
Field Duplicate	Accuracy and Precision	1 in 20 project samples	RPD <35% for water (or absolute difference <5x RL) RPD <100% for solid (or absolute difference <5x RL) RPD <35% for air	Qualify as necessary

Notes:

% = percent
LCS/LCSD = Laboratory Control Sample/Laboratory Control Sample Duplicate
MDL = Method Detection Limit
ML = Method Minimum Level
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QA/QC = Quality Assurance/Quality Control
RL = Reporting Limit
RPD = Relative Percent Difference
** QA/QC only analyzed as relevant per method requirements*

JAMES BELLEW

Principal

EDUCATION

M.S., Environmental Geology, Queens College
B.S., Geology, Pre-Law, Environmental Science, Binghamton University

PROFESSIONAL SOCIETIES

American Council of Engineering Companies, Member, 2017
Urban Land Institute, Member, 2016
Business Council of New York, Member, 2018

SPECIAL STUDIES AND COURSES

40-Hour OSHA Hazardous Waste Operations and Emergency Response Training (29 CFR 1910.120)
30-Hour OSHA Construction Safety and Heath
8-hour OSHA Site Supervisor Certification
OSHA Confined Space Entry Training Certification
Erosion and Sediment Control, New York, No. 006925
USDOT/IATA Training on the Shipping and/or Transportation of Hazardous Materials

James has a hands-on approach to every project. He believes that being present and putting himself into his clients' shoes is the best way to understand their needs. As a Principal, James's expertise includes due diligence, environmental risk development, building surveys, remedial investigations, remedial design, and technical oversight. Mr. Bellew has completed over 50 NYCOER E-Designation Sites and NYSDEC Brownfield Cleanup Program Sites which include preparation of all reports through to the certificate of completion and a certificate of occupancy.

Clients appreciate James' strategies from the inception of a project through closure under various regulatory programs nationwide. That comprehensive approach is what James loves the most about his job. He enjoys taking on complex projects and finding rational, cost-effective, remedial solutions. His biggest reward? When he can bring a client cost relief through value engineering.

RELEVANT PROJECT EXPERIENCE

Development, NYCDDC Shirley Chisholm Recreational Center, Brooklyn, New York. Principal for the project released by the New York City Department of Design and Construction, on behalf of the NYC Parks Department, for the design and construction of a new recreational center located at 3002 Foster Avenue in Brooklyn New York. Scope of services included execution of a Phase II Environmental Site Assessment, soil characterization, remedial oversight, geotechnical percolation testing and closure with the NYC Department of Environmental Protection.

Development's, New York State Superfund Site, Former NuHart Plastics Site, New York State Superfund Site (NuHart West) and Brownfield Cleanup Program Site (NuHart East), Brooklyn, New York. Principal for the preparation of the feasibility study, offsite investigation reports, RCRA (Resource Conservation and Recovery Act) Closure Work Plan, execution of the RCRA Closure, preparation of the Brownfield Cleanup Application (NuHart East), 100% Remedial Design, preparation of all BCP related work plans (NuHart East), coordination to vest the Site for 421-a and all community outreach programs for a former plasticizer facility with on- and off-site pollutant concerns. Responsible for all remedial cost and alternative analysis with the client to bring the Site to a certificate of completion. NuHart is a high-profile Site that requires coordination with the New York State Department of Environmental Conservation (NYSDEC), the New York City Office of Environmental Remediation (NYCOER), local regulatory agencies, community stakeholders and local elected officials. The NuHart East Site has completed the remediation and received the Certificate of Completion with the NYSDEC and the NuHart West Site is close to completion with an anticipated 2024 transition from a Class 2 to a Class 4 Inactive Hazardous waste Site.

Development's, 101 Fleet Place, Brooklyn, New York. Principal responsible for the due diligence during acquisition, preparation of the Brownfield Cleanup Program Application, Change of Use Documents, BCA Amendments, remedial investigation, and remedial action design (BCP and OER) for a former bus depot Site under the New York State Brownfield Cleanup program and NYCOER E-Designation Programs (Air/Noise). The Site has a footprint of 20,000 SF with a planned development of a 21-story mixed use building with approximately 292 units which include affordable housing.

Development's, Speedway Portfolio, Multiple Boroughs, New York. Principal responsible for the expedited due diligence during acquisition of 5 former Speedway Sites of Phase I ESA's and Limited Phase II ESI's, preparation of the Brownfield Cleanup Program Applications, Remedial Investigation Work Plans, Interim Remedial Measure Work Plans and Air/Noise Remedial Action Work Plans (NYCOER). Five of the Sites were accepted into the NYSDEC Brownfield Cleanup program. Remedial Investigations for compliance with the Brownfield Cleanup Program have been completed and the remedial design on the Sites include a variety of remedial approaches which include in situ chemical treatment for groundwater, soil vapor extraction, excavation and dewatering removal and treatment.

Development, 138 Bruckner Boulevard, Bronx, New York. Principal responsible for the due diligence during acquisition, preparation of the Brownfield Cleanup Program Application, Change of Use Documents, coordination to vest the Site for 421-a, BCA Amendments, remedial investigation, and remedial action design (BCP and OER) for the former Zaro's Bakery Site under the New York State Brownfield Cleanup program and NYCOER E-Designation Programs (Air/Noise). The Site has a footprint of 50,000 SF with a planned development of a 12-story mixed use building with approximately 447 units which include affordable housing.

Development, 310 Grand Concourse, Bronx, New York. Principal responsible for environmental and construction management services required to successfully navigate this two-building redevelopment project through the NYSDEC Brownfield Cleanup Program (BCP) and NYCOER E-Designation Program (Air/Noise). Project included site investigation, design, and remediation for development of two buildings within a 30,000 square-foot lot in the Bronx, New York. Remediation included excavation of approximately 20,000 cubic yards of soil, groundwater extraction and treatment, underground storage tank (UST) removal, design, and installation an ex-situ chemical in situ soil stabilization process for elevated levels of metals.

Development, 40 Bruckner Boulevard, Bronx, New York. Principal responsible for the due diligence during acquisition, preparation of the Brownfield Cleanup Program Application, Change of Use Documents, BCA Amendments, remedial investigation, and remedial action design (BCP and OER) for the former Mill Sanitary Wiping Cloth Site under the New York State Brownfield Cleanup program and NYCOER E-Designation Programs (Air/Noise). The Site has a footprint of 45,000 SF with a planned development of a 12-story mixed use building with approximately 480 units which include affordable housing.

Development, 297 Wallabout Street, Brooklyn New York. Principal responsible for the due diligence during acquisition, preparation of the Brownfield Cleanup Program Application, Change of Use Documents, BCA Amendments, remedial investigation, and remedial action design (BCP and OER) for the 297 Wallabout Street Site under the New York State Brownfield Cleanup program and NYCOER E-Designation Programs (Air). Successfully delineated the onsite tetrachloroethene (PCE) plume in soil and groundwater. The Site is currently in the remedial implementation phase.

Developments, 89-91 Gerry & 93 Gerry Street, Brooklyn New York. Principal responsible for the due diligence during acquisition, preparation of the Brownfield Cleanup Program Application, Change of Use Documents, BCA Amendments, remedial investigation, and remedial action design (BCP and OER) for two Sites (adjacent to each other) located at 89-91 Gerry Street and 93 Gerry Street under the New York State Brownfield Cleanup program and NYCOER E-Designation Programs (Air). The Sites are currently preparing to execute the remedial action.

Development, Former Techtronics Site (8 Walworth Street), Brooklyn, New York. Principal for the remedial investigation, remedial action design and remedial action implementation for the former Techtronics Site under the New York State Brownfield Cleanup program as a Participant where trichloroethene (TCE) and tetrachloroethene (PCE)

were encountered in soil and groundwater. James successfully delineated the vertical and lateral extents of the plumes which were identified as an upgradient, on-site. For this Site we have designed source removal to 20'bgs, Zero Valent Iron (ZVI) Reactive Barrier Wall, in situ ZVI injections sitewide and a vertical vapor mitigation system. The Site is currently in the remedial implementation phase.

Development, 346 Grand Concourse, Bronx, New York. Principal for the proposed 9-story, 60 key commercial building with one-level deep cellar. Design phase environmental services consist of guiding the Site through the New York City Office of Environmental of Remediation Voluntary Cleanup and E-Designation Programs, including Hazmat, Air Quality and Noise requirements. This program included submission of a Remedial Investigation Work Plan, implementation of a Remedial Investigation, submittal of a Remedial Investigation Report, Remedial Action Work Plans (Hazmat Air and Noise) and the Final Installation Report for the Certificate of Occupancy.

Development, 3294 Atlantic Avenue, Brooklyn, New York. Principal for the proposed 12-story, 80 key commercial building with one-level deep cellar. Design phase environmental services consist of guiding the Site through the New York City Office of Environmental of Remediation Voluntary Cleanup and E-Designation Programs, including Hazmat, Air Quality and Noise requirements. This program included submission of a Remedial Investigation Work Plan, implementation of a Remedial Investigation, submittal of a Remedial Investigation Report, Remedial Action Work Plans (Hazmat Air and Noise) and the Final Installation Report for the Certificate of Occupancy.

590-594 Myrtle Avenue, Brooklyn, New York. Principal for the proposed 6-story, 12-unit residential building with one-level deep cellar. Design phase environmental services consist of guiding the Site through the New York City Office of Environmental of Remediation Voluntary Cleanup and E-Designation Programs, including Hazmat, Air Quality and Noise requirements. This program included submission of a Remedial Investigation Work Plan, implementation of a Remedial Investigation, submittal of a Remedial Investigation Report, Remedial Action Work Plans (Hazmat Air and Noise) and the Final Installation Report for the Certificate of Occupancy.

Development, 3530 Webster Avenue, Bronx, New York. Principal for the proposed 8-story, 75 key commercial building with one-level deep cellar. Design phase environmental services consist of guiding the Site through the New York City Office of Environmental of Remediation Voluntary Cleanup and E-Designation Programs, including Hazmat, Air Quality and Noise requirements. This program included submission of a Remedial Investigation Work Plan, implementation of a Remedial Investigation, submittal of a Remedial Investigation Report, Remedial Action Work Plans (Hazmat Air and Noise). The project is currently in the construction phase of the NYCOER program.

Development, Former BP Station, Elmhurst Queens, New York. Principal for the preparation of a full environmental impact statement with respect to a mixed-use development proposed in Elmhurst Queens for submission to the NYC Department of City Planning to rezone the project. The work included a full impact assessment of the proposed construction with respect to the neighborhood, evaluation of green/open spaces for the community and environmental site investigation and remediation services.

New York State Brownfield Site, Former Delta Metals Site, Brooklyn, New York. Senior Project manager for the remedial investigation and remedial action design for the former Delta Metal Products Company. Project is under the New York State Brownfield Cleanup program as a Participant where TCE and tetrachloroethene (PCE) were encountered in soil and groundwater. James successfully delineated the vertical and lateral extents of the plumes which were identified as an upgradient, on-site and downgradient plume. Investigation results triggered the NYSDEC to utilize its call-out contract to perform a plume track down for the immediate area and identify additional Potentially Responsible Parties. The design for an Air Sparge Soil Vapor Extraction system has been accepted and the project is currently under construction.

Manufacturing-Industrial, Hess Amerada, Bogota and Edgewater, New Jersey. Senior Project Manager and technical Lead for the construction management services for the demolition of two waterfront terminals on the Hackensack and Hudson rivers. Services included demolition design, submittal review, site execution and coordination of activities

related to asbestos abatement, demolition of buildings, thirty holding tanks, piping structures, containment structures and storm water structures.

Manufacturing-Industrial, PQ Corporation, Northeastern United States. Senior Project Manager responsible for the design and implementation of a three phased program for handling polychlorinated biphenyl (PCB) containing materials on approximately 100 tank structures at large, active industrial sites, which included coating removal, encapsulation, demolition, and Toxic Substances Control Act (TSCA) remediation. He was responsible for development of the overall program, specifications, drawings, bid packages, construction oversight and project administration until closure. The program also included design and oversight of a new façade and roof upgrades completed concurrently to client operations.

Development, New York State Brownfield Site, Former Cascade Laundry, Brooklyn, New York. Senior Project Manager responsible for environmental and construction management services required to successfully navigate a seven-building redevelopment project through the NYSDEC Brownfield Cleanup Program (BCP) and NYCOER E-Designation Program (Air/Noise). Project included site investigation, design, and remediation for development of seven buildings within a 2-acre site in Brooklyn, New York. Remediation included excavation of approximately 40,000 cubic yards of soil, groundwater extraction and treatment, underground storage tank (UST) removal, design, and installation of a sub slab depressurization system (SSDS) and ex situ chemical oxidation of groundwater impacted by petroleum.

Development, New York City Brownfield Site - 520-534 West 29th Street, New York, New York. James was responsible for environmental site investigation and remediation activities required to successfully navigate the project through the NYCOER's E-Designation and Voluntary Cleanup Programs. This program included submission of a Remedial Investigation Work Plan, implementation of a Remedial Investigation, submittal of a Remedial Investigation Report, Remedial Action Work Plans (Hazmat Air and Noise). The project is currently in the construction phase of the NYCOER program.

Development, New York State Brownfield Site, BJ's Wholesale, Brooklyn, New York. Senior Project Manager for the remedial execution within the NYSDEC BCP and NYCOER E-Designation programs at an 8-acre peninsula in Gravesend Bay being redeveloped by BJ's Wholesale Club (BJ's) into a "big-box" warehouse and parking garage, and a publicly accessible, waterfront open space. He implemented a comprehensive community air monitoring plan (CAMP), managed the design and installation of a passive sub slab depressurization system, and oversaw handling and off-site disposal of impacted material generated by BJ's (the Lessee for the subject site) during their foundation construction activities.

Development, New York State Brownfield Site, Coney Island, Brooklyn, New York. Senior Project Manager responsible for the environmental design during the rehabilitation and expansion of a 1970s-era mixed-use complex, which covers an area equivalent to three city blocks. He facilitated the BCP applications for two adjacent parcels within the complex impacted by historic dry-cleaning uses. Site investigations performed had documented the presence of PCE in soil gas and was delineated over three separate structural slabs in commercial and residential space utilizing a mobile laboratory. He designed and installed two sub-slab depressurization systems and prepared Remedial Investigation Work Plan which outlined work required to delineate the vertical and horizontal extent of the impacted soils, soil vapor and groundwater at both BCP sites. The system was designed with below slab suction pits, remote sensing vacuum monitoring points, and a variable frequency drive blower tied into the monitoring points for optimization and power savings.

Development, New York City Brownfield Site, Hospitals, Memorial Sloan Kettering Cancer Center (MSKCC), New York, New York. Project Manager for environmental remediation for this MSKCC development project. James was solely responsible for subsurface investigation and remediation activities, large, manufactured gas plant (MGP) gas holder removal (from former Con Edison Operations), UST removal, daily status updates to the NYCOER, implementation of the CAMP and the management, handling, characterization, and off-site disposal of MGP impacted soil and dewatering fluids.

New York State Spill Remediation, Metropolitan Transportation Agency Bridges and Tunnels, New York, New York. Project Manager responsible for execution of a remedial action scope which included UST removal, excavation of 600 cubic yards of petroleum impacted soil, design and installation of a groundwater extraction and treatment system and post remediation samples. He implemented the In Situ Chemical Oxidation program for the injection of 54,000 gallons of 8 percent solution Fenton's Reagent and the O&M (Operation & Maintenance) of the petroleum spill with respect to Fenton's performance and the plume migration.

Various Public Schools, New York City School Construction Authority, New York, New York. Project Manager responsible for environmental remediation proposed several school developments sites, including PS 312, P.S. 281, and PS 27K. Assisted in the design and implementation of the remediation programs for the sites for petroleum spills, PCB TSCA contamination and hazardous lead hot spots.

Development, i.Park Edgewater, Edgewater, New Jersey. Project Manager responsible for the design and environmental remediation on-site. Implemented the construction plan for remediation of arsenic, pitch- and PCB-impacted soil for excavation and off-site disposal of 20,000 tons. He managed the air monitoring system on-site which consisted of four permanent stations set upwind and downwind on-site for volatile organic compounds (VOCs) and particulate migration off-site. Also, James performed redesigns throughout the project to keep within the current schedule and budget.

Development, New York State Brownfield, Queens West, Long Island City, New York. Project Manager responsible for oversight of the Environmental Remediation on-site. James implemented the construction plan for remediation of 20,000 cubic yards of LNAPL on the Site; he assisted in design and oversight of the In Situ Chemical Oxidation mixing on-site. The project was eventually developed into three large towers and a new school.

Manufactured Gas Plant, National Grid, Rockaway, New York. James aided in the design and implementation of the soil characterization plan for MGP impacted sands. After delineation of the contamination plume, drafted work plans and site layout of the negative pressure tent. He performed and trained the on-site staff on the use of personal air monitoring equipment and aided with design considerations on the installation of a waterloo barrier to be advanced to minus 80 feet below grade surface. James also helped with the design and permitting for the groundwater treatment system installed on-site.

Manufactured Gas Plant, Con Edison, New York, New York. Environmental engineer for responsible party for all environmental issues associated with this job, including transportation and disposal of 8,000 tons of MGP contaminated soil from former Con Edison operations. James scheduled weekly work for all civil and environmental tasks on the job. He was responsible for the design and installation of the dewatering treatment system with a daily discharge of 25,000 gallons per day of MGP -impacted water.

New York State Superfund Project, NYSDEC, Hicksville, New York. James performed O&M and reporting on the Site's Potassium Permanganate Injection system, which was on a timed system; maintained the system, troubleshooting problems and ensuring that the proper ratios were being injected. He performed the fieldwork for analysis and drafted interim reports for the project manager.

Retail Petroleum, New York State Spills Program, Hess Amerada, Various Locations, New York. Environmental Engineer responsible for the design and installation of groundwater and soil vapor remedial systems at over 30 retail petroleum stations for Hess. Responsible for ensuring that the remedial systems were operating properly and performing repairs as necessary during operation. He performed groundwater and soil vapor monitoring and drafted O&M reports for the NYSDEC. Plume size ranged from within the retail station property with monitoring off-site impacts in local neighborhoods greater than a 3-mile radius.

Retail Petroleum, New York State Spills Program, British Petroleum (BP), Various Locations, New York. Environmental Engineer responsible for the design and installation of groundwater and soil vapor remedial systems at over 10 retail petroleum stations for BP. He was responsible for ensuring that the remedial systems were operating properly and performing repairs necessary during operation. He performed groundwater and soil vapor monitoring

and drafted O&M reports for the NYSDEC. Plume size ranged from within the retail station property with monitoring off-site impacts in local neighborhoods greater than a 2-mile radius.

Development, 524 West 19th Street, New York, NY (Metal Shutter Homes). Project Engineer responsible party for all environmental and civil issues associated with this job, including transportation and disposal of 5,000 tons of MGP contaminated soil from former Con Edison operations. James scheduled weekly work for all civil and environmental tasks on the job. He successfully redesigned the grout cutoff wall connections to the installed steel sheeting with a secant wall installed off-site. He provided technical guidance for drilling 4-foot diameter exploratory casings for subsurface anomalies. Additionally, James was responsible for the design and installation of the dewatering treatment system with a daily discharge of 25,000 gallons per day of MGP impacted water.

EPA Superfund Site, Newtown Creek Superfund, Brooklyn, New York. Environmental Engineer who aided in the design of the pump and treat system installed at Peerless Importers. He also aided in the design and installation of the harbor boom set up. Operated and Maintained groundwater/LNAPL extraction systems on-site and performed monthly site gauging as part of the O&M plan.

MATTHEW J. LEVY

Senior Project Manager | Environmental Scientist

EDUCATION

BS, Biochemistry and Environmental Science, Muhlenberg College

SPECIAL STUDIES AND COURSES

40-Hour OSHA Hazardous Waste Operations and Emergency Response Training (29 CFR 1910.120)
8-Hour OSHA Hazardous Waste Worker Refresher Training (29 CFR 1910.120)
30-Hour OSHA Construction
NYSDEC Erosion and Sediment Control Inspector
American Red Cross First Aid Training and CPR Course

Matthew is a project manager with experience in soil, groundwater and soil vapor investigation, specializing in remedial design and implementation. During his time at Haley & Aldrich, Matthew's focus has been serving the environmental and real estate markets. He is experienced in Phase I Environmental Site Assessments and Phase II Environmental Site Investigations, site characterization, hazardous materials analysis, regulatory closure reports as well as remedial design and implementation.

Matthew has experience in composing site closure documentation including Remedial Closure Reports reviewed by the Office of Environmental Remediation as well as Final Engineering Reports reviewed by the New York State Department of Environmental Conservation. His background includes the development of and compliance with regulator-approved site management plans, overseeing the operation and maintenance of on-site engineering controls and ensuring the protection of human health and the environment.

Matthew has also worked on city rezoning proposals by performing work associated with and composing the Hazardous Materials Analysis chapter included in Final Environmental Impact Statements published by New York City Department of Planning. Analysis methods were performed in accordance with the City Environmental Quality Review (CEQR) guidelines for neighborhoods including East Harlem, Manhattan and Gowanus, Brooklyn as well as Industry City, Brooklyn.

RELEVANT PROJECT EXPERIENCE

Redevelopment and Remediation

The Jay Group, Brownfield Cleanup Program Remediation Site, 101 Fleet Place, Brooklyn, New York. Project manager for environmental consulting services during the redevelopment of a former childcare center into a mixed-use commercial and residential high-rise. The Site has been assigned New York City Office of Environmental Remediation (NYC OER) E-Designation status for hazardous materials, noise and air quality and has received its Certificate of Completion for remedial work completed in the NYS Brownfield Cleanup Program (BCP). OER Services development of an Air Quality/Noise Remedial Action Plan and Installation Report. New York State BCP services included completion of a remedial investigation, composition of a Remedial Investigation Report (RIR), development of a BCP Remedial Action Work Plan (RAWP), Remedial Oversight during the implementation of the RAWP, composition of the Site Management Plan and composition of the Final Engineering Report (FER).

The Jay Group, Brownfield Cleanup Program Remediation Site, 401 West 207th Street, New York, New York. Project manager for environmental consulting services during the redevelopment of a former gas station into a mixed-use commercial and residential high-rise. The Site has been assigned New York City Office of Environmental Remediation

(NYC OER) E-Designation status for hazardous materials, noise and air quality and has received its Certificate of Completion for remedial work completed in the NYS Brownfield Cleanup Program (BCP). OER Services development of an Air Quality/Noise Remedial Action Plan and Installation Report. New York State BCP services included completion of a remedial investigation, composition of a Remedial Investigation Report (RIR), development of a BCP Remedial Action Work Plan (RAWP), Remedial Oversight during the implementation of the RAWP, composition of the Final Engineering Report (FER).

Manhattan Management, Brownfield Cleanup Program Remediation Site, Bedford Beverly Redevelopment, Brooklyn York, New York. Project manager for environmental consulting services during the redevelopment of a former auto service center, landmark commercial building and associated parking lots into a development renovating the landmarked building and redeveloping the surrounding space into four mixed-use commercial and residential high-buildings. The Site is being remediated under the NYS Brownfield Cleanup Program (BCP). BCP services included completion of a remedial investigation, composition of a Remedial Investigation Report (RIR), development of a BCP Remedial Action Work Plan (RAWP), Remedial Oversight during the implementation of the RAWP, composition of the Final Engineering Report (FER) and composition of a Site Management Plan (SMP).

Titan Equity Group, Hotel Redevelopment, Bronx, New York. Project manager for a hotel redevelopment in the south Bronx. The site has been assigned New York City Office of Environmental Remediation (NYC OER) E-Designation status for hazardous materials, noise, and air quality. Services included completion of a remedial investigation, composition of a Remedial Investigation Report and development of Hazardous Material Remedial Action Work Plan and Air Quality/Noise Remedial Action Plan as per NYC OER requirements.

Private Developer, Mixed-Use Redevelopment, Queens, New York. Project manager for a mixed-use residential and commercial redevelopment in Queens. The Site has been assigned New York City Office of Environmental Remediation (NYC OER) E-Designation status for hazardous materials. Services included completion of a remedial investigation, composition of a Remedial Investigation Report and development of Hazardous Material Remedial Action Work Plan as per NYC OER requirements.

ZACHARY SIMMEL

Assistant Project Manager | Senior Engineer

EDUCATION

BS, Environmental Engineering, Syracuse University

SPECIAL STUDIES AND COURSES

40-Hour OSHA Hazardous Waste Operations and Emergency Response Training (29 CFR 1910.120)
8-Hour OSHA HAZWOPER Refresher Training
10-Hour OSHA Construction Safety Training
8-Hour DOT Hazmat Employee & RCRA Hazardous Waste Generator Training
American Red Cross First Aid Training and CPR Course
XRF Training
Asbestos Inspector Training

Zachary is an engineer with experience in remedial site investigations, subsurface investigations, observations of rock blasting/excavation, preparation of technical reports, and data collection and analysis. He also has extensive experience with conducting Phase I environmental site assessments and Phase II environmental site assessments, and other forms of environmental due diligence. He has performed groundwater sampling events, soil gas/vapor surveys, and assisted with preparation of soils management plans. Zachary regularly utilizes computer programs such as Microsoft Excel, Microsoft Word, and Bluebeam in his daily job functions.

He will focus his time at Haley & Aldrich serving the Building and Infrastructure markets with performing site reconnaissance to observe existing conditions, assess site access for subsurface explorations, and identify important site features. He will also monitor subsurface exploration activities to collect soil, bedrock, groundwater, as well as other pertinent information for project design, and assist in the development of remedial work plans.

RELEVANT PROJECT EXPERIENCE

Environmental

310 Grand Concourse Residential Construction, South Bronx, New York. As a field engineer, Zachary performed excavation oversight and was responsible for the collection of endpoint samples, air monitoring, and logging trucks for off-site disposal. He assisted in the development of a map that accounted for the different impacted zones on the site including hazardous lead and petroleum areas. He was exposed to general support of excavation (SOE) practices including the installation of soldier piles, structural piles, timber lagging, walers, and rakers. Approximately 24,000 tons of soil was excavated and transported off-site (includes hazardous lead, petroleum impacted, urban fill, and native soil) and approximately 10,250 tons of broken-up bedrock was removed from the site. Thirteen underground storage tanks containing gasoline were encountered and removed as part of the remediation. The site achieved the most stringent remediation standards in New York state.

Former Techtronics Facility, 8 Walworth Street, Brooklyn, New York. As field engineer, Zachary was responsible for the oversight of soil borings by Direct Push and installation of fifteen permanent groundwater monitoring wells using mud-rotary drilling. Cluster wells were installed to vertically delineate chlorinated volatile organic compounds (CVOCs) on-site plume and to evaluate other plumes migrating onto the site. Adjusted well locations due to site-specific challenges, specifically shallow refusal. His responsibilities included collecting soil and groundwater environmental samples, gauging wells, overseeing survey performed by license surveyor, and compiling laboratory data and hydrogeologic information to formulate an interim remedial measure (IRM) design involving soil vapor extraction/air sparging systems and implementing a bioremediation injection barrier wall.

297 Wallabout Street, Brooklyn, New York. As field engineer, Zachary was responsible for the oversight of soil borings and installation of five permanent groundwater monitoring wells. His responsibilities included classifying soil, developing/purging wells, collecting environmental soil samples, and conducting low-flow groundwater sampling for various analyses.

Excavation Oversight and CAMP Monitoring, Various Sites, Bronx and Brooklyn, New York. Zachary served as field engineer for several projects under the NYC Mayor's Office of Environmental Remediation (NYCOER) program. His responsibilities included performing excavation oversight, air monitoring, vapor barrier installation oversight, and logging trucks for off-site disposal.

Former NuHart Plastics Manufacturing Plant, Brooklyn, New York. Zachary worked as field engineer for multiple monitoring events which consisted of the removal of light non-aqueous-phase liquid (LNAPL) performed in compliance with the site-specific, NYSDEC-approved Operation, Maintenance, and Monitoring Plan (OM&M Plan) for the product recovery system.

Rock Brokerage Environmental Site Assessments, New York City, New York. Zachary served as field engineer for environmental waste characterization services as required by the disposal facility at several sites throughout the greater New York City area.

Building & Infrastructure Construction/Development

I-95 Express Lanes Fredericksburg Extension, Fredericksburg/Stafford, Virginia. As field engineer, Zachary was responsible for the oversight of geotechnical borings using (HSAs) along Interstate 95. Work areas included both road work and limited access areas (i.e. wetlands, medians). He provided quality real-time data under an intense project deadline and collaborated daily with earthwork firm (i.e. branch civil). Logged soils using Virginia Department of Transportation Classification System and collected both split spoon and Shelby tube samples. Equipment used for soil classification included a pocket penetrometer.

Greenwich Country Day School South Campus Addition, Greenwich, Connecticut. As field engineer, Zachary observed construction activities for south campus addition which included rock removal (line drilling and blasting), installing footings, preparing bearing surfaces, installing underslab and perimeter drainage systems, and earthworks. Project responsibilities also included collecting blast vibration monitoring information from the blaster and regularly checking in with surveyor to maintain elevation control of excavation.

Corbin Avenue Mixed-Use Residential Development, Darien, Connecticut. Zachary served field engineer for subsequent site investigation for a mixed-use residential development. The development will consist of several, mixed-use residential buildings, and an underground parking structure. His responsibilities included monitoring of test borings (using HAS and mud rotary) and rock drilling, collecting pertinent information from drill rig crews (monitored two at a time), collecting environmental samples, and gauging previously installed groundwater monitoring wells. Adjusted test boring locations due to site specific challenges including shallow refusal depth, utilities, and other site (i.e. parked vehicles, access restrictions).

Lambert Houses Parcel 5, Bronx, New York. As field engineer for site investigation of proposed development at E 179th Street, Zachary monitored 15 test borings and one test it to obtain information on subgrade and depth of bedrock across the site.

Lincoln Avenue Bridge Replacement, Trenton, New Jersey. As field engineer for site investigation of proposed replacement of bridge, Zachary monitored test borings to obtain information on subgrade and depth to bedrock. Test boring extended down to approximately 100 feet; 25 feet was rock cored. Both soil and rock cores were collected, observed, and properly identified in logs.

Keeler Brook Force Main Final Design, Connecticut Avenue, Norwalk, Connecticut. Zachary served as field engineer for site investigation of proposed installation of 2,475 linear feet (lf) of 16-in.-dia., HDPE-force main running along the south side on Connecticut Avenue. Final design included 1,100 lf horizontal directional drilling (HDD) and 725 lf pipe jacking area. His responsibilities included monitoring of test borings and rock drilling to obtain information on subgrade and depth to bedrock.

Environmental Remediation Experience

The Stanwich School, Environmental Remediation Investigation, Greenwich, Connecticut. As field engineer, Zachary was responsible for the oversight of the remediation of former hiking trails impacted by historical placement of fill material (e.g., primarily ash, coal, slag). Primary contaminants of concern included heavy metals, specifically arsenic and lead. Assisted with preliminary subsurface investigation involving the installation of test pits in order to characterize and assess distribution of fill material. Primary responsibilities included oversight of the removal of fill material, segregating cut stone for re-use, collecting endpoint samples to determine performance of the remedy, compiling laboratory data, oversight of the installation of filter fabric, and preparing a site remediation report with appropriate figures. Acted as liaison between general contractor and both soil brokerage firm and environmental laboratory.

Marc Service Station, Environmental Remediation, Stamford, Connecticut. As field engineer, Zachary was responsible for the remedial oversight of former gasoline service station. He conducted both Phase I and Phase II Environmental Site Assessments prior to remediation. Primary responsibilities included oversight of the excavation and removal of two abandoned in-ground hydraulic lifts, an out-of-service oil/water separator, and interior drain lines. Project also called for the removal of historic impacted soil in the vicinity of a former pump island and locations of former underground storage tanks grossly contaminated with primarily Benzene, Toluene, Ethylbenzene and Xylene (BTEX) contaminants and petroleum. He was responsible for the collection and analysis of soil samples, verification of completeness of the work, documentation, and preparation of a closure/soil remediation report.

Rubino Brothers Scrap Metal, Environmental Remediation Investigation, Stamford, Connecticut. As field engineer, Zachary was responsible for the remedial oversight of former storage lot operated by scrap metal yard. The storage lot was comprised of three different parcels which were formerly operated by a variety of light industrial and commercial businesses including a foundry and lumber yard. Assisted in the development of a grid system across the entirety of the site, each approximately 25 ft x 25 ft. Remediation was conducted in several phases: removal of top layer of asphalt and millings, removal of reinforced concrete slabs across the entirety of the site, and removal of impacted soil (primary contaminants of concern [Extractable Total Petroleum Hydrocarbons], arsenic, and lead). Encountered orphan underground gasoline storage tanks and a waste oil tank. Primary responsibilities included oversight of the removal of impacted soil, segregating non-native material, collecting endpoint samples, and documenting completion of work. Collected composite samples from stockpiles for waste characterization and disposal facility. Created spreadsheet and tables of laboratory results, prepared appropriate site plans, and assisted with compilation of remediation report.

Environmental Investigation Experience

Multiple Confidential Clients, Phase I ESAs and Due Diligence, Multiple Locations in Connecticut, New York, New Jersey. Zachary conducted Phase I ESAs, for buyer and vendor sides, on a variety of properties including commercial, industrial, and residential sites. Experience with conducting Phase I ESAs and Transaction Screens (in CT) on dry cleaners, auto body shops, and service stations.

Multiple Confidential Clients, Phase II, Multiple Locations, Connecticut. As field engineer, Zachary conducted Phase II ESAs and supplemental Phase III ESAs on a variety of different sites. His assisted with the development of sampling plans primarily based off previous environmental investigations and due diligence. Primary responsibilities for Phase II investigations included oversight of the installation of test borings and/or test pits and the installation of groundwater

monitoring wells. Some project scopes also called for the completion of a soil gas survey using a photoionization detector as a field instrument. Phase III investigations involved further intrusive environmental media sampling to further delineate the vertical and horizontal extent of contamination.

Other Experience

Spill Management and Closure Services, Multiple Sites, Connecticut. As field engineer, Zachary was responsible for spill closure activities including monitoring removal of underground storage tanks and at times, overseeing excavation of contaminated soil related to leaking underground storage tanks. Primary responsibilities for underground storage tank closure/removal included oversight of the removal of impacted soil, collecting endpoint samples, preparing soil samples for laboratory analysis, and preparing a closure report to be submitted to state agency.

Multiple Dry Cleaners, Stamford, Connecticut. Zachary's responsibilities included conducting quarterly groundwater sampling events using low flow sampling technique, preparing data and reports. Air monitoring and routine soil vapor extraction system maintenance checks were also required at several of the dry cleaners.

KATHERINE R. MILLER

Senior Project Manager

EDUCATION

BS, Chemistry, University of Arizona

SPECIAL STUDIES AND COURSES

40-Hour OSHA Hazardous Waste Operations and Emergency Response Training (29 CFR 1910.120 and 40 CFR 265.16)
8-Hour OSHA Refresher Training (29 CFR 1910.120)
Level IV Data Validation Training

AWARDS

Pinnacle Award, 2009
Pathfinder Award, 2014

In her 10+ years at Haley & Aldrich, Katherine has worked on soil and groundwater environmental investigations and the preparation of environmental reports for private, industrial, and government-based project clients. She is a qualified Data Validator capable of performing various levels of validation on laboratory water quality data according to US Environmental Protection Agency (EPA) National Functional Guidelines and to U.S. Department of Energy radiochemical guidelines. She also has experience designing and maintaining databases for project-specific needs.

Project management responsibilities for a $1.5 million per year stormwater project include preparation of subcontractor bids and contracts; preparation of cost estimates, proposals, and reports; coordination of field testing programs; and interpretation of chemical testing results. She has interacted with local regulatory agencies.

RELEVANT PROJECT EXPERIENCE

Confidential Aerospace Manufacturer, Groundwater Monitoring, Western U.S. Katherine served as project manager for the comprehensive stormwater management program. Responsibilities included project finance management and data management including quality assurance/quality control (QA/QC) and interpretation of chemical testing results. Evaluated QA/QC of groundwater quality data, prepared reports and managed data for the site. Performed data validation of quarterly water quality data from over 300 locations according to EPA National Functional Guidelines and to DOE radiochemical guidelines over a six-year period. Also, responsible for updating and maintaining the integrity of over 200,000 records during that time period. Assisted with management of sampling, analysis, and reporting of constituents of concern, ensured compliance with post-closure permit monitoring and reporting requirements, Data Management Plan, QAPP, and Environmental Data Management System, and ensured and maintained 100% compliance with the QAPP and Data Management Plan. Additionally, prepared groundwater data summaries for proposed extraction wells including comparisons to site NPDES outfall limits in support of Groundwater Interim Measures planning.

Asarco Hayden Plant Site, Hayden, Arizona. Katherine assisted with field preparation, QA/QC of analytical data, and data validation as part of the Remedial Investigation/Feasibility Work Plan including soil, sediment, air, process water, surface water, and stormwater.

Former MGP Site, California. Katherine assisted with report preparation, QA/QC of soil and/or groundwater quality data, and data validation for the investigation of three large former MGP sites in an urban, residential setting; includes over 200 residential properties.

General Manufacturing, Leitchfield, Kentucky. Katherine assisted with report preparation, QA/QC of soil and/or groundwater quality data, and data validation for a soil and groundwater RCRA site. Groundwater monitoring is conducted annually at more than 50 locations for volatile organic compounds (VOCs), including 1,4-dioxane and semi-volatile organic compound (SVOCs).

Skyworks Solutions, Inc., Newbury Park, California. Katherine assisted with report preparation, QA/QC of soil and/or groundwater quality data, and data validation at groundwater remediation site. She monitored for VOCs, including 1,4-dioxane, and inorganic chemicals, including hexavalent chromium.

Teledyne Scientific Company, Thousand Oaks, California. Katherine assisted with report preparation for this groundwater assessment site. Monitored natural attenuation has been instituted as the long-term site remedy.

Port of Redwood City, Permitting and Sediment Characterization, California. Katherine assisted with report preparation, QA/QC of sampling data, and data validation.

Kiewit Infrastructure West, Sediment Quality Study, California. Katherine assisted with report preparation, QA/QC of sampling data, and data validation.

Aeolian Yacht Harbor, Permitting, Eel Grass Conservation and Sediment Characterization, California. Katherine assisted with report preparation, QA/QC of sampling data, and data validation.

Marin County, Paradise Cay Permitting and Sediment Characterization, California. Katherine assisted with report preparation, QA/QC of sampling data, and data validation.

BRIAN FITZPATRICK, CHMM

Corporate Director, Health and Safety

EDUCATION

M.P.A., Environmental Policy, Syracuse University
B.S., Environmental Science, University of Massachusetts-Amherst
A.S., Chemistry, Valley Forge Military Junior College
Commissioned Officer, United States Army

Certified Hazardous Materials Manager (Reg. No. 13454)
Certified Department of Transportation Shipper
Certified International Air Transport Authority Shipper

PROFESSIONAL SOCIETIES

Alliance of Hazardous Materials Professionals
Academy of Certified Hazardous Materials Managers, New England Chapter

SPECIAL STUDIES AND COURSES

Department of Transportation
International Air Transport Authority
Incident Commander
Confined Space Entry and Rescue
Radiation Safety Officer
RCRA Hazardous Waste
Massachusetts Industrial Waste Water Operator Grade 2I (expired)

AWARDS

Presidents Club Award (one million hours worked without a recordable injury), Cabot Corporation
Chancellors Award for Excellence, Syracuse University

Brian ensures the work we do for our clients is done safely – knowing this reduces costs, improves service quality and site conditions, and ultimately protects our clients' reputations. In addition to building the Haley & Aldrich Health & Safety (H&S) culture, Brian is hands-on with clients to help improve their and their partners' safety cultures.

He has extensive expertise in the Occupational Safety and Health Administration (OSHA) general industry, process safety management, and construction safety programs. He is an active member of the Alliance of Hazardous Materials Professionals and the New England chapter of the Academy of Certified Hazardous Materials Managers.

Brian knows an organization's success is predicated on empowering its people to safely work within the complex, living processes in which they operate. He is a student of human factors in the workplace, of the phenomena of human error and drift into failure, and of the safety applications of Lean techniques.

RELEVANT PROJECT EXPERIENCE

Haley & Aldrich, Inc., Burlington, Massachusetts. As Chief Health and Safety Officer, Brian has led and facilitated the development and implementation of corporate health and safety (H&S) improvement plans to enhance compliance and improve H&S performance. In Brian's time with Haley & Aldrich, Inc., the company has realized dramatic improvement on H&S goals and in Key Performance Indicators. Brian is responsible for developing a risk competence culture, where our staff are empowered to look for and engage to address risk before anyone is injured. Brian oversees the development, implementation and continuous improvement of all H&S programs for the company. Additional responsibilities include:

- Developing a safety culture through incident reporting, root cause analysis, behavior-based safety, hazard recognition and risk assessment, communication, and developing leaders;

- Monitoring proposed and existing SH&E regulations and legislation to determine their impact on operations and to ensure continued compliance;
- Overseeing the safety, industrial hygiene, and toxicology programs for over 600 staff members engaged in remediation, construction, health and safety, consulting, and general office work across 28 offices in the United States and on assignment to international project sites;
- Continuously seeks to improve H&S performance as measured by the OSHA Incident Rating (IR) and Worker's Compensation Experience Modification Rating (EMR), as well as Leading Indicators developed with the management team; and
- Participating in the corporate audit program as an auditor or lead auditor;

Energy Client, California. As Chief Health and Safety Officer, Brian led and facilitated the Alliance Partnership Safety Council in 2017, is still an active contributor to the council, and hosts routine contractor safety forums for the client. Brian is actively involved in the development and implementation of program safety, health, and environmental (SH&E) plans to ensure safe operations on project sites. Brian developed permits and Health and Safety Plans for large projects and routinely audits the site safety. Additional responsibilities include:

- Driving reporting and behavior-based safety initiatives to support our internal safety culture and developing monthly summary reports to illustrate performance to our client.
- Develop, assess and continuously improve site safety plans and practices, including specific safety protocols for working safely over and around water.
- Worked as an extension of the client's organization to provide assurance that the remedy was completed safely and consistent with client-specific requirements.
- Support on-site safety personnel in ensuring the health and safety of the general public, our staff, and our sub-contracted employees.
- Audits and visits sites to ensure compliance with our internal policies and client-specific requirements.

Energy Client, Ohio. As Chief Health and Safety Officer, Brian supports the project team in developing and executing client and project specific health and safety measures, such as a site specific Health and Safety Plan, Job Hazard Analyses, Industrial Hygiene program, and site specific training. Brian also routinely visits the site to assess current practices and condition and to ensure continuous improvement. Additional responsibilities include:

- Develop, assess, and continuously improve site safety plans and practices, including specific safety protocols to comply with supplemental EH&S requirements such as the Duke Health and Safety Handbook, Environmental Supplemental, and EHS Keys to Life.
- Develop, assess, and continuously improve site safety plans and practices to address the risks associated with the work being performed on site, as well as the environmental conditions and simultaneous operations, including trenching and excavation, hot work, work over and near water, heavy equipment, HAZWOPER, etc.
- Worked as an extension of the client's organization to provide assurance that the remedy was completed safely and consistent with client-specific requirements.
- Support on-site safety personnel in ensuring the health and safety of the general public, our staff, and our sub-contracted employees.
- Audits and visits site to ensure compliance with our internal policies and client-specific requirements.

BRIAN A. FERGUSON

Senior Engineer

EDUCATION

M. S. Geotechnical Engineering, Tufts University, Medford, Massachusetts; 2012
B. S. Civil Engineering, State University of New York - Environmental, Science, and Forestry, Syracuse, New York; 2000
Ass. Science Degree in Applied Science and Technology (Nuclear Engineering), Thomas A. Edison State College, Trenton, New Jersey; 2000

PROFESSIONAL SOCIETIES

Order of the Engineer – 2000
Boston Society of Civil Engineers (BSCE)
American Society of Civil Engineers (ASCE)

SPECIAL STUDIES AND COURSES

American Concrete Institute – Certified Field Technician Certified Grade 1
Radiation Safety and Operations of Nuclear Testing Equipment – Troxler
40-Hour OSHA Hazardous Waste Operations Training (+ 8-Hour annual refresher)
10-Hour OSHA Construction training
Confined Space Entry Training
16-Hour Asbestos Operations and Maintenance

Mr. Ferguson has over six years of experience serving as project engineer on a variety of real estate development projects. His project experience has included monitoring field investigations and performing construction oversight, performing due diligence and engineering analyses, performing geotechnical analyses and developing geotechnical recommendations, and preparing geotechnical reports and project specifications.

In addition to providing engineering design support, Mr. Ferguson has managed and participated in a number of field service activities. Field work has included construction monitoring and documentation of contractors' deep and shallow foundation related construction, including slurry walls, caissons, pile driving, pile cap installation, earthwork, backfilling and compaction, installation of soldier pile and wood lagging support systems, installation of tie backs, reading inclinometers, conducting in-place field unit weight tests, tie-back load testing, seismograph installation, monitoring, and evaluating, and preparation of footing bearing surfaces. Other responsibilities have included site development activities, including placement of utilities and subgrade preparation for roads; observations and testing to determine that work is completed in compliance with contract documents; on-site soil management; sampling of soil and groundwater for chemical laboratory testing and conducting in situ field screening; maintenance of job records including pile driving logs, results of field density tests, records of caisson and footing installations; preparation of daily field reports; in contact with key personnel; and resolution of field related problems.

RELEVANT PROJECT EXPERIENCE

St. Elizabeths Hostpital – West Campus Forensic Evaluations, Washington, D.C. Project Engineer for forensic evaluations on the adaptive reuse of former hospital buildings. Responsibilities included coordination of a field exploration program, including test borings and test pits to obtain subsurface information for project design and construction, overseeing multiple field personnel, subcontractors, assisting with project management, reviewing subcontractors invoices, reviewing and summarizing subsurface data and writing data reports.

TUFTS University, New Central Energy Plant, Medford, MA. Project engineer for a new Central Energy Plant that will house new co-generation steam boilers, centralized chilled water and electrical transformer switchgear that is planned to occupy approximately 20,000 square feet across two or three levels. Responsibilities included coordination of construction monitoring, observing SOE and footing installation, assisting with project management,

reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

Lahey Hospital and Medical Center – Stilts Infill Project, Burlington, MA Project Engineer for an addition to the existing Stilts building on the Lahey campus. Responsibilities included coordination and overseeing geotechnical and environmental subsurface investigations, coordination of construction monitoring, observing footing installation, assisting with project management, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

Gloucester Beauport Hotel, Gloucester, MA Project engineer for a four story hotel with a seawall constructed adjacent to tidal beach. Responsibilities included coordination and overseeing geotechnical and environmental subsurface investigations, coordination of construction monitoring, assisting with project management, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings, design and implementation of a sub-slab gas mitigation system.

275 Wyman Street, New Office Building, Waltham, MA. Project engineer for a new office building and parking garage founded on a shallow foundation system. Responsibilities included preparing proposals, assisting with management and planning of a subsurface investigation program, summarizing subsurface data and reviewing geotechnical test boring logs, coordination of construction monitoring and instrumentation monitoring programs, reviewing weekly field construction reports, reviewing and responding to specialty geotechnical design submittals and RFIs by others and attending project meetings.

Suffolk University - 20 Somerset Street, Boston, MA Project engineer for design of 8-story academic building with two levels of below grade finished space. Responsibilities included coordination of construction monitoring, observing SOE and footing installation, assisting with project management, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

Worcester State University, New Student Housing, Worcester, MA Project engineer for design and construction of a 7-story residence/dining hall with a single level basement and a major site retaining wall structure. Responsibilities included overseeing geotechnical subsurface investigations, provided foundation recommendations and specifications, and prepared a retaining wall contract document. Responsibilities included coordination of construction monitoring, excavation and construction of footings, and soil reuse and management, assisting with project management, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

University of Massachusetts Boston, General Academic Building No.1, Boston, MA. Project engineer responsible for assisting project manager in preliminary foundation engineering recommendations and construction considerations for a new academic building on a part of Columbia Point, a historic landfill area. Assisted in design phase services that included preparing foundation support design recommendations including the use of high allowable stresses for 190-ft long end-bearing H-piles and application of Slickcoat coating to address downdrag concerns and reduce foundation costs.

Waltham Watch Factory, Waltham, MA project engineer for redevelopment of former watch factory. Responsibilities included construction oversight of new precast parking garage, utilitiy upgrades, soil remediation and management, installation of gas mitigation systems, assisting with project management, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

Massachusetts Green High Performance Computing Center, Holyoke, MA. Project engineer for 60,000 sq. ft high level computing center and associated support utilities. Redevelopment of the site included recycling 50,000 cy of construction debris into the site fills at this historic site along the Connecticut River. Responsibilities included coordinating geotechnical and environmental field investigations, coordination of construction monitoring, seismic analysis, reviewing weekly field construction reports, reviewing and responding to geotechnical design submittals and attending project meetings.

The Shops at Riverwood, Hyde Park, MA. The project consisted of the redevelopment of a colonial era paper mill. The multi-building complex was demolished and the concrete and brick from the previous buildings were recycled. The project involved crushing 50,000 cy of brick and concrete and placement of excavated soils and recycled brick and concrete as compacted fill materials to support proposed buildings, pavement areas, and achieve 5 to 9 ft. raises in grade. Field Representative was responsible for management and reuse of brick and concrete stockpiles, in-place density testing, coordination of test pits, installation of soldier pile and versa-lok walls, and backfilling of underground vaults. Remedial activities included: excavation of 5,000 cy of petroleum contaminated soils, on-site cement batching in a pug mill, and placement of compacted recycled materials in roadway areas; delineation, excavation and off-site disposal of TSCA-regulated PCB contaminated soils associated with historical Askarel transformers and dioxin-contaminated soils associated with historical bleaching operations; and disposition of 1,000 tons of paper mill sludge encountered within an abandoned granite-walled sluiceway structure. In addition, assisted with weekly project meetings, maintaining a record of material reuse, and providing weekly field reports.

Harvard Law School, Cambridge, MA. The Harvard Law School project is located on Massachusetts Avenue in Cambridge. The project consisted of a multistory building above ground with 5 levels below ground for a parking garage. Field Representative was responsible for overseeing the installation of slurry walls into bedrock and LBEs with three installation rigs while monitoring the removal of urban fill and transfer to several different receiving facilities from another portion of the site. The slurry walls were constructed into bedrock. Other Field Representative activities were: testing of the slurry, management of the excavated soils, and record keeping of the Contractor's obstruction and down time of the equipment. In addition, assisted with weekly project meetings, maintaining a record of obstruction and machine time, and providing weekly field reports.

Soil Sample Results, page 10	"The extent of soil contamination for purposes of delineation and remedy selection should be determined by having certain soil samples tested by Synthetic Precipitation Leaching Procedure (SPLP) and the leachate analyzed for PFAS. Soil exhibiting SPLP results above 70 ppt for either PFOA or PFOS (individually or combined) are to be evaluated during the cleanup phase."	"Soil cleanup objectives for PFOA and PFOS will be proposed in an upcoming revision to 6 NYCRR Part 375-6. Until SCOs are in effect, the following are to be used as guidance values. " [Interim SCO Table] "PFOA and PFOS results for soil are to be compared against the guidance values listed above. These guidance values are to be used in determining whether PFOA and PFOS are contaminants of concern for the site and for determining remedial action objectives and cleanup requirements. Site-specific remedial objectives for protection of groundwater can also be presented for evaluation by DEC. Development of site-specific remedial objectives for protection of groundwater will require analysis of additional soil parameters relating to leachability. These additional analyses can include any or all the parameters listed above (soil pH, cation exchange capacity, etc.) and/or use of SPLP. As the understanding of PFAS transport improves, DEC welcomes proposals for site-specific remedial objectives for protection of groundwater. DEC will expect that those may be dependent on additional factors including soil pH, aqueous pH, % organic carbon, % Sand/Silt/Clay, soil cations: K, Ca, Mg, Na, Fe, Al, cation exchange capacity, and anion exchange capacity. Site-specific remedial objectives should also consider the dilution attenuation factor (DAF). The NJDEP publication on DAF can be used as a reference: https://www.nj.gov/dep/srp/guidance/rs/daf.pdf. "	9/15/2020

Citation and Page Number	Current Text	Corrected Text	Date
Testing for Imported Soil Page 11	Soil imported to a site for use in a soil cap, soil cover, or as backfill is to be tested for PFAS in general conformance with DER-10, Section 5.4(e) for the PFAS Analyte List (Appendix F) using the analytical procedures discussed below and the criteria in DER-10 associated with SVOCs. If PFOA or PFOS is detected in any sample at or above 1 µg/kg, then soil should be tested by SPLP and the leachate analyzed for PFAS. If the SPLP results exceed 10 ppt for either PFOA or PFOS (individually) then the source of backfill should be rejected, unless a site-specific exemption is provided by DER. SPLP leachate criteria is based on the Maximum Contaminant Levels proposed for drinking water by New York State's Department of Health, this value may be updated based on future Federal or State promulgated regulatory standards. Remedial parties have the option of analyzing samples concurrently for both PFAS in soil and in the SPLP leachate to minimize project delays. Category B deliverables should be submitted for backfill samples, though a DUSR is not required.	Testing for PFAS should be included any time a full TAL/TCL analyte list is required. Results for PFOA and PFOS should be compared to the applicable guidance values. If PFOA or PFOS is detected in any sample at or above the guidance values then the source of backfill should be rejected, unless a site-specific exemption is provided by DER based on SPLP testing, for example. If the concentrations of PFOA and PFOS in leachate are at or above 10 ppt (the Maximum Contaminant Levels established for drinking water by the New York State Department of Health), then the soil is not acceptable. PFOA, PFOS and 1,4-dioxane are all considered semi-volatile compounds, so composite samples are appropriate for these compounds when sampling in accordance with DER-10, Table 5.4(e)10. Category B deliverables should be submitted for backfill samples, though a DUSR is not required.	9/15/2020

Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS) Under NYSDEC's Part 375 Remedial Programs

Objective

New York State Department of Environmental Conservation's Division of Environmental Remediation (DER) performs or oversees sampling of environmental media and subsequent analysis of PFAS as part of remedial programs implemented under 6 NYCRR Part 375. To ensure consistency in sampling, analysis, reporting, and assessment of PFAS, DER has developed this document which summarizes currently accepted procedures and updates previous DER technical guidance pertaining to PFAS.

Applicability

All work plans submitted to DEC pursuant to one of the remedial programs under Part 375 shall include PFAS sampling and analysis procedures that conform to the guidelines provided herein.

As part of a site investigation or remedial action compliance program, whenever samples of potentially affected media are collected and analyzed for the standard Target Analyte List/Target Compound List (TAL/TCL), PFAS analysis should also be performed. Potentially affected media can include soil, groundwater, surface water, and sediment. Based upon the potential for biota to be affected, biota sampling and analysis for PFAS may also be warranted as determined pursuant to a Fish and Wildlife Impact Analysis. Soil vapor sampling for PFAS is not required.

Field Sampling Procedures

DER-10 specifies technical guidance applicable to DER's remedial programs. Given the prevalence and use of PFAS, DER has developed "best management practices" specific to sampling for PFAS. As specified in DER-10 Chapter 2, quality assurance procedures are to be submitted with investigation work plans. Typically, these procedures are incorporated into a work plan, or submitted as a stand-alone document (e.g., a Quality Assurance Project Plan). Quality assurance guidelines for PFAS are listed in Appendix A - Quality Assurance Project Plan (QAPP) Guidelines for PFAS.

Field sampling for PFAS performed under DER remedial programs should follow the appropriate procedures outlined for soils, sediments, or other solids (Appendix B), non-potable groundwater (Appendix C), surface water (Appendix D), public or private water supply wells (Appendix E), and fish tissue (Appendix F).

QA/QC samples (e.g. duplicates, MS/MSD) should be collected as specified in DER-10, Section 2.3(c). For sampling equipment coming in contact with aqueous samples only, rinsate or equipment blanks should be collected. Equipment blanks should be collected at a minimum frequency of one per day per site or one per twenty samples, whichever is more frequent.

Analysis and Reporting

The investigation work plan should describe analysis and reporting procedures, including laboratory analytical procedures for the methods discussed below. As specified in DER-10 Section 2.2, laboratories should provide a full Category B deliverable. In addition, a Data Usability Summary Report (DUSR) should be prepared by an independent, third-party data validator. Electronic data submissions should meet the requirements provided at: https://www.dec.ny.gov/chemical/62440.html.

DER has developed a *PFAS Analyte List* (Appendix G) for remedial programs to understand the nature of contamination at sites. It is expected that reported results for PFAS will include, at a minimum, all the compounds listed. If lab and/or matrix specific issues are encountered for any analytes, the DER project manager, in consultation with the DER chemist, will make case-by-case decisions as to whether certain analytes may be temporarily or permanently discontinued from analysis at each site. As with other contaminants that are analyzed for at a site, the *PFAS Analyte List* may be refined for future sampling events based on investigative findings.

Routine Analysis

EPA Method 1633 is the procedure to use for environmental samples. Reporting limits for PFOA and PFOS in aqueous samples should not exceed 2 ng/L. Reporting limits for PFOA and PFOS in solid samples should not exceed 0.5 µg/kg. Reporting limits for all other PFAS in aqueous and solid media should be as close to these limits as possible. If laboratories indicate that they are not able to achieve these reporting limits for the entire *PFAS Analyte List*, site-specific decisions regarding acceptance of elevated reporting limits for specific PFAS can be made by the DER project manager in consultation with the DER chemist. Data review guidelines were developed by DER to ensure data comparability and usability (Appendix H - Data Review Guidelines for Analysis of PFAS in Non-Potable Water and Solids).

Additional Analysis

Additional laboratory methods for analysis of PFAS may be warranted at a site, such as the Synthetic Precipitation Leaching Procedure (SPLP) and Total Oxidizable Precursor Assay (TOP Assay).

In cases where site-specific cleanup objectives for PFOA and PFOS are to be assessed, soil parameters, such as Total Organic Carbon (Lloyd Kahn), soil pH (EPA Method 9045), clay content (percent), and cation exchange capacity (EPA Method 9081), should be included in the analysis to help evaluate factors affecting the leachability of PFAS in site soils.

SPLP is a technique used to determine the mobility of chemicals in liquids, soils and wastes, and may be useful in determining the need for addressing PFAS-containing material as part of the remedy. SPLP by EPA Method 1312 should be used unless otherwise specified by the DER project manager in consultation with the DER chemist.

Impacted materials can be made up of PFAS that are not analyzable by routine analytical methodology. A TOP Assay can be utilized to conceptualize the amount and type of oxidizable PFAS which could be liberated in the environment, which approximates the maximum concentration of perfluoroalkyl substances that could be generated if all polyfluoroalkyl substances were oxidized. For example, some polyfluoroalkyl substances may degrade or transform to form perfluoroalkyl substances (such as PFOA or PFOS), resulting in an increase in perfluoroalkyl substance concentrations as contaminated groundwater moves away from a source. The TOP Assay converts, through oxidation, polyfluoroalkyl substances (precursors) into perfluoroalkyl substances that can be detected by routine analytical methodology.[1]

[1] TOP Assay analysis of highly contaminated samples, such as those from an AFFF (aqueous film-forming foam) site, can result in incomplete oxidation of the samples and an underestimation of the total perfluoroalkyl substances.

Commercial laboratories have adopted methods which allow for the quantification of targeted PFAS in air and biota. The EPA's Office of Research and Development (ORD) is currently developing methods which allow for air emissions characterization of PFAS, including both targeted and non-targeted analysis of PFAS. Consult with the DER project manager and the DER chemist for assistance on analyzing biota/tissue and air samples.

Data Assessment and Application to Site Cleanup

Until such time as Soil Cleanup Objectives (SCOs) for PFOA and PFOS are published, the extent of contaminated media potentially subject to remediation should be determined on a case-by-case basis using the procedures discussed below and the criteria in DER-10. Preliminary target levels for cleanup of PFOA and PFOS in other media, including biota and sediment, have not yet been established by the DEC.

Water Sample Results

NYSDEC has adopted ambient water quality guidance values for PFOA and PFOS. Groundwater samples should be compared to the human health criteria of 6.7 ng/l (ppt) for PFOA and 2.7 ng/l (ppt) for PFOS. These human health criteria should also be applied to surface water that is used as a water supply. This guidance also includes criteria for surface water for PFOS applicable for aquatic life, which may be applicable at some sites. Drinking water sample results should be compared to the NYS maximum contaminant level (MCL) of 10 ng/l (ppt). Analysis to determine if PFOA and PFOS concentrations are attributable to the site should include a comparison between upgradient and downgradient levels, and the presence of soil source areas, as defined below.

If PFOA and/or PFOS are identified as contaminants of concern for a site, they should be assessed as part of the remedy selection process in accordance with Part 375 and DER-10.

Soil Sample Results

NYSDEC will delay adding soil cleanup objectives for PFOA and PFOS to 6 NYCRR Part 375-6 until the PFAS rural soil background study has been completed. Until SCOs are in effect, the following are to be used as guidance values:

Guidance Values for Anticipated Site Use	PFOA (ppb)	PFOS (ppb)
Unrestricted	0.66	0.88
Residential	6.6	8.8
Restricted Residential	33	44
Commercial	500	440
Industrial	600	440
Protection of Groundwater[2]	0.8	1.0

PFOA and PFOS results for soil are to be compared against the guidance values listed above. These guidance values are to be used in determining whether PFOA and PFOS are contaminants of concern for the site and for determining remedial action objectives and cleanup requirements. Site-specific remedial objectives for protection of groundwater can also be presented for evaluation by DEC. Development of site-specific remedial objectives for protection of groundwater will require analysis of additional soil parameters relating to leachability. These

[2] The Protection of Groundwater values are based on the above referenced ambient groundwater guidance values. Details on that calculation are available in the following document, prepared for the February 2022 proposed changes to Part 375 (https://www.dec.ny.gov/docs/remediation_hudson_pdf/part375techsupport.pdf). The movement of PFAS in the environment is being aggressively researched at this time; that research will eventually result in more accurate models for the behaviors of these chemicals. In the meantime, DEC has calculated the guidance value for the protection of groundwater using the same procedure used for all other chemicals, as described in Section 7.7 of the Technical Support Document (http://www.dec.ny.gov/docs/remediation_hudson_pdf/techsuppdoc.pdf).

additional analyses can include any or all the parameters listed above (soil pH, cation exchange capacity, etc.) and/or use of SPLP.

As the understanding of PFAS transport improves, DEC welcomes proposals for site-specific remedial objectives for protection of groundwater. DEC will expect that those may be dependent on additional factors including soil pH, aqueous pH, % organic carbon, % Sand/Silt/Clay, soil cations: K, Ca, Mg, Na, Fe, Al, cation exchange capacity, and anion exchange capacity. Site-specific remedial objectives should also consider the dilution attenuation factor (DAF). The NJDEP publication on DAF can be used as a reference: https://www.nj.gov/dep/srp/guidance/rs/daf.pdf.

Testing for Imported Soil

Testing for PFAS should be included any time a full TAL/TCL analyte list is required. Results for PFOA and PFOS should be compared to the applicable guidance values. If PFOA or PFOS is detected in any sample at or above the guidance values then the source of backfill should be rejected, unless a site-specific exemption is provided by DER based on SPLP testing, for example. If the concentrations of PFOA and PFOS in leachate are at or above the ambient water quality guidance values for groundwater, then the soil is not acceptable.

PFOA, PFOS and 1,4-dioxane are all considered semi-volatile compounds, so composite samples are appropriate for these compounds when sampling in accordance with DER-10, Table 5.4(e)10. Category B deliverables should be submitted for backfill samples, though a DUSR is not required.

Appendix A - Quality Assurance Project Plan (QAPP) Guidelines for PFAS

The following guidelines (general and PFAS-specific) can be used to assist with the development of a QAPP for projects within DER involving sampling and analysis of PFAS.

General Guidelines in Accordance with DER-10

- Document/work plan section title – Quality Assurance Project Plan
- Summarize project scope, goals, and objectives
- Provide project organization including names and resumes of the project manager, Quality Assurance Officer (QAO), field staff, and Data Validator
    - The QAO should not have another position on the project, such as project or task manager, that involves project productivity or profitability as a job performance criterion
- List the ELAP certified lab(s) to be used for analysis of samples
- Include a site map showing sample locations
- Provide detailed sampling procedures for each matrix
- Include Data Quality Usability Objectives
- List equipment decontamination procedures
- Include an "Analytical Methods/Quality Assurance Summary Table" specifying:
    - Matrix type
    - Number or frequency of samples to be collected per matrix
    - Number of field and trip blanks per matrix
    - Analytical parameters to be measured per matrix
    - Analytical methods to be used per matrix with minimum reporting limits
    - Number and type of matrix spike and matrix spike duplicate samples to be collected
    - Number and type of duplicate samples to be collected
    - Sample preservation to be used per analytical method and sample matrix
    - Sample container volume and type to be used per analytical method and sample matrix
    - Sample holding time to be used per analytical method and sample matrix
- Specify Category B laboratory data deliverables and preparation of a DUSR

Specific Guidelines for PFAS

- Include in the text that sampling for PFAS will take place
- Include in the text that PFAS will be analyzed by EPA Method 1633
- Include the list of PFAS compounds to be analyzed (*PFAS Analyte List*)
- Include the laboratory SOP for PFAS analysis
- List the minimum method-achievable Reporting Limits for PFAS
    - Reporting Limits should be less than or equal to:
        - Aqueous – 2 ng/L (ppt)
        - Solids – 0.5 µg/kg (ppb)
- Include the laboratory Method Detection Limits for the PFAS compounds to be analyzed
-
- Include detailed sampling procedures
    - Precautions to be taken
    - Pump and equipment types
    - Decontamination procedures
    - Approved materials only to be used
- Specify that regular ice only will be used for sample shipment
- Specify that equipment blanks should be collected at a minimum frequency of 1 per day per site for each matrix

Appendix B - Sampling Protocols for PFAS in Soils, Sediments and Solids

General

The objective of this protocol is to give general guidelines for the collection of soil, sediment and other solid samples for PFAS analysis. The sampling procedure used should be consistent with Sampling Guidelines and Protocols – Technological Background and Quality Control/Quality Assurance for NYS DEC Spill Response Program – March 1991 (http://www.dec.ny.gov/docs/remediation_hudson_pdf/sgpsect5.pdf), with the following limitations.

Laboratory Analysis and Containers

Samples collected using this protocol are intended to be analyzed for PFAS using EPA Method 1633.

The preferred material for containers is high density polyethylene (HDPE). Pre-cleaned sample containers, coolers, sample labels, and a chain of custody form will be provided by the laboratory.

Equipment

Acceptable materials for sampling include stainless steel, HDPE, PVC, silicone, acetate, and polypropylene. Additional materials may be acceptable if pre-approved by New York State Department of Environmental Conservation's Division of Environmental Remediation.

No sampling equipment components or sample containers should come in to contact with aluminum foil, low density polyethylene, glass, or polytetrafluoroethylene (PTFE, Teflon™) materials including sample bottle cap liners with a PTFE layer.

A list of acceptable equipment is provided below, but other equipment may be considered appropriate based on sampling conditions.

- stainless steel spoon
- stainless steel bowl
- steel hand auger or shovel without any coatings

Equipment Decontamination

Standard two step decontamination using detergent (Alconox is acceptable) and clean, PFAS-free water will be performed for sampling equipment. All sources of water used for equipment decontamination should be verified in advance to be PFAS-free through laboratory analysis or certification.

Sampling Techniques

Sampling is often conducted in areas where a vegetative turf has been established. In these cases, a pre-cleaned trowel or shovel should be used to carefully remove the turf so that it may be replaced at the conclusion of sampling. Surface soil samples (e.g. 0 to 6 inches below surface) should then be collected using a pre-cleaned, stainless steel spoon. Shallow subsurface soil samples (e.g. 6 to ~36 inches below surface) may be collected by digging a hole using a pre-cleaned hand auger or shovel. When the desired subsurface depth is reached, a pre-cleaned hand auger or spoon shall be used to obtain the sample.

When the sample is obtained, it should be deposited into a stainless steel bowl for mixing prior to filling the sample containers. The soil should be placed directly into the bowl and mixed thoroughly by rolling the material into the middle until the material is homogenized. At this point the material within the bowl can be placed into the laboratory provided container.

Sample Identification and Logging

A label shall be attached to each sample container with a unique identification. Each sample shall be included on the chain of custody (COC).

Quality Assurance/Quality Control

- Immediately place samples in a cooler maintained at 4 ± 2º Celsius using ice
- Collect one field duplicate for every sample batch, minimum 1 duplicate per 20 samples. The duplicate shall consist of an additional sample at a given location
- Collect one matrix spike / matrix spike duplicate (MS/MSD) for every sample batch, minimum 1 MS/MSD per 20 samples. The MS/MSD shall consist of an additional two samples at a given location and identified on the COC
- Request appropriate data deliverable (Category B) and an electronic data deliverable

Documentation

A soil log or sample log shall document the location of the sample/borehole, depth of the sample, sampling equipment, duplicate sample, visual description of the material, and any other observations or notes determined to be appropriate. Additionally, care should be performed to limit contact with PFAS containing materials (e.g. waterproof field books, food packaging) during the sampling process.

Personal Protection Equipment (PPE)

For most sampling Level D PPE is anticipated to be appropriate. The sampler should wear nitrile gloves while conducting field work and handling sample containers.

Field staff shall consider the clothing to be worn during sampling activities. Clothing that contains PTFE material (including GORE-TEX®) or that have been waterproofed with PFAS materials should be avoided. All clothing worn by sampling personnel should have been laundered multiple times.

Appropriate rain gear (PVC, polyurethane, or rubber rain gear are acceptable), bug spray, and sunscreen should be used that does not contain PFAS. Well washed cotton coveralls may be used as an alternative to bug spray and/or sunscreen.

PPE that contains PFAS is acceptable when site conditions warrant additional protection for the samplers and no other materials can be used to be protective. Documentation of such use should be provided in the field notes.

Appendix C - Sampling Protocols for PFAS in Monitoring Wells

General

The objective of this protocol is to give general guidelines for the collection of groundwater samples for PFAS analysis. The sampling procedure used should be consistent with Sampling Guidelines and Protocols – Technological Background and Quality Control/Quality Assurance for NYS DEC Spill Response Program – March 1991 (http://www.dec.ny.gov/docs/remediation_hudson_pdf/sgpsect5.pdf), with the following limitations.

Laboratory Analysis and Container

Samples collected using this protocol are intended to be analyzed for PFAS using EPA Method 1633.

The preferred material for containers is high density polyethylene (HDPE). Pre-cleaned sample containers, coolers, sample labels, and a chain of custody form will be provided by the laboratory.

Equipment

Acceptable materials for sampling include: stainless steel, HDPE, PVC, silicone, acetate, and polypropylene. Additional materials may be acceptable if pre-approved by New York State Department of Environmental Conservation's Division of Environmental Remediation.

No sampling equipment components or sample containers should come in contact with aluminum foil, low density polyethylene, glass, or polytetrafluoroethylene (PTFE, Teflon™) materials including plumbers tape and sample bottle cap liners with a PTFE layer.

A list of acceptable equipment is provided below, but other equipment may be considered appropriate based on sampling conditions.

- stainless steel inertia pump with HDPE tubing
- peristaltic pump equipped with HDPE tubing and silicone tubing
- stainless steel bailer with stainless steel ball
- bladder pump (identified as PFAS-free) with HDPE tubing

Equipment Decontamination

Standard two step decontamination using detergent (Alconox is acceptable) and clean, PFAS-free water will be performed for sampling equipment. All sources of water used for equipment decontamination should be verified in advance to be PFAS-free through laboratory analysis or certification.

Sampling Techniques

Monitoring wells should be purged in accordance with the sampling procedure (standard/volume purge or low flow purge) identified in the site work plan, which will determine the appropriate time to collect the sample. If sampling using standard purge techniques, additional purging may be needed to reduce turbidity levels, so samples contain a limited amount of sediment within the sample containers. Sample containers that contain sediment may cause issues at the laboratory, which may result in elevated reporting limits and other issues during the sample preparation that can compromise data usability. Sampling personnel should don new nitrile gloves prior to sample collection due to the potential to contact PFAS containing items (not related to the sampling equipment) during the purging activities.

Sample Identification and Logging

A label shall be attached to each sample container with a unique identification. Each sample shall be included on the chain of custody (COC).

Quality Assurance/Quality Control

- Immediately place samples in a cooler maintained at 4 ± 2º Celsius using ice
- Collect one field duplicate for every sample batch, minimum 1 duplicate per 20 samples. The duplicate shall consist of an additional sample at a given location
- Collect one matrix spike / matrix spike duplicate (MS/MSD) for every sample batch, minimum 1 MS/MSD per 20 samples. The MS/MSD shall consist of an additional two samples at a given location and identified on the COC
- Collect one equipment blank per day per site and minimum 1 equipment blank per 20 samples. The equipment blank shall test the new and decontaminated sampling equipment utilized to obtain a sample for residual PFAS contamination. This sample is obtained by using laboratory provided PFAS-free water and passing the water over or through the sampling device and into laboratory provided sample containers
- Additional equipment blank samples may be collected to assess other equipment that is utilized at the monitoring well
- Request appropriate data deliverable (Category B) and an electronic data deliverable

Documentation

A purge log shall document the location of the sample, sampling equipment, groundwater parameters, duplicate sample, visual description of the material, and any other observations or notes determined to be appropriate. Additionally, care should be performed to limit contact with PFAS containing materials (e.g. waterproof field books, food packaging) during the sampling process.

Personal Protection Equipment (PPE)

For most sampling Level D PPE is anticipated to be appropriate. The sampler should wear nitrile gloves while conducting field work and handling sample containers.

Field staff shall consider the clothing to be worn during sampling activities. Clothing that contains PTFE material (including GORE-TEX®) or that have been waterproofed with PFAS materials should be avoided. All clothing worn by sampling personnel should have been laundered multiple times.

Appropriate rain gear (PVC, polyurethane, or rubber rain gear are acceptable), bug spray, and sunscreen should be used that does not contain PFAS. Well washed cotton coveralls may be used as an alternative to bug spray and/or sunscreen.

PPE that contains PFAS is acceptable when site conditions warrant additional protection for the samplers and no other materials can be used to be protective. Documentation of such use should be provided in the field notes.

Appendix D - Sampling Protocols for PFAS in Surface Water

General

The objective of this protocol is to give general guidelines for the collection of surface water samples for PFAS analysis. The sampling procedure used should be consistent with Sampling Guidelines and Protocols – Technological Background and Quality Control/Quality Assurance for NYS DEC Spill Response Program – March 1991 (http://www.dec.ny.gov/docs/remediation_hudson_pdf/sgpsect5.pdf), with the following limitations.

Laboratory Analysis and Container

Samples collected using this protocol are intended to be analyzed for PFAS using EPA Method 1633.

The preferred material for containers is high density polyethylene (HDPE). Pre-cleaned sample containers, coolers, sample labels, and a chain of custody form will be provided by the laboratory.

Equipment

Acceptable materials for sampling include: stainless steel, HDPE, PVC, silicone, acetate, and polypropylene. Additional materials may be acceptable if pre-approved by New York State Department of Environmental Conservation's Division of Environmental Remediation.

No sampling equipment components or sample containers should come in contact with aluminum foil, low density polyethylene, glass, or polytetrafluoroethylene (PTFE, Teflon™) materials including sample bottle cap liners with a PTFE layer.

A list of acceptable equipment is provided below, but other equipment may be considered appropriate based on sampling conditions.

- stainless steel cup

Equipment Decontamination

Standard two step decontamination using detergent (Alconox is acceptable) and clean, PFAS-free water will be performed for sampling equipment. All sources of water used for equipment decontamination should be verified in advance to be PFAS-free through laboratory analysis or certification.

Sampling Techniques

Where conditions permit, (e.g. creek or pond) sampling devices (e.g. stainless steel cup) should be rinsed with site medium to be sampled prior to collection of the sample. At this point the sample can be collected and poured into the sample container.

If site conditions permit, samples can be collected directly into the laboratory container.

Sample Identification and Logging

A label shall be attached to each sample container with a unique identification. Each sample shall be included on the chain of custody (COC).

Quality Assurance/Quality Control

- Immediately place samples in a cooler maintained at 4 ± 2º Celsius using ice
- Collect one field duplicate for every sample batch, minimum 1 duplicate per 20 samples. The duplicate shall consist of an additional sample at a given location
- Collect one matrix spike / matrix spike duplicate (MS/MSD) for every sample batch, minimum 1 MS/MSD per 20 samples. The MS/MSD shall consist of an additional two samples at a given location and identified on the COC
- Collect one equipment blank per day per site and minimum 1 equipment blank per 20 samples. The equipment blank shall test the new and decontaminated sampling equipment utilized to obtain a sample for residual PFAS contamination. This sample is obtained by using laboratory provided PFAS-free water and passing the water over or through the sampling device and into laboratory provided sample containers
- Request appropriate data deliverable (Category B) and an electronic data deliverable

Documentation

A sample log shall document the location of the sample, sampling equipment, duplicate sample, visual description of the material, and any other observations or notes determined to be appropriate. Additionally, care should be performed to limit contact with PFAS containing materials (e.g. waterproof field books, food packaging) during the sampling process.

Personal Protection Equipment (PPE)

For most sampling Level D PPE is anticipated to be appropriate. The sampler should wear nitrile gloves while conducting field work and handling sample containers.

Field staff shall consider the clothing to be worn during sampling activities. Clothing that contains PTFE material (including GORE-TEX®) or that have been waterproofed with PFAS materials should be avoided. All clothing worn by sampling personnel should have been laundered multiple times.

Appropriate rain gear (PVC, polyurethane, or rubber rain gear are acceptable), bug spray, and sunscreen should be used that does not contain PFAS. Well washed cotton coveralls may be used as an alternative to bug spray and/or sunscreen.

PPE that contains PFAS is acceptable when site conditions warrant additional protection for the samplers and no other materials can be used to be protective. Documentation of such use should be provided in the field notes.

Appendix E - Sampling Protocols for PFAS in Private Water Supply Wells

General

The objective of this protocol is to give general guidelines for the collection of water samples from private water supply wells (with a functioning pump) for PFAS analysis. The sampling procedure used should be consistent with Sampling Guidelines and Protocols – Technological Background and Quality Control/Quality Assurance for NYS DEC Spill Response Program – March 1991 (http://www.dec.ny.gov/docs/remediation_hudson_pdf/sgpsect5.pdf), with the following limitations.

Laboratory Analysis and Container

Drinking water samples collected using this protocol are intended to be analyzed for PFAS by EPA Method 537, 537.1, 533, or ISO Method 25101. The preferred material for containers is high density polyethylene (HDPE). Pre-cleaned sample containers, coolers, sample labels, and a chain of custody form will be provided by the laboratory.

Equipment

Acceptable materials for sampling include stainless steel, HDPE, PVC, silicone, acetate, and polypropylene. Additional materials may be acceptable if pre-approved by New York State Department of Environmental Conservation's Division of Environmental Remediation.

No sampling equipment components or sample containers should come in contact with aluminum foil, low density polyethylene, glass, or polytetrafluoroethylene (PTFE, Teflon™) materials (e.g. plumbers tape), including sample bottle cap liners with a PTFE layer.

Equipment Decontamination

Standard two step decontamination using detergent (Alconox is acceptable) and clean, PFAS-free water will be performed for sampling equipment. All sources of water used for equipment decontamination should be verified in advance to be PFAS-free through laboratory analysis or certification.

Sampling Techniques

Locate and assess the pressure tank and determine if any filter units are present within the building. Establish the sample location as close to the well pump as possible, which is typically the spigot at the pressure tank. Ensure sampling equipment is kept clean during sampling as access to the pressure tank spigot, which is likely located close to the ground, may be obstructed and may hinder sample collection.

Prior to sampling, a faucet downstream of the pressure tank (e.g., washroom sink) should be run until the well pump comes on and a decrease in water temperature is noted which indicates that the water is coming from the well. If the homeowner is amenable, staff should run the water longer to purge the well (15+ minutes) to provide a sample representative of the water in the formation rather than standing water in the well and piping system including the pressure tank. At this point a new pair of nitrile gloves should be donned and the sample can be collected from the sample point at the pressure tank.

Sample Identification and Logging

A label shall be attached to each sample container with a unique identification. Each sample shall be included on the chain of custody (COC).

Quality Assurance/Quality Control

- Immediately place samples in a cooler maintained at 4 ± 2º Celsius using ice
- Collect one field duplicate for every sample batch, minimum 1 duplicate per 20 samples. The duplicate shall consist of an additional sample at a given location
- Collect one matrix spike / matrix spike duplicate (MS/MSD) for every sample batch, minimum 1 MS/MSD per 20 samples. The MS/MSD shall consist of an additional two samples at a given location and identified on the COC
- If equipment was used, collect one equipment blank per day per site and a minimum 1 equipment blank per 20 samples. The equipment blank shall test the new and decontaminated sampling equipment utilized to obtain a sample for residual PFAS contamination. This sample is obtained by using laboratory provided PFAS-free water and passing the water over or through the sampling device and into laboratory provided sample containers.
- A field reagent blank (FRB) should be collected at a rate of one per 20 samples. The lab will provide a FRB bottle containing PFAS free water and one empty FRB bottle. In the field, pour the water from the one bottle into the empty FRB bottle and label appropriately.
- Request appropriate data deliverable (Category B) and an electronic data deliverable
- For sampling events where multiple private wells (homes or sites) are to be sampled per day, it is acceptable to collect QC samples at a rate of one per 20 across multiple sites or days.

Documentation

A sample log shall document the location of the private well, sample point location, owner contact information, sampling equipment, purge duration, duplicate sample, visual description of the material, and any other observations or notes determined to be appropriate and available (e.g. well construction, pump type and location, yield, installation date). Additionally, care should be performed to limit contact with PFAS containing materials (e.g. waterproof field books, food packaging) during the sampling process.

Personal Protection Equipment (PPE)

For most sampling Level D PPE is anticipated to be appropriate. The sampler should wear nitrile gloves while conducting field work and handling sample containers.

Field staff shall consider the clothing to be worn during sampling activities. Clothing that contains PTFE material (including GORE-TEX®) or that have been waterproofed with PFAS materials should be avoided. All clothing worn by sampling personnel should have been laundered multiple times.

Appendix F - Sampling Protocols for PFAS in Fish

This appendix contains a copy of the latest guidelines developed by the Division of Fish and Wildlife (DFW) entitled "General Fish Handling Procedures for Contaminant Analysis" (Ver. 8).

Procedure Name: General Fish Handling Procedures for Contaminant Analysis

Number: FW-005

Purpose: This procedure describes data collection, fish processing and delivery of fish collected for contaminant monitoring. It contains the chain of custody and collection record forms that should be used for the collections.

Organization: Environmental Monitoring Section
Bureau of Ecosystem Health
Division of Fish and Wildlife (DFW)
New York State Department of Environmental Conservation (NYSDEC)
625 Broadway
Albany, New York 12233-4756

Version: 8

Previous Version Date: 21 March 2018

Summary of Changes to this Version: Updated bureau name to Bureau of Ecosystem Health. Added direction to list the names of all field crew on the collection record. Minor formatting changes on chain of custody and collection records.

Originator or Revised by: Wayne Richter, Jesse Becker

Date: 26 April 2019

Quality Assurance Officer and Approval Date: Jesse Becker, 26 April 2019

Appendix H - Data Review Guidelines for Analysis of PFAS in Non-Potable Water and Solids

General

These guidelines are intended to be used for the validation of PFAS using EPA Method 1633 for projects within the Division of Environmental Remediation (DER). Data reviewers should understand the methodology and techniques utilized in the analysis. Consultation with the end user of the data may be necessary to assist in determining data usability based on the data quality objectives in the Quality Assurance Project Plan. A familiarity with the laboratory's Standard Operating Procedure may also be needed to fully evaluate the data. If you have any questions, please contact DER's Quality Assurance Officer, Dana Barbarossa, at dana.barbarossa@dec.ny.gov.

Preservation and Holding Time

Samples should be preserved with ice to a temperature of less than 6°C upon arrival at the lab. The holding time is 28 days to extraction for aqueous and solid samples. The time from extraction to analysis for aqueous samples is 28 days and 40 days for solids.

Temperature greatly exceeds 6ºC upon arrival at the lab*	Use professional judgement to qualify detects and non-detects as estimated or rejected
Holding time exceeding 28 days to extraction	Use professional judgement to qualify detects and non-detects as estimated or rejected if holding time is grossly exceeded

*Samples that are delivered to the lab immediately after sampling may not meet the thermal preservation guidelines. Samples are considered acceptable if they arrive on ice or an attempt to chill the samples is observed.

Initial Calibration

The initial calibration should contain a minimum of six standards for linear fit and six standards for a quadratic fit. The relative standard deviation (RSD) for a quadratic fit calibration should be less than 20%.

The low-level calibration standard should be within 50% - 150% of the true value, and the mid-level calibration standard within 70% - 130% of the true value.

%RSD >20%	J flag detects and UJ non detects

Continuing Calibration Verification

Continuing calibration verification (CCV) checks should be analyzed at a frequency of one per ten field samples. If CCV recovery is very low, where detection of the analyte could be in question, ensure a low level CCV was analyzed and use to determine data quality.

CCV recovery <70 or >130%	J flag results

Blanks

There should be no detections in the method blanks above the reporting limits. Equipment blanks, field blanks, rinse blanks etc. should be evaluated in the same manner as method blanks. Use the most contaminated blank to evaluate the sample results.

Blank Result	Sample Result	Qualification
Any detection	<Reporting limit	Qualify as ND at reporting limit
Any detection	>Reporting Limit and >10x the blank result	No qualification
>Reporting limit	>Reporting limit and <10x blank result	J+ biased high

Field Duplicates

A blind field duplicate should be collected at rate of one per twenty samples. The relative percent difference (RPD) should be less than 30% for analyte concentrations greater than two times the reporting limit. Use the higher result for final reporting.

RPD >30%	Apply J qualifier to parent sample

Lab Control Spike

Lab control spikes should be analyzed with each extraction batch or one for every twenty samples. In the absence of lab derived criteria, use 70% - 130% recovery criteria to evaluate the data.

Recovery <70% or >130% (lab derived criteria can also be used)	Apply J qualifier to detects and UJ qualifier to non detects

Matrix Spike/Matrix Spike Duplicate

One matrix spike and matrix spike duplicate should be collected at a rate of one per twenty samples. Use professional judgement to reject results based on out of control MS/MSD recoveries.

Recovery <70% or >130% (lab derived criteria can also be used)	Apply J qualifier to detects and UJ qualifier to non detects of parent sample only
RPD >30%	Apply J qualifier to detects and UJ qualifier to non detects of parent sample only

Extracted Internal Standards (Isotope Dilution Analytes)

Problematic analytes (e.g. PFBA, PFPeA, fluorotelomer sulfonates) can have wider recoveries without qualification. Qualify corresponding native compounds with a J flag if outside of the range.

Recovery <50% or >150%	Apply J qualifier
Recovery <25% or >150% for poor responding analytes	Apply J qualifier
Isotope Dilution Analyte (IDA) Recovery <10%	Reject results

Signal to Noise Ratio

The signal to noise ratio for the quantifier ion should be at least 3:1. If the ratio is less than 3:1, the peak is discernable from the baseline noise and symmetrical, the result can be reported. If the peak appears to be baseline noise and/or the shape is irregular, qualify the result as tentatively identified.

Reporting Limits

If project-specific reporting limits were not met, please indicate that in the report along with the reason (e.g. over dilution, dilution for non-target analytes, high sediment in aqueous samples).

Peak Integrations

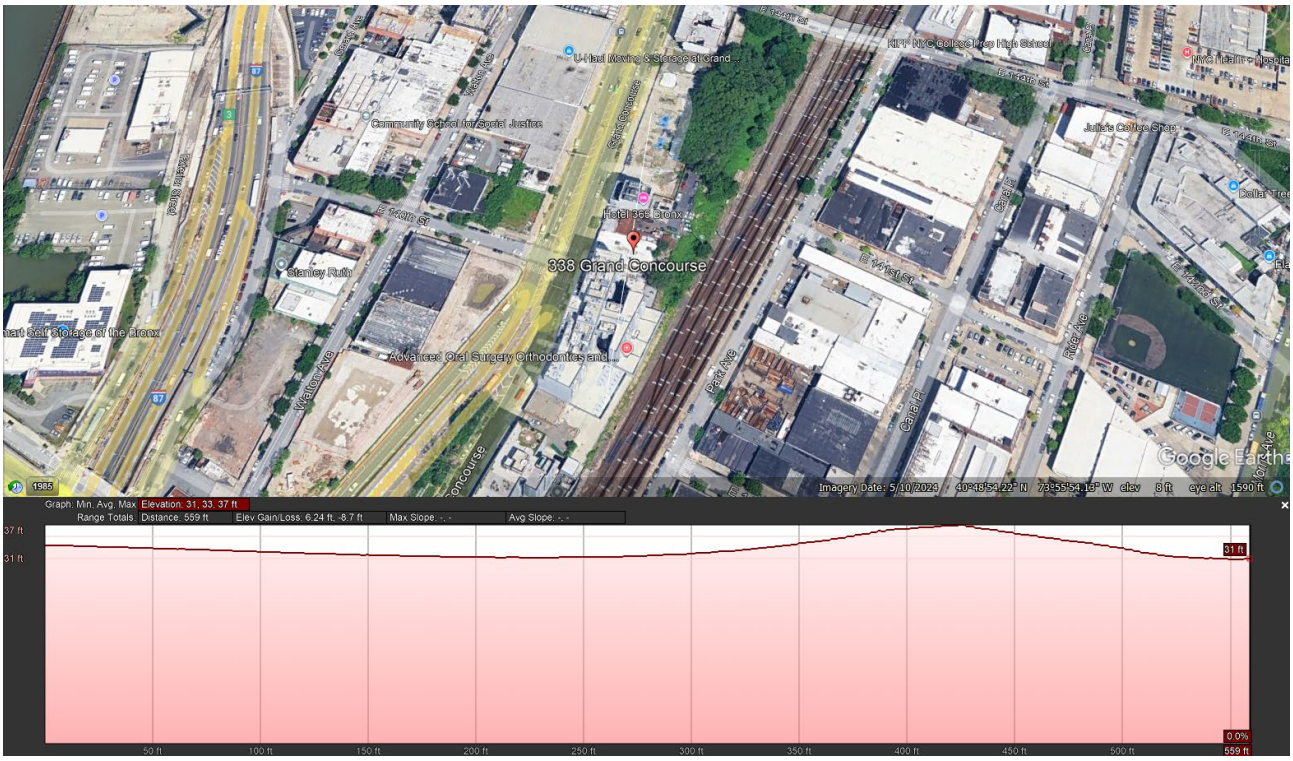
Target analyte peaks should be integrated properly and consistently when compared to standards. Ensure branched isomer peaks are included for PFAS where standards are available. Inconsistencies should be brought to the attention of the laboratory or identified in the data review summary report.

APPENDIX F
Climate Screening Checklist

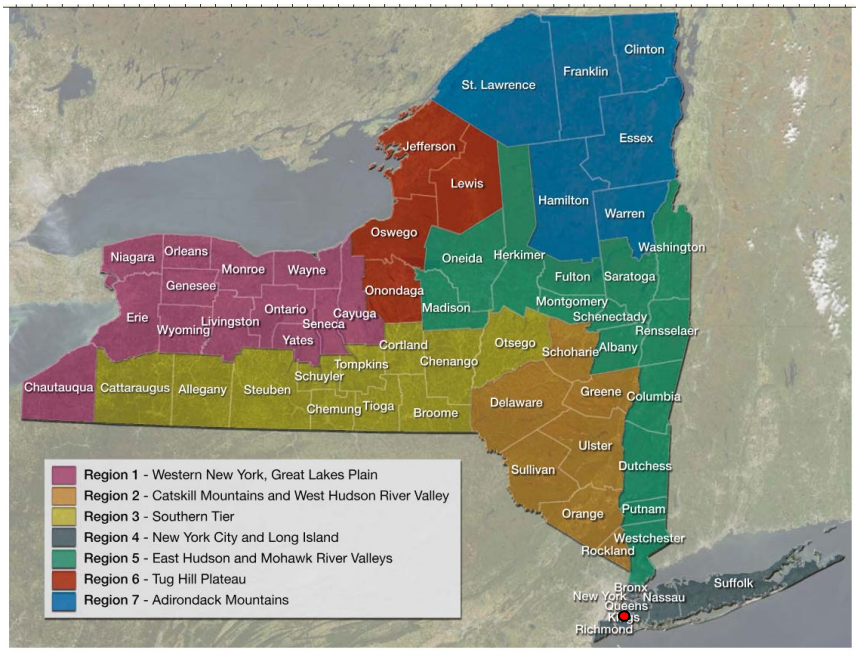
Climate Screening Checklist

Background Information

- Project Manager: Matthew Levy
- Site Name: 338-344 Grand Concourse Redevelopment Site
- Site Number: C203188
- Site Location: 338-344 Grand Concourse, Bronx, New York
- Site Elevation (average above sea level): Approximately 32 feet above sea level (Google Earth)



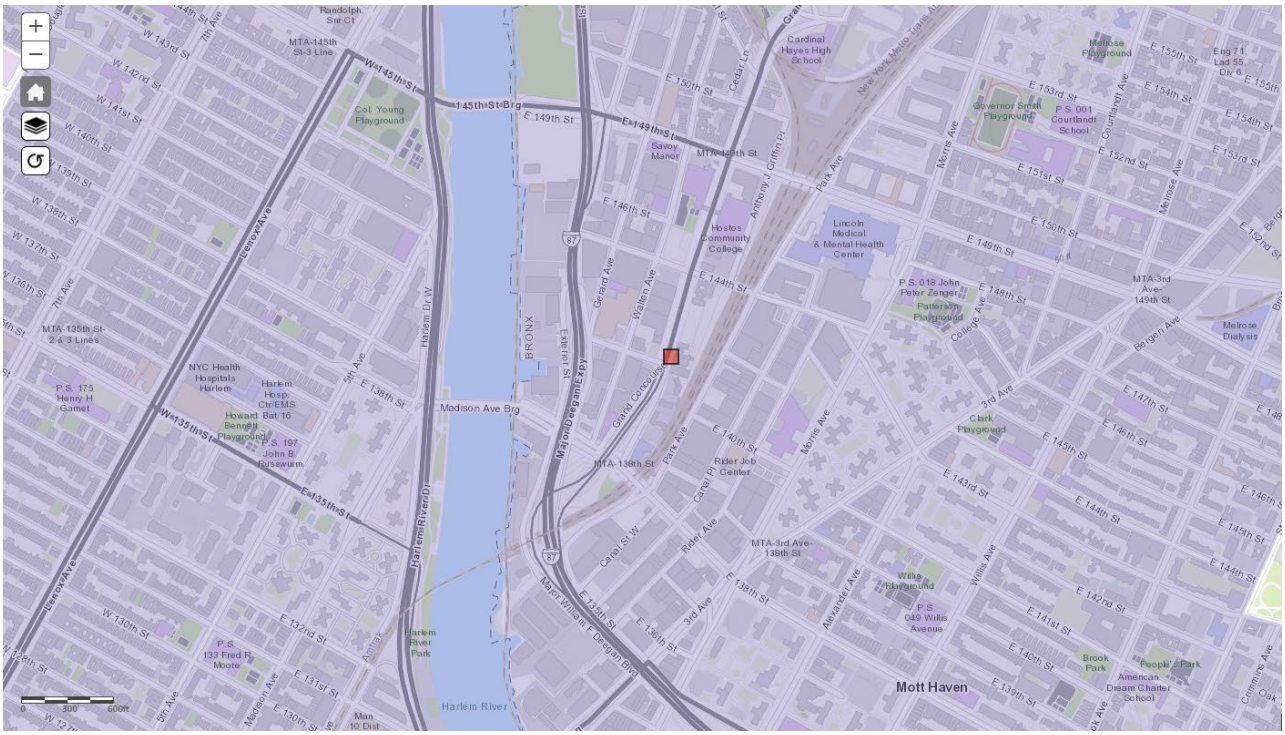
- ClimAID Region (Responding Climate Change in New York State (ClimAID) - NYSERDA): Region 4 – New York City and Long Island



- Remedial Stage/Site Classification: Remedial Investigation
- Contamination - Media Impacted/ Contaminants of Concern: Soil – metals (specifically lead and mercury), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs); and soil vapor – VOCs (specifically petroleum-related VOCs and chlorinated VOCs [CVOCs]).
- Proposed/Current Remedy: Investigation/Design Phase
- What is the predicted timeframe of the remedy? Will components of the remedy still be in place in 10+ years? Remedy is anticipated to be completed in approximately one year. If required, engineering controls will remain in place and be maintained or replaced as needed for the duration of the requirement under future Site management.
- Is the site in proximity to any sensitive receptors? (e.g., wetlands, waterbodies, residential properties, hospitals, schools, drinking water supplies, etc.) There are two sensitive receptors located within a 500-foot radius of the Site: Community School for Social Justice (listed as a school) and Family Life Academy Charter School III (listed as a school).

Is the site in a disadvantaged community (DAC) or potential environmental justice area (PEJA) (Use DECinfolocator: DECinfo Locator (ny.gov))?

X Yes ☐ No



If the site is in a DAC or PEJA, will climate impacts be magnified? If yes, list how and why.

☐**Yes X No**

Should thresholds of concern be lowered to account for magnification of impacts? If yes, indicate how lower thresholds will be used in the screening.

☐**Yes X No**

Climate Screening Table*

Potential Climate Hazards	**Relevant to the Site Location** (Y/N/NA)[1]	**Projected Change** (Resilience Analysis and Planning Tool [RAPT]/arcgis.com)[3]	**Potential to Impact Remedy** (Y/N)	**Is remedy/site already resilient?** (Y/N)[4]
Precipitation	Potentially	N/A	N/A	N/A
Temperature[2] (Extreme Heat or Cold Weather Impacts)	Y	Y	Y	Future remedy will evaluate
Sea Level Rise	N	N/A	N/A	N/A
Flooding	N	N/A	N/A	N/A
Storm Surge	N	N/A	N/A	N/A
Wildfire	N	N/A	N/A	N/A
Drought	N	N/A	N/A	N/A
Storm Severity	Y	N/A	Y	Future remedy will evaluate
Landslides	N	N/A	N/A	N/A
Other Hazards:	N/A	N/A	N/A	N/A

* Links to potential data sources can be found on the following page

[1] If the first column is N --> The rest of the columns will be N/A, the hazard is not applicable to the site.

[2] Extreme Heat: periods of three or more days above 90°F- Extreme Cold: Individual days with minimum temperatures at or below 0 degrees F (NYSERDA ClimAID report)

[3] List the projected change in specific terms or units e.g. inches of rainfall, feet of sea level rise, etc.

[4] If final column is Y, provide reasoning, if the final column is N --> Climate Vulnerability Assessment (CVA) required.

Required Next Steps (If no further action is required, provide justification):

Conduct severe weather storm inspections during the active remedy, as necessary.

	A-5	Total greenhouse gas emissions	Tons CO2e*	4.9	0.0	0.0	0.0	0.0	0.0	4.9
Land & Ecosystems	Qualitative Description									

** Total greenhouse gases emissions (in CO2e) include consideration of CO2, CH4, and N2O (Nitrous oxide) emissions.*
"MMBtu" = millions of Btus
"MG" = millions of gallons
"CO2e" = carbon dioxide equivalents of global warming potential
"MWh" = megawatt hours (i.e., thousands of kilowatt-hours or millions of Watt-hours)
"Tons" = short tons (2,000 pounds)

The above metrics are consistent with EPA's Methodology for Understanding and Reducing a Project's Environmental Footprint (EPA 542-R-12-002), February 2012

STOP WORK AUTHORITY

In accordance with Haley & Aldrich, Inc. (Haley & Aldrich) Stop Work Authority Operating Procedure (OP1035), any individual has the right to refuse to perform work that he or she believes to be unsafe without fear of retaliation. He or she also has the authority, obligation, and responsibility to stop others from working in an unsafe manner.

STOP Work Authority is the stop work policy for all personnel and subcontractors on the Site. When work has been stopped due to an unsafe condition, Haley & Aldrich Site management (e.g., Project Manager [PM], Site Health & Safety Officer [SHSO], etc.) and the Haley & Aldrich Senior Project Manager (SPM) will be notified immediately.

Reasons for issuing a stop work order include, but are not limited to:

- The belief/perception that injury to personnel or an accident causing significant damage to property or equipment is imminent.
- A Haley & Aldrich subcontractor is in breach of Site safety requirements and/or their own site Health and Safety Plan (HASP).
- Identifying a substandard condition (e.g., severe weather) or activity that creates an unacceptable safety risk as determined by a qualified person.

Work will not resume until the unsafe act has been stopped OR sufficient safety precautions have been taken to remove or mitigate the risk to an acceptable degree. Stop work orders will be documented as part of an on-site stop work log, on daily field reports to include the activity/activities stopped, the duration, person stopping work, person in-charge of stopped activity/activities, and the corrective action agreed to and/or taken. Once work has been stopped, only the Haley & Aldrich SPM or SHSO can give the order to resume work. Haley & Aldrich senior management is committed to supporting anyone who exercises his or her “Stop Work” authority.

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

ISSUANCE AND COMPLIANCE

This HASP has been prepared in accordance with Occupational Safety and Health Administration (OSHA) regulations (CFR 29, Parts 1904, 1910, and 1926) if such are applicable.

The specific requirements of this HASP include precautions for hazards that exist during this project and may be revised as new information is received or as site conditions change.

- This HASP must be signed by all Haley & Aldrich personnel involved in implementation of the Statement of Work (SOW; Section 2 of this HASP).
- This HASP, or a current signed copy, must be retained at all times when Haley & Aldrich staff are present.
- Revisions to this HASP must be outlined within the contents of the HASP. If immediate or minor changes are necessary, the Field Safety Manager (FSM) and Haley & Aldrich SHSO and/or PM may use Attachment 1 (HASP Amendment Form), presented at the end of this HASP. Any revision to the HASP requires employees and subcontractors to be informed of the changes so that they understand the requirements of the change.
- Deviations from this HASP are permitted with approval from the Haley & Aldrich FSM, PM, or Senior Health & Safety Manager (SHSM). Unauthorized deviations may constitute a violation of Haley & Aldrich company procedures/policies and may result in disciplinary action.
- This HASP will be relied upon by Haley & Aldrich's subcontractors and visitors to the Site. Haley & Aldrich's subcontractors must have their own HASP which will address hazards specific to their trade that are not included in this HASP. This HASP will be made available for review to Haley & Aldrich's subcontractors and other interested parties (e.g., facility personnel and regulatory agencies) to ensure that Haley & Aldrich has properly informed our subcontractors and others of the potential hazards associated with the implementation of the SOW to the extent that Haley &Aldrich is aware.

This Site-specific HASP provides only Site-specific descriptions and work procedures. General safety and health compliance programs in support of this HASP (e.g., injury reporting, medical surveillance, personal protective equipment [PPE] selection, etc.) are described in detail in the Haley &Aldrich Corporate Health and Safety Program Manual and within Haley & Aldrich's Standard Operating Procedures (SOPs). Both the manual and SOPs can be located on the Haley & Aldrich's Company Intranet. When appropriate, users of this HASP should always refer to these resources and incorporate them into the extent possible. The manual and SOPs are available to clients and regulators upon request.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

EMERGENCY EVENT PROCEDURES

1 - ASSESS THE SCENE

- **STOP WORK**
- Review the situation and ascertain if it is safe to enter the area.
- Evacuate the site if the conditions are unsafe.

2 - EVALUATE THE EMERGENCY

- **Call 911, or designated emergency number, if required.**
- **Provide first aid for the victim if qualified and safe to do so.**
  - First aid will be addressed using the onsite first aid kit. *
    - If providing first aid, remember to use proper first aid universal precautions if blood or bodily fluids are present.
- **If exposure to hazardous substance is suspected, immediately vacate the contaminated area.**
  - Remove any contaminated clothing and/or equipment.
  - Wash any affected dermal/ocular area(s) with water for at least 15 minutes.
  - Seek immediate medical assistance if any exposure symptoms are present.

** Note: Haley & Aldrich employees are not required or expected to administer first aid / CPR to any Haley & Aldrich staff member, Contractor, or Civilian personnel at any time; it is Haley & Aldrich´s position that those who do so are doing so on their own behalf and not as a function of their job.*

3 - SECURE THE AREA

- **Cordon off the incident area, if possible.**
  - Notify any security personnel, if required.
  - Escort all non-essential personnel out of the area, if able.

4 - REPORT ON-SITE ACCIDENTS / INCIDENTS TO PM / SSO

- **Notify the PM and SSO as soon as it is safe to do so.**
  - Assist PM and SSO in completing any additional tasks, as required.

5 - INVESTIGATE / REPORT THE INCIDENT

- **Record details of the incident for input to the Gensuite.**
  - Complete any additional forms as requested by the PM and SSO.

6 - TAKE CORRECTIVE ACTION

- **Implement corrective actions per the PM following root cause analysis.**
  - Complete Lessons Learned form.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

1. WORK SCOPE

This Site-Specific Health and Safety Plan addresses the health and safety practices and procedures that will be exercised by all Haley & Aldrich employees participating in all work on the Project Site. This plan is based on an assessment of the site-specific health and safety risks available to Haley & Aldrich and Haley & Aldrich's experience with other similar project sites. The scope of work includes the following:

Observe and document subsurface exploration program and soil management

Project Task Breakdown

Task No.	Task Description	Employee(s) Assigned	Work Date(s) or Duration
1	**Site Walk** – Complete site walk to mark boring locations, inspect site, and complete work.	Zavier Richards	1 Day Anticipated
2	**Underground Utility Clearance** – Oversee GPR survey to be conducted NOVA Geophysical Services to clear boring locations and identify underground utilities, tanks, or other anomalies.	Zavier Richards	1 Day Anticipated
3	**Drilling** - Oversee installation of soil borings and soil vapor points by Lakewood Environmental Services Corp. using a Geoprobe drilling rig.	Zavier Richards	7 Days Anticipated
4-6	**Soil, Groundwater and Soil Vapor Sampling -** Collect soil and soil vapor samples into laboratory-provided containers. Collect groundwater samples from pump and water quality meter assembly into laboratory-provided containers.	Zavier Richards	7 Days Anticipated

Subcontractor(s) Tasks

Firm Name	Work Activity	Work Date(s) or Duration
Lakewood Environmental Services Corp.	Drilling	7

Projected Start Date: 10/15/2025

Projected Completion Date: 11/1/2025

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

2. SITE OVERVIEW / DESCRIPTION

Site Classification

Commercial

Site Description

The site, identified as Block 2341, Lots 34 and 37 on the New York City tax map in a C6-2A zoning area, is approximately 10,900 square feet. Lot 34 is currently improved with a one-story commercial building most recently utilized as an auto repair shop and is currently vacant. Lot 37 is currently improved with a one-story commercial building currently utilized as an autobody repair shop.

Background and Historic Site Usage

The site was undeveloped by 1908. By 1935, the site was developed with several one-story structures operated as auto service and repair shops, auto painting shop, and storage. By 1944, the buildings on the eastern portion of the site were razed and the site was improved with a one-story building operated by an auto repair and service shop. By 1977, the building on Lot 34 was expanded and was operated as an auto body repair shop and has been utilized as auto body service and repair since.

Site Status

Indicate current activity status and describe operations at the site:

Inactive

The buildings on both Lots 34 and 37 are inactive, former automotive repair shops.

Site Plan

Is a site plan or sketch available? Yes

Work Areas

List and identify each specific work areas(s) on the job site and indicate its location(s) on the site plan:

The entire site will be utilized as an active work area.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Site Plan

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

3. HAZARD ASSESSMENT

Eliminate/minimize

Site Chemical Hazards

Is this Site impacted with chemical contamination? Yes

Source of information about contaminants: Owner Knowledge

Contaminant of Concern	Location/Media	Concentration	Units
3-Methylphenol/4-Methylphenol	Soil	0.8	mg/kg
Benzo(a)anthracene	Soil	2.3	mg/kg
Benzo(a)pyrene	Soil	2.2	mg/kg
Benzo(b)fluoranthene	Soil	2.8	mg/kg
Benzo(k)fluoranthene	Soil	0.87	mg/kg
Chrysene	Soil	2.2	mg/kg
Dibenzo(a,h)anthracene	Soil	0.37	mg/kg
Indeno(1,2,3-cd)pyrene	Soil	1.6	mg/kg
Arsenic	Soil	19.1	mg/kg
Barium	Soil	390	mg/kg
Cadmium	Soil	29.7	mg/kg
Copper	Soil	1,340	mg/kg
Lead	Soil	6,270	mg/kg
Mercury	Soil	7.96	mg/kg
Nickel	Soil	40.4	mg/kg
Silver	Soil	2.67	mg/kg
Zinc	Soil	3,620	mg/kg
Acetone	Soil	0.071	mg/kg

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

Total BTEX	**Soil Vapor**	**187**	**ug/m3**
Total VOCs	**Soil Vapor**	**1332.06**	**ug/m3**
Total CVOCs	**Soil Vapor**	**81.8**	**ug/m3**

VOCs: include all organic compounds (substances made up of predominantly carbon and hydrogen) with boiling temperatures in the range of 50-260 degrees C, excluding pesticides. This means that they are likely to be present as a vapor or gas in normal ambient temperatures. Substances which are included in the VOC category include aliphatic hydrocarbons (such as hexane), aldehydes, aromatic hydrocarbons (such as benzene, toluene, and the xylenes or BTEX), and oxygenated compounds (such as acetone and similar ketones). The term VOC often is used in a legal or regulatory context and in such cases the precise definition is a matter of law.

VOCs are released from oil and gasoline refining, storage and combustion as well as from a wide range of industrial processes. Processes involving fuels, solvents, paints or the use of chemicals are the most significant sources. VOCs may also be emitted from cleaning products, degreasing products, fabrics, carpets, plastic products, glues, printed material, varnishes, wax, disinfectants, and cosmetics.

Typically, VOCs are present in gas or vapor and will enter the body by breathing contaminated air. Higher concentrations of VOCs may occur in areas of poor ventilation.

Arsenic: The Occupational Safety and Health Administration has set limits of 10 microgram arsenic per cubic meter of workplace air (10 µg/m3) for 8 hour shifts and 40 hour work weeks. Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer. The World Health Organization (WHO), the Department of Health and Human Services (DHHS), and the EPA have determined that inorganic arsenic is a human carcinogen.

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs. Ingesting high levels of inorganic arsenic can result in death. Lower levels of arsenic can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Barium: is a soft, silvery metal that rapidly tarnishes in air and reacts with water. It is mostly used in drilling fluids for oil and gas wells and used in paint and in glassmaking. All barium compounds are toxic; however, barium sulfate is insoluble and so can be safely swallowed. A suspension of barium sulfate is sometimes given to patients suffering from digestive disorders.

Barium has no known biological role, although barium sulfate has been found in one type of algae. Barium is toxic, as are its water- or acid-soluble compounds. Barium occurs only in combination with other elements. The major ores are barite (barium sulfate) and witherite (barium carbonate). Barium metal can be prepared by electrolysis of molten barium chloride, or by heating barium oxide with aluminum powder.

Lead: The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

nervous system. Long-term exposure to lead can result in decreased performance in some tests measuring functions of the nervous system in adults. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys and ultimately cause death.

Mercury: is an odorless, silver metallic liquid. It can be inhaled or absorbed through the skin. Contact may cause irritation to the skin or eyes. Toxic if ingested. Fume inhalation may cause irritation in the nose, throat or lungs. This is a corrosive chemical. Symptoms of poisoning include, muscle tremors, loss of appetite, and nausea. Long-term exposure may have effects on the central nervous system and kidneys. The PEL is 0.1 mg/m^3 averaged over an 8 hour shift.

Nickel: is silvery-white metal with a gold tinge. It is used in batteries and making of alloys and is found in Earth's core and crust. If reduced to dust particles it can cause chronic bronchitis, reduced lung function and potential cancer of lung and sinus if overexposed.

Silver: is a soft white metal used in jewelry and batteries and electronics. Soluble silver compounds can cause argyria and argyrosis and other toxic effects to the liver and kidney. Irritation to the eyes, skin, and respiratory and intestinal track can occur. Metallic silver poses a minimal risk to health.

Zinc: is an odorless, bluish-white powder. It is typically used in paints and can be mixed with other metals to make bass and other types of alloys. Zinc can produce flammable gases when in contact with water, sometimes creating vigorous or explosive reactions. It can also create gaseous hydrogen in contact with water or moist air. Inhalation will cause irritation to eyes and respiratory system. Exposures cause flu-like symptoms, called "metal fume fever", which can sometimes be delayed up to 48 hours after initial exposure.

Cadmium: Cadmium became an important metal in the production of nickel-cadmium (Ni-Cd) rechargeable batteries and as a sacrificial corrosion-protection coating for iron and steel. Common industrial uses for cadmium today are in batteries, alloys, coatings (electroplating), solar cells, plastic stabilizers, and pigments. Acute (short-term) exposure to Cadmium fumes is irritating to the respiratory tract. Inhalation of fumes may cause a buildup of fluid in the lungs. Inhalation of fumes may cause metal fume fever. The effects may be delayed, and medical observation is recommended. Prolonged (chronic) exposure to Cadmium dust may result in impairment of lungs. Cadmium and its compounds are highly toxic and exposure to this metal is known to cause cancer and targets the body's cardiovascular, renal, gastrointestinal, neurological, reproductive, and respiratory systems. Cadmium is a carcinogen.

Polycyclic aromatic hydrocarbons (PAHs): are a class of chemicals that occur naturally in coal, crude oil, and gasoline. They also are produced when coal, oil, gas, wood, garbage, and tobacco are burned. PAHs generated from these sources can bind to or form small particles in the air. High-temperature cooking will form PAHs in meat and in other foods. Naphthalene is a PAH that is produced commercially in the United States to make other chemicals and mothballs. Cigarette smoke contains many PAHs.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Site Hazards Checklist			
Weather			
Cold Temperatures	High Winds		Select Hazard

Cold Temperatures

Cold stress may occur at any time work is being performed at low ambient temperatures and high velocity winds. Because cold stress is common and has potentially serious illnesses associated with outdoor work during cold seasons, regular monitoring and other preventative measures are vital.

Refer to OP1003-Cold Stress for additional information and mitigation controls.

High Winds

While high winds are commonly associated with severe thunderstorms and hurricanes they may also occur as a result of differences in air pressures, such as when a cold front passes across the area. They can cause downed trees and power lines, and flying debris (such as dust or larger debris), which adds additional risks and could lead to power outages, transportation disruptions, damage to buildings and vehicles, and serious injury.

Wind Advisory are issued for sustained winds 25 to 39 mph and/or gusts to 57 mph. High Wind warnings are issued by the National Weather Service when high wind speeds may pose a hazard or is life threatening. The criteria for this warning will varies by state. The Beaufort Wind Scale is a helpful tool to when dealing with high winds.

Biological			
Small Mammals	Stinging Insects	Wildlife Droppings	Choose an item.

Small Mammals

Rodents, are the most abundant order of mammals. There are hundreds of species of rats; the most common are the black and brown rat. Other rodents you may encounter are mice, beavers, squirrels, guinea pigs, capybaras and coypu.

The Brown Rat has small ears, blunt nose, and short hair. It is approximately 14-18” long (with tail). They frequently infest garbage/rubbish, slaughterhouses, domestic dwellings, warehouses, and supermarkets. They also frequent any space with an easy meal and potential nesting sites. The Black Rat is identified by its tail, that is always longer than the length from the head to the body. It is also slimmer and more agile than the Brown rat. Its size varies according to its environment and food supply.

The House Mouse has the amazing ability to adapt and can frequently be found in human dwellings. In buildings, mice will live anywhere and difficult to keep out. Mice are omnivorous, they will eat anything. Rats and mice often become a serious problem in cold winter months when they seek food and warmth inside buildings. They may suddenly appear in large numbers when excavation work disturbs their in-ground nesting locations or their food source is changed.

Some major problems caused by rats and mice are contaminating the food they eat with urine and excrement. Gnawing into materials such as paper, wood, or upholstery, to use as nest material. Also

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

gnawing plastic, cement, soft metals such as lead and aluminum, and wiring, which may cause a fire hazard. Occasionally biting people and may kill small animals. They, or the parasites they carry, like fleas, mites and worms, spread many diseases such as salmonella, trichinosis, rat bite fever, hantavirus, Weil's disease, and bubonic plague. They damage ornamental plants by burrowing among the roots or feeding on new growth. They also eat garden vegetables, such as corn and squash. These rodents have been a problem for centuries, because of their incredible ability to survive and are so difficult to eliminate. In addition, they are extremely compatible with human behavior and needs.

Avoid contact with rodents, if possible. Avoid contact with rodent excrement. Do not eat food or water that may have encountered rodent excrement. If exposed, wash hands and avoid touching your face with your hands.

Stinging Insects

Stinging Insects fall into two major groups: Apidae (honeybees and bumblebees) and vespids (wasps, yellow jackets, and hornets). Apidae are docile and usually do not sting unless provoked. The stinger of the honeybee has multiple barbs, which usually detach after a sting. Vespids have few barbs and can inflict multiple stings.

There are several kinds of stinging insects that might be encountered on the project site. Most stings will only result in a temporary injury. However, sometimes the effects can be more severe, even life-threatening depending on where you are stung and what allergies you have. Being stung in the throat area of the neck may cause edema (swelling caused by fluid build-up in the tissues) around the throat and may make breathing difficult.

In rare cases, a severe allergic reaction can occur. This can cause "anaphylaxis" or anaphylactic shock with symptoms appearing immediately or up to 30 minutes later. Symptoms include; Hives, itching and swelling in areas other than the sting site, swollen eyes/eyelids, wheezing, chest tightness, difficulty breathing, hoarse voice, swelling of the tongue, dizziness or sharp drop in blood pressure, shock, unconsciousness or cardiac arrest. Reactions can occur the first time you are stung or with subsequent stings. If you see any signs of reaction, or are unsure, call or have a co-worker call emergency medical services (e.g., 911) right away. Get medical help for stings near the eyes, nose or throat. Stay with the person who has been stung to monitor their reaction.

Staff who are allergic to bee stings are encouraged to inform their staff/project manager. If staff member carries an Epi-pen (i.e., epinephrine autoinjector) they are encouraged to inform their colleagues in case they are stung and are incapable of administering the injection. Examine site for any signs of activity or a hive/nest. If you see several insects flying around, see if they are entering/exiting from the same place. Most will not sting unless startled or attacked. Do not swat, let insects fly away on their own. If you must, walk away slowly or gently "blow" them away. If a nest is disturbed and you hear "wild" buzzing, protect your face with your hands and run from the area immediately. Wear long sleeves, long pants, and closed-toed boots. Wear light colored clothes such as khakis. Avoid brightly colored, patterned, or black clothing. Tie back long hair to avoid bees or wasps from entanglement. Do not wear perfumes, colognes or scented soaps as they contain fragrances that are attractive. If bee or wasp is found in your car, stop and leave windows open.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Wildlife Droppings

Project sites involving abandoned buildings may bring staff into contact with animal droppings. There are many diseases that one can be exposed to from a variety of animals.

Mice and Rats
Hantavirus is transmitted to humans from dried droppings, urine, or saliva of mice and rats. The disease begins as a flu-like illness with fever, chills, and muscle aches, but can rapidly progress to a life-threatening condition marked by respiratory failure as fluids fill the lungs. Persons working in infested buildings are at increased risk to this disease, particularly during dusty clean-up activities.

Birds and Bats
Large populations of roosting birds may present a disease risk. The most serious health risks arise from disease organisms that grow in the nutrient-rich accumulations of bird droppings, feathers and debris under a roost, particularly if roosts have been active for years.

Histoplasmosis and Cryptococcosis are the most common fungal diseases associated with bird and bat dropping. Infection occurs when spores, carried by the air, are inhaled, especially after a roost has been disturbed. The active and inactive roosts of blackbirds, starlings and cowbirds have also been found to be heavily contaminated with fungus spores. Most infections are mild and produce either no symptoms or a minor influenza-like illness. Occasionally the disease can cause high fever, blood abnormalities, pneumonia and even death.

Do not touch droppings with unprotected hands. Avoid disturbing the droppings and generating dust. Employee work practices and dust control measures that eliminate or reduce dust generation during removal of manure from a building will also reduce risks of infection and development of disease. Use an industrial vacuum cleaner with a high-efficiency (HEPA) filter to bag contaminated material.

Location/Terrain			
Economically Depressed	Slip/Trip/Falls	SIMOPS	Choose an item.

Economically Depressed Areas

Economically depressed areas may have high crime rates. Projects involving work in and around inactive industrial sites may bring staff into contact with indigent and homeless persons. Staff could be subjected to crime that includes but may not be limited to thievery, vandalism, and violence. Prior to the start of work staff need to understand the work locations and the potential for exposure to low level crime.

Staff members should never work alone in these areas. A buddy system is required. Conduct during daylight hours. Secure equipment and vehicles. If warranted, contact the local police department for a security detail. Leave the work area immediately and contact the local authorities if staff members feel threatened or are threatened.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Slips, Trips & Falls

Slip and trip injuries are the most frequent injuries to workers. Statistics show most falls happen on the same level resulting from slips and trips. Both slips and trips result from unintended or unexpected change in the contact between the feet and the ground or walking surface. Good housekeeping, quality of walking surfaces (flooring), awareness of surroundings, selection of proper footwear, and appropriate pace of walking are critical for preventing fall accidents.

Site workers will be walking on a variety of irregular surfaces, that may affect their balance. Extra care must be taken to walk cautiously near rivers because the bottom of the riverbed maybe slick and may not be visible. Rocks, gradient changes, sandy bottoms, and debris may be present but not observable.

Take your time and pay attention to where you are going. Adjust your stride to a pace that is suitable for the walking surface and the tasks you are doing. Check the work area to identify hazards - beware of trip hazards such as wet floors, slippery floors, and uneven surfaces or terrain. Establish and utilize a pathway free of slip and trip hazards. Choose a safer walking route. Carry loads you can see over. Keep work areas clean and free of clutter. Communicate hazards to on-site personnel and remove hazards as appropriate.

SIMOPS

SIMOPS are described as the potential class of activities which could bring about an undesired event or set of circumstances, e.g., safety, environment, damage to assets, schedule, commercial, financial, etc. SIMOPS are defined as performing two or more operations concurrently.

SIMOPS should be identified at an early stage before operations commence to understand issues such as schedule and physical clashes, maintenance activities, failure impacts, interferences between vessels, contracts and third part interfaces and environmental impacts.

Coordinate project with site activities. Identify and understand the hazards associated with the host and client's activities. Integrate site emergency response protocols where appropriate and communicate to all project staff. Integrate site communication protocols and communicate to all project staff.

Miscellaneous			
Extended Shift	Choose an item.	Choose an item.	Choose an item.

Extended Shift

An extended shift can include extending a workday beyond eight hours. Extended or unusual work shifts may be more stressful physically, mentally, and emotionally. Non-traditional shifts and extended work hours may disrupt the body's regular schedule, leading to increased fatigue, stress, and lack of concentration. This leads to an increased risk of operator error, injuries and/or accidents. The degree to which an individual is exposed to fatigue risk factors depends upon the work schedule. As both the duration of the workday and the number of days worked increase so does the fatigue risk factors. Staff Managers need to be aware of the fatigue risk factors and ensure projects are structured to mitigate these factors. Staff Members also have a responsibility to manage the personal fatigue risk factors that they can control outside of work (e.g, duration and quality of sleep, diet, drugs, and alcohol)

Fatigue is a message to the body to rest and can be eliminated with proper rest. However, if rest is not possible, fatigue can increase and becomes distressing and eventually debilitating. Fatigue symptoms,

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

both mental and physical, vary and depend on the person and degree of overexertion. Examples include: weariness, sleepiness, irritability, reduced alertness, lack of memory, concentration and motivation, increased susceptibility to illness, depression, headache, loss of appetite, and digestive problems.

When possible, managers should limit use of extended shifts and increase the number of days worked. Working shifts longer than 8 hours generally result in reduced productivity and alertness. Additional breaks and meals should be provided when working extended shift periods. Tasks requiring heavy physical labor or intense concentration should be performed at the beginning of the shift if possible. This is an important consideration for pre-emergency planning.

Make efforts, when feasible, to ensure that unavoidable extended work shifts and shift changes allow affected employees time for adequate rest and recovery. Project Managers need to plan to have an adequate number of personnel available to enable workers to take breaks, eat meals, relax, and sleep.

Plan for regular and frequent breaks throughout the work shift. If at remote sites, ensure if possible, that there is a quiet, secluded area designated for rest and recuperation. In addition to formal breaks such as lunch or dinner, encourage use of micro breaks to change positions, move about, and shift concentration. Personnel should look to obtain an adequate quantity and quality of sleep.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Task Hazard Summary

Task 1 - Site Walk

General hazards associated with site walk-throughs and site surveys include the following: • Exposure to irritant and toxic plants such as poison ivy and sticker bushes may cause allergic reactions to personnel. • Surfaces covered with heavy vegetation and undergrowth create a tripping hazard. • Back strain due to carrying equipment, tools, and instruments. • Native wildlife such as rodents, ticks, and snakes present the possibility of insect bites and associated diseases such as Lyme disease
Driving vehicles on uneven or unsafe surfaces can result in accidents such as overturned vehicles or flat tires. • Heat stress/cold stress exposure.

HAZARD PREVENTION • Wear long-sleeved clothing and slacks to minimize contact with irritant and toxic plants and to protect against insect bites. Appropriate first aid for individuals' known allergic reactions. • Be alert and observe terrain while walking to minimize slips and falls. • Use proper lifting techniques to prevent back strain. • Avoid wildlife when possible. In case of an animal bite, perform first aid and capture the animal, if possible, for rabies testing. Perform a tick check after leaving a wooded or vegetated area. • Ensure all maintenance is performed on vehicles before going to the field. A site surveillance on foot might be required to choose clear driving paths. • Implement heat stress management techniques such as shifting work hours, fluid intake, and monitoring employees, especially high risk workers.

Task 2 - Underground Utility Clearance

Ground disturbance activities such as excavating or drilling have the potential to contact underground utilities and may be considered a hazardous activity and a permit to work may be required. Once the H&A Project Manager has identified the work zone and the areas designated for ground disturbance the PM or designee is required to delineate the area with either white paint or flags so that the appropriate agencies know which area to check for their respective utilities. Haley & Aldrich staff members must ensure that permission has been gained from the property owner to access the property prior to site entry and before marking any proposed exploration or drilling locations.

The Project Manager shall verify that the proposed dig or drill zones are adequately marked or staked prior to the locators site visit, and that the appropriate Line Location Organization/ Contractor has been notified (a minimum of 72 business hours in advance) of all planned ground disturbance activities and a request for line location has been registered with the applicable One Call or dial Before You Dig organization when applicable. Personnel that are required to mark the area need to identify and understand the hazards associated with the project area which can range from a public roadway to a greenspace in a remote location.

See OP1020 Work Near Utilities.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Task 3 – Drilling

Drilling is conducted for a range of services that can include but are not limited to: soil characterization, environmental investigation, well installation, and ore exploration. Familiarity with basic drilling safety is an essential component of all drilling projects. Potential hazards related to drilling operations include, but are not limited to encountering underground or overhead utilities, traffic and heavy equipment, hoisting heavy tools, steel impacts, open rotation entanglement, and the planned or unexpected encountering of toxic or hazardous substances. While staff members do not operate drilling equipment, they may work in close proximity to operating drilling equipment and may be exposed to many of the same hazards as the drilling subcontractor. It is imperative that staff are aware of emergency stops and establish communication protocols with the drillers prior to the start of work.

See OP 1002 Drilling Safety for more information.

Task 4a – Soil Sampling

Soil sampling by H&A staff on active construction sites can be conducted in conjunction with a wide range activities such as building construction, earthwork and soil management related activities. These activities can include, but are not limited to: drill spoil characterization and management during building foundation element installation, characterization of excavated soils for management/disposal/reuse during earthwork activities, and as part of environmental remedial activities such as delineation and confirmation sampling. Familiarity with basic heavy construction safety, site conditions (geotechnical and environmental), and potential soil contaminants are essential components of soil sampling performed on active sites. Potential hazards related to soil sampling at construction sites include, but are not limited to: encountering site vehicle traffic and heavy equipment operations, manual lifting, generated waste, contact or exposure to impacted soil, and encountering unknown toxic or hazardous substances. Although soil sampling is commonly performed within active excavations, from stockpiles, or within trench excavations, sampling locations and situations will vary depending on site conditions. Care should be taken while entering and exiting excavations or trenches, and when accessing (climbing up or down) soil stockpiles, ensuring that the sampling area is not being actively accessed by construction equipment. Care should also be taken with handling of potentially environmentally impacted soil during sampling, with appropriate PPE identified and used. At no time during classification activities are personnel to reach for debris near machinery that is in operation, place any samples in their mouth, or come in contact with the soils without the use of gloves. Staff will have to carry and use a variety of sampling tools, equipment, containers, and potentially heavy sample bags. It is imperative that staff are aware of emergency / communication protocols with the Contractor prior to the start of work.

Task 4b – Water Sampling

Environmental water sampling could include activities such as groundwater sampling from permanent or temporary wells, or surface water sampling from streams, rivers, lakes, ponds, lagoons, and surface impoundments.

Sampling tasks could involve uncapping, purging (pumping water out of the well), and sampling, and/or monitoring, new or existing monitoring wells. A mechanical pump may be used to purge the wells and

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

can be hand-, gas-, or electric-operated. Water samples taken from the wells are then placed in containers and shipped to an analytical laboratory for analysis. The physical hazards of these operations are primarily associated with the collection methods and procedures used.

When sampling bodies of water containing known or suspected hazardous substances, adequate precautions must be taken to ensure the safety of sampling personnel. The sampling team member collecting the sample should not get too close to the edge, where ground failure or slips, trips or falls may cause him/her to lose his/her balance. The person performing the sampling should have fall restraint or protection for the task. When conducting sampling from a boat in an impoundment or flowing waters, appropriate vessel safety procedures should be followed. Avoid lifting heavy coolers with back muscles; instead, use ergonomic lifting techniques, team lift or mechanical lifts. Wear proper gloves, such as when handling sample containers to avoid contacting any materials that may have spilled out of the sample containers.

Inhalation and absorption of COCs are the primary routes of entry associated with water sampling, due to the manipulation of sample media and equipment, manual transfer of media into sample containers, and proximity of operations to the breathing zone. During this project, several different groundwater sampling methodologies may be used based on equipment accessibility and the types of materials to be sampled. These sampling methods may include hand or mechanical bailing. The primary hazards associated with these specific sampling procedures are not potentially serious; however, other operations in the area or the conditions under which samples must be collected may present chemical and physical hazards. The hazards directly associated with groundwater sampling procedures are generally limited to strains or sprains from hand bailing, and potential eye hazards. Exposure to water containing COCs is also possible. All tools and equipment that will be used at the site must be intrinsically safe (electronics and electrical equipment) and non-sparking or explosion-proof (hand tools).

Task 4c – Soil Vapor

Soil gas sampling is employed as an indirect indicator of contamination in soil or groundwater particularly over and around landfill waste sites, or groundwater plumes. Soil gas sampling points can be installed manually using a slam bar or power driven mechanical devices (e.g., demolition hammer or Geoprobe) may be used based on site conditions (i.e., pavement, frozen ground, very dense clays, etc.). Soil gas samples can be drawn through the probe itself, or through Teflon tubing inserted through the probe and attached to the probe point. Samples are collected and analyzed as described below. Other field air monitoring devices, such as the Combustible Gas Indicator (CGI) and the Organic Vapor Analyzer (OVA), can also be used, depending on specific site conditions.

Because the sample is being drawn from underground, and no contamination is introduced into the breathing zone, soil gas sampling usually occurs in Level D. Nevertheless, ambient air should be constantly monitored to obtain background and breathing zone readings during the sampling procedure in the event the seal around the sampling point is breached. As long as the levels in ambient air do not rise above background, no upgrade of the level of protection is needed. Also, an underground utility search must be performed prior to sampling.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Summary of Physical Hazards & Controls

Compressed Gas

Hazards associated with compressed gases include oxygen displacement, fires, explosions, and toxic gas exposures, as well as the physical hazards associated with pressurized containers. In most instances, accidents are caused by improper application, misuse of the gas, or its container by inadequately trained personnel. Special storage, use, and handling precautions are necessary to minimize accidents and control these hazards above.

See OP 1048 Compressed Gas Safety for more information.

Controls

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

- Visually inspect the cylinder prior to and after use for any damage. Report any damage to the vendor for direction.
- Ensure that cylinders are clearly identified. Labels must not be defaced or removed.
- Leave valve protection caps in place (if provided) until cylinders are secured and connected for use.
- Keep cylinder valves closed except when the cylinder is being used.
- When opening a cylinder valve, stand so the valve outlet is pointed away from yourself and all other employees. Open valves slowly.
- Replace protective caps and outlet caps or plugs before returning empty cylinders to the supplier.
- Never tamper with or alter cylinders, valves, or safety relief devices.
- Do not tighten connections or leaking fittings or attempt repairs while the system is under pressure.
- Do not subject cylinders to artificially low temperatures or temperatures above 125 F. Do not place them next to heat sources or allow a flame to contact any part of the cylinder.
- Avoid dragging or sliding cylinders. Do not lift cylinders by the caps.
- Firmly secure the cylinder and move with a suitable hand truck, lift truck, or crane with a cradle or platform.

Storage

- Provide adequate space or segregate by partitions and post a conspicuous sign that identifies the gas or hazard class.
- Storage areas should be dry, well-drained, ventilated, and fire resistant.
- Cylinders can be stored in the open, but they should be protected from the ground or continuous dampness to prevent rusting.
- Cylinders can usually be stored in the sun; but, cylinders must not exceed temperatures >125 F.
- Always refer to the manufacturers' storage requirements and SDSs.
- Storage areas should protect cylinders from damage. Do not store on unprotected platform edges or obstruct walkways or exits.
- Use brackets, chains, or straps around the upper third of the cylinder to secure cylinders in storage or in use.

Transport

- Cylinders must be stored upright, firmly secured, and be capped during transport.

Congested Areas

Working in congested areas can expose both workers and the public to a wide range of hazards depending upon the specific activities taking place. Staff Members need to understand the work scope, work areas, equipment on-site, and internal traffic patterns to minimize or eliminate exposure potential.

Controls

- Provide barricades, fencing, warning signs/signals and adequate lighting to protect people while working in or around congested areas.
- Vehicles and heavy equipment with restricted views to the rear should have functioning back-up alarms that are audible above the surrounding noise levels. Whenever possible, use a signaler to assist heavy equipment operators and/or drivers in backing up or maneuvering in congested areas.
- Lay out traffic control patterns to eliminate excessive congestion.
- Workers in congested areas should always wear high visibility clothing.
- Be aware of Line of Fire hazards when performing work activities in congested areas.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

- Hazards associated with SIMOPs should be discussed daily at Tailgate Safety Meetings.

Ergonomics

Most Work-related Musculoskeletal Disorders (WMSDs) are caused by Ergonomic Stressors. Ergonomic Stressors are caused by poor workplace practices and/or insufficient design, which may present ergonomic risk factors. These stressors include, but not limited to, repetition, force, extreme postures, static postures, quick motions, contact pressure, vibration, and cold temperatures.

WMSDs are injuries to the musculoskeletal system, which involves bones, muscles, tendons, ligaments, and other tissues in the system. Symptoms may include numbness, tightness, tingling, swelling, pain, stiffness, fatigue, and/or redness. WMSD are usually caused by one or more Ergonomic Stressors. There may be individual differences in susceptibility and symptoms among employees performing similar tasks. Any symptoms are to be taken seriously and reported immediately.

See OP1053 Ergonomics for more information.

Controls

- Ensure workstations are ergonomically correct so bad posture is not required to complete tasks.
- Take periodic breaks over the course of the day.
- Stretch during break times.
- Break up tasks that require repetitive motion.
- Contact Corporate H&S with any ergonomic concerns

Generated Waste

Activities on environmental sites may generate waste that requires regulated handling and disposal. Excess sample solids, decontamination materials, poly sheeting, used PPE, etc. that are determined to be free of contamination through field or laboratory screening can usually be disposed into client-approved, on-site trash receptacles. Uncontaminated wash water may be discarded onto the ground surface away from surface water bodies in areas where infiltration can occur. Contaminated materials must be segregated into liquids or solids and drummed separately for off-site disposal.

Controls

- Manage waste properly through good work practices.
- Collect, store, containerize waste, and dispose of it properly.
- All wastes generated shall be containerized in an appropriate container (i.e. open or closed top 55-gallon drum, roll-off container, poly tote, cardboard box, etc.) as directed by the PM.
- Containers should be inspected for damages or defects
- Waste containers should be appropriately labeled indicating the contents, date the container was filled, owner of the material (including address) and any unique identification number, if necessary.
- Upon completion of filling the waste container, the container should be inspected for leaks and an appropriate seal.

Ground Disturbance

Ground disturbance is defined as any activity disturbing the ground. Ground disturbance activities include, but are not limited to, excavating, trenching, drilling (either mechanically or by hand), digging, plowing, grading, tunneling and pounding posts or stakes.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Because of the potential hazards associated with striking an underground utility or structure, the operating procedure for underground utility clearance shall be followed prior to performing any ground disturbance activities.

See OP1020 Working Near Utilities

Controls
Prior to performing ground disturbance activities, the following requirements should be applied:

- Confirm all approvals and agreements (as applicable) either verbal or written have been obtained.
- Request for line location has been registered with the applicable One-Call or Dial Before You Dig organization, when applicable.
    - Whenever possible, ground disturbance areas should be adequately marked or staked prior to the utility locators site visit.
- Notification to underground facility operator/owner(s) that may not be associated with any known public notification systems such as the One-Call Program regarding the intent to cause ground disturbance within the search zone.
- Notifications to landowners and/or tenant, where deemed reasonable and practicable.
- Proximity and Common Right of Way Agreements shall be checked if the line locator information is inconclusive.

Heavy Equipment

Staff must be careful and alert when working around heavy equipment, failure or breakage and limited visibility can lead to accidents and worker injury. Heavy equipment such as cranes, drills, haul trucks, or other can fail during operation increasing chances of worker injury. Equipment of this nature shall be visually inspected and checked for proper working order prior to commencement of field work. Those operating heavy equipment must meet all requirements to operate the equipment. Haley & Aldrich, Inc. staff that supervise projects or are associated with high risk projects that involve digging or drilling should use due diligence when working with a construction firm.

See OP1052 Heavy Equipment for additional information.

Controls

- Only approach equipment once you have confirmed contact with the operator (e.g., operator places the bucket on the ground).
- Always maintain visual contact with operators and keep out of the strike zone whenever possible.
- Always be alert to the position of the equipment around you.
- Always approach heavy equipment with an awareness of the swing radius and traffic routes of all equipment and never go beneath a hoisted load.
- Avoid fumes created by heavy equipment exhaust.

Inadequate Lighting

Work may be conducted during off-hours when natural light is limited or nonexistent. Reduced or inadequate lighting limits one's ability to see which may increase the risk of an accident or injury. Regulations require work that is conducted at night meet specific requirements regarding project site illumination. Staff may also find themselves working in buildings or locations where the power has been

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

cutoff or where only emergency lighting is operational. It is important that staff have appropriate means of lighting to ensure work and access to the site is done safely.

Controls

- Nighttime project sites conducted on a roadway must have appropriate lighting consistent with the MUTCD. Contact the PM if lighting is not sufficient and poses a hazard.
- Non roadway projects must have an appropriate level of lighting that allows work to be completed safely and effectively. Staff should bring additional means of lighting (e.g., flashlight) as a precaution when working at night or areas that require illumination for the work to be conducted safely.

Line of Fire

Line of fire refers to the path an object will travel. Examples of line of fire situations typically observed on project sites include lifting/hoisting, lines under tension, objects that can fall or roll, pressurized objects or lines, springs or stored energy, work overhead, vehicles and heavy equipment.

Controls

- Never walk under a suspended load.
- Be aware and stay clear of tensioned lines such as cable, chain and rope.
- Be cautious of torque stresses that drilling equipment and truck augers can generate. Equipment can rotate unexpectedly long after applied torque force has been stopped.
- Springs and other items can release tremendous energy if compressed and suddenly released
- Items under tension and pressure can release tremendous energy if it is suddenly released.
- Not all objects may be overhead; be especially mindful of top-heavy items and items being transported by forklift or flatbed.
- Secure objects that can roll such as tools, cylinders, and pipes.
- Stay clear of soil cuttings or soil stockpiles generated during drilling operations and excavations, be aware that chunks of soil, rocks, and debris can fall or roll.

Manual Lifting/Moving

Most materials associated with investigation, remedial, or construction-related activities are moved by hand. The human body is subject to damage in the forms of back injury, muscle strains, and hernia if caution is not observed in the handling process.

Controls

- Under no circumstances should any one person lift more than 49 pounds unassisted.
- Always push, not pull, the object when possible.
- Size up the load before lifting. If it is heavy or clumsy, get a mechanical aid or help from a worker.
- Bend the knees; it is the single most important aspect of lifting.
- When performing the lift:
    - Place your feet close to the object and center yourself over the load.
    - Get a good handhold.
    - Lift straight up, smoothly and let your legs do the work, not your back!
    - Avoid overreaching or stretching to pick up or set down a load.
    - Do not twist or turn your body once you have made the lift.
    - Make sure beforehand that you have a clear path to carry the load.
    - Set the load down properly.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Noise

Working around heavy equipment (drill rigs, excavators, etc.) often creates excessive noise. The effects of noise include physical damage to the ear, pain, and temporary and/or permanent hearing loss. Workers can also be startled, annoyed, or distracted by noise during critical activities. Noise monitoring data that indicates that working within 25 feet of operating heavy equipment result in exposure to hazardous levels of noise (levels greater than 85 dBA).

See OP 1031 Hearing Conservation for additional information.

Controls

- Personnel are required to use hearing protection (earplugs or earmuffs) within 25 feet of any operating piece of heavy equipment.
- Limit the amount of time spent at a noise source.
- Move to a quiet area to gain relief from hazardous noise sources.
- Increase the distance from the noise source to reduce exposure.

Sharp Objects

Workers who handle sharp edged objects like sheets of steel or glass are at risk of cuts. Workers who handle sharp edged objects are also at risk of cuts. Injuries may occur to hands, fingers, or legs when they are in the way of the blade, when the blade slips, or if an open blade is handled unexpectedly. Other hazards at job sites include stepping on sharp objects (e.g. wooden boards with protruding nails, sharp work-tools, chisels, etc.) and colliding with sharp and/or protruding objects.

Controls

Always be alert when handling sharps. Never look away or become distracted while handling sharp objects. Use caution when working with tools; use right tool for the job. Keep tools sharp, dull blades are a safety hazard, requiring more force to make cuts which can lead to tool slippage. Wear appropriate PPE and do not handle sharp objects (i.e., broken glass) with bare hands. Use mechanical devices, when possible. Stay away from building debris; avoid handling site debris or placing your hand where you cannot see. Watch out for barbed wire and electrical fences; cover with a car mat or equivalent to cross or walk around; use the buddy system to avoid entanglement; wear gloves. Do not leave unprotected sharps unattended. Use protective shields, cases, styrofoam blocks, etc. Pass a sharp by handing it over carefully by the handle with the blade down or retracted. Fixed open blades are prohibited. Always cut away from the body, making several passes when cutting thicker materials. Make sure blades are fitted properly into the knife. Never cut items with a blade or other sharp object on your lap. Never try to catch a blade or cutting tool that is falling.

Slippery Surfaces

Both slips and trips result from unintended or unexpected change in the contact between the feet and ground or walking surface. Good housekeeping, quality of walking surfaces, selection of proper footwear, and appropriate pace of walking are critical for preventing fall accidents. Slips happen where there is too little friction or traction between the footwear and walking surface.

Common causes of slips are wet or oily surfaces, spills, weather hazards, loose unanchored rugs or mats and flooring or other walking surfaces that do not have same degree of traction in all areas.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Weather-related slips and falls become a serious hazard as winter conditions often make for wet or icy surfaces outdoors. Even wet organic material or mud can create hazardous walking conditions. Spills and leaks can also lead to slips and falls.

Controls

- Evaluate the work area to identify any conditions that may pose a slip hazard.
- Address any spills, drips or leaks immediately.
- Mark areas where slippery conditions exist.
- Select proper footwear or enhance traction with additional PPE.
- Where conditions are uncertain or environmental conditions result in slippery surfaces walk slowly, take small steps, and slide feet on wet or slippery surfaces.

Underground Utilities

Various forms of underground/overhead utility lines or conveyance pipes may be encountered during site activities. Prior to the start of intrusive operations, utility clearance is mandated, as well as obtaining authorization from all concerned public utility department offices. Should intrusive operations cause equipment to come into contact with utility lines, the SHSO, Project Manager, and Regional H&S Manager shall be notified immediately. Work will be suspended until the client and applicable utility agency is contacted and the appropriate actions for the situation can be addressed.

See OP1020 Work Near Utilities for complete information.

Controls

- Obtain as-built drawings for the areas being investigated from the property owner;
- Visually review each proposed soil boring locations with the property owner or knowledgeable site representative;
- Perform a geophysical survey to locate utilities;
- Hire a private line locating firm to determine location of utility lines that are present at the property;
- Identifying a no-drill or dig zone;
- Hand dig or use vacuum excavation in the proposed ground disturbance locations if insufficient data is unavailable to accurately determine the location of the utility lines.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

4. PROTECTIVE MEASURES

The personal protective equipment and safety equipment (if listed) is specific to the associated task. The required PPE and equipment listed must be onsite during the task being performed. Work shall not commence unless the required PPE or Safety Equipment is present.

Required Safety & Personal Protective Equipment

Required Personal Protective Equipment (PPE)	**Task 1**	**Task 2**	**Task 3**	**Task 4**
	Site Walk	Underground Utility Clearance	Drilling	Soil, Groundwater, and Soil Vapor Sampling
Hard hat	☒	☒	☒	☒
Safety Glasses	☐	☐	☒	☒
Safety Toed Shoes	☒	☒	☒	☒
Class 2 Safety Vest	☒	☒	☒	☒

Required Safety Equipment				
First Aid Kit	☒	☒	☒	☒
Fire Extinguisher	☐	☐	☒	☐

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

5. TRAINING REQUIREMENTS

The table below lists the training requirements staff must have respective to their assigned tasks and that are required to access the Site.

Site Specific Training Requirements
HAZWOPER - 40 Hour (Initial)
HAZWOPER - 8 Hour (Annual Refresher)

Task Specific Training Requirements				
Required Training Type	**Task 1**	**Task 2**	**Task 3**	**Task 4**
	Site Walk	Underground Utility Clearance	Drilling	Soil, Groundwater, and Soil Vapor Sampling
RCRA Haz Waste Generator	☐	☐	☒	☒

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

6. AIR MONITORING PLAN AND EQUIPMENT

Exposures to airborne substances shall be fully characterized throughout project operations to ensure that exposure controls are effectively selected and modified as needed.

Is air/exposure monitoring required at this work site for personal protection? Yes

Is perimeter monitoring required for community protection? Yes

Air monitoring plan not applicable No

Air Monitoring/Screening Equipment Requirements

Aeroqual AQS1 station with Dust Sentry and VOC Sensor

Photo-Ionization Detector (PID) 10.6eV

The required equipment listed above must be on site. Work shall not commence unless the equipment is present and in working order.

Monitoring Plans

Parameter/ Contaminant	Equipment	Action Level	Response Activity
VOCs	PID 10.6 eV	< 5 ppm (15-min avg)	Continue work and monitoring.
		>5 ppm but <25 ppm (persistent 15-min avg)	Halt work. Identify and control source. Resume only after levels 200 ft downwind (or applicable distance) fall below 5 ppm (15-min avg).
		>25 ppm	Shut down activities immediately. Implement corrective actions and maintain continuous monitoring.

Zone Location and Monitoring Interval
Upwind and Downwind of the Work Zone. Recorded every 15 minutes.

Parameter/ Contaminant	Equipment	Action Level	Response Activity
Particulate Matter (PM-10)	Dust Sentry (Aeroqual ASQ1)	>100 µg/m^3 (15-min avg) above upwind level or visible dust migration	Employ dust suppression techniques. Work may continue if levels remain ≤ 150 µg/m^3 above upwind and no visible dust migrates.
		>150 µg/m^3 (15-min avg) above upwind level after dust suppression	Stop work. Re-evaluate activities. Resume only after dust suppression measures reduce PM-10 levels ≤ 150 µg/m^3 above upwind and no visible dust migration.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Zone Location and Monitoring Interval
Breathing zone and edge of Exclusion Zone.

***If chemical does not have an action level use TLV or REL, whichever is lowest, to be used as an action level. If TLV or REL are the same as PEL, cut the PEL in half for an action level.**

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

7. DECONTAMINATION & DISPOSAL METHODS

All possible and necessary steps shall be taken to reduce or minimize contact with chemicals and contaminated/impacted materials while performing field activities (e.g., avoid sitting or leaning on, walking through, dragging equipment through or over, tracking, or splashing potential or known contaminated/impacted materials.)

Personal Hygiene Safeguards

The following minimum personal hygiene safeguards shall be adhered to:

1. No smoking or tobacco products in any project work areas.
2. No eating or drinking in the exclusion zone.
3. It is required that personnel present on site wash hands before eating, smoking, taking medication, chewing gum/tobacco, using the restroom, or applying cosmetics and before leaving the site for the day.

It is recommended that personnel present on site shower or bathe at home at the end of each day of working on the site.

Decontamination Supplies

All decontamination should be conducted at the project site in designated zones or as dictated by Client requirements. Decontamination should not be performed on Haley & Aldrich owned or leased premises.

☐ Acetone	☒ Distilled Water	☐ Polyethylene Sheeting
☒ Alconox Soap	☒ Drums	☐ Pressure/Steam Cleaner
☒ Brushes	☐ Hexane	☐ Tap Water
☒ Disposal Bags	☐ Methanol	☐ Wash tubs
☒ 5 Gallon Buckets	☒ Paper Towels	☐ Other: Specify

Location of Decontamination Station

Decontamination will take place prior to leaving the Site at the exit.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Standard Personal Decontamination Procedures

Outer gloves and boots should be decontaminated periodically as necessary and at the end of the day. Brush off solids with a hard brush and clean with soap and water or other appropriate cleaner whenever possible. Remove inner gloves carefully by turning them inside out during removal. Wash hands and forearms frequently. It is good practice to wear work-designated clothing while on-site which can be removed as soon as possible. Non-disposable overalls and outer work clothing should be bagged onsite prior to laundering. If gross contamination is encountered on-site contact the Project Manager and Field Safety Manager to discuss proper decontamination procedures.

The steps required for decontamination will depend upon the degree and type of contamination but will generally follow the sequence below.

1. Remove and wipe clean hard hat
2. Rinse boots and gloves of gross contamination
3. Scrub boots and gloves clean
4. Rinse boots and gloves
5. Remove outer boots (if applicable)
6. Remove outer gloves (if applicable)
7. Remove Tyvek coverall (if applicable)
8. Remove respirator, wipe clean and store (if applicable)
9. Remove inner gloves (if outer gloves were used)

PPE that is not grossly contaminated can be bagged and disposed in regular trash receptacles.

Small Equipment Decontamination

Pretreatment of heavily contaminated equipment may be conducted as necessary:

1. Remove gross contamination using a brush or wiping with a paper towel
2. Soak in a solution of Alconox and water (if possible)
3. Wipe off excess contamination with a paper towel

Standard decontamination procedure:

4. Wash using a solution of Alconox and water
5. Rinse with potable water
6. Rinse with methanol (or equivalent)
7. Rinse with distilled/deionized water

Inspect the equipment for any remaining contamination and repeat as necessary.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Disposal Methods

Procedures for disposal of contaminated materials, decontamination waste, and single use personal protective equipment shall meet applicable client, locate, State, and Federal requirements.

Disposal of Single Use Personal Protective Equipment

PPE that is not grossly contaminated can be bagged and disposed in regular trash receptacles. PPE that is grossly contaminated must be bagged (sealed and field personnel should communicate with the Project Manager to determine proper disposal.

Disposal Method for Contaminated Soil

- Contaminated soil cuttings and spoils must be containerized for disposal off-site unless otherwise specifically directed.
- Soil cuttings and spoils determined to be free of contamination through field screening can usually be returned to the boreholes or excavations from which they came.

Standard Disposal Methods for Contaminated Materials

- Excess sample solids, decontamination materials, rags, brushes, poly-sheeting, etc. that are determined to be free of contamination through field screening can usually be disposed into client-approved, on-site trash receptacles.
- Uncontaminated wash water may be discarded onto the ground surface away from surface water bodies in areas where infiltration can occur.
- Contaminated materials must be segregated into liquids or solids and containerized separately for offsite disposal.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

8. SITE CONTROL

The overall purpose of site control is to minimize potential contamination of workers, protect the public from the site's hazards, and prevent vandalism. Site control is especially important in emergency situations. The degree of site control necessary depends on site characteristics, site size, and the surrounding community. The following information identifies the elements used to control the activities and movements of people and equipment at the project site.

Communication

Internal
Haley & Aldrich site personnel will communicate with other Haley & Aldrich staff member and/or subcontractors or contractors with:

Face to Face Communication

External
H&S site personnel will use the following means to communicate with off-site personnel or emergency services.

Cellular Phones

Visitors

Project Site
Will visitors be required to check-in prior to accessing the project site?

Yes

Visitor Access
Authorized visitors that require access to the project site need to be provided with known information with respect to the site operations and hazards as applicable to the purpose of their site visit. Authorized visitors must have the required PPE and appropriate training to access the project site.

Zavier Richards is responsible for facilitating authorized visitor access.

Zoning

Work Zone
The work zone will be clearly delineated to ensure that the general public or unauthorized worker access is prevented. The following will be used:

Cones
Flagging Tape

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

9. SITE SPECIFIC EMERGENCY RESPONSE PLAN

The Emergency Response Plan addresses potential emergencies at this site, procedures for responding to these emergencies, roles, responsibilities during emergency response, and training. This section also describes the provisions this project has made to coordinate its emergency response with other contractors onsite and with offsite emergency response organizations (as applicable).

During the development of this emergency response plan, local, state, and federal agency disaster, fire, and emergency response organizations were consulted (if required) to ensure that this plan is compatible and integrated with plans of those organizations. Documentation of the dates of these consultations are the names of individuals contacted is kept on file and available upon request.

The site has been evaluated for potential emergency occurrences, based on site hazards, and the major categories of emergencies that could occur during project work are:

- Fire(s)/Combustion
- Hazardous Material Event
- Medical Emergency
- Natural Disaster

A detailed list of emergency types and response actions are summarized in Table X below. Prior to the start of work, the SSO will update the table with any additional site-specific information regarding evacuations, muster points, or additional emergency procedures. The SSO will establish evacuation routes and assembly areas for the Site. All personnel entering the Site will be informed of these routes and assembly areas.

Pre-Emergency Planning

Before the start of field activities, the Project Manager will ensure preparation has been made in anticipation of emergencies. Preparatory actions include the following:

Meeting with the subcontractor/and or client concerning the emergency procedures in the event a person is injured. Appropriate actions for specific scenarios will be reviewed. These scenarios will be discussed, and responses determined before the sampling event commences. A form of emergency communication (i.e.; Cell phone, Air horn, etc.) between the Project Manager and subcontractor and/or client will be agreed on before the work commences.

A training session (i.e., “safety meeting”) given by the Project Manager or their designee informing all field personnel of emergency procedures, locations of emergency equipment and their use, and proper evacuation procedures.

Ensuring field personnel are aware of the existence of the emergency response HASP and ensuring a copy of the HASP accompanies the field team(s).

Onsite Emergency Response Equipment

Emergency procedures may require specialized equipment to facilitate work rescue, contamination control and reduction or post-emergency cleanup. Emergency response equipment stocked

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Table 9.1 Emergency Equipment and Emergency PPE			
Emergency Equipment	**Specific Type**	**Quantity Stocked**	**Location Stored**
First Aid Kit	General First Aid Kit	1	With H&A personnel
Emergency PPE	**Specific Type**	**Quantity Stocked**	**Location Stored**
Gloves - "Nitrile"	General Nitrile Gloves	2 boxes	With H&A personnel

EVACUATION ALARM
Verbal Communication (Site Personnel are adjacent in work zone)
EVACUATION ROUTES
Will be given a map after site specific training
EVACUATION MUSTER POINT(S)/ SHELTER AREA(S)
Will be given a locations after site specific training
EVACUTION RESPONSE DRILLS
The Site relies on outside emergency responders and a drill is not required.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

Table 9-2 – Emergency Planning

Emergency Type	Notification	Response Action	Evacuation Plan/Route
Chemical Exposure	Report event to SSO immediately	Refer to Safety Data Sheet for required actions	Remove personnel from work zone
Fire - Small	Notify SSO and contact 911	Use fire extinguisher if safe and qualified to do so	Mobilize to *Muster Point*
Fire – Large/Explosion	Notify SSO and contact 911	Evacuate immediately	Mobilize to *Muster Point*
Hazardous Material – Spill/Release	Notify SSO; SSO will contact PM to determine if additional agency notification is	If practicable don PPE and use spill kit and applicable procedures to contain the release	See Evacuation Map for route, move at least 100 ft upwind of spill location
Medical – Bloodborne Pathogen	Notify SSO	If qualified dispose in container or call client or city to notify for further instruction.	None Anticipated
Medical – First Aid	Notify SSO	If qualified perform first aid duties	None Anticipated
Medical – Trauma	If life threatening or transport is required call 911, immediately	Wait at site entrance for ambulance	Noe Anticipated
Security Threat	Notify SSO who will call 911 as warranted	Keep all valuables out of site and work zones delineated.	None Anticipated
Weather – Earthquake/Tsunami's	STOP WORK and evacuate Site upon any earthquake	Turn off equipment and evacuate as soon as is safe to do so	Mobilize to *Shelter Location*
Weather – Lightning Storm	STOP WORK	Work may resume 30 minutes after the last observed lightning.	None Anticipated
Weather – Tornadoes/Hurricanes	Monitor weather conditions STOP WORK and evacuate the site	Evacuate to shelter location or shelter in place immediately	Mobilize to *Shelter Location*
MUSTER POINT Sidewalk along Grand Concourse		*SHELTER LOCATION* Personnel vehicle	
In case of site emergencies, site personnel shall be evacuated per this table and will not participate in emergency response activities. Site emergencies shall be reported to local, state, and federal governmental agencies as required.			

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

10. HASP ACKNOWLEDGEMENT FORM

All Haley & Aldrich employees onsite must sign this form prior to entering the site.

I hereby acknowledge receipt of, and briefing on, this HASP prior to the start of on-site work. I declare that I understand and agree to follow the provisions, processes, and procedures set forth herein at all times while working on this site.

Printed Name	Signature	Date

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

ATTACHMENT A
HASP AMENDMENT FORM

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

HASP AMENDMENT FORM

This form is to be used whenever there is an immediate change in the project scope that will require an amendment to the HASP. For project scope changes associated with "add-on" tasks, the changes must be made in the body of the HASP. Before changes can be made, a review of the potential hazards must be initiated by the Haley & Aldrich Project Manager.

This original form must remain on site with the original HASP. If additional copies of this HASP have been distributed, it is the Project Manager's responsibility to forward a signed copy of this amendment to those who have copies.

Amendment No.

ATTACHMENT B
TRAINING REQUIREMENTS

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

TRAINING REQUIREMENTS

Health and Safety Training Requirements

Personnel will not be permitted to supervise or participate in field activities until they have been trained to a level required by their job function and responsibility. Haley & Aldrich staff members, contractors, subcontractors, and consultants who have the potential to be exposed to contaminated materials or physical hazards must complete the training described in the following sections.

The Haley & Aldrich Project Manager/FSM will be responsible for maintaining and providing to the client/site manager documentation of Haley & Aldrich staff members' compliance with required training as requested. Records shall be maintained per OSHA requirements.

40-Hour Health and Safety Training

The 40-Hour Health and Safety Training course provides instruction on the nature of hazardous waste work, protective measures, proper use of personal protective equipment, recognition of signs and symptoms which might indicate exposure to hazardous substances, and decontamination procedures. It is required for all personnel working on-site, such as equipment operators, general laborers, and supervisors, who may be potentially exposed to hazardous substances, health hazards, or safety hazards consistent with 29 CFR 1910.120.

8-hour Annual Refresher Training

Personnel who complete the 40-hour health and safety training are subsequently required to attend an annual 8-hour refresher course to remain current in their training. When required, site personnel must be able to show proof of completion (i.e., certification) at an 8-hour refresher training course within the past 12 months.

8-Hour Supervisor Training

On-site managers and supervisors directly responsible for, or who supervise staff members engaged in hazardous waste operations, should have eight additional hours of Supervisor training in accordance with 29 CFR 1910.120. Supervisor Training includes, but is not limited to, accident reporting/investigation, regulatory compliance, work practice observations, auditing, and emergency response procedures.

Additional Training for Specific Projects

Haley & Aldrich personnel will ensure their personnel have received additional training on specific instrumentation, equipment, confined space entry, construction hazards, etc., as necessary to perform their duties. This specialized training will be provided to personnel before engaging in the specific work activities including:

- Client specific training or orientation
- Competent person excavations
- Confined space entry (entrant, supervisor, and attendant)
- Heavy equipment including aerial lifts and forklifts
- First aid/ CPR
- Use of fall protection
- Use of nuclear density gauges
- Asbestos awareness

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

ATTACHMENT C
ROLES AND RESPONSIBILITIES

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

SITE ROLES AND RESPONSIBILITIES

Haley & Aldrich Personnel

Field Safety Manager (FSM)

The Haley & Aldrich FSM is a full-time Haley & Aldrich staff member, trained as a safety and health professional, who is responsible for the interpretation and approval of this Safety Plan. Modifications to this Safety Plan cannot be undertaken by the PM or the SSO without the approval of the FSM.

Specific duties of the FSM include:

- Approving and amending the Safety Plan for this project
- Advising the PM and SHSOs on matter relating to health and safety
- Recommending appropriate personal protective equipment (PPE) and air monitoring instrumentation
- Maintaining regular contact with the PM and SSO to evaluate the conditions at the property and new information which might require modifications to the HASP and
- Reviewing and approving JSAs developed for the site-specific hazards.

Project Manager (PM)

The Haley & Aldrich PM is responsible for ensuring that the requirements of this HASP are implemented at that project location. Some of the PM´s specific responsibilities include:

- Assuring that all personnel to whom this HASP applies have received a copy of it;
- Providing the FSM with updated information regarding environmental conditions at the site and the scope of site work;
- Providing adequate authority and resources to the on-site SHSO to allow for the successful implementation of all necessary safety procedures;
- Supporting the decisions made by the SHSO;
- Maintaining regular communications with the SHSO and, if necessary, the FSM;
- Coordinating the activities of all subcontractors and ensuring that they are aware of the pertinent health and safety requirements for this project;
- Providing project scheduling and planning activities; and
- Providing guidance to field personnel in the development of appropriate Job Safety Analysis (JSA) relative to the site conditions and hazard assessment.

Site Health & Safety Officer (SHSO)

The SHSO is responsible for field implementation of this HASP and enforcement of safety rules and regulations. SHSO functions may include some or all of the following:

- Act as Haley & Aldrich´s liaison for health and safety issues with client, staff, subcontractors, and agencies.
- Verify that utility clearance has been performed by Haley & Aldrich subcontractors.
- Oversee day-to-day implementation of the Safety Plan by Haley & Aldrich personnel on site.

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

- Interact with subcontractor project personnel on health and safety matters.
- Verify use of required PPE as outlined in the safety plan.
- Inspect and maintain Haley & Aldrich safety equipment, including calibration of air monitoring instrumentation used by Haley & Aldrich.
- Perform changes to HASP and document in Appendix A of the HASP as needed and notify appropriate persons of changes.
- Investigate and report on-site accidents and incidents involving Haley & Aldrich and its subcontractors.
- Verify that site personnel are familiar with site safety requirements (e.g., the hospital route and emergency contact numbers).
- Report accidents, injuries, and near misses to the Haley & Aldrich PM and FSM as needed.

The SHSO will conduct initial site safety orientations with site personnel (including subcontractors) and conduct toolbox and safety meetings thereafter with Haley & Aldrich employees and Haley & Aldrich subcontractors at regular intervals and in accordance with Haley & Aldrich policy and contractual obligations. The SHSO will track the attendance of site personnel at Haley & Aldrich orientations, toolbox talks, and safety meetings.

Field Personnel

Haley & Aldrich personnel are responsible for following the health and safety procedures specified in this HASP and for performing their work in a safe and responsible manner. Some of the specific responsibilities of the field personnel are as follows:

- Reading the HASP in its entirety prior to the start of on-site work;
- Submitting a completed Safety Plan Acceptance Form and documentation of medical surveillance and training to the SHSO prior to the start of work;
- Attending the pre-entry briefing prior to beginning on-site work;
- Bringing forth any questions or concerns regarding the content of the Safety Plan to the PM or the SHSO prior to the start of work;
- Stopping work when it is not believed it can be performed safely;
- Reporting all accidents, injuries and illnesses, regardless of their severity, to the SHSO;
- Complying with the requirements of this safety plan and the requests of the SHSO; and
- Reviewing the established JSAs for the site-specific hazards on a daily basis and prior to each shift change, if applicable.

Visitors

Authorized visitors (e.g., Client Representatives, Regulators, Haley & Aldrich management staff, etc.) requiring entry to any work location on the site will be briefed by the Site Supervisor on the hazards present at that location. Visitors will be escorted at all times at the work location and will be responsible for compliance with their employer´s health and safety policies. In addition, this safety plan specifies the minimum acceptable qualifications, training and personal protective equipment which are required for entry to any controlled work area; visitors must comply with these

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

requirements at all times. Unauthorized visitors, and visitors not meeting the specified qualifications, will not be permitted within established controlled work areas.

SUBCONTRACTOR PERSONNEL

Subcontractor Site Representative

Each contractor and subcontractor shall designate a Contractor Site Representative. The Contractor Site Representative will interface directly with Insert Staff Name Here, the Subcontractor Site Safety Manager, with regards to all areas that relate to this safety plan and safety performance of work conducted by the contractor and/or subcontractor workforce. Contractor Site Representatives for this site are listed in the Contact Summary Table at the beginning of the Safety Plan.

Subcontractor Site Safety Manager

Each contractor / subcontractor will provide a qualified representative who will act as their Site Safety Manager (Sub-SSM). This person will be responsible for the planning, coordination, and safe execution of subcontractor tasks, including preparation of job hazard analyses (JHA), performing daily safety planning, and coordinating directly with the Haley & Aldrich SHSO for other site safety activities. This person will play a lead role in safety planning for Subcontractor tasks, and in ensuring that all their employees and lower tier subcontractors are in adherence with applicable local, state, and/or federal regulations, and/or industry and project specific safety standards or best management practices.

General contractors / subcontractors are responsible for preparing a site-specific HASP and/or other task specific safety documents (e.g., JHAs), which are, at a minimum, in compliance with local, state, and/or federal other regulations, and/or industry and project specific safety standards or best management practices. The contractor(s)/subcontractor(s) safety documentation will be at least as stringent as the health and safety requirements of the Haley & Aldrich Project specific HASP.

Safety requirements include, but are not limited to: legal requirements, contractual obligations and industry best practices. Contractors/subcontractors will identify a site safety representative during times when contractor/subcontractor personnel are on the Site. All contractor/subcontractor personnel will undergo a field safety orientation conducted by the Haley & Aldrich SHSO and/or PM prior to commencing site work activities. All contractors / subcontractors will participate in Haley & Aldrich site safety meetings and their personnel will be subject to training and monitoring requirements identified in this Safety Plan. If the contractors / subcontractors means and methods deviate from the scope of work described in Section 1 of this Safety Plan, the alternate means and methods must be submitted, reviewed and approved by the Haley & Aldrich SHSO and/or PM prior to the commencement of the work task. Once approved by the Haley & Aldrich SHSO and/or PM, the alternate means and methods submittal will be attached to this Safety Plan as an Addendum.

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

JOB SAFETY ANALYSES

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

338-344 GRAND CONCOURSE REDEVELOPMENT SITE

KEY TASK All Tasks as Below:		
Subtask Category	**Potential Hazards**	**Controls**
GPR Survey	Slips, Trips, and Falls	• Take your time and pay attention to where you are going • Adjust your stride to a pace that is suitable for the walking surface and tasks you are doing • Check the work area to identify hazards – beware of trip hazards such as wet floors, slippery floors, and uneven surfaces or terrain • Establish and utilize a pathway free of slip and trip hazards • Choose a safer walking route • Carry loads you can see over • Keep work areas clean and free of clutter • Communicate hazards to on-site personnel – remove hazards as appropriate
GPR Survey	Poisonous plants	• Wear long-sleeved clothing and slacks to minimize contact with irritant and toxic plants and to protect against insect bites. • Have appropriate first aid for individuals' known allergic reactions on site.
GPR Survey	Vehicle traffic/safety	• Watch out for vehicular traffic in and around work area • Access work area along routes that are the least busy
Drilling	Work site access and controls	• Observe all work site access and controls before entering work area • Use only routes that are designated for personnel • Do not change or alter established work site access or controls

Note: This HASP has been developed for Haley & Aldrich purposes only and is not for use by others.

Drilling	Utility locators and underground hazards	• Observe work from a distance in case of utility strike • Immediately evacuate work area in the event of a utility strike
Drilling	Heavy equipment	• Personal protective equipment, licensed excavator/machine operators • Maintain a safe distance from moving equipment and observe equipment swing radii
Drilling	Noise reduction	• Personal protective equipment, ear plugs or ear muffs
Drilling	Cold stress	• Take breaks indoors, hand warmers
Drilling	Weather-related hazards	• Avoid slippery surfaces as a result of weather • Seek shelter in the event of a lightning storm and stay clear of potential lightning receptors
Drilling	Vehicle traffic/safety	• Same as above
Drilling	Slips, trips, and falls	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Slips, trips, and falls	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Vehicle traffic/safety	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Weather-related hazards	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Cold stress	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Lifting	• Same as above
Soil, Soil Vapor, and Groundwater Sampling	Tool/Equipment Use	• Inspect any tools or equipment before you use them • Ensure that any cords or plugs are not frayed or damaged • Only use tools/equipment for the purpose they are meant to be used – tools/equipment are not toys to be played with • Think of the steps in which you will use the tools/equipment before using them

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

		• Handle all tools/equipment in a safe manner • If unsure how to use a tool/equipment, be sure to receive proper training or instruction prior to using them • Use tools/equipment at a safe pace • Do not force tools/equipment to work

Note: This HASP is developed for Haley & Aldrich purposes only and not for use by others.

A	DER-10 Generic CAMP and Fugitive Dust and Particulate Monitoring

1. Introduction

This Community Air Monitoring Plan (CAMP) has been prepared for the proposed activities to be performed under the Remedial Investigation Work Plan (RIWP) at the 338-344 Grand Concourse Redevelopment Site. The CAMP details measures for protection of the downwind community (i.e., off-site receptors, including residences and businesses) from potential airborne contaminant releases resulting from sampling activities at the Site.

Compliance with this CAMP is required during all work associated with intrusive activities that have the potential to generate airborne particulate matter and volatile organic compounds (VOCs). These activities include drilling and monitoring well installation. This CAMP is specific to the Site and was developed in accordance with the New York State Department of Health Generic Community Air Monitoring Plan and the New York State Department of Environmental Conservation (NYSDEC) DER-10 Technical Guidance for Site Investigation and Remediation. CAMP adjustments may be recommended by NYSDEC/New York State Department of Health (NYSDOH) based on actual Site conditions, local community input, and the location of sensitive receptors.

2. Community Air Monitoring Program

Real-time air monitoring will be conducted in at least two locations during ground-intrusive activities including: 1) at the egress of the ground-intrusive work zone (permanent station); and 2) at a downwind location(s), to be evaluated daily and logistically biased toward nearby sensitive receptors and occupied structures within 20 feet, to prevent potential exposure to the surrounding community (Figure 1).

Continuous monitoring will be performed for all ground-intrusive activities and during the handling of contaminated or potentially contaminated media. Ground-intrusive activities include, but are not limited to drilling and monitoring well installation. Monitoring equipment will be set up to connect to a cloud-based data management system where data will be stored on a real-time basis.

2.1 VOC MONITORING, RESPONSE LEVELS, AND ACTIONS

VOCs will be monitored at CAMP stations at the egress of the ground-intrusive work zone (permanent station) and at a downwind location biased toward nearby sensitive receptors and occupied structures within 20 feet. Upwind concentrations will be measured at the start of each workday and periodically thereafter to establish background conditions. Roaming equipment to assess VOCs will be carried by the field support overseeing implementation of the RIWP. The monitoring work will be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment will be calibrated at least daily or by what is recommended by the equipment specifications, for the contaminant(s) of concern or for an appropriate surrogate. The equipment will be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

- If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities will be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities will resume with continued monitoring.
- If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate the emissions, and monitoring continued. After these steps, work activities will resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.
- If the organic vapor level is above 25 ppm at the perimeter of the work area, activities will be shut down.

All 15-minute readings must be recorded and be available for NYSDEC personnel to review. Instantaneous readings, if any, used for decision purposes will also be recorded.

2.2 PARTICULATE MONITORING, RESPONSE LEVELS AND ACTIONS

Dust particulates will be monitored at CAMP stations at the egress of the ground-intrusive work zone (permanent station) and at a downwind location(s) biased toward nearby sensitive receptors and

occupied structures within 20 feet. Particulate concentrations will be evaluated through particulate monitoring via real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM_{10}). In the event this equipment is implemented, the equipment will be capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level discussed below:

- If the downwind PM_{10} particulate level is 100 micrograms per cubic meter ($\mu g/m^3$) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques will be employed. Work will continue with dust suppression techniques provided that downwind PM_{10} particulate levels do not exceed 150 $\mu g/m^3$ greater than the upwind level and provided that no visible dust is migrating from the work area.
- If, after implementation of dust suppression techniques, downwind PM_{10} particulate levels are greater than 150 $\mu g/m^3$ above the upwind level, work will be stopped and a re-evaluation of activities initiated. Work will resume provided that dust suppression measures and other controls are successful in reducing the downwind PM_{10} particulate concentration to within 150 $\mu g/m^3$ of the upwind level and in preventing visible dust migration.

All 15-minute readings must be recorded and be available for NYSDEC personnel to review. Instantaneous readings, if any, used for decision purposes, will also be recorded. Proactive measures will be taken to control dust particulates, such as use of water sprayers to suppress dust generation and off-Site migration.

2.3 SPECIAL REQUIREMENTS

When work areas are within 20 feet of potentially exposed populations or occupied structures, the continuous monitoring locations for VOCs and particulates must reflect the nearest potentially exposed individuals and the location of ventilation system intakes for nearby structures. The use of engineering controls, such as vapor/dust barriers, temporary negative pressure enclosures, or special ventilation devices should be considered to prevent exposures related to the work activities and to control dust and odors. Consideration should be given to implementing the planned activities when potentially exposed populations are at a minimum, such as during weekends or evening hours in non-residential settings.

- If total VOC concentrations opposite the walls of occupied structures or next to intake vents exceed 1 ppm, monitoring should occur within the occupied structure(s). Background readings in the occupied spaces must be taken prior to commencement of the planned work. Any unusual background readings should be discussed with NYSDOH prior to commencement of the work.
- If total particulate concentrations opposite the walls of occupied structures or next to intake vents exceed 150 $\mu g/m^3$, work activities should be suspended until controls are implemented and are successful in reducing the total particulate concentration to 150 $\mu g/m^3$ or less at the monitoring point.
- Depending upon the nature of contamination and remedial activities, other parameters (e.g., explosivity, oxygen, hydrogen sulfide, and carbon monoxide) may also need to be monitored. Response levels and actions should be pre-determined, as necessary, for each site.

2.4 SENSITIVE RECEPTORS

Below is a list of sensitive receptors within a 0.25-mile radius of the Site and shown on Figure 1.

- Community School for Social Justice – 350 Gerard Avenue, Bronx, New York 10451, listed as a public 9-12 school.
- Family Life Academy Charter School III – 370 Gerard Avenue, Bronx, New York 10451, listed as a public K-12 school.
- Hostos Community College – 500 Grand Concourse, Bronx, New York 10451, listed as a community college.
- NYC Health + Hospitals/Lincoln – 234 East 149th Street, Bronx, New York 10451, listed as full-service medical center and hospital.
- BOOM! Health – 226 East 144th Street, Bronx, New York 10451, listed as a harm reduction center.
- Sunshine Learning Center of Morris Avenue – 253 East 142nd Street, Bronx, New York 10451, listed as child educational center.
- The Urban Assembly Bronx Academy of Letters – 339 Morris Avenue, Bronx, New York 10451, listed as middle and high school.
- Success Academy Charter School Bronx 1 – 1021 Jennings Street, Bronx, New York 10460, listed as a middle school.

3. Reporting

Exceedances of action levels observed during performance of the CAMP will be reported to the NYSDEC and NYSDOH via email and included in the daily report to be submitted to NYSDEC the morning after Site activities are completed, along with actions and responses. Daily reports will include the following information:

- Date
- Personnel
- Wind direction
- Meteorological Data (i.e., temperature, weather)
- Site Map
- CAMP station locations
- Notes regarding any equipment malfunctions
- Notes regarding any mitigation efforts or work stoppage due to CAMP exceedances

4. Data Quality Assurance

To ensure data quality, instrument calibration will be completed as required by the manufacturer and recorded daily. Calibration checks and duplicate readings may be completed as needed to confirm instrument response and accuracy. All instruments will be operated in accordance with manufacturer's specifications, copies of which will be kept on Site.

The on-Site field engineers will review monitoring data throughout the day and evaluate in comparison to the action levels. The project manager will review monitoring data periodically and/or when action levels are triggered.

APPENDIX A
DER-10 Generic CAMP And
Fugitive Dust And Particulate Monitoring

Appendix 1A
New York State Department of Health
Generic Community Air Monitoring Plan

Overview

A Community Air Monitoring Plan (CAMP) requires real-time monitoring for volatile organic compounds (VOCs) and particulates (i.e., dust) at the downwind perimeter of each designated work area when certain activities are in progress at contaminated sites. The CAMP is not intended for use in establishing action levels for worker respiratory protection. Rather, its intent is to provide a measure of protection for the downwind community (i.e., off-site receptors including residences and businesses and on-site workers not directly involved with the subject work activities) from potential airborne contaminant releases as a direct result of investigative and remedial work activities. The action levels specified herein require increased monitoring, corrective actions to abate emissions, and/or work shutdown. Additionally, the CAMP helps to confirm that work activities did not spread contamination off-site through the air.

The generic CAMP presented below will be sufficient to cover many, if not most, sites. Specific requirements should be reviewed for each situation in consultation with NYSDOH to ensure proper applicability. In some cases, a separate site-specific CAMP or supplement may be required. Depending upon the nature of contamination, chemical- specific monitoring with appropriately-sensitive methods may be required. Depending upon the proximity of potentially exposed individuals, more stringent monitoring or response levels than those presented below may be required. Special requirements will be necessary for work within 20 feet of potentially exposed individuals or structures and for indoor work with co-located residences or facilities. These requirements should be determined in consultation with NYSDOH.

Reliance on the CAMP should not preclude simple, common-sense measures to keep VOCs, dust, and odors at a minimum around the work areas.

Community Air Monitoring Plan

Depending upon the nature of known or potential contaminants at each site, real-time air monitoring for VOCs and/or particulate levels at the perimeter of the exclusion zone or work area will be necessary. Most sites will involve VOC and particulate monitoring; sites known to be contaminated with heavy metals alone may only require particulate monitoring. If radiological contamination is a concern, additional monitoring requirements may be necessary per consultation with appropriate DEC/NYSDOH staff.

Continuous monitoring will be required for all ground intrusive activities and during the demolition of contaminated or potentially contaminated structures. Ground intrusive activities include, but are not limited to, soil/waste excavation and handling, test pitting or trenching, and the installation of soil borings or monitoring wells.

Periodic monitoring for VOCs will be required during non-intrusive activities such as the collection of soil and sediment samples or the collection of groundwater samples from existing monitoring wells. “Periodic” monitoring during sample collection might reasonably consist of taking a reading upon arrival at a sample location, monitoring while opening a well cap or

overturning soil, monitoring during well baling/purging, and taking a reading prior to leaving a sample location. In some instances, depending upon the proximity of potentially exposed individuals, continuous monitoring may be required during sampling activities. Examples of such situations include groundwater sampling at wells on the curb of a busy urban street, in the midst of a public park, or adjacent to a school or residence.

VOC Monitoring, Response Levels, and Actions

Volatile organic compounds (VOCs) must be monitored at the downwind perimeter of the immediate work area (i.e., the exclusion zone) on a continuous basis or as otherwise specified. Upwind concentrations should be measured at the start of each workday and periodically thereafter to establish background conditions, particularly if wind direction changes. The monitoring work should be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment should be calibrated at least daily for the contaminant(s) of concern or for an appropriate surrogate. The equipment should be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

1. If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities must be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities can resume with continued monitoring.

2. If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities must be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities can resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.

3. If the organic vapor level is above 25 ppm at the perimeter of the work area, activities must be shutdown.

4. All 15-minute readings must be recorded and be available for State (DEC and NYSDOH) personnel to review. Instantaneous readings, if any, used for decision purposes should also be recorded.

Particulate Monitoring, Response Levels, and Actions

Particulate concentrations should be monitored continuously at the upwind and downwind perimeters of the exclusion zone at temporary particulate monitoring stations. The particulate monitoring should be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The equipment must be equipped with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration should be visually assessed during all work activities.

1. If the downwind PM-10 particulate level is 100 micrograms per cubic meter (mcg/m^3) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques must be employed. Work may continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 mcg/m^3 above the upwind level and provided that no visible dust is migrating from the work area.

2. If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 mcg/m^3 above the upwind level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 mcg/m^3 of the upwind level and in preventing visible dust migration.

3. All readings must be recorded and be available for State (DEC and NYSDOH) and County Health personnel to review.

December 2009

Appendix 1B
Fugitive Dust and Particulate Monitoring

A program for suppressing fugitive dust and particulate matter monitoring at hazardous waste sites is a responsibility on the remedial party performing the work. These procedures must be incorporated into appropriate intrusive work plans. The following fugitive dust suppression and particulate monitoring program should be employed at sites during construction and other intrusive activities which warrant its use:

1. Reasonable fugitive dust suppression techniques must be employed during all site activities which may generate fugitive dust.

2. Particulate monitoring must be employed during the handling of waste or contaminated soil or when activities on site may generate fugitive dust from exposed waste or contaminated soil. Remedial activities may also include the excavation, grading, or placement of clean fill. These control measures should not be considered necessary for these activities.

3. Particulate monitoring must be performed using real-time particulate monitors and shall monitor particulate matter less than ten microns (PM10) with the following minimum performance standards:

(a) Objects to be measured: Dust, mists or aerosols;
(b) Measurement Ranges: 0.001 to 400 mg/m3 (1 to 400,000 :ug/m3);
(c) Precision (2-sigma) at constant temperature: +/- 10 :g/m3 for one second averaging; and +/- 1.5 g/m3 for sixty second averaging;
(d) Accuracy: +/- 5% of reading +/- precision (Referred to gravimetric calibration with SAE fine test dust (mmd= 2 to 3 :m, g= 2.5, as aerosolized);
(e) Resolution: 0.1% of reading or 1g/m3, whichever is larger;
(f) Particle Size Range of Maximum Response: 0.1-10;
(g) Total Number of Data Points in Memory: 10,000;
(h) Logged Data: Each data point with average concentration, time/date and data point number
(i) Run Summary: overall average, maximum concentrations, time/date of maximum, total number of logged points, start time/date, total elapsed time (run duration), STEL concentration and time/date occurrence, averaging (logging) period, calibration factor, and tag number;
(j) Alarm Averaging Time (user selectable): real-time (1-60 seconds) or STEL (15 minutes), alarms required;
(k) Operating Time: 48 hours (fully charged NiCd battery); continuously with charger;
(l) Operating Temperature: -10 to 50^{o} C (14 to 122^{o} F);
(m) Particulate levels will be monitored upwind and immediately downwind at the working site and integrated over a period not to exceed 15 minutes.

4. In order to ensure the validity of the fugitive dust measurements performed, there must be appropriate Quality Assurance/Quality Control (QA/QC). It is the responsibility of the remedial party to adequately supplement QA/QC Plans to include the following critical features: periodic instrument calibration, operator training, daily instrument performance (span) checks, and a record keeping plan.

5. The action level will be established at 150 ug/m3 (15 minutes average). While conservative,

this short-term interval will provide a real-time assessment of on-site air quality to assure both health and safety. If particulate levels are detected in excess of 150 ug/m3, the upwind background level must be confirmed immediately. If the working site particulate measurement is greater than 100 ug/m3 above the background level, additional dust suppression techniques must be implemented to reduce the generation of fugitive dust and corrective action taken to protect site personnel and reduce the potential for contaminant migration. Corrective measures may include increasing the level of personal protection for on-site personnel and implementing additional dust suppression techniques (see paragraph 7). Should the action level of 150 ug/m3 continue to be exceeded work must stop and DER must be notified as provided in the site design or remedial work plan. The notification shall include a description of the control measures implemented to prevent further exceedances.

6. It must be recognized that the generation of dust from waste or contaminated soil that migrates off-site, has the potential for transporting contaminants off-site. There may be situations when dust is being generated and leaving the site and the monitoring equipment does not measure PM10 at or above the action level. Since this situation has the potential to allow for the migration of contaminants off-site, it is unacceptable. While it is not practical to quantify total suspended particulates on a real-time basis, it is appropriate to rely on visual observation. If dust is observed leaving the working site, additional dust suppression techniques must be employed. Activities that have a high dusting potential--such as solidification and treatment involving materials like kiln dust and lime--will require the need for special measures to be considered.

7. The following techniques have been shown to be effective for the controlling of the generation and migration of dust during construction activities:

(a) Applying water on haul roads;
(b) Wetting equipment and excavation faces;
(c) Spraying water on buckets during excavation and dumping;
(d) Hauling materials in properly tarped or watertight containers;
(e) Restricting vehicle speeds to 10 mph;
(f) Covering excavated areas and material after excavation activity ceases; and
(g) Reducing the excavation size and/or number of excavations.

Experience has shown that the chance of exceeding the 150ug/m3 action level is remote when the above-mentioned techniques are used. When techniques involving water application are used, care must be taken not to use excess water, which can result in unacceptably wet conditions. Using atomizing sprays will prevent overly wet conditions, conserve water, and provide an effective means of suppressing the fugitive dust.

8. The evaluation of weather conditions is necessary for proper fugitive dust control. When extreme wind conditions make dust control ineffective, as a last resort remedial actions may need to be suspended. There may be situations that require fugitive dust suppression and particulate monitoring requirements with action levels more stringent than those provided above. Under some circumstances, the contaminant concentration and/or toxicity may require additional monitoring to protect site personnel and the public. Additional integrated sampling and chemical analysis of the dust may also be in order. This must be evaluated when a health and safety plan is developed and when appropriate suppression and monitoring requirements are established for protection of health and the environment.
