CERTIFICATION

I, Paul McMahon, certify that I am currently a Qualified Environmental Professional as defined in 6 New York Codes, Rules, and Regulations (NYCRR) Part 375 and that this Remedial Investigation Work Plan was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation.

DRAFT

Paul McMahon, PE

DRAFT

1.0 INTRODUCTION

This Remedial Investigation Work Plan (RIWP) was prepared on behalf of 8th Regiment Partners LLC (the Applicant) for the Bronx Kingsbridge Armory Site at 1 West Kingsbridge Road (Bronx County Tax Block 3247, Lot 10) in Bronx, New York (the "site"). This RIWP is being submitted concurrently with a New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) Application for the site. The Applicant is proposing the enter the BCP as a Volunteer.

The objective of the Remedial Investigation (RI) is to investigate and characterize the nature and extent of environmental impacts at the site and to provide sufficient information to evaluate remedial alternatives and threats to human health and the environment. This RIWP was developed in accordance with the process and requirements identified in the NYSDEC Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation (May 2010), the New York State Department of Health (NYSDOH) "Guidance for Evaluating Soil Vapor Intrusion in the State of New York, with updates" (October 2006), and the NYSDEC "Guidelines for Sampling and Analysis of Per- and Polyfluoroalkyl Substances (PFAS) Under NYSDEC's Part 375 Remedial Programs" (April 2023).

DRAFT

2.0 SITE BACKGROUND

2.1 Site Description

The approximately 5.6-acre site is identified on the Bronx Borough Tax Map as Block 3247, Lot 10 and is located at 1 West Kingsbridge Road in the Bronx, New York. The site is developed with an approximately 200,000-square-foot, multi-story former military facility (armory building) on the majority of the site. The remainder of the site comprises access roadways, concrete and asphalt-paved areas, and landscaped areas to the north, west and south of the building.

The interior of the armory building consists of a central drill hall at ground level with an arched framing roof that extends about 110 feet above the floor of the drill hall. Beneath the drill hall are two basement levels, identified as the basement and basement mezzanine. These two levels were formerly used by the Army National Guard, with the lower level occupied by offices, a garage and vehicle storage area, a gymnasium, rifle and pistol ranges with earthen floors, and other ancillary rooms. In the southern part of the building, a crawl space is present at the sub-basement level. Above the drill hall there are four, three- to five-story towers in the southern part of the building, which previously contained offices and residential quarters. The site has been largely vacant for thirty years since the City of New York acquired the site in 1996. It has only occasionally been used for events held within the central drill hall.

The site is at the center of the city block bound by West 195th Street to the north, Jerome Avenue and an elevated New York City Transit (NYCT) structure (4 Train) to the east, West Kingsbridge Road to the south, and Reservoir Avenue to the west. A site location map and site plan are included as Figures 1 and 2, respectively.

According to the New York City Zoning Resolution and Map, the site is located within an MX-30 special purpose mixed-use designation which pairs M1-4A and R7-2 zoning districts, which permits residential uses and select commercial and light industrial uses. The site is currently subject to a rezoning action and associated land use approvals to facilitate redevelopment of the Kingsbridge Armory site, which is consistent with the proposed redevelopment plan for the site.

2.2 Surrounding Property Land Use

The site is located in an area that is characterized by residential, commercial, and institutional properties. The following table summarizes adjoining and surrounding property usage:

Direction	Adjoining Properties	Surrounding Area
North	New York Army National Guard buildings (10 West 195th Street)	West 195th Street followed by schools and public institutions
East	Jerome Avenue and the Metropolitan Transportation Authority (MTA) 4 Train followed by mixed-use commercial and residential building (2700 Jerome Avenue) and a commercial and office building (1 East Kingsbridge Road)	Mixed-use commercial and residential buildings
South	West Kingsbridge Road followed by commercial and office buildings (2, 26, 40, and 50 West Kingsbridge Road, and 2650 Davidson Avenue) and open space (1690 Reservoir Avenue)	Residential, commercial, and institutional buildings
West	Reservoir Avenue followed by multi-family and one-family residential buildings (2745 and 2727 Reservoir Avenue), mixed-use commercial and residential buildings (2691 Reservoir Avenue and 2724 University Avenue), Fordham Manor Church (2703 Reservoir Avenue), and an auto repair shop, Armory Auto Parts & Repair, Inc. (2717 Reservoir Avenue)	Mixed-use commercial and residential, and institutional buildings

Major infrastructure (storm drains, sewers, and underground utility lines) exists within sidewalks, streets, and properties surrounding the site. The nearest ecological receptor is the Harlem River, located approximately 0.59 miles west of the site. Sensitive receptors within ½-mile of the site include the following:

Name (Approximate distance from Site)	Address
P.S. 340 (approximately 0.03 miles northwest)	25 West 195th Street, Bronx, NY 10468
KIPP Bronx Charter School II ("Inquire Elementary School") (approximately 0.1 miles east)	2720 Jerome Avenue, Bronx, NY 10468
P.S. 86 The Kingsbridge Heights School (approximately 0.2 miles northwest)	2756 Reservoir Avenue, Bronx, NY 10468
Discovery High School (approximately 0.2 miles northwest)	2780 Reservoir Avenue, Bronx, NY 10468
High School for Teaching and the Professions (approximately 0.2 miles northwest)	2780 Reservoir Avenue, Bronx, NY 10468
Kingsbridge International High School (approximately 0.2 miles northwest)	2780 Reservoir Avenue, Bronx, NY 10468
Gods Angels Daycare Inc. (approximately 0.2 miles southwest)	2776 Parkview Terrace, Apt. 1A, Bronx, NY 10468
James J. Peters Department of Veterans Affairs Medical Center (approximately 0.2 miles west)	130 West Kingsbridge Road, Bronx, NY 10468

Name (Approximate distance from Site)	Address
The Plaza Rehabilitation and Nursing Center (approximately 0.2 miles west)	100 West Kingsbridge Road, Bronx, NY 10468
The New Jewish Home University Avenue Assisted Living (approximately 0.3 miles south)	2553 University Avenue, Bronx, NY 10468
D'Jesus Daycare and 3K Program (approximately 0.3 miles northeast)	50 E 191st Street, Bronx, NY 10468
Paradise Group Family Daycare (approximately 0.3 miles northwest)	2850 Webb Avenue, Bronx, NY 10468
Santana Soriano, Arabel (approximately 0.4 miles southwest)	200 West Kingsbridge Road, Apt. 3L, Bronx, NY 10463
Lehman College, City University of New York (approximately 0.3 miles north)	250 Bedford Park Boulevard West, Bronx, NY 10468
SUNY Bronx Educational Opportunity Center (approximately 0.3 miles southeast)	2467 Jerome Avenue, Bronx, NY 10468
Little Bright Minds NYC Group Family Daycare (approximately 0.3 miles northwest)	2809 Clafin Avenue, Bronx, NY 10468
Start of A New Home Daycare Corp. (approximately 0.3 miles northwest)	2849 Webb Avenue, Apt. 3B, Bronx, NY 10468
Tiny Blessings Daycare (approximately 0.3 miles east)	2710 Morris Avenue / 2600 Creston Avenue, Bronx, NY 10468
P.S. 246 Poe Center (approximately 0.4 miles southeast)	2641 Grand Concourse, Bronx, NY 10468
Tolentine Zeiser Community Life Center, Inc. (approximately 0.4 miles west)	2340 Andrews Avenue, Bronx, NY 10468
Lali's Daycare (approximately 0.4 miles northeast)	2800 Creston Avenue, Apt. 1A, Bronx, NY 10468
Kingsbridge Heights Community Center / NYCEEC (approximately 0.5 miles northwest)	3101 Kingsbridge Terrace, Bronx, NY 10463
Early Learning Family Group Daycare (approximately 0.6 miles northeast)	315 E 196th Street, Apt. 2H, Bronx, NY 10458
Blessing from Heaven Daycare Corp. (approximately 0.6 miles east)	2558 Grand Concourse, Apt. 2C, Bronx, NY 10458
The New School for Leadership and the Arts (approximately 0.8 miles northwest)	120 231st Street, Bronx, NY 10463

2.3 Proposed Redevelopment Plan

Proposed redevelopment plans are in progress but are expected to include the renovation of the on-site armory building into a multi-use commercial building including an events venue,

entertainment and arcade area, museum, cultural center, community space, light manufacturing incubators, space for the National Guard, and parking and loading areas.

2.4 Site Physical Conditions

2.4.1 Topography

Based upon a draft topographic, boundary, and utility survey, prepared by Langan, dated July 10, 2026, the site is at an elevation ranging from approximately elevation (el) 130 to 143 feet[1]. The highest elevations occur along the western and southwestern portions of the site adjacent to Reservoir Avenue (approximately el 142 to 143 feet), while the lowest elevations are located along the eastern portions of the site (approximately el 130 to 131). The topography on site slopes downward from west to east.

2.4.2 Geology

Based on previous geotechnical and environmental reports, the site is underlain by non-native fill, consisting of coarse- to fine-grained sand with silt, gravel, brick, and rock, to depths ranging from about 6 to 25 feet below grade surface (bgs). The non-native fill is underlain by silty sand, which varies in thickness from about 3 to 37 feet. Decomposed rock and bedrock consisting of grey mica gneiss was encountered beneath the silty sand at depths between about 9 to 58 feet bgs.

Based on review of the USGS Bedrock and Engineering Geologic Maps of Bronx County and Parts of New York and Queens Counties, New York, by Charles A. Baskerville (1992), the site is underlain by quartz, plagioclase, and biotite and is part of the Fordham Gneiss geologic unit.

2.4.3 Hydrogeology

Groundwater flow is typically hydraulically influenced, as shallow groundwater tends to originate in areas of topographic highs and flow toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeologic network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetative cover, and extent of impervious cover. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks.

Based on previous environmental and geotechnical reports for the site, groundwater was encountered at the site at depths ranging from about 9 to 30 feet bgs throughout the site and is inferred to flow to the southwest. According to the current Federal Emergency Management

[1] All elevations are in feet and referenced to North American Vertical Datum of 1988 (NAVD88).

Agency (FEMA) Flood Insurance Rate Map (FIRM) dated September 5, 2007 (Map No. 3604970082F), the site is located outside of the 0.2% annual chance floodplain.

2.5 Site Environmental History

Previous reports for the site include a 2000 Environmental Survey Report (prepared by ATC), a 2006 Phase I Environmental Site Assessment (ESA) (prepared by M&E), a 2007 Phase II ESA (prepared by TRC Environmental Corporation), and a 2008 Phase II ESI, 2008 Geotechnical Investigation, 2008 Asbestos Investigation Report, 2009 Supplemental Groundwater Investigation, 2013 Phase II ESI, 2019 Limited Hazardous Building Materials Survey Report, and May 2026 Phase I ESA prepared by Langan. Information relevant to the site is summarized below.

Phase I ESAs

A Phase I ESA was prepared by M&E for the site and the northern adjoining property in September 2006. At the time of site reconnaissance, the armory building was vacant. The September 2006 Phase I ESA identified two potential recognized environmental conditions (RECs) and one business environmental risk (BER). The RECs were associated with: 1) historical site operations; and 2) deteriorating 55-gallon drums in a vehicle storage area. The BER was related to the documented presence of asbestos-containing materials and lead-based paint at the site, identified in a previous Environmental Survey Report prepared by ET Environmental in September 2000.

The 2026 Phase I ESA prepared by Langan identified three RECs, one de minimis condition, and four BERs, as summarized below.

The following RECs were identified: 1) historical operations and documented contamination at the site; 2) aboveground storage tanks (ASTs) observed at the site during the site reconnaissance; and 3) historical use of adjoining properties including automotive repair shops at an eastern adjoining property (2704 Jerome Avenue) and western adjoining property (2717 Reservoir Avenue), a gasoline station at the western adjoining property (2717 Reservoir Avenue), and dry cleaners at a southern adjoining property (40 West Kingsbridge Road) and western adjoining property (2691 Reservoir Avenue).

During the site reconnaissance, areas of localized de minimis staining were observed on the concrete slab throughout the vehicle storage area in the northern part of the armory building. The concrete slab appeared to be in good condition and the staining did not extend across any cracks or breaks within the concrete, or across floor drains within the building.

The following BERs were identified: 1) E-Designation at the site; 2) drums observed at the site during the renaissance; 3) monitoring wells observed at the site during the reconnaissance; and

4) asbestos-containing materials (ACM), lead-based paint (LBP), and hazardous building materials previously identified at the site.

Asbestos-Containing Materials and Hazardous Building Materials Surveys

ACM and hazardous building materials surveys were conducted at the site in 2000, 2008, and 2019. Based on previous reports for the surveys conducted, ACM, assumed ACM, LCP, and universal/hazardous waste articles are identified within the site building.

ACM, assumed ACM and LCP were identified throughout most of the interior of the armory building. Universal and hazardous waste articles identified during the surveys included fluorescent light ballasts, fluorescent light bulbs, MEC thermostat, high intensity discharge (HID), mercury containing equipment, batteries, and miscellaneous chemicals. The presence of ACM, LCP, and hazardous building materials is considered a BER.

The 2000 environmental survey of the building also identified four underground storage tanks (USTs) based on the observations of fill ports and vent pipes throughout the site; one in the western parking area, two USTs associated with the maintenance garage, and one UST associated with the heating plant of the National Guard office and garage. The survey also identified seven additional 275-gallon ASTs in the basement southeast hallway opposite the shooting ranges. The contents of these ASTs were unknown, with the tanks reportedly not included in the Petroleum Bulk Storage (PBS) listing for the property.

Previous Environmental Site Assessments

Investigations have been conducted at the site between 2007 and 2013 and included geophysical surveys, advancement of soil borings and test pits, the installation of groundwater monitoring wells and soil vapor points, and collection of soil, groundwater, and soil vapor samples throughout the site and the northern adjoining property. Results observed within the site boundaries are summarized below.

Geophysical surveys at the site identified an abandoned fill port and vent pipe along the western exterior of the armory building and a 30-foot-long by 30-foot-wide anomaly indicative of a potential UST along the western exterior of the armory building in 2000.

Non-native fill, primarily consisting of coarse- to fine-grained sand with silt, gravel, brick, concrete and weathered rock, was observed in soil borings and test pits to depths ranging from about 6 to 20 feet bgs. The fill layer was underlain by silty sands, followed by weathered rock and bedrock. Groundwater was encountered at depths between about 9 and 30 feet bgs.

Soil samples were collected from surface grade to depths up to 34 feet bgs. Analytical results from the previous soil samples are summarized below.

- Two volatile organic compounds (VOCs), acetone and methylene chloride, were detected in soil samples at concentrations above the NYSDEC Part 375 Protection of Groundwater (PGW) Soil Cleanup Objectives (SCOs) in soil samples.

- Eight semivolatile organic compounds (SVOCs), including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and phenanthrene, were detected in soil samples at concentrations above the PGW and/or Restricted Use Commercial (RUC) SCOs.

- Two metals, barium and total chromium were detected in soil samples at concentrations above the PGW and RUC SCOs.

- Total lead was detected in soil samples at concentrations above the PGW and RUC SCOs in samples collected within the former rifle and pistol ranges in the armory building.

- Soil samples from within the rifle and pistol ranges in the armory building were also analyzed for the Toxicity Characteristic Leaching Procedure (TCLP) for lead. These samples identified lead at hazardous concentrations in soil at a maximum of 1,900 milligrams per liter (mg/L).

Analytical results from the previous groundwater samples are summarized below.

- Six VOCs, including 1,2,4-trimethylbenzene, benzene, ethylbenzene, isopropylbenzene, methylene chloride, and n-propylbenzene, were detected in groundwater samples at concentrations exceeding the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1. Ambient Water Quality Standards (AWQS) and Guidance Values (collectively referred to as the NYSDEC SGVs).

- Three SVOCs, hexachlorobutadiene, naphthalene, and phenol, were detected in groundwater samples at concentrations above the NYSDEC SGVs.

- Three dissolved metals, including magnesium, manganese, and sodium, were detected at concentrations above the NYSDEC SGVs in groundwater samples.

Analytical results from the previous soil vapor samples are summarized below.

- Petroleum-related VOCs and chlorinated VOCs (CVOCs), including acetone, methylene chloride, n-heptane, n-hexane, tetrachloroethene (PCE), toluene, and trichloroethene (TCE), were detected in soil vapor samples.

- One VOC, TCE, was detected in one soil vapor sample at a concentration of 400 micrograms per cubic meter (µg/m^3), above the concentration for which mitigation is recommended when compared to the NYSDOH Decision Matrices.

2.6 Areas of Concern

The following areas of concern (AOC) were identified during previous investigations and will be further investigated during the RI. AOCs are shown on Figure 4.

AOC 1: SVOCs and Metal Impacts in Non-Native Fill

Non-native fill material was observed below the surface cover to depths ranging from 6 to 25 feet bgs throughout the site during previous environmental and geotechnical investigations. SVOCs, including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene, and phenanthrene, and metals, including barium, total chromium, copper, iron, magnesium, nickel, zinc, and lead, were detected at concentrations above their respective PGW and/or RUC SCOs in fill samples.

AOC 2: Hazardous Lead-Impacted Soil in Former Rifle and Pistol Ranges

Hazardous concentrations of lead (TCLP lead concentrations ranging from 5.1 milligrams per liter [mg/L] to 1,900 mg/L) were identified in multiple soil samples collected from 0 to 2.5 feet bgs in the vicinity of the former rifle and pistol range areas. The extent of hazardous lead concentrations has not been delineated.

AOC 3: Petroleum-Related VOCs in Groundwater and Soil Vapor

Petroleum-related VOCs including 1,2,4-trimethylbenzene, benzene, ethylbenzene, isopropylbenzene, and n-propylbenzene, were detected in groundwater samples collected from the northern and central parts of the site at concentrations exceeding the NYSDEC SGVs. Petroleum-related VOCs, including n-heptane, n-hexane, and toluene, were detected in soil vapor samples collected from the northern and central parts of the site.

AOC 4: Chlorinated Volatile Organic Compounds (CVOCs) in Soil Vapor

The CVOC, trichloroethene (TCE), was detected in one soil vapor sample (SV-4) collected in the central part of the site at a concentration of 400 µg/m^3, for which mitigation is recommended when compared to the NYSDOH Decision Matrices.

3.0 SCOPE OF WORK

The objective of the investigation summarized in this RIWP is to characterize the nature and extent of environmental impacts at and emanating from the site per Environmental Conservation Law (ECL) Article 27, Title 14 (Brownfield Cleanup Program) and DER-10. The rationale for each sampling location in relation to the AOCs and analytical parameters for each proposed sample are provided in Table 1 and proposed sample locations are shown on Figures 5A, 5B, 5C, and 5D. Hazardous building materials abatement and/or waste removal is anticipated to be required to facilitate the remedial investigation in portions of the building, including former locker rooms, storage areas, and other ancillary rooms throughout the basement and sub-basement, as the presence of these materials in current friable form pose an immediate environmental exposure risk to building occupants. The field tasks are discussed in more detail in the following sections.

<u>Geophysical Survey</u>

- Completion of a geophysical survey in all accessible areas of the site to clear sample locations and identify potential subsurface utilities and structures, including USTs. Sample locations may be relocated as necessary, based on the findings of the geophysical survey and other available utility information.

<u>Soil Boring Advancement and Sampling</u>

- Advancement of 25 soil borings throughout the site to about 35 feet below sidewalk grade (about 23 feet below basement grade) with a track-mounted Geoprobe and/or Sonic drill rig at soil boring locations. Soil borings to be converted to groundwater monitoring wells will be advanced to at least 5 feet below the observed groundwater interface.
- Collection of up to three samples from each of the 25 soil borings (plus quality assurance/quality control [QA/QC] samples) for laboratory analysis. Samples for laboratory analysis will be collected from within non-native fill, terminus of fill, and at the groundwater interface. If petroleum-like impacts are observed, additional samples may be collected.
- Advancement of up to 51 delineation soil borings positioned throughout the former rifle and pistol ranges in the basement of the armory building to attempt vertical and horizontal delineation of lead hazardous soil.
- Collection of up to four samples from each of the soil boring locations for vertical delineation of hazardous lead-impacted soil and laboratory analysis. The samples will be collected from the 0 to 1-foot, 1- to 2-foot, 2- to 3-foot, and 3- to 4-foot intervals.

Monitoring Well Installation and Sampling

- Installation of 10 permanent groundwater monitoring wells.
- Development of groundwater monitoring wells.
- Collection of one groundwater sample from each monitoring well (plus quality QA/QC samples) for laboratory analysis.
- Surveying and gauging the monitoring wells to measure groundwater elevation and evaluate flow direction.

Soil Vapor Sampling

- Installation of four soil vapor points to about 5 feet bgs or 2 feet above groundwater (whichever is shallower) in the exterior parts of the site.
- Installation of 13 sub-slab vapor points below the basement level.
- Collection of 6 indoor air samples co-located with the sub-slab vapor point locations.
- Collection of one outdoor ambient air sample.

Modifications to this scope of work may be required: 1) due to site equipment or access restrictions; 2) if contamination is observed and additional analytical data is warranted; and 3) to adequately characterize and delineate subsurface impacts in compliance with the applicable regulations and investigation guidance documents (e.g., DER-10). NYSDEC and NYSDOH will be contacted to obtain approval for these modifications. All modifications will be reflected in the Remedial Investigation Report (RIR).

The field investigation will be completed in accordance with the procedures specified in Langan's Health and Safety Plan (HASP), Community Air Monitoring Plan (CAMP), and Quality Assurance Project Plan (QAPP) provided in Appendices B, C, and D respectively. A CAMP will be implemented during this investigation (see Section 3.6.2 and Section 8 of the HASP).

Names, contact information, and roles of the principal personnel who will participate in the investigation are listed below. Résumés for each Langan employee are provided in the QAPP (Appendix D).

3.1. Geophysical Survey

A geophysical contractor will conduct a survey in accessible areas of the site to clear boring locations and identify potential subsurface utilities and structures, including USTs, prior to commencing subsurface work. The geophysical survey may be completed using a range of geophysical instruments, including electromagnetic and utility line locator instruments, and ground-penetrating radar. The results of the survey may require relocation of borings.

3.2 Soil Investigation

3.2.1 Soil Sampling and Analysis

An environmental drilling subcontractor will advance 25 soil borings throughout the site to about 35 feet bgs (about 23 feet below basement grade) with a track-mounted Geoprobe and/or Sonic drill rig. Additionally, up to 51 delineation soil borings will be advanced to about 4 feet below basement grade throughout the former rifle and pistol ranges for vertical and horizontal delineation.

Proposed soil boring locations are shown on Figures 5A and 5B, and a summary of the proposed laboratory analyses for each sample is included as Table 1. The following table indicates which borings are associated with each AOC and the rationale for each boring.

AOC	Associated Soil Boring(s)	Rationale
AOC 1	SB01 through SB25	Investigate non-native fill/soil quality

AOC	Associated Soil Boring(s)	Rationale
AOC 2	LB01 through LB42 and step outs to the north, east, south, and west	Delineate hazardous lead impacts in the former rifle and pistol ranges observed during the 2007 and 2013 investigations
AOC 3	SB01, SB02, SB03, SB04, SB05, SB06, SB07, SB08, SB09, SB11, SB16, SB17, SB18, SB19, SB20, SB22, SB23	Investigate petroleum-related VOCs
AOC 4	SB22	Investigate CVOCs

A Langan engineer, geologist, or scientist will document the work, screen the soil samples for environmental impacts, and collect environmental samples for laboratory analyses under the direct supervision of a QEP. Soil will be screened continuously to the boring termination depth for total VOCs concentration using a PID equipped with a 10.6 electron volt (eV) bulb, and for visual and olfactory indications of environmental impacts (e.g., staining, odor). Soil descriptions will be recorded in boring logs.

Up to three samples will be collected for each of the 25 soil borings, plus QA/QC samples, for laboratory analysis from the following depth intervals:

- Shallow fill/soil from within the top two feet of recovery
- Terminus of fill or at the groundwater interface (whichever is shallower).
- Additional samples may be collected as follows:
    - Soil that exhibits evidence of a chemical or petroleum release (if observed); and
    - Clean interval below observed impacts (if observed);

Up to four samples will be collected from each of the 63 delineation borings from the 0 to 1-foot, 1- to 2-foot, 2- to 3-foot, and 3- to 4-foot depth intervals. Samples will be analyzed sequentially, with the shallowest and those collected nearest to the original borings exhibiting characteristics of hazardous lead analyzed first. If sample results indicate a hazardous lead concentration, the next corresponding step-out and/or depth sample will be analyzed.

Non-disposable, down-hole drilling equipment and sampling apparatus will be decontaminated between locations with Alconox® (or similar) and water. Water used for decontamination and rinsate will be containerized into United Nations/Department of Transportation (UN/DOT)-

approved 55-gallon drums, labeled, and staged for off-site disposal. Following sampling, each soil boring will be backfilled with soil cuttings that are not grossly impacted and/or clean sand.

The samples will be collected in laboratory-supplied containers and will be sealed, labeled, and placed in an ice-chilled cooler (to attempt to maintain a temperature of about 4°C) for delivery to a NYSDOH Environmental Laboratory Approval Program (ELAP)-certified laboratory. Soil samples will be analyzed for one or more of the following parameters:

- Part 375 List and Target Compound List (TCL) VOCs (United States Environmental Protection Agency [USEPA] Method 8260C);
- Part 375 List and TCL SVOCs, including 1,4-dioxane (USEPA Method 8270D and/or 8270 SIM);
- Part 375 List polychlorinated biphenyls (PCBs) (USEPA Method 8082A);
- Part 375 List and TCL Pesticides (USEPA Method 8081B);
- Part 375 List and TCL Herbicides (USEPA Method 8151A);
- Target Analyte List (TAL)/Part 375 List metals, including hexavalent and trivalent chromium and total cyanide (USEPA Methods 6010D, 7471B, 7196A, and 9010C/9012B, respectively);
- NYSDEC List PFAS (USEPA Method 1633A); and
- Total and TCLP lead (delineation samples only)

QA/QC procedures to be followed are described in the QAPP in Appendix D. Proposed soil samples and rationale are summarized in Table 1.

3.3 Groundwater Investigation

3.3.1 Monitoring Well Installation

Ten (10) of the soil borings will be converted into groundwater monitoring wells. Figure 5C shows proposed monitoring well locations providing general coverage across the site, subject to revision pending soil boring findings (e.g., petroleum-like impacts). Monitoring wells will be installed in accordance with NYSDEC guidance, with a nominal 2-inch inside diameter well installed within a minimum 6-inch diameter borehole to provide a minimum 2-inch annular space around the well casing.

Following installation, the monitoring wells will be developed using a surge block across the well screen to agitate and remove fines. The surge block will be moved within the well screen in 2- to 3-foot increments for approximately 2 minutes per increment. After surging, the well will be

purged via pumping until the water becomes clear (having turbidity less than 50 Nephelometric Turbidity Units [NTU]). The wells will then be allowed to sit for a minimum of one week prior to collecting groundwater samples. Prior to development, the wells will be gauged for depth to water and light non-aqueous phase liquids (LNAPL).

3.3.2 Monitoring Well Survey

The elevation of the groundwater monitoring wells (top of casing elevations) and horizontal positions will be surveyed. This data will be used with synoptic groundwater well gauging data to prepare a groundwater contour map to evaluate the direction of groundwater flow. Vertical control will be established by surveying relative to the North American Vertical Datum of 1988 (NAVD88), and horizontal positions will be surveyed relative to North American Datum of 1983 (NAD83) by a NYS-licensed land surveyor. Elevations of the top of monitoring well casings and protective well casings will be surveyed to the nearest 0.01 foot.

3.3.3 Groundwater Sampling and Analysis

At least one week after well development, one groundwater sample will be collected from each monitoring well. Prior to groundwater sampling, a complete round of synoptic water level measurements will be collected using an electronic oil-water interface probe, and each monitoring well will be purged. Purging will consist of pumping, at a minimum, the stabilized drawdown volume plus the pump's tubing volume, and waiting until the physical and chemical parameters (e.g., temperature, dissolved oxygen, oxygen reduction potential, turbidity) stabilize within the ranges specified in the USEPA's Low Stress Purging and Sampling Procedure for the Collection of Groundwater Samples From Monitoring Wells, dated July 30, 1996, and 4th revision September 19, 2017, unless otherwise specified by the Langan project manager. Samples will be collected with a peristaltic pump and dedicated polyethylene tubing. Development and purge water will be containerized for off-site disposal.

The groundwater samples will be collected in laboratory-supplied containers and will be sealed, labeled, and placed in an ice-chilled cooler (to maintain a temperature of about 4°C) for delivery to the laboratory. The samples will be analyzed for the following parameters:

- TCL VOCs (USEPA 8260C)
- TCL SVOCs (USEPA 8270D)
- PCBs (USEPA 8082A)
- Part 375 List and TCL pesticides (USEPA 8081B)
- Part 375 List and TCL herbicides (USEPA 8151A)

- Filtered and unfiltered metals (including hexavalent and trivalent chromium, dissolved-phase only) (USEPA Methods 6020B, 7470A, 7196A, and 9010C/9012B, respectively)
- NYSDEC List PFAS (USEPA method 1633A)
- 1,4-dioxane (USEPA Method 8270 SIM)

QA/QC procedures to be followed are described in the QAPP in Appendix D. Proposed groundwater samples and rationale are summarized in Table 2.

3.4 Soil Vapor Investigation

3.4.1 Soil Vapor Sampling and Analysis

A soil vapor intrusion evaluation will be completed in accordance with the Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH October 2006, with updates). This evaluation will include sub-slab soil vapor samples, sub-surface soil vapor samples, indoor air samples, and an outdoor ambient air sample, for which proposed locations are shown on Figure 5D.

Prior to collecting samples, an Indoor Air Quality Questionnaire and Building Inventory from (Appendix B in the NYSDOH 2006) will be completed to identify potential sources of interference. Products will be removed/isolated, or samples will be relocated as necessary in an effort to avoid interference from products stored within the building.

Four temporary soil vapor implants will be set at outdoor locations about 5 feet bgs or 2 feet above groundwater, whichever is shallower, with direct push or sonic technology. Clean No. 2 sand will be placed in the annulus around the implant and tubing and the surface sealed with hydrated bentonite. Thirteen (13) temporary sub-slab soil vapor samples will be installed immediately below the bottom of the basement slab using a hammer drill. Each sub-slab soil vapor location will consist of dedicated polyethylene tubing and sealed at grade with hydrated bentonite.

Six of the 13 sub-slab samples will be paired with co-located indoor air samples. Indoor air samples will be collected about 3 feet above the floor to be representative of the breathing zone. An outdoor ambient air sample will also be collected from about 3 feet above the ground.

Prior to vapor sampling, a tracer gas will be used in accordance with NYSDOH protocols to serve as a QA/QC device to verify the integrity of bentonite seals on sub-slab and sub-surface soil vapor samples. A container (box, plastic pail, etc.) will serve to keep the tracer gas in contact with the probe during testing. A portable monitoring device will be used to analyze a sample of soil vapor

for the tracer gas prior to sampling. If the tracer sample results show a significant presence of the tracer, the probe seals will be adjusted to prevent infiltration.

Prior to sampling, a minimum of three tubing volumes will be purged from each sub-slab sample location and soil vapor point. Soil vapor, sub-slab, indoor, and ambient air samples will be collected into individually certified clean 2.7-liter Summa® canisters with flow controllers calibrated for a 8-hour sample interval and analyzed for VOCs using USEPA Method TO-15. Flow rate for both purging and sampling will not exceed 0.2 L/min. At the conclusion of the sampling round, tracer monitoring will be performed a second time to confirm the integrity of the probe seals.

A sample log sheet will be maintained summarizing sample identification, date and time of sample collection, sampling depth, identity of samplers, sampling methods and devices, soil vapor purge volumes, volume of the soil vapor extracted, vacuum of canisters before and after the samples are collected, apparent moisture content of the sampling zone, and chain of custody protocols. Proposed soil vapor sample locations and rationale are summarized in Table 3.

3.5 Data Management and Validation

Laboratory analyses of soil, groundwater, soil vapor, and air samples will be conducted by a NYSDOH ELAP-approved laboratory in accordance with USEPA SW-846 methods and presented in accordance with NYSDEC Analytical Services Protocol (ASP) Category B deliverable format. Environmental data will be reported electronically using the database software application Environmental Quality Information System (EQuIS) as part of NYSDEC's Environmental Information Management System (EIMS).

QA/QC procedures required by the NYSDEC ASP and SW-846 methods, including initial and continuing instrument calibrations, standard compound spikes, surrogate compound spikes, and analysis of other samples (blanks, laboratory control samples, and matrix spikes/matrix spike duplicates), will be followed. The laboratory will provide sample bottles, which will be pre-cleaned and preserved in accordance with the SW-846 methods. Where there are differences in the SW-846 and NYSDEC ASP requirements, the NYSDEC ASP shall take precedence.

Data validation will be performed in accordance with the USEPA validation guidelines for organic and inorganic data review. Validation will include the following:

- Verification of QC sample results (both qualitative and quantitative)
- Verification of sample results (both positive hits and non-detects)
- Preparation of Data Usability Summary Reports (DUSR)

The DUSRs will be prepared and reviewed by the Program Quality Assurance Monitor (PQAM). The DUSRs will present the results of data validation, including a summary assessment of laboratory data packages, sample preservation and COC procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method. A detailed assessment of each sample delivery group (SDG) will follow. Additional details on the DUSRs are provided in the QAPP in Appendix D.

3.6 Management of Investigation-Derived Waste

Soil cuttings will be returned to the borehole unless:

- Free product, soil that is noticeably stained or odorous or with PID response greater than background is present in the cuttings;
- Backfilling the borehole with cuttings will create a significant path for vertical movement of contaminants. Soil additives (bentonite) may be added to the cuttings to reduce permeability; or
- The soil cannot fit into the borehole.

Boreholes requiring disposal of drill cuttings will be filled with hydrated bentonite chips or clean sand and capped with asphalt or concrete. Excess investigation-derived waste (IDW), including soil cuttings, purged groundwater, and decontamination fluids, will be containerized in properly-labeled and sealed UN/DOT-approved 55-gallon drums and staged for future waste characterization and off-site disposal at a facility permitted to accept the waste. The drums will be staged in an area on-site, pending receipt of laboratory data and off-site disposal to an appropriate facility. Management of IDW will comply with NYSDEC DER-10 3.3(e).

3.7 Air Monitoring

Air monitoring will be conducted for site workers and the community. Air monitoring results will be recorded in the field book during the investigation activities, downloaded from field instruments and summarized in daily reports.

3.7.1 Worker Air Monitoring

Air monitoring of the breathing zone will be performed periodically during drilling and sampling activities to document health and safety protection for the work team. Langan will monitor VOCs with a PID in accordance with the HASP (Appendix B). If air monitoring during intrusive operations identifies the presence of VOCs, the field engineer will follow the guidelines outlined in the HASP regarding action levels, permissible exposure, engineering controls, and personal protective equipment. If the VOC action level is exceeded, work will cease and the work location will be evacuated. Monitoring will continue until the levels drops to permissible limits, at which point, work will resume with continued monitoring. If high levels persist, field activities will be halted

and the work relocated to another area. If dust emissions are observed, work will stop and dust suppression measures (i.e., water spray) will be implemented.

3.7.2 Community Air Monitoring Plan

In addition to air monitoring in the worker breathing zone, community air monitoring will be performed in compliance with the NYSDOH Generic CAMP (provided as Appendix C) during ground intrusive work and soil handling. CAMP deployment will comply with NYSDEC DER-10 Appendix 1A and Appendix 1B.

CAMP will consist of continuous monitoring for VOCs and dust emissions during ground-intrusive activities (i.e., soil boring and monitoring well installation). Two units will be deployed in the upwind and downwind directions. The locations of these CAMP stations will be determined each day in the field based on the prevailing wind direction. Upwind concentrations will be measured at the start of each workday, and periodically thereafter, to establish background concentrations. VOCs and dust emissions will be monitored at the downwind perimeter of the work zone, which will be established at a point on the site where the general public or site employees may be present. VOC Monitoring will be conducted with a PID equipped with a 10.6 eV lamp. Dust emissions will be monitored using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM10) and capable of averaging a period of 15 minutes (or less) for comparison to the airborne particulate action level (e.g., DustTrak). If dust emissions are observed, work will stop and dust suppression measures will be used. The results will be presented in the daily reports (see DER-10 for details).

3.8 Qualitative Human Health Exposure Assessment

A Qualitative Human Health Exposure Assessment will be conducted in accordance with Appendix 3B of the NYSDEC DER-10, Technical Guidance for Site Investigation and Remediation. The assessment will be submitted in the RIR.

3.9 Fish and Wildlife Resources Impact Analysis

Although it is not anticipated, a Fish and Wildlife Resources Impact Analysis (FWRIA) will be conducted, if necessary, in accordance with Section 3.10 and Appendix 3C of the NYSDEC DER-10, Technical Guidance for Site Investigation and Remediation. The assessment will be submitted in the RIR.

4.0 REPORTING

4.1 Daily Field Reports

Daily reports will be prepared and submitted to the NYSDEC project manager by the end of each day following the reporting period and will include:

- Progress updates
- Photographic documentation
- Identification of samples collected
- Locations and references to a site map for completed activities
- A summary of any and all community complaints with relevant details, including contact information
- A summary of CAMP findings, including elevated concentrations and response actions, if any
- An explanation of notable site conditions
- A list of anticipated work for the following reporting day

Daily reports are not intended to notify the NYSDEC of emergencies (e.g., accident, spill), request changes to the RIWP, or communicate other sensitive or time-critical information. However, such conditions will also be included in the daily reports. Emergency conditions and changes to the RIWP will be communicated directly to the NYSDEC Project Manager.

4.2 Remedial Investigation Report

Following completion of the RI and receipt of analytical data, an RIR will be prepared in accordance with the applicable requirements of DER-10 Section 3.14. The report will:

- Describe site history and previous investigations
- Describe site environmental conditions
- Describe sampling methodology and field observations
- Evaluate analytical results and describe findings
- Provide conclusions and recommendations for any further assessment (if warranted)

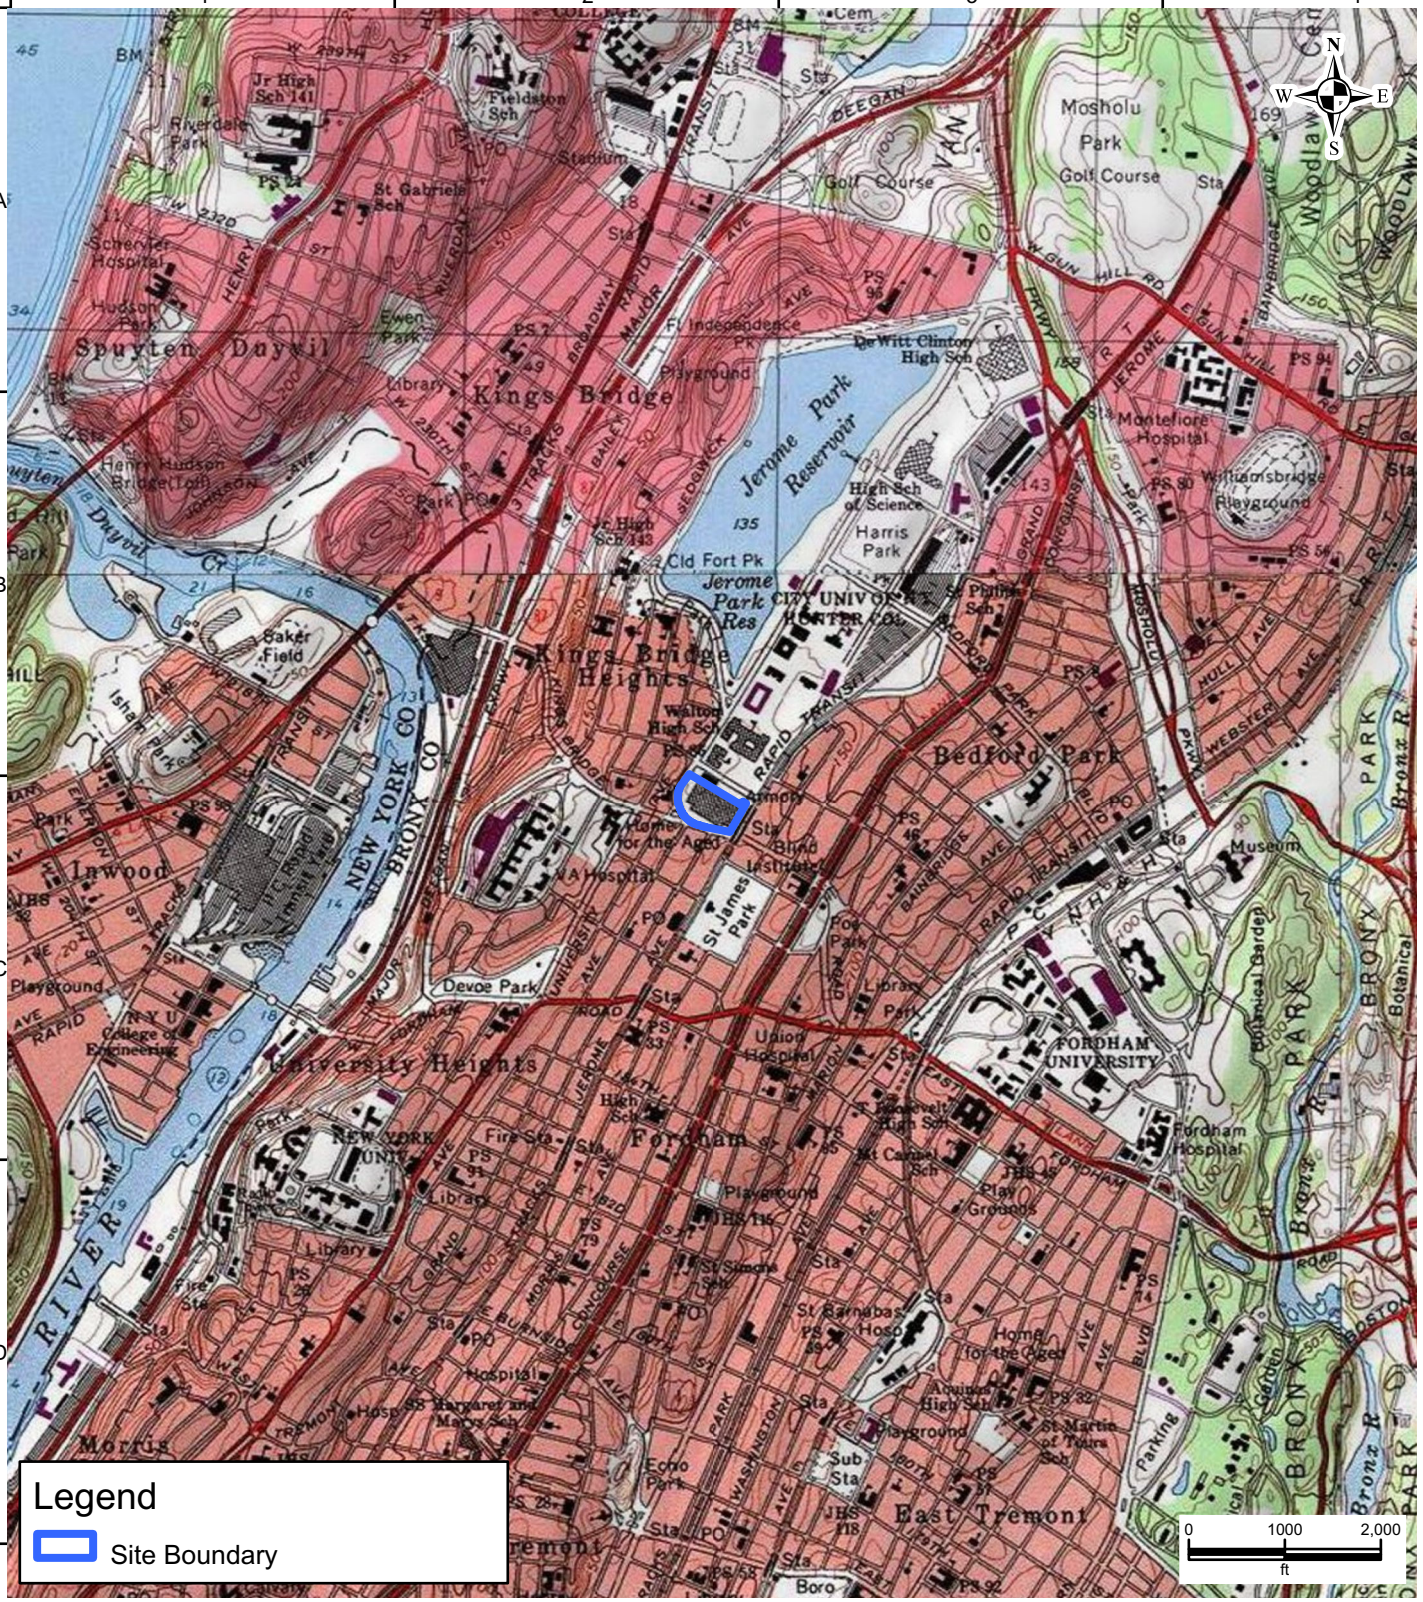
The report will summarize the nature and extent of contamination and identify unacceptable exposure pathways (as determined through a Qualitative Human Health Exposure Assessment). DUSRs will be included in the RIR and electronic data deliverables will be submitted to the NYSDEC EQuIS database prior to submission of the draft RIR.

DRAFT

The report will include soil borings, monitoring well construction logs, soil vapor logs, and sampling logs, tabulated analytical results, figures, and laboratory data packages. The tabulated analytical results will be organized in table format and include sample location, media sampled, sample depth, field/laboratory identification numbers, analytical results and the applicable Standards, Criteria, and Guidance (SCG) pertaining to the site and contaminants of concern for comparison. The report will include scaled figures showing site stratigraphy and hydrogeology (via cross sections), the locations of soil borings, monitoring wells, soil vapor points, sample concentrations above SCGs for each media, groundwater elevation contours and flow direction, and, if appropriate, groundwater contaminant concentration contours.

The RIR will be provided in an electronic format to the NYSDEC.

DRAFT



5.0 SCHEDULE

The table below presents an anticipated schedule for the proposed RI and reporting following the approval of the RIWP. If the schedule changes, it will be updated and submitted to the NYSDEC.

Milestone	Weeks from NYSDEC Approval of RIWP	Estimated Duration (weeks)
RI Mobilization	3	2
RI Field Investigation	5	4
Laboratory Analysis	9	3
Data Validation	12	3
Remedial Investigation Report Preparation and Submission to the NYSDEC	15	4

NOTES:

1. SOIL SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NYSDEC TITLE 6 OF THE OFFICIAL COMPILATION OF NYCRR PART 375 PROTECTION OF GROUNDWATER (PGW) SOIL CLEANUP OBJECTIVES (SCO) AND RESTRICTED USE COMERCIAL SCO.
2. NYSDEC PART 375 PGW SCO EXCEEDANCES ARE BOLDED.
3. NYSDEC PART 375 RESTRICTED USE COMERCIAL SCO EXCEEDANCES ARE HIGHLIGHTED.
4. VOCs = VOLATILE ORGANIC COMPOUNDS
5. SOIL SAMPLE RESULTS ARE DISPLAYED IN UNITS OF MILLIGRAM PER KILOGRAM (mg/kg)
6. U = THE ANALYTE WAS ANALYZED FOR, BUT WAS NOT DETECTED AT A LEVEL. GREATER THAN OR EQUAL TO THE REPORTING LIMIT (RL); THE VALUE SHOWN IN THE TABLE IS THE RL.
7. J = THE ANALYTE WAS DETECTED ABOVE THE METHOD DETECTION LIMIT (MDL), BUT BELOW THE RL; THEREFORE, THE RESULT IS AN ESTIMATED CONCENTRATION.
8. B = THE ANALYTE WAS FOUND IN THE ASSOCIATED ANALYSIS BATCH BLANK
9. D = THE CONCENTRATION REPORTED IS A RESULT OF A DILUTED SAMPLE
10. DUP-1 (052113) IS A DUPLICATE SAMPLE OF LG-19 (0-2)
11. NA = NOT TESTED

Exceedance Summary:

10 - Result exceeds NYSDEC SGVs

NOTES:

1. GROUNDWATER SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TECHNICAL AND OPERATIONAL GUIDANCE SERIES (TOGS) 1.1.1 AMBIENT WATER QUALITY STANDARDS (AWQS) AND GUIDANCE VALUES FOR DRINKING WATER (CLASS GA), COLLECTIVELY REFERRED TO AS 'NYSDEC SGVs'.
2. ONLY DETECTIONS ARE SHOWN.
3. NYSDEC TOGS 1.1.1 AWQS AND GUIDANCE VALUES EXCEEDANCES ARE HIGHLIGHTED AND BOLDED.
4. VOCs = VOLATILE ORGANIC COMPOUNDS
5. SVOCs = SEMIVOLATILE ORGANIC COMPOUNDS
6. NA = NOT TESTED
7. GROUNDWATER SAMPLE RESULTS ARE DISPLAYED IN UNITS OF MICROGRAMS PER LITER (ug/l)
8. U = THE ANALYTE WAS ANALYZED FOR, BUT WAS NOT DETECTED AT A LEVEL GREATER THAN OR EQUAL TO THE REPORTING LIMIT (RL); THE VALUE SHOWN IN THE TABLE IS THE RL.
9. J = THE ANALYTE WAS DETECTED ABOVE THE METHOD DETECTION LIMIT (MDL), BUT BELOW THE RL; THEREFORE, THE RESULT IS AN ESTIMATED CONCENTRATION.
10. B = THE ANALYTE WAS FOUND IN THE ASSOCIATED ANALYSIS BATCH BLANK.
11. DUP-1_052313 IS A DUPLICATE SAMPLE OF MW-7_052313
12. BASE MAP IS REFERENCED FROM 2013 CONCEPTUAL SITE PLAN BY BBB ARCHITECTS

LEGEND

- SITE BOUNDARY
- SB-A/1 — 2007 SOIL BORING LOCATION
- MW-2 — 2007–2009 MONITORING WELL LOCATION
- LB-1(OW) — 2008 OBSERVATION WELL LOCATION
- LG-5 — 2008 SOIL BORING LOCATION
- TP-6 — 2008 TEST PIT LOCATION
- LG-19 — 2013 SOIL BORING LOCATION
- MW-5 — 2013 TEMPORARY MONITORING WELL LOCATION
- SV-1 — 2013 SOIL VAPOR SAMPLING POINT
- SSV01/IA01 — PROPOSED SUB-SLAB SOIL VAPOR/INDOOR AIR SAMPLE LOCATION
- SV16 — PROPOSED SOIL VAPOR SAMPLE LOCATION
- AOC 1: SVOCs AND METALS IMPACTS IN FILL
- AOC 2: HAZARDOUS LEAD-IMPACTED SOIL
- AOC 3: PETROLEUM-RELATED VOCs IN GROUNDWATER AND SOIL VAPOR
- AOC 4: CVOCs IN SOIL VAPOR

NOTES:

1. BASE MAP IS REFERENCED FROM TOPOGRAPHIC, BOUNDARY & UTILITY SURVEY, DATED JULY 25, 2019, PREPARED BY LANGAN
2. SVOCs = SEMIVOLATILE ORGANIC COMPOUNDS
3. VOCs = VOLATILE ORGANIC COMPOUNDS
4. CVOCs = CHLORINATED VOLATILE ORGANIC COMPOUNDS

EXECUTIVE SUMMARY

ATC Associates Inc. was contracted by ET Environmental Corp. to conduct a survey of the Kingsbridge Armory 29 West Kingsbridge Road, Bronx, NY. The intent was to identify asbestos containing materials, lead containing and/or lead based paints and coatings, mercury containing switches or lamps, suspect PCB (polychlorinated biphenyls) or DEHP (Di (2-ethylhexyl) phathatlate) containing light ballasts, storage tanks and stored or abandoned materials at the facility.

The survey identified an estimated fourteen thousand two hundred sixty (14,260) feet of thermal system insulation (piping, cementitious joints), thirty-three thousand six hundred sixty (33,660) square feet of flooring materials (floor tiles, linoleum) and two-hundred thirty-five thousand (235,000) square feet of roofing materials (2-tab shingles, built-up roofing, mastics). Additionally, glazing associated with the windows (interior and exterior) and caulking material associated with windows and exterior joints, seams and cracks was identified as asbestos containing materials. Plaster surfaces primarily walls and ceilings were tested throughout the armory and were determined to **not** be an asbestos containing material.

The survey confirmed lead at detectable levels and above for each substrate as follows; 59% of brick, 45% concrete, 73% metal, 89% plaster and 56% wood. Substrates were distinguished by and identified by the exposed coating color. However, variance of lead results within a single testing combination particularly gray painted concrete substrate indicate that the lead containing layer(s) occur below the exposed common layer. Therefore, the generally poor condition of painted surfaces combined with the inability to distinguish painted components by the exposed color all paint should be considered lead containing for purposes of OSHA compliance, waste stream management and environmental dust control.

Copyright © 2000

No mercury containing switches were observed. Ballasts inspected at various locations of the Armory were found to be not labeled as to content or in poor condition, therefore all ballasts were considered PCB or DEHP containing. An estimated six hundred fifty (650) light fixtures, one thousand two hundred fifty (1,250) bulbs/tubes, seven hundred (700) ballasts and one hundred nine (109)metal halide lights were observed. All PCB/DEHP-contaminated materials should be incinerated, mercury containing lighting lamps, such as: Fluorescent, Mercury Vapor, and High Intensity Discharge lamps (including Metal Halide lamps, High Pressure Sodium lamps, and Low Pressure Sodium lamps) should be disposed through a complete recycling process.

The visual inspection of the Armory grounds indicated that at least four underground storage tanks existed at one time as determined by identified vent pipes and fill ports. Regulatory database review identified five underground storage tanks and two aboveground storage tanks associated with the Armory. An electro-magnetic survey of suspect areas indicated that two buried tanks might exist in the garage parking area. Presumably, these could be the closed tanks identified as tank 1 –diesel and tank 2- unleaded gasoline. Additionally, the survey identified seven additional aboveground 275-gallon storage tanks in the basement not identified in the regulatory database. Tanks 1 and 2 appear to have been closed and abandoned in place, which can be verified by test pits. Additional investigation is required to ascertain the disposition of tanks 3 through 7. The seven aboveground storage tanks identified by the survey need to be examined/tested for product type, content and eventual disposition.

Throughout the Armory, various paints, solvents and maintenance products were observed that would require consolidation and disposal. Abandoned refrigeration/air conditioner units may contain CFC compounds and require reclamation prior to disposal. Several animal/bird carcasses and small quantities of avian excreta were observed in localized areas, disturbance of these items would require personal protective equipment.

INTRODUCTION

ATC Associates Inc. was contracted by ET Environmental Corp. to conduct a survey of the Kingsbridge Armory 29 West Kingsbridge Road, Bronx, NY. The intent was to identify asbestos containing materials, lead containing and/or lead based paints and coatings, mercury containing switches or lamps, suspect PCB (polychlorinated biphenyls) or DEHP (Di (2-ethylhexyl) phathatlate) containing light ballasts, storage tanks and stored or abandoned materials at the Kingsbridge Armory.

Messrs James Ruchalski and Jay Dupay of ATC performed the asbestos survey. Mr. Dupay holds certifications from the New York City Department of Environmental Protection as an Asbestos Investigator and the New York State Department of Labor as an Asbestos Inspector and will be the inspector of record for all filings. Mr. Ruchalski holds certification from the New York State Department of Labor as an Asbestos Inspector. Mr. Richard Edwards and Maraina Medinets performed the XRF survey. The survey was performed from July 24 through August 22, 2000.

STANDARDS OF CARE

ATC Associates Inc.'s work was performed in a professional manner with the best interest of our client in mind. Our objective was to perform our work with care, exercising the customary skills and competence of consulting professionals in the relevant disciplines. The conclusions presented in this report are professional opinions based upon visual observations of the site and laboratory results from samples collected and analyzed.

Copyright © 2000

The opinions and recommendations presented herein apply to site conditions existing at the time of our observations. ATC Associates Inc. cannot act as insurers, and no expressed or implied representation or warrant is included or intended in our report except that our work was performed, within the limits prescribed by our clients, with the customary thoroughness and competence of our profession at the time and place the services were rendered. This report is designed to generally identify the accessible recognized environmental materials identified in the introduction at the facility

ASBESTOS – SURVEY

Guidelines used for the survey were established by the Environmental Protection Agency (EPA) in the Guidance for Controlling Asbestos Containing Materials in Buildings, Office of Pesticides and Toxic Substances, Doc 560/5-85-024, and 40 CFR Part 763, Asbestos Hazard Emergency Response Act (AHERA).

Field information was organized in accordance with the AHERA methodology of homogenous area (HA). During the survey, reasonable effort was made to identify all locations and types of ACM materials associated with the scope of work. Multiple samples of homogeneous materials were chosen at random. However, due to inconsistencies of a manufacturer's processes and the contractor's installation methods, materials of similar construction may contain various amounts of asbestos. Further, some materials that were not originally specified to contain asbestos may in fact contain this mineral. For example, cementitious pipe insulation and plaster were frequently mixed with asbestos at the construction site for ease of application. Locating all asbestos materials can only be definitively achieved by conducting exploratory demolition and sampling every section of pipe insulation, fitting or valve covering, fireproofing, and other suspect ACM.

Copyright © 2000

Bulk samples of suspect ACM were analyzed using polarized light microscopy (PLM) coupled with dispersion staining, as described in 40 CFR Part 763 and the National Emissions Standard for Hazardous Air Pollutants (NESHAP). NESHAP is the standard industry protocol for the determination of asbestos in building materials. A suspect material is immersed in a solution of known refractive index and subjected to illumination by polarized light. The color displays that result is compared to a standardized atlas whereby the specific variety of asbestos is determined. It should also be recognized that PLM is primarily a qualitative identification method whereby asbestos percentage, if any, is estimated. While EPA, New York State; and New York City regulations governing ACM consider materials containing greater than 1-percent as asbestos, accurately quantifying asbestos content below 5-percent has been shown to be unreliable. Without additional and more sophisticated analysis, using transmission electron microscopy (TEM), a 1-percent content or less of asbestos in a building material sample may still result in an exposure or possible respiratory hazard should the material be indiscriminately demolished. Therefore, for identification and appropriate asbestos management, ATC recommends that any detected asbestos in a suspect material using PLM be considered asbestos. For those materials revealing no asbestos using PLM, TEM analysis should be conducted for confirmation.

The New York State Department of Health has revised the PLM Stratified Point Counting Method. The new method, "Polarized Light Microscopy Methods for Identifying and Quantifying Asbestos in Bulk Samples" can be found as item 198.1 in the Environmental Laboratory Approval program (ELAP) Certification manual. The method specifies a procedure of analysis for bulk samples that fall into the category of "Non-friable Organically Bound" (NOB). This category includes any sample in a flexible to rigid asphalt or vinyl matrix (floor tiles, mastic, roofing shingles, roofing felt, etc.). Additional materials that may fall into this category are textured paints and stucco, pipe valve and joint packing, and a variety of other applications. These samples must be "ashed" in a muffle furnace at 480-degrees Celsius (to remove organic matrix), treated with acid (to remove any mineral carbonate), and filtered through a 0.4-micron filter before being analyzed by PLM. The sample must be weighted between each of these steps to track the percent loss of organic matrix.

Copyright © 2000

ELAP has determined that analysis of NOB materials is not reliably performed by PLM. Therefore, if PLM yields results of 1-percent asbestos or less, the result must be confirmed by TEM. Bulk samples that undergo TEM analysis use the sample reduction methodology stated above for NOB analysis by PLM. ELAP certified laboratories must include the following statement with their PLM analysis results for each "inclusive" (1-percent or less asbestos) NOB sample: "Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Before this material can be considered or treated as non-ACM, confirmation must be made by quantitative transmission electron microscopy".

Selected samples initially analyzed by Polarized Light Microscopy which yielded a negative PLM result and which are classified as a "non-friable" material, were then re-analyzed utilizing Transmission Electron Microscopy methodology described above. The laboratory performing both these analysis procedures was ATC Associates Inc., located at 104 East 25th Street, New York, New York. The following laboratory accreditation's are included in Appendix C:

- National Voluntary Laboratory Accreditation Program (Lab Code 1187-00)
- New York State Environmental Laboratory Approval Program (Lab No. 10879)
- American Industrial Hygiene Association Accredited Laboratory (Lab No. 7054)

ASBESTOS – SURVEY FINDINGS

Two hundred twenty-five bulk samples were collected from representative homogeneous areas throughout the facility. Tabular summary of bulk samples is located in Appendix A with field data/chain of custody forms in Appendix B. Asbestos sample locations and schematic material drawings are located in Appendix H. Based upon visual inspection of representative materials likely to be impacted by the planned interior demolition and/or renovation and bulk sample laboratory analytical results, the following materials have been identified as **asbestos containing materials [ACM]** (greater than one percent asbestos).

Copyright © 2000

- 2-tab roof shingle
- Built-up roofing
- Tar paper underlayment
- Roofing mastics/adhesives
- Pitch pockets
- 9" x 9" floor tiles (all colors)
- Sheet linoleum
- Corrugated (aircell) pipe insulation
- Cementitious pipe joint insulation associated with corrugated (aircell) pipe insulation
- magnesia (pre-formed block) pipe insulation
- Cementitious pipe joint insulation associated with magnesia (pre-formed block) pipe insulation
- Cementitious pipe joint insulation associated with fiberglass pipe insulation (National Guard Office only)
- window glazing (interior and exterior)
- Caulking material associated with windows and exterior joints, seams and cracks

Thermal system insulation was identified primarily in exposed readily accessible locations throughout the facility as described below. However, concealed thermal system insulation was observed in interstitial wall spaces associated with bathroom fixtures and the plenum area above suspended plaster ceilings.

Sub-basement	No ACM observed
Basement	TSI located on perimeter steam, hot and cold water lines. Piping in hallways has been abated and replaced with non-ACM insulation.
Basement Mezzanine	TSI located on perimeter steam, hot and cold water lines. TSI located on steam lines parallel to hallway in ammunition storage rooms. Asbestos containing flooring in office areas on southern wall.

Copyright © 2000

Drill Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Drill Floor Mezzanine	TSI located on steam, hot and cold water lines associated with bathrooms. Asbestos containing flooring in office areas on southern wall.
Second Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Third Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Roofs	Built-up and two tab shingle roofing including underlayment, mastics, flashings and adhesives. Mastics, flashing material, adhesives and caulking on gable ends, clerestory bands and parapets.

The survey identified the following estimated quantities of asbestos containing thermal system insulation (piping, cementitious joints), flooring materials (floor tiles, linoleum) and roofing materials (3-tab shingles, built-up roofing, mastics) within the survey boundaries.

Level	Thermal System Insulation (Linear Feet)	Flooring Material (Square Feet)	Roofing (Square Feet)
Basement	7,410	300	-
Basement Mezzanine	2,275	1,000	-
Drill Floor	3,540	6,460	-
Second Floor	675	17,500	-
Third Floor	210	8,400	-
Fourth Floor	150	-	-
Roofs	-	-	235,000
Totals	**14,260**	**33,660**	**235,000**

A detailed table of asbestos containing materials by area is located in Appendix D.

Copyright © 2000

Based upon visual inspection of materials determined to be impacted by the renovation program and bulk sample laboratory analytical results, the following materials are identified as **not asbestos containing materials** (less than one- percent asbestos).

- Boiler insulation'
- Breeching insulation
- Gray floor coating – drill floor
- Cementitious pipe joint insulation associated with fiberglass pipe insulation (Main armory building)
- 12" x 12" ceiling tile
- 2' x 2' ceiling tile
- 2' x 4' ceiling tile
- Joint compound
- Wall plaster – brown coat
- Wall plaster – white coat
- Ceiling plaster – brown coat
- Ceiling plaster – white coat
- Brown paper under 3-tab shingle
- Wallboard

LEAD – SURVEY (PAINTED SURFACES)

The objective of this survey was to identify existing lead-based paint on potentially impacted building surfaces during pending renovation/demolition activities. All painted components were not sampled with the XRF; rather, the survey sampled representative painted building substrates and components and based on the results assumptions as to lead content are made in this report. If questions arise as to the lead content in paint found on a specific surface not tested by ATC, additional testing may be required.

Copyright © 2000

A portable Lead Paint Analyzer manufactured by Radiation Monitoring Devices (RMD) was used to test all accessible painted components. The instrument was operated in accordance with manufacturer's instructions and XRF performance characteristic sheet (PCS). Representative readings were taken from each surface. Three calibration readings were taken before and after testing in the facility to ensure proper instrument operation. XRF results were divided into three categories: positive, inconclusive, and negative as defined by the PCS. According to the revised PCS for the RMD device, inconclusive ranges exist only for metal substrates. If the result was inconclusive, a paint chip sample was collected for laboratory analysis to determine the actual result.

LEAD –SURVEY FINDINGS (PAINTED SURFACES)

One thousand one hundred ninety building surfaces were tested with a portable X-Ray Fluorescence analyzer for lead content. Substrates tested within the Armory were; brick, concrete, metal, plaster, sheetrock, and wood. Substrates were distinguished by and identified by the exposed coating color. Bulk samples collected form the steel arch's on the drill floor confirmed lead content on the arched of between 8.92 and 56.67 %. A tabular summary of XRF survey data and bulk samples is located in Appendix E

Substrate	Shots	Shots >.4	Shots > 1	Percent of components with XRF detectable levels of lead	Percent of components with a Lead based coating
Brick	119	70	67	59%	56%
Concrete	178	80	62	45%	35%
Metal	403	295	238	73%	59%
Plaster	207	184	180	89%	87%
Sheetrock	34	0	0	0%	0%
Wood	249	140	106	56%	43%
Sub-Total	1190	769	653	65%	55%
Calibration	35				
Total	1225				

VATC ASSOCIATES INC.
Copyright © 2000

LEAD – SURVEY (TARGET RANGES)

Waste classification of the soils/sand identified within the basement rifle and pistol ranges was performed to determine proper handling and storage requirements as well as the disposal location (i.e., either RCRA Subtitle "C" landfill or Construction and Demolition (C&D) Subtitle "D" landfill). Environmental Protection Agency's (EPA) Resource Conservation and Recovery Act (RCRA) mandates that the lead containing media be characterized as either hazardous or non-hazardous waste prior to disposal. The TCLP composite samples were representative of the various materials that constituted the waste stream. The Inspector donned disposable gloves, which were changed prior to the collection of each sample. The material was placed into a ziplock bag, sealed, and labeled with a unique identifier. A minimum of 100 grams of material was collected. A chain of custody form was completed and submitted with the samples to the laboratory.

LEAD – SURVEY FINDINGS (TARGET RANGES)

ATC collected four (4) representative four-point composite samples from the basement shooting ranges. Sample 1 was collected form Pistol Ranges 9 – 16, Sample 2 was collected form Pistol Ranges 1 – 8, Sample 3 was collected from the most recently active portion of the Rifle Ranges, Sample 4 was collected from the abandoned portion of the Rifle Ranges behind the steel back stop. Analytical results indicate that the anticipated waste stream from each of the sampled areas contain levels of leachable lead in excess of RCRA standards. All four samples contained leachable lead above 5ppm.

Sample	Location	Analytical Result)
1	Pistol Range 9 – 16	1,480 ppm
2	Pistol Range 1 – 8	655 ppm
3	Rifle Range (active)	23.9 ppm
4	Rifle Range (abandoned)	5.84 ppm

Copyright © 2000

Based on TCLP results indicating leachable levels of lead greater than 5 ppm, the waste streams generated by the removal of the soils, sands and other material are characterized as a hazardous lead containing solid waste as defined by RCRA.

FLUORESCENT AND HIGH-INTENSITY DISCHARGE LIGHTING (HID)/BALLASTS

A visual walk-through of the Armory was conducted including examination of typical fixtures to ascertain the approximate quantity of mercury containing switches, lamps and suspect PCB or DEHP containing light ballasts. A drawing identifying approximate room locations and quantities of fixtures, bulbs and ballasts in located in Appendix H. No mercury containing switches were observed. Ballasts inspected at various locations of the Armory were found to be not labeled as to content or in poor condition, therefore all ballasts were considered PCB or DEHP containing. An estimated quantity of light fixtures, bulbs and ballasts is as follows:

Level	FIXTURES	Bulbs/Tubes	Ballasts	Metal Halide Lights
Basement	185	450	300	9
Basement Mezzanine	190	300	145	-
Drill Floor	175	300	145	100
Second Floor	100	200	110	-
Third Floor	-	-	-	-
Fourth Floor	-	-	-	-
Totals	**650**	**1250**	**700**	**109**

The primary concern regarding the disposal of used fluorescent ballasts is the health risk associated with polychlorinated biphenyl's (PCBs). Human exposure to these possible carcinogens can cause skin, liver, and reproductive disorders. Fluorescent and high-intensity discharge (HID) ballasts contain a small capacitor that may contain high concentrations of PCBs (greater than 90% pure PCBs or 900,000 ppm). These chemical compounds were widely used as insulators in electrical equipment such as capacitors, switches, and voltage regulators through the late 1970s.

Copyright © 2000

The Toxic Substances Control Act (TSCA) was enacted in 1976, and subsequently banned the production of PCBs in the United States. The specific regulations governing the use and disposal of PCBs are found in Volume 40 Code of Federal Regulations (CFR) Part 761.

The proper method for disposing used ballasts depends on several factors, such as the type and condition of the ballasts and the regulations or recommendations in effect in the state(s) where you remove or discard them. TSCA specifies the disposal method for ballasts that are leaking PCBs. In addition, generators of PCB-containing ballast wastes may be subject to notification and liability provisions under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) (also known as "Superfund").

Identifying criteria

- All ballasts manufactured through 1979 contain PCBs.
- Ballasts manufactured after 1979 that do not contain PCBs are labeled "No PCBs."
- If a ballast is not labeled "No PCBs," assume it contains PCBs.

DEHP-CONTAINING BALLASTS

Di (2-ethylhexyl) phathatlate (DEHP) is a substance that was used to replace PCBs in certain ballast capacitors beginning in 1979. DEHP in its pure form is listed as a hazardous waste under the Resource Conservation and Recovery Act (RCRA). However, once it has been used in a lighting ballast, it is no longer hazardous as defined by RCRA. (See 40 CFR 261.33, Part 261 Appendix VII, Section 268.34, and Section 268.43.) DEHP is regulated under CERCLA--the Superfund law. The "Reportable Quantity" (RQ) of DEHP under CERCLA is 100 pounds. (See 40 CFR, Section 302.4.) This means that if you are disposing of 100 pounds or more of the material in a 24 hour period (approximately 1,600 fluorescent lighting ballasts), you are required to notify the National Response Center at (800) 424-8802. It also means that parties involved with the disposal of DEHP ballasts may be held liable under Superfund if clean up of the DEHP is required.

Copyright © 2000

Identifying criteria

- DEHP has been found in ballasts designed for the following lighting fixtures: four foot fluorescent fixtures manufactured between 1979 and 1985
- Eight foot fluorescent fixtures manufactured between 1979 and 1991
- High intensity discharge (HID) fixtures manufactured between 1979 and 1991

MERCURY-CONTAINING LAMPS

Fluorescent and high-intensity discharge (HID) lamps contain a small quantity of mercury that can be harmful to the environment and to human health when improperly managed. Mercury is regulated under RCRA, which is administered by the US Environmental Protection Agency. Under current Federal law, mercury-containing lamps such as fluorescent and HID lamps may be hazardous waste. In addition, incandescent and HID lamps may contain small quantities of lead that can also be potentially harmful to human health and the environment.

STORAGE TANKS

The visual inspection of the Armory grounds indicated that at least four underground storage tanks existed; one underground storage tank (UST) in the western parking area as evidenced by an observed fill port and possible vent line, two UST's associated with the maintenance garage as evidenced by two vent lines and one UST associated with the heating plant of the National Guard Office and garage as evidenced by an observed fill port and vent line. A database search located in Appendix F provided by Environmental Data Resources, Inc. identified five underground storage tanks and two aboveground storage tanks associated with the Armory as follows:

Tank	Product	Capacity (gallons)	Status
1	Diesel	3,000	Closed
2	Unleaded Gasoline	2,000	Closed
3	1,2 or 4 Fuel Oil	2,000	Closed
4	1,2 or 4 Fuel Oil	8,000	Closed
5	Unleaded Gasoline	225	Closed
6	Diesel	225	Unknown
7	Other	275	Unknown

Copyright © 2000

Additionally, eight additional aboveground 275-gallon storage tanks were identified in the basement southeast hallway opposite the shooting ranges, and not identified in the regulatory database.

Sanborn fire insurance maps for the years 1896, 1900, 1914, 1945, 1950, 1981, 1991, 1992, 1993, 1995 and 1996, and aerial photographs for years 1954, 1966, 1975, 1984 and 1994 provided by Environmental Data Resources, Inc. did not provide any indication of tank locations.

An electro-magnetic of suspect areas was performed by NAEVA (Appendix G) indicated that two buried tanks might exist in the garage parking area. Presumably, these could be the closed tanks identified as tank 1 –diesel and tank 2- unleaded gasoline.

SURVEY LIMITATIONS

No lighting, extensive debris, standing water and microbial growth obscure many areas throughout the facility. These limitations impeded access and restricted viewing of some materials. Access to the upper shed roof and the entire north roof was not possible during this survey.

Copyright © 2000

CONCLUSIONS AND RECOMMENDATIONS

Asbestos

Asbestos containing materials have been located throughout the Kingsbridge Armory. Asbestos containing materials identified by the survey or revealed by subsequent demolition to be asbestos containing should be removed and disposed of prior to initiation of construction activities. The removal of these materials should be conducted by a State of New York licensed asbestos abatement contractor in accordance with all applicable federal, state, and local regulations. Sufficient sample density exists from the plasters to allow ATC to prepare a New York City Department of Environmental Protection Asbestos Control Program form 5 (Not an Asbestos Project) for demolition of plaster surfaces following abatement of the asbestos containing materials.

Lead - (Painted Surfaces)

All painted surfaces and building components should be assumed to contain lead and be handled in accordance with the requirements of the OSHA Lead Exposure in Construction Standard (29 CFR 1926.62) and any other local requirements. Painted components within the Armory are in generally poor condition throughout and should be considered lead containing for purposes of OSHA compliance, waste stream management and environmental dust control.

This survey does not relieve any renovation/demolition contractors from the responsibility of:

- The Occupational Safety and Health Administration's (OSHA) Construction Industry requirements.
- The Resource Conservation and Recovery Act (RCRA) requirements for testing and disposal of lead-contaminated materials.
- Any other applicable federal, state, or local regulations.

Copyright © 2000

Lead –(Target Ranges)

All sand including wood dead stop material should be handled and disposed of as lead contaminated material.

PCB/DEHP, Mercury

All PCB/DEHP-contaminated materials should be incinerated pursuant to the U.S. Environmental Protection Agency's PCB Rules 40 CFR Part 761 and relevant state rules and regulations. All mercury containing lighting lamps, such as: Fluorescent, Mercury Vapor, and High Intensity Discharge lamps (including Metal Halide lamps, High Pressure Sodium lamps, and Low Pressure Sodium lamps) should be disposed through a complete recycling process.

Storage Tanks

Tanks 1 and 2 appear to have been closed and abandoned in place, which can be verified by test pits. Additional investigation is required to ascertain the disposition of tanks 3 through 7. The seven aboveground storage tanks identified by the survey need to be examined/tested for product type, content and eventual disposition

MISCELANEOUS

The Kingsbridge Armory is identified as a large quanity generator of hazardous/regulated waste. This registration if inactive should be closed out. Throughout the Armory, various paints, solvents and maintenance products were observed that would require consolidation and disposal. Abandoned refrigeration/air conditioner units may contain CFC compounds and require reclamation prior to disposal. Several animal/bird carcasses and small quantities of avian excreta were observed in localized areas, disturbance of these items would require personal protective equipment.

REPORT DATE: 08-14-00

CLIENT: ET Environmetal

PROJECT No: 75018.0001

SAMPLED BY: F. Burkhardt

SAMPLE DATE: 08-11-00
DATE RECEIVED: 08-13-00
DATE ANALYZED: 08-13-00

SAMPLE MEDIA: Paint Chips
ANALYSIS REQUIRED: Method EPA 3050/7420

ANALYSIS RESULTS

SAMPLE ID	BATCH NO.	SAMPLE DESCRIPTION	LEAD CONCENTRATION (% by weight)	DETECTION LIMIT
1	8583	Rifle. R. - Aband.	0.07	0.01
2	8583	Rifle R. - Active	0.04	0.01
3	8583	Pistol 1-4	1.17	0.01
4	8583	Pistol 9-12	56.67	0.01
C-1	8583	Steel Truss	32.21	0.01
C-2	8583	Steel Truss	39.68	0.01
C-3	8583	Steel Truss	16.56	0.01
C-4	8583	Steel Truss	21.66	0.01
C-5	8583	Steel Truss	8.92	0.01
C-6	8583	Steel Truss	0.46	0.01

NOTE 1:
THE REPORTING LIMIT (RL) IS 0.01%

NOTE 2:
HUD defines lead-based paint as paint having a lead concentration equal to or above 0.5% by weight.
Results preceded by "<" are below the detectable levels by this analysis method.

CERTIFICATION AND SIGNATURES

ANALYSIS PERFORMED BY: TC

REPORT PREPARED BY: [signature]

ATC certifies that this report is an accurate and authentic report of results obtained from the laboratory analysis.

QUALITY ASSURANCE COORDINATOR: [signature]

LABORATORY DIRECTOR: [signature]

ATC is accredited by the New York State Department of Health Environmental Laboratory Approval Program (NYS DOH ELAP) to perform analysis of lead in paint and dust wipes (ELAP #10879).

EXECUTIVE SUMMARY

Metcalf & Eddy of New York, Inc. ("M&E") was retained by the New York City Economic Development Corporation ("EDC") to conduct a Phase I Environmental Site Assessment ("ESA") of a property identified as the Kingsbridge Armory (the "Armory") and located at 29 West Kingsbridge Road (the "Site") in the Borough of the Bronx, New York. The Site is identified by the New York City Department of Finance as Block 3247, Lot 2 and is located on five (5) acres and encompasses four (4) city blocks. The Armory is situated north of West Kingsbridge Road, south of West 195th Street, east of Reservoir Avenue and west of Jerome Avenue in the Kingsbridge Heights section of the Borough of the Bronx in the City of New York (the "City"). The Armory was designed by architects Pilcher and Tachau as a medieval, Romanesque-style fortress with towers and parapets and built between 1913 and 1917. The Armory is comprised of over 475,000 square feet of space and was formerly used as a staging area for military operations and training in the Bronx. Two (2) annex buildings are located north of the Armory along West 195th Street. The building located at 10 West 195th Street is a two (2) story concrete and brick structure and currently houses the State Armory National Guard Recruiting office and the 258th Field Artillery Unit. A one (1) story building located near the intersection of Reservoir Avenue and West 195th Street is used for vehicle storage by the National Guard. Major renovations to the Armory were conducted by Turner Construction between 2000 and 2005. The renovations included the roof above the drill floor, the company rooms and towers south of the drill floor, and asbestos abatement of the roofing material and piping insulation on the mezzanine level of the drill floor. The Site which is owned by the City, was designated a New York City landmark in September 1974 and was placed on the National Register of Historic Places in 1982.

An environmental database provided by Environmental Data Resources ("EDR") identified sites within the search radii where documented environmental impacts have occurred. Although the EDR database information did not include any documentation from which it could be concluded that the sites identified within the search radii have impacted the Site, it is possible that groundwater under the site has been impacted due to the industrial/commercial use of the surrounding area, and by potential contamination in on-site fill materials. However, it should be noted that the groundwater in this area is not used as a potable source.

During the Phase I ESA, a visual inspection of the Site was performed. The visual inspection identified three (3) 275 gallon above ground fuel oil tanks ("ASTs"). One (1) tank is located in the northeast corner of the building on the drill hall floor; the two (2) remaining tanks are located two (2) levels below the drill hall in the southwestern portion of the building, east of the former

bowling alley. None of the tanks appeared to contain significant amounts of product. A petroleum odor was detected in room B-20 located on the first level below the drill floor in the western portion of the building; however, no source for the odor could be located. Several 5-gallon pails of Esguard LubraKote Black, a flashing cement, were observed in several of the rooms on the second level below the drill hall in the western portion of the building. Cans of motor oil, brake fluid and other petroleum-based lubricants as well as empty gasoline cans were observed in the motor pool workshops located along the northern portion of the company rooms on the mezzanine of the second level below the drill floor. Ten (10) 55-gallon steel drums were observed in the parking/vehicle storage area located three (3) levels below the drill hall floor. The drums are beginning to show signs of deterioration with rust and holes present in several of the drums. The content of the drums is unknown, although most appear to be free of liquids. In addition, possible oil staining of the concrete near the center of the parking/vehicle storage area was observed as well as an area where the concrete floor was saw cut and backfilled with sand. This area may have once contained a UST.

Three (3) earthen floored rifle and pistol ranges were observed on the Site and are suspected to contain elevated concentrations of lead from spent munitions. The first pistol range is located on the second level below the motor pool workshops. Spent munitions were observed embedded in the wooden walls of pistol range. The other pistol/rifle ranges are located on the third level below the drill floor in the eastern portion of the building near Jerome Avenue. No spent munitions were observed at these ranges.

Deteriorating equipment such as the boiler located in the southwestern portion of the basement of the company rooms and air conditioning units located in the northeastern portion of the Armory, one (1) level beneath the drill hall may contain asbestos, lubricating oils and refrigerants. Peeling paint that may contain lead, light ballasts possibly containing polychlorinated biphenyls ("PCBs"), potential asbestos containing materials ("ACM") including pipe wrap and floor tiles and extensive mold growth was present in the majority of the company rooms located along the southern portion of the Armory and the company rooms beneath the drill hall. In addition, water damage to the walls, ceilings and floors of the upper level company rooms and turret rooms is prevalent.

In September 2000, ET Environmental submitted an Environmental Survey Report to the EDC prior to the roofing renovations to determine the presence of asbestos, lead-based paint ("LBP") and bird droppings. Samples collected in the vicinity of the work areas indicated non-friable asbestos and LBP were present on the Site. Additional sampling for PACM, LBP and a light ballast survey are recommended for the company rooms and the levels beneath the drill hall. A

survey of the 55 gallon drums should be conducted to include an inventory of the drums and a determination of the contents of the drums. Once completed, the drums and their contents should be properly disposed. It is also recommended that the three (3) ASTs be removed as well as the petroleum products in the motor pool workshops and the lower levels beneath the drill hall. Deteriorating equipment should also be properly removed from the site. In addition, the earthen floors of the pistol and rifle ranges and the spent rounds from the walls of the second level pistol range should be removed due to the potential presence of lead.

Additional recommendations could be warranted should potential environmental issues be identified by outstanding FOIL/Information requests submitted to the New York City Department of Environmental Protection, the New York City Department of Health, and the New York State Department of Health.

1.0 INTRODUCTION

Metcalf & Eddy of New York, Inc. ("M&E") was retained by the New York City Economic Development Corporation ("EDC") to conduct a Phase I Environmental Site Assessment ("ESA") of a property identified as the Kingsbridge Armory (the "Armory") and located at 29 West Kingsbridge Road (the "Site")in the Borough of the Bronx, New York. The Site is identified by the New York City Department of Finance as Block 3247, Lot 2 and is located on five (5) acres and encompasses four (4) city blocks. The Armory is situated north of West Kingsbridge Road, south of West 195th Street, east of Reservoir Avenue and west of Jerome Avenue in the Kingsbridge Heights section of the Borough of the Bronx in the City of New York (the "City"). The Armory was designed by architects Pilcher and Tachau as a medieval, Romanesque-style fortress with towers and parapets and built between 1913 and 1917. The Armory is comprised of over 475,000 square feet of space and was formerly used as a staging area for military operations and training in the Bronx. Two (2) annex buildings are located north of the Armory along West 195th Street. The building located at 10 West 195th Street is a two (2) story concrete and brick structure and currently houses the State Armory National Guard Recruiting office and the 258th Field Artillery Unit. A one (1) story building located near the intersection of Reservoir Avenue and West 195th Street is used for vehicle storage by the National Guard. Major renovations to the Armory were conducted by Turner Construction between 2000 and 2005. The renovations included the roof above the drill floor, the company rooms and towers south of the drill floor, and asbestos abatement of the roofing material and piping insulation on the mezzanine level of the drill floor. The Site which is owned by the City, was designated a New York City landmark in September 1974 and was placed on the National Register of Historical Places in 1982.

1.1 Purpose

The ESA was performed to determine if any potential environmental impacts occurred at or in the vicinity of the Site.

1.2 Report Outline

The report is divided into twelve (12) sections:

- Section 1 presents the introduction to the report;
- Section 2 details M&E's scope of work for this project;
- Section 3 provides information on the site background, setting, and operations;
- Section 4 provides details on the historical use and development of the site;

- Section 5 presents the results of the regulatory agency review;
- Section 6 presents the results of contacts with local agencies;
- Section 7 presents information provided by the client;
- Section 8 provides observations made during the site reconnaissance;
- Section 9 identifies facility personnel who were interviewed;
- Section 10 presents M&E's findings and conclusions;
- Section 11 presents a statement of limitations; and,
- Section 12 contains a list of references.

2.0 SCOPE OF WORK

2.1 Scope of Assessment

The purpose of the ESA was to evaluate the Site conditions with respect to potential impacts to soil or groundwater from petroleum products or hazardous substances. The scope of the ESA consisted of the performance of a site walk-through and visual site inspection with respect to environmental issues, interviews with key personnel, and requesting/reviewing local governmental files relating to environmental issues at the Site. An environmental database search (Appendix B), historical aerial photographs (Appendix C), Sanborn Fire Insurance Maps (Appendix D), historical topographic maps (Appendix E), a city directory search (Appendix F), and an Environmental Lien search (Appendix G) were obtained from Environmental Data Resources, Inc. ("EDR") in Southport, Connecticut.

2.2 Significant Assumptions

This Phase I ESA was prepared using information obtained from/provided by the following sources:

- Information provided by the client;
- Visual inspection of the subject site;
- Available published information;
- EDR database searches;
- Local/State government officials; and,
- Site/Owner representatives.

It is assumed that the information obtained through the above methods is valid and accurate as provided. The passage of time, manifestation of latent conditions, and occurrence of future events or changes to existing codes/regulations may alter the conclusions and recommendations of this report.

2.3 Limitations and Exceptions

Performance of the Phase I ESA was limited to a visual assessment of the Site.

2.4 Reliance

This report has been prepared on behalf of and for the exclusive use of the EDC and is subject to

and issued in connection with the Agreement and provisions thereof.

3.0 SITE BACKGROUND

3.1 Location

The Site is located at 29 West Kingsbridge Road on five (5) acres and encompassing four (4) city blocks in the Kingsbridge Heights section of the Borough of the Bronx (Figure 1). The geographic coordinates for the Site are 40° 52' 3.0" N, 73° 53' 51.0" W. The Site is identified by the City of New York Department of Finance as Block 3247, Lot 2.

The Site is comprised of an approximate 900,000 square foot building formerly used as a staging area for military operations and training in the Bronx. Two (2) annex buildings are located north of the Armory along West 195th Street. The building located at 10 West 195th Street is a two (2) story concrete and brick structure and currently houses the State Armory National Guard Recruiting office and the 258th Field Artillery Unit. A one (1) story building located near the intersection of Reservoir Avenue and West 195th Street is used for vehicle storage by the National Guard. The Site is approximately 130-140 feet above mean sea level ("msl"), based upon United States Geological Survey ("USGS") Central Park NY-NJ 7.5 Minute Quadrangle and EDR mapping obtained for the Site. A Site Plan is provided as Figure 2.

3.2 Geology/Hydrogeology

The area containing the Site lies within the glaciated Highlands physiographic province of New York. The bedrock geology in the area, described in a report titled Geology and Engineering Geology of the New York Metropolitan Area, Field Trip Guidebook T361 (Baskerville 1989) prepared for the 28th International Geological Congress, consists of the Fordham Gneiss of Proterozoic age. Surficial deposits in the region are mapped as glacial till (Cadwell et al 1986). Depending upon the specific location in the region the overburden material could also include fluvial, marine-tidal marsh, and recent fill deposits. Many low-lying areas have been historically filled to accommodate development. The bedrock surface is reportedly greater than 20 feet below grade near the Site, but large outcrops are visible east of Third Avenue. The outcrop appears to be associated with the Fordham Gneiss, member C, which consists of a fine-grained schist with biotite-muscovite-quartz interlayers.

Soils in New York City are typically classified as "Urban Land", a generic description of soils that have been buried, re-worked, or otherwise altered as a result of human activities. The buried, native soils in the general area of the Site are believed to be composed of loamy sand, silt loam, sandy loam and fine sandy loam. The deeper soil types are believed to consist of very gravelly-loamy sand, and stratified sandy loam. It is likely that the original soils at the Site developed on

glacial material.

3.3 Description of Facilities

The Armory was designed by architects Pilcher and Tachau as a medieval, Romanesque-style fortress with towers and parapets and built between 1913 and 1917. The Armory is located on five (5) acres encompassing four (4) city blocks and was formerly used as a staging area for military operations and training in the Bronx. Two (2) annex buildings are located north of the Armory along West 195th Street. The building located at 10 West 195th Street is a two (2) story concrete and brick structure and currently houses the State Armory National Guard Recruiting office and the 258th Field Artillery Unit. A one (1) story building located near the intersection of Reservoir Avenue and West 195th Street is used for vehicle storage by the National Guard. Major roof renovations to the metal and glass roof spanning the drill hall and to the flat roof behind the parapets above the company rooms located south of the drill hall were conducted between 2000 and 2005.

Three (3) levels exist beneath the drill hall floor. These levels include additional company rooms and work shops, a theater and lecture hall, a former gymnasium and basketball court, a former bowling alley, rifle and pistol ranges, and a subterranean parking/vehicle storage space. The company rooms on the upper levels are largely comprised of living quarters, office/administrative space, dining and entertainment rooms (including a library, bar and sitting rooms). Below the drill floor level, the company rooms consist of work shops, nurses' aid stations, locker rooms and the boiler room.

3.4 Facility Operations

The Site is managed by Apple Industrial who currently employs two (2) full–time workers to maintain the Site. The eastern portion of the drill hall of the Armory is occupied by the City of New York Community Assistance Unit, Anti-Graffiti Task Force. The task force parks vehicles on the Site and occupies several offices. Turner Construction maintains office space in the Armory but does not have any employees currently on Site.

The Armory was home to the New York National Guards 258th Field Artillery Unit until 1984 when the unit relocated to the smaller 2-story building located at 10 West 195th Street. The New York City Department of Homeless Services operated a woman's shelter at 2727 Jerome Avenue; in the northeastern portion of the Site until mid-2000.

3.5 Adjacent Properties

The buildings and land use types surrounding the site are as follows:

- North: West 195th Street, Public School 86 and Walton High School.
- South: Retail, commercial and residential properties located south of West Kingsbridge Road.
- East: Jerome Avenue and the New York City Transit elevated rail lines west of retail, commercial and residential properties along eastbound Jerome.
- West: Fordham Manor Reformed Church and Apartment buildings further west.

4.0 SITE HISTORY

4.1 General Site History

The Site is located in Kingsbridge Heights section of The Bronx, in an area that was developed in the middle to late 1800s. The area has since included residential, commercial, and small industrial facilities. Historical site information was obtained from historical aerial photographs, Sanborn Fire Insurance Maps, historical topographic maps and a City Directory Search. A review of these sources indicates that the Site was originally below water along the southern portion of the Jerome Park Reservoir in the late 1800s. Construction of Armory began in 1913 and was completed in 1917. A detailed description of the documents reviewed is presented below.

4.2 Historical Aerial Photographs

Historical black and white aerial photographs were reviewed for the years 1954, 1966, 1974, 1984, and 1994. The scale of the photographs prevents detailed analysis; however, the photographs do provide an overall view of history of urbanization of the Site and surrounding area. A description of each photograph is presented below. Aerial photographs are included as Appendix C.

1954 Aerial Photograph (1 inch = 750 feet)

The 1954 aerial photograph shows the Site as completely developed, but fine details cannot be identified. The surrounding areas are also completely developed.

1966, 1974, and 1984 Aerial Photographs (1-inch = 750 feet)

There are no significant changes visible at the Site or surrounding areas since the 1954 Aerial Photograph.

1994 Aerial Photograph (1-inch = 833 feet)

No significant on-site or off-site changes are visible from the previous aerial photographs.

4.3 Sanborn Fire Insurance Maps

The Sanborn Fire Insurance Map database was searched by EDR. Sanborn Maps were reviewed for the years 1896, 1901, 1914, 1950, 1978, 1981, 1984, 1989, 1991, 1992, 1993, 1995, and 1996 (Appendix D). The Sanborn Map findings are summarized below.

1896-1901 Sanborn Maps

The Site is shown to be part of the southern portion of a surface water body identified as the Jerome Park Reservoir (the reservoir was not completed until 1906). The surrounding parcels to the east, west and south are undeveloped.

1914 Sanborn Map

The Site is shown as the Armory, 8th Coast Artillery, District N. G. N. Y. (National Guard New York) in the midst of construction. The Sanborn map notes the roof over the drill room as a steel truss with asbestos on wood planking. A gate house to the Armory is depicted at the northeast corner of Reservoir Avenue and West Kingsbridge Road. The Jerome Park Reservoir, with a notation stating "not yet constructed", is shown to the north of the Site (though the reservoir was completed in 1906). No other surrounding structures are depicted on the Sanborn map.

1950 Sanborn Map

The majority of the Site remains unchanged from the previous Sanborn map; however, the gate house depicted on the 1914 Sanborn map is no longer present and a small outbuilding is present off the northeast corner of the Armory. West 195th Street, Public School 86 and Walton High School are shown in the area previously depicted as the site of the Jerome Park Reservoir. The elevated train station at the corner of West Kingsbridge Road and Jerome Avenue is shown as under construction. Properties located east, west and south of the Armory are not depicted on the 1950 Sanborn map.

1978 Sanborn Map

The 1978 Sanborn map shows the 2-story building located at 10 West 195th Street and states that it was constructed in 1958. The map indicates that the building was used as lockers (first floor) and classrooms (second floor). This building currently houses the New York National Guards 258th Field Artillery Unit. The Armory garage located to the west of this building is also shown. However, no construction date for the garage is provided. There are no visible changes to the properties north of the Site.

1981-1984 Sanborn Maps

There are no visible changes to the Site or adjacent lots on the Sanborn Maps for this period.

1989 Sanborn Map

There are no visible changes to the Site from the previous Sanborn maps. The map identifies an iron structure containing additional classrooms (likely a prefabricated building) was constructed east of Public School 86, north of the Site.

1991-1993 Sanborn Maps

There are no visible changes to the Site or adjacent lots on the Sanborn maps for this period.

1995-1996 Sanborn Maps

There are no visible changes to the Site from the Sanborn maps. An Air Balloon Gym is shown on these maps east of the Public School 86 addition first depicted on the 1989 Sanborn map.

4.4 Historical Topographic Maps

Historical topographic maps (USGS 7.5 minute Quadrangle sections) were obtained from EDR, and were reviewed for the years 1897, 1947, 1966, 1979 and 1995. A brief description of each map and the scale is presented below. The maps are included as Appendix E.

1897 Topographic Map (1:62,500)

The Site is shown to be within a surface water identified as the Jerome Park Reservoir (which was completed in 1906). The land surrounding the reservoir is shown as mostly undeveloped.

1947 Topographic Map (1:25,000)

The southern portion of the Jerome Park Reservoir appears to have been filled in and the Site is shown on this map and depicted as the 27th Tank Company Armory. The surrounding areas are shown as completely urbanized and Public School 86 and Walton High School are depicted to the north of the Site.

1966-1995 Topographic Maps (1:24,000)

No significant changes are visible at the Site on any of these maps. The garage building appears on the 1966 and subsequent maps; however, the 2-story building at 10 West 195th Street is not shown on any of these maps. No changes to the properties surrounding the Site are shown on these maps.

4.5 City Directory Search

A City Directory Search was conducted for the years 1927 - 2000, using 1 West Kingsbridge Road as the center point of the search (Appendix E). The Site address was not listed in the research sources. A search of the neighboring properties identifies retail and commercial businesses at addresses located along East and West Kingsbridge Roads and Jerome Avenue.

4.6 Environmental Lien Search

The EDR Environmental Lien Search Report (Appendix F) is intended to assist in the search for environmental liens filed in land title records. The environmental lien search indicates that there are no liens on the Site.

4.7 Historical Information Concerning Adjacent Properties

Limited site-specific information on the history of the adjoining properties was available through the Sanborn maps, aerial photographs, the city directory search, and historical topographic maps. The majority of the area surrounding the Site since the turn of the twentieth century has been and remains residential, retail and commercial in character.

5.0 REGULATORY AGENCY DATABASE REVIEW

EDR conducted a regulatory file review for the Site and surrounding areas. The search radius for the database review was centered on a point located at 29 West Kingsbridge Road at the coordinates 40° 52' 3.0" N, 73° 53' 51.0" W. A copy of the EDR report is provided in Appendix B. The Phase I ESA discusses only those facilities identified by EDR in the databases searched as of the last agency contact date, and at the distances from the property boundary noted below. The databases were searched and selected by EDR based on the requirements of ASTM E1527-05.

Federal Database Records

- National Priority List ("NPL") for both existing and deleted facilities within a 1-mile boundary of the Site as of April 19, 2006.

- Proposed NPL, sites proposed for inclusion on the NPL as of April 19, 2006.

- The NPL Deletions database for sites approximately 1 mile of the Site as of April 19, 2006. The NPL Deletions database identifies sites meeting the EPA's criteria to delete sites from the NPL per the National Oil and Hazardous Substances Pollution Contingency Plan.

- NPL Recovery database as of October 15, 1991. The NPL Liens database lists those sites where the USEPA has filed liens against real property in order to recover remedial action expenditures. The database search is for only the Site.

- Comprehensive Environmental Response, Compensation, and Liability Information System ("CERCLIS") sites located within approximately 1/2 mile of the boundary of the Site as of February 1, 2006.

- No Further Remedial Action Proposed ("NFRAP") sites located within 1/2 mile of the boundary of the Site as of February 1, 2006.

- RCRA Corrective Action Activity ("CORRACTS") of the subject property within 1 mile of the Site as of March 15, 2006. CORRACTS identifies RCRA facilities under corrective action activity.

- Resource Conservation and Recovery Information System ("RCRIS") Facilities Lists including large and small quantity generators and treatment facilities located within approximately 1/4 mile and storage, transportation, and disposal facilities located within approximately 1/2 mile of the boundary of the Site as of February 21, 2006.

- Emergency Response Notification System ("ERNS") listings for the Site as of December 31, 2005.

- The Hazardous Materials Information Reporting System ("HMIRS") as of December 31, 2005. The HMIRS database contains hazardous materials spill incidents reported to the DOT. The database search is for only the Site.

- US ENG Control as of March 21, 2006 is a listing of sites with engineering controls in place including various forms of caps, building foundations, liners and treatment methods to create pathway elimination for regulated substances to enter environmental media or affect human health.

- US INST Control as of March 21, 2006 is a listing of sites with institutional controls in place including administrative measures such as groundwater use, construction and property use restrictions, and post remediation care requirements intended to prevent exposure to contaminant remaining on site.

- Department of Defense ("DOD") database include federally owned or lands administered by the DOD that have any area greater than 640 acres. This data set was last updated December 31, 2004.

- Formerly Used Defense Site ("FUDS") database as of December 5, 2005 includes properties where the US Army Corps of Engineers is actively working and will take necessary cleanup measures.

- US Brownfields database as of November 29, 2005 includes sites addressed by Targeted Brownfield Assessments ("TBA") and EPA Cooperative Agreement Recipients.

- The Superfund Consent Decrees ("CONSENT") are major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites including settlements within approximately 1 mile of the boundary of the Site. This data set was last updated December 14, 2004.

- The Record of Decision ("ROD") for sites approximately 1 mile of the Site as of December 7, 2005. The ROD documents mandate a permanent remedy at an NPL site containing technical and health information to aid in the cleanup.

- The Toxic Release Inventory System ("TRIS") Database searches for the Site as of December 31, 2003. The TRIS sites are required to complete a Toxic Chemical Release Form (Form R) for specified chemicals.

- The Toxic Substances Control Act ("TSCA") database as of December 31, 2002. The TSCA database identifies facilities that manufacture or chemical substances included on the TSCA Chemical Substance Inventory list. The database search is for only the Site.

- The FIFRA/TSCA Tracking System ("FTTS") database as of January 17, 2006. The FTTS database tracks administrative cases and pesticide enforcement actions related to the Federal Insecticide, Fungicide, and Rodenticide Act ("FIFRA"), TSCA, and Emergency Planning and Right to Know ("EPCRA") Act. The database search is for only the Site.

- SSTS database as of December 31, 2003 is the Section Seven Tracking Systems database of the FTTS, which requires all pesticide producing establishments to submit an annual report to the EPA by March 1 of each year.

- The PCB Activity Database System ("PADS") as of December 27, 2005. PADS is maintained by EPA and identifies generators, transporters, commercial storers and /or brokers and disposers of PCB's. The database search is for only the subject site.

- The Material Licensing Tracking System ("MLTS") as of February 10, 2006. MLTS is maintained by the NRC and contains a list of approximately 8,100 sites that possess or use radioactive materials and which are subject to NRC licensing requirements. The database search is for only the Site.

- The Mines Master Index File ("MINES") for sites within 1/4 mile of the Site as of November 8, 2005. MINES is maintained by the Department of Labor, Mine Safety and Health Administration to identify mining issues.

- The Facility Index System/Facility Identification Initiative Program Summary Report ("FINDS") as of January 9, 2006. The FINDS database contains both facility information and "pointers" to other sources that contain more detail. The database search is for only the Site.

- The RCRA Administrative Action Tracking System ("RAATS") database has been discontinued; however the EPA has retained a copy for historical records.

- The Biennial Reporting System ("BRS") as of December 31, 2003. The BRS is a system administered by EPA that collects data on the generation and management of hazardous wastes.

State of New York ASTM Standard Records

- The Hazardous Substance Waste Disposal Site Inventory ("HSWDS") database contains a listing of any known or suspected hazardous waste disposal sites that are within 1/2 mile of the Site. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that USEPA Preliminary Assessment ("PA") reports or Site Investigation ("SI") reports were prepared. This database is no longer maintained as a separate entity. The last update to the database was made September 1, 2002, and the last EDR contact was February 27, 2006.

- The Inactive Hazardous Waste Disposal Sites ("SHWS") database contains site records within 1 mile of the Site that are the State's equivalent to CERCLIS. The date of the last EDR contact was March 17, 2006.

- DEL SHWS is a database of sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites. The latest update was made December 30, 2005.

- The Solid Waste Facilities/Landfill Sites ("SWF/LF") database contains an inventory of solid waste disposal facilities or landfills in the state within 1/2 mile of the Site. The latest update to the database was May 3, 2006.

- The Registered Recycling Facility List ("SWRCY") as of May 3, 2006. The database lists facilities that are within 1/2 mile of the Site.

- The Registered Waste Tire Storage Facility List ("SWTIRE") as of April 1, 2004. The database identifies if the Site is on the list.

- LTANKS is the Spills Information Database which includes Leaking Storage Tank Incident Reports and contains an inventory as of April 5, 2006 of reported leaking storage tanks

(above or under ground) within 1/2 mile of the Site. The causes include tank test failures, tank failures, or tank overfills. HIST LTANKS is a listing of leaking underground and above ground storage tanks. In 2002 the DEC stopped providing updates to its original Spills Information Database. The date of the last EDR contact was April 6, 2006.

- The Petroleum Bulk Storage database ("PBS UST") identifies underground storage tanks ("UST") sites with capacities ranging from 1,100 gallons to 400,000 gallons that are located within 1/4 mile of the Site. The date of the last EDR contact was May 17, 2006.

- The Chemical Bulk Storage Database ("CBS") identifies facilities within 1/4 mile of the Site that store regulated hazardous substances in USTs of any size. The date of the last EDR contact was October 24, 2005.

- The Major Oil Storage Facilities Database UST ("MOSF") identifies facilities within 1/2 mile of the Site that may be onshore facilities, or vessels, with petroleum storage capacities of 400,000 gallons or greater. The date of the last EDR contact was July 25, 2005.

- The Petroleum Bulk Storage ("PBS AST") database identifies registered aboveground storage tanks ("AST") located at the Site. The date of the last EDR contact was May 17, 2006.

- The Chemical Bulk Storage Database, AST ("CBS AST") identifies facilities within 1/4 mile of the Site that store regulated hazardous substances in ASTs with capacities of 185 gallons or greater, and/or in USTs of any size. The date of the last EDR contact was July 25, 2005.

- The Major Oil Storage Facilities Database AST ("MOSF-AST") identifies AST facilities within 1/2 mile of the Site that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. The date of the last EDR contact was July 25, 2005.

- NY MANIFEST as of March 1, 2006 is a database that tracks facility and manifest data.

- The Spills Information Database ("SPILLS") identifies data collected on spills within 1/8 mile of the Site that were reported to NYSDEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date. The latest update to the database was April 5, 2006. HIST SPILLS is a listing of leaking USTs and ASTs. In 2002 the DEC stopped providing updates to its original Spills Information Database. The date of the last EDR contact was July 7, 2005.

- ENG CONTROL as of December 30, 2005 is a listing of sites with engineering controls in place including various forms of caps, building foundations, liners and treatment methods to create pathway elimination for regulated substances to enter environmental media or affect human health.

- INST CONTROL as of December 30, 2005 is a listing of sites with institutional controls in place including administrative measures such as groundwater use, construction and property use restrictions, and post remediation care requirements intended to prevent exposure to contaminant remaining on site.

- The Voluntary Cleanup Agreements ("VCP") identifies sites within 1/2 mile of the Site where private monies are being used to remediate contaminated sites to levels allowing for the sites' productive use. The program covers virtually any kind of site and contamination. The date of the last EDR contact was March 12, 2006.

- DRYCLEANERS as of June 15, 2004 is a listing of registered dry cleaning facilities.

- BROWNFIELDS as of December 30, 2005 is the New York State Brownfields site list.

- The State Pollutant Discharge Elimination System ("SPDES") for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. SPDES also controls point source discharges to groundwater as well as surface waters. The last EDR contact was May 9, 2006.

- The Aerometric Information Retrieval System ("AIRS") as of December 31, 2002 includes air emissions data.

The following sections discuss EDR's findings. Only databases for which information was found are presented below.

5.1 Results of Database Search

The Site was identified by street address on the RCRIS-SQG, RCRIS-LQG, FINDS, LTANKS, HIST LTANKS and NY MANIFEST databases searched by EDR. The Site was also identified by street address as NYS DMNA OMS#31 and listed on the RCRIS-SQG and NY MANIFEST databases; however, the Site was not identified as the target property by EDR. In addition, the

annex building located at 10 West 195th Street was identified on the UST and AST databases searched by EDR. The results of the database search are presented below:

Site Name	Address	Database(s)	Comments
Kingsbridge Armory	29 West Kingsbridge Road	RCRIS-SQG FINDS NY MANIFEST	RCRIS-SQG; no violations reported. FINDS indicated that the site has other pertinent environmental activity listed on the RCRIS database; however, no additional information was presented. NY MANIFEST has an additional fifteen (19) records on file.
Kingsbridge Armory	29 West Kingsbridge Road	LTANKS HIST LTANKS	Spill No. 8802461 reported 6/17/88. No. 2 fuel oil tank failed tightness test. Report states that the last of seven tanks was scheduled for removal in 8/04. Spill closed 8/10/04. Spill No. 9211568 reported 1/7/93. Soil contamination from piping detected during tank pull. Spill closed 3/28/05. Spill No. 9308016 reported 10/1/93. Diesel tank failure reported during tank removal. 100 yards of soil stockpiled on site. Spill remains open.
NYC EDC Kingsbridge Armory	29 West Kingsbridge Road-Roof	RCRIS-LQG NY MANIFEST	RCRIS-LQG; no violations reported. NY MANIFEST has an additional seven (7) records on file.
NYS DMNA OMS #31*	29 West Kingsbridge Road	RCRIS-SQG NY MANIFEST	RCRIS-SQG; no violations reported. NY MANIFEST has an additional one (1) record on file.
NYS Armory	10 West 195th Street	UST AST	One (1) 3,000 gallon diesel and one (1) 2,000 gallon unleaded gasoline USTs reported closed-removed on 9/1/93. One (1) 2,000 gallon fuel oil UST reported in service. One (1) 8,000 gallon fuel oil UST reported closed-removed 1/1/99 and one (1) 225 gallon unleaded gasoline UST reported closed-removed on 5/1/95. One (1) 225 gallon diesel fuel AST and one (1) 275 gallon AST with "other" contents reported on site.

* - Not reported by EDR as the target property

5.2 Nearby Sites

EDR identified one hundred sixty (160) sites within the search radii of the Site. The following

identifies the sites that are within 1/4 mile of the Site and have assumed groundwater elevations equal to or higher than the Site (based upon the assumed flow direction of groundwater to the north-northeast). Sites located downgradient of the Site are not included since the potential for these sites to impact the subject property is low. Each of these is identified below with respect to the database in which they appear and the same site may be listed on more than one database.

5.2.1 RCRIS-SQG Sites

EDR identified a total of three (3) listed Small Quantity Generator ("SQG") sites within 1/4 mile of the subject Site. Of these, one (1) is listed as an alias for the Site and described in Section 5.1 and one (1) was located at an elevation equal to or higher and hydrogeologically upgradient or sidegradient to the Site with respect to the assumed groundwater flow direction. This SQG is summarized below:

Site Name	Address	Distance / Direction [1]	Comments
MTA NYCT – Kingsbridge Road Sta.	Jerome Avenue and Kingsbridge Road	0-1/8 mile E/sidegradient	No violations found.

1. Upgradient/sidegradient direction based on assumed groundwater flow direction.

5.2.2 LTANKS Sites

EDR identified forty-one (41) sites on the LTANKS database within 1/2 mile of the site. Of these, one (1) was located at an elevation equal to or higher and hydrogeologically upgradient or sidegradient to the Site with respect to the assumed groundwater flow direction and within 1/4 mile of the Site. A summary of the LTANK site is provided below:

Site Name	Address	Distance / Direction [1]	Comments
55 E. 196th Street	55 E. 196th Street	1/8-1/4 mile E/upgradient	Spill No. 9408807 reported 10/3/94. Twenty (20) gallons of #4 fuel oil reported spilled from tank overfill, spill closed 10/30/94.

1. Upgradient/sidegradient direction based on assumed groundwater flow direction.

5.2.3 UST Sites

EDR identified twenty-four (24) sites on the UST database. Of these, seven (7) were within 1/4 mile of the Site and hydrogeologically upgradient or sidegradient with respect to the assumed groundwater flow direction. One (1) of the sites is listed as an alias for the Site and described in Section 5.1. A summary of the remaining six (6) UST sites is provided below:

Site Name	Address	Distance / Direction (1)	Comments
2683 Morris Av Assoc.	2683 Morris Avenue	0-1/8 mile E/sidegradient	One (1) 4,000 gallon vaulted steel fuel oil UST reported in service. Date of installation is not reported.
2690 Morris Ave. Assoc.	2690 Morris Avenue	0-1/8 mile E/sidegradient	One (1) 5,000 gallon vaulted steel fuel oil UST reported in service. Date of installation is not reported.
Neiler Associates, LLC	2771 Morris Avenue	1/8-1/4 mile NE/upgradient	One (1) 3,500 gallon steel fuel oil UST reported in service. Date of installation is not reported.
2754 Grand Concourse	2754 Grand Concourse (2501 40th Avenue)	1/8-1/4 mile E/sidegradient	One (1) 7,000 gallon vaulted steel fuel oil UST reported in service. Date of installation is not reported.
Roban Mgmt	2784 Morris Avenue	1/8-1/4 mile NE/upgradient	One (1) 5,000 gallon vaulted steel fuel oil UST reported in service. Date of installation is not reported.
2786 Jerome Avenue	2786 Jerome Avenue	1/8-1/4 mile NNE/upgradient	One (1) 4,000 gallon vaulted steel fuel oil UST reported in service. Date of installation is not reported.

1. Upgradient/sidegradient direction based on assumed groundwater flow direction.

5.2.4 NYSPILLS Sites

EDR identified one (1) site on the Spills Information database that was within 1/8 mile of the Site. This site is located hydrogeologically upgradient or sidegradient to the Site with respect to groundwater flow. A summary of the NYSPILLS site is provided below:

Site Name	Address	Distance / Direction (1)	Comments
2683 Morris Av Assoc.	2683 Morris Avenue	0-1/8 mile E/sidegradient	Spill No. 0005691 reported on 8/11/00 and closed 8/25/05. Con Ed reported fuel oil contaminated soil found during gas line replacement. The site was reported to have recently had the fill line replaced.

1. Upgradient/sidegradient direction based on assumed groundwater flow direction.

5.2.5 Orphan Sites

Orphan sites are those having limited address information that precludes mapping the site. One hundred forty six (146) unmapped sites were identified by EDR. Orphan sites are listed in the EDR report found in Appendix B. One (1) orphan site found on the NY MANIFEST database

was listed as United States Military-Kings Bridge and may be associated with the Site. One (1) additional orphan site, NYC BOE-Walton HS is located approximately 1/8 mile north of the Site. This site was identified on the NY MANIFEST, FINDS and RCRA-SQG databases. However, the database report did not provide any specific information each of the sites. No additional orphan sites were identified during the site reconnaissance.

6.0 AGENCY REVIEW

M&E contacted several city, borough, and state officials to determine whether they had any knowledge of the Site or environmental concerns in the vicinity of the Site. A brief summary of M&E's correspondence is presented in the following sections, with copies of FOIL requests included in Appendix H and downloaded New York City Department of Buildings ("DOB") information included in Appendix I.

6.1 City/Borough Agencies

The following is a summary of information obtained from several local regulatory agencies.

Fire Department of the City of New York

A Records Search Request was submitted to the Fire Department of the City of New York ("FDNY") for any records related to heating oil tanks and USTs. No response from the FDNY has been received to date.

New York City Department of Buildings

M&E performed a search on the Buildings Information Search ("BIS") on the DOB website on August 3 and 14, 2006. The BIS indicated that there are two Building Information Numbers ("BINs") for the Site at Block 3247 Lot 2. BIN 2098782 corresponds to the 2 West 195th Street address and lists five (5) active DOB violations. BIN 2098784 corresponds to the 29 West Kingsbridge Road address and lists forty-five (45) total Actions at the site. These actions include building notices, miscellaneous, curb cut, elevator, fire protection plans, public assembly, permit, Special Reports and plumbing repair slips. In addition, there are six (6) complaints, eighteen (18) DOB violations, and three (3) ECB violations. All six (6) complaints are reported to be resolved. Of the eighteen (18) DOB violations, seventeen (17) are for boiler violations, and one (1) for a construction violation. All DOB violations remain active. Two (2) of the three (3) ECB violations remain open, failure to maintain exterior building wall has been resolved.

New York City Department of Health and Mental Hygiene

A FOIL letter was submitted to the Records Access Officer of the New York City Department of Health and Mental Hygiene ("NYCDHMH") by M&E on July 20, 2006 requesting a file search for the Site. No response from the NYCDHMH has been received to date. M&E will immediately notify the EDC should the NYCDHMH provide information indicating the presence of additional environmental concerns at the Site.

New York City Department of Environmental Protection

A FOIL letter dated July 20, 2006 was submitted to Mr. Frank Schiano, legal advisor to the New York City Department of Environmental Protection ("NYCDEP") and the New York City Department of Environmental Health ("NYCDEH"). To date, no response has been received from the NYCDEP or the NYCDEH. M&E will notify EDC if additional site information is provided by this agency.

6.2 State Agencies

New York State Department of Environmental Conservation

A FOIL letter was submitted to the Records Access Officer of the New York State Department of Environmental Conservation ("NYSDEC") by M&E on July 20, 2006 requesting a file search for the Site. NYSDEC has not yet replied to M&E. Should any environmental concerns be noted by the NYSDEC in their reply, M&E will immediately notify the EDC.

7.0 CLIENT PROVIDED INFORMATION

M&E requested that the EDC provide copies of all available information related to the subject site or surrounding area. Mr. Daniel Bruen of Turner Construction was contacted and provided a copy of the ET Environmental Corporation (September 15, 2000) *Kingsbridge Armory Roof Rehabilitation Project Environmental Survey Report*. The report consisted of an asbestos survey report and removal specifications, a LBP survey report and removal specifications and a survey of biological contamination (bird droppings). The findings of the report were used to determine the environmental conditions and potential impacts to scheduled roof renovation activities.

8.0 SITE RECONNAISSANCE

Mr. Ronald Kantor of M&E accompanied by Mr. Carl Gregg of Apple Industrial (an EDC subcontractor) conducted the site reconnaissance on June 30, 2006. A photographic log is located in Appendix J.

8.1 Methodology and Limiting Conditions

Performance of the Phase I ESA was limited to visual inspection of the Site. The Site was completely accessible with the exception of certain rooms in the towers where the floors were compromised from water damage and the floor of the theater and the basement boiler room, both of which were flooded at the time of the site visit.

8.2 Site Conditions

The Site is accessible from a gated entrance off Reservoir Avenue. Entrance to the Armory is monitored by a security guard stationed in a guard shack located at the Reservoir Avenue entrance. All remaining entrances to the Armory are locked and the Armory is surrounded by chain-link security fence. Access to the 2-story annex building is along West 195th Street, and the National Guard garage building west of the annex is also fenced. Grassy areas are present along the northern, southern and western perimeters of the Site; however, the western portion is mostly paved and utilized for parking and access to the Armory drill floor. The eastern portion of the Armory abuts the sidewalk of northbound Jerome Avenue.

Major roof renovations to the metal and glass roof spanning the drill hall and to the flat roof behind the parapets above the company rooms located south of the drill hall were conducted between 2000 and 2005.

Three (3) levels exist beneath the poured concrete drill hall floor, which was originally an earthen floor. These levels include additional company rooms and work shops; a theater and lecture hall; a former gymnasium and basketball court; a former bowling alley; rifle and pistol ranges; and, subterranean parking/vehicle storage space. Peeling paint and mold were prevalent throughout the subterranean levels. Trash and debris is also present in many of the smaller company rooms as well as used clothing left by the former Woman's Shelter. Standing water is present on the former theater/lecture hall floor and is currently pumped to the sanitary sewer. Standing water is also present in the lower level parking/vehicle storage area.

Two (2) 275 gallon fuel oil ASTs located two (2) levels below the drill hall in the southwestern portion of the Armory, east of the former bowling alley. The tanks did not appear to contain significant amounts of product. An additional 275 gallon fuel oil AST was observed on the drill hall floor in the northeastern portion of the Armory and also did not appear to contain a significant amount of product. A petroleum odor was detected in room B-20 located on the first level below the drill floor in the western portion of the building; however, no source for the odor could be located. Several 5-gallon pails of Esguard LubraKote Black, a flashing cement, were observed in several of the rooms on the second level below the drill hall in the western portion of the Armory. Cans of motor oil, brake fluid and other petroleum-based lubricants as well as empty gasoline cans were observed in the motor pool workshops located along the northern portion of the company rooms on the mezzanine of the second level below the drill floor. Ten (10) 55-gallon steel drums were observed in the lower level parking/vehicle storage area. The drums show signs of deterioration with rust and holes in several of the drums. The content of the drums is unknown, although most appear to be empty.

Three (3) earthen floored rifle and pistol ranges were observed on the Site and are suspected to contain elevated concentrations of lead from spent munitions. The first pistol range is located on the second level below the motor pool workshops. Spent munitions were observed embedded in the wooden walls of pistol range. The other pistol/rifle ranges are located on the third level below the drill floor in the eastern portion of the building near Jerome Avenue. No spent munitions were observed at these ranges.

On-site equipment such as the boiler located in the southwestern portion of the basement of the company rooms and air conditioning units located in the northeastern portion of the Armory, one (1) level beneath the drill hall are deteriorating and appear to be no longer functional.

The company rooms and tower rooms in the southern portion of the Site are largely comprised of living quarters, office/administrative space, dining and entertainment rooms (including a library, bar and sitting rooms). The upper floors of the company rooms are significantly water damaged with walls, floors and ceilings beginning to or already collapsing. Peeling paint, mold and trash and debris are prevalent throughout the company rooms. The boiler room, located in the lowest level in southwestern portion of the company rooms, is flooded. The boiler is no longer operational. An electrical panel was reported to have fallen into a large puddle of water on the boiler room floor. Con Ed responded by taking the electrical panel off-line and ran emergency lighting in the boiler room.

8.3 Site Utilities

The Armory is served in a limited electrical service. The National Guard building is served by electric, natural gas, sewer and water. Public utility features observed in the street and sidewalk areas indicate that the area is served by Con Edison (electricity), Keyspan Energy (natural gas), the NYCDEP (sewer, water), and Verizon (telephone).

8.4 Site Drainage

The site is located within the City's Ward's Island Drainage Area, and is served by the water pollution control plant of the same name. Under normal conditions, drainage from the Site is collected in the surrounding combined sewers, and treated at the plant prior to discharging to the East River.

8.5 Underground and Aboveground Storage Tanks

Three (3) 275 gallon fuel oil ASTs were observed at the Site during the site reconnaissance. The ASTs appear to be in fair to good condition with some surface oxidation and peeling paint observed on the two (2) tanks located in the vicinity of the former bowling alley. The ASTs did not appear to contain significant amounts of product. In addition, the center of the parking/vehicle storage area was observed to have been saw cut and backfilled with sand. This area may have once contained a UST.

8.6 Oil-Filled Equipment

The boiler and air conditioning units located in the northeastern portion of the Armory, one (1) level beneath the drill hall units may contain residual fuel oil and lubricating oils.

8.7 Hazardous Materials and Petroleum Storage

Peeling lead-based paint ("LBP"), light ballasts possibly containing polychlorinated biphenyls ("PCBs"), and potential asbestos containing materials ("ACM") including pipe wrap and floor tiles are most likely present. Residual fuel oil may be present in the three (3) ASTs. Cans of motor oil, brake fluid and other petroleum-based lubricants as well as empty gasoline cans were observed in the motor pool workshops located along the northern portion of the company rooms on the mezzanine of the second level below the drill floor.

8.8 Waste Generation

Solid wastes generated at the Site are collected by the New York City Department of Sanitation.

8.9 Neighboring Properties

Neighboring properties include PS 86 and Walton High School to the north; retail, commercial and residential properties east along Jerome Avenue and south along West Kingsbridge Road; and, the Fordham Manor Reformed Church and Apartment buildings west of the Site.

9.0 INTERVIEWS WITH FACILITY PERSONNEL

Charles Braswell and Carl Gregg of Apple Industrial provided information regarding the current operations of the Site and additional background information regarding the basement boiler room flooding and electrical panel failure for this Phase I ESA.

10.0 FINDINGS AND CONCLUSIONS

An environmental database provided by EDR identified sites within the search radii where documented environmental impacts have occurred. Although the EDR database information did not include any documentation from which it could be concluded that the sites identified within the search radii have impacted the Site, it is possible that groundwater under the Site has been impacted due to the industrial/commercial use of the surrounding area, and by potential contamination in on-site fill materials. However, it should be noted that the groundwater in this area is not used as a potable source.

During the Phase I ESA, a visual inspection of the Site was performed. The visual inspection identified three (3) 275 gallon fuel oil ASTs. One (1) tank is located in the northeast corner of the building on the drill hall floor; the two (2) remaining tanks are located two (2) levels below the drill hall in the southwestern portion of the building, east of the former bowling alley. None of the tanks appeared to contain significant amounts of product. A petroleum odor was detected in room B-20 located on the first level below the drill floor in the western portion of the building; however, no source for the odor could be located. Several 5-gallon pails of Esguard LubraKote Black, a flashing cement, were observed in several of the rooms on the second level below the drill hall in the western portion of the building. Cans of motor oil, brake fluid and other petroleum-based lubricants as well as empty gasoline cans were observed in the motor pool workshops located along the northern portion of the company rooms on the mezzanine of the second level below the drill floor. Ten (10) 55-gallon steel drums were observed in the parking/vehicle storage area located three (3) levels below the drill hall floor. The drums are beginning to show signs of deterioration with rust and holes present in several of the drums. The content of the drums is unknown, although most appear to be empty. In addition, possible oil staining of the concrete near the center of the parking/vehicle storage area was observed as well as an area where the concrete floor was saw cut and backfilled with sand. This area may have once contained a UST.

Three (3) earthen floored rifle and pistol ranges were observed on the Site and are suspected to contain elevated concentrations of lead from spent munitions. The first pistol range is located on the second level below the motor pool workshops. Spent munitions were observed embedded in the wooden walls of pistol range. The other pistol/rifle ranges are located on the third level below the drill floor in the eastern portion of the building near Jerome Avenue. No spent munitions were observed at these ranges.

Deteriorating equipment such as the boiler located in the southwestern portion of the basement of

the company rooms and air conditioning units located in the northeastern portion of the Armory, one (1) level beneath the drill hall may contain asbestos, lubricating oils and refrigerants. Peeling paint that may contain lead, light ballasts possibly containing PCBs, potential ACM including pipe wrap and floor tiles and extensive mold growth was present in the majority of the company rooms located along the southern portion of the Armory and the company rooms beneath the drill hall. In addition, water damage to the walls, ceilings and floors of the upper level company rooms and turret rooms is prevalent.

In September 2000, ET Environmental submitted an Environmental Survey Report to the EDC prior to the roofing renovations to determine the presence of ACM, LBP and bird droppings. Samples collected in the vicinity of the work areas indicated non-friable asbestos and LBP were present on the Site. Additional sampling for ACM, LBP and a light ballast survey are recommended for the company rooms and the levels beneath the drill hall. A survey of the 55 gallon drums should be conducted to include an inventory of the drums and a determination of the contents of the drums. Once completed, the drums and their contents should be properly disposed. It is also recommended that the three (3) ASTs be removed as well as the petroleum products in the motor pool workshops and the lower levels beneath the drill hall. Deteriorating equipment should also be properly removed from the site. In addition, the earthen floors of the pistol and rifle ranges should be remediated and the spent rounds from the walls of the second level pistol range should be removed due to the potential presence of lead.

Additional recommendations could be warranted should potential environmental issues be identified by outstanding FOIL/Information requests submitted to the New York City Department of Environmental Protection, the New York City Department of Health, and the New York State Department of Health.

11.0 STATEMENT OF LIMITATIONS

The data presented and the opinions expressed in this report are qualified as follows:

1. The sole purpose of the investigation and of this report is to assess the physical characteristics of the Site with respect to the presence or absence in the environment of oil or hazardous materials and substances as defined in the applicable state and federal environmental laws and regulations and to gather information regarding current and past environmental conditions at the Site.

2. Metcalf & Eddy (M&E) derived the data in this report primarily from visual inspections, examination of records in the public domain, and interviews with individuals with information about the Site. The passage of time, manifestation of latent conditions or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, and conclusions expressed in the report.

3. In preparing this report, M&E has relied upon and presumed accurate certain information (or the absence thereof) about the Site and adjacent properties provided by governmental officials and agencies, the Client, and others identified herein. Except as otherwise stated in the report, M&E has not attempted to verify the accuracy or completeness of any such information.

4. The data reported and the findings, observations, and conclusions expressed in the report are limited by the Scope of Services. The Scope of Services was defined by the requests of the Client, the time and budgetary constraints imposed by the Client, and the availability of access to the Site.

5. Because of the limitations stated above, the findings, observations, and conclusions expressed by M&E in this report are not, and should not be considered, an opinion concerning the compliance of any past or present owner or operator of the site with any federal, state or local law or regulation. No warranty or guarantee, whether express or implied, is made with respect to the data reported or findings, observations, and conclusions expressed in this report. Further, such data, findings observations, and conclusions are based solely upon site conditions in existence at the time of investigation.

6. This report has been prepared on behalf of and for the exclusive use of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

7. The Phase I ESA was performed using standard engineering practices, with the understanding that environmental professionals can and should use their professional judgment in carrying out environmental site assessments.

1.0 INTRODUCTION

This Phase II Environmental Site Assessment (Phase II ESA) Work Plan details the investigation activities and methodologies implemented at the Kingsbridge Armory Site (refer to Site Description below). This Work Plan was prepared by TRC Environmental Corporation (TRC) on behalf of the New York City Economic Development Corporation (NYCEDC). As documented by previous environmental reports and a site visit by TRC, there are recognized environmental conditions (RECs) and environmental concerns associated with the Site that were evaluated under the Phase II ESA. The overall objective of the Phase II Environmental Site Assessment (Phase II ESA) was to assess the potential presence and nature of Site contamination not including lead based paint, asbestos containing materials, mold, or hazardous building materials (e.g., fluorescent bulbs, ballasts) associated with the property.

1.1 Site Description

The Site is an approximately 5-acre parcel encompassing four city blocks and consisting of a Romanesque-style fortress (the "Armory"), two smaller annex buildings located to the north of the Armory, and paved parking area at the west end of the Site. The legal description for the Site is Block 3247, Lot 2. The Site is bounded by West 195th Street to the north, Jerome Avenue to the east, Kingsbridge Road to the South, and Reservoir Avenue to the west.

The Armory is comprised of over 475,000 square feet of space, with a main drill hall occupying most of the ground floor and three levels below the drill hall. The lower levels of the Armory include rifle and pistol ranges, subterranean parking, and open storage space. A one-story brick Annex building is located to the north of the Armory, near the intersection of Reservoir Avenue and West 195th Street, and is used for vehicle storage (the "Maintenance Building") by the National Guard. A two-story brick Annex Building is located to the north of the Armory, at 10 West 195th Street, and is used as a recruiting office for the National Guard.

Figure 1 shows the general location of the Site. Figure 2 shows site layout and the boundaries of property.

1.2 Site History

The Phase I ESA Sanborn fire insurance maps from 1914 to 1996 indicate that the Site was developed since at least 1914 and occupied by the 8th Coast Artillery, District N.G.N.Y. (National Guard of New York). According to the Phase I Environmental Site Assessment (Phase I ESA) report dated September

2006 and prepared by Metcalf and Eddy, Inc. (M&E) for EDC, construction of the Armory began in 1913 and was completed in 1917. A 1978 Sanborn map presented in the Phase I ESA indicates that the adjacent two-story Annex building was constructed in 1958. The adjacent Annex garage building is also shown on this Sanborn map; however, there is no construction date indicated on the map for the building.

1.3 Future Use of the Site

The planned redevelopment of the Site includes a mixed-use of community space, schools, department store, movie theatre, parking garage, and a YMCA. The proposed future development plans will require extensive renovation of the existing Armory and Annex Buildings currently located at the Site.

2.0 PREVIOUS STUDIES

As previously indicated, M&E prepared a Phase I ESA report for the Kingsbridge Armory dated September 2006 on behalf of NYCEDC. The Phase I ESA made no conclusions with regards to the presence or absence of RECs at the Site. However, the following findings in the Phase I ESA report can be interpreted as representing RECs or environmental concerns for the Site:

- An area of the concrete floor on the lowest level of the Armory appeared to be saw cut and backfilled with sand. The Phase I ESA concluded that this area represent a possible location where an underground storage tank (UST) had been removed. The former presence of a UST at this location represents an REC; however, TRC was unable to find this location and any records concerning the prior presence of an UST at this location.
- The three earthen floor indoor shooting ranges within the Armory potentially have spent lead-containing shells. The presence of lead-containing shells within the Armory represents an environmental concern.
- Three 275-gallon fuel oil aboveground storage tanks (ASTs) were identified in the Armory. One tank is located in the northeast corner of the drill hall floor and the other two are located two levels below the drill hall floor in the southwestern portion of the building, east of the former bowling alley. TRC observed the one AST located on the drill hall floor during our site visit. This tank still contained diesel fuel for an emergency generator that was no longer operable. The tank appeared to be in good condition with no signs of leaks. The other two tanks were observed to be in the subbasement and appeared empty with no signs of leaks; however, access to the tanks was limited due to the presence of surrounding debris and standing water.
- Ten 55-gallon steel drums were reported in the parking/vehicle storage area located three levels below the drill hall floor. The drum's contents were reported as unknown and most free of liquids. During TRC's site visit, several empty drums were observed in this area with no signs of potential releases.
- Suspected peeling lead based paint, potential polychlorinated biphenyl (PCB) containing light ballasts, potential asbestos containing materials (ACM) including pipe wrap and floor tiles, and extensive mold growth were noted present in portions of the Armory.

Naeva Geophysics Inc. (Naeva) prepared a geophysical survey report on behalf of ATC Associates, Inc., dated August 18, 2000. The geophysical survey report identified the following current and former locations of USTs that represent RECs:

- An abandoned fill port and vent pipe were located along the western exterior of the Armory, and the geophysical survey traced the lines associated with the vent pipe and fill port to a nearby 12-foot by 15-foot area where the asphalt pavement had been removed. The geophysical survey found no evidence of buried metal at this location, and the report interpreted the area to represent a former UST location.
- A 30-foot by 30-foot area of reinforced pavement is located along the western exterior of the Armory and to the south of the aforementioned former UST location. The geophysical survey detected elevated electromagnetic (EM) response at this location, and the report interpreted the geophysical anomaly to represent a potential UST location.
- Two vent pipes were observed along the western perimeter of the Maintenance Building to the north of the Armory. The geophysical survey traced the lines associated with the vent pipes to two areas where the concrete pavement had been patched. Although the findings of the geophysical survey were inconclusive regarding USTs at these locations due to interference from metal objects on the surface (i.e., cars and metal dumpsters), the geophysical survey report interpreted each of the patched areas to represent a potential UST location.

3.0 SCOPE AND METHODOLOGY

From July 18, 2007 to August 6, 2007, TRC conducted a Phase II ESA at the Site. The overall scope and methodologies of TRC's Phase II ESA is consistent with the Phase II ESA Work Plan dated July 2007. Photographs documenting implementation of the Phase II ESA are presented in Appendix B.

3.1 Scope of Phase II ESA

TRC's Phase II Environmental Site Assessment included the following:

- Geophysical survey at suspected historic underground storage tank (UST) locations and planned drilling locations (buried utility clearance),
- Test pit excavations at two of the three historic tank locations,
- Completion of 13 soil borings around historic UST locations,
- Installation of 4 permanent groundwater monitoring wells around historic UST locations,
- Collection of 18 soil samples from 15 locations at the indoor shooting ranges, and
- Collection of 14 soil boring samples and 4 groundwater samples for laboratory analysis in response to the aforementioned recognized environmental conditions,

The scope of each of these elements is described in the subsections below.

3.2 Geophysical Survey

The results of the prior Naeva geophysical investigation and TRC's site visits indicated evidence of several potential USTs along the western perimeter of the Armory and Maintenance Building. In addition, the Phase I ESA identified a potential UST location within the lowest level of the Armory. However, this location was not evident in the field and therefore could not be investigated further.

The primary objective of the geophysical survey was to identify the presence of historic USTs and to assess planned subsurface sampling locations for underground utilities. Enviroprobe conducted a subsurface geophysical investigation at the subject property at the suspect UST locations under the direction of TRC. The investigation utilized a Mala Geoscience Ramac X3M cart-mounted Ground Penetrating Radar (GPR) unit, a Radiodetection PDL2-4M multi-frequency receiver and transmitter (Radiodetection), and a Fischer Scientific TW-6 metal detector.

The penetration depth of the GPR unit varies from several inches to tens of feet according to site-specific conditions. The penetration depth decreases with increased soil conductivity. The penetration depth is the greatest in ice, dry sands and fine gravels. Clayey, highly saline or saturated soils, areas covered by steel reinforced concrete, foundry slag, of other highly conductive materials greatly reduced GPR penetration. The Radiodetection receiver and transmitter are commonly used for pipe and cable locating. These instruments were used to identify suspect USTs, buried pipelines and other potential subsurface structures of concern.

The two historic UST locations at Kingsbridge Armory west of the Maintenance Building are covered by reinforced concrete, thereby limiting the effectiveness of the geophysical survey equipment to locate the USTs. At a third suspect UST location that corresponds with an area that Naeva had previously indicated where asphalt pavement had been removed and a fill and vent pipe were present, and the geophysical survey found no evidence of buried metal. A small guard booth for the Armory is currently present at this location. The guard booth was installed by NYCEDC at this location in the Summer of 2003 and is constructed of metal frame and siding on a concrete slab. The previously identified flush-mounted steel fill pipe for this location is still present in the asphalt just south of the Guard Booth and inscribed with the words GASOLINE along its rim. At the 30-foot by 30-foot area of reinforced concrete pavement previously identified by Naeva and located along the western exterior of the Armory to the south of the aforementioned former UST location, there are no signs of potential USTs (e.g., fill pipe, vent pipe, manway) and no known historic USTs at this location associated with the Armory. Furthermore, TRC believes that this slab may be related to a former below-grade pump house reported in this area for the Jerome Reservoir previously located on the Armory site.

Numerous utilities including water, sewer, gas, and electric are also located near the UST locations and planned soil boring/well locations. Some soil boring and well locations were adjusted to avoid buried utilities to assure safe working conditions.

3.3 Test Pits

Following the completion of the geophysical surveys, test pit excavations were completed at two of the three historic UST locations by American Environmental under contract to TRC to assess the presence of an UST. Based on the test pitting findings at the two locations, TRC was able to confirm the presence of two abandoned USTs west of the Maintenance Building. Concrete slabs over the tank locations were marked with the numbers "94" along with several individual names likely indicative of the date that the slabs were poured (i.e., tanks closed) and the persons that did the work. After removing a portion of the slab and underlying soils to expose the tanks, it was determined that the top of each steel UST had been cut open and filled with a gravel/sand mixture. The gravel/sand in the tanks appears to have settled and

as a result a void space in the top of each tank appears to have filled with rain water that had penetrated cracks in the surface concrete and collected in the void space inside the tanks. The water, sand and gravel were visually observed and field screened with a PID and there were no signs of any petroleum impacts. TRC did not collect soil or water samples from the test pit locations. The test pits were backfilled with removed material and the removed overlying concrete slab area was filled to grade with recycled concrete/aggregate material brought to the site by American Environmental. The concrete slab debris from each test pit location was removed from the site and disposed of offsite.

3.4 Soil Sampling and Analysis/UST Investigation

The primary objective of the soil sampling was to assess overall soil conditions at the three known historic UST locations. As shown on Figure 4, TRC advanced thirteen soil borings, corresponding to four borings at each of the known existing and former UST locations and one additional boring (SB-13) near one boring location (SB-12) where an elevated PID soil reading was measured at the bottom of boring and the boring was terminated due to refusal.

A vehicle-mounted, hydraulically-powered machine (Geoprobe® Model 6600) using static force and percussion advanced small-diameter tools into the subsurface to collect soil samples at each soil boring location. At each location, an attempt was made to advance a soil boring to the water table utilizing the direct push unit. At several boring locations, shallow refusal was encountered before groundwater. At least one boring location per UST location was completed to groundwater. All soil boring samples were continuously collected at 5-foot intervals and field screened for volatile organic compounds (VOCs) and signs of potential petroleum contamination to the water table, utilizing a PID and field observations (e.g., staining, odors, etc.). Geologic descriptions of the soil and field screening results were recorded in field logs. Appendix C contains the soil boring logs prepared by TRC.

At a minimum, one sample was selected from each boring for laboratory analysis from depths exhibiting evidence of potential contamination (e.g., odors, staining, PID readings). If there were no indications of potential contamination, the soil samples for analysis were either collected from the sampling interval above the inferred depth of the water table or the deepest interval prior to refusal. Selected discrete soil samples were analyzed for the following parameters:

- Target Compound List Volatile Organic Compounds (TCL VOCs),
- Target Compound List Semivolatile Organic Compounds (TCL SVOCs),
- Target Compound List Pesticides/Polychlorinated Biphenyls (TCL pesticides/PCBs) and
- Target Analyte List Metals (TAL Metals)

Samples were containerized in accordance with EPA analytical protocols. Each container was properly labeled and placed in an iced cooler for transport to the laboratory. A chain-of-custody was completed in the field and accompanied the samples to the laboratory.

3.5 Groundwater Sampling and Analysis

A conventional hollow-stem auger rig was used to install four, two-inch diameter permanent groundwater monitoring wells at the Site. The initial scope of work called for 5 wells to be installed; however, due to the greater than anticipated depth to groundwater and numerous obstructions (cobbles, boulders, etc) that were encountered during the drilling, only four groundwater wells were able to be installed. Groundwater depth ranged from 26.69 feet (ft) below top of well casing (BTOC) to 29.88 ft BTOC in MW-1. The wells are flush-mounted wells with the top of casing located slightly below the adjacent grade. Groundwater flow direction is to the south west. Figure 4 shows the surveyed groundwater depth as well as the groundwater flow direction.

Groundwater monitoring wells were constructed of threaded Schedule 40 PVC well casing and 20-slot well screen. The wells were screened approximately 10 feet above the water table and 10 feet below the water table. Clean silica sand, Morie No. 2, or equivalent, was placed in the annular space around the well screen to a minimum of one foot above the top of the well screen, two feet being optimal. A two-foot bentonite seal was placed above the sand pack and hydrated with potable water. A portland cement/bentonite grout (6:1 ratio) was placed the well annulus up to 12 inches below grade only after the underlying bentonite seal was fully hydrated. A concrete ground surface seal or apron was installed 12 inches deep and surrounding the well at least 6 inches wide and sloped flush to surrounding paved surfaces. An 8-inch diameter protective flush-mounted steel surface manhole marked MONITORING WELL with a bolted cover was securely set in the concrete with a 12-inch steel skirt over the PVC well casing. A locking well cap with a keyed-alike brass lock was provided for each well. Well construction diagrams were prepared by TRC for each well and are located in Appendix C.

Following development, the wells were allowed to equilibrate for seven days prior to groundwater sampling. The volume of water removed, the well development time, and field instrument readings were recorded. Groundwater development and sample logs are located in Appendix D.

Just prior to sampling the new groundwater monitoring wells, the wells were purged utilizing a low-flow submersible stainless steel pump and dedicated polyethylene tubing connected to a flow-through cell for monitoring water quality parameters. The submersible pump was decontaminated prior to sampling utilizing a solution of deionized water and Alconox detergent. Low purging rates were used to minimize suspension of particulate matter in the well. Field parameters including temperature, conductivity, pH,

turbidity, and dissolved oxygen (DO) were recorded during purging and before sampling. Prior to sampling, the goal of within ±10 percent for two consecutive readings for the field parameters was attained at each location. After completing purging, groundwater samples were collected with the low-flow submersible pump and dedicated disposable polyethylene tubing.

The locations and elevations of the tops of casings of all groundwater monitoring wells at the Site were surveyed by a New York State licensed land surveyor under contract to NYCEDC.

The groundwater samples were analyzed for the following parameters:

- TCL VOCs,
- TCL SVOCs, and
- TAL Metals (filtered and unfiltered).

Samples were containerized in accordance with EPA analytical protocols. Each container was properly labeled and placed in an iced cooler for transport to the laboratory. A chain-of-custody was completed in the field and accompanied the samples to the laboratory.

3.6 Surficial Soil Sampling/Shooting Ranges

Soil samples were collected from the three separate rifle/pistol shooting ranges located on the interior lower levels of the Armory. Dedicated, decontaminated stainless steel spoons were utilized to collect the soil samples at each of the shooting ranges, and samples were collected from multiple depths in each area. The soil samples were collected from 0 to 1.5 feet below ground intervals. A total of eighteen (18) soil samples were collected for total lead analysis from the five pistol shooting ranges and one rifle shooting range. Several of the samples were also screened in the field with a No. 5 sieve (4 mm or 0.157 inch opening to remove large pieces of lead shot. Based on the total lead sample results, eleven (11) of these soil samples were analyzed for TCLP leachable lead for waste disposal characterization. The locations of the soil sampling associated with the shooting ranges are shown on Figure 5.

Additional lead impacted material disposal will be necessary in the pistol range containing SB-I/9, SB-J/10, and SB-P/16. The wall on the west end of this firing rang is composed of wood (approximately 840 cubic ft) containing lead shot. The location of the wooden wall is shown on Figure 5.

3.7 Waste Management

Investigation derived wastes (IDW) are waste materials that was generated during the Phase II site investigation. The IDW included boring soil, well development and purge groundwater,

decontamination liquids, and personal protective equipment (PPE). Following groundwater well installation, six drums were properly labeled and stored on site. Three drums containing soil, two drums containing groundwater from well development and purging/sampling and decontamination water, and one drum containing soiled PPE was accumulated during the soil and groundwater investigation and are currently staged on site.

4.0 OBSERVATIONS AND ANALYTICAL FINDINGS

4.1 Nature of On-Site Materials

TRC completed 13 soil borings to characterize subsurface conditions adjacent to historic UST locations at the Site. Soil borings exposed urban fill materials to depths of approximately 5- to 10-feet below grade (ftbg). The urban fill appears to consist mainly of brown fine to coarse sand with some gravel and silt and contains construction debris including brick and concrete. Native glacial deposits below the urban fill consist of brown fine to coarse sand with some fine gravel and cobbles. Shallow refusal was encountered at several locations and was believed to be caused by large cobles or boulders. Boring logs describing subsurface conditions at the Site are presented in Appendix C.

4.2 Geophysical Survey

On July 16, 2007, a geophysical survey was performed by Enviroprobe for the purpose of locating underground storage tanks (USTs) and clearing proposed boring locations of buried utilities. The GPR penetration depth varied throughout the survey area and ranged from approximately 2 to 5 ftbg. Due to the presence of reinforced concrete, the GPR range was limited and could not confirm whether or not USTs were present at the two locations near the Maintenance Building. For each proposed boring location, an area measuring approximately 10 feet by 10 feet around the borings, were surveyed for underground utility pipes using Radiodetection instruments, metal detector and GPR. Located buried utilities were marked on the ground surface with spray paint to aid in locating borings away from these utilities.

4.3 Soil Boring/UST Investigation

TRC completed 13 soil borings and collected 14 soil samples from these borings for laboratory analysis to assess the soil conditions near the historic UST locations. The soil boring sample analytical results are summarized in Tables 1 through 5. Laboratory sample data summary reports are presented in Appendix D. Figure 3 shows the soil sampling boring locations. Soil contaminant levels were evaluated by comparison with the NYSDEC's 6 NYCRR Part 375 Brownfield Cleanup Program (BCP) Unrestricted Residential Use and Restricted Residential Use Soil Cleanup Objectives (SCOs). The SCO values used for comparison are the lower of the Protection of Public Health SCO or Protection of Groundwater SCO. These SCOs are the most recent published risk- and use-based levels that became effective December 14, 2006. Additionally, soil contaminant levels were compared to NYSDEC's Technical and Administrative Guidance Memorandum 4046 (TAGM 4046) recommended soil cleanup objectives (RSCOs) for inactive hazardous waste sites. The TAGM 4046 soil guidelines are still used by the NYSDEC to assess soil levels at sites outside of the BCP, Environmental Restoration Program, or

inactive hazardous waste disposal site remedial program. Therefore, comparison to the TAGM 4046 criteria is included because some NYSDEC Departments and the New York City Department of Environmental Protection (NYCDEP) continue to use these guidelines to evaluate sites in NYC. Significant findings of the soil boring sample analyses are summarized below:

- Slightly elevated PID readings and petroleum-like odors were observed in the field at boring locations SB-8 and SB-12.
- No VOCs were detected in the soil samples at concentrations exceeding NYSDEC Unrestricted or Restricted Residential Use SCOs or TAGM 4046 RSCOs. The 1,2-Dichloroethane presence in several of the soil samples was due to laboratory contamination. The laboratory has provided documentation confirming that the analysis for this compound is artificially elevated.
- SVOCs were detected at concentrations exceeding NYSDEC Unrestricted and Restricted Residential Use SCOs and TAGM 4046 RSCOs in 3 samples (SB-1 (13-15), SB-3 (12-14) and SB-7 (18-20)) of the 14 soil boring samples. The reporting limits for some SVOCs reported as undetected are slightly above the respective SCO; however, TRC was informed by the laboratory that the reporting limits are the lowest that could be achieved by the analytical method. The SVOCs detected above the comparison criteria consist primarily of carcinogenic polycyclic aromatic hydrocarbons (PAHs). While PAHs are associated with petroleum contamination, they are also commonly detected in urban fill due to fill characteristics and site conditions (e.g., asphalt fragments, urban atmospheric deposition). The highest concentrations of total SVOCs were detected at sample locations SB-1 (13-15). This soil sample was characterized as brown sand, clay and gravel with no PID readings, staining or odors. Soil sample SB-8 (18-20) and SB-12 (11-12) that had the highest observed PID levels and signs of potential petroleum impacts had nondetectable SVOC levels with similar reporting limits.
- No pesticides or PCBs were detected in the soil samples at concentrations exceeding NYSDEC's Unrestricted or Restricted Residential Use SCOs or TAGM 4046 RSCOs. The reporting limits for some pesticide compounds reported as undetected are slightly above the respective SCO; however, TRC was informed by the laboratory that the reporting limits are the lowest that could be achieved by the analytical standard method.
- Metals were not detected at concentrations exceeding NYSDEC Restricted Residential Use SCOs in the 13 samples collected. Several metals, were detected in the soil boring samples at levels above Unrestricted Residential Use SCOs including mercury in five samples, lead in three of the samples, nickel in two samples, and copper and zinc in one sample. Sample SB-6 (15-17) had three metals exceeding Unrestricted Residential Use SCOs and this sample consisted of sand and weathered rock with no signs of potential contamination. Several metals were detected in

the soil boring samples at levels above TAGM NYS background levels including beryllium in all eighteen samples, chromium in all eighteen samples, copper in seven samples, iron in all eighteen samples, nickel in seventeen samples, and zinc in all eighteen samples. Soil sample SB-8 (18-20) that had the highest observed PID level and signs of potential petroleum impacts (staining, odor) had no metals detected above SCOs. Based on the absence of any signs or potential sources of metals contamination related to the Site, these findings are likely indicative of site-specific background metals soil levels related to the native soils and/or urban fill conditions.

4.4 Groundwater Quality

TRC collected groundwater samples at four groundwater monitoring wells installed near historic UST locations at the western end of the Site to assess the presence of any groundwater impacts related to the former known UST operations. The analytical results are summarized on Tables 6 through 9. Groundwater contaminant levels were evaluated by comparison with the State's Ambient Water Quality Standards and Guidance Values for Class GA groundwater, as presented in the Division of Water Technical and Operational Guidance Series (TOGS) Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations (TOGS 1.1.1). Class GA groundwater represents a source of Drinking Water, and represents the groundwater classification that the NYSDEC would likely assign to the Site. Laboratory summary reports for the groundwater samples are presented in Appendix D. Figure 3 shows the groundwater sample locations. Significant findings of the groundwater sample analyses for this Phase II ESA are summarized below.

- One VOC was detected in the groundwater samples and it was detected a concentration just above the respective Class GA drinking water standard. Hexachlorobutadiene was detected at 0.63ug/L, slightly exceeding the Class GA standard of 0.5 ug/L. According to the federal Agency for Toxic Substances and Disease Registry (ATSDR) toxicological profile for this substance, Hexachlorobutadiene does not occur naturally in the environment. It is formed during the processing of other chemicals such as tetrachloroethylene, trichloroethylene, and carbon tetrachloride. Hexachlorobutadiene is an intermediate in the manufacture of rubber compounds and lubricants. It is used as a fluid for gyroscopes, a heat transfer liquid, or a hydraulic fluid. Therefore, TRC does not believe that this finding is related to the former historic UST operations on the Site.
- No SVOCs were detected in the groundwater samples.
- Several metals were detected at concentrations exceeding Class GA standards in each groundwater sample including iron, magnesium, manganese and sodium. Both the total and

dissolved (filtered) metals levels exceeded these standards. All of these metals are naturally occurring metals that are likely related to background soil and bedrock conditions in the area. Other metals detected in at least one of the groundwater samples but at levels below Class GA standards include calcium, copper, and chromium. Calcium was detected in each sample; however, there is no NYS groundwater standard or guidance value for calcium. Copper and chromium were only detected in sample MW-1 located just upgradient of the former gasoline UST along the western side of the Armory building.

- There were no signs of potential petroleum impacts (e.g., sheen, odor, free product) in the groundwater during the development, purging, or sampling of the wells.

4.5 Surficial Soil Quality/Shooting Ranges

TRC collected 18 soil samples from fifteen (15) surficial soil sampling locations for laboratory analysis to characterize total lead conditions at the indoor shooting ranges on the Site. One surficial soil sample was collected from within the 0 to 6 inches below grade at each location, In addition, at three of the locations, collocated samples were collected from multiple depths including TRC-SB-J/10 (0-3") and TRC-SB-O/16 (6"-1'), TRC-SB-K/11 and TRC-SB-Q/17 (screened through sieve), and TRC-SB-E/5 and TRC-SB-R/18 (screened through sieve). All of these samples were analyzed for total lead to assess the lead levels in the soils related to the prior shooting range operations. Of the 18 samples collected, 11 surficial soil samples were also analyzed for TCLP lead to assess leachable lead levels in representative samples from these areas. The surficial soil sample analytical results are summarized in Tables 6 and 7. Laboratory sample data summary reports are presented in Appendix D. Figure 5 shows the indoor shooting range soil sample locations. Soil contaminant levels were evaluated by comparison with the NYSDEC's 6 NYCRR Part 375 Unrestricted Residential Use and Restricted Residential Use Soil Cleanup Objectives SCOs and NYSDEC's TAGM 4046 RSCOs. Significant findings of the soil sample analyses are summarized below:

- The total lead levels of all but one of the soil samples (SB-O/15(0-3")) from the shooting ranges exceed the Unrestricted Residential Use SCO for lead (63 ppm). Of the remaining 17 soil samples, 12 samples had total lead levels that exceeded the Restricted Residential Use SCO (400 ppm) and the TAGM typical urban background upper range (500 ppm). Samples SB-K/11 and SB-E/5 were screened through a sieve in the field to remove large pieces of lead shot from the samples to produce samples SB-Q/17 and SB-R/18, respectively. The total lead concentrations between the sieved and non-sieved samples revealed little to no differences in concentrations. However, the shallow and deep analysis total lead comparison in samples TRC-SB-J/10 (0-3") (2,400 mg/kg) and TRC-SB-P/16 (6"-1') (180 mg/kg) from the same location showed significant differences in total lead concentrations. Also, there was a significant difference in concentration levels with regards to the distance of the sample location from the metal backstop or soil berm.

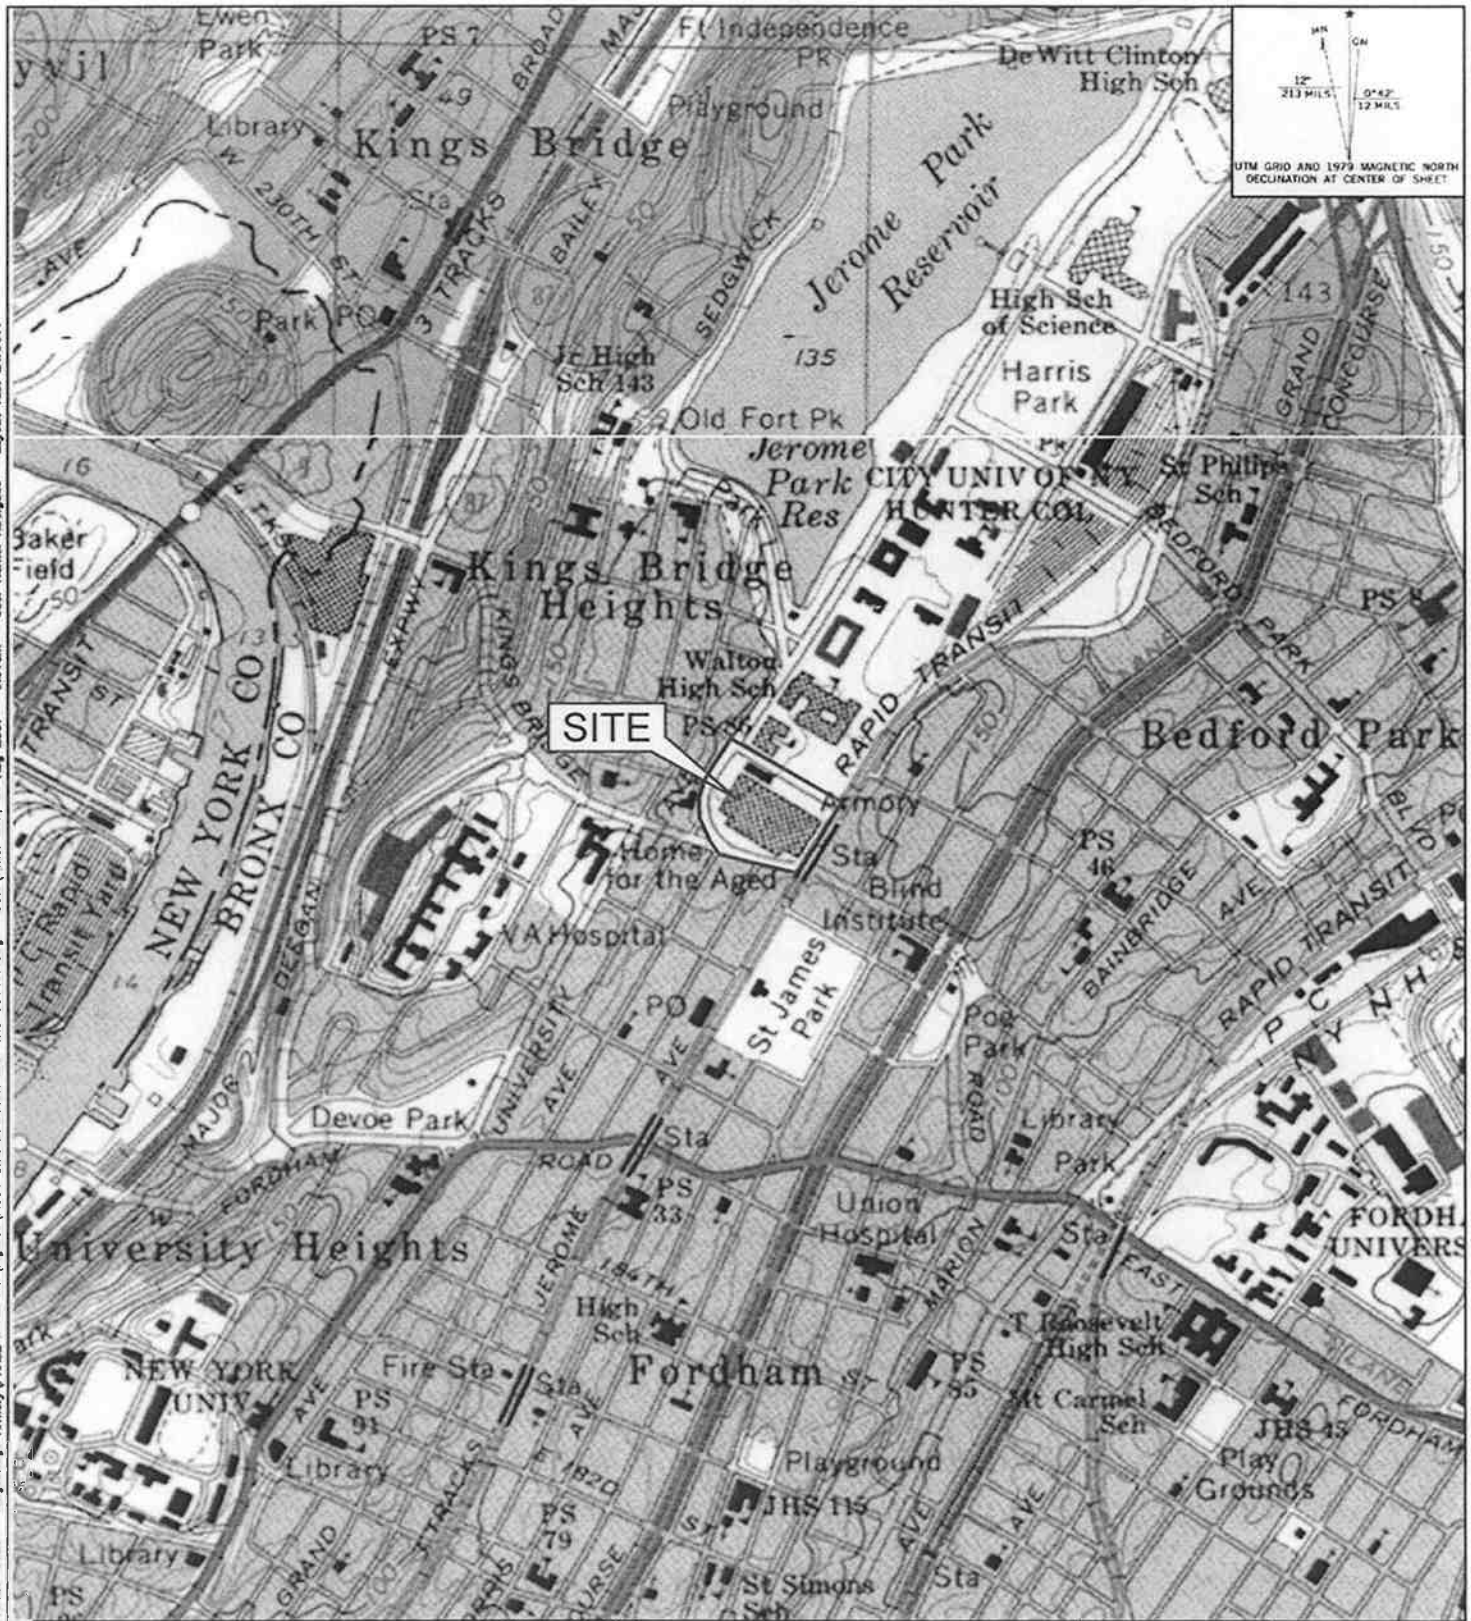
Generally, the samples collected closer to the metal backstop or soil berm backstop contained a higher concentration of total lead. The exceptions to this finding are samples SB-G/7 (3,200 mg/kg, collected from soil berm backstop) and SB-H/8 (5,500 mg/kg, collected from midway between firing area and berm), which were collected from the same shooting range. This finding may be due to the presence of more lead shot being present in the H/8 sample than the G/7 sample and not necessarily representative of the overall conditions in that range.

- TCLP lead was detected in 10 of the 11 soil samples submitted for this analysis. Representative samples were selected for TCLP testing based on the total lead sample results and consideration of various sample locations and depths in the shooting ranges. Leachable lead concentrations ranged from 1.6 mg/kg in TRC-SB-L/12 (3"-6") to 1,900 mg/kg in TRC-SB-A/1 (3-6"). Eight of these samples had TCLP lead levels that exceed the hazardous waste criterion for characterizing waste. The sieve screened samples TRC-SB-Q/17 and TRC-SB-R/18 showed a minor decrease in leachable concentrations from sieving samples SB-K/11 and SB-E/5. Whereas, a comparison of the leachable lead levels in the shallow and deep samples from the same location, TRC-SB-J/10 (0-3") (100 mg/L) and TRC-SB-P/16 (6"-1') (4.2 mg/L), showed significant differences in leachable lead concentrations.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Three inactive suspect petroleum ASTs are present in the building. One inactive AST located on the drill floor still contains diesel fuel and must be emptied and removed. Two other former ASTs on the subbasement level appeared to be empty; however, they were not completely accessible due to surrounding debris and could not be opened. These tanks must be emptied of any remaining or residual contents and removed. The drums that remain on the site are empty and should be collected and disposed of off site. Any other abandoned containers of unused products (e.g., paints, roofing cement) should also be collected and appropriately disposed of off site.

The test pit investigation confirmed the presence of two former petroleum USTs at the Site that had been closed in place by filling with gravel/sand mixture. The two tanks are located below two concrete covered areas in the parking lot directly west of the Maintenance Building. These are likely the two on-site USTs (3,000 gallon diesel, and 2,000 gallon gasoline) noted in the Phase I ESA report that were closed in September 1993. At another former gasoline UST location west of the Armory building, the survey did not detect a remaining UST; however, an existing guard booth over the suspected former UST location made it impossible to survey the actual suspected former UST location. Although a previous geophysical survey at the same location prior to the construction of the guard booth indicated no remaining UST. The Phase I ESA provides a record indicating that one 225-gallon gasoline UST was closed-removed in 1995 at the Site. This may have been the gasoline tank that was at this location but there is insufficient documentation to confirm if this was the same tank. The Phase I ESA also includes records regarding several spill reports associated with leaking tanks at the Site. The spill reports indicate the removal of tanks and soil contamination; however, there is insufficient information to determine the exact locations of the historic tanks and spills. NYSDEC records or other records sources (e.g., National Guard, Phase I ESA FOIL responses) should be researched further for any additional documentation on the tank closures and associated spills at the Site.



The results of the soil boring investigation around the former petroleum UST location indicate no significant concentrations of VOCs, SVOCs, PCBs, pesticides, or metals in the soils associated with the tanks. Rather, the investigation generally revealed the presence of soils with no signs of petroleum impacts with low levels of SVOCs and metals typically associated with such urban soils. Signs of petroleum impacts (e.g., odors, staining, PID readings) were observed at depths above the groundwater table at two boring locations (SB-8 at 18-20 ftbg, SB-12 at 11-12 ftbg). However, no SVOCs were

detected in either sample and only low levels of VOCs below established soil cleanup objective were detected in soil sample SB-8.

The results of the groundwater sample analysis indicate no detectable concentrations of SVOCs, pesticides, or PCBs in the groundwater near the former petroleum USTs. A low level of one VOC, hexachlorobutadiene, was detected in one well sample (MW-2) and at a concentration (0.63 ppb) slightly above the respective GA drinking water standard (0.5 ppb). The source of this VOC is unknown; however, it is not believed to be related to the former petroleum USTs on the Site. In addition, there were no signs of potential petroleum impacts (e.g., sheen, odor, free product) in the groundwater during the development, purging, or sampling of the wells. Other than calcium, iron, magnesium, manganese, and sodium, which typically reflect regional groundwater quality, no elevated concentrations of metals were detected in the groundwater. Based on the soil boring and groundwater findings, TRC does not recommend any further soil or groundwater investigations at the former UST locations unless such additional information is required by NYSDEC to close out open spill reports associated with the UST closures.

The indoor shooting range soil testing indicates the presence of elevated concentrations of total and TCLP leachable lead in the soils in the range. The highest lead levels were generally detected in the near surface soils and in the soil mounds located at the ends of several of the ranges. Lower lead levels were also generally detected in soils near the front of the ranges away from the ends where the bullets deflected into the soil floor. A majority of the samples tested for leachable lead levels showed lead levels that exceed hazardous waste characteristic criteria. TRC also observed evidence that there are large amounts of gunshot imbedded in the deteriorated wooden timber wall of the one western-most pistol range. Based on these findings, these soils and wooden timber wall should be removed and properly disposed off site with much of these soils having to be appropriately managed/disposed of as hazardous waste. The physical separation of lead shot from the soils during any removal will likely aid in reducing the soil lead levels, however, the limited screening done under this assessment showed no appreciable reduction.

TAGM = New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandums

Represents restricted residential use prohibits use of single family housing and vegetable gardens. Includes active recreational uses, which are public uses with a reasonable potential for soil contact. Restrictions on the use of groundwater are allowed

U - Concentration less than the minimum laboratory detection limit.

NC - No guidance criteria established for this compound

Bold values exceed unrestricted residential use.

Shaded values exceed restricted residential use.

TAGM = New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandums

Represents restricted residential use prohibits use of single family housing and vegetable gardens. Includes active recreational uses, which are public uses with a reasonable potential for soil contact. Restrictions on the use of groundwater are allowed
U - Concentration less than the minimum laboratory detection limit
NC - No guidance criteria established for this compound
Bold values exceed unrestricted residential use
Shaded values exceed restricted residential use
Italicized valhues exceed TAGM criteria

TAGM = New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandums

Represents restricted residential use prohibits use of single family housing and vegetable gardens. Includes active recreational uses, which are public uses with a reasonable potential for soil contact. Restrictions on the use of groundwater are allowed
U - Concentration less than the minimum laboratory detection limit.
NC - No guidance criteria established for this compound
Bold values exceed unrestricted residential use.
Shaded values exceed restricted residential use
Italicized vallues exceed TAGM criteria

Re: Asbestos Investigation
Kingsbridge Armory
29 West Kingsbridge Road
Bronx, New York
Langan Project No. 5815101

Dear Mr. Vanderwarker:

Langan Engineering and Environmental Services, P.C. (Langan) completed an asbestos investigation of the above referenced building. The purpose of this investigation was to confirm the presence/absence of asbestos containing materials (ACM) within the subject building. The asbestos investigation was performed on September 4, 5, and 8, 2008, by Langan's New York City Department of Environmental Protection Agency (NYCDEP) certified asbestos investigators, Messrs Miroslaw Baran and Sanjay Patel. Langan's certifications are provided in the Attachments.

Site and Building Description

The project site is at the center of a city block bordered by West 195th Street to the north, West Kingsbridge Road to the south, Jerome Avenue to the east, and Reservoir Avenue to the west (Figure 1). Most of the Site is occupied by the landmark Kingsbridge Armory building (Armory), which was constructed on an approximately 200,000-square-foot (sq-ft) footprint between 1912 and 1917 over the abandoned east basin of the Jerome Park Reservoir. The main drill hall at the center of the Armory measures approximately 300 by 600 feet (ft) and is spanned freely by an arched roof framing that rises 110 ft above the drill hall floor. Beneath the drill floor, two cellar levels formerly housed offices, a garage, a gymnasium, rifle and pistol ranges, and rooms for other military functions. The drill hall volume is flanked to the south by a two-story headhouse with a single cellar floor and four towers that contain offices and residential quarters. The eastern portion of the sub-cellar area underlies the Jerome Avenue sidewalk. The sub-cellar of the Armory building is accessible by a ramp that extends from West 195th Street. The Armory is currently owned and operated by the City of New York, and is used for

storage of City property. The heat and hot water to the building was supplied by oil-fired boilers located in the sub-basement.

Observations and Findings

Prior to conducting the field investigation, we reviewed the Environmental Survey Report dated August 24, 2000, prepared by ET Environmental Corporation (ET). The report documented the following building materials to be asbestos containing materials (ACM): Built-up roofing and flashing materials, Roof shingle, Various colors 9-inch square floor tiles, Air-cell and magnesia pipe and pipe joint insulation, Mud-pack pipe joint insulation associated with fiberglass pipe insulation, Window caulking and glazing putty, and Caulking associated with exterior joints, seams and cracks. The wall and ceiling plaster, boiler breeching and insulation, grey floor coating, various ceiling tiles and panels, wallboard and joint compound were documented to be non-ACM.

During Langan's investigation, suspect materials observed in the building were documented, assessed, quantified, and sampled, as necessary. In addition to the materials identified in ET report, Langan observed the following suspect materials which were not addressed: Baseboard Molding Glue, Pyroblock, Pressboard material, Wire wrap insulation, Electric ebony/Transite switch panel, Safety switch backing material, Vibration dumper cloth, Floor joint fill material, Wall panel glue, Mirror glue, Exterior and interior door caulking, Black and brown linoleum, 9-inch square beige floor tile and associated mastic, Black floor tile and associated mastic under plywood, 12-inch square beige floor tile and associated mastic, 12-inch square tan wood design floor tile and associated mastic, 12-inch square terracotta floor tile and associated mastic, 12-inch square dark brown floor tile and associated mastic, Mastic associated with various 9-ich square floor tiles, Pipe insulation debris mixed with plaster, wood and contaminated construction debris.

A total of sixty-six (66) bulk samples of the observed suspect materials were collected during our investigation. Samples were analyzed by AmeriSci laboratory of New York, New York. AmeriSci is accredited by the Environmental Laboratory Accreditation Program (ELAP) and National Voluntary Laboratory Accreditation Program (NVLAP). A copy of laboratory test results, chain-of–custody documentation, and Laboratory's accreditations is provided in the Attachments.

Findings

According to USEPA, a material with an asbestos content greater than one percent by weight is considered as an asbestos-containing material. Consequently, the following materials in the building were identified to be ACM:

- Pipe and Joint Insulation = 9,048 linear feet
- Wire wrap insulation = 26,500 linear feet

- Electric Transite switch panel= 45 square feet
- Floor joint fill material =1,800 square feet
- Wall panel glue = 1,600 square feet
- Mirror glue = 20 square feet
- Various types of floor tiles/mastic (9-inch square beige floor tile and associated mastic, Black floor tile and associated mastic under plywood, 12-inch square tan wood design floor tile and associated mastic, 12-inch square terracotta floor tile and associated mastic, and Mastic associated with various 9-inch square floor tiles) = 28,100 square feet
- Exterior and interior door caulking = 208 Masonry openings
- Original built-up roofing and flashing materials = 50 square feet
- Pipe insulation debris mixed with plaster, wood and other construction debris = 58,700 square feet plus additional 40 cubic yards

The baseboard molding glue, Pyroblock, pressboard material, safety switch backing material, vibration dumper cloth, black and brown linoleum, 12-inch square beige floor tile and associated mastic, 12-inch square dark brown floor tile and associated mastic were identified to be non-ACM. A summary of the asbestos survey findings is provided in attached Table 1.

The ET report documented the built-up roofing material. Apparently, the building was observed to have fairly new built-up roofing. Based on our field observations and review of the Building Department records, it appears that as part of 2002 exterior restoration project, the built-up roofing materials and several windows in the building were replaced. Any roof cuts would void existing warranty, and therefore, the roofs were not sampled during our investigation.

Conclusions and Recommendations

Asbestos-containing materials were identified in friable and non-friable forms in the subject building. All confirmed and presumed ACM in the building that is to be left in place should be managed in good condition under an Operations and Management (O & M) plan. The purpose and objective of the O & M Plan is to maintain the assumed, presumed or known asbestos containing materials in good condition, prevent future release of asbestos fibers, and minimize exposure of all building occupants to asbestos fibers.

Asbestos containing debris from damaged pipe insulation was observed throughout the building. Access to the building should be restricted until the clean-up work is completed.

ACM that would be impacted by planned renovation must be properly removed prior to performing such activities. Refer to Table 1 for the summary of asbestos inspection findings. The removal and disposal of ACM must be performed by a NYS-DOL licensed asbestos handling contractor in accordance with Federal, state, and local regulations. Proper notifications must be filed with the US-EPA, NYS-DOL, NYC-DEP and other regulatory agencies prior to performing such activities.

Abatement design documents should be prepared to identify the locations of ACM removal and specify removal work practices.

As required by the NYS-DOL and NYC-DEP regulations, the abatement project must be monitored by a NYS-DOL certified project monitor. The project monitor oversees contractor's work practices to ensure regulatory compliance and also performs pre, during, and final clearance post abatement air sampling in accordance with the state and city regulations.

In addition to ACM, lead based paint was observed throughout the building. The paint was flaking, cracking, with debris lying on the floor. Apparently, paint stabilization work was performed in the basement and sub-basement. In addition to LBP, suspect PCB/Mercury containing electrical articles were observed throughout the building.

Estimated Remediation Cost

Budgetary estimates for asbestos abatement are provided in Attachments.

The cost for the removal of visually observed ACM/contaminated debris, removal of PCB/Mercury containing electrical articles, and remediation/stabilization of damaged paint in the building is estimated to be approximately **$ 1,350,000,** including preparation of abatement design documents, project monitoring, air sample analysis, and closeout documentation.

We trust that this report will satisfy your requirements. If you have any questions regarding this report, please call me at 201-794-6900.

Sincerely,
Langan Engineering & Environmental Services, P.C.

Vijay Patel
Associate

1st Floor Mezzanine				
Pipe insulation debris mixed with plaster on the floor.	ACM	500 SF	—	—
Various types of floor tile and associated mastic	ACM	1,600 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM.
Electrical wire insulation	ACM	1,000 LF	Unknown	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Cove base and associated mastic	Non-ACM	—	Fair	—
2nd Floor				
Block and air-cell pipe insulation	ACM	250 LF	Fair	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. Pipe gauges, dents, and open ends were observed.
Pipe insulation debris on suspended ceiling plaster.	ACM	600 SF	—	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Various types of floor tile and associated mastic	ACM	7,700 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM. Up to two layers of floor tile/covering and mastic were observed at isolated locations. Hardwood flooring underneath floor tiles was mouldered and was in poor condition. Hardwood flooring was installed on concrete sub-flooring.
Wall panel glue	ACM	1,600 SF	—	—
Mirror glue	ACM	20 SF	—	—
Electrical wire insulation	ACM	2,000 LF	Unknown	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Cove base and associated mastic	Non-ACM	—	Fair	—
3rd Floor and 4th Tower Level				
Block and air-cell pipe insulation	ACM	180 LF	Fair	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. Pipe gauges, dents, and open ends were observed.
Pipe insulation debris mixed with plaster on the floor.	ACM	1,000 SF	—	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Various types of floor tile and associated mastic	ACM	3,500 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM. Up to two layers of floor tile/covering and mastic were observed at isolated locations. Hardwood flooring underneath floor tiles was mouldered and was in poor condition. Hardwood flooring was installed on concrete sub-flooring.
Electrical wire insulation	ACM	500 LF	Unknown	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Cove base and associated mastic	Non-ACM	—	Fair	—
Roofs and Exteriors				
Original built-up roofing, flashing and mastic materials	ACM	50 SF	Good	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. See Note 1.
Window caulking and glazing putty	ACM	200 masonry window openings	Good to fair	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000.
Exterior door caulking	ACM	5 masonry door openings	Good	—
Floor joint fill material along perimeter building walls.	ACM	1,800 LF	Good	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Caulking on gable ends and clerestory bands	ACM	12,000 SF of surface impacted by caulking presence	—	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000.
Inaccessible areas				
Block and air-cell pipe insulation	ACM	3,000 LF	Unknown	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. An allowance is provided for the presence of concealed ACM pipe insulation within wall and ceiling cavities.
Pipe insulation debris mixed with plaster on the floor and floor covering.	ACM	1,000 SF	—	An allowance is provided for the presence of concealed ACM pipe insulation within inaccessible building spaces.

Notes:

1. The ET report documented the built-up roofing material. Apparently, the building was observed to have fairly new built-up roofing. Based on our field observations and review of the Building Department records, it appears that as part of 2002 exterior restoration project, the built-up roofing materials and several windows in the building were replaced. Any roof cuts would void existing warranty, and therefore, the roofs were not sampled during our investigation.
2. Any suspect material that is not listed in this report must be presumed ACM until confirmed via laboratory testing.

Table 2 – Budgetary Estimate for Asbestos Abatement

TABLE 2
BUDGETARY ESTIMATE FOR HAZMAT ABATEMENT
Kingsbridge Armory
29 West Kingsbridge Road
BRONX, NEW YORK

ACM or Presumed ACM	Quantity of ACM or Presumed ACM	Unit Price	Budgetary Estimate
SUB-BASEMENT			
Original mud-pack pipe joint insulation associated w/ fiberglass	3 Joint	$500	$1,500
BASEMENT			
Original mud-pack pipe joint insulation associated w/ fiberglass	20 joint	$15	$300
Block and air-cell pipe insulation	4,350 LF	$18	$78,300
Pipe insulation debris mixed with plaster, wood and other construction debris on the floor.	39,000 SF	$5	$195,000
Pipe insulation debris mixed with plaster, wood and other construction debris in black plastic bags.	25 CY	$300	$7,500
Various types of floor tile and associated mastic	300 SF	$7	$2,100
Electrical wire insulation	10,000 LF	$3	$30,000
Interior door caulking	3 DO	$100	$300
BASEMENT MEZZANINE			
Block and air-cell pipe insulation	1,125 LF	$12	$13,500
Pipe insulation debris mixed with plaster, wood and other construction debris on the floor.	17,500 SF	$5	$87,500
Pipe insulation debris mixed with plaster, wood and other construction debris in black plastic bags.	10 CY	$300	$3,000
Various types of floor tile and associated mastic	5,500 SF	$7	$38,500
Electrical wire insulation	3,000 LF	$3	$9,000
FIRST FLOOR			
Block and air-cell pipe insulation	120 LF	$50	$6,000
Pipe insulation debris mixed with plaster on the floor.	300 SF	$10	$3,000
Pipe insulation debris mixed with plaster, wood and other construction debris in black plastic bags.	5 CY	$300	$1,500
Various types of floor tile and associated mastic	9,500 SF	$7	$66,500
Ebony/Transite Electric switch panel	45 SF	$15	$675
Electrical wire insulation	10,000 LF	$3	$30,000
FIRST FLOOR MEZZANINE			
Pipe insulation debris mixed with plaster on the floor.	500 SF	$5	$2,500
Various types of floor tile and associated mastic	1,600 SF	$7	$11,200
Electrical wire insulation	1,000 LF	$3	$3,000

BUDGETARY ESTIMATE FOR HAZMAT ABATEMENT
Kingsbridge Armory
29 West Kingsbridge Road
BRONX, NEW YORK

ACM or Presumed ACM	Quantity of ACM or Presumed ACM	Unit Price	Budgetary Estimate
SECOND FLOOR			
Block and air-cell pipe insulation	250 LF	$15	$3,750
Pipe insulation debris on suspended ceiling plaster.	600 SF	$5	$3,000
Various types of floor tile and associated mastic	7,700 SF	$7	$53,900
Wall panel glue	1,600 SF	$6	$9,600
Mirror glue	20 SF	$6	$120
Electrical wire insulation	2,000 LF	$3	$6,000
THIRD FLOOR AND FOURTH TOWER LEVEL			
Block and air-cell pipe insulation	180 LF	$30	$5,400
Pipe insulation debris mixed with plaster on the floor.	1,000 SF	$5	$5,000
Various types of floor tile and associated mastic	3,500 SF	$7	$24,500
Electrical wire insulation	500 LF	$3	$1,500
ROOFS AND EXTERIORS			
Original built-up roofing, flashing and mastic materials	50 SF	$50	$2,500
Window caulking and glazing putty	200 WO	$500	$100,000
Exterior door caulking	5 DO	$100	$500
Floor joint fill material along perimeter building walls.	1,800 LF	$5	$9,000
INACCESSIBLE AREAS			
Block and air-cell pipe insulation concealed within wall and ceiling cavities	3,000 LF	$35	$105,000
Pipe insulation debris mixed with plaster on the floor and floor covering.	100 SF	$10	$1,000
TOTAL ASBESTOS ABATEMENT ESTIMATES			**$920,645**
ESTIMATED COST FOR THE MANAGEMENT AND REMEDIATION OF LEAD BASED PAINTED COMPONENTS			**$229,355**
ESTIMATED COST FOR THE REMOVAL OF PCB/MERCURY CONTAINING ELECTRICAL ARTICLES			**$50,000**
ESTIMATED TOTAL FOR PREPARATION OF DESIGN DOCUMENTS, PROJECT MONITORING, AIR SAMPLE ANALYSIS, CLOSURE REPORT, AND SUBMITTAL REVIEW			**$150,000**
ESTIMATED TOTAL FOR THE REMEDIATION OF HAZMAT			**$1,350,000**

Notes:

1. The aforementioned unit prices for asbestos removal are based on the location, size and complexity of the project, and assume that all abatement work will be completed in one phase. These estimates are for budgetary purposes only. Actual removal cost may vary depending upon the market conditions and time of the year ACM are being removed, and work phasing. The estimates include the cost for insurance, overhead, material, labor, disposal permits, OSHA sampling and analysis, and profits. Additionally, the estimated cost is also based on the assumption that union labor wage rate will be used for the workers' and supervisors' wages.

Reporting Notes:

Analyzed by: John P. Koubiadis

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0), ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile,FR 59,146,38970,8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab # 102843.

Analyzed by: Aleksandr Barengolts; Date Analyzed 9/15/2008

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation); or ELAP 198.4 for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); AIHA Lab # 102843, NVLAP Lab Code 200546-0, NYSDOH ELAP LAB ID 11480.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

Duly Authorized Representative – Vijay Patel

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

1.0 INTRODUCTION

Langan Engineering & Environmental Services, P.C. (Langan) has prepared this Supplemental Groundwater Investigation Report in support of the redevelopment of the Kingsbridge Armory facility at 29 West Kingsbridge Road in the Bronx, New York ("the Site"). This report presents the results of supplemental groundwater sampling that was conducted at the Site and on the adjacent National Guard property that borders the Site to the north. The objective of the supplemental investigation was to determine whether two abandoned underground storage tanks (USTs) on the National Guard property are the source of groundwater impacts that were detected in a monitoring well in the Armory building during a 2008 Phase II Environmental Site Investigation (ESI). The supplemental investigation also included follow-up sampling of the well in which impacts were detected.

2.0 BACKGROUND

The Kingsbridge Armory is being considered for redevelopment as a multiple-use community, educational, and retail facility. The project site is located on the city block bordered by West 195th Street to the north, West Kingsbridge Road to the south, Jerome Avenue to the east, and Reservoir Avenue to the west. The Armory is bordered to the north along West 195th Street and Reservoir Road by two New York State National Guard (National Guard) maintenance buildings and a parking lot. A Site Location Map is provided as Figure 1.

Langan conducted a Phase II ESI of the Armory property in October 2008. Five volatile organic compounds (VOCs) and one semi-volatile organic compound (SVOC) were detected in well MW-3, which was installed in the northwestern portion of the sub-cellar of the Armory, at concentrations above the New York State Department of Environmental Conservation (NYSDEC) Technical and Operational Guidance Series (TOGS) Ambient Water Quality Standards (AWQS). Elevated organic vapor concentrations were also detected in soil samples collected from MW-3 and nearby borings. The Phase II ESI did not reveal an obvious source for the groundwater impacts; however, a 2007 environmental investigation conducted by TRC, Inc. identified two, abandoned 3,000-gallon and 2,000-gallon diesel and gasoline USTs located under the parking area of the National Guard property northwest of the Armory building. TRC's investigation indicated that the tanks were likely closed in September 1993. Based on the proximity of the former USTs to well MW-3, the tanks were deemed potential sources of impacted groundwater at the Site. This supplemental investigation was conducted to evaluate the off-site USTs as sources of VOC and SVOC contamination at the Site.

2.0 SUPPLEMENTAL GROUNDWATER INVESTIGATION

Langan conducted the Supplemental Groundwater Investigation on May 27 and 28, 2009. The investigation included a geophysical survey, advancement of soil borings, installation of a monitoring well, and groundwater sampling.

2.1 Geophysical Survey

Under Langan's oversight, Nova Geophysical Services of Forest Hills, New York conducted a geophysical survey in the western parking lot of the National Guard property on May 27, 2009. The survey was conducted to identify potential utilities at proposed Geoprobe boring locations and to locate the two decommissioned USTs and associated piping. The survey utilized an electromagnetic metal detector (Geonics EM-61 Pipe Locator) and a ground penetrating radar (GPR) system (MALA 250 MHz to 500 MHz GPR units). The survey methodology is discussed in detail and the survey location plan is provided in Nova's Geophysical Engineering Survey Report, which is included as Appendix A.

The survey identified two anomalies consistent with USTs underneath the southeastern and northeastern portions of the parking lot, with dimensions of approximately 19- by 27- ft and 9- by 19- ft, respectively. The UST locations were consistent with those identified in TRC's 2007 investigation report. The survey identified two former pump islands along the eastern boundaries of the USTs. The survey also detected anomalies consistent with a water line and north-south oriented sewer line that enter the parking lot from West 195th Street and transect the central and northeastern portions of the parking lot.

3.2 Soil Borings and Groundwater Monitoring Well Installation

3.2.1 Soil Borings

Two direct-push soil borings (MW-4 and MW-5) were advanced with a track-mounted Geoprobe 7730DT unit in the National Guard property parking lot. The borings were advanced in preparation for installation of two monitoring wells between the southern-most UST and the northwestern portion of the Armory property. Soil samples were collected continuously from each boring into new, dedicated acetate liners with a 2-inch diameter, 5-ft macrocore sample barrel. Soil retrieved from each boring was classified for soil type and screened for organic vapors with a photoionization detector (PID).

Boring PMW-4 was advanced to 34 ft below the top of concrete, and groundwater was encountered at approximately 27 ft below top of concrete. Refusal was encountered in either rock or concrete at 18 ft below the top of concrete during advancement of boring PMW-5. Two offset borings advanced 5 ft and 9 ft west of boring PMW-5 encountered refusal at 14.5 ft and 15 ft below the top of concrete, respectively. Groundwater was not encountered in boring

MW-5 or the two offset locations. The presence of a concrete wall east of PMW-5, the Armory Building south of PMW-5, and buried utilities in this area limited access for the advancement of additional offset borings. Boring refusal and spatial limitations therefore precluded installation of well MW-5. The detailed boring logs are included as Appendix B. The soil boring locations are shown in Figure 2.

3.2.2 Monitoring Well Installation

Groundwater monitoring well MW-4 was installed in the soil boring advanced near the southwestern corner of the southern-most UST. The well was constructed of 2-inch diameter threaded, flush-joint PVC riser and 10 ft of 0.01-inch slot screen. The screen was placed across the water table interface, and the annulus was filled with clean sand (Morie #1) to a height of approximately six inches to one foot above the top of the screened interval. A two- foot layer of hydrated bentonite clay was placed above the sand pack to seal the well. The remainder of the annular space was filled with soil cuttings from the boring. The remaining soil cuttings were placed in a sealed and labeled 55-gallon drum and stored on the National Guard property pending disposal. The well was completed with a flush mount, steel well cover set into concrete and over the well for protection. A monitoring well construction log is provided in Appendix C.

3.3 Groundwater Sampling

Three groundwater samples were collected from MW-4, TRC-MW-3, which TRC installed west of the southern-most decommissioned UST, and MW-3, which is located in the northwestern portion of the sub-cellar of the Armory building. Because well MW-3 was installed with one-inch diameter riser, a peristaltic pump and dedicated, disposable polyethylene tubing were used to purge the well. Wells MW-4 and TRC-MW-3 were purged with a 2-inch diameter submersible pump and sampled in general accordance with procedures set forth in the U.S. EPA's low-flow groundwater sampling procedure to allow for collection of a representative sample ("Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures", EPA/540/S-95/504, April 1996).

The static water level in each well was measured to the nearest 0.01 foot with a decontaminated oil/water interface probe. Prior to sample collection, each well was purged at a rate less than 0.5 liters per minute in order to minimize drawdown and sample turbidity. During purging and sampling, monitoring well effluent was pumped into a flow-through cell attached to a Horiba U-22 Water Quality Monitoring System probe (Horiba U-22). The Horiba U-22 was used to monitor the purge water for hydrogen ion concentration (pH), oxidation/reduction potential, conductivity, temperature, dissolved oxygen, and turbidity. Five well volumes were purged until variations between successive groundwater parameter measurements had stabilized to within 10 percent. Purge water was contained in two 55-gallon drums, labeled,

and stored on the National Guard property. Groundwater sampling logs are provided in Appendix C.

The samples were collected into laboratory-provided containers, which were labeled and placed in ice-filled coolers pending delivery to the lab under proper chain-of-custody protocol. The samples were submitted to Spectrum Analytical, Inc. (Spectrum) of Agawam, Massachusetts for analysis of VOCs and SVOCs via EPA Methods 8260 and 8270, respectively. Spectrum is a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified laboratory. A Groundwater Sample Location and Results Map is provided in Figure 3.

4.0 OBSERVATIONS AND RESULTS

4.1 Field Observations

Soil observed in the borings consisted of fill, which is comprised of brown fine to coarse-grained sand with traces of silt, gravel, timber, concrete, and brick. Groundwater was encountered in monitoring wells TRC-MW-3 and MW-4 at a depth of approximately 27 ft below the top of concrete in the parking lot. The depth to groundwater in MW-3 was 4.2 ft below the top of the sub-cellar floor slab.

Field indications of a spill or other impacts to soil on the National Guard property were not observed during the investigation. PID readings in soil boring MW-4 ranged from 1.0 ppm (24-26 ft depth interval) to 1.9 ppm (4-5 ft depth interval). PID readings in the three MW-5 offset borings ranged from 0.0 ppm to 0.6 ppm. Minor staining was observed in conjunction with asphalt fragments in soil samples collected from below the concrete in boring MW-4 and the MW-5 offset borings. Consistent with Langan's observations during the 2008 Phase II ESI, a petroleum odor was observed in monitoring well MW-3 in the Armory sub-cellar.

4.2 Analytical Results

Analytical results from the groundwater samples were compared to NYSDEC TOGS AWQS. One VOC, 4-isopropyltoluene, was detected in the groundwater sample collected from well MW-4 at a concentration of 804 µg/L, which exceeds the TOGS AWQS standard of 5 ug/L. VOCs and SVOCs were not detected at concentrations above TOGS AWQS in the groundwater samples collected from wells MW-3 and TRC-MW-3. Seven VOCs (naphthalene, n-butylbenzene, n-propylbenzene, isopropylbenzene, methyl tert-butyl ether, toluene, and 4-isopropyltoluene were detected in the sample collected from well MW-3 at concentrations below the TOGS AWQS. Analytical detections of VOCs and SVOCs in the groundwater samples are presented in Table 1. The laboratory analytical report is provided in Appendix E.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the field observations and analytical results from the soil borings and groundwater samples, we conclude that:

- The elevated VOC and SVOC concentrations observed in well MW-3 during the 2008 investigation appear to have attenuated to levels below regulatory standards and were not detected during this supplemental investigation, and
- Evidence of an off-site spill associated with the decommissioned USTs on the National Guard property is not present.

Further investigation is not recommended at this time.

6.0 LIMITATIONS

This Supplemental Groundwater Investigation report was prepared expressly for Related Retail for the Kingsbridge Armory Project in the Bronx, New York and for the objectives defined herein (due diligence). Langan cannot assume responsibility for the use of this Report for any property other than the specific site addressed in this report, or by any third party without specific written authorization from Langan.

The conclusions, opinions, and recommendations provided in this report are based on subsurface conditions ascertained from the analysis of a limited number of samples and from environmental reports prepared by other professionals that were provided by "the Client". Recommendations provided are contingent upon one another and no recommendation should be followed independent of the others. Actual conditions encountered may differ substantially from those presented herein and should be brought to our attention whereby we may determine how such changes may affect our conclusions, opinions and recommendations.

1.0 INTRODUCTION

This Phase II Supplemental Environmental Site Investigation (SESI) was conducted for the Kingsbridge Armory property at 29 Kingsbridge Road (Tax Block 3247, Lot 2) in the Bronx, New York (The "Site"). The Site is being considered for redevelopment as the Kingsbridge National Ice Center (KNIC), a multiple use ice skating and recreational facility. The KNIC project is undergoing review by the City of New York in accordance with Uniform Land Use Review Procedure (ULURP). Accordingly, all investigative and remediation activities are subject to review and approval by the New York City Department of Environmental Protection (NYCDEP).

Langan and TRC Environmental Corporation conducted extensive soil and groundwater investigations at the Site between 2007 and 2009 during an earlier joint redevelopment effort. As such, the sub-surface environmental conditions underneath the armory building and exterior areas are well documented. As approximately four years have passed since the most recent environmental investigation and the current redevelopment plan incorporates a new design and Site use, this SESI was conducted to augment the existing data and address potential new areas of soil disturbance during redevelopment.

This Phase II SESI Report presents the environmental data and findings from the Site Investigation that was conducted between May 14 and 24, 2013.

2.0 PROJECT BACKGROUND

2.1 Site Description

The project site is at the center of a city block bordered by West 195th Street to the north, West Kingsbridge Road to the south, Jerome Avenue to the east, and Reservoir Avenue to the west (Figure 1). Most of the Site is occupied by the landmark Kingsbridge Armory building (Armory), which was constructed on an approximately 200,000-square-foot (sq-ft) footprint between 1912 and 1917, over the abandoned east basin of the Jerome Park Reservoir. An asphalt-paved parking area is located along the western perimeter of the Site along Reservoir Avenue, and landscaped areas border the southern perimeter of the structure along West Kingsbridge Road. Two National Guard annex buildings and a parking area border the Site to the north along West 195th Street.

The main drill hall at the center of the Armory measures approximately 300 by 600 feet (ft) and is spanned freely by an arched roof framing that rises 110 ft above the drill hall floor. Beneath the drill floor, two cellar levels formerly housed offices, a garage, a gymnasium, rifle and pistol ranges, and rooms for other military functions. The drill hall is flanked to the south by a two-

story head house with a single cellar floor and four towers that contain offices and residential quarters. The eastern portion of the sub-cellar area underlies the Jerome Avenue sidewalk. The sub-cellar of the Armory building is accessible by a ramp that extends from West 195th Street. The Site is currently owned and operated by the City of New York.

The Armory has remained unused since the 2009 environmental investigation, with the exception that an interior parking area is used for the staging of City graffiti removal vehicles. Occasional events are also held inside the central drill hall. No significant changes of use since the previous environmental investigations are apparent on adjacent and nearby properties.

2.2 Proposed Site Redevelopment

KNIC proposes to convert the interior of the Armory into a national ice rink facility with two levels of parking provided in the cellar and sub-cellar. Multiple ice rinks will be constructed within the shell of the central drill hall, including a main, ground-level rink with surrounding bleachers. Additional ice rinks will be constructed on the ground level and a mezzanine level on either side of the main rink. Vehicle access ramps to the cellar parking garages and loading docks will span between the building and West 195th Street to the north and Reservoir Avenue to the west. The sub-cellar parking area will be constructed at the elevation of the current floor slab. Mass excavation of soil and removal of groundwater are therefore not anticipated during the redevelopment project. Soil excavation underneath the western parking area and northern moat area adjoining West 195th Street may be required to accommodate the construction of footings for the access ramps. Additionally, soil may be excavated to install new caisson support structures for the building.

2.3 Previous Investigations

The following environmental reports were generated on behalf of Related Retail and the New York City Economic Development Corporation during the initial Kingsbridge Armory redevelopment effort:

Phase I Environmental Site Assessment (ESA), Kingsbridge Armory, dated September 2006; prepared by Metcalf & Eddy

This Phase I ESA was conducted on behalf of the New York City Economic Development Corporation (EDC) and identified the following environmental concerns:

- Industrial and commercial use of properties in the surrounding area may have impacted groundwater at the Site.
- Potential contamination from on-site fill materials may have impacted groundwater at the Site.

- One 275-gallon fuel oil aboveground storage tank (AST) was identified on the northeast portion of the drill room floor, and two 275-gallon fuel oil ASTs were identified on the southwest portion of the sub-cellar.
- A petroleum odor was noted in a room (B-20) on the western portion of the cellar; however, a source for the odor was not identified.
- Multiple containers of petroleum products were observed in the motor pool workshops of the cellar area, and ten 55-gallon steel drums were noted in the vehicle storage area in the sub-cellar. The drums were partially deteriorated and were generally free of liquids.
- Oil staining and a saw cut in the concrete floor near the center of the sub-cellar vehicle storage area indicated a possible former underground storage tank (UST).
- Three earthen-floored rifle and pistol ranges were observed in the sub-cellar, and were suspected to contain elevated concentrations of lead from spent munitions.
- Three New York State Department of Environmental Conservation (NYSDEC) spills are associated with the Site:
    - Spill Number 8802461 was reported in 1988 when a Fuel Oil No. 2 UST failed a tightness test. The regulatory database stated that the last of seven USTs were scheduled to be removed from the Site in August 2004, and the spill was closed on August 10, 2004.
    - Spill Number 9211568 was reported in 1993 when soil contamination from piping was detected during removal of a tank. The spill was closed on March 25, 2005.
    - Spill Number 9308016 was reported in 1993 when a diesel tank failure was reported during removal of the tank. According to the database entry, 100 yards of soil was stockpiled on the Site, and the spill remained open as of September 2006. Langan's research of NYSDEC's Spill Incidents Database website revealed that the spill was closed on June 3, 2008.
- Potentially hazardous materials, such as PCBs, asbestos, lead-based paint, lubricating oils, mold, and refrigerants, were associated with the cellar boiler unit and air conditioning units and construction materials throughout the structure.
- One 2,000-gallon fuel oil UST was reported to be in service at the adjacent property to the north along West 195th Street. Four USTs were reported to have been closed at the adjacent property in 1993, 1995, and 1999.

The Phase I ESA report recommended that additional sampling for asbestos, lead-based paint and PCB-containing materials be conducted at the property. The report also recommended the removal and proper disposal of the three ASTs, 55-gallon drums, petroleum products, earth floors of the rifle and pistol ranges, and deteriorating boiler and air conditioning equipment.

Phase II Environmental Site Assessment Report, Kingsbridge Armory, dated September 19, 2007; prepared by TRC Environmental Corporation

This Phase II ESA was conducted to investigate recognized environmental conditions identified in the Phase I ESA report. The report confirmed the presence of the three ASTs and stated that the AST on the drill hall floor still contained diesel fuel for an emergency generator that was no longer operable. Several empty 55-gallon drums with no evidence of potential release were observed in the vehicle storage area and suspect lead-based paint, PCB-containing light ballasts, asbestos-containing materials, and areas of mold growth were noted in the Armory. This report did not identify the saw cut area in the sub-cellar discussed in the September 2006 Phase I ESA.

The report summarized a geophysical survey conducted in August 2000. The survey identified:

(1) an abandoned fill port and vent pipe and a 12 by 15-ft area of removed pavement that are likely associated with a former UST along the western exterior of the Armory building;

(2) a 30 by 30-ft electromagnetic anomaly indicating a potential UST along the Armory's western exterior south of the aforementioned former UST; and

(3) two vent pipes and two areas of patched asphalt possibly associated with two USTs on the northwest portion of the site adjacent to the maintenance building (not included in the subject area for Langan's ESI).

TRC coordinated a follow-up geophysical survey during the Phase II ESA. The follow-up survey found no evidence of buried metal near the 12-ft by 15-ft saw-cut area, but noted a near-by fill pipe labeled with the word "Gasoline". The report noted that a guard booth had been constructed at the potential former UST location. The survey noted no indications of potential USTs at the 30 by 30-ft anomaly and suggested that the reinforced concrete area may be associated with the former reservoir pump house that was located west of the Armory building.

TRC's subsurface investigation included excavation of three test pits, advancement of 13 soil borings, and installation of four groundwater monitoring wells along the western portion of the property near the potential USTs. In addition, 18 soil samples were collected from the upper 1.5-ft depth interval in the pistol and rifle ranges. TRC reported the following:

Test Pits near Maintenance Building

- Although this area is not part of the project Site, the environmental issues identified may impact project Site conditions. Test pit excavations confirmed two abandoned USTs west of the maintenance building. The tanks appeared to have been cut open and filled with sand and gravel. Organic vapors indicative of petroleum impacts were not reported in the sand and gravel and rain water that had accumulated within the former USTs. The report noted that the tanks were likely the 3,000-gallon diesel and 2,000-gallon gasoline USTs that were closed in September 1993, discussed in the Phase I ESA.

Soil Samples West of the Armory Building

- Slightly elevated organic vapor concentrations were detected in two borings on the northwest portion of the property west of the maintenance building near the former USTs.
- Semi-volatile organic compounds (SVOCs) and metals (beryllium, chromium, copper, iron, nickel, and zinc) were detected at concentrations above NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046 recommended soil cleanup objectives (RSCOs) in multiple soil samples collected from the western portion of the Site. Based on the absence of coincident field indications of contamination at these locations, TRC concluded that the SVOC detections are likely associated with urban fill conditions at the Site.
- Volatile organic compounds (VOCs), PCBs, and pesticides were not detected in soil samples at concentrations that exceeded TAGM RSCOs.

Groundwater Samples West of the Armory Building

- One VOC, hexachlorobutadiene, was detected at a concentration above the NYSDEC Technical and Operational Guidance Series (TOGS) Ambient Water Quality Standards in a groundwater sample collected from the well located adjacent to the former gasoline UST near the western exterior of the Armory. TRC noted that hexachlorobutadiene does not occur naturally in the environment, and is formed during the processing of other chlorinated compounds.
- Several metals (iron, magnesium, manganese, and sodium) were detected at concentrations that exceeded TOGS Class GA standards in each groundwater sample. TRC concluded that the metals are naturally occurring; therefore, the detections were likely attributable to background soil and bedrock conditions in the area.

- SVOCs were not detected in the groundwater samples, and field indications of petroleum impacts in groundwater were not observed during the investigation.

Soil Samples in the Shooting Ranges

- Twelve of the 18 soil samples collected from 15 locations contained lead concentrations that exceeded the TAGM typical urban background upper range of 500 mg/kg. In general, samples collected from nearer the soil berm or metal backstop in the rifle ranges exhibited higher lead concentrations.
- Eight of the 11 soil samples submitted for Toxicity Characteristic Leaching Procedure (TCLP) analysis for lead contained concentrations that exceeded the Resource Conservation and Recovery Act (RCRA) hazardous waste criterion.

The report stated that the former potential UST area west of the Armory at the present guard booth location may be the former location of a 225-gallon gasoline UST that was reported to be closed and removed from the Site in 1995, based on information provided in the Phase I ESA. Because existing information is insufficient to document the location of the gasoline UST and other USTs associated with historic spills at the Site, TRC recommended that NYSDEC and other regulatory records be researched for additional information regarding the tanks. TRC did not recommend additional soil or groundwater sampling near the former UST locations west of the Armory, unless requested by NYSDEC to close out open spills associated with the USTs; however, NYSDEC's Spill Incidents Database revealed that the only open spill discussed in the Phase I ESA was closed in June 3, 2008. Other open spills have not documented at the Site. TRC also recommended that the lead-impacted soil and deteriorated wooden timber wall in the pistol and rifle ranges be removed and disposed in accordance with appropriate hazardous waste management and disposal regulations.

***Draft Phase II ESI of Kingsbridge Armory,* November 6, 2008, prepared by Langan.**

The objective of this Phase II ESI investigation was to assess environmental remediation costs associated with proposed site development, including lead contamination in the former pistol and rifle ranges, historical fill material below the sub-cellar and western parking area, and former USTs in the western parking area and off-site maintenance area northwest of the Armory. The investigation consisted of the following:

- Geophysical survey in the western exterior parking area;
- 17 direct-push soil borings from which 23 soil samples were collected in the western parking area, sub-cellar, and pistol and rifle ranges.
- 10 test pits from which 10 soil samples were collected in the sub-cellar; and
- 3 monitoring wells from which 3 groundwater samples were collected in the sub-cellar.

Figure 2 shows the locations of the borings, monitoring wells, and test pits. The findings of the investigation revealed the following:

- The geophysical survey did not identify obvious indications of USTs. Signal interference precluded verification of the potential UST associated with the gasoline fill port discussed in TRC's report.
- Soil underlying the Site consists of historic fill comprised of sand with traces of silt, gravel, brick, and ash. The fill generally extends to depths of 4 ft to 7 ft below the cellar floor slab and about 19 ft below ground surface (bgs) in the western parking area. Weathered rock was encountered at 12 ft to 15 ft below the sub-cellar floor slab. Groundwater was encountered in the monitoring wells at depths of 4 ft to 6 ft below the sub-cellar floor slab.
- Elevated organic vapor concentrations, stained soil, and petroleum odors were observed in two test pits and one boring (MW-3) in the northwest portion of the sub-cellar. The impacted soil was observed at depths of between 2 ft and 12 ft below the floor slab.
- A petroleum odor and an elevated organic vapor reading were detected in soil collected from the 25 ft to 30 ft depth interval in one boring in the western parking area (LG-14).
- In general, soil samples exhibited concentrations of SVOCs and metals typical of historic urban fill and did not indicate a spill at the Site.
- Six of the 17 soil samples collected from the pistol and rifle ranges exhibited Toxicity Characteristic Leaching Procedure (TCLP) lead concentrations indicative of hazardous waste.
- Five VOCs and one SVOC (naphthalene) were detected at concentrations that exceeded the TOGS AWQS in the groundwater sample collected from well MW-3 in the northwest portion of the sub-cellar. Naphthalene was also detected at a concentration exceeding the TOGS AWQS in a groundwater sample collected from the western parking area (LB-16).

The report concluded that groundwater under the northwestern portion of the sub-cellar had been impacted with petroleum. Additional off-site groundwater sampling was recommended to determine whether the two historical USTs on the northern adjoining property were the source of the impacts.

***Supplemental Groundwater Investigation Report*, June 17, 2009, prepared by Langan**

Groundwater sampling was conducted on the National Guard property to evaluate the source of groundwater impacts in the northwestern portion of the sub-cellar in the Armory building. Langan installed a monitoring well (MW-4) south of a former UST and collected groundwater samples from existing monitoring wells (TRC-MW-3 on the National Guard property and MW-3

in the northwest portion of the Armory building). The field observations and analytical results of the investigation did not indicate the presence of an off-site spill associated with the decommissioned USTs on the National Guard property. Concentrations of VOCs and SVOCs in groundwater collected from the northwestern portion of the Armory building appeared to have attenuated to levels below regulatory standards. The locations of the off-site monitoring wells are shown in Figure 2.

2.5 Geology

Based on Langan's 2008 Geotechnical Investigation, the Site is underlain by historic fill material to depths of 7 to 25 ft below the top of pavement, which corresponds to el 125 to 105. Fill extended to a depth of 50 ft below sidewalk grade in a boring LB-1, which is located along the northern exterior of the Armory. The fill consists of brown, coarse- to fine-grained sand with silt, gravel, brick, and rock. Silty sand underlies the fill material at a thickness that varies from 3 to 37 ft. Decomposed rock, which is 2 to 17 ft thick, is located 9 ft to 50 ft below sidewalk grade. Bedrock consisting of grey mica gneiss was encountered at 9 ft to 58 below sidewalk grade ft (el 116 to el 73). According to the Bedrock and Engineering Geologic Maps of Bronx County and Parts of New York and Queens Counties, New York, by Charles A. Baskerville (1992), bedrock at the Site belongs to the Fordham Gneiss geologic unit. Rocks of the Fordham Gneiss are Proterozoic in age, and are typically harder than neighboring units due to the interlocking texture attributable to formation under high-grade (i.e., granulite) metamorphic conditions.

2.6 Hydrogeology

Based on groundwater level readings collected during the geotechnical investigation, Phase II ESI, and Phase II SESI, groundwater elevations generally range from about el 115 on the eastern portion of the Site to el 109 on the western portion of the Site. The depth to groundwater in observation wells that were installed on paved exterior areas at sidewalk grade ranged from 11.6 ft in LB-1 along the northern exterior of the building to 30.4 ft in LB-16 in the parking area near Reservoir Avenue. The depth to groundwater in the interior monitoring wells (MW-1 through MW-9) installed inside the sub-cellar ranged from 3.0 ft in MW-3 on the northwestern portion of the sub-cellar to 10.4 ft in MW-8 on the southwestern portion of the sub-cellar.

Groundwater elevation data indicates that groundwater at the Site flows towards the southwest, which generally conforms to the south-southwest sloping topographic gradient shown on the USGS Central Park, N.Y. Topographic Quadrangle Map, dated 1966 and revised in 1979. Groundwater flow in the fill may be influenced locally by underground structures (e.g., pipes, foundations, and buried structures). Groundwater in this area of New York City is not used as a potable (drinking) water source. The potable water supply is provided by the City of

New York and is derived from surface impoundments in the Croton, Catskill, and Delaware watersheds.

3.0 FIELD INVESTIGATION

Langan implemented the Phase II SESI activities between May 20 and 24, 2013. The scope of work was designed to:

- Investigate areas of potential soil disturbance during proposed development construction;
- Investigate potential impacts attributable to the adjoining National Guard property;
- Collect information and analytical data to facilitate selection of a remedial approach; and,
- Evaluate the need for remedial actions associated with the proposed future use of the Site.

The scope of work for the investigation consisted of:

- A geophysical survey to identify any subsurface anomalies, storage tanks, and utilities;
- Installation of 5 subsurface soil vapor points and collection of 5 soil gas samples and one ambient air (background) sample;
- Collection of 18 soil samples from 9 environmental borings to assess soil conditions and potential health and safety issues regarding soil disturbance during the proposed site renovation; and
- Installation and sampling of 5 temporary groundwater monitoring wells and sampling of 2 existing permanent monitoring wells in order to assess site groundwater conditions;

3.1 Geophysical Survey

On May 14, 2013, NOVA Geophysical & Environmental, Inc. (NOVA) of Douglaston, New York completed geophysical surveys under the supervision of a Langan field engineer. The surveys used ground penetrating radar (GPR), electromagnetic (EM) detectors, and comprehensive subsurface utility (CSUL) locators to locate and identify current and former utility lines, anomalies, underground storage tanks (USTs), subsurface structures, and to clear and mark proposed boring locations at the project Site. Borings were relocated as necessary to avoid subsurface utilities and anomalies.

3.2 Soil Sampling Procedures

On May 20 and 21, 2013, environmental samples were collected from nine borings (MW-5 through MW-10 and LG-19 through LG-21) to assess soil conditions with respect to current and

historic Site usages. The borings were completed by Laurel Environmental Associates, Ltd. (Laurel) of Huntington Station, New York, using Geoprobe 6610DT and 7822DT track-mounted drill rigs. Environmental borings were advanced to depths of 8 to 35 feet bgs. A Langan engineer was on Site during all drilling activities. Soil boring locations are shown on Figure 2.

Soil samples were collected continuously throughout each environmental boring to termination depths with a 2-inch diameter Macro-Core® sampler. Soil samples retrieved from each boring were visually classified for soil type, grain size, and texture. Each soil sample was also inspected for visual and olfactory evidence of contamination and screened for total organic vapors using a photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp. Soil boring logs are provided in Appendix A.

Two soil samples were collected for laboratory analysis from each boring: one sample from the upper two-foot depth interval and one sample from the depth interval exhibiting the greatest degree of contamination based on field observations. In the event that no contamination was observed, the second sample was collected from the depth interval immediately above the groundwater interface. Soil samples were collected in laboratory-supplied containers and shipped under chain-of-custody protocol to York Analytical, Inc. (York), a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory in Stamford, Connecticut. Soil samples were analyzed for NYSDEC Part 375 list VOCs with MTBE per EPA Method 8260B (utilizing En Core® collection method), SVOCs per EPA Method 8270C, PCBs per EPA Method 8082, and target analyte list (TAL) metals per EPA Method 6020/7000 Series. The shallow soil samples were also analyzed for pesticides via EPA Method 8081.

3.3 Groundwater Sampling Procedures

In order to assess groundwater conditions at the Site, five borings were completed as temporary groundwater monitoring wells (MW-6 through MW-10). A sixth temporary groundwater monitoring well (MW-5) was planned but could not be installed due to refusal at bedrock encountered above the groundwater table. The wells were installed at depths ranging from approximately 15 to 35 feet bgs (el 106.2 to 104.4). Monitoring wells were constructed with 1-inch inner diameter (ID), threaded flush-joint, polyvinyl chloride (PVC) casings and screens, with 10 feet of 0.02 in slotted screen. Clean sand was used to backfill the area around the screen to approximately 2 feet above the screen. Well Construction Logs are provided in Appendix B.

Following installation, the monitoring wells were developed using a peristaltic pump such that a minimum of three well volumes were purged and the discharge was visibly free of silt or fine sand.

After development, the monitoring wells were purged and sampled using low-flow purging techniques to minimize drawdown. In addition to sampling the five temporary groundwater wells, existing groundwater monitoring wells MW-3 (installed in 2008) and TRC-MW-3 (installed in 2007) were sampled. Sampling for existing monitoring well MW-4 (installed in 2009) was proposed; however, the well was not sampled due to lack of access. Prior to sampling, the monitoring wells were purged using a peristaltic pump and dedicated, disposable polyethylene tubing. During purging, the turbidity, pH, temperature, conductivity, Redox potential, and dissolved oxygen of the groundwater were monitored using a Horiba U-52 Water Quality meter with a flow-through cell. The groundwater was purged until the water quality parameters were stable and the turbidity was below 50 Nephelometric Turbidity Units (NTU). The monitored parameters were recorded on the Well Development and Sampling Logs provided in Appendix C.

After purging the wells, a groundwater sample was collected from each well in laboratory-supplied containers with appropriate preservatives and shipped under chain-of-custody protocol to York. Groundwater samples were analyzed for NYSDEC Part 375 list VOCs with MTBE per EPA Method 8260B, SVOCs per EPA Method 8270C, PCBs per EPA Method 8082, and TAL metals per EPA Method 6020/7000 Series. All groundwater samples except for MW-8 were also analyzed for pesticides via EPA Method 8081.

3.4 Soil Vapor Sampling Procedures

In order to assess soil vapor conditions and evaluate the potential for vapor intrusion at the Site, five soil vapor points (SV-1 though SV-5) were installed (see Figure 2). The soil vapor points were installed by Laurel under the full time supervision of a Langan field engineer. The sampling was conducted in accordance with the October 2006 NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York.

Five indoor sub-slab soil vapor points were installed at a depth of approximately 1 ft bgs. At each sub-slab location, dedicated polyethylene tubing was inserted into each boring. The annulus around the probe/tubing was backfilled with a sand filter and sealed with hydrated bentonite. Soil vapor logs are included as Appendix D.

As a quality assurance/quality control (QA/QC) measure, an inert tracer gas (helium) was introduced into an above-grade sampling chamber to ensure that the soil vapor sampling points

were properly sealed above the target sampling depth thereby preventing sub-surface infiltration of ambient air. The sample chamber was sealed above the sample point with hydrated bentonite. Each soil vapor point was purged using a PID at a rate of 0.5 liters per minutes (L/min) to evacuate a minimum of three tubing volumes prior to sample collection. Soil vapor samples were then collected into laboratory-supplied, batch-certified 6-Liter Summa® canisters that were calibrated for a sampling rate of two hours per sample. The canisters were properly labeled and transported via courier to York following standard chain-of-custody protocols. Samples were analyzed for VOCs via EPA Method TO-15.

One indoor ambient air sample (KIC_AA) sample was collected for QA/QC.

4.0 OBSERVATIONS AND RESULTS

4.1 Geophysical Survey

The geophysical surveys did not identify anomalies consistent with USTs at the Site. Several scattered minor anomalies were observed throughout the surveyed areas and near some of the proposed boring locations. Boring locations were adjusted prior to drilling to avoid subsurface utilities and anomalies.

4.2 Subsurface Observations

Surface cover at the Site is primarily concrete. General sub-surface conditions encountered during the Phase II ESI included:

- Fill material, predominantly consisting of grey and brown to dark brown, fine- to coarse-grained sand with some silt, gravel, brick, concrete, weathered rock, and small rock fragments was identified in the borings through a depth of approximately 6 to 20 ft bgs (el 123.7 to 109.8). The fill layer is underlain by primarily brown fine to coarse sands with some silt and sandy silts. Petroleum-related odors, staining, and PID readings greater than background levels were not observed in any of the borings.

- Bedrock was observed underlying the native silt and sand layer at boring locations MW-5 and LG-20 at depths of approximately 8 ft bgs (el. 111.8) and 27.5 ft bgs (el 110.3), respectively.

- Groundwater was encountered at depths of approximately 9 to 30 ft bgs (el 110.6 to 108.7). Inferred groundwater flow direction is southwest.

4.3 Analytical Results

4.3.1 Soil Sample Results

Soil samples analytical results were compared to the NYSDEC Title 6 of the official compilation of New York Codes, Rules and Regulations (6 NYCRR) Part 375 Unrestricted Use and Restricted Commercial-Use Soil Cleanup Objectives (SCOs). Soil samples analytical detections are summarized in Table 1 and are shown on Figure 3. A complete copy of the laboratory report is included in Appendix E. The following is a summary of detections and exceedances of applicable Unrestricted and Restricted Commercial-Use SCOs:

VOCs

Four VOCs (2-butanone, acetone, bromomethane, and methylene chloride) were detected in one or more soil samples.

No VOCs were detected at concentrations exceeding their respective Unrestricted or Restricted Commercial-Use SCOs in soil samples.

SVOCs

Multiple SVOCs were detected in one or more soil samples; however, SVOCs were detected at concentrations exceeding their respective Unrestricted Use SCOs in only one soil sample (LG-19 [0-2]) collected from 0 to 2 ft bgs in boring LG-19. There were no SVOC detections above the applicable SCOs in the duplicate sample (DUP-1 (052113)) of soil sample LG-19 (0-2). The following SVOCs exceeded their respective Unrestricted Use SCOs:

- Benzo(a)pyrene (1 mg/kg[1]) – 1.04 mg/kg
- Benzo(k)fluoranthene (1 mg/kg) – 1.05 mg/kg
- Indeno(1,2,3-cd)pyrene (0.5 mg/kg) – 0.597 mg/kg

An SVOC was detected at a concentration exceeding its respective Restricted Commercial-Use SVOC in only one soil sample (LG-19 [0-2]) for benzo(a)pyrene at 1.04 mg/kg. There were no SVOC detections above the Restrictive Commerical-Use SCO in the duplicate sample (DUP-1 [052113]) of soil sample LG-19 (0-2).

[1] Part 375 Unrestricted Use SCOs shown in parentheses following analyte name

Metals

Eighteen metals were detected in soil samples collected at the Site, including five metals detected at concentrations exceeding their respective Unrestricted Use SCOs:

- Barium (350 mg/kg) - 558 mg/kg in MW-7 (1-5)
- Copper (50 mg/kg) – 50.1 mg/kg in MW-7 (1-5)
- Chromium (30[1] mg/kg)
    - 31.7 mg/kg in LG-20 (0-2); and
    - 32.9 mg/kg in LG-21 (20-22)
- Lead (63 mg/kg)
    - 134 mg/kg in MW-6 (0-2);
    - 392 mg/kg in MW-7 (1-5);
    - 155 mg/kg in MW-8 (0.5-2.5);
    - 79.5 mg/kg in MW-9 (0-2); and
    - 143 in DUP-1 (052113) (duplicate of sample LG-19 (0-2))
- Nickel (30 mg/kg) – 30.7 mg/kg in MW-10 (1-3)
- Zinc (109 mg/kg) – 112 mg/kg in MW-6 (0-2); 501 mg/kg in MW-7 (1-5); and 203 mg/kg in MW-8 (0.5-2.5)

One metal was detected at a concentration exceeding its Restricted Commercial-Use SCO:

- Barium (400 mg/kg) - 558 mg/kg in MW-7 (1-5)

PCBs

There were no PCB detections in the soil samples.

Pesticides

Only the shallow soil samples from each soil boring were analyzed for pesticides. Pesticides were detected but none exceeded their respective Unrestricted or Restricted Commercial-Use SCOs.

[1] Unrestricted Use SCO criteria (30 mg/kg) is for Trivalent Chromium

4.3.2 Groundwater Results

Groundwater analytical results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards (AWQS) and Guidance Values for Class GA water (drinking water). The analytical results for groundwater are summarized in Table 2 and presented on Figure 4. The table and figure provide results for each compound and highlight the results that are above TOGS AWQS or Guidance Values for drinking water. The analytical results of the groundwater samples are summarized as follows:

VOCs

Bromomethane and methylene chloride were the only VOCs detected in groundwater throughout the Site. Only one VOC, methylene chloride, a common laboratory artifact, was detected at concentrations exceeding its TOGS AWQS or Guidance Value. Methylene Chloride exceedances were detected in all samples including the field blank sample.

SVOCs

Bis(2-ethylhexyl)phthalate was the only SVOCs detected in groundwater throughout the Site, however it did not exceed its respective TOGS AWQS or Guidance Value in any groundwater samples.

Metals

Fifteen metals were detected in groundwater samples. The following is a summary of the three metals that exceeded their respective NYSDEC TOGS Class GA AWQS and GV:

- Iron (300 µg/l)
  - 529 µg/l in MW-6;
  - 4,060 µg/l in MW-7;
  - 1,450 µg/l in the duplicate of sample MW-7

- Manganese (300 µg/l)
  - 352 µg/l in MW-6;
  - 351 µg/l in MW-7;
  - 343 µg/l in the duplicate of sample MW-7;
  - 1,660 µg/l in MW-8;
  - 315 µg/l in MW-9; and
  - 706 µg/l in MW-10

- Sodium (20,000 µg/l)
    - 124,000 µg/l in MW-3;
    - 47,200 µg/l in MW-6;
    - 53,200 µg/l in MW-7;
    - 53,800 µg/l in the duplicate of sample MW-7;
    - 59,500 µg/l in MW-8;
    - 71,400 µg/l in MW-9;
    - 332,000 µg/l in MW-10; and
    - 326,000 µg/l in TRC-MW-3.

Pesticides and PCBs

Pesticides and PCBs were not detected in any of the groundwater samples.

4.3.3 Soil Vapor Results

New York State currently does not have standards, criteria, or guidance values for concentrations of VOCs in sub-surface soil vapor. Therefore, analytical results for soil vapor samples were compared to:

- NYSDOH Air Guideline Values (AGVs) for methylene chloride, tetrachloroethene (PCE), and trichloroethene (TCE);
- NYSDOH Decision Matrix 1 and 2 that address PCE, TCE, 1,1,1-trichloroethane (1,1,1-TCA), and carbon tetrachloride; and
- Background levels of VOCs in indoor air presented in Appendix C of the NYSDOH Guidance, including Upper Fence Limit Indoor Air Values from;
    - "Table C-1 NYSDOH 2003: Study of Volatile Organic Chemicals in Air of Fuel Oil Heated Homes,"
    - 90th Percentile indoor air values from "Table C-2 - EPA 2001: Building Assessment and Survey Evaluation (BASE) Database, SUMMA canister method", and
    - the 95th Percentile Indoor Air Values from "Table C-5, Health Effects Institute (HEI) 2005: Relationship of Indoor, Outdoor and Personal Air".

The analytical results for soil vapor and ambient air are summarized in Table 3 and shown in Figure 5. The following VOCs were reported at concentrations that exceeded the range of specified background concentrations:

- n-Hexane
- Trichloroethylene (TCE)
- Tetrachloroethylene (PCE)

NYSDOH AGV Results

- Methylene chloride and PCE were not detected at concentrations exceeding NYSDOH AGV in any of the sub-slab soil vapor samples.
- TCE was detected at a concentration of 400 micrograms per cubic meter (µg/m³) in sample SV-4, exceeding the NYSDOH AGV of 5 µg/m³.

The soil vapor sample results were also compared to Decision Matrices 1 and 2 in the NYSDOH Soil Vapor Intrusion Guidance. The matrices address the compounds tetrachloroethene (PCE), trichloroethene (TCE), 1,1,1-trichloroethane (1,1,1-TCA), and carbon tetrachloride.

Decision Matrix 1 (TCE and carbon tetrachloride)

- The indoor air TCE concentration was 0.18 µg/m^3.
    - TCE was detected at a concentration of 400 µg/m^3 at SV-4, exceeding its AGV of 5 µg/m^3. Matrix 1 recommends mitigation for sub-slab TCE concentrations >250 µg/m^3 for all indoor air TCE concentrations.
    - TCE was not detected in samples taken from SV-1, SV-2, SV-3, and SV-5. Matrix 1 recommends no further action for sub-slab TCE concentrations <50 µg/m^3 for indoor air TCE concentrations <0.25 µg/m^3.
- The indoor air carbon tetrachloride concentration was 0.47 µg/m^3.
    - Carbon tetrachloride was not detected in any of the sub-slab soil vapor samples. Matrix 1 recommends reasonable and practical actions to identify sources and reduce exposures for indoor air concentrations between 0.25 and 1 µg/m^3.

Decision Matrix 2 (PCE and 1,1,1-TCA)

- The indoor air PCE concentration was 3.7 µg/m^3.
    - PCE was detected at concentrations less than 100 µg/m^3 at all soil vapor points. For indoor air PCE concentrations between 3 and 30 µg/m^3 and sub-slab PCE concentrations less than 100 µg/m^3, Matrix 2 recommends reasonable and practical actions to identify sources and reduce exposures.
- 1,1,1-TCA concentration was not detected in the indoor air sample.
    - 1,1,1-TCA was not detected in any of the soil vapor samples. Matrix 2 recommends no further action for indoor air concentrations less than 3 µg/m^3 and sub-slab concentrations less than 100 µg/m^3.

5.0 CONCLUSIONS

Based on the findings of the Phase II SESI, we conclude the following:

- The subsurface at the Site consists of historic fill material underlain by silt and sand above bedrock, which is also consistent with prior investigations. The historic fill layer is predominantly comprised of fine to coarse sand with some silt, gravel, weathered rock, and rock fragments. Historic fill was generally observed up to approximately 20 ft bgs at the outdoor sidewalk-grade boring locations and 8 ft bgs at the indoor basement boring locations.

- No evidence of petroleum impacts was observed based on visual, olfactory, and PID readings.

- Groundwater was encountered between approximately 3 and 30 ft bgs (el 112 to 109) at the Site, with a presumed southwesterly flow.

- Anomalies consistent with utilities, building remnant structures, and urban fill were detected on Site; however, no geophysical anomalies indicative of USTs were identified in surveyed areas.

- Site soils were found to contain SVOCs and metals that are consistent with typical historic fill concentrations.

- Site groundwater was found to contain one VOC and three metals at concentrations above NYSDEC TOGS Class GA AWQS and GVs. However, the presence of methylene chloride, the VOC, is likely not representative of actual groundwater conditions since it is a common laboratory contaminate and it was detected at a similar concentration in the field blank sample, which indicates that the laboratory-supplied deionized water used to perform the field blank may have been contaminated.

- Three VOCs were detected above NYSDOH background levels in soil gas, including PCE and TCE. TCE was detected at a concentration above its AGV of 5 $\mu g/m^3$ in one of the soil vapor samples. TCE was not detected in soil and groundwater samples collected during the SESI.

6.0 LIMITATIONS

This Phase II SESI report was prepared expressly for Kingsbridge National Ice Center ("the Client") for the Site (29 West Kingsbridge Ave. in the Bronx, New York) in support of the

proposed development at the Site. Langan cannot assume responsibility for the use of this Report for any property other than the specific site addressed in this report, or by any third party without specific written authorization from Langan.

The conclusions, opinions, and recommendations provided in this report are based on subsurface conditions ascertained from the analysis of a limited number of samples and from environmental reports prepared by other professionals that were provided by "the Client". Recommendations provided are contingent upon one another and no recommendation should be followed independent of the others. Actual conditions encountered may differ substantially from those presented herein and should be brought to our attention whereby we may determine how such changes may affect our conclusions, opinions, and recommendations.

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules and Regulations (NYCRR) Part 375 Restricted Use Comercial and Unrestricted Use Soil Cleanup Objectives (SCO).
2. Only compounds with detections are shown in the table.
3. NYSDEC Part 375 Restricted Use Comercial SCO exceedances are highlighted.
4. NYSDEC Part 375 Unrestricted Use SCO exceedances are bolded.
4. Method Detection Limits (MDL) above NYSDEC Part 375 Restricted Use Comercial SCO standards are italicized.
5. VOC = Volatile organic compounds
6. SVOC = Semi-volatile organic compounds
7. PCB = Polychlorinated Biphenyls
8. mg/kg = miligrams per kilogram
9. ~ = this indicates that no regulatory limit has been established for this analyte
10. * = NYSDEC Part 375 Restricted Use Comercial SCO and Unrestricted Use SCO criteria (1500 and 30 mg/kg) are for Trivalent Chromium
11. ND = Not Detected
12. NT = Not Tested

Qualifiers:
B = Analyte found in the analysis batch blank
D = Result is from an analysis that required a dilution
E = Estimated value
J = Analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U = Analyte not detected at or above the level indicated

Notes:
1. Soil vapor samples analytical results are compared to the New York State Department of Health (NYSDOH) Air Guideline Value (AGV), the NYSDOH Fuel Oil 2003 Upper Fence Value, the US Environmental Protection Agency (EPA) Building Assessment and Survey Evaluation (BASE) Database 90th Percentile Indoor Air, and the Health Effects Institute (HEI) 2005 95th Percentile Indoor Air.
2. Only compounds with detections are shown in table.
3. NYSDOH AGV exceedances are highligted and bolded.
4. Results above all three specified background levels are bolded.
5. VOCs = Volatile Organic Compounds
6. µg/m^3 = micrograms per cubic meter
7. ~ = This indicates that no regulatory limit has been established for this analyte.

Qualifiers:
U = Analyte not detected at or above the level indicated
D = Result is from an analysis that required a dilution

Remarks
(Drilling Fluid, Depth of Casing, Fluid Loss, Drilling Resistance, etc.)

0730 - Begin Drilling
0745 - Refusal Encountered at 8 ft bgs, groundwater not observed
Refusal encountered at 8 ft bgs at 9 locations between 4 and 40 ft North and West of original location
No well set. Take samples from original boring location.
1025 - Take Sample MW-5 (0-2)
VOC/SVOC/Metals/ Pesticides/PCBs

1035 - Take Sample MW-5 (6-8)
VOC/SVOC/Metals/PCBs

End of Boring @ 8 ft bgs - refusal at bedrock (~111 ft above msl)

APPENDIX B

WELL CONSTRUCTION SUMMARY

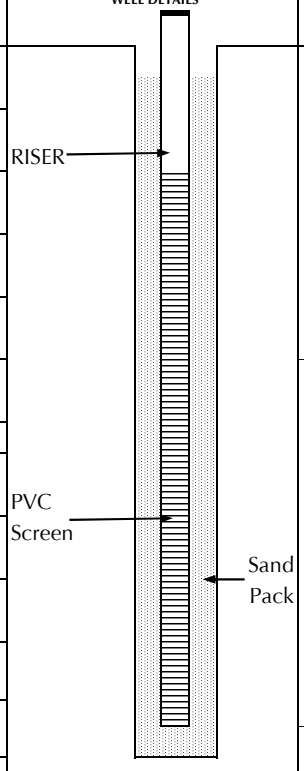
Well No. **MW-6**

PROJECT Kingsbridge National Ice Center	**PROJECT NO.** 170246501
LOCATION New York, NY	**ELEVATION AND DATUM** 121.1 ft above msl Top of Casing
DRILLING AGENCY Laurel Environmental Associates, Ltd.	**DATE STARTED** 5/21/2013 **DATE FINISHED** 5/21/2013
DRILLING EQUIPMENT Geoprobe 6610DT	**DRILLER** Steve Bitetto
SIZE AND TYPE OF BIT 2" Steel	**INSPECTOR** Paul McMahon

METHOD OF INSTALLATION

2" steel casing was used to advance the boring to 15 feet. A 10-foot long 1-inch diameter Schedule 40 PVC screen was set from a depth of approximately 3.6 to 13.6 feet. The annulus was filled with #1 morie filter sand to a depth of approximately 1 foot.

METHOD OF WELL DEVELOPMENT



The well was purged with a peristaltic pump until the total purge volume was greater than 3 well volumes and NTU<50.

TYPE OF CASING PVC	**DIAMETER** 1-inch	**TYPE OF BACKFILL MATERIAL** N/A	
TYPE OF SCREEN PVC	**DIAMETER** 1-inch	**TYPE OF SEAL MATERIAL** N/A

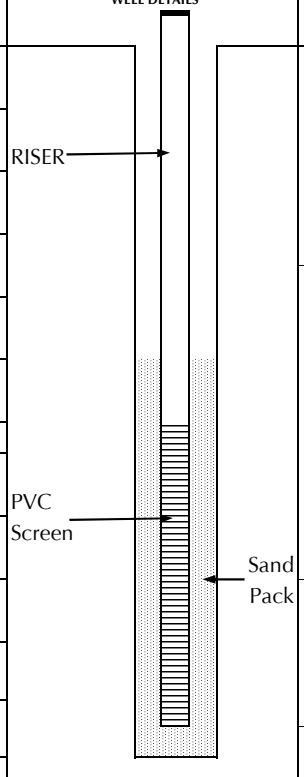
Well No. **MW-10**

PROJECT Kingsbridge National Ice Center	**PROJECT NO.** 170246501
LOCATION New York, NY	**ELEVATION AND DATUM** 140.1 ft above msl Top of Casing
DRILLING AGENCY Laurel Environmental Associates, Ltd.	**DATE STARTED** 5/21/2013 **DATE FINISHED** 5/21/2013
DRILLING EQUIPMENT Geoprobe 7822DT	**DRILLER** Kevin Kegel
SIZE AND TYPE OF BIT 2" Steel	**INSPECTOR** Paul McMahon

METHOD OF INSTALLATION

2" steel casing was used to advance the boring to 35 feet. A 10-foot long 1-inch diameter Schedule 40 PVC screen was set from a depth of approximately 24.2 to 34.2 feet. The annulus was filled with #1 morie filter sand to a depth of approximately 21 feet.

METHOD OF WELL DEVELOPMENT



The well was purged using a combination of weighted bailor and peristaltic pump. 4 Liters were purged using a weighted bailor. The well was subsequently purged with a peristaltic pump until NTU<50.

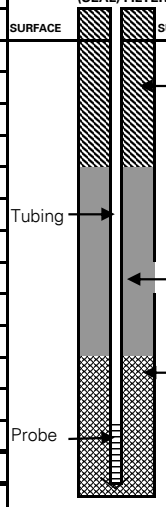
APPENDIX D

SOIL VAPOR SAMPLING LOG SHEET

Sample Number: SV-1



PROJECT: Kingsbridge National Ice Center	**PROJECT NO.:** 170246501
LOCATION: The Bronx, NY	**SURFACE ELEVATION AND DATUM:** 119.8 ft above mean sea level
DRILLING FIRM OR LANGAN INSTALLER: Laurel Environmental Associates, Ltd.	**INSTALLATION DATE STARTED:** 5/20/2013 **DATE FINISHED:** 5/20/2013
INSTALLATION FOREMAN: Steve Bitetto	**SAMPLE DATE STARTED:** 5/20/2013 **DATE FINISHED:** 5/20/2013
INSTALLATION EQUIPMENT: Hilti Hammer Drill with 3/4" x 24" bit	**TYPE OF SAMPLING DEVICE:** 6-L Summa Canister with 2-hour Flow Regulator
INSPECTOR: Paul McMahon	**SAMPLER:** Paul McMahon
POTENTIAL SAMPLE INTERFERENCES: None	**WEATHER CONDITIONS (PRECIP., TEMP., PRESS., WIND SPEED AND DIR.):** @ INSTALLATION: Mostly Cloudy, 60's, Wind: SW @ SAMPLING: Mostly Cloudy, 60's, Wind: SW

METHOD OF INSTALLATION AND PURGING:
Install soil vapor point with a Hilti hammer drill.
Purge with a PID for 5 min at at flow rate of 500 ml/min.
Sample Type = Integrated 2-hour sample; soil vapor sample.

TUBING TYPE/DIAMETER: Poly (1/2" OD; 3/8 " ID)	**TYPE OF MATERIAL ABOVE SEAL:** Bentonite
IMPLANT SCREEN TYPE/LENGTH/DIAMETER: Poly (1/2" OD; 3/8 " ID)	**SEAL MATERIAL (Bentonite, Beeswax, Modeling Clay, etc.):** Bentonite
BOREHOLE DIAMETER: 3/4"	**FILTER PACK MATERIAL (Sand or Glass Beads):** #2 Morie Sand

Attention: Paul McMahon

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on May 21, 2013 and listed below. The project was identified as your project: **170246501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

York Sample ID	Client Sample ID	Matrix	Date Collected	Date Received

General Notes for York Project (SDG) No.: 13E0710

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

U	Analyte included in the analysis, but not detected
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
D	The result reported is from a dilution of the sample due to levels of target compounds found

---

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

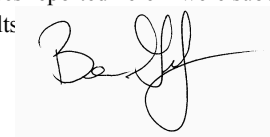
Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on May 21, 2013 and listed below. The project was identified as your project: **170246501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.



The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 13E0711

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results ples submitted on the attached chain-of-custody form(s) received by York.

Approved By:  **Date:** 05/28/2013

Notes and Definitions

U	Analyte included in the analysis, but not detected
S-BN	Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.
S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL); therefore, the result is an estimated concentration.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
D	The result reported is from a dilution of the sample due to levels of target compounds found
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on May 22, 2013 and listed below. The project was identified as your project: **170246501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 13E0744

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

U	Analyte included in the analysis, but not detected
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL); therefore, the result is an estimated concentration.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
D	The result reported is from a dilution of the sample due to levels of target compounds found
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Attention: Paul McMahon

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on May 24, 2013 and listed below. The project was identified as your project: **170246501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 13E0868

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

U	Analyte included in the analysis, but not detected
S-AC	Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL); therefore, the result is an estimated concentration.
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

EXECUTIVE SUMMARY

This report by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C. (Langan) presents the findings of Hazardous building materials (Hazmat) identified at the Kingsbridge Armory located at 1 West Kingsbridge Road, Bronx, New York 10468 (Block: 3247, Lot: 10). The objective of this Hazmat Survey was to identify the presence/absence of asbestos-containing materials (ACM), lead containing paint (LCP), and universal/hazardous waste articles. The survey was limited to the building interiors. Suspect materials located on exterior elevations and roofs were excluded from the scope of work.

PROJECT INFORMATION:

Client Name:	Gilbane Building Company	Survey Dates:	October 23 & 25, 2019
Professional's Project #:	1707321307	Construction Dates:	1913
Professional's Project Manager:	Vijay Patel	No. of Building(s):	1
Phone No.:	973.560.4983	No. of Stories:	9 Levels, including Mezzanines, sub-basement, basement, and Towers.
Email:	vpatel@langan.com	Estimated Gross Footage:	Over 385,600 SF
Property Address:	Kingsbridge Armory 1 West Kingsbridge Road Bronx, New York 10468 (Block: 3247, Lot: 10)	Property Use:	Vacant

The following is a summary of ACM, LCP and other universal/miscellaneous hazardous articles identified in the building:

Asbestos-Containing Materials (ACM)

The following ACM and Assumed ACM materials were identified within the interiors of the Armory:

Material	Survey Results	Estimated Quantity
Block/air-cell pipe & joint insulation	ACM	6,250 LF
Concealed block and air-cell pipe insulation	ACM	7,100 LF
Pipe insulation debris	ACM	2,280 SF

Material	Survey Results	Estimated Quantity
Loose ACM contaminated construction & household debris	ACM	59,195 SF
Bags with ACM contaminated construction & household debris	ACM	90 CY
VAT & mastic	ACM	16,310 SF
VAT & mastic (damaged) & ACM contaminated construction & household debris	ACM	14,015 SF
Electrical wire insulation	ACM	46,250 SF
Mastic, flashing materials and caulking on gable ends and clerestory bands and contaminated panels	ACM	12,000 SF
Door caulk	ACM	60 SF
Ebony/Transite with electrical box	ACM	187 SF
Mirror glue	ACM	20 SF
Wall panel glue	ACM	1,750 SF

Most of the ACM was in damaged condition. Refer to Table 1 for a summary of asbestos survey findings.

Lead Containing Paint (LCP)

As per 40 CFR Part 745, TSCA, Title IV (Lead Exposure Reduction), the term "lead containing paint" means paint or other surface coatings that contain lead in excess of 1.0 milligrams per centimeter (mg/cm^2) or 0.5 percent by weight. Painted surfaces at the Armory were previously tested for lead and documented in 2000 Environmental Corporation (ET) report. Limited testing of lead in painted surfaces was performed by Langan during our recent site visits.

The vast majority of painted building components were identified to contain lead in excess of 1.0 milligrams per centimeter (mg/cm^2). Refer to Table 2 for the testing conducted by Langan, and Attachment D for a copy of XRF screening data documented in ET report.

Universal and Hazardous Waste Articles

Universal waste and hazardous waste articles consisting of fluorescent light ballasts, fluorescent light bulbs, MEC thermostat, high intensity discharge (HID), mercury containing equipment, batteries, and miscellaneous chemicals, etc. were identified in the building. The lamp ballasts/capacitors were assumed to contain Polychlorinated Biphenyls (PCBs) and/or di (2) ethylhexyl phthalate (DEHP) based on the information observed on labels or markings. The

inspection did not include sampling and analysis for waste classification, confirmation or identification purposes. Refer to Table 3 for an inventory of these materials.

1.0 INTRODUCTION

This report by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C. (Langan) presents the findings of Hazardous building materials (Hazmat) identified at the Kingsbridge Armory located at 1 West Kingsbridge Road, Bronx, New York 10468 (Block: 3247, Lot: 10). The objective of this Hazmat Survey was to identify the presence/absence of asbestos-containing materials (ACM), lead containing paint (LCP), and universal/hazardous waste articles. The survey was limited to the building interiors. Suspect materials located on exterior elevations and roofs were excluded from the scope of work.

The remainder of this report presents our observations, findings, laboratory test results, plans showing sampling locations, and an itemized inventory of hazmat identified within the Armory.

2.0 SURVEY METHODOLOGY

Asbestos-Containing Materials

The asbestos survey was conducted in accordance with EPA protocol outlined in the EPA publication "Asbestos in Buildings". Suspect ACM was visually identified during a room-by-room, floor-by-floor survey of the buildings. Suspect ACM was categorized into various homogeneous materials and types, and sampled and analyzed for asbestos content. Sampling and analysis was conducted in accordance with EPA protocol 600/M4-82-020 per 40 CFR 763. Samples collected were properly packaged in individual containers, sealed; catalogued and chain-of-custody documentation was completed. Quantities of suspect materials were recorded and observations such as physical condition and friability of the materials were also noted. Samples were analyzed by AmeriSci laboratories.

Lead-Containing Paint Screening

A Heuresis Pb200i X-Ray Fluorescence (XRF) Spectrum Analyzer was used to test painted surfaces for lead. The Heuresis Pb200i analyzer uses a cobalt 57 radioactive

source and an advanced solid-state radiation detector to generate an x-ray fluorescence spectrum of a painted surface. During the analysis, the intensity of the x-rays is converted by the instrument's internal software into an estimate of the concentration of lead in the substance being analyzed. The results are interpreted as concentrations of lead in milligrams per square centimeter (mg/cm^2). This device is a field-screening tool, used to collect multiple readings in a short period of time. The method of measurement is based on spectrometric analysis of lead x-ray fluorescence within a controlled depth of interrogation. The reading is an estimate of lead content in all layers of paint.

Universal/Hazardous Waste Articles

As mandated by Subtitle C of the Resource Conservation and Recovery Act (RCRA), EPA promulgated hazardous waste regulations in 1980 to ensure that wastes which pose a threat to human health and the environment should be managed safely. Any waste within a building that makes it potentially harmful to human health or the environment is considered as a hazardous waste. Hazardous wastes are divided into listed wastes, characteristic wastes, universal wastes, and mixed wastes. The survey included preparing an inventory of universal and hazmat waste articles.

3.0 ASBESTOS CONTAINING MATERIALS

3.1 Terminology

Suspect Asbestos-Containing Materials

Asbestos has historically been used in certain types of construction and building materials. Until a material is examined using light microscopy or a similar technique, the building material is considered to be a suspect asbestos-containing material. A few examples of these materials include floor tiles, ceiling panels, thermal system insulation, fireproofing insulation, roofing materials, etc. Any suspect ACM of unknown asbestos content (that is not tested) should be handled as if it were an asbestos-containing material.

Asbestos–Containing Material

A material with an asbestos concentration greater than one percent by weight is considered to be asbestos-containing by the United States Environmental Protection Agency (USEPA). Thus, a material which contains asbestos in concentrations greater

than 1% by weight is considered as "positive" while materials that do not contain asbestos or asbestos is detected in concentrations less than one percent by weight are considered as "negative".

3.2 Files Review

Prior to conducting site survey, we reviewed the following pertinent reports for Armory:

1. October 6, 2008 Asbestos Investigation Report prepared by Langan
2. August 24, 2000 Environmental Investigation Report prepared by ET Environmental Corporation (ET) for subject building.

The reports reviewed documented presence of the following ACM in the Armory:

- various types of floor tiles/mastic (9-inch square beige floor tile and associated mastic, Black floor tile and associated mastic under plywood, 12-inch square tan wood design floor tile and associated mastic, 12-inch square terracotta floor tile and associated mastic, and Mastic associated with various 9-inch square floor tiles),
- pipe insulation debris mixed with plaster, wood and other construction debris
- air-cell and magnesia pipe and pipe joint insulation and mud-pack pipe joint insulation associated with fiberglass pipe insulation,
- wire wrap insulation,
- electric Transite switch panel,
- wall panel glue,
- mirror glue,
- interior door caulk

In addition to ACM, the vast majority of the painted building components were identified to contain lead in excess of 1.0 mg/cm^2. A copy of 2008 Langan and 2000 ET reports are provided in Appendices C & D, respectively.

3.3 Observations and Findings

The field survey of the subject Armory was conducted on October 23 & 25, 2019 by Langan's Miroslaw Baran, Adem Bajrami and Sanjay Patel, NYCDEP-certified asbestos investigators and NYSDOL-certified asbestos inspectors. Limited confirmatory samples of suspect materials were collected during the survey. As required by the USEPA, samples were analyzed by individual layer (i.e. floor tile and the associated mastic were analyzed as two (2) separate samples). Bulk samples of the suspect ACM were analyzed using the Polarized Light Microscopy (PLM) analytical methodology in accordance with 40CFR 763 and NESHAP regulations. Non-friable organically bound (NOB) material samples which tested negative via PLM were reanalyzed using transmission electron microscopy (TEM). Analytical testing was performed in accordance with NYSELAP Methods 198.1 (friable materials), 198.1(NOB), 198.4 (NOB-TEM) and 198.8 (surfacing materials containing vermiculite).

Refer to Table 1 for a summary of asbestos survey findings and Appendix A for the analytical test results and chain of custody documentation for the sampling performed during October 23 & 25, 2019 site visit. Sampling locations are depicted on Drawings ASL-1 thru ASL-7.

4.0 LEAD CONTAINING PAINT

Our review of the prior inspection report by ET indicate that the vast majority of the painted building components were identified to contain lead in excess of 1.0 mg/cm^2.

Limited testing of lead in painted surfaces was performed by Langan during our recent site visits. Overall, the painted surfaces were observed to be in poor condition. With the exception of ground level Drill Area, debris from damaged paint was observed mixed with ACM and other household debris throughout the building.

Refer to Table 2 for the testing conducted by Langan, and Attachment D for a copy of XRF screening data documented in ET report.

5.0 HAZARDOUS WASTE

The ET report documented and provided an inventory of Universal and other Waste identified in the building including but not limited to fluorescent lamps, high intensity discharge (HID) lamps, ballasts, mercury containing equipment, batteries, and miscellaneous chemicals. The lamp ballasts/capacitors were assumed to contain Polychlorinated Biphenyls (PCBs) and/or di (2) ethylhexyl phthalate (DEHP) based on the information observed on labels or markings. The inspection did not include sampling and analysis for waste classification, confirmation or identification purposes.

6.0 CONCLUSIONS AND RECOMMENDATIONS

6.1 Asbestos Containing Materials

Regulatory Guidelines and Requirements:

Federal

In accordance with the Clean Air Act (CAA), the EPA established National Emission Standards for Hazardous Air Pollutants (NESHAP) to protect the public from exposure to airborne pollutants. Asbestos was one of the air pollutants, which was addressed under the NESHAP 40 CFR Part 61. The purpose of asbestos NESHAP regulations is to protect public health by minimizing the release of asbestos when facilities which contain ACM are being renovated or demolished. EPA is responsible for enforcing regulations related to asbestos during renovations and demolition; however, the CAA allows the EPA to delegate this authority to state and local Agencies. Even after the EPA delegates responsibility to a state or local agency, the EPA retains the authority to oversee agency performance and to enforce NESHAP regulations as appropriate.

State

Asbestos in New York State is regulated under the Labor Law Section 906, Part 56 of Title 12 of the Official Compilation of Codes, Rules, and Regulations. Within the department and for the purpose of the Department of Labor, this part (rule) is known as Industrial Code Rule No. 56 (ICR 56) relating to hazards to public safety and health during the removal, encapsulation, or disturbance of friable asbestos, or any handling of ACM that may result in the release of asbestos fiber.

City Regulations

Asbestos Control Program (ACP), Title 15, Chapter 1 of the New York City Department of Environmental Protection (NYCDEP) regulates all asbestos abatement activities occurring within the City of New York. The ACP regulations also require asbestos surveys and abatement work to be performed by a NYCDEP certified asbestos investigator and asbestos workers, respectively.

The New York City Department of Building (NYCDOB) requires an ACP notification to be included with the renovation/demolition permit applications. The notification is performed using ACP 5 or ACP 20/21 forms.

Asbestos containing materials were identified at the Armory. With the exception of the ground level Drill Area, debris from damaged ACM mixed with other household debris and damaged paint was throughout the building. Access to the building should be restricted until the clean-up inside the Armory is completed.

All confirmed and presumed ACM in the building that is to be left in place should be managed in good condition under an Operations and Management (O & M) plan. The purpose and objective of the O & M Plan is to maintain the assumed, presumed or known asbestos containing materials in good condition, prevent future release of asbestos fibers, and minimize exposure of all building occupants to asbestos fibers.

All identified ACM that would be impacted by any planned renovation/demolition must be removed prior to commencing such activities. The removal and disposal of ACM must be performed by a NYSDOL licensed asbestos handling contractor in accordance with Federal, state, and local regulations. Proper notifications must be filed with the EPA, NYSDOL, NYC-DEP and other regulatory agencies prior to performing such activities.

As required by NYSDOL and NYCDEP regulations, the abatement project must be monitored by a NYSDOL certified project monitor. The project monitor oversees the contractor's work practices and also performs pre, during, and final clearance post-abatement air sampling in accordance with state and city regulations.

6.2 Lead Containing Paint

The vast majority of the painted building components were identified to contain lead in excess of 1.0 mg/cm^2. The paint was flaking, cracking and in deteriorated conditions. With the exception of the ground level Drill Area, debris from damaged paint was observed mixed with ACM and other household debris throughout the building.

Debris clean-up and stabilization of painted surfaces will be necessary prior to building occupancy. The Occupational Safety and Health Administration (OSHA) considers any concentration of lead in paint to be lead containing paint. Regardless of the lead concentrations in painted surfaces, the contractor shall comply with 29 CFR 1926.62, OSHA regulations, and take precautionary measures for dust control and limit employee exposure to lead dust during construction.

Painted surfaces that would be impacted by planned activities such as drilling, cutting, scrapping, etc. and create dust should be properly addressed by following safe work practices, good housekeeping procedures and/or following proper abatement procedures. Grinding and sanding of paint without HEPA filter exhaust, open flame gas-fired torches, unconfined abrasive blasting, and chemical strippers containing methylene chloride or other human carcinogenic chemicals are not recommended.

In addition to dust control work practices, personal protective equipment (PPE) per task type is required. Depending on presumed exposure, this requires at least prescribed respirator equipment (i.e., P-100 to full face mask), protective clothing in addition to necessary (Standard of Care) protective task gloves and traditional construction safety gear including protective eyewear/boots/hard hat/safety vest.

The Federal Resource Conservation and Recovery Act (RCRA) regulation governs the handling, transportation, and disposal of hazardous materials. As part of the demolition work scope it must be determined whether the demolition debris that is generated exhibits one or more of the characteristic wastes listed in subpart C of 40 CFR Part 261. Lead in paint is a characteristic waste, and therefore, the demolition debris must be characterized prior to its disposal and, if found to be hazardous waste as defined by Federal Statutes, it will need to be properly handled and disposed.

Workers protection in accordance with 29 CFR 1926.62 shall be followed while performing torch cutting and welding operations on painted metal objects.

6.3 Hazardous Waste

Miscellaneous and universal waste consisting of but not limited to fluorescent light ballasts, fluorescent light bulbs, HID bulbs, HVAC units, etc. were identified at the Armory. Hazardous waste articles which would require removal shall be properly managed; recycled and/or disposed of at a landfill permitted to accept such waste. The removal, handling, recycling, and disposal shall be performed in accordance with applicable federal, state, and local regulations.

7.0 LIMITATIONS, EXCEPTIONS AND ASSUMPTIONS

Opinions and recommendations presented in this report apply to site conditions and features as they existed at the time of Langan's site visit, and those reasonably foreseeable. They cannot necessarily apply to conditions and features of which Langan is unaware and has not had the opportunity to evaluate.

Langan's evaluation of ACM was conducted in accordance with the standard of care and current customary practice of the profession. There are limitations inherent to visual surveys, and therefore, this asbestos survey does not claim to have sampled all possible suspect ACM present in the building.

Demolition/renovation activities may reveal concealed materials that were not accessible during the asbestos survey. Any suspect building material that is not listed in this report must be assumed to be ACM and treated as such unless otherwise confirmed by laboratory testing. If any concealed suspect ACM is uncovered during the planned demolition activities, then those activities that will impact suspect ACM must be discontinued until the suspect materials is sampled by an asbestos consultant and tested by an accredited laboratory for the presence of asbestos.

NOTES:

1 ACM as per Langan Asbestos Investigation Report dated September 25, 2008.

2 Non-ACM as per Langan Asbestos Investigation Report dated September 25, 2008.

3 With the exception of the ground level Drill Area, debris from damaged ACM mixed with other household debris and damaged paint was throughout the Armory.

4 Black bags filled with asbestos contaminated construction & household debris were identified at several locations, all bags in the building shall be assumed ACM contaminated.

5 Multi-layers of floor tile/covering and mastic were observed at isolated locations. At the eastern section of the Basement Mezzanine, ACM floor tiles and mastic were observed covered with a layer of plywood and non-ACM floor tiles.

6 This area was renovated , however, old ACM floor tiles as identified in 2008 Langan Report may exist under new flooring.

7 Provided quantity reflects an approximate length of electrical conduits exposed and concealed within wall, floor and ceiling cavities throughout the floor. The size and number of wires within the conduits may vary.

8 An estimate is provided for the presence of concealed ACM pipe insulation within inaccessible wall, floor, and ceiling cavities.

9 The estimated quantity reflects area occupied by the panels. The information related to ACM within the gable areas is based on the data documented in prior survey reports. Due to height restrictions, the gable areas were inaccessible during Langan surveys.

10 Non-ACM as per Langan Asbestos Investigation Report dated September 25, 2008. Confirmatory sampling was performed during recent survey. Laboratory test results confirmed wall and ceiling plaster to be non-ACM.

Article/Device	**Approximate Quantity [Units]**						
	Sub-Basement	**Basement**	**Basement Mezzanine**	**Ground Level**	**Ground Mezzanine**	**Second Floor**	**Third Floor**
UNIVERSAL WASTE GROUP							
Fluorescent lamps	50	1,000	1,400	250	50	350	2
Emergency lights with Batteries	--	7	30	10	--	--	--
Batteries	--	5	--	7	--	--	--
MCE Thermostats/Gauges	9	1	--	--	--	--	--
HID, MVC, HPS, MH lamps	--	6	--	13	--	--	--
Compact Fluorescent Lamp (CFL)	--	--	--	10	5	--	--
Mercury light ballasts	--	--	--	72	--	--	--
WASTE CONTAINING RADIOACTIVE MATERIALS* GROUP							
Smoke detectors	--	--	30	--	--	--	--
Exit signs	--	10	10	12	--	20	--
PCBs CONTAING WASTE* GROUP							
Fluorescent Light Ballasts	25	450	690	150	25	70	4
Electric motors with capacitors that may contain PCBs (associated with pumps, fans, shutter door openers, etc.)	12	11	--	7	--	--	--
Electronic equipment containing circuit boards with capacitors such as Computers and Peripherals, Telephones, TVs, etc.	--	--	--	30	10	--	--
Wall mounted electronic devices containing circuit boards with capacitors	--	20	20	--	--	--	--
WASTE CONTAINING CFCs and/or HCFCs* GROUP							
Refrigerator/Water Fountain	1	2	--	2	--	--	--
MIXED HAZARDOUS WASTE GROUP							
Fire extinguishers	1	5	10	--	--	1	2
Chemicals (Bottles/Cans)	--	--	--	--	5	--	10
Paint (5-Gallon Bucket) - Old unknown content	--	--	70	--	--	--	--

* - Due to live electricity and building's operations the ballasts associated with the light fixtures and other electrical devices are assumed to contain PCBs; EXIT signs and smoke detectors are assumed to contain radioactive materials; and heat transformer systems are assumed to contain CFCs and/or HCFCs.

MCE - Mercury-Containing Equipment; HID - High Intensity Discharge; MVC - Mercury Vapor Containing; HPS - High Pressure Sodium; MH - Metal Halide; CFCs - Chlorodifluoromethanes (R-12); HCFCs - Hydrofluorocarbons (R-22)

Reporting Notes:

(1) This job was - Analyzed using Motic BA310 Pol Scope S/N 1190000538

(2) Analysis Results For Soil, Dust, Or Debris May Be Highly Variable Because Of The Heterogeneous Nature Of These Samples

Analyzed by: Kensen Caro _____

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by Appd E to Subpt E, 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by Appd E to Subpt E, 40 CFR 763 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. Analyzed by: Khaalid W. Perine_____; Date Analyzed 10/30/2019

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by Appd E to Subpt E, 40 CFR 763 or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses): NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

117 EAST 30TH ST
NEW YORK, NY 10016

Certificate Expiration Date:
April 01, 2020

Dear Mr. Mucha,

Enclosed are certificate(s) of approval issued to your environmental laboratory for the current permit year. The certificate(s) supersede(s) any previously issued one(s) and is(are) in effect through the expiration date listed. Please carefully examine the certificate(s) to insure that the categories, subcategories, analytes, and methods for which your laboratory is approved are correct. In addition, verify that your laboratory's name, address, lead technical director, and identification number are accurate.

Pursuant to NYCRR Subpart 55-2.2, original certificates must be posted conspicuously in the laboratory and copies shall be made available to any client of the laboratory upon request.

Pursuant to NYCRR Subpart 55-2.6, any misrepresentation of the fields of accreditation (category - method - analyte) for which your laboratory is approved may result in denial, suspension, or revocation of your certification. Any use of the Environmental Laboratory Approval Program (ELAP) or National Environmental Laboratory Accreditation Program (NELAP) name, reference to the laboratory's approval status, and/or using the NELAP logo in any catalogs, advertising, business solicitations, proposals, quotations, laboratory analytical reports, or other materials must include the laboratory's ELAP identification number and distinguish between testing for which the laboratory is approved and testing for which the laboratory is not approved.

If you have any questions, please contact ELAP at the New York State Department of Health (NYS DOH), Wadsworth Center, PO Box 509, Albany NY, 12201-0509; by phone at (518) 485-5570; by facsimile at (518) 485-5568; and by email at elap@health.ny.gov.

Sincerely,

Victoria Pretti

Re: Asbestos Investigation
Kingsbridge Armory
29 West Kingsbridge Road
Bronx, New York
Langan Project No. 5815101

Dear Mr. Vanderwarker:

Langan Engineering and Environmental Services, P.C. (Langan) completed an asbestos investigation of the above referenced building. The purpose of this investigation was to confirm the presence/absence of asbestos containing materials (ACM) within the subject building. The asbestos investigation was performed on September 4, 5, and 8, 2008, by Langan's New York City Department of Environmental Protection Agency (NYCDEP) certified asbestos investigators, Messrs Miroslaw Baran and Sanjay Patel. Langan's certifications are provided in the Attachments.

Site and Building Description

The project site is at the center of a city block bordered by West 195th Street to the north, West Kingsbridge Road to the south, Jerome Avenue to the east, and Reservoir Avenue to the west (Figure 1). Most of the Site is occupied by the landmark Kingsbridge Armory building (Armory), which was constructed on an approximately 200,000-square-foot (sq-ft) footprint between 1912 and 1917 over the abandoned east basin of the Jerome Park Reservoir. The main drill hall at the center of the Armory measures approximately 300 by 600 feet (ft) and is spanned freely by an arched roof framing that rises 110 ft above the drill hall floor. Beneath the drill floor, two cellar levels formerly housed offices, a garage, a gymnasium, rifle and pistol ranges, and rooms for other military functions. The drill hall volume is flanked to the south by a two-story headhouse with a single cellar floor and four towers that contain offices and residential quarters. The eastern portion of the sub-cellar area underlies the Jerome Avenue sidewalk. The sub-cellar of the Armory building is accessible by a ramp that extends from West 195th Street. The Armory is currently owned and operated by the City of New York, and is used for

storage of City property. The heat and hot water to the building was supplied by oil-fired boilers located in the sub-basement.

Observations and Findings

Prior to conducting the field investigation, we reviewed the Environmental Survey Report dated August 24, 2000, prepared by ET Environmental Corporation (ET). The report documented the following building materials to be asbestos containing materials (ACM): Built-up roofing and flashing materials, Roof shingle, Various colors 9-inch square floor tiles, Air-cell and magnesia pipe and pipe joint insulation, Mud-pack pipe joint insulation associated with fiberglass pipe insulation, Window caulking and glazing putty, and Caulking associated with exterior joints, seams and cracks. The wall and ceiling plaster, boiler breeching and insulation, grey floor coating, various ceiling tiles and panels, wallboard and joint compound were documented to be non-ACM.

During Langan's investigation, suspect materials observed in the building were documented, assessed, quantified, and sampled, as necessary. In addition to the materials identified in ET report, Langan observed the following suspect materials which were not addressed: Baseboard Molding Glue, Pyroblock, Pressboard material, Wire wrap insulation, Electric ebony/Transite switch panel, Safety switch backing material, Vibration dumper cloth, Floor joint fill material, Wall panel glue, Mirror glue, Exterior and interior door caulking, Black and brown linoleum, 9-inch square beige floor tile and associated mastic, Black floor tile and associated mastic under plywood, 12-inch square beige floor tile and associated mastic, 12-inch square tan wood design floor tile and associated mastic, 12-inch square terracotta floor tile and associated mastic, 12-inch square dark brown floor tile and associated mastic, Mastic associated with various 9-ich square floor tiles, Pipe insulation debris mixed with plaster, wood and contaminated construction debris.

A total of sixty-six (66) bulk samples of the observed suspect materials were collected during our investigation. Samples were analyzed by AmeriSci laboratory of New York, New York. AmeriSci is accredited by the Environmental Laboratory Accreditation Program (ELAP) and National Voluntary Laboratory Accreditation Program (NVLAP). A copy of laboratory test results, chain-of–custody documentation, and Laboratory's accreditations is provided in the Attachments.

Findings

According to USEPA, a material with an asbestos content greater than one percent by weight is considered as an asbestos-containing material. Consequently, the following materials in the building were identified to be ACM:

- Pipe and Joint Insulation = 9,048 linear feet
- Wire wrap insulation = 26,500 linear feet

- Electric Transite switch panel= 45 square feet
- Floor joint fill material =1,800 square feet
- Wall panel glue = 1,600 square feet
- Mirror glue = 20 square feet
- Various types of floor tiles/mastic (9-inch square beige floor tile and associated mastic, Black floor tile and associated mastic under plywood, 12-inch square tan wood design floor tile and associated mastic, 12-inch square terracotta floor tile and associated mastic, and Mastic associated with various 9-inch square floor tiles) = 28,100 square feet
- Exterior and interior door caulking = 208 Masonry openings
- Original built-up roofing and flashing materials = 50 square feet
- Pipe insulation debris mixed with plaster, wood and other construction debris = 58,700 square feet plus additional 40 cubic yards

The baseboard molding glue, Pyroblock, pressboard material, safety switch backing material, vibration dumper cloth, black and brown linoleum, 12-inch square beige floor tile and associated mastic, 12-inch square dark brown floor tile and associated mastic were identified to be non-ACM. A summary of the asbestos survey findings is provided in attached Table 1.

The ET report documented the built-up roofing material. Apparently, the building was observed to have fairly new built-up roofing. Based on our field observations and review of the Building Department records, it appears that as part of 2002 exterior restoration project, the built-up roofing materials and several windows in the building were replaced. Any roof cuts would void existing warranty, and therefore, the roofs were not sampled during our investigation.

Conclusions and Recommendations

Asbestos-containing materials were identified in friable and non-friable forms in the subject building. All confirmed and presumed ACM in the building that is to be left in place should be managed in good condition under an Operations and Management (O & M) plan. The purpose and objective of the O & M Plan is to maintain the assumed, presumed or known asbestos containing materials in good condition, prevent future release of asbestos fibers, and minimize exposure of all building occupants to asbestos fibers.

Asbestos containing debris from damaged pipe insulation was observed throughout the building. Access to the building should be restricted until the clean-up work is completed.

ACM that would be impacted by planned renovation must be properly removed prior to performing such activities. Refer to Table 1 for the summary of asbestos inspection findings. The removal and disposal of ACM must be performed by a NYS-DOL licensed asbestos handling contractor in accordance with Federal, state, and local regulations. Proper notifications must be filed with the US-EPA, NYS-DOL, NYC-DEP and other regulatory agencies prior to performing such activities.

Abatement design documents should be prepared to identify the locations of ACM removal and specify removal work practices.

As required by the NYS-DOL and NYC-DEP regulations, the abatement project must be monitored by a NYS-DOL certified project monitor. The project monitor oversees contractor's work practices to ensure regulatory compliance and also performs pre, during, and final clearance post abatement air sampling in accordance with the state and city regulations.

In addition to ACM, lead based paint was observed throughout the building. The paint was flaking, cracking, with debris lying on the floor. Apparently, paint stabilization work was performed in the basement and sub-basement. In addition to LBP, suspect PCB/Mercury containing electrical articles were observed throughout the building.

Estimated Remediation Cost

Budgetary estimates for asbestos abatement are provided in Attachments.

The cost for the removal of visually observed ACM/contaminated debris, removal of PCB/Mercury containing electrical articles, and remediation/stabilization of damaged paint in the building is estimated to be approximately **$ 1,350,000,** including preparation of abatement design documents, project monitoring, air sample analysis, and closeout documentation.

We trust that this report will satisfy your requirements. If you have any questions regarding this report, please call me at 201-794-6900.

Sincerely,
Langan Engineering & Environmental Services, P.C.

Vijay Patel
Associate

Sub-Basement				
Original mud-pack pipe joint insulation associated w/ fiberglass	ACM	3 joints	Fair	—
New mud-pack pipe joint insulation associate w/ fiberglass	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Boiler gasket	Non-ACM	—	Good	—
Boiler edge patch material	Non-ACM	—	Good	—
Breeching insulation	Non-ACM	—	Good	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Wall plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Basement				
Original mud-pack pipe joint insulation associated w/ fiberglass	ACM	20 joints	Fair to poor	—
Block and air-cell pipe insulation	ACM	4,350 LF	Poor	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. Pipe gauges, dents, and open ends were observed.
Pipe insulation debris mixed with plaster, wood and other construction debris on the floor.	ACM	39,000 SF	—	The average thickness of the debris layer in majority of the contaminated area was one inch; however, in several locations, thickness of debris layer reached up to two feet.
Pipe insulation debris mixed with plaster, wood and other construction debris in black plastic bags.	ACM	25 CY	—	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Various types of floor tile and associated mastic	ACM	300 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM.
Electrical wire insulation	ACM	10,000 LF	Unknown	—
Interior door caulking	ACM	3 door openings	Good	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
New mud-pack pipe joint insulation associate w/ fiberglass	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Vibration dumper cloth	Non-ACM	—	Good to fair	—
Electric panel board	Non-ACM	—	Good to fair	—
Pressboard material	Non-ACM	—	Good to fair	—
Cove base and associated mastic	Non-ACM	—	Fair	—
Pyroblock	Non-ACM	—	Unknown	—
Basement Mezzanine				
Block and air-cell pipe insulation	ACM	1,125 LF	Poor	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. Pipe gauges, dents, and open ends were observed.

KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Pipe insulation debris mixed with plaster, wood and other construction debris on the floor.	ACM	17,500 SF	—	The average thickness of the debris layer in majority of the contaminated area was one inch; however, in several locations, thickness of debris layer reached up to two feet.
Pipe insulation debris mixed with plaster, wood and other construction debris in black plastic bags.	ACM	10 CY	—	—
Various types of floor tile and associated mastic	ACM	5,500 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM. Up to two layers of floor tile/covering and mastic were observed at isolated locations. At the eastern section of Basement Mezzanine ACM floor tiles and mastic were observed to be covered with layer of plywood and non-ACM floor tiles.
Electrical wire insulation	ACM	3,000 LF	Unknown	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
New mud-pack pipe joint insulation associate w/ fiberglass	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Vibration dumper cloth	Non-ACM	—	Good to fair	—
Electric panel board	Non-ACM	—	Good to fair	—
Cove base and associated mastic	Non-ACM	—	Fair	—

Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Cove base and associated mastic	Non-ACM	—	Fair	—
3rd Floor and 4th Tower Level				
Block and air-cell pipe insulation	ACM	180 LF	Fair	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. Pipe gauges, dents, and open ends were observed.
Pipe insulation debris mixed with plaster on the floor.	ACM	1,000 SF	—	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Various types of floor tile and associated mastic	ACM	3,500 SF	Fair to poor	Most of the identified floor tiles were confirmed positive as per ET Environmental Corp. report dated August 24, 2000 and recent Langan's investigation. Mastic associated with these floor tiles was sampled and analyzed during recent Langan's investigation and was confirmed to be ACM. Up to two layers of floor tile/covering and mastic were observed at isolated locations. Hardwood flooring underneath floor tiles was mouldered and was in poor condition. Hardwood flooring was installed on concrete sub-flooring.
Electrical wire insulation	ACM	500 LF	Unknown	—
Wall and ceiling plaster	Non-ACM	—	Poor	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Sheetrock wallboard and joint compound	Non-ACM	—	Good to fair	Confirmed negative as per ET Environmental Corp. report dated August 24, 2000.
Cove base and associated mastic	Non-ACM	—	Fair	—
Roofs and Exteriors				
Original built-up roofing, flashing and mastic materials	ACM	50 SF	Good	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. See Note 1.
Window caulking and glazing putty	ACM	200 masonry window openings	Good to fair	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000.
Exterior door caulking	ACM	5 masonry door openings	Good	—
Floor joint fill material along perimeter building walls.	ACM	1,800 LF	Good	—

TABLE 1
SUMMARY OF ASBESTOS SURVEY FINDINGS
KINGSBRIDGE ARMORY
29 KINGSBRIDGE ROAD
BRONX, NEW YORK

Homogeneous Material	ACM or Non-ACM	Approximate Quantity of ACM	Condition	Comments
Caulking on gable ends and clerestory bands	ACM	12,000 SF of surface impacted by caulking presence	—	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000.
Inaccessible areas				
Block and air-cell pipe insulation	ACM	3,000 LF	Unknown	Confirmed positive as per ET Environmental Corp. report dated August 24, 2000. An allowance is provided for the presence of concealed ACM pipe insulation within wall and ceiling cavities.
Pipe insulation debris mixed with plaster on the floor and floor covering.	ACM	1,000 SF	—	An allowance is provided for the presence of concealed ACM pipe insulation within inaccessible building spaces.

Notes:

1. The ET report documented the built-up roofing material. Apparently, the building was observed to have fairly new built-up roofing. Based on our field observations and review of the Building Department records, it appears that as part of 2002 exterior restoration project, the built-up roofing materials and several windows in the building were replaced. Any roof cuts would void existing warranty, and therefore, the roofs were not sampled during our investigation.
2. Any suspect material that is not listed in this report must be presumed ACM until confirmed via laboratory testing.

Pipe insulation debris mixed with plaster on the floor.	500 SF	$5	$2,500
Various types of floor tile and associated mastic	1,600 SF	$7	$11,200
Electrical wire insulation	1,000 LF	$3	$3,000

BUDGETARY ESTIMATE FOR HAZMAT ABATEMENT
Kingsbridge Armory
29 West Kingsbridge Road
BRONX, NEW YORK

ACM or Presumed ACM	Quantity of ACM or Presumed ACM	Unit Price	Budgetary Estimate
SECOND FLOOR			
Block and air-cell pipe insulation	250 LF	$15	$3,750
Pipe insulation debris on suspended ceiling plaster.	600 SF	$5	$3,000
Various types of floor tile and associated mastic	7,700 SF	$7	$53,900
Wall panel glue	1,600 SF	$6	$9,600
Mirror glue	20 SF	$6	$120
Electrical wire insulation	2,000 LF	$3	$6,000
THIRD FLOOR AND FOURTH TOWER LEVEL			
Block and air-cell pipe insulation	180 LF	$30	$5,400
Pipe insulation debris mixed with plaster on the floor.	1,000 SF	$5	$5,000
Various types of floor tile and associated mastic	3,500 SF	$7	$24,500
Electrical wire insulation	500 LF	$3	$1,500
ROOFS AND EXTERIORS			
Original built-up roofing, flashing and mastic materials	50 SF	$50	$2,500
Window caulking and glazing putty	200 WO	$500	$100,000
Exterior door caulking	5 DO	$100	$500
Floor joint fill material along perimeter building walls.	1,800 LF	$5	$9,000
INACCESSIBLE AREAS			
Block and air-cell pipe insulation concealed within wall and ceiling cavities	3,000 LF	$35	$105,000
Pipe insulation debris mixed with plaster on the floor and floor covering.	100 SF	$10	$1,000
TOTAL ASBESTOS ABATEMENT ESTIMATES			**$920,645**
ESTIMATED COST FOR THE MANAGEMENT AND REMEDIATION OF LEAD BASED PAINTED COMPONENTS			**$229,355**
ESTIMATED COST FOR THE REMOVAL OF PCB/MERCURY CONTAINING ELECTRICAL ARTICLES			**$50,000**
ESTIMATED TOTAL FOR PREPARATION OF DESIGN DOCUMENTS, PROJECT MONITORING, AIR SAMPLE ANALYSIS, CLOSURE REPORT, AND SUBMITTAL REVIEW			**$150,000**
ESTIMATED TOTAL FOR THE REMEDIATION OF HAZMAT			**$1,350,000**

Notes:

1. The aforementioned unit prices for asbestos removal are based on the location, size and complexity of the project, and assume that all abatement work will be completed in one phase. These estimates are for budgetary purposes only. Actual removal cost may vary depending upon the market conditions and time of the year ACM are being removed, and work phasing. The estimates include the cost for insurance, overhead, material, labor, disposal permits, OSHA sampling and analysis, and profits. Additionally, the estimated cost is also based on the assumption that union labor wage rate will be used for the workers' and supervisors' wages.

Reporting Notes:

Analyzed by: John P. Koubiadis

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0), ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile,FR 59,146,38970,8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab # 102843.

Analyzed by: Aleksandr Barengolts; Date Analyzed 9/15/2008

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation); or ELAP 198.4 for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); AIHA Lab # 102843, NVLAP Lab Code 200546-0, NYSDOH ELAP LAB ID 11480.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

Duly Authorized Representative – Vijay Patel

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

5. Survey of Biological Contamination

Attachment(s):

A. Environmental Survey Report Prepared By ATC

EXECUTIVE SUMMARY

Environmental testing was conducted to determine if any hazardous building materials will be impacted by roofing work scheduled at the Kingsbridge Armory. Specifically, the roof area was investigated for the presence of asbestos, lead-based paint and bird droppings. This Environmental Survey reports the following findings which may impact construction activities in the roof area of the Kingsbridge Armory:

- Built-up roofing, two-tab shingle and underlayment and caulking were identified as Category 1 non-friable asbestos-containing materials.
- Pipe insulation on the Drill Floor Mezzanine was identified as friable asbestos-containing material.
- Painted surfaces throughout the building contain regulated levels of lead-based paint.
- Bird droppings are present on the roof trusses

Removal/management of these materials is necessary in order to minimize worker exposures and prevent release of hazardous materials into the environment. Abatement plans, which outline procedures for handling these hazardous materials, are incorporated in the enclosed documentation.

The information enclosed is limited in scope to accessible areas of the roof and other areas that may be impacted by roof renovation. Any new materials encountered during the renovation process should be appropriately tested prior to disturbance.

Summary Scope of Work

Asbestos

A. Remove and dispose of all layers of built-up roofing including underlayment, mastics, flashings and adhesives to the deck from the South and North Shed Roofs.

B. Remove and dispose of all layers of two tab shingle roofing including underlayment, mastics, flashings and adhesives to the deck from the South and North Vault Roofs.

C. Remove and dispose of all layers of EPDM, rigid insulation and built-up roofing including underlayment, mastics, flashings and adhesives to the deck from the low slope administrative building roof, parapet band and one story structures located on the roof.

D. Remove and dispose of all exposed and concealed mastics, flashing material, adhesives and caulking from the East and West gable ends.

E. Remove and dispose of all exposed and concealed mastics, flashing material, adhesives and caulking from the North and South clerestory bands.

F. Remove and dispose of all exposed and concealed caulking from the parapet wall.

G. Remove and dispose of perimeter pipe insulation on the drill floor mezzanine level to facilitate roof abatement.

H. Removal and disposal of accumulated debris on drill floor as asbestos contaminated waste prior to commencement of scaffolding work and throughout roof abatement work.

I. Removal and disposal of accumulated roofing debris surrounding the armory building prior to commencement of abatement work and throughout roof abatement work.

Demolition

A. Remove and dispose of existing roof decking from the South and North shed and vault roofs. If contaminated with roofing material dispose of as asbestos containing waste.

B. Remove metal panels from the East and West gable ends to access mastics, flashing material, adhesives and caulking. If metal panels are contaminated with mastics, flashing materials, adhesives or caulking decontaminate or dispose of as asbestos containing waste.

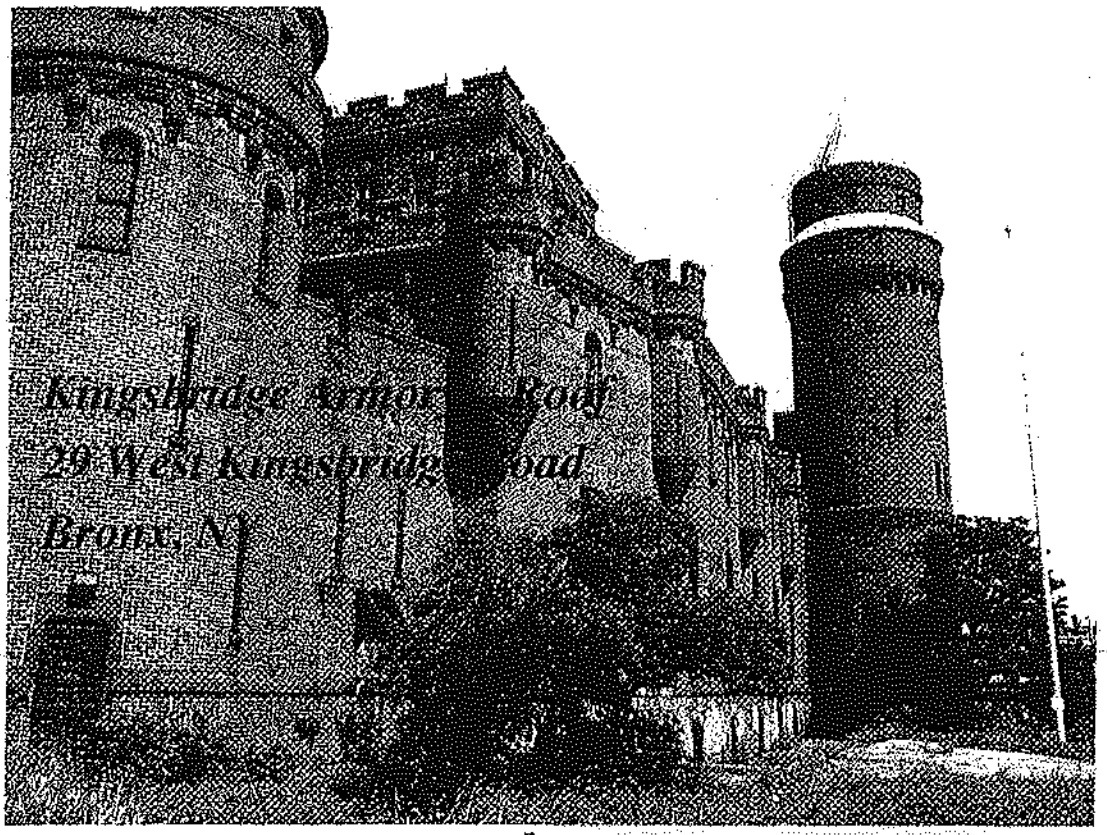
C. Remove corrugated and metal panels from the North and South clerestory bands to access mastics, flashing material, adhesives and caulking. If corrugated or metal panels are contaminated with mastics, flashing materials, adhesives or caulking decontaminate or dispose of as asbestos containing waste.

Avian Fecal Contamination

A. Remove any significant deposits of bird droppings.

B. Place all waste in 6 mil poly bags.

C. Dispose of waste as normal construction debris.



Load Paint Abatement/Surface Preparation

A. Remove all coatings and debris from the top cord of roof trusses and angle brackets exposed by removal of the roof decking.

B. Coatings removal shall meet SSPC Specifications SP-11-87T for Power Tool Cleaning to Bare Metal. It is the intent to remove all coatings and debris from these surfaces to facilitate other trades' work on these surfaces during this project.

KINGSBRIDGE ARMORY ROOF REHABILITATION PROJECT
Asbestos Survey Report (Summary) And Removal Specifications

Date Prepared: *September 15, 2000*

Prepared for: *New York City Economic Development Corporation*
110 William Street
New York, NY 10038

Prepared by: *ET Environmental Corporation*
3424 Peachtree Road
Suite 200
Atlanta, GA 30326

Written by: *George Pineda, CIH, CHMM*
Piotr Chmielinski, M.S., CIH

REPORT SUMMARY

Testing was conducted to determine if asbestos is present in the roofing material of a building planned for renovation, located at 29 West Kingsbridge Road in Bronx, New York. The survey and collection of samples was conducted in August, 2000. This report concludes that non-friable asbestos containing materials are present on the roof.

Chrysotile asbestos (Category 1 non-friable) was identified in:

South Shed Roof	Built-up roofing, wood decking* (Black, ~64,800 sf)
North Shed Roof	Built-up roofing, wood decking (Black, ~64,800 sf)
South Vault Roof	Two-tab shingle and underlayment, wood decking (Black, ~41,300 sf)
North Vault Roof	Two-tab shingle and underlayment, wood decking (Black, ~41,300 sf)
Low slope – Administrative Wing	Two-tab shingle and underlayment, wood decking (Black, ~41,300 sf)
East Metal Gable End	Caulking (Black, ~3,500 sf)
West Metal Gable End	Caulking (Black, ~3,500 sf)
South Clerestory Band	Caulking (Black, ~2,500 sf)
North Clerestory Band	Caulking (Black, ~2,500 sf)
Parapet Wall	Caulking (Black, ~1,400 sf)

NOTE: Quantities are an estimation only. If used for abatement purposes, the contractor should confirm these amounts.

** if contaminated by ACM*

This report is submitted the 8th day of September in the Year 2000 by:

Introduction

Project Description

The property located at 29 West Kingsbridge Road was surveyed at the request of the New York City Economic Development Corporation. The building is located in Bronx, New York.

The building is a 900,000 square foot building previously used as an armory.

In August, 2000, Mr. James Ruchalski (New York Certificate # AH 91-06714) and Mr. Jay Dupay (New York Certificate # AN 88-05963) of ATC Associates, Inc. (ATC) inspected the above mentioned structure and collected a total of 29 representative samples of different suspect building materials on the roof. Inspection and collection of samples included accessing all roof areas and collecting samples of any roofing materials that were suspected to contain asbestos.

Bulk sampling was conducted utilizing techniques of destructive methods (a complete review of survey limitations is provided under Bulk Sampling Collection).

Objective of Survey

The goal of the survey was to determine if any materials on the roof contain asbestos. This information is required to comply with current State of New York and City of New York asbestos regulations prior to the renovation of this structure.

Current Regulatory Guidelines

OSHA: Meets criteria for OSHA medical records rule. 29 CFR 1910.20 (7/1/88)

OSHA: 8 hr Time Weighted avg.: 0.1 fiber/cc. A fiber is defined as a particulate form of asbestos, tremolite, anthophyllite, or actinolite, 5 µm or longer, with a length-to-diameter ratio of at least 3:1. 29 CFR 1910.1001 (8/10/94)

NIOSH: 8-hr TWA: .1 fiber/cc (fibers greater than 5 µm in length) NIOSH. NIOSH POCKET GUIDE CHEM HAZ 2ND PRT 1987 Appendix D

ACGIH: TLV - Time Weighted Avg. (TWA) 0.2 fiber/cc (fibers longer than 5 µm and with an aspect ratio equal to or greater than 3:1) (1980) ACGIH. TLVs 1989-90., p. 12

EPA: Asbestos has been designated as a hazardous air pollutant under section 112 of the Clean Air Act. 40 CFR 61.01 (7/1/88)

Miscellaneous Published Reports

NTIS: Industrial Health Hazards Due to Atmospheric Factors, April 1982-May 1983.

USEPA/ECAO: Asbestos Health Update (1984) EPA 600/8-84-003A

WHO: Environ Health Criteria: Asbestos and Other Natural Mineral Fibers (1986)

USEPA: Health and Environmental Effects Profile for Asbestos (1979)

Survey and Analytical Methods

Air Sample Collection

No air samples were collected during this inspection.

Bulk Sample Collection

Samples of building material were collected using metal sampling devices. Material collected was contained entirely within catch containers and emissions from sampling were contained by application of wetting agents when appropriate.

Bulk sampling was conducted utilizing standard techniques. Efforts were made not to impair the function or appearance of items sampled. In some instances, samples could not be taken without adversely impacting the intended function of the material

Sample Analysis

Analysis of bulk building material for the presence of asbestos, was conducted using the current NIOSH 7403 method. The technique includes use of polarized light microscopy with confirmation technique using dispersion staining. This method is designed to identify asbestos minerals and determine their estimated concentrations as a percent by weight. Ref: NIOSH. MANUAL ANALYT METH 3RD ED VOLS 1,2 SUPPLS 1984. V1 7403-1.

The United States Environmental Protection Agency (USEPA) defines ACM as a material which contains greater than 1% (w/w) of asbestos. Thus, materials that contain asbestos in concentrations greater than 1% are frequently labeled "positive" while materials containing less than 1% are labeled "negative". Although this convention has gained general acceptance, the designation was arbitrarily determined and may be subject to revision in the future. Precedent for such a revision can be found in the redefinition of "ACM" by the USEPA to include non-friable materials.

In some cases limitations associated with the analytical method must also be considered when determining what is a "positive" result. For instance, when asbestos fibers are contained within a vinyl matrix of a floor tile, the analysis requires that the vinyl be dissolved in organic solvents. In this case it is difficult to assign an accurate percentage to the asbestos content of the floor tile and labeling this floor tile as "negative", when it contains less than 1% asbestos, may be inappropriate and misleading. Likewise, some flooring materials are formulated using very fine asbestos fibers. At some point these very fine fibers become invisible to light microscopy techniques. Experience has demonstrated that reports of trace quantities of asbestos in some flooring materials following examination by light microscopy may be inaccurate. Frequently flooring materials are found to contain significantly more asbestos when analyzed by other techniques such as electron microscopy.

For these reasons, the "positive" designation in this report will be applied to materials when even trace quantities of asbestos are detected. This will remain the case unless additional testing or other information is available to confirm the concentration of asbestos to be less than or equal to 1%.

Results

The laboratory report listing the results for all twenty-nine (29) samples collected from the roof area is included in Attachment A to this survey report. Asbestos was identified in twenty-two (22) of the samples.

Results Summary

The on-site inspection and subsequent review of laboratory results of the 29 bulk samples collected during the survey in August, 2000 found that

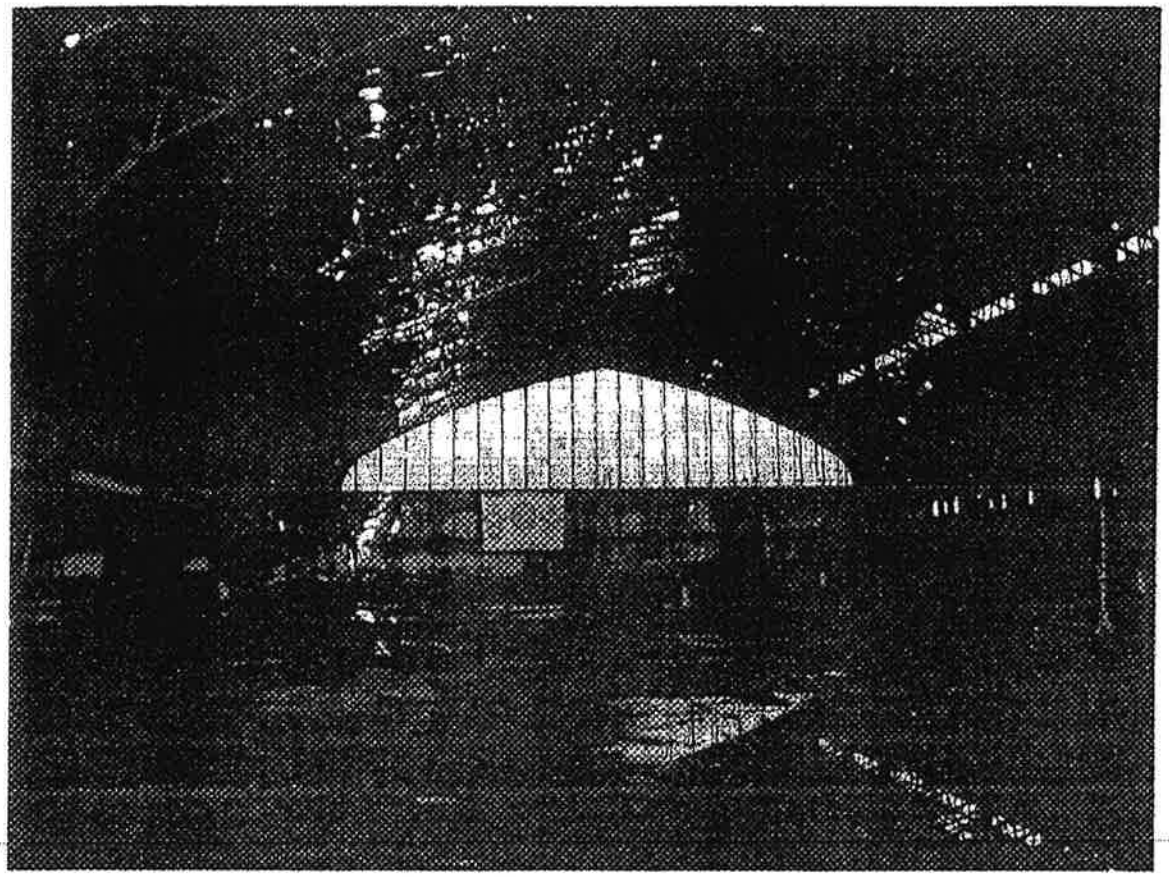
- Chrysotile asbestos (Category 1 non-friable) was identified in the built-up roofing located on the North and South Shed Roofs.
- Chrysotile asbestos (Category 1 non-friable) was identified in the two tab shingle and underlayment located on the North Vault Roof.
- Chrysotile asbestos (Category 1 non-friable) was identified in the window mastic (see Photograph 4) located on the East and West Gable Ends, North and South Clerestory Bands and Parapet Wall.

Conclusions and Recommendations

The findings of this survey include Category 1 non-friable roofing material and caulking.

Due to the planned renovation of the building, the State of New York and City of New York require any asbestos-containing materials (i.e. roofing material and pipe insulation) that will be disturbed during renovation to be removed prior to renovation. All asbestos removal work must be performed by a qualified asbestos abatement contractor.

NOTE: While care has been taken to locate and sample all suspect materials associated with the structures, the potential does exist for additional materials to be concealed within the structures (i.e. behind framing, under roofing, etc.). For this reason, during the renovation process, care should be taken to recognize any materials that may become evident and accessible. Additional testing and/or removal of the materials may be required.



If renovation is not scheduled for the near future in building areas not included in the roof rehabilitation phase, the building owner should implement the following:

1. Control access to the area where the asbestos containing materials are located. This controlled access should include restricting workers and repair activities in the area to those persons who have been notified that some building materials contain asbestos.
2. Use work practices and/or other controls as necessary to inhibit the release or spread of asbestos fibers from the ACM. These work practices should include instructions not to cut, drill, sand or disturb the ACM matrix in any manner that may cause the release of asbestos fibers from the material.

ASBESTOS REMOVAL SPECIFICATIONS

ASBESTOS REMOVAL SPECIFICATIONS

PART 1 GENERAL

1.01 SCOPE OF WORK

A. This asbestos abatement Project will consist of the removal and disposal of all asbestos containing roofing, contaminated decking, caulking, miscellaneous adhesives and pipe insulation materials from the areas identified below at the Kingsbridge Armory, Bronx, NY.

B. The work shall include but not be limited to the removal of following asbestos-containing materials (ACM):

Location:	ACM	Quantity
South Shed Roof	Built-up roofing, wood decking[1]	64,800 SF
North Shed Roof	Built-up roofing, wood decking	64,800 SF
South Vault Roof	Two-tab Shingle and underlayment, wood decking	41,300 SF
North Vault Roof	Two-tab Shingle and underlayment, wood decking	41,300 SF
Low slope – Administrative Wing	EPDM & Rigid Insulation over built-up roofing	20,000 SF
East Metal Gable End	Caulking[2]	3,500 SF
West Metal Gable End	Caulking[2]	3,500 SF
South Clerestory Band	Caulking[2]	2,500 SF
North Clerestory Band	Caulking[2]	2,500 SF
Parapet Wall	Caulking[2]	1,400 LF
Drill Floor Mezzanine	Pipe Insulation	1,500 LF
Drill Floor	Debris[3]	180,000 sf
Exterior (around building perimeter)	Roofing debris	N/A

[1] If wood decking is contaminated by ACM.

[2] Approximate square footage of surfaces impacted by the caulking.

EXECUTIVE SUMMARY

ATC Associates Inc. was contracted by ET Environmental Corp. to conduct a survey of the Kingsbridge Armory 29 West Kingsbridge Road, Bronx, NY. The intent was to identify asbestos containing materials, lead containing and/or lead based paints and coatings, mercury-containing switches or lamps, suspect PCB (polychlorinated biphenyls) or DEHP (Di (2-ethylhexyl) phathatlate) containing light ballasts, storage tanks and stored or abandoned materials at the facility.

The survey identified an estimated fourteen thousand two hundred sixty (14,260) feet of thermal system insulation (piping, cementitious joints), thirty-three thousand six hundred sixty (33,660) square feet of flooring materials (floor tiles, linoleum) and two-hundred thirty-five thousand (235,000) square feet of roofing materials (2-tab shingles, built-up roofing, mastics). Additionally, glazing associated with the windows (interior and exterior) and caulking material associated with windows and exterior joints, seams and cracks was identified as asbestos containing materials. Plaster surfaces primarily walls and ceilings were tested throughout the armory and were determined to **not** be an asbestos containing material.

The survey confirmed lead at detectable levels and above for each substrate as follows; 59% of brick, 45% concrete, 73% metal, 89% plaster and 56% wood. Substrates were distinguished by and identified by the exposed coating color. However, variance of lead results within a single testing combination particularly gray painted concrete substrate indicate that the lead-containing layer(s) occur below the exposed common layer. Therefore, the generally poor condition of painted surfaces combined with the inability to distinguish painted components by the exposed color all paint should be considered lead containing for purposes of OSHA compliance, waste stream management and environmental dust control.

Copyright © 2000

No mercury containing switches were observed. Ballasts inspected at various locations of the Armory were found to be not labeled as to content or in poor condition, therefore all ballasts were considered PCB or DEHP containing. An estimated six hundred fifty (650) light fixtures, one thousand two hundred fifty (1,250) bulbs/tubes, seven hundred (700) ballasts and one hundred nine (109)metal halide lights were observed. All PCB/DEHP-contaminated materials should be incinerated, mercury containing lighting lamps, such as: Fluorescent, Mercury Vapor, and High Intensity Discharge lamps (including Metal Halide lamps, High Pressure Sodium lamps, and Low Pressure Sodium lamps) should be disposed through a complete recycling process.

The visual inspection of the Armory grounds indicated that at least four underground storage tanks existed at one time as determined by identified vent pipes and fill ports. Regulatory database review identified five underground storage tanks and two aboveground storage tanks associated with the Armory. An electro-magnetic survey of suspect areas indicated that two buried tanks might exist in the garage parking area. Presumably, these could be the closed tanks identified as tank 1 –diesel and tank 2- unleaded gasoline. Additionally, the survey identified seven additional aboveground 275-gallon storage tanks in the basement not identified in the regulatory database. Tanks 1 and 2 appear to have been closed and abandoned in place, which can be verified by test pits. Additional investigation is required to ascertain the disposition of tanks 3 through 7. The seven aboveground storage tanks identified by the survey need to be examined/tested for product type, content and eventual disposition.

Throughout the Armory, various paints, solvents and maintenance products were observed that would require consolidation and disposal. Abandoned refrigeration/air conditioner units may contain CFC compounds and require reclamation prior to disposal. Several animal/bird carcasses and small quantities of avian excreta were observed in localized areas, disturbance of these items would require personal protective equipment.

INTRODUCTION

ATC Associates Inc. was contracted by ET Environmental Corp. to conduct a survey of the Kingsbridge Armory 29 West Kingsbridge Road, Bronx, NY. The intent was to identify asbestos containing materials, lead containing and/or lead based paints and coatings, mercury containing switches or lamps, suspect PCB (polychlorinated biphenyls) or DEHP (Di (2-ethylhexyl) phathatlate) containing light ballasts, storage tanks and stored or abandoned materials at the Kingsbridge Armory.

Messrs James Ruchalski and Jay Dupay of ATC performed the asbestos survey. Mr. Dupay holds certifications from the New York City Department of Environmental Protection as an Asbestos Investigator and the New York State Department of Labor as an Asbestos Inspector and will be the inspector of record for all filings. Mr. Ruchalski holds certification from the New York State Department of Labor as an Asbestos Inspector. Mr. Richard Edwards and Maraina Medinets performed the XRF survey. The survey was performed from July 24 through August 22, 2000.

STANDARDS OF CARE

ATC Associates Inc.'s work was performed in a professional manner with the best interest of our client in mind. Our objective was to perform our work with care, exercising the customary skills and competence of consulting professionals in the relevant disciplines. The conclusions presented in this report are professional opinions based upon visual observations of the site and laboratory results from samples collected and analyzed.

ATC ASSOCIATES INC.
Copyright © 2000

The opinions and recommendations presented herein apply to site conditions existing at the time of our observations. ATC Associates Inc. cannot act as insurers, and no expressed or implied representation or warrant is included or intended in our report except that our work was performed, within the limits prescribed by our clients, with the customary thoroughness and competence of our profession at the time and place the services were rendered. This report is designed to generally identify the accessible recognized environmental materials identified in the introduction at the facility.

ASBESTOS – SURVEY

Guidelines used for the survey were established by the Environmental Protection Agency (EPA) in the Guidance for Controlling Asbestos Containing Materials in Buildings, Office of Pesticides and Toxic Substances, Doc 560/5-85-024, and 40 CFR Part 763, Asbestos Hazard Emergency Response Act (AHERA).

Field information was organized in accordance with the AHERA methodology of homogenous area (HA). During the survey, reasonable effort was made to identify all locations and types of ACM materials associated with the scope of work. Multiple samples of homogeneous materials were chosen at random. However, due to inconsistencies of a manufacturer's processes and the contractor's installation methods, materials of similar construction may contain various amounts of asbestos. Further, some materials that were not originally specified to contain asbestos may in fact contain this mineral. For example, cementitious pipe insulation and plaster were frequently mixed with asbestos at the construction site for ease of application. Locating all asbestos materials can only be definitively achieved by conducting exploratory demolition and sampling every section of pipe insulation, fitting or valve covering, fireproofing, and other suspect ACM.

Copyright© 2000

Bulk samples of suspect ACM were analyzed using polarized light microscopy (PLM) coupled with dispersion staining, as described in 40 CFR Part 763 and the National Emissions Standard for Hazardous Air Pollutants (NESHAP). NESHAP is the standard industry protocol for the determination of asbestos in building materials. A suspect material is immersed in a solution of known refractive index and subjected to illumination by polarized light. The color displays that result is compared to a standardized atlas whereby the specific variety of asbestos is determined. It should also be recognized that PLM is primarily a qualitative identification method whereby asbestos percentage, if any, is estimated. While EPA, New York State; and New York City regulations governing ACM consider materials containing greater than 1-percent as asbestos, accurately quantifying asbestos content below 5-percent has been shown to be unreliable. Without additional and more sophisticated analysis, using transmission electron microscopy (TEM), a 1-percent content or less of asbestos in a building material sample may still result in an exposure or possible respiratory hazard should the material be indiscriminately demolished. Therefore, for identification and appropriate asbestos management, ATC recommends that any detected asbestos in a suspect material using PLM be considered asbestos. For those materials revealing no asbestos using PLM, TEM analysis should be conducted for confirmation.

The New York State Department of Health has revised the PLM Stratified Point Counting Method. The new method, "Polarized Light Microscopy Methods for Identifying and Quantifying Asbestos in Bulk Samples" can be found as item 198.1 in the Environmental Laboratory Approval program (ELAP) Certification manual. The method specifies a procedure of analysis for bulk samples that fall into the category of "Non-friable Organically Bound" (NOB). This category includes any sample in a flexible to rigid asphalt or vinyl matrix (floor tiles, mastic, roofing shingles, roofing felt, etc.). Additional materials that may fall into this category are textured paints and stucco, pipe valve and joint packing, and a variety of other applications. These samples must be "ashed" in a muffle furnace at 480-degrees Celsius (to remove organic matrix), treated with acid (to remove any mineral carbonate), and filtered through a 0.4-micron filter before being analyzed by PLM. The sample must be weighted between each of these steps to track the percent loss of organic matrix.

Copyright © 2000

ELAP has determined that analysis of NOB materials is not reliably performed by PLM. Therefore, if PLM yields results of 1-percent asbestos or less, the result must be confirmed by TEM. Bulk samples that undergo TEM analysis use the sample reduction methodology stated above for NOB analysis by PLM. ELAP certified laboratories must include the following statement with their PLM analysis results for each "inclusive" (1-percent or less asbestos) NOB sample: "Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Before this material can be considered or treated as non-ACM, confirmation must be made by quantitative transmission electron microscopy".

Selected samples initially analyzed by Polarized Light Microscopy which yielded a negative PLM result and which are classified as a "non-friable" material, were then re-analyzed utilizing Transmission Electron Microscopy methodology described above. The laboratory performing both these analysis procedures was ATC Associates Inc., located at 104 East 25th Street, New York, New York. The following laboratory accreditation's are included in Appendix C:

- National Voluntary Laboratory Accreditation Program (Lab Code 1187-00)
- New York State Environmental Laboratory Approval Program (Lab No. 10879)
- American Industrial Hygiene Association Accredited Laboratory (Lab No. 7054)

ASBESTOS – SURVEY FINDINGS

Two hundred twenty-five bulk samples were collected from representative homogeneous areas throughout the facility. Tabular summary of bulk samples is located in Appendix A with field data/chain of custody forms in Appendix B. Asbestos sample locations and schematic material drawings are located in Appendix H. Based upon visual inspection of representative materials likely to be impacted by the planned interior demolition and/or renovation and bulk sample laboratory analytical results, the following materials have been identified as **asbestos containing materials [ACM]** (greater than one percent asbestos).

Copyright © 2000

- 2-tab roof shingle
- Built-up roofing
- Tar paper underlayment
- Roofing mastics/adhesives
- Pitch pockets
- 9" x 9" floor tiles (all colors)
- Sheet linoleum
- Corrugated (aircell) pipe insulation
- Cementitious pipe joint insulation associated with corrugated (aircell) pipe insulation
- magnesia (pre-formed block) pipe insulation
- Cementitious pipe joint insulation associated with magnesia (pre-formed block) pipe insulation
- Cementitious pipe joint insulation associated with fiberglass pipe insulation (National Guard Office only)
- window glazing (interior and exterior)
- Caulking material associated with windows and exterior joints, seams and cracks

Thermal system insulation was identified primarily in exposed readily accessible locations throughout the facility as described below. However, concealed thermal system insulation was observed in interstitial wall spaces associated with bathroom fixtures and the plenum area above suspended plaster ceilings.

Sub-basement	No ACM observed
Basement	TSI located on perimeter steam, hot and cold water lines. Piping in hallways has been abated and replaced with non-ACM insulation.
Basement Mezzanine	TSI located on perimeter steam, hot and cold water lines. TSI located on steam lines parallel to hallway in ammunition storage rooms. Asbestos containing flooring in office areas on southern wall.

Copyright © 2000

Drill Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Drill Floor Mezzanine	TSI located on steam, hot and cold water lines associated with bathrooms. Asbestos containing flooring in office areas on southern wall.
Second Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Third Floor	Perimeter steam and hot and cold water lines. Asbestos containing flooring in office areas along southern wall. Asbestos containing window caulking and glazing on all windows.
Roofs	Built-up and two tab shingle roofing including underlayment, mastics, flashings and adhesives. Mastics, flashing material, adhesives and caulking on gable ends, clerestory bands and parapets.

The survey identified the following estimated quantities of asbestos containing thermal system insulation (piping, cementitious joints), flooring materials (floor tiles, linoleum) and roofing materials (3-tab shingles, built-up roofing, mastics) within the survey boundaries.

Level	Thermal System Insulation (Linear Feet)	Flooring Material (Square Feet)	Roofing (Square Feet)
Basement	7,410	300	-
Basement Mezzanine	2,275	1,000	-
Drill Floor	3,540	6,460	-
Second Floor	675	17,500	-
Third Floor	210	8,400	-
Fourth Floor	150	-	-
Roofs	-	-	235,000
Totals	**14,260**	**33,660**	**235,000**

A detailed table of asbestos containing materials by area is located in Appendix D.

Copyright © 2000

Based upon visual inspection of materials determined to be impacted by the renovation program and bulk sample laboratory analytical results, the following materials are identified as **not asbestos containing materials** (less than one- percent asbestos).

- Boiler insulation'
- Breeching insulation
- Gray floor coating – drill floor
- Cementitious pipe joint insulation associated with fiberglass pipe insulation (Main armory building)
- 12" x 12" ceiling tile
- 2' x 2' ceiling tile
- 2' x 4' ceiling tile
- Joint compound
- Wall plaster – brown coat
- Wall plaster – white coat
- Ceiling plaster – brown coat
- Ceiling plaster – white coat
- Brown paper under 3-tab shingle
- Wallboard

LEAD – SURVEY (PAINTED SURFACES)

The objective of this survey was to identify existing lead-based paint on potentially impacted building surfaces during pending renovation/demolition activities. All painted components were not sampled with the XRF; rather, the survey sampled representative painted building substrates and components and based on the results assumptions as to lead content are made in this report. If questions arise as to the lead content in paint found on a specific surface not tested by ATC, additional testing may be required.

Copyright © 2000

A portable Lead Paint Analyzer manufactured by Radiation Monitoring Devices (RMD) was used to test all accessible painted components. The instrument was operated in accordance with manufacturer's instructions and XRF performance characteristic sheet (PCS). Representative readings were taken from each surface. Three calibration readings were taken before and after testing in the facility to ensure proper instrument operation. XRF results were divided into three categories: positive, inconclusive, and negative as defined by the PCS. According to the revised PCS for the RMD device, inconclusive ranges exist only for metal substrates. If the result was inconclusive, a paint chip sample was collected for laboratory analysis to determine the actual result.

LEAD –SURVEY FINDINGS (PAINTED SURFACES)

One thousand one hundred ninety building surfaces were tested with a portable X-Ray Fluorescence analyzer for lead content. Substrates tested within the Armory were; brick, concrete, metal, plaster, sheetrock, and wood. Substrates were distinguished by and identified by the exposed coating color. Bulk samples collected form the steel arch's on the drill floor confirmed lead content on the arched of between 8.92 and 56.67 %. A tabular summary of XRF survey data and bulk samples is located in Appendix E

Substrate	Shots	Shots >.4	Shots > 1	Percent of components with XRF detectable levels of lead	Percent of components with a Lead based coating
Brick	119	70	67	59%	56%
Concrete	178	80	62	45%	35%
Metal	403	295	238	73%	59%

LEAD – SURVEY (TARGET RANGES)

Waste classification of the soils/sand identified within the basement rifle and pistol ranges was performed to determine proper handling and storage requirements as well as the disposal location (i.e., either RCRA Subtitle "C" landfill or Construction and Demolition (C&D) Subtitle "D" landfill). Environmental Protection Agency's (EPA) Resource Conservation and Recovery Act (RCRA) mandates that the lead containing media be characterized as either hazardous or non-hazardous waste prior to disposal. The TCLP composite samples were representative of the various materials that constituted the waste stream. The Inspector donned disposable gloves, which were changed prior to the collection of each sample. The material was placed into a ziplock bag, sealed, and labeled with a unique identifier. A minimum of 100 grams of material was collected. A chain of custody form was completed and submitted with the samples to the laboratory.

LEAD – SURVEY FINDINGS (TARGET RANGES)

ATC collected four (4) representative four-point composite samples from the basement shooting ranges. Sample 1 was collected form Pistol Ranges 9 – 16, Sample 2 was collected form Pistol Ranges 1 – 8, Sample 3 was collected from the most recently active portion of the Rifle Ranges, Sample 4 was collected from the abandoned portion of the Rifle Ranges behind the steel back stop. Analytical results indicate that the anticipated waste stream from each of the sampled areas contain levels of leachable lead in excess of RCRA standards. All four samples contained leachable lead above 5ppm.

Sample	Location	Analytical Result)
1	Pistol Range 9 – 16	1,480 ppm
2	Pistol Range 1 – 8	655 ppm
3	Rifle Range (active)	23.9 ppm
4	Rifle Range (abandoned)	5.84 ppm

Copyright © 2000

Based on TCLP results indicating leachable levels of lead greater than 5 ppm, the waste streams generated by the removal of the soils, sands and other material are characterized as a hazardous lead containing solid waste as defined by RCRA.

FLUORESCENT AND HIGH-INTENSITY DISCHARGE LIGHTING (HID)/BALLASTS

A visual walk-through of the Armory was conducted including examination of typical fixtures to ascertain the approximate quantity of mercury containing switches, lamps and suspect PCB or DEHP containing light ballasts. A drawing identifying approximate room locations and quantities of fixtures, bulbs and ballasts in located in Appendix H. No mercury containing switches were observed. Ballasts inspected at various locations of the Armory were found to be not labeled as to content or in poor condition, therefore all ballasts were considered PCB or DEHP containing. An estimated quantity of light fixtures, bulbs and ballasts is as follows:

Level	FIXTURES	Bulbs/Tubes	Ballasts	Metal Halide Lights
Basement	185	450	300	9
Basement Mezzanine	190	300	145	-
Drill Floor	175	300	145	100
Second Floor	100	200	110	-
Third Floor	-	-	-	-
Fourth Floor	-	-	-	-
Totals	**650**	**1250**	**700**	**109**

The primary concern regarding the disposal of used fluorescent ballasts is the health risk associated with polychlorinated biphenyl's (PCBs). Human exposure to these possible carcinogens can cause skin, liver, and reproductive disorders. Fluorescent and high-intensity discharge (HID) ballasts contain a small capacitor that may contain high concentrations of PCBs (greater than 90% pure PCBs or 900,000 ppm). These chemical compounds were widely used as insulators in electrical equipment such as capacitors, switches, and voltage regulators through the late 1970s.

Copyright © 2000

The Toxic Substances Control Act (TSCA) was enacted in 1976, and subsequently banned the production of PCBs in the United States. The specific regulations governing the use and disposal of PCBs are found in Volume 40 Code of Federal Regulations (CFR) Part 761.

The proper method for disposing used ballasts depends on several factors, such as the type and condition of the ballasts and the regulations or recommendations in effect in the state(s) where you remove or discard them. TSCA specifies the disposal method for ballasts that are leaking PCBs. In addition, generators of PCB-containing ballast wastes may be subject to notification and liability provisions under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) (also known as "Superfund").

Identifying criteria

- All ballasts manufactured through 1979 contain PCBs.
- Ballasts manufactured after 1979 that do not contain PCBs are labeled "No PCBs."
- If a ballast is not labeled "No PCBs," assume it contains PCBs.

DEHP-CONTAINING BALLASTS

Di (2-ethylhexyl) phathatlate (DEHP) is a substance that was used to replace PCBs in certain ballast capacitors beginning in 1979. DEHP in its pure form is listed as a hazardous waste under the Resource Conservation and Recovery Act (RCRA). However, once it has been used in a lighting ballast, it is no longer hazardous as defined by RCRA. (See 40 CFR 261.33, Part 261 Appendix VII, Section 268.34, and Section 268.43.) DEHP is regulated under CERCLA– the Superfund law. The "Reportable Quantity" (RQ) of DEHP under CERCLA is 100 pounds. (See 40 CFR, Section 302.4.) This means that if you are disposing of 100 pounds or more of the material in a 24 hour period (approximately 1,600 fluorescent lighting ballasts), you are required to notify the National Response Center at (800) 424-8802. It also means that parties involved with the disposal of DEHP ballasts may be held liable under Superfund if clean up of the DEHP is required.

Copyright © 2000

Identifying criteria

- DEHP has been found in ballasts designed for the following lighting fixtures: four foot fluorescent fixtures manufactured between 1979 and 1985
- Eight foot fluorescent fixtures manufactured between 1979 and 1991
- High intensity discharge (HID) fixtures manufactured between 1979 and 1991

MERCURY-CONTAINING LAMPS

Fluorescent and high-intensity discharge (HID) lamps contain a small quantity of mercury that can be harmful to the environment and to human health when improperly managed. Mercury is regulated under RCRA, which is administered by the US Environmental Protection Agency. Under current Federal law, mercury-containing lamps such as fluorescent and HID lamps may be hazardous waste. In addition, incandescent and HID lamps may contain small quantities of lead that can also be potentially harmful to human health and the environment.

STORAGE TANKS

The visual inspection of the Armory grounds indicated that at least four underground storage tanks existed; one underground storage tank (UST) in the western parking area as evidenced by an observed fill port and possible vent line, two UST's associated with the maintenance garage as evidenced by two vent lines and one UST associated with the heating plant of the National Guard Office and garage as evidenced by an observed fill port and vent line. A database search located in Appendix F provided by Environmental Data Resources, Inc. identified five underground storage tanks and two aboveground storage tanks associated with the Armory as follows:

Tank	Product	Capacity (gallons)	Status
1	Diesel	3,000	Closed
2	Unleaded Gasoline	2,000	Closed
3	1,2 or 4 Fuel Oil	2,000	Closed
4	1,2 or 4 Fuel Oil	8,000	Closed
5	Unleaded Gasoline	225	Closed
6	Diesel	225	Unknown
7	Other	275	Unknown

Copyright © 2000

Additionally, eight additional aboveground 275-gallon storage tanks were identified in the basement southeast hallway opposite the shooting ranges, and not identified in the regulatory database.

Sanborn fire insurance maps for the years 1896, 1900, 1914, 1945, 1950, 1981, 1991, 1992, 1993, 1995 and 1996, and aerial photographs for years 1954, 1966, 1975, 1984 and 1994 provided by Environmental Data Resources, Inc. did not provide any indication of tank locations.

An electro-magnetic of suspect areas was performed by NAEVA (Appendix G) indicated that two buried tanks might exist in the garage parking area. Presumably, these could be the closed tanks identified as tank 1 –diesel and tank 2- unleaded gasoline.

SURVEY LIMITATIONS

No lighting, extensive debris, standing water and microbial growth obscure many areas throughout the facility. These limitations impeded access and restricted viewing of some materials. Access to the upper shed roof and the entire north roof was not possible during this survey.

Copyright © 2000

CONCLUSIONS AND RECOMMENDATIONS

Asbestos

Asbestos containing materials have been located throughout the Kingsbridge Armory. Asbestos containing materials identified by the survey or revealed by subsequent demolition to be asbestos containing should be removed and disposed of prior to initiation of construction activities. The removal of these materials should be conducted by a State of New York licensed asbestos abatement contractor in accordance with all applicable federal, state, and local regulations. Sufficient sample density exists from the plasters to allow ATC to prepare a New York City Department of Environmental Protection Asbestos Control Program form 5 (Not an Asbestos Project) for demolition of plaster surfaces following abatement of the asbestos containing materials.

Lead - (Painted Surfaces)

All painted surfaces and building components should be assumed to contain lead and be handled in accordance with the requirements of the OSHA Lead Exposure in Construction Standard (29 CFR 1926.62) and any other local requirements. Painted components within the Armory are in generally poor condition throughout and should be considered lead containing for purposes of OSHA compliance, waste stream management and environmental dust control.

This survey does not relieve any renovation/demolition contractors from the responsibility of:

- The Occupational Safety and Health Administration's (OSHA) Construction Industry requirements.
- The Resource Conservation and Recovery Act (RCRA) requirements for testing and disposal of lead-contaminated materials.
- Any other applicable federal, state, or local regulations.

Copyright © 2000

Lead –(Target Ranges)

All sand including wood dead stop material should be handled and disposed of as lead contaminated material.

PCB/DEHP, Mercury

All PCB/DEHP-contaminated materials should be incinerated pursuant to the U.S. Environmental Protection Agency's PCB Rules 40 CFR Part 761 and relevant state rules and regulations. All mercury containing lighting lamps, such as: Fluorescent, Mercury Vapor, and High Intensity Discharge lamps (including Metal Halide lamps, High Pressure Sodium lamps, and Low Pressure Sodium lamps) should be disposed through a complete recycling process.

Storage Tanks

Tanks 1 and 2 appear to have been closed and abandoned in place, which can be verified by test pits. Additional investigation is required to ascertain the disposition of tanks 3 through 7. The seven aboveground storage tanks identified by the survey need to be examined/tested for product type, content and eventual disposition

MISCELANEOUS

The Kingsbridge Armory is identified as a large quanity generator of hazardous/regulated waste. This registration if inactive should be closed out. Throughout the Armory, various paints, solvents and maintenance products were observed that would require consolidation and disposal. Abandoned refrigeration/air conditioner units may contain CFC compounds and require reclamation prior to disposal. Several animal/bird carcasses and small quantities of avian excreta were observed in localized areas, disturbance of these items would require personal protective equipment.
