I Introduction

The subject property (Site), located at 1 Beard Street, Brooklyn, N.Y. (Red Hook section – see Figure #1) was formerly occupied by the United States Dredging Shipyard (USDC). The Site was subject to remedial actions under the New York State Brownfield Cleanup Program (BCP) administered by the New York State Department of Environmental Conservation (NYSDEC) under New York Environmental Conservation Law (ECL) Section 27-1401 et seq. (the “Brownfields Law”). The Site was remediated, to facilitate construction of new IKEA retail store, in accordance with the Brownfield Cleanup Agreement (BCA) between One Beard Street, LLC (the Volunteer), a wholly owned subsidiary of IKEA Property, Inc. (IKEA), and NYSDEC under Index #W2-1023-04-10, Site #C224043 (effective on January 11, 2005).

Upon completion of the remedial actions referenced above, a Site Management Plan (SMP, dated 5/08) was prepared to address long term site management issues. The SMP was prepared in accordance with the environmental easement executed by the Volunteer and recorded against the property with the Kings County Clerk pursuant to ECL Section 27-1419(2)(e) and in accordance with the Brownfields Regulations. The SMP was prepared on behalf of the Volunteer in accordance with the Brownfields Law, the Brownfields Regulations, guidelines contained in NYSDEC Draft DER-10 Technical Guidance for Site Investigation and Remediation, dated December 2002, and other guidelines provided by NYSDEC. As required by the Brownfields Law and Regulations, the SMP, among other things, addresses the implementation of Site-specific engineering controls (ECs), which were identified in the Remedial Work Plan (RWP).

ECs identified in the SMP that require routine monitoring include:

- The composite site cap;
- The sub-slab vapor mitigation system (SSVMS) and associated perimeter soil-vapor monitoring system, which consists of 15 soil-vapor monitoring wells or implants.

The SMP mandates that the composite site cap be subject to yearly monitoring/inspection, the results of which will be reported in the Annual Site Management Report. The SMP further mandates that the SSVMS and associated perimeter monitoring wells be subject to monthly/quarterly monitoring and inspection. Notably, per the directive of the NYSDEC (dated 2/27/15) the monitoring period was reduced to semiannually because methane concentrations have been documented to be generally consistent. The results of required monitoring and inspection efforts for the time period 6/26/18 to 1/4/19 are presented herein and will also be incorporated into the Annual Site Management Report. All monitoring and inspection activities were conducted in conformance with the SMP.

II Sub-slab Vapor Mitigation System (SSVMS) Monitoring

The sub-slab vapor mitigation system associated with the IKEA retail store consists of: (i) a sub-slab network of horizontal slotted screen PVC piping in a gravel layer under selected portions of the building, which consists of two separate manifolds or zones; (ii) two separate riser pipes (one per manifold) that extend from the piping network to the roof; (iii) two blower units (one per riser) mounted on the roof of the IKEA Building; and (iv) a Liquid Boot brand vapor barrier membrane, which was sprayed into the gravel layer and is attached to the underside of the building's structural slab. When operational, the blowers create negative air pressure or suction in the horizontal well network. As organic vapors naturally rise to the gravel layer, the vapors are captured by Recovered vapors are discharged through short stacks on top of the blowers to the atmosphere.

Visual inspection of accessible portions of the SSVMS was performed in conformance with Section 4.2 of the SMP. During the time period 6/26/18 to 1/4/19, there was no need for an unscheduled inspection or sampling due to: (i) suspected failure of the SSVMS; or (ii) other emergency.

a) System Start-Up and Testing

Prior to activation of the system, qualified Soil Mechanics Environmental Services (SMES) professionals reviewed the status of the equipment and inspected/tested same to ensure all equipment meets performance requirements and were fully operational. The system was formally put into fulltime operation on 6/3/08.

b). Monthly System Operation/Monitoring

Regular monthly inspections were conducted by qualified SMES professionals on 8/3/18, 8/29/18, 10/12/18, 11/9/18, 12/7/18 and 1/4/19. The inspections were conducted to: (i) ensure the SSVMS is operating properly; (ii) to document any unusual conditions; and (iii) make any necessary repairs/adjustments. During the time period 6/26/18 to 1/4/19, the SSVMS operated as designed; there were no system malfunctions or low vacuum pressure alarms with the exception of that which is cited below in Table A below. Repairs and or adjustments were made as necessary to ensure proper operation of the SSVMS and protection of building occupants (see Monthly SSVMS Inspection Forms attached for complete summaries)

Table A

Date	Comments
Not Applicable	SSVMS operated as designed; there were no system malfunctions or low vacuum pressure alarms

Visual inspection of vapor sampling ports revealed no evidence of any damage (e.g., broken valve, cracked piping). Vapor discharge sampling, utilizing a GEM 2000 Landfill Gas Analyzer, indicated non-detectable concentrations of methane during monitoring efforts conducted on 2/13/18, 3/6/18, 3/27/18, 4/30/18, 6/7/18 and 6/25/18 at both blower locations (see Monthly SSVMS Inspection Forms attached for complete summary).

III Semiannually Soil Vapor Sampling – 6/26/18 to 1/4/19

A series of 15 permanent soil-vapor monitoring wells, identified as SVW-1 to SVW-15, were installed along the perimeter of the Site in conformance with the SMP (see Figure #2). Inspection of all well locations revealed that they were all in good condition. Accordingly, on 12/14/18 qualified SMES professionals visited the subject property to provide real-time monitoring of the wells for methane and acquire samples for laboratory testing for volatile organic compounds (EPA method TO-15, including helium) and real time analysis for methane and other organic vapors.

a) Methane Sampling

The wells were sampled, on 12/14/18, for the presence of methane, organic vapor, oxygen, and carbon dioxide utilizing a GEM 2000 Landfill Gas Analyzer and MiniRae 3000 organic vapor analyzer. Samples were collected via connection of the sampling equipment directly to dedicated valves at each well location. The sampling equipment was purged with ambient air between sample locations. Table #1 (Soil Vapor Sampling Form - see attached) provides a complete summary of all recorded measurements, including temperature and barometric pressure. Chart #1 provides a graphic representation of methane monitoring results since commencement of data collection efforts. The results of monitoring activities for organic vapor and methane indicated:

- Non-detectable concentrations of methane at monitoring well locations SVW-1, 2, 3, and 5 to 12 and 15; detectable concentrations at the balance of the well locations, all of which were within the lower explosive limit (LEL) for methane of 5% gas by volume with the exception of well SVW-13;
- Non-detectable concentrations of organic vapor at monitoring well locations SVW-1 to 12, 14 and 15; detectable concentration at well SVW-13 (0.4 parts/million).

b) Volatile Organic Compound (VOC) Sampling

Organic vapor samples were collected directly from the sample port(s) at each well location, utilizing 1 liter Summa canisters equipped with flow regulators to allow sample collection over a two-hour period (see Site Plan). The vapor samples were collected from all wells on the property on 12/14/18, utilizing the procedure detailed below.

Samples were collected as follows:

- Prior to sample collection, one to three probe volumes were purged.
- Flow rates for both purging and sample collection did not exceed 0.2 liters per minute.
- New, clean 1/8-inch inside diameter polyethylene tubing was attached to the sampling port and the sample port valve opened.
- The inlet on a labeled Tedlar bag was opened and attached to the discharge end of the tubing. The bag was allowed to fill approximately two-thirds full and the inlet valve closed. The bag was subsequently detached and the valve on the sampling port closed.
- The Tedlar bag was field screened for VOCs by attaching the sample port to the PID probe using a new section of polyethylene tubing. The PID pump was allowed to draw the soil gas sample into the meter. Once the readings stabilized measurements were recorded.
- The tubing on the stack sample port was connected to the inlet of a certified clean, labeled Summa canister equipped with a flow regulator and vacuum gauge. The vacuum reading from the vacuum gauge on the canister at the beginning of the sampling period was recorded. The valve of the canister was opened and then the valve on the system sample port to initiate sample collection. The initial vacuum reading and sampling start time was recorded.
- At the end of the sampling period and prior to the vacuum gauge returning to ambient pressure, the valve was closed and the flow-rate controller and vacuum gauge removed, canister cap was installed, and the time recorded.
- The canister was placed into the shipping container for transportation to the testing laboratory.
- Sample locations, measurements, weather conditions are recorded (see Table #1).

The results of VOC sampling are presented in Table #2 for all acquired samples. Standards, criteria, and/or guidance values for selected compounds presented in Table #2, i.e., carbon tetrachloride (CCl_4), tetrachloroethene (C_2Cl_4), 1, 1, 1-trichloroethane ($\text{C}_2\text{H}_3\text{Cl}_3$), trichloroethene (C_2HCl_3), 1, 1-dichloroethene ($\text{C}_2\text{H}_3\text{Cl}_2$), *cis*-1,2-dichloroethene ($\text{C}_2\text{H}_3\text{Cl}_2$), and vinyl chloride ($\text{C}_2\text{H}_3\text{Cl}$) are contained in decision making matrices provided by New York State Department of Health - Guidance for Evaluating Soil Vapor Intrusion in the State of New York (10/06). Notably, however, the noted matrices could not be utilized for comparative purposes since soil vapor samples

acquired at the Site were not collected from wells located in the footprint of the IKEA building or from a sub-slab environment. As per the SMP(5/08), up and down wind ambient air samples were collected for laboratory analysis (EPA Method TO-15). The results of these samples are also presented in Table #2. As a quality assurance/quality control (QA/QC) measure, helium tracer was utilized to verify that soil vapor samples were not diluted by outdoor air infiltration during sampling efforts. Helium was used because: (i) it is readily available; (ii) has a low toxicity; (iii) can be monitored with portable measurement devices; and (iv) it can be included in the targeted suite of analytical parameters requested by the testing laboratory.

Helium was utilized to enrich the atmosphere in the immediate vicinity of the area where the probe intersects the ground during all sampling efforts. Appropriate measures were implemented to keep the tracer gas in contact with the probe during the testing as shown in pp.28 of NYSDEC Guidance for Evaluating Soil Vapor Intrusion in New York State (10/06). The effectiveness of the probe seals at well locations were documented as follow:

- Prior to and after completion of sampling efforts, vapor samples were monitored for elevated concentrations of tracer gas (> 10% of helium) utilizing MGD 2002 Portable Helium Monitor equipped with a Tedlar bag. Tracer gas was not detected by the field monitoring instrument at any of the probe locations during this round of sampling activities. Accordingly, probe seals did not require enhancement to reduce/eliminate the infiltration of outdoor air.
- Helium was not detected in soil vapor samples subject to laboratory testing.

Appropriate QA/QC procedures were followed during all aspects of sample collection and analysis to ensure that sampling error is minimized and high quality data are obtained. Sampling team members avoided actions (e.g., fueling vehicles, using permanent marking pens, wearing freshly dry-cleaned clothing or personal fragrances, etc.). Portable air monitoring equipment or field instrumentation was properly maintained, calibrated and tested to ensure validity of measurements. Air sampling equipment was stored, transported and between samples decontaminated in a manner consistent with the best environmental consulting practices to minimize problems such as field contamination and cross-contamination. Samples were collected using certified clean sample devices supplied by the testing laboratory. Gas used by the laboratory to clean the sample device was different from the gas used as a tracer during sampling (e.g., helium). Samples met holding times and temperatures and were delivered to the analytical laboratory (CENTEK Laboratories or Syracuse, N.Y. – NYS ELAP certified) as soon as possible after collection. Further, laboratory accession procedures were followed, including field documentation (sample collection information and locations), chain of custody, field/trip blanks, field sample duplicates and laboratory duplicates, as appropriate to prepare a Category "B" deliverables package (see attached). Qualified Soil Mechanics personnel completed all sampling activities, in general compliance with appropriate sampling and decontamination protocols recognized by the NYSDEC/NYSDOH.

IV Residual Management Zone – Work Conducted Beneath Site Cap

Since the potential for residual contamination and methane exist beneath the Site Cap, certain engineering and institutional controls were employed at the subject property to ensure the long-term effectiveness of the remedy to protect human health and the environment. Accordingly, based on the aforementioned, all activities on the Site that in any way disturbed residual contamination must be conducted in accordance with Site Management Plan (SMP).

During the time period of this report (6/26/18 to 1/4/19), no activities were conducted at the subject property that breached the established Site Cap or in any way disturbed residual site contamination.

V Conclusion, Comments and Recommendations

The SSVMS was observed to be operating, as designed and in compliance with the SMP, during the time period 6/26/18 to 1/4/19. The system operated continuously and did not require any shut downs or repairs with the exception of that which is cited in Table A above.

Visual inspection of accessible portions of the SSVMS was performed in conformance with Section 4.2 of the SMP. During the time period 6/26/18 to 1/4/19, there was no need for an unscheduled inspection or sampling due to: (i) suspected failure of the SSVMS; or (ii) other emergency.

Based on the results of real time monitoring and laboratory testing of acquired samples, presented in Tables #1 and 2, no modifications or adjustments to the system are required. Accordingly, monthly/semiannual monitoring activities will continue, as required by the SMP.

An elevated concentration of methane gas was detected at monitoring well location SVW-13 during this reporting period. Notably, methane gas has been recorded at this monitoring well location at concentrations exceeding its lower explosive limit or LEL during prior reporting periods (see Chart #1). At those times, all concerned parties, including National Grid, were advised of the identified condition so that appropriate actions could be taken. Implementation of mitigative measures has not been considered, however, because the identified condition has, in our opinion, been inconsistent and representative of isolated and/or intermittent occurrence. Further, monitoring well SVW-13 was, by design, positioned along Beard St. to coincide with the location wherein utilities enter/exit the subject property, in this case, National Grid's natural gas supply line/valve, which is likely the source of the identified condition. In any case, indoor air quality within the IKEA building is already protected with the SSVMS. Notably, if subsequent round(s) of monitoring activities reveal elevated concentrations of methane gas on a regular basis at a given monitoring well location, mitigative measures will be considered. We, therefore, recommend that monitoring efforts continue as established with the SMP.

Finally, an oil-like substance was identified to be leaking from one of the four mothballed Gantry Cranes on the subject property during the prior monitoring period. As a result of mitigative measures established to be protective of human health and the environment (see monitoring report for time period 12/20/16 to 6/27/17), no evidence of any discharge(s) was observed in association with any of the mothballed Gantry Cranes during this reporting period. Nevertheless, we recommend that the Gantry Cranes be subject to regular monitoring efforts for evidence of any discharges that would represent threat to human health or the environment.

Canisters should be evacuated to a reading of less than or equal to 50 millitorr prior to shipment to sampling personnel. The vacuum in the canister will be field checked prior to sampling, and must read 28" of Hg ($\pm 2"$, vacuum, absolute) before a sample can be collected. After the sample has been collected, the pressure of the canister will be read and recorded again, and must be 5" of Hg ($\pm 1"$, vacuum, absolute) for the sample to be valid. Once received at the laboratory, the canister vacuum should be confirmed to be 5" of Hg, $\pm 1"$. Please record and report the pressure/vacuum of received canisters on the sample receipt paperwork. A pressure/vacuum reading should also be taken just prior to the withdrawal of sample from the canister, and recorded on the sample preparation log sheet. All regulators are calibrated to meet these requirements before they leave the laboratory. However, due to environmental conditions and use of the equipment Centek can not guarantee that this criteria can always be achieved.

Date Initiated: 21-Dec-18

Corrective Action Report ID: 3869

Initiated By: Russell Pellegrino

Department: MSVOA

Corrective Action Description

CAR Summary: CC did not meet criteria.

Description of Nonconformance Root/Cause(s): Continuing calibration did not meet criteria on 12/21/18 for Bromoform & Dibromochloroethane. The compound was more sensitive. The compounds in question was not detected in the associated samples. Compounds met criteria in the associated LCS and LCSD

Description of Corrective Action w/Proposed C.A.: Since the compound of interest was not detected the results should be considered valid. If compounds remain outside criteria perform system calibration. All sets of data submitted.

Corrective Action Report ID: 3870
Department: MSVOA

Corrective Action Description

CAR Summary: IS did not meet criteria.

Description of Nonconformance Root/Cause(s): IS was high and did not meet criteria for samples C1812057-009. Based on the chromatographic evidence, it appears that the contamination is from high concentration of interfering compounds.

Description of Corrective Action w/Proposed C.A.: Sample was analyzed further as dilutions with criteria being met. Due to matrix being in a canister it is difficult to see any signs of problems. All sets of data submitted.

Corrective Action Description

CAR Summary: MS/MSD did not meet criteria.

Description of Nonconformance Root/Cause(s): Several compounds did not meet criteria for sample C1812057-016A MS/MSD. Based on the chromatographic evidence this is most likely due to matrix interference.

Description of Corrective Action w/Proposed C.A.: Since MS/MSD show similar results at this time no further corrective action taken. All other QC meets criteria. The samples show many hits in the matrix which will interfere with spike results. All sets of data submitted

GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where:
Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values}}{\text{mean RRF}} * 100$$

Percent Difference (%D)

$$\% D = \frac{(RRFc - \text{mean } RRF_i) * 100}{\text{mean } RRF_i}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$\text{ppbv} = \frac{Ax * Is * Df}{Ais * RRF}$$

where:
Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF = relative response factor for the compound being measured
Df = Dilution factor

Quantitation Report (QT Reviewed)

This figure is a gas chromatogram plot. The x-axis is labeled "Time-->" and ranges from 5.00 to 23.00 minutes. The y-axis is labeled "Abundance" and ranges from 0 to 300,000. The plot displays several peaks corresponding to different halogenated alkenes. Key peaks are labeled with their chemical names: "Methylene chloride,T" at approximately 6.5 min, "Bromoacetylormethane,T" at approximately 8.5 min, "1,4-difluorobenzene,I" at approximately 10 min, "Methyl trisopropyl Ketone,I" at approximately 12 min, "Chlorobenzene-d5,I" at approximately 14 min, "Bromofluorobenzene,S" at approximately 16 min, and "Vial: 20 Operator: RJP Inst : MSD #1 Multiplr: 1.00" at approximately 18 min. The plot also shows a baseline with minor noise.
