

January 13, 2009

Mr. Samuel B. Freed
Attorney at Law
98-20 Metropolitan Avenue
Forest Hills, NY 11375-6628

**RE: Phase II ESA – 491 Wortman Avenue, Brooklyn, New York
NYSDEC Spill # 08-09879**

Dear Mr. Freed:

P.W. Grosser Consulting, Inc. (PWGC) has prepared this report to document the results of the Phase II Environmental Site Assessment (ESA) performed at the above-referenced property. The scope of work was based on the recommendations contained in a September 2008 Phase I ESA Report prepared by Middleton Environmental, Inc. (MEI) and included the characterization of soil and groundwater to determine if the site's former operation as a metal etching company, a steel tube manufacturer, or a plumbing faucet/fixture company had impacted the subsurface.

Analytical results of samples collected during the Phase II ESA identified elevated concentrations of volatile organic compounds (VOCs) in soil and groundwater. Based on these elevated concentrations, New York State Department of Environmental Conservation (NYSDEC) Spill #08-09879 was assigned to the site, and further subsurface investigation is recommended.

BACKGROUND

The site is comprised of one (1) industrial building located at 491 Wortman Avenue in Brooklyn, New York. A site vicinity map is included as **Figure 1**. The site is 0.44 acres in area and is improved with one 19,000 square foot building. The building occupies the entire area of the property. The building is currently vacant.

Based on the former usage of the property, MEI recommended that a Phase II ESA be conducted at the site to include a soil boring investigation consisting of the collection of soil and groundwater samples to determine if improper discharge had impacted the site's subsurface.

The Phase I ESA Report indicated the possible presence of a plating pit in the northwest corner of the building. Also, floor drains were observed in the building. MEI recommended that the potential plating pit be accessed and inspected, and that a dye flush test be performed for the pit and the floor drains to determine their discharge points.

The Phase I ESA Report indicated the presence of a fuel oil fill port and vent pipe in front of the building along Wortman Avenue. MEI did not observe a fuel oil tank. However, MEI did not have access to the partial basement, where the tank was believed to exist. MEI recommended that, during the Phase II ESA, the basement be investigated to determine if a fuel oil tank or floor drains are present.

FIELD ACTIVITIES

Subsurface Investigation

On November 17, 2008, PWGC conducted the Phase II ESA which consisted of the completion of seven (7) soil borings at the subject site. Boring locations are illustrated on **Figure 2**. Soils were sampled continuously from grade using a truck-mounted Geoprobe®. The Geoprobe® utilizes direct-push technology to advance sampling equipment into the subsurface and retrieve samples of soil and groundwater from discreet depths. Geoprobe® services were provided by AR Water & Soil Environmental, LLC (AR) of Effort, Pennsylvania.

A PWGC hydrogeologist was on-site to oversee and document the soil boring effort. Soils beneath the site were generally characterized as dry, poorly-graded sand and silt. Groundwater at the site was encountered at approximately 10 feet below ground surface (bgs). Soil boring logs are included as **Appendix A**.

Soil samples were screened in the field for the presence of VOCs using a photo-ionization detector (PID). The PID is a field sensing instrument used to detect the presence of a wide range of VOCs contained in many industrial chemical products. A PID response above background levels was obtained from soil samples collected from each boring location.

Shallow soil samples from boring locations GP-01, GP-02, GP-03, GP-04, and GP-07, and one deep soil sample from GP-02 were submitted to the laboratory based on PID response. Two (2) groundwater samples were also collected at boring locations GP-01 and GP-04. GP-01 and GP-04 represented general down-gradient and up-gradient locations of the property. It is assumed, but not confirmed, that based on regional topography, groundwater direction would be toward the south.

Soil and groundwater samples were contained in pre-cleaned, laboratory-supplied glassware and stored in a cooler with ice for transport to Environmental Testing Laboratories, Inc. (ETL) of Farmingdale, New York, a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP) certified laboratory. The soil and groundwater samples were analyzed for the following:

- Volatile Organic Compounds by EPA Method 8260, and
- Metals by EPA Method 6010 (unfiltered samples only)

The above suite of analyses was selected for this investigation based on the former usage of the property. It is important to note that the groundwater samples were not filtered which can result in elevated metals concentrations as a result of interference from soil/sediment particles.

Basement Investigation

On November 17, 2008, PWGC accessed the partial basement located in the middle of the southern portion (front) of the building. The fill and vent lines observed along the front (south side) of the building entered a concrete block containment vault in the basement, indicating that a fuel oil aboveground storage tank (AST) was present. The partial basement and the AST are indicated on **Figure 2**.

One boring (HA-1) was performed manually in the partial basement adjacent to the AST vault utilizing a stainless steel hand auger, as the basement was not accessible to the Geoprobe®. One soil sample was collected from the 0 to 2 feet below grade interval. The soil was classified as moist, poorly-

graded, brown sand with silt. A PID response above background levels was recorded, but petroleum staining was not observed. The soil sample collected from HA-1 was analyzed for the following:

- VOCs by EPA Method 8260 (STARS Analyte List), and
- Semi-Volatile Organic Compounds by EPA Method 8270 (STARS Analyte List)

The NYSDEC STARS is a list of compounds commonly associated with petroleum products.

No floor drains were identified in the basement.

Floor Drain Dye Test

A floor drain was identified in the warehouse bathroom in the southern portion of the building. The floor drain location is indicated on **Figure 2**. Upon inspection, it was determined the drain was clogged. A discharge point for the drain could not be determined.

Potential Plating Pit

The potential plating pit could not be accessed during the Phase II ESA. It was later identified by the owner of the property as a loading bay / truck scale which is no longer in use and had been covered over with a large steel plate.

ANALYTICAL RESULTS

Soil and groundwater analytical data are summarized on **Tables 1** through **5**. Laboratory data sheets are included as **Appendix B**.

Soil

Soil analytical results were compared to the Recommended Soil Cleanup Objectives (RSCOs) specified in the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046.

As shown on **Table 1**, trichloroethene (TCE) was detected at concentrations above the RSCO in both samples collected from boring GP-02. Boring GP-02 was located in the reported vicinity of a former TCE degreasing tank. Based on this, the degreasing tank appears to be the source of the TCE in the soil. TCE was detected in the other soil samples, but at concentrations within the RSCO. MTBE was also detected at a concentration (201 µg/Kg) slightly exceeding the RSCO (120 µg/Kg) in the deep sample collected from GP-02. Other detected concentrations of VOCs were within RSCOs.

Table 2 indicates concentrations of calcium, copper, mercury, and zinc above RSCOs. However, these concentrations were on the same order of magnitude as the RSCOs, and are inherent in historic fill material, which comprises the shallow subsurface of the site.

AST Soil

As shown on **Table 3**, the VOCs MTBE and toluene were detected at concentrations within RSCOs for the soil sample collected beneath the AST (HA-1). There were no other VOCs detected in soil sample HA-1. Two SVOCs, Benzo(a)pyrene and Dibenzo(a,h)anthracene, were detected at concentrations slightly exceeding RSCOs.

Groundwater

Groundwater analytical results were compared to the NYSDEC Ambient Water Quality Standards and Guidance Values (AWQS) for Class GA groundwater, as specified in Technical and Operational

Guidance Series (TOGS) 1.1.1, Ambient Water Quality Standards and Guidance Values on Groundwater Effluent Limitations, June 1998.

As shown on **Table 4**, several VOCs were detected at concentrations above the NYSDEC Standards in the two groundwater samples (GP-01 and GP-04). The detected VOCs are common chlorinated solvents. The highest concentration was that of TCE in sample GP-01 (24,000 µg/L). The VOC concentrations in GP-04 were much lower than those detected in GP-01. Based on the local topography, it appears that groundwater flows toward the south. Based on this, it appears that the elevated TCE concentration at boring location GP-01 is attributable to the operation of the former TCE degreasing tank located to the north.

As shown on **Table 5**, metals were detected in each of the two groundwater samples above NYSDEC Standards. However, the occurrence of these metals is likely the result of suspended sediment in the groundwater samples and not representative of dissolved metals concentrations, which are most likely lower.

CONCLUSIONS AND RECOMMENDATIONS

Elevated concentrations of chlorinated VOCs detected in soil and groundwater samples warrant further investigation at the subject site. Based on these elevated concentrations, New York State Department of Environmental Conservation (NYSDEC) Spill #08-09879 was assigned to the site. As such, site activities regarding contamination at the site are subject to the approval of the NYSDEC. It appears that TCE concentrations in the soil and the groundwater are the result of the usage of the compound in and around a degreasing tank which was reportedly located to the south of the former loading bay / truck scale.

PWGC recommends further investigation of the impacted soils and groundwater at the site. The investigation should consist of additional soil borings to delineate the horizontal and vertical extent of on-site soil and groundwater impact. The former loading bay / truck scale should be accessed to identify floor drains which may have acted as conduits for contaminants. A work plan for such an investigation is detailed in a Supplemental Subsurface Investigation proposal prepared by PWGC in December 2008.

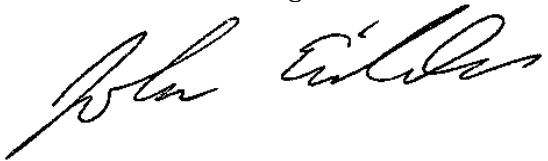

Based on the elevated VOC concentrations, PWGC recommends that indoor air quality be addressed with regard to the potential for vapor intrusion at the site.

Metals concentrations detected in soils above RSCOs are inherent in the historic fill material which comprises the shallow subsurface of the site. Metals concentrations detected in the groundwater above NYSDEC Standards are likely the result of suspended sediment in the groundwater samples and not representative of dissolved metals concentrations, which are most likely lower. PWGC recommends no further investigation regarding metals in both the soils and groundwater.

Analytical results indicate that the fuel oil AST in the basement has not impacted the subsurface. The elevated SVOCs have relatively low clean-up objectives and are compounds that are typically found in historic fill material. These compounds are not likely associated with a specific contaminant source at the site. However, if no longer in use, the AST should be properly closed.

Sincerely Yours,

P.W. Grosser Consulting

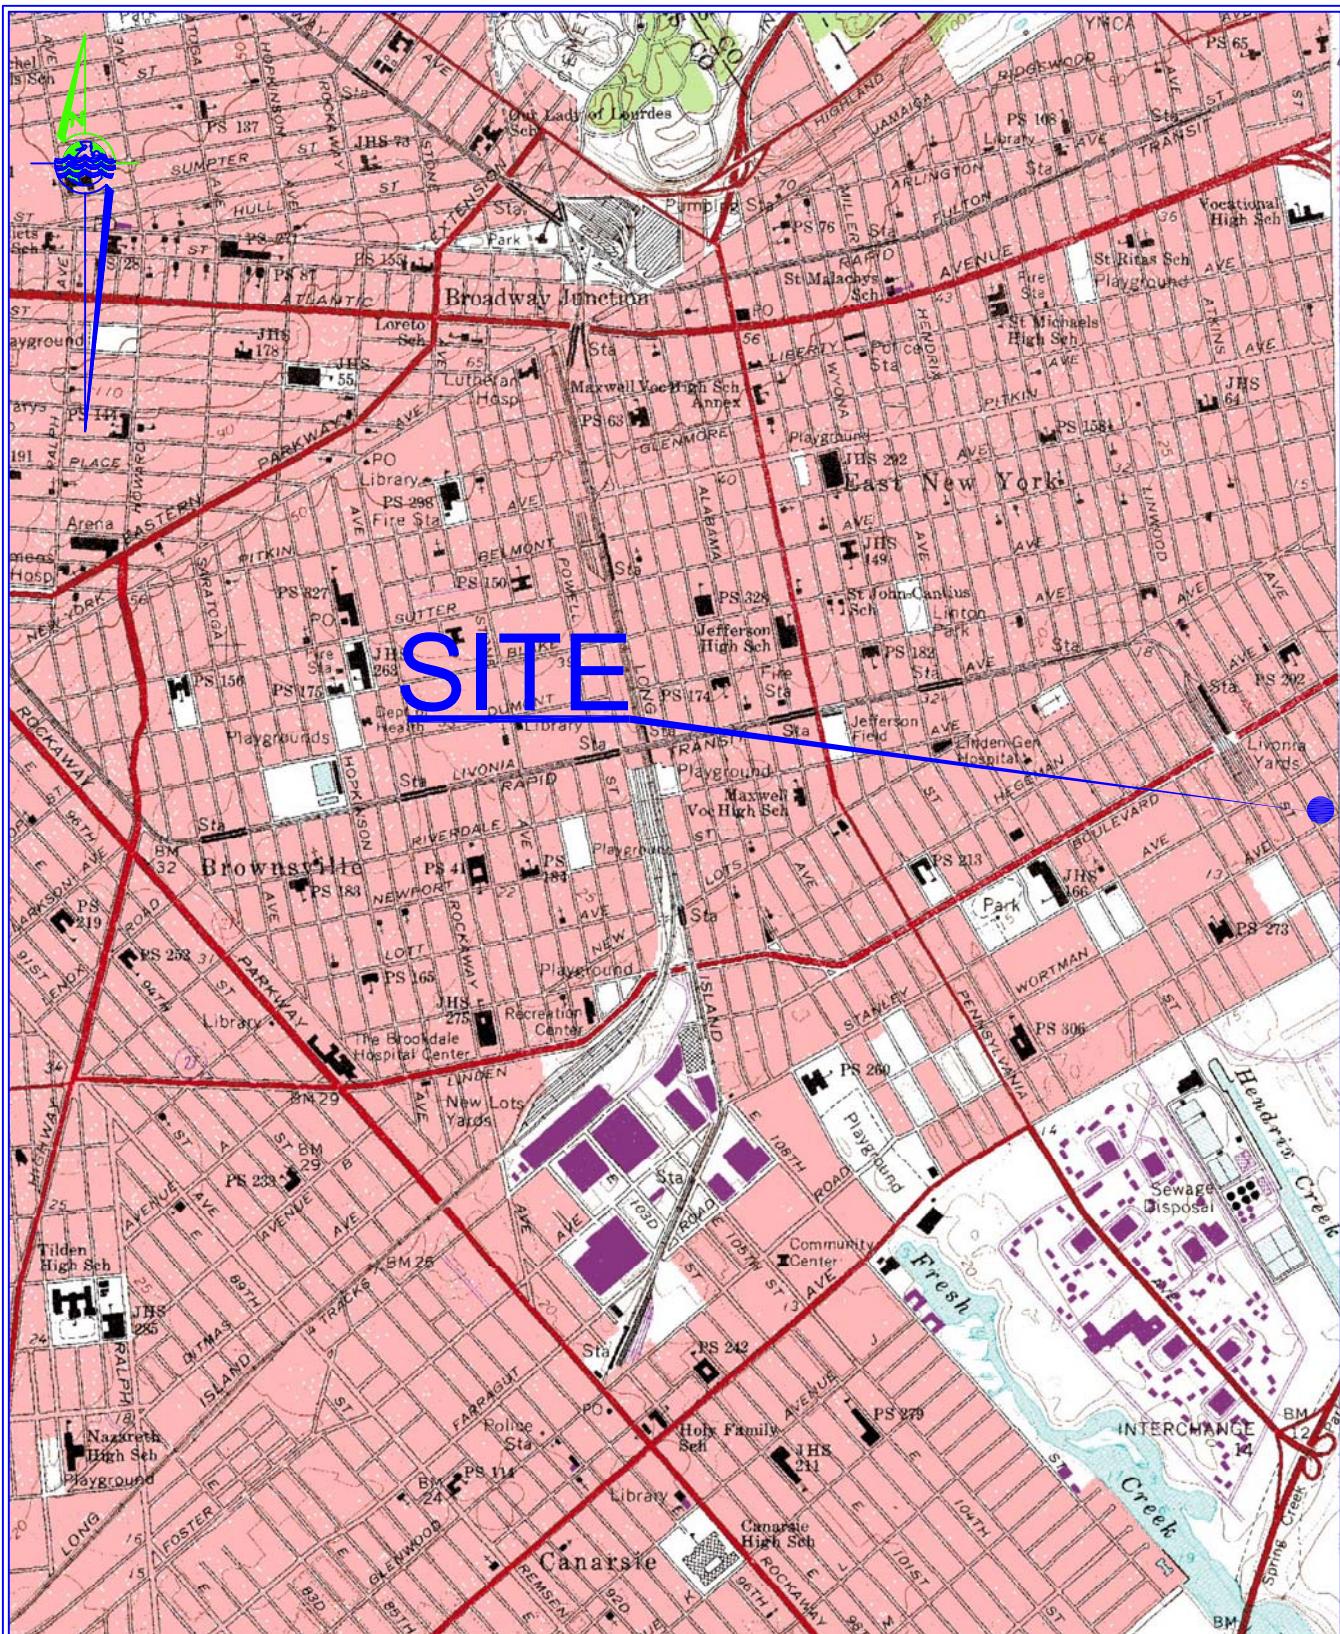

John D. Eichler

Case Narrative

EPA 8260 VOLATILE ANALYSIS:

The following compounds were calibrated at 25, 50, 100, 150 and 200 ppb levels in the initial calibration curve:

Acetone
2-Butanone
4-Methyl-2-pentanone
2-Hexanone

M&P-Xylenes and 2-Chloroethylvinylether were calibrated at 10, 40, 100, 200 and 300 ppb levels.

Acrolein/Acrylonitrile were calibrated at 50,100,150,200 and 250 ppb levels.

Tert Butyl Alcohol (TBA) was calibrated at 50,200,500,1000 and 1500 ppb levels.

All other compounds were calibrated at 5, 20, 50, 100 and 150 ppb levels.

0811311-14 was analyzed at a low level soil dilution of 1:2 with results indicating one surrogate recovery below limit. This sample was also analyzed at a medium level soil dilution with all surrogate recoveries within limits. Matrix interference was proven to cause the low recovery in the 1:2 dilution analysis.

METALS ANALYSIS

Batch 3505

Custoday 0801311:

As, Be, Cd, Co, Pb, Sb, Se were rejected for sample #5 after a review of the spectra revealed no peaks above the baseline.

As, Be, Cd, Co, Pb, Sb, Se, V were rejected for sample #12 after a review of the spectra revealed no peaks above the baseline.

Be was rejected for sample #2 after a review of the spectra revealed no peaks above the baseline.

As, Be, Sb were rejected for sample #6 after a review of the spectra revealed no peaks above the baseline.

Be, Sb were rejected for sample #7 after a review of the spectra revealed no peaks above the baseline.

As, Be, Sb were rejected for sample #8 after a review of the spectra revealed no peaks above the baseline.

As, Be, Sb were rejected for sample #10 after a review of the spectra revealed no peaks above the baseline.

As, Be, Sb were rejected for sample #14 after a review of the spectra revealed no peaks above the baseline.

ORGANIC METHOD QUALIFIERS

Q - Qualifier - specified entries and their meanings are as follows:

- U - The analytical result is not detected above the Method Detection Limit (MDL).
All MDL's are lower than the lowest calibration standard concentration.
- J - Indicates an estimated value. The concentration reported was between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
- B - The analyte was found in the associated method blank as well as the sample.
It indicates possible/probable blank contamination and warns the data user to take appropriate action.
- E - The concentration of the analyte exceeded the calibration range of the instrument.
- D - This flag indicates a system monitoring compound diluted out.

INORGANIC METHOD QUALIFIERS

C - (Concentration) qualifiers are as follows:

- B - Entered if the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL) but greater than or equal to the Method Detection Limit (MDL).
- U - Entered when the analyte was analyzed for, but not detected above the Method Detection Limit (MDL) which is less than the lowest calibration standard concentration.

Q - Qualifier specific entries and their meanings are as follows:

- E - Reported value is estimated because of the presence of interferences.

M - (Method) qualifiers are as follows:

- A - Flame AA
- AS - Semi-automated Spectrophotometric
- AV - Automated Cold Vapor AA
- C - Manual Spectrophotometric
- F - Furnace AA
- P - ICP
- T - Titrimetric

OTHER QUALIFIERS

ND - Not Detected
