VOC	Volatile Organic Compound

1.0 INTRODUCTION

1.1 Project Background

This Remedial Investigation Report (RIR) was prepared on behalf of The Rabsky Group LLC for the property located at 11 Jackson Street in the borough of Brooklyn, New York. In May 2013, The Rabsky Group LLC filed an application with the New York State Department of Environmental Conservation (NYSDEC), to admit the Project Site into the New York State Brownfield Cleanup Program (BCP).

The purpose of the Remedial Investigation (RI) is to collect data of sufficient quality and quantity to characterize the nature and extent of contamination in on-site groundwater, soil and soil vapor, to complete a qualitative exposure assessment for future occupants of the buildings and the surrounding community.

The overall objectives of the project are to prepare the site for unrestricted use as defined in the Brownfield Cleanup Agreement and to remediate known and unknown environmental conditions at the site to the satisfaction of the NYSDEC and the New York State Department of Health (NYSDOH).

The field work portion of the RI was conducted by EBC on May 8, 2013.

1.2 Site Location and Description

The address for the subject property is 11 Jackson Street, Brooklyn, New York 11211. The subject property is designated as Block 2741, Lot 47 by the New York City Department of Assessment. The subject property is located in the City of New York and Borough of Brooklyn (Kings County) as shown on **Figure 1**. The lot consists of 72 feet of street frontage on Jackson Street and is 130 feet deep for a total of 9,360 square feet (0.20 acres). The lot is currently developed with a vacant one-story brick building occupying the entire lot (**Figure 2**).

The property has an elevation of approximately 15 feet above the National Geodetic Vertical Datum (NGVD) feet. The depth to groundwater beneath the site, as determined from field measurements, is approximately 8 feet below grade. Based on regional groundwater contour maps, groundwater flow is expected to be toward the west.

The area surrounding the site consists of a mix of residential and commercial properties. The Site is located adjacent to the Brooklyn-Queens Connecting Highway.

1.3 Redevelopment Plans

The site is to be redeveloped through the new construction of a single 8-story multi-family apartment building. The building will include 44 residential apartments split between studio, 1 and 2 bedroom apartments. The project does not include a basement level. First floor use will include garage space for cars and bicycles, on-site laundry rooms, a lobby and a first floor daycare center.

1.4 Site History

The environmental history of the Site was previously investigated through the review of Federal and State Environmental databases, Environmental Sanborn Fire Insurance maps, NYC Department of Building records and the NYC Department of Finance databases as part of the Phase I Environmental Site Assessment completed in January 2012.

1.5 Summary of Previous Investigations

Environmental investigations performed at the Site include the following:

- Phase I Environmental Site Assessment, Environmental Business Consultants, January 2012.

1.5.1 January 2012 – Phase I Environmental Site Assessment Report (EBC)

EBC was able to establish a history for the property dating back to 1887. According to a review of NYC records, City Directory Listings and historic Sanborn maps, as well as personal interviews, the Site was developed prior to 1887 as three separate thin lots, each developed with a 3-story residential building in the front of the lots, and smaller 2-story dwellings in the rear of the lots. Each of the three lots was labeled with the street numbers 11 Jackson Street, 13 Jackson Street and 15 Jackson Street. The lots remained unchanged until around 1951 when two of the lots were cleared, leaving only the 3-story residential building on 11 Jackson Street. The 3-story building remained until the property was redeveloped in 1951 with the same building currently located at the Site. All Sanborn maps until the most recent map (2007) label the Site building as being used for lumber storage. City Directory listings from 1965 and 1973 identify the Driggs Plywood Corporation at the 11 Jackson Street address. Arnmart Whole Beer Distributors were posted in directory listings from 1997 and 2000, and “Car Fashion Seat Covers” was listed in 2005. It is not known if the beer distributor or car seat cover shop occupied half of the building or the entire building.

At the time of the Phase I inspection half of the building was occupied by a charter bus maintenance / repair garage and half was occupied by a metal fabrication shop.

Based upon reconnaissance of the Site and surrounding properties, interviews and review of historical records and regulatory agency databases, EBC noted the following recognized environmental conditions for the Site.

- The use of the Site as an auto / charter bus repair facility.
- The use of the Site as a metal fabrication shop.

2.0 REMEDIAL INVESTIGATION

2.1 Field Investigation

The field work portion of the RI was conducted by EBC during two mobilizations to the site: the initial RI mobilization March 16, 2012 through March 20, 2012 and a supplemental mobilization on May 8, 2013. The field investigation consisted of the environmental sampling, field observations and measurements to determine:

- Local geologic/hydrogeologic conditions
- Definition of source areas
- Potential migration of contaminants from the site to surrounding areas
- Overall characterization of site-related contamination in all media

The field effort included the collection and analysis of soil, groundwater and soil vapor samples. Drilling services were provided by Eastern Environmental Services (Eastern) of Manorville, NY. Laboratory services were provided by Phoenix Environmental Laboratories of Manchester, CT. A sample matrix showing the number, type and analysis of samples collected during the Remedial Investigation is provided as **Table 1**.

2.2 Deviations from the Remedial Investigation Work Plan

There were no deviations from the work plan.

2.3 Soil Sampling

2.3.1 Soil Borings

A total of 5 soil borings, B1 through B5, were advanced during the initial site mobilization in March 2012. Drilling services were provided by Eastern Environmental Services of Manorville, NY.

At each soil boring location soil samples were collected continuously in 5-foot intervals using a Geoprobe™ model 6620DT, probe drilling machine. The Geoprobe™ system uses a direct push hydraulic percussion system to drive and retrieve core samplers. Soil samples were retrieved using a 1.5-inch diameter 5-foot long macro-core sampler with disposable acetate liners.

Each soil sample recovered from the soil borings was characterized by an experienced geologist qualified environmental professional (QEP) and field screened for the presence of VOCs using a photo-ionization detector (PID). The geologist's field observations and PID readings were recorded for each boring in a soil boring log (see **Appendix A**). The location of soil borings are shown on **Figure 3**.

Borings B1 and B2 were completed on the northern portion of the property, boring B3 was completed in the center of the property, and borings B4 and B5 were completed on the southern portion of the property. Soil samples were collected continuously from grade to a final depth of 10ft below existing grade. Soil samples were retained from 0-2 feet below grade and 4-6 feet below grade at each location and submitted for laboratory analysis of volatile organic compounds (VOCs) by EPA Method 8260, semi-volatile organic compounds (SVOCs-BN) by EPA Method 8270, TAL Metals, pesticides and PCBs by EPA Methods 8081/8082.

Two additional soil borings, B6 and B7, were completed during a supplemental mobilization in May 2013 to further evaluate chlorinated compounds in soil gas. Each of the two borings were performed utilizing a 2-foot long AMS Dual-Purpose Soil Recovery Probe with disposable plastic liners and a slap hammer. At each sampling location, the soil recovery probe was driven to a depth of approximately 2 feet below grade and a sample was retained representing the interval 0-2 feet below grade. Soil recovered from the soil borings was characterized by an experienced geologist qualified environmental professional (QEP) and field screened for the presence of VOCs using a photo-ionization detector (PID). The geologist's field observations and PID readings were recorded for each boring in a soil boring log (see **Appendix A**). The location of soil borings are shown on **Figure 3**.

Borings B6 and B7 were completed on the northern portion of the property, north of previously completed borings B1 and B2. Retained samples were submitted for laboratory analysis of volatile organic compounds (VOCs) by EPA Method 8260.

2.4 Groundwater Sampling

EBC collected a groundwater sample from soil boring locations B1 (GW1), B3 (GW2) and B4 (GW4) during the initial site mobilization in March 2012 to evaluate groundwater quality across the site. Sample locations are identified in **Figure 4**. Groundwater samples were collected by installing a one-inch diameter temporary PVC monitoring well, set approximately 5 feet below the water table interface. A groundwater sample was then collected from each temporary well utilizing dedicated polyethylene tubing and a peristaltic pump. Each of the three groundwater samples and the duplicate sample were collected in pre-cleaned, laboratory supplied glassware, stored in a cooler with ice and submitted to Phoenix for analysis of VOCs by EPA Method 8260, SVOCs by EPA Method 8270, pesticides/PCBs by EPA Methods 8081/8082 and TAL metals.

2.4.1 Groundwater Sampling

Groundwater samples were obtained from boring locations B1 (GW1), B3 (GW2) and B4 (GW4) during the March 2012 mobilization.

A peristaltic pump and polyethylene tubing were used to purge and collect samples from the temporary well locations. Sample tubing was replaced between each sample location. Samples were collected directly into pre-cleaned laboratory supplied glassware, stored in a cooler with ice and submitted to Phoenix Environmental Laboratories of Manchester, CT, a New York State ELAP certified environmental laboratory (ELAP Certification No. 11301).

All groundwater samples were analyzed for VOCs / SVOCs by EPA method 8260 / 8270, target analyte list (TAL) metals (total, dissolved) and pesticides/PCBs by Method 8081/8082.

2.5 Soil Vapor Sampling

To assess the presence of VOCs in soil vapor beneath the site, three sub-slab soil vapor samples (SG1-SG3) were collected at the site during the initial mobilization in March 2012. Three additional sub-slab vapor samples (SG4-SG6) were collected during the supplemental mobilization in May 2013, as a result of chlorinated compounds detected in soil gas during the initial mobilization. Soil

vapor sampling locations are shown on **Figure 5**. All soil vapor samples were collected over a 2 hr sampling period.

Soil vapor samples were collected in accordance with the procedures outlined in the *Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH 10/06)*.

2.5.1 Installation of Soil vapor Implants

Three sub-slab soil vapor implants were installed during the initial mobilization in March 2012 and three additional sub-slab soil vapor implants were installed during the supplemental mobilization in May 2013. The sub-slab soil gas sampling points were installed by drilling a 1/2 inch hole through the building slab with a handheld drill, and inserting 1/4 inch polyethylene tubing to no more than 2 inches below the base of the slab. The tubing was then sealed at the surface with hydrated granular bentonite. All of the implants were installed utilizing the same technique to minimize possible discrepancies and a 12" x 12" (approx.) plastic sheet.

2.5.2 Surface Seal Test Procedure

In accordance with NYSDOH guidance, a tracer gas (helium) was used as a quality assurance/quality control device to verify the integrity of the sampling point seal prior to collecting the samples. This was accomplished by enriching the air space above the seal with a tracer gas (helium) while continuously monitoring air drawn from the implant with a helium detector (Dielectric Model MGD-2002, Multi-Gas Detector).

The tracer gas test procedure was employed at all 6 soil vapor sampling locations. All seals tested tight with no infiltration of helium through the surface.

2.5.3 Soil vapor Sample Collection

Following verification that the surface seal was tight, one to three volumes (i.e., the volume of the sample probe and tube) were purged with a handheld vacuum pump prior to collecting the samples to ensure samples collected were representative. After purging, a 6-liter summa canister, fitted with a 2-hour flow regulator was attached to the surface tube of each of the sampling points and the valve opened to initiate sampling. Sample identification, date, start time, start vacuum, end time and end vacuum were recorded on tags attached to each canister and on a sample log sheet (**Appendix B**). When the remaining vacuum in the canisters was between 5 and 8 inches Hg, (approximately 2 hrs) the valve was closed and the canisters were detached from the sampling tube.

Sample canisters were returned to the EBC office and picked up the following day by a Phoenix laboratory courier and delivered to the laboratory for analysis of VOCs by USEPA Method TO-15.

2.6 Laboratory Analysis

Data tables summarizing the laboratory results are provided in **Tables 2** through **11** and copies of the laboratory reports (with chains-of-custody) are included in digital format in **Appendix C**. Soil sample results were compared to both Unrestricted Use and Restricted Residential Soil Cleanup Objectives (SCOs) as promulgated in 6 NYCRR Subpart 375-6. Groundwater results were compared to NYSDEC Division of Water, Technical & Operational Guidance Series 1.1.1, Ambient Water Quality Standards and Guidance Values (AWQS), June 1998. Soil vapor analytical results were compared to Outdoor Background Levels for Selected Compounds and sub-slab and indoor air

guidance levels as presented in the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006, 2002). **Table 12** contains a list of parameters detected above Track 1 unrestricted soil cleanup objectives and the range in detections. **Table 13** contains a list of parameters detected above ambient groundwater standards and the range in detections.

2.6.1 Analytical Results – Soil Samples

A total of 12 soil samples were collected from 7 soil borings for laboratory analysis of one or more of the following depending on location and depth: VOCs (EPA Method 8260), SVOCs (EPA Method 8270), TAL metals and Pesticides/PCBs (EPA Method 8081/8082). All results above Unrestricted Use SCOs are posted on **Figure 6**.

As shown in **Table 2**, no VOCs were detected at concentrations above Unrestricted Use SCOs in any of the 13 samples.

As shown in **Table 3**, SVOCs were detected at concentrations above Unrestricted Use SCOs in the following samples:

B1 (0-2 ft) – Benzo(k)fluoranthene (1,000 µg/kg), Chrysene (2,700 µg/kg)

B2 (0-2 ft) – Napthalene (17,000 µg/kg)

B3 (0-2 ft) – Chrysene (1,400 µg/kg)

B4 (0-2 ft) – Chrysene (1,600 µg/kg)

B5 (0-2 ft) – Benzo(k)fluoranthene (2,100 µg/kg)

SVOCs were detected at concentrations above Restricted Residential SCOs in the following samples:

*B1 (0-2 ft) - Benzo(a)anthracene (2,800 µg/kg), Benzo(a)pyrene (2,500 µg/kg),
Benzo(b)fluoranthene (3,100 µg/kg), Dibenzo(a,h)anthracene (500 µg/kg),
Indeno(1,2,3-cd)pyrene (1,500 µg/kg)*

*B2 (0-2 ft) - Benzo(a)anthracene (43,000 µg/kg), Benzo(a)pyrene (38,000 µg/kg),
Benzo(b)fluoranthene (50,000 µg/kg), Benzo(k)fluoranthene (19,000
µg/kg), Chrysene (36,000 µg/kg), Dibenzo(a,h)anthracene (11,000 µg/kg),
Indeno(1,2,3-cd)pyrene (20,000 µg/kg)*

*B3 (0-2 ft) - Benzo(a)anthracene (1,400 µg/kg), Benzo(a)pyrene (1,300 µg/kg),
Benzo(b)fluoranthene (1,500 µg/kg), Indeno(1,2,3-cd)pyrene (690 µg/kg)*

*B4 (0-2 ft) - Benzo(a)anthracene (1,600 µg/kg), Benzo(a)pyrene (1,500 µg/kg),
Benzo(b)fluoranthene (1,900 µg/kg), Indeno(1,2,3-cd)pyrene (910 µg/kg)*

B5 (0-2 ft) - Benzo(a)anthracene (5,700 µg/kg), Benzo(a)pyrene (5,300 µg/kg),

Benzo(b)fluoranthene (6,200 µg/kg), Chrysene (5,500), Dibenzo(a,h)anthracene (1,100 µg/kg), Indeno(1,2,3-cd)pyrene (3,600 µg/kg)

There were no other SVOCs detected above Unrestricted/Restricted SCOs in any of the remaining samples.

As shown in **Table 4** there were no pesticides or PCBs reported above Unrestricted Use SCOs in any of the samples.

As shown in **Table 5**, Metals detected at concentrations above Unrestricted Use SCOs in the following samples:

B1 (0-2 ft) - Barium (357 mg/kg), Copper (65.8 mg/kg), Zinc (535 mg/kg)

B1 (4-6 ft) - Mercury (0.56 mg/kg), Lead (151 mg/kg)

B2 (0-2 ft) - Arsenic (13.2 mg/kg), Copper (156 mg/kg), Zinc (620 mg/kg)

B2 (4-6 ft) - Copper (78.4 mg/kg), Zinc (1,400 mg/kg)

B3 (0-2 ft) - Copper (165 mg/kg), Zinc (514 mg/kg)

B3 (4-6 ft) - Mercury (0.53 mg/kg), Lead (216 mg/kg), Zinc (119 mg/kg)

B4 (0-2 ft) - Copper (94.1 mg/kg), Zinc (536 mg/kg)

B4 (4-6 ft) - Mercury (0.47 mg/kg), Zinc (210 mg/kg)

B5 (0-2 ft) - Chromium (95.6 mg/kg), Zinc (1,010 mg/kg)

2.6.2 Analytical Results – Groundwater Samples

Analytical results for VOCs, as summarized in **Table 6**, indicate no VOC parameters were identified above NYSDEC Groundwater Standards.

As summarized in **Table 7**, one SVOC compound, Bis(2-ethylhexyl)phthalate, was detected slightly above water quality standards within one of the three groundwater samples. No other SVOCs were detected above GQS in any of the three groundwater samples collected at the Site. However, phenanthrene was detected within all three groundwater samples ranging in concentration from 0.08 to 0.15 ppb, which is well below the GQS of 50 ppb.

Groundwater parameters reported above groundwater standards are presented in **Figure 7**. As shown in **Table 8**, there were no reported detections of pesticides or PCBs above water quality standards in any of the monitoring wells sampled.

As shown in **Tables 9** and **10**, the total concentration (unfiltered) of one or more of the metals

arsenic, barium, beryllium, chromium, copper, iron, magnesium, manganese, sodium, lead, nickel, and antimony were reported in each of the 3 groundwater samples above water quality standards. The dissolved concentration of the metals iron, magnesium, manganese and sodium were reported in all 3 of the groundwater samples above their corresponding water quality standards. These parameters are associated with background water quality throughout most of northern Brooklyn and are also associated with brackish water conditions.

2.6.3 Analytical Results – Soil vapor Samples

Since the NYSDOH has not established guidance values for VOCs in soil vapor, analytical results were compared to the Summary of Background Levels for Selected Compounds (NYSDOH Database, Outdoor values, 2003) and to sub-slab guidance levels for select parameters as presented in the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006.

Soil vapor samples showed a range of petroleum and chlorinated volatile organic compounds at relatively low concentrations, as shown in **Table 11**. Several petroleum related VOCs were detected at slightly elevated concentrations in one or more of the sub-slab soil gas samples including toluene (as high as 248 µg/m³) and xylenes (as high as 100 µg/m³). Additional elevated concentrations of VOCs including acetone (as high as 593 µg/m³), ethanol (as high as 350 µg/m³), hexane (as high as 260 µg/m³), and heptane (as high as 112 µg/m³).

High concentrations of the chlorinated VOCs trichloroethylene (TCE) and tetrachloroethylene (PCE) were also detected within five of the six the sub-slab soil gas sampled collected at the Site. PCE ranged from 10.4 to 8,270 µg/m³ and TCE ranged from 10.4 to 12,300 µg/m³. TCE concentrations in 5 of the 6 samples obtained and PCE concentrations in 4 of the 6 samples were above the NYSDOH threshold requiring action (monitoring or mitigation).

Soil vapor results are summarized in **Table 11** and posted on **Figure 8**.

2.6.4 Data Usability Summary Report

Data obtained during this investigation has been submitted for third party validation by H&S Environmental, Inc. of Westborough, Massachusetts. The individual data usability reports (DUSR) for sample groupings will be submitted upon receipt.

3.0 HYDROGEOLOGIC ASSESSMENT AND PHYSICAL SETTING

3.1 Site Topography

The topography of the site and surrounding area was reviewed from the USGS 7.5 minute series topographic map for the Brooklyn Quadrangle. The elevation of the building slab is approximately 15 feet above the National Geodetic Vertical Datum (NGVD).

3.2 Surrounding Land Use

The surrounding land use includes underutilized commercial/vacant properties to the west, multi-family residential buildings to the north, mixed-use residential buildings to the east and the Brooklyn Queens Expressway to the south.

The area surrounding the property is highly urbanized and predominately consists of multi-family residential buildings with mixed-use buildings along the main corridors such as Meeker Street located just south of the Site and Union Avenue just west of the Site. The area is marked by late 19th and early 20th century rowhouses with commercial and industrial properties interspersed throughout the residential sections. The areas to the north of the Site was historically characterized by heavy industry and manufacturing.

3.3 Regional Geology / Hydrogeology

The geologic setting of Long Island is well documented and consists of crystalline bedrock overlain by layers of unconsolidated deposits. According to geologic maps of the area created by the United States Geologic Survey (USGS), the bedrock in this area of Brooklyn is an igneous intrusive classified as the Ravenswood grano-diorite of middle Ordovician to middle Cambrian age. Unconsolidated sediments overlie the bedrock and consist of Pleistocene aged sand, gravel and silty clays, deposited by glacial-fluvial activity. Non-native fill materials consisting of dredge spoils, rubble and / or other materials have been historically used to raise and improve the drainage of low lying areas.

3.4 Site Geology / Hydrogeology

Subsurface soils at the site include a mixture of silty non-native fill to a depth of approximately 6 feet below grade followed by sandy-silt to a depth of approximately 10 feet below grade. Groundwater at the Site is present at a depth of approximately 8 feet below surface grade within the native silty- sand, and based upon regional contour maps groundwater flow is expected to be west toward the East River.

4.0 NATURE AND EXTENT OF CONTAMINATION

4.1 Identification of Source Areas

The historic use of the Site as a metal fabrication business and bus repair garage combined with the site-wide PCE/TCE detections in soil and soil gas is evidence that CVOC contamination at the site is related to an on-site release and historic use. TCE is known to have been commonly extensively used to clean and degrease metals and would be expected to be used in a metal fabrication business which specializes in manufacturing metal store-front components in various metals. An on-site painting booth was also noted in the metal fabrication shop which would require degreasing of metal parts prior to painting. The second most-common use of PCE behind dry-cleaning is in automotive brake cleaners and it has also been used extensively in automotive parts washing solutions. A parts washing station was noted in the bus garage during the Phase I investigation.

The most likely release scenario would include surface spills from the use of PCE brake cleaners and parts washing solutions, the storage of automotive fluids and waste liquids within the bus garage and the use of TCE in degreasing metals in the metal fabrication shop. Operations regarding the plywood business are unknown. It is possible that the release of chlorinated solvents were also related to these operations.

No other source areas were identified or indicated during this RI. Elevated levels of SVOCs and metals reported in shallow soil throughout the site are characteristic of the historic fill materials present at the site and throughout the area.

4.2 Groundwater Impacts

Low levels of PCE and MTBE were detected in one of the three groundwater samples, GW2, at a concentrations below GQS. No other VOCs were detected in any of the three groundwater samples obtained.

4.3 Soil-Vapor Impacts

Several petroleum related VOCs were detected at slightly elevated concentrations in one or more of the sub-slab soil gas samples. Total petroleum related volatile organic compounds were generally moderate and consistent with background levels, ranging from 2 $\mu\text{g}/\text{m}^3$ in SG-5 located on the northeast perimeter of the building to 492 $\mu\text{g}/\text{m}^3$ in SG-2 located in the central portion of the building.

Chlorinated VOCs were reported in all soil vapor samples. TCE was reported above the maximum sub-slab value of 5 $\mu\text{g}/\text{m}^3$ (above which monitoring is recommended) in five of the six locations (SG-1 through SG-4 and SG-6), and ranged from 10.4 $\mu\text{g}/\text{m}^3$ to 12,300 $\mu\text{g}/\text{m}^3$. PCE was reported at a maximum sub-slab value of 100 $\mu\text{g}/\text{m}^3$ (above which monitoring is recommended) in four of the six locations (SG-1, SG-2, SG-3, and SG-6), and ranged from 245 $\mu\text{g}/\text{m}^3$ to 8,270 $\mu\text{g}/\text{m}^3$. The highest concentrations of PCE and TCE in soil vapor were located on the northern portion of Lot 10 at location SG-1. This is consistent with the area of highest CVOC concentrations in shallow soils.

4.4 Site Conceptual Model

CVOC contamination at the Site consists mainly of TCE in shallow soil, though PCE and other chlorinated compounds are also present. The extent of contamination is expected to be limited to shallow soil in the central area of the building directly below the building slab to a maximum depth of 5 feet.

Sanborn fire insurance maps identify the past use of the Site by the Driggs Plywood Corp. It is not known if plywood manufacturing took place on the property or if it was simply used for storage. It is also possible that some type of fleet vehicle maintenance took place while Driggs Plywood operated at the Site or by other operators who occupied the Site after Driggs. At the time of the Phase I inspection half of the building was occupied by a charter bus maintenance / repair garage and half was occupied by a metal fabrication shop.

The historical use of the site as a metal fabrication business and bus repair garage combined with the site-wide PCE / TCE detections in soil and soil gas is evidence that CVOC contamination at the site is related to an on-site release and historic use. TCE is known to have been commonly and extensively used to clean and degrease metals and would be expected to be used in a metal fabrication business which specialized in manufacturing metal store-front components in various metals (aluminum, brass, nickel, chrome, etc.). An on-site painting booth was also noted in the metal fabrication shop which would require degreasing of metal parts prior to painting.

The second most-common use of PCE behind dry-cleaning is in automotive brake cleaners and it has also been used extensively in automotive parts washing solutions. A parts washing station was noted in the bas garage during the phase I inspection.

The most likely release scenario would include surface spills from the use of PCE brake cleaners and parts washing solutions, the storage of automotive fluids and waste liquids within the bus garage and the use of TCE in degreasing metals in the metal fabrication shop. Housekeeping in both businesses were noted to be grossly deficient with open containers and spills evident during the inspection. Operations regarding the plywood business are unknown. It is possible that the release of chlorinated solvents were also related to these operations.

The nature and extent of the soil contamination is indicative of a limited surface spill which migrated through cracks or other voids in the concrete floor. The timing and scenario of the release are unknown.

In any case the spill was limited, and did not migrate much beyond a depth of 5 feet below grade as indicated by the low CVOC concentrations in groundwater. Off-gassing is occurring from the residually contaminated soils which are resulting in elevated concentrations of TCE and PCE in soil gas.

No other source areas were identified or indicated during this RI. Elevated levels of SVOCs, metals and pesticides reported in shallow soil throughout the site are characteristic of the historic fill materials present at the site and throughout the area. However, SVOC concentrations reported in one of the locations (B2) was reported at concentrations considerably higher than that associated with fill material and may be related to petroleum.

5.0 QUALITATIVE EXPOSURE ASSESSMENT

The objective of the qualitative exposure assessment under the BCP is to identify potential receptors to the contaminants of concern (COC) that are present at, or migrating from, the site. The identification of exposure pathways describes the route that the COC takes to travel from the source to the receptor. An identified pathway indicates that the potential for exposure exists; it does not imply that exposures actually occur. An exposure pathway has five elements; a contaminant source, release and transport mechanisms, point of exposure, route of exposure and a receptor population.

The potential exposure pathways identified below, represent both current and future exposure scenarios.

5.1 Contaminant Source

The source of CVOCs detected in soil at the site is indicative of surface spills of PCE brake cleaners and parts washing solutions, storage of automotive fluids and waste liquids within the bus garage and the use of TCE in degreasing metals in the metal fabrication shop, which migrated through cracks or other voids in the concrete floor.

5.2 Contaminant Release and Transport Mechanism

CVOCs present in on-site shallow soils are volatilizing to air contributing to elevated levels of contamination in soil gas, as seen in analytical results from sub-slab soil gas samples SG1, SG2, SG3, SG4 and SG6. There does not appear to be a correlation between the CVOC contamination in soil and that in groundwater as TCE was detected in only one of the three groundwater samples obtained, at a concentration below GQS and no PCE was detected in any of the three groundwater samples obtained onsite.

5.3 Point of Exposure, Route of Exposure and Potentially Exposed Populations

Potential On-Site Exposures: Remediation workers and construction workers engaged in the excavation of impacted and non-impacted soil at the site may be exposed to CVOCs through several routes. Workers excavating impacted soil may be exposed to CVOCs through inhalation, ingestion and dermal contact. Workers excavating non-impacted soil may be exposed to CVOCs in soil vapor through inhalation. A site specific Health and Safety Plan has been developed to identify and minimize the potential hazards to on-site workers.

Under a future scenario, residents within the proposed buildings may be exposed to vapor intrusion if remediation of the source area is not completed, and also if preventive measures are not incorporated into the new building design to protect against contaminated soil vapor intrusion. This potential route of exposure will be reduced in response to the degree and success of source area remediation.

Potential Off-Site Exposures: The entire area is serviced by the New York City Water System which distributes water from the Croton Reservoir system. Since there are no public or private potable supply wells in the area, exposure from contact with tap water is not a concern. Off-site exposure is

therefore limited to vapor intrusion from CVOCs migrating from the site. Potential off-site exposure related to CVOC vapor intrusion is a concern. The potentially exposed population in this case would include residents and commercial workers in adjacent buildings.

Potential Off-Site Environmental Impacts: CVOCs in soil have the potential to migrate to the groundwater table and pass beneath the site, the groundwater to surface water discharge pathway was evaluated. The nearest surface water is the East River approximately 4,200 feet west (downgradient). Based upon the low concentrations of CVOC contaminants currently in soil and groundwater at the Site and the distance and position of the site relative to The East River, there are no expected impacts to surface water environments from contaminants potentially migrating beneath the Site.

6.0 CONCLUSIONS AND RECOMENDATIONS

Subsurface soils at the site include silty non-native fill with bricks, wood and other rubble to approximately 6 feet below grade. The fill materials contain elevated levels (above unrestricted or restricted residential SCOS) of SVOCs and metals. A native brown fine-medium grained silty-sand is present immediately below the fill material to a depth of approximately 10 feet below grade (boring termination).

Groundwater at the Site is present at a depth of approximately 8 feet below surface grade within the native fine-medium grained sand. Based upon regional groundwater contour maps, groundwater flows in a westerly direction.

The results of sampling performed during this RI, identified an isolated area of CVOC contaminated soil within the central area of the building, which is likely related to intermittent surface spills of chlorinated solvents used as degreasers in both metal fabrication and in automotive repair, which migrated through cracks or other voids in the concrete floor. The timing and scenario of the release(s) are unknown and may have occurred during operations of current and/or past occupants.

High levels of SVOCs were reported at boring B2 in the northeast portion of the Site. The SVOC concentrations at this location were an order of magnitude higher than that related to historic fills and may be associated with petroleum.

Groundwater samples obtained from all three temporary monitoring wells indicate that there were low levels of PCE and MTBE present in one of the three groundwater samples, GW2, at concentrations below GQS. No other VOCs were detected in any of the three groundwater samples obtained.

Off-gassing is occurring from the shallow contaminated soils resulting in elevated concentrations of PCE and TCE in soil gas. The highest concentrations of both PCE and TCE in soil vapor were located on the northwestern portion of the Site, at location SG1. This is consistent with the area of CVOC detections in shallow soil.

The qualitative exposure assessment identified potential completed routes of exposure to construction workers and remediation workers through inhalation, ingestion and dermal contact during excavation activities. The Health and Safety Plan prepared for the site identifies such exposures and provides instructions for on-site workers to minimize potential exposure. Occupants in the proposed on-site residential building may be exposed to CVOCs through the vapor intrusion pathway if preventive measures are not incorporated into the design of the new buildings.

The exposure assessment also identified potential exposure to commercial workers and residents in adjacent buildings through migrating vapors off-gassing from the source in shallow soil.

Potential environmental impacts through the groundwater to surface water discharge are unlikely based upon the low concentration of CVOCs in groundwater (maximum concentration of 2 µg/L) and distance to the East River (approximately 4,200 feet).

Recommendations include the characterization of soils for disposal following building demolition and slab removal to check for CVOC "hot spots" in shallow soil and for waste profiling. Removal of CVOC impacted soils with confirmatory soil sampling should be completed prior to excavation for the new building's foundation structures. Following hot spot CVOC removal soils containing elevated levels of metals and SVOCs can be excavated and disposed of as needed for construction of the new building.

Soil vapor intrusion mitigation measures such as a vapor barrier and sub-slab depressurization system should be considered in the design of the new buildings to be constructed on the site. Further evaluation of vapor intrusion can also be performed following implementation of the RAWP to determine if conditions improve to the point where active mitigation is unnecessary. The results of this evaluation and the design elements of any mitigation system should then be incorporated into the Remedial Action Work Plan for the site.

NA - No guidance value or standard available

(a) Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York. October 2006. New York State Department of Health.

(b) NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York, February 2005, Summary of Background Levels for Selected Compounds (NYSDOH Database, Outdoor values)

* Petroleum Volatile Organic Compounds

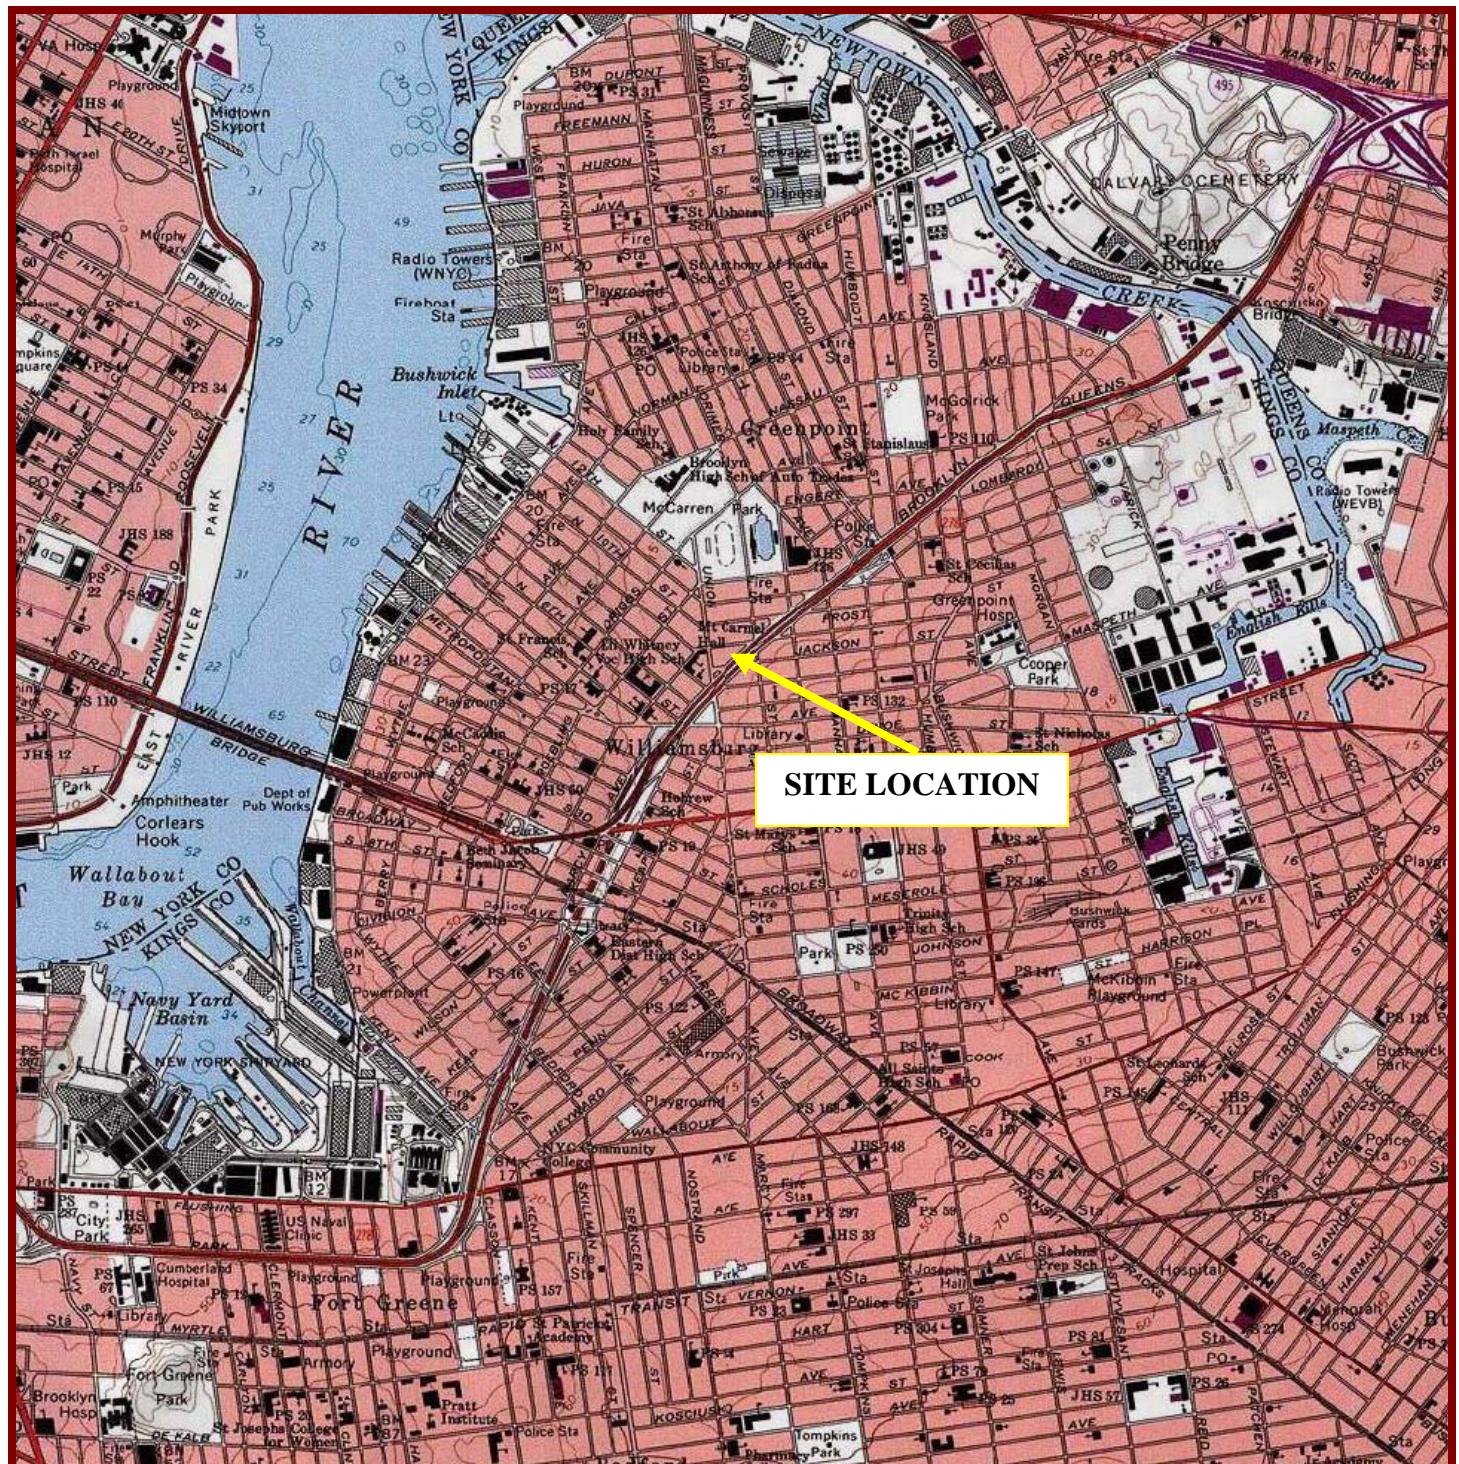

** Benzene, toluene, ethylbenzene, xylene

*** Volatile Organic Compounds (excluding acetone)

Value detected above NYSDOH Air Guidance Value of 5 $\mu\text{g}/\text{m}^3$, which according to Soil Vapor/Indoor Air Matrix 1 would require at a minimum, monitoring.

Value detected above NYSDOH Air Guidance Value of 100 $\mu\text{g}/\text{m}^3$, which according to Soil Vapor/Indoor Air Matrix 2 would require at a minimum, monitoring.

APPENDIX - C
*Laboratory Reports/Data Usability Summary
Reports (Digital Copy)*

Tuesday, March 27, 2012

Attn: Mr. Charles B. Sosik, P.G.
Environmental Business Consultants
1808 Middle Country Rd
Ridge NY 11961-2406

Project ID: 11-15 JACKSON ST BKLYN NY
Sample ID#s: BB57203 - BB57205

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAC requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink that reads "Phyllis Shiller".

Phyllis Shiller

46L CAN SET FOR 24H - Sample Time

Monday, March 26, 2012

Attn: Mr. Charles B. Sosik, P.G.
Environmental Business Consultants
1808 Middle Country Rd
Ridge NY 11961-2406

Project ID: 11 JACKSON ST BKLYN NY
Sample ID#s: BB55453 - BB55468

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAC requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink that reads "Phyllis Shiller".

Parameter	Result	RL	Units	Date	Time	By	Reference
-----------	--------	----	-------	------	------	----	-----------

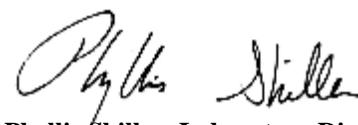

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters.

Comments:

**Poor IS recovery was observed for volatiles due to matrix interference. Sample was analyzed twice with similar results.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

Parameter	Result	RL	Units	Date	Time	By	Reference
-----------	--------	----	-------	------	------	----	-----------

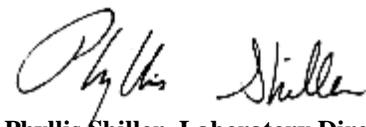

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters.

Comments:

**Poor IS recovery was observed for volatiles due to matrix interference. Sample was analyzed twice with similar results.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

Parameter	Result	RL	Units	Date	Time	By	Reference
-----------	--------	----	-------	------	------	----	-----------

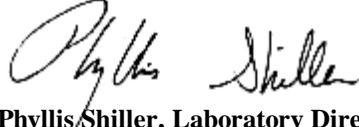

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters.

Comments:

**Poor IS recovery was observed for volatiles due to matrix interference. Sample was analyzed twice with similar results.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

Parameter	Result	RL	Units	Date	Time	By	Reference
-----------	--------	----	-------	------	------	----	-----------

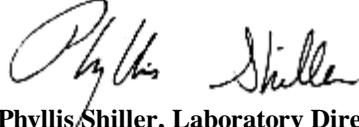

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters.

Comments:

Poor surrogate recovery was observed for volatiles due to matrix interference.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink that reads "Phyllis Shiller".

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B = Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quanitation) ND=Not Detected
BRL=Below Reporting Level

Comments:

**Poor surrogate recovery was observed for volatiles. Sample was analyzed twice with similar results indicating matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

This report must not be reproduced except in full as defined by the attached chain of custody.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quanitation) ND=Not Detected
BRL=Below Reporting Level

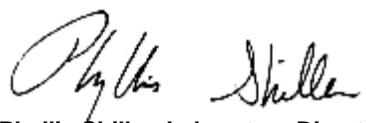

Comments:

**Poor surrogate recovery was observed for volatiles due to matrix interference. Sample was analyzed twice with similar results.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

This report must not be reproduced except in full as defined by the attached chain of custody.

Comment:

Additional 8260 criteria: 10% of compounds can be outside of acceptance criteria as long as recovery is 40-160%.

l = This parameter is outside laboratory lcs/lcsd specified recovery limits.

m = This parameter is outside laboratory ms/msd specified recovery limits.

r = This parameter is outside laboratory rpd specified recovery limits.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

RPD - Relative Percent Difference

LCS - Laboratory Control Sample

LCSD - Laboratory Control Sample Duplicate

MS - Matrix Spike

MS Dup - Matrix Spike Duplicate

NC - No Criteria

Intf - Interference

Sample Criteria Exceedences Report

GBD70294 - EBC

Page 1 of 1

Phoenix Laboratories does not assume responsibility for the data contained in this report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink that reads "Phyllis Shiller".

Sample Criteria Exceedences Report

GBD70291 - EBC

Page 1 of 1

*** No Data to Display ***

Phoenix Laboratories does not assume responsibility for the data contained in this report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.
