1.0 INTRODUCTION

1.1 Project Background

This Remedial Investigation Report (RIR) was prepared on behalf of Z65 Realty LLC for the property known as the Former Carter Spray Finishing Corp. Site, located at 65 Eckford Street, Brooklyn, New York (hereafter referred to as the Site). In May 2015, Z65 Realty LLC filed an application with the New York State Department of Environmental Conservation (NYSDEC), to admit the Project Site into the New York State Brownfield Cleanup Program (BCP). The application was deemed complete by the NYSDEC on May 18, 2015. On June 29, 2015, the NYSDEC informed Z65 Realty LLC that the project had been accepted into the BCP with Z65 Realty LLC classified as a “Volunteer”. The Brownfield Cleanup Agreement was executed by NYSDEC on July 16, 2015 (Site No. C224218).

The purpose of this Remedial Investigation Report is to collect data of sufficient quality and quantity to characterize the nature and extent of contamination and to complete a qualitative exposure assessment for future occupants of the proposed building and the surrounding community.

The overall objectives of the project are to prepare the Site for unrestricted use as defined in the Brownfield Cleanup Agreement and to remediate known and unknown environmental conditions at the Site to the satisfaction of the NYSDEC and the New York State Department of Health (NYSDOH).

The field work portion of the RI was conducted by EBC in December 2015.

1.2 Site Location and Description

The street address for the Site is 65 Eckford Street, Brooklyn, NY 11222 (**Figure 1**). The Site is located in the City of New York and Borough of Brooklyn and is identified as Block 2698, Lot 26 on the New York City Tax Map. The Site is an irregular shaped lot consisting of approximately 85 feet of frontage along Eckford Street (**Figure 2**) and a depth of approximately 100 feet for a total of approximately 10,206 ft² (0.23 acres).

The 1 and 2-story industrial/manufacturing building (constructed between 1905 and 1916) that previously occupied the entire footprint of Lot 26 was demolished in November/December of 2015. The Site was previously utilized by several industrial operations, including a woodworking shop, machine shop, wood box manufacturing facility, automobile parking garage with underground gasoline storage tank(s), and a metal finishing facility that utilized two 275-gallon aboveground storage tanks that contained Trichloroethene (TCE). A topographic survey showing underground utilities is provided in **Figure 3**.

The elevation of the Site ranges from 19 to 20 feet above the National Geodetic Vertical Datum (NGVD). The area topography gradually slopes downward to the north and west. The depth to groundwater beneath the Site is approximately 12 to 13 feet below grade. Based on regional groundwater elevation maps, groundwater flows to the north-northwest.

The area surrounding the property (**Figure 4**) is highly urbanized and predominantly consists of multi-family residential buildings with mixed-use buildings (residential w/ first floor retail) along main corridors such as Driggs Avenue located at the end of the block to the north and McGuinness Boulevard, located two blocks to the east. The area is marked by late 19th and early 20th century row houses with commercial and industrial properties interspersed throughout the residential sections. The area to the west of the Site was historically characterized by heavy industry and manufacturing. Following a steady decline of manufacturing in the area from the late 1960's through the 1980's, many of the industrial properties were vacated leaving the buildings to be vandalized and become derelict. Four sensitive receptors were identified within a ¼ mile radius of the Site. Each is identified below:

- 1) John Ericsson Middle School 126 (500 feet south of Site)
424 Leonard Street, Brooklyn, New York 11222
- 2) Northside Charter High School (500 feet south of Site)
424 Leonard Street, Brooklyn, NY 11222
- 3) Automotive High School (1,200 feet west of Site)
50 Bedford Avenue, Brooklyn, New York 11222
- 4) St. Stanislaus Kostka School (600 feet east-northeast of Site)
189 Driggs Avenue, Brooklyn, New York 11222
- 5) ABC Infant & Toddler Center, Inc. (800 feet north of Site)
109 Nassau Avenue, Brooklyn, NY 11222

The entire area is serviced by the New York City municipal water system which provides water from a series of reservoir systems (Croton, Delaware, Catskill) located north of the City. There are no known public or private drinking water supply wells within a half mile down gradient of the Site.

1.3 Redevelopment Plans

The redevelopment project consists of the construction of a new 5-story hotel building with a full cellar level and a rear cellar level courtyard. The cellar level and rear cellar level courtyard will require excavation of the entire Site to a depth of approximately 12 ft below grade with additional excavation to depths of approximately 15 feet in some areas for the building's footings and foundation. With groundwater present at 12 feet below grade, extensive dewatering will be required during construction of the building's foundation.

The cellar level will consist of a recreational room, gym, lobby/lounge, kitchen and break room for the hotel, six mechanical rooms located in the front of the cellar, and eight hotel rooms that face a cellar level, concrete capped rear yard.

1.4 Site History

A history for the Site dating back to 1887 was established. A review of Sanborn maps shows that the Site and adjacent properties were undeveloped prior to 1887. By 1905, several one-story manufacturing buildings were constructed on the Site and used as a part of the Meisel Danowitz & Co. woodworking operation. The Site was redeveloped by 1916 with the existing one and two-story building currently constructed at the Site. The 1916 Sanborn map indicates the center portion of the building was used as a parking garage for 30 cars, the rear of the building was used as a machine shop, and the front portion of the building was vacant. By 1942, the Eckford Garage utilized the entire building for parking of up to 40 cars. The 1916 and 1942 Sanborn maps indicate an underground gasoline storage tank was located in the northeast portion of the parking garage building, just beyond the front portion of the building that has a 2nd floor. The approximate location of the underground storage tank is shown on **Figure 3**. By 1950, the building was occupied with a wood box manufacturing company, and a company that performed laquer spraying on the 2nd floor. The 1965 through 1989 Sanborn maps indicate the building was used for metal finishing and spraying. City Directory Listings from 1960 to 2008 indicate the building was occupied by Carter Spray Finishing Corp.

1.5 Summary of Previous Investigations

Environmental investigations performed at the Site include the following:

- Phase I Environmental Site Assessment Screening - EBC (May 2015)
- Phase II Subsurface Investigation Data Summary - EBC (May 2015)

A digital copy of the reports is provided in **Attachment A**.

1.5.1 May 2015 – Phase I Environmental Site Assessment Screening (EBC)

Based upon reconnaissance of the Site and surrounding properties, and review of historical records and regulatory agency databases, the Phase I ESA identified the following Recognized Environmental Conditions (RECs) for the Site:

- The 1916 and 1942 Sanborn maps show a parking garage building with an underground gasoline storage tank in the northeast portion of the building. A Site inspection performed in 2015 noted a fill port indicative of an underground gasoline storage tank within the same area of the gasoline tank drawn on the Sanborn maps. Therefore, the tank(s) has not been removed. No information regarding the current status of this tank and/or soil quality in its vicinity was available for review. As such, there is a potential for spills or release from the gasoline underground storage tank to have impacted the subsurface.
- NYC Department of Building records indicate fuel oil was used for heating the building. Based on the age and size of the building, it is assumed that an underground storage tank of at least 550 gallons was used. No information/records were obtained indicating proper removal/abandonment of a No. 2 fuel oil underground storage tank has occurred. As such, there is a potential for spills or release from the No. 2 fuel oil underground storage tank to have impacted the subsurface.

- City Directory Listings, Sanborn maps and internet search results indicate the building has been historically utilized for industrial purposes, including a machine shop, parking garage, wood box manufacturing (with lacquer spray booths), and metal finishing. From approximately 1959 to 1998, Carter Spray Finishing Corp. utilized two 275-gallon aboveground storage tanks containing trichloroethene (TCE) and the Toxic Chemical Release Inventory System (TRIS) database indicates Carter Spray Finishing Corp. emitted greater than 8,000 pounds per year of TCE into the air. As such, there is a potential for historic Site operations to have impacted soil, groundwater and/or soil vapor quality beneath the Site. Further, the Site was identified as a New York City Department of City Planning (NYCDCP) Environmental "E" declaration site due to its historic use and the presence of the UST.

Based upon its findings, EBC recommended the following:

- A geophysical survey (e.g., magnetometer and/or ground penetrating radar surveys) should be conducted across the Site to confirm the location of the underground gasoline storage tank, locate a possible No. 2 fuel oil underground storage tank, and identify any other tanks, pits, drums, etc.
- If present, any historic USTs should be removed in accordance with New York State Department of Environmental Conservation (NYSDEC) and New York City Fire Department (FDNY) regulations. Any identified geophysical anomalies should be further investigated through the excavation of test pits, with soil samples collected for laboratory analysis as warranted.
- To evaluate potential impacts related to historic usage of the Site and to satisfy the NYCDCP and New York City Office of Environmental Remediation (NYCOER) requirements related to the site's listing as an "E"-designated property, a subsurface investigation should be performed. At a minimum, the investigation should include the installation of soil borings with the collection of representative soil, groundwater and/or soil vapor samples for laboratory analysis to document subsurface conditions and determine the nature and extent of contamination (if present).

The EDR Radius Map Report identified Brumar Sheet Metal, Inc. (498 Leonard Street) with open NYSDEC Spill No. 1205075. Brumar Sheet Metal, Inc. is the adjacent property to the rear/west. NYSDEC Spill file notes provided within the EDR Radius Map Report indicate ten 1,000-gallon underground storage tanks were removed in February of 2015 near the property line that separates the Site from the adjacent property to the west. Test pits excavated on the adjacent property and monitoring wells installed on the property noted free product on the groundwater surface.

A digital copy of the Phase I Environmental Site Assessment Screening is included in **Attachment A**.

1.5.2 May 2015 - Phase II Investigation Data Summary (EBC)

An initial subsurface investigation was performed on February 26, 2015, and additional sampling was performed on April 21, 2015. The initial investigation included the installation of two soil borings (B1 and B2) and the collection of one groundwater sample (B1 GW), and the second sampling event consist of the installation of three soil borings (B2, B3, B4) and the collection of a

groundwater sample from each of the three soil boring locations (GW2, GW3, G4). The installation location of all of the soil borings is shown on **Figure 5**.

A shallow soil sample representing the depth interval 0-2 feet below grade was collected from soil borings B1 and B2 in February 2015, and from 2 to 4 feet below grade from soil borings B2 and B3 in April 2015. Each of the shallow soil samples were collected from the historic fill layer below the building slab. The two historic fill soil samples collected in February were submitted for laboratory analysis of PCBs and TAL metals, and the two historic fill soil samples collected in April were submitted for laboratory analysis of SVOCs via EPA method 8270, TAL metals and TCLP Lead.

A soil sample was collected from both soil borings B1 and B2 in February from the water table interface and submitted for laboratory analysis of VOCs via EPA Method 8260 and SVOCs (CP51 list) via EPA Method 8270. Soil samples were also retained from the water table interface (11 to 13 feet below grade) from soil borings B2, B3 and B4 in April. These three soil samples were submitted for laboratory analysis of VOCs via EPA method 8260 and SVOCs via EPA method 8270.

The laboratory results identified petroleum related VOCs above Unrestricted Use SCOs and Protection of Groundwater SCOs within each of the four soil samples collected from the water table interface, including n-Propylbenzene, sec-Butylbenzene, tert-Butylbenzene, and Toluene. The concentration of total VOCs (when including naphthalene) were reported as high as 102,700 µg/kg in soil sample B3(11-13). The chlorinated VOC Trichloroethene was also detected within one of the soil samples collected in February at the water table interface at a concentration of 1,100 µg/kg.

Petroleum VOCs were detected above groundwater quality standards (GQS) within the groundwater sample collected in February 2015 and each of the three groundwater samples collected in April 2015. Petroleum VOCs detected above GQS includes 2-Isopropyltoluene, Isopropylbenzene, n-Butylbenzene, n-Propylbenzene, sec-Butylbenzene, and tert-Butylbenzene. Total petroleum VOCs were reported in the three groundwater samples at a concentration ranging from 135 to 457 µg/L.

SVOCs including Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, and Indeno(1,2,3-cd)pyrene were all reported above Restricted Residential Use SCOs within the soil sample collected from the water table interface from soil boring B2. No historic fill material was present at the water table interface, so the total SVOC concentration in soil sample B2(11-13) (165,300 µg/kg) is believed to be associated with a fuel oil or other petroleum release.

2.0 REMEDIAL INVESTIGATION

2.1 Field Investigation

The field work portion of the RI was conducted by EBC in December 2015. The field investigation consisted of environmental sampling, field observations and measurements to determine:

- Local geologic/hydro geological conditions;
- Definition of source areas;
- Potential migration of contaminants from the Site to surrounding areas; and,
- Overall characterization of site-related contamination in all media.

The field effort included the collection and analysis of soil, groundwater and soil vapor samples. Laboratory services for soil, groundwater and soil vapor analysis were provided by Phoenix Environmental Laboratories, Inc. located at 587 East Middle Turnpike, Manchester, CT (NY Cert No. 11301). A sample matrix showing the number, type and analysis of samples collected during the Remedial Investigation is provided as **Table 1**.

2.2 Soil Sampling

2.2.1 Soil Borings

On December 16, 2015, and December 17, 2015, a total of ten soil borings (15SB1 – 15SB10) were advanced. The soil borings were performed during the RI to identify source areas and to obtain general soil quality information present at the Site (**Figure 4**). From each soil boring location, soil samples were collected continuously in 5-foot intervals to a depth of 20 feet below the former building slab using a track-mounted Geoprobe™ model 66DT sampling system. The Geoprobe™ uses a direct push hydraulic percussion system to drive and retrieve core samplers. Soil samples were retrieved using a 2-inch diameter, 5-foot long macro-core sampler with disposable acetate liners. Each soil sample recovered from the soil borings was characterized by an experienced geologist and field screened for the presence of VOCs using a photo-ionization detector (PID). The geologist's field observations and PID readings were recorded for each boring in a soil boring log (see **Attachment B**).

Soil samples were retained from each of the soil borings for laboratory analysis. Samples collected for laboratory analysis include the following:

- Soil samples representing the interval 0 to 2 feet below the former building slab grade were retained from soil borings 15SB1, 15SB2, and 15SB5 through 15SB10. Soil samples representing the interval 2 to 4 feet below the former building slab grade were retained from soil borings 15SB3 and 15SB4. Each of the samples was submitted for laboratory analysis of VOCs by EPA Method 8260C plus TICs, SVOCs by EPA Method 8270 plus TICs, pesticides by EPA Method 8081B, PCBs by EPA Method 8082, and target analyte list metals (EPA Method 6010). The 15SB3(2-4) and 15SB4(2-4) soil samples were also submitted for laboratory analysis of chlorinated herbicides by EPA Method 8151A and organophosphate pesticides by EPA Method 8141B.

- A soil sample was retained from each of the soil borings from the water table interface, which was determined to be the interval 11 to 13 feet below grade. Each of the samples was submitted for laboratory analysis of VOCs by EPA Method 8260C, and SVOCs by EPA Method 8270.
- A soil sample was retained from each of the soil borings from the clean native soil layer that exhibited no olfactory or PID evidence of petroleum contamination. Each of the samples correlated to the 18 to 20 foot interval, with the exception of the soil sample retained from soil boring 15SB5, which was retained from 22 to 24 ft. Each of the samples was submitted for laboratory analysis of VOCs by EPA Method 8260C, SVOCs by EPA Method 8270, pesticides by EPA Method 8081, PCBs by EPA Method 8082, and target analyte list metals (EPA Method 6010).

A total of thirty one soil samples (plus one duplicate) were retained for analysis from the ten soil boring locations. Soil sample analytical results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use Soil Cleanup Objectives, Protection of Groundwater SCOS, Residential Restricted Use SCOs and/or Commercial SCOs on **Tables 3** through **6**.

2.3 Monitoring Well Installation

Eight groundwater monitoring wells (15MW1 through 15MW8), were installed at the Site on December 17, 2015. The locations of each of the monitoring wells are shown on **Figure 5**. All of the monitoring wells were installed with a track mounted probe drilling machine to a depth of approximately 20 ft below grade with 10 ft of 0.010 PVC well screen and 10 ft of PVC riser.

A No. 00 morie filter-pack sand filled the annulus surrounding the screen within two feet above the top of the screen. A one-foot hydrated bentonite seal was then placed on top of the filter sand and the remainder of the borehole was backfilled to grade. Following installation, each of the wells was surveyed to determine relative casing elevation to the nearest 0.01 ft and horizontal position to the nearest 0.1 ft. Groundwater elevations and monitoring well specifications for each well are provided in **Table 2**. Well completion reports detailing monitoring well construction are provided in **Attachment C**.

Prior to sampling, a synoptic round of depth-to-groundwater (DTW) measurements were obtained from the monitoring wells to determine the water table elevation and to calculate the volume of standing water in the well. The depth to groundwater was approximately 12 to 13 ft below grade. Depth to water and survey readings are provided in **Table 2**.

2.3.1 Groundwater Sampling

Each of the eight monitoring wells (15MW1 through 15MW8) was sampled on December 22, 2015. Groundwater samples were collected from the monitoring wells using low-flow sampling techniques and were monitored continuously until parameters stabilized. A peristaltic pump and polyethylene sampling tube were used to purge and collect samples from each well location. Sample tubing and the silicone pump tubing were replaced between each sample location. Samples were collected directly into pre-cleaned laboratory supplied glassware, stored in a cooler with ice and submitted to Phoenix Environmental Laboratories, Inc. Groundwater sampling logs are provided in **Attachment D**.

All groundwater samples from the monitoring wells were analyzed for VOCs by EPA Method 8260, SVOCs by EPA method 8270, Pesticides/PCBs by method 8081/8082, target analyte list (TAL) total metals and dissolved metals by EPA method 6010.

2.4 Soil Vapor Sampling

Seven soil vapor samples (SG1 through SG7) were collected during the RI from a depth of approximately 8 feet below the existing building slab on December 22, 2015. Each of the soil vapor sampling locations is shown on **Figure 6**. All soil vapor samples were collected over a 2-hr sampling period. Soil vapor samples were collected in accordance with the procedures as described in the *Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH 10/06)*.

2.4.1 Installation of Soil Vapor Implants

The eight soil vapor implants were installed at the Site on December 17, 2015. The vapor implants (Geoprobe™ Model AT86 series), were constructed of a 6-inch length of double woven stainless steel wire and installed to a depth of 8 ft below grade using Geoprobe™ equipment.

During installation, the barbed end of each implant was attached to ¼ inch polyethylene tubing which extended approximately 24 inches beyond that needed to reach the surface. The tubing was capped with a ¼ inch plastic end to prevent the infiltration of foreign particles into the tube. Coarse sand was placed around the vapor implant to a height of approximately 1 foot above the bottom of the implant. The remainder of the borehole was sealed with a bentonite slurry to the surface. The tubing and borehole were then sealed at the surface with hydrated granular bentonite and a 12" x 12" (approx.) plastic sheet.

2.4.2 Surface Seal Test Procedure

In accordance with NYSDOH guidance, a tracer gas (helium) was used as a quality assurance/quality control device to verify the integrity of the sampling point seal prior to collecting the samples. This was accomplished by enriching the air space above the seal with a tracer gas (helium) while continuously monitoring air drawn from the implant with a helium detector (Ionscience Gas Check G). The tracer gas test procedure was employed at all eight soil vapor sampling locations. All seals tested tight with no infiltration of helium through the surface.

2.4.3 Soil Vapor Sample Collection

Following verification that the surface seal was tight, one to three volumes (i.e., the volume of the sample probe and tube) were purged with a handheld vacuum pump prior to collecting the samples to ensure samples collected were representative. After purging, a 6-liter summa canister, fitted with a 2-hour flow regulator was attached to the surface tube of each of the sampling points and the valve opened to initiate sampling. Sample identification, date, start time, start vacuum, end time and end vacuum were recorded on tags attached to each canister and on a sample log sheet (**Attachment E**). When the remaining vacuum in the canisters was between 5 and 8 inches Hg, (after approximately 2 hrs of run-time) the valve was closed and the canisters were detached from the sampling tube.

Sample canisters were picked up the following day by the laboratory courier and delivered to the Phoenix Environmental Laboratories, Inc. for analysis of VOCs by USEPA Method TO-15.

2.6 Laboratory Analysis

Data tables summarizing the laboratory results are provided in **Tables 3** through **12** and copies of the laboratory reports (with each chain-of-custody) are included in digital format in **Attachment F**. Soil sample results were compared to Unrestricted Use Soil Cleanup Objectives (SCOs), Protection of Groundwater SCOs, and Restricted Residential Use SCOs, as promulgated in 6 NYCRR Subpart 375-6. Groundwater results were compared to NYSDEC Division of Water, Technical & Operational Guidance Series 1.1.1, Ambient Water Quality Standards and Guidance Values (AWQS), June 1998. Soil vapor analytical results were compared to Summary of Background Levels for Selected Compounds (NYSDOH Database, Outdoor values, 2003) and New York State Department of Health (NYSDOH) Final Guidance on Soil Vapor Intrusion (October 2006) Matrix 1 and Matrix 2 values. **Table 13** contains a list of parameters detected in each of the soil samples above SCOS and the range in detections. **Table 14** contains a list of parameters detected above Ambient Groundwater Quality Standards and the range in detections.

2.6.1 Analytical Results – Soil Boring Soil Samples

A total of thirty soil samples (and one duplicate) were collected from ten soil borings for laboratory analysis of VOCs by EPA Method 8260C plus TICs, SVOCs by EPA Method 8270 plus TICs, PCBs by EPA Method 8082, and target analyte list metals (EPA Method 6010). Soil samples 15SB1(2-4), 15SB1(18-20), 15SB3(2-4), 15SB3(18-20), 15SB5(2-4), and 15SB5(22-24) were also analyzed for chlorinated herbicides by EPA Method 8151A, and organophosphorus pesticides by EPA Method 8141B. Analytical results of the soil samples collected from the soil borings are summarized and compared to Unrestricted Use SCOs, Protection of Groundwater SCOs, Restricted Residential Use SCOs, and/or Commercial SCOs in **Tables 3** through **6**.

All soil samples results above Unrestricted Use SCOs are presented in **Table 13** and posted on **Figure 7**.

Petroleum related VOCs were detected above Unrestricted Use SCOs and Protection of Groundwater SCOs within six of the ten soil samples retained from the groundwater interface (11 to 13 feet below grade). No VOCs were detected above Restricted Residential Use SCOs. Petroleum related VOCs were not detected above Unrestricted Use SCOs or Protection of Groundwater SCOs within any of the clean native soil samples retained from the 18 to 20 ft interval, or the soil samples collected from the historic fill layer, representing the 0 to 2 ft or 2 to 4 ft intervals.

Chlorinated Volatile Organic Compounds

The chlorinated VOC Tetrachloroethylene was detected within several of the shallow soil samples collected from the historic fill layer, but not at a concentration above Unrestricted Use SCOs or Protection of Groundwater SCOs. PCE was not detected above the laboratory reporting limit (RL) within any of the soil samples retained at the groundwater interface (11 to 13 ft) or from the native soil layer (18 to 20 ft). It should be noted that the RL for each of the soil samples from the 11 to 13 ft interval was significantly higher due to elevated concentrations of petroleum related VOCs.

The chlorinated VOC Trichloroethylene was detected within six of the ten soil samples collected from the historic fill layer at a concentration above Unrestricted Use SCOs and Protection of Groundwater SCOs. The highest Trichloroethylene concentrations were reported in soil samples 15SB1(2-4) (6,600 µg/kg), 15SB2(0-2) (4,000 µg/kg), and 15SB10 (0-2) (2,100 µg/kg). The 15SB1, 15SB2 and 15SB10 soil borings are all located in the rear of the Site. TCE was not detected above the laboratory reporting limit (RL) within any of the soil samples retained at the groundwater interface (11 to 13 ft) or from the native soil layer (18 to 20 ft), with the exception of soil sample 15SB2(18-20) (3.8 µg/kg). It should be noted that the RL for each of the soil samples from the 11 to 13 ft interval was significantly higher due to elevated concentrations of petroleum related VOCs.

2.6.2 Analytical Results – Groundwater Samples

A total of eight groundwater samples were collected from the eight groundwater monitoring wells for laboratory analysis of VOCs (EPA Method 8260), SVOCs (EPA Method 8270), pesticides/PCBs (EPA Method 8081/8082), and total and dissolved TAL metals (EPA Method 6010). The results of groundwater samples collected during the RI are summarized in **Tables 7** through **11** and posted on **Figure 9**. Several VOC detections were in excess of the NYSDEC Division of Water, Technical & Operational Guidance Series 1.1.1, Ambient Water Quality Standards (GQS) for Class GA (drinking water), June 1998.

The chlorinated VOC Trichloroethene was detected at a concentrations below GQS within 15MW1 (3.5 µg/L), 15MW2 (0.54 µg/L), and 15MW4 (1.2 µg/L). The chlorinated VOCs Tetrachloroethene (0.32 µg/L), Chlorobenzene (8.1 µg/L), cis-1,2-Dichloroethene (13 µg/L), 1,4-Dichlorobenzene (0.91 µg/L), and 1,2-Dichlorobenzene (0.99 µg/L) were also detected in groundwater sample 15MW1.

SVOCs in Groundwater Above GQS:

SVOCs were detected in all eight groundwater samples at concentrations above GQS. SVOC detections above GQS were limited to those polynuclear aromatic hydrocarbons (PAHs) with a 2 per trillion standard.

Pesticides and PCBs in Groundwater Above GQS:

No pesticides or PCBs were detected in any of the groundwater samples collected at the Site.

Dissolved Metals in Groundwater Above GQS:

The dissolved concentrations of the metals Iron, Manganese and/or Sodium were detected above GQS within each of the eight groundwater samples. Dissolved metal GQS exceedances for each groundwater sample are provided below:

15MW1 – Iron (1.63 mg/L), Manganese (0.848 mg/L), Sodium (151 mg/L)

15MW2 – Iron (2.38 mg/L), Manganese (0.82 mg/L), Sodium (164 mg/L)

Total Metals in Groundwater Above NYSDEC GQS:

Multiple metals were reported above standards in the unfiltered samples from all of the monitoring wells including Arsenic, Copper, Iron, Lead, Manganese, and Sodium. As demonstrated by the filtered samples, these detections are a function of suspended solids in the sample and are not representative of metals concentrations dissolved in the groundwater.

2.6.4 Analytical Results – Soil Vapor Samples

In order to determine the vapor quality in the soil beneath the Site, soil vapor samples were collected from seven soil vapor implants (SG1 through SG7) installed approximately 8 feet below grade. Analytical results were compared to the Summary of Background Levels for Selected Compounds (NYSDOH Database, Outdoor values, 2003) and NYSDOH Final Guidance on Soil Vapor Intrusion (October 2006) Matrix 1 and Matrix 2 values.

BTEX concentrations were generally low in soil vapor samples. BTEX concentrations ranged from 6.21 $\mu\text{g}/\text{m}^3$ (SG7) to 99.8 $\mu\text{g}/\text{m}^3$ (SV-4).

Chlorinated VOCs (CVOC) were detected at elevated concentrations within several of the soil vapor samples collected at the Site. Trichloroethene (TCE) was detected in all 7 soil gas samples at a maximum concentration of 1,650 $\mu\text{g}/\text{m}^3$ (SG1) and tetrachloroethane was detected within all 7 soil gas samples at a maximum concentration of 47.6 $\mu\text{g}/\text{m}^3$ (SG3).

The CVOC Carbon Tetrachloride was detected within one of the seven soil gas samples at a concentration of 0.35 $\mu\text{g}/\text{m}^3$ and 1,1,1-Trichloroethane was detected within four of the seven soil gas samples at a maximum concentration of 47.6 $\mu\text{g}/\text{m}^3$. Soil vapor results are summarized on **Table 17** and posted on **Figure 10**.

2.6.5 Data Usability Summary Report

Data validation services were provided by H&S Environmental (H&S) of Westborough, Massachusetts. H&S reported that, in general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria. The Data Usability Summary Reports prepared by H&S are provided in **Attachment G**.

3.0 HYDROGEOLOGIC ASSESSMENT AND PHYSICAL SETTING

3.1 Site Topography

According to the USGS topographic map for the area (Brooklyn Quadrangle), the elevation of the property ranges from 19 to 20 feet above the National Geodetic Vertical Datum (NGVD). The area topography gradually slopes downward to the north and west.

3.2 Surrounding Land Use

The area surrounding the property is highly urbanized and predominantly consists of multi-family residential buildings with mixed-use buildings (residential w/ first floor retail) along main corridors such as Driggs Avenue located at the end of the block to the north and McGuinness Boulevard, located two blocks to the east. The area is marked by late 19th and early 20th century row-houses with commercial and industrial properties interspersed throughout the residential sections. A large portion of the neighborhood to the west consists of McCarren Park, which has a track, playing fields and a public swimming pool. The Site is situated on a block (Block 2698) which has historically been utilized for heavy industry and manufacturing. Following a steady decline of manufacturing in the area from the late 1960's through the 1980's, many of the industrial properties were vacated leaving the buildings to be vandalized and become derelict. Conditions continued to decline throughout the 1980's and 1990's.

The land use in the immediate vicinity of the Site includes of a one-story manufacturing building currently occupied with an automotive repair facility (75 Eckford Street) and a 3-story commercial building currently occupied with a Polish Hall/Club (261 Driggs Avenue) to the north, a lot undergoing construction of a new 4-story apartment building (498 Leonard Street) and a one-story warehouse/manufacturing building (488 Leonard Street) to the west, multi-family row houses (62, 64 66 and 68 Eckford Street) to the east and a 10-story apartment building (55 Eckford Street) to the south. There are no daycare centers in the immediate area of the Site, however there are two daycare facilities located within a 1,200 ft radius of the Site. Two schools (Northside Charter High School and John Ericsson Middle School 126) are located at 424 Leonard Street, which is approximately 500 feet to the south.

3.3 Regional Geology / Hydrogeology

Long Island's present configuration is primarily the result of glaciation which during the Pleistocene Era, predominately that of the last ice age, the Wisconsin, which ended about ten thousand years ago. Two advances of the Wisconsin ice sheet during the Upper Pleistocene of the Quaternary Period caused the island to be blanketed with till, ice contact stratified drift, outwash deposits and deposits composed of clay, silt, sand, gravel and boulders. The terminal moraines and the north shore are composed primarily of stratified drift with some till. The area between the moraines and south of them are mostly the outwash deposits. Central and South Long Island are of the glaciofluvial origin. The Pleistocene deposits lie atop the gently-dipping Cretaceous rocks.

The bedrock was eroded to a peneplain before the overlying Cretaceous sediments were deposited; its surface shows signs of later erosion by Pleistocene glaciation in the north. Bedrock crops out in

northwestern Queens County near the East River and slopes southward at about eighty (80) feet per mile. Consequently, the overlying formations form a southward-dipping wedge that attains a maximum thickness of one-thousand fifty (1,050) feet in the southeast corner of Queens County. The maximum thickness of unconsolidated deposits in Kings County is about eight-hundred (800) feet in southeast Kings.

Overlying bedrock is the Raritan Formation of Late Cretaceous age, consisting of the Lloyd Sand Member and an upper, unnamed clay member. Overlying the Raritan Formation is the Magothy Formation and Matawan Group, undifferentiated, also of Late Cretaceous age, the Jameco Gravel of Pleistocene age, the Gardiners Clay of Pleistocene age, upper Pleistocene deposits of Wisconsin age, and a generally thin soil mantle of Holocene age. Holocene beach deposits make up most of the Rockaway Peninsula and Coney Island in the south, and Holocene salt-marsh deposits underlie and fringe the south-shore bay areas. Artificial filling has been done in low and swampy shoreline areas. Because Holocene deposits occur in relative small areas of Kings and Queens and are not significant water bearers, they are not included in the geologic descriptions that follow. The four distinct formations on Long Island: The Upper Glacial, the Jameco, the Magothy and the Lloyd aquifers. They all occur in the unconsolidated materials overlying the bedrock.

3.4 Site Geology / Hydrogeology

The geologic setting of Long Island is well documented and consists of crystalline bedrock overlain by layers of unconsolidated deposits. According to geologic maps of the area created by the United States Geologic Survey (USGS), the bedrock in this area of Brooklyn is an igneous intrusive classified as the Ravenswood grano-diorite of middle Ordovician to middle Cambrian age. Unconsolidated sediments overlie the bedrock and consist of Pleistocene aged sand, gravel and silty clays, deposited by glacial-fluvial activity. Non-native fill materials consisting of dredge spoils, rubble and / or other materials have historically been used to reinforce and extend shoreline areas and to raise and improve the drainage of low lying areas.

Soil at the Site consists of historic fill material that extends to depths as great as 13 feet below grade in some areas followed by grey silty clay. According to the USGS topographic map for the area (Brooklyn Quadrangle), the elevation of the property is approximately 14 feet above mean sea level. The area topography gradually slopes downward to the north and west.

Groundwater occurs beneath the Site at a depth of 11 to 12 feet below sidewalk grade (**Table 2**) under water table conditions. Regional groundwater flow is to the northwest and the groundwater flow at the Site was calculated to be towards the north-northwest (**Figure 11**).

4.0 NATURE AND EXTENT OF CONTAMINATION

4.1 Identification of Source Areas

4.1.1 Chlorinated VOCs in Soil

The chlorinated VOC Trichloroethene was detected above Unrestricted Use SCOs within shallow soil samples collected from the 0 to 2 ft and 2 to 4 ft intervals across the majority of the Site. The highest concentrations were detected within the rear of the building within soil samples 15SB1 (2-4) (6,600 µg/kg), 15SB2 (0-2) (4,000 µg/kg), and 15SB10 (0-2) (2,100 µg/kg). Trichloroethylene was not detected above the laboratory reporting limit (RL) within any of the RI soil samples retained at the groundwater interface (11 to 13 ft) or from the native soil layer (18 to 20 ft), with the exception of soil sample 15SB2(18-20) (3.8 µg/kg). It should be noted that the RL for each of the soil samples from the 11 to 13 ft interval was significantly higher due to elevated concentrations of petroleum related VOCs. Trichloroethene was detected within a soil sample retained from the water table interface during the subsurface investigation performed in February 2015. Trichloroethene was detected at a concentration of 1,100 µg/kg within soil sample B2(10-12ft).

4.1.2 Petroleum VOCs in Soil

A 5 to 6 ft smear zone of petroleum contaminated soil is present across the Site at the groundwater interface. Petroleum related VOCs were detected above Unrestricted Use SCOs and Protection of Groundwater SCOs within six of the ten soil samples retained from the groundwater interface (11 to 13 feet below grade) during the RI. No petroleum related VOCs were detected above Restricted Residential Use SCOs. Petroleum related VOCs were not detected above Unrestricted Use SCOs or Protection of Groundwater SCOs within any of the clean native soil samples retained from the 18 to 20 ft interval, or the soil samples collected from the historic fill layer, representing the 0 to 2 ft or 2 to 4 ft intervals.

Evidence of a gasoline underground storage tank was observed in the western half of the Site (front). The tank is located approximately 30ft from the western property line (Eckford Street) and 30ft from the southern property line. The tank, tank piping and/or former dispenser may be the source of the petroleum contamination. However, no PID or olfactory evidence of petroleum contamination was noted within the soil boring performed immediately adjacent to the tank until the groundwater interface was encountered. Since no shallow petroleum contaminated soil was encountered within any of the soil borings performed at the Site, the petroleum contaminated soil present at the groundwater interface is likely associated with the spill (NYSDEC Spill No. 1205075) on the adjacent property to the rear/west. NYSDEC notes provided within the EDR Radius Map Report (see Phase I Report) indicated ten 1,000-gallon underground storage tanks were removed from the rear of the property in February of 2015 and test pits excavated at the property and monitoring wells installed on the property noted free product on the groundwater surface.

SVOCs including Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, and Indeno(1,2,3-cd)pyrene were all reported above Restricted Residential Use SCOs within the soil sample collected from the water table interface from soil boring B2 during the February 2015 Subsurface Investigation. Historic fill material was not observed within the soil boring at the water table interface, so the total SVOC concentration in soil sample B2(11-13) (165,300 µg/kg) is believed to be associated with a fuel oil or other petroleum release.

4.1.3 Historic Fill Material

Historic fill material has been identified across the Site to depths as great as 13 feet below grade. The historic fill material contains SVOCs above Restricted Residential Use and Commercial Use SCOs, the metals arsenic, barium, copper, lead and mercury above Commercial Use SCOs, cadmium, chromium, nickel and zinc above Unrestricted Use and/or Restricted Residential Use SCOs.

4.1.4 Elevated Metals in Deep Native Soil

The metals arsenic (maximum of 35.8 ppm) and mercury (maximum of 12.1 ppm) were detected above Commercial Use SCOs within several of the soil samples retained from the deep native soil layer (18-20ft). The metal lead (maximum of 529 mg/kg) was detected above Restricted Residential Use SCOs, and the metal zinc (359 mg/kg) was detected above Unrestricted Use SCOs with the deep soil samples retained from the native soil layer. Soil at the 18-20ft interval was found to consist primarily of a grey silty clay with pieces of shells and/or organic matter such as reeds or peat moss. Prior to being backfilled in the late 1800's, the Site and most of the adjacent properties to the west had a much lower elevation because the area was part of the Bushwick Inlet (formerly known as Bushwick Creek). The elevated metals detected within the soil samples retained from the 18-20ft interval are likely associated with sediment associated with the former creek.

4.2 Groundwater Impacts

4.1.1 Chlorinated VOCs in Groundwater

The chlorinated VOC Trichloroethene was detected at a concentrations below GQS within groundwater samples 15MW1 (3.5 µg/L), 15MW2 (0.54 µg/L), and 15MW4 (1.2 µg/L), which were all collected from the rear (western) and southern end of the Site. The chlorinated VOCs Tetrachloroethene (0.32 µg/L), Chlorobenzene (8.1 µg/L), cis-1,2-Dichloroethene (13 µg/L), 1,4-Dichlorobenzene (0.91 µg/L), and 1,2-Dichlorobenzene (0.99 µg/L) were also detected in groundwater sample 15MW1 which was collected from the southwestern corner (rear) of the Site. These chlorinated VOCs were detected in shallow soil samples (0 to 2 and 2 to 4 feet below grade) collected from the rear of the Site during the RI, and within a deeper soil sample (10 to 12 feet below grade) collected during the February 2015 Subsurface Investigation, which suggests the CVOCs detected in groundwater may be associated with the CVOCs detected in soil within the rear of the Site.

4.1.2 Petroleum VOCs in Groundwater

Petroleum related VOCs were detected above GQS in six of the eight groundwater samples collected at the Site. The concentrations were fairly low, and evenly distributed across the Site. The absence of petroleum contamination within soil above the groundwater interface and the low, evenly distributed concentrations of petroleum related VOCs in groundwater suggests an off-Site source.

SVOC detections above GQS were limited to those polynuclear aromatic hydrocarbons (PAHs) with a 2 parts per trillion standard. Exceedances of the part per trillion standards for PAHs were reported in all eight groundwater samples. SVOCs reported in the parts per trillion range are a function of the laboratory's ability to achieve extremely low detection limits and general background conditions.

No pesticides or PCBs were detected above GQS within any of the groundwater samples collected at

the Site. The dissolved metals detected above GQS (Iron, Manganese, and Sodium) within the groundwater samples collected at the Site are consistent with general groundwater quality throughout the area.

4.3 Soil-Vapor Impacts

BTEX concentrations were generally low within the soil vapor samples. BTEX concentrations ranged from 6.21 $\mu\text{g}/\text{m}^3$ (SG7) to 99.8 $\mu\text{g}/\text{m}^3$ (SV-4).

Chlorinated VOCs (CVOC) were detected at elevated concentrations within several of the soil vapor samples collected at the Site. Trichloroethene (TCE) was detected in all 7 soil gas samples at a maximum concentration of 1,650 $\mu\text{g}/\text{m}^3$ (SG1) and tetrachloroethane was detected within all 7 soil gas samples at a maximum concentration of 47.6 $\mu\text{g}/\text{m}^3$ (SG3). The highest TCE concentrations were detected in SG1 (1,650 $\mu\text{g}/\text{m}^3$) and SG6 (245 $\mu\text{g}/\text{m}^3$). The elevated TCE concentrations in soil vapor samples collected from the rear of the building correlates with the elevated TCE concentrations detected in shallow soil samples collected from the rear of the building.

The CVOC Carbon Tetrachloride was detected within one of the seven soil gas samples at a concentration of 0.35 $\mu\text{g}/\text{m}^3$ and 1,1,1-Trichloroethane was detected within four of the seven soil gas samples at a maximum concentration of 47.6 $\mu\text{g}/\text{m}^3$.

4.4 Site Conceptual Model

Contamination at the Site consists of historic fill material that contains metals and SVOCs above Unrestricted Use, Restricted Residential Use, and/or Commercial Use SCOs to depths as great a 13 feet below grade, CVOC contaminated soil in the rear of the Lot from grade to depths of at least 12 feet below grade, and a 5 to 6 foot thick smear zone of petroleum impacted soil at the groundwater interface (approximately 10 to 15 feet below grade).

The historic fill material was likely imported to the Site to raise the grade and backfill a former building's cellar prior to construction of the recently demolished one-story industrial building.

The CVOC contaminated soil at the Site is likely associated with the historic use of Trichloroethene at the Site. From approximately 1959 to 1998, Carter Spray Finishing Corp. utilized two 275-gallon aboveground storage tanks containing Trichloroethene for metal finishing purposes. The most likely release scenario would include a surface spill(s) during use. The nature and extent of the soil contamination is indicative of a limited surface spill which migrated through cracks or other voids in the concrete floor. The timing and scenario of the release are unknown. In any case, the Trichloroethene contamination appears to be limited to the rear half of the Site, and did not migrate much as indicated by the low CVOC concentrations in groundwater. Off-gassing is occurring from the residually contaminated soil which resulted in elevated concentrations of Trichloroethene in soil vapor samples collected from the rear of the Site.

A 5 to 6 ft smear zone of petroleum contaminated soil is present across the Site at the groundwater interface. Petroleum related VOCs were detected above Unrestricted Use SCOs and Protection of Groundwater SCOs within six of the ten soil samples retained from the groundwater interface (11 to

13 feet below grade) during the RI. Evidence of a gasoline underground storage tank was observed in the central rear half of the Site. The tank, tank piping and/or former dispenser may be the source of the petroleum contamination. However, no PID or olfactory evidence of petroleum contamination was noted within the soil boring performed immediately adjacent to the tank until the groundwater interface was encountered. Since no shallow petroleum contaminated soil was encountered within any of the soil borings performed at the Site, the petroleum contaminated soil present at the groundwater interface is likely associated with the spill (NYSDEC Spill No. 1205075) on the adjacent property to the rear/west. NYSDEC notes provided within the EDR Radius Map Report (see Phase I Screening Report included in **Attachment A**) indicated ten 1,000-gallon underground storage tanks were removed from the rear of the property in February of 2015 and test pits excavated on the adjacent property and monitoring wells installed on the property noted free product on the groundwater surface.

Elevated concentrations of the metals arsenic, lead, mercury and zinc were detected within soil samples retained from the 18-20ft interval. Soil at this depth was found to consist primarily of a grey silty clay with pieces of shells and/or organic matter such as reeds or peat moss. Prior to being backfilled in the late 1800's, the Site and most of the adjacent properties to the west had a much lower elevation because the area was part of the Bushwick Inlet (formerly known as Bushwick Creek). The elevated metals detected within the soil samples retained from the 18-20ft interval are likely associated with sediment associated with the former creek.

5.0 QUALITATIVE EXPOSURE ASSESSMENT

The objective of the qualitative exposure assessment under the Brownfields Cleanup Program (BCP) is to identify potential receptors to the contaminants of concern (COC) that are present at, or migrating from, the Site. The identification of exposure pathways describes the route that the COC takes to travel from the source to the receptor. An identified pathway indicates that the potential for exposure exists; it does not imply that exposures actually occur. An exposure pathway has five elements; a contaminant source, release and transport mechanisms, point of exposure, route of exposure and a receptor population.

The potential exposure pathways identified below, represent both current and future exposure scenarios.

5.1 Contaminant Source

5.1.1 Petroleum VOCs in Soil/Groundwater

A 5 to 6 foot smear zone of petroleum contaminated soil was encountered at the groundwater interface across the Site. The petroleum contamination at the groundwater interface is likely associated with the adjacent property to the west (rear). Ten 1,000-gallon underground storage tanks were recently removed near the property line that separates the Site from the adjacent property to the west. Test pits excavated on the adjacent property and monitoring wells installed on the property noted free product on the groundwater surface.

5.1.2 Chlorinated VOCs in Soil/Groundwater/Soil Gas

CVOC contaminated soil was detected within shallow soil samples (0 to 2 feet and 2 to 4 feet below grade) collected from the rear half of the Site during the RI, and one of the deeper soil samples (10 to 12 feet below grade) collected from the rear during the February 2015 Subsurface Investigation. The CVOCs detected within the soil samples are likely associated with the historic use of Trichloroethene at the Site. From approximately 1959 to 1998, Carter Spray Finishing Corp. utilized two 275-gallon aboveground storage tanks containing Trichloroethene. Trichloroethene contamination appears to be limited to the rear half of the Site, and did not migrate much as indicated by the low CVOC concentrations in groundwater. Off-gassing is occurring from the residually contaminated soil which resulted in elevated concentrations of Trichloroethene in soil vapor samples collected from the rear of the Site.

5.1.3 Historic Fill Material

PAHs and other metals such as Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Nickel and Zinc were also present at concentrations above Unrestricted Use, Restricted Residential Use and/or Commercial SCOs in fill material throughout the Site to depths as great as 13 feet below grade.

5.1.4 Elevated Metals in Deep Native Soil

The elevated concentrations of the metals arsenic, lead, mercury and zinc within native soil samples retained from the 18-20ft interval are not believed to be associated with a spill/release. The elevated concentrations are likely present in the sediment of the former Bushwick Inlet (formerly known as Bushwick Creek) which was historically present in the area of the Site.

5.2 Contaminant Release and Transport Mechanism

Historic fill material with elevated concentrations of SVOCs and metals is present across the Site to depths as great as 13 feet below grade. The contaminants detected within the historic fill material are not believed to be associated with a spill/release, but are likely associated with the source of material originally brought in to backfill/raise the property.

The petroleum contamination may be associated with a gasoline underground storage tank located in central rear portion of the Site, the former piping or dispenser associated with the tank, or another unidentified tank. However, no PID or olfactory evidence of petroleum contamination was noted within the soil boring performed immediately adjacent to the tank until the groundwater interface was encountered. Since no shallow petroleum contaminated soil was encountered within any of the soil borings performed at the Site, the petroleum contaminated soil present at the groundwater interface is likely associated with the spill (NYSDEC Spill No. 1205075) on the adjacent property to the rear/west. NYSDEC notes provided within the EDR Radius Map Report (see Phase I Report) indicated ten 1,000-gallon underground storage tanks were removed from the rear of the property in February of 2015 and test pits excavated on the adjacent property and monitoring wells installed on the property noted free product on the groundwater surface. There does not appear to be any significant transfer of petroleum VOCs to the vapor phase.

CVOCs were detected within shallow soil samples (0 to 2 feet and 2 to 4 feet below grade) collected from the rear of the Site and may be the source of CVOC contamination detected in groundwater samples collected at the Site. CVOCs present in on-Site soils are volatilizing to soil vapor contributing to the elevated levels of CVOCs detected within the soil vapor samples collected from the rear of the Site (SG1 and SG6).

5.3 Point of Exposure, Route of Exposure and Potentially Exposed Populations

Potential On-Site Exposures: Remediation workers and construction workers engaged in the excavation of impacted and non-impacted soil at the Site may be exposed to petroleum VOCs / SVOCs, CVOCs, and heavy metals through several routes. Workers excavating impacted soil may be exposed to VOCs, SVOCs, and heavy metals through inhalation, ingestion and dermal contact. A site specific Health and Safety Plan has been developed to identify and minimize the potential hazards to on-site workers. Site trespassers could also be exposed to impacted soil during excavation, however, security measures including an 8 ft high construction fence and 24 hr security will minimize potential exposure through this route. Potential vapor intrusion is a concern for future building occupants of proposed building, but remediation of the source area and installation of the cellar below/at the groundwater interface is expected to greatly reduce if not eliminate this potential.

Potential Off-Site Exposures: Off-Site residents could also be exposed to dust or vapors during the excavation of impacted soil. A site-specific Community Air Monitoring Plan has been developed to identify and minimize the potential for off-site exposure to residents through continuous air monitoring during excavation activity.

The entire area is serviced by the New York City Water System which distributes water from the Croton Reservoir system. Since there are no public or private potable supply wells in the area,

exposure from contact with tap water is not a concern. Off-site exposure is therefore limited to vapor intrusion from CVOCs. Since the highest concentrations in soil vapor were reported in close proximity to the impacted soil area, there appears to be a potential for off-Site exposure through soil vapor intrusion. This potential will be further reduced following the removal of the source area under the planned redevelopment of the Site.

Potential Off-Site Environmental Impacts: Since petroleum VOCs and chlorinated VOCs in groundwater may be migrating beneath the Site at low concentrations in a north-northwesterly direction, the groundwater to surface water discharge pathway was evaluated. The nearest surface water to the Site is Bushwick Inlet located approximately 2,800 feet to the northwest. Based upon the concentrations of contaminants currently in groundwater beneath the Site, there are no expected impacts to surface water environments from contaminants migrating from the Site.

6.0 CONCLUSIONS AND RECOMENDATIONS

Subsurface soil at the Site consists of a non-native fill material to a depth of approximately 13 feet below grade. PAHs and metals such as Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Nickel and Zinc were detected above Unrestricted Use, Restricted Residential Use, and/or Commercial SCOs within the soil samples collected from the historic fill material. A native grey (wet) silty clay is present below the fill material to a depth of at least 20 feet below grade. Some borings also noted the presence of organic plant matter and/or shells at depths of approximately 15 to 20 feet below grade. Groundwater at the Site is present at a depth of approximately 12 to 13 feet below sidewalk grade and regional groundwater flow is to the northwest. Groundwater flow at the Site was determined to be towards the north-northwest.

A 5 to 6 foot thick smear zone of petroleum impacted soil was detected at the groundwater interface. Petroleum related VOCs were also detected above GQS in six of the eight groundwater samples collected at the Site. The concentrations of petroleum related VOCs in groundwater were fairly low, and evenly distributed across the Site. An absence of petroleum contaminated soil above the groundwater interface indicates the petroleum contamination in soil/ground water is associated with NYSDEC Spill No. 1205075, assigned to the adjacent property to the rear/west. Ten 1,000-gallon underground storage tanks were recently removed near the property line that separates the Site from the adjacent property to the west. Test pits excavated on the adjacent property and monitoring wells installed on the property noted free product on the groundwater surface.

The CVOC Trichloroethene was detected above Unrestricted Use SCOs within shallow soil samples (0 to 2 feet and 2 to 4 feet below grade) collected from the rear of the Site during RI, and within one of the soil samples retained from the groundwater interface during the February 2015 Subsurface Investigation. Therefore, the Trichloroethene detected with soil samples collected from the rear of the Site is likely the source of the low level CVOC (Trichloroethene, Chloroethane, cis-1,2-Dichloroethene) contamination detected in groundwater samples collected at the Site. Trichloroethene present in on-Site soil in the rear of the Site is volatilizing to soil vapor contributing to the elevated levels of Trichloroethene detected within soil vapor samples SG1 (1,650 $\mu\text{g}/\text{m}^3$) and SG6 (245 $\mu\text{g}/\text{m}^3$) which were also collected from the rear of the Site. These Trichloroethylene (TCE) concentrations are above NYSDOH mitigation values.

Arsenic and mercury were detected above Commercial Use SCOs, and lead and zinc were detected above Unrestricted Use SCOs within soil samples retained from the native soil layer at a depth of approximately 18 to 20 feet below grade. The elevated metals concentrations are not believed to be associated with a spill/release. The elevated concentrations are likely present in the sediment of the former Bushwick Inlet (formerly known as Bushwick Creek) which was historically present in the area of the Site.

The qualitative exposure assessment identified potential completed routes of exposure to construction workers and remediation workers through inhalation, ingestion and dermal contact of petroleum compounds and heavy metals during excavation activities. The Health and Safety Plan prepared for the site identifies such exposures and provides instructions for on-site workers to minimize potential exposure. Occupants in the proposed on-Site commercial buildings may be exposed to CVOCs through the vapor intrusion pathway, if remedial action is not taken to remove the source.

The exposure assessment indicated a limited potential exposure to residents and commercial workers in adjacent buildings which would be reduced further following the removal of the identified source areas.

Potential environmental impacts through the groundwater to surface water discharge were considered unlikely based on the concentrations of VOCs in groundwater.

Recommendations include removal of the UST(s), excavation and disposal of all petroleum and chlorinated VOC contaminated soil, and proper handling and disposal of all soils excavated for structural elements of the new building. This work would be performed under an approved Remedial Action Work Plan which includes a Soil Management Plan, a Construction Health and Safety Plan and a Community Air Monitoring Plan.

Potential soil vapor impact should be re-evaluated following the completion of remedial activities to determine if conditions improve to the point where active mitigation is unnecessary. Further evaluation of vapor intrusion can also be performed following implementation of the RAWP to determine if the design elements of a subslab depressurization system should then be incorporated into the Remedial Action Work Plan for the Site as a contingency, should the potential for vapor intrusion remain following the removal of the impacted soils.

SDG Comments

January 22, 2016

SDG I.D.: GBK43846

Version 1: Analysis results minus QC and forms.

Version 2: Complete report with QC and forms.

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

 QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

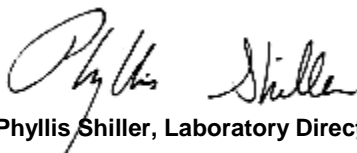

Volatile Comment:

Elevated reporting limits due to the foamy nature of the sample.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

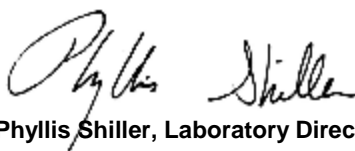

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

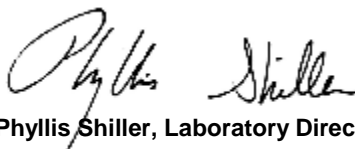

Pesticide Comment:

Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, an elevated RL was reported.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

Semi-Volatile Comment:

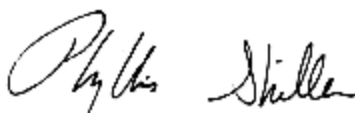

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

Volatile Comment:

Due to the presence of a large amount of non-target petroleum material, this sample required a dilution. Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

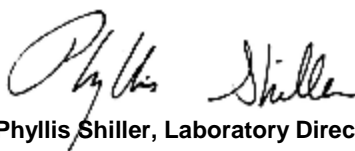

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
 B = Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

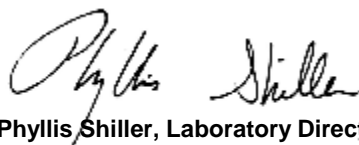

Volatile Comment:

Due to the presence of a large amount of non-target petroleum material, this sample required a dilution. Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

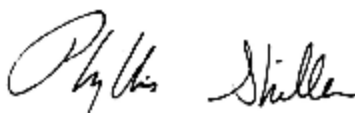

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
 3 = This parameter exceeds laboratory specified limits.
 B = Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
 QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:

Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

Volatile Comment:

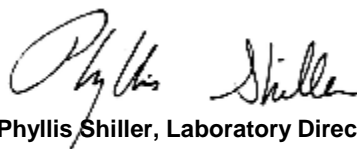

Due to the presence of a large amount of non-target petroleum material, this sample required a dilution. Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

One or more surrogate recoveries were outside control limits for volatiles due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

 QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

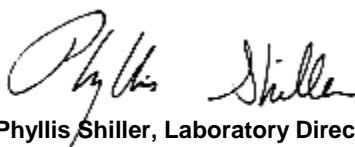

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:

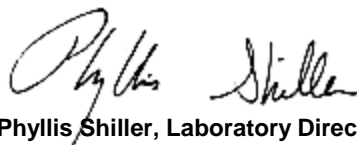

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
 B = Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

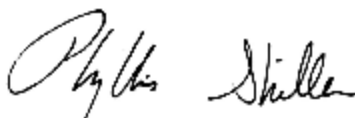

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

B = Present in blank, no bias suspected.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:

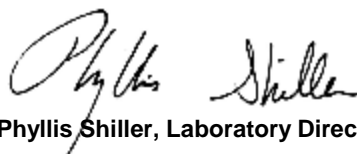

Sample exhibited matrix interference in the volatile analysis. Both Low-level vials were analyzed with one or more poor internal standard responses. The high level analysis did not exhibit this interference. Had any compounds been detected in the high level analysis, they would have been reported at that dilution. The low level analysis was reported, in order to meet the requested reporting criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
 3 = This parameter exceeds laboratory specified limits.
 B = Present in blank, no bias suspected.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Semi-Volatile Comment:

Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

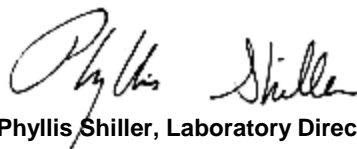

Volatile Comment:

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

B* = Present in blank, a bias is possible.

B = Present in blank, no bias suspected.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight., TRIP BLANK INCLUDED.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

SDG Comments

January 20, 2016

SDG I.D.: GBK41633

Version 1: Analysis results minus QC and forms.

Version 2: Complete report with QC and forms.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Due to the concentration of target and non-target compounds not all of the requested criteria could be achieved.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

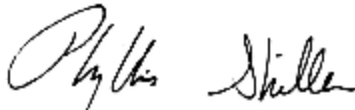

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:

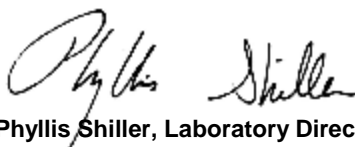

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

**Surrogate recoveries were outside control limits for volatiles due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

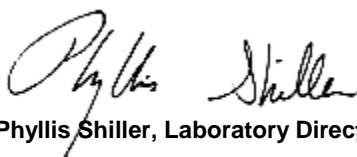

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Pesticide Comment:
 An elevated RL was reported due to low % solids.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

 QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

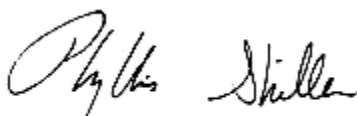

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

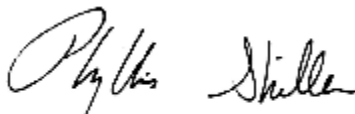

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

 QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

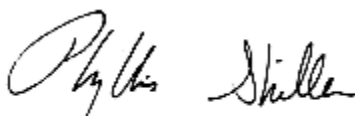

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

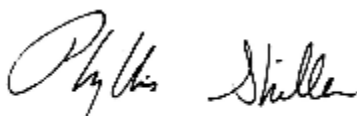

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Semi-Volatile Comment:

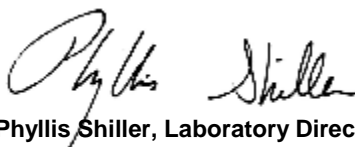

Poor surrogate recovery was observed for one acid and/or one base surrogate. The other surrogates associated with this sample were within QA/QC criteria. No significant bias suspected.

Pesticide Comment:

Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, an elevated RL was reported.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

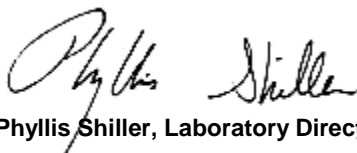

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

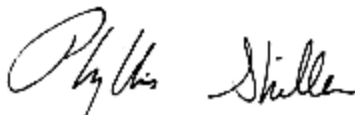

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

**Surrogate recoveries were outside control limits for volatiles due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

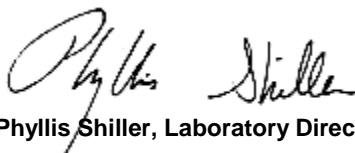

Volatile Comment:

Poor IS recoveries were observed for low level volatiles due to dirt in the threads of the vial preventing the sample from purging. The other low level did not pass quality control. The results are reported from the methanol high level.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.
 3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit
 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

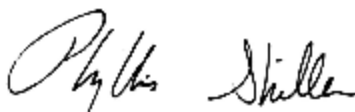

Volatile comment:

**Surrogate recoveries were outside control limits for volatiles due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

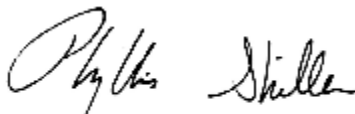

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

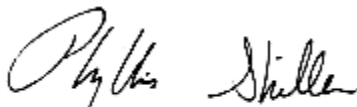

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile comment:

One of the surrogate recoveries is above the upper range due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

 QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

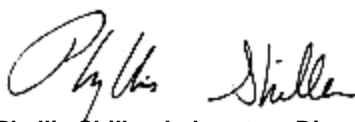

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:
 Elevated reporting limits for volatiles due to the presence of non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

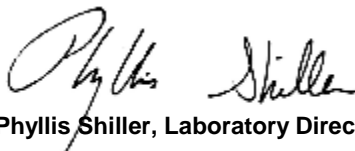

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of non-target compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

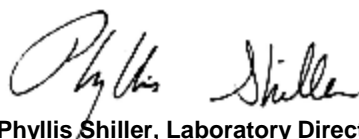

Volatile Comment:

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:

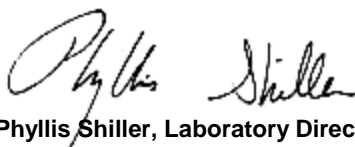

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

**Surrogate recoveries were outside control limits for volatiles due to matrix interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

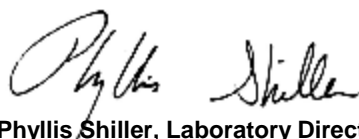

Volatile Comment:

There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

SDG I.D.: GBK43852

Version 1: Analysis results minus QC and forms.

Version 2: Complete report with QC and forms.

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B = Present in blank, no bias suspected.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:

Elevated reporting limits due to the foamy nature of the sample.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

Pesticide Comment:

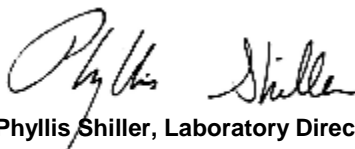

Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, an elevated RL was reported.

Volatile Comment:

Due to the presence of a large amount of non-target petroleum material, this sample required a dilution. Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

3 = This parameter exceeds laboratory specified limits.

B* = Present in blank, a bias is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

8260 Volatile Organics:

1,2-Dibromoethane, 1,2,3 Trichloropropane, and 1,2-Dibromo-3-chloropropane do not meet NY TOGS GA criteria, these compounds are analyzed by GC/FID method 504 or 8011 to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

SIM Analysis:

The lowest possible reporting limit under SIM conditions is 0.02 ug/L. The NY TOGS GA criteria for some PAHs is 0.002 ug/L. This level can not be achieved.

Toxaphene is reported to the lowest possible reporting level. The NY TOGS criteria for this compound can not be achieved.

Semi-Volatile Comment:

One of the surrogate recoveries was above the upper range due to sample matrix interference. The other surrogates associated with this sample were within QA/QC criteria. No significant bias is suspected.

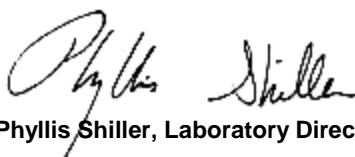

Volatile Comment:

Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

S - Laboratory solvent, contamination is possible.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level LOD=Limit of Detection MDL=Method Detection Limit

QA/QC Surrogates: Surrogates are compounds (preceded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

An elevated reporting level was reported for TO15 due to a matrix interference of non target compounds., Air Analysis:
*Surrogate criteria exceeded method criteria due to a matrix interference.

S - Laboratory solvent, contamination is possible.

SDG #: GBK43852
Client: Environmental Business Consultants
Date: 02/22/2016
Laboratory: Phoenix Environmental Laboratories, Inc.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for three (3) water samples for Semi-volatiles by SW-846 Method 8270D [full scan and Selected Ion Monitoring (SIM)] in accordance with the NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 12/23/2015. The samples were submitted to Phoenix Environmental Laboratories, Inc., Manchester, CT on 12/23/2015 for analysis.
3. The USEPA Region-II SOP HW-35, Revision 2, March 2013, Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry, SW-846 Method 8270D was used in evaluating the Semi-volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).

SDG #: GBK43846
Client: Environmental Business Consultants
Date: 02/21/2016
Laboratory: Phoenix Environmental Laboratories, Inc.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for six (6) water samples for Semi-volatiles by SW-846 Method 8270D [full scan and Selected Ion Monitoring (SIM)] in accordance with the NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 12/22/2015. The samples were submitted to Phoenix Environmental Laboratories, Inc., Manchester, CT on 12/23/2015 for analysis.
3. The USEPA Region-II SOP HW-35, Revision 2, March 2013, Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry, SW-846 Method 8270D was used in evaluating the Semi-volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).

DATA USABILITY SUMMARY REPORT (DUSR)
VOLATILE ORGANIC COMPOUNDS
USEPA Region II –Data Validation

Project Name: 65 Eckford Street
Location: Brooklyn, New York
Project Number: 3020-022
SDG #: GBK43839
Client: Environmental Business Consultants
Date: 02/19/2016
Laboratory: Phoenix Environmental Laboratories, Inc.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for seven (7) air samples analyzed for Volatiles by TO-15 in accordance to NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 12/22/2015. The samples were submitted to Phoenix Environmental Laboratories, Inc., Manchester, CT on 12/23/2015 for analysis.
3. The USEPA Region-II SOP # HW-31, Revision 4, October 2006, Validating Air Samples Volatile Organic Analysis Of Ambient Air in Canister By Method TO-15 was used in evaluating the Volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).

Result (ppbv) = 5.42

Molecular Weight @ 25°C=92.14

DF = 1

$$\text{Concentration } (\mu\text{g}/\text{m}^3) = \frac{5.42 \times 92.14 \times 1}{24.46} = 20.4\mu\text{g}/\text{m}^3$$

DATA USABILITY SUMMARY REPORT (DUSR)
SEMI-VOLATILE ORGANIC COMPOUNDS
USEPA Region II –Data Validation

Project Name: 65 Eckford Street
Location: Brooklyn, New York
Project Number: 3020-022
SDG #: GBK41655
Client: Environmental Business Consultants
Date: 2/16/2016
Laboratory: Phoenix Environmental Laboratories, Inc.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for nine (9) soil samples analyzed for Semi-volatiles by SW-846 Method 8270D in accordance with the NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 12/16/2015. The samples were submitted to Phoenix Environmental Laboratories, Inc., Manchester, CT on 12/18/2015 for analysis.
3. The USEPA Region-II SOP HW-35, Revision 2, March 2013, Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry, SW-846 Method 8270D was used in evaluating the Semi-volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).

DATA USABILITY SUMMARY REPORT (DUSR)
SEMI-VOLATILE ORGANIC COMPOUNDS
USEPA Region II –Data Validation

Project Name: 65 Eckford Street
Location: Brooklyn, New York
Project Number: 3020-022
SDG #: GBK41633
Client: Environmental Business Consultants
Date: 2/11/2016
Laboratory: Phoenix Environmental Laboratories, Inc.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for twenty-two (22) soil samples analyzed for Semi-volatiles by SW-846 Method 8270D in accordance with the NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 12/17/2015. The samples were submitted to Phoenix Environmental Laboratories, Inc., Manchester, CT on 12/18/2015 for analysis.
3. The USEPA Region-II SOP HW-35, Revision 2, March 2013, Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry, SW-846 Method 8270D was used in evaluating the Semi-volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).
