TCE	trichloroethylene
TOGS	Technical and Operational Guidance Series
trans-1,2-DCE	trans-1,2-dichloroethylene
UST	underground storage tank
µg/L	microgram per liter
$\mu g/m^3$	microgram per cubic meter
UUSCO	Unrestricted Use Soil Cleanup Objective
VOC	volatile organic compound

1.0 INTRODUCTION

This Interim Remedial Measure (IRM) Work Plan (IRMWP) has been prepared by AKRF, Inc. (AKRF) on behalf of Atlantic Chestnut Affordable Housing LLC (the "Volunteer") for the Atlantic Chestnut – Lot 3 site, located at 275 Chestnut Street in Brooklyn, New York, hereafter referred to as the "Site". The Site is identified on the New York City Tax Map as Brooklyn Tax Block 4143, Lot 3. Historically, Lot 1 encompassed the entirety of Block 4143, but was apportioned into three lots (Lots 1, 2, and 3) in 2016. A Site Location Map is provided as Figure 1.

Atlantic Chestnut Affordable Housing LLC entered into a Brownfield Cleanup Agreement (BCA) Index No. C224236-05-16 on May 26, 2016 with the New York State Department of Environmental Conservation (NYSDEC) as a Volunteer. A BCA amendment was submitted to the NYSDEC in August 2017 to document: (1) the change of address from 3301 Atlantic Avenue to 275 Chestnut Street, and (2) an acreage increase for the Site from 1.0475 acres to 1.2020 acres to support the redevelopment. The BCA amendment was executed on August 24, 2017. The current and former Brownfield Cleanup Program (BCP) Site boundaries are shown on Figure 2.

A Remedial Investigation (RI) was completed at the Site from December 2 to 14, 2016, and from November 6 to December 12, 2017 and an RI Report (RIR) was submitted to NYSDEC in December 2017. Based on an evaluation of the data and information from the RI, there is contaminated soil, groundwater, and soil vapor present at the Site, including: solvent-related volatile organic compounds (VOCs) and metals in soil; solvent-related VOCs in groundwater; and petroleum-, solvent-related, and refrigerant VOCs in soil vapor. Previous on-site investigations, summarized in Section 3.0, are sufficient to delineate the nature and extent of contamination at the Site.

To address the significant threat determination from NYSDEC for soil vapor, an IRM soil vapor extraction (SVE) system is currently operating at the Site to prevent off-site migration of contaminated vapors. The SVE system IRM is being employed until implementation of remedial actions under a forthcoming Remedial Action Work Plan (RAWP), currently anticipated to be submitted to NYSDEC for review in spring 2023.

This IRMWP has been prepared to enable remedial excavation of source material along the northern portion of the Site, called the Pedestrian Plaza (as shown on Figure 2), in conjunction with the ongoing remedial excavation at the north-adjacent property (Atlantic Chestnut – Lot 2 NYSDEC BCP Number: C224235) until the full remedy, including remedy of groundwater and soil vapor, if needed, can be implemented under the forthcoming RAWP. Once the remedial excavation contemplated in this IRMWP is complete, the excavation would be backfilled with several (10+) feet of clean material, without any hardscaping or concrete cap; therefore, there would be no obstructions if future well installation and piping was required in the forthcoming RAWP. Both sites are being remediated by the same Volunteer.

The Health and Safety Plan (HASP) and Community Air Monitoring Plan (CAMP), provided as Appendices A and B, respectively, will be implemented during activities outlined in this IRMWP. The quality assurance/quality control (QA/QC) protocol detailed in the Quality Assurance Project Plan (QAPP), provided as Appendix C, will be strictly adhered to for the field work and sampling described in the following sections.

2.0 SITE DESCRIPTION AND HISTORY

2.1 Site Description and Surrounding Land Use

The Site is composed of a concrete- and asphalt-paved vacant lot with a former loading dock on the central portion of the Site. The Site formerly consisted of a series of vacant, interconnected, fire-damaged factory buildings that were demolished by December 2016. A Site Plan is provided as Figure 2.

The surrounding area is developed primarily with residential, commercial, manufacturing, transportation, and industrial uses. The elevated J- and Z- Metropolitan Transit Authority subway tracks run along Fulton Street to the north and the Long Island Railroad tracks are located beneath Atlantic Avenue to the south.

2.2 Site Geology, Hydrogeology, and Subsurface Characteristics

The stratigraphy of the Site, from the surface down, generally consisted of fill comprising sand, silt, and gravel with varying amounts of concrete, brick, coal ash, clay, and asphalt up to 16 feet below grade, underlain by apparent native sand, gravel, clay, and silt to boring termination depths (up to 80 feet below grade). Bedrock was not encountered during previous investigations.

The Site lies at an elevation of approximately 37 to 41 feet above national geodetic vertical datum (NGVD), an approximate of mean sea level. Groundwater was encountered during previous investigations at depths ranging from approximately 7.5 to 8.7 feet above NGVD (approximately 32 feet below grade). Based on the well elevation surveys, shallow, intermediate, and deep groundwater aquifers flow in a generally southerly direction beneath the Site and surrounding area. Groundwater in this part of Brooklyn is not used as a potable source and there are no surface water bodies on or immediately adjacent to the Site.

2.3 Site History and Previous Owners

Historic records indicate that the Site was developed with residences and a road in 1887 and with industrial and manufacturing uses, including the Columbia Machine Works and Malleable Iron Company, the Columbia Cable and Electric Corporation, Blue Ridge Farms, Inc., and Chloe Foods Corp. between 1908 and 2012. Blue Ridge Farms, Inc. and Chloe Foods Corp. are listed on multiple federal and state databases, as discussed in Section 3.0. The Site was shown with a 10,000-gallon fuel oil tank in 1951 and 1980 and as a gasoline filling station between 1982 and 1988. Prior uses that appear to have led to Site contamination include blacksmithing and stamping, a brass foundry, woodworking, railroad operations, a machine shop, tank and engine rooms, an iron works, wire braiding, a gasoline filling station, and cable manufacturing. The Site has remained vacant since a July 2012 fire caused severe structural damage to the former Site buildings. Demolition of the Site buildings was completed between July and December 2016.

Past owners of Block 4143, Lot 1 include: Columbia Electric Realty, Inc. in 1980; Avnal, Inc. from 1980 to 1984; Blue Ridge Farms, Inc. from 1984 to 2004; 3301 Atlantic Avenue, LLC from 2004 to 2013; Sapphire Luxury Estates, LLC from 2013 to 2014; Atlantic Chestnut, LLC from 2014 to 2015; and Atlantic Chestnut Affordable Housing, LLC from 2015 to present. It is noted that Block 4143 formerly comprised Lot 1 but was subsequently divided into three lots (Lots 1, 2, and 3).

2.4 Proposed Development

The proposed development is still being finalized but will include affordable residential units. The ground floor may contain residential amenities and a lobby, and/or community facility space. As part of the development, the Pedestrian Plaza will connect Dinsmore Place to Euclid Avenue across the northern portion of the Site. The project will satisfy one of the objectives of the Cypress Hills Brownfield Opportunity Area.

3.0 PREVIOUS ENVIRONMENTAL REPORTS

Subsurface (Phase II) Investigation Report – Blue Ridge Farms, 3301 Atlantic Avenue, 84 Dinsmore Place, and 111 Dinsmore Place, Brooklyn, NY, AKRF, May 2001

AKRF conducted a Subsurface (Phase II) Investigation of a larger area including the Site in May 2001. At the time of this investigation, the Site was developed with food processing and storage buildings. The Subsurface (Phase II) Investigation included the performance of a geophysical survey across exterior portions of the Site and the advancement of four soil borings with the collection and analysis of soil and groundwater samples. The scope of the investigation was based on a December 2000 Phase I Environmental Site Assessment (ESA) of the Site by IVI Environmental, Inc.

Due to reinforced concrete across the Site, the geophysical survey was inconclusive. Soil consisted of fill material (brick, concrete, asphalt, clay, silt, sand, and gravel) up to 6 feet below grade, underlain by native soil (sand, gravel, silt, and clay) to depths of at least 16 feet below grade (terminal boring depth). Groundwater was encountered at approximately 32 feet below grade.

Petroleum-related VOCs and the semivolatile organic compound (SVOC) naphthalene were detected in the soil samples collected above NYSDEC Recommended Soil Cleanup Objectives listed in the NYSDEC Technical and Administrative Guidance Memorandum, the applicable soil cleanup objectives at the time of the investigation. Solvent and petroleum-related VOCs and metals were detected in the groundwater sample above Ambient the Guidance Values listed in the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) Memo. VOCs were detected above TOGS standards in pre- and post-process water samples. Based on elevated photoionization detector (PID) detections and laboratory analytical data from the soil borings surrounding the on-site tank system, Spill No. 0101620 was assigned to the historic address 3301 Atlantic Avenue.

AKRF recommended preparation of a work plan to be submitted to the NYSDEC to further delineate, excavate, and dispose of petroleum-contaminated soil at the Site to close Spill No. 0101620.

Phase I ESA Report – 3301 Atlantic Avenue, 3238 Fulton Street, 226-296 Euclid Avenue, and 215-279 Chestnut Street, Brooklyn, NY, Property Solutions, Inc., June 2010

Property Solutions, Inc. (PSI) conducted a Phase I ESA of a larger area including the Site in April 2014. The Phase I ESA identified historical uses including: a machine and iron works facility, an electrical cable manufacturer, and a food processing plant; records indicating that five underground storage tanks (USTs) were previously located at 3301 Atlantic Avenue, a historic address encompassing current BCP Site Nos. C224234, C224235, and C224236; and Historic Recognized Environmental Conditions including listing in the Leaking UST and Spills databases. PSI recommended conducting a subsurface investigation, including a geophysical survey, to investigate the potential impacts associated with historic operations and fuel oil storage.

Asbestos Investigation and Bulk Sample/Laboratory Analysis – 3301 Atlantic Avenue, Brooklyn, NY, Safety Environmental, Co. of NY, Inc., July 2013

Safety Environmental, Co. of NY, Inc. (Safety) conducted an asbestos survey of the buildings located on the northern portion of the Site and north-adjacent to the Site in July 2013. A total of 131 samples were collected for laboratory analysis from on- and off-site portions of the buildings. Asbestos-containing material (ACM) was identified within the building at the following locations: boiler No. 4 door insulation, boiler No. 3 caulking, first floor pipe insulation, roof transite shingles, roof membranes, roof flashing, and roof vent membranes. Based on AKRF's inspections of BCP Site Nos. C224234, C224235, and C224236 prior to building demolition, it is noted that the boilers were formerly located on the northwestern portion of BCP Site No. C224234. It is unknown how many ACM samples were collected at the Site vs. the adjacent BCP sites. Safety recommended removal of all ACM prior to demolition of the buildings.

Phase I ESA Report – 3301 Atlantic Avenue (Block 4143, Lot 1), Brooklyn, NY, Legette, Brashears, & Graham, Inc., March 2014

Legette, Brashears, & Graham, Inc. (LBG) conducted a Phase I ESA of the Site and the north-adjoining area in April 2014. The Phase I ESA identified RECs associated with former uses, including: blacksmithing and stamping, a machine and iron works shop, an electric cable manufacturer, a gasoline filling station, and listings in the Spills database. The report noted the following de Minimis conditions: nearby hazardous materials/waste storage, use, or releases; and the potential presence of ACM, lead-based paint (LBP), and fluorescent lighting. LBG recommended that any contaminated soil discovered during redevelopment of the Site should be handled according to applicable federal, state, and local regulations.

Chain of Title Summary Report – 3301 Atlantic Avenue and 242 Chestnut Street, Brooklyn, NY, Phipps Houses, 2015

A Chain of Title Summary Report was compiled by Phipps Houses that outlined ownership of the Site and north-adjoining (BCP Site Nos. C224234 and C224235) and nearby properties between 2004 and 2015. The report showed the transfer of ownership from Blue Ridge Farms, Inc. to 3301 Atlantic Avenue, LLC in May 2004; from 3301 Atlantic Avenue, LLC to Sapphire Luxury Estates, LLC in July 2013; a foreclosure and sale judgment for the Site and north-adjacent properties to be sold at public auction in September 2013; and an agreement for assignment of rights and claims from Blue Ridge Farms, Inc. to 3301 Atlantic Partners, LLC in March 2014.

Phase I ESA Report – 3301 Atlantic Avenue and 242 Chestnut Street, Brooklyn, NY, AKRF, September 2015

AKRF conducted a Phase I ESA of a larger area including the Site in September 2015. The Phase I ESA identified the following:

- Historic on-site industrial operations, including the Columbia Machine Works and Malleable Iron Company, and the Columbia Cable and Electric Corporation. Undocumented releases from historic industrial uses may have affected subsurface conditions at the Site.
- The address 3301 Atlantic Avenue was formerly associated with the entirety of Block 4143. At the time of the Phase I ESA, 3301 Atlantic Avenue was listed in the following databases: NYSDEC Petroleum Bulk Storage database for the storage of several USTs and aboveground storage tanks; Comprehensive Environmental Response, Compensation, and Liability Information System; Chemical Bulk Storage; Spill database; Toxic Release Inventory System; and Air Discharge databases. These listings may have been related to the Site and/or north-adjacent property(ies).
- The former interconnected factory buildings on the northeastern portion of the Site and the north-adjacent properties (BCP Sites No. C22434 and C224235) were damaged by a fire in 2012. Abundant debris, including metal, wood, and ash were observed throughout the buildings during the Site inspection. Based on the documented storage of petroleum and chemicals, the report noted that undocumented discharges due to the fire may have affected subsurface conditions at the Site, including high concentrations of metals and SVOCs in the ash.
- Two July 2013 Asbestos Reports identified ACM throughout the buildings' interiors and on exterior built-up roofing materials. Interior and exterior building materials were observed to be in fair to poor condition, with the majority of the northeastern portion of the Site buildings damaged by fire. Observed painted surfaces were generally in fair to poor condition. Based on the age of the Site buildings, the report noted that LBP may have been present and the fluorescent lighting fixtures and remaining electrical equipment may have contained mercury and/or polychlorinated biphenyls (PCBs). No evidence of leaks or stains from these fixtures and equipment was observed; however, it was noted that releases may have occurred during the fire that were not able to be investigated due to inaccessibility and/or debris throughout the Site buildings.

AKRF recommended a Subsurface (Phase II) Investigation to characterize subsurface conditions of soil, groundwater, and soil vapor throughout the Site and BCP Site Nos. 224234 and 224235 prior to redevelopment.

Subsurface (Phase II) Investigation Report – 3301 Atlantic Avenue, Brooklyn, NY, AKRF, January 2016

AKRF conducted a Subsurface (Phase II) Investigation at the Site in December 2015. The investigation included: the advancement of three soil borings with the collection and laboratory analysis of six soil samples; the installation of two temporary, one-inch diameter groundwater monitoring wells at two of the boring locations with the collection and laboratory analysis of two groundwater samples; and the installation of two temporary soil vapor points with the collection and laboratory analysis of two soil vapor samples. An ambient air sample was collected from the northern portion of Block 4143 for comparison and QA/QC purposes.

Historic fill materials (including sand, gravel, silt, clay, ash, concrete, brick, and asphalt) were observed from just below the surface to approximately three feet below grade within the soil borings, underlain by apparent native sand, clay, and gravel to termination depths. PID readings were not detected in the soil borings advanced during the investigation.

No free phase product was detected in either of the monitoring wells during the sampling event. A slight sheen was observed on the groundwater in monitoring well L3-SI-MW-1 during sampling. Results of the soil sample analysis were as follows:

- The VOC cis-1,2-dichlroroethylene (cis-1,2-DCE) was detected in soil sample L3-SI-SB-4 (14-15) at a concentration above its Unrestricted Use Soil Cleanup Objective (UUSCO), but below its Restricted Residential Soil Cleanup Objective (RRSCO). Trichloroethylene (TCE) was detected in soil samples L3-SI-SB-1 (0-2) and L3-SI-SB-4 (14-15) at concentrations exceeding its UUSCO and RRSCO. TCE is a chlorinated solvent, which was likely used during historic operations at the Site and cis-1,2-DCE is a breakdown compound of TCE.
- Zinc was detected in soil sample L3-SI-SB-4 (0-2) at a concentration exceeding its UUSCO, but below its RRSCO. This metal detection is likely related to historic filling and/or historic operations at the Site.
- PCBs were not detected above laboratory reporting limits, and SVOCs and pesticides were not detected above applicable standards in any of the soil samples analyzed.

Results of the groundwater sample analyses were as follows:

- The VOCs trans-1,2-dichloroethylene (trans-1,2-DCE) and vinyl chloride were detected in groundwater sample L3-SI-GW-1 at concentrations above their respective TOGS standard. TCE was detected in both groundwater samples (L3-SI-GW-1 and L3-SI-GW-4) at concentrations above its NYSDEC Ambient Water Quality Standards. The detection of TCE is likely related to historic operations at the Site and the presence of trans-1,2-DCE is a breakdown compound.
- The SVOCs benzo(a)anthracene and chrysene were detected in groundwater sample L3-SI-GW-1 at estimated concentrations above their respective TOGS standards. However, these detections were likely related to sediment entrained in the sample and not necessarily indicative of groundwater conditions at the Site.
- Nickel was detected in unfiltered groundwater sample L3-SI-GW-4 at a concentration exceeding its TOGS standard. Sodium was detected in both of the unfiltered groundwater samples L3-SI-GW-1 and L3-SI-GW-4 at concentrations above its TOGS standard. Sodium was also detected in the filtered groundwater samples L3-SI-GW-1 and L3-SI-GW-4 in concentrations above its TOGS standard.
- PCBs and pesticides were not detected above laboratory reporting limits in any of the groundwater samples analyzed.

Results of the soil vapor sample analyses were as follows:

- Petroleum-related compounds were detected in each of the soil vapor samples at individual concentrations up to 422 micrograms per cubic meter ($\mu g/m^3$). Solvent-related compounds were detected at individual concentrations up to 9,190 $\mu g/m^3$. According to the New York State Department of Health (NYSDOH) Soil Vapor/Indoor Air Matrix 1, the applicable matrix for TCE, sub-slab soil vapor concentrations of 250 $\mu g/m^3$ and above resulted in a "mitigate action", even if the indoor air concentration is less than 0.25 $\mu g/m^3$. Tetrachloroethylene (PCE) and TCE are chlorinated solvents, which were likely used during historic operations at the Site.

The Subsurface (Phase II) Investigation Report concluded that there was solvent-related contamination in soil, groundwater, and soil vapor and petroleum-related contamination in soil vapor present at the Site. These detections appeared to be related to historic use at the Site.

BCA Amendment Application – 275 Chestnut Street, Brooklyn, NY, AKRF, Inc., July 2017

AKRF prepared a BCA Amendment Application for the Site in July 2017 to document the change of address from 3301 Atlantic Avenue to 275 Chestnut Street, as filed with the New York City Department of Buildings; and to document the alteration of the northern property boundary, resulting in an acreage increase from 1.0475 acres to 1.2020 acres. The BCA Amendment was filed on October 23, 2017.

Remedial Investigation Report – 275 Chestnut Street, Brooklyn, NY, AKRF, December 2017

AKRF conducted an RI at the Site from December 2 to 14, 2016, and from November 6 to December 12, 2017. The scope of the RI was based on a November 2016 Remedial Investigation Work Plan (RIWP) and a November 2017 Supplemental RIWP, and included: the performance of a geophysical survey and utility mark-outs; the advancement of 36 soil borings across the Site and collection of 130 soil samples for chemical analysis from the soil borings to evaluate soil quality; the installation of 11 permanent 2-inch diameter groundwater monitoring wells and 7 permanent 2-inch diameter nested groundwater monitoring wells and collection of 32 groundwater samples for chemical analysis from the monitoring wells to evaluate groundwater quality; the installation of 7 temporary soil vapor probes across the Site and collection of 7 soil vapor samples and 1 ambient air sample for chemical analysis; and the survey of groundwater monitoring well elevations on the Site and north-adjacent lots [Atlantic Chestnut – Lot 1 (BCP Site No. C224234 and Atlantic Chestnut – Lot 2 (BCP Site No. C224235)] to develop groundwater contour maps and determine groundwater flow beneath the Site and surrounding area.

The RI was conducted in two phases: in December 2016 and between November and December 2017. The goal of the first phase of the RI was to determine the extent of soil, groundwater, and soil vapor contamination identified during AKRF's December 2016 Subsurface (Phase II) Investigation. The second phase of the RI was conducted to further horizontally and vertically delineate soil and groundwater contamination identified during the first phase of the RI, to investigate the presence of the emerging contaminants 1,4-dioxane (1,4-Dx), perfluorooctanoic acid, and perfluorooctanoic sulfonate in shallow, intermediate, and deep groundwater across the Site, and to aid in the design of the remedy. Based on the RI results, the primary contaminants of concern at the Site include chlorinated VOCs (CVOCs), specifically TCE and its breakdown compounds 1,1-dichloroethylene (1,1-DCE), cis-1,2-DCE, and trans-1,2-DCE in soil; TCE and PCE, and their associated breakdown compounds vinyl chloride, 1,1-DCE, cis-1,2-DCE, and trans-1,2-DCE in groundwater; and TCE and PCE in soil vapor.

The CVOCs detected in soil above UUSCOs, RRSCOs, and/or Protection of Groundwater Soil Cleanup Objectives (PGWSCOs) were mostly found in the northern portion of the Site, with the greatest concentrations of TCE at borings L3-SRI-SB-16 [383 milligrams per kilogram (mg/kg)] and L3-SRI-SB-17 (351 mg/kg) from 4 to 5 feet below grade. TCE was also detected above UUSCOs and PGWSCOs in the southwestern portion of the Site at L3-RI-SB-6 (5.47 mg/kg) from 12 to 13 feet below grade. The TCE contamination on the northern portion of the Site extends vertically down to 7 to 13 feet below grade except at L3-SRI-SB-2, where the contamination extends down to 25 feet below grade, and L3-RI-SB-2 and L3-RI-SB-3 where it extends down to the shallow groundwater table. The greatest concentrations of 1,1-DCE,

cis-1,2-DCE, and trans-1,2-DCE were found at soil borings L3-SRI-SB-15 and L3-SRI-SB-16, also located in the northern portion of the Site. In addition to the CVOCs, several metals, including copper, lead, hexavalent chromium, and zinc are present in soil across the Site at concentrations above UUSCOs. Mercury was detected in one shallow sample on the western portion of the Site above its UUSCO and RRSCO. These exceedances are most likely attributable to historic filling, undocumented discharges due to a fire in 2012, and/or historic operations at the Site.

The vertical and horizontal extent of CVOCs in groundwater is consistent with a Site-specific groundwater flow to the south and southwest, and the concentrations of CVOCs in soil. The greatest concentrations of TCE in the shallow groundwater were found on the north-central portion of the Site; specifically, at L3-RI-MW-2 [1,070 micrograms per Liter (µg/L)] and L3-SRI-MW-10 (408 µg/L), with lesser concentrations on the western and southwestern portion of the Site ranging from 89.7 µg/L (L3-RI-MW-4) to 322 µg/L (L3-SRI-MW-7). TCE concentrations decrease significantly vertically and horizontally moving southeast across the Site. PCE was detected slightly above their respective TOGS standards in the shallow groundwater at L3-RI-MW-1 (6.4 µg/L) and L3-RI-MW-2 (5.2 µg/L) in the northern and western portions of the Site. TCE breakdown compounds, including 1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride were detected above their respective TOGS standards in shallow groundwater samples collected from wells L3-RI-MW-6 and L3-SRI-MW-7, and in the intermediate groundwater sample collected from L3-SRI-MW-6, which are located on the southern portion of the Site close to the in-situ chemical oxidation injection points associated with closed Spill Nos. 8805745 and 0101620. The elevated detections of breakdown compounds are likely breakdown compounds related to the partial treatment of CVOCs from the in-situ chemical oxidation program that was conducted to remediate the petroleum spills.

Elevated concentrations of TCE and PCE were detected in each of the soil vapor samples collected along the eastern, southern, and western Site boundaries. The highest concentrations of TCE and PCE were 7,690 µg/m^3 (L3-RI-SV-5) and 8,070 µg/m^3 (L3-RI-SV-4) collected from the southeastern and southwestern Site boundaries, respectively. Cis-1,2-dichloroethylene was detected at 1,150 µg/m^3 (L3-RI-SV-6) on the southwestern portion of the Site. In addition, the refrigerants trichlorofluoromethane and diclorodifluoromethane were detected in several soil vapor samples across the Site, with the highest concentrations on the northwestern portion of the Site (323 µg/m^3 of diclorodifluoromethane) at the location of the former Chloe Foods cold storage room.

Interim Remedial Measure Work Plan – Atlantic Chestnut – Lot 3, 275 Chestnut Street, Brooklyn, New York, AKRF, Inc., August 2018

AKRF prepared an IRMWP in August 2018. The IRMWP was prepared to address the potential for off-site migration of soil vapor until the selected remedy is implemented under a NYSDEC-approved RAWP. The IRMWP was approved by NYSDEC in August 2018.

Construction Completion Report – Atlantic Chestnut – Lots 1, 2, and 3, 250 Euclid Avenue, 254 Euclid Avenue, and 275 Chestnut Street, AKRF, August 2022

AKRF installed and operated an aboveground soil vapor extraction system at the Site and two south-adjoining sites (Atlantic Chestnut – Lot 2; BCP Site C224235 and Atlantic Chestnut – Lot 3; C224236) to prevent the off-site migration of contaminated soil vapor until it could be addressed under NYSDEC approved RAWPs. The report detailed pilot testing, design, installation, and operation, maintenance, and monitoring (OM&M) of the systems; and included OM&M Plans as attachments. The associated Construction Completion Report (CCR) was approved in October 2022.

4.0 OCTOBER 2022 SUPPLEMENTAL INVESTIGATION - SOIL SAMPLING

To further refine the conceptual model of Site contamination presented in Section 4.1 and assist with design of the remedial excavation prior to implementation of this IRMWP, AKRF conducted additional soil sampling via soil borings on October 12 and 13, 2022. The work included the advancement of four soil borings with continuous soil sampling to the groundwater table with the laboratory analysis of 32 soil samples. The locations of these soil borings are shown on Figure 3.

4.1 Soil Sampling

Soil samples were collected from surface grade to boring termination depths at approximately 35 feet below surface grade in four soil borings (L3-PP-SB-1, L3-PP-SB-2, L3-RI-SB-2B, and L2-RI-SB-10B). Soil borings L3-PP-SB-1 and L3-PP-SB-2 were advanced to determine the horizontal extent of remedial excavation needed in the Pedestrian Plaza portion of the Site. Soil borings L3-RI-SB-2B and L2-RI-SB-10B were advanced near the locations of former borings L3-RI-SB-2 and L3-RI-SB-10, respectively, to determine the extent of remedial excavation needed in the Pedestrian Plaza.

In-Text Table I summarizes the soil samples collected for laboratory analysis from each soil boring.

Table I

As shown on the boring logs provided in Appendix D, PID readings and faint solvent-like odors were detected in each of the soil borings. Lithology was consistent with that noted in previous investigations (see Section 2.0) and consisted of fill material underlain by native material down to the groundwater interface, which appeared to be encountered at approximately 35 feet below surface grade.

Soil samples slated for laboratory analysis were placed in laboratory-supplied containers in accordance with United States Environmental Protection Agency (EPA) protocols. The soil samples were analyzed by Eurofins of Edison, New Jersey, a NYSDOH Environmental Laboratory Accreditation Program (ELAP)-certified laboratory. Soil samples were analyzed for CVOCs by EPA Method 8260. For QA/QC purposes and in accordance with Category B deliverables sampling, matrix spike/matrix spike duplicates (MS/MSD) blind duplicate samples, field blanks, and two trip blanks were also submitted for laboratory analysis at a frequency of 1 per 20 soil samples. The QA/QC samples were also analyzed for CVOCs by EPA Method 8260.

Third-party data validation was performed by L.A.B. Validation Corp., of Northport, New York, and a data usability summary report (DUSR) was prepared. The DUSR confirmed usability of the data with additional qualifiers.

Soil analytical data is provided on Attached Table 1. The soil boring locations and exceedances of applicable standards are shown on Figure 3. Soil boring logs are provided in Appendix D. The laboratory analytical report and DUSR are provided in Appendix E.

4.2 Air Monitoring

Roving air monitoring for VOCs using a calibrated PID and for airborne particulates using a calibrated dust meter was implemented during all subsurface disturbance activities. No exceedances were detected. The air monitoring logs are provided in Appendix F.

5.0 NATURE AND EXTENT OF CONTAMINATION

5.1 Conceptual Model of Site Contamination

Site contamination, present in shallow and deep soil; shallow, intermediate, and deep groundwater; and soil vapor across the Site, appears to be related to the Site's historic industrial and manufacturing uses. The CVOCs detected in soil above UUSCOs, RRSCOs, and/or PGWSCOs were mostly found in the northern portion of the Site, with the greatest concentrations of TCE in shallow soil from 4 to 5 feet below grade and in deep soil between 12 and 13 feet below grade on the southern portion of the Site. Slightly lesser concentrations of TCE were detected in deeper soil on the northern portion of the Site extending down to the groundwater table. Breakdown solvent compounds, including 1,1-DCE, cis-1,2-DCE, and trans-1,2-DCE, were also detected on the northern portion of the Site. In addition to the CVOCs, metals, including copper, lead, hexavalent chromium, and zinc are present in soil across the Site at concentrations above UUSCOs. Mercury was detected in one shallow sample on the western portion of the Site above its UUSCO and RRSCO. These exceedances are most likely attributable to historic filling, undocumented discharges due to a fire in 2012, and/or historic operations at the Site.

The vertical and horizontal extent of CVOCs in groundwater is consistent with a Site-specific groundwater flow to the south and southwest, and the concentrations of CVOCs in soil. The greatest concentrations of TCE in the shallow groundwater were found on the north-central portion of the Site, with lesser concentrations on the western and southwestern portions of the Site. TCE concentrations decrease significantly vertically and horizontally moving southeast across the Site. TCE breakdown compounds, including 1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride were detected above their respective standards in shallow and intermediate groundwater samples collected from wells on the southern portion of the Site, proximal to the in-situ chemical oxidation injection points associated with closed Spill Nos. 8805745 and 0101620. The elevated detections of breakdown compounds are likely side effects of partially treating some CVOCs, which were unintentionally treated from the in-situ chemical oxidation program conducted to remediate these petroleum spills.

Elevated concentrations of TCE and PCE were detected in each of the soil vapor samples collected along the eastern, southern, and western Site boundaries. The highest concentrations of TCE and PCE were collected from the southeastern and southwestern Site boundaries and breakdown compounds were detected at elevated concentrations on the southwestern portion of the Site. In addition, the refrigerants trichlorofluoromethane and diclorodifluoromethane were detected in several soil vapor samples across the Site, with the highest concentrations on the northwestern portion at the location of the former Chloe Foods cold storage room. Soil vapor sample concentrations are shown on Figure 10 of the RIR.

5.2 Contaminated Media

The subsurface investigations conducted at the Site concluded that contaminated soil, groundwater, and soil vapor are present. Elevated concentrations of solvents in shallow and deep soil were detected on the northern and southern portions of the Site, with concentrations exceeding applicable standards extending to the groundwater table on the northern portion of the Site. The vertical and horizontal extent of CVOCs in groundwater is consistent with a Site-specific groundwater flow to the south and southwest and the concentrations of CVOCs in soil, with the greatest concentrations on the northern portion of the Site and breakdown compounds on the southern and southwestern portions of the Site. Elevated concentrations of solvent-related VOCs were detected in soil vapor across the Site and elevated concentrations of refrigerants were detected on the northwestern portion of the Site.

5.3 Qualitative Human Health Exposure Assessment

A Qualitative Human Health Exposure Assessment (QHHEA) was completed as part of the RIR. The results of the QHHEA indicated that existing soil and groundwater conditions do not pose a threat to human health, as the Site is undeveloped and fully capped with concrete and asphalt, and groundwater is not used as a source of drinking water in this part of Brooklyn. In addition, the QHHEA concluded that there is a potential exposure pathway from soil vapor emanating from the subsurface to enter the adjoining buildings as a result of any basement floor or lower wall openings/cracks. The indoor air quality at the adjoining properties could be susceptible to contamination from subsurface vapor intrusion. In response to the QHHEA, to prevent the off-site migration of soil vapor, an IRM SVE system was installed and operates at the Site. The RM SVE System will not be turned off without NYSDEC and NYSDOH approval.

As part of the north-adjacent site's (Atlantic Chestnut – Lot 2 NYSDEC BCP Number: C224235) support of excavation (SOE) and redevelopment activities, the existing site cap would need to be removed on the northern portion of the Site, which would create a potential exposure pathway (direct contact of soil). This IRMWP is being prepared to address the potential exposure pathway being created.

6.0 INTERIM REMEDIAL MEASURE

The proposed IRM includes removal of contaminated soil (source material) along the northern portion of the Site to facilitate remedial activities on the north-adjacent property (Atlantic Chestnut – Lot 2 NYSDEC BCP Number: C224235). Upon completion of the IRM, either an IRM CCR will be prepared for inclusion in the Final Engineering Report (FER), or the information will be included in the FER. This will depend on the implementation schedule of the forthcoming RAWP and/or direction from NYSDEC.

This section outlines the scope of work and procedures for monitoring, Site controls, and handling and disposal of contaminated materials during the implementation of the IRMWP.

6.1 Site Preparation

Site construction fencing and/or barricades will be installed and all necessary permits pertaining to demolition and excavation activities will be procured prior to starting work. Site mobilization involving utility mark-outs will be performed prior to undertaking any demolition or excavation activities. The Volunteer and its contractors will be solely responsible for the identification of utilities that might be affected by this work and implementation of all required, appropriate, or necessary health and safety measures.

6.2 Interim Remedial Measure Excavation

Based on sampling conducted to date, remedial excavation is anticipated to extend to depths between 15 and 35 feet below grade in the Pedestrian Plaza, as shown on Figure 4. Portions will be sloped within the excavation of the Pedestrian Plaza to reach terminal excavation depths, while SOE will be installed along the western and southern boundaries. The remedial excavation will be performed in conjunction with the ongoing remedial excavation at the north-adjacent property (Atlantic Chestnut – Lot 2 NYSDEC BCP Number: C224235); therefore, the adjacent portions to the north and east will be an extension of the Lot 2 remedial excavation. It is noted that the remedial excavation depths for Lot 2 are equivalent or deeper than the proposed remedial excavation depths within the Pedestrian Plaza, and SOE including piles and lagging will be installed along the western and southern excavation extents of the Pedestrian Plaza. Final excavation depths will be determined by endpoint sample analytical results, detailed in Section 6.3. Endpoint sample depths will be determined in the field based on PID readings and visual and olfactory evidence of contamination. Excavation will extend until PGWSCOs for CVOCs are met.

6.3 Endpoint Soil Sampling

Excavation endpoint samples will be collected at the proposed locations shown on Figure 4. The results of the endpoint soil samples will be used as part of the remedial evaluation in the forthcoming RAWP.

6.3.1 Endpoint Sampling Frequency

Endpoint Samples

Based on the sampling frequency outlined in Section 5.4 of Division of Environmental Remediation Technical Guide 10 (DER-10), Pedestrian Plaza endpoint sampling will include one base endpoint soil sample for every 900 square feet across the excavation biased to the deepest excavation depths. Sidewall endpoint samples will be collected every 30 linear feet except where there is presence of SOE (western and southern boundaries) or along the northern boundary where the Site meets Lot 2 as the Lot 2 soil will be removed concurrently with the Pedestrian Plaza excavation. a In these areas where sidewall samples cannot be collected, base endpoint samples will be shifted to be biased to be along the base (perimeter) of the excavations.

Hazardous CVOC Endpoint Samples

Based on the sampling frequency outlined in Section 5.4 of DER-10, hazardous CVOC endpoint sampling will include one base endpoint soil sample for every 10 square feet across the hazardous excavation biased to the deepest excavation depths. Sidewall endpoint samples will be collected every 10 linear feet except where there is presence of SOE; alternatively, base endpoint samples will be shifted to be biased to be along the base (perimeter) of the excavations if sidewall samples cannot be collected.

Contingency Hotspot Endpoint Samples

In addition, a minimum of five endpoint samples consisting of four sidewalls (except where SOE is present) and one bottom sample will be collected from any encountered tank or other previously unknown hotspot excavations, as well as one additional sample for every 15 linear feet of trench for any associated piping.

6.3.2 Methodology

The excavation endpoint samples will be collected using a decontaminated stainless steel sampling trowel, hand auger, or a dedicated wooden tongue depressor and placed directly into pre-sterilized laboratory-issued containers. The sample containers will be properly labeled and immediately placed on ice within a cooler. Sample time, date, and location will be recorded on a chain of custody. The Site-wide endpoint soil samples will be submitted to an NYSDOH ELAP-certified laboratory for analysis of VOCs by EPA Method 8260C, SVOCs by EPA Method 8270D, PCBs by EPA Method 8082A, Pesticides by EPA Method 8081B, Target Analyte List (TAL) Metals by EPA Method 6000/7000, and per- and polyfluorinated substances (PFAS) by EPA Method 1633. The soil samples collected from the hazardous CVOC areas will be analyzed for CVOCs only by EPA Method 8260. Analysis for contingency hotspot endpoint samples, if required, will be confirmed with the NYSDEC project manager depending on the type of contamination found.

The laboratory will follow the NYSDEC – Analytical Services Protocol (ASP) dated 1995 using NYSDEC ASP Category B deliverables. Further details regarding the specific sampling methodology and analytical procedures are presented in the QAPP, included as Appendix C.

6.3.3 Quality Assurance/Quality Control

The fundamental QA objective with respect to accuracy, precision, and sensitivity of analysis for laboratory analytical data is to achieve the QC acceptance of the analytical protocol. The accuracy, precision, and completeness requirements will be addressed by the laboratory for all data generated. Collected samples will be appropriately packaged, placed in coolers, and shipped or delivered directly to the analytical laboratory by field personnel. Samples will be containerized in appropriate laboratory-provided glassware and shipped in plastic coolers. Samples will be preserved to maintain a temperature of 4 °C. Decontamination of non-dedicated sampling equipment will consist of the following: gently tap or scrape to remove adhered soil; rinse with tap water; wash with Alconox and scrub; rinse with tap water; and rinse with distilled or deionized water. Field blanks will be prepared by pouring distilled or deionized water over decontaminated equipment and collecting the water in laboratory provided containers.

One trip blank, one field blank, one blind duplicate sample, and one MS/MSD sample will be collected per every 20 samples or sample delivery group and submitted for analysis during the endpoint sampling event. The field blank(s), blind duplicate(s), and MS/MSD(s) will include all parameters included in the sample analysis while the trip blank will be

analyzed for VOCs only. Additional QA/QC information is provided in the QAPP, provided as Appendix C.

6.3.4 Data Usability Summary Report

A qualified data validator (third-party) will review the endpoint sample laboratory reports and prepare a DUSR. The DUSR will be included in the IRM CCR/FER.

6.3.5 Reporting of Endpoint Data

The IRM CCR/FER will include a detailed description of endpoint sampling activities, data summary tables, concentration figure showing endpoint sample locations and concentrations, DUSRs, and laboratory reports. Chemical labs used for all endpoint sample results and contingency sampling (if any) will be NYSDOH ELAP-certified. Endpoint sampling, including bottom and sidewall sampling, will be performed in accordance with DER-10 sample frequency requirements. The analytical results of the endpoint samples will be tabulated and compared to UUSCOs and RRSCOs plus PGWSCOs for CVOCs. All analytical data will be submitted in electronic data deliverable format via the Environmental Quality Information System (EQuIS™).

6.4 Soil Characterization

Waste characterization samples have been and will be collected from the soil to secure waste disposal facility acceptance. Samples were collected at a frequency of approximately one sample per 800 cubic yards and analyzed in accordance with the typical requirements of disposal facilities. It is noted that additional samples and/or analysis may be required based on the results of this sampling and/or the chosen disposal facilities requirements. Based on the sampling results, one or more appropriately permitted waste disposal facilities will be selected for off-site disposal. The disposal facility information, including locations, will be submitted to the NYSDEC Project Manager prior to commencing the disposal activities.

All soil excavated and removed from the Site will be disposed of in accordance with all local, state [including Title 6 of the New York Codes, Rules, and Regulations (6 NYCRR) Part 360, and federal regulations]. If any native soil from this Site is proposed for unregulated disposal (not anticipated during IRM activities), a formal request with an associated plan will be submitted to the NYSDEC Project Manager for approval. Material that does not meet UUSCOs is prohibited from being taken to a New York State recycling facility. A contained-in determination will be sought from NYSDEC Solid Waste Management for any soil that is planned to be disposed of as non-hazardous.

The following documentation will be obtained and reported by the Qualified Environmental professional (QEP) [under supervision of the Remedial Engineer (RE)] for each disposal location used in this project to fully demonstrate and document that the disposal of material derived from the Site conforms with all applicable laws: (1) a letter from the QEP or his/her designee or Volunteer to the receiving facility describing the material to be disposed and requesting formal written acceptance of the material. This letter will state that material to be disposed of is contaminated material generated at an environmental remediation Site in New York State. The letter will provide the project identity and the name and phone number of the QEP or his/her designee. The letter will include an attachment summarizing all chemical data for the material being transported (including Site Characterization data); and (2) a letter from each receiving facility stating that it is in receipt of the correspondence (noted above) and is approved to accept the material. These documents will be included in the IRM CCR/FER.

The IRM CCR/FER will include an accounting of the destination of all material removed from the Site during this IRM, including excavated soil, contaminated soil, fill material, solid waste, and hazardous waste, non-regulated material, and fluids. Documentation associated with disposal of all

material must also include records and approvals for receipt of the material. This information will be presented in tabulated form in the IRM CCR/FER.

Bill of Lading system or equivalent will be used for off-site movement of non-hazardous wastes and contaminated soils. This information will be reported in the IRM CCR/FER. Hazardous wastes derived from on-site will be stored, transported, and disposed of in full compliance with applicable local, State, and Federal regulations.

Appropriately licensed haulers will be used for material removed from this Site and will be in full compliance with all applicable local, State, and Federal regulations and only hard covers will be used on trucks.

Waste characterization will be performed for off-site disposal in a manner suitable to the receiving facility and in conformance with applicable permits. Sampling and analytical methods, sampling frequency, analytical results, and QA/QC will be reported in the IRM CCR/FER. All data available for soil to be disposed at a given facility must be submitted to the disposal facility with suitable explanation prior to shipment and receipt.

6.5 Backfill from Off-Site Sources

The importation of clean fill from off-site source(s) may be needed to backfill the excavated areas as part of the IRM. All materials proposed for import onto the Site will be approved by the RE and will be in compliance with provisions in this IRM prior to receipt at the Site. Material proposed for import shall be either from a NYSDEC registered certified clean fill facility or other permitted facility. Any facility proposed for import shall undergo a facility history review and background check by the RE. Material from industrial sites, spill sites, other environmental remediation sites, or other potentially contaminated sites will not be imported to the Site. Solid waste will not be imported onto the Site.

Prior to import, soil will be segregated and tested at the source facility for analysis of VOCs, SVOCs, PCBs, pesticides, TAL metals, PFAS, and 1,4-Dx at the frequency outlined in Table 5.4(e)10 on page 161 of the DER-10 Technical Guidance for Site Investigation and Remediation and in accordance with NYSDEC Sampling, Analysis, and Assessment of PFAS (January 2021). The analytical results will be compared to Table 375-6.8(b) of 6 NYCRR Part 375 and submitted to NYSDEC for review and approval prior to importation and placement on-site. Virgin quarried stone with less than 10% fines will not require testing.

All imported soils will meet NYSDEC approved backfill or cover soil quality objectives for this Site. These NYSDEC-approved backfill or cover soil quality objectives are the lower of the RRSCOs and PGWSCOs as set forth in Table 375-6.8(b) of 6 NYCRR Part 375. Non-compliant soils will not be imported onto the Site without prior approval by NYSDEC. Nothing in this IRMWP or its approval by NYSDEC should be construed as an approval for this purpose.

Soils that meet ‘exempt’ fill requirements under 6 NYCRR Part 360, but do not meet backfill or cover soil objectives for this Site, will not be imported onto the Site without prior approval by NYSDEC. Nothing in this IRMWP should be construed as an approval for this purpose.

Solid waste will not be imported to the Site. Trucks entering the Site with imported soils will be securely covered with tight fitting covers.

The IRM CCR/FER will include the following certification by the RE: “I certify that all import of soils from off-site, including source evaluation, approval and sampling, has been performed in a manner that is consistent with the methodology defined in the IRMWP.”

6.6 Stockpile Methods

6.6.1 On-Site Stockpile Methods

Any stockpiled soil will be managed in accordance with appropriate guidelines. Stockpiled contaminated soil will be placed on and covered with polyethylene sheeting and secured with large rocks or other appropriate weights to protect against leaching or runoff of contaminants into groundwater or stormwater. Stockpiles will be managed to minimize dust generation, run-off and erosion, using water, plastic covers, silt fences, and/or hay bales, as necessary. A dedicated water hose connected to a fire hydrant will be available on-site for dust control.

If separate piles are needed to address different disposal requirements (hazardous or non-hazardous), each pile will be separated by a sufficient distance to ensure that mixing of dissimilar or potentially dissimilar materials does not occur. The location and classification of each staging area will be tracked on Site drawings and updated, as necessary, at the end of each workday. Copies of Site drawings will be kept in the field logbook.

As applicable, manifest forms and shipment manifest records will be completed as required by the appropriate regulatory agencies for verifying the material and quantity of each load in unit of volume and weight.

6.7 Transportation

Transportation of material leaving the Site for off-site disposal will be in accordance with federal, state, and local requirements (including 6 NYCRR Part 364 and United States Department of Transportation regulations) covering licensing of haulers and trucks, placarding, truck routes, manifesting, etc. The schedule for truck arrival will be coordinated to meet the approved project schedule. The schedule will be compatible with the availability of equipment and personnel for material handling operations at the job site.

All vehicles leaving the Site will be inspected to ensure that contaminated soil adhering to the wheels or undercarriage are removed prior to the vehicle leaving the Site. Any situations involving material spilled in transit or mud and dust tracked off-site will be remedied. The access routes will be inspected for road conditions, overhead clearance, and weight restrictions.

Contaminated materials from other projects will not be combined with material from the construction area. The transporter will not deliver waste to any facility other than the disposal facility(s) listed on the shipping manifest.

6.8 Truck Inspection Station

An outbound-truck inspection station will be set up close to the Site exit using a gravel track pad. A filter fabric will be placed prior to the installation of the gravel. Before exiting the Site, trucks will be required to stop at the truck inspection station to be examined for evidence of contaminated soil on the undercarriage, body, and wheels. Soil and debris will be removed from vehicles and equipment using brooms, shovels and clean water, as necessary, and the material will be shipped off-site with the Site soil during the remedial work.

6.9 Site Control Measures

The potential off-site transport of sediment, dust and organic vapors potentially generated during soil excavation activities will be controlled by: covering soil stockpiles and/or open excavations with 6-mil polyethylene sheeting; backfilling open excavations with uncontaminated fill material; decontaminating equipment used for soil excavation/sampling; providing drainage inlet protection for catch basins; and/or the use of odor-controlling spray foam, as warranted. These measures will be installed according to the requirements of all applicable or relevant and appropriate Federal, State and local laws.

6.10 Surveying

The limits of the interim remedial excavation and the locations and elevations of soil samples will be surveyed by a New York State-licensed surveyor and incorporated into the Site plan.

6.11 Decontamination Procedures

All non-dedicated sampling equipment will be decontaminated between discrete locations using the following procedure:

1. Scrub equipment with a bristle brush using a tap water/Simple Green® solution.
2. Rinse with tap water.
3. Scrub again with a bristle brush using a tap water/Simple Green® solution.
4. Rinse with tap water.
5. Rinse with distilled water.
6. Air-dry the equipment.

6.12 Management of Investigation-Derived Waste

Soil cuttings will be containerized in properly labeled Department of Transportation -approved 55-gallon drums for future off-site disposal at a permitted facility. The drums will be sealed at the end of each workday and labeled with the date, contents, the type of waste (i.e., decontamination water) and the name of an AKRF point-of-contact. All drums will be labeled "pending analysis" until laboratory data is available. All investigation-derived waste will be disposed of or treated according to applicable local, state, and federal regulations. Disposable sampling equipment, including spoons, gloves, bags, paper towels, etc. that come in contact with environmental media will be double bagged and disposed of as municipal trash in a facility trash dumpster as non-hazardous refuse.

6.13 Health and Safety Plan

A Site-specific HASP for this IRMWP was prepared and included as Appendix A. All work performed under this IRMWP will be in full compliance with governmental requirements, including Site and worker safety requirements mandated by federal Occupational Safety and Health Act. Work zone monitoring will be performed for the health and safety of workers in accordance with action levels and guidance outlined in the HASP. The intrusive activities outlined in this work plan include initial excavation of soil to be utilized as part of the pilot study and set-up of the reactors. The Volunteer and associated parties conducting the work under this work plan are completely responsible for the implementation of the HASP and for the appropriate performance of work according to the plan and applicable laws.

6.14 Community Air Monitoring Plan

Community air monitoring will be conducted via two fixed stations at the perimeter of the Site during all soil-disturbing Site activities in compliance with the NYSDOH Generic CAMP and the Site-specific CAMP provided in Appendix B.

6.15 Quality Assurance Project Plan

Sampling conducted as part of the IRWMP will be conducted in accordance with the QAPP included as Appendix C, which details field screening and sampling methodologies, sample submittal to the laboratory, and reporting requirements. The QAPP includes the project team responsible for implementing the remediation requirements and provisions set forth in this work plan. All samples will be reported with Category B deliverables and EQuIS™ electronic data deliverables, with the exception of disposal sampling.

7.0 REPORTING REQUIREMENTS

Upon completion of the IRM, either an IRM CCR will be prepared for inclusion in the FER or the information will be included in the FER, and submitted to NYSDEC and NYSDOH. The IRM CCR and/or FER will include:

- Photographs of Site demolition and excavation activities;
- Air monitoring results and corrective actions taken (if required);
- Post-excavation endpoint sampling results collected during implementation of the interim remedial measures;
- Tabulated quantities of all material removed from the Site and associated manifests/bills of lading and certificates of disposal from the receiving facilities;
- Tank removal and spill remediation (if appropriate) documentation; and
- Documentation of source approval and sampling for any imported backfill material.

8.0 SCHEDULE

The following tentative schedule has been developed for the project. The schedule would be subject to change to ensure that the data needs of the IRMWP, RAWP, etc. are met to the satisfaction of the NYSDEC.

Table II
Proposed IRM and Project Schedule

Activity	Time To Complete
Submittal of Draft IRMWP	February 2023
IRMWP Comments Received from NYSDEC	March 2023
IRMWP Approval	March 2023
Implementation of IRMWP	March 2023 – October 2023
Submittal of the Draft RAWP	May 2023
RAWP 45-Day Public Comment Period	May – July 2023
NYSDEC Approves RAWP and Issues Decision Document	September 2023
Submittal of IRM CCR, if needed	December 2023
Dismantle IRM Soil Vapor Extraction System[1]	December 2023
Begin Implementation of RAWP	January 2024
Submittal of Draft Environmental Easement	June 2024
Draft Site Management Plan Submitted to NYSDEC	August 2024
Execution of Environmental Easement	September 2024
Draft FER Submitted to NYSDEC	October 2024
Certificate of Completion and Fact Sheet	December 2024
Completion of Building (first occupancy)	December 2026

Notes:
[1] IRM SVE System will not be turned off without NYSDEC and NYSDOH approval.

9.0 CERTIFICATION

I, Michelle Lapin, P.E., certify that I am currently a New York State registered Professional Engineer as defined in 6 NYCRR Part 375 and that this IRMWP was prepared in accordance with all applicable statutes and regulations and in substantial conformance with DER-10.

I certify that all information and statements in this certification are true. I understand that a false statement made herein is punishable as Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law.

Michelle Lapin, P.E.		March 16, 2023

Sample ID	NYSDEC	NYSDEC	NYSDEC	L3-SRI-SB-19 (4-5) 20171108
Date Sampled	UUSCO	RRSCO	PGWSCO	11/8/2017
VOCs	mg/kg	mg/kg	mg/kg	mg/kg
Trichloroethylene (TCE)	0.47	21	0.47	5.33 JD

Sample ID
Sample Date
Concentration in Soil
Analyte/Compound in Soil

JH : The analyte was detected at a concentration above the laboratory reporting limit; the reported concentration is approximate and may be inaccurate or imprecise and biased high.

D : The reported concentration is the result of a diluted sample analysis.

NS : A standard has not been established for the analyte.

NE : The analyte was not detected at a concentration above UUSCOs or RRSCOs.

b : The compound was detected at an elevated detection limit due to dilution required for high interfering element.

JD : The reported concentration is the result of a diluted sample analysis and is estimated.

LD : The reported concentration is the result of a diluted sample analysis and is biased low.

*** :** Both the high-level analysis and low-level analysis of VOCs for sample L3-RI-SB-6 (12-13') 20161207 are reported due to significantly higher results obtained for the high-level analysis. The low-level analysis is presented with one asterisk next to the sample name.

NA : Only chlorinated volatile organic compounds (CVOCs) were compared to PGWSCOs. The PGWSCO for the compound is not applicable.

Part 375 Soil Cleanup Objectives : Soil Cleanup Objectives (SCOs) listed in New York State Department of Environmental Conservation (NYSDEC) Part 375 Regulations (6 NYCRR Part 375).

mg/kg : milligrams per kilogram = parts per million (ppm)

Exceedances of Part 375 Unrestricted Use Soil Cleanup Objectives (UUSCOs) are highlighted in bold font.
Exceedances of Part 375 Restricted Residential Soil Cleanup Objectives (RRSCOs) are highlighted in gray.
Exceedances of Part 375 Protection of Groundwater Soil Cleanup Objectives (PGWSCOs) are highlighted in italic font.

Soil sample L3-RI-SB-X (12-13') 20161205 is a blind duplicate of soil sample L3-RI-SB-2 (12-13') 20161205.
Soil sample L3-RI-SB-X (12-13') 20161207 is a blind duplicate of soil sample L3-RI-SB-6 (12-13') 20161207.
Soil sample L3-SRI-SB-X9 (4-5) 20171109 is a blind duplicate of soil sample L3-SRI-SB-17 (4-5) 20171109.

Notes

DEFINITIONS

J : The concentration given is an estimated value.

L : Sample result is estimated and biased low.

U : The analyte was not detected at the indicated concentration.

mg/kg : milligrams per kilogram

STANDARDS

Part 375 Soil Cleanup Objectives : Soil Cleanup Objectives listed in New York State Department of Environmental Conservation (NYSDEC) "Part 375" Regulations [6 New York Codes, Rules and Regulations (NYCRR) Part 375].

Exceedances of Part 375 Unrestricted Use Soil Cleanup Objectives (UUSCOs) are highlighted in bold font.
Exceedances of Part 375 Restricted Residential Soil Cleanup Objectives (RRSCOs) are highlighted in gray shading.
Exceedances of Part 375 Protection of Groundwater Soil Cleanup Objectives (PGWSCOs) are highlighted with an underline.

1.0 INTRODUCTION

This environmental Health and Safety Plan (HASP) was prepared by AKRF, Inc. (AKRF) on behalf of Atlantic Chestnut Affordable Housing LLC (the "Volunteer") for the Atlantic Chestnut – Lot 3 site, located at 275 Chestnut Street in Brooklyn, New York, hereafter referred to as the "Site". This HASP was developed for the Interim Remedial Measure (IRM) Work Plan dated February 2023 for excavation of the Pedestrian Plaza portion of the Site for implementation by AKRF personnel and other personnel working to implement the IRM Work Plan. The Site is identified on the New York City Tax Map as Brooklyn Tax Block 4143, Lot 3. Historically, Lot 1 encompassed the entirety of Block 4143, but was apportioned into three lots (Lots 1, 2, and 3) in 2016. A map showing the Site location is provided as Figure 1. The surrounding area is developed with residential, commercial, manufacturing, transportation, and industrial uses. The elevated J- and Z- Metropolitan Transit Authority (MTA) subway tracks run along Fulton Street to the north and the Long Island Railroad tracks are located beneath Atlantic Avenue to the south.

Atlantic Chestnut Affordable Housing LLC entered into a Brownfield Cleanup Agreement (BCA) Index No. C224236-05-16 with the New York State Department of Environmental Conservation (NYSDEC) on May 26, 2016 as a Volunteer. A BCA Amendment was submitted to the NYSDEC in August 2017 and executed on August 24, 2017 to document changes to the street address and lot size.

Historic records indicated that the Site was developed with residences and a road in 1887 and with industrial and manufacturing uses, including the Columbia Machine Works and Malleable Iron Company, the Columbia Cable and Electric Corporation, Blue Ridge Farms, Inc., and Chloe Foods Corp., between 1908 and 2012. Blue Ridge Farms, Inc. and Chloe Foods Corp. are listed on multiple federal and state databases. The Site was shown with a 10,000-gallon fuel oil tank in 1951 and 1980 and as a gasoline filling station between 1982 and 1988. Prior uses that appear to have led to Site contamination include blacksmithing and stamping, a brass foundry, woodworking, railroad operations, a blacksmith, a machine shop, tank and engine rooms, an iron works, wire braiding, a gasoline filling station, and cable manufacturing. The Site has been vacant since a July 2012 fire caused severe structural damage to the former Site buildings, which were demolished between July and December 2016.

Site contamination, present in shallow and deep soil, shallow and intermediate groundwater, and soil vapor across the Site, appears to be related to the Site's historic industrial and manufacturing uses. The elevated detections of semivolatile organic compounds (SVOCs) and metals in shallow fill are most likely attributable to historic filling, undocumented discharges due to the fire in 2012, and/or historic operations at the Site. The presence of petroleum-related compounds in soil and soil vapor, associated with NYSDEC Spill No. 1708008, are related to former and/or current on-site petroleum storage tanks. The presence of the solvent-related volatile organic compounds (VOCs) trichloroethylene (in soil, groundwater, and soil vapor), tetrachloroethylene (in soil, groundwater and soil vapor), cis-1,2-dichloroethylene, and trans-1,2-dichloroethylene (in soil), chloroform (in groundwater), and carbon tetrachloride and refrigerants (in soil vapor) are likely related to the historic manufacturing operations at the Site. Based on groundwater flow, the contaminants in shallow groundwater are likely migrating off-site to the south. Additionally, when organic compounds are exposed to air, contamination can partition from soil and groundwater and migrate in a vapor phase through the pore spaces in unsaturated soil. The vapors can accumulate beneath structures such as pavement and building foundations. The affected media for the existing or potential future releases at the Site include soil, groundwater, and soil vapor. To address the significant threat determination for soil vapor, an IRM soil vapor extraction system is currently operating at the Site to prevent off-site migration of contaminated vapors. The SVE system IRM is being employed until implementation of remedial actions.

This HASP does not discuss routine health and safety issues common to general construction and excavation, including, but not, limited to slips, trips, falls, shoring, and other physical hazards. All AKRF employees are additionally directed that all work must be performed in accordance with the AKRF's Generic HASP and all Occupation Safety and Health Administration (OSHA)-applicable regulations for the work activities required for the project. All project personnel are furthermore directed that they are not

permitted to enter Permit Required Confined Spaces (as defined by OSHA). For issues unrelated to contaminated materials, all non-AKRF employees are to be bound by all applicable OSHA regulations as well as any more stringent requirements specified by their employer in their corporate HASP or otherwise. AKRF is not responsible for providing oversight for issues unrelated to contaminated materials for non-employees. This oversight shall be the responsibility of the employer of that worker or other official designated by that employer.

2.0 HEALTH AND SAFETY GUIDELINES AND PROCEDURES

2.1 Hazard Evaluation

2.1.1 Hazards of Concern

The hazards of concern include organic and inorganic chemicals, heat and cold stress, and explosive/flammable materials.

2.1.2 Physical Characteristics

The physical characteristics of the hazards of concern include liquid, solid, sludge, vapor, and free-phase petroleum.

2.1.3 Hazardous Materials

The chemicals known and/or expected to be encountered at the Site include: VOCs, SVOCs, pesticides, and metals; the solids include ash, asbestos, and historical fill; the solvents include chlorinated solvents; and the oils include hydraulic oil, gasoline, and fuel oil.

2.1.4 Chemicals of Concern

Table 1
Chemicals Of Concern

Chemicals	REL/PEL/STEL	Health Hazards
1,2-Dichloroethylene	REL = 200 ppm PEL = 200 ppm	Irritation eyes, respiratory system; central nervous system depression.
Arsenic	REL = 0.002 mg/m^3 PEL = 0.01 mg/m^3	Ulceration of nasal septum, dermatitis, gastrointestinal disturbances, peripheral neuropathy, respiratory irritation, hyperpigmentation of skin; potential occupational carcinogen.
Benzene	REL = 0.1 ppm PEL = 1 ppm STEL = 5 ppm	Irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude, dermatitis; bone marrow depression, potential occupational carcinogen.
Chromium	REL = 0.5 mg/m^3 PEL = 0.5 mg/m^3	Irritation eyes; sensitization dermatitis.
Copper	REL = 0.1 mg/m^3 PEL = 0. 1 mg/m^3	Irritation eyes, upper respiratory system; metal fume fever: chills, muscle ache, nausea, fever, dry throat, cough, lassitude (weakness, exhaustion); metallic or sweet taste; discoloration skin, hair.
Ethylbenzene	REL = 100 ppm PEL = 100 ppm	Irritation eyes, skin, mucous membrane; headache; dermatitis; narcosis, coma.
Fuel Oil	REL = 350 mg/m^3 PEL = 400 ppm	Nausea, irritation – eyes, hypertension, headache, light-headedness, loss of appetite, poor coordination; long-term exposure – kidney damage, blood clotting problems; potential carcinogen.
Lead	REL = 0.05 mg/m^3 PEL = 0.05 mg/m^3	Lassitude (weakness, exhaustion), insomnia; facial pallor; anorexia, weight loss, malnutrition; constipation, abdominal pain, colic; anemia; gingival lead line; tremor; paralysis wrist, ankles; encephalopathy; kidney disease; irritation eyes; hypertension.
Mercury	REL = 0.1 mg/m^3 PEL = 0.05 mg/m^3	Irritation eyes, skin; cough, chest pain, dyspnea (breathing difficulty), bronchitis, pneumonitis; tremor, insomnia, irritability, indecision, headache, lassitude (weakness, exhaustion); stomatitis, salivation; gastrointestinal disturbance, anorexia, weight loss; proteinuria.

Table 1
Chemicals Of Concern

Chemicals	REL/PEL/STEL	Health Hazards
Polycyclic Aromatic Hydrocarbons	PEL = 5 mg/m^3	Harmful effects to skin, bodily fluids, and ability to fight disease, reproductive problems; [potential occupational carcinogen].
Trichloroethylene	PEL = 100 ppm	Lassitude (weakness, exhaustion), dizziness, tremor, drowsiness, nausea, vomiting; dermatitis; cardiac arrhythmias, paresthesia; liver injury; [potential occupational carcinogen].
Tetrachloroethylene	PEL = 100 ppm STEL = 200 ppm	Irritation eyes, skin, nose, throat, respiratory system; nausea; flush face, neck; dizziness, poor coordination; headache, drowsiness; skin erythema (skin redness); liver damage; potential occupational carcinogen.
Toluene	REL = 100 ppm PEL = 200 ppm STEL = 300 ppm	Irritation eyes, nose; lassitude, confusion, euphoria, dizziness, headache; dilated pupils, lacrimation (discharge of tears); anxiety, muscle fatigue, insomnia; paresthesia (skin tingling or numbness); dermatitis; liver, kidney damage.
Xylenes	REL = 100 ppm PEL = 100 ppm	Irritation eyes, skin, nose, throat; dizziness, excitement, drowsiness, poor coordination, staggering gait; corneal vacuolization; anorexia, nausea, vomiting, abdominal pain; dermatitis.
Vinyl Chloride	PEL = 1 ppm PEL = 5 ppm (Ceiling)	Lassitude (weakness, exhaustion); abdominal pain, gastrointestinal bleeding; enlarged liver; pallor or cyanosis of extremities; liquid: frostbite; [potential occupational carcinogen].
Zinc	REL = 5 mg/m^3 PEL = 5 mg/m^3	Metal fume fever: chills, muscle ache, nausea, fever, dry throat, cough; lassitude (weakness, exhaustion); metallic taste; headache; blurred vision; low back pain; vomiting; malaise (vague feeling of discomfort); chest tightness; dyspnea (breathing difficulty), rales, decreased pulmonary function.
Particulates	PEL = 15 mg/m^3 (total) PEL = 5 mg/m^3 (respirable)	Irritation eyes, skin, throat, upper respiratory system.
Notes: REL = National Institute for Occupational Safety and Health Recommended Exposure Limit PEL = OSHA Permissible Exposure Limit STEL = OSHA Short Term Exposure Limit		

The potential health effects from the on-site contaminants listed above are further described in Attachment A.

2.2 Designated Personnel

AKRF will appoint one of its on-site personnel as the Site Safety Officer (SSO). This individual will be responsible for the implementation of this HASP. The SSO will have experience in implementation of air monitoring and hazardous materials sampling programs. Health and safety training required for the SSO and all field personnel is outlined in Section 2.3 of this HASP.

2.3 Training

All personnel who enter the work area while intrusive activities are being performed will have completed a 40-hour training course that meets OSHA requirements of 29 CFR Part 1910, Occupational Safety and Health Standards. In addition, all personnel will have up-to-date 8-hour refresher training. The training will allow personnel to recognize and understand potential hazards to health and safety. All field personnel must attend a training program, whose purpose is to:

- Make them aware of the potential hazards they may encounter;
- Provide the knowledge and skills necessary for them to perform the work with minimal risk to health and safety;
- Make them aware of the purpose and limitations of safety equipment; and
- Ensure that they can safely avoid or escape from emergencies.

Each member of the field crew will be instructed in these objectives before he/she goes onto the Site. A Site safety meeting will be conducted at the start of the project. Additional meetings shall be conducted, as necessary, for new personnel working at the Site.

2.4 Medical Surveillance Program

All AKRF and subcontractor personnel performing field work involving subsurface disturbance at the Site are required to have passed a complete medical surveillance examination in accordance with 29 CFR 1910.120(f). A physician's medical release for work will be confirmed by the SSO before an employee can begin Site activities. The medical release shall consider the type of work to be performed and the required personal protective equipment (PPE). The medical examination will, at a minimum, be provided annually and upon termination of hazardous waste Site work.

2.5 Site Work Zones

During any activities involving subsurface disturbance, the work area must be divided into various zones to prevent the spread of contamination, ensure that proper protective equipment is donned, and provide an area for decontamination.

The Exclusion Zone is defined as the area where exposure to contaminated media could be encountered. The Contamination Reduction Zone (CRZ) is the area where decontamination procedures take place and is located next to the Exclusion Zone. The Support Zone is the area where support facilities such as vehicles, fire extinguisher, and first aid supplies are located. The emergency staging area (part of the Support Zone) is the area where all workers on-site would assemble in the event of an emergency. A summary of these areas is provided below. These zones may be changed by the SSO, depending on that day's activities. All field personnel will be informed of the location of these zones before work begins.

Table 2
Site Work Zones

Task	Exclusion Zone	CRZ	Support Zone
Excavation	15 feet from Excavation Area	15 feet from Excavation Area	As Needed

2.6 Personal Protection Equipment

The PPE required for various kinds of Site investigation tasks are based on 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response, Appendix B, "General Description and Discussion of the Levels of Protection and Protective Gear."

AKRF field personnel and other Site personnel shall wear, at a minimum, Level D PPE. The protection will be based on the air monitoring described in this section.

Table 4
Personal Protection Equipment Requirements

LEVEL OF PROTECTION & PPE		All Tasks
Level D (**X**) Steel Toe Shoes (**X**) Hard Hat (within 25 ft. of excavator) (**X**) Work Gloves	(**X**) Safety Glasses ( ) Face Shield (**X**) Ear Plugs (within 25 ft. of excavator) (**X**) Nitrile Gloves (**X**) Tyvek for tank contractor if NAPL present	Yes
Level C *(in addition to Level D)* (**X**) Half-Face Respirator (**X**) Full Face Respirator ( ) Full-Face PAPR	( ) Particulate Cartridge ( ) Organic Cartridge (**X**) Dual Organic/Particulate Cartridge	If PID > 5 ppm or particulates > 0.125 mg/m^3 in breathing zone
Comments: Cartridges to be changed out at least once per shift unless warranted beforehand (e.g., more difficult to breath or any odors detected). PAPR = powered air purifying respirator		

2.7 General Work Practices

To protect health and safety, all field personnel will adhere to the guidelines listed below during activities involving subsurface disturbance:

- Eating, drinking, chewing gum or tobacco, and smoking are prohibited except in designated areas on the Site. These areas will be designated by the SSO.
- Workers must wash their hands thoroughly on leaving the work area and before eating, drinking, or any other such activity.
- The workers should shower as soon as possible after leaving the Site. Contact with contaminated or suspected surfaces should be avoided.
- The buddy system should always be used; each buddy should watch for signs of fatigue, exposure, and heat/cold stress.

3.0 EMERGENCY PROCEDURES AND EMERGENCY RESPONSE PLAN

The field crew will be equipped with emergency equipment, such as a first aid kit and disposable eyewashes. In the case of a medical emergency, the SSO will determine the nature of the emergency and he/she will have someone call for an ambulance, if needed. If the nature of the injury is not serious, i.e., the person can be moved without expert emergency medical personnel, he/she should be driven to the Brookdale University Hospital by on-site personnel. Directions to the hospital are provided below, and a hospital route map is provided as Figure 2. Report forms are provided in Attachment B. Emergency hand signals are provided in Attachment C.

Table 5
Hospital Directions

Hospital Name	Brookdale University Hospital
Phone Number	(718) 240-5363
Address/Location	1 Brookdale Plaza, Brooklyn, New York 11212
Directions	1. Exit through the gate on the southern portion of the Site. Turn right onto Atlantic Avenue. 2. Turn left onto Miller Avenue. 3. Turn right onto Glenmore Avenue. 4. Turn left onto Pennsylvania Avenue. 5. Turn right onto New Lots Avenue. 6. Turn left onto Hinsdale Street. 7. Turn right onto Linden Boulevard. 8. Keep left to stay on Linden Boulevard. 9. Turn right onto Rockaway Parkway. 10. The destination will be on the right.

3.1 Emergency Contacts

Table 6
Emergency Contacts

Company	Individual Name	Title	Contact Number
AKRF	Michelle Lapin, P.E.	Remedial Engineer	646-388-9520 (office)
	Deborah Shapiro, QEP	Project Director	646-388-9544 (office)
	Kenneth Wiles	Project Manager	646-388-9828 (office)
	Marco Balletta	SSO	646-270-7195 (cell)

POTENTIAL HEALTH EFFECTS FROM ON-SITE CONTAMINANTS

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

1,2-DICHLOROETHENE
CAS # 540-59-0, 156-59-2, and 156-60-5

This fact sheet answers the most frequently asked health questions (FAQs) about 1,2-dichloroethene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to 1,2-dichloroethene occurs mainly in workplaces where it is made or used. Breathing high levels of 1,2-dichloroethene can make you feel nauseous, drowsy, and tired. *cis*-1,2-Dichloroethene has been found in at least 146 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA). *trans*-1,2-Dichloroethene was found in at least 563 NPL sites. 1,2-Dichloroethene was found at 336 sites, but the isomer (*cis*- or *trans*-) was not specified.

What is 1,2-dichloroethene?

(Pronounced 1,2-dī-klôrʹ ō-ĕthʹēn)

1,2-Dichloroethene, also called 1,2-dichloroethylene, is a highly flammable, colorless liquid with a sharp, harsh odor. It is used to produce solvents and in chemical mixtures. You can smell very small amounts of 1,2-dichloroethene in air (about 17 parts of 1,2-dichloroethene per million parts of air [17 ppm]).

There are two forms of 1,2-dichloroethene; one is called *cis*-1,2-dichloroethene and the other is called *trans*-1,2-dichloroethene. Sometimes both forms are present as a mixture.

What happens to 1,2-dichloroethene when it enters the environment?

- 1,2-Dichloroethene evaporates rapidly into air.
- In the air, it takes about 5-12 days for half of it to break down.
- Most 1,2-dichloroethene in the soil surface or bodies of water will evaporate into air.
- 1,2-Dichloroethene can travel through soil or dissolve in water in the soil. It is possible that it can contaminate groundwater.
- In groundwater, it takes about 13-48 weeks to break down.
- There is a slight chance that 1,2-dichloroethene will break down into vinyl chloride, a different chemical which is believed to be more toxic than 1,2-dichloroethene.

How might I be exposed to 1,2-dichloroethene?

- Breathing 1,2-dichloroethene that has leaked from hazardous waste sites and landfills.
- Drinking contaminated tap water or breathing vapors from contaminated water while cooking, bathing, or washing dishes.
- Breathing 1,2-dichloroethene, touching it, or touching contaminated materials in the workplace.

How can 1,2-dichloroethene affect my health?

Breathing high levels of 1,2-dichloroethene can make you feel nauseous, drowsy, and tired; breathing very high levels can kill you.

When animals breathed high levels of *trans*-1,2-dichloroethene for short or longer periods of time, their livers and lungs were damaged and the effects were more severe with longer exposure times. Animals that breathed very high

levels of *trans*-1,2-dichloroethene had damaged hearts.

Animals that ingested extremely high doses of *cis*- or *trans*-1,2-dichloroethene died.

Lower doses of *cis*-1,2-dichloroethene caused effects on the blood, such as decreased numbers of red blood cells, and also effects on the liver.

The long-term (365 days or longer) human health effects after exposure to low concentrations of 1,2-dichloroethene aren't known. One animal study suggested that an exposed fetus may not grow as quickly as one that hasn't been exposed.

Exposure to 1,2-dichloroethene hasn't been shown to affect fertility in people or animals.

How likely is 1,2-dichloroethene to cause cancer?

The EPA has determined that *cis*-1,2-dichloroethene is not classifiable as to its human carcinogenicity.

No EPA cancer classification is available for *trans*-1,2-dichloroethene.

Is there a medical test to show whether I've been exposed to 1,2-dichloroethene?

Tests are available to measure concentrations of the breakdown products of 1,2-dichloroethene in blood, urine, and tissues. However, these tests aren't used routinely to determine whether a person has been exposed to this compound. This is because after you are exposed to 1,2-dichloroethene, the breakdown products in your body that are detected with these tests may be the same as those that come from exposure to other chemicals. These tests aren't available in most doctors' offices, but can be done at special laboratories that have the right equipment.

Has the federal government made recommendations to protect human health?

The EPA has set the maximum allowable level of *cis*-1,2-dichloroethene in drinking water at 0.07 milligrams per liter of water (0.07 mg/L) and *trans*-1,2-dichloroethene at 0.1 mg/L.

The EPA requires that any spills or accidental release of 1,000 pounds or more of 1,2-dichloroethene must be reported to the EPA.

The Occupational Health Safety and Health Administration (OSHA) has set the maximum allowable amount of 1,2-dichloroethene in workroom air during an 8-hour workday in a 40-hour workweek at 200 parts of 1,2-dichloroethene per million parts of air (200 ppm).

Glossary

Carcinogenicity: Ability of a substance to cause cancer.

CAS: Chemical Abstracts Service.

Fertility: Ability to reproduce.

Ingest: To eat or drink something.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Solvent: A chemical that can dissolve other substances.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ARSENIC
CAS # 7440-38-2

Division of Toxicology ToxFAQs™ December 2003

This fact sheet answers the most frequently asked health questions (FAQs) about arsenic. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to higher than average levels of arsenic occurs mostly in the workplace, near hazardous waste sites, or in areas with high natural levels. At high levels, inorganic arsenic can cause death. Exposure to lower levels for a long time can cause a discoloration of the skin and the appearance of small corns or warts. Arsenic has been found at 1,014 of the 1,598 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is arsenic?

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds.

Inorganic arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides, primarily on cotton plants.

What happens to arsenic when it enters the environment?

❑ Arsenic cannot be destroyed in the environment. It can only change its form.
❑ Arsenic in air will settle to the ground or is washed out of the air by rain.
❑ Many arsenic compounds can dissolve in water.
❑ Fish and shellfish can accumulate arsenic, but the arsenic in fish is mostly in a form that is not harmful.

How might I be exposed to arsenic?

❑ Eating food, drinking water, or breathing air containing arsenic.
❑ Breathing contaminated workplace air.
❑ Breathing sawdust or burning smoke from wood treated with arsenic.
❑ Living near uncontrolled hazardous waste sites containing arsenic.
❑ Living in areas with unusually high natural levels of arsenic in rock.

How can arsenic affect my health?

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs. Ingesting high levels of inorganic arsenic can result in death. Lower levels of arsenic can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the

appearance of small "corns" or "warts" on the palms, soles, and torso.

Skin contact with inorganic arsenic may cause redness and swelling.

Organic arsenic compounds are less toxic than inorganic arsenic compounds. Exposure to high levels of some organic arsenic compounds may cause similar effects as inorganic arsenic.

How likely is arsenic to cause cancer?

Several studies have shown that inorganic arsenic can increase the risk of lung cancer, skin cancer, bladder cancer, liver cancer, kidney cancer, and prostate cancer. The World Health Organization (WHO), the Department of Health and Human Services (DHHS), and the EPA have determined that inorganic arsenic is a human carcinogen.

How can arsenic affect children?

We do not know if exposure to arsenic will result in birth defects or other developmental effects in people. Birth defects have been observed in animals exposed to inorganic arsenic.

It is likely that health effects seen in children exposed to high amounts of arsenic will be similar to the effects seen in adults.

How can families reduce the risk of exposure to arsenic?

❑ If you use arsenic-treated wood in home projects, you should wear dust masks, gloves, and protective clothing to decrease exposure to sawdust.
❑ If you live in an area with high levels of arsenic in water or soil, you should use cleaner sources of water and limit contact with soil.

Is there a medical test to show whether I've been exposed to arsenic?

There are tests to measure the level of arsenic in blood, urine, hair, or fingernails. The urine test is the most reliable test for arsenic exposure within the last few days. Tests on hair and fingernails can measure exposure to high levels or arsenic over the past 6-12 months. These tests can determine if you have been exposed to above-average levels of arsenic. They cannot predict how the arsenic levels in your body will affect your health.

Has the federal government made recommendations to protect human health?

EPA has set limits on the amount of arsenic that industrial sources can release to the environment and has restricted or canceled many uses of arsenic in pesticides. EPA has set a limit of 0.01 parts per million (ppm) for arsenic in drinking water.

The Occupational Safety and Health Administration has set limits of 10 μg arsenic per cubic meter of workplace air (10 $\mu g/m^3$) for 8 hour shifts and 40 hour work weeks.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

BENZENE
CAS # 71-43-2

This fact sheet answers the most frequently asked health questions (FAQs) about benzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Benzene is a widely used chemical formed from both natural processes and human activities. Breathing benzene can cause drowsiness, dizziness, and unconsciousness; long-term benzene exposure causes effects on the bone marrow and can cause anemia and leukemia. Benzene has been found in at least 813 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is benzene?

(Pronounced bĕn′zēn′)

Benzene is a colorless liquid with a sweet odor. It evaporates into the air very quickly and dissolves slightly in water. It is highly flammable and is formed from both natural processes and human activities.

Benzene is widely used in the United States; it ranks in the top 20 chemicals for production volume. Some industries use benzene to make other chemicals which are used to make plastics, resins, and nylon and synthetic fibers. Benzene is also used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene include volcanoes and forest fires. Benzene is also a natural part of crude oil, gasoline, and cigarette smoke.

What happens to benzene when it enters the environment?

- Industrial processes are the main source of benzene in the environment.
- Benzene can pass into the air from water and soil.
- It reacts with other chemicals in the air and breaks down within a few days.
- Benzene in the air can attach to rain or snow and be carried back down to the ground.
- It breaks down more slowly in water and soil, and can pass through the soil into underground water.
- Benzene does not build up in plants or animals.

How might I be exposed to benzene?

- Outdoor air contains low levels of benzene from tobacco smoke, automobile service stations, exhaust from motor vehicles, and industrial emissions.
- Indoor air generally contains higher levels of benzene from products that contain it such as glues, paints, furniture wax, and detergents.
- Air around hazardous waste sites or gas stations will contain higher levels of benzene.
- Leakage from underground storage tanks or from hazardous waste sites containing benzene can result in benzene contamination of well water.
- People working in industries that make or use benzene may be exposed to the highest levels of it.
- A major source of benzene exposures is tobacco smoke.

How can benzene affect my health?

Breathing very high levels of benzene can result in death, while high levels can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion, and unconsciousness. Eating or drinking foods containing high levels of benzene can cause vomiting, irritation of the stomach, dizziness, sleepiness, convulsions, rapid heart rate, and death.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

The major effect of benzene from long-term (365 days or longer) exposure is on the blood. Benzene causes harmful effects on the bone marrow and can cause a decrease in red blood cells leading to anemia. It can also cause excessive bleeding and can affect the immune system, increasing the chance for infection.

Some women who breathed high levels of benzene for many months had irregular menstrual periods and a decrease in the size of their ovaries. It is not known whether benzene exposure affects the developing fetus in pregnant women or fertility in men.

Animal studies have shown low birth weights, delayed bone formation, and bone marrow damage when pregnant animals breathed benzene.

How likely is benzene to cause cancer?

The Department of Health and Human Services (DHHS) has determined that benzene is a known human carcinogen. Long-term exposure to high levels of benzene in the air can cause leukemia, cancer of the blood-forming organs.

Is there a medical test to show whether I've been exposed to benzene?

Several tests can show if you have been exposed to benzene. There is test for measuring benzene in the breath; this test must be done shortly after exposure. Benzene can also be measured in the blood, however, since benzene disappears rapidly from the blood, measurements are accurate only for recent exposures.

In the body, benzene is converted to products called metabolites. Certain metabolites can be measured in the urine. However, this test must be done shortly after exposure and is not a reliable indicator of how much benzene you have been exposed to, since the metabolites may be present in urine from other sources.

Has the federal government made recommendations to protect human health?

The EPA has set the maximum permissible level of benzene in drinking water at 0.005 milligrams per liter (0.005 mgL). The EPA requires that spills or accidental releases into the environment of 10 pounds or more of benzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit of 1 part of benzene per million parts of air (1 ppm) in the workplace during an 8-hour workday, 40-hour workweek.

Glossary

Anemia: A decreased ability of the blood to transport oxygen.

Carcinogen: A substance with the ability to cause cancer.

CAS: Chemical Abstracts Service.

Chromosomes: Parts of the cells responsible for the development of hereditary characteristics.

Metabolites: Breakdown products of chemicals.

Milligram (mg): One thousandth of a gram.

Pesticide: A substance that kills pests.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

CHROMIUM

CAS # 7440-47-3

Division of Toxicology and Environmental Medicine ToxFAQs™ September 2008

This fact sheet answers the most frequently asked health questions (FAQs) about chromium. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to chromium occurs from ingesting contaminated food or drinking water or breathing contaminated workplace air. Chromium(VI) at high levels can damage the nose and cause cancer. Ingesting high levels of chromium(VI) may result in anemia or damage to the stomach or intestines. Chromium(III) is an essential nutrient. Chromium has been found in at least 1,127 of the 1,669 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is chromium?

Chromium is a naturally occurring element found in rocks, animals, plants, and soil. It can exist in several different forms. Depending on the form it takes, it can be a liquid, solid, or gas. The most common forms are chromium(0), chromium(III), and chromium(VI). No taste or odor is associated with chromium compounds.

The metal chromium, which is the chromium(0) form, is used for making steel. Chromium(VI) and chromium(III) are used for chrome plating, dyes and pigments, leather tanning, and wood preserving.

What happens to chromium when it enters the environment?

❑ Chromium can be found in air, soil, and water after release from the manufacture, use, and disposal of chromium-based products, and during the manufacturing process.
❑ Chromium does not usually remain in the atmosphere, but is deposited into the soil and water .
❑ Chromium can easily change from one form to another in water and soil, depending on the conditions present.
❑ Fish do not accumulate much chromium in their bodies from water.

How might I be exposed to chromium?

❑ Eating food containing chromium(III).
❑ Breathing contaminated workplace air or skin contact during use in the workplace.
❑ Drinking contaminated well water.
❑ Living near uncontrolled hazardous waste sites containing chromium or industries that use chromium.

How can chromium affect my health?

Chromium(III) is an essential nutrient that helps the body use sugar, protein, and fat.

Breathing high levels of chromium(VI) can cause irritation to the lining of the nose, nose ulcers, runny nose, and breathing problems, such as asthma, cough, shortness of breath, or wheezing. The concentrations of chromium in air that can cause these effects may be different for different types of chromium compounds, with effects occurring at much lower concentrations for chromium(VI) compared to chromium(III).

The main health problems seen in animals following ingestion of chromium(VI) compounds are irritation and ulcers in the stomach and small intestine and anemia. Chromium(III) compounds are much less toxic and do not appear to cause these problems.

Sperm damage and damage to the male reproductive system have also been seen in laboratory animals exposed to chromium(VI).

Skin contact with certain chromium(VI) compounds can cause skin ulcers. Some people are extremely sensitive to chromium(VI) or chromium(III). Allergic reactions consisting of severe redness and swelling of the skin have been noted.

How likely is chromium to cause cancer?

The Department of Health and Human Services (DHHS), the International Agency for Reseach on Cancer (IARC), and the EPA have determined that chromium(VI) compounds are known human carcinogens. In workers, inhalation of chromium(VI) has been shown to cause lung cancer. Chromium(VI) also causes lung cancer in animals. An increase in stomach tumors was observed in humans and animals exposed to chromium(VI) in drinking water.

How can chromium affect children?

It is likely that health effects seen in children exposed to high amounts of chromium will be similar to the effects seen in adults.

We do not know if exposure to chromium will result in birth defects or other developmental effects in people. Some developmental effects have been observed in animals exposed to chromium(VI).

How can families reduce the risks of exposure to chromium?

❑ Children should avoid playing in soils near uncontrolled hazardous waste sites where chromium may have been discarded.

❑ Chromium is a component of tobacco smoke. Avoid smoking in enclosed spaces like inside the home or car in order to limit exposure to children and other family members.

❑ Although chromium(III) is an essential nutrient, you should avoid excessive use of dietary supplements containing chromium.

Is there a medical test to determine whether I've been exposed to chromium?

Since chromium(III) is an essential element and naturally occurs in food, there will always be some level of chromium in your body. Chromium can be measured in hair, urine, and blood.

Higher than normal levels of chromium in blood or urine may indicate that a person has been exposed to chromium. However , increases in blood and urine chromium levels cannot be used to predict the kind of health effects that might develop from that exposure.

Has the federal government made recommendations to protect human health?

The EPA has determined that exposure to chromium in drinking water at concentrations of 1 mg/L for up to 10 days is not expected to cause any adverse effects in a child.

The FDA has determined that the chromium concentration in bottled drinking water should not exceed 1 mg/L.

The Occupational Health and Safety Administration (OSHA) has limited workers' exposure to an average of 0.0005 mg/m^3 chromium(VI), 0.5 mg/m^3 chromium(III), and 1.0 mg/m^3 chromium(0) for an 8-hour workday, 40-hour workweek.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

COPPER

CAS # 7440-50-8

Division of Toxicology ToxFAQs™ **September 2002**

This fact sheet answers the most frequently asked health questions (FAQs) about copper. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Copper is a reddish metal that occurs naturally in the environment. It also occurs naturally in plants and animals. Low levels of copper are essential for maintaining good health. High levels can cause harmful effects such as irritation of the nose, mouth and eyes, vomiting, diarrhea, stomach crumps, and nausea. Copper has been found in at least 884 of the 1,613 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is copper?

Copper is a reddish metal that occurs naturally in rocks, soil, water, and air. Copper also occurs naturally in plants and animals.

Metallic copper can be easily molded or shaped. Metallic copper can be found in the U.S. penny, electrical wiring, and some water pipes. Metallic copper is also found in mixtures (called alloys) with other metals such as brass and bronze. Copper is also found as part of other compounds forming salts. Copper salts occur naturally, but are also manufactured. The most common copper salt is copper sulfate. Most copper compounds are blue-green in color. Copper compounds are commonly used in agriculture to treat plant diseases like mildew, for water treatment and, as preservatives for wood, leather, and fabrics.

What happens to copper when it enters the environment?

❑ Copper can enter the environment from the mining of copper and other metals and from factories that make or use metallic copper or copper compounds.

❑ It can also enter the environment through domestic waste water, combustion of fossil fuels and wastes, wood production, phosphate fertilizer production, and natural sources (e.g., windblown dust from soils, volcanoes, decaying vegetation, forest fires, and sea spray).

❑ Copper in soil strongly attaches to organic material and minerals.

❑ Copper that dissolves in water becomes rapidly bound to particles suspended in the water.

❑ Copper does not typically enter groundwater.

❑ Copper carried by particles emitted from smelters and ore processing plants is carried back to the ground by gravity or in rain or snow.

❑ Copper does not break down in the environment.

How might I be exposed to copper?

❑ Breathing air, drinking water, eating food, and by skin contact with soil, water, or other copper-containing substances.

❑ Some copper in the environment can be taken up by plants and animals.

❑ Higher exposure may occur if your water is corrosive and you have copper plumbing and brass water fixtures. ❑ You may be exposed to higher amounts of copper if you drink water or swim in lakes or reservoirs recently treated with copper to control algae or receive cooling water from a power plant that may have high amounts of dissolved copper.

❑ Using some garden products (e.g., fungicides) to control plant diseases.

❑ Living near bronze and brass production facilities may expose you to higher copper levels in soil.

❑ You may breathe copper-containing dust or have skin contact if you work in the industry of mining copper or

processing the ore. You may breathe high levels if you grind or weld copper metal.

How can copper affect my health?

Copper is essential for good health, but high amounts can be harmful. Long-term exposure to copper dust can irritate your nose, mouth, and eyes, and cause headaches, dizziness, nausea, and diarrhea.

Drinking water with higher than normal levels of copper may cause vomiting, diarrhea, stomach cramps, and nausea. Intentionally high intakes of copper can cause liver and kidney damage and even death.

How likely is copper to cause cancer?

We do not know whether copper can cause cancer in humans. The EPA has determined that copper is not classifiable as to carcinogenicity.

How can copper affect children?

Exposure to high levels of copper will result in the same type of effects in children and adults. Studies in animals suggest that the young children may have more severe effects than adults; we do not know if this would also be true in humans. There is a very small percentage of infants and children who are unusually sensitive to copper.

We do not know if copper can cause birth defects or other developmental effects in humans. Studies in animals suggest that ingestion of high levels of copper may cause a decrease in fetal growth.

How can families reduce the risk of exposure to copper?

❑ The greatest potential source of copper exposure is through drinking water, especially in water that is first drawn in the morning after sitting in copper pipes and brass faucets overnight.

❑ To reduce exposure, run the water for at least 15-30 seconds before using it.

❑ If you are exposed to copper at work, you may carry copper home on your skin, clothes, or tools. You can avoid this by showering, and changing clothing before leaving work, and your work clothes should be kept separate from other clothes and laundered separately.

Is there a medical test to show whether I've been exposed to copper?

Copper is normally found in all tissues of the body, blood, urine, feces, hair, and nails. High levels of copper in these samples can show that you have been exposed to higher than normal levels of copper. Tests to measure copper levels in the body are not routinely available at the doctor's office because they require special equipment. These tests cannot tell the extent of exposure or whether you will experience harmful effects.

Has the federal government made recommendations to protect human health?

The EPA has determined that drinking water should not contain more than 1.3 milligrams of copper per liter of water (1.3 mg/L).

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.1 mg per cubic meter (0.1 mg/m^3) of copper fumes (vapor generated from heating copper) and 1 mg/m^3 of copper dusts (fine metallic copper particles) and mists (aerosol of soluble copper) in workroom air during an 8-hour work shift, 40-hour workweek.

The Food and Nutrition Board of the Institute of Medicine recommends dietary allowances (RDAs) of 340 micrograms (340 µg) of copper per day for children aged 1-3 years, 440 µg/day for children aged 4-8 years, 700 µg/day for children aged 9-13 years, 890 µg/day for children aged 14-18 years, and 900 µg/day for adults.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ETHYLBENZENE
CAS # 100-41-4

Agency for Toxic Substances and Disease Registry ToxFAQs **June 1999**

This fact sheet answers the most frequently asked health questions (FAQs) about ethylbenzene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Ethylbenzene is a colorless liquid found in a number of products including gasoline and paints. Breathing very high levels can cause dizziness and throat and eye irritation. Ethylbenzene has been found in at least 731 of the 1,467 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is ethylbenzene?

(Pronounced ĕthʹ əl bĕnʹ zēnʹ)

Ethylbenzene is a colorless, flammable liquid that smells like gasoline. It is found in natural products such as coal tar and petroleum and is also found in manufactured products such as inks, insecticides, and paints.

Ethylbenzene is used primarily to make another chemical, styrene. Other uses include as a solvent, in fuels, and to make other chemicals.

What happens to ethylbenzene when it enters the environment?

- Ethylbenzene moves easily into the air from water and soil.
- It takes about 3 days for ethylbenzene to be broken down in air into other chemicals.
- Ethylbenzene may be released to water from industrial discharges or leaking underground storage tanks.
- In surface water, ethylbenzene breaks down by reacting with other chemicals found naturally in water.
- In soil, it is broken down by soil bacteria.

How might I be exposed to ethylbenzene?

- Breathing air containing ethylbenzene, particularly in areas near factories or highways.
- Drinking contaminated tap water.
- Working in an industry where ethylbenzene is used or made.
- Using products containing it, such as gasoline, carpet glues, varnishes, and paints.

How can ethylbenzene affect my health?

Limited information is available on the effects of ethylbenzene on people's health. The available information shows dizziness, throat and eye irritation, tightening of the chest, and a burning sensation in the eyes of people exposed to high levels of ethylbenzene in air.

Animals studies have shown effects on the nervous system, liver, kidneys, and eyes from breathing ethylbenzene in air.

How likely is ethylbenzene to cause cancer?

The EPA has determined that ethylbenzene is not classifiable as to human carcinogenicity.

ToxFAQs Internet address via WWW is http://www.atsdr.cdc.gov/toxfaq.html

No studies in people have shown that ethylbenzene exposure can result in cancer. Two available animal studies suggest that ethylbenzene may cause tumors.

How can ethylbenzene affect children?

Children may be exposed to ethylbenzene through inhalation of consumer products, including gasoline, paints, inks, pesticides, and carpet glue. We do not know whether children are more sensitive to the effects of ethylbenzene than adults.

It is not known whether ethylbenzene can affect the development of the human fetus. Animal studies have shown that when pregnant animals were exposed to ethylbenzene in air, their babies had an increased number of birth defects.

How can families reduce the risk of exposure to ethylbenzene?

Exposure to ethylbenzene vapors from household products and newly installed carpeting can be minimized by using adequate ventilation.

Household chemicals should be stored out of reach of children to prevent accidental poisoning. Always store household chemicals in their original containers; never store them in containers children would find attractive to eat or drink from, such as old soda bottles. Gasoline should be stored in a gasoline can with a locked cap.

Sometimes older children sniff household chemicals, including ethylbenzene, in an attempt to get high. Talk with your children about the dangers of sniffing chemicals.

Is there a medical test to show whether I've been exposed to ethylbenzene?

Ethylbenzene is found in the blood, urine, breath, and some body tissues of exposed people. The most common way to test for ethylbenzene is in the urine. This test measures substances formed by the breakdown of ethylbenzene. This test needs to be done within a few hours after exposure occurs, because the substances leave the body very quickly.

These tests can show you were exposed to ethylbenzene, but cannot predict the kind of health effects that might occur.

Has the federal government made recommendations to protect human health?

The EPA has set a maximum contaminant level of 0.7 milligrams of ethylbenzene per liter of drinking water (0.7 mg/L).

The EPA requires that spills or accidental releases into the environment of 1,000 pounds or more of ethylbenzene be reported to the EPA.

The Occupational Safety and Health Administration (OSHA) has set an occupational exposure limit of 100 parts of ethylbenzene per million parts of air (100 ppm) for an 8-hour workday, 40-hour workweek.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

FUEL OILS

CAS # 8008-20-6, 70892-10-3, 68476-30-2, 68476-34-6, 68476-31-3

This fact sheet answers the most frequently asked health questions (FAQs) about fuel oils. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Fuel oils are liquid mixtures produced from petroleum, and their use mostly involves burning them as fuels. Drinking or breathing fuel oils may cause nausea or nervous system effects. However, exposure under normal use conditions is not likely to be harmful. Fuel oils have been found in at least 26 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are fuel oils?

(Pronounced fyo͞o′əl oilz)

Fuel oils are a variety of yellowish to light brown liquid mixtures that come from crude petroleum. Some chemicals found in fuel oils may evaporate easily, while others may more easily dissolve in water.

Fuel oils are produced by different petroleum refining processes, depending on their intended uses. Fuel oils may be used as fuel for engines, lamps, heaters, furnaces, and stoves, or as solvents.

Some commonly found fuel oils include kerosene, diesel fuel, jet fuel, range oil, and home heating oil. These fuel oils differ from one another by their hydrocarbon compositions, boiling point ranges, chemical additives, and uses.

What happens to fuel oils when they enter the environment?

- Some chemicals found in fuel oils may evaporate into the air from open containers or contaminated soil or water.
- Some chemicals found in fuel oils may dissolve in water after spills to surface waters or leaks from underground storage tanks.
- Some chemicals found in fuel oils may stick to particles in water, which will eventually cause them to settle to the bottom sediment.
- Some of the chemicals found in fuel oils may be broken down slowly in air, water, and soil by sunlight or small organisms.
- Some of the chemicals found in fuel oils may build up significantly in plants and animals.

How might I be exposed to fuel oils?

- Using a home kerosene heater or stove, or using fuel oils at work.
- Breathing air in home or building basements that has been contaminated with fuel oil vapors entering from the soil.
- Drinking or swimming in water that has been contaminated with fuel oils from a spill or a leaking underground storage tank.
- Touching soil contaminated with fuel oils.
- Using fuel oils to wash paint or grease from skin or equipment.

How can fuel oils affect my health?

Little information is available about the health effects that may be caused by fuel oils. People who use kerosene

stoves for cooking do not seem to have any health problems related to their exposure.

Breathing some fuel oils for short periods may cause nausea, eye irritation, increased blood pressure, headache, lightheadedness, loss of appetite, poor coordination, and difficulty concentrating. Breathing diesel fuel vapors for long periods may cause kidney damage and lower your blood's ability to clot.

Drinking small amounts of kerosene may cause vomiting, diarrhea, coughing, stomach swelling and cramps, drowsiness, restlessness, painful breathing, irritability, and unconsciousness. Drinking large amounts of kerosene may cause convulsions, coma, or death. Skin contact with kerosene for short periods may cause itchy, red, sore, or peeling skin.

How likely are fuel oils to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that some fuel oils (heavy) may possibly cause cancer in humans, but for other fuel oils (light) there is not enough information to make a determination. IARC has also determined that occupational exposures to fuel oils during petroleum refining are probably carcinogenic in humans.

Some studies with mice have suggested that repeated contact with fuel oils may cause liver or skin cancer. However, other mouse studies have found this not to be the case. No studies are available in other animals or in people on the carcinogenic effects of fuel oils.

Is there a medical test to show whether I've been exposed to fuel oils?

There is no medical test that shows if you have been exposed to fuel oils. Tests are available to determine if some of the chemicals commonly found in fuel oils are in your blood. However, the presence of these chemicals in blood may not necessarily mean that you have been exposed to fuel oils.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) and the Air Force Office of Safety and Health (AFOSH) have set a permissible exposure level (PEL) of 400 parts of petroleum distillates per million parts of air (400 ppm) for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that average workplace air levels not exceed 350 milligrams of petroleum distillates per cubic meter of air (350 mg/m^3) for a 40-hour workweek.

The Department of Transportation (DOT) lists fuel oils as hazardous materials and, therefore, regulates their transportation.

Glossary

Carcinogenic: Able to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or a gas.

Hydrocarbon: Any compound made up of hydrogen and carbon.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

LEAD

CAS # 7439-92-1

Division of Toxicology and Environmental Medicine ToxFAQs™ **August 2007**

This fact sheet answers the most frequently asked health questions (FAQs) about lead. For more information, call the ATSDR Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to lead can happen from breathing workplace air or dust, eating contaminated foods, or drinking contaminated water. Children can be exposed from eating lead-based paint chips or playing in contaminated soil. Lead can damage the nervous system, kidneys, and reproductive system. Lead has been found in at least 1,272 of the 1,684 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is lead?

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Lead can be found in all parts of our environment. Much of it comes from human activities including burning fossil fuels, mining, and manufacturing.

Lead has many different uses. It is used in the production of batteries, ammunition, metal products (solder and pipes), and devices to shield X-rays. Because of health concerns, lead from paints and ceramic products, caulking, and pipe solder has been dramatically reduced in recent years. The use of lead as an additive to gasoline was banned in 1996 in the United States.

What happens to lead when it enters the environment?

- ❏ Lead itself does not break down, but lead compounds are changed by sunlight, air, and water.
- ❏ When lead is released to the air, it may travel long distances before settling to the ground.
- ❏ Once lead falls onto soil, it usually sticks to soil particles.
- ❏ Movement of lead from soil into groundwater will depend on the type of lead compound and the characteristics of the soil.

How might I be exposed to lead?

- ❏ Eating food or drinking water that contains lead. Water pipes in some older homes may contain lead solder. Lead can leach out into the water.
- ❏ Spending time in areas where lead-based paints have been used and are deteriorating. Deteriorating lead paint can contribute to lead dust.
- ❏ Working in a job where lead is used or engaging in certain hobbies in which lead is used, such as making stained glass.
- ❏ Using health-care products or folk remedies that contain lead.

How can lead affect my health?

The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the nervous system, both in adults and children. Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high levels of exposure to lead may cause miscarriage. High-level exposure in men can damage the organs responsible for sperm production.

How likely is lead to cause cancer?

We have no conclusive proof that lead causes cancer in humans. Kidney tumors have developed in rats and mice that had been given large doses of some kind of lead compounds. The Department of Health and Human Services

(DHHS) has determined that lead and lead compounds are reasonably anticipated to be human carcinogens and the EPA has determined that lead is a probable human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic lead is probably carcinogenic to humans and that there is insufficient information to determine whether organic lead compounds will cause cancer in humans.

How can lead affect children?

Small children can be exposed by eating lead-based paint chips, chewing on objects painted with lead-based paint, or swallowing house dust or soil that contains lead.

Children are more vulnerable to lead poisoning than adults. A child who swallows large amounts of lead may develop blood anemia, severe stomachache, muscle weakness, and brain damage. If a child swallows smaller amounts of lead, much less severe effects on blood and brain function may occur. Even at much lower levels of exposure, lead can affect a child's mental and physical growth.

Exposure to lead is more dangerous for young and unborn children. Unborn children can be exposed to lead through their mothers. Harmful effects include premature births, smaller babies, decreased mental ability in the infant, learning difficulties, and reduced growth in young children. These effects are more common if the mother or baby was exposed to high levels of lead. Some of these effects may persist beyond childhood.

How can families reduce the risks of exposure to lead?

❑ Avoid exposure to sources of lead.

❑ Do not allow children to chew or mouth surfaces that may have been painted with lead-based paint.

❑ If you have a water lead problem, run or flush water that has been standing overnight before drinking or cooking with it.

❑ Some types of paints and pigments that are used as make-up or hair coloring contain lead. Keep these kinds of products away from children

❑ If your home contains lead-based paint or you live in an area contaminated with lead, wash children's hands and faces often to remove lead dusts and soil, and regularly clean the house of dust and tracked in soil.

Is there a medical test to determine whether I've been exposed to lead?

A blood test is available to measure the amount of lead in your blood and to estimate the amount of your recent exposure to lead. Blood tests are commonly used to screen children for lead poisoning. Lead in teeth or bones can be measured by X-ray techniques, but these methods are not widely available. Exposure to lead also can be evaluated by measuring erythrocyte protoporphyrin (EP) in blood samples. EP is a part of red blood cells known to increase when the amount of lead in the blood is high. However, the EP level is not sensitive enough to identify children with elevated blood lead levels below about 25 micrograms per deciliter (μg/dL). These tests usually require special analytical equipment that is not available in a doctor's office. However, your doctor can draw blood samples and send them to appropriate laboratories for analysis.

Has the federal government made recommendations to protect human health?

The Centers for Disease Control and Prevention (CDC) recommends that states test children at ages 1 and 2 years. Children should be tested at ages 3–6 years if they have never been tested for lead, if they receive services from public assistance programs for the poor such as Medicaid or the Supplemental Food Program for Women, Infants, and Children, if they live in a building or frequently visit a house built before 1950; if they visit a home (house or apartment) built before 1978 that has been recently remodeled; and/or if they have a brother, sister, or playmate who has had lead poisoning. CDC considers a blood lead level of 10 μg/dL to be a level of concern for children.

EPA limits lead in drinking water to 15 μg per liter.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

MERCURY
CAS # 7439-97-6

This fact sheet answers the most frequently asked health questions (FAQs) about mercury. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to mercury occurs from breathing contaminated air, ingesting contaminated water and food, and having dental and medical treatments. Mercury, at high levels, may damage the brain, kidneys, and developing fetus. This chemical has been found in at least 714 of 1,467 National Priorities List sites identified by the Environmental Protection Agency.

What is mercury?

(Pronounced mŭr′kyə-rē)

Mercury is a naturally occurring metal which has several forms. The metallic mercury is a shiny, silver-white, odorless liquid. If heated, it is a colorless, odorless gas.

Mercury combines with other elements, such as chlorine, sulfur, or oxygen, to form inorganic mercury compounds or "salts," which are usually white powders or crystals. Mercury also combines with carbon to make organic mercury compounds. The most common one, methylmercury, is produced mainly by microscopic organisms in the water and soil. More mercury in the environment can increase the amounts of methylmercury that these small organisms make.

Metallic mercury is used to produce chlorine gas and caustic soda, and is also used in thermometers, dental fillings, and batteries. Mercury salts are sometimes used in skin lightening creams and as antiseptic creams and ointments.

What happens to mercury when it enters the environment?

- Inorganic mercury (metallic mercury and inorganic mercury compounds) enters the air from mining ore deposits, burning coal and waste, and from manufacturing plants.
- It enters the water or soil from natural deposits, disposal of wastes, and volcanic activity.
- Methylmercury may be formed in water and soil by small organisms called bacteria.
- Methylmercury builds up in the tissues of fish. Larger and older fish tend to have the highest levels of mercury.

How might I be exposed to mercury?

- Eating fish or shellfish contaminated with methylmercury.
- Breathing vapors in air from spills, incinerators, and industries that burn mercury-containing fuels.
- Release of mercury from dental work and medical treatments.
- Breathing contaminated workplace air or skin contact during use in the workplace (dental, health services, chemical, and other industries that use mercury).
- Practicing rituals that include mercury.

How can mercury affect my health?

The nervous system is very sensitive to all forms of mercury. Methylmercury and metallic mercury vapors are more harmful than other forms, because more mercury in these forms reaches the brain. Exposure to high levels of metallic, inorganic, or organic mercury can permanently damage the brain, kidneys, and developing fetus. Effects on brain functioning may result in irritability, shyness, tremors, changes in vision or hearing, and memory problems.

Short-term exposure to high levels of metallic mercury vapors may cause effects including lung damage, nausea,

vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes, and eye irritation.

How likely is mercury to cause cancer?

There are inadequate human cancer data available for all forms of mercury. Mercuric chloride has caused increases in several types of tumors in rats and mice, and methylmercury has caused kidney tumors in male mice. The EPA has determined that mercuric chloride and methylmercury are possible human carcinogens.

How can mercury affect children?

Very young children are more sensitive to mercury than adults. Mercury in the mother's body passes to the fetus and may accumulate there. It can also can pass to a nursing infant through breast milk. However, the benefits of breast feeding may be greater than the possible adverse effects of mercury in breast milk.

Mercury's harmful effects that may be passed from the mother to the fetus include brain damage, mental retardation, incoordination, blindness, seizures, and inability to speak. Children poisoned by mercury may develop problems of their nervous and digestive systems, and kidney damage.

How can families reduce the risk of exposure to mercury?

Carefully handle and dispose of products that contain mercury, such as thermometers or fluorescent light bulbs. Do not vacuum up spilled mercury, because it will vaporize and increase exposure. If a large amount of mercury has been spilled, contact your health department. Teach children not to play with shiny, silver liquids.

Properly dispose of older medicines that contain mercury. Keep all mercury-containing medicines away from children.

Pregnant women and children should keep away from rooms where liquid mercury has been used.

Learn about wildlife and fish advisories in your area from your public health or natural resources department.

Is there a medical test to show whether I've been exposed to mercury?

Tests are available to measure mercury levels in the body. Blood or urine samples are used to test for exposure to metallic mercury and to inorganic forms of mercury. Mercury in whole blood or in scalp hair is measured to determine exposure to methylmercury. Your doctor can take samples and send them to a testing laboratory.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 2 parts of mercury per billion parts of drinking water (2 ppb).

The Food and Drug Administration (FDA) has set a maximum permissible level of 1 part of methylmercury in a million parts of seafood (1 ppm).

The Occupational Safety and Health Administration (OSHA) has set limits of 0.1 milligram of organic mercury per cubic meter of workplace air (0.1 mg/m^3) and 0.05 mg/m^3 of metallic mercury vapor for 8-hour shifts and 40-hour work weeks.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

POLYCYCLIC AROMATIC HYDROCARBONS (PAHs)

Agency for Toxic Substances and Disease Registry ToxFAQs **September 1996**

This fact sheet answers the most frequently asked health questions (FAQs) about polycyclic aromatic hydrocarbons (PAHs). For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to polycyclic aromatic hydrocarbons usually occurs by breathing air contaminated by wild fires or coal tar, or by eating foods that have been grilled. PAHs have been found in at least 600 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polycyclic aromatic hydrocarbons?

(Pronounced pŏl′ĭ-sī′klĭk ăr′ə-măt′ĭk hī′drə-kar′bənz)

Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale yellow-green solids. PAHs are found in coal tar, crude oil, creosote, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides.

What happens to PAHs when they enter the environment?

- PAHs enter the air mostly as releases from volcanoes, forest fires, burning coal, and automobile exhaust.
- PAHs can occur in air attached to dust particles.
- Some PAH particles can readily evaporate into the air from soil or surface waters.
- PAHs can break down by reacting with sunlight and other chemicals in the air, over a period of days to weeks.
- PAHs enter water through discharges from industrial and wastewater treatment plants.
- Most PAHs do not dissolve easily in water. They stick to solid particles and settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or water after a period of weeks to months.
- In soils, PAHs are most likely to stick tightly to particles; certain PAHs move through soil to contaminate underground water.
- PAH contents of plants and animals may be much higher than PAH contents of soil or water in which they live.

How might I be exposed to PAHs?

- Breathing air containing PAHs in the workplace of coking, coal-tar, and asphalt production plants; smokehouses; and municipal trash incineration facilities.
- Breathing air containing PAHs from cigarette smoke, wood smoke, vehicle exhausts, asphalt roads, or agricultural burn smoke.
- Coming in contact with air, water, or soil near hazardous waste sites.
- Eating grilled or charred meats; contaminated cereals, flour, bread, vegetables, fruits, meats; and processed or pickled foods.
- Drinking contaminated water or cow's milk.

- Nursing infants of mothers living near hazardous waste sites may be exposed to PAHs through their mother's milk.

How can PAHs affect my health?

Mice that were fed high levels of one PAH during pregnancy had difficulty reproducing and so did their offspring. These offspring also had higher rates of birth defects and lower body weights. It is not known whether these effects occur in people.

Animal studies have also shown that PAHs can cause harmful effects on the skin, body fluids, and ability to fight disease after both short- and long-term exposure. But these effects have not been seen in people.

How likely are PAHs to cause cancer?

The Department of Health and Human Services (DHHS) has determined that some PAHs may reasonably be expected to be carcinogens.

Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer).

Is there a medical test to show whether I've been exposed to PAHs?

In the body, PAHs are changed into chemicals that can attach to substances within the body. There are special tests that can detect PAHs attached to these substances in body tissues or blood. However, these tests cannot tell whether any health effects will occur or find out the extent or source of your exposure to the PAHs. The tests aren't usually available in your doctor's office because special equipment is needed to conduct them.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m^3). The OSHA Permissible Exposure Limit (PEL) for mineral oil mist that contains PAHs is 5 mg/m^3 averaged over an 8-hour exposure period.

The National Institute for Occupational Safety and Health (NIOSH) recommends that the average workplace air levels for coal tar products not exceed 0.1 mg/m^3 for a 10-hour workday, within a 40-hour workweek. There are other limits for workplace exposure for things that contain PAHs, such as coal, coal tar, and mineral oil.

Glossary

Carcinogen: A substance that can cause cancer.

Ingest: Take food or drink into your body.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

TRICHLOROETHYLENE

CAS # 79-01-6

Division of Toxicology ToxFAQs™ **July 2003**

This fact sheet answers the most frequently asked health questions (FAQs) about trichloroethylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Trichloroethylene is a colorless liquid which is used as a solvent for cleaning metal parts. Drinking or breathing high levels of trichloroethylene may cause nervous system effects, liver and lung damage, abnormal heartbeat, coma, and possibly death. Trichloroethylene has been found in at least 852 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is trichloroethylene?

Trichloroethylene (TCE) is a nonflammable, colorless liquid with a somewhat sweet odor and a sweet, burning taste. It is used mainly as a solvent to remove grease from metal parts, but it is also an ingredient in adhesives, paint removers, typewriter correction fluids, and spot removers.

Trichloroethylene is not thought to occur naturally in the environment. However, it has been found in underground water sources and many surface waters as a result of the manufacture, use, and disposal of the chemical.

What happens to trichloroethylene when it enters the environment?

- Trichloroethylene dissolves a little in water, but it can remain in ground water for a long time.
- Trichloroethylene quickly evaporates from surface water, so it is commonly found as a vapor in the air.
- Trichloroethylene evaporates less easily from the soil than from surface water. It may stick to particles and remain for a long time.
- Trichloroethylene may stick to particles in water, which will cause it to eventually settle to the bottom sediment.
- Trichloroethylene does not build up significantly in plants and animals.

How might I be exposed to trichloroethylene?

- Breathing air in and around the home which has been contaminated with trichloroethylene vapors from shower water or household products such as spot removers and typewriter correction fluid.
- Drinking, swimming, or showering in water that has been contaminated with trichloroethylene.
- Contact with soil contaminated with trichloroethylene, such as near a hazardous waste site.
- Contact with the skin or breathing contaminated air while manufacturing trichloroethylene or using it at work to wash paint or grease from skin or equipment.

How can trichloroethylene affect my health?

Breathing small amounts may cause headaches, lung irritation, dizziness, poor coordination, and difficulty concentrating.

Breathing large amounts of trichloroethylene may cause impaired heart function, unconsciousness, and death. Breathing it for long periods may cause nerve, kidney, and liver damage.

ToxFAQs™ Internet address is http://www.atsdr.cdc.gov/toxfaq.html

Drinking large amounts of trichloroethylene may cause nausea, liver damage, unconsciousness, impaired heart function, or death.

Drinking small amounts of trichloroethylene for long periods may cause liver and kidney damage, impaired immune system function, and impaired fetal development in pregnant women, although the extent of some of these effects is not yet clear.

Skin contact with trichloroethylene for short periods may cause skin rashes.

How likely is trichloroethylene to cause cancer?

Some studies with mice and rats have suggested that high levels of trichloroethylene may cause liver, kidney, or lung cancer. Some studies of people exposed over long periods to high levels of trichloroethylene in drinking water or in workplace air have found evidence of increased cancer. Although, there are some concerns about the studies of people who were exposed to trichloroethylene, some of the effects found in people were similar to effects in animals.

In its 9th Report on Carcinogens, the National Toxicology Program (NTP) determined that trichloroethylene is "reasonably anticipated to be a human carcinogen." The International Agency for Research on Cancer (IARC) has determined that trichloroethylene is "probably carcinogenic to humans."

Is there a medical test to show whether I've been exposed to trichloroethylene?

If you have recently been exposed to trichloroethylene, it can be detected in your breath, blood, or urine. The breath test, if it is performed soon after exposure, can tell if you have been exposed to even a small amount of trichloroethylene.

Exposure to larger amounts is assessed by blood and urine tests, which can detect trichloroethylene and many of its breakdown products for up to a week after exposure. However, exposure to other similar chemicals can produce the same breakdown products, so their detection is not absolute proof of exposure to trichloroethylene. This test isn't available at most doctors' offices, but can be done at special laboratories that have the right equipment.

Has the federal government made recommendations to protect human health?

The EPA has set a maximum contaminant level for trichloroethylene in drinking water at 0.005 milligrams per liter (0.005 mg/L) or 5 parts of TCE per billion parts water.

The EPA has also developed regulations for the handling and disposal of trichloroethylene.

The Occupational Safety and Health Administration (OSHA) has set an exposure limit of 100 parts of trichloroethylene per million parts of air (100 ppm) for an 8-hour workday, 40-hour workweek.

Glossary

Carcinogenicity: The ability of a substance to cause cancer.
CAS: Chemical Abstracts Service.
Evaporate: To change into a vapor or gas.
Milligram (mg): One thousandth of a gram.
Nonflammable: Will not burn.
ppm: Parts per million.
Sediment: Mud and debris that have settled to the bottom of a body of water.
Solvent: A chemical that dissolves other substances.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

TETRACHLOROETHYLENE
CAS # 127-18-4

This fact sheet answers the most frequently asked health questions (FAQs) about tetrachloroethylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Tetrachloroethylene is a manufactured chemical used for dry cleaning and metal degreasing. Exposure to very high concentrations of tetrachloroethylene can cause dizziness, headaches, sleepiness, confusion, nausea, difficulty in speaking and walking, unconsciousness, and death. Tetrachloroethylene has been found in at least 771 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is tetrachloroethylene?

(Pronounced tĕt′rə-klôr′ ō-ĕth′ə-lēn′)

Tetrachloroethylene is a manufactured chemical that is widely used for dry cleaning of fabrics and for metal-degreasing. It is also used to make other chemicals and is used in some consumer products.

Other names for tetrachloroethylene include perchloroethylene, PCE, and tetrachloroethene. It is a nonflammable liquid at room temperature. It evaporates easily into the air and has a sharp, sweet odor. Most people can smell tetrachloroethylene when it is present in the air at a level of 1 part tetrachloroethylene per million parts of air (1 ppm) or more, although some can smell it at even lower levels.

What happens to tetrachloroethylene when it enters the environment?

- Much of the tetrachloroethylene that gets into water or soil evaporates into the air.
- Microorganisms can break down some of the tetrachloroethylene in soil or underground water.
- In the air, it is broken down by sunlight into other chemicals or brought back to the soil and water by rain.
- It does not appear to collect in fish or other animals that live in water.

How might I be exposed to tetrachloroethylene?

- When you bring clothes from the dry cleaners, they will release small amounts of tetrachloroethylene into the air.
- When you drink water containing tetrachloroethylene, you are exposed to it.

How can tetrachloroethylene affect my health?

High concentrations of tetrachloroethylene (particularly in closed, poorly ventilated areas) can cause dizziness, headache, sleepiness, confusion, nausea, difficulty in speaking and walking, unconsciousness, and death.

Irritation may result from repeated or extended skin contact with it. These symptoms occur almost entirely in work (or hobby) environments when people have been accidentally exposed to high concentrations or have intentionally used tetrachloroethylene to get a "high."

In industry, most workers are exposed to levels lower than those causing obvious nervous system effects. The health effects of breathing in air or drinking water with low levels of tetrachloroethylene are not known.

Results from some studies suggest that women who work in dry cleaning industries where exposures to tetrachloroethyl-

ene can be quite high may have more menstrual problems and spontaneous abortions than women who are not exposed. However, it is not known if tetrachloroethylene was responsible for these problems because other possible causes were not considered.

Results of animal studies, conducted with amounts much higher than those that most people are exposed to, show that tetrachloroethylene can cause liver and kidney damage. Exposure to very high levels of tetrachloroethylene can be toxic to the unborn pups of pregnant rats and mice. Changes in behavior were observed in the offspring of rats that breathed high levels of the chemical while they were pregnant.

How likely is tetrachloroethylene to cause cancer?

The Department of Health and Human Services (DHHS) has determined that tetrachloroethylene may reasonably be anticipated to be a carcinogen. Tetrachloroethylene has been shown to cause liver tumors in mice and kidney tumors in male rats.

Is there a medical test to show whether I've been exposed to tetrachloroethylene?

One way of testing for tetrachloroethylene exposure is to measure the amount of the chemical in the breath, much the same way breath-alcohol measurements are used to determine the amount of alcohol in the blood.

Because it is stored in the body's fat and slowly released into the bloodstream, tetrachloroethylene can be detected in the breath for weeks following a heavy exposure.

Tetrachloroethylene and trichloroacetic acid (TCA), a breakdown product of tetrachloroethylene, can be detected in the blood. These tests are relatively simple to perform. These tests aren't available at most doctors' offices, but can be performed at special laboratories that have the right equipment.

Because exposure to other chemicals can produce the same breakdown products in the urine and blood, the tests for breakdown products cannot determine if you have been exposed to tetrachloroethylene or the other chemicals.

Has the federal government made recommendations to protect human health?

The EPA maximum contaminant level for the amount of tetrachloroethylene that can be in drinking water is 0.005 milligrams tetrachloroethylene per liter of water (0.005 mg/L).

The Occupational Safety and Health Administration (OSHA) has set a limit of 100 ppm for an 8-hour workday over a 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that tetrachloroethylene be handled as a potential carcinogen and recommends that levels in workplace air should be as low as possible.

Glossary

Carcinogen: A substance with the ability to cause cancer.

CAS: Chemical Abstracts Service.

Milligram (mg): One thousandth of a gram.

Nonflammable: Will not burn.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

TOLUENE
CAS # 108-88-3

Division of Toxicology ToxFAQs™ **February 2001**

This fact sheet answers the most frequently asked health questions (FAQs) about toluene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to toluene occurs from breathing contaminated workplace air, in automobile exhaust, some consumer products paints, paint thinners, fingernail polish, lacquers, and adhesives. Toluene affects the nervous system. Toluene has been found at 959 of the 1,591 National Priority List sites identified by the Environmental Protection Agency

What is toluene?

Toluene is a clear, colorless liquid with a distinctive smell. Toluene occurs naturally in crude oil and in the tolu tree. It is also produced in the process of making gasoline and other fuels from crude oil and making coke from coal.

Toluene is used in making paints, paint thinners, fingernail polish, lacquers, adhesives, and rubber and in some printing and leather tanning processes.

What happens to toluene when it enters the environment?

❑ Toluene enters the environment when you use materials that contain it. It can also enter surface water and groundwater from spills of solvents and petrolieum products as well as from leasking underground storage tanks at gasoline stations and other facilities.

❑ When toluene-containing products are placed in landfills or waste disposal sites, the toluene can enter the soil or water near the waste site.

❑ Toluene does not usually stay in the environment long.

❑ Toluene does not concentrate or buildup to high levels in animals.

How might I be exposed to toluene?

❑ Breathing contaminated workplace air or automobile exhaust.

❑ Working with gasoline, kerosene, heating oil, paints, and lacquers.

❑ Drinking contaminated well-water.

❑ Living near uncontrolled hazardous waste sites containing toluene products.

How can toluene affect my health?

Toluene may affect the nervous system. Low to moderate levles can cause tiredness, confusion, weakness, drunken-type actions, memory loss, nausea, loss of appetite, and

hearing and color vision loss. These symptoms usually disappear when exposure is stopped.

Inhaling High levels of toluene in a short time can make you feel light-headed, dizzy, or sleepy. It can also cause unconsciousness, and even death.

High levels of toluene may affect your kidneys.

How likely is toluene to cause cancer?

Studies in humans and animals generally indicate that toluene does not cause cancer.

The EPA has determined that the carcinogenicity of toluene can not be classified.

How can toluene affect children?

It is likely that health effects seen in children exposed to toluene will be similar to the effects seen in adults. Some studies in animals suggest that babies may be more sensitive than adults.

Breathing very high levels of toluene during pregnancy can result in children with birth defects and retard mental abilities, and growth. We do not know if toluene harms the unborn child if the mother is exposed to low levels of toluene during pregnancy.

How can families reduce the risk of exposure to toluene?

❑ Use toluene-containing products in well-ventilated areas.

❑ When not in use, toluene-containing products should be tightly covered to prevent evaporation into the air.

Is there a medical test to show whether I've been exposed to toluene?

There are tests to measure the level of toluene or its breakdown products in exhaled air, urine, and blood. To determine if you have been exposed to toluene, your urine or blood must be checked within 12 hours of exposure. Several other chemicals are also changed into the same breakdown products as toluene, so some of these tests are not specific for toluene.

Has the federal government made recommendations to protect human health?

EPA has set a limit of 1 milligram per liter of drinking water (1 mg/L).

Discharges, releases, or spills of more than 1,000 pounds of toluene must be reported to the National Response Center.

The Occupational Safety and Health Administration has set a limit of 200 parts toluene per million of workplace air (200 ppm).

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

VINYL CHLORIDE

CAS # 75-01-4

Division of Toxicology and Environmental Medicine ToxFAQs™ **July 2006**

This fact sheet answers the most frequently asked health questions (FAQs) about vinyl chloride. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to vinyl chloride occurs mainly in the workplace. Breathing high levels of vinyl chloride for short periods of time can cause dizziness, sleepiness, unconsciousness, and at extremely high levels can cause death. Breathing vinyl chloride for long periods of time can result in permanent liver damage, immune reactions, nerve damage, and liver cancer. This substance has been found in at least 616 of the 1,662 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is vinyl chloride?

Vinyl chloride is a colorless gas. It burns easily and it is not stable at high temperatures. It has a mild, sweet odor. It is a manufactured substance that does not occur naturally. It can be formed when other substances such as trichloroethane, trichloroethylene, and tetrachloroethylene are broken down. Vinyl chloride is used to make polyvinyl chloride (PVC). PVC is used to make a variety of plastic products, including pipes, wire and cable coatings, and packaging materials.

Vinyl chloride is also known as chloroethene, chloroethylene, and ethylene monochloride.

What happens to vinyl chloride when it enters the environment?

❑ Liquid vinyl chloride evaporates easily. Vinyl chloride in water or soil evaporates rapidly if it is near the surface.
❑ Vinyl chloride in the air breaks down in a few days to other substances, some of which can be harmful.
❑ Small amounts of vinyl chloride can dissolve in water.
❑ Vinyl chloride is unlikely to build up in plants or animals that you might eat.

How might I be exposed to vinyl chloride?

❑ Breathing vinyl chloride that has been released from plastics industries, hazardous waste sites, and landfills.
❑ Breathing vinyl chloride in air or during contact with your skin or eyes in the workplace.
❑ Drinking water from contaminated wells.

How can vinyl chloride affect my health?

Breathing high levels of vinyl chloride can cause you to feel dizzy or sleepy. Breathing very high levels can cause you to pass out, and breathing extremely high levels can cause death.

Some people who have breathed vinyl chloride for several years have changes in the structure of their livers. People are more likely to develop these changes if they breathe high levels of vinyl chloride. Some people who work with vinyl chloride have nerve damage and develop immune reactions. The lowest levels that produce liver changes, nerve damage, and immune reaction in people are not known. Some workers exposed to very high levels of vinyl chloride have problems with the blood flow in their hands. Their fingers turn white and hurt when they go into the cold.

The effects of drinking high levels of vinyl chloride are unknown. If you spill vinyl chloride on your skin, it will cause numbness, redness, and blisters.

Animal studies have shown that long-term exposure to vinyl chloride can damage the sperm and testes.

How likely is vinyl chloride to cause cancer?

The U.S. Department of Health and Human Services has determined that vinyl chloride is a known carcinogen. Studies in workers who have breathed vinyl chloride over many years showed an increased risk of liver, brain, lung cancer, and some cancers of the blood have also been observed in workers.

How can vinyl chloride affect children?

It has not been proven that vinyl chloride causes birth defects in humans, but studies in animals suggest that vinyl chloride might affect growth and development. Animal studies also suggest that infants and young children might be more susceptible than adults to vinyl chloride-induced cancer.

How can families reduce the risk of exposure to vinyl chloride?

Tobacco smoke contains low levels of vinyl chloride, so limiting your family's exposure to cigarette or cigar smoke may help reduce their exposure to vinyl chloride.

Is there a medical test to show whether I've been exposed to vinyl chloride?

The results of several tests can sometimes show if you have been exposed to vinyl chloride. Vinyl chloride can be measured in your breath, but the test must be done shortly after exposure. This is not helpful for measuring very low levels of vinyl chloride.

The amount of the major breakdown product of vinyl chloride, thiodiglycolic acid, in the urine may give some information about exposure. However, this test must be done shortly after exposure and does not reliably indicate the level of exposure.

Has the federal government made recommendations to protect human health?

Vinyl chloride is regulated in drinking water, food, and air. The EPA requires that the amount of vinyl chloride in drinking water not exceed 0.002 milligrams per liter (mg/L) of water.

The Occupational Safety and Health Administration (OSHA) has set a limit of 1 part vinyl chloride per 1 million parts of air (1 ppm) in the workplace.

The Food and Drug Administration (FDA) regulates the vinyl chloride content of various plastics. These include plastics that carry liquids and plastics that contact food. The limits for vinyl chloride content vary depending on the nature of the plastic and its use.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

XYLENE
CAS # 1330-20-7

This fact sheet answers the most frequently asked health questions (FAQs) about xylene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to xylene occurs in the workplace and when you use paint, gasoline, paint thinners and other products that contain it. People who breathe high levels may have dizziness, confusion, and a change in their sense of balance. This substance has been found in at least 658 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is xylene?

(Pronounced zī′lēn)

Xylene is a colorless, sweet-smelling liquid that catches on fire easily. It occurs naturally in petroleum and coal tar and is formed during forest fires. You can smell xylene in air at 0.08–3.7 parts of xylene per million parts of air (ppm) and begin to taste it in water at 0.53–1.8 ppm.

Chemical industries produce xylene from petroleum. It's one of the top 30 chemicals produced in the United States in terms of volume.

Xylene is used as a solvent and in the printing, rubber, and leather industries. It is also used as a cleaning agent, a thinner for paint, and in paints and varnishes. It is found in small amounts in airplane fuel and gasoline.

What happens to xylene when it enters the environment?

- Xylene has been found in waste sites and landfills when discarded as used solvent, or in varnish, paint, or paint thinners.
- It evaporates quickly from the soil and surface water into the air.
- In the air, it is broken down by sunlight into other less harmful chemicals.
- It is broken down by microorganisms in soil and water.
- Only a small amount of it builds up in fish, shellfish, plants, and animals living in xylene-contaminated water.

How might I be exposed to xylene?

- Breathing xylene in workplace air or in automobile exhaust.
- Breathing contaminated air.
- Touching gasoline, paint, paint removers, varnish, shellac, and rust preventatives that contain it.
- Breathing cigarette smoke that has small amounts of xylene in it.
- Drinking contaminated water or breathing air near waste sites and landfills that contain xylene.
- The amount of xylene in food is likely to be low.

How can xylene affect my health?

Xylene affects the brain. High levels from exposure for short periods (14 days or less) or long periods (more than 1 year) can cause headaches, lack of muscle coordination, dizziness, confusion, and changes in one's sense of balance. Exposure of

people to high levels of xylene for short periods can also cause irritation of the skin, eyes, nose, and throat; difficulty in breathing; problems with the lungs; delayed reaction time; memory difficulties; stomach discomfort; and possibly changes in the liver and kidneys. It can cause unconsciousness and even death at very high levels.

Studies of unborn animals indicate that high concentrations of xylene may cause increased numbers of deaths, and delayed growth and development. In many instances, these same concentrations also cause damage to the mothers. We do not know if xylene harms the unborn child if the mother is exposed to low levels of xylene during pregnancy.

How likely is xylene to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that xylene is not classifiable as to its carcinogenicity in humans.

Human and animal studies have not shown xylene to be carcinogenic, but these studies are not conclusive and do not provide enough information to conclude that xylene does not cause cancer.

Is there a medical test to show whether I've been exposed to xylene?

Laboratory tests can detect xylene or its breakdown products in exhaled air, blood, or urine. There is a high degree of agreement between the levels of exposure to xylene and the levels of xylene breakdown products in the urine. However, a urine sample must be provided very soon after exposure ends because xylene quickly leaves the body. These tests are not routinely available at your doctor's office.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 10 ppm of xylene in drinking water.

The EPA requires that spills or accidental releases of xylenes into the environment of 1,000 pounds or more must be reported.

The Occupational Safety and Health Administration (OSHA) has set a maximum level of 100 ppm xylene in workplace air for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) and the American Conference of Governmental Industrial Hygienists (ACGIH) also recommend exposure limits of 100 ppm in workplace air.

NIOSH has recommended that 900 ppm of xylene be considered immediately dangerous to life or health. This is the exposure level of a chemical that is likely to cause permanent health problems or death.

Glossary

Evaporate: To change from a liquid into a vapor or a gas.

Carcinogenic: Having the ability to cause cancer.

CAS: Chemical Abstracts Service.

ppm: Parts per million.

Solvent: A liquid that can dissolve other substances.

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

ZINC
CAS # 7440-66-6

Division of Toxicology ToxFAQs™ **August 2005**

This fact sheet answers the most frequently asked health questions (FAQs) about zinc. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Zinc is a naturally occurring element. Exposure to high levels of zinc occurs mostly from eating food, drinking water, or breathing workplace air that is contaminated. Low levels of zinc are essential for maintaining good health. Exposure to large amounts of zinc can be harmful. It can cause stomach cramps, anemia, and changes in cholesterol levels. Zinc has been found in at least 985 of the 1,662 National Priority List sites identified by the Environmental Protection Agency (EPA).

What is zinc?

Zinc is one of the most common elements in the earth's crust. It is found in air, soil, and water, and is present in all foods. Pure zinc is a bluish-white shiny metal.

Zinc has many commercial uses as coatings to prevent rust, in dry cell batteries, and mixed with other metals to make alloys like brass, and bronze. A zinc and copper alloy is used to make pennies in the United States.

Zinc combines with other elements to form zinc compounds. Common zinc compounds found at hazardous waste sites include zinc chloride, zinc oxide, zinc sulfate, and zinc sulfide. Zinc compounds are widely used in industry to make paint, rubber, dyes, wood preservatives, and ointments.

What happens to zinc when it enters the environment?

❏ Some is released into the environment by natural processes, but most comes from human activities like mining, steel production, coal burning, and burning of waste.
❏ It attaches to soil, sediments, and dust particles in the air.
❏ Rain and snow remove zinc dust particles from the air.
❏ Depending on the type of soil, some zinc compounds can move into the groundwater and into lakes, streams, and rivers.
❏ Most of the zinc in soil stays bound to soil particles and does not dissolve in water.
❏ It builds up in fish and other organisms, but it does not build up in plants.

How might I be exposed to zinc?

❏ Ingesting small amounts present in your food and water.
❏ Drinking contaminated water or a beverage that has been stored in metal containers or flows through pipes that have been coated with zinc to resist rust.
❏ Eating too many dietary supplements that contain zinc.
❏ Working on any of the following jobs: construction, painting, automobile mechanics, mining, smelting, and welding; manufacture of brass, bronze, or other zinc-containing alloys; manufacture of galvanized metals; and manufacture of machine parts, rubber, paint, linoleum, oilcloths, batteries, some kind of glass, ceramics, and dyes.

How can zinc affect my health?

Zinc is an essential element in our diet. Too little zinc can cause problems, but too much zinc is also harmful.

Harmful effects generally begin at levels 10-15 times higher than the amount needed for good health. Large doses taken by mouth even for a short time can cause stomach cramps, nausea, and vomiting. Taken longer, it can cause anemia and decrease the levels of your good cholesterol. We do not know if high levels of zinc affect reproduction in humans. Rats that were fed large amounts of zinc became infertile.

Inhaling large amounts of zinc (as dusts or fumes) can cause a specific short-term disease called metal fume fever. We do not know the long-term effects of breathing high levels of zinc.

Putting low levels of zinc acetate and zinc chloride on the skin of rabbits, guinea pigs, and mice caused skin irritation. Skin irritation will probably occur in people.

How likely is zinc to cause cancer?

The Department of Health and Human Services (DHHS) and the International Agency for Research on Cancer (IARC) have not classified zinc for carcinogenicity. Based on incomplete information from human and animal studies, the EPA has determined that zinc is not classifiable as to its human carcinogenicity.

How can zinc affect children?

Zinc is essential for proper growth and development of young children. It is likely that children exposed to very high levels of zinc will have similar effects as adults. We do not know whether children are more susceptible to the effects of excessive intake of zinc than the adults.

We do not know if excess zinc can cause developmental effects in humans. Animal studies have found decreased weight in the offspring of animals that ingested very high amounts of zinc.

How can families reduce the risks of exposure to zinc?

❑ Children living near waste sites that contain zinc may be exposed to higher levels of zinc through breathing contaminated air, drinking contaminated drinking water, touching or eating contaminated soil.

❑ Discourage your children from eating soil or putting their hands in their mouths and teach them to wash their hands frequently and before eating.

❑ If you use medicines or vitamin supplements containing zinc, make sure you use them appropriately and keep them out of the reach of children.

Is there a medical test to determine whether I've been exposed to zinc?

There are tests available to measure zinc in your blood, urine, hair, saliva, and feces. These tests are not usually done in the doctor's office because they require special equipment. High levels of zinc in the feces can mean high recent zinc exposure. High levels of zinc in the blood can mean high zinc consumption and/or high exposure. Tests to measure zinc in hair may provide information on long-term zinc exposure; however, the relationship between levels in your hair and the amount of zinc you were exposed to is not clear.

Has the federal government made recommendations to protect human health?

The EPA recommends that drinking water should contain no more than 5 milligrams per liter of water (5 mg/L) because of taste. The EPA requires that any release of 1,000 pounds (or in some cases 5,000 pounds) into the environment be reported to the agency.

To protect workers, the Occupational Safety and Health Administration (OSHA) has set an average limit of 1 mg/m^3 for zinc chloride fumes and 5 mg/m^3 for zinc oxide (dusts and fumes) in workplace air during an 8-hour workday, 40-hour workweek.

Similarly, the National Institute for Occupational Safety and Health (NIOSH) has set the same standards for up to a 10-hour workday over a 40-hour workweek.

Attachment A – NYSDOH Generic CAMP and Special Requirements

1.0 INTRODUCTION

This Community Air Monitoring Plan (CAMP) was prepared by AKRF, Inc. (AKRF) on behalf of Atlantic Chestnut Affordable Housing LLC (the "Volunteer") for the Atlantic Chestnut – Lot 3 site, located at 275 Chestnut Street in Brooklyn, New York, hereafter referred to as the "Site". This CAMP was developed for the Interim Remedial Measure (IRM) Work Plan dated February 2023 for excavation of the Pedestrian Plaza portion of the Site for implementation by AKRF personnel and personnel working under the IRM Work Plan. The Site is identified on the New York City Tax Map as Brooklyn Tax Block 4143, Lot 3. Historically, Lot 1 encompassed the entirety of Block 4143, but was apportioned into three lots (Lots 1, 2, and 3) in 2016. A map showing the Site location is provided as Figure 1. The surrounding area is developed with residential, commercial, manufacturing, transportation, and industrial uses. The elevated J- and Z- Metropolitan Transit Authority (MTA) subway tracks run along Fulton Street to the north and the Long Island Railroad tracks are located beneath Atlantic Avenue to the south.

Atlantic Chestnut Affordable Housing LLC entered into a Brownfield Cleanup Agreement (BCA) Index No. C224236-05-16 with the New York State Department of Environmental Conservation (NYSDEC) on May 26, 2016 as a Volunteer. A BCA Amendment was submitted to the NYSDEC in August 2017 and executed on August 24, 2017 to document changes to the street address and lot size.

Historic records indicated that the Site was developed with residences and a road in 1887 and with industrial and manufacturing uses, including the Columbia Machine Works and Malleable Iron Company, the Columbia Cable and Electric Corporation, Blue Ridge Farms, Inc., and Chloe Foods Corp., between 1908 and 2012. Blue Ridge Farms, Inc. and Chloe Foods Corp. are listed on multiple federal and state databases. Prior uses that appear to have led to Site contamination include blacksmithing and stamping, a brass foundry, woodworking, a blacksmith, a machine shop, tank and engine rooms, an iron works, wire braiding, and cable manufacturing. The Site has been vacant since a July 2012 fire caused severe structural damage to the former Site buildings, which were demolished between July and December 2016.

Site contamination, present in shallow and deep soil, shallow and intermediate groundwater, and soil vapor across the Site, appears to be related to the Site's historic industrial and manufacturing uses. The elevated detections of semivolatile organic compounds (SVOCs) and metals in shallow fill are most likely attributable to historic filling, undocumented discharges due to the fire in 2012, and/or historic operations at the Site. The presence of petroleum-related compounds in soil and soil vapor, associated with NYSDEC Spill No. 1708008, are related to former and/or current on-site petroleum storage tanks. The presence of the solvent-related volatile organic compounds (VOCs) trichloroethylene (in soil, groundwater, and soil vapor), tetrachloroethylene (in soil, groundwater and soil vapor), cis-1,2-dichloroethylene, and trans-1,2-dichloroethylene (in soil), chloroform (in groundwater), and carbon tetrachloride and refrigerants (in soil vapor) are likely related to the historic manufacturing operations at the Site. Based on groundwater flow, the contaminants in shallow groundwater are likely migrating off-site to the south. Additionally, when organic compounds are exposed to air, contamination can partition from soil and groundwater and migrate in a vapor phase through the pore spaces in unsaturated soil. The vapors can accumulate beneath structures such as pavement and building foundations. The affected media for the existing or potential future releases at the Site include soil, groundwater, and soil vapor. To address the significant threat determination for soil vapor, an IRM soil vapor extraction system is currently operating at the Site to prevent off-site migration of contaminated vapors. The SVE system IRM is being employed until implementation of remedial actions.

All AKRF employees are directed that all work must be performed in accordance with the AKRF's Generic HASP and all Occupation Safety and Health Administration (OSHA)-applicable regulations for the work activities required for the project. All project personnel are furthermore directed that they are not permitted to enter Permit Required Confined Spaces (as defined by OSHA). For issues unrelated to contaminated materials, all non-AKRF employees are to be bound by all applicable OSHA regulations as well as any more stringent requirements specified by their employer in their corporate HASP or

otherwise. AKRF is not responsible for providing oversight for issues unrelated to contaminated materials for non-employees. This oversight shall be the responsibility of the employer of that worker or other official designated by that employer.

2.0 AIR MONITORING PROGRAM

The purpose of the air monitoring program is to identify any exposure of the field personnel and the community to potential environmental hazards in the soil and groundwater. Air Monitoring will be conducted in accordance with the New York State Department of Health (NYSDOH) and New York State Department of Environmental Conservation (NYSDEC) guidance. Results of the air monitoring will be used to determine the appropriate response action, if needed. Field personnel will be trained in the proper operation of all field instruments at the start of the field program. The equipment will be calibrated according to manufacturer specifications at the start of each day of fieldwork. If an instrument fails calibration, the project manager will be contacted immediately to obtain a replacement instrument and arrange for repairs.

2.1 Work Zone Air Monitoring

2.1.1 Volatile Organic Compound Monitoring

Continuous monitoring for VOCs will be conducted using roving hand-held equipment during all ground-intrusive activities, including soil boring advancement and groundwater monitoring well installation. Upwind concentrations will be measured at the start of each workday and periodically thereafter to establish background concentrations. VOCs will be monitored continuously at the downwind perimeter of the exclusion zone. Monitoring will be conducted with a photoionization detector (PID) equipped with an 11.7 electron Volt (eV) lamp capable of calculating 15-minute running average concentrations. More frequent intervals of monitoring will be conducted if required as determined by the Site Safety Officer (SSO). All PID readings will be recorded and available for NYSDEC and NYSDOH personnel to review. Instantaneous readings will also be recorded.

2.1.2 Airborne Particulate Monitoring

A DustTrak® or equivalent would be used to measure real-time concentrations of total particulates 10 micrometers or less (PM_{10}). Measurements for particulates will be taken prior to commencement of the work and during the work in areas where contaminated soil would be disturbed. The action levels listed in Table 1 are based on 15-minute averages of the monitoring data. The measurements will be made at the breathing height of the workers and as close to their location as practicable. The SSO will set up the equipment and confirm that it is working properly. His/her qualified designee may oversee the air measurements during the day. The initial measurement for the day will be performed before the start of work and will establish background levels. The final measurement for the day will be performed after the end of work. The action levels for particulates and VOCs and required responses are listed in Table 1.

Table 1
Work Zone Action Levels and Required Responses

Monitoring	Action Level[1]	Response Action
Particulate	Less than 0.125 mg/m^3 above background	**Level D or D-Modified** (Requires coveralls and steel toe boots) (As applicable: Chemical resistant gloves, chemical resistant boot covers, hard hat, safety glasses, face shield, or escape mask)
	Between 0.125 mg/m^3 and 0.150 mg/m^3 above background	**Level C** (Requires full face or half face respirator, hooded chemical resistant two-piece Tyvek suit or overalls, chemical resistant inner and outer gloves, chemical resistant boot covers, steel toe and shank boots) (As applicable: hard hat, face shield, or escape mask) Apply dust suppression measures. Resume work or upgrade.
	Greater than 0.150 mg/m^3 above background	**Stop work** Apply additional dust suppression measures. Resume work when less than 0.150 mg/m^3 and maintain Level C.
VOCs	Less than 5 ppm in breathing zone	**Level D or D-Modified**
	Between 5 and 50 ppm	**Level C**
	More than 50 ppm	**Stop work** Resume work when source of vapors is abated and readings are less than 50 ppm above background.

Notes:
[1] - 15-minute time-weighted average
parts per million = ppm
milligrams per cubic meter = mg/m^3

2.2 Perimeter Community Air Monitoring

Fixed air monitoring stations will be set up at the upwind and downwind perimeters of the exclusion zone during all ground intrusive activities and will continuously log VOC and particulate levels. Each fixed monitoring station will be fully enclosed and equipped with the following:

- A PID equipped with a 10.6 eV lamp capable of calculating 15-minute running average VOC concentrations;
- A TSI 8530 DustTrak II or equivalent dust monitor capable of measuring the concentration of airborne respirable particulates at PM_{10} and calculating 15-minute running average particulate concentrations; and
- A Netronix™ Thiamus™ ICU-820 or equivalent Global System for Mobile Communication (GSM)/Global Positioning System (GPS) device capable of recording air monitoring and location data.

Each monitoring station will be capable of sending e-mail alerts to the SSO to indicate an exceedance of action levels. Additionally, the SSO will conduct an inspection of the monitoring stations on at least an hourly basis. Upon completion of Site activities, all air monitoring data will be available to download via the Environet® website. All air monitoring data recorded at the fixed monitoring stations will be available for NYSDOH and NYSDEC review and will be included in the IRM Report.

Site-wide monitoring for particulates and VOCs will be conducted during remedial excavation in conformance with the NYSDOH CAMP and NYSDOH special requirements for work within 20 feet of potentially exposed individuals or structures, and for indoor work with co-located residences or facilities (Attachment A).

2.2.1 Perimeter Community Air Monitoring Action Levels

VOC Action Levels

The following actions will be taken based on organic vapor levels measured:

- If total organic vapor levels exceed 5 parts per million (ppm) above background for the 15-minute average at the exclusion zone perimeter, work activities will be temporarily halted and monitoring continued. If levels readily decrease (per instantaneous readings) below 5 ppm above background, work activities will resume with continued monitoring.
- If total organic vapor levels at the downwind perimeter of the exclusion zone persist at levels in excess of 5 ppm above background, but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities will resume provided that the total organic vapor level 200 feet downwind of the hot zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less – but in no case less than 20 feet – is below 5 ppm above background for the 15-minute average.
- If the total organic vapor level is above 25 ppm at the perimeter of the exclusion zone, activities will be shutdown.

Particulate Action Levels

The following actions will be taken based on particulate levels measured:

- If the downwind particulate concentrations are greater than 0.100 mg/m^3 above background (upwind concentrations), and no other obvious source is apparent, then it will be assumed that the elevated particulate concentrations are a result of site activities. In such instances, dust suppression measures will be implemented, and monitoring will be continued. Work will be allowed to continue with dust suppression if downwind particulate levels do not exceed 0.150 mg/m^3 above the background (upwind concentration) and provided that no visible dust is migrating from the work area.
- If particulate levels persist at 0.150 mg/m^3 above the background, work must be stopped until dust suppression measures bring particulate levels to below 0.150 mg/m^3 above background.

2.3 Major Vapor Emission Response Plan

If any organic levels greater than 5 ppm over background are identified 200 feet downwind from the work Site, or half the distance to the nearest residential or commercial property, whichever is less, all work activities must be halted, or vapor controls must be implemented.

If, following the cessation of the work activities, or as the result of an emergency, organic levels persist above 5 ppm above background 200 feet downwind or half the distance to the nearest residential or commercial property from the exclusion zone, then the air quality must be monitored within 20 feet of the perimeter of the nearest residential or commercial structure (20 Foot Zone).

If either of the following criteria is exceeded in the 20 Foot Zone, then the Major Vapor Emission Response Plan shall automatically be implemented:

- Sustained organic vapor levels approaching 1 ppm above background for a period of more than 30 minutes; or

- Organic vapor levels greater than 5 ppm above background for any period.

Upon activation, the following activities shall be undertaken as part of the Major Vapor Emission Response Plan:

- The NYSDEC, NYSDOH, and local police authorities will be immediately contacted by the SSO and advised of the situation;
- Frequent air monitoring will be conducted at 30-minute intervals within the 20 Foot Zone. If two successive readings below action levels are measured, air monitoring may be halted or modified by the Site Health and Safety Officer; and
- All Emergency contacts will go into effect as appropriate.

All readings will be recorded and be available for NYSDEC and NYSDOH personnel to review.

2.4 Reporting

CAMP summary reports will be prepared and submitted to NYSDEC and NYSDOH for review as part of the daily reports, and in supplemental weekly CAMP reports. In the event there is an action level exceedance or complaint, NYSDEC and NYSDOH will be notified within 24 hours (same day to the extent possible) of the exceedance or complaint. The notification will include a description of the exceedance or complaint, the cause of the exceedance, and any corrective actions taken. All recorded CAMP data will be included in the IRM Construction Completion Report and Final Engineering Report.

ATTACHMENT A

NYSDOH GENERIC CAMP AND SPECIAL REQUIREMENTS

Appendix 1A
New York State Department of Health
Generic Community Air Monitoring Plan

Overview

A Community Air Monitoring Plan (CAMP) requires real-time monitoring for volatile organic compounds (VOCs) and particulates (i.e., dust) at the downwind perimeter of each designated work area when certain activities are in progress at contaminated sites. The CAMP is not intended for use in establishing action levels for worker respiratory protection. Rather, its intent is to provide a measure of protection for the downwind community (i.e., off-site receptors including residences and businesses and on-site workers not directly involved with the subject work activities) from potential airborne contaminant releases as a direct result of investigative and remedial work activities. The action levels specified herein require increased monitoring, corrective actions to abate emissions, and/or work shutdown. Additionally, the CAMP helps to confirm that work activities did not spread contamination off-site through the air.

The generic CAMP presented below will be sufficient to cover many, if not most, sites. Specific requirements should be reviewed for each situation in consultation with NYSDOH to ensure proper applicability. In some cases, a separate site-specific CAMP or supplement may be required. Depending upon the nature of contamination, chemical- specific monitoring with appropriately-sensitive methods may be required. Depending upon the proximity of potentially exposed individuals, more stringent monitoring or response levels than those presented below may be required. Special requirements will be necessary for work within 20 feet of potentially exposed individuals or structures and for indoor work with co-located residences or facilities. These requirements should be determined in consultation with NYSDOH.

Reliance on the CAMP should not preclude simple, common-sense measures to keep VOCs, dust, and odors at a minimum around the work areas.

Community Air Monitoring Plan

Depending upon the nature of known or potential contaminants at each site, real-time air monitoring for VOCs and/or particulate levels at the perimeter of the exclusion zone or work area will be necessary. Most sites will involve VOC and particulate monitoring; sites known to be contaminated with heavy metals alone may only require particulate monitoring. If radiological contamination is a concern, additional monitoring requirements may be necessary per consultation with appropriate DEC/NYSDOH staff.

Continuous monitoring will be required for all ground intrusive activities and during the demolition of contaminated or potentially contaminated structures. Ground intrusive activities include, but are not limited to, soil/waste excavation and handling, test pitting or trenching, and the installation of soil borings or monitoring wells.

Periodic monitoring for VOCs will be required during non-intrusive activities such as the collection of soil and sediment samples or the collection of groundwater samples from existing monitoring wells. “Periodic” monitoring during sample collection might reasonably consist of taking a reading upon arrival at a sample location, monitoring while opening a well cap or

overturning soil, monitoring during well baling/purging, and taking a reading prior to leaving a sample location. In some instances, depending upon the proximity of potentially exposed individuals, continuous monitoring may be required during sampling activities. Examples of such situations include groundwater sampling at wells on the curb of a busy urban street, in the midst of a public park, or adjacent to a school or residence.

VOC Monitoring, Response Levels, and Actions

Volatile organic compounds (VOCs) must be monitored at the downwind perimeter of the immediate work area (i.e., the exclusion zone) on a continuous basis or as otherwise specified. Upwind concentrations should be measured at the start of each workday and periodically thereafter to establish background conditions, particularly if wind direction changes. The monitoring work should be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment should be calibrated at least daily for the contaminant(s) of concern or for an appropriate surrogate. The equipment should be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

1. If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities must be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities can resume with continued monitoring.

2. If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities must be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities can resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.

3. If the organic vapor level is above 25 ppm at the perimeter of the work area, activities must be shutdown.

4. All 15-minute readings must be recorded and be available for State (DEC and NYSDOH) personnel to review. Instantaneous readings, if any, used for decision purposes should also be recorded.

Particulate Monitoring, Response Levels, and Actions

Particulate concentrations should be monitored continuously at the upwind and downwind perimeters of the exclusion zone at temporary particulate monitoring stations. The particulate monitoring should be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The equipment must be equipped with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration should be visually assessed during all work activities.

1. If the downwind PM-10 particulate level is 100 micrograms per cubic meter (mcg/m^3) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques must be employed. Work may continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 mcg/m^3 above the upwind level and provided that no visible dust is migrating from the work area.

2. If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 mcg/m^3 above the upwind level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 mcg/m^3 of the upwind level and in preventing visible dust migration.

3. All readings must be recorded and be available for State (DEC and NYSDOH) and County Health personnel to review.

December 2009

Appendix 1B
Fugitive Dust and Particulate Monitoring

A program for suppressing fugitive dust and particulate matter monitoring at hazardous waste sites is a responsibility on the remedial party performing the work. These procedures must be incorporated into appropriate intrusive work plans. The following fugitive dust suppression and particulate monitoring program should be employed at sites during construction and other intrusive activities which warrant its use:

1. Reasonable fugitive dust suppression techniques must be employed during all site activities which may generate fugitive dust.

2. Particulate monitoring must be employed during the handling of waste or contaminated soil or when activities on site may generate fugitive dust from exposed waste or contaminated soil. Remedial activities may also include the excavation, grading, or placement of clean fill. These control measures should not be considered necessary for these activities.

3. Particulate monitoring must be performed using real-time particulate monitors and shall monitor particulate matter less than ten microns (PM10) with the following minimum performance standards:

(a) Objects to be measured: Dust, mists or aerosols;
(b) Measurement Ranges: 0.001 to 400 mg/m3 (1 to 400,000 :ug/m3);
(c) Precision (2-sigma) at constant temperature: +/- 10 :g/m3 for one second averaging; and +/- 1.5 g/m3 for sixty second averaging;
(d) Accuracy: +/- 5% of reading +/- precision (Referred to gravimetric calibration with SAE fine test dust (mmd= 2 to 3 :m, g= 2.5, as aerosolized);
(e) Resolution: 0.1% of reading or 1g/m3, whichever is larger;
(f) Particle Size Range of Maximum Response: 0.1-10;
(g) Total Number of Data Points in Memory: 10,000;
(h) Logged Data: Each data point with average concentration, time/date and data point number
(i) Run Summary: overall average, maximum concentrations, time/date of maximum, total number of logged points, start time/date, total elapsed time (run duration), STEL concentration and time/date occurrence, averaging (logging) period, calibration factor, and tag number;
(j) Alarm Averaging Time (user selectable): real-time (1-60 seconds) or STEL (15 minutes), alarms required;
(k) Operating Time: 48 hours (fully charged NiCd battery); continuously with charger;
(l) Operating Temperature: -10 to 50^{o} C (14 to 122^{o} F);
(m) Particulate levels will be monitored upwind and immediately downwind at the working site and integrated over a period not to exceed 15 minutes.

4. In order to ensure the validity of the fugitive dust measurements performed, there must be appropriate Quality Assurance/Quality Control (QA/QC). It is the responsibility of the remedial party to adequately supplement QA/QC Plans to include the following critical features: periodic instrument calibration, operator training, daily instrument performance (span) checks, and a record keeping plan.

5. The action level will be established at 150 ug/m3 (15 minutes average). While conservative,

this short-term interval will provide a real-time assessment of on-site air quality to assure both health and safety. If particulate levels are detected in excess of 150 ug/m3, the upwind background level must be confirmed immediately. If the working site particulate measurement is greater than 100 ug/m3 above the background level, additional dust suppression techniques must be implemented to reduce the generation of fugitive dust and corrective action taken to protect site personnel and reduce the potential for contaminant migration. Corrective measures may include increasing the level of personal protection for on-site personnel and implementing additional dust suppression techniques (see paragraph 7). Should the action level of 150 ug/m3 continue to be exceeded work must stop and DER must be notified as provided in the site design or remedial work plan. The notification shall include a description of the control measures implemented to prevent further exceedances.

6. It must be recognized that the generation of dust from waste or contaminated soil that migrates off-site, has the potential for transporting contaminants off-site. There may be situations when dust is being generated and leaving the site and the monitoring equipment does not measure PM10 at or above the action level. Since this situation has the potential to allow for the migration of contaminants off-site, it is unacceptable. While it is not practical to quantify total suspended particulates on a real-time basis, it is appropriate to rely on visual observation. If dust is observed leaving the working site, additional dust suppression techniques must be employed. Activities that have a high dusting potential--such as solidification and treatment involving materials like kiln dust and lime--will require the need for special measures to be considered.

7. The following techniques have been shown to be effective for the controlling of the generation and migration of dust during construction activities:

(a) Applying water on haul roads;
(b) Wetting equipment and excavation faces;
(c) Spraying water on buckets during excavation and dumping;
(d) Hauling materials in properly tarped or watertight containers;
(e) Restricting vehicle speeds to 10 mph;
(f) Covering excavated areas and material after excavation activity ceases; and
(g) Reducing the excavation size and/or number of excavations.

Experience has shown that the chance of exceeding the 150ug/m3 action level is remote when the above-mentioned techniques are used. When techniques involving water application are used, care must be taken not to use excess water, which can result in unacceptably wet conditions. Using atomizing sprays will prevent overly wet conditions, conserve water, and provide an effective means of suppressing the fugitive dust.

8. The evaluation of weather conditions is necessary for proper fugitive dust control. When extreme wind conditions make dust control ineffective, as a last resort remedial actions may need to be suspended. There may be situations that require fugitive dust suppression and particulate monitoring requirements with action levels more stringent than those provided above. Under some circumstances, the contaminant concentration and/or toxicity may require additional monitoring to protect site personnel and the public. Additional integrated sampling and chemical analysis of the dust may also be in order. This must be evaluated when a health and safety plan is developed and when appropriate suppression and monitoring requirements are established for protection of health and the environment.

Special Requirements for Work Within 20 Feet of Potentially Exposed Individuals or Structures

When work areas are within 20 feet of potentially exposed populations or occupied structures, the continuous monitoring locations for volatile organic compounds (VOCs) and particulates must reflect the nearest potentially exposed individuals and the location of ventilation system intakes for nearby structures. The use of Engineering Controls (ECs) such as vapor/dust barriers, temporary negative-pressure enclosures, or special ventilation devices should be considered to prevent exposures related to the work activities and to control dust and odors. Consideration should be given to implementing the planned activities when potentially exposed populations are at a minimum, such as during weekends or evening hours in non-residential settings.

- If total VOC concentrations opposite the walls of occupied structures or next to intake vents exceed 1 part per million, monitoring should occur within the occupied structure(s). Depending upon the nature of contamination, chemical-specific colorimetric tubes of sufficient sensitivity may be necessary for comparing the exposure point concentrations with appropriate pre-determined response levels (response actions should also be pre-determined). Background readings in the occupied spaces must be taken prior to commencement of the planned work. Any unusual background readings should be discussed with New York State Department of Health prior to commencement of the work.
- If total particulate concentrations opposite the walls of occupied structures or next to intake vents exceed 150 micrograms per cubic meter ($\mu g/m^3$), work activities should be suspended until controls are implemented and are successful in reducing the total particulate concentration to 150 $\mu g/m^3$ or less at the monitoring point.
- Depending upon the nature of contamination and remedial activities, other parameters (e.g., explosivity, oxygen, hydrogen sulfide, carbon monoxide) may also need to be monitored. Response levels and actions should be pre-determined, as necessary, for each site.

Special Requirements for Indoor Work with Co-Located Residences or Facilities

Unless a self-contained, negative-pressure enclosure with proper emission controls will encompass the work area, all individuals not directly involved with the planned work must be absent from the room in which the work will occur. Monitoring requirements shall be as stated above under "Special Requirements for Work Within 20 Feet of Potentially Exposed Individuals or Structures" except that in this instance "nearby/occupied structures" would be adjacent occupied rooms. Additionally, the location of all exhaust vents in the room and their discharge points, as well as potential vapor pathways (openings, conduits, etc.) relative to adjoining rooms, should be understood and the monitoring locations established accordingly. In these situations, it is strongly recommended that exhaust fans or other ECs be used to create negative air pressure within the work area during remedial activities. Additionally, it is strongly recommended that the planned work be implemented during hours (e.g., weekends or evenings) when building occupancy is at a minimum.

Attachment A – Resumes for Project Team

1.0 INTRODUCTION

This Quality Assurance Project Plan (QAPP) was prepared by AKRF, Inc. (AKRF) on behalf of Atlantic Chestnut Affordable Housing LLC (the "Volunteer") for the Atlantic Chestnut – Lot 3 site, located at 275 Chestnut Street in Brooklyn, New York, hereafter referred to as the "Site". This QAPP describes the protocols and procedures that will be followed during implementation of the Interim Remedial Measure Work Plan (IRMWP) dated February 2023 for excavation of the Pedestrian Plaza portion of the Site. The Site is identified on the New York City Tax Map as Brooklyn Tax Block 4143, Lot 3. Historically, Lot 1 encompassed the entirety of Block 4143, but was apportioned into three lots (Lots 1, 2, and 3) in 2016. The objective of the QAPP is to provide for Quality Assurance (QA) and maintain Quality Control (QC) of environmental investigative, sampling, and remedial activities conducted during implementation of the IRMWP. Adherence to the QAPP will ensure that defensible data will be obtained while completing the IRMWP.

2.0 PROJECT TEAM

The project team will be drawn from AKRF professional and technical personnel and AKRF's subcontractors. All field personnel and subcontractors will have completed a 40-hour training course and updated 8-hour refresher course that meet the Occupational Safety and Health Administration (OSHA) requirements of 29 CFR Part 1910. The following sections describe the key project personnel and their responsibilities.

2.1 Remedial Engineer

The Remedial Engineer (RE) for this project will be Michelle Lapin, P.E. The RE will have primary direct responsibility for implementation of the IRMWP for the Site. The RE (or their representative) will coordinate the work of other contractors and subcontractors involved in all aspects of Site management. The RE will be responsible for all appropriate communication with New York State Department of Environmental Conservation (NYSDEC) and the New York State Department of Health (NYSDOH). Ms. Lapin's resume is included in Attachment A.

2.2 Project Director

The project director will be responsible for the general oversight of all aspects of the project, including scheduling, budgeting, data management, and decision-making regarding the field program. The project director will communicate regularly with all members of the AKRF project team and NYSDEC to ensure a smooth flow of information between involved parties. Deborah Shapiro, Qualified Environmental Professional (QEP), will serve as the project director for the IRMWP. Ms. Shapiro's resume is included in Attachment A.

2.3 Project Manager

The project manager will be responsible for directing and coordinating all elements of the IRMWP. He will prepare reports and participate in meetings with the Site owner and/or the NYSDEC. Kenneth Wiles will serve as the project manager for the IRMWP. Mr. Wiles' resume is included in Attachment A.

2.4 Field Team Leader

The field team leader will be responsible for supervising the daily sampling and health and safety activities in the field and will ensure adherence to the work plan and Health and Safety Plan (HASP). He will report to the project manager on a regular basis regarding daily progress and any deviations from the IRMWP. The field team leader will be a qualified, responsible person, able to act professionally and promptly during soil disturbing activities. Marco Balletta will be the field team leader; the field team leader alternate is Claire Bearden of AKRF. Mr. Balletta's and Ms. Bearden's resumes are included in Attachment A.

2.5 Project Quality Assurance/Quality Control Officer

The Quality Assurance/Quality Control (QA/QC) Officer will be responsible for adherence to the QAPP. He will review the procedures with all personnel prior to commencing any fieldwork and will assess implementation of the required procedures. Eric Park will serve as the QA/QC officer for the IRMWP.

2.6 Laboratory Quality Assurance/Quality Control Officer

The laboratory QA/QC officer will be responsible for quality control procedures and checks in the laboratory and ensuring adherence to laboratory protocols. He/she will track the movement of

samples from the time they are checked in at the laboratory to the time that analytical results are issued. He/she will conduct a final check on the analytical calculations and sign off on the laboratory reports. The laboratory QA/QC officer will be determined upon selection of a contract laboratory(s) for the IRMWP.

3.0 STANDARD OPERATING PROCEDURES

The following sections describe the standard operating procedures (SOPs) for the remedial activities included in the IRMWP. During these operations, safety monitoring will be performed as described in the project HASP and all field personnel will wear appropriate personal protective equipment (PPE).

3.1 Remedial Measures

3.1.1 Excavation of Soil

The stratigraphy of the Site, from the surface down, generally consisted of fill comprising sand, silt, and gravel with varying amounts of concrete, brick, coal ash, clay, and asphalt up to 16 feet below grade, underlain by apparent native sand, gravel, clay, and silt to boring termination depths (up to 80 feet below grade). Bedrock was not encountered during previous investigations.

The Site lies at an elevation of approximately 37 to 41 feet [National Geodetic Vertical datum (NGVD)], an approximate of mean sea level.

Groundwater was encountered during previous investigations at depths ranging from approximately 7.5 to 8.7 feet NGVD. Based on the well elevation surveys, shallow, intermediate, and deep groundwater aquifers flow in a generally southerly direction beneath the Site and surrounding area. Groundwater in this part of Brooklyn is not used as a potable source and there are no surface water bodies on or immediately adjacent to the Site.

Site contamination, present in shallow and deep soil, shallow and intermediate groundwater, and soil vapor across the Site, appears to be related to the Site's historic industrial and manufacturing uses. The elevated detections of semivolatile organic compounds (SVOCs) and metals in shallow fill are most likely attributable to historic filling, undocumented discharges due to a fire in 2012, and/or historic operations at the Site. The presence of the solvent-related volatile organic compounds (VOCs) trichloroethylene (in soil, groundwater, and soil vapor), tetrachloroethylene (in soil, groundwater and soil vapor), cis-1,2-dichrloroethylene, and trans-1,2-dichloroethylene (in soil), chloroform (in groundwater), and carbon tetrachloride and refrigerants (in soil vapor) are likely related to the historic manufacturing operations at the Site. Based on groundwater flow, the contaminants in shallow groundwater are likely migrating off-site to the south. Additionally, when organic compounds are exposed to air, contamination can partition from soil and groundwater and migrate in a vapor phase through the pore spaces in unsaturated soil. The vapors can accumulate beneath structures such as pavement and building foundations. The affected media for the existing or potential future releases at the Site include soil, groundwater, and soil vapor.

3.1.2 Tank Removal (if necessary)

Any tanks and appurtenances discovered during implementation of the IRMWP will be cleaned, removed, and disposed of in accordance with accepted industry standards and applicable Federal, State, and local regulatory agency requirements. Tank and soil removal from the vicinity of discovered underground storage tanks will be conducted in consultation with the NYSDEC.

Typical tank removal procedures are summarized below:

1. Open fill cap or vent pipe and measure for product. Collect a sample of the product. Tank contents will be sampled in accordance with applicable federal, state and local requirements and tested in accordance with the requirements of the receiving facility. Proper disposal of tank contents at an approved facility will be dictated by sample results.
2. Excavate to expose the tank. Vacuum liquid tank contents and pumpable tank bottom residue.
3. Excavate around the tank with care to avoid release of tank and piping contents. Hand excavation around the tank may be necessary. The sides of all excavated areas will be properly stabilized in accordance with OSHA regulations. Continuously monitor the excavated areas in the worker breathing zone for the presence of flammable, toxic or oxygen deficient atmosphere with a photoionization detector (PID), a combustible gas indicator (CGI), and an oxygen meter.
4. Inert the tank of flammable vapors using dry ice and verify using an oxygen meter (less than 7 percent). An access hole will be cut in the tank and the tank will be thoroughly cleaned of residual liquids and sludges.
5. Entry of the tank, if necessary, shall be conducted in conformance with OSHA confined space requirements.
6. Remaining fuels, loose slurry, sludge materials and wastewater will be collected in New York State Department of Transportation-approved drums, sampled and analyzed for disposal characterization. After disposal characterization, waste material will be removed and disposed of in accordance with applicable regulations.
7. Remove the tank and all associated piping from the ground and clean the outside of the tank. The tank and piping will be rendered "not reusable," removed from the site and disposed of according to applicable regulations with proper documentation. Remove and dispose of all concrete tank support structures or vaults as encountered.
8. After tank removal, examine for evidence of petroleum releases in accordance with NYSDEC requirements.
9. Suspect materials will be field screened with a PID. If soil contamination is present, excavate and remove contaminated soil from the tank areas in accordance with the IRMWP. Material will be excavated until field screening with a PID yields concentrations of less than 20 parts per million (ppm) and until there are no remaining visible signs of contamination or odors. Endpoint sampling will be conducted as directed by the NYSDEC.
10. Photo-document all procedures and record all procedures in a bound field notebook.

3.2 Soil Sampling

3.2.1 Soil Screening

During soil excavation and tank removal activities (if necessary), the excavated material will be inspected by AKRF field personnel for evidence of contamination (i.e., separate

phase liquid, staining, sheening and/or odors) and field-screened using a PID calibrated at the start of each day in accordance with the manufacturer's instructions.

3.2.2 Soil Sampling

Soil sampling will be conducted according to the following procedures:

- Characterize the sample according to the modified Burmister soil classification system.
- Collect an aliquot of soil from each sampling location and place in labeled sealable plastic bags. The bag should be labeled with the soil boring number and the depth the sample was collected. Place the plastic bags in a chilled cooler to await selection of samples for laboratory analysis.
- After selecting which samples will be analyzed in the laboratory, fill the required laboratory-supplied sample jars with the soil from the selected sampling location or labeled sealable plastic bags. Seal and label the sample jars as described in Section 4.4 of this QAPP and place in an ice-filled cooler.
- Decontaminate any soil sampling equipment between sample locations as described in Section 3.5 of this QAPP.
- Record boring number, sample depth and sample observations (evidence of contamination, PID readings, soil classification) in field logbook and boring log data sheet, if applicable.

3.3 Excavation Backfill

Any imported soil will meet the backfill and cover soil quality standards established in 6 New York Codes, Rules and Regulations (NYCRR) 375-6.7(d). Approval will also be based on an evaluation of the land use, protection of groundwater and protection of ecological resources criteria. Soil will be considered appropriate for use as on-site imported backfill if contaminant concentrations are below the lesser of the 6 NYCRR Part 375 Restricted Residential and Groundwater Protection Soil Cleanup Objectives. Soils that meet 'exempt' fill requirements under 6 NYCRR Part 360, but do not meet backfill or cover soil objectives for this Site, will not be imported to the Site without prior approval by NYSDEC. Solid waste will not be imported to the Site.

Native material from a virgin quarry source need not be sampled prior to use as backfill on the Site. All other imported material will be tested via collection of one composite sample per 1,000 cubic yards of material from each source. Samples will be analyzed for Target Compound List (TCL) of VOCs using United States Environmental Protection Agency (EPA) Method 8260, TCL SVOCs using EPA Method 8270, polychlorinated biphenyls (PCBs) using EPA Method 8082, pesticides using EPA Method 8081, herbicides using EPA Method 8151, target analyte list (TAL) metals using EPA Method 6000/7000 series, and the standard list of 21 per- and polyfluoroalkyl substances (PFAS) compounds by modified EPA Method 1633.

3.4 Materials Reuse On-Site

Material reuse on-site is not anticipated during the IRM; however, if reuse is proposed, the following applies:

- Organic matter (wood, roots, stumps, etc.) or other solid is prohibited for reuse on-site. Soil that does not exhibit evidence of contamination during field screening and is free of

demolition debris will be stockpiled and tested at a frequency of one sample per 1,000 cubic yards and characterized if reuse is contemplated. Each sample will be tested for TCL VOCs by EPA Method 8260, TCL SVOCs by EPA Method 8270, PCBs by EPA Method 8082, pesticides by EPA Method 8081, TAL metals by EPA Method 6000/7000 series, and the standard list of 21 PFAS compounds by modified EPA Method 1633. Samples will be shipped to the laboratory with appropriate chain of custody documentation. The samples will be analyzed in a laboratory following NYSDOH Analytical Services Protocol Category B deliverables.

3.5 Decontamination Of Sampling Equipment

All non-disposable sampling equipment (hand augers, sampling spoons, etc.) will be either dedicated or decontaminated between sampling locations. The decontamination procedure will be as follows:

1. Scrub using tap water/Simple Green® mixture and bristle brush.
2. Rinse with tap water.
3. Scrub again with tap water/ Simple Green® and bristle brush.
4. Rinse with tap water.
5. Rinse with distilled water.
6. Air-dry the equipment, if possible.

Decontamination will be conducted within five-gallon buckets to capture decontamination water.

3.6 Management Of Investigation Derived Waste

All excavated soil will be stockpiled and disposed of in accordance with the IRMWP. If field evidence of gross contamination is identified, decontamination wastewater will be drummed and staged near the point of generation and will be properly disposed of off-site based on laboratory results. If free of visible contamination, disposable PPE and sampling equipment (scoops, gloves, rope, etc.) will be placed in heavy-duty plastic bags and disposed of properly.

4.0 SAMPLING AND LABORATORY PROCEDURES

4.1 Soil Sampling

Soil sampling shall be conducted according to the following procedures:

- Field screening for evidence of contamination (e.g., odors, staining, elevated PID measurements). Using a hand auger or sampling spoon, remove a small amount of soil from the bottom or sidewall of the excavation. A grab sample can also be collected from the excavator bucket after targeted soil removal from the excavation. Place the soil in a zip-lock bag and insert the PID through the sealed bag to obtain an organic vapor concentration measurement.
- After selecting which samples will be analyzed in the laboratory, fill the required laboratory-supplied sample jars with the soil from the selected sampling location or labeled sealable plastic bags. Seal and label the sample jars as described in Section 4.4 of this QAPP and place in an ice-filled cooler.
- Decontaminate any soil sampling equipment between sample locations as described in Section 3.5 of this QAPP.
- Record boring number, sample depth and sample observations (evidence of contamination, PID readings, soil classification) in field logbook and boring log data sheet, if applicable.

4.2 Laboratory Methods

Table 1 summarizes the laboratory methods that will be used to analyze field samples and the sample container type, preservation, and applicable holding times. An Environmental Laboratory Approval Program-certified laboratory will be used for all chemical analyses in accordance with Division of Environmental Remediation-10 2.1(b) and 2.1(f), including Category B Deliverables.

Table 1
Laboratory Analytical Methods for Analysis Groups

Matrix	Analysis	EPA Method	Bottle Type	Preservative	Hold Time
Soil	TCL VOCs	8260	Encore sampler (3) / Terracore Sampler (1)	4 °C 0 °C within 24 hrs	48 hours to extract 14 days to analyze
	TCL SVOCs and 1,4-Dioxane	8270	Glass 8 oz. Jar	4 °C	14 days to extract 40 days to analyze
	TAL Metals	6000/7000	Glass 8 oz. Jar	4 °C	6 months (28 days for Hg)
	Pesticides	8081	Glass 8 oz. Jar	4 °C	14 days to extract 40 days to analyze
	PCBs	8082	Glass 8 oz. Jar	4 °C	14 days to extract 40 days to analyze
	PFAS	1633	Plastic 4 oz. Jar	4 °C	14 days to extract 40 days to analyze

4.3 Quality Control Sampling

In addition to the laboratory analysis of the characterization soil samples for reuse and off-site disposal, additional analysis will be included for quality control measures, as required by the Category B sampling techniques. These samples will include field blanks, trip blanks, matrix

spike/matrix spike duplicates (MS/MSD), and blind duplicate samples at a frequency of one sample per 20 field samples collected. Table 2 provides a summary of the field samples and QA/QC samples to be analyzed by the laboratory.

Table 2
Field Sample and Quality Control Sample Quantities

Sample Type	Parameters	EPA Method	Field Samples	QC Samples			
				Field Blank	Trip Blank	MS/MSD	Blind Duplicate
Soil	VOCs	EPA 8260	20	1	1	1	1
	SVOCs	EPA 8270	20	1	--	1	1
	TAL Metals	EPA 6000/7000	20	1	--	1	1

4.4 Sample Handling

4.4.1 Sample Identification

All samples will be consistently identified in all field documentation, chain-of-custody documents, and laboratory reports. All samples will be given a unique name and the collection date at the end of the sample same in a year, month, day (YYYYMMDD) format. All samples will have the prefix "L3-". Blind duplicate sample nomenclature will consist of the sample type, followed by an "X"; MS/MSD samples nomenclature will consist of the parent sample name only; and trip and field blanks will consist of "TB-" and "FB-", respectively, followed by a sequential number of the trip/field blanks collected within the sample designation group. Special characters, including primes/apostrophes (’), will not be used for sample nomenclature.

Endpoint Soil Sampling
Soil endpoint samples will be identified with "EP-" and the endpoint sample number in sequential order that the endpoint sample was collected, and the depth below grade the sample was collected from in parentheses. Table 3 provides examples of the sampling identification scheme for the post-excavation endpoint samples.

Table 3
Endpoint Sample Nomenclature

Sample Description	Sample Designation
Post-excavation endpoint soil sample EP-1 collected from 3 feet below grade on March 1, 2023	L3-EP-01_3_20230301
Matrix spike/matrix spike duplicate sample of post-excavation endpoint soil sample EP-1 collected from 3 feet below grade on March 1, 2023	L3-EP-01_3_20230301
Duplicate of post-excavation endpoint soil sample EP-1 collected from 3 feet below grade on March 1, 2023	L3-EP-X_3_20230301
First trip blank sample collected during a soil sampling event on March 1, 2023	L3-TB-01S-20230301
First field blank sample collected during a soil sampling event on March 3, 2023	L3-FB-01S-20230301

Waste Classification/ Tank Excavation Soil Sampling

In addition to the nomenclature detailed above, if necessary, any confirmatory endpoint samples collected from a tank excavation will be identified by the excavation grid area and the cardinal direction of the sidewalls. The sample(s) collected from the bottom of the excavation will be amended with a "B-", followed by the number of bottom samples collected from the excavation in sequential order. Waste classification samples will be amended with "WC-" and the alphanumeric grid identification (if alphanumeric girds assigned at this time). Additionally, samples will be amended with the depth the sample was collected in feet below grade in parentheses. Table 4 below provides examples of the sampling identification scheme for proposed waste classification samples and any hotspot or tank excavation samples.

Table 4
Waste Classification/Hotspot/Tank Excavation Sample Nomenclature

Sample Description	Sample Designation
Waste classification composite sample collected between grade and 3 feet below grade in grid C6 on May 7, 2023	L3-WC-C6-C_0-3_20230507
Waste classification grab sample collected between grade and 3 feet below grade in grid C6 on May 7, 2023	L3-WC-C6-G_0-3_20230507
Soil sample collected from the northern sidewall of an encountered contamination hotspot at 4 feet below grade on August 15, 2023	L3-HS1-01N_4_20230815
Soil sample collected from the northern sidewall of the first tank grave encountered at 4 feet below grade on August 15, 2023	L3-UST-01N_4_20230815

4.4.2 Sample Labeling and Shipping

All sample containers will be provided with labels containing the following information:

- Project identification
- Sample identification
- Date and time of collection
- Analysis(es) to be performed
- Sampler's initials

Once the samples are collected and labeled, they will be placed in chilled coolers and stored in a cool area away from direct sunlight to await shipment to the laboratory. All samples will be shipped to the laboratory at least twice per week. At the start and end of each workday, field personnel will add ice to the coolers as needed.

The samples will be prepared for shipment by placing each sample in a sealable plastic bag, then wrapping each container in bubble wrap to prevent breakage, adding freezer packs and/or fresh ice in sealable plastic bags and the chain-of-custody form. Samples will be shipped overnight (e.g., Federal Express) or transported by a laboratory courier. All coolers shipped to the laboratory will be sealed with mailing tape and a chain-of-custody seal to ensure that the coolers remain sealed during delivery.

4.4.3 Sample Custody

Field personnel will be responsible for maintaining the sample coolers in a secured location until they are picked up and/or sent to the laboratory. The record of possession of samples from the time they are obtained in the field to the time they are delivered to the laboratory or shipped off-site will be documented on chain-of-custody forms. The chain-of-custody forms will contain the following information: project name; names of sampling personnel; sample number; date and time of collection and matrix; and signatures of individuals involved in sample transfer, and the dates and times of transfers. Laboratory personnel will note the condition of the custody seal and sample containers at sample check-in.

4.5 Field Instrumentation

Field personnel will be trained in the proper operation of all field instruments at the start of the field program. Instruction manuals for the equipment will be on file at the Site for referencing proper operation, maintenance, and calibration procedures. The equipment will be calibrated according to manufacturer specifications at the start of each day of fieldwork, if applicable. If an instrument fails calibration, the project manager or QA/QC officer will be contacted immediately to obtain a replacement instrument. A calibration log will be maintained to record the date of each calibration, any failure to calibrate and corrective actions taken. The PID will be calibrated each day using 100 ppm isobutylene standard gas.

ATTACHMENT A

RESUMES FOR PROJECT TEAM

MICHELLE LAPIN, PE

SENIOR VICE PRESIDENT

Michelle Lapin, PE is a Senior Vice President with experience in the assessment and remediation of hazardous waste issues. She leads the firm's Hazardous Materials group and offers extensive experience providing strategic planning and management for clients. Michelle has been responsible for the administration of technical solutions to contaminated soil, groundwater, air and geotechnical problems. Her other duties have included technical and report review, proposal writing, scheduling, budgeting, and acting as liaison between clients and regulatory agencies, and project coordination with federal, state, and local authorities.

Michelle's hydrogeologic experience includes groundwater investigations, formulation and administration of groundwater monitoring programs and remediation throughout the Northeast. Her experience with groundwater contamination includes Level B hazardous waste site investigations; leaking underground storage tank studies, including hazardous soil removal and disposal and associated soil and water issues; soil gas/vapor intrusion surveys; and wetlands issues. Michelle is experienced in coordinating and monitoring field programs concerning hazardous waste cell closures. She has directed hundreds of Phase I, Phase II, and Phase III investigations and remediations, many of them in conjunction with developers, law firms, lending institutions, and national retail chains. Michelle is also experienced in the cleanup of contaminated properties under Brownfield Cleanup Program (BCP) and Voluntary Cleanup Program (VCP) regulations.

28 years with AKRF

RELEVANT EXPERIENCE

YMCA of Greater New York, Northeast Bronx YMCA, Bronx, NY

AKRF was retained by YMCA of Greater New York to assist the YMCA of Greater New York in its response to a request for proposals by the Economic Development Corporation for the development of a site in the Edenwald section of the Bronx into a community center. AKRF provided site assessment and remediation services and site-civil engineering due diligence services on the site. The YMCA was successful in winning the development rights, and AKRF prepared an Environmental Assessment for the site. AKRF continued assisting the YMCA in their development with site assessment and remediation services and geotechnical services for the new development at 1250 East 229th Street in

the Bronx for the construction of the two-story, 30,000-square foot building. Michelle Lapin is leading the efforts for the Site Assessment and Remediation services, which includes a Remedial Action Plan and Construction Health and Safety Plan, field monitoring and subsequent Closure Report submitted to the New York City Department of Environmental Protection.

Atlantic Chestnut, Brooklyn, NY

AKRF was retained by Phipps Houses to provide environmental consulting services in connection with the purchase and development of former burned manufacturing buildings encompassing an entire city block in Brooklyn, New York. As part of due diligence, AKRF prepared a Phase I Environmental Site Assessment (ESA) Report for the property. After acquisition, the property was divided into three separate sites (3264 Fulton Street, 235 Chestnut Street, and 3301 Atlantic Avenue). AKRF prepared a Subsurface (Phase II) Investigation Work Plans and conducted Phase IIs at each of the sites, which included the collection and analysis of soil, soil vapor, and groundwater samples. Based on the results of the Phase IIs, documented in Subsurface (Phase II) Reports, New York State Brownfield Cleanup Program (NYSBCP) applications were prepared for each of the sites. After acceptance into the NYSBCP, AKRF prepared Citizen Participation Plans (CPPs) and distributed public notices. AKRF prepared Remedial Investigation (RI) Work Plans (RIWPs) for each of the sites to further investigate contaminated media prior to redevelopment, conducted the RIs, and is in the process of preparing the RI Reports (RIRs). Michelle Lapin is the Remedial Engineer for the project and oversees all remedial activities.

West 61st Street Rezoning/Residential Development, New York, NY

Michelle Lapin directed the firm's hazardous materials work for this mixed-use development in Manhattan. The Algin Management Company hired AKRF to prepare an environmental impact statement (EIS) for the proposed rezoning of the western portion of the block between West 60th and 61st Streets, between Amsterdam and West End Avenues. The purpose of the proposed action was to facilitate the development of two 30-story residential towers with accessory parking spaces, and landscaped open space. The EIS examined a "worst case" condition for rezoning the block, which allowed Algin to build a residential building of approximately 375,000 square feet at their site. The building now contains 475 apartments, 200 accessory parking spaces, a health club, and community facility space. This site, with the services of AKRF, entered into New York State's Brownfield Cleanup Program (BCP). On-site issues included underground storage tanks remaining from previous on-site buildings, petroleum contamination from these tanks and possibly from off-site sources, and other soil contaminants (metals, semi-volatile organic compounds, etc.) from fill materials and previous on-site buildings. AKRF oversaw the adherence to the Construction Health and Safety Plan (HASP), which was submitted to and approved by the New York State Department of Environmental Conservation (NYSDEC), and monitored the waste streams, to ensure that the different types of waste were disposed of at the correct receiving facilities. This oversight also included confirmation and characteristic soil sampling for the receiving facilities and NYSDEC. A "Track 1" Clean up of the majority of the property (the portion including the buildings) was completed and the final Engineering Report was approved by the NYSDEC. AKRF has also completed a smaller portion of the property as a "Track 4" cleanup, which includes a tennis court and landscaped areas. Ms. Lapin continues to manage the annual inspections for the property owner in accordance with the Brownfield Cleanup Agreement.

2477 Third Avenue, Bronx, NY

AKRF conducted the investigation and remediation of the former 2477 Third Avenue gasoline station property under the New York State Department of Environmental Conservation's (NYSDEC's) Brownfield Cleanup Program (BCP). The work included shallow and deep aquifer groundwater testing, delineation of known areas of soil contamination, soil vapor analyses, and investigation and delineation of non-aqueous phase liquid (DNAPL) from past industrial activities. Upon NYSDEC approval of the Remedial Action Work Plan (RAWP), AKRF conducted the removal of the nine on-

site underground storage tanks (USTs) and 1,100 tons of petroleum-contaminated soil, the application of six in-situ chemical oxidation (ISCO) groundwater treatments, and the implementation of four Enhanced Fluid Recovery (EFR) events to remove desorbed gasoline-related hydrocarbons in the groundwater. The site received a Certificate of Completion (COC) from the BCP and a Notice of Satisfaction (NOS) from the Mayor's Office of Environmental Remediation (OER) in connection with the hazardous materials E-Designation assigned to the property. Michelle Lapin was the professional engineer of record, responsible for the remediation design elements and overall adherence to the NYSDEC and New York City Office of Environmental Remediation (OER) regulations and continues to manage the required inspections and reporting for the property owner in accordance with the Brownfield Cleanup Agreement..

443 Greenwich Street, Manhattan, NY

This Site was assigned an E-Designation for hazardous materials (and air quality and noise) during the North Tribeca Rezoning in 2010, which requires environmental testing and, if necessary, remediation to the satisfaction of the New York City Mayor's Office of Environmental Remediation (OER). After years of public opposition to the original redevelopment scheme calling for a boutique hotel, this former manufacturing building and its current developer gained acceptance through the Department of City Planning and the Landmarks Preservation Commission to move forward with redevelopment as residential lofts. The redevelopment process began in 2012 and led to initial re-occupancy in 2016 after overcoming several regulatory challenges while seeking LEED® certification.

Once trichloroethene (TCE) was identified on-site, the typically straight forward assignment of delineating contaminant sources for AKRF became much more complex following the identification of an off-site TCE groundwater plume. Based on the completion of several rounds of additional sampling and investigation activities including a compound specific isotopic analysis (CSIA) of the chlorinated volatile organic compounds (VOCs) detected in the central portion of the Site and the off-site monitor wells south of the Site, the presence of two separate releases (one originating on-site and one originating off-site) of TCE was confirmed. Based on the confirmation that the Site was not the contamination source associated with the off-site plume, the redevelopment of the Site proceeded under the review of the OER, and did not require direct or continued oversight from the New York State Department of Environmental Conservation (NYSDEC). Furthermore, the developer of the Site, who had become the owner, was not deemed responsible to complete additional off-site investigation or remediation associated with the separate, off-site TCE groundwater plume. For this project, AKRF utilized forensic-based analysis of chlorinated VOC plumes and was one of the first projects that included a groundwater treatment technology managed by the OER in its E-Designation program. The Site also includes an engineered cap to prevent exposure to underlying soil/fill, a vapor barrier/waterproofing system beneath the building slab and along foundation sidewalls, and the operation of an active sub-slab depressurization (SSD) system. The project was awarded the 2017 Environmental Protection award by the New York City Brownfield Partnership. Michelle Lapin was the professional engineer of record, responsible for the remediation design and adherence of the remediation and remediation systems installation and ongoing operation.

Larkin Plaza, Yonkers, NY – Remedial Investigation, Construction Oversight

AKRF assisted RXR Realty with enrolling the 1.1-acre Larkin Plaza site in the New York State Department of Environmental Conservation's (NYSDEC's) Brownfield Cleanup Program (BCP). Since being accepted into the program, AKRF conducted an extensive remedial investigation, prepared the necessary remedial action plans, managed the citizen participation tasks, and is in the process of conducting the remediation in conjunction with NYSDEC oversight. To date, the remedial work has included in-situ chemical oxidation (ISCO) treatments, contaminated soil removal, and petroleum product recovery. AKRF also assisted RXR with various construction-related services, including dewatering discharge permitting, soil disposal characterization testing, and stormwater pollution prevention plan (SWPPP) preparation. AKRF's Cultural Resources department is in the process of preparing a submission to the State Historic Preservation Office (SHPO) on behalf of RXR related to the acquisition of additional public funding sources.

MICHELLE LAPIN, PE

SENIOR VICE PRESIDENT

Michelle Lapin is the professional engineer of record, responsible for the remediation design elements and adherence to the NYSDEC-approved work plans and remediation design.

Memorial Sloan Kettering Cancer Center-CUNY 74th Street EIS, New York, NY

AKRF was engaged by Memorial Sloan-Kettering Cancer Center (MSK) to prepare an EIS for a proposed joint facility located on a New York City-owned parcel located between East 73rd Street and East 74th Street adjacent to the FDR Drive in Manhattan. The property, formerly occupied by the Department of Sanitation with over 41 underground storage tanks, now includes an ambulatory medical care center for MSK.

Michelle Lapin led the site assessment and remediation work, which included the preparation of the Phase I and II environmental site assessments, remedial action work plans (RAWPs), and construction health and safety plans (CHASPs) for submission to the New York City Office of Environmental Remediation (OER) for the Voluntary Cleanup Program (VCP) and to the New York State Department of Environmental Conservation (NYSDEC) for remediation of a petroleum spill. The RAWPs and CHASPs included provisions for excavation of contaminated soil and rock, removal of tanks and environmental monitoring during the construction activities. AKRF also performed a pre-demolition asbestos survey of the Department of Sanitation's remaining concrete foundation structures and prepared specifications for asbestos abatement, soil management and underground storage tank removal and disposal.

The remediation was completed in compliance with the OER-approved RAWP and the spill was closed by the NYSDEC. The project received a Notice of Satisfaction from the OER.

DEBORAH SHAPIRO, QEP

SENIOR VICE PRESIDENT

Deborah Shapiro is a Senior Vice President in the Site Assessment and Remediation Department. Ms. Shapiro supervises project teams and manages all aspects of assessment and remediation projects across the New York Metropolitan Area. Ms. Shapiro works with developers, non-profit organizations, architects, local community groups, local businesses, and government agencies. Her projects fall under the regulatory oversight of NYSDEC, NYCDEP, and NYCOER including the New York State Brownfield Cleanup Program (BCP), New York City Voluntary Cleanup Program (VCP), NYSDEC petroleum spills program, RCRA/UIC closures, and NYCOER's E-designation program. Ms. Shapiro has also assisted commercial and industrial property owners with maintaining the integrity of their portfolios by providing compliance related cleanup and chemical storage management services. Ms. Shapiro has also been a moderator and panelist at numerous conferences.

Ms. Shapiro manages all aspects of redevelopment projects from the initial Phase I ESA, Phase II, and remediation through post-remedial site management. In addition, her experience includes groundwater investigations, monitoring, and sampling programs; Brownfield and hazardous waste site investigations; In-Situ Chemical Oxidation; underground storage tank studies, including soil contamination delineation, classification, removal and disposal; waste characterization sampling; exposure assessments; on-going remedial action (especially AS/SVE), and permitting.

AKRF

RELEVANT EXPERIENCE

Elton Crossing, Bronx, NY

AKRF provided environmental consulting services in connection with the purchase and redevelopment of the Elton Crossing site at 899 Elton Avenue in the Bronx, NY. The work initially involved the preparation of a Phase II subsurface investigation including soil and soil vapor testing to determine if the site would be eligible for the New York State Brownfield Cleanup Program (NYSBCP). Upon completion of the investigation, AKRF prepared a NYCBCP Application and the site was accepted into the NYSBCP. AKRF managed all aspects of the brownfield cleanup including; development of Investigation Work Plans, performing Remedial Investigations and Reports, preparation of Phase I ESAs, preparation of a Citizen Participation Plan, distribution of public notices, preparation and implementation of a Remedial Action Work Plan (RAWP), design of a sub-slab depressurization system, preparation of the Final Engineering Report and Site Management Plan, and sampling and management of soil disposal. AKRF is in the midst of implementing the Site Management Plan. As project manager, Ms. Shapiro was responsible for managing all technical components of the project, communication with NYSDEC and the Client, and managing the budget.

Second Farms, Bronx, NY

AKRF, Inc. was initially contracted by the New York City Office of Environmental Remediation (NYCOER) to conduct a subsurface investigation of a 1.12-acre parcel in the Bronx, New York under the United States Environmental Protection Agency (USEPA) Brownfield Assessment Grant program. The investigation included a geophysical survey and utility mark-outs, and the collection and analysis of soil, groundwater, soil vapor, indoor air and ambient air samples. AKRF continued working on the project for the developer by preparing a Remedial Action Plan and Environmental Assessment Statement. AKRF is in the midst of implementing the remedy.As project manager, Ms. Shapiro was responsible for managing all technical components of the project, communication with OER, NYCDEP, and the Client, and managing the budget.

Bradhurst Cornerstone II Residences, Manhattan, NY

AKRF, Inc. prepared a Part 58 Environmental Assessment and a City Environmental Quality Review Environmental Assessment Statement for the Bradhurst Cornerstone II Apartments project. Issues of concern for the environmental review included the identification of project commitments for certain of the four sites related to historic resources, hazardous materials, air quality, and building attenuation. As part of the mitigation of hazardous materials, AKRF conducted a Phase II investigation, and prepared a Remedial Action Plan and Construction Health and Safety Plan. As project manager, Ms. Shapiro was responsible for managing all technical components of the hazardous materials portion of the project, communication with the regulatory agency and the Client, and managing the budget.

Lambert Houses, Bronx, NY

AKRF performed an EIS of the Lambert Houses affordable housing complex located in the West Farms section of the Bronx, NY. Lambert Houses consisted of multi-story apartment buildings, parking garage, and a multi-tenant retail/commercial building alongside the elevated NYC subway. AKRF also conducted a Phase I ESA with a vapor intrusion screen of the Property to satisfy HUD's vapor intrusion requirements. The Phase I and vapor intrusion screens were prepared in accordance with ASTM E1527-05, ASTM E2600, and EPA's All Appropriate Inquiry (AAI) rule. After completion of the EIS, an E designation for hazardous materials was placed on the Site. A Subsurface Investigation was conducted and a Remedial Action Work Plan was prepared under OER oversight. The Site was subsequently entered in the NYC Voluntary Cleanup Program. AKRF is in the midst of implementing the RAWP, which included remediation of a hydraulic oil spill. As project manager, Ms. Shapiro was responsible for managing all technical components of the hazardous materials portion of the project, communication with the regulatory agency and the Client, and managing the budget.

Brook 156, Bronx, NY

AKRF was retained to provide environmental consulting services in connection with the purchase and development of the Site. AKRF prepared a Phase I Environmental Site Assessment (ESA) of the NYC-owned former gasoline service station and a former railroad. A Tier 1 Vapor Encroachment Screening was also conducted to satisfy HUD's vapor intrusion requirements. AKRF prepared a Remedial Investigation Work Plan (RIWP) and conducted a Remedial Investigation (RI) at the site, which included the collection and analysis of soil, soil vapor, and groundwater. The results of the RI, which were documented in a Remedial Investigation Report (RIR), were used to prepare a New York City Brownfield Cleanup Program (NYCBCP) application. The site was accepted into the New York State Brownfield Cleanup Program (NYSBCP). AKRF prepared a Citizen Participation Plan (CPP), distributed public notices, and conducted multiple Remedial Investigations to further investigate soil, soil vapor, and groundwater at the site prior to redevelopment. The results of the investigations were used to prepare a Remedial Action Work Plan (RAWP), which is undergoing review and approval by NYSDEC. The proposed remedy includes excavation of soil, design and installation of a soil vapor extraction system and sub-slab depressurization system, contingent groundwater treatment program, and installation of a vapor barrier and composite cover system. As project manager, Ms. Shapiro is responsible for managing all technical components of the project, communication with NYSDEC and the Client, and managing the budget.

On-Call Environmental Consulting Services (Various Locations), New York City Mayor's Office of Environmental Remediation (OER) (administered by NYCEDC)

Ms. Shapiro is managing an on-call contract with the OER for brownfields environmental assessment and remediation. The work has included conducting Phase I environmental site assessments (ESAs) and multi-media sampling of soil, groundwater, and soil vapor for various sites funded by EPA grants. The work plans and investigation reports were completed in accordance with OER and EPA requirements. AKRF also implemented a remedial plan for capping a park site in Staten Island. In addition, AKRF provided support to OER and an affordable housing developer to expedite an application for entry into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP), as well as preparation and implementation of the remedial investigation and remedial plan.

Atlantic Chestnut, Brooklyn, NY

AKRF was retained to provide environmental consulting services in connection with the purchase and redevelopment of former burned manufacturing buildings encompassing an entire city block in Brooklyn, New York. As part of due diligence, AKRF prepared a Phase I Environmental Site Assessment (ESA) Report for the property. After acquisition, the property was divided into three separate sites (3264 Fulton Street, 235 Chestnut Street, and 3301 Atlantic Avenue). AKRF prepared a Subsurface (Phase II) Investigation Work Plans and conducted Phase IIs at each of the sites, which included the collection and analysis of soil, soil vapor, and groundwater samples. Based on the results of the Phase IIs, which were documented in Subsurface (Phase II) Reports, New York State Brownfield Cleanup Program (NYSBCP) applications were prepared for each of the sites. After acceptance into the NYSBCP, AKRF prepared Citizen Participation Plans (CPPs) and distributed public notices. AKRF prepared Remedial Investigation (RI) Work Plans (RIWPs) and implemented numerous Remediation Investigations for each of the sites to further investigate contaminated media at the site prior to redevelopment, and prepared the RI Reports (RIRs). AKRF is in the midst of preparing Interim Remedial Work Plans for each Site, which include installation of a Soil Vapor Extraction to prevent the off-site migration of contaminants. As project manager, Ms. Shapiro was responsible for managing all technical components of the project, communication with NYSDEC and the Client, and managing the budget.

KENNETH A. WILES

ENVIRONMENTAL SCIENTIST – SENIOR TECHNICAL DIRECTOR

Kenneth Wiles is an Environmental Scientist with twelve years of environmental assessment and remediation experience. He has performed and managed numerous site and remedial investigations, supervised and developed work plans for subsurface soil, groundwater, and soil vapor intrusion investigations; and remedial actions, and underground storage tank (UST) removals for a wide variety of clients and property types. Kenneth has been a critical member managing large profile projects, in addition to smaller projects, and responsible for project/client/contract management, preparing proposals, and preparing compliance reports, for several environmental remediation projects. He is certified in Occupational Safety and Health Administration Hazardous Waste Operations and Emergency Response (OSHA HAZWOPER) and is knowledgeable in Geographic Information System (GIS), AutoCAD, and Microsoft Project. Kenneth is experienced in numerous field activities, including environmental sampling, monitoring well installation and advancement of soil boring oversight, and contractor oversight.

RELEVANT EXPERIENCE

100 Franklin Street, New York, NY

AKRF completed a Phase I Environmental Site Assessment, Phase II Environmental Site Investigation, prepared a Remedial Action Work Plan, a NYCDEP Dewatering Application and Permit, and performed soil waste classification sampling (which required the preparation of a NYC Transit Subsurface Investigation Permit to perform the associated soil borings) for the proposed redevelopment for a 29,564-square foot, eight-story mixed-use building with a cellar. AKRF completed a Phase I Environmental Site Assessment (ESA), Phase II ESI, prepared a Remedial Action Work Plan, a NYCDEP Dewatering Application and Permit, and performed soil waste classification sampling (which required the preparation of a NYC Transit Subsurface Investigation Permit to perform the associated soil borings) for the proposed redevelopment for a 29,564-square foot, eight-story mixed-use building with a cellar.

Kenneth Wiles served as Deputy Project Manager and coordinated with the client and contactors, supervised field staff during on-site remediation activities, and compiled and evaluated field data to prepare associated project reports and permits.

KENNETH A. WILES

ENVIRONMENTAL SCIENTIST - SENIOR TECHNICAL DIRECTOR

1100 Myrtle Avenue, Brooklyn, NY

AKRF prepared a Remedial Investigation Work Plan (RIWP) for New York City Mayor's Office of Environmental Remediation (OER) and performed the associated Remedial Investigation. Following, the site was accepted into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP), which AKRF prepared the application. AKRF also prepared the BCP RIWP.

As the Project Manager, Kenneth Wiles coordinated with the client and subcontractors, supervised field staff during on-site investigation activities, and prepared the project's reports.

29 Jay Street, Brooklyn, NY

AKRF has provided site assessment/remediation, air quality, and noise E-Designation services to obtain approval for the remediation and start of construction on a new commercial office building at 29 Jay Street in the DUMBO neighborhood of Brooklyn, NY. We will continue to be on-site daily to conduct community air monitoring and oversee the removal of petroleum and hazardous-lead contaminated soil. Kenneth Wiles served as Project Manager.

East Side Coastal Resiliency (ESCR) Preliminary & Final Design, New York, NY

AKRF is leading a multidisciplinary design team that was selected by the New York City agency partnership of NYCDDC, New York City Department of Parks and Recreation (NYCDPR), New York City Department of Transportation, and the Mayor's Office of Recovery and Resiliency (ORR) to provide engineering, planning, landscape architecture, urban design and community engagement services for the Preliminary and Final Design Services for East Side Coastal Resiliency (ESCR).

Kenneth Wiles' responsibilities included preparing the Supplemental Subsurface Investigation Work Plan, managing the associated field investigation activities, compiling and evaluating the field data to prepare the Supplemental Subsurface Investigation Report, spearheaded the effort for generating environmental cross-sections throughout the project site, and preparing the Mitigation Work Plan and supporting reports for NAPL recovery via several recovery wells.

Rego Park Home Depot, Ridgewood, NY

Solvent contamination was encountered during retail development of a former industrial property in Rego Park, Queens, New York. The site work included an extensive investigation and a multi-phase remediation performed under the NYSDEC Voluntary Cleanup Program (VCP). Remediation included removal of aboveground and underground storage tanks (ASTs and USTs) and hotspot soil removal. An Air Sparging/Soil Vapor Extraction (AS/SVE) groundwater remediation system designed by AKRF was installed as part of the building construction. Continued remediation work included upgrading and expanding the AS/SVE system after the store was opened. AKRF continues operations, maintenance, and monitoring under the NYSDEC-approved Site Management Plan.

Kenneth Wiles prepared the Remedial Optimization Work Plan (ROWP) and associated work plan update and assisted in the preparation and implementation of the ROWP, including the procurement of the subcontractors.

609-611 West 56th Street (823 Eleventh Avenue), New York, NY

AKRF is providing site assessment and remediation services for 611 West 56th Street (aka 823 Eleventh Avenue), a 37-story, 80-unit condominium building in Hell's Kitchen, Manhattan. We facilitated the 10,000-square-foot site's enrollment in the New York City Voluntary Brownfield Cleanup Program. AKRF performed a remedial investigation to

compile and evaluate data and information necessary to develop a Remedial Action Work Plan; performed the required sampling and prepared the application package to obtain a NYCDEP construction dewatering permit; performed waste classification sampling to characterize the soil for off-site disposal; and oversaw construction excavation activities to ensure compliance with the Remedial Action Work Plan.

As Project Manager, Kenneth Wiles was responsible for coordinating/directing field staff for construction oversight, preparing the NYCDEP dewatering permit, managing the waste characterization sampling event and preparing the associated report, and assisting in the preparation of the RAWP.

Gowanus Canal First Street Turn Basin, New York, NY

AKRF performed professional services for the remedial design for restoration of the Filled-in Former First Street Turning Basin adjacent to the Gowanus Canal in Brooklyn, New York. The remediation is being conducted as part of an Order of Consent between the City of New York and USEPA for the Gowanus Canal Superfund Site. The remedial design will include removal of fill and sediment within the filled-in turning basin in an approximately 475-foot by 50-foot area and the creation of a wetland shelf. Design considerations include geotechnical concerns related to adjacent buildings and new and existing bulkheads; soil and water management; landscape design; and access/construction logistics. The project design is anticipated to be completed in 2020.

Kenneth Wiles manages the design team subconsultants, prepares report submittals, compiles and integrates several report components into larger report submittals, coordinates the implementation of field activities, and coordinates requirements pertaining to the prime contract with NYC Department of Design and Construction (DDC).

New York City School Construction Authority (NYCSCA) On-Call Contract for Environmental Consulting Services, Various Sites in New York, NY

AKRF provides the NYCSCA environmental consulting services for schools undergoing design and development. As Environmental Scientist, Kenneth Wiles prepares contract specifications and reviews contractor submittals for compliance with the specification requirements. The work has also included the investigation of underground storage tanks (USTs) for existing schools. Due to the sensitivity of school sites, work under this contract is often conducted on short notice and during non-school hours.

The Max at 606 West 57th Street, New York, NY

AKRF was been retained by TF Cornerstone to provide environmental services for the redevelopment of a portion of the block bounded by Eleventh and Twelfth Avenues and West 56th and 57th Streets. AKRF prepared an Environmental Impact Statement (EIS) for the NYC Department of City Planning (DCP) to analyze the effects of the proposed actions and development of the proposed building. The EIS addressed the full range of environmental impacts associated with the proposed development. After completion of the EIS, the client enrolled in the NYC Voluntary Brownfield Cleanup Program to investigate and remediate the 83,260-square foot site for planned redevelopment. A remedial investigation was performed to compile and evaluate data and information necessary to develop a Remedial Action Work Plan (RAWP) pertaining to the planned development. AKRF performed oversight of the construction excavation activities to ensure compliance with the RAWP.

Kenneth Wiles was responsible for coordinating/directing field staff for construction oversight activities for compliance with the RAWP, and assisting in the preparation of the Remedial Closure Report.

KENNETH A. WILES

ENVIRONMENTAL SCIENTIST - SENIOR TECHNICAL DIRECTOR

432 East 14th Street, Environmental Management Specifications, Design Coordination and Pre-Characterization of Soil for Off-site Disposal, New York, NY

AKRF completed a Phase II Environmental Site Investigation, prepared a Remedial Action Work Plan, UST Removal Report, and performed soil waste classification sampling for the redevelopment of the site, which formerly consisted of a 23,000-square foot, two-story United States Postal Service office. The soil waste characterization sampling identified hazardous soil, which was successfully managed and disposed of at a licensed facility.

Kenneth Wiles served as Deputy Project Manager and coordinated with the client and contractors, supervised field staff during day-to-day on-site remediation activities, reviewed contractor submittals, and prepared compliance reports including the remedial closure report.

West Side Federation for Senior and Supportive Housing, WSFSSH West 108th Street, New York, NY

AKRF performed a Phase I Environmental Site Assessments and Phase II Environmental Site Investigation (ESI), on behalf of the NYC Office of Environmental Remediation for the proposed redevelopment of four lots. The Phase II ESI Work Plan consisted of an EPA compliant Quality Assurance Project Plan (QAPP). AKRF additionally prepared a Remedial Action Work Plan (RAWP) and supplemental Phase II ESI.

Kenneth Wiles supervised field staff during on-site investigation activities, provided review of the Phase II ESI and RAWP, and drafted contractor specifications for the redevelopment.

New York City Department of Design & Construction, On-Call Contract (HWEARC03), New York, NY

As part of a joint venture, AKRF has been awarded a contract to provide on-call EASs and engineering support to the DDC infrastructure division for various projects throughout the city. The services provided under this contract vary from EASs, property acquisition support, stormwater drainage and water quality analysis to traffic studies, preparation of PDI reports, mapping, roadway design, and ULURP support. AKRF's primary responsibilities include implementation and monitoring of the task orders issued under the contract, and the firm is directly responsible for project management, staffing, schedule, and budgetary requirements of the contract, as well as completing roadway and infrastructure designs, preparing ULURP maps and applications, EASs, PDIs and Damage and Acquisition Maps.

Kenneth Wiles' responsibilities included preparing the Supplemental Subsurface Investigation Work Plan, managing the associated field investigation activities, compiling and evaluating the field data to prepare the Supplemental Subsurface Investigation Report, spearheaded the effort for generating environmental cross-sections throughout the project site, and preparing the Mitigation Work Plan and supporting reports for NAPL recovery via several recovery wells.

New York City School Construction Authority, On-Call Environmental Consulting, New York, NY

For new school sites, initial due diligence involves conducting Phase I environmental site assessments (ESAs) and multi-media sampling of soil, groundwater, and soil vapor to determine the suitability of a site for development as a school and remediation requirements and associated costs. Once design for a school is underway, AKRF would prepare remediation plans and construction specifications and oversee the construction activities. For existing school sites, the work can involve conducting Phase I ESAs and indoor air quality testing, preparation of specifications, supervision of storage tank removals, investigation and remediation of spills, and development of remediation cost estimates.

Kenneth Wiles prepared contract specifications and reviews contractor submittals for compliance with the specification requirements. The work has also included the investigation of underground storage tanks (USTs) for existing schools.

ERIC PARK

ENVIRONMENTAL ENGINEER

BACKGROUND

Working in the Hazardous Materials department, Mr. Park has served as environmental consultant and project manager to clients remediating and developing their properties. Services provided include remediation system design, bid and technical specification preparation, remediation design, submittal review, contractor negotiations, construction and remediation oversight and management, and Site closure coordination with regulatory agencies. Mr. Park has worked extensively on projects involving tetrachloroethylene (PCE) contamination and with remedial technologies including sub-slab depressurization systems (SSDS), and oxygen injection and air sparge (AS)/soil vapor extraction (SVE).

Education

B.S. Engineering, Cooper Union Albert Nerken School of Engineering, 2006

Licenses/Certifications

40-hour OSHA Certified

Order of the Engineer

Professional Memberships

Years of Experience

Year started in industry and company: 2006

RELEVANT EXPERIENCE

2350 Fifth Avenue, New York, NY

Mr. Park has been involved in the remediation at this privately owned, former-commercial facility with historic PCE contamination. The Site was investigated and remediated as part of the New York State Inactive Hazardous Waste Site Registry (State Superfund) Program, and included multiple rounds of remedial investigation and remediation implementation prior to receiving approval for Site closure from NYSDEC and NYSDOH. The Site remediation tasks included the retro-fitting of an SSDS and SVE system across the majority of the 1.58-acre Site, in-situ chemical oxidation, and contaminant source removal. Mr. Park co-lead the remediation technology design and management of field tasks during implementation of the remedy. Site closure was approved in January 2015.

145 West Street, Greenpoint, NY

Mr. Park has managed the design and implementation of remediation at the former Huxley Envelope site in Greenpoint, Brooklyn. The project is primarily overseen by NYSDEC as part of the Brownfield Cleanup Program (BCP) but is also under NYCOER jurisdiction as multiple E-Designations, including for Hazardous Materials, were applied to the Site during the Greenpoint-Williamsburg Rezoning. Remediation of the Site included removal of underground storage tanks; installation of permanent sheeting; excavation of nearly 100,000 tons of contaminated soil; installation and maintenance of a vapor mitigation system consisting of a vapor barrier and sub-

slab depressurization system (SSDS); construction and maintenance of a Site cover system. Mr. Park is managing the remediation efforts and interfaces with owners, counsel, consultants, and contractors to address construction concerns through completion of the project.

Home Depot, Queens, NY

Mr. Park co-managed remediation implementation at a Home Depot site in Queens, New York as part of the NYSDEC BCP. Remediation of the Site included the design, installation, startup, and maintenance of an AS/SVE system to address PCE contamination in the aquifer. Tasks have included pilot testing, designing the system expansion, writing bid specifications and workplans, and coorinating with the client, contractors and regulatory agencies. Mr. Park was involved in project management through closure of the Site and is currently overseeing ongoing Site management tasks as required by NYSDEC and the Site Management Plan.

Brooklyn Bridge Park, Brooklyn, NY

Mr. Park has been involved in the application for the Department of Sanitation of New York (DSNY) Fill Materials Operation (FMO) permit. He has been working with project consultants and architects to complete the requirements necessary to obtain the FMO. The DSNY permit will allow for the import of gross amounts of approved fill to be used on-site for the construction of noise mitigating hills at the proposed park.

East Side Access, Long Island City, NY

Mr. Park has been working with the New York Metropolitan Transit Authority (MTA) in continued dust concentration analysis related to the East Side Access underground tunnel drilling operation. Mr. Park has been working with MTA and its subcontractors to ascertain the source of particulate in the local ambient air and mitigate all sources.

Queens West Remediation, Long Island City, NY

Mr. Park has been involved in the on-going post-remediation activities at various sites in the Queens West development community. Queens West has a long history of contaminated sites, mostly caused by coal tar-related industrial facilities that were located in the vicinity in the past. Working with other consultants, Mr. Park has taken part in groundwater, soil and soil gas sampling and has been involved in the post investigation documentation.

Halesite MGP RFP, Halesite, NY

Mr. Park was involved in the response to a Request for Proposal regarding the in-situ remediation of a former manufactured gas plant. Mr. Park researched the relevant current in-situ groundwater remediation technologies including Chemox and air sparging. Groundwater and soil beneath the property have been affected by MGP related contaminants such as coal tar. Mr. Park was involved in coordination meeting with in-house marketing and sub-contractors working in conjunction with AKRF for the submission of the proposal.

Flushing Industrial Park, Flushing, NY

Mr. Park was involved in the remedial activities at the Brownfield site in Flushing, New York. Mr. Park assisted in the installation and sampling of post-remediation groundwater monitoring wells. Mr. Park has also been involved in the preparation of the Site Management Plan and Final Engineering Report, detailing the on-site remedial activities to date.

Columbia University Manhattanville Academic Mixed-Use Development, New York, NY

Mr. Park was involved in the preparation of the Remedial Action Plan / Construction Health and Safety Plan for the redevelopment of Columbia University. Due to the scope and scale of the intended development, many issues

concerning hazardous materials (auto-industry related facilities, historic MGP sites) were addressed in conjunction with issues from the associated Environmental Impact Statement.

AvalonBay Gold Street, Brooklyn, NY

Mr. Park was involved in subsurface investigations at the proposed AvalonBay development site. The work entailed collecting soil samples for waste characterization and groundwater data. The site work was used as part of the ongoing pre-construction phase activities.

AvalonBay Willoughby West, Brooklyn, NY

Mr. Park has conducted Phase I Site Assessment and Phase II subsurface investigations at the proposed AvalonBay development in Downtown Brooklyn. Working closely with the landowner and AvalonBay, Mr. Park has been evaluating subsurface conditions at the site concerning a known fuel oil spill and potential solvent and gasoline contamination plumes within the site.

Paragon Paint, Long Island City, NY

Mr. Park oversaw the installation of ten soil borings at the abandoned Paragon Paint facility. Soil, soil vapor, and groundwater samples were collected to determine the severity of the contamination associated with ten on site underground storage tanks as well as the paint operations formerly conducted on site.

MARCO BALLETTA

ENVIRONMENTAL SCIENTIST

Marco Balletta is an Environmental Scientist in AKRF's Hazardous Materials Department. Marco has a 5-year degree in Environmental Science from - Seconda Universita' degli Studi di Napoli (SUN) – Caserta, Campania, Italy. He has practical experience in both a laboratory setting and in the field. His range of expertise includes the collection and analysis of environmental samples including soil, sediment, groundwater, surface water, indoor air and ambient air. Marco has professional experience including: Environmental Field Technician, Health and Safety Officer, Industrial Hygienist, Lab Analyst, Laboratory Research Assistant, Solid Waste Geologist Intern at the New York State Department of Environmental Conservation (NYSDEC).

BACKGROUND

Education

Seconda Universita' degli Studi di Napoli, Caserta, Italy, Environmental Science, 2009

Licenses/Certifications

NYSDEC Erosion and Sediment Control Site Inspector
NYSDOL Asbestos Inspector
OSHA 10 Hour Construction Safety & Health Course
OSHA 40 Hour HAZWOPER
OSHA 8 Hour Refresher
OSHA 8 Hour Supervisor

Years of Experience

11 years in the industry
10 years with AKRF

RELEVANT EXPERIENCE

25 Broad Street, New York, NY

AKRF was retained by LCOR to design and implement a Community Air Monitoring program during demolition of a former residential building on a property in lower Manhattan that is to be redeveloped. The program includes real-time community monitoring for volatile organic compounds and particulate matter, personnel monitoring for particulate matter, and confirmatory sampling for silica.

Marco Balletta was the on-site construction inspector responsible for calibrating equipment and monitoring levels of volatile organic compounds and particulate matter for the surrounding area and construction personnel. Reports of the daily activity including data collected throughout the day were prepared for submittal to the client. Marco summarized the data and contributed to the Final Engineering Report.

Convent of the Sacred Heart, New York, NY

AKRF prepared an Environmental Assessment Statement (EAS) for a new 4-story, approximately 50,000 square foot educational/athletic facility for the Convent of the Sacred Heart School of New York. The new educational/athletic facility would include a natatorium, lobby, locker rooms, and a homework room/lounge on the ground floor, classrooms on the second floor, a full gymnasium on the third floor, classrooms on the fourth floor, and possibly an artificial turf roof, and would serve the school's existing students. The proposed action required a special permit from the Board of

MARCO BALLETTA

ENVIRONMENTAL SCIENTIST

Standards and Appeals pursuant to Section 73-19 of the New York City Zoning Resolution to allow a school use in a C8-4 zoning district.

Marco Balletta served as the construction inspector for this project, during which he monitored construction activities in accordance with the OER-approved RAP. His duties included community air monitoring for volatile organic compounds and airborne dust, and preparing daily reports for submittal to the OER project manager.

181 Avenue A, New York, NY

In his role as an Environmental Scientist, Marco Balletta performed an Asbestos-Containing Materials (ACM) Survey at Avenue A Site (a former Catholic School complex), located at 181 Avenue A in Manhattan, New York. The survey included the inspection of the building to identify suspect ACMs; collection of representative samples of suspect ACMs; documentation of sampling locations in accordance with laboratory requirements on a Chain-of-Custody form; and submission of samples for analysis of suspect ACMs at a New York State Department of Health (NYSDOH)-approved laboratory.

Riverside South Parcel K1 Environmental Monitoring, New York, NY

In his role as Construction Inspector, Marco Balletta has overseen soil management activities, conducted air quality monitoring, and prepared daily reports for submittal to the regulatory agency.

Memorial Sloan Kettering East 64th Street Laboratory Medicine Building, New York, NY

Noise produced by mobile sources (automobiles, trucks, and trains), stationary sources (machinery, ventilation systems, and manufacturing operations), and construction activities can cause stress-related illness, disrupt sleep, and break concentration. The noise impact study for the Memorial Sloan Kettering Cancer Center was conducted to determine real time noise levels prior to renovations and construction activities. This provided a background level reference point for when construction activities started.

In his role as an Environmental Scientist, Marco Balletta assisted New York City certified asbestos investigators and inspector with an ACM Survey of the approximately 24,300-square foot, two-story garage with a partial basement located at 327 East 64th Street in New York, NY. Marco also assisted asbestos investigators with the identification of suspect ACMs, the collection of representative samples of suspect ACMs, the documentation of sampling locations on a Chain-of-Custody form.

Peerless - Empire, Brooklyn, NY

AKRF was contracted by a private landowner of a 17-acre site along the Newtown Creek waterfront located above the 55-acre 20-million gallon underground petroleum plume. The site is located on property formerly utilized for petroleum refining and storage, and the property owner requested assistance understanding the impacts, negotiating investigation and cleanup activities with ExxonMobil and NYSDEC, to protect employees and limit disturbances to business operations.

Marco Balletta performed an on-site chemical inventory; concrete floor inspection for cracks and damage; inspection of the Sub-Slab Depressurization System (SSDS) for proper operation and negative pressure readings; and indoor and ambient air sampling using Summa canisters equipped with regulators set to obtain a continuous sample over a 24-hour period.

MARCO BALLETTA

ENVIRONMENTAL SCIENTIST

New York City School Construction Authority (NYCSCA), Hurricane Sandy Emergency Response, PS 2R & 52R - Water Disinfection, Staten Island, NY

In his role as an Environmental Scientist, Marco Balletta provided oversight to ensure that the water disinfection and flushing were performed in accordance with the contract specifications, the approved DWQTP, New York City Plumbing Code, and other applicable Federal, State and local regulations.

NYCSCA, Hurricane Emergency Response, Bronx and Brooklyn, NY

In his role as Environmental Scientist, Marco Balletta oversaw the spill remediation activities and documented these activities on behalf of the SCA.

NYCSCA, On-Call Environmental Consulting, New York, NY

For new school sites, initial due diligence involves conducting Phase I environmental site assessments (ESAs) and multi-media sampling of soil, groundwater, and soil vapor to determine the suitability of a site for development as a school and remediation requirements and associated costs. Once design for a school is underway, AKRF would prepare remediation plans and construction specifications and oversee the construction activities. For existing school sites, the work can involve conducting Phase I ESAs and indoor air quality testing, preparation of specifications, supervision of storage tank removals, investigation and remediation of spills, and development of remediation cost estimates.

In his role as an Environmental Scientist, Marco Balletta worked on the following assignments under this contract:

- SCA ERC Hazmat CS
- 3k - 319 Stanhope Street
- 3k - 272 Moffat Street
- JHS 014K
- PS 214K
- IS 252K
- PS 307K
- PS 682K
- PS 97M
- PS 31Q
- PS 434Q
- PS 450Q - Long Island City High School
- PS 347X - International Leadership Charter High School
- PS 468X

NYCSCA, On-Call Environmental Consulting (Multiple Contracts), New York, NY

AKRF has held multiple on-call hazardous materials consulting contracts with the NYCSCA. In addition to conducting Phase I and Phase II Environmental Site Assessments, AKRF performed lead in drinking water sampling in about 160 schools during two three-month periods. AKRF continues to provide lead sampling, reporting and remedial recommendations, as new plumbing is installed. AKRF also oversees plumbing disinfection work, which is required prior to new plumbing being placed into service. The assignments involve reviewing and commenting on disinfection plans, supervision of the disinfection and confirmation testing, and preparation of reports documenting the work was

conducted in accordance with the specifications and applicable requirements. Due to the sensitivity of school sites, work under this contract is often conducted on short notice and during non-school hours.

In his role as an Environmental Scientist, Marco Balletta worked on the following assignments under these contracts:

- PS 108K - Water Disinfection
- PS 90K - Water Disinfection
- PS 101K - Disinfection and Lead
- PS 682K
- 1223 Coney Island Ave Brooklyn
- 4323 2nd Ave Brooklyn

- 28-42 Trinity Place
- Bronx Regional HS - Water Disinfection
- Hurricane Emergency Response

NYCSCA On-Call Contract (SEQRA), Various locations, NY

Under an on-call contract with NYCSCA, AKRF is providing Site Acquisition and SEQR Services at various school sites. The contract also involves the preparation of the EISs and Environmental Assessment Forms (EAFs) with Supplemental Studies for existing and potential school properties.

In his role as an Environmental Scientist, Marco Balletta worked on an assignment for the 8th Street Archaeology project under this contract.

CLAIRE BEARDEN

SENIOR PROFESSIONAL

Claire Bearden is an Environmental Scientist in AKRF's Hazardous Materials Department with experience in preparing Phase I environmental site assessments, Phase II Site Investigations, Remedial Investigations, and technical reporting, in addition to performing various remedial oversight and field investigation responsibilities.

BACKGROUND

Education
BS, Syracuse University, Earth Science with Environmental Focus, 2016

Licenses/Certifications
OSHA 10-hour Construction Industry
OSHA 40-hour HAZWOPER Certified
OSHA 8-Hour Supervisor Training Certified

Professional Memberships
Programs Committee Member, Society of Women Environmental Professionals, NJSWEP Programs Committee

Years of Experience
5 years in the industry
1 year with AKRF

RELEVANT EXPERIENCE

Remedial Construction Oversight and Certification Under NYSDEC of Regional Food Hub Warehouse on Former MGP Site, Bronx, NY

Remedial construction oversight and certification under NYSDEC of regional food hub warehouse on former MGP site. Claire Bearden performed remedial construction oversight to satisfy NYSDEC Brownfield Cleanup Program (BCP) program requirements during the initial redevelopment stages of a former Manufactured Gas Plant (MGP) facility. Claire's duties have included administering a Community Air Monitoring Program (CAMP) with continuous data collection and automated telemetry for airborne particulates and volatile organics during remedial activities. Claire has completed progress reporting for NYSDEC, and assisted with the collection of soil and concrete samples proposed for reuse and/or off-site disposal during the redevelopment.

Raritan Rail Yard SIWP, Raritan, NJ

AKRF is performing a Site Investigation for NJ Transit under NJDEP's Site Remediation Program to evaluate several historic petroleum releases at this active rail yard. Claire Bearden has been responsible for conducting preliminary review of historic investigation activities on file with NJ Transit dating back to the early 1980s. Clarie has also submitted requests to NJDEP to review regulatory files for active and inactive remedial cases on and adjacent to the site. As part of the initial phase of the site investigation, Claire completed rail safety training and helped retrieve passive soil gas samplers at the site.

CLAIRE BEARDEN

SENIOR PROFESSIONAL

Hudson Piers, Yonkers, NY

AKRF is providing site assessment/remediation services for the southern half of the Hudson Piers site along the Yonkers waterfront. The 17.4-acre, $585 million project will yield a mix of market-rate housing, affordable apartments, and retail space. Claire Bearden collected soil vapor and groundwater samples.

167 North Broadway, Yonkers, NY

Claire Bearden performed remedial construction oversight for a structurally complicated 20-foot-deep excavation, which required a sliding rail shoring system for support of excavation to protect adjacent buildings and structures. Claire's responsibilities included direct oversight of the contractor performing the excavation, implementation of community air monitoring, and collection of post-excavation end point samples. Upon completion of the remediation, Claire drafted the remedial action report for submission to NYSDEC.

Hunters Point South Towers, Queens, NY

AKRF provided environmental analysis and documentation pursuant to CEQR and NEPA guidelines, prepared the construction protection plan for adjacent infrastructure, provided facade noise attenuation consulting, and has been providing site assessment and remediation consulting for 52-41 Center Boulevard and 52-03 Center Boulevard in Long Island City as part of the Hunter's Point waterfront development. AKRF completed on-site Phase I and Phase II investigations, drafted the NYCDEP Remedial Action Plans, are conducting construction monitoring work, and will be preparing closure reports when the construction work is complete.

Claire Bearden performed construction oversight and air monitoring during the excavation work required for installation of utilities in the courtyard. For this project, Claire screened and oversaw the trenching and stockpiling of soil as a representative of the generator. She also performed a Air Monitoring Program for airborne particulates and VOCs during soil handling activities.

1000-1006 Westchester Avenue, Bronx, NY

A new commercial and community building is planned for 1000-1006 Westchester Avenue in the Bronx, including a Democracy Prep Public Schools charter school. AKRF is providing site assessment/remediation and civil engineering services for the project. Claire Bearden drafted the waste classification report for this project.

1941 & 1959 Jerome Avenue, Bronx, NY

AKRF conducted a Supplemental Remedial Investigation (RI) on behalf of the Client to support an application to the NYSDEC Brownfield Cleanup Program (BCP) for this automotive facility in the Bronx. Claire Bearden logged soils cores and collected soil vapor, soil and groundwater samples.

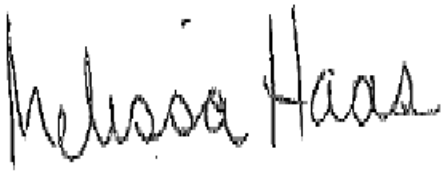
APPENDIX E

OCTOBER 2022 SUPPLEMENTAL INVESTIGATION - LABORATORY REPORT AND DUSR



ANALYTICAL REPORT

Job Number: 460-267360-1

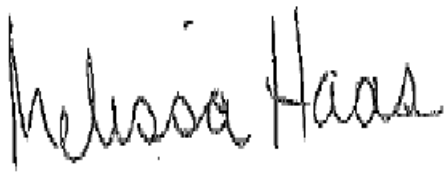
Job Description: Atlantic Chestnut Lot 3

For:
AKRF Inc
440 Park Avenue South
7th Floor
New York, NY 10016

Attention: Mr. Eric Park

Approved for release.
Melissa Haas
Senior Project Manager
10/25/2022 5:45 PM

Melissa Haas, Senior Project Manager
777 New Durham Road, Edison, NJ, 08817
(203)308-0880
Melissa.Haas@et.eurofinsus.com
10/25/2022



The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of Eurofins Environment Testing Northeast, LLC Edison and its client. All questions regarding this report should be directed to the Eurofins Environment Testing Northeast, LLC Edison Project Manager or designee who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northeast, LLC Project Manager.This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Job Number: 460-267360-1

Job Description: Atlantic Chestnut Lot 3

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Approved for release.
Melissa Haas
Senior Project Manager

CASE NARRATIVE

Client: AKRF Inc

Project: Atlantic Chestnut Lot 3

Report Number: 460-267360-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 10/12/2022 7:00 PM, 10/13/2022 7:00 PM and 10/14/2022 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.3º C, 1.7º C and 2.5º C.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. Tests were not checked off for samples on page 2 of the 10/12 COC. The client instructed the lab to analyze all samples.

One or more containers for the following sample was received empty: L3-PP-SB-2_10-12_20221013 (460-267521-7). 1 of 3 Cores was received empty.

Holds were cancelled by the client on 10/25/22.

Trip blank and field blank IDs were revised by the client on 10/25/22.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC/MS)

Samples L2-RI-SB-10B_15-16_20221012 (460-267360-1), L2-RI-SB-10B_16-18_20221012 (460-267360-2), L2-RI-SB-10B_18-20_20221012 (460-267360-3), L2-RI-SB-10B_20-22_20221012 (460-267360-4), L2-RI-SB-10B_22-24_20221012 (460-267360-5), L2-RI-SB-10B_24-26_20221012 (460-267360-6), L2-RI-SB-10B_26-28_20221012 (460-267360-7), L2-RI-SB-10B_28-30_20221012 (460-267360-8), L2-RI-SB-10B_30-32_20221012 (460-267360-9), L2-RI-SB-10B_32-34_20221012 (460-267360-10), L3-SB-X1_20221012 (460-267360-11), L3-RI-SB-2B_15-16_20221012 (460-267360-12), L3-RI-SB-2B_16-18_20221012 (460-267360-13), L3-RI-SB-2B_18-20_20221012 (460-267360-14), L3-RI-SB-2B_20-22_20221012 (460-267360-15), L3-RI-SB-2B_22-24_20221012 (460-267360-16), L3-RI-SB-2B_24-26_20221012 (460-267360-17), L3-RI-SB-2B_26-28_20221012 (460-267360-18), L3-RI-SB-2B_28-30_20221012 (460-267360-19), L3-RI-SB-2B_30-32_20221012 (460-267360-20) and L3-RI-SB-2B_32-34_20221012 (460-267360-21) were analyzed for Volatile Organic Compounds (GC/MS) in accordance with EPA SW-846 Method 8260D. The samples were prepared on 10/14/2022 and analyzed on 10/17/2022 and 10/18/2022.

Samples FB1_20221012 (460-267360-22) and TB1_20221012 (460-267360-23) were analyzed for Volatile Organic Compounds (GC/MS) in accordance with EPA SW-846 Method 8260D. The samples were analyzed on 10/14/2022.

The continuing calibration verification (CCV) analyzed in batch 460-872260 was outside the method criteria for the following analyte(s): Chloromethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) associated with batch 460-872456 recovered above the upper control limit for Carbon tetrachloride. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 460-872456 recovered outside control limits for the following analytes: 1,1,1-Trichloroethane, Carbon tetrachloride and Dibromochloromethane. These analytes were biased high in the LCS/LCSD and were not detected in the associated samples; therefore, the data have been reported.

The continuing calibration verification (CCV) associated with batch 460-872353 recovered above the upper control limit for 1,1-Dichloroethene and Carbon tetrachloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 460-872353 recovered outside control limits for the following analytes: 1,1,1-Trichloroethane, Carbon tetrachloride and Dibromochloromethane. These analytes were biased high in the LCS/LCSD and were not detected in the associated samples; therefore, the data have been reported.

Internal standard (ISTD) response for 1,4-Dioxane-d8 for the following samples in analytical batch 460-872434 was outside acceptance criteria: L3-PP-SB-1_10-12_20221013 (460-267458-4). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

The continuing calibration verification (CCV) analyzed in batch 460-872160 was outside the method criteria for the following analyte(s): Chloromethane and Vinyl chloride. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Internal standard (ISTD) response for 1,4-Dioxane-d8 for the following samples in analytical batch 460-872315 was outside acceptance criteria: L3-PP-SB-1_8-10_20221013 (460-267458-3), L3-PP-SB-1_12-14_20221013 (460-267458-5) and L3-PP-SB-1_14-15_20221013 (460-267458-6). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

The laboratory control sample (LCS) for analytical batch 460-872315 recovered outside control limits for the following analytes: 1,1,1-Trichloroethane, Carbon tetrachloride, Tetrachloroethene and Vinyl chloride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The continuing calibration verification (CCV) associated with batch 460-872711 recovered above the upper control limit for 1,1,2,2-Tetrachloroethane. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 460-872711 recovered outside control limits for the following analytes: 1,1-Dichloroethene (biased low) and Methylene Chloride (biased high). These analytes were not detected in the associated samples; therefore, the data have been reported.

The following sample was diluted to bring the concentration of target analytes within the calibration range: L3-PP-SB-1_5-6_20221013 (460-267458-1). Elevated reporting limits (RLs) are provided.

The continuing calibration verification (CCV) analyzed in batch 460-872367 was outside the method criteria for the following analyte(s): 1,1,2,2-Tetrachloroethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Internal standard (ISTD) response for 1,4-Dioxane-d8 for the following sample in analytical batch 460-872987 was outside acceptance criteria: L3-PP-SB-2_14-15_20221013 (460-267521-9). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Internal standard (ISTD) response for 1,4-DIoxane-d8 for the following sample in analytical batch 460-872520 was outside acceptance criteria: L3-PP-SB-2_12-14_20221013 (460-267521-8). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Internal standard (ISTD) response for 1,4-Dioxane-d8 and TBA-d9 for the following sample in analytical batch 460-872520 was outside acceptance criteria: L3-PP-SB-2_10-12_20221013 (460-267521-7). These ISTDs do not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

The following sample was diluted to bring the concentration of target analytes within the calibration range: L3-PP-SB-2_5-6_20221013 (460-267521-3). Elevated reporting limits (RLs) are provided.

The laboratory control sample duplicate (LCSD) for analytical batch 460-873205 recovered outside control limits for the following analyte: trans-1,3-Dichloropropene. This analyte was biased high in the LCSD and was not detected in the associated samples; therefore, the data have been reported.

Several analytes failed the recovery criteria low for the MS of sample L2-RI-SB-10B_15-16_20221012MS (460-267360-1) in batch 460-872430. Trichloroethene failed the recovery criteria high.

Several analytes failed the recovery criteria low for the MSD of sample L2-RI-SB-10B_15-16_20221012MSD (460-267360-1) in batch

460-872430. Trichloroethene exceeded the RPD limit.

No other difficulties were encountered during the Volatiles analysis.

All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE

Samples L2-RI-SB-10B_15-16_20221012 (460-267360-1), L2-RI-SB-10B_16-18_20221012 (460-267360-2), L2-RI-SB-10B_18-20_20221012 (460-267360-3), L2-RI-SB-10B_20-22_20221012 (460-267360-4), L2-RI-SB-10B_22-24_20221012 (460-267360-5), L2-RI-SB-10B_24-26_20221012 (460-267360-6), L2-RI-SB-10B_26-28_20221012 (460-267360-7), L2-RI-SB-10B_28-30_20221012 (460-267360-8), L2-RI-SB-10B_30-32_20221012 (460-267360-9), L2-RI-SB-10B_32-34_20221012 (460-267360-10), L3-SB-X1_20221012 (460-267360-11), L3-RI-SB-2B_15-16_20221012 (460-267360-12), L3-RI-SB-2B_16-18_20221012 (460-267360-13), L3-RI-SB-2B_18-20_20221012 (460-267360-14), L3-RI-SB-2B_20-22_20221012 (460-267360-15), L3-RI-SB-2B_22-24_20221012 (460-267360-16), L3-RI-SB-2B_24-26_20221012 (460-267360-17), L3-RI-SB-2B_26-28_20221012 (460-267360-18), L3-RI-SB-2B_28-30_20221012 (460-267360-19), L3-RI-SB-2B_30-32_20221012 (460-267360-20) and L3-RI-SB-2B_32-34_20221012 (460-267360-21) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 10/16/2022.

No difficulties were encountered during the %solids/moisture analysis.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	MS or MSD is outside acceptance limits.
*	Duplicate RPD exceeds control limits
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits
J	Indicates an estimated value.
U	Analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: AKRF Inc
Job ID: 460-267360-1
Project/Site: Atlantic Chestnut Lot 3

Laboratory: Eurofins Edison

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
New York	NELAP	11452	04-01-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids
