## 1.0 INTRODUCTION

This Remedial Investigation Report (RIR) was prepared on behalf of 224 Third Ave Owner LLC (the Volunteer) for the property located at 224 3<sup>rd</sup> Avenue (Brooklyn Tax Block 426, Lot 36) in the Gowanus neighborhood of Brooklyn, New York (the site). The Volunteer executed a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) on May 17, 2023 to investigate and remediate the site under the New York State Brownfield Cleanup Program (BCP Site No. C224373). An E-designation (E-601) for hazardous materials, air quality, and noise was assigned to the site by the New York City (NYC) Department of City Planning (DCP) as part of the 2021 Gowanus Neighborhood Plan Rezoning (City Environmental Quality Review [CEQR] No. 19DCP157K). Sites with E-Designations are subject to environmental review by the New York City Mayor's Office of Environmental Remediation (NYCOER).

This RIR presents environmental data and findings from the remedial investigation (RI) conducted between July 14, 2023 and April 19, 2024. The RI was completed by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C. (Langan) and was conducted in accordance with Title 6 of the Official Compilation of New York Codes, Rules and Regulations (NYCRR) Part 375-1, 3.8, 6.8, NYSDEC Division of Environmental Remediation (DER) Technical Guidance for Site Investigation and Remediation (DER-10), and applicable New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006, with updates. The objectives of this RI include:

- Define the nature and extent of contamination in soil, soil vapor, and groundwater at or emanating from the site
- Generate sufficient data to evaluate the remedial action alternatives and prepare a Remedial Action Work Plan (RAWP) to be implemented concurrently with site redevelopment
- Generate sufficient data to evaluate potential threats to human health and the environment

## 2.0 SITE PHYSICAL CHARACTERISTICS

### 2.1 Site Description

The about 8,470 square feet (0.19± acres) site is located at 224 3<sup>rd</sup> Avenue in Brooklyn, New York and is identified on the Brooklyn Borough Tax Map as Block 426, Lot 36. The site is improved with a vacant one-story building with a partial cellar that was most recently occupied by A&A Brake Services Company Inc. ## 2.3 Site Physical Conditions

### 2.3.1 Topography

According to monitoring well survey measurements obtained by Langan on August 12, 2023, site surface elevations (el) range from about el 18.14 feet<sup>1</sup> in the northwest corner of the site to el 18.96 feet in the southeast part of the site. The topography of the site is relatively flat and the topographic gradient of the surrounding areas gently slopes west towards the Gowanus Canal.

### 2.3.2 Regional Geology

The site is located in a developed part of Brooklyn, New York that is generally covered with paved roads, public walkways and buildings. The built environment is typically underlain by uncontrolled fill used during construction and development since the 1800’s. The area surrounding the Gowanus Canal, including the site, was originally part of the former Gowanus Creek and

<sup>1</sup> Elevations in this RIR refer to North American Vertical Datum of 1988 (NAVD88), which is about 1.1 feet above mean sea level at Sandy Hook, NJ.

associated wetlands. In 1848, the State of New York authorized construction of the Gowanus Canal as well as the draining and filling of the wetlands of South Brooklyn (New York City Department of City Planning, 1985). By 1869, the Gowanus Canal was completed with the current street configuration surrounding the Canal.

According to "Bedrock and Engineering Geologic Maps of Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey," dated 1994, by Charles A. Baskerville, et al., the site is underlain by the Hartland Formation, which generally consists of white quartz-microcline-muscovite granite, gray biotite-muscovite-quartz schist, gray sillimanite-plagioclase-muscovite schist, and greenish-black amphibolite. The depth to bedrock is expected to be greater than 100 feet bgs.

### 2.3.3 Regional Hydrogeology

Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeological network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks. Groundwater in the vicinity of the site generally flows west towards the Gowanus Canal. A groundwater elevation contour map is provided as Figure 4. Groundwater in Kings County is not used as a potable water source. Potable water provided to Kings County is sourced from reservoirs in the Catskill and Delaware watersheds.

### 2.3.4 Wetlands

Wetlands were evaluated by reviewing the National Wetlands Inventory and NYSDEC regulated wetlands map. There are no wetlands on the site. The nearest mapped wetland is the Gowanus Canal, classified as an estuarine and marine deepwater wetland, located about 720 feet west of the site.

### **3.0 SITE BACKGROUND**

This section describes historical site uses and the proposed redevelopment, and provides a summary of the findings from previous environmental investigations. Potential areas of concern (AOC) were developed based on a review of the previous reports and are summarized in Section 3.4.

#### **3.1 Historical Site Usage**

The Gowanus neighborhood of Brooklyn has a history of industrial operations that have resulted in environmental impacts to the subsurface. According to Sanborn maps, the site has been in a densely-developed urban area, characterized by commercial and industrial uses, as early as 1886. Historical records indicate the site was improved with multiple dwellings dating back to 1886. Around 1915, the dwellings appear to have been replaced by two new buildings used for “laundry” and a Bottle Cleaning & Storage facility, and portion of a third building is designated as bottle storage. By 1938, the new buildings appear to have been removed and a new single structure (built circa 1930) appears and is designated as a garage with a 550-gallon underground storage tank (UST). The site configuration is unchanged between 1938 and present day. The site is presently vacant but was most recently used for automobile repair and auto parts retail.

#### **3.2 Proposed Redevelopment Plan**

The current development proposes a new 11-story mixed-use residential and commercial building, with a partial cellar. The cellar will be used for building utilities (i.e., mechanical, electrical, plumbing). The ground floor will contain an outdoor recreational space, fitness room, indoor recreational room, lobby, and commercial spaces. Floors 2 through 11 will contain residential units. The development will designate 25% of the residential units for affordable housing. The fourth floor will have a setback green roof and outdoor terrace in the southern part of the building footprint. The proposed building will generate electricity through photovoltaic arrays and will be connected to Consolidated Edison’s electrical distribution system. The proposed development plans are included as Appendix A.

#### **3.3 Summary of Previous Environmental Investigations**

Environmental documents prepared for the BCP site include the following (copies are provided as Appendix B):

- *Limited Subsurface Investigation (LSI)*, prepared by Langan, dated October 2021.
- Phase I Environmental Site Assessment Report, prepared by Brussee Environmental Corp. (BEC), dated May 2022.
- Limited Phase II Investigation, prepared by BEC, dated May 6, 2022.

The following is a summary of relevant findings for each environmental data package:

---

Limited Subsurface Investigation (LSI), prepared by Langan, dated October 2021

An LSI was completed at the site and adjacent properties to evaluate subsurface soil, groundwater, and soil vapor conditions. Four soil borings, one temporary groundwater well, and one soil vapor point were installed at the site. Soil sample analytical results identified several metals at concentrations above the restricted use restricted-residential (RR) soil cleanup objectives (SCO). Groundwater analytical results identified metals at concentrations above the NYSDEC Ambient Water Quality Standards and Guidance Values (SGV) for Class GA (drinking water). The volatile organic compound (VOC) tetrachloroethene (PCE) was detected in soil vapor at concentrations that warrant mitigation when compared to the NYSDOH decision matrices. A PCE source was not identified during the LSI.

Phase I Environmental Site Assessment Report, prepared by BEC, dated May 2022

BEC reviewed historical documents and conducted a site visit as part of a May 2022 Phase I Environmental Site Assessment (ESA). The following Recognized Environmental Conditions (REC) were identified:

- Underground Storage Tank: A 550-gallon UST was identified on Sanborn historical maps and possible tank piping (a fill port and vent pipe) was observed during the site reconnaissance. The potential for spills and releases from this tank was considered a REC.
- Historical Use of the Subject Property and Surrounding Properties: The site was used as an auto garage from the 1930's to 2022. Surrounding properties included various commercial and industrial uses, including the former Fulton Works Manufactured Gas Plant (MGP) that may have contributed to contamination of the subsurface at the subject property.

Limited Phase II Investigation, prepared by BEC, dated May 6, 2022

BEC conducted a Phase II subsurface investigation to further investigate the RECs identified in their Phase I ESA. The Phase II consisted of a geophysical survey, advancement of six soil borings to 15 feet bgs, installation of three groundwater monitoring wells, and installation of three soil vapor points. Seven soil samples, three groundwater samples, and three soil vapor samples were collected. SVOCs and metals were detected in soil at concentrations above the RR SCOs. PCE was detected in shallow soil at concentrations below the RR SCO and in groundwater below the SGV. PCE was detected in soil vapor at 150,000 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ), which would require vapor mitigation in future development where the foundation is above the groundwater table.

---

### **3.4 Summary of Potential Areas of Concern**

Based on site observations, development history, and findings of the previous environmental reports, AOCs were identified and investigated during the RI and are described below. Sample locations and the AOC areas are shown on Figure 5.

#### **AOC 1: 550-Gallon Gasoline Tank**

Based on the Sanborn Maps, by 1938 the site was occupied by a one-story garage and repair shop containing a 550-gallon gasoline tank, which is shown through the 1988 Sanborn map. During the 2021 LSI, a geophysical survey identified a subsurface anomaly resembling a UST in the eastern part of the site, consistent with the location shown on the Sanborn maps. Investigation locations were placed in proximity to the UST to further investigate the potential for a historical release or petroleum-related impacts.

#### **AOC 2: Auto Parts Cleaning Area**

During a site visit in December 2021, an auto parts cleaning area associated with the former auto repair operations was observed near the southwest part of the site. Solvents including PCE and trichloroethene (TCE) have historically been used to degrease metal parts at auto repair facilities. Undocumented releases of these solvents may have adversely affected soil, groundwater, and/or soil vapor beneath the site. One soil vapor sample taken in the center of the site contained a PCE concentration of 1,800  $\mu\text{g}/\text{m}^3$ , which warrants mitigation when evaluated against the NYSDOH Decision Matrices. Additional investigation was performed in the vicinity of the auto parts cleaning area to further investigate potential sources and extents of PCE impacts.

#### **AOC 3: Historical Site Operations**

The site has historically been used for industrial purposes since the 1900's. Between 1915 and 1930, operations included a "laundry" and bottle cleaning and storage. Auto-repair and parts cleaning are estimated to have begun around 1930 and continued until early November 2022. The industrial history may have resulted in a release of target compounds to subsurface soil, groundwater, and/or soil vapor and was further investigated during the RI.

## **4.0 REMEDIAL INVESTIGATION**

The RI was completed between July 14, 2023 and April 19, 2024 to investigate potential AOCs and to determine, to the extent practical, the nature and extent of contamination in soil, groundwater, and sub-slab vapor. The scope of the RI included the field tasks listed below to supplement the data and findings of previous investigations. A summary of the collected samples is provided in Table 1. Sample locations from the RI and previous LSI, and AOCs, are presented on Figure 5.

The RI and consisted of the following:

- A geophysical survey to identify potential USTs and other suspect underground structures, and to clear investigation locations of subsurface obstructions or utilities;
- Advancement of 12 soil borings to depths from 20 to 35 feet bgs, from which 36 soil samples (plus two quality assurance/quality control [QA/QC] duplicate samples), were collected;
- Advancement of three delineation soil borings around RIB01 to depths ranging from 20 to 30 feet bgs, from which two soil samples were collected, to delineate petroleum impacts;
- Advancement of two deep borings to depths of 100 and 110 feet bgs to investigate potential presence of grossly contaminated material (GCM)/non-aqueous phase liquid (NAPL). Two deep soil samples were collected;
- Installation of seven groundwater monitoring wells and collection of seven groundwater samples;
- Installation of seven temporary sub-slab vapor points and collection of seven sub-slab vapor samples with co-located indoor air samples; and
- Survey and gauging of monitoring wells to evaluate groundwater elevation and flow direction.

The RI was performed in accordance with the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (May 2010) and the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006, with updates) and the NYSDEC-approved June 22, 2023 Remedial Investigation Work Plan (RIWP).

### **4.1 Geophysical Survey and Utility Location**

On July 14, 2023, NOVA Geophysical Services Inc. (NOVA) of Douglaston, New York completed a geophysical survey under the supervision of Langan field personnel. NOVA used ground-penetrating radar (GPR) and electromagnetic detection equipment to locate the suspected UST and identify any potential additional USTs, buried utilities, and subsurface anomalies across the

site. RI borings were relocated as necessary to avoid identified subsurface utilities and anomalies. A copy of the geophysical survey report presenting these findings is included in Appendix C.

## 4.2 Soil Investigation

### 4.2.1 Soil Boring Investigation Methodology

Twelve soil borings and three supplemental petroleum delineation borings were advanced during the RI by Eastern Environmental Solutions (Eastern) of Manorville, New York. Boring locations were selected to evaluate potential AOCs listed in Section 3.4, to supplement the previous environmental data, and to delineate impacts observed in the field. RI soil borings were advanced using a Geoprobe 7822DT track-mounted direct-push drill rig. Two additional deep soil borings (RIB05\_D and RIB06\_D) were advanced by Coastal Environmental Solutions (Coastal) of Bohemia, New York to investigate whether GCM/NAPL was present at the site, using an Eijkelkamp Sonic Drill Rig. RIB05\_D and RIB06\_D were advanced instead of off-site borings RIB13 and RIB14, which were proposed in the RIWP as alternate locations if the investigation could not be completed onsite due to drill rig clearances. A map showing the RI soil borings, delineation borings, deep boring locations, and previous borings advanced during the January 2023 LSI is presented as Figure 5.

The following table summarizes the AOCs and their associated RI borings.

AOC	Associated Soil Borings
AOC 1 – 550-Gallon Gasoline Tank	RIB01, RIB01_NE, RIB01_SE, RIB01_W, RIB02, and RIB03
AOC 2 – Auto Parts Cleaning Area	RIB07, RIB09
AOC 3 – Historical Site Operations	RIB04, RIB05, RIB06, RIB08, RIB10, RIB11, RIB12

Soil borings were advanced to the first apparent undisturbed soil interval, which was encountered between 10 and 25 feet bgs. Soil boring RIB10 was further advanced to 35 feet bgs because no recovery was obtained from the 20- to 30-foot bgs interval. Additionally, two deep borings were advanced to 100 and 110 feet bgs to investigate potential impacts of grossly contaminated material originating from off-site sources.

Direct push soil samples were collected into dedicated 5-foot-long acetate liners using a 2-inch diameter Macrocore sampler and Sonic samples were collected into 5-foot-long plastic sleeves using a core barrel sampler. Discrete soil samples were collected from the surface to the final depth of each boring and were screened for visual, olfactory, and instrumental evidence of environmental impacts and visually classified for soil type, grain size, texture, and moisture

content. Instrument screening for the presence of VOCs was performed using a PID equipped with a 10.6 electron volt (eV) lamp. Langan personnel documented the work, logged the soil type, screened the soil samples for environmental impacts, and collected environmental samples for laboratory analyses. Soil boring logs are presented in Appendix D.

#### 4.2.3 Soil Sampling

Langan collected 38 grab soil samples, plus 2 duplicates, for laboratory analysis. Three grab soil samples were collected from borings RIB01 through RIB12 to investigate AOCs. Two grab samples were collected from RIB01\_W to delineate field indications of petroleum impacts at RIB01.

Additionally, two grab samples (totaling 42 RI soil samples) were collected from RIB05\_D to evaluate potential GCM impacts. Generally, samples were collected from the upper two-foot interval, the first occurrence of undisturbed soil or the greatest degree of impacts determined by visual, olfactory, or instrumental means, and from the boring termination depth or the first interval below which environmental impacts were apparent, when applicable.

Soil samples submitted for VOC analysis were collected directly from the plastic liner or dedicated polyethylene-bag samples using laboratory-supplied Terra Core soil samplers. The remaining sample volume was placed into laboratory-supplied containers for analysis of non-VOC parameters. The sample containers were labeled, placed in a laboratory-supplied cooler and packed with ice (to maintain a temperature of  $4 \pm$  °C). The sample coolers were picked up and delivered via courier under chain-of-custody to York Analytical Laboratories, Inc. (York) in Stratford, Connecticut – a NYSDOH Environmental Laboratory Approval Program (ELAP)-certified analytical laboratory (ELAP ID No. 10854).

Soil samples were analyzed for Part 375/Target Compound List (TCL) VOCs, semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides and herbicides, Part 375/Target Analyte List (TAL) inorganics/metals (including hexavalent and trivalent chromium), cyanide, 1,4-dioxane (EPA Method 8270) and PFAS (EPA Method 1633).

Soil samples collected from RIB05\_D were analyzed for Part 375/TCL VOCs, SVOCs and cyanide, to evaluate potential GCM impacts.

### **4.3 Groundwater Investigation**

Langan field personnel documented installation of seven permanent monitoring wells to investigate groundwater conditions and potential impacts associated with the AOCs. The following table summarizes the installed monitoring wells and the associated soil boring.

<b>Soil Boring</b>	<b>Corresponding Monitoring Well</b>
RIB01	RIMW01
RIB03	RIMW02
RIB05	RIMW03
RIB07	RIMW04
RIB09	RIMW05
RIB11	RIMW06
RIB12	RIMW07

#### 4.3.1 Monitoring Well Installation, Development, and Surveying

Groundwater monitoring wells were installed per the NYSDEC Guidelines on Installation of Overburden Wells (Monitoring Wells) for Environmental Investigation. Due to site conditions and limited access to the drilling locations Langan could not mobilize a drilling rig that could install wells with two inches of annular space surrounding the well; therefore, each monitoring well was constructed using 2-inch-diameter polyvinyl chloride (PVC) riser pipe attached to a 15-foot-long, pre-packed, 0.02-inch slotted screen that was set to straddle the observed groundwater table. An about 3.5-inch borehole was advanced via direct-push to set each well. The annulus created by the pre-packed screen is about ½-inch. The annulus around the pre-packed well screens was filled with clean No. 2 sand to about two feet above the top of the screen, followed by a bentonite seal to surface grade. The monitoring wells were finished with flush-mount manhole covers encased in concrete. Following installation, the monitoring wells were surged and developed by the driller by purging with a submersible pump until the water ran clear. Well construction details are summarized in Table 2, and construction logs are provided in Appendix E.

Langan field personnel completed synoptic groundwater gauging on July 28, 2023 using a Solinst 122 oil/water interface probe. The monitoring well top-of-casing elevations were surveyed by Langan on August 14, 2023 and are referenced in feet to the North American Vertical Datum of 1988 (NAVD88). Groundwater elevations ranged from el. 5.4 in RIMW01 to el. 4.5 in RIMW07. Complete groundwater elevations are presented in Table 3. A groundwater elevation contour map is presented as Figure 4. During the groundwater sampling in April 2024, groundwater depth ranged from 11.8 to 13.77 feet bgs and 4.44 feet below cellar grade.

#### 4.3.2 Groundwater Sampling

Groundwater samples were collected from each well at least one week after well development, on April 18 and 19, 2024. Samples were collected in accordance with the United States Environmental Protection Agency (USEPA) low-flow groundwater sampling procedure ("Low

Stress [low-flow] Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells”, dated July 30, 1996 and revised September 19, 2017), and best management practices outlined in DER-10, to allow for collection of representative samples using a peristaltic pump with dedicated polyethylene tubing. Prior to sample collection, groundwater was purged from each well while monitoring physical and chemical groundwater parameters (i.e., pH, conductivity, turbidity, dissolved oxygen, temperature, and oxidation-reduction potential). Because groundwater samples were also analyzed for PFAS, monitoring wells were not gauged for static water level or drawdown during purging to avoid cross-contamination. Groundwater was purged until physical and chemical groundwater parameters stabilized, or for a minimum of one hour. Stabilization was achieved in five of the seven wells. In the two wells that did not stabilize, turbidity ranged from 19.8 NTU in RIMW02 and 51.8 NTU in RIMW01 at the time of sample collection. Groundwater sampling logs are included in Appendix F.

Seven groundwater samples were collected into laboratory-supplied glassware, packed with ice to maintain a temperature of 4 °C, and transported via courier service to York Analytical Laboratories under chain-of-custody protocol. Groundwater samples were analyzed for Part 375/TCL VOCs, SVOCs, PCBs, pesticides and herbicides, Part 375/TAL total and dissolved metals, (including cyanide and hexavalent and trivalent chromium) 1,4-dioxane (8270-SIM) and PFAS.

#### **4.4 Sub-Slab Vapor Investigation**

Seven sub-slab vapor samples (SSV01 through SSV07) and seven co-located indoor air samples (IA01 through IA07) were collected inside the vacant building to evaluate vapor intrusion conditions associated with the AOCs. Sub-slab vapor construction logs, and sub-slab vapor and indoor air sampling logs are provided in Appendix G.

##### 4.4.1 Sub-Slab Vapor Point Installation

The sub-slab vapor points were installed by Eastern using a hammer drill to advance the points to 2 inches below the bottom of the building slab, in general accordance with the NYSDOH's Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006, with updates) (hereafter referred to as SVI Guidance). Sub-slab vapor points consisted of dedicated polyethylene tubing – the annular space around the tubing was backfilled with No. 2 filter sand followed by bentonite seal to grade.

##### 4.4.2 Sub-Slab Vapor and Indoor Air Sampling and Analysis

As a QA/QC measure before sampling, an inert tracer gas (helium) was introduced into an above-grade sampling chamber to check that the sub-slab vapor sampling points were properly sealed above the target sampling depth, thereby preventing subsurface infiltration of ambient air. Direct

readings of less than 10 percent helium in the sampling tube were considered sufficient to verify a tight seal at each sample point.

Each sub-slab vapor point was also purged using a MultiRAE meter at a rate less than 0.2 liters per minute (L/min) to evacuate a minimum of three sample tubing volumes prior to sample collection. The purged sub-slab vapor was monitored for VOCs and the values were recorded. After purging was completed, sub-slab vapor and indoor air samples were collected into laboratory-supplied, batch-certified, 6-Liter Summa canisters calibrated for 8 hours of sampling.

Summa canisters were labeled and transported by a courier to York under chain-of-custody protocol for analysis of VOCs and naphthalene by USEPA Method TO-15.

#### **4.5 Quality Control Sampling**

Field blanks, PFAS field blanks, trip blanks, field duplicate samples, and MS/MSD samples were collected and submitted for laboratory analysis for QA/QC purposes. QA/QC samples are summarized in Table 1.

Langan collected 14 soil QA/QC samples (including two duplicates, two matrix spike/matrix spike duplicate [MS/MSD] samples, two field blanks, four per- and polyfluoroalkyl substances [PFAS] field blanks, and four trip blanks) and 6 aqueous QA/QC samples (including one MS/MSD sample, one field blank, four PFAS field blanks, and four trip blanks) for laboratory analysis.

Field duplicates were collected to assess the accuracy of the analytical methods relative to the sample matrix. The duplicates were collected from the same sample media as the primary sample by splitting the volume of homogenized sample collected in the field into two sample containers.

Field blank samples were collected to determine the cleanliness of unused nitrile gloves used to collect samples. Field blank samples were analyzed for the same analytes as the corresponding sampling event, with the exception of PFAS. One PFAS field blank sample was collected per day of sampling when PFAS was analyzed.

Trip blank samples were collected to assess the potential for contamination of the sample containers and samples by handling/sampling during the trip from the laboratory to the field, and back to the laboratory for analysis. Trip blanks contain approximately 40 milliliters of acidic water that is sealed by the laboratory when the empty sample containers are shipped to the field, and unsealed and analyzed by the laboratory when the sample shipment is received from the field. The trip blank samples were analyzed for VOCs.

MS/MSD samples were collected to assess the effect of the sample matrix on the recovery of target compounds or target analytes. MS/MSD samples were collected from the same soil or

groundwater as the primary sample by splitting the volume of the homogenized sample collected in the field into three sample containers.

## **4.6 Data Validation**

Analytical data was submitted to a Langan validator for review in accordance with USEPA and NYSDEC validation protocols. Data usability summary reports (DUSR) and the data validator's credentials are provided in Appendix H.

### 4.6.1 Data Usability Summary Report Preparation

A DUSR was prepared for each delivery group following data validation. The DUSR presents the results of data validation, including a summary assessment of laboratory data packages, sample preservation and chain-of-custody procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method. For each of the organic analytical methods, the following was assessed:

- Holding times
- Instrument tuning
- Instrument calibrations
- Blank results
- System monitoring compounds or surrogate recovery compounds (as applicable)
- Internal standard recovery results
- MS/MSD results
- Target compound identification
- Chromatogram quality
- Compound quantization and reported detection limits
- System performance
- Results verification

For each of the inorganic compounds, the following was assessed:

- Holding times
- Calibrations
- Blank results
- Interference check sample
- Laboratory check samples

- Duplicates
- Matrix Spike
- Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES) QC
- ICP serial dilutions
- Results verification and reported detection limits

Based on the results of data validation, the following qualifiers may be assigned to the data in accordance with the USEPA guidelines and best professional judgment:

**R** – The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

**J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

**UJ** – The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.

**U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

**NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

After data validation was complete, validated data was used to prepare the tables and figures included in this report.

#### **4.7 Field Equipment Decontamination**

Handheld sampling equipment, including the interface probe, water quality meter, and sampling pump, was decontaminated using an Alconox-based solution and triple rinsed with distilled water. Liquids were temporarily contained in 5-gallon buckets, and between rinses, equipment was placed such that contact with the ground was avoided. Decontamination wastewater was drummed for storage prior to disposal.

#### **4.8 Investigation-Derived Waste Management**

Soil cuttings, and decontamination and well development/purging fluids (investigation-derived wastes [IDW]) were containerized in eight labeled United Nations/Department of Transportation (UN/DOT)-approved 55-gallon DOT-approved drums with closed tops. All drums were properly labeled, sealed, and staged in a secured area on-site. Four drums containing soil cuttings, two drums containing drilling spoils, and two drums containing investigation-derived fluids were removed by Eastern, a licensed waste hauler, on August 14, 2023 for off-site disposal at the

---

Clean Water of New York facility located in Staten Island, New York. Three drums containing investigation-derived fluids were generated during the April 2024 groundwater sampling and are pending off-site disposal.

## **5.0 FIELD OBSERVATIONS AND ANALYTICAL RESULTS**

### **5.1 Geophysical Investigation Findings**

The geophysical survey identified multiple anomalies, including subsurface utilities (e.g., sewer, water, electric, gas, and telecom). A subsurface anomaly indicative of a UST was identified in the eastern-central part of the site. A suspected fill port, vent pipe, and cut fuel lines were observed adjacent to the suspected UST. A copy of the geophysical survey report is included as Appendix C.

### **5.2 Geology and Hydrogeology**

Provided below is a description of the geological and hydrogeological observations made during the RI. Groundwater elevations are summarized in Table 3. A depiction of groundwater elevation contours is provided as Figure 4. Cross-sectional diagrams interpreting soil profiles beneath the site are shown on Figures 6A and 6B. Boring logs are provided in Appendix D.

#### 5.2.1 Uncontrolled Fill

The building concrete slab is underlain by uncontrolled fill, predominantly consisting of tannish-brown to dark-brown and greyish-brown, fine-grained sand with varying amounts of silt, fine gravel, concrete, brick, coal, coal ash, ceramics, and glass and extending to depths ranging from about 10 to 25 feet bgs. Bedrock was not encountered during the subsurface investigation.

#### 5.2.2 Undisturbed Soil Layers

The uncontrolled fill layer is underlain by undisturbed soil that predominantly consists of tannish-brown to grayish-brown fine sand with trace fine gravel and trace to some clay or silt, followed by brown, dark-brown, or gray to dark-gray high plasticity clay with varying amounts of fibrous vegetation. In soil borings RIB01\_W, RIB01\_NE, RIB03, RIB05, RIB06, RIB07, RIB08, RIB09, and RIB12, undisturbed clay was encountered directly below the uncontrolled fill.

#### 5.2.3 Bedrock

The USGS "Bedrock and Engineering Geologic Maps of New York County and Parts Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" indicates that the bedrock underlying the site is part of the Hartland Formation and is between 100 and 200 feet bgs. Bedrock was not encountered during the RI.

#### 5.2.4 Hydrogeology

Synoptic groundwater level measurements were collected from all seven monitoring wells on July 28, 2023. Groundwater depth ranged from about 13 to 13.8 feet bgs, with corresponding elevations from about el. 5.4 to 4.5, respectively. During the groundwater sampling in April 2024, groundwater depth ranged from 11.8 to 13.77 feet bgs and 4.44 feet below cellar grade. The

regional groundwater table is relatively flat with a slight gradient to the west towards the Gowanus Canal. Dewatering activities at neighboring construction sites may also be influencing groundwater elevations and flow direction.

#### 5.2.5 Surface Water and Drainage

The BCP site is improved with building slabs that prevent rainwater infiltration. Runoff from the surrounding area typically drains through catch basins into city sewers. No surface water is present at the site.

### **5.3 Soil Findings**

#### 5.3.1 Soil Boring Field Observations

Petroleum-like impacts, evidenced by odors, staining, and PID readings above background, were apparent in two borings (RIB01 and RIB01\_W) in the northeastern part of the site. Petroleum-like odor, matte-black staining, and PID readings up to 555.3 ppm were observed in soil boring RIB01 between 10 and 13.5 feet bgs. Petroleum-like odor and a maximum PID reading of 21.7 ppm were observed in western offset boring RIB01\_W between 15 and 16 feet bgs. The horizontal and vertical extents of petroleum-like impacts were delineated by soil borings RIB01\_NE, RIB01\_SE, and RIB04, where no petroleum-like impacts were observed.

NAPL was not identified in the deep borings. Residual coal tar-like impacts, evidenced by odors, staining, and PID readings above background levels were apparent in one boring (RIB05\_D) in the northwestern part of the site. Naphthalene-like odors and a maximum PID reading of 55.3 ppm were observed between 93 and 100 feet bgs. Dark-gray staining was observed in RIB05\_D between 93 to 93.5 feet bgs. Sheen, coating, blebs, saturation, oil, tar, or solid tar were not observed. Based on these observations and coordination in the field with NYSDEC and their consultant representative, further delineation was not warranted.

#### 5.3.2 Analytical Results

As part of the RI, 38 soil samples, plus two field duplicates, were collected and analyzed for Part 375/TCL VOCs, SVOCs, PCBs, pesticides and herbicides, Part 375/TAL inorganics/metals (including cyanide, hexavalent and trivalent chromium), 1,4-dioxane (8270) and PFAS (1633). Two additional grab soil samples were collected and analyzed for Part 375/TCL VOCs, SVOCs and cyanide, to evaluate coal tar odors identified as part of the deep investigation.

Soil sample analytical results are summarized in Table 4 with comparisons to UU and RR SCOs, and the NYSDEC April 2023 PFAS guidance values. Soil sample locations and analytical results from the and RI are shown on Figure 7. Laboratory analytical reports are included in Appendix I.

### PFAS (40-Compound list) and 1,4-Dioxane

The SVOC 1,4-dioxane was not detected in soil samples. Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) concentrations are compared to the UU and RR Guidance Values (GV) published in the NYSDEC April 2023 "Sampling, Analysis and Assessment of PFAS under NYSDEC's Part 375 Remedial Programs". PFOS and PFOA were not detected in soil above the UU NYSDEC GVs.

### Protection of Groundwater Evaluation

Compounds detected in soil, that were also present in groundwater at concentrations above the SGVs, were also compared to the Protection of Groundwater (PGW) SCOs. Table 4 includes soil analytical result comparisons to the PGW SCOs. The following table summarizes the applicable compounds detected above PGW SCOs:

## 5.4 Groundwater Findings

### 5.4.1 Field Observations

Monitoring wells were gauged with an oil/water interface probe to evaluate the presence of light or dense NAPL product; NAPL was not detected in monitoring wells. Odors were not apparent at any wells during purging or sampling. Monitoring well PID headspace readings ranged from 0.0 ppm to 349.2 ppm at RIMW01.

During the groundwater sampling in April 2024, groundwater depth ranged from 11.8 to 13.77 feet bgs and 4.44 feet below cellar grade. The regional groundwater table is relatively flat with a slight gradient to the west towards the Gowanus Canal.

### 5.4.2 Analytical Data

Seven groundwater samples were collected and analyzed for TCL VOCs, SVOCs, pesticides, herbicides, and PCBs, Part 375/TAL total and dissolved inorganics/metals, 1,4-dioxane (8270-SIM) and PFAS (1633). Groundwater sample analytical results with comparisons to the 6 NYCRR Part 703.5 and the NYSDEC Technical and Operational Guidance Series (TOGS 1.1.1) Ambient Water Quality Standards and Guidance Values (SGV) for Class GA water are presented in Table 5. When comparing the maximum concentrations of PCE and TCE to the Decision Matrices, the NYSDOH recommended action is “mitigate”. Carbon tetrachloride, cis-1,2-DCE, 1,1,1-TCA, methylene chloride, 1,1-dichloroethene (11-DCE), and vinyl chloride were not detected at concentrations that would warrant further action.

Benzene concentrations in sub-slab vapor ranged from 2  $\mu\text{g}/\text{m}^3$  in SSV03\_072123 to 8.2  $\mu\text{g}/\text{m}^3$  in SSV06\_072123; concentrations in indoor air ranged from 0.74  $\mu\text{g}/\text{m}^3$  in IA04\_072123 to 1.5  $\mu\text{g}/\text{m}^3$  in IA05\_072123 and IA06\_072123. Naphthalene concentrations in sub-slab vapor ranged from 3.1  $\mu\text{g}/\text{m}^3$  in SSV06\_072123 to 4.9  $\mu\text{g}/\text{m}^3$  in SSV01\_072123 and SSV02\_072123; concentrations in indoor air ranged from 3.9  $\mu\text{g}/\text{m}^3$  in IA07\_072123 to 5.1  $\mu\text{g}/\text{m}^3$  in IA02\_072123. O - xylene concentrations in sub-slab vapor ranged from 23  $\mu\text{g}/\text{m}^3$  in SSV07\_072123 to 61  $\mu\text{g}/\text{m}^3$  in SSV03\_072123; concentrations in indoor air ranged from 0.92  $\mu\text{g}/\text{m}^3$  in IA04\_072123 to 2.9  $\mu\text{g}/\text{m}^3$  in IA05\_072123.

When comparing the maximum concentrations of naphthalene and benzene to the Decision Matrices, the NYSDOH recommended action is "identify source(s) or resample or mitigate". When comparing the maximum concentrations of o - xylene to the Decision Matrices, the NYSDOH recommended action is "monitor". Ethylbenzene, 1,2,4 - Trimethylbenzene, 1,3,5 - Trimethylbenzene, m & p - xylene, heptane, hexane and toluene were not detected at concentrations that would warrant further action.

## 5.6 Quality Control Results

Duplicates, MS/MSDs, field blanks, PFAS blanks, and trip blanks were collected during the RI are detailed in Table 1. The duplicates, field blanks, and MS/MSD sample pairs for soil and groundwater were collected at a frequency of 1 per 20 primary samples (and one per media, per day for PFAS samples), in accordance with the approved RIWP. QA/QC sample results were evaluated as part of data validation and are provided in Table 7.

## 5.7 Data Usability

Category B laboratory reports for soil, groundwater, sub-slab vapor, and indoor air samples collected during the August 2021 LSI and the 2023 RI were provided by York Analytical, Inc. (YORK), a NYSDOH ELAP-certified laboratory located in Stratford, CT and Richmond Hill, NY, and were forwarded to Langan's data validator. Data Usability Summary Report (DUSRs) are provided in Appendix H. The results of the data validation review are summarized below.

The data were determined to be acceptable. Completeness, defined as the percentage of analytical results that are judged to be valid, is 100 percent. No major deficiencies were identified. All data is considered useable as qualified.

## 5.8 Evaluation of Potential Areas of Concern

This section discusses the results of the RI with respect to the three potential AOCs described in detail in Section 3.4. AOC extents have been revised based on findings during the remedial investigation. AOC locations are shown on Figure 5.

### 5.8.1 AOC 1: 550-gallon Gasoline UST

Releases of petroleum products associated with an identified 550-gallon gasoline UST in the east-central part of the site may have adversely affected soil, groundwater and/or sub-slab vapor. A summary of the findings for AOC 1 is provided below:

#### *AOC 1 - Soil*

- Soil borings RIB01, RIB01\_W, RIB01\_NE, RIB01\_SE, RIB02, and RIB03 were advanced within or adjacent to AOC 1 to evaluate and delineate petroleum impacts. Petroleum-like staining, odors, and/or elevated PID readings were encountered in two borings (RIB01 and RIB01\_W) in the northeastern part of the site. Gasoline-like odor, matte-black staining, and PID readings up to 555.3 ppm were observed in soil boring RIB01 between 10 and 13.5 feet bgs. Gasoline-like odor and a maximum PID reading of 21.7 ppm were observed in the western delineation boring RIB01\_W between 15 and 16 feet bgs. RIB01\_NE and RIB01\_SE were also advanced to provide visual delineation of petroleum-like impacts. Borings could not be advanced in the northeast direction because that corner of the building was inaccessible at the time of the investigation. The horizontal and vertical extents of petroleum-like impacts were delineated to the north, south, and west by soil borings RIB01\_NE, RIB01\_SE, and RIB04, where petroleum-like impacts were not observed. Petroleum-related VOCs at the impacted sample intervals were below RR SCOs and appear to represent impacts that have exhibited degradation. The petroleum-related impacts are considered localized to the area around the 550-gallon tank and will be removed during redevelopment.
- One or more of three petroleum-related VOCs (n-butylbenzene, n-propylbenzene, and sec-butylbenzene) were detected above the UU SCOs in samples collected from depths ranging from 10.5 to 13.5 feet bgs in soil borings RIB01 and RIB03.

#### *AOC 1 - Groundwater*

- One petroleum-related VOC (chloromethane) was detected above the SGVs in the groundwater sample from monitoring well RIMW01.

#### *AOC 1 – Sub-slab Vapor*

- Several petroleum-related VOCs were detected in sub-slab vapor; however, these compounds do not have corresponding NYSDOH matrix values for comparison.
- Total BTEX in sub-slab vapor ranged from 268  $\mu\text{g}/\text{m}^3$  in SSV02 to 275.4  $\mu\text{g}/\text{m}^3$  in SSV01

#### *AOC 1 - Conclusions*

Petroleum-related impacts appear limited to the northeastern part of the site. The observed impacts to soil extend from about 10 to 16 feet bgs, which is consistent with the top of groundwater depth interval. Petroleum-related VOCs in soil exceed UU SCOs in samples

collected from 10.5 to 13.5 feet bgs in soil borings within the area of concern (RIB01 and RIB03). VOCs in groundwater exceeded SGVs for one well (RIMW01) within AOC 1. Sub-slab vapor samples contained several petroleum-related VOCs, which do not have relevant comparison criteria. The source of petroleum-related impacts appears to be associated with the 550-gallon gasoline UST. Based on the concentrations of petroleum-related VOCs detected below RR SCOs in RIB01 and the lack of impacts at RIB01\_NE and RIB01\_SE, the petroleum-related impacts are considered localized to the area around the 550-gallon UST; the tank and impacted soil will be removed during remediation/redevelopment.

### 5.9.2 AOC 2: Auto Parts Cleaning Area

Releases of VOCs, specifically chlorinated solvents associated with the historical site use as an auto-repair and cleaning facility since at least 1983, may have adversely affected soil, groundwater and/or sub-slab vapor. A summary of the findings for AOC 2 is provided below:

#### *AOC 2 - Soil*

- Soil borings RIB07, RIB08, RIB09, and RIB10 were advanced within or adjacent to AOC 2 to evaluate potential impacts.
- VOCs were not detected above UU in samples collected from soil borings RIB07, RIB08, RIB09, and RIB10, with the exception of acetone, which is a common laboratory contaminant and was detected in at least one trip blank.

#### *AOC 2 - Groundwater*

- Groundwater samples collected within or adjacent to AOC 2 include samples collected from RIMW04 and RIMW05.
- 1,4-dioxane was detected at concentrations above the SGVs in the groundwater sample collected from RIMW05.

#### *AOC 2 – Sub-slab Vapor*

- PCE was detected at 2,700  $\mu\text{g}/\text{m}^3$  in SSV04 and 23  $\mu\text{g}/\text{m}^3$  in co-located indoor air sample IA04. PCE was detected at concentrations of 13,000  $\mu\text{g}/\text{m}^3$  in SSV05 and 3  $\mu\text{g}/\text{m}^3$  in co-located indoor air sample IA05.
- TCE was detected at 35  $\mu\text{g}/\text{m}^3$  in SSV04 and 1.1  $\mu\text{g}/\text{m}^3$  in co-located indoor air sample IA04. TCE was detected at concentrations of 61  $\mu\text{g}/\text{m}^3$  in SSV05 and 1.1  $\mu\text{g}/\text{m}^3$  in co-located indoor air sample IA05.
- A comparison of the maximum concentrations compared to the NYSDOH Decision Matrices recommends “Mitigate”.

### AOC 2 Conclusions

Chlorinated VOCs were detected in sub-slab vapor samples at concentrations requiring mitigation in future development where the foundation is above the groundwater table. A source of chlorinated VOCs was not identified in soil or groundwater. Acetone was detected in soil, groundwater and sub-slab vapor throughout the site. The concentrations are likely associated with laboratory contamination. Vapor mitigation options will be considered for incorporation into the new development.

### 5.8.2 AOC 3: Historical Site Operations

AOC 3 is related to site-wide historical operations, including “laundry”, bottle cleaning & storage facility, auto-repair facility, and garage. The site is located in the Gowanus neighborhood of Brooklyn and in an area of historical industrial operations. Undocumented spills or releases of solvents, petroleum, chemicals, and/or other hazardous substances associated with historical site operations may have adversely affected soil, groundwater, and/or soil vapor beneath the site. A summary of the analytical results related to historical site operations is summarized as follows:

#### *AOC 3 – Soil*

- One or more of three VOCs (acetone, n-butylbenzene, and n-propylbenzene) were detected above the UU SCOs in samples collected from soil borings RIB01 through RIB12. Acetone is a common laboratory artifact that was detected in trip and laboratory batch blanks and may not be associated with historical site use.
- One or more of 11 SVOCs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, dibenzofuran, fluoranthene, indeno[1,2,3-cd]pyrene, phenanthrene, and pyrene), were detected at concentrations exceeding the UU and/or RR SCOs in samples from soil borings RIB01, RIB02, RIB03, RIB04, RIB05, RIB06, RIB08, RIB09, and RIB11 collected at depths from surface grade to 16 feet bgs.
- Metals, including arsenic, barium, cadmium, trivalent chromium, copper, lead, mercury, nickel, and zinc were detected at concentrations exceeding the UU and/or RR SCOs in 38 samples, including 2 duplicates, from soil borings RIB01 through RIB12 collected at depths from surface grade to 27.5 feet bgs.
- PFOS and PFOA were not detected above UU GVs in soil samples collected during the RI.

#### *AOC 3 – Groundwater*

- VOCs in groundwater above SGVs were limited to RIMW01 and are attributed to petroleum-related impacts (AOC 1).
- Up to six SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene) were detected at

concentrations above SGVs in samples collected from monitoring wells RIMW01, RIMW02, and RIMW04. The source of SVOCs in groundwater is expected to be SVOC-impacted soil, in which similar contaminants were detected.

- One or more of four total metals (magnesium, manganese, selenium, and sodium) and four dissolved metals (magnesium, manganese, selenium, and sodium) were detected in all seven monitoring wells (RIMW01 through RIMW07) at concentrations above the SGVs. Magnesium, manganese, selenium and sodium are typically found in brackish groundwater; therefore, these compounds are not considered a result of historical site uses.
- PFOS was detected in groundwater samples above the SGV in monitoring wells RIMW05 and RIMW07 at concentrations from 6.11 ng/L to 9.88 ng/L. PFOA was detected in groundwater samples above the SGV in each monitoring wells RIMW01 through RIMW07 at concentrations from 18.5 ng/L to 96.1 ng/L. 1,4-dioxane was detected in groundwater samples above the SGV in each monitoring well except RIMW04 at concentrations from 0.32 µg/L to 1.54 µg/L. A source of these contaminants was not identified in soil.

#### *AOC 3 – Sub-slab Vapor*

- AOC 3 is a site-wide area, so all RI sub-slab vapor samples were evaluated.
- Up to seven VOCs that are evaluated in the NYSDOH Decision Matrices (carbon tetrachloride, PCE, TCE, cis-1,2-DCE, 1,1-DCE, 1,1,1-TCA, and vinyl chloride) were detected in sub-slab vapor samples SSV01 through SSV07.
- PCE was detected in all seven sub-slab vapor samples, at concentrations ranging from 37 µg/m<sup>3</sup> in SSV03 to 13,000 µg/m<sup>3</sup> in SSV05. PCE concentrations were greatest in sub-slab vapor samples collected from SSV05, and impacts at this location are attributed to AOC 2.
- A comparison of the maximum concentrations of VOCs that are evaluated in the NYSDOH Decision Matrices results in a NYSDOH recommendation for “mitigate.”
- Carbon tetrachloride, methylene chloride, 1,1-DCE, and vinyl chloride were not detected above the NYSDOH Decision Matrices minimum concentrations in sub-slab vapor or indoor air samples.

#### *AOC 3 Conclusions*

VOCs, SVOCs, and metals were detected at concentrations above the UU and/or RR SCOs in soil samples collected across the site. VOCs in soil are concentrated in the northeastern part of the site and are associated with petroleum-related impacts (AOC 1). Acetone was also detected in soil and groundwater, but its presence is believed to be related to laboratory contamination because of the low-level concentrations and its presence in QA/QC blank samples. SVOCs above

UU and RRU SCOs are distributed across the site and may be attributed to historical site uses or anthropogenic materials comingled in soil.

SVOCs detected in groundwater samples at concentrations above NYSDEC SGVs are attributed to contaminants that exceeded PGW SCOs in soil. Magnesium, manganese, selenium, and sodium are naturally occurring metals in groundwater likely associated with brackish conditions and are typical of groundwater encountered in New York City.

PFOA and PFOS were identified in groundwater samples site-wide above the SGVs; however, these compounds were not detected in soil at concentrations that would suggest an on-site source was present.

A site source of chlorinated VOCs in sub-slab vapor were not identified; however, accidental releases of CVOCs may have occurred during historical automobile repairs and parts cleaning operations.

## **6.0 QUALITATIVE HUMAN AND FISH/WILDLIFE EXPOSURE ASSESSMENT**

Human health exposure risk was evaluated for both current and future on-site and off-site conditions, in accordance with NYSDEC DER-10. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, NYSDEC DER-10 requires an on-site and off-site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. According to the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, there was no need to prepare an FWRIA for the site. A completed form of DER-10 Appendix 3C is included in Appendix J.

### **6.1 Current Conditions**

The site (Brooklyn Tax Block 426) is bordered by Degraw Street to the north, 3<sup>rd</sup> Avenue to the east, Sackett Street to the south, and Nevins Street to the west in the Gowanus neighborhood of Brooklyn. The Gowanus neighborhood has a history of diverse industrial uses with known area-wide environmental impacts to subsurface conditions. The site contains a one-story building with a partial cellar and was last occupied by A&A Brake Services Company Inc. (an automobile repair shop) and Mack Truck Parts (an automobile parts retailer).

### **6.2 Proposed Conditions**

The current development proposes a new 11-story mixed-use residential and commercial building, with a partial cellar. The cellar will be used for building utilities (i.e., mechanical, electrical, plumbing). The ground floor will contain an outdoor recreational space, fitness room, indoor recreational room, lobby, and commercial spaces. Floors 2 through 11 will contain

residential units. The development will designate 25% of the residential units for affordable housing. The fourth floor will have a setback green roof and outdoor terrace in the southern part of the building footprint. The proposed building will generate electricity through photovoltaic arrays and will be connected to the Consolidates Edison's distribution system.

### **6.3 Summary of Environmental Conditions**

AOCs include a 550-gallon gasoline UST, an auto parts cleaning area, and site-wide historical operations. Contaminants of concern (COC) associated with the AOCs include VOCs, SVOCs, and metals.

The following contaminants of concern (COCs) were identified:

- VOCs, SVOCs, and metals in soil
- VOCs, SVOCs, and metals in groundwater
- CVOCs and petroleum-related VOCs in sub-slab vapor

#### *Petroleum-impacted Soil*

Visible petroleum impacts in soil are present within the northeastern part of the site. Three petroleum-related VOCs were detected above the UU SCOs in samples collected at or below the groundwater table from the uncontrolled fill within AOC 1. Four petroleum-related VOCs (including isopropylbenzene, n-butylbenzene, n-propylbenzene, and sec-butylbenzene) were detected above the SGVs in the groundwater sample from the monitoring well within the impacted area. Petroleum-related VOCs in soil, groundwater, and sub-slab vapor are attributed to the 550-gallon gasoline UST.

#### *Soil Impacted with VOCs, SVOCs, and Metals*

Several SVOCs (primarily PAHs) and metals were detected at concentrations above the Part 375 UU SCOs and/or RR SCOs in samples collected throughout the site. Concentrations of SVOCs and metals are associated with historical site use and/or anthropogenic materials identified within the top 10 to 25 feet of soil. The VOC acetone was detected in soil throughout the site and is suspected to be associated with laboratory contamination.

Benzene was identified marginally above the UU SCOs in one soil sample collected from 95 to 97 feet bgs in boring RIB05\_D. Benzene was not detected in the sample from the same boring

at 100 to 102 feet bgs. There is a known off-site source of benzene (Former Fulton MGP site) at this depth.

### Groundwater

#### *Petroleum-impacted Groundwater*

Petroleum-related VOCs were detected in groundwater at concentrations above the SGVs in RIMW01, located in the northeastern part of the site. The observed petroleum-related impacts are attributed to residual contamination associated with a historical release from a suspected 550-gallon gasoline tank.

#### *Groundwater-Impacted with PAHs, Metals, and PFAS*

Six PAHs and four metals were detected in groundwater throughout the site at concentrations above SGVs. The source of these contaminants in groundwater at concentrations above the SGVs is where similar contaminants in soil were also detected, or naturally occurring groundwater conditions. Soil exceeding the lower of PGW and RRU SCOs will be removed as part of future site development.

PFOA and/or PFOS were detected in groundwater samples above the NYSDEC SGVs in all seven monitoring wells that were sampled. No historical use consistent with PFAS was identified at the site; therefore, its presence is attributed to an off-site source.

### Sub-slab Vapor

#### *CVOCs in Sub-slab Vapor*

CVOCs, specifically TCE and PCE, were detected in sub-slab vapor at concentrations that warrant mitigation; however, a source of these CVOCs was not identified in site soil groundwater. CVOCs in sub-slab vapor were at their highest concentrations near the western perimeter of the site, within the vicinity of the historical parts cleaning area (AOC-2).

## **6.4 Conceptual Site Model**

A conceptual site model (CSM) was developed based on the findings of the RI to produce a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways.

### 6.4.1 Potential Sources of Contamination

Potential sources of contamination (also discussed in Section 5.8) include:

- Historical releases from a 550-gallon gasoline UST and historical site operations (VOCs in soil and groundwater)
- Chlorinated solvents associated with the historical site use for auto-repair (i.e., parts cleaning) (CVOCs in sub-slab vapor)

- Contaminated soil from historical site operations and/or anthropogenic materials identified in soil (VOCs, SVOCs, and metals in soil and SVOCs and metals in groundwater)

#### 6.4.2 Exposure Media

The impacted media include soil, groundwater, and sub-slab vapor, which may have been impacted by former site operations and/or anthropogenic material in soil. Petroleum impacts were observed in two soil borings in the northeastern part of the site. Gasoline-like odor, matte-black staining, and PID readings up to 555.3 ppm were apparent in soil boring RIB01 between 10 and 13.5 feet bgs. Gasoline-like odor and a maximum PID reading of 21.7 ppm were observed in RIB01\_W between 15 and 16 feet bgs. Petroleum-related VOCs were detected in soil above UU SCOs and in groundwater above SGVs in the impacted area.

Analytical data also shows that soil contains SVOCs and metals above RR and/or UU SCOs. The SVOCs and metals may be associated with historical site use and/or anthropogenic material in soil (e.g., concrete, brick, coal, coal ash, ceramics, and glass) that may have been placed during historical site development. Groundwater impacts include VOCs, SVOCs and metals. Groundwater is not a potable source of water. CVOs (specifically PCE and TCE) are present in sub-slab vapor at concentrations requiring mitigation in future development. A maximum concentration of 13,000  $\mu\text{g}/\text{m}^3$  was detected in sub-slab vapor at SSV05 in the southwestern part of the site near the former auto parts cleaning area (AOC-2). A review of soil, sub-slab vapor, and groundwater data is provided in Section 7.0 (Nature and Extent of Contamination).

#### 6.4.3 Receptor Populations

The site is improved with a vacant one-story building with a partial cellar. Current receptor populations are limited to visitors of the site during investigation and abatement activities. During site development, human receptors may include demolition, construction, and remediation workers, authorized guests visiting the site, and the public adjacent to the site. Under future conditions, receptors will include the residential and commercial use occupants, employees, and the nearby community, including children.

### **6.5 Potential Exposure Pathways – On-Site**

#### 6.5.1 Current Conditions

Human exposure to contaminated soil is prevented by the foundation of the one-story building covering the site. Site access is restricted by locked doorways; therefore, human exposure to contaminated soil is limited. There is a potential pathway through dermal absorption, inhalation and ingestion for investigation workers that handle soil beneath the surface cover materials, but this is controlled by implementation of a site-specific Health and Safety Plan (HASP).

Groundwater in this area of New York City is not used as a potable water source. There is a potential exposure pathway during groundwater sampling associated with site investigation. The

potential pathway for site investigation workers is through dermal absorption and ingestion, but is controlled by implementation of a site-specific HASP.

Sub-slab vapor contains VOCs at concentrations that warrant vapor mitigation; however, any potential exposure to soil vapor is limited as the one-story building contains a concrete building slab and the roof has been partially removed, allowing ventilation with the outside air.

#### 6.5.2 Construction/Remediation Conditions

Construction and remediation may result in potential exposures to site contaminants in the absence of a HASP and a Community Air Monitoring Plan (CAMP). Construction and remedial activities will likely include excavation and off-site disposal of impacted soil, and construction of foundation elements and paved walkways. In the absence of a HASP and CAMP, this scenario presents the potential for exposure of soil contaminants to construction and remediation workers via dermal absorption, ingestion, and inhalation of vapors and particulate matter. This exposure pathway will be marginalized through the implementation of the HASP, CAMP, and vapor and dust suppression techniques.

#### 6.5.3 Proposed Future Conditions

Currently, the contemplated project includes a mixed-use affordable residential and commercial development. The site is anticipated to undergo a Track 4 cleanup and new development will incorporate a cover system across the site and an active vapor mitigation system.

There is no pathway for ingesting residual groundwater impacts, since the site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate and not from groundwater. The potential pathway for soil vapor intrusion into the future on-site building would be mitigated by installation of a waterproofing/vapor barrier membrane and sub-membrane depressurization system.

If necessary, institutional controls will require maintenance of engineering controls and will serve to further mitigate exposure under future conditions.

### **6.6 Potential Exposure Pathways – Off-Site**

In its current condition, there is minimal potential for off-site exposure to site contaminants because the site has been made inaccessible to the public using locked doors and is covered with an impermeable surface. During remediation, in the absence of a CAMP and HASP, soil has the potential to be transported off-site by wind in the form of dust or on the tires of vehicles or equipment leaving the site during ground disturbances. Off-site transport creates a potential exposure pathway to the community adjacent to the site.

The potential off-site migration of soil contaminants is not expected to result in a complete exposure pathway for current, construction and remediation, or future conditions for the following reasons:

- The site is located in an urban area and predominantly covered with continuous impervious surface covering.
- During site remediation and construction, the following protective measures will be implemented:
  - A site-specific HASP, including a CAMP, will be implemented to protect on-site personnel and to monitor the perimeter of the site to mitigate off-site migration of particulates and VOCs during construction.
  - Perimeter air monitoring will be conducted for particulates (dust) and VOCs during ground-intrusive work as part of a CAMP. Dust and/or vapor suppression techniques will be employed to limit the potential for off-site migration of soil and vapors.
  - Vehicle tires and undercarriages will be washed as necessary prior to leaving the site to prevent tracking material off-site.
  - A soil erosion/sediment control plan will be implemented during construction to control off-site migration of soil.
- The new building foundations and pavers will cover the entirety of the site footprint.
- There is no pathway for ingesting residual groundwater impacts, as the site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate and not from groundwater.

## **6.7 Evaluation of Human Health Exposure**

Based on the CSM and review of environmental data, complete on-site exposure pathways appear to be present, in the absence of monitoring and mitigation or engineering controls in construction/remediation and future use conditions.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the site is provided below.

### 6.7.1 Current Conditions

Contaminant sources include varying concentrations of VOCs and SVOCs, pesticides, and metals in soil and/or groundwater and petroleum- and CVOC-impacted sub-slab vapor.

Contaminant release and transport mechanisms include contaminated soil transported as dust (dermal, ingestion, inhalation), and existing soil vapor contaminants (inhalation). Under current conditions, the likelihood of human exposure is limited, as 1) site access is restricted to employees, ownership and authorized visitors; 2) impermeable concrete building slabs cover the site; and 3) the groundwater beneath the site is not a source of drinking water.

#### 6.7.2 Construction/Remediation Activities

During the excavation and foundation construction, points of exposure include disturbed and exposed soil and groundwater during excavation and possible dewatering, and dust and potential organic vapors generated during excavation. Routes of exposure include ingestion and dermal absorption of contaminated soil and groundwater, inhalation of potential organic vapors arising from contaminated groundwater and soil, and inhalation of dust originating from contaminated soil. The receptor population includes construction and remediation workers, and to a lesser extent, the community adjacent to the site.

The potential for completed exposure pathways is present since all five elements exist; however, the risk can be avoided or minimized by applying appropriate health and safety measures during construction and remediation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, cleaning truck undercarriages and securing tarp covers before they leave the site to prevent off-site soil tracking, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

A HASP, a RAWP, and a CAMP that include measures such as conducting a community air-monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, restricting eating and drinking on-site, maintaining a secure construction entrance, proper housekeeping, and applying vapor and dust suppression measures to prevent off-site migration of vapors and particulates during construction will be implemented. Such measures will prevent completion of exposure pathways for soil, groundwater, and soil vapor contaminants.

#### 6.7.3 Proposed Future Conditions

For the proposed future conditions a Track 4 cleanup is anticipated. Residual contaminants may remain on-site and would include those listed under current conditions. If institutional and/or engineering controls are not implemented, points of exposure include potential cracks in the foundation or slab of the proposed development, and exposure during any future soil-disturbing activities. The receptor population includes potential building tenants and/or employees, visitors and maintenance workers. The possible routes of exposure can be avoided or mitigated by the installation of engineering controls, such as a site capping system and vapor mitigation system, and the implementation of institutional controls, such as restrictions on groundwater and land use and execution of a Site Management Plan (SMP).

---

#### 6.7.4 Human Health Exposure Assessment Conclusions

1. Under current conditions, there is a marginal risk for exposure. The primary exposure pathways are dermal contact, ingestion and inhalation of soil, dust, or groundwater by authorized site visitors in instances where the impermeable site cover is compromised or during site investigation. The exposure risks can be avoided or minimized by following the appropriate HASP and vapor and dust suppression measures, and by implementing a CAMP during intrusive activities.
2. In the absence of engineering controls, there is a potential for exposure during the construction and remediation activities. The primary exposure pathways are:
  - a. Dermal contact, ingestion and inhalation of contaminated soil, groundwater or soil vapor by construction workers.
  - b. Dermal contact, ingestion and inhalation of soil (dust) by the community in the vicinity of the site.

These can be avoided or minimized by performing community air monitoring and by following the appropriate health and safety, dust suppression, and site security measures outlined in a site-specific HASP.

3. The existence of a complete exposure pathway for site contaminants to human receptors during the proposed future use condition is unlikely, as most contaminated soil will be excavated and transported to an off-site disposal facility, groundwater will be remediated, and residual contaminated media may be capped with an impermeable cover, depending on remedial track. Regional groundwater is not used as a potable water source in NYC. The potential pathway for soil vapor intrusion into the future on-site building would be addressed by installation of a waterproof vapor barrier and sub-membrane depressurization system, which would minimize soil vapor infiltration.
4. It is possible that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors during current, construction-phase, and future conditions. Monitoring and control measures have been and will continue to be used during remediation/construction to prevent completion of this pathway. Under future conditions, the site will be remediated, and engineering and institutional controls will be implemented, if necessary, to prevent completion of this pathway.

## **7.0 NATURE AND EXTENT OF CONTAMINATION**

This section evaluates the nature and extent of soil, groundwater and sub-slab vapor contamination. The nature and extent of the contamination is derived from a combination of field observations and analytical data that were discussed in Section 5.0.

### **7.1 Soil Contamination**

Soil impacted with VOCs, SVOCs, and metals attributed to historical site use was encountered up to about 25 feet bgs.

Petroleum-like staining, odors, and/or PID readings above background were encountered in soil borings located in the northeastern part of the site to depths of about 16 feet bgs. The horizontal and vertical extents of petroleum-like impacts were delineated by soil borings RIB01\_NE, RIB01\_SE, and RIB04, in which no petroleum-like impacts were observed. Petroleum-related VOCs exceeded UU SCOs but did not exceed RR SCOs within the impacted area.

Residual coal tar-like impacts, evidenced by odors, staining, and PID readings above background were apparent in one deep boring (RIB05\_D) in the northwestern part of the site. Faint naphthalene-like odors and a maximum PID reading of 55.3 ppm were observed between 93 and 100 feet bgs. Dark gray staining was observed in RIB05\_D between 93 to 93.5 feet bgs. Sheen, coating, blebs, saturation, oil, tar, or solid tar were not identified. Based on these observations and coordination in the field with NYSDEC and their consultant representative, further delineation was not warranted.

SVOCs and metals, including arsenic, lead, mercury, barium, copper, nickel, and zinc, were detected at concentrations above the UU and/or RR SCOs across the site. UU and RR exceedances were encountered to depths of about 16 feet bgs for SVOCs and 27.5 feet bgs for metals.

### **7.2 Groundwater Contamination**

Groundwater analytical results identified VOCs, SVOCs, metals, and PFAS above the SGVs. Some PAHs detected in soil were also identified in groundwater at concentrations above SGVs. One VOC (chloromethane) was detected in one monitoring well (RIMW01), in the same location where similar petroleum impacts were identified in soil. Six SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene) were detected above SGVs in RIMW01, RIMW02, and RIMW04. The source of SVOCs in groundwater is the overlying SVOC-impacted soil. Metals, including magnesium, manganese, selenium, and sodium were also detected across the site. PFOA and PFOS, and 1,4-dioxane were detected in groundwater samples site-wide above the SGVs, but were not

identified in soil above the UU guidance value. PFOA, PFOS, and 1,4-dioxane concentrations were not indicative of an on-site source or release.

### **7.3 Sub-slab Vapor Contamination**

CVOCs (specifically PCE and TCE) were detected in sub-slab vapor at three locations (SSV04, SSV05, and SSV07) at concentrations that warrant mitigation in future development.

## 8.0 CONCLUSIONS

1. Stratigraphy: Site stratigraphy consists of an uncontrolled fill layer, primarily consisting of tannish brown to dark brown and grayish brown, fine-grained sand with varying amounts of silt, fine gravel, concrete, brick, coal, coal ash, ceramics, and glass, that extends to between 10 and 25 feet bgs. The fill layer is underlain by undisturbed soil that predominantly consists of tannish brown to grayish brown fine sand with trace fine gravel and trace to some clay or silt, followed by brown, dark brown, or gray to dark gray high plasticity clay with varying amounts of fibrous vegetation. In some soil borings, clay was observed directly below the uncontrolled fill. Bedrock was not encountered during the subsurface investigation.
2. Hydrogeology: During the groundwater sampling in April 2024, groundwater depth ranged from 11.8 to 13.77 feet bgs and 4.44 feet below cellar grade and generally flows west. The regional groundwater table is relatively flat with a slight gradient to the west towards the Gowanus Canal. Dewatering activities at neighboring construction sites may also be influencing groundwater elevations and flow direction.
3. Petroleum- and Gasoline-Impacted Fill/Soil and Groundwater: Petroleum- or gasoline-like staining, odors, and/or PID readings above background were encountered in soil borings located in the northeastern part of the site. Petroleum-related VOCs were detected in soil above UU SCOs and in groundwater above SGVs in the impacted area. The source of petroleum-related impacts is likely from a historical release associated with the suspect 550-gallon gasoline UST. Impacts in this area are defined and do not appear to be migrating.
4. Groundwater: VOCs, SVOCs, metals, 1,4-dioxane and PFAS were detected in groundwater at concentrations above the SGVs. Some PAHs detected in soil were also identified in groundwater at concentrations above SGVs. One VOC (chloromethane) was detected in one monitoring well (RIMW01), which is in the same area as the soil samples that exhibited the highest degree of petroleum- or gasoline-related impacts. Six petroleum-related SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene) were detected above SGVs in RIMW01, RIMW02, and RIMW04. Metals, including, magnesium, manganese, selenium, and sodium were also detected across the site but are naturally occurring in brackish water and present in groundwater throughout New York City. PFOA and PFOS, and 1,4-dioxane were detected in site-wide groundwater above the SGVs, but were not identified in soil above the UU guidance value. The detected PFOA, PFOS, and 1,4-dioxane concentrations were not indicative of an on-site source or release.

5. Soil Vapor: CVOCs were detected in sub-slab vapor at concentrations requiring mitigation in future development where the foundation is above groundwater. An on-site source of CVOCs in soil vapor was not identified.
6. Sufficient data were gathered during the RI to establish site-specific soil cleanup levels and to develop a remedy for the site. The remedy will be described and evaluated in the RAWP prepared in accordance with New York State BCP guidelines. The remedy will address impacts to soil, groundwater, and soil vapor described in this RIR.

CAS - Chemical Abstract Service

NS - No standard

mg/kg - milligram per kilogram

NA - Not analyzed

RL - Reporting limit

<RL - Not detected

Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Title 6 of the Official Compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use, Restricted Use Restricted-Residential, and Protection of Groundwater Soil Cleanup Objectives (SCO).

Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Part 375 Remedial Programs Guidelines for Sampling and Analysis of Per- and Polyfluoroalkyl Substances (PFAS) Unrestricted Use, Restricted Use Restricted-Residential, and Protection of Groundwater Guidance Values (April 2023).

Criterion comparisons for 3- & 4-methylphenol (m&p cresol) are provided for reference. Promulgated SCOs are for 3-methylphenol (m-cresol) and 4-methylphenol (p-cresol).

**Qualifiers:**

D - The concentration reported is a result of a diluted sample.

B - The analyte was found in the associated analysis batch blank.

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

**Exceedance Summary:**

**10** - Result exceeds Unrestricted Use SCOs

**10** - Result exceeds Restricted Use Restricted-Residential SCOs

10 - Result exceeds Protection of Groundwater SCOs

**Notes:**

CAS - Chemical Abstract Service  
NS - No standard  
ug/l - microgram per liter  
NA - Not analyzed  
RL - Reporting limit  
<RL - Not detected

Groundwater sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Title 6 Codes, Rules, and Regulations (NYCRR) Part 703.5 and the NYSDEC Technical and Operation Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values for Class GA Water and published addenda (herein collectively referenced as "NYSDEC SGVs").

**Qualifiers:**

- D - The concentration reported is a result of a diluted sample.
- J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.
- U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the RL.
- B - The analyte was found in the associated analysis batch blank.

**Exceedance Summary:**

**10** - Result exceeds NYSDEC SGVs

**Notes:**

IA - Indoor Air

SSV - Sub-slab Soil Vapor

CAS - Chemical Abstract Service

NS - No standard

ug/m<sup>3</sup> - microgram per cubic meter

NA - Not analyzed

RL - Reporting limit

<RL - Not detected

Indoor air sample analytical results are compared to the New York State Department of Health (NYSDOH) Air Guideline Values (AGVs) as set forth in the NYSDOH October 2006 Guidance for Evaluating Soil Vapor Intrusion in the State of New York and subsequent updates (2013, 2015, 2017).

Ambient air sample analytical results are shown for reference only.

**Qualifiers:**

D - The concentration reported is a result of a diluted sample.

B - The analyte was found in the associated analysis batch blank.

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

**Exceedance Summary:**

**10** - Result exceeds NYSDOH AGVs

Re: Geophysical Engineering Survey (GES) Report  
Commercial Site-  
224 3rd Avenue,  
Brooklyn, New York 11217

Dear Ms. McConnell,

Nova Geophysical Services (NOVA) is pleased to provide the findings of the geophysical engineering survey (GES) at the above referenced project site: 224 3<sup>rd</sup> Avenue, Brooklyn, New York 11217 (the "Site").

## INTRODUCTION TO GEOPHYSICAL ENGINEERING SURVEY (GES)

NOVA performed a geophysical engineering survey (GES) consisting of a Ground Penetrating Radar (GPR) and Electromagnetic (EM) survey at the site. The purpose of this survey is to locate and identify utilities, underground storage tanks and other substructures on July 14<sup>th</sup>, 2021.

The equipment selected for this investigation was a GSSI UtilityScan 350 MHz ground penetrating radar (GPR) with a shielded antenna Sensors and Software Noggin 250 MHz GPR with a shielded antenna and a RadioDetection RD7100 Electromagnetic utility locator. A GPR system consists of a radar control unit, control cable, and transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250/350 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control

cable. The transmitter electronics amplify the trigger pulse into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

A typical electromagnetic (EM) utility locating system consists of a transmitter unit and a receiver unit. The receiver unit can be used independently of the transmitter unit in order to detect utility lines with an inherent EM signature (electric utility lines, water lines, etc.). If needed a current at a specific frequency can also be placed on a utility that is being located. This can be done via the transmitter unit by either direct connection or induction via an EM field varying at specific frequency. The receiver unit is then set to the selected frequency and the electromagnetic field created by the current running through the utility can be located allowing the utility to be marked.

## GEOPHYSICAL METHODS

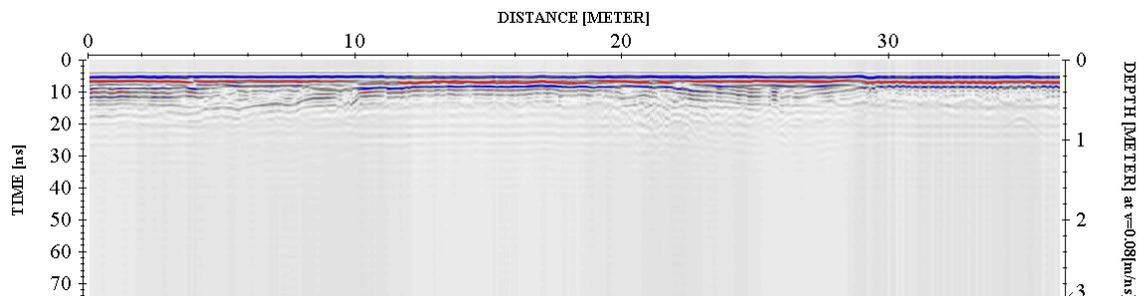

The project site was screened using GPR to search the specified area and inspected for reflections, which could be indicative of substructures and utilities within the subsurface. An EM utility locator was used to help determine the locations of utilities within the survey area.

EM data was collected and interpreted on site and suspected utilities marked as needed. GPR data profiles were collected for the areas of the Site specified by the client and processed as specified below.

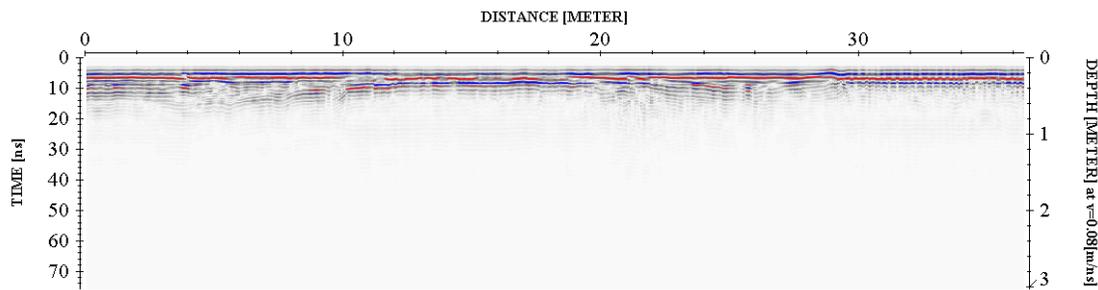

## DATA PROCESSING

In order to improve the quality of the results and to better identify anomalies NOVA processed the collected data. The processing work flow is briefly described in this section.

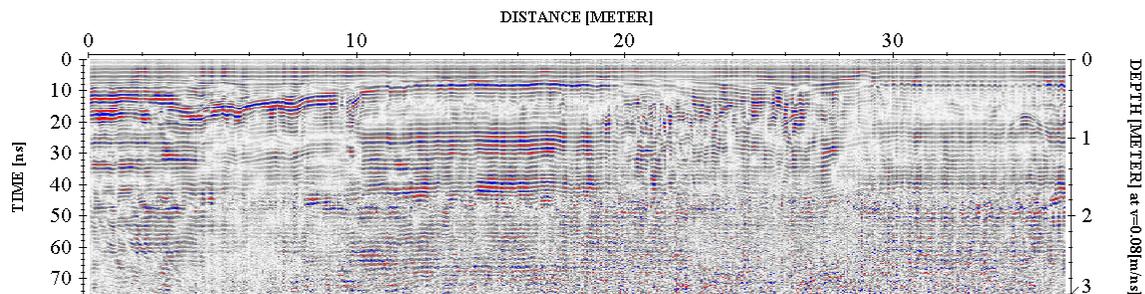

### Step 1. Import Raw RAMAC data to standard processing format

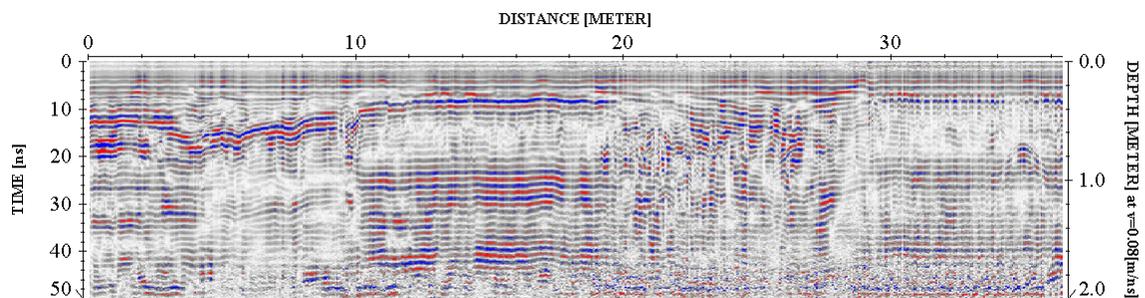

## Step 2. Remove instrument noise (*dewow*)

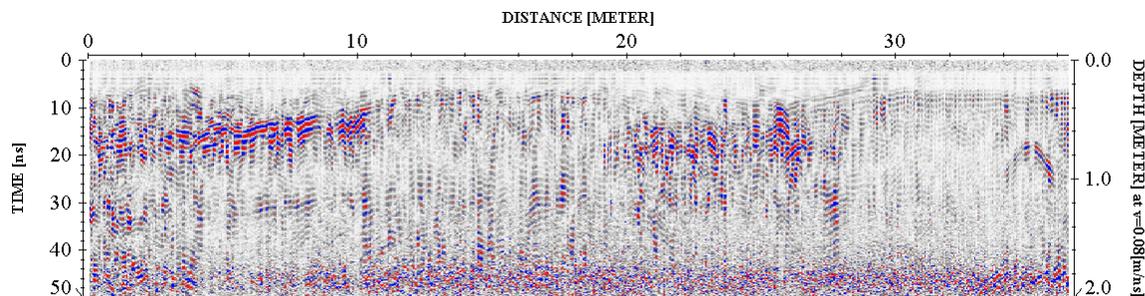

## Step 3. Correct for attenuation losses (*energy decay function*)

## Step 4. Remove static from bottom of profile (*time cut*)

## Step 5. Mute horizontal ringing/noise (*subtracting average*)

The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and represents the subsurface anomalies much more accurately.

## PHYSICAL SETTINGS

NOVA observed the following physical conditions at the time of the survey.

**Weather:** Cloudy, Rainy

**Temperature:** 75° F

**Surface:** Concrete, Asphalt

**Survey Parameters:** A GPR grid scan was conducted within the survey areas as shown on the survey plan. The approximate line spacing of the grid survey was approximately 5'.

**Limitations:** The geophysical noise level at the site was very high due to being located in an urban environment and heavily reinforced concrete. A GPR grid scan was completed only in the vicinity of proposed boring locations in these areas.

## RESULTS

The results of the geophysical engineering survey (GES) identified the following at the project site:

- The GES identified anomalies resembling potential subsurface utilities (such as sewer, water, gas, telecom and electric) located within the survey area. The approximate locations are shown in the survey plan.
- NOVA identified a suspected fill port, vent pipe, and cut fuel lines located aboveground during the GES. The lines were traced to an area beneath a tent (limited access area). A tank is suspected in this area but could not be confirmed at the time of the GES due to interference from a tent that had an asbestos warning covering it.
- NOVA additionally identified a port resembling either a fill port (for the above suspected UST) or a potential sewer cleanout (due to close proximity to sewer lines.) Due to limited access and excessive presence of geophysical noise, the associated anomaly was not able to be identified during the GES. Shown in the survey plan.
- NOVA cleared and marked all boring locations shown in the survey plan.

If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

**NOVA Geophysical Services**

Well screen was installed from approximately 8 to 23 feet bgs with riser from 8 feet bgs to surface. Wells were finished with a flush mounted well cover and concrete pad.

For 224 3rd Avenue  
July 2023 Soil Samples  
Langan Project No.: 170758101

This memorandum presents the findings of an analytical data validation from the analysis of soil samples collected in July 2023 by Langan Engineering and Environmental Services at 224 3rd Avenue. The samples were analyzed by York Analytical Laboratories, Inc. (NYSDOH NELAP registration #10854 and 12058) for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), per- and polyfluoroalkyl substances (PFAS), herbicides, polychlorinated biphenyls (PCBs), pesticides, metals, cyanide (CN), hexavalent chromium (CrVI), and trivalent chromium (CrIII) by the methods specified below.

- VOCs by SW-846 Method 8260C
- SVOCs by SW-846 Method 8270D/8270D SIM
- PFAS by USEPA Method 1633
- Herbicides by SW-846 Method 8151A
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- Metals by SW-846 Method 6010D/6020B/7473/7470
- Cyanide by SW-846 Method 9014/9010C
- Hexavalent Chromium by SW-846 Method 7196A
- Trivalent Chromium (calculated)

Table 1, attached, summarizes the laboratory and client sample identification numbers, sample collection dates, level of data validation, and analytical parameters subject to review.

### **Validation Overview**

This data validation was performed in accordance with the following guidelines, where applicable:

- USEPA Region II Standard Operating Procedures (SOPs) for Data Validation

# Technical Memorandum

- USEPA Contract Laboratory Program “National Functional Guidelines for Organic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020)
- USEPA Contract Laboratory Program “National Functional Guidelines for Inorganic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020), and
- published analytical methodologies.

The following acronyms may be used in the discussion of data-quality issues:

%D	Percent Difference	MB	Method Blank
CCV	Continuing Calibration Verification	MDL	Method Detection Limit
FB	Field Blank	MS	Matrix Spike
FD	Field Duplicate	MSD	Matrix Spike Duplicate
ICAL	Initial Calibration	RF	Response Factor
ICV	Initial Calibration Verification	RL	Reporting Limit
ISTD	Internal Standard	RPD	Relative Percent Difference
LCL	Lower Control Limit	RSD	Relative Standard Deviation
LCS	Laboratory Control Sample	TB	Trip Blank
LCSD	Laboratory Control Sample Duplicate	UCL	Upper Control Limit

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs values; field duplicate RPDs, laboratory duplicate RPDs, and LCS/LCSD recoveries and RPDs. Five SDGs underwent Tier 1 validation review.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA guidelines and our best professional judgment:

**R** – The sample results are unusable because certain criteria were not met when generating the data. The analyte may or may not be present in the sample.

**J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

**UJ** – The analyte was not detected at a level greater than or equal to the reporting limit; however, the reported reporting limit is approximate and may be inaccurate or imprecise.

**U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

**NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned, these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are considered invalid and are not technically usable for data interpretation. Data that is otherwise qualified because of minor data-quality anomalies are usable, as qualified in Table 2 (attached).

## **MAJOR DEFICIENCIES:**

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

## **MINOR DEFICIENCIES:**

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

## FIELD DUPLICATES:

Two field duplicate and parent sample pairs were collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than  $\pm 2X$  the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 50% for soil. The following field duplicate and parent sample pairs were compared to the precision criteria:

- RIDUP02\_071823 and RIB10\_18-20
- RIBDUP01\_071723 and RIB03\_10.5-12.5

The field duplicate and parent sample (RIDUP02\_071823 and RIB10\_18-20) exhibited RPDs above the control limit for arsenic (78.1%), lead (86.9%), mercury (142%), and zinc (112.6%). The associated results are qualified as J because of potential indeterminate bias.

The field duplicate and parent sample (RIDUP02\_071823 and RIB10\_18-20) exhibited an absolute difference above the RL for beryllium (0.181 mg/kg). The associated results are qualified as J because of potential indeterminate bias. The field duplicate and parent sample (RIBDUP01\_071723 and RIB03\_10.5-12.5) exhibited a RPD above the control limit for methylcyclohexane (63.6%). The associated results are qualified as J because of potential indeterminate bias.

RIBDUP01\_071723 and RIB03\_10.5-12.5 met precision criteria.

## CONCLUSION:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above,

This memorandum presents the findings of an analytical data validation from the analysis of groundwater samples collected in July 2023 by Langan Engineering and Environmental Services at 224 3rd Avenue. The samples were analyzed by York Analytical Laboratories, Inc. (NYSDOH NELAP registration #10854 and 12058) for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), per- and polyfluoroalkyl substances (PFAS), herbicides, polychlorinated biphenyls (PCBs), pesticides, metals, cyanide (CN), hexavalent chromium (CrVI), and trivalent chromium (CrIII) by the methods specified below.

- VOCs by SW-846 Method 8260C
- SVOCs by SW-846 Method 8270D/8270D SIM
- PFAS by USEPA Method 1633
- Herbicides by SW-846 Method 8151A
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- Metals by SW-846 Method 6010D/6020B/7470

Table 1, attached, summarizes the laboratory and client sample identification numbers, sample collection dates, level of data validation, and analytical parameters subject to review.

### **Validation Overview**

This data validation was performed in accordance with the following guidelines, where applicable:

- USEPA Region II Standard Operating Procedures (SOPs) for Data Validation

# Technical Memorandum

- USEPA Contract Laboratory Program “National Functional Guidelines for Organic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020)
- USEPA Contract Laboratory Program “National Functional Guidelines for Inorganic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020), and
- published analytical methodologies.

The following acronyms may be used in the discussion of data-quality issues:

%D	Percent Difference	MB	Method Blank
CCV	Continuing Calibration Verification	MDL	Method Detection Limit
FB	Field Blank	MS	Matrix Spike
FD	Field Duplicate	MSD	Matrix Spike Duplicate
ICAL	Initial Calibration	RF	Response Factor
ICV	Initial Calibration Verification	RL	Reporting Limit
ISTD	Internal Standard	RPD	Relative Percent Difference
LCL	Lower Control Limit	RSD	Relative Standard Deviation
LCS	Laboratory Control Sample	TB	Trip Blank
LCSD	Laboratory Control Sample Duplicate	UCL	Upper Control Limit

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs values; field duplicate RPDs, laboratory duplicate RPDs, and LCS/LCSD recoveries and RPDs. Four SDGs underwent Tier 1 validation review.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA guidelines and our best professional judgment:

- R** – The sample results are unusable because certain criteria were not met when generating the data. The analyte may or may not be present in the sample.
- J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** – The analyte was not detected at a level greater than or equal to the reporting limit; however, the reported reporting limit is approximate and may be inaccurate or imprecise.
- U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned, these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are considered invalid and are not technically usable for data interpretation. Data that is otherwise qualified because of minor data-quality anomalies are usable, as qualified in Table 2 (attached).

## **MAJOR DEFICIENCIES:**

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

## **MINOR DEFICIENCIES:**

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

## **FIELD DUPLICATES:**

One field duplicate and parent sample pair was collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than  $\pm 1X$  the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 30% for groundwater. The following field duplicate and parent sample pair was compared to the precision criteria:

- GWDUP01\_072823 and RIMW03\_072823

The field duplicate and parent sample (GWDUP01\_072823 and RIMW03\_072823) exhibited a RPD above the control limit for naphthalene (55.8%). The associated results are qualified as J because of potential indeterminate bias.

## **CONCLUSION:**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All of the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

For 224 3<sup>rd</sup> Ave  
July 2023 Sub-slab Vapor and Indoor Air Samples  
Langan Project No.: 170758101

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of air samples collected in July 2023 by Langan Engineering and Environmental Services at the 224 3rd Ave site. The samples were analyzed by York Analytical Laboratories, Inc. (NYSDOH NELAP registration #10854 and 12058) for volatile organic compounds (VOCs) by the methods specified below.

- VOCs by USEPA Method TO-15

Table 1, attached, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

### **Validation Overview**

This data validation was performed in accordance with the following guidelines, where applicable:

- USEPA Region II Standard Operating Procedure (SOP) #HW-31, "Analysis of Volatile Organic Compounds in Air Contained in Canisters by Method TO-15" (September 2016, Revision 6),
- USEPA Contract Laboratory Program "National Functional Guidelines for Organic Superfund Methods Data Review" (EPA 540- R-20-005, November 2020), and
- published analytical methodologies.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator.

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs

# Technical Memorandum

values; field duplicate RPDs, laboratory duplicate RPDs, and LCS/LCSD recoveries and RPDs. One SDG underwent Tier 1 validation review.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- R** – The sample results are unusable because certain criteria were not met when generating the data. The analyte may or may not be present in the sample.
- J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** – The analyte was not detected at a level greater than or equal to the reporting limit; however, the reported reporting limit is approximate and may be inaccurate or imprecise.
- U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are considered invalid and are not technically usable for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified in Table 2 (attached).

The following acronyms may be used in the discussion of data-quality issues:

%D	Percent Difference	MB	Method Blank
CCV	Continuing Calibration Verification	MDL	Method Detection Limit
FB	Field Blank	MS	Matrix Spike
FD	Field Duplicate	MSD	Matrix Spike Duplicate
ICAL	Initial Calibration	RF	Response Factor
ICV	Initial Calibration Verification	RL	Reporting Limit
ISTD	Internal Standard	RPD	Relative Percent Difference
LCL	Lower Control Limit	RSD	Relative Standard Deviation
LCS	Laboratory Control Sample	TB	Trip Blank
LCSD	Laboratory Control Sample Duplicate	UCL	Upper Control Limit

## MAJOR DEFICIENCIES:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

This memorandum presents the findings of an analytical data validation from the analysis of soil samples collected in August 2021 by Langan Engineering and Environmental Services at 224 3rd Avenue. The samples were analyzed by York Analytical Laboratories, Inc. (NYSDOH NELAP registration #10854 and 12058) for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals by the methods specified below.

- VOCs by SW-846 Method 8260D
- SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Metals by SW-846 Method 6010D/7473

Table 1, attached, summarizes the laboratory and client sample identification numbers, sample collection dates, level of data validation, and analytical parameters subject to review.

## Validation Overview

This data validation was performed in accordance with the following guidelines, where applicable:

- USEPA Region II Standard Operating Procedures (SOPs) for Data Validation
- USEPA Contract Laboratory Program “National Functional Guidelines for Organic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020)
- USEPA Contract Laboratory Program “National Functional Guidelines for Inorganic Superfund Methods Data Review” (EPA 540- R-20-005, November 2020), and
- published analytical methodologies.

# Technical Memorandum

The following acronyms may be used in the discussion of data-quality issues:

%D	Percent Difference	MB	Method Blank
CCV	Continuing Calibration Verification	MDL	Method Detection Limit
FB	Field Blank	MS	Matrix Spike
FD	Field Duplicate	MSD	Matrix Spike Duplicate
ICAL	Initial Calibration	RF	Response Factor
ICV	Initial Calibration Verification	RL	Reporting Limit
ISTD	Internal Standard	RPD	Relative Percent Difference
LCL	Lower Control Limit	RSD	Relative Standard Deviation
LCS	Laboratory Control Sample	TB	Trip Blank
LCSD	Laboratory Control Sample Duplicate	UCL	Upper Control Limit

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs values; field duplicate RPDs, laboratory duplicate RPDs, and LCS/LCSD recoveries and RPDs. 1 SDG 21H0946 underwent Tier 1 validation review.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA guidelines and our best professional judgment:

- R** – The sample results are unusable because certain criteria were not met when generating the data. The analyte may or may not be present in the sample.
- J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** – The analyte was not detected at a level greater than or equal to the reporting limit; however, the reported reporting limit is approximate and may be inaccurate or imprecise.
- U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned, these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are considered invalid and are not technically usable for data interpretation. Data that is otherwise qualified because of minor data-quality anomalies are usable, as qualified in Table 2 (attached).

## **MAJOR DEFICIENCIES:**

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

## **MINOR DEFICIENCIES:**

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

### **SVOCs by SW-846 Method 8270D**

21H0946

The LCS for batch BH11297 exhibited percent recoveries above the UCL for benzaldehyde (776%), caprolactam (930%), atrazine (970%), n-nitrosodimethylamine (143%), benzoic acid (550%), 3,3'-dichlorobenzidine (169%), biphenyl (diphenyl or 1,1'-biphenyl) (778%), and acetophenone (816%). The associated detected results in samples SB20\_1-2, SB21\_6-7, SB22\_9-10, and SB23\_10-11 are qualified as J because of potential high bias. Results that are non-detects require no qualifications.

## **OTHER DEFICIENCIES:**

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

### **VOCs by SW-846 Method 8260D**

21H0946

The LCS/LCSD for batch BH11165 exhibited percent recoveries above the UCL for bromomethane (189%, 193%) and chloroethane (156%, 159%). The associated results are non-detect. No qualification is necessary.

### **PCBs by SW-846 Method 8082A**

21H0946

The MS/MSD performed on sample SB22\_9-10 exhibited a percent recovery below the LCL for PCB-1016 (27.3%, 35.3%). Organic results are not qualified on the basis of MS/MSD recoveries alone. No qualification is necessary.

## Metals by SW-846 Method 6010D/7473

21H0946

The MB for batch BH11316 exhibited a detection of calcium (11.2 mg/kg). The associated results are >10X the contamination. No qualification is necessary.

### **CONCLUSION:**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All of the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

LCS	Laboratory Control Sample	TB	Trip Blank
LCSD	Laboratory Control Sample Duplicate	UCL	Upper Control Limit

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs values; field duplicate RPDs, laboratory duplicate RPDs, and LCS/LCSD recoveries and RPDs. SDG 21H0945 underwent Tier 1 validation review.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA guidelines and our best professional judgment:

- R** – The sample results are unusable because certain criteria were not met when generating the data. The analyte may or may not be present in the sample.
- J** – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** – The analyte was not detected at a level greater than or equal to the reporting limit; however, the reported reporting limit is approximate and may be inaccurate or imprecise.
- U** – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- NJ** – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned, these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are considered invalid and are not technically usable for data interpretation. Data that is otherwise qualified because of minor data-quality anomalies are usable, as qualified in Table 2 (attached).

## **MAJOR DEFICIENCIES:**

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

## **MINOR DEFICIENCIES:**

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

### **SVOCs by SW-846 Method 8270D/8270D SIM**

#### 21H0945

The LCS/LCSD for batch BH11199 exhibited percent recoveries and RPDs outside control limits for numerous analytes (ranging between 0% and 218% %, and ranging between 20.1% and 39.1%, respectively). All associated results in sample MW04\_081821 are qualified as J or UJ because of potential bias.

The LCS/LCSD for batch BH11199 (SIM) exhibited a percent recovery below the LCL for n-nitrosodimethylamine (0%). The associated results in sample MW04\_081821 are qualified as UJ because of potential low bias.

### **Metals by SW-846 Method 6010D/6020B/7473/7470**

#### 21H0945

The MB for batch BH11222 exhibited a detection of dissolved selenium (0.00586 mg/l). The associated results in sample MW04\_081821 are qualified as J because of potential blank contamination.

The LCS for batch BH11369 exhibited a percent recovery above the UCL for total sodium (136%). The associated results in sample are qualified as J because of potential high bias.

## **OTHER DEFICIENCIES:**

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

### **VOCs by SW-846 Method 8260D**

#### 21H0945

The MB for batch BH11442 exhibited a detection of chloromethane (methyl chloride) (0.40 ug/l). The associated results are non-detect. No qualification is necessary.

The LCS for batch BH11442 exhibited a percent recovery above the UCL for dichlorodifluoromethane (145%). The associated results are non-detect. No qualification is necessary.

### **SVOCs by SW-846 Method 8270D/8270D SIM**

#### 21H0945

The sample MW04\_081821 exhibited a percent recovery above the UCL for the surrogate terphenyl-d14 (117%). No more than one surrogate from a single fraction was recovered outside of the control limits. No qualification is necessary.

### **Metals by SW-846 Method 6010D/6020B/7473/7470**

#### 21H0945

The MB for batch BH11369 exhibited a detection of total calcium (0.174 mg/l). The associated results are >10X the contamination. No qualification is necessary.

The MB for batch BH11370 exhibited a detection of dissolved calcium (0.215 mg/l). The associated results are >10X the contamination. No qualification is necessary.

The MS performed on sample MW04\_081821 exhibited a percent recovery below the LCL for dissolved iron (24.9%). The associated results in the parent sample are >4X the spiked amount. No qualification is necessary.

## CONCLUSION:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All of the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of air samples collected in August 2023 by Langan Engineering and Environmental Services at the 224 3<sup>rd</sup> Avenue site. The samples were analyzed by York Analytical Laboratories, Inc. (NYSDOH NELAP registration #10854 and 12058) for volatile organic compounds (VOCs) by the methods specified below.

- VOCs by USEPA Method TO-15

Table 1, attached, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

### **Validation Overview**

This data validation was performed in accordance with the following guidelines, where applicable:

- USEPA Region II Standard Operating Procedure (SOP) #HW-31, "Analysis of Volatile Organic Compounds in Air Contained in Canisters by Method TO-15" (September 2016, Revision 6),
- USEPA Contract Laboratory Program "National Functional Guidelines for Organic Superfund Methods Data Review" (EPA 540- R-20-005, November 2020), and
- published analytical methodologies.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator.

Tier 1 data validation is based on completeness and compliance checks of sample-related QC results including: sample receipt documentation; analytical holding times; sample preservation; blank results (method, field, and trip); surrogate recoveries; MS/MSD recoveries and RPDs

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on July 14, 2023 and listed below. The project was identified as your project: **170758101**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

## Sample and Data Qualifiers Relating to This Work Order

S-08	The recovery of this surrogate was outside of QC limits.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
P	This qualifier indicates the compound detected exhibited greater than 40% between the quantitation and confirmatory columns.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) exceeded 110% of the expected value. Positive detections may be biased high.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

### Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

**High Bias** High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

**Non-Dir.** Non-dir. flag (Non-Directional Bias ) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

**Corrective Action:** The PFAS container for sample RIB12\_18-20 was received empty. On 7/18/23, Liz Mcconnell advised to cancel all parameters on this sample.

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on July 17, 2023 and listed below. The project was identified as your project: **170758101**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.
