I, Jeffrey Diamond, am a Qualified Environmental Professional, as defined in RCNY § 43-1402(ar). I have primary direct responsibility for implementation of the Phase II ESI for the Site located at 962-972 Franklin Avenue Brooklyn, NY 11225. I am responsible for the content of this Phase II ESI Report, have written this report and certify that this Phase II ESI Report is accurate to the best of my knowledge and contains all available environmental information and data regarding the property.

1.0 EXECUTIVE SUMMARY

ALC Environmental (ALC) was contracted by The Continuum Company LLC (the “Client”) to perform a Phase II Environmental Site Investigation (ESI) at the properties located at 962 and 972 Franklin Avenue Brooklyn, NY 11225 (the “Site”). The purpose of this investigation was to address recognized environmental conditions (RECs) and areas of concern (AOCs) identified in the Phase I Environmental Site Assessment (ESA) report and determine the presence of soil and soil vapor contaminants in the subsurface soils that would require special considerations during the development of this Site.. The Phase II ESI was at the request of the client based on a Phase I ESA prepared by ALC and dated February 6, 2023.

The geology beneath the site generally consisted of clayey and silty fine to coarse sand with fine gravel and sandy clay with lenses of coarse to very coarse sand. There was also some fill material that consisted of brick and concrete fragments, incinerator ash and a tar like material. Groundwater was not encountered during the soil boring phase of this ESI. One soil boring SB-7 was drilled to 50 feet below ground surface (bgs) without any presence of groundwater

The environmental investigation entailed 11 soil sampling locations with the collection of 22 soil samples that were submitted for laboratory analysis for Volatile Organic Compounds, Semi Volatile Organic Compounds, Metals, Pesticides and PCBs. A summary of the analytical results of the soil samples results are as follows:

- There were several Volatile Organic Compounds that were detected in the soil samples submitted for laboratory analysis. The compounds are 2-Butanone, Acetone, Methylene chloride, Tetrachloroethylene and Trichloroethylene. Only Acetone at SB-1(18’-20’) at a concentration of 0.0590 mg/kg and Methylene chloride at SB-10 (4’-6’) at a concentration of 0.064 mg/kg exceeded the NYSDEC Unrestricted Soil Cleanup Objective. Acetone is a common laboratory contaminant.

- There are 14 Semi Volatile Organic compounds were detected in the collected soil samples submitted for laboratory analysis. Of these 16 compounds, only the compounds Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene and Indeno(1,2,3-cd)pyrene exceeded the NYSDEC Restricted Residential Use Soil Cleanup Objective or the Commercial Use Soil Cleanup Objective.
- There are 22 metals that were detected in the soil samples submitted for analysis, only seven are in exceedance of the Unrestricted Soil Cleanup Objective or Commercial Use Cleanup Objective. The metals in exceedance of the NYSDEC Unrestrictive Use Cleanup Objective are: lead, nickel, mercury, copper, selenium and zinc. Arsenic was detected in both samples from soil boring SB-6 at a concentration of 61.20 mg/kg and 301 mg/kg exceeding the Commercial Use Cleanup Objective. Lead was detected at soil boring SB-6 (0'-2') at a concentration of 2,370 mg/kg exceeding the NYSDEC Commercial Use Soil Cleanup Objective. At soil boring SB-10 (4'-6') sample, copper was detected at a concentration of 763 mg/kg and mercury was detected at a concentration of 9.04 mg/kg both concentrations exceed the NYDEC Commercial Use Soil Cleanup Objective.
- Only three pesticides were detected in the soil samples at soil boring SB-1 (0'-2') and SB-10 (4'-6') sample. Beta-BHC was detected at a concentration of 0.00202 at soil boring SB-1 (0'-2'). At soil boring SB-10 (4'-6') soil sample, 4,4'-DDE was detected at a concentration of 0.0065 mg/kg and 4,4'-DDT was detected at a concentration of 0.0246 mg/kg. Both concentrations exceed the NYSDEC Unrestrictive Use Soil Cleanup Objective.
- There were no polychlorinated biphenyls (PCBs) detected in any of the soil samples submitted for laboratory analysis.
- Groundwater was not present in the subsurface soils beneath the Site. One soil boring SB-7 was advanced to 50 feet below the ground surface and did not indicate the presence of any groundwater bearing formations.

- The other phase of the environmental investigation entailed the collection of ten soil vapor samples at locations across the Site. The soil vapor was collected at depths of six feet below the ground surface and between the depths of 18.00 and 20.00 feet. Six inch long stainless steel mesh screen was set to the required depth at each of the 10 soil vapor sampling locations through the use of direct push drilling technologies. A six-liter Summa Canister fitted with four - hour flow regulator was used to collect the soil vapor samples. The soil vapor samples were analyzed for chlorinated volatile organic compounds by USEPA Method TO-15. The analytical results of the soil vapor samples are as follows:
 - Of the twenty -four volatile organic compounds that were detected in the soil vapor analysis, the NYSDOH has only issued guidance values for three compounds, methylene chloride, trichloroethylene and tetrachloroethylene. The NYSDOH has established a guidance value of 30 micro grams per cubic meter ($\mu\text{g}/\text{m}^3$) for the compound tetrachloroethylene. The concentration of tetrachloroethylene was exceeded at all of the soil vapor sampling locations with the exception of the soil vapor sample collected at SV-4. The soil vapor sample collected at a depth of six feet at SV-8 had the highest concentration of $830 \mu\text{g}/\text{m}^3$. The NYSDOH has established a guidance value of $2.00 \mu\text{g}/\text{m}^3$ for trichloroethylene. The concentration of trichloroethylene exceeded the NYSDOH guidance value in the soil vapor samples SV6 through SV-10. The highest concentration was detected at the soil vapor sample collected at SV-8 at a concentration of $2,200 \mu\text{g}/\text{m}^3$. The other Volatile Organic Compounds detected in the soil vapor samples included: 1,1,1-Trichloroethylene, 1,2,4-Trimethylbenzene, 1,3,5- Trimethylbenzene, 2-Butanone, 4-Methyl – 2-pentanone, Acetone, Benzene, Carbon disulfide, Carbon tetrachloride, Cyclohexane, Chloroform, Dichlorodifluoromethane, Ethylbenzene, Isopropanol, n-Heptane, n-Hexane, o-Xylene, p-&m-Xylenes, p-Ethyltoluene, Tetrachloroethylene, Tetrahydrofuran, Toluene, Trichloroethylene and Trichlorofluoromethane (Freon 11).

1.1 Site Location and Current Usage

The Site is located in the Crown Heights section of the New York City Borough of Brooklyn. The Site is comprised of an irregular shaped vacant lot that is currently undeveloped and has an area of 0.924 acres. An adjoining lot that currently contains a vacant one-story building is 0.295 acres in area. The Site is identified by the New York City Department of Finance as Block 1192 Lots 63 and 66. The location of the Site is shown in **Figure 1**.

1.2 Description of Surrounding Properties

The Site is located on the west side of Franklin Avenue, north of Sullivan Place and south of Montgomery Street. The general vicinity of the Site consists of vacant light industrial buildings, an institutional building known as P.S. 375 Jackie Robinson School and multi-family apartment building. The Metropolitan Transit Authority railroad tracks and Washington Avenue, located to the west of the Site. To the north of the Site is a vacant industrial site located at 124 Montgomery Street. To the east of the Site is a four-story institutional building, P.S. 375 Jackie Robinson School, 945 Franklin Avenue. To the south of the Site is two, six-story multi-family residential buildings, 1015 and 1035 Washington Avenue. To the west of the Site is a four -story multi-family residential building located at 975 Washington Avenue and a vacant lot located at 995 Washington Avenue.

The general area surrounding the Site consists of residential and institutional buildings. No heavy manufacturing or industrial land usage was observed in the immediate proximity to the Site. Please refer to the Site Vicinity Map provided in **Figure 2**.

The elevation of the site slopes upward in a westward direction from Franklin Avenue, where the on-site ground elevation is 84.67 ft. above mean sea level, North America Vertical Datum of 1988 (AMSL NAVD 1988) to 90.70 feet AMSL NAVD 1988 at the northwest corner of the site. The Site map is provided in **Figure 3**. The United States Geological Survey 7.5 minute Brooklyn, NY Quadrangle with the site location is provided in **Figure 4**.

1.3 Summary of Past Site Uses and Areas of Concern

A Phase I Environmental Site Assessment (ESA) was conducted by ALC Environmental, for the property located at 970 Franklin Avenue Brooklyn, NY 11225. The report, dated February 4, 2023, identified the following Recognized Environmental Conditions (RECs) at the Site. According to the historical sources reviewed (Fire Insurance maps and city directories), Lot 63 (962 Franklin Avenue) has historically been used for manufacturing purposes. The following occupants of this single story warehouse building included the following:

- A spring manufacturer occupied this portion of the Site, as depicted on the 1951 Sanborn Fire Insurance map.
- A metal products manufacturer also occupied this portion of the Site as depicted on the 1963 Sanborn Fire Insurance map,
- A chemical manufacturer occupied this portion of the Site between 1978 and 2007, as per the 1969 Certificate of Occupancy. The chemical manufacturer produced toiletries such as hair spray, lacquers, rinses, and shampoo.
- Arcade Laundry Co. and Star Napkin & Towel Supply Co. was the occupant of the Site, as per the 1928 city directory.
- The property was used by the Consumers Park Brewery for bottling and barrel storage.
- The building that was constructed between 1888 and 1908 a spice manufacturer and storage facility, M.S. Golombeck Inc., operated at the adjacent northern property used the building as part of their operations.

Lot 66 (972 Franklin Avenue) was occupied by Rubel Ice Corp. from the late 1920s and early 1930s before being demolished prior to 1951.

The property was converted into tennis courts with an associated small office along the southern border of the lot. By 1963, the tennis courts were no longer present, but the small office building is still present. Per the city directories reviewed, Stones Accountants occupied the small office building in 1976. No other prior uses were identified.

The northern adjoining property (124 Montgomery Street) was occupied by a manufacturer of mattresses and cotton Felts (Burton Dixie Corp.) from as early as 1932 until at least 1951. An additional manufacturing company (Leake Manufacturer Corp.) was listed in the 1960 city directories, and EJK Corp. Aircraft & Machine Division was listed between at least 1965 and 1985. This site was subsequently occupied by M. S. Golombeck Inc.- Spice Importers until at least 2017.

1.4 Summary of the Work Performed under the Phase II ESI

1.4.1 Geophysical Survey

Prior to the start of any intrusive site work, a geophysical survey of the property at 972 Franklin Avenue was conducted. The purpose of the geophysical survey was to locate and mark detectable underground utilities and other underground anomalies within the property boundaries of the Site. The geophysical survey consisted of the use of a ground penetrating radar (GPR) consisting of an Impulse Radar Pin Point R Ultra-Wide Band (UWB) Penetrating Radar System along with a Vivax-Metrotech vLoc3-Pro Receiver/Transmitter and a TW-6 Pipe and Cable Locator, a handheld magnetometer that detects buried metal objects. The ground penetrating radar is a non-destructive geophysical method that produces a continuous cross-sectional profile of subsurface features in real time. GPR operates by transmitting both high and low frequency electromagnetic wave pulses down into the ground through a transmitter in the antenna. The transmitted electromagnetic waves reflect off materials with contrasting dielectric properties from surrounding medium such as underground storage tanks, utilities, distinct contacts between different earth materials, and other various subsurface objects. The antenna receiver collects the reflected electromagnetic waves which are then interpreted by the operator. The vLoc3-Pro Receiver is a hand-operated antenna capable of detecting electromagnetic (EM) fields emitted from a source. The EM antenna can detect pipes and cables in the ground at depths of up to 20 feet using active or passive tracing techniques as underground utilities and possible Underground Storage Tanks (USTs).

1.4.2 Soil Sampling

Eleven of nine soil borings were advanced utilizing a Geoprobe™ track mounted 7728DT and a Geoprobe™ 420M portable drilling rig utilizing direct push drilling technology. Soil Boing SB-7 was drilled with Sonic Drilling Technologies with a Fraste Fijkelkamp Sonic Soil Sample Drill. The soil borings, designated as SB-1 through SB-11 were continuously sampled from the ground surface to depths ranging between six and 50 feet below ground surface (bgs). The soil sampling depths were determined by the future development of the Site. The fifty foot soil boring at SB-7 locations was to determine that groundwater did not occur within thirty feet below the basement floor of the proposed apartment building. The soil samples were collected in clear plastic sleeves fitted into a five-foot Macro Core sampler. The soil samples from the sonic drilling rig were vibrated out of the ten-foot long soil sampler into five foot long plastic bags. Upon retrieval, the collected soil sample was measured for length of recovery, opened and screened for the presence of volatile organic compounds (VOCs) utilizing a Photo Ionization Detector (PID). The presence of odors and soil discoloration was made by utilizing olfactory and visual observations. The PID was calibrated to a standard of 100 ppm of isobutylene, as per the manufactures standard operating procedures. There was only one slight evidence of a petroleum like odor in the sample collected at soil boring SB-1 at a depth of 14.30 to 15.00 ft. bgs. There was no PID readings above 0.0 parts per million (ppm), however upon opening the soil sample collected between 10 and 15 ft. bgs, a slight petroleum like order was detected. The highest PID reading was 3.5 ppm detected at a depth of 2.00 feet at soil boring SB-3, corresponding to light gray tar like fill material.

The soil sampling locations and their associated designations and sampling depths are shown in **Figure 5**. Due to subsurface obstructions, soil borings SB-1 and SB-2 were moved in order to achieve the required sampling depth. The soil boring logs are provided in **Appendix A**.

1.4.3 Soil Vapor Sampling

Seven soil vapor probes were installed and designated as SV-1 through SV-10. The locations are shown in **Figure 6**. The soil vapor probes were installed using standard direct push technology by first advancing a Geoprobe® MacroCore to depths ranging between six and twenty feet bgs, a six-inch long stainless steel vapor implant was placed at depths of 6.00 to 6.50 ft bgs, 20.00 to 20.50 ft. bgs and 18.00 to 18.50 ft, bgs. Polyethylene tubing, 0.17 inch in diameter was attached to the vapor implant and extended approximately two feet above the ground surface. A graded silica sand was placed around the implant, and the remainder of the annular space was filled with hydrated bentonite powder in order to prevent cross contamination with the atmosphere. The Soil vapor implants were installed on October 12, 2023 and were sampled on October 13, 2023. A PID was used to screen each sampling location for the presence of VOCS. To the extent possible, several volumes of air were evacuated from the soil vapor points 24 hours after the installation of the vapor probes and screened with a PID. The PID readings were low, ranging between 0.0 and 1.4 ppm. The soil vapor probes were connected to six-Liter Summa® canister, each equipped with a four-hour regulator. The flow rate for Summa canisters ranged between 20.23 and 22.85 milliliters per minute (ml/min). The soil vapor sample SV-2 was only installed to a depth of six feet below ground surface due to sub surface obstructions. A few attempts were made to install the soil vapor probe at the proposed 20 foot depth. Two other soil vapor sampling points were placed between 18.00 and 18.50 ft. bgs, SV-5 and SV-6 were pulled up to a shallower depth due to the presence of perched groundwater.

1.4.4 Quality Assurance/ Quality Control Samples

Quality Assurance / Quality Control (QA/QC) samples are collected and analyzed in addition to environmental samples to assist in identifying the origin of both field and laboratory contamination. In order to provide useful information, QA/QC samples must be prepared and analyzed appropriately. For this Phase II ESI, three QA/QC samples were also submitted for analysis along with the collected environmental samples.

Two QA/QC samples were collected in the field and the third one was prepared by York Analytical Laboratories, Inc. and accompanied the samples from their acquisition to their analysis at YORK's Stratford Connecticut laboratory.

A field replicate is used to assess error (precision) associated with sample heterogeneity, sampling methodology and analytical procedures. Field replicates are field samples obtained from one location, homogenized, and divided into separate containers. They are treated as separate samples throughout the remaining sample handling and analytical processes. The field replicate, SB-12 was collected from the same soil sample as SB-4 sample from 18 to 20 ft, bgs. The field blank was prepared in the field by filling the appropriate sample container with certified clean water passed through the plastic liner of the Macro Core soil sampler and then submitted to the laboratory for analysis.

A field blank is primarily used to evaluate contamination error associated with field operations and shipping but may also be used to evaluate contamination error associated with laboratory procedures. The field blank, designated as FB101323, underwent the same sample analysis as the collected soil samples. The third QA/QC sample was a trip blank. Trip blanks are only required for volatile organics analysis and are prepared prior to going into the field. Trip blanks consist of certified clean water placed into two- 40 milliliter vials and are handled, transported, and analyzed in the same manner as the other volatile organic samples collected during the Phase II ESI. Trip blanks are used to evaluate contamination error associated with sample handling and shipment, or laboratory handling and analysis.

1.5 Regulatory Standards

The soil sampling procedures of this investigation were performed in accordance with the New York State Department of Environmental Conservation (NYSDEC) Technical Guidance for Site Investigation and Remediation Division of Environmental Remediation-10 (DER-10). Soil vapor sampling was performed in accordance with the New York State Department of Health (NYSDOH) Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH October 2006).

2.0 Site Investigation and Field Activities

The objective of this ESI was to evaluate potential impacts associated with the identified RECs. Soil sampling procedures of this investigation were performed in accordance with the NYSDEC Technical Guidance for Site Investigation and Remediation DER-10, dated May 2010, and Sampling Guidelines and Protocols, dated March 1991.

Soil vapor sampling was conducted in accordance with the NYSDOH Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006). On March 20, 2019. On June 28 and 29 2022, ALC performed the following activities at the Site in accordance with the Phase II ESI Work Plans for the two properties, 962 and 972 Franklin Avenue Brooklyn, NY 11225. The environmental investigation area is shown in **Figure 3**.

- A ground penetrating radar survey (GPR) was conducted on the vacant property at 972 Franklin Ave. Access into the vacant building at 962 Franklin Avenue could not be attained and the survey was limited to the adjacent vacant lot.
- Eleven (11) soil borings were advanced at the Site. The soil borings were advanced to the depths ranging between six and 50 ft. bgs. The soil borings within the footprint of the basement of the proposed building were drilled to a depth of 20 ft. bgs. The soil borings at the western portion of the site, in the area that will be unexcavated were drilled to a depth of 10 ft. bgs, with the exception of SB-7 that was drilled to a depth of 50 ft. bgs. Soil borings SB-9 through SB-11 were drilled inside of the vacant one-story building using portable drilling equipment and were only able to be advanced to a maximum depth of nine ft. bgs.
- The recovered soils from the soil sampling sleeves were assessed for lithology and field-screened with a photo-ionization detector (PID).

- Ten (10) soil vapor probes were installed at the Site. The soil vapor samples were collected in 6- liter Suma Canisters and submitted for chemical analysis. The depths of the soil vapor probes within the basement footprint of the proposed apartment building were placed at a depth of 20 ft. bgs. Soil vapor sampling points, SV-7 through SV-10 were set a depth of six ft. bgs.

- **2.1 Geophysical Investigation**

The Ground Penetrating Survey (GPR) was conducted on October 10, 2023 by Dennis Berthold, Director of Geophysical Operations for Coastal Environmental Solutions, Inc. The work was overseen by Roswell Ryan, an environmental scientist with ALC Environmental. The purpose of the investigation was to determine the location of subsurface features such as underground utilities and possible Underground Storage Tanks (USTs) and to located and mark other underground anomalies. GPR operates by transmitting both high and low frequency electromagnetic wave pulses down into the ground through a transmitter in the antenna. The transmitted electromagnetic waves reflect off materials with contrasting dielectric properties from surrounding medium such as underground storage tanks, utilities, distinct contacts between different earth materials, and other various subsurface objects. The antenna receiver collects the reflected electromagnetic waves which are then interpreted by the operator. The Impulse Radar Pin Point R UWB GPR utilizes a dual band 400/800 MHz HS antenna mounted to a stroller frame which rolls over the surface. The total depth of penetration achieved with the antenna can be up to 10 feet but widely varies based on site-specific subsurface conditions. Conductive materials in the soil attenuate the GPR signal causing a decrease in effective depth of penetration and clarity. The results of the GPR survey indicated that a large portion of the site appeared to contain demolition debris from a former building in the form of brick, cinder block fragments, and other metallic debris mixed within the shallow subsurface. A number of metallic anomalies were discovered but all were determined to be scrap metal from the demolition activities.

An underground sanitary line structure was located within a manhole nearest the central gate to the site. The lines appeared to have collapsed and been damaged which impeded in the complete locate of the lines. The effective depth of GPR penetration was limited to 5 feet. The limiting factor was due to soil conductivity attenuating the GPR signal likely due to the recent demolition and stockpiling soil on top of the existing grade. The GPR report is provided in **Appendix D**.

- **2.2 Soils Investigation**

On October 12, 13, 16 and 17, ALC utilized the services of Coastal Environmental Solutions, Inc. to advance eleven soil borings at the Site. All of the soil borings were advanced through the unstratified soils to the approved sampling depths. Soil borings SB-1 through SB-6 were advanced to a depth of 20 ft. bgs and were advanced using a track mounted 7728DT Geoprobe™ drilling rig using direct push drilling technology. These borings, in the footprint for the basement of the proposed apartment building were advanced two feet below the bottom of the basement floor. Soil boring SB-8 was advanced to a depth of 10 ft. bgs utilizing the Geoprobe™ 7728DT drill rig. Soil borings SB-9 through SB-11, inside of the vacant one-story building were advanced using a Geoprobe™ 420M portable drill rig. The soil samples were advanced to a depth of nine ft, bgs for SB-9 and to six ft. bgs for SB-10 and SB-11 due to a subsurface obstruction. Soil boring SB-7 was advanced to a depth of 50 ft. bgs through the use of Sonic Drilling technologies. The purpose for the extensive sampling depth for this soil boring was to provide proof that there was not a groundwater bearing formation that was 30 feet deeper than the depth of the basement for the proposed apartment building that is 18 feet deep. The subsurface soils consisted of silty and clayey sands that varied in color and grain size, grayish color clays of moderate to low plasticity and peat was observed at a depth of 15.00 to 18.00 and 33.00 to 35.00 ft. bgs.

The Geoprobe™ five-foot MacroCore® sampler was fitted with a new plastic liner for each sample and the exterior of the sampler was cleaned with a Alconox, a laboratory grade soap and water and rinsed with potable water. A new plastic liner was used for each of the 20 soil samples. The soil samples collected with the Sonic Drill Rig was a ten foot long and the soil samples were vibrated out of the sampler into new plastic bags in five foot long core sections.

Upon retrieval, each soil collected soil sample was opened, screened for the presence of VOCs with a PID, described as per the Unified Soil Classification System (UCS) a system used to describe color, grain size and texture of unconsolidated soils. The soil sampling locations are showed in **Figure 5**, the soil boring logs were prepared by a qualified geologist are presented in **Appendix A**.

Two soil samples were collected from the eleven soil borings and were submitted for laboratory analysis. The collected soils designated for laboratory analysis were collected from the ground surface to a depth of two feet below the ground surface. The second soil sample was collected at the two foot interval above the termination depth of the soil boring. For the 20.00 foot deep soil borings (SB-1 through SB-6), the second soil sample was collected at a depth of 18.00 to 20.00 ft. bgs. For the 50 foot deep soil boring (SB-7) the second soil boring was collected at a depth of 48.00 to 50.00 ft. bgs. For soil boring SB-8, the second soil sample was collected at a depth of eight to 10 ft. bgs. Soil boring SB-9 the second soil sample was collected at a depth of seven to nine ft. bgs. For soil borings SB-10 and SB-11, the second soil sample was collected at depths of four to six ft. bgs,

The soil collected from each of the two sampling intervals were placed into laboratory supplied bottles and jars using disposable plastic scoops and disposable five gram sampler (Terracore) for the VOC samples. The collected soil samples were placed under a chain of custody protocol from the time of their acquisition until their analysis by the laboratory. To preserve the integrity of the collected soil samples prior to their deliver to the laboratory, the soil samples were also kept at a temperature of 4° Celsius (C). York Analytical Laboratories, Inc. (YORK) performed the required following analysis:

- Volatile organic compounds (VOCs) by USEPA Method 8260D;
- Semi-volatile organic compounds (SVOCs) by US EPA Method 8270E;
- Total Analyte List (TAL) Metals by USEPA Method 6010 and 7471;
- Mercury by USEPA Method 7473;
- Pesticides by USEPA Method 8081A
- PCBs (polychlorinated biphenyls) by USEPA Method 8082A

York is a certified laboratory enrolled in the New York State Department of Health Environmental Laboratory Accreditation Program with certification number 10854.

The subsurface lithology consisted mainly of silty and clayey medium to fine sands, varying in color from light brown to dark yellowish brown to light brown to medium to dark gray with a trace to some fine gravel. Peat with silt and clay was detected at depths of 15.00 to 18.00 and 33.00 to 35.00 ft. bgs. Thinly bedded dark yellowish brown coarse to fine sand with fine to coarse gravel was observed at depths of 31.50 to 33.00 and 46.70 to 47.00 ft. bgs.

2.3 Analytical Results of Soil Samples

The analytical results of the soil samples collected during this investigation were compared to the NYSDEC Title 6 New York Codes, Rules and Regulations (6NYCRR) Part 375-6 Unrestricted Use (Track 1), Residential Use and Restricted Residential Use (Track 2) and commercial Soil Cleanup Objectives (SCOs). A summary of the analytical results for the soil samples are presented in **Table 5** through **Table 8**. The Laboratory report is provided in **Appendix D**. The following is a summary of the analytical results of the soil sampling phase of the subsurface investigation. There were several Volatile Organic Compounds detected in the collected soil samples submitted for laboratory analysis. The VOCs are: Acetone, 2- Butanone, Methylene chloride, Tetrachloroethylene and Trichloroethylene. Only two compounds exceeded the New York State Department of Environmental Conservation (NYSDEC) Unrestricted Use Soil Cleanup Objective. Acetone with a concentration of 0.059 mg/kg in the 18.00 to 20.00 foot sample at SB-1. The regulatory guidance value is 0.05 mg/kg. Also, methylene chloride with a concentration of 0.064 mg/kg in the 4.00 to 6.00 ft. sample at SB-10 exceeded the Unrestricted Use SCO. The guidance value for methylene chloride is 0.05 mg/kg. A summary of the VOCs detected in all of the collected soil samples is provided in **Table 5**.

As many as 15 Semi Volatile Organic Compounds (SVOCs) were detected in all of the shallow soil samples 0.00 to 2.00 ft. bgs across the Site and at a depth of 4.00 to 6.00 ft. bgs at soil boring SB-10. The compounds that were detected are Acenaphthene, Anthracene, Benzo(a) anthracene, Benzo(a) pyrene, Benzo(b)fluoranthene, Benzo(g,h,i) perylene, Benzo(k) fluoranthene, Bis(2-ethylhexyl) phthalate, Chrysene, Fluoranthene, Dibenzo(a,h) anthracene, Indeno(1,2,3-cd) pyrene, Phenanthrene and Pyrene.

The other SVOCs that exceeded the Track 1 and Track 2 SCOs are as follows:

TABLE 1 CONCENTRATIONS OF SVOCs EXCEEDING THE RESTRICTED RESIDENTIAL USE AND COMMERCIAL USE SCOs			
	SOIL SAMPLING LOCATIONS (Compound concentrations in mg/kg)		
COMPOUND	SB-2 (0'-2')	SB-5 (0'-2')	SB-6 (0'-2')
Benzo(a) anthracene		5.35	5.64
Benzo(a) pyrene		4.87	5.60
Benzo(b) fluoranthene	1.06	4.39	4.62
Benzo(k) flouranthene		3.93	4.36
Dibenz(a,h) anthracene		1.07	1.20
Indeno(1,2,3-cd) pyrene	0.682	3.06	3.58
Chrysene		4.96	5.88

All concentrations are in micrograms per kilogram (µg/kg) or parts per billion (ppb).

A summary of the SVOCs detected in all of the soil samples is provided in **Table 5**.

Twenty two metals were detected in the soil samples that were submitted for laboratory analysis only arsenic, lead, nickel, copper, mercury selenium and zinc exceeded the Track 1 and Track 2 SCOs. Only lead at a concentration of 2,370 mg/kg in the 0.00 to 2.00 ft. sample at SB-6 exceeded the Commercial Use SCO. Arsenic at a concentration of 61.20 mg/kg in the 0.00 to 2.00 ft. sample at SB-9. Also, in the 7.00 to 9.00 foot sample at SB-9, the concentration of arsenic was detected at 301 mg/kg. In the 4.00 to 6.00 foot sample at SB-10, the concentration of copper was detected at 763 mg/kg and mercury was detected at a concentration of 9.04 mg/kg. Both concentrations exceed the Commercial Use SCO.

The predominant metals that were detected above the Soil Cleanup Objective are copper, nickel, mercury and lead. These three metals were present in all of the collected soil samples. The soil sampling locations and sample depths that exceeded the SCOs are as follows:

Soil Sampling Location and Depth	TABLE 2 TARGET ANALYTE LISTED (TAL) METALS (concentrations in mg/kg)						
	Arsenic	Copper	Lead	Nickel	Mercury	Selenium	Zinc
SB-1 (0'-2')			177				
SB-2 (0'-2')				32.90	0.304		
SB-2 (18'-20')				33.00			
SB-3 (0'-2')			88.60		0.211		
SB-3 (18'-20')				69.90			
SB-4 (0'-2')		55.70				8.15	
SB-5 (18'-20')				30.60			

Soil Sampling Location and Depth	TABLE 2 (continued) TARGET ANALYTE LISTED (TAL) METALS (concentrations in mg/kg)						
	Arsenic	Copper	Lead	Nickel	Mercury	Selenium	zinc
SB-6(0'-2')			2,370	39.70			253
SB-6 (18'-20')		70.20		56.10			
SB-7(0'-2')				31.80			
SB-8 (0'-2')			77.60				
SB-9 (0'-2')	61.20	183					204
SB-9 (7'-9')	301	160			0.466		
SB-10 (4'-6')		763	144		9.04		246

The concentration of these contaminants will need to be considered when selecting a disposal site for the excavated soils. The concentrations listed in bold, exceed the Commercial Use SCO. A summary of all of the metals detected in all of the soil samples is presented in **Table 7**.

Pesticides were detected at two soil sampling locations, SB-1 (0'-2') and SB-10 (4'-6') sample. The pesticide beta-BHC was detected at a concentration of 0.00202 mg/kg in the 0.00 to 2.00 foot sample at SB-1. Two pesticides, 4,4'DDE and 4,4'DDT were detected in the 4.00 to 6.00 foot sample at SB-10 at concentrations of 0.0065 mg/kg and 0.0246 mg/kg respectively. The concentrations of 4,4'DDE and 4,4' DDT both exceed the Unrestrictive Use SCO. An analytical summary of the detected pesticides in the collected soil samples submitted for analysis is provided in **Table 8**.

There were no polychlorinated biphenyls (PCBs) detected in any of the soil samples submitted for chemical analysis. A summary of all of the PCBs detected in the soil samples submitted for analysis is presented in **Table 8**.

2.4 Soil Vapor Sampling

The soil vapor sampling was conducted on October 13, 2023. ten soil vapor sampling locations were located across the two properties and designated as SV-1 through SV-10, as shown on **Figure 6**. As previously stated, the soil vapor samples were collected in Summa Canisters fitted with four-hour flow controllers. Summa canisters are a stainless - steel container that is placed under a vacuum by York. The canister is connected to the vapor intake screen via polyethylene tubing. A screening of the subsurface vapor with a PID to determine if any volatile compounds are present. A test with a tracer gas, helium is to ensure there is no cross connection between subsurface vapor and the outdoor ambient ai. The intake screens are six-inches in length set at depths ranging from 6.00 to 20.00 ft bgs. The following information was recorded on field information record sheet. This information was transferred to the chain of custody record that accompanied the samples to the laboratory for analysis:

- Soil vapor sampling location
- Summa® canister number
- Flow regulator number
- Helium concentration
- PID reading
- Initial pressure (inches of mercury)
- Start time
- Final pressure (inches of mercury)
- End time

The sampling was stopped when the final pressure in the Summa® canister was approximately a negative five inches of mercury.

The data recorded on the sample information record forms were transferred to the chain of custody forms. The samplers were placed under a chain of custody protocol between the collection of the soil vapor sample and being picked up by the courier from York for analysis. The collected soil vapor samples were analyzed by York at their Richmond Hill laboratory via USEPA Method TO-15. York Analytical Laboratory ELAP certification number is 12058. The analytical summary for the soil vapor analysis is provided in **Table 4**. The soil vapor sampling logs are included in **Appendix B**. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006*.

2.5 Analytical Results of Soil Vapor Samples

The New York State Department of Health (NYSDOH) has issued indoor air standards for certain chlorinated volatile organic compounds (CVOCs), including tetrachloroethylene¹ (PCE), trichloroethylene² (TCE), and methylene chloride. In addition, the NYSDOH has issued three matrices³ for decision-making and has assigned a total of eight CVOCs including carbon tetrachloride, 1,1-dichloroethene (11-DCE), cis-1,2-dichloroethene (c12-DCE), methylene chloride, 1,1,1-trichloroethane (111-TCA), PCE, TCE, and vinyl chloride, to these matrices. The following is a summary of the analytical laboratory results for the three VOCs that the NYSDOH has established guidance values for.

TABLE 3
Summary of Target Compounds detected in Soil Vapor

Volatile Organic Compound	Air Guideline Value (ug/m ³)	SV-1	SV-2	SV-3	SV-4	SV-5	SV-6	SV-7	SV-8	SV-9	SV-10
Methylene chloride	60	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
Tetrachloroethylene (PCE)	30	210	75.00	440	4.60	290	130	260	830	270	330
Trichloroethylene (TCE)	2	0.33	1.50	0.30	ND	0.87	66.00	41.00	2,200	150	370

NOTE: Values listed above in bold are in exceedance of the NYSDOH guidance values.

Evaluation Soil Vapor Intrusion in New York State, October 2006, providing a new guideline for tetrachloroethylene, lowering the recommended level in ambient air from 100 ug/m³ to 30 ug/m³.

² Soil Vapor Intrusions updates were made in August 2015, to the final guidance, providing a new guideline for trichloroethylene, lowering the recommended level in ambient air from 5 ug/m³ to 2 ug/m³.

³ Soil Vapor Intrusions updates were made in May 2017, to the final guidance, for the assignment of eight volatile chemicals to three newly revised and renamed Soil Vapor/Indoor Air Decision Matrices.

- 1,1,1- Trichloroethane was detected in soil vapor sample SV-9 and SV-10. A maximum concentration of 13.00 $\mu\text{g}/\text{m}^3$ was detected in SV-10 soil vapor sample.
- 1,2,4-trichlorobenzene was only detected at soil vapor sample SB-10 at a concentration of 2.90 $\mu\text{g}/\text{m}^3$.
- 1,2,4- Trimethylbenzene was detected in all of the soil vapor samples. A maximum concentration of 12.00 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-10.
- 1,3,5- Trimethylbenzene was not detected in soil vapor samples SV-4, SV-7 and SV-8. A maximum concentration of 4.80 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-5
- 2-Butanone was detected in all of the soil vapor samples. A maximum concentration of 14.00 $\mu\text{g}/\text{m}^3$ was detected in the soil vapor sample SV-5.
- 4-Methyl-2-pentanone was only detected in soil vapor samples collected at SV-5, SV-9 and SV-10. A maximum concentration of 5.40 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-5
- Acetone was detected in all of the soil vapor samples. A maximum concentration of 130 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-1. Acetone is a common laboratory contaminant.
- Benzene was detected in all of the soil vapor samples. A maximum concentration of 35.00 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-5.
- Carbon disulfide was detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of 88.00 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- Carbon tetrachloride was only detected in soil vapor samples SV-4 and SV-9. A maximum concentration of 0.98 $\mu\text{g}/\text{m}^3$ was detected in the soil vapor sample SV-9.
- Chloroform was only detected in soil vapor samples SV-1, SV-3, SV-6 and SV-9. A maximum concentration of 230 $\mu\text{g}/\text{m}^3$ was detected in the soil vapor sample at SV-9.
- Chloromethane was only detected in soil vapor samples SV-1 through SV-4 and SV-6. A maximum concentration of 1.40 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-4.

- Cis-1,2-Dichloroethylene was only detected in the soil vapor samples at SV-7 and SV-8. A maximum concentration of $3.70 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- Cyclohexane was not detected in soil vapor samples SV-4, SV-8 and SV-9. A maximum concentration of $4.80 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-7.
- Dibromochloromethane was not detected in soil vapor samples SV-7, SV-8 and SV-9. A maximum concentration of $4.60 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-10.
- Ethyl benzene was not detected in soil vapor samples SV-4 and SV-8. A maximum concentration of $13.00 \mu\text{g}/\text{m}^3$ was detected in the soil vapor sample at SV-7.
- Isopropanol was detected in all of the soil vapor samples. A maximum concentration of $12.00 \mu\text{g}/\text{m}^3$ was detected in the soil vapor sample collected at SV-3.
- Chloromethane was only detected in soil vapor samples SV-1 through SV-4 and SV-6. A maximum concentration of $1.40 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-4.
- n-Heptane was detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of $8.40 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- n-Hexane was detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of $40.00 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- o-Xylene was detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of $17.00 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-10.
- p- & m-Xylenes were detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of 52.00 was detected in soil vapor sample SV-10.
- p-Ethyltoluene was detected in all soil vapor samples with the exception of SV-4. A maximum concentration of $15.00 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-10.
- Propylene was only detected in soil vapor samples SV-1 and SV-2. A maximum concentration of $93.00 \mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-1.

- Tetrachloroethylene (PCE) was detected in all of the soil vapor samples. A maximum concentration of 830 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- Tetrahydrofuran was only detected in soil vapor samples SV-1, SV-3 and SV-10. A maximum concentration of 4.40 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-3.
- Toluene was detected in all of the soil vapor samples. A maximum concentration of 41.00 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-5.
- Trichloroethylene was detected in all of the soil vapor samples with the exception of SV-4. A maximum concentration of 2,200 $\mu\text{g}/\text{m}^3$ was detected in soil vapor sample SV-8.
- Trichlorofluoromethane (Freon 11) was detected in all of the soil vapor samples with the exception of SV-4, SV-7 and SV-8. A maximum concentration of 1.20 was detected in soil vapor sample SV-1.

The compound, methylene chloride was not detected in any of the soil vapor samples.

Tetrachloroethylene (PCE) was detected in all of the soil vapor samples. The concentration of PCE exceeded the NYSDOH guidance value of 30.00 $\mu\text{g}/\text{m}^3$ at all of the soil vapor sampling locations with the exception of SV-4 that had a detected concentration of 4.60 $\mu\text{g}/\text{m}^3$. Elevated concentrations that ranged between 75.00 $\mu\text{g}/\text{m}^3$ and 440 $\mu\text{g}/\text{m}^3$ were detected at a depth of 18.00 to 20.00 ft bgs within the footprint of the proposed apartment building.

The compound, trichloroethylene (TCE) was only detected in concentrations that exceed the NYSDOH guidance value of 2.00 $\mu\text{g}/\text{m}^3$ in soil vapor samples SV-6 through SV-10, the concentrations range between 66.00 $\mu\text{g}/\text{m}^3$ and 2,200 $\mu\text{g}/\text{m}^3$. While soil vapor sampling point SV-6 is in the footprint of the proposed apartment building, the other four sampling locations are outside of the footprint of the proposed apartment building. A summary of the soil vapor analytical data is provided in **Table 4**.

3.0 CONCLUSIONS

The objective of the Phase II ESI was to evaluate potential impacts associated with the identified RECs that were identified in the Phase I ESA. This was accomplished through a series of soil borings and soil vapor sampling conducted across the Site. Based on the laboratory analytical results of the collected soil and soil vapor samples, visual and olfactory observations of the soil samples and the use of the PID to screen the soil samples and the soil vapor samples, the following conclusions are based on the findings of the environmental investigation.

3.1 GEOPHYSICAL SURVEY

A geophysical survey was conducted on the vacant lot located at 972 Franklin Avenue was conducted on October 10, 2023. The purpose of the geophysical survey was to located any abandoned underground storage tanks, utility lines or subsurface obstructions that would need for the relocation of the soil boring locations. The non-destructive geophysical survey produces a continuous cross-sectional profile of subsurface features in real time. The Ground Penetrating Radar (GPR) operates by transmitting both high and low frequency electromagnetic wave pulses down into the ground through a transmitter in the antenna. The transmitted electromagnetic waves reflect off materials with contrasting dielectric properties from surrounding medium such as underground storage tanks, utilities, distinct contacts between different earth materials, and other various subsurface objects. The results of the GPR survey indicated that there were no underground storage tanks detected. Most of the shallow objects detected consisted of building debris, concrete, brick and scrap metal. A partially collapsed sanitary sewer line that ran between Franklin Avenue and a manhole at the end of a driveway from the main entrance way into the site.

3.2 SOIL INVESTIGATION

Eleven soil borings were drilled to a depth of twelve feet bgs across the Site. Twenty-two soil samples were collected for laboratory analysis. Two soil samples were collected from each soil boring consisted of a shallow soil sample, zero to two feet bgs and a deeper soil sample was collected at a depth of 18.00 to 20.00 ft. bgs at soil boring

locations SB-1 through SB-6. The deeper soil sample was collected at depths ranging from eight to ten ft. bgs at soil boring SB-8, at a depth of 48.00 to 50.00 ft. bgs at soil boring SB-7. At soil boring SB-9 the deeper soil sample was collected between seven and nine ft. bgs and at soil borings SB-10 and SB-11 the deeper soil sample was collected at a depth of four to six ft. bgs.

The soil samples, collected at soil boring locations SB-1 through SB-6 and SB-8 were collected in five-foot Macro Core samplers by Direct Push Drilling Technology. The soil samples collected at SB-9 through SB-11 were collected in three foot Macro Core Samples due to the portable drilling equipment that was needed to drill inside of the vacant building at 962 Franklin Avenue. Due to the subsurface geology beneath the site a track mounted drilling rig that utilized sonic drilling technology was required to advance soil boring SB-7 to a depth of 50.00 ft. bgs. The soil samples were collected in ten foot long, three inch diameter cores that were vibrated into new plastic bags in five foot long sections. The geology underlying the site consisted of mainly clayey and silty sands that varied in color from moderate brown to moderate yellowish brown to a pale yellowish brown, gray sandy and silty clays, thin lenses of medium to very coarse micaceous sand and peat. Screening of the soil samples with a PID indicated very low levels of VOCs, with the highest reading recorded was 3.5 ppm at a depth of 2.0 ft. bgs at Soil boring SB-2, correspond to a tar like fill material. The soil sample at SB-1 at a depth of 14.30 to 15.00 ft. bgs, had a slight petroleum like odor, however when the soil was screened with the PID, the reading was 0.0 ppm. The analytical results of the soil samples collected at the Site were compared to the NYSDEC 6 NYCRR Subpart 375-6: Remedial Program Soil Cleanup Objectives for evaluation. A summary of the analytical results are as follows:

- Only two Volatile Organic Compounds exceeded the Unrestricted Use SCO, acetone at a concentration of 0.0059 mg/kg in the 18.00 to 20.00 foot sample at SB-1 and methylene chloride at a concentration of 0.046 mg/kg in the 4.00 to 6.00 foot sample at SB-10. Both compounds are used as cleaning agents in the laboratory and are known laboratory contaminants.

- Several Semi Volatile Organic compounds were detected that exceeded the Restricted Use and Commercial Use SCOs. The compounds that were in exceedance are Benzo(a) anthracene, Benzo(a) pyrene, Benzo(k) fluoranthene Dibenzo(a,h) anthracene, Indeno(1,2,3-cd) pyrene, and chrysene, were detected in the 0.00 to 2.00 ft. sample at SB-2, SB-5 and SB-6. These compounds are common to petroleum products.
- There were seven metals that were in exceedance of the Unrestricted Use and the Commercial Use SCOs. The metals are arsenic, copper, mercury, lead, zinc, nickel and selenium were detected in these soil samples: SB-1 (0'-2'), SB-2 (0'-2'), SB-2 (18'-20'), SB-3 (0'-2'), SB-3 (18'-20'), SB-4 (0'-2'), SB-5 (18'-20'), SB-6 (0'-2'), SB-6 (18'-20'), SB-7 (0'-2'), SB-8 (0'-2'), SB-9 (0'-2'), SB-9 (7'-9'), SB 10 (4'-6') and SB-11 (0'-2').
- Only two pesticides were detected that exceeded the Unrestricted Use SCO. The pesticides, 4,4'-DDE at a concentration of 0.0065 mg/kg and 4,4'-DDT at a concentration of 0.0246 mg/kg. Both pesticides were detected in the 4.00 to 6.00 foot sample at SB-10.
- There were not PCBs detected in any of the collected soil samples submitted for laboratory analysis.

3.3 SOIL VAPOR INVESTIGATION

Soil vapor samples were collected at ten locations across the Site. The soil vapor samples were collected from stainless – steel screens placed at depths ranging between 6.00 and 20.00 ft. bgs. The soil vapor samples were collected in stainless-steel Summa canisters, over a four- hour sampling period on October 13, 2023. The soil vapor was also screened with a PID and each sampling point was checked with a tracer gas to ensure that there was no cross connection with the ambient air.

Of the twenty -eight volatile organic compounds that were detected in the soil vapor analysis, the NYSDOH has only issued guidance values for three compounds, methylene chloride, trichloroethylene and tetrachloroethylene. Methylene chloride was not detected at any of the soil vapor sampling locations.

Tetrachloroethylene (PCE) was detected at all of the soil vapor sampling locations, at concentrations exceeding the NYSDOH guidance value of 30.00 $\mu\text{g}/\text{m}^3$ with the exception of the soil vapor sample collected at SV-4. The PCE concentration in this sample was 4.60 $\mu\text{g}/\text{m}^3$.

Trichloroethylene (TCE) was detected at all of the soil vapor sampling locations with the exception of SV-4. The concentration of TCE exceeded the NYSDOH guidance value of 2.00 $\mu\text{g}/\text{m}^3$ at soil vapor sampling locations SV-6 through SV-10. An elevated concentration of TCE of 2,200 $\mu\text{g}/\text{m}^3$ was detected in the soil vapor sample at SV-8 at a depth of 6.00 ft. bgs. The other VOCs that were detected in the soil vapor samples are: 1,1,1- Trichloroethane, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, 2-Butanone, 4-methyl 2-pentanone, acetone, benzene, carbon disulfide, carbon tetrachloride, chloroform, chloromethane, cyclohexane, cis-1,2-dichloroethylene, dibromochloromethane, ethyl benzene, isopropanol, n-Heptane, n-Hexane, o-Xylene, p- & m- Xylenes, p-Ethyltoluene, propylene, tetrachloroethylene, tetrahydrofuran, toluene, trichloroethylene and trichlorofluoromethane (freon 11).

4.0 RECOMMENDATIONS

The analytical results of the soil samples and soil vapor samples collected during the Phase II ESI, revealed limited environmental impacts in the on-site subsurface soil and soil vapor. The presence of VOCs, SVOCs, pesticides, and metals, detected in soils throughout the Site, are likely impacted by historic urban fill, and historical uses of the Site.

The contaminated soil within the footprint of the proposed building that will be excavated for the construction of the foundation of the proposed apartment building, as part of the development of this Site. The presence of elevated concentrations of SVOCs and the metals, arsenic, copper, mercury, lead, nickel, selenium and zinc, detected in the soils at the two properties, 962 and 972 Franklin Avenue, will require waste classification sampling for disposal authorization at a secure disposal facility. A Soil Management Plan may need to be developed to address the removal and disposal of contaminated soil during construction of the proposed building.

The upper two feet of soil in the unexcavated area of the site will also have to be sent for off-site disposal at a secure disposal facility. Two feet of certified clean soil will have to be imported onto the Site for this area.

Groundwater was not encountered during site investigation activities. The excavation for the foundation for the proposed apartment building is not anticipated to extend into the confined aquifer beneath the site. The Site will not pose as a threat to the water of the State of New York or to the future residents, as groundwater is not planned to be used as a source of potable water or non-domestic usage.

Based on the NYSDOH guidelines and analytical results, elevated concentrations of tetrachloroethylene and trichloroethylene exist in the soil vapor beneath the site. The concentrations of tetrachloroethylene greatly exceed the NYSDOH guideline values for this compound. The concentration of trichloroethylene were found to be elevated at the eastern and western portion of the site and under the vacant building at 962 Franklin Avenue. A 20 mil vapor barrier manufactured by Stego Industries, GCP Applied Technologies or other approved manufacturer, will have to be constructed under the basement floor and also cover the foundation walls and terminate at the ground surface. This should be considered a proactive measure to reduce any potential exposure that could possibly be attributed to vapor intrusion.

In addition to the Remedial Action Work Plan (RAWP) and a Construction Health and Safety Plan (CHASP), ALC recommends a Soil Management Plan (SMP) to be in place prior to the start of the construction work. The RAWP will require a review and approval by a NYS Licensed Professional Engineer .

NOTES:

NYSDOH - New York State Department of Health

µg/m³ - micrograms per cubic meter

~ - this indicates that no regulatory limit has been established for this analyte

TO-LCS-H - The result reported for this compound may be biased high due to its behavior in the analysis batch LCS where it recovered greater than 130% of the expected value.

TO-CCV - The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).

ND - analyte not detected

Highlighted - Indicateds value exceeds the NYSDOH Guidance Values

NOTES:											
~ - this indicates that no regulatory limit has been established for this analyte											
NYSDEC - New York State Department of Conservation											
mg/kg - milligrams per kilogram											
ND - analyte not detected											
Any Regulatory Exceedences are color coded by Regulation											
J - Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC											
SB-12 ¹ : Soil Sample is a Blind Duplicate of the 18'-20' soil sample collected at SB-4											
FB - Field Blank											
TB - Trip Blank

Notes:

- Water Table Depth
- bgs : Below Ground Surface
- No PID reading

well screen
 Native soils
 Gravel Pack
 Bentonite Seal
 Concrete

Lithology described as per Unified Soil Classification System (USCS)

- SW- well graded sand
- SP- poorly graded sand
- SM- silty sands or silt
- CL: silty clays or lean clay
- SC: Clayey sands, sand-clay mixtures
- ML: Inorganic silts and very fine sands

Notes:

A vertical cross-section diagram of a well casing. The casing is composed of several distinct layers, each with a unique hatching pattern. From top to bottom, the layers are: a thin layer with horizontal lines, a layer with a grid pattern, a layer with diagonal lines, a layer with a cross-hatch pattern, and a thick bottom layer with a dense, irregular pattern. To the right of the casing, the following labels are aligned with their respective layers: 'well screen' (top), 'Native soils' (second layer), 'Gravel Pack' (third layer), 'Bentonite Seal' (fourth layer), and 'Concrete' (bottom layer).

SW- well graded sand
SP- poorly graded sand
SM- silty sands or silt
 Organic silts & organic clays of low
OL- plasticity
Pt: Peat & other highly organic soils

MH :	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
CL :	silty clays or lean clay
SC :	Clayey sands, sand-clay mixtures
ML :	Inorganic silts and very fine sands
OH :	Organic clays of medium to high plasticity, fat clays.

View of the Site looking in a westerly direction

Soil sampling with the Geoprobe 7728 DT at Soil boing Location SB-1

Drilling the borehole for the soil vapor implant at SV-4 location

Soil Sample collected at SB-2 at 0'-5' depth. Moderate brown clayey sand with fill material (bricks & concrete).

Bottom portion of the soil sample collected at SB-2 at 0'-5' depth. Medium gray micaceous sand.

Soil sample at SB-6 at 15'-20; depth. Light to moderate brown clayey sand.

Soil sample collected at SB-6 at 15'-20' depth. Medium gray silty clay underlain by yellowish brown clayey fine sand

View of the Fraste Eijkelkamp Sonic Drilling rig set up on soil boring SB-7

Soil sample being vibrated out of the sampler into a plastic bag.

Soil sample at SB-7 at 0'-2' depth. Fill material, concrete & gravel with yellowish brown silty sand.

Soil sample at SB-7 at 20'-25' depth. Brownish black silty clay & brownish gray clayey sand.

Soil sample at SB-7 at 30'-31.50' depth. Variegated light brown, dark yellowish brown and gray sandy clay with olive brown clayey fine sand.

Soil sample at SB-7 at 31.50'-33.00' depth. Dark brown sand with gravel.

Soil sample at SB-7 at a depth of 30'-35'. Brownish gray clayey sand with brown peat.

Soil sample at SB-7 at 40'-45' depth. Brown clayey sand with fine to coarse gravel (cobbles- boulders).

Soil sample at SB-7 at 45'-50' depth. Dark yellowish brown clayey sand with fine gravel, wet.

Using a portable drilling rig to collect soil samples inside the building at 962 Franklin Avenue, SB-11 location

Attaching the 3 foot macro-core soil sampler onto the portable drilling equipment.

View of the interior of the building located at 962 Franklin Avenue.

Drilling the borehole for the soil vapor implants inside 962 Franklin Avenue with a hammer drill.

¼" diameter tubing from the soil vapor implant extended up through a piece of plywood to provide a solid and even surface to check the vapor implant seals.

Checking the soil vapor sampling point for VOCs with a PID (yellow instrument) and to ensure a good seal from the ambient air with the bucket, air sampling pump and the helium detector

Using helium to enrich the air inside of the inverted bucket to check that there is no cross connection between the subsurface soil vapor and the outside (ambient) air.

Checking the collected air sample in the tedlar bag for the presence of helium with the helium detector.

Summa canister connected to the soil vapor sampling implant

GEOPHYSICAL SURVEY REPORT

DRAFT

Coastal Environmental Solutions, Inc.

GEOPHYSICAL INVESTIGATION REPORT

10.23.2023

Site: 962-972 Franklin Avenue, Brooklyn, NY

Date of Investigation: 10/10/2023

Prepared for:

ALC Environmental
39 West 29th Street, 8th Floor
New York, NY 10001

Prepared By:

Dennis Berthold
Director of Geophysical Operations
Coastal Environmental Solutions, Inc.
PO Box 342
Medford, New York 11763

1.0 INTRODUCTION

On 10/10/2023, Coastal Environmental Solutions, Inc (Coastal) personnel performed a limited geophysical investigation at 962-972 Franklin Avenue, Brooklyn, NY. The areas of interest included the exterior fenced-in lot as indicated by the client. The purpose of the investigation was to determine the location of subsurface features such as underground utilities and possible Underground Storage Tanks (USTs). During the initial investigation of the site, the interior of the buildings was deemed to be inaccessible. Surface conditions consisted of soil.

2.0 SCOPE OF WORK

1. Locate and mark detectable underground utilities and other underground anomalies within client specified areas.

3.0 EQUIPMENT

ImpulseRadar PinPointR Ultra-Wide Band (UWB) Penetrating Radar System

Ground Penetrating RADAR (GPR) is a non-destructive geophysical method that produces a continuous cross-sectional profile of subsurface features in real time. GPR operates by transmitting both high and low frequency electromagnetic wave pulses down into the ground through a transmitter in the antenna. The transmitted electromagnetic waves reflect off materials with contrasting dielectric properties from surrounding medium such as underground storage tanks, utilities, distinct contacts between different earth materials, and other various subsurface objects. The antenna receiver collects the reflected electromagnetic waves which are then interpreted by the operator.

The ImpulseRadar PinPointR UWB GPR utilizes a dual band 400/800 MHz HS antenna mounted to a stroller frame which rolls over the surface. The total depth of penetration achieved with the antenna can be up to 10 feet but widely varies based on site-specific subsurface conditions. Conductive materials in the soil attenuate the GPR signal causing a decrease in effective depth of penetration and clarity.

Vivax-Metrotech vLoc3-Pro Receiver/Transmitter

The vLoc3-Pro Receiver is a hand-operated antenna capable of detecting electromagnetic (EM) fields emitted from a source. The EM antenna can detect pipes and cables in the ground at depths of up to 20 feet using active or passive tracing techniques. Passive tracing is the act of locating an underground utility through the detection of electrical or radio signals travelling along conductive utilities. Active tracing is used in conjunction with the Transmitter that is directly connected to the target utility or to a conductive rodder within a non-conductive line. A signal is sent through the utility at a specific frequency that can be detected by the Receiver. The detectability of a target utility depends on many factors including access to the target utility, grounding, depth of utility, conductivity, and other site-specific factors.

TW-6 Pipe and Cable Locator

The TW-6 Pipe and Cable locator is a handheld magnetometer which utilizes a transmitter-receiver pair attached to opposite ends of a handle and carried approximately 1-2ft from the surface. The

magnetometer induces an electromagnetic (EM) field into the ground that is generated by the transmitter. Once the induced EM field passes through a buried metallic object, it generates a secondary EM field which is detected by the receiver, generating an audible tone. Based on the calibration of the magnetometer, the audible tone reflects the strongest response as the highest pitched sound, trailing off on all sides of the peak. This piece of technology can be used to detect subsurface features such as metallic USTs, large diameter conductive pipes, and buried manholes, especially in areas in which traditional GPR methods cannot be utilized, such as overgrown or uneven surfaces.

4.0 METHODOLOGY

1. A subsurface investigation was performed in close proximity to the client proposed locations. Active and passive detection methods were utilized with the VLoc3-Pro receiver/transmitter. Coastal personnel directly connected to all accessible and traceable pipes, conduits, valve covers, and any other surface feature throughout the site. A passive scan was performed throughout the site to detect any potential underground utilities that could not be located with active scan.
2. (If applicable) The TW-6 was utilized to sweep accessible areas around suspected UST locations in 3-to-5-foot spacings for readings that may represent a buried metallic anomaly. Upon detection of a reading, the approximate size and shape of the anomalous area was marked on the surface to be investigated further with GPR.
3. GPR was utilized to further characterize the approximate dimensions, depth, and shape of the anomalies located with the TW-6. The remainder of the areas around the suspected locations were scanned with GPR in 3-to-5-foot spacing to locate any anomalous features not previously detected such as non-conductive piping and former excavations.
4. All findings were marked on the surface utilizing the American Public Works Association (APWA) recommended color code, seen below:

WHITE	Proposed Excavation
PINK	Temporary Survey Markings (Approximate UST Locations, Soil Boring Locations)
RED	Electric Power Lines, Cables, Conduit and Lighting Cables
YELLOW	Gas, Oil, Steam, Petroleum or Gaseous Materials
ORANGE	Communication, Alarm or Signal Lines, Cables or Conduit
BLUE	Water (Domestic and Fire Lines)
PURPLE	Irrigation (Not commonly used)
GREEN	Sewers and Drain Lines

5.0 SUMMARY OF FINDINGS

Geophysical Investigation

Coastal personnel conducted a geophysical investigation on all accessible locations within the area of concern for the purpose of detecting any subsurface anomalies representing USTs or other relevant discoveries. A visual investigation of the site indicated a large portion of the site appeared to contain demolition debris from a former building in the form of brick, cinder block fragments, and other metallic debris mixed within the shallow soil. An attempt to gain access to the building

on site was not successful, so the entirety of the geophysical survey occurred within the fenced-in lot. A number of metallic anomalies were discovered but all were determined to be shallow scrap from the demolition activities.

An underground sanitary line structure was located within a manhole nearest the central gate to the site. The lines appeared to have collapsed and been damaged which impeded in the complete locate of the lines. The detected features were marked in green paint and indicated to the client.

Limitations

The effective depth of GPR penetration was limited to 5 feet. The limiting factor was due to soil conductivity attenuating the GPR signal likely due to the recent demolition and stockpiling soil on top of the existing grade. The GPR and TW-6 were unable to be utilized within close proximity to parked vehicles and exterior walls.

Disclaimer

The subsurface investigation was performed by Coastal after considering the limits of the scope of work and the time constraint for the investigation. The investigation that is described in this report was undertaken in accordance with current accepted standards and practices of the geophysical survey industry. The results and interpretations that are presented are based on professional judgment and are as accurate as can reasonably be achieved. However, no geophysical equipment can accurately depict all subsurface features due to the geology and environmental conditions of the subsurface. Any intrusive work in proximity to identified anomalies should be carefully considered and cross-referenced with all available site-specific documentation. Coastal is not liable for the use, interpretation, or application of the data and information in this report.

PHOTOS & GPR SCREENSHOTS

Photo and GPR Screenshot 1 –Photo of the manhole on site which contained a portion of the former collapsed sanitary lines. The GPR screenshot shows a location at which the shallow soil has sunken down and been backfilled, likely during the demolition of the building on site.

Photo 2 – View of the interior of the manhole indicated in Photo 1.

Photo 3 – View of one of the many metallic anomalies detected with the TW-6 Magnetometer which detects the presence of shallow metal objects. Upon further investigation with the GPR unit shown above, the anomalies were determined to be unremarkable.

Photo 4 – View of the sanitary line at the points it was detected between the manhole pictured in Photos 1 and 2 and the central gate. An additional manhole is located immediately inside the gate, obscured in the above photo by overgrowth.

Photo 5 – View of the building, inaccessible at the time of the geophysical investigation.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on October 13, 2023 and listed below. The project was identified as your project: **500-1027 962-972 Franklin Ave., Brooklyn, NY.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 23J0926

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon current NELAC/TNI Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Attention: Jeff Diamond

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on October 13, 2023 and listed below. The project was identified as your project: **500-1027 962-972 Franklin Ave., Brooklyn, NY.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 23J0987

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
S-08	The recovery of this surrogate was outside of QC limits.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-BS	The recovery for this element in the batch blank spike recovered slightly outside of control limits
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon current NELAC/TNI Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on October 17, 2023 and listed below. The project was identified as your project: **500-1027 968-972 Franklin Ave., Brooklyn, NY.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 23J1127

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

S-08	The recovery of this surrogate was outside of QC limits.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect. This effect was confirmed by reanalysis.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) exceeded 110% of the expected value. Positive detections may be biased high.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
IS-LO	The internal std associated with this target compound did not meet acceptance criteria (area <50% CCV) at the stated dilution due to matrix effects. Sample was rerun to confirm matrix effects.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon current NELAC/TNI Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on October 16, 2023 and listed below. The project was identified as your project: **500-1027 962 Franklin Ave., Brooklyn, NY.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 23J1007

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

TO-VAC	The final vacuum in the canister was less than -2 inches Hg vacuum. The time integrated sampling may be affected and not reflect proper sampling over the time period. The data user should take note.
TO-LCS-H	The result reported for this compound may be biased high due to its behavior in the analysis batch LCS where it recovered greater than 130% of the expected value.
TO-CCV	The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon current NELAC/TNI Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.
