Langan Project No.: 170229030

LANGAN

CERTIFICATION

I, Jason Hayes, certify that I am currently a Qualified Environmental Professional as defined in 6 NYCRR Part 375 and that this Remedial Investigation Report was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the Division of Environmental Remediation (DER) Technical Guidance for Site Investigation and Remediation (DER-10).

Jason Hayes, PE

1.0 INTRODUCTION

Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C. (Langan) prepared this Remedial Investigation Report (RIR) on behalf of GPLC HoldCo LLC, GPLC Member LLC and GPLC Owner LLC (the Participants) for the property at 21 Freeman Street (Building C1), 37 Freeman Street (Building C2), and 209 West Street (Building C3) in the Greenpoint neighborhood of Brooklyn, New York (the site). The Participants were accepted into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program) BCP to investigate and remediate the site pursuant to the NYSDEC Brownfield Cleanup Agreement (BCA) executed on 9 December 2025 (Index No. C224435-09-25). BCP Site No. C224435 was assigned to the site.

This RIR presents environmental data and findings from the Remedial Investigation (RI) that was completed by Langan from July 25 to August 5, 2022, the first Supplemental Remedial Investigation (herein referred to as SRI No. 1) that was completed by Langan from January 12-14, 2026, and the second SRI (herein referred to as SRI No. 2) that was completed by Langan from March 18-19, 2026. The objective of the RIs was to investigate and characterize the nature and extent of environmental impacts at the site and to provide sufficient information to evaluate remedial alternatives and actual and potential threats to human health and the environment. In April 2023, the NYSDEC released new guidance for Sampling, Analysis, and Assessment of PFAS under NYSDEC's Part 375 Remedial Programs. Langan, on behalf of the Participants, performed SRI No. 1 to collect additional groundwater samples for analysis of the full suite of PFAS compounds outlined in the April 2023 guidance. SRI No. 1 was conducted in accordance with the NYSDEC-approved January 8, 2026 Supplemental Remedial Investigation Work Plan No. 1 (SRIWP No. 1). In response to the request from the NYSDEC on March 11, 2026, Langan performed a second SRI to delineate the extent of the carbon tetrachloride in soil vapor. SRI No. 2 was conducted in accordance with the NYSDEC-approved March 18, 2026 SRIWP No. 2.

This RIR is organized as follows:

- Section 2.0 describes the setting and physical characteristics of the site.
- Section 3.0 describes the site background, including results of previous investigations and identified areas of concern (AOCs).
- Section 4.0 presents the investigation field procedures.
- Section 5.0 describes field observations and analytical results.
- Section 6.0 presents an assessment of the exposure risks of site contaminants to human, fish, and wildlife receptors.
- Section 7.0 presents the nature and extent of contamination in site media as determined through field investigation and analysis of environmental samples.
- Section 8.0 summarizes the results of the investigation and presents conclusions based on field observations and analytical results.

- Section 9.0 presents the references used in preparation of this report.

2.0 SITE PHYSICAL CHARACTERISTICS

2.1 Site Description

The site is about 163,000 square feet (±3.737 acres) in area and is located at 21 Freeman Street (Building C1), 37 Freeman Street (Building C2), and 209 West Street (Building C3) in the Greenpoint neighborhood of Brooklyn, New York. The site is identified on the Brooklyn Borough Tax Map as Block 2502, part of (p/o) Lot 1 and p/o Lot 5, and Block 2510, p/o Lot 1 and p/o Lot 100. As of the date of this RIR, the site is a paved and vacant parcel of land. A site location map is presented as Figure 1 and a site plan is presented as Figure 2.

The site is under the regulatory jurisdiction of the New York City Office of Environmental Remediation (NYCOER) pursuant to the Greenpoint-Williamsburg Rezoning dated 11 May 2005 (CEQR No. 04DCP003K), which placed E-Designations for Hazardous Materials and Noise (E-138) on the tax lots comprising the site. The E-Designation includes environmental restrictions during development for hazardous materials and noise (i.e., window wall attenuation and alternate means of ventilation requirements).

The site is bound by Greenpoint Landing Parcel D (Block 2472, Lots 2, 3, 4, 21 and 23, Block 2502, Lot 2 and part of Lot 5) to the north; West Street to the east, a parking lot to the south, and the East River to the west. The northern-adjoining property (Greenpoint Landing Parcel D) was enrolled in the NYCOER Voluntary Cleanup Program (VCP) as Site No. 19CVCP053K. The Greenpoint Landing Parcel D site received its Certificate of Completion (COC) in February 2023.

2.1.1 Description of Surrounding Properties

According to the New York City Planning Commission Zoning Map 12c, the site is located within R6, R8, and C2-4 zoning districts. The following is a summary of surrounding property use:

Direction	Adjoining and Adjacent Properties			Surrounding Properties
	Block No.	Lot No.	Description	
North	2502	2, 5	Eagle Street	Open space & outdoor recreation and Newtown Creek
	2472	2, 3, 4, 21, and 23	Mixed residential & commercial buildings, open space & outdoor recreation, and part of Eagle Street	

Direction	Adjoining and Adjacent Properties			Surrounding Properties
	Block No.	Lot No.	Description	
East	2503	1	West Street followed by commercial & office buildings	Mixed residential & commercial buildings and multi-family walk-up buildings
South	2510	1	Miscellaneous - Other (Z9)	Industrial & manufacturing and mixed residential & commercial buildings
West	East River			

Major infrastructure (storm and sanitary sewers and other underground utilities) exists within the streets surrounding the site. Land use within a half-mile radius of the site is urban and includes residential, commercial, industrial, and institutional uses, and parks. The nearest ecological receptors are the East River (located adjoining to the west of the site) and Newtown Creek (located about 0.2 miles north/northeast of the site). Sensitive receptors, as defined in NYSDEC DER-10, within a half mile of the site include those listed below:

Number	Name (Approximate distance from site)	Address
1	Greenpoint Landing Esplanade (<1 foot northwest)	Near: 1 Eagle Street Brooklyn, New York
2	East River (<1 foot west; western site boundary)	N/A
3	Bunny Hill Greenpoint Daycare and Preschool (about 65 feet north)	213 West Street Brooklyn, New York
4	Greenpoint Childcare (about 0.1 miles south)	145 West Street Brooklyn, NY 11222
5	Newtown Barge Playground (about 0.1 miles north)	3 Commercial Street Brooklyn, New York
6	Green Point Public Park (about 0.1 miles south)	143 India Street Brooklyn, New York
7	Greenpoint Playground (about 0.1 miles northeast)	243 Franklin Street Brooklyn, New York

Number	Name (Approximate distance from site)	Address
8	Public Park Playground (about 0.1 miles south)	21 India Street Brooklyn, New York
9	WNYC Transmitter Park (about 0.1 miles south)	Greenpoint Ave, Brooklyn, NY 11222
10	Carrusel Child Care Center 2 (about 0.2 miles southeast)	167 Franklin Street Brooklyn, NY 11222
11	Newtown Creek (about 0.2 miles north)	N/A
12	Greenpoint Garden Playhouse (about 0.2 miles southeast)	53 India Street Brooklyn, New York
13	Hunter's Point South Park and Kayak Ramp (about 0.2 miles north)	Near: 5627 2nd Street Long Island City, New York
14	Java Street Community Garden (about 0.2 miles northeast)	59 Java St, Brooklyn, NY 11222
15	Building Blocks of Greenpoint (about 0.3 miles south)	44 Kent St, Brooklyn, NY 11222
16	American Playground (about 0.3 miles southeast)	Milton St & 81 Franklin St, Brooklyn, NY 11222
17	The Goddard School of Greenpoint (about 0.3 miles northeast)	85 Commercial Street, Brooklyn, NY 11222
18	Carrusel Child Care Center Brooklyn (about 0.36 miles southeast)	168 Java Street Brooklyn, NY 11222
19	Helen Owen Carey Residence (about 0.4 miles east)	174 Java St, Brooklyn NY 11222
20	Iglesia Pentecostal El Tabor (about 0.4 miles east)	256 Franklin St #2R, Brooklyn NY 11222
21	Greenpoint Reformed Church (about 0.4 miles southeast)	136 Milton St, Brooklyn, NY 11222
22	Greenpoint Shul (about 0.4 miles southeast)	108 Noble St, Brooklyn, NY 11222
23	Green Bean Day Care & Learning Center (about 0.46 miles southeast)	161 Greenpoint Avenue Brooklyn, NY 11222

A map showing the surrounding land uses is included as Figure 3 and a map showing the historical site and surrounding property uses is included as Figure 4.

2.1.2 Topography

The 2023 USGS 7.5-minute quadrangle topographic map for Brooklyn depicts the site at an elevation (el) of approximately 10 feet above mean sea level (msl). The general topographic gradient of the site and the surrounding properties slope gently towards the west in the direction of the East River. Based on available Langan surveys, the elevation of the site ranges from about el. 12 NAVD88 at West Street to about el. 7 NAVD88 at the shoreline of the East River.

2.1.3 Stormwater Runoff and Drainage

The site is covered by impervious asphalt pavement. Stormwater runoff from the site is expected to sheet flow towards the East River to the west.

2.1.4 Wetlands

Wetlands near the site were evaluated by reviewing the National Wetlands Inventory and NYSDEC regulated wetlands map. There are no wetlands on the site. The nearest wetlands are the East River (located adjoining to the west of the site) and Newtown Creek (located about 0.2 miles north/northeast of the site).

According to the preliminary National Flood Insurance Rate map for the City of New York published by the Federal Emergency Management Agency (Community Panel No. 3604970202G, dated 5 December 2013), the site falls within Zone AE, which is subject to inundation by the 1% annual chance flood and Zone X.

2.2 Geology and Hydrogeology

2.2.1 Regional and Site Geology

The surficial geology in the vicinity of the site generally consists of glacial and fluvial soil deposits, as well as anthropogenic fill. The glacial deposits, commonly referred to as outwash deposits, ground moraine, or till, are a widespread dense layer typically consisting of heterogeneous mixtures of clay, silt, sand, gravel, and boulders.

According to USGS "Bedrock and Engineering Geology Maps of New York County, and parts of Kings and Queens Counties, New York, and parts of Bergen and Hudson Counties, New Jersey", bedrock stratigraphy in the area consists of Ravenswood Granodiorite of the Middle Ordovician to Middle Cambrian Age and Hartland Formation of the Middle Ordovician to Lower Cambrian Age. Ravenswood Granodiorite typically consists of medium- to dark-gray, sillimanite-garnet-pink microcline-plagioclase-biotite-muscovite-quartz and biotite-hornblende-orthoclase layered gneiss. The Hartland formation typically consists of gray sillimanite-garnet-microcline gneiss and fine-grained biotite-muscovite-quartz schist interlayered with quartz-plagioclase-muscovite pegmatite, hornblende amphibolite, and coarse granoblastic-textured amphibolite gneiss. Bedrock was not encountered during the RI or previous environmental investigations; however, bedrock was encountered during a geotechnical investigation at about 55 to 108 feet below existing grade.

Based on RI observations, the site is underlain by non-native historical fill, predominantly consisting of tannish brown to black fine-grained sand with varying amounts of gravel, silt, clay, brick, asphalt, concrete, glass, coal, coal ash, slag, wood, mortar, ceramics, organics, and shell fragments that generally extends from surface grade to between about 7 and 19 feet below grade surface (bgs). The non-native historical fill is followed by glacial outwash deposits (sand layers with silt and/or clay lenses).

2.2.2 Regional and Site Hydrogeology

Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeological network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks.

Infiltration of precipitation to the water table is likely minimal due to the presence of impervious surfaces throughout the site. Stormwater runoff is expected to flow towards the East River to the west. Groundwater in New York City is not used as a potable water source. Potable water provided to New York City is derived from surface impoundments in the Croton, Catskill, and Delaware watersheds.

Groundwater was observed at depths ranging from 5.64 to 9.50 feet bgs and groundwater elevations ranged from about el. 0.20 to 2.92[1] based on synoptic groundwater level measurements collected from 13 wells during the RI. During SRI No. 1, groundwater was observed at depths ranging from 7.75 to 9.90 feet bgs and groundwater elevations ranged from about el. -0.33 to 2.28 based on groundwater level measurements collected from 11 wells.[2] Groundwater flows to the west towards the East River. A groundwater elevation contour and flow direction map is presented as Figure 5.

[1] North American Vertical Datum of 1988 (NAVD88)

[2] Monitoring well MW07 could not be located and MW09 was not accessible at the time of gauging.

3.0 SITE BACKGROUND

3.1 Historical Site Use

Coal, lumber, and masonry materials storage were the primary uses of the site for more than 100 years from the late 1800s until circa 2000. In 1916, the southeastern part of the site was occupied by a manufacturing and packing facility. The Newton Creek Corporation occupied part of the site in 1922, and Newtown Creek Coal and Coke Co. Inc. occupied part of the site in 1928. Parts of the site appeared to have been vacant between 1916 through the 1940s. The site was again used for lumber storage from the early 1950s to circa 2000. The site has been used by various commercial and industrial tenants since the early 2000s, including Bay Crane and other tenants using the property for parking and storage of construction materials and equipment.

3.2 Redevelopment Plan

As currently conceived, the project would include construction of three new residential buildings named C1, C2, and C3:

- The C1 building will be a 451-foot tall (40-story plus bulkhead) high-rise residential tower with a 10-story podium and a partial cellar level for back-of-house space, storage, and a swimming pool.
- The C2 building will be a 348-foot-tall (30-story plus bulkhead) residential tower with a 3-story podium and two full-cellar levels used for vehicle parking, tenant storage, and/or building systems/maintenance.
- The C3 building will be an 87-foot tall, 9-story mixed-use residential and commercial building with a full-cellar level used for vehicle parking, amenities, tenant storage, and/or building systems/maintenance.

The cellar levels of Buildings C2 and C3 will be connected. The residential units in the C1, C2, and C3 buildings will be a mix of market-rate and affordable units under Affordable NY and inclusionary housing programs (overall approximately 70% market rate and 30% affordable). There will be new public access sidewalks and roadways along Freeman Street and a private internal connector road that will transect the site in a north-south direction to the adjoining cul-de-sac at the western end of Eagle Street. The sidewalks and roadways will include street lighting, trees, and plantings. The shoreline along the East River will be stabilized and the waterfront will be developed into a public park/esplanade, including 52,240-square-feet of public waterfront, shore public walkway, upland connection, and view corridor, that will be transferred to the City of New York upon completion. New utilities, including water, sewer, gas, electric, telecommunications, will be constructed to service the new buildings.

A proposed development plan is presented as Figure 6.

3.3 Previous Environmental Reports

Environmental reports prepared for the site include the following:

1. *Phase I Environmental Site Assessment Report – Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc. dated July 2001*
2. *Phase II Site Investigation Report – Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc. dated October 2001*
3. *Supplemental Subsurface (Phase II) Investigation Report – Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc. dated April 2004*

Reports are summarized below, and available reports are included in Appendix A.

July 2001 Phase I ESA Report – Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc.

AKRF, Inc. was retained by Park Tower Realty Corporation to perform an Environmental Site Assessment (ESA) of a 22-acre former lumber storage yard in the Greenpoint neighborhood of Brooklyn, New York (the subject property). The upland acres that comprise the former lumber storage yard are the Greenpoint Landing development property and include Parcel C.

Specific to the site, coal, lumber, and masonry material storage were the primary uses of the site for more than 100 years from the late 1800s until circa 2000. In 1916, the southeastern part of the site was occupied by a manufacturing and packing facility. Parts of the site appeared to have been vacant between 1916 through the 1940s. The site was again used for lumber storage from the early 1950s to circa 2000. At the time of the Phase I ESA, the site was used for the storage of construction materials and equipment and repossessed vehicles. Several 55-gallon drums of hydraulic oil, resins, and/or lubricators were observed at the site during the site reconnaissance.

The Phase I concluded that releases of petroleum or hazardous substances may be present on the former lumber storage yard (including the site) as the result of historical uses of the subject property and surrounding area.

October 2001 Phase II Site Investigation Report – Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc.

This investigation was performed across the Greenpoint Landing development property and included the completion and sampling of two soil borings (B3 and MW-2) and the completion of and sampling of one monitoring well (MW-2) within Parcel C. Soil samples were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and metals. Soil samples were not analyzed for polychlorinated biphenyls (PCBs), pesticides, or herbicides.

A summary of the observations and results of the soil and groundwater sampling is provided below:

- Non-native historical fill was identified in both borings completed at the site and was composed of varying amounts of sand and silt with ash, brick, coal, concrete, schist, slag, and wood. Non-native historical fill was observed immediately below the asphalt pavement to boring termination depths of about 10 feet below ground surface (bgs) in boring B3 and to about 7 feet bgs in boring MW2. Non-native historical fill was underlain by native soil composed of brown and black sandy silt. An organic/petroleum-like odor was observed between 5 feet bgs to boring termination depth (about 11 feet bgs) in boring MW2.
- One VOC, acetone (a common laboratory artifact), was detected above the NYSDEC Part 375-6.8(b) Unrestricted Use (UU) Soil Cleanup Objectives (SCOs) in soil samples collected from boring MW2. Eight SVOCs (di-n-butyl phthalate, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, ideno(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene) exceeded the UU and/or NYSDEC Part 375-6.8(b) Restricted Use Restricted-Residential (RRU) SCOs in soil samples collected from the two borings. Total SVOCS were detected at a maximum concentration of 12,992 milligrams per kilogram (mg/kg) in a sample collected from the 8- to 10-foot interval in boring B3. Three metals (copper, lead, and/or zinc) were detected above the UU SCOs in soil samples collected from the two borings.

VOCs and SVOCs were not detected in groundwater samples. Thirteen metals (antimony, barium, chromium, copper, iron, lead, magnesium, manganese, mercury, nickel, silver, sodium, and zinc) exceeded the NYSDEC Technical Operational and Guidance Series (TOGS) Ambient Water Quality Standards and Guidance Values (SGVs) for Class GA water at total concentrations and six metals (barium, iron, magnesium, manganese, sodium, and zinc) exceeded the NYSDEC SGVs at dissolved concentrations in the groundwater sample collected from MW2.

April 2004 Supplemental Subsurface (Phase II) Investigation Report- Greenpoint Lumber Yard, Brooklyn, New York, prepared by AKRF, Inc.

This investigation was also performed across the Greenpoint Landing development property and included the completion of four soil borings (B8, B9, B10, and B11) and collection of eight soil samples within Parcel C. Soil samples were analyzed for VOCs, SVOCs, PCBs, pesticides, and metals. Soil samples were not analyzed for herbicides.

Non-native historical fill was identified in all four borings and was composed of varying amounts of sand, silt, gravel, and clay with brick, coal, concrete, metal, slag, and wood. Non-native historical fill was observed directly below the asphalt cap to depths ranging from 6.5 to 15 feet bgs. Non-native historical fill was underlain by native soil composed of varying amounts of sand and silt. A petroleum-like odor was observed at about 6 feet bgs in boring B10 and about 2 feet bgs in boring B11.

No VOCs were detected above the UU or RRU SCOs. Sixteen SVOCs (acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, dibenzofuran, fluoranthene, fluorene, ideno(1,2,3-c,d)pyrene, naphthalene, phenanthrene, and/or pyrene) exceeded the UU and/or RRU in soil samples collected from the four borings. Total SVOCs were detected at a maximum concentration of 4,691.36 mg/kg in a sample collected from the 5- to 7-foot interval in boring B10. Total PCBs exceeded the UU SCOs in soil samples collected from B9, B10, and B11. Three pesticides (4,4'-DDD, 4,4'-DDE, and/or 4,4'-DDT) exceeded the UU SCOs in soil samples collected from the four borings. Eight metals (arsenic, barium, cadmium, copper, lead, mercury, nickel, and zinc) exceeded the UU and/or RRU SCOs in soil samples collected from the four borings.

3.4 Summary of Areas of Concern

The following site-wide AOCs required further investigation and were developed based on site observations, the site development history, and the findings of the previous environmental reports. The pre-RI AOCs that were investigated include the following:

AOC 1: Historical Site Use

Coal, lumber, and masonry materials storage were the primary uses of the site for more than 100 years from the late 1800s until circa 2000. In 1916, the southeastern part of the site was occupied by a manufacturing and packing facility. The Newton Creek Corporation occupied part of the site in 1922, and Newtown Creek Coal and Coke Co. Inc. occupied part of the site in 1928. Parts of the site appeared to have been vacant between 1916 through the 1940s. The site was again used for lumber storage from the early 1950s to circa 2000. The site has been used by various commercial and industrial tenants since the early 2000s, including Bay Crane and other tenants using the property for parking and storage of construction materials and equipment. Releases from these historical operations might have affected soil, groundwater, and/or soil vapor quality.

AOC 2: Historical Use of Adjoining Properties

Historical uses of adjacent properties include, but are not limited to, lumber storage, storage of construction materials, heavy construction equipment, and machinery, a veneer factory, a machine shop, soap works, laundry and linen supply, garages, wood working, a shipping company, dye/wood extracting operations, and residential buildings. Releases from these historical operations might have migrated to and affected groundwater and/or soil vapor quality.

AOC 3: Non-native Historical Fill

Historical maps from the mid to late 1800s show the original shoreline of the East River crossed the site in a northeast-southwest orientation originating from a point near the present-day intersection of Eagle Street and West Street and extending out a point near the westernmost boundary of the site. This finding indicates about half or two-thirds of the site lies entirely on

reclaimed land, a result of historical filling activities. As documented by previous reports, non-native historical fill at the site contains SVOCs, metals, and pesticides.

4.0 FIELD INVESTIGATION

The RI was implemented from July 25 to August 5, 2022 to investigate and characterize the nature and extent of environmental impacts at the site and provide sufficient information to evaluate remedial alternatives and actual and potential threats to human health and the environment. SRI No. 1 was implemented from January 12-14, 2025 to collect additional groundwater samples for analysis of the full suite of PFAS parameters outlined in the April 2023 guidance for Sampling, Analysis, and Assessment of PFAS under NYSDEC's Part 375 Remedial Programs. SRI No. 2 was implemented from March 18-19, 2026 to collect additional soil vapor samples to delineate the extents of carbon tetrachloride in soil vapor south of Post-RI AOC 2 in the southwestern part of the site and to determine if carbon tetrachloride-impacted soil vapor is migrating off-site. The RI, SRI No. 1, and SRI No. 2 were conducted in accordance with Title 6 of the New York Codes, Rules, and Regulations (NYCRR) Part 375 and the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (May 2010). A photograph log documenting this investigation is included as Appendix B.

The RI consisted of the following:

- Geophysical survey to identify subsurface anomalies consistent with utilities, substructures, physical obstructions, and underground storage tanks (USTs), and to pre-clear soil boring locations;
- Advancement of 28 soil borings (SB01 through SB28) and collection of 66 soil samples plus quality assurance/quality control (QA/QC) samples;
- Installation of 13 permanent groundwater monitoring wells and collection of 13 groundwater samples plus QA/QC samples;
- Installation of 12 temporary soil vapor points and collection of 12 soil vapor samples plus QA/QC samples; and
- Survey and synoptic groundwater gauging of newly installed monitoring wells to evaluate the elevation and flow of groundwater.

SRI No. 1 included the collection of 12 groundwater samples plus QA/QC samples from 12 existing groundwater monitoring wells.

SRI No. 2 consisted of the following:

- Geophysical and electromagnetic survey to identify subsurface anomalies consistent with utilities, substructures, physical obstructions, and USTs, and to pre-clear sample locations;
- Installation of 12 temporary soil vapor points and collection of 12 soil vapor samples; and
- Implementation of a Community Air Monitoring Plan (CAMP).

A summary of the samples collected for laboratory analysis is provided as Table 1 and sample locations are shown on Figure 7. Each remedial investigation component is further described in the following sections.

During the NYSDEC review of the BCP application, a petroleum spill was reported on October 15, 2025 based on the field observations recorded in several soil borings during the 2022 RI. The Department assigned Spill No. 25-06379 to the case.

4.1 Geophysical Investigation and Utility Location

NOVA Geophysical Engineering (NOVA) of Douglaston, New York conducted geophysical surveys during the July 2022 RI and the March 2026 SRI No. 2, prior to intrusive field activities. The surveys used ground-penetrating radar to identify potential USTs and locate buried utilities and subsurface structures in the work zone and clear all borings/sampling locations. Borings/sampling locations were relocated as necessary to avoid subsurface utilities and other identified anomalies during both remedial investigations. Copies of the geophysical survey reports are included as Appendix C.

4.2 Soil Investigation

4.2.1 Soil Boring Investigation

A total of 28 soil borings (SB01 through SB28) were advanced by Lakewood Environmental Services, Corp. between July 25 and August 3, 2022. Boring locations were selected to provide sufficient site coverage and to evaluate the AOCs listed in Section 3.4. A Geoprobe® 6610 drill rig was used to advance borings from surface grade to between about 15 to 25 feet bgs.

Soil was collected continuously from surface grade to the final depth of each soil boring into 5-foot-long acetate liners using a 2.25-inch diameter open-point or a closed-point MacroCore® sampler. Recovered soil was screened for visual, olfactory, and instrumental evidence of environmental impacts and was visually classified for soil type, grain size, color, texture, and moisture content. Instrument screening for the presence of VOCs was performed with a photoionization detector (PID) equipped with a 10.6 electron volt lamp. Soil boring logs are included as Appendix D.

4.2.2 Soil Sampling and Analysis

Sixty-six soil samples (plus QA/QC samples) were collected from the soil borings for laboratory analysis. Soil samples were collected as follows:

- One to two representative non-native historical fill samples were collected above the groundwater table in every boring.
- In borings SB01, SB08, SB16, SB20, SB22, and SB28, one soil sample was collected from native soil.

- One sample was collected from the intervals exhibiting petroleum-like contamination where observed (based on the presence of staining, odor, and/or PID readings above background) in borings SB03, SB10, SB17, SB18, and SB19.
- In borings SB03, SB10, SB17, SB18, and SB19, one sample was collected from the first interval below the where the impacts were observed where evidence of staining, odor, and/or PID readings were absent.
- One sample was collected midway within the non-native historical fill layer from SB18.

Grab samples submitted for VOC analysis were collected directly from the acetate sleeves via laboratory-supplied Terra Core® soil sample kits. The remaining sample volume was homogenized and placed into laboratory-supplied glassware. The sample containers were labeled, placed in a laboratory-supplied cooler, and packed with ice (to maintain a temperature of 4 ±2°C). The samples were relinquished, under standard chain-of-custody protocol, to a courier for delivery to Alpha Analytical Laboratories, Inc. (Alpha), a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory in Westborough, Massachusetts (ELAP No. 11148), under chain of custody. Soil samples were analyzed using one or more of the following United States Environmental Protection Agency (USEPA) methods for NYSDEC Part 375 list and USEPA Target Compound List (TCL)/Target Analyte List (TAL) parameters:

- VOCs by USEPA methods 8260C
- SVOCs by USEPA method 8270D
- Pesticides by USEPA method 8081B
- Herbicides by USEPA method 8151A
- PCBs by USEPA method 8082A
- Metals by USEPA methods 6010D/7471B
- Toxicity Characteristic Leaching Procedure (TCLP) Metals by USEPA method 1311
- Hexavalent/trivalent chromium by USEPA method 7196A
- Total cyanide by USEPA method 9010C
- NYSDEC PFAS (21-compound list) by USEPA method 537[3]
- 1,4-Dioxane by USEPA method 8270 with SIM isotope dilution

A soil sample collection summary is included in Table 1.

[3] The investigation was completed using the NYSDEC's June 2022 Guidelines for Sampling and Analysis of PFAS as this was the established guidance at the time of the remedial investigation.

4.3 Groundwater Investigation

Groundwater monitoring wells were installed and sampled to characterize groundwater conditions and to investigate potential impacts to groundwater associated with the identified AOCs.

4.3.1 Monitoring Well Installation and Development

Thirteen soil borings were converted into permanent groundwater monitoring wells (SB01 through SB13 were converted to MW01 through MW13, respectively). The soil borings were over-drilled with 3.25-inch outer diameter direct push rods with an expendable 3.75-inch closed drive shoe. The monitoring wells were installed with 1-inch-diameter, threaded, flush-joint, polyvinyl chloride (PVC) casing and 0.01-inch-slot well screens set to straddle the groundwater table. The screens were set from 7 to 17 feet bgs or from 3 to 13 feet bgs; solid PVC risers were installed above the screens to extend each well to grade. The annulus of the borehole around the well screen (about 1.25 inches) was filled with No. 1 sand to about 2 feet above the top of the screen. Hydrated bentonite well seals (at least six inches thick) were installed above the filter sand. The remaining annulus above the bentonite seal was filled with No. 1 sand and the wells were finished with flush-mount access covers with a cement pad at the surface. Monitoring well construction logs are included in Appendix E.

Following installation, each well was developed by surging using a surge block and purging at least 3 well volumes with a peristaltic pump.

4.3.2 Groundwater Sampling and Analysis

During the RI, groundwater samples were collected from each newly installed well in accordance with NYSDEC DER-10, USEPA's Low Flow Purging and Sampling Procedures for the Collection of Groundwater Samples from Monitoring Wells (EQASOP-GW4 Revised Sep. 2017) and NYSDEC's June 2022 Guidelines for Sampling and Analysis of PFAS (the established PFAS sampling guidance at the time of the investigation). The groundwater samples from the RI were analyzed for twenty-one PFAS compounds. During SRI No. 1, groundwater samples were collected from twelve groundwater monitoring wells[4] in accordance with the NYSDEC's April 2023 guidance for Sampling, Analysis, and Assessment of PFAS under NYSDEC's Part 375 Remedial Programs. The groundwater samples from SRI No. 1 were analyzed for forty PFAS compounds.

Before RI and SRI No. 1 groundwater samples were collected, wells were continuously purged until groundwater quality parameters (pH, conductivity, turbidity, dissolved oxygen, temperature, and oxidation-reduction potential) stabilized, to the extent practical, in accordance with the USEPA low-flow guidance. A multi-parameter water-quality system was used to monitor the

[4] Monitoring well MW07 could not be located.

groundwater-quality parameters during sampling. Samples were collected with a peristaltic pump and dedicated polyethylene tubing.

During the RI, thirteen groundwater samples plus QA/QC samples were collected (one from each of the thirteen newly installed wells [MW01 through MW13]). Samples were collected into laboratory-supplied glassware and delivered via courier service to Alpha for analysis by one or more of the following USEPA methods for NYSDEC Part 375 list and USEPA TCL/TAL:

- VOCs by USEPA Method 8260C
- SVOCs (unfiltered and field-filtered) by USEPA Method 8270D/8270D SIM
- Pesticides by USEPA Method 8081B
- Herbicides by USEPA Method 8151A
- PCBs by USEPA Method 8082A
- Metals (unfiltered and field-filtered) by USEPA Method 6010D/6020B/7470A
- Hexavalent/Trivalent Chromium by USEPA Method 7196A
- Total cyanide by SM 4500
- 1,4-Dioxane by USEPA Method 8270D SIM
- PFAS by USEPA Method 537[5]

During SRI No. 1, twelve groundwater samples (one from each permanent monitoring well installed during the RI) plus QA/QC samples were collected for laboratory analysis. Monitoring well MW07 could not be located to sample during SRI No. 1. Samples were collected into laboratory-supplied glassware and delivered via courier service to York analytical laboratories for analysis of PFAS by USEPA Method 1633.

A groundwater sample collection summary is included in Table 1. Groundwater elevations are presented in Table 2 and a groundwater elevation contour and flow direction map is presented as Figure 5. Groundwater sampling logs are included in Appendix E.

4.4 Soil Vapor Investigation

4.4.1 Soil Vapor Point Installation

Twelve temporary soil vapor points (SV01 through SV09, SV14, SV15, and SV16) were installed with a Geoprobe® 6610 drilling rig to about 5 feet bgs during the 2022 RI. Twelve additional temporary soil vapor points (SV17, SV18, SV19A, and SV19B through SV27) were installed with a Geoprobe® 7822 drilling rig to about 5 feet bgs during the 2026 SRI No. 2. The soil vapor points were constructed with a dedicated 1-7/8-inch polyethylene implant threaded into polyethylene

[5] The investigation was completed using the NYSDEC's June 2022 Guidelines for Sampling and Analysis of PFAS as this was the established guidance at the time of the investigation.

tubing that extended to surface grade. A clean sand filter pack was placed around the screen implant and the remaining annular space was sealed with hydrated bentonite.

4.4.2 Soil Vapor Sampling and Analysis

Twelve soil vapor samples were collected between July 29 and August 3, 2022 during the RI, and 12 soil vapor samples were collected on March 19, 2026 during SRI No. 2 (one from each of the 24 total installed soil vapor points) in general accordance with the NYSDOH's Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006 and subsequent updates). The vapor samples are summarized in Table 1. Before collecting vapor samples, three soil vapor point volumes were purged from each sample location at a rate of less than 0.2 liters per minute using a RAE Systems MultiRAE® meter set at a low flow setting. The purged soil vapor was monitored for VOCs with the MultiRAE® during purging.

A helium tracer gas was used in accordance with the NYSDOH guidance to serve as a QA/QC technique to document the integrity of each soil vapor point seal before and after sampling. The tracer gas was introduced into a container, which shrouded the soil vapor point and seal. Helium was measured from the sampling tube and inside the container. Direct readings of less than 10% helium in the sampling tube were considered sufficient to verify a tight seal at each sample point.

One ambient air sample (designated AA01_080222) was collected concurrently with the soil vapor samples during the 2022 RI. Soil vapor and ambient air samples were collected using laboratory-provided, batch-certified clean, 6-liter air canisters equipped with 2-hour sample interval flow controllers. Soil vapor and ambient air samples were sealed, labeled, and transported via courier service to Alpha to be analyzed for VOCs by USEPA Method TO-15.

A soil vapor sample collection summary is included in Table 1. Soil vapor point construction and sampling logs are included as Appendix F.

4.5 Quality Assurance/Quality Control Sampling

Trip blanks, field blanks, field duplicate samples, and matrix spike/matrix spike duplicate (MS/MSD) samples were collected and submitted for laboratory analysis for QA/QC purposes. A QA/QC sample collection summary is included in Table 1. Matrix-specific QA/QC samples that were collected for the remedial investigations are summarized below:

Soil QA/QC Samples

- Three field duplicate samples;
- Three MS/MSD samples;
- Three field blank samples;
- Two field blank samples for PFAS; and

- Eight trip blanks.

RI Groundwater QA/QC Samples

- One field duplicate sample;
- One MS/MSD sample;
- One field blank sample;
- Four field blank samples for PFAS; and
- Five trip blanks.

RI Soil Vapor QA/QC Samples

- One ambient air sample

SRI No. 1 Groundwater QA/QC Samples

- One field duplicate sample;
- One MS/MSD sample; and
- Three field blank samples for PFAS

Field duplicate samples were collected to assess the precision of the analytical methods relative to the sample matrix. The duplicates were collected from the same material as the primary sample (i.e., parent sample) by splitting the volume of homogenized sample collected in the field into two sample containers.

MS/MSD samples were collected to assess the effect of the sample matrix on the recovery of target compounds or target analytes. Similarly to duplicate samples, MS/MSD samples were collected from the same material as the primary sample by splitting the volume of homogenized sample collected in the field into three sample containers.

Field blanks were collected to determine whether samples were affected by ambient contamination in the field during sampling. Field blank samples consisted of deionized, distilled water provided by the laboratory. Field blank samples were analyzed for the same list of analytes as the corresponding sampling event and sample matrix.

PFAS field blanks were collected to assess the potential for contamination of the sample containers and samples with PFAS during sample collection. Field blank samples consisted of PFAS-free, deionized, distilled water provided by the laboratory. PFAS field blank samples were analyzed for PFAS by USEPA Method 537.

Trip blank samples were collected to assess the potential for contamination of the sample containers and samples during transport from the laboratory to the field, and back to the laboratory for analysis. Trip blanks contain about 40 milliliters of acidic water (doped with hydrochloric acid) that is prepared and sealed by the laboratory when the empty sample

containers are shipped to the field, and then unsealed and analyzed for VOCs by the laboratory when the sample shipment is received from the field.

4.6 Data Validation

Analytical data was validated by a Langan validator in accordance with USEPA and NYSDEC validation protocols. Copies of the data usability summary reports (DUSR) are provided as Appendix H.

4.6.1 Data Usability Summary Report Preparation

A DUSR was prepared for each sampling matrix. The DUSR presents the results of data validation, including a summary assessment of laboratory data packages, sample preservation and chain of custody procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method.

For the soil and groundwater samples, the following items were assessed:

- Hold times
- Sample preservation
- Sample extraction and digestion
- Laboratory blanks
- Laboratory control samples
- System monitoring compounds
- MS/MSD recoveries
- Field duplicate, trip blank, and field blank sample results

For the soil vapor samples, the following items were assessed:

- Holding times
- Canister certification
- Laboratory blanks
- Laboratory control samples
- System monitoring compounds
- Target compound identification and qualification

Based on the results of data validation, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- "U" – The analyte was analyzed for but was not detected at a level greater than or equal to the reporting limit (RL) or the sample concentration or the sample concentration for results impacted by blank contamination.
- "UJ" – The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.
- "J" – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- "R" – The sample results are not useable due to quality of the data generated because certain criteria were not met. The analyte may and may not be present in the sample.
- "B" – Analyte was found in the associated analysis batch blank.
- "D" – Result is from an analysis that required dilution.

Data was judged to be 100% valid, as qualified. After data validation activities were complete, validated data was used to prepare the tables and figures included in this report.

4.7 Air Monitoring

Community air monitoring was implemented during soil-intrusive work on March 19, 2026 in accordance with the NYSDEC-approved SRIWP No. 2 and the NYSDOH Generic Community Air Monitoring Program (CAMP). Continuous dust and VOC monitoring was conducted using one upwind and one downwind monitoring station at the site perimeter. Dust emissions were monitored using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10). Organic vapors were monitored with a photoionization detector (PID). PIDs used were equipped with a 10.6 eV bulb. Odors were periodically monitored by site personnel at and beyond the site perimeter. Dust and odor suppression measures (e.g., water misting, odor suppressant) were implemented as needed.

Action levels used to monitor community and visitor exposure were set forth in the CAMP included in the Health and Safety Plan (HASP) (Attachment 1 in the SRIWP No. 2) and are summarized as:

- Particulate Action Level: 100 micrograms per cubic meter (µg/m^3) of air above background for a 15-minute average.
- VOC Action Level: 25 parts per million (ppm) for instantaneous readings above background or 5 ppm above background for a 15-minute average.

Aerosol monitors and PIDs recorded measurements on a continuous basis during intrusive activities. Fifteen-minute running averages were calculated from the recorded data, and averages

were compared to the action levels specified above. Action levels established in the HASP were not exceeded during SRI No. 2. Community air monitoring summary data is included as Appendix G.

4.8 Field Equipment Decontamination

Handheld sampling equipment, including oil/water interface probes and water quality meters were decontaminated using an Alconox®-based solution and triple rinsed with distilled water. Down-hole drilling equipment was decontaminated between each boring by rinsing with an Alconox®-based solution. Decontamination wastewater was placed into 55-gallon drums for off-site disposal.

4.9 Investigation-Derived Waste Management

Investigation derived waste generated during the RI included excess soil cuttings and purged groundwater. Soil cuttings were containerized in one labeled United Nations (UN)/ Department of Transportation (DOT)-approved 55-gallon steel drum. Purged groundwater and decontamination water were containerized in two labeled UN/DOT-approved 55-gallon steel drums. On September 8, 2022, the drums were transported by AARCO Environmental Services Corp. (AARCO), a licensed waste hauler, to the Dale Transfer Corp facility located in West Babylon, NY.

On February 2, 2026, purged groundwater and decontamination water generated during SRI No. 1 , containerized in one labeled UN/DOT-approved 55-gallon steel drum, and was transported by AARCO to the Dale Transfer Corp facility located in West Babylon, NY. Investigation derived waste was not generated during SRI No. 2.

5.0 FIELD OBSERVATIONS AND ANALYTICAL RESULTS

5.1 Geophysical Investigation Findings

NOVA identified anomalies suspected to be subsurface utilities. No anomalies consistent with USTs were identified during the geophysical investigations. Copies of the July 2022 and the March 2026 geophysical reports are included as Appendix C.

5.2 Geology and Hydrogeology

A summary of the geological and hydrogeologic observations made during the RI is provided below. A groundwater elevation contour map is included as Figure 5, subsurface profiles are included as figures 8A and 8B, and soil boring logs are provided as Appendix D.

5.2.1 Non-native Historical Fill

The site is underlain by a layer of non-native historical fill ranging from surface grade to between about 7 (SB20) and 19 feet bgs (SB01 and SB03). The layer is predominately characterized as tannish brown to black fine-grained sand with varying amounts of gravel, silt, clay, brick, asphalt, concrete, glass, coal, coal ash, slag, wood, mortar, ceramics, organics, and shell fragments.

5.2.2 Native Soil Layers

The non-native historical fill layer is underlain by tannish brown to dark-gray sand with varying amounts of silt, clay, gravel, mica, and shells.

5.2.3 Bedrock

The USGS "Bedrock and Engineering Geologic Maps of New York County and Parts Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" indicates that the bedrock consists of Ravenswood Garnodiorite and parts of the Hartland Formation overlain by glacial and fluvial soil deposits. Bedrock was not encountered during this RI or during previous environmental site investigations; however, bedrock was encountered during a geotechnical investigation at between about 55 to 108 feet below existing grade.

5.2.4 Hydrogeology

Groundwater was observed between 5.64 and 9.50 feet bgs and groundwater elevations ranged from el. 0.20 to 2.92 NAVD88 based on synoptic groundwater level measurements collected during the RI. During SRI No. 1, groundwater was observed at depths ranging from 7.75 to 9.90 feet bgs and groundwater elevations ranged from about el. -0.33 to 2.28. Groundwater flows to

the west towards the East River. Groundwater elevations are shown in Table 2. A map showing groundwater elevation contours from the RI and flow direction is provided as Figure 5.

5.3 Soil Findings

5.3.1 Field Observations

Petroleum-like impacts, evidenced by odors, staining, and/or PID readings above background levels, were observed in the borings summarized in the table below.

Boring	Field Observation	Depth of Observed Impacts (ft bgs)	Highest Recorded PID Reading (parts per million [ppm])
SB03	Petroleum-like odor	14 to 16	84.9 ppm at 14.5 ft bgs
SB10	Petroleum-like odor and staining	13 to 14	0.0 ppm at 14 ft bgs
SB17	Petroleum-like odor and staining	18 to 20	0.0 ppm at 19 ft bgs
SB18	Staining	13 to 15	0.0 ppm at 14 ft bgs
SB19	Petroleum-like odor and staining	13 to 15	0.0 ppm at 14 ft bgs

Petroleum- or chemical-like impacts were not observed in the other RI borings. No non-aqueous phase liquid (NAPL) observed in soil recovered from any completed soil boring. There were only isolated occurrences of petroleum-like odors and stained soil. No source of petroleum was identified. No free-phase petroleum liquid were noted in the soil boring logs. Petroleum-related field observations are likely attributed to non-native historical fill quality based on the depths at which the impacts were observed in the borings. The field observations could also be related to historical (i.e., pre-2005) industrial land uses. There is also no documented history of petroleum bulk storage or discharges of petroleum at the site. Petroleum-related VOCs were not detected above UU SCOs in samples collected from these depth intervals.

A petroleum spill (Spill No. 25-06379) was reported on October 15, 2025 on account of these field observations and analytical data during the Department's review of the BCP application.

5.3.2 Analytical Results

A summary of laboratory detections for RI soil samples, with comparisons to NYSDEC Part 375 UU, Protection of Groundwater (PGW), and RURR SCOs, and the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic is provided as Tables 3A and 3B. Soil sample results that exceed UU, PGW, and/or RURR SCOs for samples collected during the RI are shown on Figures 9A and 9B. The PGW SCOs are applicable for analytes that were detected and exceeded groundwater regulatory standards in groundwater samples. Laboratory analytical data reports are included as Appendix I.

The following sections present summaries of RI soil sample results that exceeded UU, PGW, and/or RURR SCOs and are organized by analytical parameter.

VOCs

One or more of five VOCs were detected in 17 soil samples collected from surface grade to depths of up to 20 feet bgs at concentrations above the UU and PGW SCOs. VOCs were not detected in soil above the RURR SCOs. The results are summarized in the following table (the number of detections above criteria follow each VOC in parentheses, and the detected concentrations that exceed PGW SCOs are underlined):

Analyte	UU SCOs (mg/kg)	PGW SCOs (mg/kg)	RURR SCOs (mg/kg)	Minimum Detected Concentration above SCOs (mg/kg)		Maximum Detected Concentration above SCOs (mg/kg)	
Acetone* (15)	0.03	0.03	100	0.032	SB02_0-2 SB03_16-18	0.22	SB10_13-15
Benzene (2)	0.06	0.06	3.7	0.21	SB22_0-2	2.9	SB04_0-2
Naphthalene (1)	12	12	100	39	SB14_6-8	39	SB14_6-8
Toluene (1)	0.7	0.7	100	5.1	SB04_0-2	5.1	SB04_0-2
Total Xylenes (2)	0.26	1.2	100	1	SB22_0-2	5.7	SB04_0-2

*Acetone was not present in laboratory batch blanks, but is a common laboratory contaminant and therefore, its presence in soil results is not likely representative of site conditions.

SVOCs

One or more of 19 SVOCs were detected in 40 soil samples collected from surface grade to depths of up to 15 feet bgs at concentrations above the UU, PGW, and/or RURR SCOs as summarized in the following table (the number of detections above criteria follow each SVOC in parentheses, the detected concentrations that exceed RURR SCOs are bolded, and detected concentrations that exceed PGW SCOs are underlined):

Analyte	UU SCOs (mg/kg)	PGW SCOs (mg/kg)	RURR SCOs (mg/kg)	Minimum Detected Concentration above SCOs (mg/kg)		Maximum Detected Concentration above SCOs (mg/kg)	
2-Methylphenol (o-Cresol) (3)	0.33	0.33	100	0.48	SB12_0-2	1.7	SB14_6-8
3 & 4 Methylphenol (m&p Cresol) (4)	0.33	0.33	100	0.77	SB12_5-7	4.7	SB14_6-8
Acenaphthene (3)	20	98	100	38	SB14_6-8	58	SB19_13-15
Anthracene (1)	100	1,000	100	**150**	SB12_0-2	**150**	SB12_0-2
Benzo(a)anthracene (28)	1	1	1.4	1.1	SB18_0-2	**230**	SB12_0-2

Pesticides

Three pesticides were detected at concentrations above the UU SCOs in 31 soil samples collected from surface grade to depths of up to 8 feet bgs, as summarized in the following table (the number of detections above criteria follow each pesticide in parentheses). Pesticides were not detected above PGW or RURR SCOs.

Analyte	UU SCOs (mg/kg)	PGW SCOs (mg/kg)	RURR SCOs (mg/kg)	Minimum Detected Concentration above SCOs (mg/kg)		Maximum Detected Concentration above SCOs (mg/kg)	
4,4'-DDD (29)	0.0033	14	5	0.00408	SB25_4-6	0.492	SB04_0-2

4,4'-DDT (20)	0.0033	135	3.8	0.00571	SB13_0-2	0.188	SB04_0-2 SB08_0-2

Herbicides

Herbicides were not detected in soil above regulatory criteria.

PCBs

Total PCB concentrations in 16 soil samples collected from surface grade to depths of up to 7 feet bgs were above the UU, PGW, and/or RURR SCOs as summarized in the following table (the number of detections above criteria follow the analyte in parentheses, the detected concentrations that exceed RURR SCOs are bolded and detected concentrations that exceed PGW SCOs are underlined):

Analyte	UU SCOs (mg/kg)	PGW SCOs (mg/kg)	RURR SCOs (mg/kg)	Minimum Detected Concentration above SCOs (mg/kg)		Maximum Detected Concentration above SCOs (mg/kg)	
Total PCBs (16)	0.1	3.2	1	0.114	SB15_0-2	**3.25**	SODUP03_080122

Metals

One or more of 11 metals were detected in 55 soil samples collected from surface grade to depths of up to 21 feet bgs at concentrations above the UU, PGW, and/or RURR SCOs as summarized in the following table (the number of detections above criteria follow each metal in

parentheses, the detected concentrations that exceed PGW SCOs are underlined, and the detected concentrations that exceed RURR SCOs are bolded):

Analyte	UU SCOs (mg/kg)	PGW SCOs (mg/kg)	RURR SCOs (mg/kg)	Minimum Detected Concentration above SCOs (mg/kg)		Maximum Detected Concentration above SCOs (mg/kg)

TCLP Metals

TCLP lead was detected in one soil sample (SB05_0-2) above the maximum concentration for the toxicity characteristic. The sample was collected from the non-native historical fill.

PFAS

PFAS were not detected in soil at concentrations exceeding the UU, PGW, and/or RURR SCOs.

1,4-Dioxane

1,4-Dioxane was not detected in soil at concentrations exceeding the UU, PGW, and/or RURR SCOs.

5.4 Groundwater Findings

5.4.1 Field Observations

Prior to sampling, monitoring well headspaces were measured with a PID. During the RI, monitoring well headspace PID measurements ranged from 0.0 to 0.3 ppm (highest reading in MW09 and MW12) during sampling. A sulfur-like odor was noted while sampling MW01 and a petroleum-like odor and a faint sheen were observed while sampling MW03. A sheen was also observed in MW06. Turbidity values in all 13 RI wells prior to sample collection ranged from 0 to 298 Nephelometric Turbidity Units (NTU). No free phase petroleum was observed in groundwater monitoring wells during the RI.

During SRI No. 1, no detectable monitoring well headspace PID readings were observed during sampling. A sulfur-like odor was noted while sampling MW02 and MW04. Turbidity values in all 12 SRI No. 1 wells prior to sample collection ranged from 2 to 831 NTU. No free phase petroleum was observed in groundwater monitoring wells during SRI No.1.

5.4.2 Analytical Results

A summary of laboratory detections for RI and SRI No. 1 groundwater samples, with comparisons to NYSDEC SGVs, is presented in Table 4. Groundwater sample results that exceeded NYSDEC SGVs for RI and SRI No. 1 samples are shown on Figure 10. Groundwater sampling logs are included in Appendix E and laboratory analytical data reports are included as Appendix I.

The following sections present summaries of RI groundwater sample results that exceeded NYSDEC SGVs and are organized by analytical parameter.

VOCs

VOCs were not detected in groundwater at concentrations exceeding the NYSDEC SGVs.

Total SVOCs

One or more of 6 total SVOCs were detected in 8 groundwater samples at concentrations above the NYSDEC SGVs as summarized in the following table (number of detections above criteria follow each total SVOC in parentheses):

Analyte	NYSDEC SGVs (micrograms per liter [µg/L])	Minimum Detected Concentration above NYSDEC SGVs (µg/L)		Maximum Detected Concentration above NYSDEC SGVs (µg/L)	
Benzo(a)anthracene (3)	0.002	0.03	MW12_080122	1.4	MW05_080222

Chrysene (1)	0.002	0.02	MW05_080222_FILTERED	0.02	MW05_080222_FILTERED
Indeno(1,2,3-cd)pyrene (1)	0.002	0.01	MW10_080522_FILTERED	0.01	MW10_080522_FILTERED
Phenol (13)	1	1.2	MW06_080322_FILTERED	46	MW04_080422_FILTERED

Total Metals

One or more of 5 total metals were detected in all groundwater samples at concentrations above the NYSDEC SGVs as summarized in the following table (number of detections above criteria follow each total metal in parentheses):

Analyte	NYSDEC SGVs (µg/L)	Minimum Detected Concentration above NYSDEC SGVs (µg/L)		Maximum Detected Concentration above NYSDEC SGVs (µg/L)	
Iron (13)	300	1,040	MW13_080322	48,200	MW06_080322
Lead (1)	25	32.89	MW10_080522	32.89	MW10_080522
Magnesium (8)	35,000	58,900	MW12_080122	964,000	MW13_080322
Manganese (11)	300	410.6	MW09_080122	4,344	MW07_080422
Sodium (13)	20,000	42,900	MW06_080322	8,020,000	MW13_080322

Dissolved Metals

One or more of 5 dissolved-phase metals were detected in all groundwater samples at concentrations above the NYSDEC SGVs as summarized in the following table (number of detections above criteria follow each dissolved-phase metal in parentheses):

Analyte	NYSDEC SGVs (µg/L)	Minimum Detected Concentration Above NYSDEC SGVs (µg/L)		Maximum Detected Concentration above NYDSEC SGVs (µg/L)	
Iron (10)	300	4,570	MW01_080522	44,000	MW06_080322
Magnesium (8)	35,000	59,000	MW12_080122	1,010,000	MW13_080322
Manganese (11)	300	393.6	MW09_080122	4,470	MW07_080422
Sodium (13)	20,000	42,100	MW06_080322	8,260,000	MW13_080322
Thallium (1)	0.5	3.2	MW13_080322	3.2	MW13_080322

Pesticides, Herbicides, and PCBs

Pesticides, herbicides, and PCBs were not detected in groundwater at concentrations exceeding the NYSDEC SGVs.

PFAS

PFAS concentrations in groundwater were compared to the NYSDEC SGVs. According to the April 2023 PFAS Guidance, groundwater samples should be compared to the human health criteria of 6.7 ng/L (ppt) for Perfluorooctanoic Acid (PFOA) and 2.7 ng/L (ppt) for Perfluorooctanesulfonic Acid (PFOS).

PFOA and PFOS were detected in groundwater samples above the NYSDEC SGVs in all monitoring wells during the RI, and in ten of the twelve monitoring wells during SRI No.1. Detected concentrations above the NYSDEC SGVs are summarized in the following tables (number of detections above criteria follow each PFAS in parentheses):

Analyte	NYSDEC SGVs (µg/L)	Minimum Detected Concentration above NYSDEC SGVs (µg/L)		Maximum Detected Concentration above NYSDEC SGVs (µg/L)	
RI					
PFOS (11)	0.0027	0.00273	MW03_080222	0.037	MW08_080422
PFOA (11)	0.0067	0.00726	MW12_080122	0.0675	MW06_080322
SRI No. 1					
PFOS (7)	0.0027	0.00286	MW03_011326	0.0207	MW08_011426
PFOA (10)	0.0067	0.00697	MW11_011326	0.0354	MW05_011226

1,4-Dioxane

1,4-Dioxane was not detected in groundwater at concentrations exceeding the NYSDEC SGVs.

5.5 Soil Vapor Findings

5.5.1 Field Observations

VOCs were not detected in post-purge PID measurements during the 2022 RI. Post-purge PID measurements ranged from 0.1 ppm in soil vapor sample SV19A_031926 to 0.9 ppm in SV20_031926 during SRI No. 2.

5.5.2 Analytical Results

Soil vapor sample results are summarized in Table 5 and shown on Figure 11.

Although no standards currently exist for soil vapor samples in New York State, the maximum VOC concentrations in soil vapor for the compounds addressed by the NYSDOH Guidance Decision Matrices for Sub-Slab Vapor and Indoor Air and Subsequent Updates (2017, updated 2024, referred to as the "NYSDOH Decision Matrices"), are presented in the table below:

Analyte	Maximum Detected Concentration (µg/m³)	
VOCS		
1,1,1-Trichloroethane	14.9	SV03_080222
1,1-Dichloroethane	2.02	SV02_080322
1,1-Dichloroethene	1.49	SV03_080222

Vinyl Chloride	1.73	SV04_072922

5.6 QA/QC Sample Results

Duplicate, field blank, emerging contaminant field blank, MS/MSD, and trip blank sample results are detailed in Table 6. Duplicate, field blank, and MS/MSD samples were generally collected at a frequency of about 1 per 20 primary soil and groundwater samples. Trip blank samples were generally collected for soil and groundwater at a frequency of 1 per day of VOC sampling. PFAS field blanks were generally collected at a frequency of 1 per day of emerging contaminant sampling. QA/QC sample results were evaluated as part of data validation.

5.7 Data Usability

New York Analytical Services Protocols Category B laboratory reports for the soil, groundwater, and soil vapor samples collected during the RI and SRIs were provided by Alpha and were reviewed by a Langan data validator. Completeness, defined as the percentage of analytical results that are judged to be valid, is 100% for each sample set. Copies of the DUSRs are provided in Appendix H.

5.8 Evaluation of Areas of Concern

This section discusses the results of the RI and presents new and/or redefined AOCs based on the field observations and the analytical results. Post-RI AOC locations are shown on Figure 12.

5.8.1 RI AOC 1: Historical Site Use and Non-native Historical Fill

During the RI, a non-native historical fill layer was encountered in all borings from site grade to depths ranging from about 7 to 19 feet bgs. Contaminants of concern associated with RI AOC 1 include petroleum-related VOCs, SVOCs, PCBs, and metals. Pesticides were detected at concentrations above the UU SCOs in non-native historical fill; however, the pesticide concentrations may be attributed to non-native historical fill quality and/or routine pesticide application during historical site use. AOC 1 also includes isolated field observations related to Spill No. 25-06379.

Findings Summary

RI AOC 1 is a site-wide AOC. Investigation of AOC 1 included the completion of all soil borings and monitoring wells.

Soil

Non-native historical fill was identified from surface grade to depths between about 7 and 19 feet bgs and is composed of tannish brown to black fine-grained sand with varying amounts of gravel, silt, clay, brick, asphalt, concrete, glass, coal, coal ash, slag, wood, mortar, ceramics, organics, and shell fragments. The non-native historical fill layer contains petroleum-related VOCs, SVOCs, PCBs, pesticides, and metals at concentrations above UU, PGW, and/or RURR SCOs.

Results of the on-site RI soil samples collected from within the non-native historical fill layer are summarized as follows:

- Four petroleum-related VOCs were detected at concentrations above the UU and PGW SCOs in six soil samples collected from the non-native historical fill layer. Petroleum-related VOC concentrations above the SCOs are likely associated with residual petroleum contamination in the non-native historical fill layer, which is substantiated by petroleum-like odors, staining, and/or PID readings above background that were observed in five soil borings in the western part of the site at depths ranging from about 13 to 20 feet bgs. There is no documented history of petroleum bulk storage or discharges of petroleum and geophysical anomalies that resemble USTs were not detected at the site, therefore, the residual petroleum-like contamination is likely attributed non-native historical fill quality and/or historical (i.e., pre-2005) industrial uses. While concentrations exceeded PGW SCOs, VOCs were not found in groundwater at concentrations exceeding the NYSDEC SGVs; this confirms that these areas are not a "source" to groundwater contamination, consistent with the analytical data. This also indicates that the PGW SCOs are not relevant for these constituents.
- Eighteen SVOCs were detected above UU, PGW, and/or RURR in 34 soil samples collected from the non-native historical fill layer. SVOC concentrations are likely attributed to non-native historical fill quality or historical industrial uses, including coal storage.
- Total PCB concentrations above the UU, PGW, and/or RURR SCOs were detected in 16 soil samples collected from the non-native historical fill layer. Total PCB concentrations are likely attributed to non-native historical fill quality or historical industrial uses.
- Ten metals were detected above the UU, PGW, and/or RURR SCOs in 53 soil samples collected from the non-native historical fill layer. The lead concentration in soil sample SB05_0-2 was also above the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic. Metal concentrations are likely attributed to non-native historical fill quality or historical industrial uses, including coal storage. Arsenic concentrations may also be attributed to historical site use as a lumber storage yard.

Groundwater

- Petroleum-related VOCs were not detected in groundwater; however, a petroleum-like odor was noted during sampling at MW03, and sheen was observed in MW03 and MW06. There is no documented history of petroleum bulk storage or discharges of petroleum at the site and geophysical anomalies resembling USTs were not identified. Therefore, the odor and sheens are likely attributed to non-native historical fill quality and/or historical (i.e., pre-2005) industrial uses; they could also be the result of organics derived from the site's former condition as marshland and/or iron bacteria. The lack of

petroleum-related VOCs in groundwater reflects the immobility of VOCs in non-native historical fill and the lack of impacts to groundwater resources.

- Six total SVOCs were detected above the NYSDEC SGVs in eight groundwater samples collected across the site and five dissolved-phase SVOCs were detected above the NYSDEC SGVs in thirteen groundwater samples collected across the site. SVOC concentrations (in both the total and dissolved state) are likely attributed to non-native historical fill quality.
- Total lead was detected above the NYSDEC SGV of 25 µg/L in groundwater collected from monitoring well MW10. Lead was not detected above the SGV in the filtered sample. The lead concentration is likely the result of suspended solids derived from non-native historical fill entrained in the groundwater sample.
- Four total metals (iron, magnesium, manganese, and sodium) and five dissolved-phase metals (iron, magnesium, manganese, sodium, and thallium) were detected above the NYSDEC SGVs in all groundwater samples collected across the site. Metals concentrations for iron, magnesium, manganese, sodium, and thallium (in both the total and dissolved state) are likely attributed to regional conditions. The presence of manganese is likely attributed to brackish groundwater conditions, is considered naturally occurring, and is related to the proximity of the site to the East River and Newtown Creek.

Soil Vapor

Several petroleum-related VOCs were detected in vapor samples collected across the site during the RI and SRI No. 2. The six petroleum-related VOCs detected at notable concentrations (benzene [max. 233 ug/m^3], cyclohexane [max. 187 ug/m^3], m,p-xylene [max. 222 ug/m^3], n-heptane [max. 2,860 ug/m^3], n-hexane [max. 2,460 ug/m^3], and propylene [max. 806 ug/m^3]) were detected in one or more of the 12 soil vapor sample locations in the western part and along the southern boundary of the site, and in one or more of the seven off-site soil vapor sample locations. In most on-site sample locations where petroleum-related VOCs were detected in soil vapor, petroleum-related VOCs were also detected in on-site soil samples. Therefore, the petroleum-related VOC concentrations in soil vapor are likely attributed to residual petroleum contamination in the non-native historical fill layer as there is no documented history of petroleum bulk storage or spills at the site. Based on the concentrations of petroleum-related VOCs in soil vapor in the off-site samples from the southern-adjoining property (collected/analyzed as part of SRI No. 2) and northern-adjoining property (collected/analyzed as part of the Greenpoint Landing Parcel D NYCOER VCP No. 19CVCP053K), the most noteworthy concentrations of petroleum-related VOCs in soil vapor are confined to the site and appear not to be migrating off-site.

RI AOC 1 Conclusions

Based on the analytical results and field observations, non-native historical fill was identified from surface grade to depths between about 7 and 19 feet bgs.

Contaminants commonly associated with non-native historical fill, including SVOCs, PCBs, pesticides, and metals were detected at concentrations above UU, PGW, and RURR SCOs and above the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic (lead only) in soil samples collected from the non-native historical fill layer and these contaminants are likely attributed to non-native historical fill quality and/or historical industrial uses, including coal and lumber storage.

Petroleum-related VOCs detected in soil and soil vapor and petroleum-related field observations in soil and groundwater are likely attributed to residual petroleum contamination from an unidentified source. There is no documented history of petroleum bulk storage or spills at the site and geophysical anomalies indicative of a UST were not identified, therefore, the residual petroleum contamination is likely attributed to an unidentified site source.

Lead was identified in non-native historical fill in soil sample SB05_0-2 above the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic. Additional delineation sampling in the vicinity of SB05 is anticipated in conjunction with the remedy. The lead concentration identified above regulatory criteria in groundwater at MW10 is likely the result of suspended solids derived from non-native historical fill entrained in the groundwater sample. The lead concentration in MW10 is not likely the result of lead concentration in soil sample SB05_0-2 that is above the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic, because SB05 is about 200 feet away from MW10 and is located cross-gradient and the sample was collected below impervious site cover. Other metals identified in groundwater above the regulatory criteria are likely attributed to regional conditions.

5.8.2 RI AOC 2: CVOC-Impacted Soil Vapor: Carbon Tetrachloride

During the 2022 RI, carbon tetrachloride was detected at concentrations ranging from 170 µg/m^3 and 4,230 µg/m^3 in four soil vapor sample locations in the western part of the site. This is likely attributed to an unknown on-site source. Other chlorinated volatile organic compounds (CVOCs) were detected in soil and groundwater, but concentrations were below the applicable regulatory criteria.

In response to a March 11, 2026 NYSDEC request, Langan performed SRI No. 2 to collect additional soil vapor samples to delineate the extents of carbon tetrachloride in soil vapor in the southwestern part of the site and to determine if carbon tetrachloride-impacted soil vapor is migrating off-site. Based on the results of the delineation, carbon tetrachloride was not detected in any off-site samples and does not appear to be migrating off-site.

5.8.3 RI AOC 3: CVOC-Impacted Soil Vapor: PCE

During SRI No. 2, PCE was detected in all on-site samples along the southern site boundary at concentrations ranging from 551 µg/m^3 to 1,110 µg/m^3 and all off-site soil vapor samples at concentrations ranging from 52 µg/m^3 to 895 µg/m^3. The full extent of PCE in soil vapor off-site will be delineated at a later date. The source of the PCE detected in on-site and off-site soil vapor is presently unknown; however, PCE was not detected in on-site groundwater nor was it detected in on-site soil above UU SCOs. The three detections of PCE in soil samples (below UU SCOs) from the site are not co-located with the soil vapor samples collected along the southern site boundary.

6.0 QUALITATIVE HUMAN AND FISH/WILDLIFE EXPOSURE ASSESSMENT

Human health exposure risk was evaluated for current and future site and off-site conditions, in accordance with the May 2010 NYSDEC Final DER-10 Technical Guidance for Site Investigation and Remediation. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, NYSDEC DER-10 requires an on-site and off-site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. According to the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, an FWRIA was completed for the site and is included in Appendix J.

6.1 Current Conditions

The site encompasses about 163,000 square-feet (±3.737 acres) and is currently a vacant parcel of land. The site footprint is covered by impervious asphalt pavement.

6.2 Post Redevelopment Conditions

As currently conceived, the project would include construction of three new residential buildings named C1, C2, and C3:

- The C1 building will be a 451-foot tall (40-story plus bulkhead) high-rise residential tower with a 10-story podium and a partial cellar level for back-of-house space, storage, and a swimming pool.
- The C2 building will be a 348-foot-tall (30-story plus bulkhead) residential tower with a 3-story podium and two full-cellar levels used for vehicle parking, tenant storage, and/or building systems/maintenance.
- The C3 building will be an 87-foot tall, 9-story mixed-use residential and commercial building with a full-cellar level used for vehicle parking, amenities, tenant storage, and/or building systems/maintenance.

The cellar levels of Buildings C2 and C3 will be connected. The residential units in the C1, C2, and C3 buildings will be a mix of market-rate and affordable units under Affordable NY and inclusionary housing programs (overall about 70% market rate and 30% affordable). There will be new public access sidewalks and roadways along Freeman Street and a private internal connector road that will transect the site in a north-south direction to the adjoining cul-de-sac at the western end of Eagle Street. The sidewalks and roadways will include street lighting, trees, and plantings. The shoreline along the East River will be stabilized and the waterfront will be developed into a public park/esplanade, including about 52,240-square-feet of public waterfront, shore public walkway, upland connection, and view corridor, that will be transferred to the City of New York upon completion. Shoreline stabilization also includes installation of a 450 linear-foot

steel bulkhead along the western edge of the BCP boundary. New utilities, including water, sanitary and storm sewers, gas, electricity, telecommunications, will be constructed to service the new buildings.

6.3 Conceptual Site Model

A conceptual site model (CSM) was developed based on the findings of the RIs and previous investigations to produce a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways.

6.3.1 Potential Sources of Contamination

Potential sources of contamination include non-native historical fill, historical site use, an unknown on-site source of carbon tetrachloride contamination in soil vapor (carbon tetrachloride was not identified in groundwater or soil), and an unknown source of PCE contamination in soil vapor (PCE was not detected in on-site groundwater nor was it was detected in on-site soil above UU SCOs).

Non-native Historical Fill - The site-wide presence of non-native historical fill was established as a source of petroleum-related VOCs, SVOCs, PCBs, and metals in soil, including detections of hazardous lead concentrations, a source of SVOCs in groundwater, and a source of petroleum-related VOCs in soil vapor.

Prior Site Use - Historical site use as a coal and lumber storage yard was established as a source of SVOCs and/or metals in soil.

Unknown Source of Carbon Tetrachloride – Carbon tetrachloride concentrations in soil vapor are likely attributed to an unknown on-site source.

Unknown Source of PCE – The source of PCE in soil vapor is presently unknown.

6.3.2 Exposure Media

Impacted media include soil, groundwater, and soil vapor. Soil contains VOCs, SVOCs, pesticides, PCBs, and metals at concentrations above regulatory standards. SVOCs, metals, and PFAS were identified in groundwater above regulatory criteria. VOCs, including petroleum-related VOCs and CVOCs, were detected in soil vapor at the site.

6.3.3 Receptor Populations

Site access is currently limited to authorized personnel. Under future construction conditions, human receptors may include construction and remediation workers, authorized guests, and the public adjacent to the site. Under future use conditions, human receptors include residents, visitors, and the public adjacent to the site.

6.4 Potential Exposure Pathways – On-Site

6.4.1 Current Conditions

The site footprint is covered by impervious asphalt pavement; therefore, exposure to contaminated soil/fill and soil vapor is not anticipated except through cracks or holes in asphalt via dermal absorption, inhalation, and/or ingestion pathways. Groundwater in this area of New York City is not used as a potable water source.

There is a potential exposure pathway to contaminated soil/fill, groundwater, and soil vapor during site investigation through dermal absorption, inhalation, and/or ingestion. Activity is limited to trained investigation personnel and is performed under a site-specific HASP with provisions to minimize exposure risk.

6.4.2 Construction/Remediation Condition

Construction and remediation may result in potential exposures to contaminated soil, groundwater, or soil vapor. The implementation of a HASP and a CAMP, as well as vapor and dust suppression techniques, will limit the exposure pathways presented by potential dermal absorption, ingestion, and inhalation.

6.4.3 Proposed Future Conditions

Exposure pathways to residual soil contamination will be incomplete unless the composite cover system is disturbed. The potential for soil vapor exposure risk can be mitigated through various vapor mitigation methods such as positive pressure HVAC systems, active depressurization systems, and/or installation of a vapor barrier beneath the building slabs.

There is no pathway for ingesting groundwater since the site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate. The City of New York Administrative Code prohibits the use of groundwater for drinking water and other potable purposes. Moreover, the site will have an easement/deed restriction for groundwater use to prevent exposure to any residual contamination remaining after the completion of the remedy.

6.5 Potential Exposure Pathways – Off-Site

6.5.1 Current Conditions

The site is covered with impervious asphalt pavement; thus, it is unlikely that contaminated site soil will be exposed or disturbed and migrate off-site in particulate form. Contaminated soil vapor that may migrate through concrete and asphalt cracks would be expected to dissipate readily in ambient air and not present an exposure risk to off-site receptors. While groundwater contaminants may migrate off-site, the contaminants and their concentrations are consistent with background/regional conditions. Moreover, groundwater in the surrounding area is not used as a potable water source, and therefore no complete exposure pathway exists.

6.5.2 Construction/Remediation Condition

Contaminated soil has the potential to be transported off-site by wind in the form of dust or by the tires of vehicles or equipment leaving the site during development and create an exposure risk to the public adjacent to the site during construction. Contaminated soil vapor would be expected to dissipate readily in ambient air and not present an exposure risk to off-site receptors. Nonetheless, air monitoring will be conducted for particulates (i.e., dust) and VOCs during all intrusive activities as part of a CAMP. Dust and/or vapor suppression techniques will be employed to limit the potential for off-site migration of soil and vapors. Vehicle tires and undercarriages will be washed as necessary prior to leaving the site to prevent tracking soil off-site. A soil erosion/sediment control plan will be implemented during construction to control off-site migration of soil.

Dewatering will be required during construction. Extracted groundwater will be containerized and treated before it is discharged to the East River under an individual NYSDEC State Pollutant Discharge Elimination System permit limiting any potential complete exposure pathways.

6.5.3 Proposed Future Conditions

The potential off-site migration of site contaminants in soil, groundwater, and soil vapor is not expected to result in a complete exposure pathway for future conditions because the site will be covered with a building, a capping system, or a vapor mitigation system that will prevent exposure to off-site receptors of soil and soil vapor. Further, groundwater in the area is not used as a potable water source; therefore, no complete exposure pathway to impacted groundwater would exist in the future condition.

6.6 Evaluation of Human Health Exposure

Based on the CSM and the review of environmental data, complete on-site and off-site exposure pathways appear to be present, in the absence of institutional controls (IC) and engineering controls (EC), under current, construction and remediation, and future conditions. The complete exposure pathways indicate there is a risk of exposure to humans from site contaminants via exposure to soil, groundwater, and potentially to soil vapor if ICs and ECs are not implemented.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the site is provided below.

6.6.1 Current Conditions

Contaminant sources include 1) non-native historical fill with varying levels of petroleum-related VOCs, SVOCs, PCBs, and metals; 2) historical site uses that may have contributed to the presence of SVOCs and metals in non-native historical fill; and 3) an unidentified on-site source that contributed to CVOC contamination in soil vapor.

Contaminant release and transport mechanisms include contaminated soil transported as dust (dermal, ingestion, inhalation), contaminated groundwater flow (dermal contact), and volatilization of contaminants from the soil and groundwater matrices to the soil vapor phase (inhalation).

Under current conditions, the likelihood of soil, groundwater, or soil vapor exposure to on-site and off-site humans is limited, as the site is capped with impervious surface cover and no buildings are currently present on-site. Exposure to contaminants in soil, groundwater, and soil vapor via dermal contact, ingestion, or inhalation during site investigation is minimized, as these activities would occur under a HASP. In addition, groundwater is not used as a potable water source and therefore no complete exposure pathway to groundwater exists.

6.6.2 Remedial Construction Activities

During development and remediation, points of exposure will include disturbed and exposed non-native historical fill during excavation and dust and organic vapors generated during excavation. Potential routes of exposure will include ingestion and dermal absorption of non-native historical fill, inhalation of organic vapors arising from contaminated soil, and inhalation of dust derived from non-native historical fill. The receptor population includes construction and remediation workers and, to a lesser extent, the public adjacent to the site.

The potential for completed exposure pathways is present since all five elements exist; however, the risk will be minimized by the implementation of appropriate health and safety measures, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, cleaning truck undercarriages before they leave the site to prevent off-site soil tracking, maintaining site security, and site workers wearing the appropriate personal protective equipment (PPE).

In accordance with a Remedial Action Work Plan (RAWP), which will include a Construction Health and Safety Plan (CHASP), a Soil/Fill Management Plan (SFMP), and a CAMP, measures such as conducting an air-monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, maintaining a secure construction entrance, proper housekeeping, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented to prevent completion of these potential exposure pathways to both on- and off-site receptor populations.

6.6.3 Proposed Future Conditions

After construction, residual contamination will likely remain on-site in soil, groundwater, and soil vapor. ICs and ECs will be included as elements of the site remedy, including an engineered site-wide composite cover system and an EC along the southern site boundary. These controls will be maintained pursuant to a Site Management Plan (SMP) and will preclude exposure to on- and off-site receptor populations.

6.6.4 Human Health Exposure Assessment Conclusions

1. Under current conditions, there is a marginal risk for exposure. The primary exposure pathways are for dermal contact, ingestion, and inhalation of soil, soil vapor, or groundwater by site investigation and remediation workers. The exposure risks would be avoided or minimized by following the appropriate health and safety measures outlined in the site-specific HASP during ground-intrusive activities.
2. In the absence of a HASP and a CAMP, there is a moderate risk of exposure during construction and remediation. The primary exposure pathways would be:
    a. Dermal contact, ingestion, and inhalation of contaminated soil, groundwater, and soil vapor by construction workers.
    b. Dermal contact, ingestion, and inhalation of soil (airborne dust) and organic vapors by the community in the vicinity of the site.

    These exposure risks can be avoided or minimized by performing community air monitoring and by following the appropriate health and safety, vapor and dust suppression, and site security measures outlined in a site-specific HASP. As needed, extracted groundwater from construction dewatering will be pretreated and discharged off-site in accordance with appropriate permits.
3. The existence of a complete exposure pathway for site contaminants to human receptors during proposed future conditions is unlikely, as ECs and ICs will be implemented pursuant to the proposed remedy. Regional groundwater is not used as a potable water source in this part of New York City. The construction of ECs including a site cover system and/or any necessary vapor mitigation systems will mitigate the exposure pathway to contaminants in soil, groundwater, and/or soil vapor.
4. Regional groundwater is not used as potable water in Kings County so there is no complete exposure to regional groundwater contaminants.
5. Although it is possible (though unlikely) that complete exposure pathways exist for the migration of site contaminants to off-site human receptors for current, construction/remediation phase, or future conditions, monitoring and control measures have been and will continue to be used during investigation and construction to prevent completion of this pathway. Under future conditions, the site will be remediated, and ICs and ECs will be implemented to prevent completion of this pathway.

7.0 NATURE AND EXTENT OF CONTAMINATION

This section evaluates the nature and extent of soil, groundwater, and soil vapor contamination as derived from a combination of field observations and analytical data that were discussed in Section 5.0.

7.1 Soil Contamination

Soil contamination, characterized by field observations and soil sample analytical results exceeding UU, PGW, and/or RURR SCOs, is attributed to the presence of non-native historical fill and/or historical (i.e., pre-2005) industrial uses with the exception of acetone concentrations in soil. Acetone is a common laboratory contaminant and the presence of acetone in soil samples is unlikely to be related to non-native historical fill quality.

7.1.1 Historical Site Use and Non-native Historical Fill

Non-native historical fill, predominantly consisting of tannish brown to black fine-grained sand with varying amounts of gravel, silt, clay, brick, asphalt, concrete, glass, coal, coal ash, slag, wood, mortar, ceramics, organics, and shell fragments, was encountered from site grade to depths ranging between about 7 and 19 feet bgs. The non-native historical fill layer contains VOCs, SVOCs, pesticides, PCBs, and metals at concentrations above UU, PGW, and/or RURR SCOs and the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic and these contaminants are likely attributed to non-native historical fill quality or historical (i.e., pre-2005) industrial uses, including coal and lumber storage as a lumber storage yard. Petroleum-related VOCs detected in soil and petroleum-related field observations in soil are likely attributed non-native historical fill quality and/or historical (i.e., pre-2005) industrial use. There is no documented history of petroleum bulk storage or discharges of petroleum at the site and geophysical anomalies indicative of a UST were not identified. Petroleum–related VOCs were not identified in groundwater above the NYSDEC SGVs and therefore the petroleum-related VOCs detected in soil are not viewed as an on-site source.

A petroleum spill (Spill No. 25-06379) was reported on October 15, 2025 on account of field observations and the detection of petroleum-related VOCs in soil from the RI during the NYSDEC review of the BCP application for this site.

7.2 Groundwater Contamination

Groundwater contamination, characterized by field observations and groundwater sample analytical results exceeding NYSDEC SGVs, is attributed to non-native historical fill quality, historical (i.e., pre-2005) industrial uses, including coal and lumber storage, and/or regional groundwater conditions.

7.2.1 Petroleum-Impacted Groundwater

Petroleum-related VOCs were not detected in groundwater; however, a petroleum odor was noted during sampling at MW03, and sheen was observed in MW03 and MW06. No free phase petroleum was observed in groundwater monitoring wells. The field observations are most likely a result of non-native historical fill and/or historical (i.e., pre-2005) industrial use; it could also be the result of organics derived from the site's former condition as marshland and/or iron bacteria (note: no petroleum-related VOCs were identified in groundwater in the wells where the odors and sheens were observed). There is no documented history of petroleum bulk storage or discharges of petroleum at the site and geophysical anomalies indicative of a UST were not identified; therefore, the physical indicators of residual petroleum contamination are likely attributed to non-native historical fill quality and/or historical (i.e., pre-2005) industrial uses. The lack of petroleum-related VOCs in groundwater reflects the immobility of VOCs in non-native historical fill and the lack of impacts to groundwater resources.

7.2.2 SVOCs in Groundwater

Total and dissolved-phase SVOCs were detected above the NYSDEC SGVs in all groundwater monitoring wells across the site. SVOC concentrations (in both the total and dissolved-phase state) are likely attributed to non-native historical fill quality or historical (i.e., pre-2005) industrial uses, including coal storage.

7.2.3 Metals-impacted Groundwater

Five total metals (iron, lead, magnesium, manganese, and sodium) and five dissolved-phase metals (iron, magnesium, manganese, sodium, and thallium) were detected above the NYSDEC SGVs in all groundwater monitoring wells across the site. Total lead was detected above the NYSDEC SGV of 25 µg/L in groundwater collected from monitoring well MW10. The total lead concentration in groundwater sample MW10_080522 is likely the result of suspended solids derived from non-native historical fill entrained in the groundwater sample. Both total and dissolved-phase iron, magnesium, manganese, sodium, and thallium may be attributed to regional conditions. The presence of manganese is attributed to brackish groundwater conditions, is considered naturally occurring, and is related to the proximity of the site to the East River and Newtown Creek.

7.2.4 PFAS in Groundwater

PFOA and PFOS were detected above the NYSDEC SGVs in all groundwater samples collected for the RI and ten of the twelve groundwater samples collected for SRI No. 1. No historical uses or on-site source of PFOA or PFOS in soil was identified; therefore, the presence of PFOA and PFOS in groundwater is likely attributed to regional groundwater quality.

7.3 Soil Vapor Contamination

Several petroleum-related VOCs were detected in vapor samples collected across the site during the RI and SRI No. 2. The six petroleum-related VOCs detected at notable concentrations (benzene [max. 233 ug/m^3], cyclohexane [max. 187 ug/m^3], m,p-xylene [max. 222 ug/m^3], n-heptane [max. 2,860 ug/m^3], n-hexane [max. 2,460 ug/m^3], and propylene [max. 806 ug/m^3]) were detected in one or more of the 12 soil vapor sample locations in the western part and along the southern boundary of the site, and in one or more of the seven off-site soil vapor sample locations. In most on-site sample locations where petroleum-related VOCs were detected in soil vapor, petroleum-related VOCs were also detected in on-site nearby soil samples. Therefore, the petroleum-related VOC concentrations in soil vapor are likely attributed to residual petroleum contamination in the non-native historical fill layer as there is no documented history of petroleum bulk storage or spills at the site. Based on the concentrations of petroleum-related VOCs in soil vapor in the off-site samples from the southern-adjoining property (collected/analyzed as part of SRI No. 2) and northern-adjoining property (collected/analyzed as part of the Greenpoint Landing Parcel D NYCOER VCP No. 19CVCP053K), the most noteworthy concentrations of petroleum-related VOCs in soil vapor are confined to the site and appear not to be migrating off-site.

During the 2022 RI, carbon tetrachloride was detected at concentrations ranging from 170 micrograms per cubic meter (µg/m^3) to 4,230 µg/m^3 in four soil vapor sample locations in the western part of the site. During SRI No. 2, carbon tetrachloride was detected at concentrations between 8.8 µg/m^3 and 31 µg/m^3 along the southern site boundary; however, carbon tetrachloride was not detected off-site and it was concluded that carbon tetrachloride appears to have not migrated off-site. The carbon tetrachloride identified on-site may be attributed to an unknown on-site source. The results of the 2026 delineation confirm that carbon tetrachloride in soil vapor appears to have not migrated off-site.

PCE was detected in all on-site samples along the southern site boundary at concentrations ranging from 551 µg/m^3 to 1,110 µg/m^3 and in all off-site soil vapor samples at concentrations ranging from 52 µg/m^3 to 895 µg/m^3. The full extent of PCE in soil vapor off-site will be delineated at a later date. The source of the PCE detected in on-site and off-site soil vapor is presently unknown; however, PCE was not detected in on-site groundwater nor was it was detected in on-site soil above UU SCOs. The three detections of PCE in soil samples (below UU SCOs) from the site are not co-located with the soil vapor samples collected along the southern site boundary. Other CVOCs were detected in soil and groundwater, but concentrations were below the applicable regulatory criteria.

8.0 CONCLUSIONS

The RI was completed in August 2022. The findings summarized herein are based on both qualitative data (field observations and instrumental readings) and soil, groundwater, and vapor laboratory analytical results. Findings and conclusions are as follows:

1. Stratigraphy: A non-native historical fill layer was observed from surface grade to depths ranging from about 7 to 19 feet bgs and consisted of tannish brown to black fine-grained sand with varying amounts of gravel, silt, clay, brick, asphalt, concrete, glass, coal, coal ash, slag, wood, mortar, ceramics, organics, and shell fragments. The non-native historical fill layer is underlain by native soil consisting of tannish brown to dark-gray sand with varying amounts of silt, clay, gravel, mica, and shells. Bedrock was not encountered during the RI or previous environmental investigations conducted at the site; however, bedrock was encountered during a geotechnical investigation at about 55 to 108 feet below existing grade.

2. Hydrogeology: During the RI, groundwater was encountered between 5.64 and 9.50 feet bgs and groundwater elevations ranged from el. 0.20 to 2.92 NAVD88 in thirteen monitoring wells installed across the site. During SRI No.1, groundwater was observed at depths ranging from 7.75 to 9.90 feet bgs and groundwater elevations ranged from about el. -0.33 to 2.28 NAVD88 in eleven monitoring wells. Groundwater flows to the west towards the East River.

3. Non-native historical fill: Contaminants commonly associated with non-native historical fill, including VOCs, SVOCs, PCBs, pesticides, and metals, were detected at concentrations above UU, PGW, and/or RURR SCOs and lead was detected above the USEPA Maximum Concentration of Contaminants for the Toxicity Characteristic in soil samples collected from the non-native historical fill layer. These contaminants are likely attributed to non-native historical fill quality and/or historical (i.e., pre-2005) industrial uses, including coal and lumber storage.

   Hazardous concentrations of lead were identified in non-native historical fill in soil sample SB05_0-2. Additional delineation sampling in the vicinity of SB05 would be completed in conjunction with the remedy.

   Petroleum-related VOCs detected in soil and soil vapor and petroleum-related field observations in soil and groundwater are likely attributed to non-native historical fill quality and/or historical (i.e., pre-2005) industrial uses. There is no documented history of petroleum bulk storage or discharges of petroleum at the site and geophysical anomalies associated with USTs were not identified.

4. Metals in Groundwater: Total and dissolved-phase metals were detected above the NYSDEC SGVs in all groundwater monitoring wells across the site. The total lead

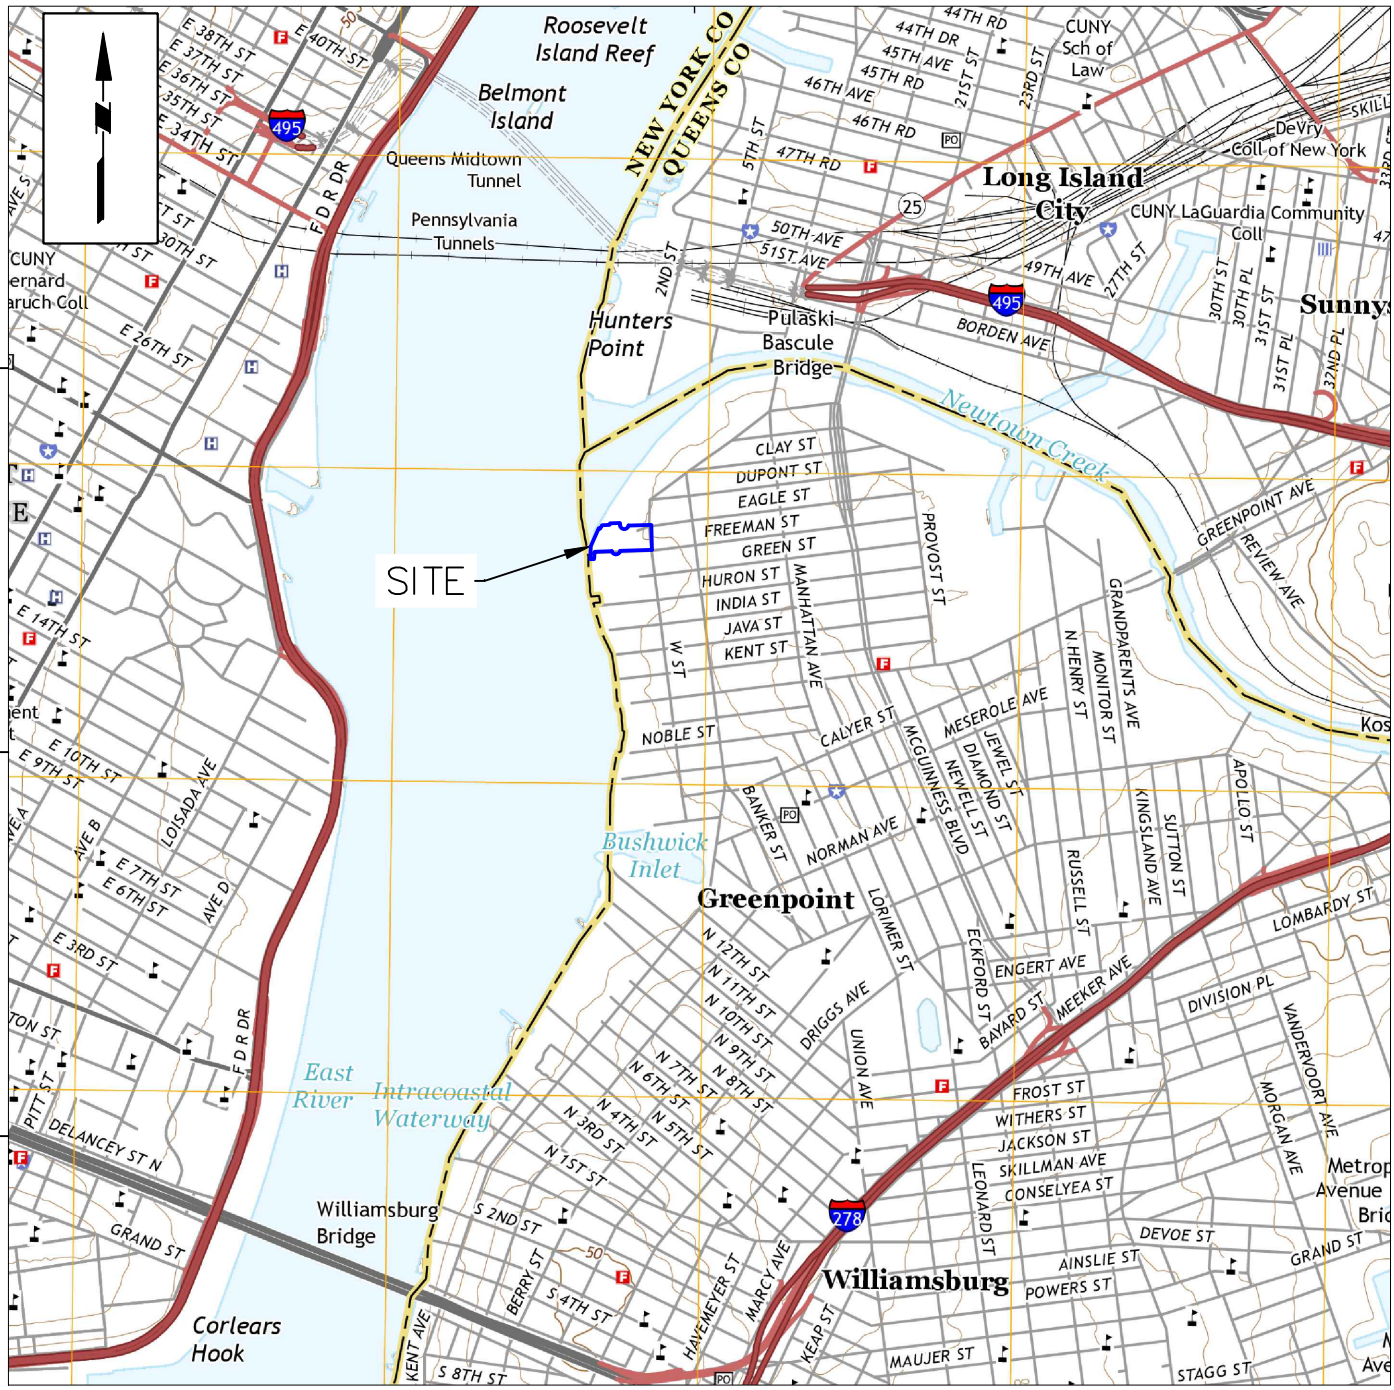
concentration in groundwater sample MW10_080522 is likely the result of suspended solids derived from non-native historical fill entrained in the groundwater sample. Both total and dissolved-phase iron, magnesium, manganese, sodium, and thallium may be attributed to regional conditions. The presence of manganese is attributed to brackish groundwater conditions, is considered naturally occurring, and is related to the proximity of the site to the East River and Newtown Creek.

5. PFAS in Groundwater: PFOA and PFOS were detected above the NYSDEC SGVs in all groundwater samples during the RI and ten of the twelve groundwater samples during SRI No. 1. No historical uses or on-site source of PFOA or PFOS was identified; therefore, the presence of PFOA and PFOS is likely attributed to regional groundwater quality.

6. CVOC contamination in Soil Vapor: During the 2022 RI, carbon tetrachloride was detected at concentrations ranging from 170 micrograms per cubic meter (µg/m^3) to 4,230 µg/m^3 in four soil vapor sample locations in the western part of the site. During SRI No. 2, carbon tetrachloride was detected at concentrations between 8.8 µg/m^3 and 31 µg/m^3 along the southern site boundary; however, carbon tetrachloride was not detected in off-site locations and it was concluded that carbon tetrachloride appears to not be migrating off-site. The carbon tetrachloride identified on-site is likely attributed to an unknown on-site source.

   During SRI No. 2, PCE was detected in all on-site soil vapor samples along the southern site boundary at concentrations ranging from 551 µg/m^3 to 1,110 µg/m^3 and all off-site soil vapor samples at concentrations ranging from 52 µg/m^3 to 895 µg/m^3. The full extent of PCE in off-site soil vapor will be delineated at a later date. The source of the PCE detected in on-site and off-site soil vapor is presently unknown; however, PCE was not detected in on-site groundwater nor was it detected in on-site soil above UU SCOs.

   Other CVOCs were detected in soil and groundwater on-site at concentrations below the applicable regulatory criteria.



7. FWRIA: The preliminary FWRIA identified the East River as a sensitive natural resource in the area surrounding the site. However, soil contamination at the site is not expected to affect the East River because of the proposed remediation and site redevelopment plans. Based on a review of groundwater data, constituents in groundwater related to historical site operations are not migrating to the East River.

8. Sufficient analytical data were gathered during the RI to establish site-specific soil cleanup levels and to develop a remedy for the site. Based on the RIs, off-site investigation or remediation may be required. The final remedy will be described and evaluated in a RAWP to be prepared in accordance with BCP guidelines. The remedy will address contaminants in non-native historical fill and CVOCs in soil vapor.

BLOCK 2472, LOT 21

- LUMBER STORAGE (LATE 1800S TO 1980)
- CONSTRUCTION MATERIALS, HEAVY CONSTRUCTION EQUIPMENT, AND MACHINERY STORAGE (1980s TO 2011)
- SITE REMEDIATED UNDER THE NEW YORK CITY OFFICE OF ENVIRONMENTAL REMEDIATION VOLUNTEER CLEANUP PROGRAM (2019 TO 2022)
- MIXED RESIDENTIAL AND COMMERCIAL BUILDING (2022 TO PRESENT)

BLOCK 2503, LOT 1

- VENEER FACTORY, TIMBER STORAGE (1887)
- MACHINE SHOP (1887–1916)
- RESIDENTIAL BUILDINGS (1887–2007)
- TANKS AND COAL SHED, WOOD WORKING (1905)
- SOAP WORKS (1905–1916)
- BARREL SHED, GOTHAM CAN CO. (1916)
- LAUNDRY AND LINEN SUPPLY, GARAGE (1942–1988)
- SHIPPING COMPANY (1951–2007)

BLOCK 2502, PART OF (P/O) LOT 1 AND P/O LOT 5, AND BLOCK 2510, P/O LOT 1 AND P/O LOT 100

- COAL, LUMBER, AND MASONRY MATERIAL STORAGE (1800s TO 2000)
- MANUFACTURING AND PACKING FACILITY (1916)
- NEWTOWN CREEK CORPORATION (1922)
- NEWTOWN CREEK COAL AND COKE CO. INC. (1928)
- LUMBER STORAGE (EARLY 1950s TO CIRCA 2000)
- STORAGE OF CONSTRUCTION MATERIALS, EQUIPMENT, AND REPOSSESSED VEHICLES (CIRCA 2000)

BLOCK 2510, LOT 1

- NEW YORK DYE–WOOD EXTRACT AND CHEMICAL COMPANY (1887)
- NEW YORK BOSTON DYE WOOD WORKS (1905)
- NEW YORK QUEBRACHO EXTRACT CO. INC. (1916)
- LUMBER STORAGE (1942–2007)

- APPROXIMATE SITE BOUNDARY
- MW01/SB01 (0.43') — APPROXIMATE LOCATION OF SOIL BORING/ PERMANENT GROUNDWATER MONITORING WELL (GROUNDWATER ELEVATION)
- 2.6 — GROUNDWATER CONTOUR ELEVATION
- INFERRED GROUNDWATER FLOW DIRECTION

NOTES:

1. BASE MAP IS TAKEN FROM "FINAL SURVEY', FIGURE FS103, PREPARED BY LANGAN, DATED FEBRUARY 26, 2025.
2. ALL SAMPLE LOCATIONS ARE APPROXIMATE.
3. ELEVATIONS SHOWN IN THE FIGURE ARE BASED ON NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88), WHICH IS APPROXIMATELY 1.1 FEET ABOVE MEAN SEA LEVEL DATUM AT SANDY HOOK, NEW JERSEY AS DEFINED BY THE UNITED STATES GEOLOGIC SURVEY (USGS NGVD 1929).
4. MONITORING WELL TOP OF CASING ELEVATIONS WERE SURVEYED BY LANGAN ON AUGUST 05, 2022.
5. GROUNDWATER ELEVATIONS ARE BASED ON A SYNOPTIC GROUNDWATER GAUGING EVENT PERFORMED BY LANGAN ON AUGUST 05, 2022.
6. GROUNDWATER CONTOUR INTERVAL IS 0.4 FEET.

WARNING: IT IS A VIOLATION OF THE NYS EDUCATION LAW ARTICLE 145 FOR ANY PERSON, UNLESS HE IS ACTING UNDER THE DIRECTION OF A LICENSED PROFESSIONAL ENGINEER, LAND SURVEYOR OR GEOLOGIST, TO ALTER THIS ITEM IN ANY WAY.

LEGEND:

- APPROXIMATE SITE BOUNDARY
- SB16 — APPROXIMATE LOCATION OF SOIL BORING
- MW01/SB01 — APPROXIMATE LOCATION OF SOIL BORING/ PERMANENT GROUNDWATER MONITORING WELL

Analyte	RCRA Characteristics of Hazardous Waste
Metals	
Lead	5

Exceedance Summary:

10 - Result exceeds the RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic

NOTES:

1. BASE MAP IS TAKEN FROM "FINAL SURVEY', FIGURE FS103, PREPARED BY LANGAN, DATED FEBRUARY 26, 2025.
2. ALL LOCATIONS ARE APPROXIMATE.
3. SOIL SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE TITLE 6 NEW YORK CODES RULES AND REGULATIONS (NYCRR) PART 371.3 AND 40 CFR 261 SUBPART C AND TABLE 1 OF 40 CFR 261.24 - ENVIRONMENTAL PROTECTION AGENCY (EPA) RESOURCE CONSERVATION AND RECOVERY ACT (RCRA) CHARACTERISTIC OF HAZARDOUS WASTE.
4. J = THE ANALYTE WAS POSITIVELY IDENTIFIED AND THE ASSOCIATED NUMERICAL VALUE IS THE APPROXIMATE CONCENTRATION OF THE ANALYTE IN THE SAMPLE.

WARNING: IT IS A VIOLATION OF THE NYS EDUCATION LAW ARTICLE 145 FOR ANY PERSON, UNLESS HE IS ACTING UNDER THE DIRECTION OF A LICENSED PROFESSIONAL ENGINEER, LAND SURVEYOR OR GEOLOGIST, TO ALTER THIS ITEM IN ANY WAY.

Exceedance Summary:

10 - Result exceeds NYSDEC SGVs

LEGEND:

APPROXIMATE SITE BOUNDARY

MW01/SB01 APPROXIMATE LOCATION OF SOIL BORING/ PERMANENT GROUNDWATER MONITORING WELL

NOTES:

1. BASE MAP IS TAKEN FROM "FINAL SURVEY', FIGURE FS103, PREPARED BY LANGAN, DATED FEBRUARY 26, 2025.
2. ALL LOCATIONS ARE APPROXIMATE.
3. GROUNDWATER SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TITLE 6 NEW YORK CODES RULES AND REGULATIONS (NYCRR) PART 703.5 AND THE NYSDEC TECHNICAL AND OPERATION GUIDANCE SERIES (TOGS) 1.1.1 AMBIENT WATER QUALITY STANDARDS AND GUIDANCE VALUES FOR CLASS GA WATER AND PUBLISHED ADDENDA (HEREIN COLLECTIVELY REFERENCED AS "NYSDEC SGVS".
4. J = THE ANALYTE WAS POSITIVELY IDENTIFIED AND THE ASSOCIATED NUMERICAL VALUE IS THE APPROXIMATE CONCENTRATION OF THE ANALYTE IN THE SAMPLE.
5. UJ = THE ANALYTE WAS NOT DETECTED AT A LEVEL GREATER THAN OR EQUAL TO THE REPORTING LIMIT (RL); HOWEVER, THE REPORTED RL IS APPROXIMATE AND MAY BE INACCURATE OR IMPRECISE.
6. U = THE ANALYTE WAS ANALYZED FOR, BUT WAS NOT DETECTED AT A LEVEL GREATER THAN OR EQUAL TO THE LEVEL OF THE RL OR THE SAMPLE CONCENTRATION FOR RESULTS IMPACTED BY BLANK CONTAMINATION.

WARNING: IT IS A VIOLATION OF THE NYS EDUCATION LAW ARTICLE 145 FOR ANY PERSON, UNLESS HE IS ACTING UNDER THE DIRECTION OF A LICENSED PROFESSIONAL ENGINEER, LAND SURVEYOR OR GEOLOGIST, TO ALTER THIS ITEM IN ANY WAY.

LEGEND:

- APPROXIMATE SITE BOUNDARY
- POST RI AOC 1: HISTORICAL SITE USE AND NON-NATIVE FILL
- POST RI AOC 2: CVOC-IMPACTED SOIL VAPOR (CARBON TETRACHLORIDE)
- POST RI AOC 3: CVOC-IMPACTED SOIL VAPOR (PCE)
- SB16 — APPROXIMATE LOCATION OF RI SOIL BORING (2022)
- MW01/SB01 — APPROXIMATE LOCATION OF RI SOIL BORING/PERMANENT GROUNDWATER MONITORING WELL (2022)
- SV01 — APPROXIMATE LOCATION OF RI SOIL VAPOR SAMPLE POINT (2022)
- SV17 — APPROXIMATE LOCATION OF SRI NO. 2 SOIL VAPOR SAMPLE POINT (2026)

NOTES:

1. BASE MAP IS TAKEN FROM "FINAL SURVEY', FIGURE FS103, PREPARED BY LANGAN, DATED FEBRUARY 26, 2025.
2. ALL LOCATIONS ARE APPROXIMATE.
3. AOC = AREA OF CONCERN
4. CVOC = CHLORINATED VOLATILE ORGANIC COMPOUND
5. PCE = TETRACHLOROETHENE
6. RI = REMEDIAL INVESTIGATION
7. SRI = SUPPLEMENTAL REMEDIAL INVESTIGATION

WARNING: IT IS A VIOLATION OF THE NYS EDUCATION LAW ARTICLE 145 FOR ANY PERSON, UNLESS HE IS ACTING UNDER THE DIRECTION OF A LICENSED PROFESSIONAL ENGINEER, LAND SURVEYOR OR GEOLOGIST, TO ALTER THIS ITEM IN ANY WAY.

1/13/2026	MW13	1	3 to 13	5.84	7.75	0.20	13	-7.16

Notes:
1. NAVD88 - North American Vertical Datum of 1988
2. TOC = top of casing
3. bTOC = below top of casing
4. Grade surface elevations are referenced to the North American Vertical Datum of 1988, and were surveyed by Langan on 8/5/2022.
5. Depth to groundwater was measured in feet below the top of well casing.

RL - Reporting limit
<RL - Not detected
Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Title 6 of the Official Compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use, Protection of Groundwater, and Restricted Use Restricted-Residential Soil Cleanup Objectives (SCO) (December 2025).
Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Part 375 Remedial Programs Guidelines for Sampling and Analysis of Per- and Polyfluoroalkyl Substances (PFAS) Unrestricted Use, Restricted Use Restricted-Residential, and Protection of Groundwater Guidance Values (April 2023).

Qualifiers:
J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.
U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

Exceedance Summary:
10 - Result exceeds Unrestricted Use SCOs
10 - Result exceeds Protection of Groundwater SCOs
10 - Result exceeds Restricted Use Restricted-Residential SCOs

			Sample Date	07/26/2022	07/26/2022	07/26/2022	07/26/2022
			Sample Depth	0-2	0-2	0-2	0-2
			Unit	Result	Result	Result	Result
Metals							
Lead	7439-92-1	**5**	mg/l	1.58	1.59	**12.4**	0.457 J

Notes:
TCLP - Toxicity Characteristic Leaching Procedure
CAS - Chemical Abstract Service
NS - No standard
mg/l - milligram per liter
mg/kg - milligram per kilogram
deg C - degrees Celsius
NA - Not analyzed
RL - Reporting limit
<RL - Not detected

Soil sample analytical results are compared to the 6 New York Codes, Rules and Regulations (NYCRR) Part 371.3 and 40 CFR 261 Subpart C and Table 1 of 40 CFR 261.24 - Environmental Protection Agency (EPA) Resource Conservation and Recovery Act (RCRA) Characteristics of Hazardous Waste.

Qualifiers:
J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

Exceedance Summary:
10 - Result exceeds the RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic

Table 4
Remedial Investigation Report
Groundwater Sample Analytical Results

Greenpoint Landing Parcel C
Brooklyn, New York
NYSDEC BCP Site No.: C224435
Langan Project No.: 170229030

Notes:

CAS - Chemical Abstract Service
NS - No standard
ug/l - microgram per liter
NA - Not analyzed
RL - Reporting limit
<RL - Not detected

Groundwater sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Title 6 Codes, Rules, and Regulations (NYCRR) Part 703.5 and the NYSDEC Technical and Operation Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values for Class GA Water and published addenda (herein collectively referenced as "NYSDEC SGVs").

Qualifiers:

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

Exceedance Summary:

10 - Result exceeds NYSDEC SGVs

Table 5
Remedial Investigation Report
Soil Vapor Sample Analytical Results

C Block
Brooklyn, New York
Langan Project No.: 170229030

Notes:

AA - Ambient Air
SV - Soil Vapor
CAS - Chemical Abstract Service
NS - No standard
ug/m3 - microgram per cubic meter
NA - Not analyzed
ND - Not detected
RL - Reporting limit
<RL - Not detected
Ambient air sample analytical results are shown for reference only.

Qualifiers:

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.
U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

Table 5
Remedial Investigation Report
Quality Assurance/Quality Control Sample Analytical Results

Greenpoint Landing Parcel C
Brooklyn, New York
NYSDEC BCP Site No.: C224435
Langan Project No.: 170229030

Notes:

FB - Field Blank
TB - Trip Blank
CAS - Chemical Abstract Service
NS - No standard
ug/l - microgram per liter
NA - Not analyzed
RL - Reporting limit
<RL - Not detected

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the RL.

B - The analyte was found in the associated analysis batch blank.

Greenpoint Lumber Yard

Brooklyn, New York

PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

Project Number: 30260-0001

Prepared for:

Park Tower Realty Corporation
499 Park Avenue
New York, New York 10022

Prepared by:

AKRF, Inc.
117 East 29th Street
New York, NY 10016-8022
(212) 696-0670

July 2001

EXECUTIVE SUMMARY

AKRF, Inc. was retained by Park Tower Realty Corporation to perform an Environmental Site Assessment of the approximately 21-acre former lumber yard located along West and Commercial Streets in the Greenpoint neighborhood of Brooklyn, New York (See Figure 1). The objective of this assessment is to identify any potential environmental concerns associated with the site resulting from past or current usage of the site as well as similar usage of neighboring properties. The site is currently used primarily for the storage and transfer of heavy equipment, trucks, contractor's materials and lumber. Twelve tenants currently occupy the site. The subject blocks are generally bounded to the north by Newtown Creek; to the east by portions of Commercial Street, Franklin Street and West Street; to the south by Huron Street; and to the west by the East River. The surrounding neighborhood is predominantly mixed-use residential and industrial in nature.

This assessment was performed in accordance with customary principles and practices in the environmental consulting industry, and in conformance with the scope and limitations of ASTM Standard E1527-00, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Practice*. Any exceptions to, or deletions from, this practice are described in Section 6.0 of this report.

The regulatory databases, Fire Department records, historical land-use atlases, and the visual site inspection indicate that the subject property has over a 100-year history of industrial use related primarily to the lumber and coal industries. Lumber Exchange Terminal, Inc, the current owner of the property, reportedly assembled the property in the 1930s, 1940s and 1950s. The owner began to phase out lumber yard operations in the 1980's when he began leasing portions of the property to industrial tenants, mainly for use as contractor's storage yards. Currently, only a small portion of the property remains occupied by Lumber Exchange Terminal, Inc. For the purpose of clarity, each Tax Block will be discussed individually (See Figure 2), and then potential environmental impairments located outside of the subject property will be discussed.

- **Tax Block 2520, Lot 57** - This portion of the property was historically occupied by a portion of the New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (also located on Block 2510); it was used for logwood, wagon and pattern storage. This Lot was also occupied by a portion of the New York Quebracho Extract Company ca. 1916 (also located on Block 2510); it contained a cooperage and a wagon house. Quebracho is a natural bark extract, rich in tannins, which is used to treat leather. Although quebracho is an organic substance, the process used to extract it may have involved the use or generation of hazardous materials or wastes. However, it appears this portion of the business was used more for storage than for manufacturing. Block 2520, Lot 57 was occupied by Lumber Exchange Terminal Inc. prior to 1942 through the present (Area 1 - Areas are shown in Figure 2). Other tenants currently occupying the Lot include Acquisitions Investment, Inc. (Area 2 - used for bus parking and minor repair) and Trochom Construction Corporation (a portion of Area 3 - used for auto parking and contractor's materials storage). This portion of the property currently contains a two-story brick office building (which

first appeared on Sanborn Maps in 1887), a large corrugated metal garage (which first appeared on Sanborn Maps in 1965), and a small guard shed near the Green Street entrance. Surface staining was observed in Areas 1, 2, and 3. 20- and 30-cubic yard waste containers were observed in Areas 2 and 3, respectively.

Suspect asbestos-containing materials, including boiler insulation, pipe insulation, spray-on fire proofing, floor and ceiling tiles were observed in the two-story brick building during site inspection. The roof was inaccessible at the time of inspection, however, due to the age of the structure, it can be assumed to contain asbestos. This structure was reportedly heated by fuel oil located in one 550-gallon tank enclosed behind a brick wall near the boiler room. In addition, one fuel pump was observed outside of the two-story brick building, which was reportedly serviced by two 550-gallon underground gasoline tanks. New York City Buildings Department Block and Lot records for Block 2520, Lot 57 included a 1935 Fuel Oil Permit for a 550-gallon underground storage tank to be located directly outside of a two-story office, a 1935 blueprint showing an underground gasoline tank located at the northwest corner of a two-story brick building, a 1938 Permit to install one 550-gallon underground gasoline tank and one fuel pump and a 1957 record showing one 550-gallon fuel oil tank within a two-story building. A search of computerized Fire Department records did not locate any heating or motor fuel oil records for the property.

The small guard shed may contain asbestos-containing and/or lead paint-containing materials, though none were observed during site inspection.

The eastern portion of the garage building was used primarily to store fork lifts and old car parts; the western portion of the garage was primarily used for the storage of car batteries, tires and tools. The area was illuminated with new-looking pole mounted fluorescent lights, however, old, ceiling mounted fluorescent lights (potentially with PCB-containing ballasts) were observed throughout the structure. One 275-gallon aboveground storage tank of hydraulic oil, one 275-gallon aboveground storage tank of motor oil and over twenty 55-gallon drums and several 5-gallon drums of petroleum products were observed in the eastern portion of the structure; several 55-gallon drums of lube oil and antifreeze and two oxygen and acetylene tanks were observed in the western portion. AKRF personnel were informed that auto and fork lift repair occurred in the areas directly east and west of the garage building. Severe surface staining and several 55-gallon drums of petroleum products were observed in these areas.

The fuel oil, gasoline, hydraulic oil and motor oil tanks; the 55- and 5-gallon containers of petroleum products; and the Block's current usage for auto repair could have contributed to petroleum contamination in soil and/or groundwater. The Block's former usage as a dye and chemical factory, as a quebracho extract company and as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site. Asbestos-containing and/or lead paint containing building materials could be present in the two-story brick office building and/or in the corrugated metal garage on the Block. Finally, mercury-containing fluorescent lights and/or PBC-containing ballasts could be present in lighting fixtures in on-site structures.

- **Tax Block 2510** - This portion of the property was historically occupied by a portion of the New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (also located on Block 2520, Lot 57); it contained a large logwood storage shed, a small oil storage shed, an area with 15 wooden dye tanks, a large tank house, and storage, cutting and manufacturing buildings. This Lot was also occupied by a portion of the New York Quebracho Extract Company ca. 1916 (also located on Block 2510); it contained several storage sheds and industrial buildings, a large tank room and two areas with dye wood tanks and logwood tanks. This portion of the business appeared to have been used both for manufacturing and for storage. Block 2510 was occupied by Lumber Exchange Terminal Inc. prior to 1942 through 1989. Tenants currently occupying the Block include Trochom Construction Corporation (a portion of Area 3 - used for contractor's materials storage), Bay Crane Services, Inc., (Area 4 - used for storage of cranes and other large construction vehicles), Safway Steel Products, Inc./ Spring Scaffolding (a portion of Area 6 - used for storage of scaffolding materials) and Hylan Electrical Contracting, Inc. (Area 7 - used for storage of materials used to install fiber optic cabling). 55-gallon drums of water-based curing compounds for concrete surfaces, hydraulic oil and white resin and several five-gallon drums of silicon sealant were observed in Area 3. Surface staining was also observed in Area 3. Generators, several fork lifts and 55-gallon drums of fiber optic cable lubricator were observed in Area 6. 20- and 30-cubic yard waste containers were observed in Areas 3 and 6, respectively.

  The 55- and 5-gallon containers of chemicals and petroleum products and the Block's former usage as a dye and chemical factory, as a quebracho extract company and as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site.

- **Tax Block 2502** - This portion of the property was historically occupied by A.K. Meserole & Company (a mason material and coal storage yard) and a portion of C. Winant's Spar Company ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard and a two-story lumber shed belonging to P.M. Dingee & Sons ca. 1905; Export Auto Case Company and vacant land ca. 1916; vacant land ca. 1942; and the Lumber Exchange Terminal, Inc. ca. 1951 through ca. 2000. Tenants currently occupying the Block include Trochom Construction Corporation (a portion of Area 3 - used for contractor's materials storage), River Hauling, Inc. (a portion of Area 5 - used for temporary storage and transport of large items), Safway Steel Products, Inc. (a portion of Area 6 - used for storage of scaffolding materials) and Far Better Towing, Inc. / R-D Towing Corporation (Area 8 - used for the storage of repossessed automobiles). 55-gallon drums of water-based curing compounds for concrete surfaces, hydraulic oil and white resin and several five-gallon drums of silicon sealant were observed in Area 3. Surface staining was observed in Areas 3 and 5. Pony generators, several fork lifts and 55-gallon drums of fiber optic cable lubricator were observed in Area 6. 20- and 30-cubic yard waste containers were observed in Areas 3 and 6.

  The 55-gallon containers of chemicals and petroleum products currently on-site and the Block's former usage as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Tax Block 2472, Lots 2, 32, 100, 410 and 425** - Block 2472 was historically occupied by a portion of C. Winant's Spar Company and Church and Reeves Lumber Yard ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard, the Bergen & Company Lumber Yard and the O'Rourke Engineering Construction Company ca. 1905; the Bergen & Company Lumber Yard, a portion of the New York State Barge Canal Terminal; a portion of Alberene Stone Company Tub Storage and vacant land ca. 1916; the New York State Canal Terminal, Greenpoint Coal Docks, Inc. and vacant land ca. 1942 through ca. 1951; and the Lumber Exchange Terminal, Inc. ca. 1965 through ca. 2000. Sanborn Maps from the year 2000 indicated Block 2472 to also contain Two Guys Towing and Auto Repair and a parking lot. Current tenants include Far Better Towing, Inc. / R-D Towing Corporation (a portion of Area 8 - used to park repossessed automobiles), Lumber Exchange Terminal, Inc. (a portion of Area 1 - used to store lumber), River Hauling, Inc. (a portion of Area 5 - used for temporary storage and transport of large items), New York City Housing Authority (Area 9 - used to park cars and store materials), Henkles & McCoy (Area 10 - used to park cars and store contractor's materials), Supreme Trucking (Area 11 - used for parking and minor repair large cargo trucks and for the staging of large items), MWK Transport, Inc./SJK Transport (Area 12 - used for truck parking and the storage of materials), and Spring Scaffolding (Area 13 - used to store scaffolding materials). Several fork lifts, 55-gallon drums of hydraulic oil, a 20-cubic yard waste container and surface staining in several areas were observed in this portion of Area 5. It was reported that minor auto repairs, truck washing and tire changes were performed in Area 11. Several 55-gallon drums of lube oil were observed in Area 11. New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988. It is unknown whether these potential tanks were located aboveground or underground.

  The 55-gallon containers of petroleum products currently on-site, the potential storage tanks on-site, the Block's former usage as a lumber yard (if pressure treatment occurred on-site), and the Block's current use for auto repair could have contributed to petroleum and/or hazardous materials contamination on-site. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Block 2494, Lot 1** - Block 2494, Lot 1 was historically occupied by dwellings and stores ca. 1887 through ca. 1905; a garage and repair shop with a tank house and an underground storage tank ca. 1916; vacant land ca. 1951; and the Lumber Exchange Terminal ca. 1965 through 2000. Far Better Towing, Inc. / R-D Towing Corporation is the current occupant of the Lot (a portion of Area 8 - used to repair, park and auction seized vehicles). A trailer office and a one-story brick auto-repair shop were observed near the entrance to Area 8 (at the intersection of Franklin and Dupont Streets). The one-story building contained brick walls, concrete floors and a wood ceiling. The roof was not inspected, but can be assumed to contain asbestos. One 55-gallon drum of diesel fuel was observed in this building and three more were observed outside of the building. An employee of Far Better Towing, Inc. informed AKRF personnel that oil and tires are changed and minor repairs occur. No vehicles were reportedly fueled on the property. Piles of trash, tires, car parts, a

tank of carbon dioxide gas and one 275-gallon abandoned aboveground storage tank were observed surrounding the trailer and the one-story structure.

The 55-gallon containers of petroleum products currently on-site, the current and former auto-repair operation, the underground gasoline storage tank identified on the property, the hydraulic lift system identified on-site and the former usage as a lumber yard (if pressure treatment occurred on-site) could have contributed to petroleum and/or hazardous materials contamination on-site. Asbestos-containing and/or lead paint containing materials could be present in the one-story auto repair shop. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Environmental Conditions Located Outside of the Subject Property** - In the New York State Resource Conservation and Recovery Act (RCRA) database, one Treatment, Storage, and Disposal facilities was identified within a one-mile radius of the subject area and ten RCRA generators were listed within a one-eighth mile radius of the project site. Several of these industrial facilities with known generation of hazardous wastes (including halogenated solvents) are located up-gradient with respect to groundwater to the subject property. Several facilities have Class One RCRA violations, indicating releases may have occurred. Groundwater quality may have been impaired by these operations.

RECOMMENDATIONS:

- AKRF recommends a Phase II Subsurface Site Investigation to determine the presence and possible extent of underground storage tanks as well as petroleum and/or hazardous materials contamination in on site soil and groundwater;

- AKRF recommends any identifies tanks be properly registered, if required, with the New York State Department of Environmental Conservation and the New York City Fire Department. Prior to any renovation or demolition activities with the potential to disturb known tanks, they should be property assessed, closed and removed from the property in accordance with all federal, state and local regulations;

- Prior to any renovation or demolition activities with the potential to disturb suspect asbestos containing materials, an asbestos survey should be conducted. If these materials prove to contain asbestos, they should be properly removed and disposed of in accordance with all sate and federal regulations;

- Any renovation or demolition activities with the potential to disturb lead-based paint must be performed in accordance with the applicable Occupational Safety and Health Administration regulation (OSHA 29 CFR 1926.62 - Lead Exposure in Construction). Current New York State Department of Environmental Conservation guidance permits the disposal of construction materials covered with lead-based paint as demolition debris within an approved landfill; and

- The suspect mercury-containing fluorescent lights and suspect PCB-containing lighting fixtures do not currently present a potential hazard to human health. Unless there is labeling or test data to indicate they are not mercury- and/or PCB-containing, if disposal is required, it should be in accordance with applicable federal, state, and local regulations and guidelines.

1.0 INTRODUCTION

AKRF, Inc. was retained by Park Tower Realty Corporation to perform an Environmental Site Assessment of the approximately 21-acre former lumber yard located at 171 West Street in the Greenpoint neighborhood of Brooklyn, New York. (Please see Figure 1 for a map of the area.) The legal definition of the subject property is Tax Block 2472, Lots 2, 32, 100, 410 and 425; Tax Block 2494, Lot 1; Tax Block 2502, Lot 1; Tax Block 2510, Lot 1; and Tax Block 2520, Lot 57, as shown in Figure 2. The subject blocks are generally bounded to the north by Newtown Creek; to the east by portions of Commercial Street, Franklin Street and West Street; to the south by Huron Street; and to the west by the East River. The site is currently used primarily for the storage and transfer of heavy equipment, trucks, contractor's materials and lumber. Twelve tenants currently occupy the site (see Figure 2).

The scope of services for this assessment included the following:

- Visual observations of the project site and surrounding property were made to identify potential sources or indications of chemical contamination. The potential sources of contamination included, but were not limited to, underground storage tanks (USTs), aboveground storage tanks (ASTs), objects that could potentially contain polychlorinated biphenyls (PCBs), and areas where hazardous materials were used, stored, treated, generated and/or disposed. Indications of chemical contamination include stained surfaces and chemical odors.

  In addition, readily observable portions of the properties immediately adjacent to the site were viewed from public rights-of-way to identify or determine the likelihood of any of the aforementioned potential sources of contamination.
- Published geological and groundwater information was obtained from available sources to determine the possibility of contamination from off-site sources.
- A visual inspection of the property was conducted to identify and evaluate the condition of any suspect asbestos-containing building materials (ACMs).
- The property was evaluated for the potential presence of lead-based paint, and the condition of painted surfaces was assessed.
- A review of radon concentrations in Kings County (Brooklyn) was conducted to determine if radon levels in the general area complied with United States Environmental Protection Agency (US EPA) guidelines.
- Historical land-use atlases for the site and adjacent properties were reviewed to evaluate previous land use.
- The following federal regulatory databases were reviewed to determine the regulatory status of the site, adjacent properties, and properties within a predetermined study area: National Priority List (NPL); Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); Emergency Response Notification System (ERNS); Toxic Chemical Release Inventory System (TRIS); the Permit Compliance System of Toxic Wastewater Discharges (WWD); and the US EPA Civil Enforcement Docket. The federal listing of facilities that are subject to corrective action under the Resource Conservation and Recovery Act (CORRACTS) is discussed with the State databases of RCRA listings.

- The following state regulatory databases were reviewed to determine the regulatory status of the site, adjacent properties, and properties within a predetermined study area: the listings of hazardous material spills (SPILLS), Resource Conservation and Recovery Act Notifiers (RCRA), Chemical Bulk Storage (CBS), Solid Waste Facilities (SWF), Petroleum Bulk Storage (PBS), State Inactive Hazardous Waste Disposal Sites (SHWS), Major Oil Storage Facilities (MOSF), and Air Discharge Facilities (ADF).
- A review of available local Fire Department and Buildings Department records was conducted to obtain any information pertinent to the assessment of the environmental condition of the subject property. Specifically, records regarding past and present on-site fuel oil tanks and historical uses were requested and reviewed.

2.0 PHYSICAL SITE DESCRIPTION

Visual inspection of the site and adjacent areas was performed on June 28, 2001 by Mimi Sotiriou of AKRF, accompanied by John Doyle and Ramon Quintero of Lumber Exchange Terminal, Inc. The inspection was conducted at 10:00 AM. At the time of the inspection, the weather was clear, the visibility was good, and the premises were adequately illuminated. The site was inspected for the presence of stained surfaces and soils, stressed vegetation, storage tanks, drums, leaking pipes, transformers, suspect asbestos-containing materials, suspect lead-containing paint, or any other evidence of hazardous material usage and storage on-site. Photographs documenting the site inspection are included in Appendix A.

2.1 General Site Conditions

The project site consisted of an approximately 20-acre parcel of land, used primarily for the storage and transfer of heavy equipment, trucks, contractor's materials and lumber. Twelve tenants currently occupy the site (see Figure 2 for approximate tenant location). Partial fences partitioned the tenants apart on the property. The majority of the site consisted of a flat, asphalt-paved lot. Only three structures were noted on the property: a two-story brick office building and a corrugated metal garage located in Area 1 and a small one-story brick auto repair shop located in Area 8. Each tenant area will be described separately below:

Area 1: **Lumber Exchange Terminal, Inc.**

The portion of Area 1 that is located at the intersection of Green Street and West Street contained one two-story brick and concrete office building and one large corrugated metal garage on an asphalt-paved area. The office and the garage were used by both the Lumber Exchange Terminal, Inc. and by Acquisitions Investments, Inc. to a lesser extent.

The two-story office building was reportedly built as a barn. The building is currently used primarily for office use; however, a tool room and a storage room were located in the western portion of the first floor of the building. The floors of the building consisted of concrete, wood, ceramic (bathrooms) or several colors of 9" and 12" suspect asbestos-containing vinyl floor tiles. The walls of the building consisted of brick, concrete, plaster, wood and 1'x1' ceiling tile. The ceilings of the structure consisted of wood, concrete, plaster, and suspect asbestos-containing 1'x1' and 2'x4' suspended ceiling tiles. The ceiling of the garage room was sprayed with suspect asbestos-containing fire proofing material. The roof of the building was inaccessible at the time of inspection. Mr. Doyle informed AKRF personnel that no roof replacement activities, only patching, had been performed to his knowledge.

The two-story building was cooled with window-mounted air conditioning units. It was heated with oil-heated hot water. A boiler room was located in the western portion of the first floor. This room contained a domestic hot water heater and a boiler covered with suspect asbestos-containing insulation. Some pipes in this area were also covered with suspect asbestos-containing thermal insulation and other were un-insulated. One 550-gallon fuel oil tank was reportedly located in a concrete and brick enclosed wall adjacent to the boiler room.

The garage had a concrete floor and corrugated metal walls and roof. The area was illuminated with new-looking pole mounted fluorescent lights, however, old, ceiling mounted fluorescent lights (potentially with PCB-containing ballasts) were observed throughout the structure.

Lumber Exchange Terminal, Inc. occupied the eastern portion and Acquisitions Investments, Inc. occupied the western portion. The eastern portion of the garage was used primarily to store fork lifts and old car parts. One 275-gallon aboveground storage tank of hydraulic oil and one 275-gallon aboveground storage tank of motor oil were observed against the eastern wall of the structure. Additionally, over twenty 55-gallon drums and several 5-gallon drums of petroleum products were observed in the eastern portion of the garage. Mr. Quintero informed AKRF personnel that no auto repair is performed by Lumber Exchange Terminal, Inc. in this portion of the garage; it is performed in the paved area between the garage and the two-story office building.

The western portion of the garage was primarily used for the storage of car batteries, tires and tools. Several 55-gallon drums of lube oil and antifreeze and two oxygen and acetylene tanks were observed in this area. Mr. Quintero informed AKRF that no bus repair is performed in this portion of the garage; it is performed in Area 2 of the site, where double-decker buses are parked.

The remainder of Area 1 consisted of an asphalt paved area. One fuel pump was located directly east-adjacent to the two-story structure. Two 550-gallon underground gasoline tanks are reportedly connected to this pump. Several machines and old generators were located to the east of the garage building on the paved area. Severe surface staining was observed on the asphalt located between the two-story building and the garage. Several 55-gallon drums of unknown materials were located in this area.

A small guard shack was observed at the entrance to the property, on green street. This structure was constructed of concrete and brick, with plywood and plaster interior walls, ceilings and floors.

The portion of Area 1 located at the intersection of Commercial and Dupont Streets consisted of an asphalt-paved area with large piles of neatly-stacked lumber. Surface staining was observed in the area.

Area 2 **- Acquisitions Investments, Inc.**

Area 2 was used for double-decker tour bus parking. More than ten double-decker buses were observed parked on the asphalt-paved lot. One 20-yard waste container was also observed. Mr. Quintero informed AKRF personnel that no fuel tanks exist in this area; the buses are fueled by a fuel truck. Minor bus repair, however, was reportedly performed in this area; stained surfaces were observed.

Area 3 **- Trochom Construction Corp.**

Trochom Construction Corp used Area 3 for the storage of materials used to repair streets. The portion of Area 3 located north of Area 2 consists of an asphalt-paved parking area. Several cars and contractor's materials were stored in this area. A small wooden shack, formerly used by longshoremen, was located in this area.

The portion of Area 3 located south of Area 6 consisted of a paved, flat area. Surface staining was observed in several areas. One stream roller, one street cleaner, pipes, steel mesh, traffic lights and other street-related materials were stored in this area. 55-gallon drums of water based curing compounds for concrete surfaces, hydraulic oil and white resin and several five-gallon drums of silicon sealant were observed stored in this area. One thirty cubic yard container of wood waste was located in this portion of Area 3.

Area 4 **- Bay Crane Service, Inc.**

Area 4 was used for the storage of large cranes and other large construction equipment. The area consisted of a paved lot.

Area 5 **- River Hauling, Inc.**

River Hauling, Inc. arranges for the temporary storage and transport of very large items, including new storage tanks, heating, ventilation and air conditioning (HVAC) equipment, and computer equipment. The portion of Area 5 located north of Area 4 consisted of a flat paved lot. This portion of Area 5 was used to store HVAC equipment. The portion of Area 5 located east of Area 12 consisted of a paved lot. Surface staining was observed in several locations. This area was used for truck parking and to store HVAC units, lumber, computer equipment, metal storage cubes, computer equipment and storage tanks. Several fork lifts and 55-gallon drums of transformer fluid were observed in this portion of Area 5. Three large trailer offices were located on the property. A 20-cubic yard waste container was also located in this area.

Area 6 **- Safway Steel Products, Inc.**

Safway Steel Products, Inc. and Spring Scaffolding used Area 6 to store materials used to construct scaffolding, including steel poles and corrugated metal sheets. A trailer office, a corrugated metal shed, fork lifts, and one 20-cubic yard water container filled with household debris, wood and scaffolding netting were observed in Area 6. Area 6 was paved with asphalt.

Area 7 **- Hylan Electrical Contracting, Inc.**

Hylan Electrical Contracting, Inc. installs cable and computer fiber optic cabling. Area 7, a paved lot, was used to store large spools of cable, pony generators, trucks, 55-gallon drums of fiber optic cable lubricator, and metal storage cubes. Several fork lifts were observed in Area 7.

Area 8 **- Far Better Towing, Inc. and R-D Towing Corp.**

Far Better Towing, Inc. and R-D Towing Corp. tow and impound cars and hold car auctions. The paved lot was filled with parked cars. A trailer office and a one-story brick auto-repair shop were observed near the entrance to Area 8 (at the intersection of Franklin and Dupont Streets). The one-story building contained brick walls, concrete floors and a wood ceiling. The roof was not inspected. The structure contained one hydraulic car lift system, tools, tires, and car parts. One 55-gallon drum of diesel fuel was observed in this building and three more were observed outside of the building. An employee of Far Better Towing, Inc. informed AKRF personnel that oil and tires are changed and minor repairs occur on-site. No vehicles were reportedly fueled on the property. Piles of trash, tires, car parts, a tank of carbon dioxide gas and one 275-gallon abandoned aboveground storage tank were observed surrounding the trailer and the one-story structure.

Area 9 **- New York City Housing Authority**

Area 9 was inaccessible at the time of inspection. An eight-foot high chain link fence with a locking gate bounded the property on all sides. From a public sidewalk, AKRF personnel observed several metal storage cubes, a trailer office, and trucks and cars parked on a paved lot.

Area 10 **- Henkels & McCoy, Inc.**

Henkles & McCoy, Inc. are construction contractors. The paved lot was nearly empty, except for cars, one front end loader, several pipes and a two cubic yard waste container.

Area 11 **- Supreme Trucking, Inc.**

Supreme Trucking, Inc. arranges for the transport of large items. Several large closed cargo truck and cabs and two fork lifts were parked in this area. An employee of Supreme Trucking, Inc. informed AKRF personnel that minor auto repair, truck washing and tire changes were performed on the property. Several 55-gallon drums of lube oil were observed on Area 11.

Area 12 **- MWK Transport, Inc. / SJK Transport**

MWK Transport, Inc./SJK Transport arranges for the transport of large items. Area 12 was inaccessible at the time of inspection. An eight-foot high chain link fence with a locking gate bounded the property on all sides. From a public sidewalk, AKRF personnel observed one metal storage cube and several trucks and cars parked on a paved lot.

Area 13 **- Spring Scaffolding**

Spring Scaffolding is the tenant of Area 5, however, they only use the area to store scaffolding materials when they are conducting high volumes of business. At the time of inspection, this area appeared to be being used by River Hauling for the storage of large items.

2.2 Topography and Hydrogeology

The surface topography slopes down to the north towards Newtown Creek and to the west towards the East River. Based on reports compiled by the U.S. Geological Survey, the property lies at an elevations ranging from approximately five to fifteen feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level). The approximate depth to bedrock is 50 feet below the surface, with groundwater most likely situated approximately five to fifteen feet below the surface. Groundwater most likely flows in a northerly direction toward Newtown Creek and/or in a westerly direction towards the East River. However, actual groundwater flow at the site can be affected by many factors, including past filling activities, underground utilities and other subsurface openings, tidal fluctuations, and other factors beyond the scope of this study. Groundwater in Brooklyn is not used as a source of potable water.

2.3 Storage Tanks

2.3.1 Underground Storage Tanks (USTs)

During site inspection, one fuel pump was observed outside of the two-story office building in Area 1. Two 550-gallon gasoline tanks were reportedly associated with this pump. New York City Buildings Department Block and Lot records for Block 2520, Lot 57 included a 1935 Fuel Oil Permit for a 550-gallon underground storage tank to be located directly outside of a two-story office, a 1935 blueprint showing a gasoline tank located at the northwest corner of a two-story brick building, a 1938 Permit to install one 550-gallon gasoline tank and one fuel pump, and a 1957 record showing one 550-gallon fuel oil tank within a two-story building. Gasoline tanks are almost always required to be installed underground. New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988. It is unknown whether these potential tanks were located aboveground or underground.

Off-site USTs are discussed in Sections 4.2.2.

2.3.2 Aboveground Storage Tanks (ASTs)

One 550-gallon fuel oil tank was reportedly located behind a brick and concrete wall adjacent to the boiler room in the two-story office building in Area 1. One 275-gallon aboveground storage tank of hydraulic oil and one 275-gallon aboveground storage tank of motor oil were observed against the eastern wall of the corrugated metal garage structure in Area 1. An abandoned 275-gallon aboveground storage tank was observed behind an office trailer in Area 8. The tenant of Area 5 arranges for the transport of storage tanks; several new storage tanks were observed in this area.

New York City Buildings Department Block and Lot records for Block 2492, Lot 1 included a record showing one 550-gallon fuel oil tank within a two-story building. New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988. It is unknown whether these potential tanks were located aboveground or underground.

2.4 Polychlorinated Biphenyls (PCBs)

Prior to 1979, PCBs were widely used for their cooling properties in electrical equipment such as transformers, capacitors, switches, and voltage regulators. No known transformers are currently located on-site.

Transformers were observed in Areas 1 and 7. Hydraulic oil associated with fork lifts (observed in many Areas of the property) would not be expected to contain PCBs. Fluorescent lighting fixtures observed in the corrugated metal garage in Area 1 may include PCB-containing components, including capacitors and potting compounds. There was no observed evidence of leaks or stains from these lighting fixtures and they do not currently present a potential hazard to building occupants.

2.5 Asbestos-Containing Materials (ACMs)

The United States Occupational Safety and Health Administration (OSHA) has amended Part 1910 to Title 29 of the Code of Federal Regulations which addresses occupational exposure to asbestos. The final rule, applicable to general industry (29 CFR 1910.1001), construction (29 CFR 1926.1101, previously 1926.58), and the shipyard industry (29 CFR 1915.1001) became effective on October 1, 1995. All thermal systems insulation; sprayed-on, troweled-on or otherwise applied surfacing materials (including decorative plaster, acoustical materials, and fireproofing); asphalt; and vinyl flooring materials in buildings constructed prior to 1981 are presumed to contain asbestos unless proven otherwise.

The regulation requires owners of buildings to inform housekeeping, custodial and maintenance workers of the presence, location, and quantity of confirmed or presumed asbestos that they may come into contact with or disturb in the course of their work activities. These employees and/or employers of employees must receive asbestos awareness training each year at no expense to them. Building owners must provide appropriate warning signs and labels, as defined specifically in the regulation, and meet certain requirements on the care of these surfaces (such as resilient floor coverings). An Operations and Maintenance Plan is recommended for buildings built prior to 1981 that have not been proven to be free of asbestos. Building owners must

maintain records concerning the presence, location, and quantity of known or suspected ACMs for the duration of ownership and transfer these records to successive owners.

Mimi Sotiriou, a New York State licensed asbestos inspector, conducted a limited visual inspection for potential asbestos-containing materials in the accessible areas on-site. Asbestos is typically found in the form of friable or non-friable materials. Friable materials are those which can be crushed or reduced to a powder by hand pressure and, as such, are associated with a higher risk of producing potentially hazardous dust. Conversely, non-friable materials (such as older vinyl floor tiles or built-up roofing materials) do not typically produce significant amounts of asbestos dust while intact. As such, non-friable materials do not constitute a threat to health and may remain in place unless they will be disturbed by renovation activities.

Suspect asbestos-containing materials were observed in the two-story office building in Area 1 during site inspection. Thermal pipe insulation and boiler insulation were observed in the boiler room. Spray-on fire proofing was observed on the ceiling of the storage room. Several colors of 9" and 12" vinyl floor tiles and 1'x1' and 2'x4' ceiling tiles were also observed. The roof of this structure was not accessible at the time of inspection, however, Mr. Doyle was unaware of any roof replacement activities, only patching activities.

No suspect asbestos-containing materials were observed during site inspection in the corrugated metal garage or in the small guard shed in Area 1. No suspect asbestos-containing materials were observed in the one-story brick auto repair shop in Area 8 during site inspection. The roofs of these buildings were not accessible at the time of inspection. It should be noted that older flat roofs composed of tar paper materials are typically constructed of multiple layers, some of which may consist of asbestos- containing materials.

2.6 Lead Paint

The use of lead paint in commercial structures was severely restricted by the Consumer Products Safety Commission in 1977. Since the current two-story brick office building on Area 1 was reportedly completed prior to 1887 and the current corrugated metal garage also on Area 1 was reportedly completed prior to 1965, lead-based paint may be present in the buildings. It is unknown when the one-story guard building in Area 1 and the one-story auto repair building in Area 8 were constructed; it will be assumed that it was prior to 1977. Lead paint is potentially hazardous when in a deteriorating condition (i.e., chipped, broken, crumbling, pulverized); lead is potentially harmful to humans, particularly children, if ingested, inhaled, or otherwise absorbed.

Painted surfaces observed in the two-story brick office building, the corrugated metal garage and the small guard shed located in Area 1 and small one-story brick auto repair shop located in Area 8 were in good condition.

2.7 Utilities

Keyspan and Consolidated Edison provides natural gas and electricity, respectively, to the three on-site structures. Municipal water and sewage services are provided to the property.

2.8 Waste Management and Chemical Handling

Any wastes produced by tenants are collected and removed from the property by private haulers. 55-gallon drums of several different petroleum and other products were observed throughout the property, as were larger dumpsters (20- and 30-cubic yard). Stained surfaces, indicative of poor chemical handling, were observed in most Areas of the property.

2.9 Radon

Radon is a colorless, odorless gas produced by the radioactive decay of certain elements. The most common sources of radon are igneous and metamorphic rocks containing uranium (such as pitchblende), granite, shale, or phosphate, as well as soils or sediments derived from these parent materials. Radon may also be found in soils contaminated with certain industrial wastes (such as uranium or phosphate mine tailings) or in earth-derived building products which include industrial wastes that contain phosphate slag. In areas where the potential for radon accumulation is high, special ventilation systems may offset potential health hazards.

According to data compiled by the Bureau of Radiation Protection, a division of the New York State Department of Health, Kings County (Brooklyn) has one of the lower average levels of basement radon measurements in New York State, 1.9 picocuries/liter. The US EPA recommended action level is 4.0 picocuries/liter.

3.0 ADJACENT LAND USE

The subject property is located in a mixed-use residential, commercial and industrial area of Brooklyn. An envelope factory was observed directly south-adjacent to Areas 1, 2 and 3. Industrial structures and lofts (some have been converted to residences) were observed on blocks east of West and Franklin Streets. A playground was observed west and south of Commercial Street. A baseball diamond was observed adjacent to Areas 1, 9 and 10 on the property. A paved lot used for parking and storage was observed east of Area 5. And Newtown Creek and the East River were located north and west of the property, respectively.

4.0 SITE HISTORY AND RECORDS REVIEW

4.1 Prior Ownership and Usage

4.1.1 Historical Land-Use Maps

Historical insurance maps were reviewed for indications of industrial usage or other evidence suggesting the use or disposal of hazardous materials on or adjacent to the subject property. Specifically, Sanborn Fire Insurance maps from 1887, 1905, 1916, 1942, 1951, 1965, 1979, 1989, and 2000 were reviewed. Copies of portions of these maps are included in Appendix B.

1887

Sanborn Maps from 1887 indicated Block 2520, Lot 57 and Block 2510 to be occupied by New York Dye-Wood Extract and Chemical Company. Block 2520, Lot 57 was used for logwood storage and was shown to contain a two-story structure used for wagon and pattern storage in the eastern portion of the Lot, where the current two-story brick building is located in Area 1. Block 2510 was shown to contain a large logwood storage shed, a small oil storage shed, an area with 15 wooden dye tanks, a tank house, and storage, cutting and manufacturing buildings.

The southwestern portion of Block 2502 was shown to contain A. K. Meserole & Company - a mason material and coal storage yard. The remainder of Block 2502 and the southern portion of Block 2472 were shown to be occupied by C. Winant's Spar Yard. Church and Reeves Lumber Yard was indicated on the eastern portion of Block 2472. Finally, Block 2494, Lot 1 was shown to be vacant, except for a residence hall and two dwellings located near Franklin Street. The remainder of Block 2494, Lot 1 was shown to be vacant.

A lumber yard was indicated south-adjacent to the subject property on Block 2520. A sugar refining company was indicated east-adjacent to Block 2472. Vacant land, residential buildings, a piano manufacturer, a veneer factory, a machine shop, and a lubricator factory were indicated south of Commercial Street and east of West Street on the subject property.

1905

Sanborn Maps from 1905 indicated Block 2520, Lot 57 and Block 2510 to continue to be occupied by New York Dye-wood Extract and Chemical Company. Block 2502 and the southern portion of Block 2472 were shown to be occupied by Nesmith and Constantine Log Storage Yard, a two-story lumber shed belonging to P.M. Dingee & Sons (at the corner of Freeman and West Streets), and a small mahogany storage yard (at the intersection of Eagle and West Streets) which extended onto Block 2494. The remainder of Block 2472 was shown to be occupied by Bergen & Company Lumber Yard and by the O'Rourke Engineering Construction Company. Finally, Block 2494, Lot 1 was shown to contain the International Mahogany Company at the intersection of Eagle and West Streets and two dwellings and a store fronting Franklin Street. The remainder of Block 2494, Lot 1 was shown to be vacant.

A mahogany and veneer yard was indicated south-adjacent to the subject property on Block 2520. A sugar refining company was indicated east-adjacent to Block 2472. Vacant land, residential buildings, a lubricator factory and an iron works were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

1916

Sanborn Maps from 1916 indicated Block 2520, Lot 57 and Block 2510 to be occupied by New York Quebracho Extract Company. Several storage shed, a cooperage, a wagon house, several industrial buildings, a tank room, and two areas shown to contain dye wood tanks and logwood tanks were associated with this company. It should be noted that much of the writing on these maps was illegible. The southeastern corner of Block 2502 was shown to be occupied by Export Auto Case Company, a manufacturer and packing facility; the remainder of the block was shown to be vacant. Block 2472 was shown to be occupied by Bergen & Company Lumber Yard, a portion of the New York State Barge Canal Terminal, a portion of Alberene Stone Company Tub Storage, and by vacant land. Finally, Block 2494, Lot 1 was shown to contain a dwelling at the intersection of Eagle and West Streets and a garage and auto repair shop with a pump house and an underground gasoline tank at the intersection of Dupont and Franklin Streets. The remainder of the Lot was shown to be vacant.

A lumber company was indicated south-adjacent to the subject property on Block 2520. West Street Improvement Company was indicated east-adjacent to Block 2472; two large tanks of unknown contents were indicated on the western property boundary. Vacant land, residential buildings, a machine shop, a display fixtures factory, and a plating and machine store were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

1942

Sanborn Maps from 1942 indicated Block 2520, Lot 57 and Block 2510 to be occupied by Lumber Exchange Terminal, Inc. A small two-story structure and a large one- to two-story lumber shed were indicated on Lot 57. A gas tank was shown to be located adjacent to the two-story building. Block 2502 was shown to be vacant. Block 2472 was shown to contain the New York State Canal Terminal, Greenpoint Coal Docks, Inc., and vacant land. Finally, Block 2494, Lot 1 was shown to be vacant except for a lumber shed fronting Franklin Street.

Vacant land was indicated south-adjacent to the subject property on Block 2520. Brooklyn and Queens Transit Corporation Trolley Car Storage was indicated east-adjacent to Block 2472. A steam laundry was indicated adjacent to the subject property on Block 2494. Vacant land, residential and commercial buildings, industrial structures, and two garages were indicated south of Commercial Street and east of West Street on the subject property. A store with four gasoline tanks was indicated at the intersection of Clay and Commercial Streets. No further significant changes were indicated for the subject property or for the surrounding area.

1951

Sanborn Maps from 1951 indicated Block 2520, Lot 57, Block 2510, Block 2502, Block 2494 and the southwestern portion of Block 2472 to be occupied by Lumber Exchange Terminal, Inc. The northeastern portion of Block 2472 was shown to contain Greenpoint Coal Docks, Inc. The New York State Canal Terminal occupied a pier off of Block 2472.

Vacant land was indicated south-adjacent to the subject property on Block 2520. Brooklyn and Queens Transit Corporation Trolley Car Storage was indicated east-adjacent to Block 2472. A steam laundry was indicated adjacent to the subject property on Block 2494. Vacant land, residential and commercial buildings, industrial structures, a sheet metal works, display fixture manufacturing, and a public park were indicated south of Commercial Street and east of West Street on the subject property. A store with four gasoline tanks was indicated at the intersection

of Clay and Commercial Streets. No further significant changes were indicated for the subject property or for the surrounding area.

1965

Sanborn Maps from 1965 indicated Block 2520, Lot 57; Block 2510; Block 2494, and Block 2502; Block 2472, Lots 2, 32, 100, 410 and 425 to be occupied by Lumber Exchange Terminal, Inc. The majority of the property was shown to be used for lumber storage. A shed (approximately the same size as the current corrugated metal garage located in Area 1) was shown to have replaced the larger shed shown in the 1951 Map. The New York State Canal Terminal occupied a pier off of Block 2472.

Vacant land and four dry cement tanks were indicated south-adjacent to the subject property on Block 2520. The New York City Transit System Crosstown Depot was indicated east-adjacent to Block 2472. A steam laundry was indicated adjacent to the subject property on Block 2494. Residential and commercial buildings, industrial structures, a sheet metal works, a display fixture manufacturing facility, and a public park were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

1979

Sanborn Maps from 1979 indicated Block 2520, Lot 57; Block 2510; Block 2494, and Block 2502; Block 2472, Lots 2, 32, 100, 410 and 425 to be occupied by Lumber Exchange Terminal, Inc.

A two-story structure labeled ‘Metal Products’ and a two- to three-story manufacturing and commercial structure were indicated south-adjacent to the subject property on Block 2520. The New York City Transit System Crosstown Depot was indicated east-adjacent to Block 2472. In addition to the steam laundry, a sludge tank was indicated on Block 2474. Vacant land, residential and commercial buildings, industrial structures, manufacturing facilities, and a public park were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

1989

Sanborn Maps from 1989 indicated Block 2520, Lot 57; Block 2510; Block 2494, and Block 2502; Block 2472, Lots 2, 32, 100, 410 and 425 to be occupied by Lumber Exchange Terminal, Inc.

A two-story structure labeled ‘Devon Lithography, Inc.’ and a two- to three-story manufacturing and commercial structure were indicated south-adjacent to the subject property on Block 2520. The New York City Transit System Crosstown Depot was indicated east-adjacent to Block 2472. A steam laundry and a sludge tank were indicated on Block 2474. Vacant land, residential and commercial buildings, industrial structures, manufacturing facilities, and a public park were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

2000

Sanborn Maps from 2000 indicated Block 2520, Lot 57; Block 2510; Block 2494, and the southwestern portion of Block 2472 to be occupied by Lumber Exchange Terminal, Inc. The

northeastern portion of Block 2472 was shown to contain Two Guy's Towing and Auto Repair and a parking lot.

Vacant land, residential and commercial buildings, industrial structures, manufacturing facilities, a steam laundry, a sludge storage tank, and a public park were indicated south of Commercial Street and east of West Street on the subject property. No further significant changes were indicated for the subject property or for the surrounding area.

To summarize, the Sanborn maps indicate that the subject property was developed prior to 1887 and has maintained its industrial functions for more than 110 years. Construction for the current two-story brick office building on Area 1 was reportedly completed prior to 1887. Construction for the current corrugated metal garage also on Area 1 was reportedly completed prior to 1965. Block 2520, Lot 57 and Block 2510 reportedly contained the New York Dye - Wood Extract and Chemical Company ca 1887 through ca. 1905; the New York Quebracho Extract Company ca. 1916; and the Lumber Exchange Terminal, Inc. ca. 1942 through ca. 2000. Block 2502 reportedly contained A.K. Meserole & Company (a mason material and coal storage yard) and a portion of C. Winant's Spar Company ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard and a two-story lumber shed belonging to P.M. Dingee & Sons ca. 1905; Export Auto Case Company and vacant land ca. 1916; vacant land ca. 1942; and the Lumber Exchange Terminal, Inc. ca. 1951 through ca. 2000. Block 2472 was shown to contain a portion of C. Winant's Spar Company and Church and Reeves Lumber Yard ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard, the Bergen & Company Lumber Yard and the O'Rourke Engineering Construction Company ca. 1905; the Bergen & Company Lumber Yard, a portion of the New York State Barge Canal Terminal; a portion of Alberene Stone Company Tub Storage and vacant land ca. 1916; the New York State Canal Terminal, Greenpoint Coal Docks, Inc. and vacant land ca. 1942 through ca. 1951; and the Lumber Exchange Terminal, Inc. ca. 1965 through ca. 2000. Sanborn Maps from the year 2000 indicated Block 2472 to also contain Two Guys Towing and Auto Repair and a parking lot. Block 2494, Lot 1 was shown to contain dwellings and stores ca. 1887 through ca. 1905; a garage and repair shop with a tank house and an underground storage tank ca. 1916; vacant land ca. 1951; and the Lumber Exchange Terminal ca. 1965 through 2000.

4.1.2 Historical Aerial Photographs

Complete and thorough coverage was available for the subject property utilizing historical land-use maps. The maps typically include detailed information such as dates of construction, building occupants or a vacant status, and use and/or zoning use of structures on the site and surrounding area. Aerial photographs would most likely not provide additional, unique information that is pertinent to the environmental condition of the property. As such, aerial photographs were not reviewed for the project site.

4.1.4 Site Interviews

Mr. John Doyle, a 40-year employee of Lumber Exchange Terminal, Inc. and Mr. Ramon Quintero, a 19-year employee of Lumber Exchange Terminal, Inc. toured AKRF personnel during site inspection and answered all pertinent questions. Mr. Doyle stated that the Lumber Exchange Terminal property was assembled mostly in the 1930's and has served as a lumber yard until the 1980's, when the owner began to phase out lumber yard operations and began leasing portions of the property to industrial tenants, mainly for use as contractor's storage

yards. Mr. Doyle also stated that lumber was never pressure treated in the yard; it was simply stored, cut, and bundled for transport. To his knowledge, the only storage tanks on the property are two 550-gallon underground gasoline tanks associated with the pump in Area 1; one 550-gallon aboveground fuel oil tank associated with the two-story brick office building in Area 1; one 275-gallon aboveground storage tank of hydraulic oil and one 275-gallon aboveground storage tank of motor oil associated with the corrugated metal garage in Area 1; and one abandoned 275-gallon aboveground storage tank in Area 8. Additionally, Mr. Doyle stated that there were three mailing addresses that he knew for the property: 171 West Street, 237 Franklin Street, and 37 Commercial Street. These were the addresses used to search New York City Fire Department records. For more information, please see Section 2.0.

4.2 Regulatory Review

Toxics Targeting, Inc. of Ithaca, New York, was contracted to obtain information regarding the regulatory status of the property and the surrounding area. This information included records from databases maintained by the US EPA and New York State Department of Environmental Conservation (NYS DEC). AKRF reviewed these records to identify the use, generation, storage, treatment and/or disposal of hazardous materials and chemicals, or releases of such materials which may impact the project site. Copies of the pertinent sections of the Toxics Targeting, Inc. report are included in Appendix C.

4.2.1 Federal

The federal records reviewed included the National Priority List (NPL) Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); Emergency Response Notification System (ERNS); Toxic Chemical Release Inventory System (TRIS); the Permit Compliance System of Toxic Wastewater Discharges (WWD); and the US EPA Civil Enforcement Docket. The federal listing of facilities which are subject to corrective action under the Resource Conservation and Recovery Act (CORRACTS) is discussed with the State databases of RCRA listings.

National Priority List (NPL)

The NPL is the US EPA's database of some of the most serious uncontrolled or abandoned hazardous waste sites identified for probable remedial action under the Superfund Program. These sites may constitute an immediate threat to human health and the environment. Due to the amount of public attention focused on NPL sites, they pose a significant risk of stigmatizing surrounding properties and potentially impacting property values.

No NPL sites were identified within a one-mile radius of the project site.

Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS)

CERCLIS is a compilation of known or suspected, uncontrolled or abandoned hazardous waste sites which the US EPA has investigated, or plans to investigate, for a release or threatened release of hazardous substances pursuant to the Superfund Act of 1980 (CERCLA). Some of these sites may constitute a potential threat to human health and the environment. While it has been determined by the US EPA that some CERCLIS sites require no action, others could pose a real or perceived environmental threat to neighboring properties, thus impacting property values.

One CERCLIS sites was reported within a one-mile radius of the subject property. Brooklyn Union Gas / Williamsburgh Works, located at the intersection of Kent Avenue and North 12th Street, approximately 3,265 feet southeast of the subject property, is the location of a former manufactured gas plant. One of the byproducts produced during operation of the plant was a hydrocarbon tar, which was temporarily stored on the site until sold for use in roofing or road surfacing. This site was given a No Further Remediation Action Planned (NFRAP) listing. Furthermore, this site is located greater than a half-mile away from the subject property and any contamination would be expected to flow towards the East River.

Emergency Response Notification System (ERNS)

This federal database compiled by the Emergency Response Notification System records and stores information on reported releases of petroleum and other potentially hazardous substances.

The subject property is not currently listed as an ERNS site.

Toxic Chemical Release Inventory System (TRIS)

The TRIS contains information reported to the US EPA and/or NYS DEC by a variety of industries on their annual estimated releases of certain chemicals to the environment. The TRIS was mandated by Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986. Available information includes the maximum amount of chemicals stored on-site; the estimated quantity emitted into the air, discharged into bodies of water, injected underground, or released to land; methods used in waste treatment and their efficiency; and data on the transfer of chemicals off-site.

One TRIS sites was identified within a one-eighth mile radius of the project site. Liquimark, located at 19 Clay Street, approximately 410 feet northeast of the subject property, was listed in this database, however, no chemical information was provided.

Permit Compliance System of Toxic Wastewater Discharges (WWD)

This federal- and state- maintained database contains a listing of sites which discharge wastewater containing potentially hazardous chemicals.

No WWD facilities were reported within a one-eighth mile radius of the subject property.

United States Environmental Protection Agency Civil Enforcement Docket

This database is the US EPA's system for tracking civil judiciary cases filed on behalf of the agency by the Department of Justice.

No facilities are listed in the US EPA's Civil Enforcement Docket within a one-eighth mile radius of the subject property.

4.2.2 State

The state records reviewed included the listings of hazardous material spills (SPILLS), Resource Conservation and Recovery Act Notifiers (RCRA), Chemical Bulk Storage (CBS), Solid Waste Facilities (SWF), Petroleum Bulk Storage (PBS), State Inactive Hazardous Waste Disposal Sites (SHWS), Major Oil Storage Facilities (MOSF), and Air Discharge Facilities (ADF).

New York SPILLS Database

The New York SPILLS database includes a list of releases reported to the NYS DEC, including those attributed to tank test failures and tank failures. The tank test failures list only covers tanks that are below ground, while the tank failures list includes tanks that are either below or above ground. This database also lists spills that occur during the transportation of chemicals.

Sixty-five releases were reported within a quarter of a mile radius of the subject property, thirty three of which were within one-eighth of a mile. The closest active release involved the report of an one pint of unknown petroleum on three gallons of water in Manhole # 4273, located at the intersection of Freeman Street and West Street in April of 2000. The majority of other active spills reported within 450 feet of the subject property are either tank test failures or reports of discoveries of petroleum in manholes. These releases typically involve less than one gallon of spilled material, and most occurred aboveground and have been cleaned up with due diligence. Most small quantity on-land releases do not spread beyond the directly adjacent properties, and they are often contained within the immediate vicinity of the spill. As such, none of the listings for the surrounding area would be expected to have significantly affected the subject property.

Resource Conservation and Recovery Act (RCRA) Notifiers Listings

The NYS DEC's Bureau of Hazardous Waste Facility Compliance regulates hazardous waste from the point of generation to the point of disposal. The identified sites tracked on this list are those which have filed notification forms in accordance with the Resource Conservation and Recovery Act requirements regarding their hazardous waste activity. These sites include treatment, storage and disposal facilities (TSDs); small-quantity and large-quantity generators; and transporters of hazardous waste regulated under RCRA. The discussion below includes the CORRACTS listings (if any) of facilities which are subject to corrective action under RCRA.

One TSD facilities was identified within a one-mile radius of the subject area. Ten RCRA generators were listed within a one-eighth mile radius of the project site. Several of these industrial facilities with known generation of hazardous wastes (including halogenated solvents) are located up-gradient with respect to groundwater to the subject property. Several facilities have Class One RCRA violations, indicating releases may have occurred. Groundwater quality may have been impaired by these operations.

Kosan Industrial Corp., a treatment, storage and disposal facility located at 5-49 49th Avenue, is located north of Newtown Creek in Long Island City, therefore, it would not be expected to affect the subject property.

The following generators were listed within one-eighth mile of the subject property:

- NuHart Company, located at 49 Dupont Street, at the intersection of Franklin Street, across the street from the subject property, was listed twice as a Large Quantity Generator of Solid Wastes that exhibits the characteristics of ignitability and corrosivity, barium, spent halogenated solvents, and formaldehyde in 1990 and 1997. One Class One and one Class Two violation were listed for this facility;
- Consolidated Edison, located at 7466-7489 Huron Street, approximately 190 feet southeast of the subject property, was listed as a generator of lead in 1997;
- New York City Transit Authority, located at 65 Commercial Street, northeast adjacent to the subject property, was listed as a Large Quantity Generator of spent non-halogenated solvents, spent halogenated solvents; solid waste that exhibits the characteristic of ignitability, lead and benzene in 1992, 1993, 1996 and 1998. Two Class One violations were listed for this facility;
- Liquimark, located at 71 Green Street, approximately 205 feet southeast of the subject property, was listed in this database for generating solid waste that exhibits the characteristic

of corrosivity and spent non-halogenated solvents in 1994. Nine Class One violations were reported for this facility;

- Harte & Company, Inc., located at 77 Commercial Street, approximately 225 feet northeast of the subject property, was listed in this database as a Large Quantity Generator, however, no chemical information was provided;
- Pat & Doms Body & Fender Repair, located at 246 Franklin Street, approximately 300 feet east of the subject property, was listed as a Small Quantity Generator of five different kinds of waste in 1990;
- Huxley Envelope Corporation, located at 145 West Street, approximately 332 feet to the southeast of the subject property, was listed as a Large Quantity Generator of spent halogenated solvents used in degreasing in 1994. One Class One violation was reported for this facility;
- Interflo Technologies, located at 19 Clay Street, approximately 400 feet northeast of the subject property, was listed in this database for having generated four different kinds of waste in 1994 and 1995. Twenty-four violations were reported for this facility; and
- Electrical Precision Mete, located at 214 Franklin Street, approximately 470 feet southeast of the subject property, was listed in this database, however, not hazardous waste information was provided.

Chemical Bulk Storage (CBS) Database

The New York CBS is a list of facilities that store regulated non-petroleum substances in aboveground tanks with capacities greater than 185 gallons and/or in underground tanks of any size.

No CBS facilities were identified within a one-eighth mile radius of the subject property.

Solid Waste Facilities (SWF)

This database includes a listing of landfills, incinerators, transfer stations, recycling centers, and other sites that manage solid waste.

Fourteen SWFs were reported within a one-mile radius of the project site, the closest of which was DH Farney Contractors, Inc., located at 5502 Sencond Street, approximately 1270 feet north of the subject property. This facility was listed as a Large Transfer Station of residential waste. No waste is stored or disposed at transfer stations; waste is mainly transferred from small garbage trucks to larger vehicles for transportation to a landfill, recycling center or incinerator. These facilities are, therefore, unlikely to affect soil or groundwater conditions at the project site.

Petroleum Bulk Storage (PBS) Database

The New York State PBS lists commercial facilities with registered petroleum tanks located either above or below ground in excess of 1,100 gallons and less than 400,000 gallons.

Eleven PBS listings were reported within an eighth of a mile radius of the subject property, three of which are in the immediate vicinity. The closest three listings for bulk petroleum storage are summarized below:

- Eagle Street Association, located at 48 Eagle Street, directly across the street from the subject property, was listed as having two 10,000-gallon and one 6,000-gallon, closed-in-place, underground, #1, 2 or 4 fuel oil tanks;

- Rialto Products, Inc., located at 61-65 Green Street, directly across West Street from the subject property, was listed as having one, in-service, 2,000-gallon vaulted underground, #1, 2 or 4 fuel oil tank; and
- Deven Lithographers, Inc., located at 15 Huron Street, directly south-adjacent to the subject property on Block 2520, was listed as having one 5,000-gallon, underground, #1, 2 or 4 fuel oil tank.

It should also be noted that the Crosstown Bus Depot, located directly northeast-adjacent to the subject property, was listed as having seven closed underground and aboveground storage tanks with a total capacity of 18,320 gallons. This depot is located cross-gradient from the subject property with respect to groundwater and would therefore be less likely to have affected the subject property unless very large unreported releases occurred.

During site inspection, one 275-gallon aboveground storage tank of hydraulic oil and one 275-gallon aboveground storage tank of motor oil were observed in the corrugated metal garage in Area 1 and one abandoned 275-gallon aboveground storage tank was observed behind an office trailer in Area 8. Mr. Doyle reported that two 550-gallon underground gasoline tanks were associated with the fuel pump in Area 1 and one 550-gallon aboveground fuel oil tank was associated with the two-story brick office building in Area 1. The fuel oil tank was not observed during site inspection.

New York City Fire Department computerized records did not list any motor vehicle fuel tank of heating oil tanks for the subject property. New York City Buildings Department Block and Lot records for Block 2520, Lot 57 included a 1935 Fuel Oil Permit for a 550-gallon underground storage tank to be located directly outside of a two-story office, a 1935 blueprint showing a gasoline tank located at the northwest corner of a two-story brick building, and a 1938 Permit to install one 550-gallon gasoline tank and one fuel pump. New York City Buildings Department Block and Lot records for Block 2492, Lot 1 included a record showing one 550-gallon fuel oil tank within a two-story building. New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988.

State Inactive Hazardous Waste Disposal Site Registry (SHWS)

This database maintains information and aids decision-making regarding the investigation and clean-up of hazardous sites. The Registry's information includes the clean-up status, type of clean-up, types and quantities of contaminants involved, and the assessment of health and environmental concerns.

Six State listed inactive Hazardous Waste Sites were reported within a one-mile radius of the project site, however, all of these are located greater than one-half mile away from the subject property and are, therefore, unlikely to be of concern.

Major Oil Storage Facilities (MOSF) Database

These facilities may be on-shore facilities or vessels, with petroleum storage capacities of 400,000 gallons or more.

Eight MOSFs were reported within a 1-mile radius of the project site, however, all are located either in Long Island City (across Newtown Creek) or greater than one-half mile away from the subject property and are, therefore, not of concern.

Air Discharge Facilities Index (ADF)

This listing of sites tracked by the New York State Regulatory Compliance Information System includes address information on each facility and the source of its associated air emissions.

Twelve ADF listings were reported within a one-eighth mile radius of the subject property. The closest three listings are summarized below:

- Courier Packaging, Inc, at both 220 West Street and 48 Eagle Street, was listed as having the potential to release volatile organic compounds. The address listed for this facility, 220 West Street, would place it in Area 8 of the subject property, however, Courier Packaging, Inc. is not currently a tenant of the property. Therefore, the facility is likely located at 48 Eagle Street, directly across the street from the subject property;
- Consolidated Laundries; located at 32-48 Eagle Street, adjacent to Area 8 on the subject property, was listed in this database, however, no further information was provided; and
- NuHart & Company, located at 49 Dupont Street, approximately 40 feet northeast of the subject property, was listed twice in this database as having the actual or potential emissions of volatile organic compounds above the applicable major source thresholds. This facility was reportedly in violation with regard to procedural compliance.

4.2.3 Local

Records maintained by the New York City Fire and Buildings Departments were investigated to determine the potential presence of hazardous materials. These records typically include fuel oil, gasoline and waste oil tank installation applications and permits and records of prior uses. Mr. Doyle stated that there were three mailing addresses that he knew for the property: 171 West Street, 237 Franklin Street, and 37 Commercial Street. These were the addressed used to search New York City Fire Department records. Buildings Department records were requested for Block and Lots of the subject property, however, the following computerized records were available: Block 2472, Lot 410; Block 2492, Lot 1; Block 2510, Lot 1; and Block 2520, Lot 57. The following Block and Lot folders were available for review: Block 2494, Lot 1; Block 2502, Lot 1; and Block 2520, Lot 57. Copies of pertinent legible information are included in Appendix D.

New York City Fire Department computerized records did not list any motor vehicle fuel tank of heating oil tanks for the subject property.

New York City Buildings Department Block and Lot records for Block 2520, Lot 57 included an 1890 blue print for the construction of a brick building, a 1935 Fuel Oil Permit for a 550-gallon underground storage tank to be located directly outside of a two-story office, a 1935 blueprint showing a gasoline tank located at the northwest corner of a two-story brick building, a 1938 Permit to install one 550-gallon gasoline tank and one fuel pump, and a 1935 New Building Permit to construct a garage.

New York City Buildings Department Block and Lot records for Block 2492, Lot 1 included a record showing one 550-gallon fuel oil tank within a two-story building. This record indicated the property to be occupied by the Greenpoint Lumber Exchange.

New York City Buildings Department Block 2502, Lot 1 included a 1936 Demolition Permit for a frame dwelling house shown on the southeast corner of the block. This Permit was addressed to the Newtown Creek Coal and Coke Company, Inc.

New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our investigation, there appears to be a high potential for environmental impairments. The following concerns are noted:

The regulatory databases, Fire Department records, historical land-use atlases, and the visual site inspection indicate that the subject property has over a 100-year history of industrial use related primarily to the lumber and coal industries. Lumber Exchange Terminal, Inc, the current owner of the property, reportedly assembled the property in the 1930s, 1940s and 1950s. The owner began to phase out lumber yard operations in the 1980's when he began leasing portions of the property to industrial tenants, mainly for use as contractor's storage yards. Currently, only a small portion of the property remains occupied by Lumber Exchange Terminal, Inc. For the purpose of clarity, each Tax Block will be discussed individually (See Figure 2), and then potential environmental impairments located outside of the subject property will be discussed.

- **Tax Block 2520, Lot 57** - This portion of the property was historically occupied by a portion of the New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (also located on Block 2510); it was used for logwood, wagon and pattern storage. This Lot was also occupied by a portion of the New York Quebracho Extract Company ca. 1916 (also located on Block 2510); it contained a cooperage and a wagon house. Quebracho is a natural bark extract, rich in tannins, which is used to treat leather. Although quebracho is an organic substance, the process used to extract it may have involved the use or generation of hazardous materials or wastes. However, it appears this portion of the business was used more for storage than for manufacturing. Block 2520, Lot 57 was occupied by Lumber Exchange Terminal Inc. prior to 1942 through the present (Area 1 - Areas are shown in Figure 2). Other tenants currently occupying the Lot include Acquisitions Investment, Inc. (Area 2 - used for bus parking and minor repair) and Trochom Construction Corporation (a portion of Area 3 - used for auto parking and contractor's materials storage). This portion of the property currently contains a two-story brick office building (which first appeared on Sanborn Maps in 1887), a large corrugated metal garage (which first appeared on Sanborn Maps in 1965), and a small guard shed near the Green Street entrance. Surface staining was observed in Areas 1, 2, and 3. 20- and 30-cubic yard waste containers were observed in Areas 2 and 3, respectively.

  Suspect asbestos-containing materials, including boiler insulation, pipe insulation, spray-on fire proofing, floor and ceiling tiles were observed in the two-story brick building during site inspection. The roof was inaccessible at the time of inspection, however, due to the age of the structure, it can be assumed to contain asbestos. This structure was reportedly heated by fuel oil located in one 550-gallon tank enclosed behind a brick wall near the boiler room. In addition, one fuel pump was observed outside of the two-story brick building, which was reportedly serviced by two 550-gallon underground gasoline tanks. New York City Buildings Department Block and Lot records for Block 2520, Lot 57 included a 1935 Fuel Oil Permit for a 550-gallon underground storage tank to be located directly outside of a two-story office, a 1935 blueprint showing an underground gasoline tank located at the northwest corner of a two-story brick building, a 1938 Permit to install one 550-gallon underground gasoline tank and one fuel pump and a 1957 record showing one 550-gallon fuel oil tank within a two-story building. A search of computerized Fire Department records did not locate any heating or motor fuel oil records for the property.

The small guard shed may contain asbestos-containing and/or lead paint-containing materials, though none were observed during site inspection.

The eastern portion of the garage building was used primarily to store fork lifts and old car parts; the western portion of the garage was primarily used for the storage of car batteries, tires and tools. The area was illuminated with new-looking pole mounted fluorescent lights, however, old, ceiling mounted fluorescent lights (potentially with PCB-containing ballasts) were observed throughout the structure. One 275-gallon aboveground storage tank of hydraulic oil, one 275-gallon aboveground storage tank of motor oil and over twenty 55-gallon drums and several 5-gallon drums of petroleum products were observed in the eastern portion of the structure; several 55-gallon drums of lube oil and antifreeze and two oxygen and acetylene tanks were observed in the western portion. AKRF personnel were informed that auto and fork lift repair occurred in the areas directly east and west of the garage building. Severe surface staining and several 55-gallon drums of petroleum products were observed in these areas.

The fuel oil, gasoline, hydraulic oil and motor oil tanks; the 55- and 5-gallon containers of petroleum products; and the Block's current usage for auto repair could have contributed to petroleum contamination in soil and/or groundwater. The Block's former usage as a dye and chemical factory, as a quebracho extract company and as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site. Asbestos-containing and/or lead paint containing building materials could be present in the two-story brick office building and/or in the corrugated metal garage on the Block. Finally, mercury-containing fluorescent lights and/or PBC-containing ballasts could be present in lighting fixtures in on-site structures.

- **Tax Block 2510** - This portion of the property was historically occupied by a portion of the New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (also located on Block 2520, Lot 57); it contained a large logwood storage shed, a small oil storage shed, an area with 15 wooden dye tanks, a large tank house, and storage, cutting and manufacturing buildings. This Lot was also occupied by a portion of the New York Quebracho Extract Company ca. 1916 (also located on Block 2510); it contained several storage sheds and industrial buildings, a large tank room and two areas with dye wood tanks and logwood tanks. This portion of the business appeared to have been used both for manufacturing and for storage. Block 2510 was occupied by Lumber Exchange Terminal Inc. prior to 1942 through 1989. Tenants currently occupying the Block include Trochom Construction Corporation (a portion of Area 3 - used for contractor's materials storage), Bay Crane Services, Inc., (Area 4 - used for storage of cranes and other large construction vehicles), Safway Steel Products, Inc./ Spring Scaffolding (a portion of Area 6 - used for storage of scaffolding materials) and Hylan Electrical Contracting, Inc. (Area 7 - used for storage of materials used to install fiber optic cabling). 55-gallon drums of water-based curing compounds for concrete surfaces, hydraulic oil and white resin and several five-gallon drums of silicon sealant were observed in Area 3. Surface staining was also observed in Area 3. Generators, several fork lifts and 55-gallon drums of fiber optic cable lubricator were observed in Area 6. 20- and 30-cubic yard waste containers were observed in Areas 3 and 6, respectively.

  The 55- and 5-gallon containers of chemicals and petroleum products and the Block's former usage as a dye and chemical factory, as a quebracho extract company and as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site.

- **Tax Block 2502** - This portion of the property was historically occupied by A.K. Meserole & Company (a mason material and coal storage yard) and a portion of C. Winant's Spar Company ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard and a two-story lumber shed belonging to P.M. Dingee & Sons ca. 1905; Export Auto Case Company and vacant land ca. 1916; vacant land ca. 1942; and the Lumber Exchange Terminal, Inc. ca. 1951 through ca. 2000. Tenants currently occupying the Block include Trochom Construction Corporation (a portion of Area 3 - used for contractor's materials storage), River Hauling, Inc. (a portion of Area 5 - used for temporary storage and transport of large items), Safway Steel Products, Inc. (a portion of Area 6 - used for storage of scaffolding materials) and Far Better Towing, Inc. / R-D Towing Corporation (Area 8 - used for the storage of repossessed automobiles). 55-gallon drums of water-based curing compounds for concrete surfaces, hydraulic oil and white resin and several five-gallon drums of silicon sealant were observed in Area 3. Surface staining was observed in Areas 3 and 5. Pony generators, several fork lifts and 55-gallon drums of fiber optic cable lubricator were observed in Area 6. 20- and 30-cubic yard waste containers were observed in Areas 3 and 6.

  The 55-gallon containers of chemicals and petroleum products currently on-site and the Block's former usage as a lumber yard (if pressure treatment occurred on-site) could have contributed to hazardous materials contamination on-site. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Tax Block 2472, Lots 2, 32, 100, 410 and 425** - Block 2472 was historically occupied by a portion of C. Winant's Spar Company and Church and Reeves Lumber Yard ca. 1916; a portion of Nesmith and Constantine's Log Storage Yard, the Bergen & Company Lumber Yard and the O'Rourke Engineering Construction Company ca. 1905; the Bergen & Company Lumber Yard, a portion of the New York State Barge Canal Terminal; a portion of Alberene Stone Company Tub Storage and vacant land ca. 1916; the New York State Canal Terminal, Greenpoint Coal Docks, Inc. and vacant land ca. 1942 through ca. 1951; and the Lumber Exchange Terminal, Inc. ca. 1965 through ca. 2000. Sanborn Maps from the year 2000 indicated Block 2472 to also contain Two Guys Towing and Auto Repair and a parking lot. Current tenants include Far Better Towing, Inc. / R-D Towing Corporation (a portion of Area 8 - used to park repossessed automobiles), Lumber Exchange Terminal, Inc. (a portion of Area 1 - used to store lumber), River Hauling, Inc. (a portion of Area 5 - used for temporary storage and transport of large items), New York City Housing Authority (Area 9 - used to park cars and store materials), Henkles & McCoy (Area 10 - used to park cars and store contractor's materials), Supreme Trucking (Area 11 - used for parking and minor repair large cargo trucks and for the staging of large items), MWK Transport, Inc./SJK Transport (Area 12 - used for truck parking and the storage of materials), and Spring Scaffolding (Area 13 - used to store scaffolding materials). Several fork lifts, 55-gallon drums of hydraulic oil, a 20-cubic yard waste container and surface staining in several areas were observed in this portion of Area 5. It was reported that minor auto repairs, truck washing and tire changes were performed in Area 11. Several 55-gallon drums of lube oil were observed in Area 11. New York City Buildings Department computerized records for Block 2472, Lot 410 showed listings for Fuel Oil Permits for the following years: 1946, 1980, 1984 and 1988. It is unknown whether these potential tanks were located aboveground or underground.

  The 55-gallon containers of petroleum products currently on-site, the potential storage tanks on-site, the Block's former usage as a lumber yard (if pressure treatment occurred on-site), and

the Block's current use for auto repair could have contributed to petroleum and/or hazardous materials contamination on-site. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Block 2494, Lot 1** - Block 2494, Lot 1 was historically occupied by dwellings and stores ca. 1887 through ca. 1905; a garage and repair shop with a tank house and an underground storage tank ca. 1916; vacant land ca. 1951; and the Lumber Exchange Terminal ca. 1965 through 2000. Far Better Towing, Inc. / R-D Towing Corporation is the current occupant of the Lot (a portion of Area 8 - used to repair, park and auction seized vehicles). A trailer office and a one-story brick auto-repair shop were observed near the entrance to Area 8 (at the intersection of Franklin and Dupont Streets). The one-story building contained brick walls, concrete floors and a wood ceiling. The roof was not inspected, but can be assumed to contain asbestos. One 55-gallon drum of diesel fuel was observed in this building and three more were observed outside of the building. An employee of Far Better Towing, Inc. informed AKRF personnel that oil and tires are changed and minor repairs occur. No vehicles were reportedly fueled on the property. Piles of trash, tires, car parts, a tank of carbon dioxide gas and one 275-gallon abandoned aboveground storage tank were observed surrounding the trailer and the one-story structure.

  The 55-gallon containers of petroleum products currently on-site, the current and former auto-repair operation, the underground gasoline storage tank identified on the property, the hydraulic lift system identified on-site and the former usage as a lumber yard (if pressure treatment occurred on-site) could have contributed to petroleum and/or hazardous materials contamination on-site. Asbestos-containing and/or lead paint containing materials could be present in the one-story auto repair shop. Furthermore, illegal dumping of petroleum and/or hazardous materials could have occurred on historically vacant land.

- **Environmental Conditions Located Outside of the Subject Property** - In the New York State Resource Conservation and Recovery Act (RCRA) database, one Treatment, Storage, and Disposal facilities was identified within a one-mile radius of the subject area and ten RCRA generators were listed within a one-eighth mile radius of the project site. Several of these industrial facilities with known generation of hazardous wastes (including halogenated solvents) are located up-gradient with respect to groundwater to the subject property. Several facilities have Class One RCRA violations, indicating releases may have occurred. Groundwater quality may have been impaired by these operations.

RECOMMENDATIONS:

- AKRF recommends a Phase II Subsurface Site Investigation to determine the presence and possible extent of underground storage tanks as well as petroleum and/or hazardous materials contamination in on site soil and groundwater;

- AKRF recommends any identifies tanks be properly registered, if required, with the New York State Department of Environmental Conservation and the New York City Fire Department. Prior to any renovation or demolition activities with the potential to disturb known tanks, they should be

property assessed, closed and removed from the property in accordance with all federal, state and local regulations;

- Prior to any renovation or demolition activities with the potential to disturb suspect asbestos containing materials, an asbestos survey should be conducted. If these materials prove to contain asbestos, they should be properly removed and disposed of in accordance with all sate and federal regulations;

- Any renovation or demolition activities with the potential to disturb lead-based paint must be performed in accordance with the applicable Occupational Safety and Health Administration regulation (OSHA 29 CFR 1926.62 - Lead Exposure in Construction). Current New York State Department of Environmental Conservation guidance permits the disposal of construction materials covered with lead-based paint as demolition debris within an approved landfill; and

- The suspect mercury-containing fluorescent lights and suspect PCB-containing lighting fixtures do not currently present a potential hazard to human health. Unless there is labeling or test data to indicate they are not mercury- and/or PCB-containing, if disposal is required, it should be in accordance with applicable federal, state, and local regulations and guidelines.

6.0 QUALIFICATIONS

The purpose of this assessment was to convey a professional opinion about the potential presence or absence of contamination, or possible sources of contamination on the property and to identify existing and/or potential environmental problems associated with the property.

The assessment was performed in accordance with customary principles and practices in the environmental consulting industry and in accordance with ASTM Standard E1527-00, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Practice*. It is intended for use as a supplement to the property appraisal and is only to be used as a guide in determining the possible presence or absence of hazardous materials on the subject property at the time of the inspection. This assessment is based upon the review of readily available records relating to previous use of both the project site and the surrounding area, as well as a visual inspection of the current condition of the property. Environmental characteristics at this site and surrounding sites may be subject to change in the future.

This Phase I Assessment is not and should not be construed as, a guarantee, warranty, or certification of the presence or absence of hazardous substances, which can be made only with testing and contains no formal plans or recommendations to rectify or remediate the presence of any hazardous substances which may be subject to regulatory approval. This report is not a regulatory compliance audit.

A preliminary visual screening was performed to identify suspect asbestos-containing materials in readily accessible and visible areas. Hidden materials, such as those inside walls, crawl spaces and inside duct work were not accessed.

This report is based on services performed by AKRF, Inc. professional staff and observation of the site and its surrounding area. We represent that observations made in this assessment are accurate to the best of our knowledge and that no findings or observations concerning the potential presence of hazardous substances have been withheld or amended. The research and inspections have been carried to a level that meets accepted industry and professional standards. Nevertheless, AKRF and the undersigned shall have no liability or obligation to any party other than Park Tower Realty Corp. and their successors or assignees and AKRF's obligations and liabilities to the above, their successors or assignees is limited to fraudulent statements made, or negligent or willful acts or omissions.

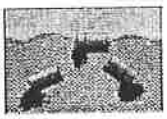
Toxic Site Databases Analyzed In Your Report

Search Radius

One-Mile 



1) ***New York Inactive Hazardous Waste Disposal Site Registry:*** a state listing of sites that can pose environmental or public health hazards requiring investigation or clean up.

One-Mile 

2) ***CERCLIS*** (Comprehensive Environmental Response, Compensation and Liability Information System): a federal listing of sites that can pose environmental or public health hazards requiring investigation or clean up.

One-Mile 

3) ***National Priority List for Federal Superfund Cleanup:*** a listing of sites known to pose environmental or health hazards that are being investigated or cleaned up under the Federal Superfund program.

One-Mile 

4) ***New York Hazardous Substance Disposal Site Draft Study:*** a state listing of sites contaminated with toxic substances that can pose environmental or public health hazards. These sites are not eligible for state clean up funding programs.

One-Mile 

5) ***New York Solid Waste Facilities Registry, including New York City 1934 Sites:*** active and inactive landfills, incinerators, transfer stations or other solid waste management facilities.

One-Mile 

6) ***New York State Major Oil Storage Facilities:*** sites with more than a 400,000 gallon capacity for storing petroleum products.

One-Mile 

7) ***New York and Federal Hazardous Waste Treatment, Storage or Disposal Facilities:*** sites reported by the NYS manifest system and the USEPA's Resource Conservation and Recovery Act Information System.

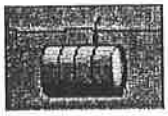
- ***RCRA violations:*** waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.
- ***RCRIS corrective action activity (CORRACTS):*** waste facilities with RCRIS corrective action activity reported by the USEPA.

Half-Mile 

8a) ***Toxic Spills: active*** stationary source spills reported to state environmental authorities, including unremediated leaking underground storage tanks.

Half-Mile 

8b) ***Toxic Spills: closed*** stationary and non-stationary source spills reported to state authorities, including remediated leaking underground storage tanks.

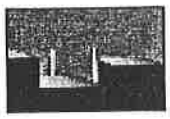


Quarter-Mile 

9) ***New York and Local Petroleum Bulk Storage Facilities:*** sites with more than an 1,100 gallon capacity for storing petroleum products.

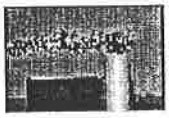
Quarter-Mile 

10) ***New York and Federal Hazardous Waste Generators and Transporters:*** sites reported by the NYS manifest system and the USEPA's Resource Conservation and Recovery Act Information System.



- ***RCRA violations:*** waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.
- ***RCRIS corrective action activity (CORRACTS):*** waste facilities with RCRIS corrective action activity reported by the USEPA.

Quarter-Mile 



11) ***New York Chemical Bulk Storage Facilities:*** Sites storing hazardous substances listed in 6 NYCRR Part 597 in aboveground tanks with capacities of 185 gallons or more and/or underground tanks of any size

Quarter-Mile 

12) ***New York Toxic Release Inventory Facilities:*** discharges of selected toxic chemicals to air, land, water or treatment facilities.

Quarter-Mile 

13) ***Historic New York City Utility Sites (1890's to 1940's):*** power generating stations, manufactured gas plants, gas storage facilities, maintenance yards and other gas and electric utility sites.

Quarter-Mile 

14) ***Air Discharges:*** Air pollution point sources monitored by U.S. EPA and/or state and local air regulatory agencies.

Quarter-Mile 

15) ***Federal Permit Compliance System Toxic Wastewater Discharges:*** permitted toxic wastewater discharges.

Quarter-Mile 

16) ***Federal Civil Enforcement Docket:*** civil judiciary cases filed on behalf of the U. S. Environmental Protection Agency by the Department of Justice.

Property only 

17) ***ERNS: Federal Emergency Response Notification System Spills:*** a listing of federally reported spills.

Limitations Of The Information In Your Report

The information presented in your *Computerized Environmental Report* has been obtained from various local, state and federal government agencies. Please be aware that: **1)** additional information on individual sites may be available, **2)** newly discovered sites are continually reported and **3)** all map locations are approximate. As a result, this report is intended to be the FIRST STEP in the process of identifying and evaluating possible environmental threats to specific properties and can only serve as a guide for conducting on-site visits or additional, more detailed toxic hazard research.

Toxics Targeting tries to ensure that the information in your report is presented accurately and with minimal alteration. The only systematic changes that are made correct obvious address errors in order to allow sites to be mapped. Any address changes that are made are noted in the map information section at the top of each corresponding *Toxic Site Profile*. Since the information presented in your report is not edited, please be aware that it can contain reporting errors or typographical mistakes made by the site owners/operators or government agencies that produced the information. Please be aware of some other limitations of the information in your report:

- The computerized map used by *Toxics Targeting* is the same one used by the U. S. Census. While the map is generally accurate, no map is perfect. In addition, *Toxics Targeting's* mapping methods estimate where toxic site addresses are located if the address is not specifically designated on the Census map. FOR THESE REASONS, ALL MAP LOCATIONS OF ADDRESSES AND REPORTED TOXIC SITES SHOULD BE CONSIDERED APPROXIMATE AND SHOULD BE VERIFIED BY ON-SITE VISITS;

- UNDISCOVERED, UNREPORTED OR UNMAPPABLE TOXIC SITES MIGHT NOT BE IDENTIFIED BY THIS REPORT'S CHECK OF 17 TOXIC SITE CATEGORIES. TOXIC SITES REPORTED IN OTHER GOVERNMENT DATABASES MIGHT ALSO EXIST. FOR THESE REASONS, YOUR REPORT MIGHT NOT IDENTIFY ALL THE TOXIC SITES THAT EXIST IN THE AREA IT SEARCHES;

- The appendix of your report contains a listing of sites that could not be mapped due to incomplete or erroneous address information or other mapping problems. This listing includes unmappable toxic sites in zip code areas within one mile of the target address as well as toxic sites without zip codes reported in the same county. IF YOU WOULD LIKE INFORMATION ON ANY OF THE LISTED SITES, PLEASE CONTACT *TOXICS TARGETING AND REFER TO THE SITE ID NUMBER.*

- Some toxic sites identified in your report may be classified as **known hazards**. Most of the toxic sites identified in your report involve **potential hazards** related to the on-site use, manufacture, handling, storage, transport or disposal of toxic chemicals. Some of the toxic sites identified in your report may be the addresses of parties responsible for toxic sites located elsewhere. YOU SHOULD ONLY CONCLUDE THAT TOXIC HAZARDS ACTUALLY EXIST AT A SPECIFIC SITE WHEN GOVERNMENT AUTHORITIES MAKE THAT DETERMINATION OR WHEN THAT CONCLUSION IS FULLY DOCUMENTED BY THE FINDINGS OF AN APPROPRIATE SITE INVESTIGATION UNDERTAKEN BY LICENSED PROFESSIONALS;

- Compass directions and distances are approximate. Compass directions are calculated from the subject property address to the mapped location of each identified toxic site. The compass direction does not necessarily refer to the closest property boundary of an identified toxic site. The compass direction also can vary substantially for toxic sites that are located very close to the subject property address.

- The information presented in your report is a summary of the information that *Toxics Targeting* obtains from government agencies on reported toxic sites. YOU MAY BE ABLE TO OBTAIN ADDITIONAL INFORMATION ABOUT REPORTED SITES WITH THE FREEDOM OF INFORMATION REQUEST FORM LETTERS THAT ARE PROVIDED ON THE INSIDE OF THE BACK COVER.

How Toxic Site Locations Are Mapped

Toxics Targeting maps toxic site locations on a computerized version of the U. S. Census map using addresses and map coordinates provided by site owners/operators or government agencies. In order to allow site locations to be verified independently, the information used to map each site is presented in the first section of each *Toxic Site Profile,* along with a description of the mapping technique used and any address corrections that were made in order to locate toxic sites with incomplete or inadequate site location information. The mapping process is explained below.

Map Identification Number: 12 Site Name: Acme World Manufacturing, Inc.

Site Address: 55 Main Street Anytown, NY 11797

MAP LOCATION INFORMATION

Site location mapped by:

Address Matching

1) Most toxic sites are mapped by matching addresses provided by site owners/operators or government agencies with locations on a computerized version of the U. S. Census map. These site locations are identified "address-matched."

Note: Some sites have an address match location and a map coordinate location. Both locations are mapped because they can be equally correct.

or Map Coordinate

2) Some toxic sites are located using map coordinates provided by site owners/operators or governnent agencies. These site locations are identified "map coordinate." Map coordinates for Toxics Wastewater Discharges, Toxic Release Inventory sites and Major Oil Storage Facilities should be considered suspect .

or Manual Mapping

or Site Visit

3) Incomplete addresses or map coordinates require some site locations to be determined by commercial street maps (manual mapping), site visits, map coordinates from other databases and address location services. Application of any of these methods is identified accordingly.

ADDRESS CHANGE INFORMATION

Revised Street: NO CHANGE

Revised zip code: NO CHANGE

4) Site addresses are sometimes corrected to eliminate obvious errors that prevent sites from being mapped. All address corrections are noted here.

Information Source Guide

Toxics Targeting's Computerized Environmental Reports contain government and other information compiled on 17 categories of reported known or potential toxic sites. Each toxic site database is described below with information detailing a) the source of the information, b) the date when each database is covered to and c) when *Toxics Targeting* obtained the information..

1) **Inactive Hazardous Waste Disposal Site Registry**: New York State database that maintains information and aids decision making regarding the investigation and cleanup of toxic sites. The Registry's data includes two-page profiles noting site name, ID number, description, classification, cleanup status, types of cleanup, owner information, types and quantities of contaminants, and assessment of health and environmental problems. ASTM required.* Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2]
Profile data updated through: 5/24/2000. Data obtained by Toxics Targeting: 10/5/2000.
New Facilities updated to: 5/24/2000. Data obtained by Toxics Targeting: 10/5/2000.

2) **CERCLIS**: Toxic sites listed in the Federal Comprehensive Environmental Response, Compensation and Liability Information System. NPL sites are also included in CERCLIS. ASTM required.* Fannie Mae required.**
Source: U. S. Environmental Protection Agency.[1]
Profile data updated through: 12/28/2000. Data obtained by Toxics Targeting: 2/4/2001.
New Facilities updated through: 12/28/2000. Data obtained by Toxics Targeting: 2/4/2001.

3) **National Priority List for Federal Superfund Cleanup**: Toxic sites nominated for cleanup under the Federal Superfund program. Annual compilation of special two-page detailed profiles of NPL sites. ASTM required.* Fannie Mae required.**
Source: U. S. Environmental Protection Agency.[1]
Profile data updated from: 6/2000-9/2000. Data obtained by Toxics Targeting: 2/1/2001.
New Facilities updated through: 12/19/2000. Data obtained by Toxics Targeting: 2/1/2001.

4) **Hazardous Substance Waste Disposal Site Study**: NYS database of waste disposal sites that may pose threats to public health or the environment, but cannot be remediated using monies from the Hazardous Waste Remedial Fund.
Source: New York State Department of Environmental Conservation.[2]
Data updated to: 5/16/2000. Data obtained by Toxics Targeting: 5/16/2000.

5) **Solid Waste Facilities**: NYS database of solid waste facilities, including, but not limited to, landfills, incinerators, transfer stations, recycling centers. ASTM required.* Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2]
Data updated to: 1/01/1998. Data obtained by Toxics Targeting: 6/30/1998.

Also includes a listing of solid waste disposal sites operated by New York City municipal authorities circa 1934.
Source: City of New York Department of Sanitation (1984). Waste Disposal Problem in New York City: A Proposal For Action.

6) **Major Oil Storage Facilities**: NYS database of facilities licensed pursuant The to Article 12 of the Navigation Law, 6NYCRR Parts 610 and 17NYCRR Part 30, such as onshore facilities or vessels, with petroleum storage capacities equal to or greater than four hundred thousand gallons. Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2] Data update schedule: rolling basis.
New facilities updated through: 7/1/2000. New facilities data obtained by Toxics Targeting: 7/17/2000.
Tank data updated through: 7/1/2000. Tank data obtained by Toxics Targeting: 7/17/2000.

7) **RCRA Hazardous Waste Treatment, Storage or Disposal Facility Databases:**

(a) **Manifest Information**: New York State database of hazardous waste facilities and shipments regulated by the DEC's Bureau of Hazardous Waste Facility Compliance pursuant to New York State Law and the Resource Conservation and Recovery Act (RCRA).
ASTM required.* Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2]
Manifest transactions data updated to: 1/01/1999. Manifest transactions data obtained by Toxics Targeting: 3/27/1999.
New facilities updated through: 1/01/1999. New facilities obtained by Toxics Targeting: 3/27/1999.

(b) **Notifier Information**: U. S. Environmental Protection Agency database of hazardous facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
ASTM required.* Fannie Mae required.**
Source: U. S. Environmental Protection Agency[1]
New facilities updated through: 3/26/1998. Data obtained by Toxics Targeting: 4/9/1998.
Data attributes updated through: 12/22/1998. Data obtained by Toxics Targeting: 3/30/1999.

(c) **RCRA Violations Information:**
U. S. Environmental Protection Agency database of violations data reported for facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
Source: U. S. Environmental Protection Agency[1]
New facilities updated through: 3/26/1998. Data obtained by Toxics Targeting: 4/9/1998.
Data attributes updated through: 12/23/1998. Data obtained by Toxics Targeting: 12/30/1998.

(d) **RCRIS Corrective Action Activity (CORRACTS) Information:** U. S. Environmental Protection Agency (EPA) database of hazardous waste facilities with corrective action activity. This data is part of the RCRIS National Oversight database.
Source: U. S. Environmental Protection Agency[1]
Data updated through: 4/20/2000. Data obtained by Toxics Targeting: 5/10/2000.

8) **Spills Information Database:** Spills reported to the DEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from Petroleum Bulk Storage Regulations) or 6 NYCRR Section 595.2 (from Chemical Bulk Storage Regulations). The database includes *active* and *closed* spills reported between 4/1/1986 and 4/1/2001.
ASTM required.* Fannie Mae.** Source: NYS Department of Environmental Conservation.[2]
New spill additions data updated through: 04/01/2001. New spill additions data obtained by Toxics Targeting: 04/46/2001.
Spill attribute data updated through: 04/01/2001. Spill attribute data obtained by Toxics Targeting: 04/26/2001.

Active spills: paperwork not completed. Closed spills: paperwork completed.
Both active and closed spills may or may not have been cleaned up (see Date Cleanup Ceased in spill profiles).

9) **Petroleum Bulk Storage Facilities:** Local and State databases of aboveground and underground petroleum storage facilities with a combined storage capacity over 1,100 gallons. ASTM required.* Fannie Mae required.**

All New York Counties except Cortland, Nassau, Rockland, and Suffolk:
Source: NYS Department of Environmental Conservation.[2]
Update schedule: rolling basis, with summary compilations made available approximately every three months
Facility data updated through: 1/1/2001 (10/1/98 for Westchester Co.). Facility data obtained by Toxics Targeting: 2/16/2001.
Tank data updated through: 1/1/2001 (10/1/98 for Westchester Co.). Tank data obtained by Toxics Targeting: 2/16/2001.

Nassau County:
Heat producing products and other products with less than 1,000 gallons storage capacity:
Source: Nassau County Department of Health.[3] Data update schedule: rolling basis
Data updated through: 10/4/2000. Data obtained by Toxics Targeting: 11/5/2000.

Generally non-heat producing products with more than 1,000 gallons storage capacity:
Source: Nassau County Fire Marshall. [4] Data update schedule: rolling basis with annual update
Data updated through: 9/27/1996. Data obtained by Toxics Targeting: 11/20/1996.

Rockland County:
Source: Rockland County Department of Health. [5]
Data updated through: 8/11/1998. Data obtained by Toxics Targeting: 8/17/1998.

Suffolk County:
Source: Suffolk County Department of Health Services. [6]
Data updated through: 1/12/1999. Data obtained by Toxics Targeting: 2/26/1999.

10. **RCRA Hazardous Waste Generators and/or Transporters Databases:**

(a) **Manifest Information:** New York State database of hazardous waste facilities and shipments regulated by the New York State Department of Environmental Conservation's Bureau of Hazardous Waste Facility Compliance pursuant to New York State Law. ASTM required.* Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2]
Manifest transactions data updated to: 1/01/1999. Manifest transactions data obtained by Toxics Targeting: 3/27/1999.
New facilities updated through: 1/01/1999. New facilities obtained by Toxics Targeting: 3/27/1999.

(b) **RCRA Notifier Information:** U. S. Environmental Protection Agency database of hazardous waste facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
Source: U. S. Environmental Protection Agency[1]
New facilities updated through: 3/26/1998. Data obtained by Toxics Targeting: 4/9/1998.
Data attributes updated through: 12/22/1998. Data obtained by Toxics Targeting: 3/30/1999.

(c) **RCRA Violations Information**: U. S. Environmental Protection Agency database of violations data reported for facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
Source: U. S. Environmental Protection Agency[1]
New facilities updated through: 3/26/1998. Data obtained by Toxics Targeting: 4/9/1998.
Data attributes updated through: 12/23/1998. Data obtained by Toxics Targeting: 12/30/1998.

(d) **RCRIS Corrective Action Activity (CORRACTS) Information**: U. S. Environmental Protection Agency (EPA) database of hazardous waste facilities with corrective action activity. This data is part of the RCRIS National Oversight database.
Source: U. S. Environmental Protection Agency[1]
Data updated through: 4/20/2000. Data obtained by Toxics Targeting: 5/10/2000.

11) **Chemical Bulk Storage Facilities**: New York State database of facilities compiled pursuant to 6NYCRR Part 596 that store regulated substances listed in 6NYCRR Part 597 in aboveground tanks with capacities greater than 185 gallons and /or in underground tanks of any size. ASTM required.* Fannie Mae required.**
Source: New York State Department of Environmental Conservation.[2]
Data updated through: 4/1/2000. Data obtained by Toxics Targeting: 4/7/2000.

12) **Toxic Release Inventory**: New York State and Federal database of manufacturing facilities required under Section 313 of the Federal Emergency Planning and Community Right-to-Know Act to report releases to the air, water and land of any specifically listed toxic chemical. See Fannie Mae requirement** below.
Source: NYS Department of Environmental Conservation[2]/U. S. Environmental Protection Agency.[1]
Data update schedule: rolling basis, with annual information summary for previous year's activities available from NYSDEC each July 1, with corrections and additional information available approximately mid-August.
Data updated through: 5/9/1996. Data obtained by Toxics Targeting: 5/14/1996

13) **Historic New York City Utility Facilities (1898 to 1950)**: An inventory of selected power generating stations, manufactured gas plants, gas storage facilities, maintenance yards and other gas and electric utility sites identified in various historic documents, maps and annual reports of New York utility companies, including: Sanborn Fire Insurance Maps of NYC (1898-1950); Consolidated Edison Co. Annual Reports (1922-1939); Consolidated Edison Co. Map: "Boroughs of Manhattan and the Bronx Showing Distribution Mains of the New York Edison Co.," (1922); and Consolidated Edison document: "Generating and Annex Stations," (1911).

14) **Air Discharge Facilities**: EPA AIRS database containing address information on each air emission facility and the type of air pollutant emission it is. Compliance information is also provided on each pollutant as well as the facility itself.
See Fannie Mae requirement** below. Source: U. S. Environmental Protection Agency[1]
Data updated through: 11/24/1999. Data obtained by Toxics Targeting: 1/06/2000

15) **Toxic Wastewater Discharges (Permit Compliance System)**: Federal database of discharges of wastewater to surface waters and groundwaters. See Fannie Mae requirement** below. Source: U. S. Environmental Protection Agency.[1]
Data updated through: 9/23/1996. Data obtained by Toxics Targeting: 9/30/1996

16) **U. S. Environmental Protection Agency Civil Enforcement Docket**: This database is the U. S. EPA's system for tracking civil judiciary cases filed on behalf of the agency by the Department of Justice. Fannie Mae required.**
Source: U. S. Environmental Protection Agency.[1]
Date updated through: 4/1996. Date information obtained by Toxics Targeting: 8/1996

17) **Emergency Response Notification System (ERNS)**: Federal database of spills compiled by the Emergency Response Notification System. ASTM required.* See Fannie Mae requirement** below. Source: U. S. Environmental Protection Agency.[1]
Data updated through: 1/31/2000. Data obtained by Toxics Targeting: 2/15/2000

*American Society of Testing Materials Standards on Environmental Site Assessments for Commercial Real Estate (E 1527-93, E 1528-93).
** Fannie Mae's Part X Environmental Hazards Management Procedures specify 1.0 mile searches for "any state or Federal list of hazardous waste sites (e.g. CERCLIS, HWDMS etc.)." Searches for the property and adjacent properties are specified for "chemical manufacturing plants," "obvious high risk neighbors engaging in storing or transporting hazardous waste, chemicals or substances" and "...any documented or visible evidence of dangerous waste handling... (e.g. stressed vegetation, stained soil, open or leaking containers, foul fumes or smells, oily ponds, etc." Searches for property and adjacent properties can include sites up to a quarter mile away (W. Hayward, Director, Multi-Family Business Planning and Control, Fannie Mae, personal communication, 5/94).

Appendix A - Boring Logs
Appendix B - Laboratory Analytical Results

1.0 INTRODUCTION

A subsurface investigation was performed on the approximately 20+-acre Greenpoint Lumber Yard Site (Project Site or Site) in the Greenpoint neighborhood of Brooklyn, New York to identify potential contamination in the soil and groundwater. The Project Site consists of Tax Block 2472, Lots 1, 32, 100, 410 and 425; Tax Block 2494, Lot 1; Tax Block 2502, Lot 1; Tax Block 2510, Lot 1; and Tax Block 2520, Lot 57. The subject blocks are generally bounded to the north by Newtown Creek; to the east by portions of Commercial, Franklin and West Streets; to the south by Huron Street; and to the west by the East River. Please see Figure 1 for Project Site Location.

The Phase II Environmental Site Investigation addresses recommendations made by AKRF, Inc. in a Phase I Environmental Site Assessment performed on the Project Site in July 2001. The Investigation was performed on August 16 and 17, 2001. Five soil borings and five soil boring / groundwater monitoring wells were completed as part of the investigation. This report summarizes the results of the soil and groundwater testing and includes conclusions and recommendations.

The Greenpoint Lumber Yard site has over a 100-year history primarily as a lumber yard. Other historical non-lumber-related uses included:

- New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (Tax Block 2520, Lot 57 and Tax Block 2510);
- New York Quebracho Extract Company ca. 1916 (Tax Block 2520, Lot 57 and Tax Block 2510);
- A.K. Meserole & Company, a mason material and coal storage yard) ca. 1916 (Tax Block 2502);
- C. Winant's Spar Company ca. 1916 (Tax Block 2502);
- Export Auto Case Company ca. 1916 (Tax Bloxk 2502);
- O'Rouke Engineering and Construction Company ca. 1905 (Tax Block 2472);
- New York State Barge Canal Terminal and Alberene Stone Company Tub Storage ca. 1916 (Tax Block 2472);
- Greenpoint Coal Docks, Inc. ca. 1942 through ca. 1951 (Tax Block 2472).

The main environmental concerns related to the redevelopment of the site include potential former site usage for pressure-treating lumber, an on-site former extract and chemical company, current auto repair and auto parking uses and several potential underground petroleum storage tanks. Lumber yards, where pressure treatment occurred, are typically contaminated with creosote (a coal tar derivative, which contains elevated levels of polyaromatic hydrocarbons and phenols) or with heavy metals (such as chromium or arsenic). Substances used by the chemical and extract companies could have impacted subsurface soil and/or groundwater with any number of contaminants. Additionally, aboveground and potential underground storage tanks were noted in the Phase I report and portions of the property are currently used for auto repair. In the areas

of known or potential tanks, subsurface petroleum and/or PCB contamination could be present. Solvent contamination could be present in areas historically used for auto repair.

1.1 Site Description

The Project Site currently contains the following structures: a two-story brick and concrete office, a small brick guard shed and a large corrugated metal garage near the intersection of Green and West Streets; and a second brick guard shack, which has been converted for auto repair, at the intersection of Dupont and Franklin Streets. The remainder of the property consists of open areas which are used by 13 tenants, primarily for contractor's materials storage.

The surface topography on the Project Site generally slopes downward to the north, toward Newtown Creek and to the west, toward the East River. Based on reports compiled by the U.S. Geological Survey, the surface elevation of the Site is approximately five to fifteen feet (National Geodetic Vertical Datum of 1929), depending on the area of the Site. Groundwater is located approximately six to fifteen feet below the surface of the site. The expected direction of groundwater flow would be to the north, toward Newtown Creek and/or to the west, toward the East River.

1.2 Previous Studies

A Phase I Environmental Site Assessment was performed by AKRF, Inc. in July 2001 on the Project Site. An Addendum to the Phase I Environmental Site Assessment was issues by AKRF, Inc. on July 17, 2001. The Phase I Assessment met the requirements of the American Society for Testing and Materials (ASTM), as established by ASTM Standard E 1527-00, and included a site inspection, a review of historical fire insurance (Sanborn) maps and a review of federal, state and local regulatory databases. Recognized environmental conditions included former site usage as a lumber yard and the possible former on-site pressure treatment of lumber; a former on-site chemical and extract company; the current use for auto parking and repair; and aboveground and potential underground petroleum storage tanks.

2.0 SOIL BORINGS AND MONITORING WELLS

2.1 Summary of the Site Investigation

Soil and groundwater boring and sampling activities occurred on August 16 and 17, 2001. AKRF's field crew consisted of Mimi Sotiriou and Melissa McGoogan. Aquifer Drilling and Testing advanced the soil borings and installed temporary groundwater monitoring wells.

Five soil borings and five soil boring / groundwater monitoring wells were completed. The borings were biased towards the location of the former chemical and extract

companies, areas near potential underground storage tanks, and areas where lumber storage and possible treatment occurred. Please see Figure 2 for the Boring and Monitoring Well locations. Borings were advanced to groundwater level except B-2, where refusal was encountered three times at 3' below grade. MW-1, MW-2 and MW-4 served as up-gradient sampling locations with respect to groundwater.

2.2 Soil Sampling Methodology

At each sampling location, a Geoprobe rig was used to drive a sampling probe into the soil. Soil samples were collected by driving the soil sampling probe with a four-foot teflon liner into the soil at four foot intervals until groundwater was reached. Soil gas was screened in the teflon liner at one foot intervals using a photoionization detector (PID). Two soil samples were collected from each boring location based on field observations. If no field contamination was apparent (visual, odor or PID readings), a sample from the two foot interval immediately beneath the original ground surface (excluding any overlying asphalt or concrete) and a sample from the groundwater interface were collected. The soil samples were containerized in accordance with EPA analytical protocols. Each sample was labeled, sealed, and chilled in a cooler for shipment to the laboratory. Soil samples were analyzed for volatile organic compounds (EPA Method 8260), semivolatile organic compounds (EPA Methods 8270) and target analyte list metals (EPA Method 6010). Selected surface soil samples were tested for polychlorinated biphenyls (PCBs) and pesticides (EPA Methods 8081 and 8082, respectively). Where insufficient material was collected, parameters were selected based on field observation. Please see Table 1 in the Tables section of this report for a summary of analytical parameters.

Nine soil borings were completed to groundwater depth. Refusal was encountered at one location (B-3) at 3' below grade; groundwater was not encountered at this location. Please see Appendix A for Boring Logs.

2.3 Groundwater Sampling Methodology

At five locations, the sampling probe was driven down to approximately four feet beneath the groundwater table to recover a sample of groundwater. Once this depth was reached, a two-inch screen was installed below the water table to extract a groundwater sample. Dedicated Teflon tubing was used to attempt to evacuate at least five well volumes prior to sampling for each well. The groundwater samples were containerized in accordance with EPA analytical protocols. Each sample was labeled, sealed, and chilled in a cooler for shipment to the laboratory. Groundwater samples were analyzed for volatile organic compounds (EPA Method 8260), semivolatile organic compounds (EPA Methods 8270) and target analyte list metals (EPA Method 6010) (both filtered and unfiltered samples).

2.4 Chain of Custody

To ensure the integrity of samples taken, a strict chain of custody record was maintained on each sample. This began after sampling with the entry in the sampler's field log book of the sampling details:

a) Date and time of sampling;
b) Sample location (as specific as possible);
c) The unique sample number, size, and container(s) used;
d) Sample description;
e) Weather conditions (if applicable); and
f) Any additional comments.

In addition, a record was kept of the sample's progress from the sample site to the laboratory where it was analyzed. This was the chain-of-custody form. The form included:

a) The sample number;
b) The sampler's name;
c) Date and time of sampling;
d) Location at which the sample was taken, including the address, if possible;
e) A description of the sample, as best known;
f) Signatures of people involved in the chain of possession; and
g) Inclusive dates of possession of each person in the chain.

The chain-of-custody form accompanied the sample throughout its trip to the laboratory. Accompanying the chain-of-custody record, or included in it, was a request to the laboratory for sample analyses. Information required included:

a) Name of person receiving the sample;
b) Laboratory sample number;
c) Date of sample receipt;
d) Sample allocation; and
e) Analyses to be performed.

Finally, on arrival at the laboratory, the sample custodian entered the sample in the laboratory's sample log book. The chain-of-custody is kept on file at the laboratory.

2.5 Laboratory Testing

American Analytical Laboratories (NYSDOH certified, #11418) of Farmingdale, New York, a New York State ELAP-certified laboratory performed all laboratory analysis. The laboratory operates a Quality Assurance/Quality Control (QA/QC) program that

consists of proper laboratory practices (including the required chain-of-custody), an internal quality control program, and external quality control audits by New York State.

3.0 SAMPLE ANALYSIS RESULTS

The analytical data is summarized in eight tables in the Tables section of this report. Complete analytical results, including compounds not detected, are in Appendix B of this report. Soil samples are designated by the boring location and depth below grade. For example, B-3(5'-7') is from boring location B-3 at a depth of five to seven feet below grade. Soil analysis data was generally evaluated relative to the Recommended Soil Clean-up Objective values in the NYS DEC Division of Hazardous Waste Remediation document TAGM 4046, issued in 1994. Groundwater data was evaluated relative to the GA Standards and Guidelines Values contained in NYS DEC TOGS 1.1.1 Ambient Water Quality Handling, Guidance Values and Groundwater Effluent Limitations.

3.1 Field Conditions

Borings were advanced to between three and fifteen feet below grade. Refusal occurred three times at 3 feet below grade at B-2. Because a limited amount of soil was recovered from this boring, only one sample was analyzed from 0'-1' below grade.

The subsurface materials encountered consisted primarily of fill material. The soil was mostly brown to black sand and clay with fragments of schist and pebbles. Wood chips, bricks, coal, ash and slag were noted in the fill material. Coal and ash were mostly observed in borings from the north central portion of the Site (B-4, B-5 and MW-3). The Phase I Environmental Site Assessment stated that a former coal storage yard was indicated on Block 2502 in Sanborn Maps from 1916 and Greenpoint Coal Docks, Inc. was indicated on Tax Block 2472 in Sanborn Maps from 1941 and 1951. Wood chips and bricks were mostly observed in borings from the southern portion of the site (B-1, B-2, B-3, and MW-2). Petroleum odors and elevated PID readings were noted in MW-1, which was located near an operational gas pump and near underground petroleum storage tank(s). An unusual organic- or petroleum-like odor was observed in MW-2 on Block 2502, which also historically contained an extract and a chemical company.

Only a limited amount of groundwater was recovered from all five groundwater wells on-site. Therefore, the wells were not purged prior to sampling and whatever liquid was recovered was used for sample material. After the liquid settled in the sample containers, sediment was evident in most jars.

3.2 Volatile Organic Compounds

Please see Table 2 for a summary of detected volatile organic compounds in soil and groundwater samples. Acetone was detected in B-1(1'-2'), B-1(4'-5'), MW-1(5'-6'), MW-1(8'-9'), MW-2(5'-7') and MW-2(9'-11'). Although two of the levels of acetone detected

(290 ppb and 780 ppb) are above the TAGM Recommended Soil Cleanup Objective, acetone is most likely a field and/or laboratory artifact and likely not actually present in the soil. No other volatile organic compounds were detected in soil samples

Several volatile organic compounds were detected in the groundwater sample from MW-1, including ethylbenzene (8 ppb); m+p xylene (14 ppb); o-xylene (8 ppb); 1,3,5-trimethylbenzene (8 ppb); and 1,2,4-trimethylbenzene (30 ppb). These compounds are typically associated with gasoline. This well is located near a gasoline pump and potential petroleum underground storage tanks. All detected levels were less than the NYS DEC Class GA Drinking Water Standard. No other volatile organic compounds were detected in groundwater samples.

3.3 Semivolatile Organic Compounds

Please see Tables 3 and 4 for a summary of detected semivolatile organic compounds in soil and groundwater samples. The vast majority of the semivolatile organic compounds detected in the soil samples were polycyclic aromatic hydrocarbons (PAHs). PAHs are a class of compounds found in ash, coal, coal tar, coal ash and some petroleum products. PAHs are widely distributed in the urban environment, and the levels detected are generally typical of urban fill material. Borings in the vicinity of the former on-site coal yard (B-3, B-4, B-5 and MW-3) exhibited the most elevated levels of PAHs. Naphthalene was noted in several boring (B-1, B-3, MW-1, MW-2, MW-3 and MW-4), which may be indicative of petroleum contamination. However, the detected levels of naphthalene were all below the TAGM Recommended Soil Cleanup Objectives (RSCOs). Several individual SVOCs were detected above TAGM RSCOs, however total SVOCs (primarily PAHs) for each sample were less than TAGM RSCO of 500,000 ppb. Total levels of SVOCs ranged from 220 ppb to 472,700 ppb.

No semivolatile organic compounds were detected in groundwater samples, except for naphthalene at MW-1 (18 ppb). MW-1 is located near an operational gasoline pump and gasoline underground storage tank(s). The detected level of naphthalene is slightly above the Class GA Guidance Value of 10 ppb; no Standard exists for naphthalene. The Guidance Value is based on protection for aesthetic purposes (odor or color) in drinking water. Groundwater in Brooklyn is not used as a source of drinking water.

3.4 Metals

Please see Tables 5 and 6 for a summary of detected metals (reported in ppm) in soil and groundwater samples (total and dissolved groundwater samples). Only iron was detected above TAGM Objectives in all of the soil sampled (maximum level of 27,360 ppm in MW-3 (0'-2')). Other metals which were detected above the TAGM include barium (maximum level of 429 ppm in MW-3(0'-2')), beryllium (maximum level of 0.598 ppm in B-3(8'-10')), cadmium (maximum level of 2.05 ppm in B-3(1'-3')), chromium (maximum level of 25.7 ppm in MW-2(5'-7')), copper (maximum level of 116 ppm in

MW-2(5'-7')), nickel (maximum level of 22.3 ppm in B-3(1'-3')), zinc (maximum level of 395 ppm in MW-3(0'-2')) and mercury (maximum level of 0.799 ppm in MW-3(0'-2')). The TAGM objectives are based on background values in the Eastern USA, not on risk-based objectives. When compared with US EPA Generic Soil Screening Levels (health-based levels), the detected levels of metals in soil are generally typical of urban fill material and are below levels which would be expected to pose a hazard to human health even if routine exposure were to occur.

Because the wells were not purged prior to sampling, the levels of metals detected in unfiltered samples should not be considered indicative of actual groundwater concentrations. Results were reported in ppm and ppb, however, the Class GA Standards (developed assuming use as drinking water) were reported in ppm. Several metals, including iron, magnesium, manganese and sodium, were detected above Class GA Standards in filtered groundwater samples. These are likely unrelated to site usage and are present throughout the area. The levels are of minimal concern to human health or the environment because extensive dilution would occur following discharge into surface water. Groundwater in Brooklyn is not used as a potable source.

3.5 Pesticides

Please see Table 7 for a summary of detected pesticides in soil samples. Endosulfan I (60 ppb), 4,4'-DDT (9.6 ppb) and endrin keytone (9.2 ppb) were detected in MW-5 (0'-2'). The detected levels are below NYS DEC Class GA Ambient Water Quality Standards. Pesticides were not detected in any of the other soil samples. Pesticides were not analyzed in groundwater samples.

3.6 PCBs

Please see Table 8 for a summary of detected PCBs in soil samples. Aroclor-1254 and Aroclor-1260 were detected in sample B-2(0'-1'). The levels detected at the B-2 location (130 ppb and 170 ppb, respectively) do not exceed the Recommended Soil Clean-up Objective for surface (0'-2')soil, which is total PCBs of 1,000 ppb. PCBs were not analyzed in groundwater samples.

4.0 CONCLUSIONS

Results from this preliminary investigation did not detect extensive soil and/or groundwater contamination at the locations tested. The following conclusions can be made:

- A limited amount of soil and groundwater contamination by semivolatile organic compounds was detected near MW-1, where an operational gasoline pump and presumably tank(s) are currently located. Detected levels of total semivolatile organic compounds in soil samples collected from MW-1 were less than the TAGM

Recommended Soil Cleanup Objective. The groundwater sample from MW-1 contained levels of naphthalene above the Class GA Groundwater Guidance Value. The Guidance Values were developed based on groundwater used as drinking water. As MW-1 was located near a gasoline pump and as several of the detected semivolatile organic compounds are often associated with petroleum contamination, a spill was reported to the New York State Department of Environmental Conservation. The spill number for the property is 0106864;

- Because only low levels of phenols and heavy metals were detected in soil samples, the elevated levels of detected PAHs in soil and groundwater can be more likely attributed to the site's former use as a coal storage yard, than to the potential former usage for pressure treating of lumber; and

- The former New York Dye - Wood Extract and Chemical Company and the New York Quebracho Extract Company were formerly located on Tax Block 2520, Lot 57 and Tax Block 2510. No significant contamination was detected in borings located on these Blocks (B-1, B-2 and MW-1).

Re: Greenpoint Lumber Yard – Project No.: 30260-0005

Dear Mr. Sotiriou;

Enclosed please find the Laboratory Analysis Report for samples received on August 17, 2001. American Analytical Laboratories analyzed the samples through August 28, 2001 for the following;

SAMPLE ID	ANALYSIS
B1 [1-2]	SW-846 8260, SW-846 8270, TAL Metals
B1 [4-5]	SW-846 8260, SW-846 8270, TAL Metals
B2 [0-1]	SW-846 8260, SW-846 8270, Pesticides, PCBs, TAL Metals
B4 [2-4]	SW-846 8260, SW-846 8270, TAL Metals
B4 [6-8]	SW-846 8260, SW-846 8270, TAL Metals
B5 [2-4]	SW-846 8260, SW-846 8270, Pesticides, PCBs, TAL Metals
B5 [5-7]	SW-846 8260, SW-846 8270, TAL Metals
MW-1 [5-6]	SW-846 8260, SW-846 8270, TAL Metals
MW-1 [8-9]	SW-846 8260, SW-846 8270, TAL Metals
MW-1	SW-846 8260, SW-846 8270, TAL Metals, TAL Metals Dissolved
MW-2 [5-7]	SW-846 8260, SW-846 8270, TAL Metals
MW-2 [9-11]	SW-846 8260, SW-846 8270, TAL Metals

This report consists of 65 pages of analytical results

If you have any questions or require further information, please call at your convenience. American Analytical Laboratories would like to thank you for the opportunity to be of service to you.

Best Regards,

American Analytical Laboratories, Inc.

Re: Greenpoint Lumber Yard – Project No.: 30260-0005

Dear Ms. Sotiriou;

Enclosed please find the Laboratory Analysis Report for samples received on August 17, 2001. American Analytical Laboratories analyzed the samples through August 28, 2001 for the following;

SAMPLE ID	ANALYSIS
B-3 [1-3]	SW-846 8260, SW-846 8270, TAL Metals
B-3 [8-10]	SW-846 8260, SW-846 8270, TAL Metals
MW-2	SW-846 8260, SW-846 8270, TAL Metals, TAL Metals Dissolved
MW-3 [0-2]	SW-846 8260, SW-846 8270, Pesticides, PCBs, TAL Metals
MW-3 [5-7]	SW-846 8260, SW-846 8270, TAL Metals
MW-3	SW-846 8260, SW-846 8270, TAL Metals, TAL Metals Dissolved
MW-4 [0-2]	SW-846 8260, SW-846 8270, TAL Metals
MW-4 [13-15]	SW-846 8260, SW-846 8270, TAL Metals
MW-4	SW-846 8260, SW-846 8270, TAL Metals, TAL Metals Dissolved
MW-5 [0-2]	SW-846 8260, SW-846 8270, Pesticides, PCBs, TAL Metals
MW-5 [4-6]	SW-846 8260, SW-846 8270, TAL Metals
MW-5	SW-846 8260, SW-846 8270, TAL Metals, TAL Metals Dissolved

This report consists of 72 pages of analytical results

If you have any questions or require further information, please call at your convenience. American Analytical Laboratories would like to thank you for the opportunity to be of service to you.

Best Regards,

American Analytical Laboratories, Inc.

APRIL 2004

EXECUTIVE SUMMARY

The Greenpoint Lumber Yard Site (Project Site or Site) is an approximately 20+-acre, mostly paved parcel of waterfront property in the Greenpoint neighborhood of Brooklyn, New York. The Project Site consists of Tax Block 2472, Lots 2, 32, and 100; Tax Block 2494, Lot 1; Tax Block 2502, Lot 1; Tax Block 2510, Lot 1; and Tax Block 2520, Lot 57.

AKRF, Inc. has performed three environmental studies on the Greenpoint Lumber Yard site since 2001, including a Phase I Environmental Site Assessment dated July 2001, a Phase II Subsurface Investigation dated October 2001 and a Supplemental Subsurface (Phase II) Investigation dated September 2003. The studies were conducted consistent with applicable requirements of the American Society for Testing and Materials (ASTM). The Phase I Environmental Site Assessment assessed the project site's 100-year industrial history, including use as a lumber yard and an on-site extract and chemical company. The Phase I noted that current site uses included auto parking and auto and machine repair and it identified several potential underground storage tanks on the property. To determine whether these environmental conditions had affected soil and groundwater conditions on the Greenpoint Lumber Yard site, two subsurface investigations were performed.

A total of 61 soil samples and 16 groundwater samples were collected and analyzed during the 2001 Phase II Site Investigation (19 soil and 5 groundwater) and the 2003 Supplemental Subsurface (Phase II) Investigation (42 soil and 11 groundwater samples). No widespread contamination from former site uses was detected during these studies. Site conditions were found to be generally consistent with background conditions on other urban waterfront sites containing historic urban fill.

There were only limited areas in which soil or groundwater exceeded applicable guidance or standards, all of which can be mitigated through well-established methods. Of the 61 soil samples collected, concentrations of polychlorinated biphenyls (PCBs), pesticides and/or total semivolatile organic compounds (SVOCs), particularly polynuclear aromatic hydrocarbons (PAHs), above the New York State Department of Environmental Conservation's (NYS DEC's) Technical and Administrative Guidance Manual (TAGM) 4046 Recommended Soil Cleanup Objectives (RSCOs) were detected in two soil sample locations located in the central portion of the site, between Freeman and Dupont Streets. No areas of concern were detected in the southern or northern portions of the site. At one of these locations, PCBs and pesticides were detected in a surface soil sample; however, PCBs and pesticides were not detected in soil samples collected from a deeper interval in this boring, indicating that contamination in this boring is vertically limited. At the second location, evidence of cresote, a product commonly used in wood preservation, was detected in a subsurface soil sample. Of the 61 soil samples analyzed on the Greenpoint Lumber Yard Site, this is the only location where contamination likely resulting from former site usage as a lumber yard was detected at concentrations exceeding the TAGM. Individual SVOCs and metals were detected in most soil samples at concentrations above TAGM RSCOs, but within ranges typical of urban fill material.

VOCs and SVOCs were detected in four groundwater monitoring wells at concentrations exceeding NYS DEC groundwater standards, which are intended to apply to potable water supplies only. One well, situated in the southeast portion of the site near a former gasoline pump and associated underground storage tank(s), is located in an upgradient location with respect to groundwater on the site; contamination detected in this well is likely related to a petroleum leak from the nearby former pump and tank(s). Two of the other three wells in which contamination was detected were also located in upgradient locations with respect to groundwater on the project site; it is likely that contamination in these two wells is from off-site sources. Contamination detected in the fourth well, located in the northwest portion of the site and downgradient with respect to groundwater, could be from on- or off-site sources. Based on this data, groundwater remediation is not anticipated. The types and concentrations of contaminants detected in

groundwater above NYS DEC's Class GA Standards are not indicative of contamination from former on-site uses and are not unusual for urban areas. Although remediation is not anticipated, groundwater monitoring may be required by the State in areas where spills have been reported to assure the removal of the source has led to stabilization or improvement of the limited groundwater contamination.

In accordance with NYS DEC reporting requirements, in 2001 a spill was reported to this agency for petroleum contamination in the vicinity of the boring and well located near a former gasoline pump and associated underground storage tank(s). Remediation of the spill must be coordinated with NYS DEC's spills group in accordance with petroleum-contaminated soil guidance policies provided in the agency's Division of Environmental Remediation's DRAFT DER-10, Technical Guidance for Site Investigation and Remediation (December 2002) and TAGM 4046. Following tank removal, spill remediation will likely include excavation and off-site disposal of petroleum-contaminated soil and the collection and analysis of endpoint samples and may include groundwater monitoring. The execution of an Administrative Order on Consent or Stipulation may be required by the State for the spill remediation. When NYS DEC is satisfied with the remediation, a No Further Action letter will be issued and the spill listing will be effectively closed. Based on the results of the two subsurface investigations, no other New York State regulatory agency involvement would be required.

New York City has proposed rezoning an area along the Brooklyn Waterfront that includes the Greenpoint Lumber Yard site. The rezoning action requires review under the City Environmental Quality Review (CEQR) process. It is anticipated that because of its industrial waterfront history, the individual lots that comprise the site will receive E-designations as part of the rezoning. E-designations require that, prior to redevelopment, further investigation and remediation, if required, be performed on the subject lot with approval from the New York City Department of Environmental Protection (NYC DEP). New York City Department of Buildings (NYC DOB) permits will be withheld until NYC DEP is satisfied with proposed remedial activities, if required, and certificates of occupancy will be withheld until NYC DEP is satisfied with the remediation.

On sites like the Greenpoint Lumber Yard site, where a Phase I and Phase II have already been performed, the final reports for these studies can be submitted to NYC DEP for review and approval. It is likely that NYC DEP will require further investigation to confirm the findings of the two subsurface investigations. It is anticipated that remediation, which would likely consist of tank and hot spot removal and capping, could take place during general excavation for the proposed project. NYC DEP will likely require the removal of the two hotspots identified by the subsurface investigations and the underground storage tanks (USTs) suspected in the Phase I ESA. Reports documenting these activities would be prepared and submitted to both the NYC DEP and the NYS DEC Spills Group. These remedial actions could satisfy DEP, but it is possible that capping of the entire Greenpoint Lumber Yard site with either paved surfaces and/or building foundations or two feet of imported clean fill material in landscaped areas would be required to eliminate the exposure pathways of ingestion and/or inhalation of contaminants in fill material that may remain in the ground after the project is complete.

Construction for the proposed project will be performed under the provisions of a Construction Health and Safety Plan, which will be required by NYC DEP. The Construction Health and Safety Plan (CHASP) will be tailored specifically to the proposed development on the Greenpoint Lumber Yard site and will establish practices and procedures to protect the health of construction personnel and others during implementation of work involving potential or known contamination on the site.

During general excavation for the site, it is anticipated that most soil on the site could be disposed of as construction and demolition debris. Areas of contamination may require disposal as petroleum-contaminated or non-hazardous contaminated material. Based on sampling results from the two subsurface investigations, none of the soil tested to date would require disposal as a hazardous waste.

1.0 INTRODUCTION

This report presents the findings of a Supplemental Subsurface (Phase II) Investigation performed on the Greenpoint Lumber Yard Site in Brooklyn, New York in July 2003. The investigation included the advancement and sampling of 21 soil borings to groundwater and the completion, development and sampling of 11 groundwater monitoring wells. Supplementing the findings of the Subsurface (Phase II) Investigation performed on the Site by AKRF, Inc. in October 2001, the purpose of this investigation was to further characterize soil and groundwater conditions on the Greenpoint Lumber Yard Site. The Sample Analysis and Results and Conclusions sections of this report summarize data from both investigations.

2.0 PROJECT SITE DESCRIPTION

The Greenpoint Lumber Yard Site (Project Site or Site) is an approximately 20+-acre, mostly paved parcel of waterfront property in the Greenpoint neighborhood of Brooklyn, New York. The Project Site consists of Tax Block 2472, Lots 2, 32, and 100; Tax Block 2494, Lot 1; Tax Block 2502, Lot 1; Tax Block 2510, Lot 1; and Tax Block 2520, Lot 57. The subject blocks are generally bounded to the north by Newtown Creek; to the east by portions of Commercial, Franklin and West Streets; to the south by Huron Street; and to the west by the East River. Please see Figure 1 for Project Site Location.

The Project Site currently contains the following structures: a two-story brick and concrete office, a small brick guard shed and a large corrugated metal garage near the intersection of Green and West Streets; and a second brick guard shack, which has been converted for auto repair, at the intersection of Dupont and Franklin Streets. The remainder of the property consists of open areas that are used primarily for contractors' materials storage.

The surface topography on the Project Site generally slopes downward to the north, toward Newtown Creek and to the west, toward the East River. Based on reports compiled by the U.S. Geological Survey, the surface elevation of the Site is approximately five to fifteen feet (National Geodetic Vertical Datum of 1929), depending on the area of the Site. Groundwater is located approximately six to fifteen feet below the surface of the Site. Groundwater predominantly flows in a westerly direction towards the East River and in a northerly direction towards Newtown Creek.

3.0 PREVIOUS STUDIES

A Phase I Environmental Site Assessment was performed on the Greenpoint Lumber Yard Site in July 10, 2001 and a Phase II Subsurface Investigation was performed in October 2001. Both studies were performed by AKRF, Inc. The findings of these investigations are summarized below.

3.1 PHASE I ENVIRONMENTAL SITE ASSESSMENT (JULY 2, 2001)

A Phase I Environmental Site Assessment was performed by AKRF, Inc. in July 2001 on the Project Site. An Addendum to the Phase I Environmental Site Assessment was issued by AKRF, Inc. on July 17, 2001. The Phase I Assessment met the requirements of the American Society for Testing and Materials (ASTM), as established by ASTM Standard E 1527-00, and included a site inspection, a review of historical fire insurance (Sanborn) maps and a review of federal, state and local regulatory databases. The Phase I identified the Site to have had over a 100-year history primarily as a lumber yard. Other historical non-lumber-related uses included:

- New York Dye - Wood Extract and Chemical Company ca. 1887 through ca. 1905 (Tax Block 2520, Lot 57 and Tax Block 2510);
- New York Quebracho Extract Company ca. 1916 (Tax Block 2520, Lot 57 and Tax Block 2510);

- A.K. Meserole & Company, a mason material and coal storage yard) ca. 1916 (Tax Block 2502);
- C. Winant's Spar Company ca. 1916 (Tax Block 2502);
- Export Auto Case Company ca. 1916 (Tax Block 2502);
- O'Rouke Engineering and Construction Company ca. 1905 (Tax Block 2472, Lot 100);
- New York State Barge Canal Terminal and Alberene Stone Company Tub Storage ca. 1916 (Tax Block 2472, Lot 100);
- Greenpoint Coal Docks, Inc. ca. 1942 through ca. 1951 (Tax Block 2472, Lot 100).

Potential environmental concerns identified for the property included potential former Site usage for pressure-treating lumber, an on-Site former extract and chemical company, current auto parking and auto and machine repair, and several potential underground storage tanks. Lumber yards often used creosote (a coal tar derivative, which contains elevated levels of polycyclic aromatic hydrocarbons [PAHs] and phenols) as a wood preservative. Substances used by the chemical and extract companies could have impacted subsurface soil and/or groundwater with any number of contaminants. Additionally, aboveground and potential underground storage tanks were noted in the Phase I report and portions of the property are currently used for auto repair. In the areas of known or potential tanks, subsurface petroleum and/or PCB contamination could be present. Solvent contamination could be present in areas used for auto repair. The Phase I Environmental Site Assessment Report recommended that a subsurface (Phase II) investigation be performed on the Site.

3.2 PHASE II SITE INVESTIGATION (OCTOBER 2, 2001)

A Subsurface (Phase II) Investigation, consisting of the advancement and sampling of ten soil borings and the sampling of groundwater at five of the locations, was performed in August 2001 and was summarized in a report dated October 2, 2001. The Phase II Report identified petroleum contamination in soil and groundwater in the vicinity of an active gasoline pump on Block 2520 and low levels of PAHs (a subset of semi-volatile organic compounds [SVOCs]) and heavy metals in soil and groundwater throughout the Site. The levels of PAHs and heavy metals that were detected are typical of those found in fill material in urban areas and appear likely to be related to coal ash. The results of this investigation are discussed in more detail in the Sample Analysis and Results and Conclusions sections of this report.

4.0 SOIL BORINGS AND GROUNDWATER MONITORING WELLS

As part of the Supplemental Subsurface (Phase II) Investigation, twenty-one soil boring were advanced to groundwater and sampled on the Greenpoint Lumber Yard Site on June 25 and 26, 2003. Eleven permanent groundwater monitoring wells were completed and developed on June 30 and July 1 and 2, 2003. The eleven groundwater monitoring wells and one additional well that was discovered on Block 2472 were sampled on July 14 and 15, 2003. AKRF's field crew consisted of Mimi Sotiriou and Julie Foley. Aquifer Drilling and Testing advanced the soil borings and installed the permanent groundwater monitoring wells.

4.1 SAMPLE LOCATION RATIONALE

The twenty-one boring and well locations, along with the ten boring and well locations from the October 2001 Phase II Site Investigation, were selected to evenly characterize soil and groundwater across the Site. Certain borings and wells, however, were biased towards the location of the former chemical and extract companies, known and potential storage tanks, and

areas where lumber storage and possible treatment occurred. Please see the chart below for Sample Location Rationale. Certain monitoring well locations were selected in both upgradient and downgradient locations to determine whether there was any impact on groundwater from on- or off-Site contaminants. Please see Figure 2 for the Boring and Monitoring Well locations.

SAMPLE LOCATION RATIONALE

BLOCK/LOT	HISTORICAL TENANT	CURRENT USE	POTENTIAL CURRENT OR FORMER TANKS	SAMPLE LOCATIONS
Block 2520, Lot 57	New York Dye – Wood Extract and Chemical Company, lumber yard	Auto parking, auto repair, contractors' materials storage	Gasoline, fuel oil, hydraulic oil and motor oil	B6, MW1 and MW6,
Block 2510	New York Dye – Wood Extract and Chemical Company, lumber yard	Contractors' materials storage, auto parking		B1, B2, B7, MW7 and MW8
Block 2502	A.K. Meserole & Company (a mason materials and coal storage yard), Export Auto Case Company, C. Winant's Spar Company, lumber yard	Contractors' materials storage, auto parking	Fuel oil	B3, B8, B9, B10, B11, MW2 and MW9
Block 2494	Lumber yard	Auto repair, auto parking, auto auction	Storage tank (unknown contents)	MW4 and MW11
Block 2472, Lot 32	Lumber Yard	Contractors' materials storage, auto parking		B4, B12, B13 MW3, MW10, MW12, MW12A
Block 2472, Lot 100	O'Rouke Engineering and Construction Company, NYS Barge Canal Terminal, Alberene Stone Company Tub Storage, Greenpoint Coal Docks, lumber yard	Contractors' materials storage, auto parking	Fuel oil	B5, B14, B15, MW5, MW11, MW13A, MW14, MW15, MW15A, MW16

4.2 SOIL SAMPLING METHODOLOGY

At each of the 21 sampling locations, a Geoprobe rig was used to drive a sampling probe into the soil. Soil samples were collected by driving the probe with a five-foot teflon liner into the soil at five-foot intervals until groundwater was reached. Soil was screened for organic vapors in the teflon liner at one foot intervals using a photoionization detector (PID). Soil samples were classified using a modified Burmister Classification System by AKRF field personnel. Please see Appendix A for Boring Logs.

Two soil samples were collected from each boring location based on field observations. If no field contamination (staining, odors or PID readings above background) was apparent, a sample from the two-foot interval immediately beneath the original ground surface (excluding any overlying asphalt or concrete) and a sample from the groundwater interface were collected. If evidence of contamination was noted in any interval, one or both of the samples were collected from the interval(s) exhibiting contamination. Soil samples were transferred from the Teflon liner to sample jars using dedicated and disposable sterile plastic sampling spoons.

The soil samples were containerized in accordance with EPA analytical protocols. Each sample was labeled, sealed, and placed in a chilled cooler for shipment to American Analytical Laboratories, Inc. in Farmingdale, New York, a NYSDOH-ELAP laboratory (No. 11418). Soil samples were analyzed for volatile organic compounds (VOCs) (EPA Method 8260), semivolatile

organic compounds (SVOCs) (EPA Methods 8270), polychlorinated biphenyls (PCBs) (EPA Method 8081), pesticides (EPA Method 8082) and target analyte list (TAL) metals (EPA Method 6010). If not enough sample material was available to analyze for all parameters, sample analysis was selected based on field observation. Category A Deliverables were requested for this data set.

Refusal was encountered at two locations (B7 R1 and B7 R2) near B7 and at one location (MW9 R1) near MW9. B7 was successfully completed to groundwater on the third attempt and MW9 was also successfully completed on the second attempt. One sample was collected from B7 R2 (5.5-6.0) and was analyzed for full span parameters. A second sample was collected from B7 (9.5-10.0). Only enough sample material was recovered from this interval to analyze this sample for volatile organic compounds.

After groundwater was encountered in the 21 boring locations, the borings were backfilled with soil cuttings and plugged with asphalt. Any cuttings that were not replaced into the borings were drummed for off-Site disposal.

4.3 GROUNDWATER SAMPLING METHODOLOGY

Groundwater monitoring wells were completed at 11 of the boring locations using the hollow-stem auger rig. The monitoring wells were advanced using a 4¼-inch hollow-stem augers and consisted of two-inch internal diameter PVC casing. A ten-foot slotted PVC screen was installed in the approximate top six feet of groundwater. A sand filter pack was placed in the annular space around the screen and extended to approximately two feet above the screen. The annular space around the well casing was sealed with bentonite for an interval of approximately two feet. A grout, consisting of a cement and bentonite mixture or an anti-shrink mixture, extended from the bentonite seal to a level of approximately two feet below ground level. The remaining annular space was sealed with a concrete cap and well apron (expanding cement). A locking well cap and a flush-mounted well cover was installed upon completion of the well. Drill cuttings were drummed for off-Site disposal. Please see Appendix A for Well Construction Logs.

Groundwater monitoring wells were successfully completed at 9 of the 11 boring locations. Refusal was encountered during well installation two times at approximately 4 and 10 feet below grade in the vicinity of boring MW12. Due to spatial confines (the adjacent park and the bulkhead), the location of the corresponding well (MW12A) was relocated approximately 100 feet south of the boring MW12. The well was successfully completed at this location. AKRF personnel could not install a monitoring well in the location of boring MW15 because the location was covered with unmovable objects. Therefore, the well location was moved approximately 10 feet south of the boring location and the well was labeled MW15A.

The wells were developed on the day they were drilled or on the day after they were drilled by pumping. The wells were pumped using a submersible whale pump and dedicated Teflon tubing for each well. Turbidity was measured using a nephelometer and temperature, conductivity, dissolved oxygen and oxygen/reduction potential were measured using the Quanta G water quality meter. The pH probe on the Quanta G was broken and no pH readings were collected during well development. Water quality parameter readings were recorded approximately every five minutes during development. The wells were developed until the water quality parameters stabilized within 10%, or until the turbidity reading was less than 50 Nephelometric Turbidity Units (NTU) or less. If the water quality parameters did not stabilize and the turbidity reading was not less than 50 NTU, but at least three well volumes were evacuated from the well and it ran dry four times, then the well was considered developed. Development water was drummed for off-Site disposal. Please see Appendix B for Well Development Logs.

All wells except for MW13 were developed successfully. The plug in the bottom of the PVC well screen in MW13 was not secured and fell out between well installation and development. Soil filled the interior of the well screen to a depth of approximately 7 feet below grade. MW13 well was over-drilled, reconstructed and developed successfully. The new well was called MW13A.

In accordance with EPA protocol, the wells were not sampled for at least seven days after development. Prior to sampling, an electronic interface meter was used to measure water levels. Well purging and sample collection was accomplished using low flow techniques. The wells were purged using a Geotech Geopump 2 at a purge rate no greater than 3.8 liters per minute. A Solinist groundwater level meter with an alarm was placed approximately 2 inches below the groundwater table to ensure no drawdown occurred during well purging. Turbidity was measured using a nephelometer and temperature, conductivity, dissolved oxygen and oxygen/reduction potential were measured using the Quanta G water quality meter. During this stage, pH readings were collected using an Oakton pHTestr sampling probe. Water quality parameter readings were recorded approximately every five minutes during well purging.

Wells were purged until sample parameters stabilized within 10%, until the turbidity reading was 10 NTU or less, or until at least five well volumes were purged. Purge water was drummed for disposal. All eleven wells, plus an additional well that was discovered on Block 2472, were successfully purged.

Groundwater samples were collected using the Geotech Geopump 2 at a sample rate no greater than 500 milliliters/minute. The Solinist groundwater level meter was used to ensure that drawdown did not occur during sampling. The groundwater samples were containerized in accordance with EPA analytical protocols. Each sample was labeled, sealed, and placed in a chilled cooler for shipment to the laboratory. Groundwater samples were analyzed for VOCs (EPA Method 8260), SVOCs (EPA Method 8270), PCBs (EPA Method 8081), pesticides (EPA Method 8082) and TAL metals (both filtered and unfiltered samples). Sufficient sample material was collected from all wells, including the found well, to analyze for all parameters. Please see Appendix B for Well Sampling Logs.

4.4 QA/QC

4.4.1 Decontamination

Sampling equipment was dedicated or disposed of after use to avoid contamination and cross-contamination of samples.

4.4.2 Chain of Custody

To ensure the integrity of samples taken, a strict chain-of-custody record was maintained on each sample. This began during sampling with the entry in the sampler's field log of the sampling details:

a) Date and time of sampling;

b) Sample location (as specific as possible);

c) The unique sample number;

d) Sample description;

e) Weather conditions (if applicable); and

f) Any additional comments.

The chain-of-custody form was kept as a record of the sample's progress from the field to the laboratory where it was analyzed. The form included:

a) The sample number;

b) The sampler's name;

c) Date of sampling;

d) Location where the sample was taken;

e) Signatures of people involved in the chain of possession; and

f) Inclusive dates of possession of each person in the chain.

The chain-of-custody form accompanied the samples throughout the trip to the laboratory.

Included in the chain-of-custody record was a request to the laboratory for sample receipt and analysis information, including:

a) Name of person receiving the sample;

b) Laboratory sample number;

c) Date of sample receipt;

d) Sample allocation; and

e) Analyses to be performed.

Upon arrival of samples at the laboratory, the sample custodian entered pertinent information for each sample in the laboratory's sample log book. The chain-of-custody is kept on file at the laboratory.

4.4.3 Laboratory Testing

American Analytical, Inc. performed all analytical work for the Supplemental Subsurface (Phase II) Investigation. American Analytical, Inc.'s office in Farmingdale, New York is ELAP-certified (NYS DOH Certificate No. 11418) by the New York State Department of Health (NYSDOH). The laboratory operates a Quality Assurance/Quality Control (QA/QC) program that consisted of proper laboratory practices (including the required chain-of-custody), an internal quality control program, and external quality control audits by New York State. Category A deliverables were produced for soil and groundwater sampling results for this project.

A trip blank and field blank were included in each batch of twenty samples collected. A total of three trip blanks and three field blanks were included with the soil samples. One trip blank and one field blank were included with the groundwater samples. Trip blanks were analyzed for TCL VOCs to check for contamination during transport and sampling procedures. The field blanks that accompanied soil and groundwater samples to the laboratory were analyzed for VOCs, SVOCs, PCBs, pesticides and TAL metals to check for contamination arising from sample collection. No duplicate or blind duplicate samples were collected.

Because it falls right on the border between volatile and semivolatile organic compounds, naphthalene was included in the parameter lists analyzed by EPA Methods 8260 and 8270, respectively.

5.0 SAMPLE ANALYSIS AND RESULTS

This Sample Analysis and Results section presents data collected during both the October 2001 Phase II Site Investigation and the 2003 Supplemental Subsurface (Phase II) Investigation. A total of 19 soil samples were collected from 10 borings (B1 through B5 and MW1 through MW5) and a total of 5 groundwater samples were collected from 5 temporary well points (MW1 through MW5) during the 2001 Phase II Site Investigation. A total of 42 soil samples were collected from 21 boring locations (B6 through B15 and MW6 through MW16) and a total of 11 groundwater samples were collected from 11 permanent groundwater monitoring wells (MW6 through MW16) during the 2003 Supplemental Subsurface (Phase II) Investigation.

The analytical data from the Supplemental Subsurface (Phase II) Investigation is summarized in Tables 1 through 10 in the Tables section of this report. The analytical data from the October 2001 Phase II Investigation in summarized in Tables 11 through 19 in the Tables Section of this report. Complete Category A deliverables for the Supplemental Subsurface (Phase II) Investigation are included in Appendix C. Laboratory deliverables for the October 2001 Investigation are included in Appendix B of the Phase II Site Investigation Report.

Soil samples are designated by the boring location and depth below grade. For example, MW13 (5'-7') is from boring location MW13 at a depth between 5 feet and 7 feet below grade. Soil analysis data was evaluated relative to the Recommended Soil Clean-up Objective (RSCO) values in the NYSDEC Division of Hazardous Waste Remediation document Technical Administrative Guidance Memorandum (TAGM) 4046, issued in 1994. Metals analysis in soil was additionally compared to the Eastern United States background range for metals listed in TAGM 4046 and to the U.S. EPA Soil Screen Levels (risk-based levels) for ingestion. Groundwater data was evaluated relative to the Class GA Standards and Guidelines Values contained in NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Handling, Guidance Values and Groundwater Effluent Limitations. GA Standards are intended for potable water supplies, but are applied to all groundwater in the State. Groundwater is not used as a potable source in Brooklyn.

5.1 FIELD CONDITIONS

At each of the 31 total boring locations (10 borings during the 2001 Investigation and 21 borings during the 2003 Investigation), borings were advanced to between 3 feet and 20 feet below grade. Groundwater was encountered between approximately 5.25 feet and 15.0 feet below grade. The overburden was generally characterized by fill composed of brown to black coarse to fine sand with varying amounts of gravel and silt. Wood fragments, coal, ash, slag and brick were noted in many borings. Much of the overburden across the Site was dark gray to black in color. Sample analytical results did not indicate widespread chemical contamination across the Site; thus, the dark soil color is more likely attributable to high coal content than to chemical staining. Significant PID readings (above 10 parts per million [ppm]) were noted in B1 (1'-2') at 58.8 ppm; B13 (0.5'-1') at 47 ppm; MW1 at 1,888 ppm; MW2 (5'-7') at 14.7 ppm; and MW7 (10'-11') at 73.1 ppm. Organic-, petroleum- and solvent-like odors were noted in several borings. Please see boring logs for a complete delineation of PID readings and odors noted in borings. Logs from the October 2001 investigation are included in Appendix A of the Phase II Site Investigation Report. Logs from the Supplemental Subsurface (Phase II) Investigation are included in Appendix A of this report.

Borings and wells from the October 2001 Investigation were analyzed for VOCs, SVOCs and TAL Metals. Only 4 of the 19 soil samples [B2 (0'-1'), B5 (2'-4'), MW3 (0'-2') and MW5 (0'-2')] from that investigation were analyzed for PCBs and pesticides. During the Supplemental Subsurface (Phase II) Site Investigation, enough sample material was recovered from all boring

intervals to analyze for all parameters (VOCs, SVOCs, PCBs, pesticides, and TAL metals), except for B7 (9.5-10.0). Only enough sample material was recovered to analyze this sample for volatile organic compounds.

A slight sheen was noted in purge water from MW6 and MW7. An organic odor was noted in purge water from MW12 and MW14. A slight petroleum-like odor was noted in purge water from MW13. Red rust flakes were noted in purge water from the Found Well. During the Supplemental Subsurface (Phase II) Site Investigation, sufficient groundwater volume was recovered at each location to analyze for all parameters (VOCs, SVOCs, PCBs, pesticides, and TAL metals [filtered and unfiltered]).

5.2 SOIL

A total of 61 soil samples were collected during the October 2001 Phase II Site Investigation (19 samples) and the 2003 Supplemental Subsurface (Phase II) Investigation (42 samples). Two soil samples were collected from each boring location based on field observations, except for B2, where only one sample was collected. If no field contamination (staining, odors or PID readings above background) was observed, a sample from the two-foot interval immediately beneath the original ground surface (excluding any overlying asphalt or concrete) and a sample from the groundwater interface were collected. If evidence of contamination was noted in any interval, one or both of the samples was collected from the interval(s) exhibiting contamination. The following subsections discuss the results of both subsurface investigations.

5.2.1 Volatile Organic Compounds

A summary of laboratory analysis of VOCs in soil samples is included in Table 1 for the Supplemental Subsurface (Phase II) Investigation and Table 11 for the October 2001 Phase II Site Investigation. Benzene, chloroform, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 4-isopropyltoluene, napthtalene, o-xylene, p-diethylbenzene, p-ethyltoluene, trichloroethene and acetone were detected in soil samples. None of the detected concentrations of volatile organic compounds were detected above the TAGM 4046 RSCO, except for acetone in two soil samples: B1(1'-2') [detected at a concentration of 290 ppb] and MW1 (5'-6') [detected at a concentration of 780 ppb]. The RSCO for acetone is 50 ppb. Acetone, which is a common field and laboratory artifact, was not detected in the field or method blanks.

5.2.2 Semivolatile Organic Compounds

A summary of laboratory analysis of SVOCs in soil samples is included in Table 2 for the Supplemental Subsurface (Phase II) Investigation and Table 12 for the October 2001 Phase II Site Investigation. Several polycyclic aromatic hydrocarbons (PAHs) were detected at concentrations above their respective TAGM 4046 RSCOs in most soil samples, including benzo(a)anthracene, benzo(a)pyrene, chrysene and dibenzo(a,h)anthracene. The detected PAHs listed above are considered carcinogenic and, therefore, have very low TAGM RSCOs, which are almost always exceeded in urban fill material containing coal, coal ash, asphalt and combustion byproducts deposited from the air.

Other carcinogenic PAHs with slightly higher TAGM RSCOs were detected above their respective RSCOs in some soil samples, including benzo(b)fluoranthene, benzo(k)fluoranthene, and ideno(1,2,3-c,d)pyrene. The detected levels of these PAHs are often associated with coal and coal ash.

The detected concentrations of total SVOCs were below 500 ppm, the TAGM RSCO, in all soil samples analyzed, except for B10 (5'-7'), where the total detected concentration was 4,691 ppm. Total detected concentrations of SVOCs were above 400 ppm in two other sample locations: B11 (1'-3') and MW4 (0'-2'). The total detected concentrations in these two samples were 419 ppm and 472 ppm, respectively. A total concentration of SVOCs above 200 ppm was detected in one soil sample: B8 (8'-10') with a total concentration of 235 ppm. A total concentration above 100 ppm was detected in three soil samples: MW7 (6.5-7.5) with a total concentration of 114 ppm; MW3 (5'-7') with a total concentration of 176 ppm; and MW5 (4'-6') with a total concentration of 111 ppm. Total concentrations of SVOCs were detected below 100 ppm in the remainder of other soil samples.

In the soil samples B10 (5'-7'), B11 (1'-3') and MW4 (0'-2'), in addition to the more prevalent TAGM SVOC exceedances discussed above, lighter PAHs, such as naphthalene and 2-methylnaphthalene were detected. Lighter PAHs are often found in used oil and/or coal tar and coal tar derivatives, such as creosote, which was historically and is currently used as a lumber preservative.

3+4-methylphenol, 2,4-dimethylphenol were also detected in B10 (5'-7'). These compounds, phenols, are commonly detected in coal tar and/or coal tar derivatives, but not in waste oil. Additionally, PID readings of up to 1.2 ppm above background and a slight petroleum-like odor were described in the soil boring log for the interval B10 (5'-7). No wood fragments were described in the logs for B10. Because of the very elevated concentrations of SVOCs and the presence of phenols and naphthalene, the SVOC detected in B10 (5'-7') are more likely attributable to coal tar derivatives than to petroleum.

PID readings of up to 3.5 ppm and a slight petroleum-like odor were noted in soil boring logs for B11 (1'-3'). PID readings of up to 3.0 ppm were noted in MW4 (0'-2'). Because no phenols were detected in these samples, the SVOCs detected in B11 (1'-3') and MW4 (0'-2') are more likely attributed to waste oil than to coal tar derivatives.

5.2.3 Polychlorinated Biphenyls

A summary of laboratory analysis of PCBs in soil samples is included in Table 3 for the Supplemental Subsurface (Phase II) Investigation and Table 13 for the October 2001 Phase II Site Investigation. PCBs were detected at total concentrations ranging from 40 ppb to 1,280 ppb in several soil samples. The detected total concentration of 1,280 ppb in B12 (0.5'-2') slightly exceeds the TAGM RSCO of 1,000 ppb total for surface samples. No other soil samples exceeded the TAGM RSCO for PCBs.

5.2.4 Pesticides

A summary of laboratory analysis of pesticides in soil samples is included in Table 4 for the Supplemental Subsurface (Phase II) Investigation and Table 14 for the October 2001 Phase II Site Investigation. 4,4'-DDD; 4,4'-DDE; 4,4'-DDT and endrin were detected above their respective TAGM RSCOs in soil sample B12 (0.5'-2'). No other pesticides were detected above their TAGM RSCOs in any other soil samples.

5.2.5 Target Analyte List Metals

A summary of laboratory analysis of target analyte list metals in soil samples is included in Table 5 for the Supplemental Subsurface (Phase II) Investigation and Table 15 for the October 2001 Phase II Site Investigation. Eleven metals (arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, iron, mercury, nickel and zinc) were detected above TAGM 4046 RSCOs in soil samples. TAGM RSCOs for metals are based on background concentrations in naturally occurring, native soil. All of the detected metals that exceeded RSCOs also exceeded the upper limit of their respective Eastern U.S. and New York State Background ranges. Neither the TAGM RSCOs nor the Eastern U.S. or New York State Background ranges are risk-based cleanup levels. When compared with US EPA Generic Soil Screening Levels (SSLs, health-based levels), the detected levels of metals in soil, with the exception of arsenic, beryllium, cadmium and lead, are below levels that would be expected to pose a hazard to human health even if routine exposure were to occur.

The RSCOs also allow for the use of site background as alternative criteria. Although no site background concentrations were established for the Site, the similarity of metals concentrations among the soil samples suggests that the soils may represent Site background and do not suggest any contaminated area of the Site. Further, no single sample contained concentrations of metals orders of magnitude above RSCOs.

Although there is not an RSCO for lead, the average background levels in metropolitan and suburban areas or near highways typically range from 200 to 500 ppm. The detected concentration of lead in soil samples B8 (0.5'-2'), B11 (1'-3), B12 (0.5'-2'), B14(2'-3.5') and MW11 (0.5'-2') exceeded the upper limit of the average background level in metropolitan areas. The highest concentration of lead detected in these samples was 2,040 in sample B8 (0.5'-2').

5.3 GROUNDWATER

A total of 16 groundwater samples were collected during the 2001 Phase II Site Investigation (5 samples) and the 2003 Supplemental Subsurface (Phase II) Investigation (11 samples). During the Supplemental Subsurface (Phase II) Investigation, samples were collected from approximately the upper foot of the static water column in each well using low-flow sampling techniques. Well Development and Sampling Logs for the Supplemental Subsurface (Phase II) Investigation are included in Appendix C. The following subsections discuss the results of both subsurface investigations.

5.3.1 Volatile Organic Compounds

A summary of laboratory analysis of VOCs in groundwater samples is included in Table 6 for the Supplemental Subsurface (Phase II) Investigation and Table 16 for the October 2001 Phase II Site Investigation. In MW7, 4-Isopropyltoluene and benzene were detected at concentrations of 7.2 ppb and 2 ppb, respectively, above the Class GA Standards of 5 ppb and 0.7 ppb, respectively. In MW13A, 4-isopropyltoluene, benzene, 1,2,4-trimethylbenzene, ethylbenzene, M+P xylene, naphthalene, o-xylene, styrene, and toluene were detected at concentrations above their respective Class GA Standards. These detected compounds in MW7 and MW13A are common gasoline constituents.

In MW11, tetrachloroethylene was detected at a concentration of 5.6 ppb, above the Class GA Standard of 5.0 ppb. This compound is a common solvent used in dry cleaning.

Isopropylbenzene, m+p xylene, methyl tert-butyl ether (MTBE), n-propylbenzene, o-xylene, p-diethylbenzene and toluene were detected below Class GA Standards in various groundwater samples. No other volatile organic compounds were detected in any other groundwater samples, in the trip blank or in the field blank.

5.3.2 Semivolatile Organic Compounds

A summary of laboratory analysis of SVOCs in groundwater samples is included in Table 7 for the Supplemental Subsurface (Phase II) Investigation and Table 17 for the October 2001 Phase II Site Investigation. In MW7, Phenol was detected at a concentration of 7.4 ppb, above the Class GA Groundwater Standard of 1 ppb. In MW1 and MW13A, naphthalene was detected at concentration of 18 ppb and 630 ppb, respectively, above the Class GA Groundwater Guidance Value (no Standard exists) of 10 ppb.

Benzoic acid, carbazole, dibenzofuran, fluorine, naphthalene, phenanthrene, 2-methylnaphthalene, acenaphthene, acenaphthylene and anthracene were detected at concentrations ranging from 5.6 ppb to 68 ppb in various groundwater samples. None of the detected levels of these compounds exceeded the Class GA Groundwater Standard.

No other SVOCs were detected in any other groundwater sample, in the trip blank or in the field blank.

5.3.3 Pesticides

A summary of laboratory analysis of pesticides in soil samples is included in Table 8 for the Supplemental Subsurface (Phase II) Investigation. No groundwater samples from the October 2001 Phase II Site Investigation were analyzed for pesticides. No pesticides were detected in any groundwater samples.

5.3.4 Polychlorinated Biphenyls

A summary of laboratory analysis of PCBs in soil samples is included in Table 9 for the Supplemental Subsurface (Phase II) Investigation. No groundwater samples from the October 2001 Phase II Site Investigation were analyzed for PCBs. No PCBs were detected in any groundwater samples.

5.3.5 Target Analyte List Metals

A summary of laboratory analysis of target analyte list metals in groundwater samples (both filtered and unfiltered) is included in Table 10 for the Supplemental Subsurface (Phase II) Investigation and Tables 18 and 19 for the October 2001 Phase II Site Investigation. The temporary groundwater well points were not purged prior to sampling during the October 2001 Phase II Site Investigation. Therefore, laboratory filtered sample results are likely more characteristic of true groundwater conditions in these wells. Antimony, iron, manganese, magnesium and sodium were detected in concentrations above the Class GA Groundwater Standards in most filtered and unfiltered water samples. These five elements are earth minerals commonly found in groundwater.

Additionally, thallium was detected at a concentration of 0.0190 ppm in MW7, above the Class GA Guidance Value (no Standard exists) of 0.004 ppm. No other metals were detected above the Class GA Groundwater Standards in any of the groundwater samples.

6.0 GROUNDWATER ELEVATIONS

A survey was performed as part of the Supplemental Subsurface (Phase II) Investigation to determine the geographic locations and elevations of the 10 boring locations, the 3 refusal locations, the 11 groundwater monitoring wells, and the found well. The survey was conducted by Lockwood, Kessler & Bartlett, Inc., a licensed surveyor in the state of New York (License No. 049496), on July 12 and 28, 2003. The well locations and elevations were measured at the top of the well cover (top of manhole) and at the top of the well casing (top of casing). Figure 2 shows the surveyed locations and elevations of the wells.

The depth to water from the top of the manhole was measured and recorded to calculate the elevation of the groundwater table for each well. Figure 3 shows groundwater table elevations for each well (calculated from top of manhole). The elevations shown on the table and figure are relative to the Brooklyn Borough Datum (BBD), which is 1.177 feet above mean sea level (National Geodetic Vertical Datum 1929). The water table elevations varied from el. -0.18 BBD in MW6 to el. 2.6 BBD in MW11. An assessment was performed of the relative groundwater table elevations on the Greenpoint Lumber Yard Site to determine the groundwater flow direction. Groundwater predominantly flows in a westerly direction towards the East River and in a northerly direction towards Newtown Creek.

7.0 CONCLUSIONS

A total of 61 soil samples and 16 groundwater samples were collected during the 2001 Phase II Site Investigation (19 soil and 5 groundwater) and the 2003 Supplemental Subsurface (Phase II) Investigation (42 soil and 11 groundwater samples). The following conclusions can be made:

7.1 SOIL

No widespread contamination of soil was detected by these investigations on the Greenpoint Lumber Yard site. Other than exceedances of the TAGM RSCOs for individual SVOCs and metals with ranges typical of urban fill material, concentrations of contaminants were detected above their TAGM RSCOs in only two soil samples:

- B10 (5'-7') – A total SVOC concentration of 4,691 ppm was detected in B10 (5'-7'). Due to the presence of lighter PAHs and phenols in this sample, the detected concentrations and compounds are typical of contamination by coal tar derivatives.
- B12 (0.5'-2') - PCBs were detected in B12 (0.5'-2') at a concentration of 1,280 ppb, above the TAGM RSCO of 1,000 ppm for surface samples. Four pesticides (4,4'-DDD; 4,4'-DDE; 4,4'-DDT and endrin) were detected in the same sample above their respective TAGM RSCOs.

Concentrations of total SVOCs were detected at levels approaching the TAGM RSCO of 500 ppm in two other borings: 419 ppm in B11 (1'-3') and 472 ppm in MW4(0'-2'). Due to the presence of lighter PAHs in these samples, the detected concentrations and compounds are typical of waste oil contamination. Evidence of waste oil contamination was not detected in soil collected from deeper intervals in these samples or in groundwater collected from MW4, indicating that the petroleum contamination is likely vertically limited in both borings.

Metals were detected in concentrations typical of urban fill material in soil samples. Lead was detected above the upper limit of the average background level in metropolitan areas of 500 ppm in four soil samples: B8 (0.5'-2'), B11 (1'-3), B12 (0.5'-2'), B14 (2'-3.5') and MW11 (0.5'-2'). The highest concentration of lead detected in these samples was 2,040 in sample B8 (0.5'-2'). Because no identified current or historical source of lead was identified in the Phase I Environmental Site Assessment, it is possible that these elevated lead values are attributable to

normal distribution in fill material, rather than to lead contamination. No volatile organic compounds were detected above TAGM RSCOs in any soil samples.

7.2 GROUNDWATER

No widespread contamination of groundwater was detected by these investigations, however, four localized areas of concern were identified:

- MW1 – One SVOC, naphthalene, was detected at a concentration of 18 ppb in MW1, above the Class GA Standard of 10 ppb. MW1 is located near a former gasoline pump and in an upgradient location on the Site. It is likely that the presence of naphthalene in the groundwater is due to leaking gasoline tanks associated with the pump.
- MW7 – Two VOCs, 4-Isopropyltoluene and benzene, were detected at concentrations of 7.2 ppb and 2 ppb, respectively, above the Class GA Standards of 5 ppb and 0.7 ppb, respectively. These detected compounds are common gasoline constituents. Additionally, one SVOC, phenol, was detected at a concentration of 7.4 ppb, above the Class GA Groundwater Standard of 1 ppb. MW7 is located in an upgradient location on the Site. It is possible that the presence of gasoline and or phenols in MW7 is due to off-Site sources.
- MW11 – One VOC, tetrachloroethylene, was detected at a concentration of 5.6 ppb, slightly above the Class GA Standard of 5.0 ppb. This compound is a common solvent used as a degreaser in auto-related businesses. The small one-story brick structure located directly east of boring location MW11 was formerly used for auto repair. MW11 is located in an upgradient location. Because of the upgradient location of MW11 and because of its proximity to an auto repair facility, this solvent contamination could have originated on- or off-Site.
- MW13A – Nine VOCs, 4-isopropyltoluene, benzene, 1,2,4-trimethylbenzene, ethylbenzene, M+P xylene, naphthalene, o-xylene, styrene, and toluene, were detected at concentrations above their respective Class GA Standards in MW13. These detected compounds are common gasoline constituents. Naphthalene was detected by EPA Method 8260 at a concentration of 700 ppb and by EPA Method 8260 at a concentration of 630 ppb. Both detected concentrations exceed the Class GA Groundwater Guidance Value (no Standard exists) of 10 ppb. MW13 is located in a downgradient location on the Site. The presence of gasoline contamination in MW13 may have resulted from on- or off-Site sources.

The concentrations of metals detected in groundwater samples are typical of those found in groundwater in urban areas and are not of concern. No pesticides or PCBs were detected in any of the groundwater samples.

7.3 SURVEY

The water table elevations varied from el. -0.18 BBD in MW6 to el. 2.60 BBD in MW11. Groundwater predominantly flows in a westerly direction towards the East River and in a northerly direction towards Newtown Creek.

7.4 SUMMARY

There was no widespread soil or groundwater contamination detected on the Greenpoint Lumber Yard site, based on the collection and analysis of 61 soil samples and 16 groundwater samples. Site conditions were found to be generally consistent with background conditions in urban waterfront areas reflecting the use of historic urban fill, including Queens West in Long Island City, Route 9A in Manhattan and west of Kent Avenue in Brooklyn. Two geographically isolated

areas of concern for soil contamination and four geographically isolated areas of concern for groundwater contamination were identified by these investigations. Groundwater flows predominantly in a westerly direction towards the East River and in a northerly direction towards Newtown Creek.

8.0 RECOMMENDATIONS

The extensive investigation undertaken for the site was based on the 100-year industrial history on the Greenpoint Lumber Yard Site. The investigatory program revealed only limited soil and groundwater contamination during two rounds of soil and groundwater sampling, which included the collection and analysis of 61 soil samples and 16 groundwater samples. Well-established procedures exist to address the areas of concern that were detected during subsurface testing. These areas of concern can be addressed prior to and/or during construction activities.

8.1 REGULATORY AGENCY INVOLVEMENT

Due to an active spill listing and a proposed rezoning of the site, it is anticipated that both State and City agencies will be involved with future development of the Greenpoint Lumber Yard Site.

8.1.1 State

In accordance with legal reporting requirements, a spill was reported to the New York State Department of Environmental Conservation (NYSDEC) for petroleum contamination in the vicinity of sampling location MW-1 in 2001. MW-1 is located near a former gasoline pump and associated underground storage tank(s). Soil sampling analytical results from the October 2001 subsurface investigation indicated elevated levels of semivolatile organic compounds above TAGM RSCOs for several compounds often associated with petroleum.

New York State provides petroleum-contaminated soil guidance policies in the Division of Environmental Remediation's DRAFT DER-10, Technical Guidance for Site Investigation and Remediation (December 2002) and in the TAGM 4046. Upon completion of remedial activities, which will likely constitute the excavation and proper off-site disposal of petroleum-contaminated soil from the vicinity of MW-1 and the collection and analysis of endpoint samples, a Spill Closure Report should be prepared and submitted to the NYS DEC Spill Coordinator for the active listing. It is possible that NYS DEC could require groundwater monitoring in the vicinity of the spill. When the spill has been remediated to the satisfaction of the State, a No Further Action letter for the spill will be issued and the spill listing will be effectively closed. In accordance with DER-10, the execution of an Administrative Order on Consent or Stipulation may be required by the State for the spill remediation. If additional areas of contamination are encountered during tank removal and/or general excavation activities, additional spills would need to be reported to New York State. Individual spill listings would be linked together and one Spill Closure Report could be submitted to the NYS DEC for the spill listings. Based on the results of the two subsurface investigations, no other New York State regulatory agency involvement would be required.

In addition to the remediation action discussed in Section 8.2, additional remedial actions, such as groundwater monitoring in locations of USTs and/or spills, vapor barriers beneath buildings, deed restrictions, etc., may be required by New York State through the Oil Spill Program.

8.1.2 City

New York City has proposed rezoning an area along the Brooklyn Waterfront that includes the Greenpoint Lumber Yard site. The rezoning action requires review under the City Environmental Quality Review (CEQR) process. It is anticipated that potential contaminated materials issues will be recognized for the Greenpoint Lumber Yard site and the individual lots that comprise the site will receive E-designations as a result of the rezoning. In accordance with Chapter 24 of Title 15 of the Rules of the City of New York, an E-designation requires that, prior to redevelopment, the property owner perform a Phase I Environmental Site Assessment (ESA), and/or a subsurface (Phase II) investigation (if recommended by the conclusions of the Phase I ESA), and/or remediation (if recommended by the conclusions of the Phase II investigation) with approval from and to the satisfaction of New York City Department of Environmental Protection (NYC DEP) before Building Permits and/or Certificates of Occupancy can be obtained from the New York City Department of Buildings.

Both the Phase I and Phase II, if required, must be completed and the Remedial Action Work Plan, if required, must be approved by NYC DEP before the New York City Department of Buildings will issue a Building Permit. Remediation may occur prior to or during general excavation. A Construction Health and Safety Plan must be submitted to NYC DEP and approved for implementation during general excavation activities, whether or not remedial activities have been completed.

After completion of the requirements of the Remediation Action Work Plan, a Closure Report must be submitted to NYC DEP. This report would contain any characterization sampling results for soil disposed of off-site; acceptance letters from disposal facilities; manifests for disposal of contaminated soil, if any; as-built site drawings showing final depth of excavation and vapor barrier specifications, if any; and documentation that any remedial activities performed during general excavation were completed in accordance with the NYC DEP-approved Remedial Action Work Plan. The report must also be certified by a licensed Professional Engineer. Once NYC DEP is satisfied that the investigation and/or remediation are complete, a Notice of Satisfaction will be issued, allowing the property owner to obtain a Certificate of Occupancy. If remedial activities, such as ongoing monitoring of groundwater or capping of a site, continue beyond completion of the project, then NYC DEP may require a Restrictive Declaration.

It has been our experience on sites similar to the Greenpoint Lumber Yard site, where a Phase I and Phase II have already been performed, that the final reports for these studies can be submitted to NYC DEP for review and approval. It is likely that NYC DEP will require further investigation to confirm the findings of the two subsurface investigations. Based on the results of the Phase II investigations, it is anticipated that remediation, as described in Section 8.2, could take place during site preparation work for the proposed project.

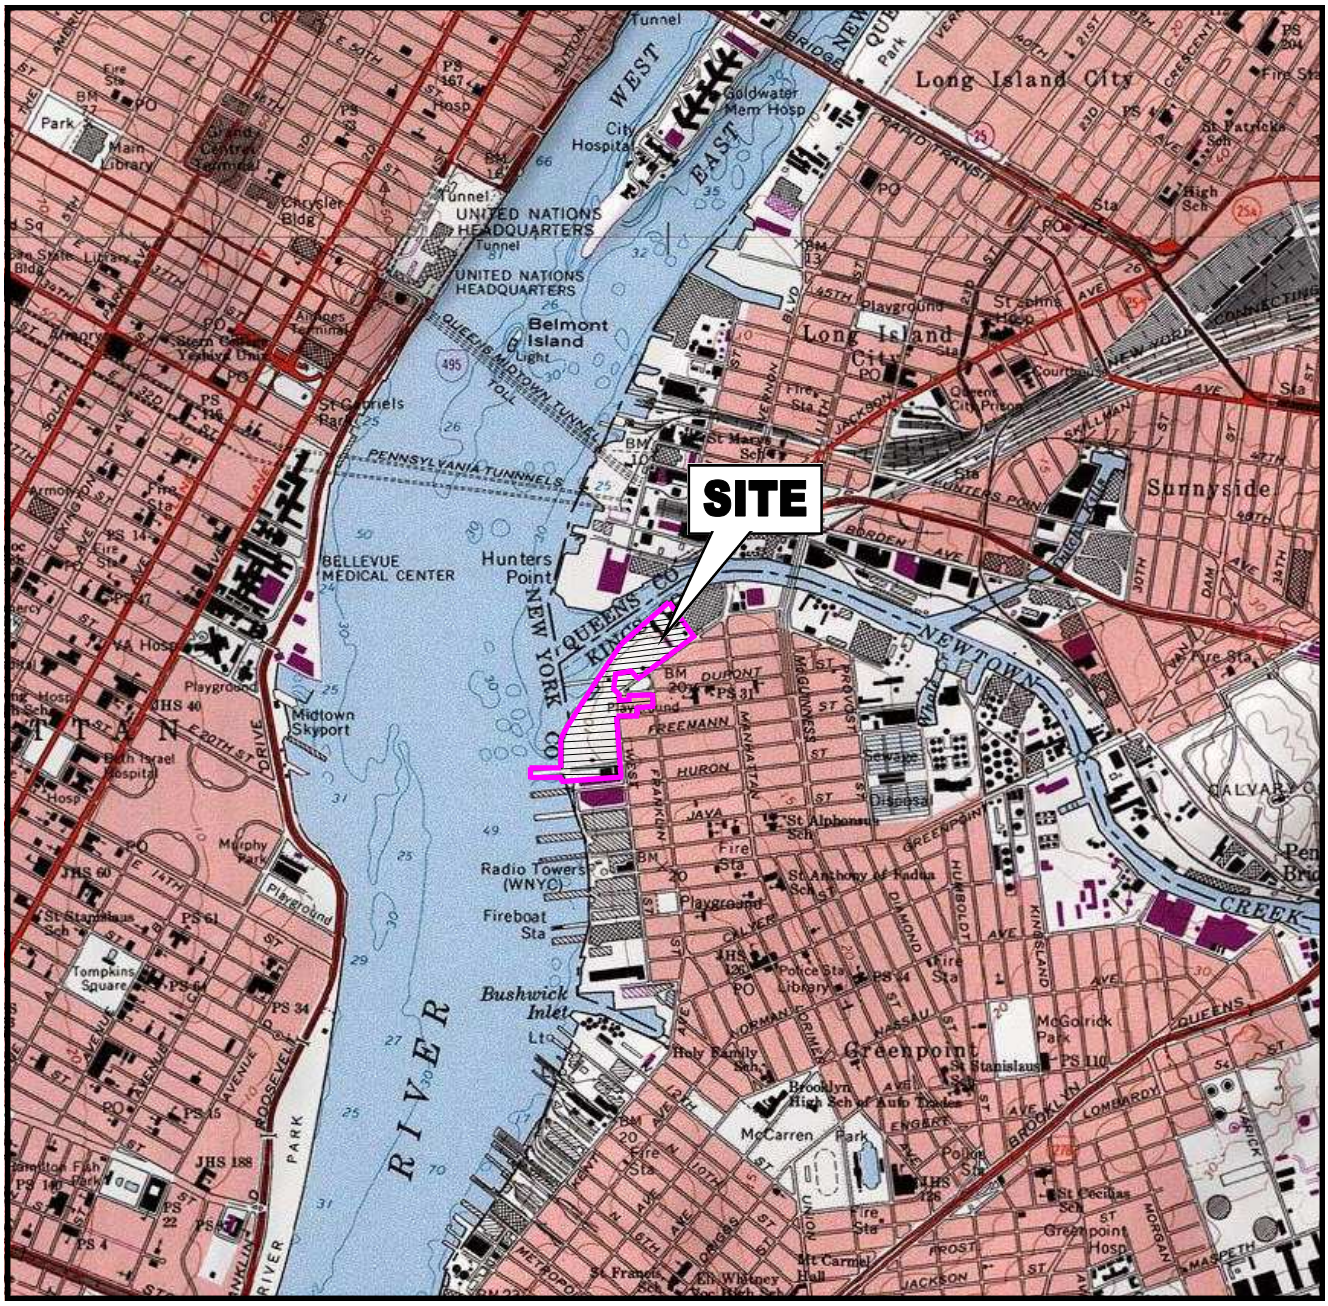
8.2 REMEDIATION

Based on our experience with City-approved remediations, we anticipate the following measures would be required by NYC DEP for the Greenpoint Lumber Yard Site:

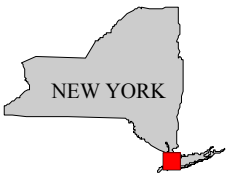
- **Soil Hotspots and Underground Storage Tank Removal.** NYC DEP will likely require the removal of the two hotspots identified in the two subsurface investigations and the underground storage tank (UST) located near MW-1 and other USTs noted in the Phase I

ESA. Tank contents and affected soil that is removed from the hotspot and UST locations would require appropriate off-site disposal and a licensed facility. Confirmatory endpoint samples would be collected from the sidewalls and base of the excavations. Disposal manifests and endpoint sampling results would be submitted to NYC DEP in a Remedial Action Report, if remedial activities occur prior to construction, or in a Closure Report, if remedial activities occur during general excavation. These reports would also be submitted to the State Spills Group.

- **Capping.** It is possible that NYC DEP would require capping of the entire Greenpoint Lumber Yard site with either paved surfaces and/or building foundations or two feet of imported clean fill material in landscaped areas to eliminate the exposure pathways of ingestion and/or inhalation of contaminants that may remain in the ground after the project is complete.



NYC DEP will also require a Construction Health and Safety Plan (see Section 8.1.2) prior to commencement of construction for the proposed project. The Construction Health and Safety Plan (CHASP) will be tailored specifically to the proposed development on the Greenpoint Lumber Yard site and will establish practices and procedures to protect the health of construction personnel and others during implementation of work involving potential or known contamination on the site. It will include contingencies for the identification and mitigation of USTs, drums or areas of contamination. The CHASP will be in conformance with the various Occupational Safety and Health Administration (OSHA) standards and NYC DEP requirements.



During general excavation, all soil removed from the site must be managed and disposed of in accordance with applicable federal, state and local regulations. Based on sampling results from the two subsurface investigations, none of the soil tested to date is a hazardous waste. Areas of contamination may require disposal as petroleum-contaminated or non-hazardous contaminated material. Most of the soil on the site, however, will likely be disposed of as construction and demolition debris.

Based on our experience, groundwater remediation is not anticipated. The Class GA exceedances that were detected in four of the groundwater sampling locations during the two subsurface investigations were very slight. The types and levels of detected contaminants are not indicative of contamination from former on-site uses as a chemical factory or lumber yard and are not unusual for urban areas. As such, contamination in three of the four wells (MW-7, MW-11 and MW-13) may result from off-site sources. The contamination in MW-1, located near a former gasoline pump and associated underground storage tank(s), is indicative of gasoline and it likely a result of leaks from the proximate pump and tank system. Although remediation is not anticipated, groundwater monitoring may be required by the State in areas where spills have been reported to assure that the removal of the source has led to the improvement or stabilization of the limited groundwater contamination.

Additional remedial actions, such as groundwater monitoring in locations of USTs and/or spills, vapor barriers beneath buildings, deed restrictions, etc., may be required by New York Site through the Oil Spill Program and/or the Brownfields Program.

RE: Greenpoint Lumber Yard Brooklyn, NY

Order No.: 0306116

Dear Mimi Sotiriou:

American Analytical Laboratories, Inc. received 20 samples on 6/27/2003 for the analyses presented in the following report.

There were no problems with the analyses and all data for associated QC met EPA or laboratory specifications.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Lori Beyer
Lab Director

American Analytical Laboratories, Inc.

SDG NARRATIVE

SDG Narrative

AAL Work Order: : 0306116
Sample Matrix : Soil
Project : Greenpoint

INTRODUCTION
This narrative covers the analysis of twenty (20) soils in accordance with protocols based on SW846 Methods 8260, 8270, 8081, 8082, 6010 and 7470.

HOLDING TIMES
The analytical holding time for these analyses was met.

CALIBRATIONS
Initial Calibration: All required minimum RRFs and maximum %RSD requirements have been met in accordance with the method.

Continuing Calibration: All required minimum RRFs and maximum %D requirements have been met in accordance with the method.

TUNE PERFORMANCE
All Tune (BFB) specifications met QC requirements.

METHOD BLANKS
The method blanks associated with these samples did not contain any target compounds at or above QC.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE/DUPLICATES
MS/MSD/Dup analysis was performed as required. Results are submitted as an appendix to this report. Spike recoveries and RPD fell within established ranges except where noted on the summary sheets. No laboratory action is required for MS/MSD outliers.

INTERNAL STANDARDS
All area responses and retention times fell within acceptable ranges.

SURROGATES (SYSTEM MONITORING COMPOUNDS)
Surrogate recoveries are summarized in the appendix to this report.

SAMPLE COMMENTS
Samples were analyzed as per the required protocols.

Semivolatile Analysis:
Semivolatile analysis of samples B12 (0.5-2'), MW-12 (0.5-2'), B9 (5'-6'), MW10 (0.5-2') were analyzed at 1:2 dilutions. Samples MW13 (0.5'-2'), MW6 (0.5'02'), B9 (14"-2.5'), B8 (8-10') were analyzed at 1:5 dilutions. B8 (8-10') was reanalyzed at a 1:50 dilution based upon target analyte concentrations.

MW13 (5'-7') was initially analyzed undiluted. Based upon target analyte concentrations the sample was reanalyzed at a 1:10 dilution

Sample B7R2 (5.5'-6.0') was analyzed at a 1:3 dilution.

Pesticide Analysis:
All samples were initially analyzed undiluted. Secondary dilutions were performed where the target concentrations exceeded the instruments linear calibration range.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory manager or his designee, as verified by the following signature." This statement shall be directly followed by signature of the Laboratory Manager or his designee with a typed line below it containing the signer's name and title, and the date of the signature.

DATA REPORTING QUALIFERS

For reporting results, the following "Results Qualifers" are used:

Value	If the result is greater than or equal to the detection limit, report the value
U	Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.
J	Indicates an estimated value. The flag is used: (1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.) (2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3ug/L was calculated report as 3J. This flag is used when similar situations arise on any organic parameter i.e. Pesticide, PCBs and others.
B	Indicates the analyte was found in the blank as well as the sample report "10B".
E	Indicates the analytes concentration exceeds the calibrated range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at a secondary dilution factor.
P	This flag is used for Pesticide / PCB target analyte when there is >25% difference for detected concentrations between the two GC Columns. The higher of the two values is reported on Form I and flagged with a "P".
N	This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used.

RE: Greenpoint Lumber Yard Brooklyn, NY

Order No.: 0306117

Dear Mimi Sotiriou:

American Analytical Laboratories, Inc. received 20 samples on 6/27/2003 for the analyses presented in the following report.

There were no problems with the analyses and all data for associated QC met EPA or laboratory specifications.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Lori Beyer

Lori Beyer
Lab Director

SDG NARRATIVE

SDG Narrative

AAL Work Order:	: 0306117
Sample Matrix	: Soil
Project	: Greenpoint

INTRODUCTION
This narrative covers the analysis of twenty (20) soils in accordance with protocols based on SW846 Methods 8260, 8270, 8081, 8082, 6010 and 7470.

HOLDING TIMES
The analytical holding time for these analyses was met.

CALIBRATIONS
Initial Calibration: All required minimum RRFs and maximum %RSD requirements have been met in accordance with the method.

Continuing Calibration: All required minimum RRFs and maximum %D requirements have been met in accordance with the method.

TUNE PERFORMANCE
All Tune (BFB) specifications met QC requirements.

METHOD BLANKS
The method blanks associated with these samples did not contain any target compounds at or above QC.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE/DUPLICATES
MS/MSD/Dup analysis was performed as required. Results are submitted as an appendix to this report. Spike recoveries and RPD fell within established ranges except where noted on the summary sheets. No laboratory action is required for MS/MSD outliers.

INTERNAL STANDARDS
All area responses and retention times fell within acceptable ranges.

SURROGATES (SYSTEM MONITORING COMPOUNDS)
Surrogate recoveries are summarized in the appendix to this report.

SAMPLE COMMENTS
Samples were analyzed as per the required protocols.

Semivolatile Analysis:
Semivolatile analysis of sample B10 (5'-7') was analyzed at a 1:10 dilution. A secondary diluted reanalysis was perform (1:50) in order to obtain several PAH concentrations within the upper half of the instruments linear calibration range. Results have been hybridized on the Form I.

Sample MW9 (1.5-3.5') was initially analyzed undiluted. A diluted reanalysis (1:5) was performed as a result of Fluoranthene concentrations. Samples MW7 (6.5-7.5) and MW9 (5'-6') were analyzed at 1:2 dilutions. MW7 (6.5-7.5) was reanalyzed at a 1:20 dilution based upon target analyte PAH concentrations. B11 (1-3) was analyzed at a 1:8 dilution. A secondary reanalysis was performed at a 1:80.

MW11 (0.5'-2') and MW15 (0.5'-2') were initially analyzed at 1:2 dilutions. Based upon target analyte concentrations the sample extracts were reanalyzed at 1:10 dilutions.

All samples were analyzed undiluted for VOCs, Pesticides, PCBs and Metals.
I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory manager or his designee, as verified by the following signature." This statement shall be directly followed by signature of the Laboratory Manager or his designee with a typed line below it containing the signer's name and title, and the date of the signature.

DATA REPORTING QUALIFERS

For reporting results, the following "Results Qualifers" are used:

Value	If the result is greater than or equal to the detection limit, report the value
U	Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.
J	Indicates an estimated value. The flag is used: (1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.) (2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3ug/L was calculated report as 3J. This flag is used when similar situations arise on any organic parameter i.e. Pesticide, PCBs and others.
B	Indicates the analyte was found in the blank as well as the sample report "10B".
E	Indicates the analytes concentration exceeds the calibrated range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at a secondary dilution factor.
P	This flag is used for Pesticide / PCB target analyte when there is >25% difference for detected concentrations between the two GC Columns. The higher of the two values is reported on Form I and flagged with a "P".
N	This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used.

1,4-Dichlorobenzene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4,5-Trichlorophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4,6-Trichlorophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4-Dichlorophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4-Dimethylphenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4-Dinitrophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,4-Dinitrotoluene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2,6-Dinitrotoluene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Chloronaphthalene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Chlorophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Methylnaphthalene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Methylphenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Nitroaniline	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
2-Nitrophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
3,3'-Dichlorobenzidine	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
3+4-Methylphenol	42	40		µg/Kg	1	7/10/2003 9:12:00 PM
3-Nitroaniline	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4,6-Dinitro-2-methylphenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Bromophenyl phenyl ether	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Chloro-3-methylphenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Chloroaniline	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Chlorophenyl phenyl ether	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Nitroaniline	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
4-Nitrophenol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Acenaphthene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Acenaphthylene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Aniline	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Anthracene	46	40		µg/Kg	1	7/10/2003 9:12:00 PM
Azobenzene	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzidine	U	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzo(a)anthracene	310	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzo(a)pyrene	310	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzo(b)fluoranthene	430	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzo(g,h,i)perylene	200	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzo(k)fluoranthene	130	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzoic acid	160	40		µg/Kg	1	7/10/2003 9:12:00 PM
Benzyl alcohol	U	40		µg/Kg	1	7/10/2003 9:12:00 PM

Qualifiers:

ND - Not Detected at the Reporting Limit

J - Analyte detected below quantitation limits

B - Analyte detected in the associated Method Blank

* - Value exceeds Maximum Contaminant Level

S - Spike Recovery outside accepted recovery limits

R - RPD outside accepted recovery limits

E - Value above quantitation range

American Analytical Laboratories, Inc.
