DEC REMARKS:

7/8/25 - Kim - ACT reported that they performed the Phase II for a bank as due diligence. The site contains urban fill with chlorinated solvents found in one portion of the site. Tetrachloroethene (Perc) was found to be present in soil (UUSCO at 1.3 ppm). Chlorinated solvents, including cis-1,2-dichloroethene at 32ug/L (compared to TOGS at 5ug/L), were also present in groundwater; however, this groundwater sample was collected from a temporary well, the sample appeared turbid, and SVOCs (not expected in dissolved phase) were also detected in this groundwater sample. ACT also spoke with R2-RSE Mahat about a previous spill, 1403242, which was for a different material (mineral oil), but a note/document referenced a sump that was cleaned out. ACT would like to know if the sump is the same location as the chlorinated solvents.

Spills will likely need to refer this case to another R2 Remedial Section. Pending receipt of Phase I Report - expected by 7/24/25.
