## **EXECUTIVE SUMMARY**

The following is a summary of findings obtained during a "Phase I" Environmental Site Assessment conducted at the subject property located at 12020 Flatlands Avenue, in Brooklyn, County of Kings, State of New York.

The subject property (approximately 10.0 acres) currently consists of a two-story masonry and steel framed building, surrounded by concrete walkways and asphalt paved parking areas, and vacant land. The subject building, occupied by New York Christian Cultural Centre, was reportedly constructed between 1997-2000. Soil Mechanics was informed that a gas collection/venting system was installed beneath the subject building due to the presence of methane gas.

Information obtained from previous investigations conducted at the subject property revealed that the site was originally marshlands and was landfilled during the early 1900's. Ash and residue from a city solid waste incinerator were reportedly used as fill material.

Review of historical Sanborn fire insurance maps revealed that several sheds, a wagon house, a residence, a gasoline filling station, a masons materials storage yard and associated storage building, an auto wrecking facility, a small commercial building, and automobile junkyards were formerly located at the subject property dating back to 1908.

Review of ownership records revealed several names of concern, i.e., Socony Mobil Oil Co., London Servicenter, and Marvic Service Station, Inc., etc. listed for Block: 4434 – Lot: 1 prior to 1960. Further, London Servicenter was involved in a declaration transaction, dated 06/24/48, at Block: 4431 – Lot: 1, Block 4432 – Lot: 1, and Block: 4433 – Lot: 1.

The results of an environmental investigation conducted at the subject property by AKRF, Inc. (Draft Environmental Impact Statement, dated June 1991) revealed elevated concentrations of methane in the area of the former gasoline service station, elevated levels of total petroleum hydrocarbons and metals throughout the subject property, and elevated concentrations of semi-volatile organics at several surface and subsurface locations. Further, elevated levels of metals, volatile organics, and semi-volatile organics were detected within aqueous samples collected from the project site.

The western portion (approximately 6.0 acres) of the site is currently improved and contains the subject building, surrounded by concrete walkways and asphalt paved parking areas. Inspection of the subject building revealed it to be divided into a sanctuary, classrooms, offices, bathrooms, cafeteria, kitchen, bookstore, sound room, and storage rooms amongst the two (2) floors. Further, two (2) passenger elevators were identified within the subject building. The eastern portion (approximately 4.0 acres) consisted of several deciduous trees, exposed surface soils, and overgrown secondary vegetation. A small excavation was noted along the western portion of this area. Rubber tires, metal, and demolition debris were observed to be intermixed with surface soils. An abandoned crane and several piles of rubber tires, demolition debris, and common household trash were identified at various locations.

One (1) pad-mounted electrical transformer was identified outside the southwestern portion of the subject building. Floor drains were observed within the kitchen area and bathrooms of the subject building. Numerous open grate and solid covered manholes were observed throughout the parking fields. Reportedly, said structures are associated with the on-site drainage system which discharge to the municipal sewer system.

There was no visible evidence to indicate the presence of any aboveground storage tanks (AST's), underground storage tanks (UST's), storage of chemicals, hazardous materials/wastes and/or water supply/ground water monitoring wells at the subject property.

A review of surrounding property use revealed several businesses, i.e., Getty and Amoco/BP service stations, Flatlands Auto Sales, Kings County Auto Salvage, 2H1 Auto Sales, Inc., a junkyard, commercial/industrial businesses, and Kent Cleaners, situated in close proximity to the subject property which are known to us as being associated with the types of operations that historically represent a potential for adverse impact to the environment. Further, review of historical Sanborn maps indicated several filling stations north of the subject property.

A review of various federal and state regulatory databases revealed one (1) **SHWS Site** (Pennsylvania Avenue Landfill) within a one (1) mile radius; one (1) **RCRIS SQG Site** (Flat Gas, Inc.) and one (1) **NYSDEC Registered Underground Storage Tank (UST) Site** (Flat Gas, Inc.) adjacent to the subject property; and a total of sixty-four (64) **NYSDEC LTANK & SPILL Sites** within a one-half mile radius. Of the sixty-four (64) **NYSDEC LTANK & SPILL Sites**, thirty (30) are listed as "active" status, meaning the spill investigations are on-going. The remaining **LTANK & SPILL Sites** are listed as "closed" status, meaning the spills have been cleaned up, all paper work completed, and no further action required by the **NYSDEC**. Of the thirty (30) "active" status sites, only one (1) is documented as affecting the groundwater (see Section 7.2).

## **1.0 PURPOSE**

The principal objectives of this "Phase I" Environmental Site Assessment were to identify and evaluate current site conditions, the visual presence or absence of contamination, possible sources of contamination, and potential environmental impairments at the subject property. The assessment was limited to historical research and site reconnaissance to evaluate the existence of any such conditions.

Consistent with generally accepted protocols, the "Phase I" Environmental Site Assessment did not include sampling or analysis of suspect materials which may have been observed on the subject property. The format of this assessment was predicated upon general guideline requirements established by individual lending institutions, American Society for Testing and Materials Standards (ASTM)(E 1527-00), various professional organizations, and our professional judgment.

### **1.1 Introduction**

Soil Mechanics Environmental Services (SMES) was retained by Mr. James M. Halek of Integrity Development, Inc. to perform a "Phase I" Environmental Site Assessment at the referenced property. Reconnaissance of all accessible portions of the subject property and of any improvements was performed by SMES personnel on March 27, 2003. The site representatives included Mr. James M. Halek of Integrity Development, Inc. and Dan Aizer of Legacy General Contracting Corp.

## 1.2 Site Location

The subject property is located at 12020 Flatlands Avenue, north of Belt Parkway, south of Linden Boulevard (Route 27), and west of Pennsylvania Avenue in Brooklyn, County of Kings, State of New York (see Figure #1 – Project Location Plan). The subject property is currently designated as Block: 4430 – Lot: 1, Block: 4431 – Lot: 1, Block: 4432 – Lot: 1, Block: 4433 – Lot: 1, and Block: 4434 – Lots: 1 and 21 at the **Borough of Brooklyn Register's Office**. Further, the subject property consists of former beds of Malta, Alabama, Georgia, and Sheffield Avenues.

## 1.3 Scope of Work

Various items were identified during the scope of this investigation and included:

1. A thorough visual inspection ("walk-through") of the subject property.
2. A survey of the adjacent property for current land use.
3. Review of historical aerial photographs and/or Sanborn Maps in order to identify past and present land usage at the subject property.
4. Review of ownership history (title search) in an attempt to identify previous owners who may have impacted the environmental quality of the subject property.
5. Review latest information from federal, state, and local agencies, regarding environmental concerns at the subject property and any potential surrounding sites.
6. Evaluation of various factors obtained during the investigation.

JOB NO.:

03-172

#### 1.4 Previous Investigations

Previous geotechnical and environmental related investigations have been conducted at the subject property or portions thereof. These reports were reviewed as part of this Phase I Environmental Site Assessment and are summarized below (see copies of reports (text only) in Appendix):

Fresh Creek Estates, Technical Memorandum to the Draft Environmental Impact Statement, dated June 1991; Prepared for: Department of Environmental Protection; Prepared by: AKRF, Inc.

This assessment was done as part of an overall environmental review under the New York City Environmental Quality Review (CEQR) process with Departments of City Planning (NYCDCP) and Environmental Protection (NYCDEP) acting as co-lead agencies.

The site was originally marshlands and was landfilled during the early 1900's. Ash and residue from a city solid waste incinerator were used as fill material. Prior to 1950, a gasoline station at the corner of Pennsylvania and Flatlands Avenues and two (2) small wooden stables occupied parts of the site. Automobile junkyards were also once located on portions of the site.

The objectives of this assessment were to establish baseline soil and groundwater quality conditions and to evaluate the potential impact posed by existing subsurface conditions on the planned building activities at the site.

An electromagnetic survey was conducted at the subject property. Results of this survey revealed two (2) anomalies near Flatlands Avenue and one (1) anomaly near the southern portion of the site near Vandalia Avenue. Test pits, each to a depth of 7.0 feet below grade surface, were excavated at these locations which revealed the following at test pit #3: auto parts, such as gasoline tanks and tire rims, and crushed drums. No metal objects were identified at test pits #1 and #2.

Results of a soil gas survey, conducted in the area of the former gasoline service station, did not indicate elevated non-methane volatile organic compounds. Methane concentrations were measured at relatively high levels, presumably resulting from organic material in the underlying marsh deposits and/or the fill material.

Results of soil sampling activities revealed elevated levels of total petroleum hydrocarbons and metals throughout the site and elevated concentrations of semi-volatile organics at several surface and subsurface locations. Elevated levels of metals, volatile organics, and semi-volatile organics were also detected within aqueous samples collected from the project site. AKRF states that the contaminants that are present at elevated levels are probably associated with the fill material or with suspended soil particles.

Based on the results of this investigation and their understanding of the project, AKRF recommended the following:

- The development and implementation of a health and safety plan (HASP). Air monitoring instruments should be operating during intrusive activities. After excavation and construction activities are completed, constituents within the site soils will, for the most part, remain separated from residents and the visiting population by coverage with buildings or pavement.
- The use of a soil barrier at portions of the site not built on or paved.
- Laboratory analyses of representative samples of the excavated soil will be required for off-site re-use or disposal.

Subsurface Investigation and Report, dated March 14 1994; Prepared for: McKissack & McKissack Architects, P.C.; Prepared by: SESI Consulting Engineers

The site is presently cleared, vacant and fenced parcel which was originally marshlands that were landfilled during the early 1900's. SESI understands that ash and residue from a city solid waste incinerator were used as fill material. It also appears that some more recent miscellaneous fill has been dumped on the site. Reportedly, prior to 1950, a gasoline station existed at the corner of Pennsylvania and Flatlands Avenue and automobile junkyards were once located on portions of the property.

A total of eight (8) borings were drilled to depths varying from 26.0 to 51.5 feet below presently existing grade. All the borings encountered a miscellaneous fill to depths varying from 18.5 to 35.0 feet below presently existing grade. The fill has a high percentage of cinders and ashes mixed with sand, silt, gravel, and clay, with inclusions of various debris such as concrete, wood, rubble, metal, brick, glass, asphalt, etc. Groundwater was encountered in all of the borings at depths varying from 17.0 to 23.0 feet below presently existing grade.

Phase I Environmental Site Assessment, dated July 1997; Prepared for: Legacy General Contracting Corp. (Owner Representative); Prepared by: Soil Mechanics Environmental Services

During the time of this report, the subject property (approximately 6.0 acres) consisted of an approximate 100,000 square foot two-story building under construction. Level areas of exposed surface soils, numerous piles of soil, an office trailer, construction vehicles, and construction supplies were observed throughout the subject property.

## **2.0 SITE HISTORY**

The subject property currently consists of a two-story building occupied by New York Christian Cultural Centre and associated improvements and approximately 4.0 acres of vacant land. Soil Mechanics was informed that the existing building was constructed between 1997-2000.

Information obtained from previous investigations conducted at the subject property revealed that the site was originally marshlands and was landfilled during the early 1900's. Ash and residue from a city solid waste incinerator were reportedly used as fill material.

Review of historical Sanborn fire insurance maps revealed that several sheds, a wagon house, a residence, a gasoline filling station, a masons materials storage yard and associated storage building, an auto wrecking facility, a small commercial building, and automobile junkyards were formerly located at the subject property dating back to 1908.

### **2.1 Historical Topographic Maps**

Historical topographical maps are a valuable historical resource for documenting the prior use of a property and, due to their frequent availability, can be particularly helpful when other standard historical sources are not reasonably ascertainable. A review of historical topographic maps (obtained from EDR Inc., 3530 Post Road, Southport, CT), dated 1900, 1943, 1956, 1967, 1979, and 1995, revealed the following (see attached copies in Appendix):

1900 Topographic Map – The subject property appears to consist of marshlands and vacant land.

1943 Topographic Map – The subject property consisted of marshlands and vacant land. A road, likely former Sheffield Avenue, is shown running parallel to Pennsylvania Avenue at the eastern portion of the site.

1956 and 1967 Topographic Maps – The subject property consisted of two (2) structures located at the northeast portion and vacant land.

1979 and 1995 Topographic Maps – The subject property consisted of vacant land.

## **2.2 Review of Historical Sanborn Maps**

Soil Mechanics personnel reviewed all available historical Sanborn fire insurance maps (obtained from EDR Inc., 3530 Post Road, Southport, CT), dated 1908, 1928, 1950, 1967, 1969, 1977, 1979, 1980, 1981, 1983, 1986, 1987, 1989, 1991, 1992, 1993, 1994, 1995, and 1996, to identify past land usage of the subject property and surrounding area. A review of these Sanborn maps revealed the following (see copies of Sanborn maps in Appendix):

1908 Sanborn Map – The subject property consisted predominately of vacant land. A small shed and wagon house were identified on Block: 4433, in between former Georgia and Sheffield Avenues. The surrounding land use consisted mostly of vacant land to the north, south, east, and west. Notably, a florist was identified northeast of the subject property.

1928 Sanborn Map – The subject property consisted predominately of vacant land. Two (2) vacant sheds were identified at Block: 4433 and two (2) sheds and a residence were identified at or near Block: 4431. The surrounding land use consisted of vacant land and scattered residential structures to the north, south, east, and west.

1950 Sanborn Map – The subject property consisted of a filling station, a masons materials storage yard and associated storage building, and vacant land. The surrounding land use consisted of four (4) filling stations, an egg farm, auto wrecking facility, and scattered residential structures to the north and vacant land to the south and east. Land usage to the west was not provided.

1967 and 1969 Sanborn Maps – The subject property consisted of an auto wrecking facility, a masons materials storage yard and associated storage building, and three (3) small office buildings. Notably, northern areas of the site were utilized as auto junk yards. The surrounding land use consisted of four (4) filling stations, an egg farm, auto junk yards, and industrial/commercial businesses to the north; vacant land to the south; and vacant land and baseball batting range, golf driving range, and miniature golf to the east. Land usage to the west was not provided.

1977, 1979, 1980, 1981, 1983, 1986, and 1987 Sanborn Maps – The subject property consisted of a small commercial building, an auto wrecking facility, a warehouse building, and three (3) small office buildings. Notably, portions of the northern areas of the site were utilized as auto junk yards. The surrounding land use consisted of multi-story apartments to the south and east. Land usage to the north and west was not provided.

1989, 1991, 1992, 1994, 1995, and 1996 Sanborn Maps – The subject property consisted of a small commercial building and vacant land. Notably, portions of the northern areas of the site were utilized as auto junk yards. The surrounding land use consisted of multi-story apartments to the south and east. Land usage to the north and west was not provided.

### **2.3 History of Ownership**

The **Borough of Brooklyn Register's Office** (Brooklyn, N.Y.) was visited in order to review past and present ownership, from approximately 1950 to the present, of the subject property (Block: 4430 – Lot: 1, Block: 4431 – Lot: 1, Block: 4432 – Lot: 1, Block: 4433 – Lot: 1, Block: 4434 – Lots: 1 and 21, and the former beds of Malta, Alabama, Georgia, and Sheffield Avenues) which may have involved hazardous materials. Several names of concern, i.e., Socony Mobil Oil Co., London Servicenter, and Marvic Service Station, Inc., etc. were listed for Block: 4434 – Lot: 1 prior to 1960.

Further, London Servicer was involved in a declaration transaction, dated 06/24/48, at Block: 4431 – Lot: 1, Block: 4432 – Lot: 1, and Block: 4433 – Lot: 1.

### **3.0 SITE DESCRIPTION**

#### **3.1 Facility Overview**

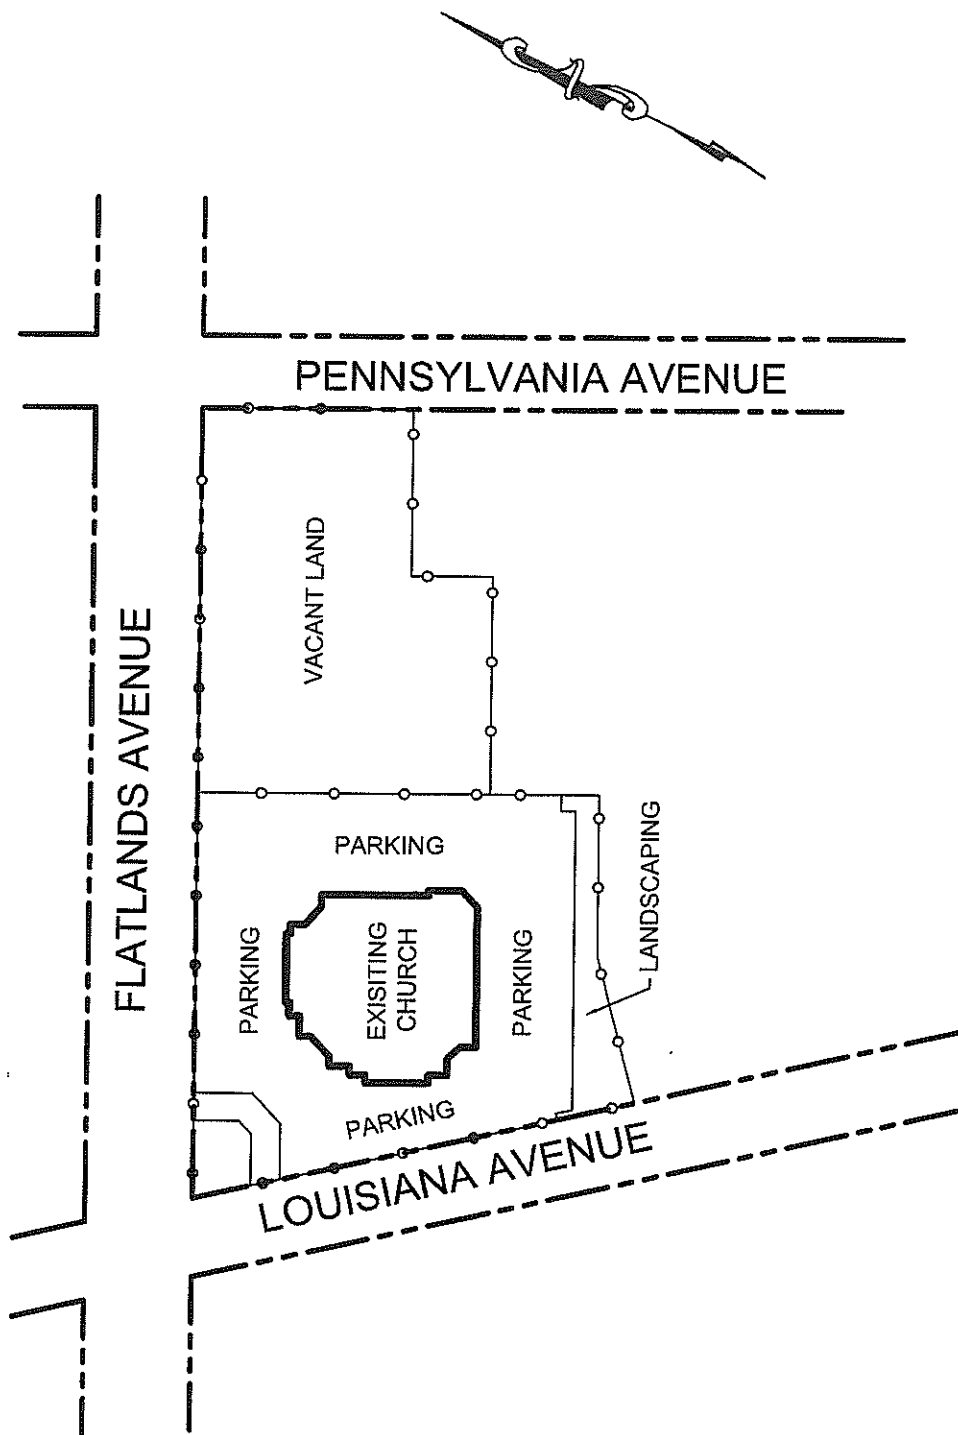

During the time of this assessment, the subject property (approximately 10.0 acres) consisted of a two-story masonry and steel framed building, surrounded by concrete walkways and asphalt paved parking areas, and vacant land. Fencing surrounds the entire subject property (see Figure #2 – Site Plan)(see attached photolog in Appendix). Soil Mechanics was informed by the site representatives that a gas collection/venting system was installed beneath the subject building due to the presence of methane gas.

#### **3.2 Visual Inspection (interior)**

A visual inspection of the interior portions of the existing two-story masonry and steel framed building revealed it to be divided into a sanctuary, classrooms, offices, bathrooms, cafeteria, kitchen, bookstore, sound room, and storage rooms amongst the two (2) floors. Further, two (2) passenger elevators were identified within the subject building. Inspection of the elevator motor rooms revealed each motor unit to be in good condition with no visible signs of leakage or damage.

#### **3.3 Visual Inspection (exterior)**

A visual inspection of the exterior portions of the subject property revealed the following:

|   |                     |         |        |
|---|---------------------|---------|--------|
| <b>SOIL MECHANICS</b><br><b>ENVIRONMENTAL SERVICES</b><br>3770 MERRICK ROAD - SEAFORD, L.I, NEW YORK - (516) 221-7500 |                     |         |        |
| SITE PLAN   |                     |         |        |
| FIGURE #2   |                     |         |        |
| BROOKLYN, NEW YORK  |                     |         |        |
| SCALE: N.T.S.   | DATE: APRIL 9, 2003 | JOB NO. | 03S172 |
| REVISED:  |                     | JMR     |        |

- The western portion (approximately 6.0 acres) of the site is currently improved and contains the subject building, surrounded by concrete walkways and asphalt parking areas. A wood-framed gazebo is located at the northwest portion of the site. One (1) pad-mounted electrical transformer, natural gas meters, and an emergency generator were identified outside the southwestern portion of the building. A garbage compactor unit, three (3) container boxes (containing building and landscaping equipment and supplies), a roll-off container (containing common trash), a bob cat, and miscellaneous storage of landscaping materials were identified outside the southeastern portion of the building. Numerous open grate and solid covered manholes were observed throughout the parking fields. Reportedly, said structures are associated with the on-site storm water drainage system which discharge to the municipal sewer system.
- The eastern portion (approximately 4.0 acres) of the subject property consists of vacant land comprised of several deciduous trees, exposed surface soils, and overgrown secondary vegetation. A small excavation was noted along the western portion of this area. Rubber tires, metal, and demolition debris were observed to be intermixed with surface soils. An abandoned crane and several piles of rubber tires, demolition debris, and common household trash were identified at various locations.

#### 4.0 VISUAL DISTURBANCES

During this inspection, the subject property revealed no visible evidence that could be attributed to major spills or discharges of hazardous materials or hazardous wastes.

All existing vegetation, on or about the subject property, appeared in good condition and showed no sign of unusual stress being placed upon it relative to the environmental conditions at the subject property.

## 5.0 SITE OPERATIONS AND UTILITIES

### 5.1 Electrical Transformer(s)

One (1) pad mounted electrical transformer was identified outside the southwestern portion of the subject building. The aforementioned transformer is owned and maintained by **Consolidated Edison Company of New York, Inc. (Consolidated Edison)**. Inspection of the transformer revealed it to be in good condition, with no visible signs of leakage or damage. There were no pole mounted electrical transformers observed at the subject property.

### 5.2 Aboveground Storage Tank(s)(AST's)

There were no aboveground storage tanks (AST's) visually identified at the subject property.

### 5.3 Underground Storage Tank(s)(UST's)

There was no visible evidence, i.e., fill ports, vent pipes, to indicate the presence of underground storage tanks (UST's) at the subject property.

### 5.4 Utilities

Soil Mechanics was informed that the subject building is heated utilizing natural gas fired rooftop units. Natural gas and electricity are provided to the subject property by **Consolidated Edison**. The subject building is reportedly connected to the municipal sewer system for the disposal of sanitary wastes and provided with potable water by a municipal water company.

### 5.5 Chemicals, Hazardous Materials/Waste Storage, and Disposal

There were no chemicals, hazardous materials and/or hazardous wastes visually identified at the subject property.

#### **5.6 Water Supply/Monitoring Well(s)**

There was no visible evidence to indicate the presence of any water supply and/or ground water monitoring wells at the subject property.

#### **5.7 Interior Drainage Structures**

Floor drains were observed within the kitchen area and bathrooms of the subject building. Said structures are assumed to discharge to the municipal sewer system.

#### **5.8 Exterior Drainage Structures**

Numerous open grate and solid covered manholes were observed throughout the parking fields. Reportedly, said structures are associated with the on-site storm water drainage system which discharge to the municipal sewer system.

### **6.0 SURROUNDING PROPERTY USE**

Adjacent land use surrounding the subject property consisted of the following (see Figure #3 - Surrounding Land Use Map):

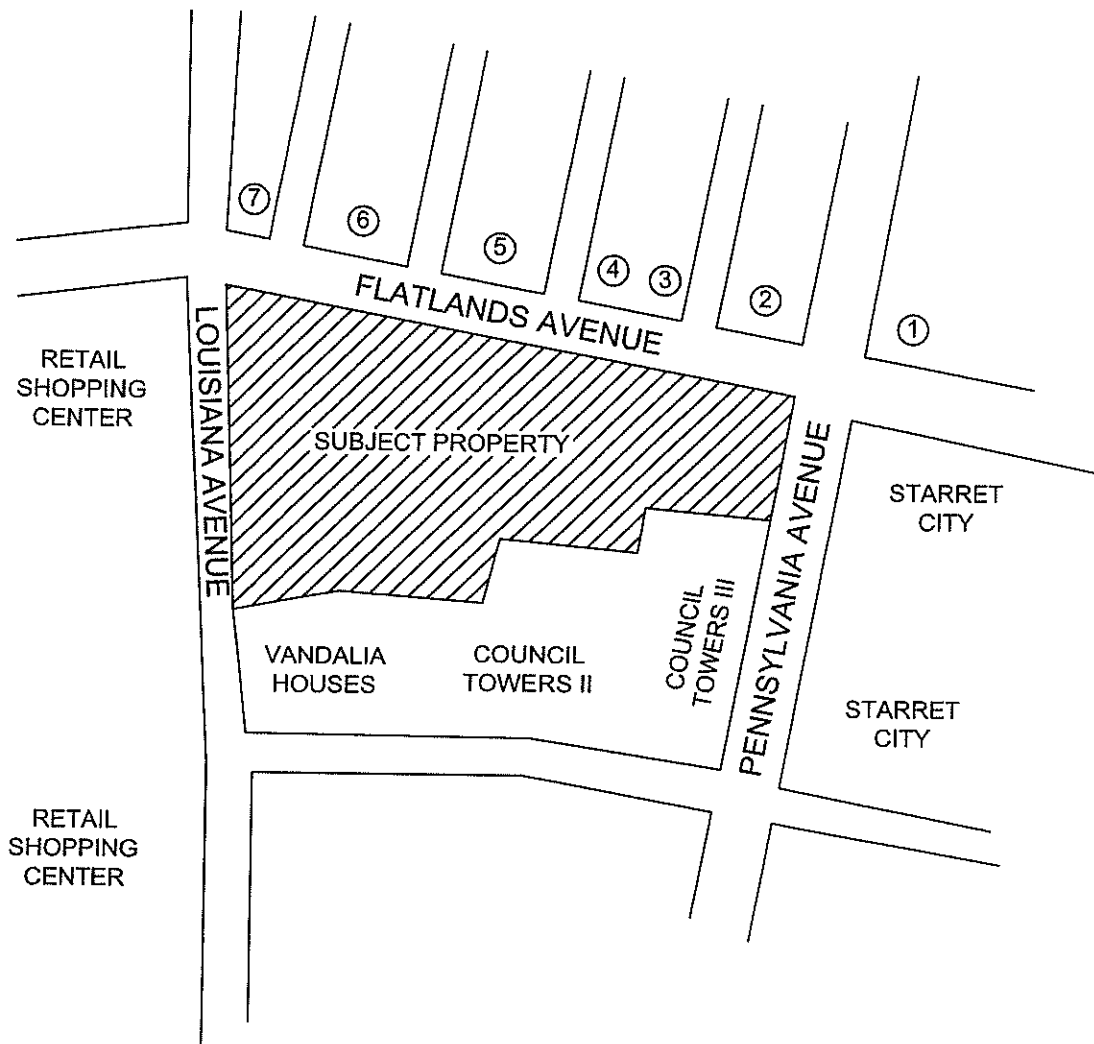

North of the site: Getty service station, BP/Amoco service station/car wash/convenience store, a motel, Flatlands Auto Sales, Kings County Auto Salvage, 2H1 Auto Sales, Inc., junkyard, and commercial/industrial businesses.

South of the site: Multi-story apartment buildings (Vandalia Houses, Council Towers II, and Council Towers III).

East of the site: Multi-story apartment buildings (Starrett City).

West of the site: Retail shopping centers (including Pathmark Supermarket, liquors, Chinese kitchen, shoes, jewelry, barber shop, martial arts, card store, Dunkin Donuts, auto insurance, Baskin Robbins, OTB, Kent Cleaners, stationary, International Food, Affordable Optical, and Hot Bagels).

FIGURE #3

BROOKLYN, NEW YORK

|        |        |          |               |         |        |
|--------|--------|----------|---------------|---------|--------|
| SCALE: | N.T.S. | DATE:    | APRIL 9, 2003 | JOB NO. | 03S172 |
|        |        | REVISED: | JMR           |         |        |

A review of surrounding property use revealed several businesses, i.e., Getty and Amoco/BP service stations, Flatlands Auto Sales, Kings County Auto Salvage, 2H1 Auto Sales, Inc., a junkyard, commercial/industrial businesses, and Kent Cleaners, situated in close proximity to the subject property which are known to us as being associated with the types of operations that historically represent a potential for adverse impact to the environment.

## **7.0 AGENCY CONTACT**

A review of various documentation, from appropriate federal, state, and local agencies, was conducted for the purpose of identifying any history of hazardous waste activity known to have occurred at the subject property or within a one mile radius. The standard environmental sources reviewed and approximate minimum search distances are pursuant to ASTM standards (see EDR-Radius Map report in Appendix).

### **7.1 Federal Agencies**

**NPL – National Priority List** - a list compiled by the USEPA pursuant to CERCLA of properties with the highest priority for cleanup pursuant to EPA's Hazard Ranking System. The subject property did not appear as an **NPL Site**. There were no **NPL Sites** identified within a one mile radius.

**CERCLIS – Comprehensive Environmental Response Compensation and Liability – Information System List** – a list of sites compiled by the USEPA that they have investigated or are currently investigating for potential hazardous substance contamination for possible inclusion on the National Priorities List. The subject property did not appear as a **CERCLIS Site**. There were no **CERCLIS Sites** identified within a one-half mile radius.

**CERCLIS NFRAP – CERCLIS No Further Remedial Action Planned** – as of February 1995, CERCLIS sites designated “No Further Remedial Action Planned” (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. The subject property or adjoining properties did not appear as a **CERCLIS NFRAP Site**.

**CORRACTS Site** – The **Corrective Action Report** is a list of hazardous waste handlers with **RCRA Corrective Action Activity**. The subject property did not appear as a **CORRACTS Site**. There were no **CORRACTS Sites** identified within a one mile radius.

**RCRIS – Resource Conservation and Recovery Information System** – RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). The subject property did not appear as a **RCRIS TSD Site**. There were no **RCRIS TSD Sites** identified within a one (1) mile radius.

The subject property did not appear as a **RCRIS Large Quantity Generator (LQG) or Small Quantity Generator (SQG) Site**. There were no **RCRIS LQG Sites** identified adjacent to the subject property. The following **RCRIS SQG Site** was identified adjacent to the subject property:

1.) Flat Gas, Inc., located north of the subject property at 1130 Pennsylvania Avenue, in Brooklyn, N.Y. No violations were noted for this facility.

**ERNS Database** – USEPA's Emergency Response Notification System is a computer database containing information on release notifications of oil and hazardous substances that have occurred throughout the United States and have been reported to the **National Response Center (NRC)** and/or one of the ten (10) USEPA regions. The subject property did not appear within the **ERNS Database**.

## **7.2    State Agencies**

**SHWS – State Hazardous Waste Sites** – State hazardous waste site records are the State's equivalent to CERCLIS. These sites may or may not be already listed on the Federal CERCLIS list. The subject property did not appear as an **NYSDEC Inactive Hazardous Waste Disposal Site**. The following **NYSDEC Inactive Hazardous Waste Disposal Site** was identified within a one mile radius:

1.) Pennsylvania Avenue Landfill, located approximately ¾ mile south of the subject property at Pennsylvania Avenue and Shore Parkway, in Brooklyn, N.Y. The site was operated by the New York City Department of Sanitation (NYCDOS) as a sanitary landfill from 1956 to 1962, with the final top soil cover placed in 1963. In 1972, the site was reactivated by the NYCDOS as a construction and demolition landfill. The site was deactivated and closed in 1985. The NYCDOS estimates that approximately 13 million gallons/year of hazardous wastes were disposed at this site. The shoreline was saturated with oil containing PCB's and heavy metals, which were leaching into Fresh Creek. The Record of Decision (ROD) was issued in February 1995. The selected remedy required capping, active leachate and product collection in the trench, and active gas collection. Air sampling on the landfill and at downwind locations indicates the landfill has not affected levels of volatile organic contaminants in ambient air. Groundwater in the area is not used as a source of potable water, but contaminated groundwater may discharge into Jamaica Bay tidal waters.

**SWF/LF Sites – Solid Waste Facilities/Landfill Sites** – SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The subject property was not listed as a **NYSDEC SWF/LF Site**. There were no **NYSDEC SWF/LF Sites** identified within a one-half mile radius.

**NYSDEC UST List – Registered Underground Storage Tank List** – UST's are regulated under Subtitle I of the RCRA and must be registered with the state department responsible for administering the UST program. The subject property did not appear within the **NYSDEC Registered Underground Storage Tank (UST) Database**. The following **NYSDEC Registered UST Site** was identified adjacent to the subject property:

1.) Flat Gas, Inc., located north of the subject property at 1130 Pennsylvania Avenue, in Brooklyn, N.Y. This facility has a total of five (5) in-service 4,000-gallon unleaded gasoline underground storage tanks (UST's) and five (5) closed-removed or closed-in place 4,000-gallon UST's registered with the NYSDEC.

A review of the **NYSDEC Leaking Storage Tank (LTANKS) and Spill (SPILL) Sites Databases** revealed no **LTANKS & SPILL Sites** reported at the subject property (12020 Flatlands Avenue, Brooklyn, N.Y.). A total of sixty-four (64) **NYSDEC LTANK & SPILL Sites** were listed within a one-half mile radius of the subject property (see EDR Report in Appendix for complete listing). Of these sixty-four (64) **NYSDEC LTANK & SPILL Sites**, thirty (30) are listed as “active” status, meaning the spill investigations are on-going. The remaining **LTANK & SPILL Sites** are listed as “closed” status, meaning the spills have been cleaned up, all paper work completed, and no further action required by the NYSDEC. Of the thirty (30) “active” status sites, one (1) is documented as affecting the groundwater and the remaining affected the land or sewer.

The following preliminary information was available regarding the “active” status NYSDEC LTANK & SPILL Site documented as affecting the groundwater:

1.) LTANK #: 94-12264, located northwest of the subject property at 400 Stanley Avenue, in Brooklyn, N.Y. Spill date: 12/12/1994; spill closed date: not reported; spill cause: tank test failure; resource affected: groundwater; spill notifier: tank tester; material: diesel. DEC Remarks: not reported. Spill Cause: Ex invest suspect remote fill – NYCFD was at site.

### **7.3 Local Agencies**

Since sufficient information was obtained regarding the historical use of the subject property, i.e., review of a city directory abstract, Sanborn fire insurance maps, and ownership records, the local building department search was excluded from this assessment. According to ASTM E-1527-00, Section 7.3.2.3, a standard historical source may be excluded (1) if the source is not reasonably ascertainable or (2) if past experience indicates that the source is not likely to be sufficiently useful, accurate, or complete in terms of satisfying 7.3.2.9 (uses of property).

## **8.0 HYDROGEOLOGIC INFORMATION**

Information obtained from the 7.5 minute series, Brooklyn, NY Quadrangle Topographic Map, published by the US Department of the Interior, Geological Survey, revealed that the subject property is located approximately fifteen to twenty (15-20) feet above sea level (see Figure #4 - Topographic Map). Notably, the project site is identified as a junkyard and two (2) buildings were present at the northeastern portion of the property.

## ENVIRONMENTAL SERVICES

3770 MERRICK ROAD - SEAFORD, NEW YORK 11783 (516) 221-7500

FIGURE #4  
TOPOGRAPHIC MAP  
BROOKLYN, NEW YORK

SCALE: N.T.S.

DATE: 04/07/03

JOB NO.: 03-172

Information obtained from the Water Table on Long Island, New York, Mar. – Apr. 1984, prepared by the United States Department of Interior – Geological Survey, indicated an estimated depth to groundwater of approximately five to ten (5-10) feet below grade surface. This map indicates a southeasterly trending groundwater flow component towards local bodies of water. Notably, groundwater was encountered at depths varying from 17.0 to 23.0 feet below presently existing grade during the 1994 subsurface investigation completed by McKissak & McKissak Architects, P.C (see Section 1.4).

### 8.1 Surface Water Bodies

There was no visible evidence of any surface water bodies present on or contiguous to the subject property (i.e., rivers, streams, lakes, ponds, ditches, etc.). No runoff from surrounding areas was observed entering the subject property.

### 9.0 RADON POTENTIAL

According to the **State of New York Department of Health's** publication, Indoor Radon In New York State: Distribution, Sources, and Controls, "Long Island is part of the broader Atlantic Coastal Plain that stretches north and south along the east coast of the United States. Beneath the thick cover of glacial moraines and outwash, Long Island is underlain by flat-lying sedimentary rocks. Coarse, gravely moraines extend the entire length of the island along the north coast and through the center. The rest of the island is covered by pebbly sand outwash with a few small areas of clay from former lakes. In general, the radium content of the soils is below average and their permeability is moderate to low. Based on these conditions, the entire island can be classified as having low indoor radon potential.

However, a number of the boulders in the moraines have been identified as emitting high levels of gamma radiation indicating the presence of uranium. These boulders are indicative of the sources for the sand and pebbles that cover most of the island. Isolated concentrations of uranium and radium may exist within the outwash deposited by way of the fluvial processes that deposited the sand. Homes, building on or into these concentrations, may possess elevated radon levels.”

## **10.0 SUMMARY OF FINDINGS**

- The subject property (approximately 10.0 acres) currently consists of a two-story masonry and steel framed building, surrounded by concrete walkways and asphalt paved parking areas, and vacant land. The subject building, occupied by New York Christian Cultural Centre, was reportedly constructed between 1997-2000. Soil Mechanics was informed that a gas collection/venting system was installed beneath the subject building due to the presence of methane gas.

- Information obtained from previous investigations conducted at the subject property revealed that the site was originally marshlands and was landfilled during the early 1900's. Ash and residue from a city solid waste incinerator were reportedly used as fill material.

- Review of historical Sanborn fire insurance maps revealed that several sheds, a wagon house, a residence, a gasoline filling station, a masons materials storage yard and associated storage building, an auto wrecking facility, a small commercial building, and automobile junkyards were formerly located at the subject property dating back to 1908.

- Review of ownership records revealed several names of concern, i.e., Socony Mobil Oil Co., London Servicenter, and Marvic Service Station, Inc., etc. listed for Block: 4434 – Lot: 1 prior to 1960. Further, London Servicenter was involved in a declaration transaction, dated 06/24/48, at Block: 4431 – Lot: 1, Block 4432 – Lot: 1, and Block: 4433 – Lot: 1.

- The results of an environmental investigation conducted at the subject property by AKRF, Inc. (Draft Environmental Impact Statement, dated June 1991) revealed elevated concentrations of methane in the area of the former gasoline service station, elevated levels of total petroleum hydrocarbons and metals throughout the subject property, and elevated concentrations of semi-volatile organics at several surface and subsurface locations. Further, elevated levels of metals, volatile organics, and semi-volatile organics were detected within aqueous samples collected from the project site.

- The western portion (approximately 6.0 acres) of the site is currently improved and contains the subject building, surrounded by concrete walkways and asphalt paved parking areas. Inspection of the subject building revealed it to be divided into a sanctuary, classrooms, offices, bathrooms, cafeteria, kitchen, bookstore, sound room, and storage rooms amongst the two (2) floors. Further, two (2) passenger elevators were identified within the subject building. The eastern portion (approximately 4.0 acres) consisted of several deciduous trees, exposed surface soils, and overgrown secondary vegetation. A small excavation was noted along the western portion of this area. Rubber tires, metal, and demolition debris were observed to be intermixed with surface soils. An abandoned crane and several piles of rubber tires, demolition debris, and common household trash were identified at various locations.

- One (1) pad-mounted electrical transformer was identified outside the southwestern portion of the subject building. Floor drains were observed within the kitchen area and bathrooms of the subject building. Numerous open grate and solid

covered manholes were observed throughout the parking fields. Reportedly, said structures are associated with the on-site drainage system which discharge to the municipal sewer system.

- There was no visible evidence to indicate the presence of any aboveground storage tanks (AST's), underground storage tanks (UST's), storage of chemicals, hazardous materials/wastes and/or water supply/ground water monitoring wells at the subject property.

- A review of surrounding property use revealed several businesses, i.e., Getty and Amoco/BP service stations, Flatlands Auto Sales, Kings County Auto Salvage, 2H1 Auto Sales, Inc., a junkyard, commercial/industrial businesses, and Kent Cleaners, situated in close proximity to the subject property which are known to us as being associated with the types of operations that historically represent a potential for adverse impact to the environment. Further, review of historical Sanborn maps indicated several filling stations north of the subject property.

- A review of various federal and state regulatory databases revealed one (1) **SHWS Site** (Pennsylvania Avenue Landfill) within a one (1) mile radius; one (1) **RCRIS SQG Site** (Flat Gas, Inc.) and one (1) **NYSDEC Registered Underground Storage Tank (UST) Site** (Flat Gas, Inc.) adjacent to the subject property; and a total of sixty-four (64) **NYSDEC LTANK & SPILL Sites** within a one-half mile radius. Of the sixty-four (64) **NYSDEC LTANK & SPILL Sites**, thirty (30) are listed as "active" status, meaning the spill investigations are on-going. The remaining **LTANK & SPILL Sites** are listed as "closed" status, meaning the spills have been cleaned up, all paper work completed, and no further action required by the **NYSDEC**. Of the thirty (30) "active" status sites, only one (1) is documented as affecting the groundwater (see Section 7.2).

## **11.0 DISCUSSIONS, CONCLUSIONS AND RECOMMENDATIONS**

In our opinion, based upon the scope of this investigation, which included a thorough visual inspection of the subject property, a survey of adjacent land use, examination of publicly available records, review of historical Sanborn maps and/or historical aerial photographs, title search records, a review of various federal, state, and local documentation, and an evaluation of these factors, the following specific items are cited:

1.) With respect to the historic land usage of the subject property (i.e., auto junkyards, auto wrecking, gasoline filling station, etc.), the use of ash and residue from a city solid waste incinerator as fill material, and the documented presence of methane and soil and groundwater contamination, it is our opinion that the recommendations outlined in the Draft Environmental Impact Statement (dated June 1991) prepared by AKRF, Inc. be strictly followed. Further, a methane gas collection/venting system may be warranted in areas of proposed building(s). All future work activities should be conducted under the supervision of the NYCDEP and/or NYSDEC, as applicable. In the event that underground storage tanks (UST's) are encountered during development activities, we recommend that they be removed in accordance with local, state, and federal regulations.

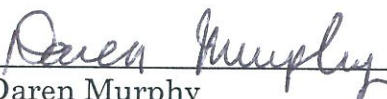

2.) We recommend the proper removal and disposal of the abandoned crane and piles of rubber tires, demolition debris, and common household trash identified at the eastern portion of the site.

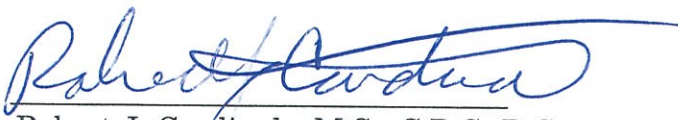

3.) In regard to the present and former surrounding property use of concern, adjacent **RCRIS SQG Site/NYSDEC Registered UST Site** (Flat Gas, Inc.), and "active" **NYSDEC LTANK/ SPILL Site** (LTANK #: 94-12264) documented as affecting the groundwater, most of these sites are located hydrodynamically upgradient in relation to the subject property and represent the potential for adverse impact to the groundwater quality beneath the subject property. Please be advised, however, that

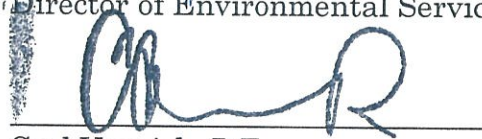

groundwater in the area of the subject property is not utilized for potable purposes. Further, any **LTANK/SPILL Sites** listed at these sites would be under the jurisdiction of the **NYSDEC**, wherein corrective actions would be required. Notably, a definitive determination of the groundwater quality beneath the subject property relative to these sites would require an appropriate subsurface investigation.

4.) Based on the hydrodynamic downgradient positioning of the **SHWS Site** (Pennsylvania Landfill), it is our opinion that this site does not represent a significant threat to the groundwater quality beneath the subject property.

5.) Based on the status, resource affected, distance away and/or hydrodynamic positioning of the sixty-four (64) **NYSDEC LTANK & SPILL Sites** identified within a one-half (1/2) mile radius (with the exception of LTANK #: 94-12264 mentioned earlier), in our opinion, none of these sites appear to represent an environmental concern to the subject property.

## INTRODUCTION

AKRF, Inc. was retained to conduct a comprehensive environmental assessment of the Fresh Creek Estates site in Brooklyn, New York. The location of the site is shown in Figure 1. This assessment is being conducted as part of an overall environmental review under the New York City Environmental Quality Review (CEQR) process with Departments of City Planning (NYCDCP) and Environmental Protection (NYCDEP) acting as co-lead agencies. DEP has technical responsibility for investigating the potential of contaminated materials on the site. The site was originally marshlands and was landfilled during the early 1900's. Ash and residue from a city solid waste incinerator was used as fill material. Prior to 1950 a gasoline station at the corner of Pennsylvania and Flatlands Avenues and two small wooden stables occupied parts of the site. Automobile junkyards were also once located on portions of the site.

The objectives of this assessment were to establish baseline soil and ground-water quality conditions and to evaluate the potential impact posed by existing subsurface conditions on the planned building activities at the site. In order to meet these objectives, the assessment involved conducting a soil-gas investigation, an electromagnetic survey, excavation of three test pits, soil sampling at ten boring locations, installation and sampling of five monitoring wells, laboratory analysis of soil and ground-water samples, and slug tests to compute ground-water coefficients. In all, 24 soil samples and five ground-water samples were collected from the site. They were analyzed for volatile and semivolatile organic compounds, total petroleum hydrocarbons (TPH), and metals. In addition, water samples were analyzed for total dissolved solids, hexavalent chromium, and chloride. AKRF's role was to conduct these field activities and evaluate the analytical results from the field and laboratory.

Results of the sampling and analytical work are presented in this report with our conclusions regarding site conditions and their potential impact to the proposed project. All work and quality assurance/quality control (QA/QC) was performed in accordance with a protocol reviewed and approved by DEP. A DEP representative also conducted field visits during the sample collection.

## METHODOLOGY

### SOIL-GAS SAMPLING

A soil gas survey was performed at the site to determine the volatile organic compound (VOC) distribution in soil and to identify potential areas of VOC contamination. The survey was conducted over the former gas station portion of the site utilizing a 25-foot grid, which resulted in 34 sampling locations. These are shown in Figure 2. The investigation consisted of sampling and analysis of soil gas from the pore space of the unsaturated zone. These compounds originate from natural organic material such as plant material in the original marsh, or from contaminants with high volatile content, such as gasoline. Soil gas moves horizontally and vertically through the soil, eventually dissipating to the atmosphere, or in some cases, becoming trapped beneath an impermeable surface such as asphalt.

To allow for collection of representative soil gas samples, the probe was placed utilizing the following procedure.

- o A hole was drilled through the surface asphalt and/or soil to approximately one foot below grade using a carbide bit with no lubricant. An organic vapor analyzer (OVA) and combustible gas indicator (CGI) were used to obtain background ambient readings which were recorded in the field notes.
- o After drilling was completed, the sampling apparatus -- a 5/8 inch diameter stainless steel shaft with a hardened point and slotted intakes -- was driven with a manual slide hammer to a depth of approximately three feet below grade.
- o A vacuum source was applied to the sampling probe head and the system purged for at least one minute to allow the collection and subsequent analysis of a representative sample of soil gas. The vacuum pressure and release time in the system was measured and recorded. Typically, the soil's permeability is indicated by the vacuum release time rather than the vacuum pressure. A short vacuum release time indicates that soil gas flows freely from the vadose zone to the sampling probe; a long vacuum release time indicates a high resistance to soil gas transport. The latter results in a VOC concentration reading below the actual level. After purging was complete, the vacuum source was removed.

The sampling probe was then attached directly to an organic vapor meter (OVM), which recorded the total non-methane organic vapor concentration.

Some organic vapors are explosive within specific concentration ranges in combination with oxygen content. Therefore, the CGI was utilized to record the explosivity potential (expressed as percentage of the lower explosive limit (%LEL)) of the soil gas, and to also determine the oxygen content of the vapor, which, if low, may affect organic vapor and %LEL readings.

The probe was then attached to the OVA in survey mode to obtain the total organic vapor reading. The OVA was then switched to the gas chromatograph (GC) mode, causing the air drawn through the probe to pass through the carbon filter which removes the non-methane component, to determine the methane content of the soil gas.

Finally, the concentration of hydrogen sulfide in the soil gas was analyzed using a Sensidyne gas sampling system with hydrogen sulfide detector tubes in the 1 to 240 parts per million (ppm) measuring range.

Results of all readings are shown in Appendix A and are discussed in the following section of this report.

#### Soil-Gas Quality Assurance

To prevent carry-over or cross-contamination of soil-gas samples, the sampling probe, tubing and pump were thoroughly purged and cleaned between samples by drawing atmospheric air through the system until concentrations of organic vapors were at ambient levels. Soil blockages of the slots and shaft were removed between each location. The probe was cleaned with distilled water and soap, and rinsed with distilled water if the soil was not readily removed by brushing or other physical means.

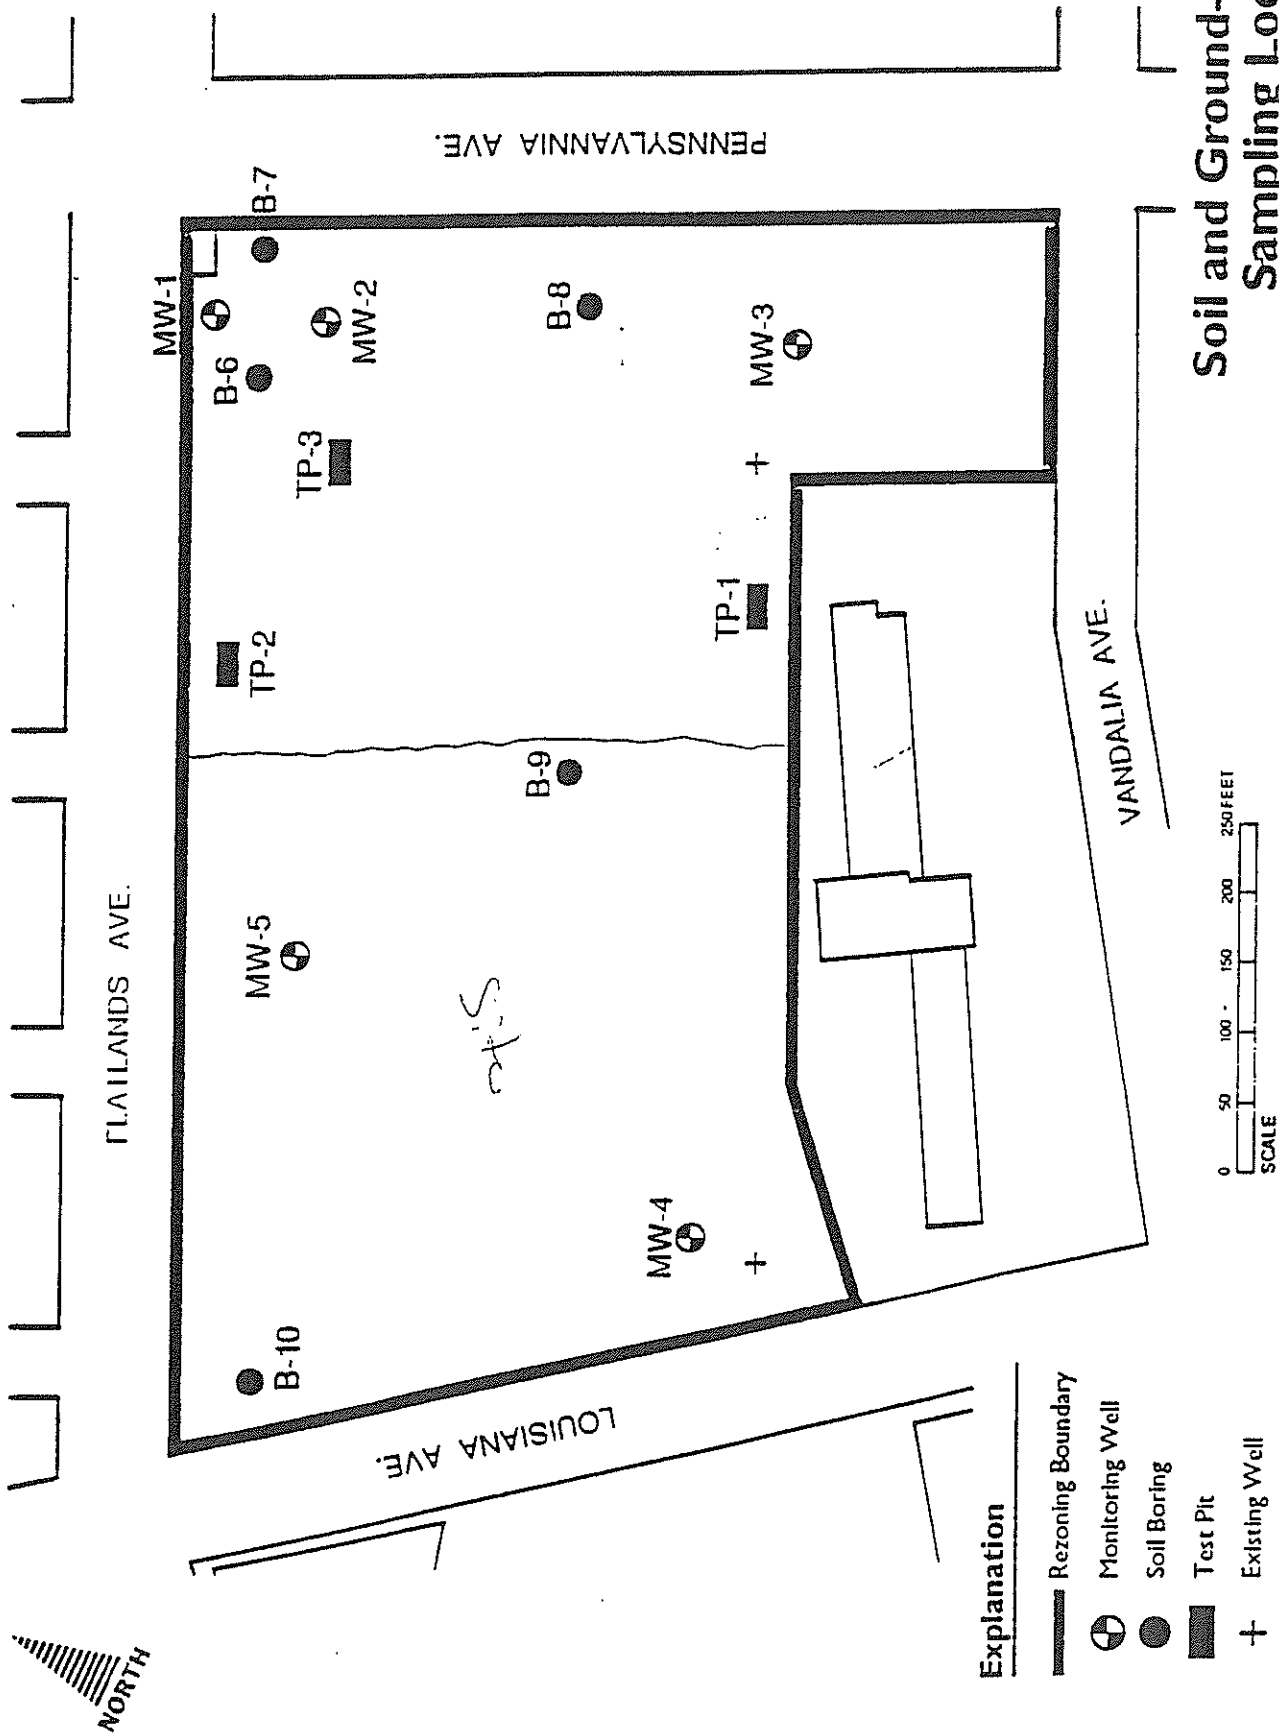

All sampling events were performed identically to the extent possible. Sample locations, dates, and values obtained were carefully noted and checked to avoid errors.

Temperature and weather conditions were also recorded because meteorological conditions can affect the flux of subsurface gases.

#### DRILLING/WELL CONSTRUCTION

The ground-water monitoring wells were drilled using a 6-inch hollow-stem auger. Each well consisted of two-inch inner diameter PVC casing. A 10-foot PVC screen was placed in the top eight feet of groundwater. The slot size was determined by the grain size of the soils encountered. Slot size 0.020 was used on the site. Construction logs for each well are provided in Appendix B.

A filter pack of sand was placed in the annular space around each screen and two feet above. A two-foot portion of the annular area around the well casing was sealed with bentonite pellets. A grout, consisting of a cement and bentonite mixture or an anti-shrink mixture, extends from the bentonite pellet seal to a level that is two feet below ground. The remaining annular space was sealed with a concrete cap and expanding cement well apron. The well was completed with a stand-pipe locking well cap for security purposes.

Soil and Ground-Water  
Sampling Locations  
Figure 3

## QUALITY ASSURANCE/QUALITY CONTROL

A New York State Department of Environmental Conservation (NYSDEC) Contract Laboratory Program (CLP) laboratory was used for all laboratory analyses. These laboratories operate a QA/QC program that consists of proper laboratory practices, an internal quality control program, and external quality control audits by the NYSDEC.

A field blank and trip blank were included with each day's samples to check for possible contamination from sampling activities and during transport, respectively. Field blanks were analyzed for all sample parameters and trip blanks for volatile organics. This follows standard industry practice for trip blanks, as volatile organics are the only substances that can potentially cause contamination during travel.

Matrix spikes and matrix spike duplicates were performed for every 20 samples of volatile and semivolatile organic compounds from the overall project.

For metals, a reagent blank, a duplicate, and a spiked sample were analyzed with every set of 20 samples. Standard calibration curves consisting of a minimum of a reagent blank and three (3) standards for each element were analyzed.

## ELECTROMAGNETIC SURVEY

An electromagnetic (EM) survey was conducted with a GEONICS EM 31 ground-conductivity meter. EM survey is a non-invasive remote sensing technique which measures subsurface conductivities from 0 to 1,000 millimhos and is capable of detecting conductance from 0 to approximately 20 feet below land surface in the vertical dipole mode. Subsurface conductivities may be determined by measuring either the quadrature phase component (90°) or the in-phase component (180°) component of the electromagnetic field. The quadrature phase component is linearly proportional to the earth's conductivity and measures the absolute conductance of the subsurface material within its zone of influence. The in-phase component is not directly related to earth's conductivity and measures relative conductance. However, this component is significantly altered by highly conductive objects and is, therefore, typically more sensitive to buried metals.

Survey lines were set up perpendicular to Pennsylvania Avenue at 50-foot intervals. Conductivity readings were recorded at 5 second intervals using an Omnidata Digital Polycorder. The EM 31 was operated in the vertical dipole mode, and both quadrature phase and in-phase readings were measured.

Three test pit locations were chosen based on the EM survey results. These locations were confirmed in the field on the day of excavation using the EM 31.

## SLUG TESTS

Slug tests were conducted on the five newly-installed ground-water monitoring wells to determine a representative estimate of permeability or hydraulic conductivity (K) of the unconsolidated materials beneath the site. The

## HYDROGEOLOGY

### HYDROLOGIC SETTING

The major geologic units below the project site correspond to hydrologic units with specific water-bearing characteristics. These hydrologic units, their corresponding geologic names and depths relative to National Geodetic Vertical Datum (NGVD) are as follows:

| <u>Depth Interval</u><br><u>(relative to NGVD)</u> | <u>Geologic Unit</u>       | <u>Hydrologic Unit</u> |
|--|----------------------------|------------------------|
| +20 ft. to -100 ft                                 | Upper Pleistocene deposits | Upper Glacial aquifer  |
| -100 ft. to -150 ft                                | Gardiners Clay             | Gardiners Clay         |
| -150 ft. to -250 ft                                | Jameco Gravel              | Jameco aquifer         |
| -250 ft. to -400 ft                                | Magothy Formation          | Magothy aquifer        |
| -400 ft. to -500 ft                                | Lloyd Sand                 | Lloyd aquifer          |
| -500 ft and below                                  | Crystalline Bedrock        | Crystalline Bedrock    |

The unconsolidated materials underlying the site were found to comprise miscellaneous fill of unknown depth containing sand, gravel, clay, bricks, organic material, concrete, glass and asphalt. Boring logs, provided in Appendix B, indicate that the deepest well penetrated to 28 feet below land surface (-2.5 NGVD). Based on sample core log descriptions it cannot be determined whether any boring penetrated the underlying glacial aquifer. However, regional maps and reports indicate that ground water in the fill is most likely in direct contact with the glacial deposits because there is no significant confining bed reported to be in the upper geologic deposits in this area. Therefore the fill and underlying aquifer appear to be hydraulically connected.

Ground water occurs under unconfined (water-table) conditions between 12.67 and 22.82 feet below grade (2.79 ft to 4.00 ft above NGVD). The water-table configuration, based on data collected on May 8, 1991, is presented in Figure 4. The contour lines show that ground water generally flows south discharging into Fresh Creek. The direction of ground-water flow at the site is in general agreement with published water-table data provided by the U.S. Geological Survey (Doriski, 1984). The slightly lower water-level elevation in MW-1 as compared to MW-2 may be caused by the well screened in a slightly less permeable material. This theory is supported by the difference in calculated hydraulic conductivities in the following slug test section. Well EW adjacent to MW-4 was not installed by AKRF. Construction details were not available and the integrity of the well is unknown. Only water level data were collected from this well.

## SLUG TEST RESULTS

The calculated values of hydraulic conductivity in feet per day from each monitoring well are as follows:

MW-1: 19 ft/day  
MW-2: 62  
MW-3: 311  
MW-4: 24  
MW-5: 32

Average K: 90 ft/day

In comparison, the estimated average hydraulic conductivity for the upper glacial aquifer on Long Island is 270 ft/day (Buxton and others, 1981), and generally ranges from 53 to 400 ft/day, (McClymonds and Franke, 1972). Therefore, the values obtained at the site are reasonable considering that the five wells may be screened in upper glacial deposits (mainly sand and gravel), or fill, or both, which could decrease K.

Ground-water gradients were calculated based on measured water elevations and horizontal distances between wells. The computed values range between  $7.6 \times 10^{-4}$  and  $1.3 \times 10^{-2}$  ft/ft with an average of  $5 \times 10^{-3}$  ft/ft. Using the above information, ground-water velocities were estimated using the equation  $v = Kdh/ndl$  where  $v$  = average velocity, in ft/day,  $n$  = porosity (0.30), and  $dh/dl$  is the average hydraulic gradient. The computed value of the average horizontal rate of ground-water movement in the subsurface material is approximately 1.5 ft/day, the same as for published values of the upper glacial aquifer in Queens County (Soren, 1971).

determine whether the presence of a contaminant represents a significant threat to public health and the environment. Thus, they represent a screening tool in different situations. Detailed evaluation, including risk analysis, would use different criteria. For example, areas used as playgrounds are evaluated differently than areas that would be paved or used for industry. For this reason, the levels are generally set at conservatively low values, indicating a need for further consideration and not establishing a need for mitigation or remediation. The metals tables also include the typical background ranges of certain analytes as provided by the U.S. Geological Survey (USGS).

For the purposes of this report, the soil samples are discussed in terms of surface and subsurface findings. Based on the proposed project plan, all surface areas and many subsurface areas will be disturbed by grading and/or excavation during site preparation. Soil will be removed from the site due to a nearly site-wide decrease in elevation, according to construction plans. Site elevations obtained from a 1990 topographic survey were compared to the proposed project elevations to determine which subsurface areas would potentially be exposed during excavation and grading. Subtraction of proposed elevations from surveyed elevations and comparison with sample depths indicate that subsurface samples MW-1:4-6, MW-2:6-10, B-6:4-6, and B-7:4-8 are in areas which will be excavated based on current plans. Other subsurface samples were taken below the depth of proposed excavation or grading.

#### Total Petroleum Hydrocarbons

The most prevalent contaminant on the site is TPH, which exceeded the NYCDEP guidance value in all but one sample. Over half of the soil samples contained TPH concentrations one order of magnitude above the NYCDEP guidance value of 100 ppm. The concentrations covered a wide range -- from 91 to 25,900 ppm. As shown on Figure 5, elevated TPH values are randomly distributed and are presumably associated with the fill material placed on the site in the 1940's.

#### TAL Metals

The NYCDEP guidance values differ for specific metals. Guidance values and analytical results are shown in Table 2. Exceedances were found for arsenic, barium, chromium, copper, lead, mercury, and zinc. As with TPH, occurrences are random, although subsurface samples and the north-eastern and southern corner of the site appear to contain a greater extent of metals. This is not apparently related to any activities in the site history. As with TPH, the metals may be associated with the fill material.

#### Arsenic

Arsenic concentrations were, for the most part, below the NYCDEP guidance value of 9 ppm, except at four locations that exceeded this concentration by less than 4 ppm: MW-4:16-18 (11.8 ppm), B-8:18-23 (11.8 ppm), TP-2 (9.3 ppm), and TP-3 (11.5 ppm). These values are all within the background range for arsenic. The two test pit areas in the northern part of the site will be encountered during site preparation activities.

ECDEP guidance value for barium is 400 ppm. The samples from MW-2:0-2 and 16-18, B-7:4-8, B-8:18-23, TP-2, and TP-3 exceeded this highest concentration, of 1,610 ppm, was detected at MW-3:19-21, and will not be exposed according to the proposed construction plans. All samples contained less than 1,000 ppm, with concentrations ranging from 546 ppm to 1,610 ppm that may be potentially encountered during site preparation.

ECDEP guidance value for chromium is 46 ppm. Elevated values were found at MW-2:0-2 (62 ppm), B-8:18-23 (67.4 ppm), and B-9:14-17 (111 ppm). In the area of potential exposure, however the reported concentration is only slightly above the guidance value and within the background range for chromium in soils.

ECDEP guidance value for copper, 170 ppm, is exceeded by samples from MW-5:10-12, B-8:18-23, B-9:14-17, and TP-2. The highest concentration, 1,580 ppm, was at MW-4. The remainder were below 520 ppm. The subsurface area of potential exposure, contained 241 ppm of copper.

ECDEP guidance value for lead ranges from 500 to 1,000 ppm. Areas that may be in contact with site soils are viewed more conservatively. The sample from B-8, and all three test pit samples exceeded 500 ppm. The samples with concentrations greater than 500 ppm are MW-3:19-21, B-8:18-23, and B-9:14-17, with only the sample from B-6 potentially exposed. Lead was detected at 660 ppm in B-6. All of the locations are on the north-eastern portion of the site.

ECDEP guidance value for mercury is 1 ppm. A value of 1.02 ppm was found at TP-3. Subsurface samples from MW-1 and B-8 contained 4.1 and 3.1 ppm, respectively. The subsurface area at MW-1 in the northern corner of the site will be exposed during excavation.

ECDEP guidance value for zinc, 350 ppm, is exceeded at MW-2:6-10, MW-3:19-21, MW-4:16-18, MW-5:10-12, B-8:18-23, B-9:14-17, TP-2, and TP-3. Concentrations ranged from 413 to 2,150 ppm. MW-2, TP-2 and TP-3 are located in the northern corner of the site, with concentrations of 1,330, 915, and 1,310 ppm, respectively. These areas will be encountered during site preparation. MW-4:16-18 in the southern corner of the site, also showed elevated zinc concentration (1,580 ppm) in a subsurface sample, although not as high as samples obtained from the northern corner of the site. The MW-4 subsurface area will not be exposed.

Semivolatiles are present at greater than guidance values at three subsurface locations, but are not associated with carcinogenic PAHs. According to proposed elevations shown on the project plans, these areas will not be exposed during grading.

#### CONTAMINANT ASSESSMENT: GROUND WATER

Ground-water samples were collected from the five monitoring wells installed by AKRF. The levels of analytes detected in ground-water samples have been compared with NYSDEC standards and guidance values for Class GA waters. These values are intended for potable water supplies but are generally applied to all non-saline ground water as an indicator of quality. Ground water is defined as saline if the chloride concentration is greater than 250 ppm or the total dissolved solids (TDS) concentrations exceeds 1,000 ppm. Class GA standards include compounds that may affect human health and non-toxic compounds that may decrease the aesthetic quality of the water. It should be noted that the ground water is not used as drinking water in the area, nor will excavations on the site reach the water table.

#### TAL Metals

Concentrations of metals in ground water were measured in filtered and unfiltered samples. The analyses of filtered samples determined the quantities of metals dissolved in the ground water. The analyses of the unfiltered samples determined the quantities of soluble and insoluble metals in the samples. Concentrations of metals in the soils are much greater than the dissolved concentrations in the ground water. Most metals do not readily dissolve in water, but will preferentially adsorb onto the soil particles. Therefore total (i.e., unfiltered) metals analyses result in much higher readings than concentrations actually dissolved in the ground water. It is important to note that solids (and their associated contaminants) do not move with the ground water. Nevertheless, DEC-regulated limits are established on the basis of total metals.

Concentrations of ten total metals exceeded GA standards or guidance values in one or more wells, as shown in Table 7. Iron, lead, and manganese were above their respective standards of 300, 25, and 300 parts per billion (ppb) in all five wells. Barium was in exceedance of the 1,000 ppb standard in all wells except MW-1. Zinc was elevated above the 5,000 ppb standard in MW-2, MW-4, and MW-5. Magnesium exceeded the 35,000 ppb guidance value in MW-3, MW-4, and MW-5. Arsenic, cadmium, and copper were in exceedance of their respective standards of 25, 10 and 1,000 ppb in MW-4 and MW-5. Beryllium exceeded the guidance value of 3 ppb in MW-3.

Concentrations of most metals in filtered water were significantly lower (Table 8). However, there were exceedances of GA standards. Manganese was elevated in all wells except MW-4. Magnesium was in exceedance of the guidance value in MW-3, MW-4, and MW-5. Iron was elevated in MW-3 and MW-5. Lead was in exceedance in MW-3. Barium was elevated to just above the standard in MW-4.

## Summary

The ground water beneath the site is not used for human consumption nor will it be encountered during the construction. Contaminants that are present at elevated levels are probably associated with the fill material or with suspended soil particles. Most metals found in the filtered samples are naturally-occurring constituents in ground water. Manganese and phenols are in exceedance in MW-1, an upgradient well, which may indicate that these substances are originating off-site. Other semivolatile organic compounds that exceeded GA standards or guidance values are either present in method blanks or may be associated with suspended soil particles. Semivolatiles detected in MW-4 may be dissolved in the ground water. Volatile organic compounds were slightly elevated in only MW-4, and, based on soil analyses, do not appear to be associated with the fill material. There is no apparent source for the volatile compounds.

Re: Subsurface Investigation and Report  
The New York Christian Life Centre  
Brooklyn, New York

Dear Mr. Counts:

We have completed our subsurface investigation and geotechnical report for the subject project. The report contains a description of our investigation, an evaluation of the geotechnical conditions at the site, and provides recommendations for foundation design and general site development.

If you have any questions regarding the report, please do not hesitate to contact us.

Very truly yours,

Soils Engineering Services, Inc.

William J. St. Pierre, P.E.

WSP:D4177RPT

96,030 - 2 story

The presently proposed construction will consist of a 60,000+ square foot air-supported sanctuary structure with associated parking and driveway areas (see Fig. 1).

#### SUBSURFACE INVESTIGATION AND CONDITIONS

A total of 8 borings were drilled to depths varying from 26.0 to 51.5 feet below presently existing grade. Six of the borings were drilled around the perimeter of the proposed air-supported structure, one boring drilled in the parking area and one boring drilled in the area of the future residential tower. Three attempts were required at the location of B-3 before successfully penetrating an obstruction at 2.5 to 3.5 feet. The location of the borings and soil logs of the borings, which describe the materials encountered, are presented on Figure 3.

Soil samples suitable for identification purposes were extracted from the borings at closely spaced intervals in accordance with the procedures of the Standard Penetration test. For this test, a standard split-spoon sampler (2 inches outside diameter, one and three-eighths inches inside diameter) is driven into the soil by a 140 pound weight falling 30 inches. After discounting the initial six inches of penetration due to possible disturbance of the materials resulting from the drilling operation, the number of blows required to drive the sampler a distance of 12 inches is recorded and designated as the standard penetration resistance or "N" value. The "N" value is an indication of the relative compactness of the soil in-situ.

All field work was performed under the direct technical observation of an engineer from SESI Consulting Engineers, P.C. Our representative maintained continuous logs of the explorations as work proceeded and

Absent any special site preparation procedure or deep foundations, detrimental total and differential settlements would occur to any structures built over the miscellaneous fill in its present condition. The natural medium-dense medium to fine sands encountered beneath the miscellaneous fill are suitable for the support of the anticipated building loads.

We have evaluated three alternate foundation schemes to provide support for the proposed 60,000 square foot building.

Alternate I - Excavation of the existing uncontrolled fill, and construction of a controlled compacted fill.

Alternate II - Piled foundations with structural slab and grade beams; and,

Alternate III - Dynamic Compaction of existing fill, and construction of controlled, compacted fill.

These alternates are addressed individually in the following sections.

#### Alternate I - Excavation and Backfill

This procedure is typically viable when the depths of excavation required are less than 10 feet and a high percentage of the excavated soils are suitable for reuse in either the building area or parking areas. Because of the significantly greater depths of fill throughout the site and the nature of the fill, this alternate is not considered economically viable.

#### Alternate II - Piled Foundations and Structural Floor Slab

Friction piles driven sufficiently into the sands beneath the miscellaneous fill would provide suitable support for the building and floor slab. Treated timber piles designed for allowable loads of 25 tons

more tube

6 to 8

The primary goal of dynamic compaction is to change an uncontrolled fill into a controlled fill. This is done by providing sufficient energy at the ground surface to cause densification of the underlying unsuitable deposits, thereby reducing the compressibility of these deposits. Dynamic compaction is an exploration tool as well as a ground improvement tool. If weak deposits are present below the ground surface, they will be revealed during the impact process by a greater than normal lowering of the ground surface.

This procedure has been used on many projects throughout the United States and Europe, including several sites done by the New York and New Jersey Port Authority. Our office has been involved in over 25 projects which have been constructed in this manner. The process has been reviewed for projects and approved by the City of New York, the State of Connecticut, and by local building officials for use on numerous projects in New Jersey.

The dynamic compaction process transmits ground vibrations that will likely be felt in the nearby buildings. However, our experience indicates that at distances greater than 30 to 50 ft. from the impact point, no structural damage will occur. However, there is the potential for cracked plaster (both real and imagined) so that a pre-construction survey of existing buildings is advisable as well as occasional seismic monitoring of ground vibrations during construction.

To handle the worst conditions on this site, we estimate that a minimum 12-ton weight dropped from a height of approximately 80± feet will be required. Two to three passes at 10 to 12± feet on centers with approximately 5 drops per pass is anticipated in the building area. The

material should be accomplished as necessary to achieve the density requirements.

#### Foundation Design Criteria For Dynamic Compaction Alternate

After the dynamic compaction procedures have been satisfactorily completed, the structure may be constructed on conventional shallow spread/strip footings with a slab-on-grade. The footings may be designed for an allowable net soil bearing pressure of 1.5 tsf (3,000 psf). If organic refuse is encountered at the bottom of the footing excavation, the excavation should be carried a minimum of 12 inches deeper (or as directed by the soils engineer) and backfilled with clean 3/4 inch crushed stone or gravel.

Exterior footings, and footings in non-heated areas, should be founded at a minimum depth of 3.0 ft. for protection against frost uplift. Interior footings in heated areas may be founded at conventional depths below the floor slab. Regardless of the loads, the minimum plan dimension of isolated column footings should be 36 inches and the minimum plan width of continuous strip footings should be 24 inches.

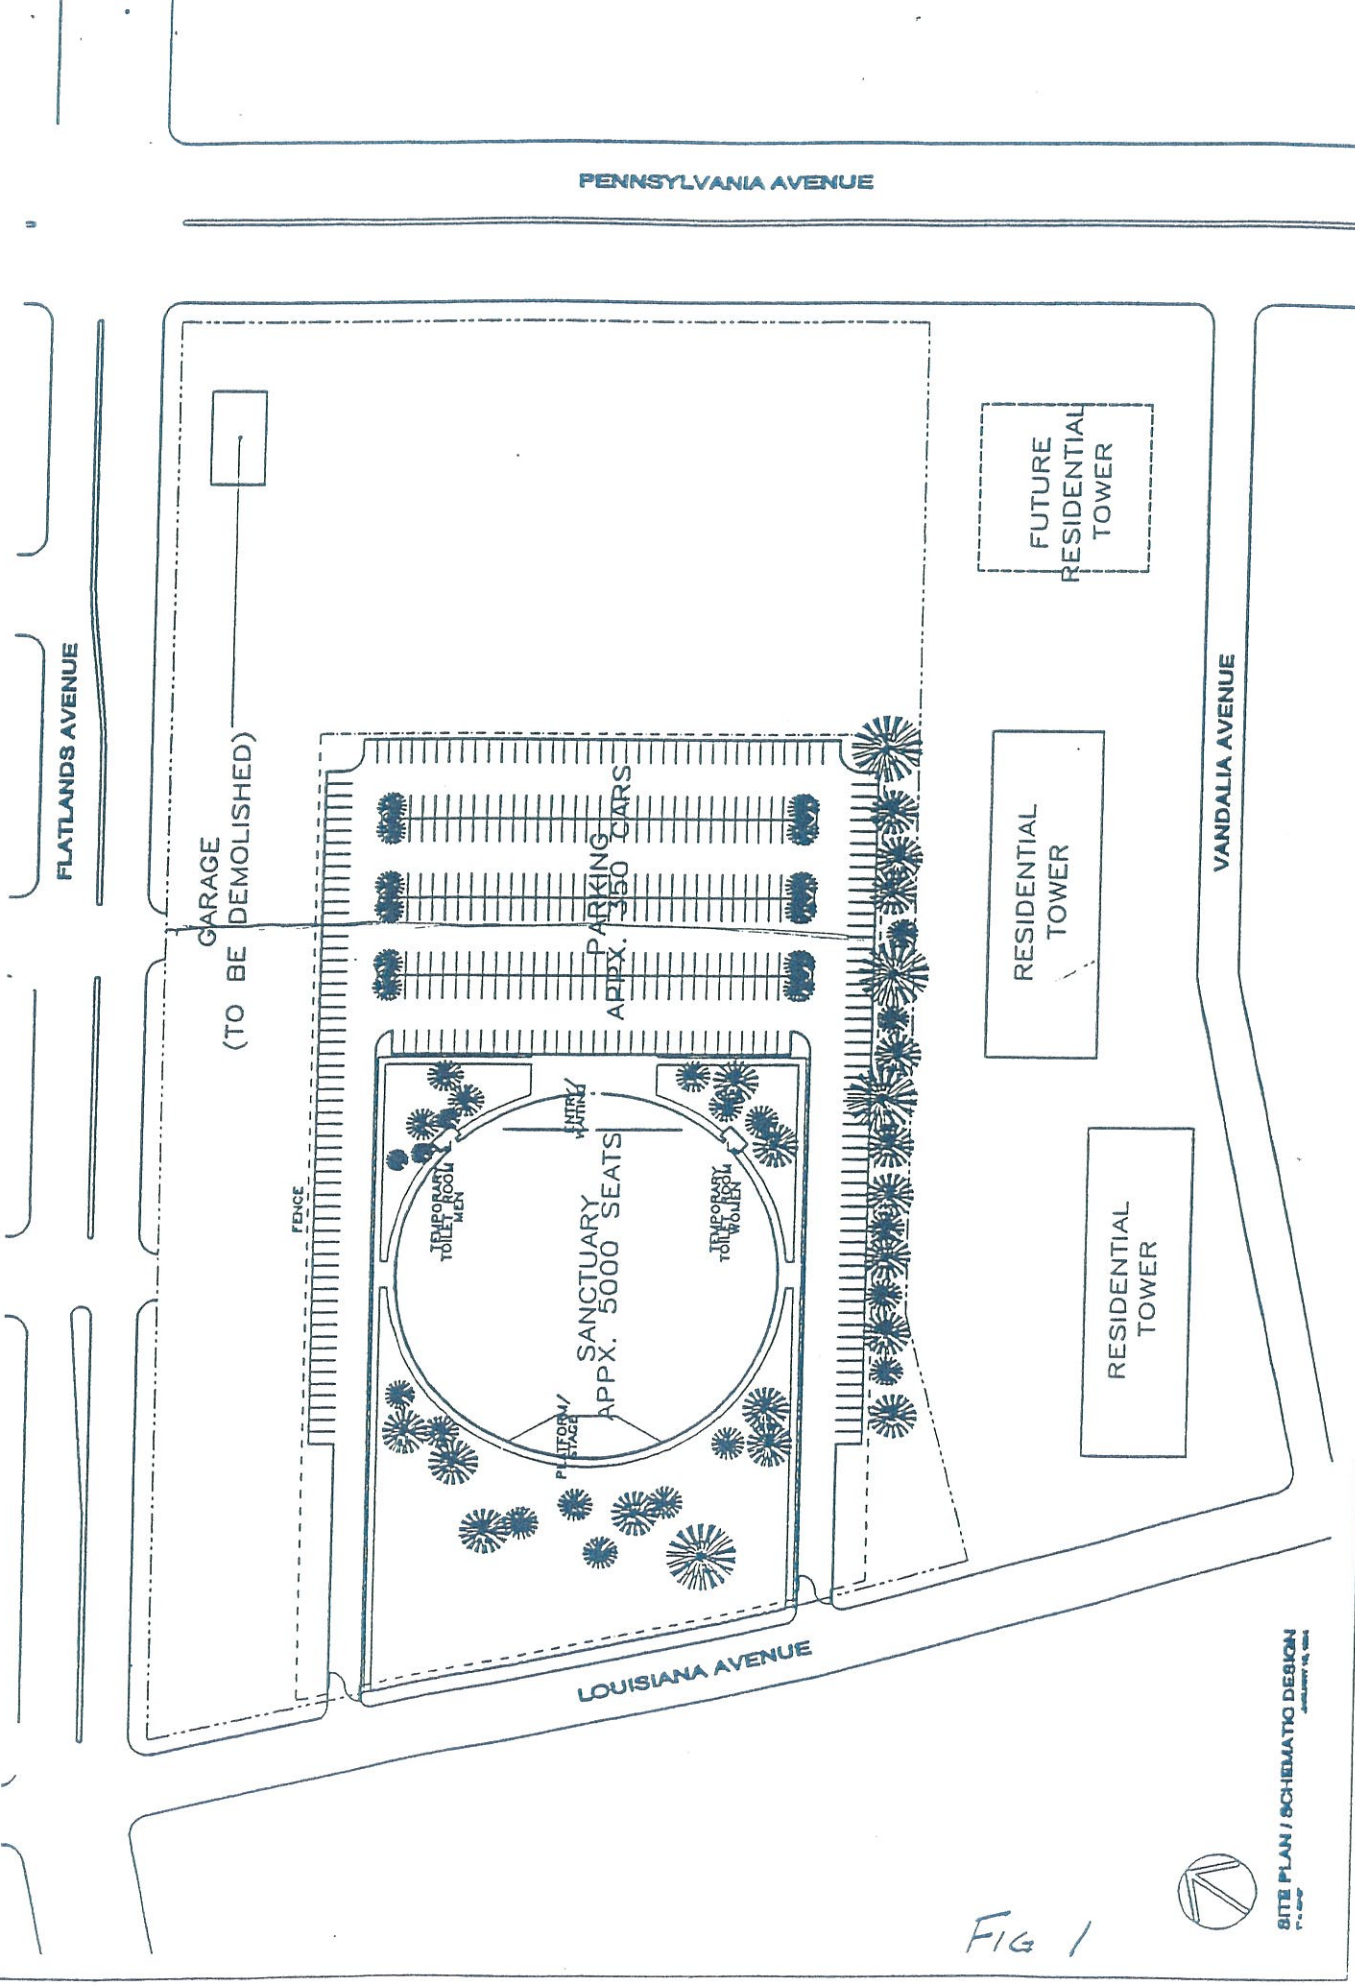

#### Pavement Design

Site preparation procedures for paved areas and for pavement design details should be evaluated after a preliminary site grading plan is developed.

#### Utility Lines

It would be advisable to dynamically compact utility lines that are sensitive to settlement. The bottom of utility line excavations will likely fall within the existing miscellaneous fill. If any soft or organic soils are encountered at invert elevation, over-excavation and

## EXECUTIVE SUMMARY

The following is a summary of the findings obtained during the "Phase I" environmental site assessment conducted at the subject property located on the southeast corner of Flatlands Avenue and Louisiana Avenue, Borough of Brooklyn, State of New York.

The subject property is currently under construction for an approximately 100,000 square foot, two-story building.

A visual inspection revealed that the subject property consisted of areas of exposed surface soil and scattered soil piles. Two (2) 55 gallon drums of gasoline, temporarily stored at the subject property for fueling construction vehicles, and two (2) trash dumpsters were identified on the property. Several construction vehicles, as well as an office trailer, were visually identified.

A review of historical Sanborn maps revealed that the subject property was vacant in 1908, 1928, and 1950 and consisted of an Auto Junk Yard in 1977, 1981, 1991, 1992, 1993, 1994, 1995, and 1996.

A review of federal and state information (obtained from the USEPA and NYSDEC) indicated there were no reported incidents concerning hazardous materials or wastes, major spills, or existing landfills at the subject property. The subject property was not listed as a **NYSDEC Inactive Hazardous Waste Disposal Site**, **NPL (Superfund)**, or **CERCLIS** site. The subject property (southeast corner of Flatlands and Louisiana Avenues, Brooklyn NY) did not appear within the **NYSDEC Leaking Storage Tank Sites** and **Spill Sites Databases**. There were no **NYSDEC Petroleum Storage Tank Sites** identified at the subject property.

Based on the information obtained during the scope of this assessment, several conclusions are cited within Section 11.0 of this report.

**SUBJECT PROPERTY**

JOB #:

97-494

The **Brooklyn Building Department** was visited in order to review any files they may have with respect to the subject property, however, no information was available. A review of historical Sanborn maps and a topographic map indicated that the entire subject property had been utilized as a junk yard from at least 1975 until at least 1981. The eastern portion of the subject property remained a junk yard until 1996.

## **2.1 Review of Historical Sanborn Maps**

Soil Mechanics personnel reviewed historical Sanborn maps (obtained from EDR Sanborn, Inc., 3530 Post Road, Southport, CT) dated 1908, 1928, 1950, 1977, 1981, 1991, 1992, 1993, 1994, 1995, and 1996, to identify past land usage at the subject property and surrounding areas (see attached Sanborn maps within Appendix).

### **1908, 1928, and 1950 Sanborn Maps**

The subject property consisted of a vacant parcel of land with no existing structures. The surrounding property usage consisted of vacant land and a residential dwelling to the north. However, a farm and a filling station were located to the northwest of the subject property on the 1950 Sanborn map.

### **1977, 1981, 1991, 1992, 1993, 1994, 1995, and 1996 Sanborn Maps**

The subject property consisted of an auto junk yard with two (2) small office buildings in the 1977 and 1981 Sanborn maps. The 1991, 1992, 1993, 1994, 1995, and 1996 maps revealed an auto junk yard on the eastern portion of the property and the remaining section of the property was vacant. Surrounding land usage consists of a community center, parking garages and residential dwellings. An auto junk yard and an auto wrecking company were adjacent to the subject property on the 1977 and 1981 Sanborn maps.

## **5.7 Drainage Structures**

There were no subsurface drainage structures (i.e., storm drains, drywells) visually identified at the subject property.

## **6.0 SURROUNDING PROPERTY USE**

Adjacent land use surrounding the subject property consisted of the following (see Figure #3 - Surrounding Land Use Map):

North of the site: Auto repair businesses and industrial businesses.

South of the site: Multi-story apartment buildings.

East of the site: Vacant/vegetated land, Sheffield Motel, and Amoco Gasoline Service Station.

West of the site: Retail properties, residential properties, and a park.

## **7.0 AGENCY CONTACT**

A review of various documentation, from appropriate federal, state and local agencies, was conducted for the purpose of identifying any history of hazardous waste activity known to have occurred at the subject property or within a one mile radius.

### **7.1 Federal Agencies**

The subject property did not appear within the federal publications, the National Priority List (NPL) or the Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS). There were no CERCLIS sites or NPL sites identified within a one mile radius.

A review of the federal database, EPA Emergency Response Notification Listing Report (ERNS), indicated no listings with respect to the subject property. There were no ERNS sites listed as adjoining the subject property.

A review of the federal database, RCRA/TSD Site Report, indicated no listings with respect to the subject property. There were no **RCRA-TSD Sites** identified within a one-half mile radius. There were no **RCRA Sites** identified as adjoining the subject property.

## **7.2 State Agencies**

A review of the current New York State Department of Environmental Conservation (NYSDEC) publication, Inactive Hazardous Waste Disposal Sites in New York State, indicated no reported incidents concerning hazardous materials, wastes, or known landfill sites at the subject property. The following NYSDEC Inactive Hazardous Waste Disposal Site was identified within a one mile radius.

1) **Pennsylvania Avenue Landfill** -located southeast at Pennsylvania Avenue and Shore Parkway, Brooklyn, New York. The property is owned by the National Park Service and operated by the New York State Department of Sanitation. The site was used as an illegal dumping ground from 1974 to 1980 and approximately 13 million gallons/year of hazardous wastes were disposed at this site. The site is classified as a significant threat to public health or the environment. The Pennsylvania Avenue Landfill is located hydrodynamically down gradient from the subject property.

A review of the Solid Waste Facility/Landfill Sites (SWF/LF) Database revealed no listings with respect to the subject property. There were no **SWF/LF Sites** identified within a one-half mile radius.

A review of the NYSDEC Petroleum Storage Tank (PST) Registration Database revealed no listings with respect to the subject property. There were no **PST Sites** located adjacent to the subject property.

Spill #:95-00631.  
Spill Date: 04/13/95  
Site Location: 875 Williams Street  
Facility Name: Unknown.  
Cause of Spill: Tank Test Failure.  
Source of Spill: Other Commercial/industrial.  
Resource Affected: On Land.  
Distance: ¼ to ½ mi. NW.  
Status: Active.

Cause of Spill: Tank Overfill.  
Source of Spill: Private Dwelling.  
Resource Affected: On Land.  
Distance: ¼ to ½ mi. West.  
Status: Active.

### **7.3    Local Agencies**

Record Search request forms were submitted to the **New York City Fire Department (NYCFD), Bureau of Fire Prevention** regarding fuel oil and/or vehicle storage tanks. No response has been received at this time. Any pertinent information will be forwarded if and when it becomes available.

The **Borough of Brooklyn Building Department** was visited to review any files they may have in regard to the subject property, however, there was no file available.

## **8.0    HYDROGEOLOGIC INFORMATION**

Information obtained from the **7.5 minute series, Brooklyn, NY Quadrangle**, published by the US Department of the Interior, Geological Survey topographic map revealed the subject property is located approximately fifteen to twenty (15-20) feet above sea level (see Topographic Map - Figure #4).

Information obtained from the **Water Table on Long Island, New York**, prepared by the US Department of the Interior, Geological Survey, indicated an existing depth to ground water of approximately ten to fifteen (10-15) feet below existing grade. This map appears to indicate a southeasterly trending ground water flow component in this area (see Ground Water Contour Map - Figure #5).

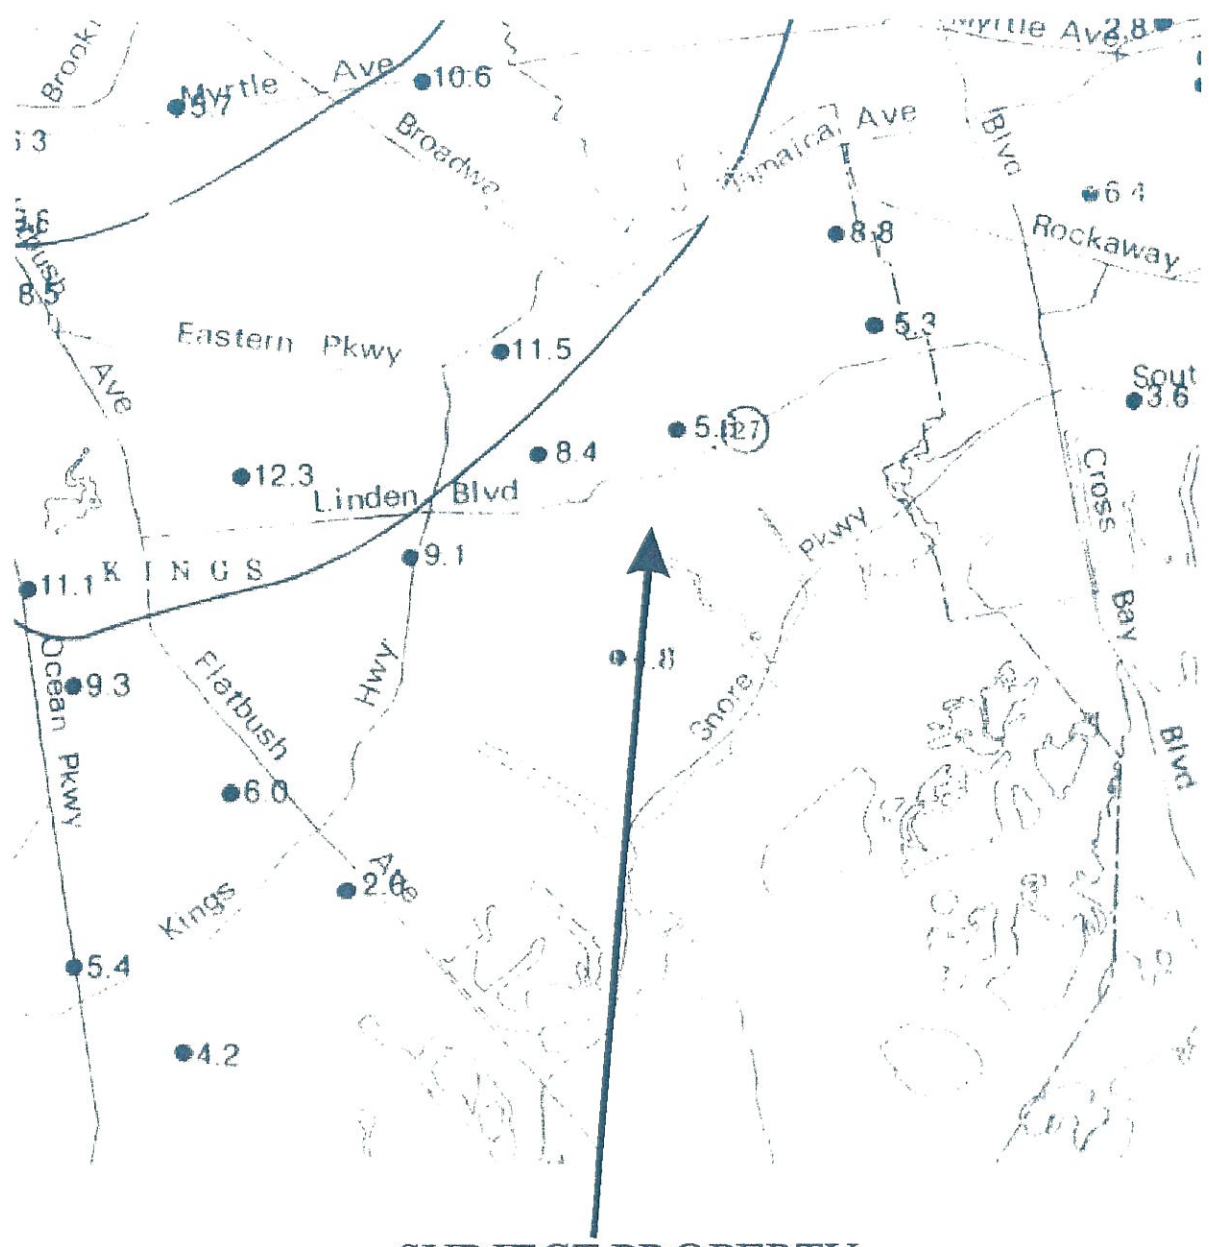

### **8.1    Surface Water Bodies**

There was no visible evidence of any surface water bodies present on the subject property (i.e., rivers, streams, lakes, ponds, wetlands, ditches, etc.). No runoff from surrounding areas was observed entering the subject property.

## **9.0    RADON POTENTIAL**

According to the **State of New York Department of Health's** publication, **Indoor Radon In New York State: Distribution, Sources, and Controls**, "Long Island is part of the broader Atlantic Coastal Plain that stretches north and south along the east coast of the United States. Beneath the thick cover of glacial moraines

- One (1) **NYSDEC Inactive Hazardous Waste Disposal Site** was located within a one mile radius of the subject property. This site appears to be located at a hydrodynamically down gradient position.

- A previous Environmental Impact Assessment was conducted at the subject property in June of 1991. This investigation concluded that any contaminated soil that would remain exposed after construction activities should be addressed through removal or encapsulation.

## **11.0 DISCUSSIONS, CONCLUSIONS AND RECOMMENDATIONS**

In our opinion, based upon the scope of this investigation conducted at the site, which included a thorough visual investigation of the subject property, a survey of adjacent land use, examination of publicly available records, review of historical Sanborn maps and/or historical aerial photographs, title search records, and an evaluation of these factors, the following specific items are cited:

1) With respect to the eleven (11) “active” status **Leaking Storage Tank Sites & Spill Sites** identified within a one-half mile radius of the subject property, three (3) of these appear to be situated hydrodynamically down and/or cross-gradient from the subject property and, in our opinion, do not represent a potential for adverse impact to the groundwater quality beneath the subject property. The remaining eight (8) sites are situated hydrodynamically up gradient from the subject property. The **New York State Department of Environmental Conservation (NYSDEC)** has responded and corrective action has been taken at all of these sites.

2) With respect to the **NYSDEC Inactive Hazardous Waste Disposal Site** identified within a one mile radius, based on its apparent hydrodynamically down-gradient positioning, it is our opinion that this site does not pose a threat to the groundwater quality beneath the subject property.

### **Disclaimer**

The findings, conclusions, and recommendations presented in this report are based on information obtained within the scope of this investigation. The conclusions and recommendations represent our best judgment using the information presently available.

## EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

Remarks: VALUE FAILED ON REFILL OF TANK 1

DEC Remarks: 6/2/99 - Saccacio - According to the Housing Authority, one of the motor  
i ed mechanical valves that switched between tanks did not engage. This  
caused the deposit of unburned oil into both tanks one of which was not  
being used and 90 full after three days the tank overflowed. The Hous  
ing Authority removed the contaminated soil. Back end samples need to b  
e submitted for the spill to be closed out.

Spiller Address: 165 ELMIRA LOOP  
BROOKLYN, NY  
Spill Class: Known release that creates potential for fire or hazard. DEC Response.  
Willing Responsible Party. Corrective action taken.  
Spill Closed Dt: 12/08/1999  
Spill Cause: Equipment Failure  
Water Affected: Not reported  
Spill Notifier: Responsible Party  
Spill Date: 11/16/1999 08:00  
Cleanup Ceased: Not reported  
Last Inspection: Not reported  
Cleanup Meets Standard: True  
Recommended Penalty: Penalty Not Recommended  
Spiller Cleanup Date: Not reported  
Enforcement Date: Not reported  
Investigation Complete: Not reported  
UST Involvement: False  
Spill Record Last Update: 12/08/1999  
Is Updated: False  
Corrective Action Plan Submitted: Not reported  
Date Spill Entered In Computer Data File: 11/16/1999  
Date Region Sent Summary to Central Office: Not reported  
Tank Test:  
PBS Number: Not reported  
Tank Number: Not reported  
Test Method: Not reported  
Capacity of Failed Tank: Not reported  
Leak Rate Failed Tank: Not reported  
Gross Leak Rate: Not reported  
Material:  
Material Class Type: 3  
Quantity Spilled: 10  
Units: Gallons  
Unknown Qty Spilled: 10  
Quantity Recovered: 0  
Unknown Qty Recovered: True  
Material: CORROSION INHIBITOR  
Class Type: Non Pet/Non Haz  
Chem Abstract Service Number: CORROSION INHIBITOR  
Last Date: Not reported  
Num Times Material Entry In File: 2  
Remarks: Losse fitting was found product is in a containment area  
DEC Remarks: On 11/16/99, DEC Sigona responded to site and met with Chaing Wei at 1:00 P.M.. The facility operators flushed the material sodium nitrate and boric acid mixture down the sewer. The mixture was a treatment used for the boiler and spilled on the ground. DEC Sigona notified DEP Thomas at IWCS who would follow-up with investigation.

# TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

**Section 1: Facility Summary . . . . . Page 3**

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

**Section 2: Facility Detail Reports . . . . . Page 4**

All available detailed information from databases where sites are identified.

**Section 3: Databases Searched and Update Information. . . . . Page 7**

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

***Thank you for your business.***  
Please contact EDR at 1-800-352-0050  
with any questions or comments.

# TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

**Section 1: Facility Summary . . . . . Page 3**

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

**Section 2: Facility Detail Reports . . . . . Page 4**

All available detailed information from databases where sites are identified.

**Section 3: Databases Searched and Update Information. . . . . Page 16**

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

***Thank you for your business.***  
Please contact EDR at 1-800-352-0050  
with any questions or comments.

# TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

**Section 1: Facility Summary . . . . . Page 3**

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

**Section 2: Facility Detail Reports . . . . . Page 4**

All available detailed information from databases where sites are identified.

**Section 3: Databases Searched and Update Information. . . . . Page 6**

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

***Thank you for your business.***  
Please contact EDR at 1-800-352-0050  
with any questions or comments.

NPL Status: ---  
Hazardous Waste: oil sludge, solvents.

PCB  
cadmium  
lead  
mercury  
phenols  
methylene chloride

#### Site Description:

The Pennsylvania Avenue Landfill is located on property owned by the City of New York and the National Park Service, south of the Belt Parkway between Fresh Creek and Hendrix Creek. The site was operated by the New York City Department of Sanitation (NYCDOS) as a sanitary landfill from 1956 to 1962, with the final top soil cover placed in 1963. In 1972, the site was reactivated by the NYCDOS as a construction and demolition debris landfill. The site was deactivated in 1979 and closed in 1985. Testimony from a driver/dispatcher for Hudson Oil Refining Co. on May 6, 1982 before the Senate Committee on Crime indicated that from 1974 to 1980, waste oil sludges, metal plating shavings, lacquer and solvents were illegally dumped at several NYC Landfills, including Pennsylvania Avenue. The NYCDOS estimates that approximately 13 million gallons/year of hazardous wastes were disposed at this site. The shoreline was saturated with oil containing PCBs and heavy metals, which were leaching into Fresh Creek. An outer containment boom and inner absorbent boom were installed at the oil outbreak to minimize the entry of contamination into Jamaica Bay. The Record of Decision (ROD) was issued in February 1995. The selected remedy required capping, active leachate and product collection in the trench, and active gas collection. The

## SECTION 2: FACILITY DETAIL REPORTS

...Continued...

### Environmental Problems:

design of the selected remedy was completed in 2000. Remedial construction activities started in 2000. The following Remedial Activities: 1) Lengthening and deepening of the leachate/oil collection trench, 2) Construction of a package treatment plant, 3) Dredging of sediment in Fresh Creek, and 4) Construction of a force-main from the site to the 26th Ward POTW began in December 2000 and are scheduled for completion in June 2002. The landfill cap contract has been awarded and work is scheduled to begin in the spring of 2002. The reconstruction of the pier is almost completed and it is operational. The shoreline along Fresh Creek was saturated with oil that is contaminated with PCBs and heavy metals. This contamination leached into Jamaica Bay.

### Health Problems:

Air sampling on the landfill and at downwind locations indicates the landfill has not affected levels of volatile organic contaminants in ambient air. Groundwater in the area is not used as a source of potable water, but contaminated groundwater may discharge into Jamaica Bay tidal waters. PCB-contaminated oil/leachate from the landfill discharges into Jamaica Bay. A containment boom and a collection trench around the leachate discharge reduce the amount of PCBs oils entering the Bay. PCB levels in samples of fish and shellfish collected from areas adjacent to the landfill and from several areas in Jamaica Bay were well below the FDA tolerance level of 2.0 ppm. Shell fishing and swimming are prohibited due to bacteriological contamination. The site is fenced and guarded, limiting on-site exposure.
