EXECUTIVE SUMMARY

Purves Street Owners LLC (the owner) entered into a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) on July 1, 2014, to investigate and remediate a ±0.62-acre property located at 44-30 Purves Street in Long Island City, New York (the Site). Purves Street Owners LLC is a Volunteer in the Brownfield Cleanup Program. Restricted Residential Use is proposed for the property. When completed, the Site will be developed as a 36-story residential apartment building with frontage along Purves Street and a one-story retail building with frontage along Thomson Avenue and 44th Drive.

This Remedial Action Work Plan (RAWP) summarizes the nature and extent of contamination as determined from data gathered during the Phase II Environmental Site Investigation (ESI), performed between February 19 and 28, 2014, the Remedial Investigation (RI) performed between April 15 and 24, 2014, and supplemental soil sampling performed on September 23, 2014. The RAWP identifies and evaluates remedial action alternatives, including a Track 1 remediation, and recommends a Track 4 cleanup for addressing impacted soil, groundwater, and soil vapor within the Site boundaries. The remedy described in this document is consistent with the procedures defined in DER-10 and complies with applicable standards, criteria and guidance. The remedy described in this document also complies with applicable Federal, State and local laws, regulations and requirements. The RI for this Site did not identify fish and wildlife resources.

Site Description/Physical Setting/Site History

The Site is located at 44-30 Purves Street in Long Island City, New York and consists of an irregularly shaped lot (Block 268, Lot 1; formerly lots 1, 24, 25, and 26). In a survey prepared by Apple Surveying, dated April 11, 2014, the Site area was reported to be 27,095 square feet. The Site is bounded by Purves Street to the east, Lot 31 with a two-story brick building to the southeast, Thomson Avenue to the southwest, 44th Drive to the west, and lots 4 (vacant one-story building) and 23 (vacant) to the north. The Site has approximately 175 feet of frontage along Purves Street, 150 feet of frontage along Thomson Avenue, and 60 feet of frontage along 44th Drive. The Site has been a vacant lot for nearly 10 years, since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes. A Site Location Map and Site Plan are provided in Figures 1 and 2, respectively.

Ground surface elevations were obtained from the April 11, 2014 survey drawing by Apple Surveying (included as Appendix A). All elevations (el) presented herein are measured in feet

and referenced to the North American Vertical Datum of 1988 (NAVD88), which is 1.095 feet above the National Geodetic Vertical Datum (NGVD29) at Sandy Hook, New Jersey.

Based on survey data, Site grade ranges from el 9.73 in the northwest to 11.90 in the northeast. The sidewalk grade of Thomson Avenue and 44th Drive is elevated above site grade, and slopes upward from north to south from el 23.46 to el 30.66. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street slopes upward from south to north from el 9.64 to el 10.82.

For depth references in this RAWP, an average elevation of 11.0 feet NAVD88 was assumed for a "Site-wide" elevation.

The Site is located in an area of historical industrial usage and has been used for manufacturing purposes since as early as the 1940s. Past uses of the Site include a chemical laboratory, automobile repair, storage, paper embossing, private garage, a contractor's yard, controller manufacturing, fine chemicals manufacturing, and welding and repair services. Sanborn maps, dated 1947 and 1950, indicate two underground storage tanks (UST) in the central portion of the Site, and geophysical anomalies were identified in this area of the Site during the February 2014 Phase II ESI.

Summary of the Remedial Investigation

RI findings and conclusions are as follows:

1. Stratigraphy: Beneath the partial Site surface cover (i.e., concrete), overburden at the Site includes a historic fill layer, which extends to depths of up to approximately 11 feet below grade surface (bgs). The historic fill layer generally consists of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Underlying the fill is a layer of gray-brown and brown/tan fine- to medium-grained sand, which is underlain by layers of brown silt, gray clay and peat. Bedrock was not encountered during this investigation; however, based on Langan's previous geotechnical investigations, depth to bedrock at the Site ranges from approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast.

2. Hydrogeology: Synoptic groundwater level measurements were collected on February 28, 2014 and April 24, 2014. Groundwater was encountered between approximately 4 and 6.4 feet bgs (el 4.89 feet to el 6.09 feet NAVD88) during the February gauging event and between approximately 5 and 7 feet bgs (el 4.24 feet to el 5.32 feet NAVD88)

during the April gauging event. The groundwater elevation is highest in the western portion of the Site and appears to slope toward the east/northeast across the majority of the Site. Groundwater flow appears to be locally influenced by the sewer beneath the Purves Street sidewalk.

3. Suspected USTs: Two USTs were identified on the Site in the 1947 and 1950 Sanborn Maps and there is no record of UST removal. The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Boring SB05, advanced at the geophysical anomaly, encountered refusal at 3 feet bgs, which may be related to the presence of UST structures. Borings in the vicinity of the UST found petroleum staining, odors, and elevated photoionization detector (PID) readings. A spill was reported to NYSDEC based on the observation of petroleum impacts. Petroleum impacts were also found in the western and northeastern parts of the Site and may be related to potential site USTs or potential off-site sources. Petroleum impacts are further described below.

4. Soil Impacts:

    a. Historic Fill – The historic fill layer contains concentrations of semivolatile organic compounds (SVOC), metals, pesticides, and polychlorinated biphenyls (PCB) at concentrations that exceed their respective Unrestricted Use or Restricted Residential Use Soil Cleanup Objectives (SCO).

        i. SVOCs were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site at levels considered typical of historic fill found in New York City.

        ii. PCB and pesticide concentrations above the Unrestricted Use SCO, but below the Restricted Residential Use SCOs, were detected in the fill.

        iii. Metals were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site. Anomalously high and potentially hazardous concentrations of lead were detected in samples from five borings, with the highest concentrations found in the shallow fill of borings SB08 and SB12 located in the northeastern corner of Lot 1, and the shallow and deep fill of boring SB02 in the northwest corner of

Lot 1. An anomalously high concentration of barium was detected in the shallow fill of boring SB02, and an anomalously high concentration of mercury was detected in the shallow fill of boring SB04, located in the southeastern portion of the Site.

b. Petroleum-Impacted Soil: Petroleum impacts, evidenced by odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, SB05, SB13 and SB14. Odors and elevated PID readings were observed in the northeast corner of the Site (boring SB01 and off-site boring SB13), and sheen was observed on groundwater during purging and development of off-site monitoring well MW13. Odors, staining, and elevated PID readings were observed straddling the water table in borings SB03 and SB14 in the western portion of the Site. There was no free product observed in any of the monitoring wells. Potential sources of petroleum-impacted soil on the Site include the various historical industrial and manufacturing uses, the on-site USTs and off-site sources.

c. Chlorinated VOC (CVOC)-Impacted Soil: CVOCs were detected at concentrations above Unrestricted Use SCOs, but below the Restricted Residential Use SCOs, within the native layer of on-site borings SB20 and SB21, and off-site boring SB13.

5. Groundwater Impacts: Groundwater volatile organic compounds (VOC), SVOC, metal, and pesticide concentrations exceeded Class GA AWQS.

a. CVOCs (1,1,1-trichloroethane, PCE, TCE, cis-1,2-dichloroethene, vinyl chloride) were found at concentrations above Class GA AWQS on the northeastern and southeastern parts of the Site, with the highest concentrations in northeastern well MW01 and off-site well MW13. Groundwater data obtained from an investigation at adjacent Lot 23 (NYSDEC BCP Site No. C241164) revealed a total CVOC concentration in groundwater in an off-site well on the Purves Street sidewalk (to the northeast of the Site) that was greater than concentrations in samples collected for this RI. Additionally, CVOC concentrations were detected in soil in off-site boring SB13 at concentrations above Unrestricted Use SCOs, indicating the CVOC impacts are likely originating from an off-site source.

b. Sodium and selenium impacts to groundwater are consistent with regional groundwater quality. Manganese impacts along the western part of the Site are consistent with regional groundwater quality or off-site sources.

c. SVOC and pesticide contaminants were only detected in off-site well MW13, and do not appear to be impacting Site groundwater.

6. Soil Vapor Impacts: Soil vapor sampling results indicate the presence of several VOCs, including CVOC and petroleum-related compounds, above the range of ambient air concentrations. The highest concentrations of TCE and PCE were identified along the eastern boundary of the Site along Purves Street and the southeastern boundary of the Site adjacent to Lot 31. VOCs may be due to historic releases of petroleum and chlorinated solvents originating from former off-site manufacturing/industrial processes.

7. Sufficient analytical data were gathered during the RI to establish site-specific soil cleanup levels and to develop a remedy for the Site. The remedy is described and evaluated in this RAWP, which has been prepared in accordance with NYS BCP guidelines. The remedy will address petroleum-impacted soil, historic fill impacted with metals and SVOCs, the potential for soil vapor intrusion, groundwater impacted with chlorinated VOCs from an off-site source, and a contingency for the removal and closure of unknown USTs.

Qualitative Human Health Exposure Assessment

Based upon the conceptual site model and the review of environmental data, complete on-site exposure pathways appear to be present, in the absence of institutional and engineering controls, in current, construction and remediation, and future conditions. The complete exposure pathways indicate there is a risk of exposure to humans from Site contaminants via exposure to soil, groundwater, and soil vapor if institutional and engineering controls are not implemented.

Current Conditions

Contaminant sources include historic fill with varying levels of SVOCs, metals, pesticides, and PCBs, two potential USTs, CVOCs in groundwater, and PCE, TCE, and other VOCs in soil vapor.

Contaminant release and transport mechanisms include contaminated soil transported as dust and volatilization of contaminants from the soil and groundwater matrices to the soil vapor phase, and existing soil vapor contaminants. Approximately 55% of the Site is covered with a

concrete slab, and the remaining 45% is covered with overgrown vegetation. In areas where human exposure to contaminated soil is possible, the potential migration pathway is likely complete for dermal absorption, inhalation and ingestion. The Site is surrounded by construction fencing and locked, which limits activity within the Site boundary to authorized guests. All five elements exist; therefore, the potential for completed exposure pathways is present. However, the risk can be avoided or minimized by applying appropriate health and safety measures during investigation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

In accordance with a Health and Safety Plan (HASP) and Community Air Monitoring Program (CAMP), measures such as conducting an air-monitoring program, donning PPE, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented. Such measures would prevent completion of these potential migration pathways.

Construction/Remediation Activities

Construction and remediation activities may result in potential exposures to Site contaminants in the absence of a Health and Safety Plan (HASP) and a Community Air Monitoring Plan (CAMP). Soil contains SVOCs and metals at concentrations that exceed Unrestricted and Restricted Residential Use SCOs, and PCBs and pesticides at concentrations that exceed Unrestricted Use SCOs. Construction and remedial activities include construction of foundation components and excavation and off-site disposal of impacted soil. In the absence of a HASP and CAMP, this scenario presents the potential for exposure of soil COCs to construction and remediation workers via dermal absorption, ingestion, and inhalation of particulate matter. In the absence of CAMP, activities may result in exposure to the public adjacent to the Site through potential generation and off-site migration of dust containing Site COCs.

Site groundwater contains VOCs and metals at concentrations that exceed their respective Class GA AWQS. Groundwater will be encountered during excavation activities by workers, and there is potential for exposure to groundwater COCs, in the absence of a HASP, to construction workers via dermal absorption, ingestion, or inhalation.

Soil vapor results indicated the presence of petroleum-related and CVOCs. During site development, construction and remediation workers may be exposed to soil vapor COCs via inhalation in the absence of a HASP. In the absence CAMP, activities may also result in

exposure to the public adjacent to the Site through volatilization of vapors into the air and potential off-site migration.

Proposed Future Conditions

The proposed development will include residential use. Upon completion of the new development, the entire Site will be capped with the concrete building foundation. These barriers will prevent direct human exposure to impacted soil and groundwater.

In the absence of engineering controls (e.g., vapor barrier and/or depressurization system), the presence of VOCs in the groundwater and soil vapor creates potential for VOCs to volatilize and accumulate in the proposed building, completing an exposure pathway for future users. In the absence of engineering controls, routes of exposure may include inhalation of vapors that accumulate in the building.

There is no risk of ingesting groundwater COCs because the Site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate and not from groundwater; groundwater is not intended for consumption.

The following conclusions were developed from the human health exposure assessment:

1. Under current conditions there is a moderate risk to exposure. Contaminated soil transport off-site as dust is limited by the site cover consisting of a concrete slab and vegetation. The exposure risks can be avoided or minimized by maintaining site security and limiting access to authorized guests, and by following the appropriate health and safety and vapor and dust suppression measures during investigation activities.

2. In the absence of institutional and engineering controls, there is a moderate risk of exposure during the construction and remediation activities. This risk can be avoided or minimized by following the appropriate health and safety, vapor and dust suppression, and site security measures.

3. The existence of a complete exposure pathway for Site contaminants to human receptors during proposed future conditions is unlikely, as a large quantity of soil will be excavated and transported to an off-site disposal facility, groundwater is not used as a potable water source in New York City, and the potential pathway for soil vapor

intrusion into the building would be addressed through the use of soil vapor mitigation measures (e.g., vapor barrier and depressurization system).

4. It is unlikely that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors for current, construction phase, or future conditions. Monitoring and control measures would be used during investigation and construction to prevent completion of this pathway. Under future conditions, the site will be remediated and engineering controls can be implemented to prevent completion of this pathway.

Summary of the Remedy

The RAWP would be executed by accomplishing the following tasks:

- Excavation (to the extent practical) and off-site disposal of soils exceeding Track 4 site-specific SCOs (Restricted Residential Use SCOs) and grossly-impacted soil, if encountered;
- Removal of USTs, if encountered, and closure of NYSDEC Spill No. 1310949, which was opened during the February 2014 Phase II ESI;
- Due to the planned excavation of two elevator pits into the ground water table, dewatering will be performed to enable the excavation and foundation work. Contaminated groundwater from dewatering operations will be treated as necessary prior to discharge to the municipal sewer system;
- Collection and analysis of documentation soil samples to document removal of targeted materials;
- Backfilling of excavated areas to development grade with certified-clean material (meeting the lower of the Protection of Groundwater SCO or the Protection of Public Health SCO for Restricted Residential Use in Part 375-6.7(d)(ii)(b)), recycled concrete aggregate (RCA) or virgin, native crushed stone (RCA will not be used for backfill in the upper 2 feet of any exposed, landscaped areas);
- Any enclosed subgrade parking garages that are included for any future on-site building(s) are required by the New York City Mechanical Code to provide ventilation;
- Installation of a vapor membrane under portions of the Site building that will not be used as a ventilated parking garage to protect against VOC intrusion into Site buildings;
- Installation of a submembrane depressurization (SMD) system under portions of the Site building that will not be used as a ventilated parking garage to protect against VOC intrusion;

- Development and execution of plans for the protection of on-site workers, community, and environment during remediation and construction activities;
- Installation of a site cover system consisting of either of the structures such as buildings, pavement, sidewalks comprising the site development or a minimum 2 foot thick clean soil cover in areas where the upper two feet of exposed surface soil will exceed the applicable SCOs; and
- Implementation of long-term Institutional Controls in the form of a Site Management Plan (SMP) and an Environmental Easement.

1.0 INTRODUCTION

Purves Street Owners LLC (the owner) entered into a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) on July 1, 2014, to investigate and remediate a ±0.62-acre property located at 44-30 Purves Street in Long Island City, New York (the Site). Purves Street Owners LLC is a Volunteer in the Brownfield Cleanup Program. Restricted Residential Use is proposed for the property. When completed, the Site will be developed as a 36-story residential apartment building with frontage along Purves Street and a one-story retail building with frontage along Thomson Avenue and 44th Drive.

This Remedial Action Work Plan (RAWP) summarizes the nature and extent of contamination as determined from data gathered during the Phase II Environmental Site Investigation (ESI), performed between February 19 and 28, 2014, and Remedial Investigation (RI) performed between April 15 and 24, 2014. The RAWP identifies and evaluates remedial action alternatives, including a Track 1 remediation, and recommends a Track 4 cleanup for addressing impacted soil, groundwater, and soil vapor within the Site boundaries. The remedy described in this document is consistent with the procedures defined in DER-10 and complies with all applicable standards, criteria and guidance. The remedy described in this document also complies with all applicable Federal, State and local laws, regulations and requirements. The RI for this Site did not identify fish and wildlife resources.

1.1 Site Location and Description

The Site is an irregularly-shaped, 27,095-square-foot (0.62-acre) vacant lot located at 44-30 Purves Street in the Long Island City neighborhood of Queens, New York (Block 268, Lot 1; formerly lots 1, 24, 25, and 26). The Site is bounded by Purves Street to the east, Lot 31 with a two-story brick building to the southeast, Thomson Avenue to the southwest, 44th Drive to the west, and lots 4 (vacant one-story building) and 23 (vacant) to the north. The Site has approximately 175 feet of frontage along Purves Street, 150 feet of frontage along Thomson Avenue, and 60 feet of frontage along 44th Drive. The Site has been a vacant lot since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes. A site location map is included as Figure 1.

Ground surface elevations were obtained from the April 11, 2014 survey drawing by Apple Surveying (Appendix A). All elevations (el) presented herein are measured in feet and referenced to the North American Vertical Datum of 1988 (NAVD88), which is 1.095 feet above the National Geodetic Vertical Datum (NGVD29) at Sandy Hook, New Jersey.

Based on survey data, Site grade ranges from el 9.73 in the northwest to 11.90 in the northeast. The sidewalk grade of Thomson Avenue and 44th Drive is elevated above site grade, and slopes upward from north to south from el 23.46 to el 30.66. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street slopes upward from south to north from el 9.64 to el 10.82.

For depth references in this RAWP, an average elevation of 11.0 feet NAVD88 was assumed for a "Site-wide" elevation.

1.2 Redevelopment Plan

The proposed project will include the construction of a 36-story residential apartment building with frontage along Purves Street and a one-story building with residential amenity space and retail along Thomson Avenue and 44th Street. A ventilated parking garage will span an area of approximately 14,000 square feet below the retail building. The parking garage will be below grade along Thomson Avenue and 44th Street and approximately at-grade along Purves Street. The 36-story residential building will not have a basement.

The general excavation cut required for development is assumed to be at approximately el 7.5 feet for the one-story retail building and el 8.5 feet for the residential tower. The development depths correspond to between approximately 2.5 and 3.5 feet below grade surface (bgs) on the Site. Additional deeper excavations will be required for an elevator pit, foundation elements, and to achieve the remedial goals as described in section 3.0 of this RAWP. Proposed development plans are provided in Appendix B and a development plan view is provided as Figure 3.

1.3 Description of Surrounding Property

The Site is located in an urban setting historically characterized by industrial and commercial development, and has recently undergone residential and commercial development due to rezoning. Surrounding properties are summarized in the following table:

Direction	Adjoining Properties	Surrounding Properties
North	Lot 4 (vacant one-story building) and lots 22 and 23 (vacant) followed by one- and two-story industrial buildings	Multiple-story residential, commercial and industrial buildings
East	Purves Street followed by a 14-story residential building and under-construction residential building	
Southeast	Lot 31 (vacant two-story building) followed by Thomson Avenue	

Direction	Adjoining Properties	Surrounding Properties
Southwest	Thomson Avenue followed by a five-story residential and commercial building	
West	44th Drive followed by multiple one- and two-story commercial buildings	

The surrounding area is highly urbanized and characterized by major infrastructure, including subway tunnels and elevated subway lines, underground utility lines, storm drains, and sewers. The presence of underground infrastructure may influence contaminant migration from potential up-gradient sources. The New York City Metropolitan Transit Authority (MTA) M and E subway lines extend underneath Jackson Avenue approximately 250 feet northwest of the Site.

Sensitive receptors within a half mile of the Site are listed in the following table:

NUMBER	NAME (Approximate distance from Site)	ADDRESS
1	Frank Sinatra High School (1,373 feet southeast)	30-20 Thomson Avenue, Long Island City, New York 11101
2	Information Technology High School (1,636 feet northwest)	21-16 44th Road, Long Island City, New York 11101
3	LaGuardia Community College High School (1,901 feet southeast)	45-35 Van Dam Street, Long Island City, New York 11101
4	Laguardia Community College Pre-School (1,901 feet southeast)	31-10 Thomson Avenue, Long Island City, New York 11101
5	Academy of American Studies High School (2,000 feet northeast)	28-04 41st Avenue, Long Island City, New York 11101
6	Robert F. Wagner Secondary School (2,006 feet southeast)	47-07 30th Place, Long Island City, New York 11101
7	Newcomers High School (2,164 feet northeast)	28-01 41st Avenue, Long Island City, New York 11101
8	YMCA of Greater New York (2,534 feet east)	32-23 Queens Blvd., Long Island City, New York 11101

1.4 Site History

1.4.1 Past Uses and Ownership

The Site is located in an area of historical industrial usage and has been used for manufacturing purposes since as early as the 1940s. Past uses of the Site include a chemical laboratory, automobile repair, storage, paper embossing, private garage, a contractor's yard, controller

manufacturing, fine chemicals manufacturing, and welding and repair services. Sanborn maps, dated 1947 and 1950, indicate two underground storage tanks (UST) in the central portion of Lot 1, and geophysical anomalies were identified in this area of the Site during the February 2014 Phase II ESI.

Adjacent and surrounding properties were historically used for industrial and manufacturing purposes. Sanborn maps indicate surrounding properties were used for chromium plating, multiple auto body/repair shops, a photochemical warehouse, steel and machine part storage, and textile printing ink manufacturing. The 1936 Sanborn map shows a UST in a garage on an adjacent property, and gasoline tanks in manufacturing buildings to the east of the Site across Purves Street.

1.4.2 Previous Environmental Reports

Previous environmental reports were reviewed as part of the preparation of this RAWP. Copies of these reports are provided in Appendix C. Environmental reports prepared for the Site include the following:

- *April 27, 2006 Phase I Environmental Site Assessment (ESA) Report, prepared by Middleton Environmental, Inc.*
- *November 5, 2006 Phase II Environmental Site Investigation (ESI) Report, prepared by Environmental Business Consultants*
- *December 9, 2011 Phase I ESA Report, prepared by IVI Assessment Services, Inc.*
- *March 18, 2014 Phase II ESI Report, prepared by Langan*
- *July 2014 Remedial Investigation Report by Langan*
- *October 20, 2014 Supplemental Soil Sampling Letter Report by Langan*

These reports are summarized below:

1.4.2.1 April 27, 2006 Phase I Environmental Site Assessment (ESA)

Middleton Environmental, Inc. prepared a Phase I ESA Report for the property located at 44-26/30 Purves Street (Block 268, Lots 24, 25, and 26), and a Phase I ESA update that included 44-32/38 Purves Street (Block 268, Lot 1). The Phase I ESA reports concluded the following:

- No recognized environmental conditions (REC) were identified.

- At the time of this Phase I ESA, two buildings were present at the Site. The buildings were vacant, and had most recently been used for automobile repair and carpet storage. The site was previously used by a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company and an air freight company.

- At the time of this Phase I ESA, surrounding property usage included a welding company, an automobile repair facility, a construction site, and vacant industrial buildings.

- A review of the 1950 Sanborn Fire Insurance Map indicated the presence of two USTs at the Site. There were no oil fill ports or fuel vents observed at the Site.

1.4.2.2 November 5, 2006 Phase II ESI Report

Environmental Business Consultants conducted a limited Phase II ESI that included the advancement of three soil borings, the installation of three temporary monitoring wells, and the collection and laboratory analysis of six soil and three groundwater samples.

Three soil borings were advanced to 20 feet bgs. Historic urban fill material was observed from surface grade to depths of 2 to 9 feet bgs. Native layers consisting of fine- to medium-grained sand, silt, and peat were observed underlying the fill layer. No evidence of impacts was observed based on photoionization detector (PID) screening of soils. Soil samples were collected from the 7 to 8 and 17 to 18 foot depth intervals in each boring. Soil samples were analyzed for the NYSDEC Spills Technology and Remediation Series (STARS)-listed volatile organic compounds (VOC) and semivolatile organic compounds (SVOC). One SVOC, pyrene, was detected in the shallow sample in boring SB2; however, the concentration did not exceed the Technical and Administrative Guidance Memorandum (TAGM) 4046 Recommended Soil Cleanup Objective (RSCO). The TAGM RSCOs have subsequently been superseded by Title 6 of the New York Codes, Rules and Regulations (NYCRR) Part 375. Under Part 375, the pyrene detection would still be below the corresponding Unrestricted Use Soil Cleanup Objective (SCO). There were no other VOC or SVOC detections in soil samples.

Three 1-inch diameter temporary monitoring wells were installed at a depth of 18 feet bgs with 15 feet of 0.010-inch slotted polyvinyl chloride (PVC) screen attached to PVC riser that extended approximately 2 feet above grade surface. Groundwater samples were collected

from each well and analyzed for NYSDEC STARS-listed VOCs and SVOCs. No STARS-listed VOCs or SVOCs were detected in groundwater samples.

1.4.2.3 December 9, 2011 Phase I ESA Report

The Phase I ESA identified the following RECs:

- *REC 1 - Historical Site Use:* Historical Site uses included a chemical laboratory, automobile repair, controller manufacturing, fine chemicals manufacturing, storage, paper embossing, machine manufacturing, automobile radiator servicing, and a contractor's yard. Two gasoline USTs were identified on the 1947 and 1950 Sanborn maps and may be still present. The historic site usage may have negatively impacted soil and/or groundwater at the Site.

- *REC 2 – Historical Use of Surrounding Properties:* Properties adjacent and surrounding the Site were previously used for chromium plating, auto body/repair shops, a photochemical warehouse and textile printing ink manufacturing. The 1936 Sanborn map shows a UST in a garage on an adjacent property, and gasoline tanks in manufacturing buildings to the east of the Site across Purves Street. The adjacent usage may have negatively impacted soil and/or groundwater at the Site.

1.4.2.4 March 18, 2014 Phase II ESI Report

Langan implemented the Phase II ESI between February 19 and 28, 2014. The investigation included the completion of a geophysical survey, advancement of eight soil borings, and installation of four permanent groundwater monitoring wells and seven soil vapor points. Samples collected from these locations (by media) included:

- Soil – 19 samples analyzed for VOCs, SVOCs, metals, pesticides, and polychlorinated biphenyls (PCBs)

- Groundwater – five samples analyzed for VOCs, SVOCs, metals, pesticides, PCBs, and hexavalent chromium

- Soil Vapor – five soil vapor samples and one ambient air sample analyzed for VOCs

Soil analytical data was compared to Unrestricted Use SCOs, groundwater analytical data was compared to NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Class GA

Ambient Water Quality Standards (AWQS), and soil vapor analytical data was compared to concurrent ambient air quality data. The findings of the investigation are summarized below:

- The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Additionally, refusal encountered during the advancement of boring SB05 may have resulted from contact with a UST-related subsurface structure.

- The subsurface soil profile generally consisted of historic fill predominately characterized as brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. The fill layer extended to between approximately 1.5 and 11 feet bgs. The fill layer was underlain by brown, fine- to medium-grained sand. In borings located within the western portion of the Site (SB02, SB03, and SB06), the sand layer was underlain by layers of silt, peat, and clay. In borings located in the southeastern portion of the Site (SB04 and SB05), the sand layer was underlain by silt. In borings located in the northeastern portion of the Site (SB01, SB07, SB08), the sand layer was underlain by a silt layer followed by a clay layer.

- Soil –

    - Petroleum-Impacted Soil – Material exhibiting staining, odor, and elevated VOC concentrations based on field screening with a PID was observed at three boring locations: SB01, SB03, and SB05. Petroleum impacts in borings SB01 and SB03 were observed straddling the water table. Petroleum impacts in boring SB05 were observed at a depth of 2 to 3 feet bgs, above an obstruction that resulted in refusal. Impacts were observed in the northern and southern portions of the Site, including the area adjacent to potential USTs. A spill was reported to NYSDEC and spill number 1310949 was assigned.

    - Historic Fill – A layer of historic fill extending to between approximately 1.5 and 11 feet bgs was identified throughout the Site. The fill was characterized as predominately consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Anomalously high concentrations of metals, particularly lead, were identified in the borings indicated below.

        - Barium – Boring SB02

- Lead – Borings SB02, SB05, SB06, and SB08
- Mercury – Borings SB03 and SB04

o Analytical Results – The following constituents were detected in soil at concentrations that exceed their respective Unrestricted Use SCOs:

- VOCs: acetone
- SVOCs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene, and pentachlorophenol
- Metals: arsenic, barium, cadmium, hexavalent chromium, trivalent chromium, copper, lead, mercury, nickel, and zinc
- Total PCBs

- Groundwater –

o Measurements collected during the ESI found groundwater ranged from 4.0 to 6.4 feet bgs.

o No light non-aqueous petroleum liquid (LNAPL) was observed in any of the monitoring wells. A PID reading of 12.8 ppm was observed in the headspace of monitoring well MW03.

o Chlorinated Solvent-Impacted Groundwater – Chlorinated VOCs (CVOC) including 1,1,1-TCA, cis-1,2-DCE, PCE, TCE, and vinyl chloride were identified in groundwater at concentrations exceeding the Class GA TOGS AWQS. Groundwater exceedances were observed in the eastern portion of the Site, with the highest concentrations in the northeast in monitoring well MW01.

o Metals – Manganese, selenium, and sodium were detected in groundwater at concentrations exceeding the Class GA TOGS AWQS in samples collected from two or more monitoring wells.

- Soil Vapor – Soil vapor results revealed concentrations of VOCs, included those related to petroleum and chlorinated solvents, above concentrations found in the ambient air sample.

1.4.2.5 July 2014 RI Report

RI findings and conclusions are as follows:

- Stratigraphy: Beneath the partial Site surface cover (i.e., concrete), overburden at the Site includes a historic fill layer, which extends to depths of up to approximately 11 feet bgs. The historic fill layer generally consists of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Underlying the fill is a layer of gray-brown and brown/tan fine- to medium-grained sand, which is underlain by layers of brown silt, gray clay and peat. Bedrock was not encountered during this investigation; however, based on Langan's previous geotechnical investigations, depth to bedrock at the Site ranges from approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast.

- Hydrogeology: Synoptic groundwater level measurements were collected on February 28, 2014 and April 24, 2014. Groundwater was encountered between approximately 4 and 6.4 feet bgs (el 4.89 feet to el 6.09 feet NAVD88) during the February gauging event and between approximately 5 and 7 feet bgs (el 4.24 feet to el 5.32 feet NAVD88) during the April gauging event. The groundwater elevation is highest in the western portion of the Site and appears to slope toward the east/northeast across the majority of the Site. Groundwater flow appears to be locally influenced by the sewer beneath the Purves Street sidewalk.

- Suspected USTs: Two USTs were identified on the Site in the 1947 and 1950 Sanborn Maps and there is no record of UST removal. The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Boring SB05, advanced at the geophysical anomaly, encountered refusal at 3 feet bgs, which may be related to the presence of UST structures. Borings in the vicinity of the UST found petroleum staining, odors, and elevated PID readings. A spill was reported to NYSDEC based on the observation of petroleum impacts. Petroleum impacts were also found in the western and northeastern parts of the Site and may be related to potential site USTs or potential off-site sources. Petroleum impacts are further described below.

- Soil Impacts:

    - Historic Fill – The historic fill layer contains concentrations of SVOC, metals, pesticides, and PCBs at concentrations that exceed their respective Unrestricted Use or Restricted Residential Use SCOs.

        - SVOCs were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site at levels considered typical of historic fill found in New York City.

        - PCB and pesticide concentrations above the Unrestricted Use SCO, but below the Restricted Residential Use SCOs, were detected in the fill.

        - Metals were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site. Anomalously high and potentially hazardous concentrations of lead were detected in samples from five borings, with the highest concentrations found in the shallow fill of borings SB08 and SB12 located in the northeastern corner of Lot 1, and the shallow and deep fill of boring SB02 in the northwest corner of Lot 1. An anomalously high concentration of barium was detected in the shallow fill of boring SB02, and an anomalously high concentration of mercury was detected in the shallow fill of boring SB04, located in the southeastern portion of the Site.

    - Petroleum-Impacted Soil: Petroleum impacts, evidenced by odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, SB05, SB13 and SB14. Odors and elevated PID readings were observed in the northeast corner of the Site (boring SB01 and off-site boring SB13), and sheen was observed on groundwater during purging and development of off-site monitoring well MW13. Odors, staining, and elevated PID readings were observed straddling the water table in borings SB03 and SB14 in the western portion of the Site. There was no free product observed in any of the monitoring wells. Potential sources of petroleum-impacted soil on the Site include the various historical industrial and manufacturing uses, the on-site USTs and off-site sources.

- CVOC-Impacted Soil: CVOCs were detected at concentrations above Unrestricted Use SCOs within the native layer off-site boring SB13.

- Groundwater Impacts: Groundwater VOC, SVOC, metal, and pesticide concentrations exceeded Class GA AWQS.

  - CVOCs (1,1,1-trichloroethane, PCE, TCE, cis-1,2-dichloroethene, vinyl chloride) were found at concentrations above Class GA AWQS on the northeastern and southeastern parts of the Site, with the highest concentrations in northeastern well MW01 and off-site well MW13. Groundwater data obtained from an investigation at adjacent Lot 23 (NYSDEC BCP Site No. C241164) revealed a total CVOC concentration in groundwater in an off-site well on the Purves Street sidewalk (to the northeast of the Site) that was greater than concentrations in samples collected for this RI. Additionally, CVOC concentrations were detected in soil in off-site boring SB13 at concentrations above Unrestricted Use SCOs, indicating the CVOC impacts are likely originating from an off-site source.

  - Sodium and selenium impacts to groundwater are consistent with regional groundwater quality. Manganese impacts along the western part of the Site are consistent with regional groundwater quality or off-site sources.

  - SVOC and pesticide contaminants were only detected in off-site well MW13, and do not appear to be impacting Site groundwater.

- Soil Vapor Impacts: Soil vapor sampling results indicate the presence of several VOCs, including CVOC and petroleum-related compounds, above the range of ambient air concentrations. The highest concentrations of TCE and PCE were identified along the eastern boundary of the Site along Purves Street and the southeastern boundary of the Site adjacent to Lot 31. VOCs may be due to historic releases of petroleum and chlorinated solvents originating from former off-site manufacturing/industrial processes.

1.4.2.6 October 20, 2014 Supplemental Soil Sampling Letter Report

Langan implemented a supplemental soil sampling investigation on September 23, 2014 to further investigate potential CVOC soil contamination in the Site's northeastern corner. Langan field personnel observed and documented field activities in the presence of a NYSDEC representative. The investigation consisted of two borings (SB20 and SB21) advanced to 25 feet below grade. Seven samples were collected and analyzed for CVOCs, and two samples

from each boring were analyzed for fraction organic carbon (FOC). The sample collection depths were based on: 1) field screening results and evidence of contamination; 2) comparable depths to remedial investigation boring SB-13; and, 3)_ boring termination depth. The investigation findings and conclusions are summarized as follows:

- The subsurface soil profile generally consisted of historic fill predominately characterized as brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, and wood. The fill layer extended to between approximately 2.5 and 8 feet bgs. The fill layer was underlain by brown, fine- to medium-grained sand. The sand layer was underlain by a silt layer followed by a clay layer.

- Soil –

    - Field Observations: Elevated PID readings (>10 ppm) were observed from approximately 13 to 18 feet bgs in boring SB20, with a maximum PID reading of 21.0 ppm at approximately 15 feet bgs. In boring SB21, elevated PID readings were observed from approximately 11 to 12 feet bgs, with a maximum PID reading of 11.5 ppm at 12 feet bgs. No discernable odors or staining were observed.

    - Analytical Results: The following CVOCs were detected in soil at concentrations that exceed their respective Unrestricted Use SCOs (no results exceeded Restricted Residential Use SCOs):

        - cis-1,2-dichloroethene, tetrachloroethene, and trichloroethene

- The supplemental soil sampling results support the conceptual site model offered in the RIR and demonstrate the absence of CVOC source material within the Site. Specifically, CVOC concentrations in SB21, which is approximately 5 feet from the Site boundary, are higher than in SB20, which is approximately 16 feet from the Site boundary. The CVOC concentrations in soil are likely the result of long-term releases of chlorinated solvents from unidentified, off-site sources.

1.4.3 Geotechnical Engineering Study

Langan conducted a geotechnical subsurface investigation in February 2008, and a supplemental investigation in April 2014. The geotechnical investigations consisted of drilling 17 borings, installing 3 observation wells, excavating ten test pits, and performing six seismic cone penetration tests. The purposes of the investigations were to investigate the subsurface

conditions, develop foundation design recommendations, and develop geotechnical engineering recommendations related to the design and construction of the proposed development.

Borings were completed to depths of approximately 53 to 75 feet bgs. The borings revealed an approximately 5- to 9-foot-thick layer of historic fill above a 7- to 14-foot-thick layer of sand that overlies a 5- to 27-foot-thick layer of silt, overlying a 10- to 15-foot thick layer of clay. Decomposed rock was encountered from approximately 44 to 48 feet bgs in four borings, and bedrock was encountered between approximately 43 and 61 feet bgs in all borings. Groundwater was measured in the three observation wells at depths of 8 to 10 feet bgs. The May 12, 2014 Geotechnical Engineering Report is included as an appendix in the RIR.

1.4.4 Sanborn Maps

All Sanborn Maps available for this Site were reviewed prior to preparation of the RAWP. The Sanborn Maps are provided in Appendix D. Review of the features shown on the Sanborn Maps is consistent with the site history provided in this RAWP.

1.5 Significant Threat

The RI Report was submitted for review by NYSDEC and NYSDOH on July 15, 2014. NYSDEC and NYSDOH have determined that this Site does not pose a significant threat to human health and the environment. Notice of the significant threat determination was provided to the public in a Fact Sheet dated September 2014.

2.0 DESCRIPTION OF REMEDIAL INVESTIGATION FINDINGS

Langan conducted a Phase II ESI between February 19 and 28, 2014, followed by supplemental remedial investigations conducted between April 15 and 24, 2014 and on September 23, 2014, to characterize the nature and extent of contamination at the Site. These investigation phases together constituted the RI. Investigation activities included a geophysical survey, soil boring advancement, monitoring well installation, soil vapor probe installation, and collection of soil, groundwater, and soil vapor samples.

The RI was conducted in accordance with New York Codes, Rules and Regulations (NYCRR) Title 6 Part 375 (6 NYCRR Part 375), the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (May 2010), the NYSDEC Draft Brownfield Cleanup Program Guide (May 2004), and the New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006).

2.1 Field Investigation

The RI consisted of the following:

- A geophysical survey;
- Advancement of 21 soil borings (SB01 through SB21) and collection of 61 soil samples, including three duplicate samples;
- Installation of nine groundwater monitoring wells (MW01 through MW04 and MW09 through MW13) and collection of eleven groundwater samples, including two duplicate samples; and
- Installation of thirteen soil vapor points (SV01 through SV13) and collection of twelve soil vapor samples, including one duplicate sample, and two ambient air samples.

2.1.1 Geophysical Investigation

Prior to commencement of intrusive RI field activities (i.e., soil borings, well installation and soil vapor sampling), NOVA Geophysical & Environmental, Inc. (NOVA) of Douglaston, New York, conducted a geophysical survey under supervision of a Langan field engineer on February 19, 2014. Borings were relocated as necessary to avoid subsurface utilities and anomalies (other subsurface impediments). The geophysical survey identified the following subsurface anomalies:

- An anomaly was observed at the location where two USTs are shown on the 1947 and 1950 Sanborn maps in the central southern part of the Site; however, it could not verify the presence of USTs.

2.1.2 Drilling and Soil Logging

A total of 21 soil borings (SB01 through SB21) were completed during the RI. Borings were advanced until a potentially confining layer of silt or clay was identified. All except seven borings were advanced to 20 feet bgs; borings SB01, SB06, SB20, and SB21 were advanced to 25 feet bgs, and SB02, SB13, and SB16 were advanced to 15 feet bgs. Boring SB13 was located off-site on the Purves Street sidewalk. There were no borings located off-site on Thomson Avenue and 44th Drive due to the retaining wall spanning the western and southwestern Site boundaries. Continuous soil samples were collected from grade surface to the final depth of each boring.

A total of 61 grab soil samples, including three field duplicates, were collected for laboratory analysis. Generally, one sample was collected from the historic fill layer, and a second sample was collected from the interval of the greatest observable impact (staining, odor, elevated PID readings) or at the groundwater interface. During the supplemental investigation, a third sample from each boring was collected at the boring termination depth.

Soil samples collected from borings SB20 and SB21 were analyzed for CVOCs by Environmental Protection Agency (EPA) Method 8260C, and two samples from each boring were analyzed for FOC by American Society for Testing and Materials (ASTM) Method D 2974-87. All other soil samples were analyzed for NYSDEC Part 375 List VOCs by EPA Method 8260C, SVOCs by EPA method 8270D, metals (including hexavalent chromium) by EPA methods 6010C/7473/7196A, pesticides by EPA method 8081B, and PCBs by EPA method 8082A. Soil samples collected during the supplemental investigation were additionally analyzed for EPA Target Compound List (TCL) VOCs, SVOCs, pesticides, and PCBs, and Target Analyte List (TAL) metals. Eight of nineteen Phase II ESI soil samples and all of the supplemental investigation soil samples were analyzed for total cyanide by EPA method 9014/9010C.

2.1.3 Groundwater Monitoring

Nine soil borings were converted into groundwater monitoring wells by inserting 10 feet of 2-inch diameter, 0.01-inch slotted, schedule 40 PVC screen, with attached risers, into the boreholes. All wells were installed to a depth of approximately 14 feet bgs. Monitoring wells were sampled one week after development, in accordance with the EPA's low-flow groundwater sampling procedure to allow for collection of a representative sample ("Low Stress [low flow] Purging and Sampling Procedure for the Collection of Groundwater Samples

from Monitoring Wells", EQASOP-GW 001, January 19, 2010). Immediately before sample collection, a minimum of three well volumes were purged from each well and groundwater parameters (pH, conductivity, turbidity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]) had stabilized and turbidity measurements were below 50 Nephelometric Turbidity Units (NTU).

Eleven groundwater samples – one sample from each well and two duplicate samples – were collected into laboratory-supplied glassware and picked up and delivered via courier service to York. Duplicate samples were collected from monitoring wells MW01 and MW13. Groundwater samples were analyzed for TCL VOCs by EPA Method 8260C, TCL SVOCs by EPA method 8270D, pesticides by EPA method 8081B, PCBs by EPA method 8082A, TAL metals by EPA methods 6010C/7470, and hexavalent chromium by EPA method 7196A. Groundwater samples collected during the supplemental investigation were additionally analyzed for NYSDEC Part 375 listed VOCs, SVOCs, Metals, PCBs, and pesticides, and total cyanide by Standard Method 4500.

2.1.4 Soil Vapor Investigation

During the RI, thirteen soil vapor sample points were installed to approximately 3 to 5 feet bgs. Twelve soil vapor samples, including one duplicate sample, and two ambient air samples, one at each sampling event were collected and submitted to York for analysis of VOCs via EPA Method TO-15. Samples collected from soil vapor points SV02 and SV05 were collected but were not submitted for analysis to due groundwater infiltration.

2.1.5 Summary of Remedial Investigation Findings

RI findings and conclusions are as follows:

1. Stratigraphy: Beneath the partial Site surface cover (i.e., concrete), overburden at the Site includes a historic fill layer, which extends to depths of up to approximately 11 feet bgs. The historic fill layer generally consists of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Underlying the fill is a layer of gray-brown and brown/tan fine- to medium-grained sand, which is underlain by layers of brown silt, gray clay and peat. Bedrock was not encountered during this investigation; however, based on Langan's previous geotechnical investigations, depth to bedrock at the Site ranges from approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast.

2. Hydrogeology: Synoptic groundwater level measurements were collected on February 28, 2014 and April 24, 2014. Groundwater was encountered between approximately 4 and 6.4 feet bgs (el 4.89 feet to el 6.09 feet) during the February gauging event and between approximately 5 and 7 feet bgs (el 4.24 feet to el 5.32 feet) during the April gauging event. The groundwater elevation is highest in the western portion of the Site and appears to slope toward the east/northeast across the majority of the Site. Groundwater flow appears to be locally influenced by the sewer beneath the Purves Street sidewalk.

3. Suspected USTs: Two USTs were identified on the Site in the 1947 and 1950 Sanborn Maps and there is no record of UST removal. The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Boring SB05, advanced in the geophysical anomaly, encountered refusal at 3 feet bgs, which may be related to the presence of UST structures. Borings in the vicinity of the UST found petroleum staining, odors, and elevated PID readings. A spill was reported to NYSDEC based on the observation of petroleum impacts. Petroleum impacts were also found in the western and northeastern parts of the Site and may be related to potential site USTs or potential off-site sources. Petroleum impacts are further described below.

4. Soil Impacts:

    a. Historic Fill – The historic fill layer contains concentrations of SVOCs, metals, pesticides, and PCBs at concentrations that exceed their respective Unrestricted Use or Restricted Residential Use SCOs.

        i. SVOCs were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site at levels considered typical of historic fill found in New York City.

        ii. PCB and pesticide concentrations above the Unrestricted Use SCO, but below the Restricted Residential Use SCOs, were detected in the fill.

        iii. Metals were detected at concentrations above Restricted Residential Use SCOs within the fill layer throughout the Site. Anomalously high and potentially hazardous concentrations of lead were detected in samples

from five borings, with the highest concentrations found in the shallow fill of borings SB08 and SB12 located in the northeastern corner of Lot 1, and the shallow and deep fill of boring SB02 in the northwest corner of Lot 1. An anomalously high concentration of barium was detected in the shallow fill of boring SB02, and an anomalously high concentration of mercury was detected in the shallow fill of boring SB04, located in the southeastern portion of the Site.

b. Petroleum-Impacted Soil: Petroleum impacts, evidenced by odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, SB05, SB13 and SB14. Odors and elevated PID readings were observed in the northeast corner of the Site (boring SB01 and off-site boring SB13), and sheen was observed on groundwater during purging and development of off-site monitoring well MW13. Odors, staining, and elevated PID readings were observed straddling the water table in borings SB03 and SB14 in the western portion of the Site. There was no free product observed in any of the monitoring wells. Potential sources of petroleum-impacted soil on the Site include the various historical industrial and manufacturing uses, the on-site USTs and off-site sources.

c. CVOC-Impacted Soil: CVOCs were detected at concentrations above Unrestricted Use SCOs, but below Restricted Residential Use SCOs, within the native layer of borings SB20, SB21, and off-site boring SB13.

5. Groundwater Impacts: Groundwater VOC, SVOC, metal, and pesticide concentrations exceeded Class GA AWQS.

a. Chlorinated VOCs (1,1,1-trichloroethane, PCE, TCE, cis-1,2-dichloroethene, vinyl chloride) were found at concentrations above Class GA AWQS on the northeastern and southeastern parts of the Site, with the highest concentrations in northeastern well MW01 and off-site well MW13. Groundwater data obtained from an investigation at adjacent Lot 23 (NYSDEC BCP Site No. C241164) revealed a total CVOC concentration in groundwater in an off-site well on the Purves Street sidewalk (to the northeast of the Site) that was greater than concentrations in samples collected for this RI. Additionally, CVOC concentrations were detected in soil in off-site boring SB13 at concentrations

above Unrestricted Use SCOs, indicating the CVOC impacts are likely originating from an off-site source.

b. Sodium and selenium impacts to groundwater are consistent with regional groundwater quality. Manganese impacts along the western part of the Site are consistent with regional groundwater quality or off-site sources.

c. SVOC and pesticide contaminants were only detected in off-site well MW13, and do not appear to be impacting Site groundwater.

6. Soil Vapor Impacts: Soil vapor sampling results indicate the presence of several VOCs, including CVOC and petroleum-related compounds, above the range of ambient air concentrations. The highest concentrations of TCE and PCE were identified along the eastern boundary of the Site along Purves Street and the southeastern boundary of the Site adjacent to Lot 31. VOCs may be due to historic releases of petroleum and chlorinated solvents originating from former off-site manufacturing/industrial processes.

7. Sufficient analytical data were gathered during the RI to establish site-specific soil cleanup levels and to develop a remedy for the Site. The remedy is described and evaluated in this RAWP, which has been prepared in accordance with NYS BCP guidelines. The remedy will address petroleum-impacted soil, historic fill impacted with metals and SVOCs, the potential for soil vapor intrusion, groundwater impacted with chlorinated VOCs from an off-site source, and a contingency for the removal and closure of unknown USTs.

2.2 Geological Conditions

Three Site-specific geologic units were identified during the RI. These units are listed in depth order (shallow to deep):

- Historic fill
- Native Soil Layers
- Bedrock

Subsurface profiles were included as part of the July 2014 RIR.

2.2.1 Historic Fill

A historic fill layer was observed that extended from surface grade to between approximately 1.5 and 11 feet bgs. The fill layer was deepest in the northwestern part of the Site (borings SB02, SB06, SB14, SB15, and SB16), and in the southeastern part (borings SB17 and SB18). A shallow fill layer (1.5 to 2.5 feet) was observed in the northeastern portion of the Site (borings SB07, SB08, SB12, SB19, and off-site boring SB13). The fill was characterized as predominantly consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood.

2.2.2 Native Soil Layers

The fill layer was underlain by brown, fine- to medium-grained sand. Soil types underlying the sand layer varied in different parts of the site, as follows:

- Western part – borings SB02, SB03, SB06, SB14, SB15, SB16 – layers of silt, peat, and organic clay
- Northeastern part – borings SB01, SB07, SB08, SB11, SB13, and SB19 – layers of silt and clay
- Southeastern part – borings SB04, SB05, SB09, SB10, SB12, SB17, SB18 – layer of silt

2.2.3 Bedrock

Based on the findings of the May 2014 Geotechnical Engineering Study conducted by Langan, bedrock consists of intermediate to hard, gray-white schist bedrock at depths ranging from approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast, and is deepest in the southeastern part of the Site.

2.2.4 Hydrogeology

Synoptic groundwater level measurements were collected on February 28, 2014, April 24, 2014, and July 9, 2014. Groundwater was encountered between approximately 4 and 6.4 feet bgs during the February gauging event and between approximately 4.5 and 7 feet bgs during the April and July gauging events. The higher groundwater elevations during the February gauging event were presumed to be the result of snow melt. The groundwater elevation is highest in the western part of the Site and appears to flow east to northeast toward Purves Street.

Groundwater flow may be locally affected by the presence of a combined sewer line that runs adjacent to the Site beneath the western Purves Street sidewalk. According to NYCDEP records, the sewer was constructed circa 1911 of reinforced concrete pipe and during the RI construction crews were observed repairing what appeared to be a surficial breach or cave in. Wastewater flows north within the sewer. The sewer is 42 inches in diameter and has an invert elevation of about 3 feet. At the groundwater elevation noted above, the invert of the sewer is below the water table. If there are any cracks or penetrations in the base or sides of the sewer, the sewer will influence groundwater flow. Based on the inferred groundwater flow directions from groundwater measurements taken during the RI, it appears groundwater may be influenced by the sewer.

Depending on the water table elevation and the integrity of the sewer pipe, the sewer will either be a gaining or losing groundwater feature. During the RI, the sewer was likely a gaining feature because the water table was roughly 1.5 feet above the sewer's invert elevation. During the Langan geotechnical investigation, the sewer was likely a losing feature because the water table was observed to be significantly lower and below the sewer invert elevation.

2.3 Contaminant Conditions

2.3.1 Description of Areas of Concern

2.3.1.1 AOC-1: Historic Fill

AOC-1 Findings Summary

During the RI, historic fill was observed from surface grade to between 1.5 and 11 feet bgs. All borings are included within AOC-1, as historic fill encompasses the entire Site. Twenty-seven samples were collected from the historic fill layer, and the analytical results are summarized as follows:

- SVOCs and metals were detected at concentrations exceeding Restricted Residential Use SCOs. SVOC and metal concentrations were observed to be in the range of typical concentrations found in New York City historic fill, with the exception of isolated areas of anomalously high metals. Anomalously high concentrations of metals, particularly lead, barium, and mercury, were identified in the borings indicated below:
    - SB02 – lead, barium
    - SB04 – mercury

- SB05, SB06, SB08, SB12, SB16 – lead

- PCBs and pesticides were detected at concentrations exceeding Unrestricted Use SCOs.

AOC-1 Conclusions

Fill material on the site was found to have one or more exceedances of both the Unrestricted Use and Restricted Residential Use SCOs for SVOCs, metals, pesticides, and PCBs. The presence of historic fill does not appear to be impacting the groundwater and soil vapor on the Site.

The anomalously high concentrations of lead, barium, and mercury are potentially hazardous. Based on the prevalence and magnitude of the lead concentrations, and the relatively higher solubility of lead than barium and mercury, lead is the most likely to exist in hazardous concentrations.

2.3.1.2 AOC-2: Historic USTs and Petroleum-Impacted Soil

AOC-2 Findings Summary

AOC-2 represents the location of two USTs that were identified on the 1947 and 1950 Sanborn maps, and the petroleum-impacted soil identified during Langan's Phase II ESI. Based on the potential presence of USTs, the presumed age of the tanks (at least 67 years), and lack of tank closure documentation, the potential tanks are an AOC. In addition, visual, olfactory, and instrumental evidence of petroleum impacts was observed in three borings (SB01, SB03, and SB05) during Langan's Phase II ESI. Contaminants of concern include petroleum-related VOCs and SVOCs in soil and groundwater and VOCs in soil vapor. Investigation locations include the southern portion of the Site, which incorporates the suspected USTs and observations of petroleum impacts in Phase II ESI borings SB05 and SB03, and the northeastern portion of the Site, which incorporates observations of petroleum impacts in Phase II ESI boring SB01.

A summary of findings associated with AOC-2 is presented below:

AOC-2 USTs

The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. While drilling boring SB05, refusal was encountered at approximately 3 feet bgs. Refusal may have been caused by a UST structure.

AOC-2 Soil

- Southern Portion of the Site

    - Petroleum-impacted soil exhibiting staining, odor and PID readings up to 240 ppm was observed at depths of approximately 2 to 3 feet bgs in boring SB05, prior to refusal. No evidence of petroleum impacts was observed at the off-site location of SB05. Boring SB10 was advanced within the suspected UST area to the north of SB05, and no evidence of petroleum impacts was observed.

    - In boring SB17, located approximately 25 feet south of the suspected UST area, petroleum-impacted soil exhibiting odor was observed below the water table at a depth of approximately 10 feet bgs.

    - In boring SB03, located approximately 25 feet southwest of the suspected UST area, petroleum-impacted soil exhibiting staining, odor, and PID readings up to 91.7 ppm was observed straddling the water table.

    - Despite field observations of petroleum impacts, there were no VOCs detected at concentrations above the SCOs. Five SVOCs, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and chrysene, were detected at concentrations exceeding Unrestricted Use and/or Restricted Residential Use SCOs in sample SB05_1-3, which was collected at the location where refusal was encountered at 3 feet bgs. There were no SVOCs detected at concentrations above the SCOs in any other samples collected from the off-set location of SB05, SB03, SB10, or SB17.

- Northeastern Portion of the Site

    - Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 14.9 ppm was observed straddling the water table in boring SB01.

    - In boring SB13, advanced off-site and approximately 15 feet east of boring SB01, petroleum-impacted soil exhibiting odor, and PID readings up to 5.8 ppm was observed within the water table at approximately 8 to 10 feet bgs.

    - In boring SB19, advanced approximately 25 feet west of boring SB01, there was no observed evidence of petroleum-impacts.

- Despite the field observations of petroleum impacts, there were no elevated petroleum-related VOCs or SVOCs detected above the SCOs in soil samples collected from these depths.

- Additional Observed Impacts

  - In boring SB14, advanced in the western portion of the Site near the Site boundary, petroleum-impacted soil exhibiting staining, odor, and PID readings up to 8.9 ppm were observed straddling the water table at a depth of approximately 7 to 10 feet bgs. There were no VOCs or SVOCs detected above the SCOs in the soil sample collected at 8 to 9 feet bgs.

AOC-2 Groundwater

There were no petroleum-related VOCs or SVOCs detected at concentrations exceeding their respective Class GA AWQS in any of the groundwater samples. Elevated PID readings were recorded in the well headspace during the sampling of well MW03 (12.8 ppm), and during the development and purging of well MW13 (64.4 ppm). Additionally, a sheen was observed on groundwater purged from well MW13. There was no evidence of petroleum impacts on groundwater during the development and sampling of monitoring well MW10, located within the suspected UST area. The PID headspace reading in MW10 was 0.0 ppm.

AOC-2 Soil Vapor

Several VOCs, including petroleum-related compounds, were detected in soil vapor at concentrations above the anticipated range of background concentrations.

AOC-2 Conclusions

Conclusions relevant to AOC-2 include:

- Although not found during the RI, USTs may still be present;
- Field observations indicate a possible petroleum release from the suspected USTs at the location of boring SB05.
- Field observations indicate the possibility of petroleum impacts resulting from off-site sources.
- Analytical results indicate VOC impacts to soil vapor and SVOC impacts to soil, however no evidence of petroleum-related VOC or SVOC impacts to groundwater was observed.

2.3.1.3 AOC-3: Chlorinated VOC Contamination in Groundwater

AOC-3 Findings Summary

CVOCs including 1,1,1-trichloroethane, cis-1,2-dichloroethylene, PCE, TCE, and vinyl chloride were identified in groundwater at concentrations exceeding the Class GA AWQS in monitoring wells located along the eastern site border and off-site (MW01, MW04, MW09, MW12 and MW13), with the highest total CVOC concentration (871 µg/L) detected in the off-site well (MW13). Additionally, sheen was observed on groundwater purged from MW13 and a PID reading of 64.4 ppm was recorded in the headspace of MW13. CVOCs were also detected at concentrations above the Unrestricted Use SCO in soil samples collected from borings SB20, SB21, and off-site boring SB13.

The adjoining site to the north (Block 268, Lot 23) is also in the NYSDEC BCP (Site No. C241164). Data from a December 2013 investigation at this site further delineates the extent of CVOC impacts to groundwater. The highest total CVOC concentration (3,436 µg/L) from the adjoining site investigation was found at an off-site well in the Purves Street sidewalk (Lot 23 location MW01).

AOC-3 Conclusions

The data, including groundwater, soil, and soil vapor results, show that the highest CVOC concentrations on the Site are in the northeastern corner of the Site and off-site. The data and field observations indicate an off-site CVOC source to the east in the direction of Purves Street.

2.3.1.4 AOC-4: Soil Vapor Contamination

AOC-4 Findings Summary

AOC-4 represents the impacts to soil vapor resulting from the use of the Site and surrounding properties for various industrial and manufacturing uses.

Soil vapor analytical results were compared to ambient air sample results collected on each day of sampling. Several VOCs, including petroleum and chlorinated-solvent related VOCs, were detected at concentrations above background ambient air concentrations in all soil vapor samples. Chlorinated VOCs, specifically PCE and TCE, are considered soil vapor contaminants of concern. The highest PCE and TCE concentrations were detected in samples collected on the eastern side of the Site adjacent to Purves Street and the southeastern portion of the Site adjacent to Lot 31. At these locations (SV03, SV06, SV07, SV09, SV12, and SV13), TCE was detected at concentrations up to 200 µg/m^3 (SV09), and PCE was detected at concentrations up to 1,500 µg/m^3 (SV13). The maximum TCE concentration was at least 1,300 times greater than

the ambient air concentration, and the maximum PCE concentration was 1,765 times greater than the ambient air concentration.

AOC-4 Conclusions

Soil vapor at the Site contains VOCs, most notably PCE and TCE. The highest PCE concentrations were detected in soil vapor samples collected on the eastern side of the Site adjacent to Purves Street, which corresponds to PCE detections in groundwater.

2.3.2 Nature and Extent of Contamination

This section evaluates the nature and extent of soil, groundwater and soil vapor contamination at the Site.

2.3.2.1 Historic Fill

The site-wide fill layer extends from surface grade to depths up to approximately 11 feet bgs and contains varying levels of SVOCs, pesticides, PCBs, and metals that are discussed in detail in this section. The discussion is divided by the following contaminant classifications:

1. SVOC-Contaminated Material
2. Metals-Contaminated Material
3. Pesticide-contaminated Material
4. PCB-contaminated Material

SVOC (cPAHs)-Contaminated Material

SVOCs were detected at concentrations exceeding Unrestricted Use SCOs in soil samples collected from eleven of nineteen boring locations. At least one SVOC was detected at a concentration above its respective Restricted Residential Use SCO in ten of nineteen borings. There was one historic fill sample, SB14_8-9, that had no SVOC detections. Total SVOC concentrations in historic fill samples with detections ranged from 0.10 mg/kg in sample SB11_2-3.5 to 61 mg/kg in sample SB06_6-8. The contaminants of concern (COCs) include:

- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- chrysene
- dibenzo(a,h)anthracene
- indeno(1,2,3-cd)pyrene
- pentachlorophenol

These SVOCs are typically found in historic fill throughout New York City. Although these compounds can be associated with motor vehicle exhausts and fuels, they are likely incomplete combustion byproducts from the burning of wood or coal that were a component of the backfill source use for Site infilling. Except for pentachlorophenol, each COC was detected above its respective Restricted Residential Use SCO in at least one sample. COCs were detected above the Restricted Residential Use SCOs in samples collected from throughout the Site, at depths ranging from surface grade to 8 feet bgs. The highest concentrations of COCs were detected in samples collected from the shallow and deep fill in the northwest portion of the Site (borings SB02 and SB06), and the shallow fill in the northeast corner of the Site (SB19). Total SVOC concentrations in these areas are summarized in the following table:

Boring	Layer	Total SVOCs (mg/kg)
SB02	shallow fill	27.19
	deep fill	20.63
SB06	shallow fill	23.78
	deep fill	61.22
SB19	shallow fill	48.41

Metals-Contaminated Material

Metals were detected at concentrations above the Unrestricted Use SCOs in samples collected from all nineteen soil borings, and at concentrations above the Restricted Residential Use SCOs in samples collected from thirteen of nineteen soil borings. Metals that were detected above Restricted Residential Use SCOs are in **bold**. The COCs include (maximum concentration observed and corresponding sample name are shown in parenthesis):

- **arsenic**
  (35.8 mg/kg in SB05A_2-4)
- **barium**
  (4,340 mg/kg in SB02_2-4)
- **cadmium**
  (7.21 mg/kg in SB18_11-13)
- **hexavalent chromium**
  (8.52 mg/kg in SB06_6-8)
- **trivalent chromium**
  (251 mg/kg in SB02_2-4)
- **lead**
  (61,000 mg/kg in SB08_0-2)
- **copper**
  (860 mg/kg in DUP01_022014, parent sample SB04_1-3)
- **mercury**
  (14.9 mg/kg in DUP01_022014, parent sample SB04_1-3)

- nickel
  (54.7 mg/kg in SB08_0-2)
- zinc
  (3,260 mg/kg in SB02_2-4)
- selenium
  (6.17 mg/kg in SB14_8-9)

Metal concentrations above the Restricted Residential Use SCOs were detected within historic fill throughout the Site at depths ranging from surface grade to 9 feet bgs. The potential source of metals contamination is likely the quality of historic fill. The former chromium plating use in the southern-adjoining site (Block 268, Lot 31) may have contributed to the presence of hexavalent chromium in borings SB09, SB17, SB04, and SB18. The elevated metals concentrations in shallow and deep fill in SB02 may be the result of the former site use as a chemical laboratory. Anomalously high and potentially hazardous concentrations of metals, particularly lead, barium, and mercury, were identified in the borings indicated below:

- Lead – SB02, SB05, SB08, SB12 and SB16
- Barium – SB02
- Mercury – SB04

The highest lead concentrations were observed in samples collected from the shallow fill in borings SB08 and SB12, which are both located in northeastern corner of Lot 1. Potential sources of metal contamination include historical site uses and the quality of fill placed at the Site. Given the magnitude of lead concentration, the Site fill may be been impacted by releases of lead-based paints from demolition of the former buildings or lead paint mixing operations.

Pesticide-Contaminated Material

Pesticides, specifically 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, and dieldrin, exceeded their respective Unrestricted Use SCOs in shallow fill samples (0 to 3 feet bgs) in borings SB10, SB14, SB15 and SB19. There were no pesticides detected at concentrations above their respective Restricted Residential Use SCOs. The elevated pesticide concentrations were scattered throughout the Site with no discernable pattern. Pesticides were not detected in deeper samples within the impacted borings. Sources of the pesticides are likely prior usage by inhabitants of the former buildings or quality of the historic fill.

PCB-Contaminated Material

Two PCBs, Aroclor 1260 and Aroclor 1262, were detected at concentrations exceeding the Unrestricted Use SCO. The PCB concentrations did not exceed the Restricted Residential Use

SCO. PCBs were detected in borings SB03 and SB15, located in the southwestern part of the Site, between 0 and 3 feet bgs, and in boring SB04, located the southeastern part of the Site, between 4 and 6 feet bgs.

2.3.2.2 CVOC-Impacted Soil

CVOCs were detected at concentrations above their Unrestricted Use SCOs, but below Restricted Residential Use SCOs in on-site borings SB20 and SB21 and off-site boring SB13. These detections were found in the native soil beneath the historic fill. The following four SVOCs were detected in one or more samples at concentrations exceeding their respective Unrestricted Use SCOs (maximum concentrations are shown for each boring):

Compound	UU SCO	SB-13	SB-20	SB-21
DCE	0.25	0.75	NE	0.45
PCE	1.3	5.60	4.40	12
TCE	0.47	0.72	NE	1.1
VC	0.02	0.12	NE	NE

DCE – cis-1,2-dichloroethene
VC – vinyl chloride
NE – no exceedance
All concentrations shown in mg/kg

The concentrations of CVOCs found on the Site do not exceed the Part 375 Restricted Residential SCOs, and are not considered source material as defined in 6 NYCRR Part 375-1.2(au). The soil concentrations are not sufficiently high enough to migrate, release significant levels of contaminants to another environmental medium, or pose a threat to public health or the environment. The CVOC concentrations in soil are likely the result of long-term releases of CVOCs from unidentified, off-site sources.

2.3.2.3 Groundwater Contamination

Evaluation of the groundwater analytical results identified the following COCs for groundwater, which are discussed in more detail in this section:

1. CVOC Contamination
2. Metals Contamination

CVOC Impacts

CVOC concentrations exceeding Class GA AWQS were found in groundwater at monitoring wells MW01, MW04, MW09, and off-site well MW13. CVOCs were also identified in

groundwater samples collected from wells on the northern-adjoining site (Lot 23, NYSDEC BCP Site No. C241164), specifically off-site wells MW01 (Purves Street Sidewalk) and MW02 (Lot 23). The COCs include the following: 1,1,1-trichloroethane, 1,1-dichloroethane, cis-1,2-dichloroethene, PCE, TCE, and vinyl chloride.

Monitoring well MW04 and MW09 each contained one CVOC at a concentration above Class GA AWQS: PCE (MW04) and cis-1,2-dichloroethene (MW09). CVOC concentrations in groundwater were highest in the northeast corner of the Site (MW01), on Lot 23 (MW02), and on the Purves Street sidewalk (MW13 and MW01). Total CVOC concentrations in these wells are summarized in the following table:

Well ID	Location	Total CVOCs (µg/L)
MW01	NE Site Corner	793
MW13	Purves Street Sidewalk	871
MW02	SE Corner – Adjacent Site (Lot 23)	733
MW01	Purves Street Sidewalk	3,436

On-site soil sampling did not reveal a source of CVOCs. CVOCs were detected in multiple on-site soil samples; however, the concentrations did not exceed Protection of Groundwater (PGW) SCOs (which is the applicable SCO for these contaminants since they are also found in groundwater) and were typically one to two orders of magnitude lower than the PGW SCO of 1.3 mg/kg. The highest on-site CVOC concentration was a PCE concentration of 12.0 mg/kg in sample SB21_24-25.

Based on soil and groundwater sampling results and field observations, the source of the chlorinated VOC contamination appears to be off-site.

Metal Impacts

Groundwater sample results revealed one or more of the following metals at concentrations that exceed their TOGS Class GA AWQS: manganese, selenium, and sodium. The presence of sodium and selenium is consistent with regional groundwater quality. Concentrations of manganese were found above the TOGS Class GA AWQS in 7 of the 9 monitoring wells, with concentrations generally higher on the eastern Site boundary, and highest in off-site monitoring well MW13. Manganese concentrations ranged from 17 to 13,400 µg/L and are considered indicative of regional groundwater quality or potential off-site sources. No manganese Unrestricted Use SCO exceedances were found in Site soil samples.

2.3.2.4 Soil Vapor Contamination

Total VOCs ranged from 62.71 µg/m³ at SV04 to 1,552 µg/m³ at SV13. PCE and TCE concentrations in soil vapor were prevalent throughout the Site. PCE was found in all soil vapor samples and ranged from 8.6 µg/m³ (SV10) to 1,500 µg/m³ (SV13). TCE was found in ten of twelve soil vapor samples (SV04 and SV08) and ranged from 2 µg/m³ in SV11 to 200 µg/m³ at SV09. The PCE and TCE concentrations were highest along the eastern portion of the Site along Purves Street and in the southeastern portion of the Site adjacent to Lot 31.

Site-wide VOC impacts to soil vapor may result from the potential USTs, historical uses of the Site and surrounding properties, or an off-site source of CVOCs along Purves Street.

2.4 Qualitative Human Exposure Assessment

Human health exposure risk was evaluated for both current and future site and off-site conditions, in accordance with the May 2010 NYSDEC Final DER-10 Technical Guidance for Site Investigation and Remediation. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, NYSDEC DER-10 requires an on-site and off-site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. Based on the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, there was no need to prepare an FWRIA for the Site. A completed form of DER-10 Appendix 3C is enclosed in Appendix K.

2.4.1 Current Conditions

The Site consists of an irregularly-shaped lot that is approximately 27,100 square feet (±0.62 acres). The Site has been a vacant lot for nearly 10 years, since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes.

2.4.2 Proposed Conditions

The proposed project will include the construction of a 33-story, approximately 263-unit residential apartment building and a one-story building with residential amenity space and retail along Thomson Avenue and 44th Street. One level of approximately at-grade parking will span an area of approximately 14,000 square feet. The anticipated excavation depth necessary for the at-grade first floor slab is approximately 1.2 to 3.4 feet bgs. Additional excavations to facilitate foundation elements and an elevator pit are anticipated but have not been finalized. Proposed development plans are provided in Appendix A.

2.4.3 Summary of Environmental Conditions

Soil sample analysis revealed SVOCs, metals, pesticides, and PCBs at concentrations that exceeded their respective Unrestricted Use SCOs, with SVOC and metal concentrations also above Restricted Residential SCOs. Additionally, CVOCs were detected at concentrations above the Unrestricted Use SCOs, but below the Restricted Residential Use SCOs, in samples collected from borings SB20 and SB21, and off-site boring SB13. Soil contaminants of concern (COC) include VOCs, SVOCs, PCBs, pesticides, and metals.

SVOC and metal impacts are widespread on the Site. SVOC concentrations above Restricted Residential Use SCOs were detected in samples collected from 10 of 19 borings (SB02, SB05, SB06, SB07, SB08, SB09, SB11, SB12, SB16, and SB19) at depths ranging from grade surface to 8 feet bgs. Metal concentrations above Restricted Residential Use SCOs were detected in samples collected from 13 of 19 borings (SB01, SB02, SB03, SB04, SB05, SB06, SB07, SB08, SB12, SB14, SB15, SB16, SB18, and SB19) at depths ranging from surface grade to 13 feet bgs.

Groundwater samples had concentrations of VOCs, SVOCs, pesticides, and metals that exceeded their respective Class GA AWQS. Chlorinated VOCs were detected in groundwater at the highest concentrations in off-site monitoring well MW13, located on Purves Street sidewalk close to the northern boundary of the Site, and MW01, located in the northeast corner of the site near Purves Street. Chlorinated VOCs were also detected in samples from monitoring wells MW04 and MW09 at concentrations above the Class GA AWQS. Metal concentrations above the Class GA AWQS were detected throughout the Site, and are likely attributable to regional groundwater conditions. One SVOC, benzo(a)anthracene, and one pesticide, alpha-chlordane, were detected above the Class GA AWQS in off-site monitoring well MW13.

Several VOCs, including chlorinated VOCs, were detected in soil vapor samples at concentrations above background ambient air levels throughout the Site.

2.4.4 Conceptual Site Model

A conceptual site model has been developed based on the findings of the RI. The purpose of the conceptual site model is to develop a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways, as discussed below.

2.4.4.1 Potential Sources of Contamination

Potential sources of contamination have been identified in Section 3.3 and are based on previous investigations. The site-wide layer of historic fill has been established as a source of SVOCs, metals, pesticides, and PCBs. Historic fill, however, does not appear to be impacting groundwater. Groundwater appears to be primarily impacted by off-site sources.

2.4.4.2 Exposure Media

The impacted media include soil, groundwater, and soil vapor. Site soil may have been impacted by former operations, the nature of the historic fill throughout the Site, and by possible historic petroleum releases. Analytical data indicates that the historic fill material underlying the Site contains SVOCs, metals, pesticides, and PCBs. Groundwater impacts include chlorinated VOCs and metals. Soil vapor throughout the Site is impacted with VOCs.

Because VOCs are present at elevated concentrations in soil vapor and portions of the proposed building slabs will be above the groundwater table, there is potential for vapors to accumulate under the proposed building slabs.

2.4.4.3 Receptor Populations

The Site is currently vacant and locked, preventing public access; therefore, human receptors are limited to occasional site visitors and workers involved in pre-development (e.g., investigation) activities. During site development, human receptors are limited to construction and remediation workers, authorized guests visiting the Site and the public adjacent to the Site. Under future conditions, receptors will include the new building tenants, workers, and visitors to the residential properties including children.

2.4.5 Potential Exposure Pathways – On-Site

2.4.5.1 Current Conditions

On-Site soil has been contaminated with SVOCs, metals, PCBs and pesticides. Approximately 55% of the Site is covered with a concrete slab, and the remaining 45% is covered with overgrown vegetation. In areas where human exposure to contaminated soil is possible, the potential migration pathway is likely complete for dermal absorption, inhalation and ingestion. The Site is surrounded by construction fencing and locked, which limits activity within the Site boundary to authorized guests.

On-Site groundwater is contaminated with VOCs and metals. Because groundwater in New York City is not used as a potable water source, there is no completion of the exposure pathway under current Site conditions. There is a potential exposure pathway during groundwater sampling associated with Site investigation. The potential pathway is through dermal absorption, inhalation, and ingestion. Site access is currently limited to authorized guests.

Soil vapor results indicate the presence of VOCs. There is a potential exposure pathway during soil vapor sampling associated with Site investigation. The potential pathway is through inhalation. Site access is currently limited to authorized guests.

2.4.5.2 Construction/Remediation Condition

Construction and remediation activities may result in potential exposures to Site contaminants in the absence of a Health and Safety Plan (HASP) and a Community Air Monitoring Plan (CAMP). Soil contains SVOCs and metals at concentrations that exceed Unrestricted and Restricted Residential Use SCOs, and PCBs and pesticides at concentrations that exceed Unrestricted Use SCOs. Construction and remedial activities include construction of foundation components and excavation and off-site disposal of impacted soil. In the absence of a HASP and CAMP, this scenario presents the potential for exposure of soil COCs to construction and remediation workers via dermal absorption, ingestion, and inhalation of particulate matter. In the absence of CAMP, activities may result in exposure to the public adjacent to the Site through potential generation and off-site migration of dust containing Site COCs.

Site groundwater contains VOCs and metals at concentrations that exceed their respective Class GA AWQS. Groundwater will be encountered during excavation activities by workers, and there is potential for exposure to groundwater COCs, in the absence of a HASP, to construction workers via dermal absorption, ingestion, or inhalation.

Soil vapor results indicated the presence of petroleum-related and chlorinated VOCs. During site development, construction and remediation workers may be exposed to soil vapor COCs via inhalation in the absence of a HASP. In the absence CAMP, activities may also result in exposure to the public adjacent to the Site through volatilization of vapors into the air and potential off-site migration.

2.4.5.3 Proposed Future Conditions

The proposed development will include residential use. Upon completion of the new development, the entire Site will be capped with the concrete building foundation. These barriers will prevent direct human exposure to impacted soil and groundwater.

In the absence of engineering controls (e.g., vapor barrier and/or depressurization system), the presence of VOCs in the groundwater and soil vapor creates potential for VOCs to volatilize and accumulate in the proposed building, completing an exposure pathway for future users. In the absence of engineering controls, routes of exposure may include inhalation of vapors that accumulate in the building.

There is no risk of ingesting groundwater COCs because the Site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate and not from groundwater; groundwater is not intended for consumption.

2.4.6 Potential Exposure Pathways – Off-Site

In the absence of CAMP, soil has the potential to be transported off-site by wind in the form of dust or on the tires of vehicles or equipment leaving the Site during development and remediation activities. Metal impacts to groundwater are considered a regional problem and are not considered a localized concern. Chlorinated VOC impacts to the groundwater in the northeast corner of the Site are likely from an off-site source. The off-site chlorinated VOC impacts migrating onto the Site and are likely migrating onto other properties as well and represent a potential exposure pathway via soil vapor intrusion.

The potential off-site migration of site contaminants is not expected to result in a complete exposure pathway for current, construction and remediation, or future conditions for the following reasons:

- Air monitoring will be conducted for particulates (i.e., dust) and VOCs during all intrusive activities as part of a community air monitoring program. Dust and/or vapor suppression techniques will be employed to limit potential for off-site migration of site soil and vapors.
- Vehicle tires and undercarriages will be washed as necessary prior to leaving the Site to prevent tracking material off-site.
- The Site is located in a highly urbanized area with continuous impervious (i.e. concrete) surface covering.

- Groundwater in New York City is not used as a potable water source.

2.4.7 Evaluation of Human Health Exposure

Based upon the conceptual site model and the review of environmental data, complete on-site exposure pathways appear to be present, in the absence of institutional and engineering controls, in current, construction and remediation, and future conditions. The complete exposure pathways indicate there is a risk of exposure to humans from Site contaminants via exposure to soil, groundwater, and soil vapor if institutional and engineering controls are not implemented.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the Site is provided below.

2.4.7.1 Current Conditions

Contaminant sources include historic fill with varying levels of SVOCs, metals, pesticides, and PCBs, two potential USTs, chlorinated VOCs in groundwater, and PCE, TCE, and other VOCs in soil vapor.

Contaminant release and transport mechanisms include contaminated soil transported as dust and volatilization of contaminants from the soil and groundwater matrices to the soil vapor phase, and existing soil vapor contaminants. Under current conditions, the likelihood of exposure to humans is limited, as the Site surface cover, consisting of a partial concrete slab and vegetation, generally prevents contact with soils, groundwater is not currently accessible and soils are not currently being disturbed except during investigation. In addition, the Site property is kept locked and activity is limited to authorized guests. All five elements exist; therefore, the potential for completed exposure pathways is present. However, the risk can be avoided or minimized by applying appropriate health and safety measures during investigation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

In accordance with a HASP and CAMP, measures such as conducting an air-monitoring program, donning PPE, and applying vapor and dust suppression measures to prevent off-site

migration of contaminants during construction will be implemented. Such measures would prevent completion of these potential migration pathways.

2.4.7.2 Construction/Remediation Activities

During development and remediation activities, points of exposure include disturbed and exposed soil during excavation, dust and organic vapors generated during excavation activities, and contaminated groundwater that will be encountered during excavation and dewatering operations. Routes of exposure include ingestion and dermal absorption of contaminated soil and groundwater, inhalation of organic vapors arising from contaminated soil and groundwater, and inhalation of dust arising from contaminated soil. The receptor population includes the construction and remediation workers and, to a lesser extent, the public adjacent to the Site. All five elements exist; therefore, the potential for completed exposure pathways is present. However, the risk can be avoided or minimized by applying appropriate health and safety measures during construction and remediation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, maintaining site security, and wearing the appropriate PPE.

In accordance with a HASP, a Soil Management Plan (SMP), and a CAMP, measures such as conducting an air-monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, proper housekeeping, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented. Such measures would prevent completion of these potential migration pathways.

2.4.7.3 Proposed Future Conditions

For the proposed future conditions, some residual contaminants may remain and may include those listed under current conditions. Contaminant release and transport mechanisms include volatilization of contaminants from soil vapor or the groundwater matrix to the soil vapor phase. If institutional and/or engineering controls are not implemented, points of exposure include potential cracks in the foundation or lower-level slab of the proposed development. Routes of exposure may include inhalation of vapors entering the building; these routes may not exist depending on the effectiveness of the remediation. The receptor population includes the building tenants, residential property employees, and visitors. The possible routes of exposure will be avoided or mitigated by proper installation of soil vapor mitigation measures (e.g., vapor barrier and depressurization system) and the impermeable (concrete) site cap.

2.4.7.4 Human Health Exposure Assessment Conclusions

The following conclusions were developed from this human health exposure assessment:

1. Under current conditions there is a moderate risk to exposure. Contaminated soil transport off-site as dust is limited by the site cover consisting of a concrete slab and vegetation. The exposure risks can be avoided or minimized by maintaining site security and limiting access to authorized guests, and by following the appropriate health and safety and vapor and dust suppression measures during investigation activities.

2. In the absence of institutional and engineering controls, there is a moderate risk of exposure during the construction and remediation activities. This risk can be avoided or minimized by following the appropriate health and safety, vapor and dust suppression, and site security measures.

3. The existence of a complete exposure pathway for Site contaminants to human receptors during proposed future conditions is unlikely, as a large quantity of soil will be excavated and transported to an off-site disposal facility, groundwater is not used as a potable water source in New York City, and the potential pathway for soil vapor intrusion into the building would be addressed through the use of soil vapor mitigation measures (e.g., vapor barrier and depressurization system).

4. It is unlikely that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors for current, construction phase, or future conditions. Monitoring and control measures would be used during investigation and construction to prevent completion of this pathway. Under future conditions, the site will be remediated and engineering controls can be implemented to prevent completion of this pathway.

2.5 Remedial Action Objectives

Based on the results of the Remedial Investigation, the following Remedial Action Objectives (RAOs) have been identified for this Site.

2.5.1 Groundwater

RAOs for Public Health Protection:

- Prevent ingestion of groundwater containing contaminant levels exceeding drinking water standards.

- Prevent contact with, or inhalation of, volatiles emanating from contaminated groundwater.

RAOs for Environmental Protection:

- Restore ground water aquifer, to the extent practicable, to pre-disposal/pre-release conditions.

2.5.2 Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation of, or exposure to, contaminants volatilizing from contaminated soil or contaminated soil in particulate form.

RAOs for Environmental Protection:

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

2.5.3 Soil Vapor

RAOs for Public Health Protection:

- Mitigate impacts to public health resulting from for the potential for soil vapor intrusion into occupied buildings at the Site.

3.0 DESCRIPTION OF REMEDIAL ACTION PLAN

The BCP requires the analysis of at least two remedial alternatives when the chosen option is not a Track 1 cleanup. This section presents an analysis of two remedial actions that can potentially be achieved under the BCP. The proposed SCOs will be the generic Track 1 Part 375 Unrestricted Use SCOs for Alternative I and Track 4, restricted residential use with site-specific SCOs for Alternative II.

This section is organized as follows:

- Section 3.1 describes the remedial goals and objectives
- Sections 3.2 and 3.3 provide technical descriptions of:
    - Alternative I, a BCP Unrestricted Use Track 1 concept
    - Alternative II, a BCP Site-specific Track 4 concept
- Section 3.4 evaluates the remedial alternatives based on the BCP Remedy Selection Evaluation Criteria
- Section 3.5 discusses the recommended remedial alternative

3.1 Standards, Criteria, Guidance, and Remedial Action Objectives

In accordance with ECL § 27-1415 and DER-10, the objectives of the remedial action are to: (1) reduce the concentrations of COCs at the Site to meet those levels that will protect public health and the environment, and (2) isolate the Site from migration of contaminated groundwater and soil vapor from potential on-site sources. In accordance with DER-10, the Volunteer will have no remedial responsibilities with respect to groundwater contamination migrating under the Site from an off-site source; however, remedial alternatives will be developed for such a case that eliminate or mitigate on-site environmental impacts or human exposures, to the extent practical, resulting from the off-site contamination. Where identifiable sources of contamination are found on the Site, the sources will be removed or treated to the extent practical.

Also in accordance with DER-10, the Remedial Action Objectives (RAO) for this Site are defined as medium-specific objectives for the protection of public health and the environment and are developed based on contaminant-specific standards, criteria, and guidance (SCGs). The SCGs for the Site include:

- NYSDEC – Brownfield Cleanup Program Guide (draft 2004);
- NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (2010);
- NYSDEC TAGM No. 4031– Fugitive Dust Suppression and Particulate Monitoring Program at Inactive Waste Sites (1989);
- NYSDEC TOGS 1.1.1 – Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations (1998);
- NYSDEC TOGS 5.1.8 – New York State Stormwater Management Design Manual (2008);
- NYSDEC TOGS 5.1.10 – New York Standards and Specifications for Erosion and Sediment Controls (2005);
- NYSDOH – Guidance for Evaluating Soil Vapor Intrusions in the State of New York (2006);
- New York State Codes, Rules and Regulations (NYCRR) Title 6 Part 364 – Waste Transporter Permits;
- 6 NYCRR Part 370 – Hazardous Waste Management System;
- 6 NYCRR Part 375 – Environmental Remediation Program (December 2006);
- 6 NYCRR Part 376 – Land Disposal Restrictions;
- 6 NYCRR Part 750 – State Pollutant Discharge Elimination System (SPDES) Regulations;
- Code of Federal Regulations (CFR) Title 29 Part 1910.120 - Hazardous Waste Operations and Emergency Response Standard;
- CFR Title 29 Part 1926 - Safety and Health Regulations for Construction; and
- NYSDEC CP-51 - Soil Cleanup Guidance (2010).

In addition to the SCGs listed above, the RAOs were developed from information derived from previous environmental investigations referenced in Section 1.4, including identified contaminated media and potential public health and environmental exposure pathways, which were summarized in Section 2.4. The RAOs for this RAWP are listed in Section 2.5.

3.2 Technical Description of Alternative I

3.2.1 Summary of Alternative I – Track 1 Remedy

Alternative I, a Track 1 remedy, would include the following tasks:

- Removal of all on-site soil exceeding Unrestricted Use SCOs and grossly-impacted material;
- Removal of USTs, if encountered, and closure of NYSDEC Spill No. 1310949;
- Dewatering the excavation to accommodate remedial excavation;
- Collection and analysis of confirmation soil samples to confirm Unrestricted Use SCOs have been achieved – over-excavation would be required as necessary to meet SCOs;
- Backfilling of excavated areas to development grade with certified-clean material (meeting Unrestricted Use SCOs), recycled concrete aggregate (RCA) or virgin, native crushed stone;
- Installation of a vapor barrier to protect against VOC intrusion from off-site sources in Site buildings;
- Any enclosed subgrade parking garages that are included for any future on-site building(s) are required by the New York City Mechanical Code to provide ventilation;
- Installation of a sub-membrane depressurization (SMD) system, under portions of the Site building that will not be used as a ventilated parking garage, to protect against VOC intrusion;
- Development and execution of plans for the protection of on-site workers, community, and environment during remediation and construction activities; and
- Short-term (less than 5 years from date of issuance of Certificate of completion) Institutional Controls in the form of a Site Management Plan and Environmental Easement to ensure operation of the SMD.

The requirements for each of the above tasks are described below. The Alternative I remedial excavation extent is shown on Figure 5. The remedial excavation extent is based on data presented in the July 2014 RI Report and the October 20, 2014 letter report.

3.2.2 Fill and Soil Removal

SVOCs, pesticides, PCBs, and metals were detected in historic fill at concentrations that exceed the Part 375 Unrestricted Use SCOs. To achieve Track 1, soil removal and disposal is estimated to extend to approximately 7 feet bgs (approx. el 4.0) throughout the majority of the Site. The area around RI borings SB08 and SB12 is anticipated to only require excavation to 2.5 feet bgs (approx. el 8.5). Additional excavation will likely be required around the following RI boring locations to achieve Track 1:

- SB02: 13 feet bgs
- SB03: 9 feet bgs
- SB06: 9 feet bgs
- SB14: 9 feet bgs
- SB16: 8 feet bgs
- SB18: 8 feet bgs
- SB20: 15 feet bgs

These hotspot areas will be excavated to the above depths and within a grid of approximately 30 feet by 30 feet around each boring. The estimated volume of fill and soil requiring removal and off-site disposal for a Track 1 cleanup is approximately 8,800 cubic yards. This estimate is based on vertical excavation limits derived from the laboratory analytical results and field observations in the RI. Soil sample results from the RI are shown on Figure 4, and the Track 1 remedial extent is shown on Figure 5. The final excavation depth would extend below the water table and will require site-wide support of excavation and dewatering and extensive measures (e.g., underpinning) to protect the adjacent buildings. Structural concerns about the retaining wall, which spans the western and southwestern Site border, would require that excavations be limited to a maximum of 10 feet in width along the wall. Each 10-foot excavation along the retaining wall would need to be backfilled to Site grade before excavation could continue.

3.2.3 UST Removal Contingency

Based on previous investigations, two USTs may be present in the central part of the Site. If USTs are encountered during remedial activities, they will be decommissioned in accordance with 6 NYCRR Part 613.9, NYSDEC Commissioner's Policy 51 (CP-51), and other applicable NYSDEC UST closure requirements. Petroleum-impacted soil, if encountered, will be excavated and disposed off-site.

3.2.4 Excavation Dewatering and Treatment

Construction dewatering of contaminated groundwater will be required to reach the proposed excavation depths. Prior to mobilization, the Contractor will follow the New York City Department of Environmental Protection (NYCDEP) "Procedure for Obtaining Letter of Approval for Groundwater Discharge to Sanitary or Combined Sewer." Based on the NYCDEP's effluent limitations and Site groundwater data, the Contractor will be required to pre-treat dewatering fluids to reduce contaminant concentrations below NYCDEP effluent limitations prior to discharge. Pretreatment may include a settling tank, bag filters, carbon filtration, etc. If the contractor's dewatering system has a pumping capacity of greater than 45 gallons per minute, a Long Island Well permit will be obtained from NYSDEC. If the Contractor will discharge more than 10,000 gallons per day, they will also have to obtain an NYCDEP Temporary Discharge of Groundwater into the City Sewer System Permit. Collected groundwater or rainwater will be discharged, as defined by the NYCDEP permit, into the New York City sewer system, via an entry point acceptable to the NYCDEP. The dewatering and treatment system will be designed by the Contractor's New York State-licensed Professional Engineer.

3.2.5 Confirmation Soil Sampling

Per NYSDEC Division of Environmental Remediation (DER) policy, confirmation soil sample collection would be completed from the excavation base at a frequency of one sample per 900 square feet of floor area. Sidewall samples would not be collected from the perimeter of the Site, since the excavation would extend site-wide and excavation support (e.g., sheeting, lagging) would provide a barrier to collection of the sidewall samples. However, sidewall samples would be collected from the interior of the Site in hot-spot excavation areas. Based on these criteria, approximately 30 base confirmation samples and 18 sidewall confirmation samples, plus required quality assurance/quality control (QA/QC) samples, would be collected. Confirmation soil samples would be analyzed for combined Part 375 and TCL+TAL listed VOCs, SVOCs, PCBs, pesticides, and metals. Over-excavation may be required as practical to remove soil that does not comply with the SCOs and represents a source of groundwater or soil vapor contamination. If over-excavation is completed, additional confirmation samples would be required. No off-site excavation would be required.

3.2.6 Excavation Backfill

After the targeted areas are excavated, they would be backfilled to bring the Site to the grade required for construction activities. About 8,000 cubic yards of fill material is anticipated to restore the Site to development grade. Backfill material will consist of clean fill (meeting the Unrestricted Use SCOs) or other acceptable fill material such as virgin, native 0.75-inch stone from a quarry or RCA. If RCA is imported to the Site, it will be from NYSDEC-permitted or registered facilities in compliance 6 NYCRR Part 360 registration and permitting requirements

for the period of acquisition of RCA. RCA imported from compliant facilities will not require chemical testing, unless required by NYSDEC under its terms for operation of the facility. RCA imported to the Site must be derived from recognizable and uncontaminated concrete. RCA material is not acceptable for, and will not be used as cover, drainage, or SMD gravel-layer material.

The clean fill would be segregated at a source/facility that is free of environmental contaminants. Qualified environmental personnel would collect representative samples at a frequency consistent with DER-10 table 5.4. The samples would be analyzed for Part 375 VOCs (EPA Method 8260), SVOCs (EPA Method 8270), pesticides/PCBs (EPA Method 8082/8081) and metals by an NYSDOH ELAP-certified laboratory. Acceptable backfill material would not exceed Unrestricted Use SCOs. Upon meeting these criteria, the certified-clean fill would be transported to the site and segregated from impacted material, as necessary, on plastic sheeting until it is used as backfill.

3.2.7 Vapor Barrier

The potential exists for future migration of VOC-impacted groundwater and soil vapor to the Site from unknown off-site sources. To mitigate potential exposure, a vapor barrier will be installed under the future Site building. The vapor barrier will be a minimum 20 mil thickness, and installed as a continuous subslab membrane under slabs. The Remediation Engineer (RE) will oversee implementation and document operations. The installation of the vapor barrier is a contingency measure and is not considered an engineering control to address on-site contamination.

3.2.8 Sub-membrane Depressurization (SMD) System

In addition to the vapor barrier, an SMD system would be installed beneath the vapor barrier of the future Site building in accordance with the NYSDOH Guidance for Evaluation Soil Vapor Intrusion in the State of New York, dated October 2006. The SMD system will include a sub-membrane collection layer (6- to 12-inch layer of ¾-inch clean stone) with horizontal perforated collection pipes, riser pipes to convey the collected vapor to the roof, and a roof-mounted blower system that will maintain a constant negative pressure through the piping and collection layer. Two riser pipes and blower systems are anticipated. The vacuum blowers will operate continuously after initial startup. Prior to initial startup of the SMD system, the system will be inspected to confirm that all components are in place. The system will be implemented in accordance with the manufacturer's recommendations. The installation of an SMD system is considered a contingency measure for protection from off-site contamination, and not an engineering control to address on-site contamination. The SMD system would operate for a

maximum of 5 years to retain Track 1 status. If the SMD system is needed for more than 5 years after the date of COC issuance, the Site would revert to Track 2.

3.2.9 On-Site Worker, Public Health and Environmental Protection

A Site-specific HASP would be developed and enforced to protect on-site workers from accidents and acute and chronic exposures from the identified contaminated media. Public health would be protected by implementing and enforcing dust, odor, and organic vapor control and monitoring procedures included in the CAMP. The CAMP would include continuous perimeter monitoring of dust and organic vapor utilizing DustTrak aerosol monitors and PIDs capable of recording data and calculating 15-minute averages. A field engineer, scientist, or geologist would monitor Site perimeters for visible dust and odors. The environment would be protected by implementing and enforcing the appropriate soil erosion prevention measures.

3.2.10 Institutional Controls/Engineering Controls

An environmental easement would be recorded referencing institutional or engineering controls (IC/EC) that are part of the selected remedy, which would be binding upon all subsequent owners and occupants of the property. The ICs would restrict the Site's use to restricted residential, commercial and industrial uses, require implementation of the SMP and include notice-of-use restrictions of the Site's soil. The ECs would include the SMD system. The SMP would identify monitoring and maintenance requirements. In order to retain Track 1 status, the active SMD system could operate for no more than 5 years after the date of the Certificate of Completion, otherwise the site would revert to Track 2 status.

3.3 Technical Description of Alternative II

3.3.1 Summary of Alternative II – Track 4 Remedy

Alternative II, a Track 4 remedy, would be executed by accomplishing the following tasks:

- Excavation (to the extent practical) and off-site disposal of soils exceeding Track 4 site-specific SCOs (Restricted Residential Use SCOs) and grossly-impacted soil, if encountered;
- Removal of USTs, if encountered, and closure of NYSDEC Spill No. 1310949, which was opened during the February 2014 Phase II ESI;
- Due to the planned excavation of two elevator pits into the ground water table, dewatering will be performed to enable the excavation and foundation work. Contaminated groundwater from dewatering operations will be treated as necessary prior to discharge to the municipal sewer system;

- Collection and analysis of documentation soil samples to document removal of targeted materials;
- Backfilling of excavated areas to development grade with certified-clean material (meeting the lower of the protection of groundwater SCO or the Protection of Public Health SCO for Restricted Residential Use in Part 375-6.7(d)(ii)(b)), recycled concrete aggregate (RCA) or virgin, native crushed stone;
- Any enclosed subgrade parking garages that are included for any future on-site building(s) are required by the New York City Mechanical Code to provide ventilation;
- Installation of a vapor membrane under portions of the Site building that will not be used as a ventilated parking garage to protect against VOC intrusion into Site buildings;
- Installation of a SMD system under portions of the Site building that will not be used as a ventilated parking garage to protect against VOC intrusion;
- Development and execution of plans for the protection of on-site workers, community, and environment during remediation and construction activities;
- Installation of a site cover system consisting of either of the structures such as buildings, pavement, sidewalks comprising the site development or a minimum 2 foot thick clean soil cover in areas where the upper two feet of exposed surface soil will exceed the applicable soil cleanup objectives (SCOs); and
- Implementation of long-term Institutional Controls in the form of a Site Management Plan (SMP) and an Environmental Easement.

The requirements for each of the above tasks are described below. The Alternative II remedial extent is shown on Figure 6. The remedial extent is based on previous data collected at the site.

3.3.2 Fill and Soil Removal

To remediate the Site to Track 4 SCOs, excavation would be targeted towards removing grossly-impacted soils (if encountered) and soils having concentrations of contaminants that exceed the Part 375 Restricted Residential Use SCOs, shown in Table 1. The Site will be excavated to 2.5 feet bgs (approx. el 8.5 feet) to remove historic fill. An additional 3.5 feet of excavation is anticipated in roughly half the Site to a total depth of 6 feet bgs (el 5.0 feet). In the western part of the Site along 44th Drive, some additional excavation up to 2 feet into the water table (7 to 8 feet bgs) may be necessary to address metal and SVOC impacts in the deeper historic fill. Support of excavation for remedial excavations deeper than 4 feet bgs will be accomplished by 1.5:1 sloping of sidewalls. The Alternative II remediation will include excavations for foundation elements where material known to exceed Track 4 SCOs and/or

historic fill is anticipated. Excavation into the groundwater table will be conducted where necessary and to the extent practical; however, site-wide dewatering will not be conducted to perform remedial excavations. Excavation will not be conducted in areas where removal of soil is unsafe and will threaten the structural integrity of the buildings and retaining wall that border the Site.

Based on these excavation guidelines, the estimated volume of fill and soil requiring removal and off-site disposal for a Track 4 cleanup is approximately 5,800 cubic yards. This estimate is based on vertical excavation limits derived from the laboratory analytical results and field observations in the RI. Soil sample results from the RI are shown on Figure 4, and the Track 4 remedial extent is shown on Figure 6.

3.3.3 UST Removal Contingency

Based on previous investigations, two USTs may be present in the central part of the Site. If USTs are encountered during remedial activities, they will be decommissioned in accordance with 6 NYCRR Part 613.9, NYSDEC Commissioner's Policy 51 (CP-51), and other applicable NYSDEC UST closure requirements. Grossly petroleum-impacted soil, if encountered, will be excavated and disposed off-site.

3.3.4 Excavation Dewatering

Localized dewatering may be required for the excavation of the two planned elevator pits. Prior to mobilization, the Contractor will follow the New York City Department of Environmental Protection (NYCDEP) "Procedure for Obtaining Letter of Approval for Groundwater Discharge to Sanitary or Combined Sewer." Based on the NYCDEP's effluent limitations and Site groundwater data, the Contractor may be required to pre-treat dewatering fluids to reduce contaminant concentrations below NYCDEP effluent limitations prior to discharge. Pretreatment may include a settling tank, bag filters, carbon filtration, etc. If the contractor's dewatering system has a pumping capacity of greater than 45 gallons per minute, a Long Island Well permit will be obtained from NYSDEC. If the Contractor will discharge more than 10,000 gallons per day, they will also have to obtain an NYCDEP Temporary Discharge of Groundwater into the City Sewer System Permit. Collected groundwater or rainwater will be discharged, as defined by the NYCDEP permit, into the New York City sewer system, via an entry point acceptable to the NYCDEP. The dewatering and treatment system will be designed by the Contractor's New York State-licensed Professional Engineer. As an alternate, the Contractor will collect the water into a vessel for off-site disposal at a facility permitted to accept the dewatering fluids.

3.3.5 Documentation Soil Samples

Per NYSDEC DER policy, documentation soil sample collection would be completed from the excavation base at a frequency of one sample per 900 square feet of floor area and one sidewall sample for every 30 linear feet around the Site perimeter. Based on these criteria, approximately 30 base confirmation samples and 24 site-perimeter sidewall samples, plus required QA/QC samples, would be collected. An estimated twelve additional sidewall samples, plus required QA/QC samples, will be collected from hotspot areas. Documentation soil samples would be analyzed for the combined Part 375 and TCL/TAL listed VOCs, SVOCs, pesticides, PCBs, and metals. Over-excavation is not anticipated for the Track 4 remedy, given that there are no impacts to groundwater from the contaminants of concern and engineering and institutional controls will be used to manage residual impacts. No off-site excavation would be required.

3.3.6 Excavation Backfill

After the targeted areas are excavated, the areas would be backfilled to the extent necessary to bring the Site to the development grade. The quantity of off-site fill material required to be imported to bring the Site to the required development grade is estimated at 5,000 cubic yards. Backfill material will consist of Part 375-6.7(d)(ii)(a) SCO-compliant soil or other acceptable fill material such as virgin, native, stone from a quarry or RCA from a NYSDEC-registered facility. In accordance with DER-10, material other than soil imported for use as backfill must contain less than 10% by weight material that would pass through a No. 80 sieve. RCA imported from compliant facilities will not require chemical testing, unless required by NYSDEC under its terms for operation of the facility. RCA imported to the Site must be derived from recognizable and uncontaminated concrete. RCA material is not acceptable for, and will not be used as cover, drainage, or SMD gravel-layer material.

Qualified environmental personnel would collect representative samples at a frequency consisted with CP-51/Soil Cleanup Guidance. The samples would be analyzed for Part 375 VOCs (EPA Method 8260), SVOCs (EPA Method 8270), pesticides/PCBs (EPA Method 8082/8081) and metals by an NYSDOH ELAP-certified laboratory. Acceptable backfill material shall not exceed site-specific SCOs. Upon meeting these criteria, the SCO-compliant fill would be transported to the site and segregated from impacted material, as necessary, on plastic sheeting until it is used as backfill.

3.3.7 Vapor Barrier

To mitigate exposure to VOCs identified in on-site soil vapor, a vapor barrier will be installed under the future Site building. The vapor barrier will be a minimum 20 mil thickness, and

installed as a continuous subslab membrane under slabs, except for ventilated parking garage. The Remedial Engineer will oversee implementation and documentation.

3.3.8 Sub-membrane Depressurization (SMD) System

In addition to the vapor barrier, an SMD system would be installed beneath the vapor barrier of the future Site building in accordance with the NYSDOH Guidance for Evaluation Soil Vapor Intrusion in the State of New York, dated October 2006. The SMD system will include a sub-membrane collection layer (6- to 12-inch layer of ¾-inch clean stone) with horizontal perforated collection pipes, riser pipes to convey the collected vapor to the roof, and a roof-mounted blower system that will maintain a constant negative pressure through the piping and collection layer. Two riser pipes and blower systems are anticipated. The vacuum blowers will operate continuously after initial startup. Prior to initial startup of the SMD system, the system will be inspected to confirm that all components are in place. The system will be implemented in accordance with the manufacturer's recommendations. Installation of monitoring points is being evaluated by NYSDEC, NYSDOH and the Remedial Engineer. If monitoring points are installed, they will be built into the SMD system during installation so that post-installation pressure readings can be collected. The number and locations of these points will be decided after RAWP approval and with NYSDEC and NYSDOH concurrence. Alternatively, system operation will be documented through pressure monitoring at the sampling ports installed at the base (interface with slab) of the SMD riser pipes.

3.3.9 On-Site Worker, Public Health and Environmental Protection

A Site-specific HASP has been developed and will be enforced to protect on-site workers from accidents and acute and chronic exposures from the identified contaminated media. The HASP is included as Appendix E. Public health would be protected by implementing and enforcing dust, odor, and organic vapor control as specified in Section 5.4.13, and monitoring procedures included in the CAMP as specified in Section 5.4.12 and the HASP. The CAMP would include continuous perimeter monitoring of dust and organic vapor utilizing DustTrak aerosol monitors and PIDs capable of recording data and calculating 15-minute averages. A field engineer, scientist, or geologist under the supervision of the Remedial Engineer would monitor Site perimeters for visible dust and odors. The environment would be protected by implementing and enforcing the appropriate soil erosion prevention measures (see Sections 4.3.2 and 5.4.10).

3.3.10 Site Cover System

A site cover system will be installed at the Site to allow for Restricted Residential Use. The cover system will consist of the concrete slab of the future building or at least two feet of clean soil or crushed stone in any landscaped areas. Where the soil cover is required it will be a minimum of two feet of soil, meeting the SCOs for cover material as set forth in 6 NYCRR Part

375-6.7(d) for restricted residential use. The cover system also serves as an engineering control for the protection of human health by establishing an incomplete exposure pathway to residual Site soils. Where clean soil cover is used in landscaped areas, a demarcation layer (e.g., orange snow fencing) will be installed on top of the residual soil layer prior to placing the clean soil cap with the upper six inches of the soil of sufficient quality to maintain a vegetation layer.

3.3.11 Institutional Controls/Engineering Controls

An environmental easement would be recorded referencing institutional or engineering controls (IC/EC) that are part of the selected remedy, which would be binding upon all subsequent owners and occupants of the property. The ICs would restrict the Site's use to restricted residential, commercial and industrial uses, require implementation of the SMP and include notice-of-use restrictions of the Site's soil. The ECs would include the appropriate surface cover (cap), SMD system and vapor barrier. The SMP would identify long-term monitoring and maintenance requirements.

3.4 Selection of Preferred Remedy

The following is an evaluation of the proposed remedy based on the NYSDEC BCP remedy evaluation criteria listed below. The first two criteria are considered "threshold criteria" and the remaining criteria are "balancing criteria". A remedial alternative must meet the threshold criteria in order to be considered and evaluated further under the balancing criteria.

A. Protection of Human Health and Environment;
B. Standards, Criteria, and Guidance (SCG);
C. Short-Term Effectiveness and Permanence;
D. Long-Term Effectiveness and Permanence;
E. Reduction of Toxicity, Mobility, or Volume;
F. Implementability;
G. Cost Effectiveness;
H. Community Acceptance; and
I. Land Use

3.4.1 Overall Protection of Public Health and the Environment

Alternative I – The remedy would eliminate all pathways of exposure from on-site contaminated media. Remediating the Site to Track 1 standards would result in the elimination of all on-site soil that exceeds Track 1 SCOs. Any encountered USTs would be decommissioned, removed and disposed off-site, and petroleum-impacted material, if encountered, would be excavated

and disposed off-site. The RAOs for public health and environmental protection would be met through the removal of all contaminated media at the Site, which would eliminate any possible ingestion, inhalation or dermal contact.

Alternative II – The Track 4 remedy would provide similar overall protection to public health and the environment to Alternative I. Under a Track 4 remedy, historic fill material exceeding site-specific SCOs would be removed and disposed of off-site. A composite site cap would make exposure pathways to residual contamination incomplete. Potential exposure pathways for off-site groundwater and soil vapor that may migrate onto the Site, and potential impacts from on-site residual petroleum contamination would be eliminated by installing a vapor barrier and SMD system. In addition, groundwater in Long Island City is not used as a source of drinking water.

Public health would be protected during remediation activities under both remedial alternatives by implementing and enforcing dust, odor, and organic vapor control and monitoring procedures when needed. The environment would be protected by implementing and enforcing the selected soil erosion plans.

3.4.2 Standards, Criteria, and Guidance

Alternative I - Remediating the Site to Track 1 Unrestricted Use standards would ensure compliance with all applicable SCGs that were listed in Section 3.1 due to the removal of all impacted on-site materials.

Alternative II – This remedy was designed to meet the requirements of a Track 4 cleanup including Site-specific SCOs. Remediation includes removal of site material to achieve site specific cleanup objectives, as set forth in DER-10, Technical Guidance for Site Investigation and Remediation, CP-51 and 6 NYCRR Part 375. Alternative II complies with the SCGs.

Remedial alternatives will also comply with standards, criteria and guidance (SCGs) that involve protection of the public health and environment during the remedial action by implementing and enforcing a Site-specific HASP. Occupational Safety and Health Administration (OSHA) requirements for on-site construction safety will be followed by the site Contractors.

3.4.3 Short-Term Effectiveness and Permanence

Alternative I - The most significant short-term adverse impacts and risks to the community will be the potential complications and risk involved with designing support of excavation and underpinning for the buildings and structures adjoining the Site. Additionally, the smaller excavations necessary to protect the retaining wall will require delays in the completion of excavations and extend the construction period. Increased truck traffic and operational noise

levels would be necessary to haul out the impacted fill excavated to achieve Track 1 standards and to haul in the additional backfill. The operation is estimated to require 680 25-cubic yard capacity truck trips to haul soil for disposal and backfill. This volume of truck traffic equates to a significantly higher discharge of greenhouse gas emissions over Alternative II. Truck traffic will be routed on the most direct course using major thoroughfares where possible and flaggers will be used to protect pedestrians at Site entrances and exits. Additionally, waiting times associated with analysis of confirmation sampling and resampling may delay construction, leaving soil exposed for a longer time resulting in a potential increase in dust, odors, and organic vapor from the excavation. The effects of these potential adverse impacts to the community, workers and the environment will be minimized by implementing their respective control plans.

Alternative II – Limiting the required excavation extent to depths ranging from 2 to 8 feet bgs based on Track 4 standards will reduce implementation of risky support of excavation techniques, minimize dewatering and reduce the duration of the excavation and the associated risks of a large excavation with underpinning of adjacent buildings. The number of truck trips required to haul out the impacted fill and import backfill is estimated to be 432 25-cubic yard capacity truck trips; approximately 36% fewer trips than that required for Alternative I. The Track 4 remedy is the most sustainable approach, because fewer fossil fuel natural resources are required and carbon emissions to the atmosphere are reduced. Excavation activities will be significantly expedited compared to Alternative I, reducing potential exposure to dust, odors, and organic vapor from the excavation and construction-related noise.

Under both remedial alternatives, dust will be controlled by the application of water spray on the haul roads, and on site, when and where needed. Engineering controls, such as slowing the pace of work, applying foam suppressant or covering portions of the excavation will be used to minimize vapors and suppress odors when required. Work will be modified or stopped according to the action levels set in the CAMP.

3.4.4 Long-Term Effectiveness and Permanence

Alternative I - The Track 1 remedy will remove all contaminated media from the site exceeding Unrestricted Use SCOs for soil. The potential exists for residual VOC concentrations in groundwater and soil vapor due to off-site sources. The potential of soil vapor intrusion from an off-site source would be addressed by a vapor barrier and SMD system for the proposed building. In addition, groundwater in this area of New York City is not used for drinking water. Therefore, the long-term effectiveness of this remedy will eliminate risks and satisfy the objectives of this criterion.

Alternative II – The magnitude of the remaining risks will be minimal because potential exposure pathways to the contaminated soil, groundwater, and soil vapor will be eliminated by the completion of the Track 4 remedy. The Track 4 remedy will remove contaminated media from the Site exceeding Site-specific SCOs for soil to depths up to 8 feet bgs. The exposure pathways to residual soil contaminants will be controlled through the use of a site cap. Potential exposure from soil vapor VOC intrusion will be prevented by the installation of a vapor barrier and an SMD system for the proposed building. In addition, groundwater in this area of New York City is not used for drinking water. Therefore, the long-term effectiveness of this remedy will eliminate risks and satisfy the objectives of this criterion.

3.4.5 Reduction of Toxicity, Mobility, and Volume

Alternative I - The Track 1 remedy will permanently and significantly reduce the toxicity, mobility, and volume of contamination through removal of all on-site contaminated fill through excavation and off-site disposal, and dewatering, treatment, and off-site disposal of groundwater.

Alternative II - The Track 4 remedy will reduce the toxicity through removal of historic fill and petroleum-impacted soil exceeding site-specific SCOs. The mobility of residual contaminants does not represent an off-site migration concern. Installation of the SMD system in the proposed building will address concerns related to the toxicity and mobility of soil vapor impacted by residual on-site contamination or potential unknown off-site sources.

3.4.6 Implementability

Alternative I - Implementing Alternative I would be technically challenging due to soil and fill exceeding Track 1 SCOs to 7 feet bgs Site-wide and up to 15 feet bgs in hot-spot areas. Extensive excavation support, underpinning of adjacent buildings and dewatering will be required to remove material exceeding the Unrestricted Use SCOs. This remedy will consist mostly of excavation with standard bucket excavators of the targeted fill and soil. The feasibility is low for the excavation activities because of the risks, costs and time associated with the extensive support of excavation design, which will rely on coordination with adjacent property owners. The risk of damage to adjacent property buildings and structures is highest for the Alternative I remedy.

Alternative II - The technical feasibility of implementing the Alternative II remedy is greater than Alternative I. Excavation support may still be required for implementation of Alternative II; however, these tasks will be minimal for Alternative II in comparison to Alternative I. This alternative will consist mostly of excavation with standard bucket excavators of the targeted fill and soil. The remedy uses typical remediation methods to address site impacts and

contractors experienced in implementing the described remedy are readily available in the area of the Site. The risk of damage to adjacent property buildings is lowest for the Alternative II remedy.

3.4.7 Cost Effectiveness

Alternative I - Based on the assumptions detailed for Alternative I, including removal of all soil and fill exceeding Unrestricted Use SCOs, dewatering and groundwater treatment, and vapor barrier and SMD system installation, the estimated remediation cost of a Track 1 cleanup is $5.752 million. As the Site will be remediated to an Unrestricted Use level, there are no operations, maintenance, or monitoring costs associated with the proposed remedy. Table 2 details the individual cost components used to arrive at this cost estimate. Alternative I is the least cost effective alternative, considering the alternative of managing lower level contaminants in place.

Alternative II - Based on the assumptions detailed for Alternative II, the estimated remediation cost to achieve a Track 4 cleanup is approximately $3.37 million. Table 3 details the individual cost-components used to arrive at this cost estimate. Alternative II presents the most cost effective alternative for achieving the remediation goals and objectives.

3.4.8 Community Acceptance

Both remedial alternatives should be acceptable to the community because the potential exposure pathways to on-site contamination will be eliminated upon completion of the respective alternatives. The selected remedy was subject to a 45-day public comment period in accordance with the Citizen Participation Plan. Any substantive public comments would need to be addressed before the remedy is approved.

3.4.9 Land Use

The current, intended, and reasonably anticipated future land use of the Site and its surroundings are compatible with the selected remedy of soil remediation. The future proposed development is a mixed-use commercial and residential building, which is expected to cover 90% of the Site footprint. The remaining 10% of the Site will consist of an uncovered driveway area and an open courtyard. Review of previous environmental and public documents for the Site has led to the following conclusions:

1. The current, intended, and reasonably anticipated future land use of the Site and its surroundings will be compatible with the selected remedy. The reasonably anticipated future use of the Site and the use of its surroundings have been documented by the volunteer in the BCP application and RI Report.

2. The use proposed for the Site conforms to applicable zoning laws or maps or the reasonably anticipated future use of the site.
3. The proposed use conforms to historical and/or recent development patterns in the area.
4. The Site does not fall within the boundaries of an existing Brownfield Opportunity Area (BOA).
5. The site is located in an urban setting that is characterized by industrial, some residential, commercial office, and commercial retail developments. There are no areas zoned for agricultural use in the proximity of the Site.
6. There are no identified environmental justice concerns.
7. There are no federal or state land designations.
8. The population growth patterns and projections support the proposed land use.
9. The Site is accessible to existing infrastructure.
10. The Site is not in close proximity to important cultural resources, including federal or state historic or heritage sites or Native American religious sites.
11. The site is not located in close proximity to important federal, state or local natural resources, including waterways, wildlife refuges, wetlands, or critical habitats of endangered or threatened species.
12. Municipal water supply wells are not present in this area of New York City; therefore, groundwater from the Site cannot affect municipal water supply wells or recharge areas.
13. According to the National Flood Insurance Rate Map for the City of New York published by the Federal Emergency Management Agency (FEMA) (Map No. 3604970202G, dated December 5, 2013), the site is located within Zone X. Zone X is designated for areas of 0.2 percent chance annual flood; areas of 1 percent chance annual flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1 percent annual chance flood.
14. Site geology is described in Section 2.2.
15. There are no known current institutional controls in effect at the Site.

3.5 Summary of Selected Remedial Actions

Based on the evaluation of the remedial alternatives described above, both alternatives will be protective of human health and the environment and meet the remedy selection criteria.

Implementation of Alternative I provides for removal of all impacted, on-site soil contamination exceeding Track 1 SCOs and treatment of groundwater through dewatering; however, the extended excavation depths required to remove all soil exceeding Track 1 SCOs is not considered practical and presents unnecessary added risk. The additional excavation required to achieve a Track 1 cleanup is expected to extend below the water table and will substantially complicate support of excavation design for adjoining buildings, structures and roadways, increase truck traffic, and prolong potential exposure to noise and contaminated dust and vapors associated with additional excavation.

Alternative II provides for removal of historic fill to the extent practical to achieve Track 4 site-specific SCOs for the Site. The exposure pathways to residual soil contaminants will be controlled through the use of a site cap and construction of a SMD system, for the proposed building, will protect against potential vapor intrusion issues from residual on-site impacts or potential off-site sources.

Unlike Alternative I, Alternative II can be practically implemented in a cost-effective manner while providing the same overall protection to human health and the environment. Therefore, Alternative II is the recommended remedial alternative for this Site. Figures depicting the Alternative II remedy are included as follows:

- Figure 6 – Alternative II –Track 4 Cleanup
- Figure 7 – SMD System and Vapor Barrier Layout Plan
- Figure 8 – Composite Cover System Plan

Remedial activities will be performed in accordance with this NYSDEC-approved RAWP. All deviations from the RAWP will be promptly reported to NYSDEC for approval and fully explained in the Final Engineering Report (FER).

4.0 REMEDIAL ACTION PROGRAM

4.1 Governing Documents

The primary documents governing the remedial action are summarized in this section. Where referenced, copies of the full plan are provided in the appendices.

4.1.1 Site Specific Health & Safety Plan

The Remedial Engineer prepared a Site-specific HASP, which is included as Appendix E. The HASP will apply to all remedial and construction-related work on-site. The HASP provides a mechanism for establishing on-site safe working conditions, safety organization, procedures, and personal protective equipment (PPE) requirements. The HASP meets the requirements of 29 CFR 1910 and 29 CFR 1926 (which includes 29 CFR 1910.120 and 29 CFR 1926.65). The HASP includes, but is not limited to, the following components listed below:

- Organization and Identification of key personnel;
- Training requirements;
- Medical surveillance requirements;
- List of site hazards;
- Excavation safety;
- Work zone descriptions;
- Personal safety equipment and protective clothing requirements;
- Decontamination requirements;
- Standard operating procedures;
- Protective measure Plan;
- CAMP; and
- Material Safety Data Sheets.

All remedial work performed under this plan will be in full compliance with governmental requirements, including Site and worker safety requirements mandated by Federal OSHA.

The Volunteer and associated parties preparing the remedial documents submitted to the State and those performing the construction work, are completely responsible for the preparation of an appropriate HASP and for the appropriate performance of work according to that plan and applicable laws.

The HASP and requirements defined in this RAWP pertain to all remedial and invasive work performed at the Site until the issuance of a Certificate of Completion (COC).

The Site Safety Coordinator will be Paul McMahon. All project personnel resumes are included in Appendix G.

Confined space entry will comply with all OSHA requirements to address the potential risk posed by combustible and toxic gasses.

4.1.2 Quality Assurance Project Plan

The RE prepared a Quality Assurance Project Plan (QAPP) that describes the quality control components employed so that the proposed remedy accomplishes the remedial goals, remedial action objectives, and is completed in accordance with the design specifications. The QAPP is provided as Appendix F and includes:

- Responsibilities of key personnel and their organizations for the proposed remedy;
- Qualifications of the quality assurance officer;
- Sampling requirements including methodologies, quantity, volume, locations, frequency, acceptance and rejection criteria; and
- Description of the reporting requirements for quality assurance activities including weekly quality assurance review reports, periodic quality assurance and quality control audits, and other report and data submissions.

4.1.3 Construction Quality Assurance Plan

The contractor will prepare a Construction Quality Assurance Plan (CQAP) that describes the quality control components that will be employed so that the proposed remedy accomplishes the remedial goals, remedial action objectives, and is completed in accordance with the design specifications. The CQAP will be reviewed by the RE prior to implementation of the RAWP. Because the remedy is being accomplished through building construction, the contractor and construction manager will have the primary responsibility to provide construction quality.

The following project personnel are anticipated for oversight of the RAWP implementation. Project personnel resumes are provided in Appendix G.

Remedial Engineer (RE):	Jason Hayes, P.E.
Project Manager:	Gerald Nicholls, P.E., CHMM
Langan Health & Safety Officer:	Tony Moffa, CHMM
Site Safety Coordinator	Paul McMahon, E.I.T.
Qualified Environmental Professional (QEP)	Nicole Rice, P.E.
Field Team Leader	Gerald Nicholls, P.E., CHMM
Quality Assurance Officer	Michael Burke, CHMM

A QEP or the RE will directly supervise field engineers, scientists and geologists that will be on-site during remedial action to monitor particulates and organic vapor in accordance with the CAMP. CAMP results that exceed specified action levels will be reported to the NYSDEC and NYSDOH in daily reports.

A QEP or the RE will directly supervise field engineers, scientists and geologists that will meet with the Construction Superintendent on a daily basis to discuss the plans for that day and schedule upcoming activities. The field engineers/scientists and geologists will document all remedial activities in the daily report. This document will be forwarded to the Field Team Leader on a daily basis and to the Project Manager and the RE on a weekly basis.

A QEP or the RE will directly supervise field engineers, scientists and geologists that will screen the excavation with a PID during intrusive activities. All readings will be noted in the record. Elevated readings will be reported to the NYSDEC and NYSDOH in the daily reports. The field engineers, scientists and geologists will collect the excavation endpoint samples in accordance with this RAWP.

A photo log will be kept to document construction activities by still photos. The photo log may also be used to record activities recorded in the Daily Report.

The project field book will be used to document all sampling activities and how they correspond to the RAWP. All observations, field and/or laboratory tests will be recorded in the project field book or on separate logs. Recorded field observations may take the form of notes, charts, sketches, or photographs.

The Field Team Leader will maintain the current field book and all original field paperwork during the performance of work. The Project Manager will maintain the field paperwork after completion and will maintain all submittal document files.

4.1.4 Soil/Materials Management Plan

The RE prepared a Soil/Materials Management Plan, which includes detailed plans for managing all soils/materials that are disturbed at the site, including excavation, handling, storage, transport and disposal. It also includes controls that will be applied to these efforts to facilitate effective, nuisance-free performance in compliance with all applicable Federal, State and local laws and regulations (see Section 5.4).

4.1.5 Stormwater Pollution Prevention Plan

Erosion and sediment controls will be in conformance with requirements presented in the New York State Guidelines for Urban Erosion and Sediment Control. Erosion and sediment controls that will be implemented are described in Section 4.3.2 (Erosion and Sedimentation Controls) and 5.4.10 (Stormwater Pollution Prevention). A Stormwater Pollution Prevention Plan (SWPPP) is not necessary because stormwater discharge, as required, will be to a combined sewer in accordance with the New York City generic stormwater pollution discharge elimination system permit.

4.1.6 Community Air Monitoring Program

A CAMP has been prepared by the RE and is included in the HASP (Appendix E).

4.1.7 Contractors Site Operations Plan

The RE will review all plans and submittals for this remedial project (including those listed above and contractor and subcontractor document submittals) and confirm that they are in compliance with this RAWP. The RE is responsible to document that all later document submittals for this remedial project, including contractor and subcontractor document submittals, are in compliance with this RAWP. All remedial documents will be submitted to NYSDEC and NYSDOH in a timely manner and prior to the start of work.

4.1.8 Citizen Participation Plan

A certification of mailing will be sent by the Volunteer to the NYSDEC project manager following the distribution of all Fact Sheets and notices that includes: (1) certification that the Fact Sheets were mailed, (2) the date they were mailed; (3) a copy of the Fact Sheet, (4) a list of recipients (contact list); and (5) a statement that the repository was inspected on (specific date) and that it contained all of applicable project documents.

No changes will be made to the approved Fact Sheets authorized for release by NYSDEC without written consent of the NYSDEC. No other information, such as brochures and flyers, will be included with the Fact Sheet mailing.

The approved Citizen Participation Plan for this project is attached in Appendix H.

A document repository has been established at the following location and contains all applicable project documents:

Queens Library - Court Square Branch
2501 Jackson Ave
Long Island City, Queens, NY 11101
Phone: 718-937-2790
Hours (Call to verify):
Monday, Thursday, Friday: 11:00 a.m. to 7:00 p.m.
Tuesday, Wednesday: 1:00 p.m. to 7:00 p.m.
Saturday & Sunday: Closed

4.1.9 Remedial Design and Green Remediation Principles

A remedial design program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows:

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gases and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals; and
- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

4.2 General Remedial Construction Information

4.2.1 Project Organization

This Section presents the anticipated project organization and associated roles, including key personnel, descriptions of duties, and lines of authority in the management of the RAWP. Information regarding the organization/personnel and their associated responsibilities is provided below.

4.2.2 Remediation Engineer (RE)

The RE for this project will be Jason Hayes, P.E. The RE is a registered professional engineer licensed by the State of New York. The RE will have primary direct responsibility for implementation of the remedial program for the 44-30 Purves Street Site (NYSDEC BCP Site No. C241162). The RE will certify in the FER that the remedial activities were observed by qualified environmental professionals under his supervision and that the remediation requirements set forth in the RAWP and any other relevant provisions of ECL 27-1419 have been achieved in full conformance with that Plan. Other RE certification requirements are listed later in this RAWP.

The RE will document the work of other contractors and subcontractors involved in all aspects of remedial construction, including soil excavation, stockpiling, characterization, removal and disposal, air monitoring, emergency spill response services, import of back fill material, and management of waste transport and disposal. The RE will be responsible for all appropriate communication with NYSDEC and NYSDOH.

The RE will review all pre-remedial plans submitted by contractors for compliance with this RAWP and will certify compliance in the FER.

In the FER, the RE will provide the certifications listed in Section 10.1.

4.2.3 Remedial Action Construction Schedule

The remedial action construction schedule is provided in Appendix I. Proposed changes, delays or deviations will be promptly communicated to NYSDEC.

4.2.4 Work Hours

The hours for operation of remedial construction will conform to the New York City Department of Buildings construction code requirements or according to specific variances issued by that agency. NYSDEC will be notified by the Volunteer of any variances issued by the Department of Buildings. NYSDEC reserves the right to deny alternate remedial construction hours.

4.2.5 Site Security

The site perimeter will be secured with gated, signed, plywood fencing with points of entry in accordance with NYCDOB and NYCDOT permits and requirements. The purpose of the fencing is to limit site access to authorized personnel, protect pedestrians from site activities, and maintain site security.

4.2.6 Traffic Control

Site traffic will be controlled through designated points of access along Purves Street. Access points will be continuously monitored and a flagging system will be used to protect workers, pedestrians and authorized guests. Traffic will also adhere to applicable local, state and federal law.

4.2.7 Contingency Plan

Contingency plans, as described below, have been developed to effectively deal with unexpected discoveries of additional contaminated media or USTs.

4.2.7.1 Discovery of Additional Targeted Contaminated Soil

During remedial and construction activities, the soil will be continuously monitored by the RE's field representatives using a PID and visual and olfactory field screening techniques to identify additional soil that may not be suitable for the current disposal facility. Soil so identified will be confirmed by collecting and analyzing a sample in accordance with disposal facility requirements. If the facility is not permitted to receive the suspect materials, the material will be disposed off-site at a permitted facility able to receive the material based on the characterization data.

4.2.7.2 Discovery of Additional USTs

Based on previous investigations, it is likely that USTs will be discovered. As a contingency, if USTs are encountered during remedial activities, they will be decommissioned in accordance with 6 NYCRR Part 613.9, and DER-10 section 5.5. Once the tank and its contents are removed, post-excavation soil samples will be collected as per the NYSDEC DER-10 requirements. If encountered, petroleum-contaminated soils will be removed. UST closure documentation, such as contractor affidavits, bills of lading for sludge disposal, and tank disposal receipts, will be provided as appendices in the FER (Section 10.0). Depending on the type, number, and capacity of discovered the tanks, the NYSDEC PBS registration requirements will be complied with as necessary.

4.2.8 Worker Training and Monitoring

Worker training and monitoring will be conducted in accordance with the HASP, included as Appendix E.

4.2.9 Agency Approvals

There are no State Environmental Quality Review Act (SEQRA) requirements for this site. All permits or government approvals required for remedial construction have been, or will be, obtained prior to the start of remedial construction.

The planned end use for the Site conforms to current zoning for the property as determined by New York City Department of Planning. A COC will not be issued for the project unless conformance with zoning designation is demonstrated.

4.2.10 NYSDEC BCP Signage

A project sign will be erected at the main entrance to the Site prior to the start of any remedial activities. The sign will indicate that the project is being performed under the New York State Brownfield Cleanup Program. The sign will meet the detailed specifications provided by the NYSDEC Project Manager and contained in Appendix J.

4.2.11 Pre-Construction Meeting with NYSDEC

A meeting will be conducted to discuss project roles and responsibilities with the RE, Volunteer, Construction Manager, Remediation Contractor and the NYSDEC. This meeting must take place prior to the start of major construction activities.

4.2.12 Emergency Contact Information

An emergency contact sheet with names and phone numbers is included in the HASP. That document will define the specific project contacts for use by NYSDEC and NYSDOH in the case of a day or night emergency.

4.2.13 Remedial Action Costs

The total estimated cost of the Track 4 Remedial Action is $3.105 million. An itemized and detailed summary of estimated costs for all remedial activity is provided as Table 3. This estimate will be revised based on actual costs and submitted as an appendix to the FER.

4.3 Site Preparation

4.3.1 Mobilization

Prior to commencing the remedial excavation, the Remediation Contractor will mobilize to the Site and prepare for remedial activities. Descriptions of mobilization and site preparation activities may include the following.

- Identifying the location of all aboveground and underground utilities (e.g., power, gas, water, sewer, telephone), equipment, and structures (as necessary to implement the remediation);
- Mobilizing necessary remediation personnel, equipment, and materials to the Site;
- Constructing one or more stabilized construction entrances consisting of nonhazardous material capped with a gravel roadway at or near the site exit, which takes into consideration the site setting and site perimeter;
- Constructing an equipment decontamination pad for trucks, equipment, and personnel that come into contact with impacted materials during remedial activities;
- Installing erosion and sedimentation control measures in accordance with the provisions of the Erosion and Sediment Control Plan;
- Installing temporary fencing or other temporary barriers to limit unauthorized access to areas where remediation activities will be conducted.

4.3.2 Erosion and Sedimentation Controls

Based on the size of the Site and the planned excavation, select common erosion and sedimentation control practices will be necessary. The Soil and Sediment Erosion Plan (SSE Plan) has been developed in accordance with NYS Standards and Specifications for Erosion and Sediment Control (August 2005). Best Management Practices (BMP) for soil erosion have been selected to minimize erosion and sedimentation off-site from the start of the remediation to the completion of development. The SSE Plan includes the following information:

- Descriptions of the selected BMPs that will be used to control erosion and sedimentation for each stage of remediation and construction.
- Map showing the location of the proposed BMPs.
- Implementation schedule and maintenance requirements for the proposed BMPs.

- For active remediation and construction work zones such as excavation pits, stockpile areas and truck wash down areas, a perimeter BMP system should be installed and maintained to contain soil and sediment.

- Accumulated sediment in the BMPs that is removed will be properly disposed if found.

The SSE Plan is includes as Appendix K.

4.3.3 Temporary Gravel Construction Entrance(s)

Temporary gravel construction entrances will be installed on-site at the existing curb cuts along Purves Street. The entrance will be graded so that runoff water will be directed on site. The Contractor will protect and maintain the existing sidewalks and roadway at site access points.

4.3.4 Utility Marker and Easements Layout

The Volunteer and its contractors are solely responsible for the identification of utilities that might be affected by work under the RAWP and implementation of all required, appropriate, or necessary health and safety measures during performance of work under this RAWP. The Volunteer and its contractors are solely responsible for safe execution of all invasive and other work performed under this RAWP. The Volunteer and its contractors must obtain any local, State or Federal permits or approvals pertinent to such work that may be required to perform work under this RAWP. Approval of this RAWP by NYSDEC does not constitute satisfaction of these requirements.

The presence of utilities and easements on the Site has been investigated by the RE. It has been determined that no risk or impediment to the planned work under this RAWP is posed by known utilities or easements on the Site.

4.3.5 Sheeting and Shoring

Appropriate management of structural stability of on-site or off-site structures during on-site activities, including excavation, is the sole responsibility of the Volunteer and its contractors. The Volunteer and its contractors are solely responsible for safe execution of all invasive and other work performed under this Plan. The Volunteer and its contractors must obtain any local, State or Federal permits or approvals that may be required to perform work under this Plan. Further, the Volunteer and its contractors are solely responsible for the implementation of all required, appropriate, or necessary health and safety measures during performance of work under the approved Plan.

4.3.6 Equipment and Material Staging

The Contractor will notify the RE and Purves Street Owners, LLC, in writing with receipt confirmed, of pending site work mobilization at least 30 calendar days in advance. During mobilization, construction equipment will be delivered to the site, temporary facilities constructed, and temporary utilities installed. The Contractor will place and maintain temporary toilet facilities within the work areas for usage by all site personnel. The Contractor will provide drinking water for all site personnel.

4.3.7 Decontamination Area

The Contractor will construct decontamination pads at each site entrance/exit planned for construction vehicle usage. The location of decontamination pads may change periodically to accommodate the Contractor's sequencing of work. The pad will be constructed by the Contractor to collect wastewater for off-site disposal or treatment and discharge, if generated during decontamination activities. The design will consider adequate space to decontaminate site equipment and vehicles, and sloping and liners to facilitate collection of wastewater. Collected decontamination wastewater shall be either discharged in accordance with the Contractor's NYCDEP permit or tested and transported to an off-site disposal facility that is permitted to accept this waste, in accordance with applicable city, state, and federal regulations.

If the Contractor uses high pressure washing methods, the Contractor shall provide splash protection around the vehicle decontamination facility. Splash protection shall minimize potential contamination from splatter and mist movement off-site during the vehicle decontamination process. Splash protection shall be temporary and stable and capable of being dismantled in the event of high winds.

Accumulated truck rinsate and decontamination materials will be collected and commingled with other waste streams for disposal, as appropriate. The Contractor will maintain the decontamination pad(s) throughout the duration of site work. Prior to demobilization, the Contractor will deconstruct the pads and dispose of materials as required.

4.3.8 Site Fencing

The Site perimeter will be secured with gated, signed, plywood fencing. The purpose of the fencing is to limit site access to authorized personnel, protect pedestrians from site activities, and maintain site security.

4.3.9 Demobilization

The contractor will be responsible for demobilizing all labor, equipment, and materials not designated for off-site disposal from the Site. The RE will be required to document that the Remediation Contractor decontaminates all equipment and materials prior to removal from the Site. The RE will be responsible to document that the Excavation Contractor performs any follow-up coordination and maintenance for the following activities: removal of sediment and erosion control measures and disposal of materials in accordance with acceptable rules and regulations; removal of any residual contaminated material or wastes; equipment decontamination; and general refuse disposal.

4.4 Reporting

Periodic reports and an FER will be required to document the remedial action. The Project RE responsible for certifying all reports will be an individual licensed to practice engineering in the State of New York; Jason Hayes, P.E. of Langan, will have this responsibility. Should Mr. Hayes become unable to fulfill this responsibility, another suitably qualified New York State professional engineer will take his place. All daily and monthly Reports will be included in the FER. In addition to the periodic reports and the FER, copies of all relevant contractor documents will be submitted to the NYSDEC.

4.4.1 Daily Reports

Daily reports will be submitted to NYSDEC and NYSDOH Project Managers by the end of each day following the reporting period and will include:

- An update of progress made during the reporting day;
- Locations of work and quantities of material imported and exported from the Site;
- References to alpha-numeric map for Site activities;
- A summary of any and all complaints with relevant details (names, phone numbers);
- A summary of CAMP findings, including excursions;
- An explanation of notable Site conditions.

Daily reports are not intended to be the mode of communication for notification to the NYSDEC of emergencies (accident, spill), requests for changes to the RAWP or other sensitive or time critical information. However, such conditions must also be included in the daily reports. Emergency conditions and changes to the RAWP will be addressed directly to NYSDEC Project Manager via personal communication.

Daily Reports will include a description of daily activities keyed to an alpha-numeric map that identifies work areas. These reports will include a summary of air sampling results, odor and dust problems and corrective actions, and all complaints received from the public.

The NYSDEC assigned project number will appear on all reports.

4.4.2 Monthly Reports

Monthly reports will be submitted to NYSDEC and NYSDOH Project Managers by the tenth of the following month of the reporting period and will include the following information, as well as the information required in the Brownfield Cleanup Agreement:

- Activities relative to the Site during the previous reporting period and those anticipated for the next reporting period, including a quantitative presentation of work performed (i.e. tons of material exported and imported, etc.);
- Description of approved activity modifications, including changes of work scope and/or schedule;
- Sampling results received following internal data review and validation, as applicable; and,
- An update of the remedial schedule including the percentage of project completion, unresolved delays encountered or anticipated that may affect the future schedule, and efforts made to mitigate such delays.

4.4.3 Other Reporting

Photographs will be taken of remedial activities and submitted to NYSDEC in digital (JPEG) format. Photos will illustrate the remedial program elements and will be of acceptable quality. Representative photos of the Site prior to any remedial actions will be provided. Representative photos will be provided of each contaminant source area and Site structures before, during and after remediation. Photos will be submitted to NYSDEC on CD or other acceptable electronic media and will be sent to NYSDEC's Project Manager (2 copies) and to NYSDOH's Project Manager (1 copy). CD's will have a label and a general file inventory structure that separates photos into directories and subdirectories according to logical Remedial Action components. A photo log keyed to photo file ID numbers will be prepared to provide explanation for all representative photos.

Job-site record keeping for all remedial work will be appropriately documented. These records will be maintained on-site at all times during the project and be available for inspection by NYSDEC and NYSDOH staff.

4.4.4 Complaint Management Plan

The management plan for documenting complaints is detailed below.

Item	Description
Approach	Complaints regarding remediation or construction activities/operations to be minimized and mitigation measures implemented to reduce the incidence of complaints.
Objective	To manage environmental complaints from the community regarding construction or remediation.
Implementation Strategy/Mitigation Measures	All complaints will be documented on a complaint register. The register will be maintained as an ongoing record. The entry will include following information: • Time, date and nature of complaint; • Type of communication (telephone, letter, personal, etc.); • Name, contact address and contact number; • Response and investigation undertaken as a result of the complaint; and action taken and signature of responsible person. Each complaint will be investigated as soon as practical in relation to requirements.
Monitoring	A representative from the Volunteer or the Remediation Engineer will follow up on the complaint within two weeks of receipt to ensure it is resolved.
Reporting	Upon receipt NYSDEC will be notified. Complaint and resolutions will be documented in daily reports.
Corrective Action	Should an incident of failure to comply occur in relation to the management of environmental complaints, one or more of the following corrective actions will be undertaken as appropriate: • Conduct additional training of staff to handle environmental complaints; • Investigate why the environmental complaint was not addressed within the specified time frame; and • Investigate complaint and action follow-up according to results of investigation.

4.4.5 Deviations from the RAWP

An addendum to this RAWP will be provided for any deviations and will include:

- Reasons for deviating from the approved RAWP;
- Approval process to be followed for changes/editions to the RAWP; and
- Effect of the deviations on overall remedy.

5.0 REMEDIAL ACTION: MATERIAL REMOVAL FROM SITE

5.1 Soil Cleanup Objectives

The Site-specific Soil Cleanup Objectives (SCOs) are listed in Table 1. Part 375 Restricted Residential Use SCOs were used to establish the Site-specific SCOs. Although not anticipated with the proposed development, any exposed soil that remains within the top 2 feet of landscaped areas of the Site must meet the Restricted Residential Use SCOs.

Soil and materials management on-site and off-site will be conducted in accordance with the Soil Management Plan as described below. UST closures will, at a minimum, conform to criteria defined in DER-10.

5.2 Remedial Performance Evaluation (Post-Excavation Documentation Sampling)

Documentation soil samples will be collected and analyzed to evaluate soil/fill remaining in place. Documentation samples will be sampled for analysis of 6 NYCRR Part 375 list and TCL/TAL list VOCs, SVOCs, PCBs, pesticides, and metals. Documentation sampling will be collected in accordance with NYSDEC DER-10. Samples will be collected from the excavation bottom at a frequency of one sample per 900 square feet. Sidewall samples will be collected at a frequency of one sample per 30 feet of sidewall. If encountered, a minimum of five additional soil samples will be collected for UST removal areas, including four sidewall samples and one bottom sample. Should additional documentation sampling be deemed necessary (e.g., additional tank closure), documentation sampling will occur in accordance with NYSDEC DER-10 and Soil Cleanup Guidance CP-51. No additional excavation will be required based on the documentation sample results.

Soil documentation samples will be transported under standard chain-of-custody protocol to an NYSDOH ELAP-approved laboratory for analysis of the Site soil contaminants of concern. Laboratory analyses will be conducted in accordance with EPA SW-846 methods and NYSDEC Analytical Services Protocol (ASP) Category B deliverable format. The quality assurance and quality control procedures required by the NYSDEC ASP and SW-846 methods will be followed. This will include instrument calibration, standard compound spikes, surrogate compound spikes, and analysis of quality control samples. The laboratory will provide sample bottles, which are pre-cleaned and preserved. Where there are differences in the SW-846 and NYSDEC ASP requirements, the NYSDEC ASP shall take precedence.

A data usability summary report (DUSR) will be included in the FER. Quality control procedures for the sampling are included in the QAPP, described in Appendix F. Confirmation analytical

results will be provided in NYSDEC electronic data deliverable (EDD) format for EQuIS™. Guidance on sampling frequency is presented in Section 5.4 of DER-10.

The FER will provide a tabular and map summary of all end-point sample results and results that exceed Site-specific SCOs.

5.3 Estimated Material Removal Quantities

The estimated quantity of soil/fill to be removed from the Site is 5,800 cubic yards (4,000 cubic yards of historic fill, 1,550 cubic yards of historic fill with potentially hazardous metal concentrations, and 250 cubic yards of petroleum-impacted soil potentially encountered in the UST area). The estimated quantity of soil to be imported for backfill is 5,000 cubic yards.

5.4 Soil/Materials Management Plan

This section presents the approach to managing, disposing and reuse of soil, fill, and debris excavated from the Site. This plan is based on the current knowledge of Site conditions, and will be augmented with the additional data collected during remediation. A field engineer, scientist or geologist, under the direction of the RE or a QEP, will monitor and document the handling and transport of contaminated material removed from the Site for disposal as a regulated solid waste. A field engineer, scientist or geologist, under the direction of the RE or a QEP, will assist the Remedial Contractor in identifying impacted materials during excavation, determining materials suitable for direct load out versus temporary on-site stockpiling, selection of samples for waste characterization, and determining the proper off-site disposal facility. Separate stockpile areas will be constructed as needed for the various materials to be excavated or generated, with the intent to most efficiently manage and characterize the materials and to avoid comingling impacted materials with non-impacted soil.

The following three material types are reasonably anticipated to be encountered during the remediation:

- Track 4 SCO-Contaminated, Non-hazardous Material – This material refers to historic fill that contains contaminants that exceed the Site-specific SCOs and will not be reused on-site. This material will be excavated throughout the Site to 2.5 feet bgs, and in approximately half of the Site to between 6 and 8 feet bgs as part of the Track 4 remedy. This material will be transported off-site, and disposed at a facility permitted to accept the material. Characterization sampling will be completed in conformance with the requirements of the disposal facility and post-excavation documentation samples will be collected to document residual soil conditions.

- Track 4 SCO-Petroleum-Impacted, Non-hazardous Material – This material refers to petroleum-impacted historic fill or soil associated with the potential on-site USTs that may contain contaminants that exceed the Site-Specific SCOs and will not be reused on-site. Grossly-impacted material with free product that may be a source to groundwater contamination will be excavated as part of the Track 4 remedy, transported off-site, and disposed at a facility permitted to accept the material. Characterization sampling will be completed to conform to the requirements of the disposal facility and post-excavation documentation samples will be collected to document residual soil conditions.

- Hazardous Material – If determined hazardous during waste characterization sampling, this material will include soil with hazardous levels of metals (lead, mercury, and/or barium). This material is potentially present in the western part of the Site, to depths of approximately 8 feet bgs. Excavated hazardous material will not be reused on-site, and must be transported off-site and disposed at a facility certified to accept the material. Hazardous material will be removed as shown on the remediation excavation drawing as part of the Track 4 remedy. Post-excavation documentation samples will be collected to document residual soil conditions.

5.4.1 Soil Screening Methods

Visual, olfactory and PID soil screening and assessment will be performed by an engineer, geologist or scientist under the direct supervision of a PE or qualified environmental professional during all remedial and development excavations into known or potentially contaminated material (Residual Contamination Zone). Soil screening will be performed regardless of when the invasive work is done and will include all excavation and invasive work performed during the remedy and during development phase, such as excavations for foundations and utility work, prior to issuance of the COC.

All primary contaminant sources (including but not limited to tanks and hotspots) identified during Site Characterization, Remedial Investigation, and Remedial Action will be surveyed by a surveyor licensed to practice in the State of New York. This information will be provided on maps in the FER.

Screening will be performed by field engineers, scientists or geologists under the direct supervision of the RE or QEP. Resumes will be provided for all personnel responsible for field screening (i.e. those representing the RE) of invasive work for known or unknown contaminant sources during remediation and development work.

5.4.2 Stockpile Methods

Soil stockpile areas, if needed for the different soil materials, will be constructed for staging of Site soil, pending loading or characterization testing. Separate stockpile areas will be constructed to avoid comingling materials of differing waste types. All stockpile areas will meet the following minimum requirements:

- The excavated soil will be placed onto a minimum thickness of 10-mil low-permeability liner of sufficient strength and thickness to prevent puncture during use; separate stockpiles will be created where material types are different (e.g., petroleum-impacted material stockpiled in a contaminated soil area). The use of multiple layers of thinner liners is permissible.
- Equipment and procedures will be used to place and remove the soil that will minimize the potential to jeopardize the integrity of the liner.
- Stockpiles will be covered at the designated times (see below) with minimum 6-mil plastic sheeting or tarps which will be securely anchored to the ground. Stockpiles will be routinely inspected and broken sheeting covers will be promptly replaced.
- Stockpiles will be covered upon reaching their capacity of approximately 1,000 cubic yards until ready for loading. Stockpiles that have not reached their capacity will be covered at the end of each workday.
- Active stockpiles will be covered at the end of each workday.
- Each stockpile area will be encircled with silt fences and hay bales, as needed to contain and filter particulates from any rainwater that has drained off the soils, and to mitigate the potential for surface water run-off.
- The stockpile areas will be inspected daily and noted deficiencies will be promptly addressed.

5.4.3 Materials Excavation and Load Out

Field engineers, scientists or geologists under the direct supervision of the RE or QEP will oversee all invasive work and the excavation and load-out of all excavated material. The Volunteer and its contractors are solely responsible for safe execution of all invasive and other work performed under this Plan.

The presence of utilities and easements on the Site has been investigated by the RE. It has been determined that no risk or impediment to the planned work under this RAWP is posed by known utilities or easements on the Site.

Loaded vehicles leaving the Site will be appropriately lined, securely covered, manifested, and placarded in accordance with appropriate Federal, State, local, and New York State Department of Transportation (NYSDOT) requirements (and all other applicable transportation requirements). Trucks hauling historic fill will not be lined unless the material exhibits free liquids or is grossly impacted.

A truck wash/cleaning area will be operated on-site. The RE will be responsible for documenting that all outbound trucks will be washed/cleaned at the truck wash before leaving the Site until the remedial construction is complete. Locations where vehicles enter or exit the Site shall be inspected daily for evidence of off-site sediment tracking.

The RE will be responsible for documenting that all egress points for truck and equipment transport from the Site will be clean of dirt and other materials derived from the Site during Site remediation and development. Cleaning of the adjacent streets will be performed as needed to maintain a clean condition with respect to Site-derived materials.

The Volunteer and associated parties preparing the remedial documents submitted to the State, and parties performing this work, are completely responsible for the safe performance of all invasive work, the structural integrity of excavations, and for structures that may be affected by excavations (such as building foundations and bridge footings).

The RE will ensure that Site development activities will not interfere with, or otherwise impair or compromise, remedial activities proposed in this RAWP.

Each hotspot and structure to be remediated (e.g., USTs, vaults and associated piping, etc.) will be removed and post-excavation documentary sampling completed before excavations related to Site development commence proximal to the hotspot or structure.

Development-related grading cuts and fills will not be performed without NYSDEC approval and will not interfere with, or otherwise impair or compromise, the performance of remediation required by this plan.

Mechanical processing of historical fill and contaminated soil on-site is prohibited, without pre-approval by NYSDEC.

All primary contaminant sources (including but not limited to tanks and hotspots) identified during Site Characterization, Remedial Investigation, and Remedial Action will be surveyed by a surveyor licensed to practice in the State of New York. The survey information will be shown on maps to be reported in the FER.

5.4.4 Materials Transport Off-Site

All transport of materials will be performed by licensed haulers in accordance with appropriate local, State, and Federal regulations, including 6 NYCRR Part 364. Haulers will be appropriately licensed and trucks properly placarded. Trucks will enter the Site using Purves Street or other routes approved by NYSDEC. All trucks loaded with Site materials will exit the vicinity of the Site using only approved truck routes.

Proposed in-bound and out-bound truck routes to the Site are shown in Figure 9. This is the most appropriate route and takes into account:

(a) limiting transport through residential areas and past sensitive sites;

(b) use of city mapped truck routes;

(c) prohibiting off- Site queuing of trucks entering the facility;

(d) limiting total distance to major highways;

(e) promoting safety in access to highways; and

(f) overall safety in transport;

(g) community input [where necessary]

Trucks will be prohibited from stopping and idling in the neighborhood outside the project Site.

Egress points for truck and equipment transport from the Site will be kept clean of dirt and other materials during Site remediation and development.

To the extent possible, queuing of trucks will be performed on-site in order to minimize off-site disturbance. Off-Site queuing will be minimized.

Material transported by trucks exiting the Site will be secured with tight-fitting covers. Loose-fitting canvas-type truck covers will be prohibited. If loads contain wet material capable of producing free liquid, truck liners will be used.

All truck carriages and wheels will be free from dirt and debris when leaving the site. As required, truck wash waters will be collected and disposed of off-site in an appropriate manner.

5.4.5 Materials Disposal Off-Site.

All soil/fill/solid waste excavated and removed from the Site will be handled, transported and disposed in accordance with all local, State (including 6 NYCRR Part 360) and Federal regulations. If disposal of soil/fill from this Site is proposed for unregulated disposal (i.e. clean

soil removed for development purposes), a formal request with an associated plan will be made to NYSDEC's Project Manager. Unregulated off-site management of materials from this Site is prohibited without formal NYSDEC approval.

Material that does not meet Track 1 Unrestricted SCOs is prohibited from being taken to a New York State recycling facility (6NYCRR Part 360-16 Registration Facility).

The following documentation will be obtained and reported by the RE for each disposal location used in this project to fully demonstrate and document that the disposal of material derived from the Site conforms to all applicable laws:

(1) A letter from the RE or BCP Volunteer to the receiving facility describing the material to be disposed and requesting formal written acceptance of the material. This letter will state that material to be disposed is contaminated material generated at an environmental remediation Site in New York State. The letter will provide the project identity and the name and phone number of the RE. The letter will include as an attachment a summary of all chemical data for the material being transported (including Site Characterization data); and

(2) A letter from all receiving facilities stating it is in receipt of the correspondence (above) and is approved to accept the material. These documents will be included in the FER.

Nonhazardous historic fill and contaminated soils taken off-site will be handled, at minimum, as a Municipal Solid Waste per 6NYCRR Part 360-1.2

Historical fill and contaminated soils from the Site are prohibited from being disposed at Part 360-16 Registration Facilities (also known as Soil Recycling Facilities).

Soils that are contaminated but nonhazardous and are being removed from the Site are considered by the Division of Materials Management (DMM) in NYSDEC to be Construction and Demolition (C/D) materials with contamination not typical of virgin soils. These soils may be sent to a permitted Part 360 landfill. They may be sent to a permitted C/D processing facility without permit modifications only upon prior notification of NYSDEC Region 2 DMM. This material is prohibited from being sent or redirected to a Part 360-16 Registration Facility. In this case, as dictated by DMM, special procedures will include, at a minimum, a letter to the C/D facility that provides a detailed explanation that the material is derived from a DER remediation Site, that the soil material is contaminated and that it must not be redirected to on-site or off-site Soil Recycling Facilities. The letter will provide the project identity and the name and phone number of the RE. The letter will include as an attachment a summary of all chemical data for the material being transported.

The FER will include an accounting of the destination of all material removed from the Site during this Remedial Action, including excavated soil, contaminated soil, historic fill, solid waste, and hazardous waste, non-regulated material, and fluids. Documentation associated with disposal of all material must also include records and approvals for receipt of the material. This information will also be presented in a tabular form in the FER.

Bill of Lading system or equivalent will be used for off-site movement of nonhazardous wastes and contaminated soils. This information will be reported in the FER.

Hazardous wastes derived from on-site will be stored, transported, and disposed of in full compliance with applicable local, State, and Federal regulations.

Appropriately licensed haulers will be used for material removed from this Site and will be in full compliance with all applicable local, State and Federal regulations.

Waste characterization will be performed for off-site disposal in a manner suitable to the receiving facility and in conformance with applicable permits. Sampling and analytical methods, sampling frequency, analytical results and QA/QC will be reported in the FER. All data available for soil/material to be disposed at a given facility must be submitted to the disposal facility with suitable explanation prior to shipment and receipt.

5.4.6 Materials Reuse On-Site

Soil excavated during installation of foundation components may be reused if the requirements in this section are met. Grossly-impacted soil will not be reused. Reused soil must be nonhazardous and meet the lower of 6 NYCRR 375-6(b) Restricted Residential Use or Protection of Groundwater SCOs in accordance with the predetermined beneficial use determination listed in 6 NYCRR § 360-1.15(b). The Protection of Groundwater SCOs apply only to compounds or analytes detected in groundwater at concentrations that exceeded the Class GA AWQS. If any of the waste materials are used for an end use specified in Section 360-1.15(b), it will not be considered a solid waste. Soil removed during implementation of the remedy or removed for grading or other purposes will not be reused within a cover soil layer, within landscaping berms, or as backfill for subsurface utility lines. Reuse of soil will be coordinated in advance with the NYSDEC case manager. Material deemed unfit for reuse will be transported for off-site disposal.

5.4.7 Fluids Management

Collection and pretreatment of contaminated groundwater is not anticipated for remedial excavations, however it may be needed for excavations associated with foundation components and/or an elevator pit. All liquids to be removed from the Site, including

dewatering fluids, will be handled, transported and disposed in accordance with applicable local, State, and Federal regulations. Liquids discharged into the New York City sewer system will be addressed through approval by NYCDEP.

Dewatered fluids will not be recharged back to the land surface or subsurface of the Site. Dewatering fluids will be managed off-site.

Discharge of water generated during remedial construction to surface waters (i.e. a local pond, stream or river) is prohibited without a SPDES permit.

Localized construction dewatering of contaminated groundwater will be required to excavate the elevator pits. For the remedy, dewatering is considered a remedial component inasmuch as it is necessary to facilitate excavation of historic fill for the elevator pits. Limited dewatering may be conducted via a sump pump or well point system. Dewatering fluids will either be containerized for off-site disposal of discharged to a NYC sewer in accordance with a NYSDEP permit. Based on the NYCDEP's effluent limitations, the Contractor may be required to install additional pretreatment utilities for dewatering fluids to reduce contaminant concentration below the NYCDEP effluent limitations prior to discharge. Additional pretreatment may include bag filters, carbon filtration, etc. If the contractor's dewatering system has a pumping capacity of greater than 45 gallons per minute, a Long Island Well permit will be obtained from NYSDEC. If the Contractor will discharge more than 10,000 gallons per day, they will also have to obtain a NYCDEP Temporary Discharge of Groundwater into the City Sewer System Permit. Collected groundwater or rainwater will be discharged, as defined by the NYCDEP permit, into the New York City sewer system, via an entry point acceptable to the NYCDEP. If required, the dewatering and treatment system will be designed by the Contractor's New York State-licensed Professional Engineer.

5.4.8 Demarcation

After the completion of soil removal and any other invasive remedial activities and prior to backfilling, a land survey will be performed by a New York State licensed surveyor. The survey will define the top elevation of residual contaminated soil. A physical demarcation layer, consisting of orange snow fencing material or equivalent material will be placed on this surface to provide a visual reference, where the surface is capped with clean soil (e.g., landscaped area). The demarcation layer is not required if the residual soil is capped with impervious surface cover (e.g., concrete slab). This demarcation layer will constitute the top of the 'Residuals Management Zone', the zone that requires adherence to special conditions for disturbance of contaminated residual soils defined in the SMP. The survey will measure the grade covered by the demarcation layer before the placement of cover soils, pavement and subsoils, structures, or other materials. This survey and the demarcation layer placed on this

grade surface will constitute the physical and written record of the upper surface of the 'Residuals Management Zone' in the SMP. A map showing the survey results will be included in the FER and the SMP.

5.4.9 Backfill from Off-Site Sources

All materials proposed for import onto the Site will be approved by the RE and will be in compliance with provisions in this RAWP prior to receipt at the Site. Material from industrial sites, spill sites, other environmental remediation sites or other potentially contaminated sites will not be imported to the Site. Solid waste will not be imported onto the Site.

The FER will include the following certification by the RE: "I certify that all import of soils from off-site, including source evaluation, approval and sampling, has been performed in a manner that is consistent with the methodology defined in the RAWP".

Backfill material will consist of clean fill (as described in the following paragraph) or other acceptable fill material such as virgin, native 0.75-inch stone from a quarry or recycled concrete aggregate (RCA). If RCA is imported to the Site, it will be from NYSDEC-permitted or registered facilities in compliance 6 NYCRR Part 360 registration and permitting requirements for the period of acquisition of RCA. RCA imported from compliant facilities will not require chemical testing, unless required by NYSDEC under its terms for operation of the facility. RCA imported to the Site must be derived from recognizable and uncontaminated concrete. RCA material is not acceptable for, and will not be used as cover, drainage, or SMD gravel-layer material.

All imported soils will meet NYSDEC approved backfill or cover soil quality objectives for this Site. These NYSDEC approved backfill or cover soil quality objectives are the lower of the protection of groundwater or the protection of public health soil cleanup objectives for Restricted Residential Use as set forth in Table 375-6.8(b) of 6 NYCRR Part 375. Non-compliant soils will not be imported without prior approval by NYSDEC. Nothing in the approved RAWP or its approval by NYSDEC should be construed as an approval for this purpose.

The clean fill would be segregated at a source/facility that is free of environmental contaminants. Qualified environmental personnel would collect representative samples at a frequency consistent with CP-51 / Soil Cleanup Guidance. The samples would be analyzed for Part 375 VOCs (EPA Method 8260), SVOCs (EPA Method 8270), pesticides/PCBs (EPA Method 8082/8081) and metals by an NYSDOH ELAP-certified laboratory. Upon meeting these criteria, the certified-clean fill would be transported to the site and segregated from impacted material, as necessary, on plastic sheeting until it is used as backfill.

Soils that meet 'exempt' fill requirements under 6 NYCRR Part 360, but do not meet backfill or cover soil objectives for this Site, will not be imported onto the Site without prior approval by NYSDEC. Nothing in this RAWP should be construed as an approval for this purpose. Trucks entering the Site with imported soils will be securely covered with tight fitting covers.

5.4.10 Stormwater Pollution Prevention

Silt fencing or hay bales will be installed around the perimeter of the remedial construction area, as required. Barriers and hay bale checks will be installed and inspected once a week and after every storm event. Results of inspections will be recorded in a logbook and maintained at the Site and available for inspection by NYSDEC. All necessary repairs shall be made immediately. Accumulated sediments will be removed as required to keep the barrier and hay bale check functional. All undercutting or erosion of the silt fence toe anchor shall be repaired immediately with appropriate backfill materials. Manufacturer's recommendations will be followed for replacing silt fencing damaged due to weathering. Erosion and sediment control measures identified in the RAWP shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters.

5.4.11 Contingency Plan

If underground tanks or other previously unidentified contaminant sources are found during on-Site remedial excavation or development related construction, sampling will be performed on product, sediment and surrounding soils, etc. Chemical analytical work will be for full scan parameters Part 375 and TCL/TAL listed VOCs, SVOCs, metals, pesticides, and PCBs. These analyses will not be limited to STARS parameters where tanks are identified without prior approval by NYSDEC. Analyses will not be otherwise limited without NYSDEC approval.

Identification of unknown or unexpected contaminated media identified by screening during invasive Site work will be promptly communicated by phone to NYSDEC's Project Manager. These findings will be also included in daily and periodic electronic media reports.

5.4.12 Community Air Monitoring Plan (CAMP)

Community air monitoring will be conducted in compliance with the NYSDOH Generic CAMP outlined below.

The CAMP will include real-time monitoring for VOCs and particulates at the downwind perimeter of each designated work area when certain activities are in progress. Continuous monitoring will be required for all ground intrusive activities and during demolition of contaminated or potentially contaminated structures. Ground intrusive activities include, but

are not limited to, soil/waste excavation and handling, test pitting and trenching, and the installation of soil borings or monitoring wells. Periodic monitoring for VOCs will be required during non-intrusive activities such as the collection of soil and sediment samples or the collection of groundwater samples from existing monitoring wells. "Periodic" monitoring during sample collection might reasonably consist of taking a reading upon arrival at a sample location, monitoring while opening a well cap or overturning soil, monitoring during well baling/purging, and taking a reading prior to leaving a sample location.

CAMP monitoring for VOCs levels will be conducted with PIDs, and monitoring for dust/particulates will be conducted with particulate sensors equipped with filters to detect particulates less than 10 microns in diameter (PM10). Monitoring for particulates and odors will be conducted during all ground intrusive activities by the RE's field inspector. The work zone is defined as the general area in which machinery is operating in support of remediation activities. A portable PID will be used to monitor the work zone and for periodic monitoring for VOCs during activities such as soil and groundwater sampling. The Site perimeter will be visually monitored for fugitive dust emissions.

The following actions will be taken based on VOC levels measured:

- If total VOC levels exceed 5 ppm above background for the 15-minute average at the perimeter, work activities will be temporarily halted and monitoring continued. If levels readily decrease (per instantaneous readings) below 5 ppm above background, work activities will resume with continued monitoring.

- If total VOC levels at the downwind perimeter of the hot zone persist at levels in excess of 5 ppm above background but less than 25 ppm, work activities will be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps work activities will resume provided that the total organic vapor level 200 feet downwind of the hot zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less – but in no case less than 20 feet, is below 5 ppm above background for the 15-minute average.

- If the total VOC level is above 25 ppm at the perimeter of the hot zone, activities will be shut down.

The following actions will be taken based on visual dust observations:

- If the downwind particulate level is 100 micrograms per cubic meter ($\mu g/m^3$) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression must be employed. Work may continue with dust suppression techniques provided that downwind PM10 levels do not

exceed 150 µg/m³ above the background level and provided that no visible dust is migrating from the work area.

- If, after implementation of dust suppression techniques, downwind PM10 levels are greater than 150 µg/m³ above the background level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM10 concentration to within 150 µg/m³ of the upwind level and in preventing visible dust migration.

Exceedances observed in the CAMP will be reported to NYSDEC and NYSDOH Project Managers and included in the Daily Report.

5.4.13 Odor, Dust and Nuisance Control Plan

Dust, odor and nuisance control will be accomplished by the remediation contractor as described in this section. The FER will include the following certification by the RE: "I certify that all invasive work during the remediation and all invasive development work were conducted in accordance with dust and odor suppression methodology defined in the RAWP."

5.4.13.1 Odor Control Plan

This odor control plan is capable of controlling emissions of nuisance odors off-site. Specific odor control methods to be used on a routine basis will include application of foam suppressants or tarps over the odor or VOC source areas. If nuisance odors are identified, work will be halted and the source of odors will be identified and corrected. Work will not resume until all nuisance odors have been abated. NYSDEC and NYSDOH will be notified of all odor events and of all other complaints about the project. Implementation of all odor controls, including the halt of work, will be the responsibility of the Volunteer's RE, who is responsible for certifying the FER. Application of odor controls is the responsibility of the Remedial Contractor.

All necessary means will be employed to prevent on- and off-site nuisances. At a minimum, procedures will include: (a) limiting the area of open excavations; (b) shrouding open excavations with tarps and other covers; and (c) using foams to cover exposed odorous soils. If odors develop and cannot be otherwise controlled, additional means to eliminate odor nuisances will include: (a) direct load-out of soils to trucks for off-site disposal; (e) use of chemical odorants in spray or misting systems; and, (b) use of staff to monitor odors in surrounding neighborhoods.

Although not anticipated, where odor nuisances have developed during remedial work and cannot be corrected, or where the release of nuisance odors cannot otherwise be avoided due to on-site conditions or close proximity to sensitive receptors, odor control will be achieved by sheltering excavation and handling areas under tented containment structures equipped with appropriate air venting/filtering systems.

5.4.13.2 Dust Control Plan

Dust suppression will include, at a minimum, the controls listed below:

- Dust suppression will be achieved through the use of a dedicated water distribution system or on-site water truck for road wetting. The truck will be equipped with a water cannon capable of spraying water directly onto off-road areas including excavations and stockpiles.
- Gravel will be used on roadways to provide a clean and dust-free road surface.
- On-Site roads will be limited in total area to minimize the area required for water truck sprinkling.

5.4.13.3 Other Nuisances

A plan for rodent control will be developed and utilized by the contractor prior to and during Site clearing and Site grubbing, and during all remedial work.

A plan will be developed and utilized by the contractor for all remedial work and will conform, at a minimum, to NYCDEP noise control standards.

6.0 RESIDUAL CONTAMINATION TO REMAIN ON-SITE

Because residual contaminated soil and groundwater will exist beneath the Site after the remedy is complete, Engineering and Institutional Controls (ECs and ICs) are required to protect human health and the environment. These ECs and ICs are described hereafter. Long-term management of EC/ICs and of residual contamination will be executed under a Site specific SMP that will be developed and included in the FER.

ECs will be implemented to protect public health and the environment by appropriately managing residual contamination. The Controlled Property (the Site) will have three primary EC systems: 1) a vapor barrier, 2) a SMD system; and 3) a site cover system consisting of a concrete building slab.

The FER will report residual contamination in tabular and map form. This will include presentation of contaminant concentrations that exceed both Track 1 and Track 4 SCOs.

7.0 ENGINEERING CONTROLS

7.1 Vapor Barrier

Exposure to residual contaminated soil vapor will be prevented by an engineered, continuous vapor barrier installed on subsurface slabs and walls of the section of the proposed development that will not be used for a ventilated parking garage. The barrier will consist of Grace Preprufe 300R (or its approved equivalent) underneath the slab and Grace Preprufe 160R or Bituthene (or its approved equivalent) on the subsurface walls. The vapor barrier extents are shown on Figure 7, and the vapor barrier manufacturer's documentation and specifications are included as Appendix L.

7.2 Soil Vapor Mitigation System

As a protective measure to mitigate potential soil vapor intrusion into the planned on-site building, an SMD system will be installed beneath the vapor barrier for the portion of the development that will not have an at-grade ventilated parking garage. The proposed SMD system layout is shown on Figure 7, and design details are provided as Appendix M. The SMD system was developed in general accordance with the NYSDOH October 2006 Guidance for Evaluating Soil Vapor Intrusion in the State of New York. The system consists of a sub-membrane collection layer and vapor conveyance piping to two active electric blowers. Installation of monitoring points is being evaluated by NYSDEC, NYSDOH and the Remedial Engineer. If monitoring points are installed, they will be built into the SMD system during installation so that post-installation pressure readings can be collected. The number and locations of these points will be decided after RAWP approval and with NYSDEC and NYSDOH concurrence. Alternatively, system operation will be documented through pressure monitoring at the sampling ports installed at the base (interface with slab) of the SMD riser pipes. The RE will oversee implementation and documentation. All as-built drawings, diagrams, calculation and manufacturer documentation for SMD system will be presented in the FER. The blower fan would remain in continuous operation until permission to discontinue its use is granted in writing by NYSDEC, at which point the active blower system would be transitioned to a passive system through the use of a wind turbine.

7.3 Site Cover System

Exposure to residual contaminated soils will be prevented by an engineered site cover system. This site cover system will be comprised of a reinforced concrete building slab that is estimated at 14-inches thick and covers approximately 90% of the Site. The additional approximately 10% of the Site includes a driveway with a concrete slab above the building's drainage system, and an open courtyard with a soil cap consisting of at least 2 feet of imported clean fill (meeting

the lower of the protection of groundwater or the protection of public health for restricted residential use SCOs). Proposed development plans are provided in Appendix B, and a site cover system plan is included as Figure 8.

A Soil Management Plan will be included in the SMP and will outline the procedures to be followed in the event that the site cover system and underlying residual contamination are disturbed after the Remedial Action is complete. Maintenance of this site cover system will be described in the SMP in the FER.

8.0 CRITERIA FOR COMPLETION OF REMEDIATION/TERMINATION OF ENGINEERING CONTROL SYSTEMS

The below sections describe the criteria for completion of remediation and termination of remedial systems.

8.1 Site Cover System and Vapor Barrier

The site cover and vapor barrier systems are permanent controls and the quality and integrity of these systems will be inspected at defined, regular intervals in perpetuity.

8.2 Sub-membrane Depressurization System (SMD)

The active SMD system will not be discontinued without written approval by NYSDEC and NYSDOH. A proposal to discontinue the active SMD system may be submitted by the property owner based on confirmatory data that justifies such request. Systems will remain in place and operational until permission to discontinue use is granted in writing by NYSDEC and NYSDOH. Refer to Appendix M for SMD system design details.

9.0 INSTITUTIONAL CONTROLS

After the remedy is complete, the Site will have residual contamination remaining in place. Engineering Controls for the residual contamination have been incorporated into the remedy to render the overall Site remedy protective of public health and the environment. Two elements have been designed to ensure continual and proper management of residual contamination in perpetuity: an Environmental Easement and an SMP. These elements are described in this Section.

A Site-specific Environmental Easement will be recorded with Queens County to provide an enforceable means of ensuring the continual and proper management of residual contamination and protection of public health and the environment in perpetuity or until released in writing by NYSDEC. It requires that the grantor of the Environmental Easement and the grantor's successors and assigns adhere to all Engineering and Institutional Controls (ECs/ICs) placed on this Site by this NYSDEC-approved remedy. ICs provide restrictions on Site usage and mandate operation, maintenance, monitoring and reporting measures for all ECs and ICs. The SMP describes appropriate methods and procedures to ensure compliance with all ECs and ICs that are required by the Environmental Easement. Once the SMP has been approved by the NYSDEC, compliance with the SMP is required by the grantor of the Environmental Easement and grantor's successors and assigns.

9.1 Environmental Easement

An Environmental Easement, as defined in Article 71 Title 36 of the Environmental Conservation Law, is required when residual contamination is left on-site after the Remedial Action is complete. If the Site will have residual contamination after completion of all Remedial Actions then an Environmental Easement is required. As part of this remedy, an Environmental Easement approved by NYSDEC will be filed and recorded with the Queens County Clerk. The Environmental Easement will be submitted as part of the FER.

The Environmental Easement renders the Site a Controlled Property. The Environmental Easement must be recorded with the Queens County Clerk before the COC can be issued by NYSDEC. A series of Institutional Controls are required under this remedy to implement, maintain and monitor these Engineering Control systems, prevent future exposure to residual contamination by controlling disturbances of the subsurface soil and restricting the use of the Site to restricted residential use(s) only. These Institutional Controls are requirements or restrictions placed on the Site that are listed in, and required by, the Environmental Easement. Institutional Controls can, generally, be subdivided between controls that support ECs, and those that place general restrictions on Site usage or other requirements. Institutional Controls

in both of these groups are closely integrated with the SMP, which provides all of the methods and procedures to be followed to comply with this remedy.

The Institutional Controls that support ECs are:

- Compliance with the Environmental Easement by the Grantee and the Grantee's successors and adherence of all elements of the SMP is required;
- All ECs must be operated and maintained as specified in this SMP;
- A site cover system consisting of the concrete building slabs must be inspected, certified and maintained as required in the SMP;
- A soil vapor mitigation system consisting of a vapor barrier and sub-membrane depressurization system under all building structures must be inspected, certified, operated and maintained as required by the SMP;
- All ECs on the Controlled Property must be inspected and certified at a frequency and in a manner defined in the SMP;
- Groundwater and other environmental or public health monitoring must be performed as defined in the SMP;
- Data and information pertinent to Site Management for the Controlled Property must be reported at the frequency and in a manner defined in the SMP;
- On-Site environmental monitoring devices, including but not limited to groundwater monitoring wells and soil vapor probes, must be protected and replaced as necessary to ensure proper functioning in the manner specified in the SMP;
- ECs may not be discontinued without an amendment or extinguishment of the Environmental Easement. The Environmental Easement may be extinguished only by release by the Commissioner of NYSDEC, or the Commissioner's designee, and filed with the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

Adherence to these Institutional Controls for the Site is mandated by the Environmental Easement and will be implemented under the SMP (discussed in the next section). The Controlled Property (Site) will also have a series of Institutional Controls in the form of Site restrictions and requirements. The Site restrictions that apply to the Controlled Property are:

- Vegetable gardens and farming on the Controlled Property are prohibited;
- Use of groundwater underlying the Controlled Property is prohibited without treatment rendering it safe for intended purpose;

- All future activities on the Controlled Property that will disturb residual contaminated material are prohibited unless they are conducted in accordance with the soil management provisions in the SMP;
- The Controlled Property may be used for restricted residential use only, provided the long-term Engineering and Institutional Controls included in the SMP are employed;
- The Controlled Property may not be used for a higher level of use, such as residential use without an amendment or extinguishment of this Environmental Easement;
- Grantor agrees to submit to NYSDEC a written statement that certifies, under penalty of perjury, that: (1) controls employed at the Controlled Property are unchanged from the previous certification or that any changes to the controls were approved by the NYSDEC; and, (2) nothing has occurred that impairs the ability of the controls to protect public health and environment or that constitute a violation or failure to comply with the SMP. NYSDEC retains the right to access such Controlled Property at any time in order to evaluate the continued maintenance of any and all controls. This certification shall be submitted annually, or an alternate period of time that NYSDEC may allow. This statement must be certified by an expert that the NYSDEC finds acceptable.

9.2 Site Management Plan (SMP)

Site Management is the last phase of remediation and begins with the approval of the FER and issuance of the COC for the Remedial Action. The SMP is submitted as part of the FER but will be written in a manner that allows its use as a complete and independent document. Site Management continues in perpetuity or until released in writing by NYSDEC. The property owner is responsible to ensure that all Site Management responsibilities defined in the Environmental Easement and the SMP are performed.

The SMP is intended to provide a detailed description of the procedures required to manage residual contamination left in place at the Site following completion of the Remedial Action in accordance with the BCA with the NYSDEC. This includes: (1) development, implementation, and management of all Engineering and Institutional Controls; (2) development and implementation of monitoring systems and a Monitoring Plan; (3) development of a plan to operate and maintain any treatment, collection, containment, or recovery systems (including, where appropriate, preparation of an Operation and Maintenance Manual); (4) submittal of Site Management Reports, performance of inspections and certification of results, and demonstration of proper communication of Site information to NYSDEC; and (5) defining criteria for termination of treatment system operation.

To address these needs, this SMP will include four plans: (1) an Engineering and Institutional Control Plan for implementation and management of EC/ICs; (2) a Monitoring Plan for implementation of Site Monitoring; (3) an Operation and Maintenance Plan for implementation of remedial collection, containment, treatment, and recovery systems; and (4) a Site Management Reporting Plan for submittal of data, information, recommendations, and certifications to NYSDEC. The SMP will be prepared in accordance with the requirements in NYSDEC Draft DER-10 Technical Guidance for Site Investigation and Remediation and the guidelines provided by NYSDEC.

Site management activities, reporting, and EC/IC certification will be scheduled on a certification period basis. The certification period will be annual and will be due for submission to NYSDEC within 45 days of the end of the reporting period.

No exclusions for handling of residual contaminated soils will be provided in the SMP. All handling of residual contaminated material will be subject to provisions contained in the SMP.

10.0 FINAL ENGINEERING REPORT

A FER and COC will be submitted to NYSDEC following implementation of the Remedial Action defined in this RAWP. The FER provides the documentation that the remedial work required under this RAWP has been completed and has been performed in compliance with this plan. The FER will provide a comprehensive account of the locations and characteristics of all material removed from the Site including the surveyed map(s) of all sources. The FER will include as-built drawings for all constructed elements, certifications, manifests, bills of lading as well as the complete SMP (formerly the Operation and Maintenance Plan). The FER will provide a description of the changes in the Remedial Action from the elements provided in the RAWP and associated design documents. The FER will provide a tabular summary of all performance evaluation sampling results and all material characterization results and other sampling and chemical analysis performed as part of the Remedial Action. The FER will provide test results demonstrating that all mitigation and remedial systems are functioning properly. The FER will be prepared in conformance with DER-10.

Where determined to be necessary by NYSDEC, a Financial Assurance Plan will be required to ensure the sufficiency of revenue to perform long-term operations, maintenance and monitoring tasks defined in the SMP and Environmental Easement. This determination will be made by NYSDEC in the context of the FER review.

The FER will include written and photographic documentation of all remedial work performed under this remedy.

The FER will include an itemized tabular description of actual costs incurred during all aspects of the Remedial Action.

The FER will provide a thorough summary of all residual contamination left on the Site after the remedy is complete. Residual contamination includes all contamination that exceeds the Track 1 Unrestricted Use SCO in 6NYCRR Part 375-6. A table that shows exceedances from Track 1 Unrestricted SCOs for all soil/fill remaining at the Site after the Remedial Action and a map that shows the location and summarizes exceedances from Track 1 Unrestricted SCOs for all soil/fill remaining at the Site after the Remedial Action will be included in the FER.

The FER will provide a summary of residual contamination that exceeds the SCOs defined for the Site in the RAWP and an explanation for why the material was not removed as part of the Remedial Action. A table that shows residual contamination in excess of Site SCOs and a map that shows residual contamination in excess of Site SCOs will be included in the FER.

The FER will include an accounting of the destination of all material removed from the Site, including excavated contaminated soil, historic fill, solid waste, hazardous waste, non-regulated material, and fluids. Documentation associated with disposal of all material must also include records and approvals for receipt of the material. It will provide an accounting of the origin and chemical quality of all material imported onto the Site.

Before approval of a FER and issuance of a COC, all project reports must be submitted in digital form on electronic media (PDF).

10.1 Certifications

The following certification will appear in front of the Executive Summary of the FER. The certification will be signed by the RE Jason Hayes, who is a Professional Engineer registered in New York State. This certification will be appropriately signed and stamped. The certification will include the following statements:

I _____certify that I am currently a NYS registered professional engineer, I had primary direct responsibility for the implementation of the subject construction program, and I certify that the Remedial Work Plan (or Remedial Design or Plans and Specifications) was implemented and that all construction activities were completed in substantial conformance with the DER-approved Remedial Work Plan (or Remedial Design or Plans and Specifications).

The data submitted to DER demonstrates that the remediation requirements set forth in the Remedial Work Plan (or Remedial Design or Plans and Specifications) and all applicable statutes and regulations have been or will be achieved in accordance with the time frames, if any, established in the work plan (or Remedial Design or Plans and Specifications).

All use restrictions, institutional controls, ECs and/or any operation and maintenance requirements applicable to the Site are contained in an environmental easement created and recorded pursuant to ECL 71-3605 and that any affected local governments, as defined in ECL 71-3603, have been notified that such easement has been recorded.

A SMP has been submitted for the continual and proper operation, maintenance, and monitoring of any ECs employed at the Site including the proper maintenance of any remaining monitoring wells, and that such plan has been approved by DER.

It is a violation of Article 145 of New York State Education Law for any person to alter this document in any way without the express written verification of adoption by any New York State licensed engineer in accordance with Section 7209(2), Article 145, New York State Education Law.

11.0 SCHEDULE

Mobilization will commence prior to remedial activities at the Site and is expected to take approximately 2 weeks. Once mobilization is complete, the remedial activities can begin, and are anticipated to take approximately 4 months. Within 90 days of completion of all remedial activities at the Site, a FER will be submitted to NYSDEC as detailed in Section 10.0. A Gantt chart showing a detailed project schedule is included in Appendix I.

Table 2
Alternative I Remedial Cost Estimate - Track 1 - Unrestricted Use SCOs
44-30 Purves Street
Block No. 268, Lots No. 1
Long Island City, New York

Track 1 – Unrestricted Use

Item No.	Description of Environmental Premium Item	Estimated Quantity		Unit Price		Estimated Premium
A - CONTRACTOR FEES						
A-1	Remediation Facilities, Mobilization, Demobilization, and Site Maintenance - Remediation and decontamination facilities, site fencing, trailer, truck cleaning facilities, etc.			**Allowance**		**$175,000**
A-2	Contaminated Material Excavation - Accounts for excavation of material containing concentrations exceeding Unrestricted Use Soil Cleanup Objectives.	**9,000**	**CY**	**$25**	**per CY**	**$225,000**
A-3	Transport and Disposal of Urban Fill - Includes transport vehicles and disposal of urban fill at a permitted facility.	**10,600**	**Tons**	**$50**	**per Ton**	**$530,000**
A-4	Transport and Disposal of Urban Fill with Hazardous Metals - Includes transport vehicles and disposal of urban fill at a permitted facility.	**2,600**	**Tons**	**$200**	**per Ton**	**$520,000**
A-5	Transport and Disposal of Petroleum Contaminated Material - Includes transport vehicles and disposal of petroleum-impacted fill material at a permitted facility.	**400**	**Tons**	**$80**	**per Ton**	**$32,000**
A-6	UST Removal - Registration, cleaning, removal and disposal of potential USTs. Includes the cost for the two anticipated USTs.	**2**	**Tanks**	**$10,000**	**per tank**	**$20,000**
A-7	Dust, Odor and Vapor Control - Includes odor, dust, and organic vapor control during the excavation of petroleum-impacted material, removal of USTs, and remediation of the Site. Assumes control measures will include, but not be limited to application of odor suppressant, foam or water.	**6**	**Months**	**$10,000**	**per Month**	**$60,000**
A-8	Support of Excavation - Includes sheeting or shoring along the perimeter of the Site.	**6,900**	**SF**	**$175**	**per SF**	**$1,207,500**
A-9	Underpinning - Accounts for foundation stabilization of southern and northern adjoining buildings during excavation.			**Allowance**		**$200,000**
A-10	Dewatering/Fluid Treatment - Accounts for the design, installation, and for cost to operate and maintain the dewatering and treatment system for 2 months.			**Allowance**		**$600,000**
A-11	Backfill - Import and placement of clean fill material to bring site to development grade. An additional 30% of material is included to account for compaction.	**8,000**	**CY**	**$45**	**per CY**	**$360,000**
A-12	Active Submembrane Depressurization System (SMD) System - To be installed under portions of the Site building that will not be used as a ventilated parking garage.			**Lump Sum**		**$140,000**
A-13	Vapor Barrier - The vapor barrier will be a minimum 20 mil thickness and installed as a continuous subslab membrane under slabs and outside subsurface walls.	**20,720**	**SF**	**$9**	**per SF**	**$187,000**
A-14	Mud Slab - To be poured on top of backfill layer in support of SMD system and vapor barrier installation.	**14,800**	**SF**	**$4**	**per SF**	**$60,000**
					SUBTOTAL (without contingency)	**$4,317,000**
					Remediation Contingency (25% of Contractor Costs)	**$1,080,000**
					SUBTOTAL (with contingency)	**$5,397,000**
B - ENGINEERING AND REMEDIATION OVERSIGHT FEES						
B-1	Preliminary Waste Characterization -Includes in-situ characterization of soil for off-site disposal in accordance with the criteria of most disposal facilities. Pre-characterization of the material to be removed as part of development/remedial excavation will assist in obtaining pre-approval from disposal facilities and understanding disposal cost.			**Lump Sum**		**$75,000**
B-2	Engineering Oversight during RAWP Implementation, Monthly and Daily Reporting - Full time oversight and office support	**6**	**Months**	**$**	**30,000 per Month**	**$180,000**
B-3	Community air monitoring program (CAMP) - Includes fulltime equipment rental and operation of perimeter dust and volatile organic compounds monitors and daily reporting.	**6**	**Months**	**$**	**2,500 per Month**	**$15,000**
B-4	Documentation Sampling - To confirm contaminated material removal (assumes analysis for VOCs, SVOCs, PCBs, pesticides, and metals for each sample).			**Lump Sum**		**$40,000**
B-5	Final Engineering Report (FER) and NYSBCP Closeout			**Lump Sum**		**$45,000**
					SUBTOTAL	**$355,000**
					REMEDIAL ALTERNATIVE 1 - TRACK 1 BCP ESTIMATE - SITE PREPARATION (without contingency)	**$4,672,000**
					REMEDIAL ALTERNATIVE 1 - TRACK 1 BCP ESTIMATE - SITE PREPARATION (with contingency)	**$5,752,000**

General Assumptions and Conditions:

1. Cost estimate is based on Langan past experience and generalized vendor estimates using 2013 dollars.
2. This estimate has been prepared for the purposes of comparing potential remedial alternatives. The information in this cost estimate is based on the available information regarding the site investigation and the anticipated scope of the remedial alternative. Changes in cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. This cost estimate is expected to be within -30% to +50% of the actual cost. Utilization of this cost estimate information beyond the stated purpose is not recommended. Langan is not licensed to provide financial or legal consulting services; as such, this cost estimate information is not intended to be utilized for complying with financial reporting requirements associated with liability services.
3. The density used for conversion from cubic yards to tons was 1.5 tons per cubic yard.
4. Excavation depths were calculated using Phase II and Remedial Investigation soil sample results, field observations, and observed fill depths.
5. If contamination could not be delineated vertically based on soil sample results, it was assumed that contamination extended to the terminus of historic fill.

Contractor Cost Assumptions:

Item A-2: The unit rate provided reflects construction labor to be OSHA certified.

Item A-4: Hazardous material disposal assumes union disposal costs for the New York City area. This number is an allowance (hazardous material presence has not been confirmed). This item does not include hazardous waste fees and taxes, which should be waived considering the site is the NYS BCP.

Items A-3 to A-5: A truck wash area will be established and maintained near the exit of the site. All trucks that have come into contact with site contaminated material will need to be washed prior to leaving Site. All trucks containing hazardous waste or petroleum-impacted material shall be lined.

Item A-7: Vapor/odor control cost estimate includes equipment, and materials necessary to monitor vapor/odor emission during intrusive site activities. Cost estimate includes application of vapor/odor suppressing foam to open excavations and soil loaded into trucks.

Item A-12: The SMD system will include a subslab collection layer (6- to 12-inch layer of ¾-inch clean stone) with horizontal perforated collection pipes, riser pipes to convey the collected vapor to the roof, and a roof-mounted blower system that will maintain a constant negative pressure through the piping and collection layer. Two riser pipers and blowers systems are anticipated.

Item A-13: Additional vapor barrier needed on sidewalls of the building perimeter and deep foundation elements was estimated by adding a 40% markup to the building area.

Engineering Cost Assumptions:

Item B-1: Sampling frequency based on 9,000 cubic yards of material at a conservative rate of 500 cubic yards/sample. A representative suite (not disposal facility specific) of analyses was assumed. Sample collection activities assumed to occur over a three-day, single mobilization. Assumes standard turnaround time for sample analysis.

Item B-2: Engineering oversight includes community air monitoring program (CAMP), onsite engineer throughout remediation, remediation health and safety including purchase and maintenance of appropriate PPE, periodic office reporting to NYSDEC, and 2 site meetings per month.

Item B-3: Community air monitoring program (CAMP) assumed duration of four months. CAMP scope includes fulltime equipment operation of perimeter dust and volatile organic compounds monitors and daily reporting.

Item B-4: Confirmation samples scope based on 53 samples analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), PCBs, pesticides, and metals. Cost includes labor and materials to collect samples and subcontracted laboratory analysis by a New York State Department of Health (NYSDOH) environmental laboratory approval program (ELAP)-accredited laboratory. Assumes standard turnaround time for sample analysis.

Table 3
Alternative II Remedial Cost Estimate - Track 4 - Site-Specific SCOs
44-30 Purves Street
Block No. 268, Lots No. 1
Long Island City, New York

Track 4 – Restricted Use with Site-Specific SCOs

Item No.	Description of Environmental Premium Item	Estimated Quantity		Unit Price		Estimated Premium
A - CONTRACTOR FEES						
A-1	Remediation Facilities, Mobilization, Demobilization, and Site Maintenance - Remediation and decontamination facilities, trailer, truck cleaning facilities, etc.			**Allowance**		**$100,000**
A-2	Contaminated Material Excavation - Accounts for excavation of material containing concentrations exceeding the cleanup levels that are estimated to be agreed upon with NYSDEC (assumes excavation can be safely executed with sloping as the only excavation support method)	**5,800**	**CY**	**$25**	**per CY**	**$145,000**
A-3	Support of Excavation - Accounts for design and implementation of excavation support for remedial excavation below 4 feet below grade surface.			**Allowance**		**$187,500**
A-4	Transport and Disposal of Urban Fill - Includes transport vehicles and disposal of urban fill at a permitted facility.	**6,000**	**Tons**	**$50**	**per Ton**	**$300,000**
A-5	Transport and Disposal of Urban Fill with Hazardous Metals - Includes transport vehicles and disposal of urban fill at a permitted facility.	**2,400**	**Tons**	**$200**	**per Ton**	**$480,000**
A-6	Transport and Disposal of Petroleum Contaminated Material - Includes transport vehicles and disposal of petroleum-impacted fill material at a permitted facility.	**400**	**Tons**	**$85**	**per Ton**	**$34,000**
A-7	UST Removal - Registration, cleaning, removal and disposal of potential USTs. Includes the cost for the two anticipated USTs.	**2**	**Tanks**	**$10,000**	**per tank**	**$20,000**
A-8	Dust, Odor and Vapor Control - Includes odor, dust, and organic vapor control during the excavation of petroleum-impacted material, removal of USTs, and remediation of the Site. Assumes control measures will include, but not be limited to application of odor suppressant, foam or water.	**4**	**Months**	**$10,000**	**per Month**	**$40,000**
A-9	Backfill - Import and placement of clean fill material to bring site to development grade. An additional 30% of material is included to account for compaction.	**5,000**	**CY**	**$45**	**per CY**	**$225,000**
A-10	Incidental Groundwater Collection and Disposal - Accounts for limited, localized groundwater pumping, collection and disposal to accommodate small excavations that may required below the water table for an elevator pit or similar.			**Allowance**		**$60,000**
A-11	Active Submembrane Depressurization System (SMD) System - To be installed under portions of the Site building that will not be used as a ventilated parking garage.			**Lump Sum**		**$140,000**
A-12	Vapor Barrier - The vapor barrier will be a minimum 20 mil thickness and installed as a continuous subslab membrane under slabs and outside subsurface walls.	**20,720**	**SF**	**$9**	**per SF**	**$187,000**
A-13	Mud Slab - To be poured on top of backfill layer in support of SMD system and vapor barrier installation.	**14,800**	**SF**	**$4**	**per SF**	**$60,000**
A-14	Composite Cap (Concrete slab) - 6-inch reinforced structural slab to be poured above the vapor barrier.	**26,850**	**SF**	**$17.50**	**per SF**	**$470,000**
				SUBTOTAL (without contingency)		**$2,448,500**
				Remediation Contingency (25% of Contractor Costs)		**$613,000**
				SUBTOTAL (with contingency)		**$3,061,500**
B - ENGINEERING AND REMEDIATION OVERSIGHT FEES						
B-1	Preliminary Waste Characterization -Includes in-situ characterization of soil for off-site disposal in accordance with the criteria of most disposal facilities. Pre-characterization of the material to be removed as part of development/remedial excavation will assist in obtaining pre-approval from disposal facilities and understanding disposal cost.			**Lump Sum**		**$45,000**
B-2	Engineering Oversight during RAWP Implementation, Monthly and Daily Reporting - Full time oversight and office support	**4**	**Months**	**$ 33,000**	**per Month**	**$132,000**
B-3	Community air monitoring program (CAMP) - Includes fulltime equipment rental and operation of perimeter dust and volatile organic compounds monitors and daily reporting.	**4**	**Months**	**$ 2,500**	**per Month**	**$10,000**
B-4	Documentation Sampling - To confirm source material removal (assumes analysis for VOCs, SVOCs, PCBs, pesticides, and metals for each sample).			**Lump Sum**		**$56,000**
B-5	Final Engineering Report (FER), Site Management Plan (SMP) and NYSBCP Closeout			**Lump Sum**		**$65,000**
				SUBTOTAL		**$308,000**
				REMEDIAL ALTERNATIVE 2 - TRACK 4 BCP ESTIMATE - SITE PREPARATION (without contingency)		**$2,756,500**
				REMEDIAL ALTERNATIVE 2 - TRACK 4 BCP ESTIMATE - SITE PREPARATION (with contingency)		**$3,369,500**

General Assumptions and Conditions:

1. Cost estimate is based on Langan past experience and generalized vendor estimates using 2013 dollars.

2. This estimate has been prepared for the purposes of comparing potential remedial alternatives. The information in this cost estimate is based on the available information regarding the site investigation and the anticipated scope of the remedial alternative. Changes in cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. This cost estimate is expected to be within -30% to +50% of the actual cost. Utilization of this cost estimate information beyond the stated purpose is not recommended. Langan is not licensed to provide financial or legal consulting services; as such, this cost estimate information is not intended to be utilized for complying with financial reporting requirements associated with liability services.

3. The density used for conversion from cubic yards to tons was 1.5 tons per cubic yard.

4. Excavation depths were calculated using Phase II and Remedial Investigation soil sample results, field observations, and observed fill depths.

5. If contamination could not be delineated vertically based on soil sample results, it was assumed that contamination extended to the terminus of historic fill.

6. We assume that slope stabilization will be achieved by sloping the excavation. This cost estimate does not include the cost of shoring or sheeting.

Contractor Cost Assumptions:

Item A-2: The unit rate provided reflects construction labor to be OSHA certified.

Item A-5: Hazardous material disposal assumes union disposal costs for the New York City area. This number is an allowance (hazardous material presence has not been confirmed). This item does not include hazardous waste fees and taxes.

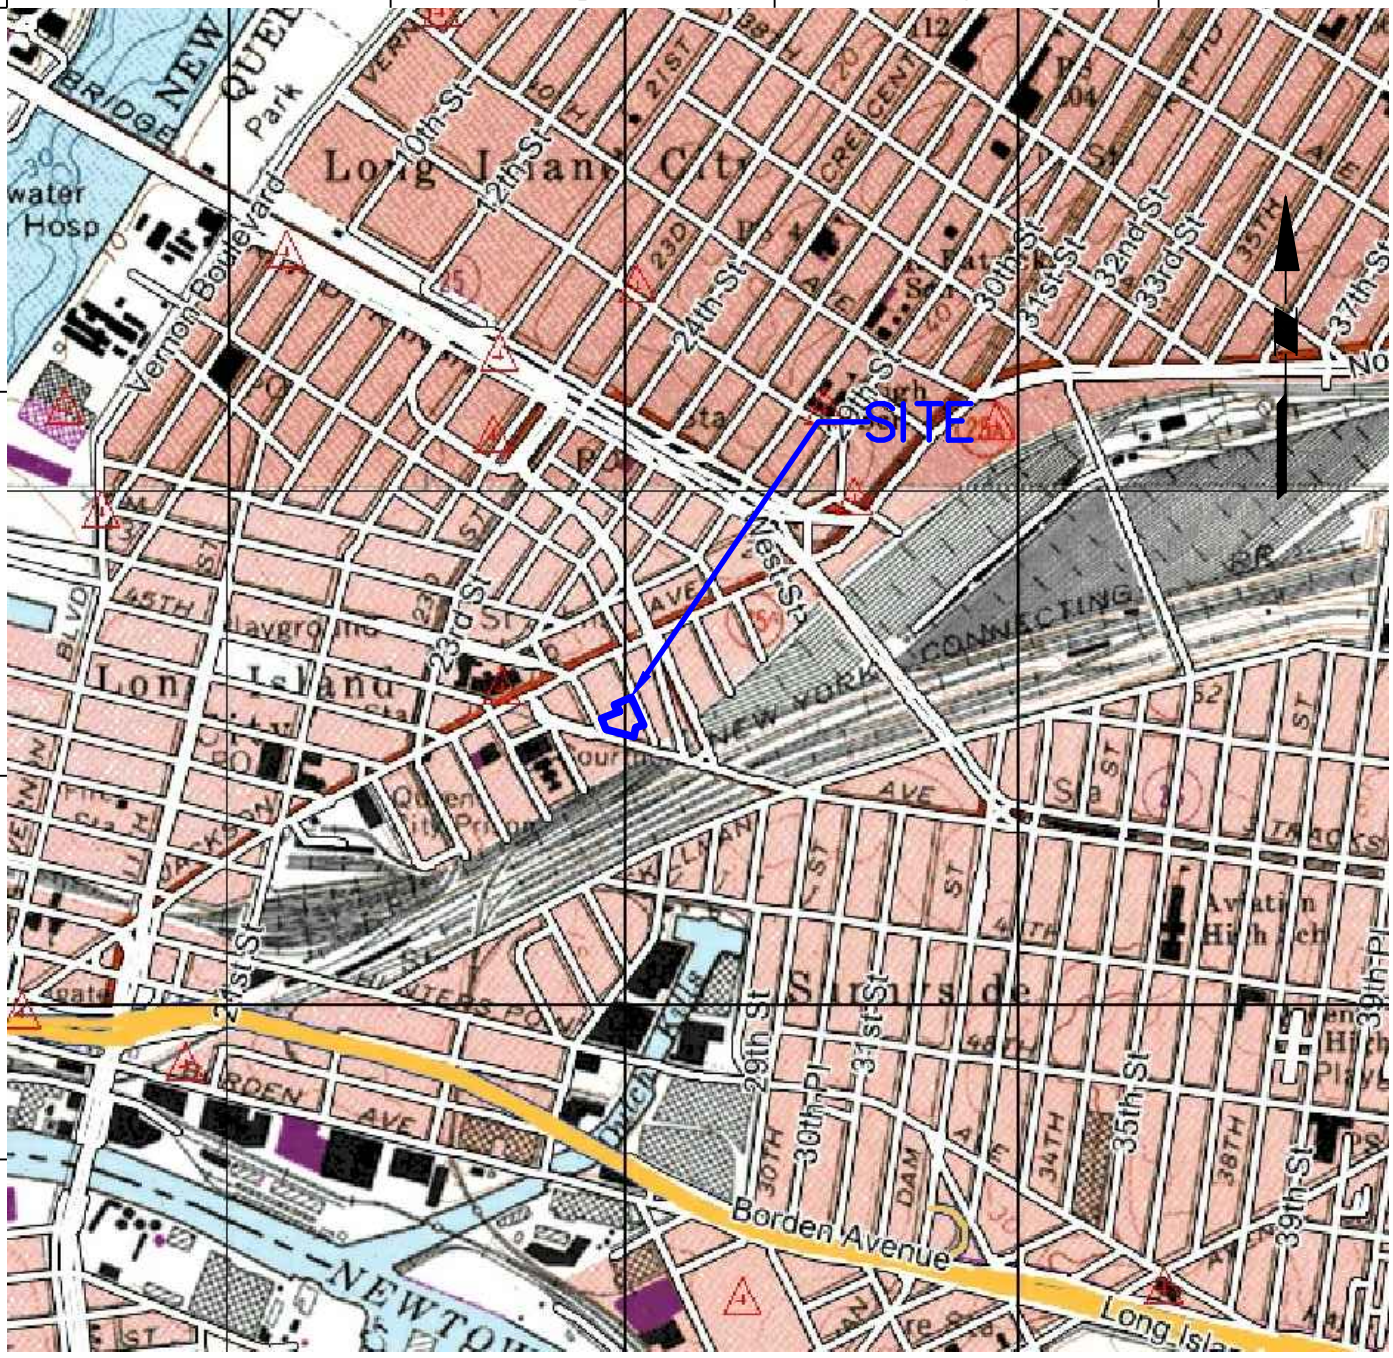
Items A-4 to A-6: A truck wash will be established and maintained near the exit of the site. All trucks that have come into contact with site contaminated material will need to be washed prior to leaving Site. All trucks containing hazardous waste or petroleum-impacted material shall be lined.

Item A-8: Vapor/odor control cost estimate includes equipment, and materials necessary to monitor vapor/odor emission during intrusive site activities. Cost estimate includes application of vapor/odor suppressing foam to open excavations and soil loaded into trucks.

Item A-11: The SMD system will include a subslab collection layer (6- to 12-inch layer of ¾-inch clean stone) with horizontal perforated collection pipes, riser pipes to convey the collected vapor to the roof, and a roof-mounted blower system that will maintain a constant negative pressure through the piping and collection layer. Two riser pipers and blowers systems are anticipated.

Item A-12: Additional vapor barrier needed on sidewalls of the building perimeter and deep foundation elements was estimated by adding a 40% markup to the building area.

Engineering Cost Assumptions:



Item B-1: Sampling frequency based on 5,800 cubic yards of material at a conservative rate of 500 cubic yards/sample. A representative suite (not disposal facility specific) of analyses was assumed. Sample collection activities assumed to occur over a three-day, single mobilization. Assumes standard turnaround time for sample analysis.

Item B-2: Engineering oversight includes community air monitoring program (CAMP), onsite engineer throughout remediation, remediation health and safety including purchase and maintenance of appropriate PPE, periodic office reporting t NYSDEC, and 2 site meetings per month.

Item B-3: Community air monitoring program (CAMP) assumed duration of four months. CAMP scope includes fulltime equipment operation of perimeter dust and volatile organic compounds monitors and daily reporting.

Item B-4: Documentation samples scope based on 73 samples analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), PCBs, pesticides, and metals. Cost includes labor and materials to collect samples an subcontracted laboratory analysis by a New York State Department of Health (NYSDOH) environmental laboratory approval program (ELAP)-accredited laboratory. Assumes standard turnaround time for sample analysis.

LEGEND

- SB05 — BORING LOCATION
- SB01/MW01 — BORING AND MONITORING WELL LOCATION
- SITE BOUNDARY
- (2' - 3') — DEPTH INTERVAL AT WHICH PETROLEUM IMPACTS, INCLUDING ODORS, STAINING, AND PHOTOIONIZATION DETECTOR (PID) READINGS ABOVE BACKGROUND LEVELS, WERE OBSERVED IN THE BORING

NOTES:

1. DRAWING BASED ON MAY 5, 2014 SURVEY BY APPLE SURVEYING.
2. MONITORING WELL LOCATIONS WERE SURVEYED, BORING LOCATIONS WERE LOCATED BY FIELD MEASUREMENTS OFF OF SURVEYED STRUCTURES.
3. SOIL SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TITLE 6 OF THE COMPILATION OF NEW YORK CODES, RULES, AND REGULATIONS (NYCRR) PART 375 UNRESTRICTED USE SOIL CLEANUP OBJECTIVES (SCO) AND RESTRICTED RESIDENTIAL RESTRICTED USE SCOs.
4. ONLY COMPOUNDS EXCEEDING THEIR RESPECTIVE SCOs ARE SHOWN.
5. CONCENTRATIONS ABOVE THE NYSDEC PART 375 UNRESTRICTED USE SCOs ARE IN BOLD.
5. CONCENTRATIONS ABOVE THE NYSDEC PART 375 RESTRICTED RESIDENTIAL RESTRICTED SCOs ARE HIGHLIGHTED.
6. DUP01_022014 IS A DUPLICATE OF SAMPLE SB04_1-3; DUPR101_041614 IS A DUPLICATE OF SAMPLE SB10_9-10; AND DUPR102_041614 IS A DUPLICATE OF SAMPLE SB16_6.5-8.
7. VOC = VOLATILE ORGANIC COMPOUND
8. SVOC = SEMIVOLATILE ORGANIC COMPOUND
9. PCB = POLYCHLORINATED BIPHENYL
10. mg/kg = MILLIGRAM PER KILOGRAM
11. ND = NOT DETECTED
12. NE = COMPOUND DETECTED AT A CONCENTRATION THAT DID NOT EXCEED THE NYSDEC PART 375 UNRESTRICTED USE SCOs AND RESTRICTED RESIDENTIAL RESTRICTED SCOs .

QUALIFIERS:

J = DETECTED ABOVE THE METHOD DETECTION LIMIT BUT BELOW THE REPORTING LIMIT; THEREFORE, THE RESULT IS AN ESTIMATED CONCENTRATION
B = ANALYTE WAS DETECTED IN THE ASSOCIATED LABORATORY ANALYSIS BATCH BLANK
DII = RESULT IS FOR A DILUTED SAMPLE, # INDICATES THE DILUTION FACTOR

GENERAL NOTES:

1. BASE MAP TAKEN FROM FXFOWLE, "FOUNDATION PLAN, FO-101.00", DATED OCTOBER 22, 2014.
2. VAPOR BARRIER EXTENDS BELOW THE FOOTPRINT AND ALONG THE VERTICAL WALLS OF DEPRESSED FOUNDATION MAT AND SLABS, AS NOTED IN THE DRAWING. VAPOR BARRIER SHALL BE INSTALLED IN ACCORDANCE WITH MANUFACTURER'S SPECIFICATIONS AND RECOMMENDATIONS.
3. VAPOR COLLECTION PIPE RUNS ARE APPROXIMATE. PIPE LOCATIONS ARE SUBJECT TO CHANGE PER FIELD CONDITIONS.
4. RISER PIPE STUB LOCATION IS APPROXIMATE. RISER PIPE RUNS AND ROOF-TOP BLOWER AND EXHAUST POINT LOCATIONS TO BE DESIGNED BY OTHERS.
5. SUBMEMBRANE DEPRESSURIZATION SYSTEM (SMD) AND VAPOR BARRIER DETAILS ARE INCLUDED IN APPENDIX E.
6. THE DEEP ELEVATOR PIT AND SHEAR WALL PILE CAP WILL NOT BE DEPRESSURIZED BECAUSE IT IS A 6-FOOT THICK CONCRETE MAT AND WILL BE WATERPROOFED IN ACCORDANCE WITH THE FOUNDATION DRAWINGS AND SPECIFICATIONS.
7. THE WATERPROOFING BENEATH THE SHEAR WALL PILE CAP, DEEP ELEVATOR PIT, AND ANY OTHER WATERPROOFED FOUNDATION ELEMENT, WILL BE MARRIED TO THE VAPOR BARRIER MEMBRANE IN ACCORDANCE WITH MANUFACTURER SPECIFICATIONS.
8. SLEEVES THROUGH GRADE BEAMS TO BE DESIGNED BY OTHERS.

NOTE:

* NOT FOR TITLE PURPOSES

CAUTION: BEFORE PERFORMING ANY DIGGING OR DRILLING ON THIS SITE, IT IS REQUIRED THAT SUBSURFACE SERVICES, INCLUDING THE UNDERGROUND MAINS BE MARKED AND IDENTIFIED BY THE UTILITY INVOLVED IN COMPLIANCE WITH INDUSTRIAL CODE 53 OF NEW YORK STATE.

1) ALL ELEVATIONS REFER TO NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88) WHICH IS 1.095 FEET ABOVE NATIONAL GEODETIC SURVEY DATUM AT SANDY HOOK NEW JERSEY.
2) UNDERGROUND UTILITY INFORMATION SHOWN WAS OBTAINED FROM VARIOUS COMPANIES AND CITY AGENCIES AND IS NOT GUARANTEED FOR ACCURACY OR COMPLETENESS.
3) THIS IS TO CERTIFY THAT THERE ARE NO APPARENT STREAMS NOR NATURAL WATER COURSES IN THE PROPERTY AS SHOWN ON THIS SURVEY.

UNAUTHORIZED ALTERATIONS OR ADDITIONS TO THIS SURVEY IS A VIOLATION OF SECTION 7209 OF THE NEW YORK STATE EDUCATION LAW. COPIES OF THIS SURVEY MAP NOT BEARING THE LAND SURVEYOR'S INKED SEAL OR EMBOSSED SEAL SHALL NOT BE CONSIDERED TO BE A VALID TRUE COPY. GUARANTEES OR CERTIFICATIONS INDICATED HEREON SHALL RUN ONLY TO THE PERSON FOR WHOM THE SURVEY IS PREPARED, AND ON HIS BEHALF TO THE TITLE COMPANY, GOVERNMENTAL AGENCY AND LENDING INSTITUTION LISTED HEREON, AND TO THE ASSIGNEES OF THE LENDING INSTITUTION. GUARANTEES OR CERTIFICATION ARE NOT TRANSFERABLE TO ADDITIONAL INSTITUTIONS OR SUBSEQUENT OWNERS.

Appendix B

Proposed Development Plans

GENERAL NOTES NEW YORK - NEW SPEC NEW CONSTRUCTION:

I - CODES

1. BUILDING CODE OF THE CITY OF NEW YORK, INCLUDING LATEST AMENDMENTS ("2008 N.Y.C. CODE"), CONSISTING OF THE 2003 INTERNATIONAL BUILDING CODE.
2. AMERICAN CONCRETE INSTITUTE "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" ACI 318-02 ("ACI") AS MODIFIED BY CHAPTER 19 OF THE N.Y.C. BUILDING CODE.
3. AMERICAN CONCRETE INSTITUTE "BUILDING CODE REQUIREMENTS FOR MASONRY STRUCTURES" ACI 530-02 ("ACI 530") AS MODIFIED CHAPTER 21 OF THE N.Y.C. BUILDING CODE.

II - MATERIALS

UNLESS OTHERWISE SHOWN OR NOTED ON DRAWINGS:

1. STRUCTURAL STEEL:
   ALL ROLLED SHAPES: ASTM A572 OR A992, GRADE 50
   ALL PLATES AND CONNECTION MATERIAL: ASTM A36
   ALL TUBULAR SECTIONS: ASTM A500, GRADE B
   ANCHOR BOLTS, U.O.N.: ASTM F1554
2. CAST-IN-PLACE CONCRETE:
   FOUNDATION WALLS & BUTTRESSES: 5000 PSI NORMAL WT. (145 PCF)
   MAT FOUNDATIONS AND PILE CAPS: 6000 PSI NORMAL WT. (145 PCF)
   GRADE BEAMS AND STRAP BEAMS: 6000 PSI NORMAL WT. (145 PCF)
   FORMED SLABS: AS NOTED ON PLAN DRAWINGS
   COLUMNS AND WALLS: AS NOTED ON COLUMN SCHEDULE
3. REINFORCEMENT:
   DEFORMED BARS: ASTM A615, GRADE 60, GRADE 75 FOR #10 & #11
   WELDED WIRE FABRIC: ASTM A185.
   WELDED DEFORMED WIRE FABRIC: ASTM A467, GRADE 60.
4. WELDING ELECTRODES: E70XX LOW HYDROGEN.
5. BOLTING MATERIALS: ASTM A325 OR F1852 (TWIST-OFFTYPE).
   OR A490. U.O.N.

III - GENERAL

1. NOTES, TYPICAL DETAILS AND SCHEDULES APPLY TO ALL STRUCTURAL WORK UNLESS OTHERWISE NOTED. FOR CONDITIONS NOT SPECIFICALLY SHOWN, PROVIDE DETAILS OF A SIMILAR NATURE. VERIFY APPLICABILITY BY SUBMITTING SHOP DRAWINGS FOR REVIEW.
2. STRUCTURAL DRAWINGS SHALL BE USED IN CONJUNCTION WITH THE SPECIFICATIONS, ARCHITECTURAL AND MECHANICAL DRAWINGS. IF THERE IS A DISCREPANCY BETWEEN DRAWINGS IT IS THE CONTRACTOR'S RESPONSIBILITY TO NOTIFY THE ENGINEER PRIOR TO PERFORMING WORK.
3. DO NOT SCALE DRAWINGS TO OBTAIN DIMENSIONAL INFORMATION.
4. SEE ARCHITECTURAL DRAWINGS AND SPECIFICATIONS FOR WATER/DAMPROOFING AND FIREPROOFING DETAILS AND REQUIREMENTS.
5. TOP OF CONCRETE SLABS ARE AT FLOOR REFERENCE ELEVATIONS EXCEPT AS NOTED. FOR FLOOR REFERENCE ELEVATIONS SEE COLUMN SCHEDULE.
6. THESE DRAWINGS DO NOT DEFINE SCOPE OF CONTRACTS. SEE CONSTRUCTION MANAGER'S DOCUMENTS.
7. AT ALL TIMES THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR THE CONDITIONS OF THE JOBSITE INCLUDING SAFETY OF PERSONS AND PROPERTY. THE ARCHITECTS OR ENGINEER'S PRESENCE OR REVIEW OF WORK DOES NOT INCLUDE THE ADEQUACY OF THE CONTRACTOR'S MEANS OR METHODS OF CONSTRUCTION.
8. SHORING, BRACING AND PROTECTION OF EXISTING AND ADJACENT STRUCTURES DURING CONSTRUCTION IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR. PROTECT AND MAINTAIN THE INTEGRITY OF ADJACENT STREETS, BUILDINGS AND STRUCTURES.
9. ALL EXISTING DIMENSIONS AND LOCATIONS OF EXISTING STRUCTURES SHOWN ON THE DRAWINGS SHALL BE VERIFIED BY FIELD MEASUREMENTS. ANY DISCREPANCIES SHALL BE REPORTED TO THE ENGINEER.
10. DRAWINGS HAVE BEEN PREPARED BASED ON AVAILABLE KNOWLEDGE OF EXISTING CONDITIONS. IF, DURING DEMOLITION, EXCAVATION OR CONSTRUCTION, ACTUAL CONDITIONS ARE DISCOVERED TO DIFFER FROM THOSE INDICATED ON DRAWINGS, ENGINEER SHALL BINOTIFIED.
11. CONSTRUCTION DOCUMENTS ARE IN COMPLIANCE WITH SECTION BC 1603 OF NEW YORK CITY BUILDING CODE.

IV - FOUNDATION NOTES

1. ALL THE COLUMNS AND SHEAR WALLS SHALL BEAR ON DEEP FOUNDATIONS SUCH AS H-PILES, PIPE PILES, OR CAISSONS.
2. NO BACKFILL SHALL BE PLACED AGAINST FOUNDATION WALLS UNLESS SUPPORTING SLABS ARE IN PLACE AND SET OR THE WALLS ARE ADEQUATELY BRACED.
3. UNDERPINNING OF EXISTING ADJACENT FOUNDATIONS MAY BE REQUIRED. ALL ENGINEERING, DESIGNS AND MEANS AND METHODS OF CONSTRUCTION RELATED TO UNDERPINNING ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR.
4. DEWATERING OF THE SITE DURING CONSTRUCTION IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR. PRECAUTIONS SHALL BE TAKEN BY THE CONTRACTOR NOT TO UNDERMINE EXISTING FOUNDATIONS. METHOD OF DEWATERING AND CALCULATIONS FOR THE APPROPRIATE SYSTEM ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR.
5. ALL PILE CAPS ARE TO BE CENTERED ON COLUMNS ABOVE, U.O.N.
6. PROVIDE DOWELS IN FOUNDATIONS FOR ALL WALLS, COLUMNS, AND SHEAR WALLS OF SAME NUMBER AND SIZE AS THE VERTICAL REINFORCEMENT ABOVE, U.O.N.
7. PROVIDE WATERSTOPS IN ALL VERTICAL CONSTRUCTION JOINTS IN BASEMENT WALLS.
8. SLABS ON GROUND SHALL BE PLACED ON SELECT FILL COMPACTED TO 95 PERCENT MODIFIED PROCTOR MAXIMUM DRY DENSITY (ASTM D1557).

V - UNDERPINNING NOTES

1. CONTRACTOR SHALL RETAIN THE SERVICE OF A PROFESSIONAL ENGINEER REGISTERED IN THE STATE OF NEW YORK TO PREPARE SIGNED AND SEALED DESIGN DRAWINGS AND CALCULATIONS FOR ALL REQUIRED UNDERPINNING OF ADJACENT STRUCTURES. THE CONTRACTOR SHALL FILE THE DRAWINGS WITH THE BUILDING DEPARTMENT.
2. SUBMIT COPY OF FILED DRAWINGS TO DESIMONE FOR INFORMATION ONLY. ALL UNDERPINNING WORK SHALL BE SUBJECT TO SPECIAL INSPECTION IN ACCORDANCE WITH LOCAL CODE REQUIREMENTS.
3. THE FULL SCOPE OF THIS WORK IS TO BE DETERMINED BY THE CONTRACTOR BY THE REVIEW OF ALL AVAILABLE DOCUMENTATION SUCH AS SURVEYS, GEOTECHNICAL REPORTS AND THE LIKE AND BY SITE REVIEW PRIOR TO BIDDING.
4. THE CONTRACTOR IS SOLELY RESPONSIBLE FOR THE SAFETY OF ALL EXISTING ADJACENT BUILDINGS, STRUCTURES, SIDEWALKS, VAULTS AND THE LIKE DURING AND AS A RESULT OF UNDERPINNING OPERATIONS.

VI - CONCRETE NOTES

1. REINFORCING STEEL SHALL HAVE A MINIMUM CLEAR COVER AS FOLLOWS, U.O.N. IN DRAWINGS:

   CONCRETE POURED AGAINST EARTH..... 3"

   CONCRETE EXPOSED TO EARTH OR WEATHER:
   #5 OR SMALLER..... 11/2"
   #6 OR LARGER..... 2"

   CONCRETE NOT EXPOSED TO WEATHER OR IN CONTACT WITH GROUND:
   COLUMNS (TIES AND MAIN REINFORCING)..... 11/2"
   SLABS, WALLS,
   #11 OR SMALLER..... 3/4"
   BEAMS (STIRRUPS AND MAIN REINF)..... 11/2"

   CLEAR COVER SHALL BE CLEARLY SHOWN ON ALL REBAR DETAIL DRAWINGS.
2. ALL REINFORCEMENT SHALL BE SECURELY HELD IN POSITION WHILE PLACING CONCRETE. IF NECESSARY, ADDITIONAL BARS SHALL BE PROVIDED BY THE CONTRACTOR TO FURNISH SUPPORT.
3. THE CONTRACTOR SHALL VERIFY THE DIMENSIONS AND LOCATIONS OF ALL OPENINGS, PIPE SLEEVES, ETC. AS REQUIRED BY ALL TRADES, BEFORE THE CONCRETE IS POURED. THE CONTRACTOR SHALL CONSULT THE ARCHITECTURAL, MECHANICAL, AND ELECTRICAL DRAWINGS, AS WELL AS THE STRUCTURAL DRAWINGS FOR THE LOCATION, NUMBER, AND SIZE OF ALL OPENINGS, SLEEVES, ETC. HOWEVER, OPENINGS NOT SHOWN ON THE STRUCTURAL DRAWINGS SHALL BE INSTALLED ONLY AFTER APPROVAL BY THE STRUCTURAL ENGINEER IS OBTAINED.
4. LOCATION OF ALL CONSTRUCTION JOINTS NOT SHOWN IN DRAWINGS SHALL BE SUBMITTED TO ENGINEER FOR APPROVAL PRIOR TO DETAILING OF REINFORCING. ALL CONSTRUCTION JOINTS TO BE CLEARLY SHOWN IN REBAR DETAIL DRAWINGS. ENGINEER MAY REQUIRE ADDITIONAL REINFORCING AT CONSTRUCTION JOINTS.
5. DIMENSIONS "Ld" AS NOTED ON DRAWINGS SHALL BE AS FOLLOWS:

BEAMS		
BAR SIZE	BOTTOM BARS	OTHER BARS
#3	13	17
#4	17	23
#5	22	28
#6	26	34
#7	38	49
#8	43	56
#9	48	63
#10	54	71
#11	60	78

COLUMNS	
BAR SIZE	Ld
#3	13
#4	17
#5	22
#6	26
#7	38
#8	43
#9	48
#10	54
#11	60

TABLE ASSUMPTIONS:
1. f'c = 5 ksi
2. A MINIMUM CLEAR COVER AS SHOWN IN NOTE 1 ABOVE
3. A MINIMUM CLEAR SPACING OF 3" BETWEEN ANY BARS
4. fy = 60 ksi
5. NORMAL WEIGHT CONCRETE
6. FOR WALLS:
   CASE 1 = CLEAR SPACING > 2db AND CLEAR COVER > db
   CASE 2 = OTHER THAN CASE 1

WALLS				
BAR SIZE	VERTICAL BARS		HORIZONTAL BARS	
	CASE 1	CASE 2	CASE 1	CASE 2
#3	13	20	17	25
#4	17	26	23	34
#5	22	32	28	42
#6	26	39	34	50
#7	38	56	49	73
#8	43	64	56	83
#9	48	72	63	94
#10	54	81	70	106
#11	60	90	78	117

SLABS / MATS			
BAR SIZE	THICKNESS 12" OR LESS	THICKNESS GREATER THEN 12"	
	ALL BARS	BOTTOM BARS	OTHER BARS
#3	13	13	17
#4	17	17	23
#5	22	22	28
#6	26	26	34
#7	56	56	73
#8	64	64	83
#9	72	72	94
#10	81	81	106
#11	90	90	117

FOR: f'c = 3 ksi Ld =1.29 x TABLE VALUE
f'c = 4 ksi Ld =1.12 x TABLE VALUE
f'c = 6 ksi Ld =0.92 x TABLE VALUE
f'c = 8 ksi Ld =0.79 x TABLE VALUE

6. ALL LAP SPLICES SHALL BE 1.3LD UNLESS NOTED OTHERWISE ON DRAWINGS.
7. FOR LIGHTWEIGHT AGGREGATE CONCRETE, MULTIPLY THE TABULATED VALUES BY 1.3.
8. COMBINATIONS OF EFFECTS DUE TO CONCRETE STRENGTH, CONCRETE WEIGHT ARE CUMULATIVE. Ld SHALL BE MULTIPLIED BY EACH FACTOR TO FIND THE CORRECT VALUE.
9. DOWEL BAR SUBSTITUTIONS SHALL BE PERMITTED PROVIDED THAT MANUFACTURER'S DATA SUPPORTS FULL TENSION SPLICES.
10. ALL SLEEVES AND PENETRATIONS SHALL BE PROVIDED BY THE SUB-CONTRACTOR REQUIRING THE OPENING.
11. CONCRETE COLUMN LENGTH ADJUSTMENT FOR ELASTIC SHORTENING, SHRINKAGE AND CREEP EFFECTS SHALL BE DISCUSSED WITH THE CONCRETE CONTRACTOR.
12. CONDUIT PLACED IN CONCRETE SLABS MUST BE PLACED IN ACCORDANCE WITH THE FOLLOWING GUIDELINES:
    a. CONTRACTOR SHALL NOT INSTALL CONDUIT THAT IS NOT SHOWN ON MECHANICAL DRAWINGS.
    b. DO NOT CROSS MORE THAN ONE LAYER OF CONDUIT OVER ANOTHER IN ANY GIVEN AREA.
    c. PLACE CENTROID OF CONDUIT OR CONDUIT GROUP AT THE MID-HEIGHT OF THE SLAB.
    d. CONDUIT OR CONDUIT GROUP CAN NOT EXTEND OUTSIDE THE MIDDLE 1/3 OF THE SLAB.
    e. MAINTAIN A MINIMUM CLEAR SPACING BETWEEN THE CONDUIT OF 3 DIAMETERS. THIS REQUIREMENT APPLIES EXCEPT WHERE CONDUIT ACCUMULATES AT "TURN DOWNS". THE CONDITIONS AT "TURN DOWNS" LOCATIONS MUST BE EVALUATED AT EACH LOCATION BY THE STRUCTURAL ENGINEER. "TURN DOWNS" CAN NOT OCCUR AT COLUMN OR BUTTRESS LOCATIONS.
    f. DO NOT PLACE ANY CONDUIT IN THE SLAB WITHIN 36" FROM THE EDGE OF ANY COLUMN OR WALL ABOVE OR BELOW THE SLAB.
    g. SLAB REINFORCEMENT MUST NOT BE MOVED, CUT, OR BENT TO ACCOMODATE CONDUIT PLACEMENT.
    h. CONDUIT IS NOT TO RUN THROUGH G/R WITHIN A COLUMN OR WALL.
    i. ALUMINUM CONDUIT SHALL NOT BE EMBEDDED IN A SLAB UNLESS IT IS EFFECTIVELY COATED.

    IF THE ABOVE REQUIREMENTS ARE ALL MET, CONDUIT LOCATIONS NEED NOT BE REVIEWED BY THE STRUCTURAL ENGINEER. ANY DEVIATIONS MUST BE SUBMITTED ON A SHOP DRAWING FOR APPROVAL BY THE STRUCTURAL ENGINEER PRIOR TO CONDUIT PLACEMENT.

    THE FOLLOWING CASES MUST BE SUBMITTED FOR REVIEW BY THE STRUCTURAL ENGINEER:

    a. LOCATIONS OF ANY CONDUIT LARGER THAN 2" IN OUTSIDE DIAMETER.
    b. LOCATIONS OF ANY BUNDLED CONDUITS.

VII - SURVEYING

1. PRIOR TO REMOVING RESHORES THE UNDERSIDE OF THE SLAB SHALL BE SURVEYED TO DETERMINE THE RELATIVE ELEVATION OF THE SLAB. AT A MINIMUM, SURVEY POINTS ARE TO BE LOCATED NEXT TO COLUMNS AND AT CENTER OF COLUMN STRIPS AND MIDDLE STRIPS. SLAB EDGES AND CANTILEVERS ARE TO BE SURVEYED AT POINTS OF THEORETICAL MAXIMUM AND MINIMUM DEFLECTIONS WITHIN EACH SPAN. SURVEYOR IS TO SUBMIT A GENERAL LAYOUT OF POINTS TO ENGINEER FOR APPROVAL PRIOR TO SURVEYING THE SLABS. ADDITIONAL POINTS MAY BE REQUIRED AT ENGINEER'S DISCRETION. THE C.M. IS TO CONTRACT OUT THE SURVEYING SERVICE TO A SURVEYOR NOT AFFILIATED WITH THE CONCRETE CONTRACTOR. THE COST OF THIS SURVEY IS TO BE INCLUDED IN THE CONSTRUCTION COST.

VIII - MASONRY NOTES

1. STRUCTURAL CONCRETE MASONRY, AS SHOWN ON THESE DRAWINGS, SHALL HAVE A COMPRESSIVE STRENGTH (F'M) OF 2,000 PSI.
2. MASONRY UNITS SHALL CONFORM TO ASTM C90, TYPE II, NORMAL WEIGHT, HOLLOW UNLESS SPECIFICALLY NOTED OTHERWISE ON THESE DRAWINGS, WITH A UNIT STRENGTH AS REQUIRED TO ACHIEVE COMPRESSIVE STRENGTH SPECIFIED ABOVE.
3. MORTAR SHALL CONFORM TO ASTM C270, TYPE M OR S FOR ABOVE GRADE, TYPE M FOR BELOW GRADE.
4. GROUT FOR FILLED CELLS SHALL CONFORM TO ASTM C476 WITH 3000 PSI STRENGTH AT 28 DAYS. CELLS SHALL BE GROUTED IN INCREMENTS NOT EXCEEDING 5 FEET VERTICALLY. FILL ALL CELLS BELOW GRADE.
5. VERTICAL REINFORCING SHALL BE ASTM A615, GRADE 60 DEFORMED BARS. MINIMUM LAP SPLICES SHALL BE AS FOLLOWS:

   # 3 BARS - 1'-6"
   # 4 BARS - 2'-0"
   # 5 BARS - 2'-6"
   # 6 BARS - 3'-0"
6. HORIZONTAL REINFORCING SHALL BE NO. 9 GAGE "DUROWALL" OR EQUIVALENT AND SHALL BE PLACED EVERY OTHER COURSE U.O.N.
7. ALL BLOCK SHALL BE PLACED IN RUNNING BOND.

IX - SPECIAL INSPECTIONS

OWNER WILL ENGAGE AND PAY FOR A SPECIAL INSPECTOR AND AN INDEPENDENT TESTING AGENCY TO PERFORM THE FOLLOWING SPECIAL INSPECTION AND TESTING AS SPECIFIED ON THE APPLICABLE SECTIONS OF THE NEW YORK CITY BUILDING CODE, CHAPTER 17, SECTION 1704. TECHNICAL REPORT STATEMENT OF RESPONSIBILITY TR-1 FORM SHALL BE FILLED WITH THE BUILDING DEPARTMENT FOR APPROVAL OF SPECIAL INSPECTOR. IT IS THE CONTRACTOR'S RESPONSIBILITY TO PROVIDE ADEQUATE PRIOR NOTICE FOR COMPLETION OF INSPECTIONS.

1. CONCRETE:
   ALL CONCRETE WORK SHALL BE SUBJECT TO SPECIAL INSPECTION BY OR UNDER THE DIRECT SUPERVISION OF A LICENSED PROFESSIONAL ENGINEER AS REQUIRED BY SUBCHAPTERS 1704.4 AND 1905.3 AND TABLE 1704.4 OF THE N.Y.C. BUILDING CODE.
   A. THE OWNER SHALL ENGAGE A LICENSED PROFESSIONAL ENGINEER, APPROVED BY THE ENGINEER OF RECORD, TO SUPERVISE THE TESTING OF THE MATERIALS AND THE INSPECTION OF CONCRETE CONSTRUCTION.
   B. THE PRELIMINARY TEST FOR CONTROLLED CONCRETE SHALL BE MADE IN ACCORDANCE WITH SUBCHAPTER 1905.3 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE AND THE APPROVED DESIGN MIXES FILED ON TECHNICAL REPORT TR-3. NO CONCRETE SHALL BE PLACED BEFORE ACCEPTANCE BY ENGINEER.
   C. QUALITY CONTROL AND INSPECTION OF MATERIALS AND OF BATCHING SHALL BE MADE IN ACCORDANCE WITH SUBCHAPTER 1905.3 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE.
   D. ALL FIELD TESTS AND INSPECTIONS SHALL BE PERFORMED AS REQUIRED BY SUBCHAPTER 1905.6 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE. CONCRETE TEST CYLINDER RESULTS SHALL BE FILED ON TECHNICAL REPORT TR-2.
   E. PRIOR TO PERMIT OWNER TO ENGAGE CONCRETE TESTING AGENCY FOR TR-2 AND TR-3 FORMS.

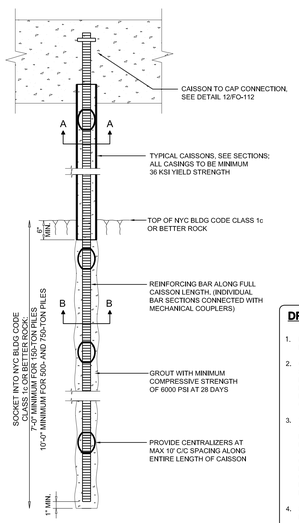
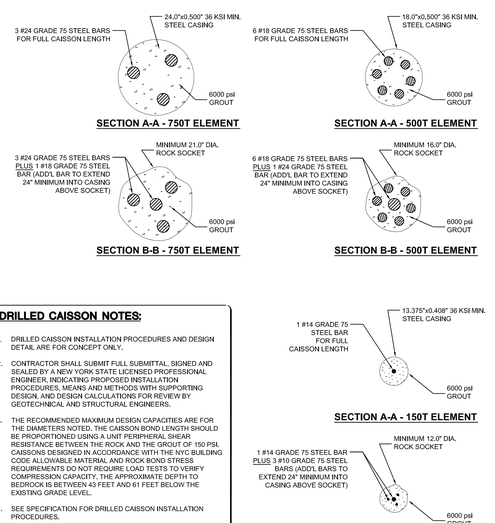
PILECAP NOTES:



1. ALL PILE CAPS ARE DESIGNED BASED ON THE PILE/CAISSON CAPACITIES LISTED IN THE REMARKS COLUMN, AS PER THE RECOMMENDATIONS OF THE GEOTECHNICAL ENGINEER.
2. SEE NOTES ON S-001 AND DRIVEN PILE AND DRILLED CAISSON SPECIFICATIONS (BY OTHERS) FOR REQUIREMENTS.
3. CONCRETE STRENGTH FOR ALL PILE CAPS SHALL BE 6,000 PSI.
4. GEOMETRY OF PILE CAPS SHOWN ON SCHEDULE IS BASED ON THE H-PILE SIZE OR PIPE DIAMETERS INDICATED.
5. "H" DESIGNATES HOOKED OR HEADED BARS TO BE USED.
6. ALLOWABLE LATERAL CAPACITY TO BE FIELD VERIFIED BY LOAD TEST IN ACCORDANCE WITH TECHNICAL SPECIFICATION SECTION 023500.

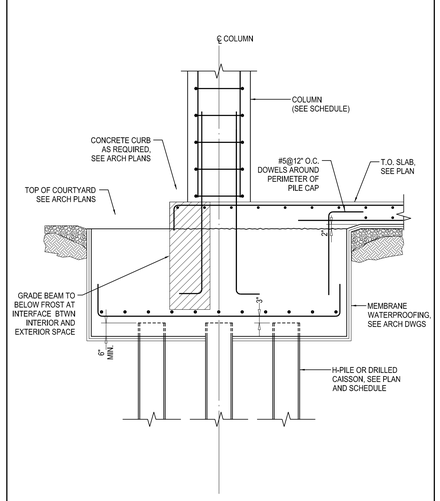
PLEASE NOTE THAT THE ABOVE PILE AND CAISSON TYPE INFORMATION IS PROVIDED BY THE GEOTECHNICAL ENGINEER. PLEASE SEE THE GEOTECHNICAL REPORT FOR FURTHER INFORMATION.

2 PILE CAP SCHEDULE AND NOTES



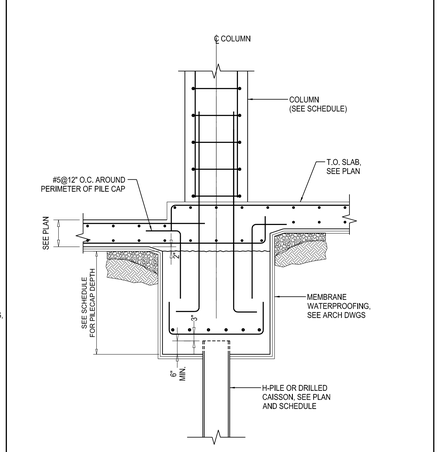
SCALE: NOT TO SCALE

MATERIAL KEYING LEGEND:



10 CONCEPTUAL CAISSON DETAILS

SCALE: NOT TO SCALE



DRILLED CAISSON NOTES:

1. DRILLED CAISSON INSTALLATION PROCEDURES AND DESIGN DETAIL ARE FOR CONCEPT ONLY.
2. CONTRACTOR SHALL SUBMIT FULL SUBMITTAL, SIGNED AND SEALED BY A NEW YORK STATE LICENSED PROFESSIONAL ENGINEER, INDICATING PROPOSED INSTALLATION PROCEDURES, MEANS AND METHODS WITH SUPPORTING DESIGN, AND DESIGN CALCULATIONS FOR REVIEW BY GEOTECHNICAL AND STRUCTURAL ENGINEERS.
3. THE RECOMMENDED MAXIMUM DESIGN CAPACITIES ARE FOR THE DIAMETERS NOTED. THE CAISSON BOND LENGTH SHOULD BE PROPORTIONED USING A UNIT PERIPHERAL SHEAR RESISTANCE BETWEEN THE ROCK AND THE GROUT OF 150 PSI. CAISSONS DESIGNED IN ACCORDANCE WITH THE NYC BUILDING CODE ALLOWABLE MATERIAL AND ROCK BOND STRESS REQUIREMENTS DO NOT REQUIRE LOAD TESTS TO VERIFY COMPRESSION CAPACITY. THE APPROXIMATE DEPTH TO BEDROCK IS BETWEEN 43 FEET AND 61 FEET BELOW THE EXISTING GRADE LEVEL.
4. SEE SPECIFICATION FOR DRILLED CAISSON INSTALLATION PROCEDURES.

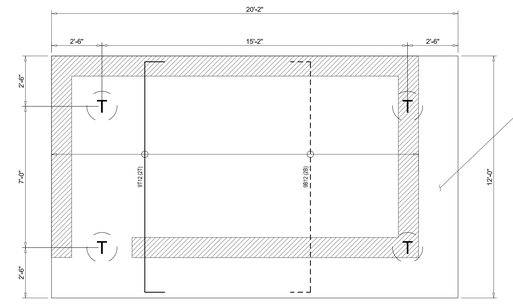
TYPICAL MAT NOTES:

1. FOR GENERAL NOTES SEE DRAWING S-001.
2. ALL CONCRETE SHEAR WALL FOUNDATIONS TO HAVE f'c = 6 ksi.
3. ALL HORIZONTAL SPLICES SHALL BE 1.3Ld. DOWELS UP TO SHEAR WALLS TO MATCH REINFORCEMENT AT WALLS ABOVE, WITH 1.3Ld MINIMUM SPLICES.
4. SEE FO-101 & F-102 FOR WALL LOCATIONS AND COORDINATES.

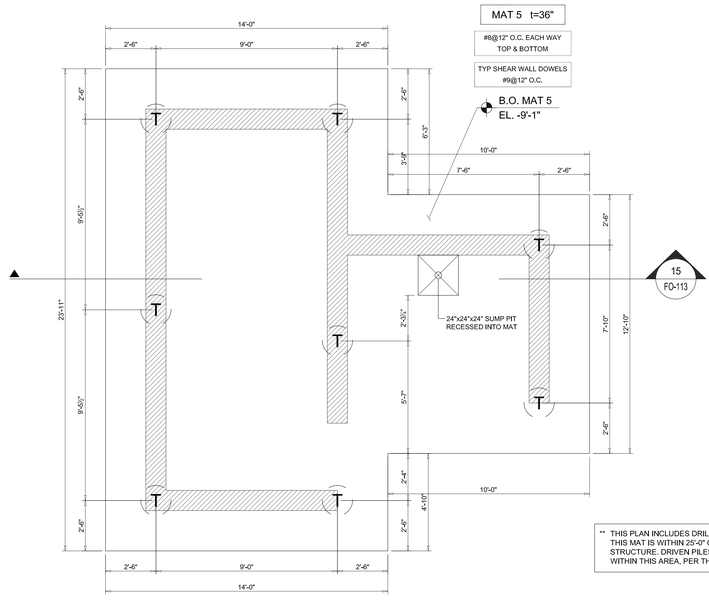


BUILDING A - DRILLED CAISSONS:

1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 750-TON COMPRESSION AND 250-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 24"Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.

** THIS PLAN IS FOR DRILLED CAISSONS; SEE FO-115 FOR DRIVEN PILE ALTERNATE OPTION. THE DRILLED CAISSON OPTION IS THE PRIMARY OPTION THAT IS REFLECTED ON THE FOUNDATION PLANS.

15 SHEAR WALL MAT 1 - LAYOUT PLAN
SCALE: 3/8"=1'-0"



** THIS PLAN INCLUDES DRILLED CAISSONS, SINCE THIS MAT IS WITHIN 25'-0" OF AN ADJACENT STRUCTURE. DRIVEN PILES ARE NOT PERMITTED WITHIN THIS AREA, PER THE GEOTECH REPORT.

BUILDING B - DRILLED CAISSONS:

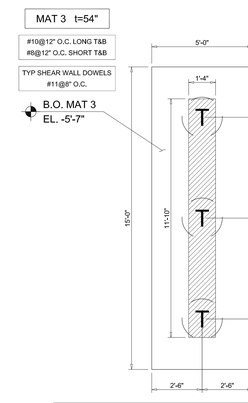
1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 500-TON COMPRESSION AND 166-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 18"Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.

2 SHEAR WALL MAT 6 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN INCLUDES DRILLED CAISSONS, SINCE THIS MAT IS WITHIN 25'-0" OF AN ADJACENT STRUCTURE. DRIVEN PILES ARE NOT PERMITTED WITHIN THIS AREA, PER THE GEOTECH REPORT.

BUILDING B - DRILLED CAISSONS:

1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 500-TON COMPRESSION AND 166-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 18"Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.



7 SHEAR WALL MAT 5 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

BUILDING A - DRILLED CAISSONS:

1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 750-TON COMPRESSION AND 250-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 24"Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.

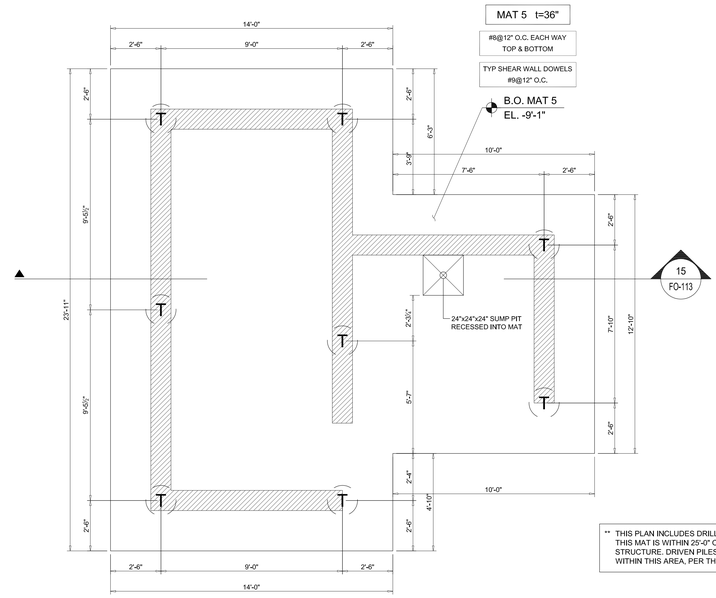
2. ALL ROCK ANCHORS INDICATED TO PROVIDE 150 KIP TENSION CAPACITY.
3. LAYOUTS SHOWN CONSIDER A HP14x117 STEEL PILE FOR THE REQUIRED CAPACITY.
4. SEE DETAIL 5 ON FO-112 FOR CONCEPTUAL ROCK ANCHOR INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.

15 SHEAR WALL MAT 1 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN IS AN ALTERNATE FOR DRIVEN PILES; SEE FO-114 FOR DRILLED CAISSON OPTION. THE DRILLED CAISSON OPTION IS THE PRIMARY OPTION THAT IS REFLECTED ON THE FOUNDATION PLANS.



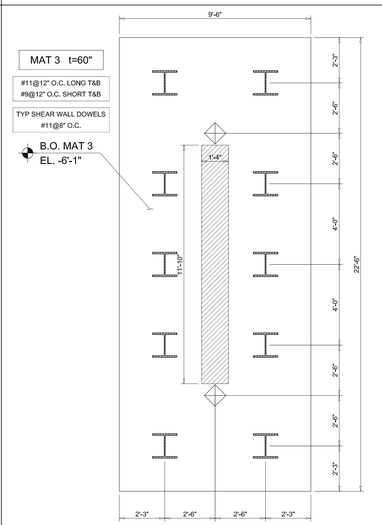
2 SHEAR WALL MAT 6 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN INCLUDES DRILLED CAISSONS, SINCE THIS MAT IS WITHIN 25'-0" OF AN ADJACENT STRUCTURE, DRIVEN PILES ARE NOT PERMITTED WITHIN THIS AREA, PER THE GEOTECH REPORT.

BUILDING B - DRILLED CAISSONS:

1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 500-TON COMPRESSION AND 166-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 16'Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.

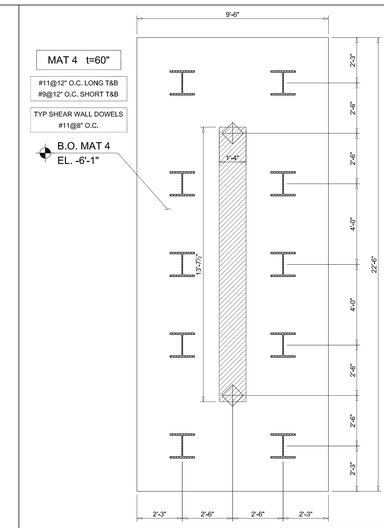
7 SHEAR WALL MAT 5 - LAYOUT PLAN
SCALE: 3/8"=1'-0"



** THIS PLAN INCLUDES DRILLED CAISSONS, SINCE THIS MAT IS WITHIN 25'-0" OF AN ADJACENT STRUCTURE, DRIVEN PILES ARE NOT PERMITTED WITHIN THIS AREA, PER THE GEOTECH REPORT.

BUILDING B - DRILLED CAISSONS:

1. ALL DRILLED CAISSONS IN SUPPORT OF BUILDING A SHEAR WALLS TO PROVIDE 500-TON COMPRESSION AND 166-TON TENSION CAPACITY.
2. LAYOUTS SHOWN CONSIDER A 16'Ø CAISSON FOR THE REQUIRED CAPACITY.
3. SEE DETAIL 10 ON FO-112 FOR CONCEPTUAL DRILLED CAISSON DESIGN INFORMATION, AND REFERENCE GEOTECH REPORT BY LANGAN ENGINEERING.



13 SHEAR WALL MAT 2 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN IS AN ALTERNATE FOR DRIVEN PILES; SEE FO-114 FOR DRILLED CAISSON OPTION. THE DRILLED CAISSON OPTION IS THE PRIMARY OPTION THAT IS REFLECTED ON THE FOUNDATION PLANS.

12 SHEAR WALL MAT 3 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN IS AN ALTERNATE FOR DRIVEN PILES; SEE FO-114 FOR DRILLED CAISSON OPTION. THE DRILLED CAISSON OPTION IS THE PRIMARY OPTION THAT IS REFLECTED ON THE FOUNDATION PLANS.

11 SHEAR WALL MAT 4 - LAYOUT PLAN
SCALE: 3/8"=1'-0"

** THIS PLAN IS AN ALTERNATE FOR DRIVEN PILES; SEE FO-114 FOR DRILLED CAISSON OPTION. THE DRILLED CAISSON OPTION IS THE PRIMARY OPTION THAT IS REFLECTED ON THE FOUNDATION PLANS.

CERTIFICATION

I, Jason J. Hayes, certify that I am currently a NYS registered professional engineer and that this Remedial Investigation Report was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10) and that all activities were performed in full accordance with the DER-approved work plan and any DER-approved modifications.

Jason J. Hayes

NYS PE No. 089491

1.0 INTRODUCTION

This Remedial Investigation (RI) Report was prepared on behalf of Purves Street Owners, LLC (the "Volunteer") for the property located at 44-30 Purves Street in the Long Island City neighborhood of Queens, New York (the "Site"). A Site Location Map is provided as Figure 1. The Volunteer was accepted into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) to remediate the Site in conjunction with new development under a NYSDEC Brownfield Cleanup Agreement (BCA) dated July 1, 2014 for Site No. C241162.

This RI Report presents a summary of environmental investigations including data obtained during the Phase II Environmental Site Investigation (ESI), conducted between February 19 and 28, 2014, and the supplemental remedial investigation, conducted between April 15 and 24, 2014. Both investigations were completed by Langan. The objective of this RI is to determine, to the extent possible, the nature and extent of contamination in soil, soil vapor, and groundwater. Information presented in this RI Report will be used to evaluate appropriate remedial action alternatives.

This RI Report is organized as follows:

- Section 2.0 describes the site setting and the physical characteristics of the site.
- Section 3.0 describes the site background including results of previous investigations and identified areas of concern (AOCs).
- Section 4.0 presents the investigation field procedures.
- Section 5.0 describes the field observations and analytical results.
- Section 6.0 presents an assessment of the exposure risks of Site contaminants to human, fish, and wildlife receptors.
- Section 7.0 presents the nature and extent of contamination in all site media as determined through the field investigation and analysis of environmental samples.
- Section 8.0 summarizes the results of the investigation and presents conclusions based on field observations and analytical results.
- Section 9.0 presents the references used in preparation of this report.

2.0 SITE PHYSICAL CHARACTERISTICS

2.1 Site Description

The Site is an irregularly-shaped, 27,100-square-foot (0.62-acre) vacant lot located at 44-30 Purves Street in the Long Island City neighborhood of Queens, New York (Block 268, Lots 1, 24, 25, and 26). The Site is bounded by Purves Street to the east, Lot 31 with a two-story brick building to the southeast, Thomson Avenue to the southwest, 44th Drive to the west, and lots 4 (vacant one-story building) and 23 (vacant) to the north. The Site has approximately 175 feet of frontage along Purves Street, 150 feet of frontage along Thomson Street, and 60 feet of frontage along 44th Drive. The Site has been a vacant lot for nearly 10 years, since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes.

2.1.1 Description of Surrounding Properties

The Site is located in an urban setting historically characterized by industrial and commercial development, and has recently undergone residential and commercial development due to rezoning. Surrounding properties are summarized in the following table:

Direction	Adjoining Properties	Surrounding Properties
North	Lot 4 (vacant one-story building) and lots 22 and 23 (vacant) followed by one- and two-story industrial buildings	Multiple-story residential, commercial and industrial buildings
East	Purves Street followed by a 14-story residential building and under-construction residential building	
Southeast	Lot 31 (vacant two-story building) followed by Thomson Street	
Southwest	Thomson Street followed by a five-story residential and commercial building	
West	44th Drive followed by multiple one- and two-story commercial buildings	

The surrounding area is highly urbanized and characterized by major infrastructure, including subway tunnels and elevated subway lines, underground utility lines, storm drains, and sewers. The presence of underground infrastructure may influence contaminant migration from potential up-gradient sources. The New York City Metropolitan Transit Authority (MTA) M and E subway lines extend underneath Jackson Avenue approximately 250 feet northwest of the Site.

Sensitive receptors within a half mile of the Site are listed in the following table:

NUMBER	NAME (Approximate distance from Site)	ADDRESS
1	Frank Sinatra High School (1,373 feet southeast)	30-20 Thomson Avenue, Long Island City, New York 11101
2	Information Technology High School (1,636 feet northwest)	21-16 44th Road, Long Island City, New York 11101
3	LaGuardia Community College High School (1,901 feet southeast)	45-35 Van Dam Street, Long Island City, New York 11101
4	Laguardia Community College Pre-School (1,901 feet southeast)	31-10 Thomson Avenue, Long Island City, New York 11101
5	Academy of American Studies High School (2,000 feet northeast)	28-04 41st Avenue, Long Island City, New York 11101
6	Robert F. Wagner Secondary School (2,006 feet southeast)	47-07 30th Place, Long Island City, New York 11101
7	Newcomers High School (2,164 feet northeast)	28-01 41st Avenue, Long Island City, New York 11101
8	YMCA of Greater New York (2,534 feet east)	32-23 Queens Blvd., Long Island City, New York 11101

A map showing the surrounding land uses and the locations of the nearest sensitive receptors is included as Figure 2.

2.1.2 Topography

Ground surface elevations were obtained from a survey drawing by Apple Surveying, dated May 5, 2014. All elevations (el) presented herein are measured in feet and referenced to the North American Vertical Datum of 1988 (NAVD88), which is 1.095 feet above the National Geodetic Vertical Datum (NGVD29) at Sandy Hook, New Jersey.

Based on survey data, Site grade ranges from el 9.73 in the northwest to 11.90 in the northeast. The sidewalk grade of Thomson Avenue and 44th Drive is elevated above site grade, and slopes upward from north to south from el 23.46 to el 30.66. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street slopes upward from south to north from el 9.64 to el 10.82.

2.1.3 Surface Water and Drainage

There are no stormwater drains on the Site. Approximately 55% of the Site is covered with a concrete slab and the remaining 45% is covered with overgrown vegetation. The partial concrete slab covers portions of the northeast and southern parts of the Site; therefore, precipitation infiltrates to the water table. The majority of runoff drains to city sewers, then to one of the several wastewater treatment plants that serve the city. The nearest sewer line is located to the east of the Site, flowing from south to north underneath the western sidewalk of Purves Street. Rainwater that infiltrates the ground percolates downwards toward the water table and joins the anticipated regional flow of groundwater, which is estimated to flow west and southwest towards the East River and Newtown Creek. However, based on our Site groundwater gauging data, localized groundwater is estimated to flow towards the east and northeast.

According to the National Flood Insurance Rate map for the City of New York published by the Federal Emergency Management (FEMA) (Community Panel No. 3604970 202 F, dated September 5,2007), the Site is located within Zone X. Zone X is designated for areas of 0.2 percent annual chance flood; areas of 1 percent annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1 percent annual chance flood.

2.1.4 Wetlands

Potential wetlands on or near the Site were evaluated by reviewing the National Wetlands Inventory and NYSDEC regulated wetlands. There are no wetlands on or adjacent to the Site. The nearest wetlands to the Site are the Dutch Kills, a tributary of Newtown Creek, located approximately 0.25 miles south-southeast of the Site, and the East River, which is located approximately 0.65 miles west of the Site.

2.2 Regional Geology and Hydrogeology

2.2.1 Regional Geology

The Site is located in the Borough of Queens which lies within the Atlantic Coastal lowlands physiographic province of New York State, an area which includes all of Long Island. The last glacial advance and retreat in New York City are primarily responsible for the present day surface features and topography. The southernmost advance of the glacial ice sheet through Queens County is marked by the Harbor Hill moraine, a ridge or mound composed of unsorted, unstratified glacial drift, formed by the direct action of the glacial ice. Glacial Lakes Bayonne

and Hudson formed north of the moraine and are underlain by varved deposits of ground moraine consisting of glacial outwash till, a mixture of rock debris ranging in size from clay to boulders. The Site is located within the former footprint of glacial Lake Bayonne.

The USGS "Bedrock and Engineering Geologic Maps of New York County and Parts of Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" indicates that the bedrock underlying the Site consists of fine- to coarse-grained, gray- to tan-weathering, quartzofeldspathic, muscovite-biotite-garnet schist.

2.2.2 Regional Hydrogeology

Within the ground, water ("groundwater") is contained within the unconsolidated geologic materials and the fractured bedrock. The upper surface of the groundwater reservoir is marked by the water table surface. Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeological network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeological and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks.

3.0 SITE BACKGROUND

This section describes historical site use, the proposed redevelopment, and provides discussion on the findings from previous environmental and geotechnical investigations. Based on a review of the previous reports, the areas of concern (AOC) are also summarized.

3.1 Historical Site Use

The Site is located in an area of historical industrial usage and has been used for manufacturing purposes since as early as 1947. Past uses of Lots 1 and 26 include a chemical laboratory, automobile repair, storage, paper embossing, private garage, and a contractor's yard. Past uses of Lots 24 and 25 include controller manufacturing, fine chemicals manufacturing, and welding and repair services. Sanborn maps, dated 1947 and 1950, indicate two underground storage tanks (UST) in the central portion of Lot 1, and geophysical anomalies indicative of USTs were identified in this area of the Site during the February 2014 Phase II ESI.

Adjacent and surrounding properties were historically used for industrial and manufacturing purposes. Sanborn maps indicate surrounding properties were used for chromium plating, multiple auto body/repair shops, a photochemical warehouse, steel and machine part storage, and textile printing ink manufacturing. The 1936 Sanborn map shows a UST in a garage on an adjacent property, and gasoline tanks in manufacturing buildings to the east of the Site across Purves Street. Historical uses of the Site and surrounding properties are shown on Figure 3.

3.2 Proposed Redevelopment Plan

The purpose of the project is to develop an underutilized, contaminated parcel into market rate residential use, while implementing remedial measures that are protective of human health and the environment. The proposed project will include the construction of a 33-story, approximately 263-unit residential apartment building and a one-story building with residential amenity space and retail along Thomson Avenue and 44th Street. One level of approximately at-grade ventilated parking will span an area of approximately 14,000 square feet.

The proposed development will not have a basement, so the majority of the excavation required for development will be to the bottom of the first floor slab. The necessary general excavation cut required for development is assumed to be at approximately el 8.5 feet, which is between approximately 1.2 and 3.4 feet bgs. Additional deeper excavations will be required for an elevator pit and foundation elements. Proposed development plans are provided in Appendix A.

3.3 Previous Investigations

Previous environmental reports were reviewed as part of this RI Report. Environmental reports prepared for the Site include the following:

- *April 27, 2006 Phase I Environmental Site Assessment (ESA) Report, prepared by Middleton Environmental, Inc.*
- *November 5, 2006 Phase II Environmental Site Investigation (ESI) Report, prepared by Environmental Business Consultants*
- *December 9, 2011 Phase I ESA Report, prepared by IVI Assessment Services, Inc.*
- *March 18, 2014 Phase II ESI Report, prepared by Langan*

The reports listed above are summarized below and are included in Appendix B.

3.3.1 April 27, 2006 Phase I ESA Report

Middleton Environmental, Inc. prepared a Phase I ESA Report for the property located at 44-26/30 Purves Street (Block 268, Lots 24, 25, and 26), and a Phase I ESA update that included 44-32/38 Purves Street (Block 268, Lot 1). The Phase I ESA reports concluded the following:

- No recognized environmental conditions (REC) were identified.
- At the time of this Phase I ESA, two buildings were present at the Site. The buildings were vacant, and had most recently been used for automobile repair and carpet storage. The site was previously used by a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company and an air freight company.
- At the time of this Phase I ESA, surrounding property usage included a welding company, an automobile repair facility, a construction site, and vacant industrial buildings.
- A review of the 1950 Sanborn Fire Insurance Map indicated the presence of two underground storage tanks (UST) at the Site. There were no oil fill ports or fuel vents observed at the Site.

3.3.2 November 5, 2006 Phase II ESI Report

Environmental Business Consultants conducted a limited Phase II ESI that included the advancement of three soil borings, the installation of three temporary monitoring wells, and the collection and laboratory analysis of six soil and three groundwater samples.

Three soil borings were advanced to 20 feet below grade surface (bgs). Historic urban fill material was observed from surface grade to depths of 2 to 9 feet bgs. Native layers consisting of fine- to medium-grained sand, silt, and peat were observed underlying the fill layer. No evidence of impacts was observed based on photoionization detector (PID) screening of soils. Soil samples were collected from the 7 to 8 and 17 to 18 foot depth intervals in each boring. Soil samples were analyzed for the New York State Department of Environmental Conservation (NYSDEC) Spills Technology and Remediation Series (STARS)-listed volatile organic compounds (VOC) and semivolatile organic compounds (SVOC). One SVOC, pyrene, was detected in the shallow sample in boring SB2; however, the concentration did not exceed the Technical and Administrative Guidance Memorandum (TAGM) 4046 Recommended Soil Cleanup Objective (RSCO). The TAGM RSCOs have subsequently been superseded by Title 6 of the New York Codes, Rules and Regulations (NYCRR) Part 375. Under Part 375, the pyrene detection would still be below the corresponding Unrestricted Use (UU) Soil Cleanup Objective (SCO). There were no other VOC or SVOC detections in soil samples.

Three 1-inch diameter temporary monitoring wells were installed at a depth of 18 feet bgs with 15 feet of 0.010-inch slotted polyvinyl chloride (PVC) screen attached to PVC riser that extended approximately 2 feet above grade surface. Groundwater samples were collected from each well and analyzed for NYSDEC STARS-listed VOCs and SVOCs. No STARS-listed VOCs or SVOCs were detected in groundwater samples.

3.3.3 December 9, 2011 Phase I ESA Report

The Phase I ESA identified the following RECs:

- *REC 1 - Historical Site Use:* Historical Site uses included a chemical laboratory, automobile repair, controller manufacturing, fine chemicals manufacturing, storage, paper embossing, machine manufacturing, automobile radiator servicing, and a contractor's yard. Two gasoline USTs were identified on the 1947 and 1950 Sanborn maps and may be still present. The historic site usage may have negatively impacted soil and/or groundwater at the Site.

- *REC 2 – Historical Use of Surrounding Properties:* Properties adjacent and surrounding the Site were previously used for chromium plating, auto body/repair shops, a photochemical warehouse and textile printing ink manufacturing. The 1936 Sanborn map shows a UST in a garage on an adjacent property, and gasoline tanks in manufacturing buildings to the east of the Site across Purves Street. The adjacent usage may have negatively impacted soil and/or groundwater at the Site.

3.3.4 March 18, 2014 Phase II ESI Report

Langan implemented the Phase II ESI between February 19 and 28, 2014. The investigation included the completion of a geophysical survey, advancement of eight soil borings, and installation of four permanent groundwater monitoring wells and seven soil vapor points. Samples collected from these locations (by media) included:

- Soil – 19 samples analyzed for VOCs, SVOCs, metals, pesticides, and PCBs
- Groundwater – five samples analyzed for VOCs, SVOCs, metals, pesticides, PCBs, and hexavalent chromium
- Soil Vapor – five soil vapor samples and one ambient air sample analyzed for VOCs

Soil analytical data was compared to UU SCOs, groundwater analytical data was compared to NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Class GA Ambient Water Quality Standards (AWQS), and soil vapor analytical data was compared to concurrent ambient air quality data. The findings of the investigation are summarized below:

- The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Additionally, refusal encountered during the advancement of boring SB05 may have resulted from contact with a UST-related subsurface structure.
- The subsurface soil profile generally consisted of historic fill predominately characterized as brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. The fill layer extended to between approximately 1.5 and 11 feet bgs. The fill layer was underlain by brown, fine- to medium-grained sand. In borings located within the western portion of the site (SB02, SB03, and SB06), the sand layer was underlain by layers of silt, peat, and clay. In borings located in the southeastern portion of the site (SB04 and SB05), the sand layer was underlain by silt.

In borings located in the northeastern portion of the site (SB01, SB07, SB08), the sand layer was underlain by a silt layer followed by a clay layer.

- Soil –
    - Petroleum-Impacted Soil – Material exhibiting staining, odor, and elevated VOC concentrations based on field screening with a PID was observed at three boring locations: SB01, SB03, and SB05. Petroleum impacts in borings SB01 and SB03 were observed straddling the water table. Petroleum impacts in boring SB05 were observed at a depth of 2 to 3 feet bgs, above an obstruction that resulted in refusal. Impacts were observed in the northern and southern portions of the Site, including the area adjacent to potential USTs. A spill was reported to NYSDEC and spill number 1310949 was assigned.
    - Historic Fill – A layer of historic fill extending to between approximately 1.5 and 11 feet bgs was identified throughout the site. The fill was characterized as predominately consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Anomalously high concentrations of metals, particularly lead, were identified in the borings indicated below.
        - Barium – Boring SB02
        - Lead – Borings SB02, SB05, SB06, and SB08
        - Mercury – Borings SB03 and SB04
    - Analytical Results – The following constituents were detected in soil at concentrations that exceed their respective UU SCOs:
        - VOCs: acetone and methylene chloride
        - SVOCs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene
        - Metals: arsenic, barium, cadmium, hexavalent chromium, trivalent chromium, copper, lead, mercury, nickel, and zinc
        - Total PCBs

- Groundwater –
    - Measurements collected during the ESI found groundwater ranged from 4.0 to 6.4 feet bgs.
    - No light non-aqueous petroleum liquid (LNAPL) was observed in any of the monitoring wells. A PID reading of 12.8 ppm was observed in the headspace of monitoring well MW03.
    - Chlorinated Solvent-Impacted Groundwater – Chlorinated VOCs (CVOC) including 1,1,1-TCA, cis-1,2-DCE, PCE, TCE, and vinyl chloride were identified in groundwater at concentrations exceeding the Class GA TOGS AWQS. Groundwater exceedances were observed in the eastern portion of the site, with the highest concentrations in the northeast in monitoring well MW01.
    - Metals – Manganese, selenium, and sodium were detected in groundwater at concentrations exceeding the Class GA TOGS AWQS in samples collected from two or more monitoring wells.
- Soil Vapor – Soil vapor results revealed concentrations of VOCs, included those related to petroleum and chlorinated solvents, above concentrations found in the ambient air sample.

3.4 Geotechnical Engineering Study

Langan conducted a geotechnical subsurface investigation in February 2008, and a supplemental investigation in April 2014. The geotechnical investigations consisted of drilling 17 borings, installing 3 observation wells, excavating ten test pits, and performing six seismic cone penetration tests. The purposes of the investigations were to investigate the subsurface conditions, develop foundation design recommendations, and develop geotechnical engineering recommendations related to the design and construction of the proposed development.

Borings were completed to depths of approximately 53 to 75 feet below grade surface (bgs). The borings revealed an approximately 5- to 9-foot-thick layer of historic fill above a 7- to 14-foot-thick layer of sand that overlies a 5- to 27-foot-thick layer of silt, overlying a 10- to 15-foot thick layer of clay. Decomposed rock was encountered from approximately 44 to 48 feet bgs in four borings, and bedrock was encountered between approximately 43 and 61 feet bgs in all borings. Groundwater was measured in the three observation wells at depths of 8 to 10 feet bgs. The May 12, 2014 Geotechnical Engineering Report is included in Appendix C.

3.5 Summary of Areas of Concern

Based on a review of previous reports, the following AOCs were identified:

1. AOC-1 - Historic Fill: A layer of historic fill spanning from surface grade to between 2 and 11 feet bgs was identified during previous subsurface investigations at the Site. In addition, based on the data provided by the New York City Office of Environmental Remediation Searchable Property Database Environmental E-Database (SPEED), the Site is listed under the Vacant Property Database and the Vacant Property Database Fill Properties, which indicate the Site is vacant and likely in-filled using historic fill. The analytical results of soil samples collected during Langan's Phase II ESI indicated that the historic fill layer is impacted with SVOCs, metals, and PCBs.

2. AOC-2 - Historical Underground Storage Tanks (UST) and Petroleum-Impacted Soil: USTs were identified on the Site on the 1947 and 1950 Sanborn Maps, and the geophysical survey conducted for Langan's Phase II ESI identified an anomaly in the area of the suspected USTs. Visual, olfactory, and instrumental evidence of petroleum impacts was observed on soil in one boring in the area of the USTs and in borings in the western and northeastern parts of the Site. A spill was called in during Langan's Phase II ESI and spill number 1310949 was assigned.

3. AOC-3 - Chlorinated VOC Contamination in Groundwater: Langan's Phase II ESI found chlorinated solvent impacts (e.g. PCE and TCE) to groundwater along the eastern Site boundary near Purves Street.

4. AOC-4 - Potential Soil Vapor Contamination: The above listed historical site uses, historical uses of surrounding properties, and historical presence of USTs on the site and surrounding properties indicate potential for soil vapor contamination at the Site.

4.0 FIELD INVESTIGATION

Langan conducted a Phase II ESI between February 19 and 28, 2014, followed by a supplemental remedial investigation conducted between April 15 and 24, 2014, to characterize the nature and extent of contamination at the Site. The two investigation phases together constitute the RI. Investigation activities included a geophysical survey, soil boring advancement, monitoring well installation, soil vapor probe installation, and collection of soil, groundwater, and soil vapor samples. A summary of samples collected is provided in Table 1, and sample locations are shown on Figure 4.

The RI consisted of the following:

- Advancement of nineteen soil borings (SB01 through SB19) and collection of 54 soil samples, including three duplicate samples.
- Installation of nine groundwater monitoring wells (MW01 through MW04 and MW09 through MW13) and collection of eleven groundwater samples, including two duplicate samples.
- Installation of thirteen soil vapor points (SV01 through SV13) and collection of twelve soil vapor samples, including one duplicate sample, and two ambient air samples.

Langan conducted the RI in accordance with New York Codes, Rules and Regulations (NYCRR) Title 6 Part 375 (6 NYCRR Part 375), the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (May 2010), the NYSDEC Draft Brownfield Cleanup Program Guide (May 2004), and the New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006).

4.1 Geophysical Investigation

Prior to commencement of intrusive RI field activities (i.e., soil borings, well installation and soil vapor sampling), NOVA Geophysical & Environmental, Inc. (NOVA) of Douglaston, New York, conducted a geophysical survey under supervision of a Langan field engineer on February 19, 2014. Borings were relocated as necessary to avoid subsurface utilities and anomalies (other subsurface impediments). A geophysical report presenting the findings is included in Appendix D.

4.2 Soil Investigation

4.2.1 Investigation methodology

A total of 19 soil borings (SB01 through SB19) were completed during the RI. Boring locations were selected to provide sufficient Site coverage and to evaluate the AOCs listed in section 3.5. Borings SB01 through SB08 were advanced during the Phase II ESI with a direct-push Geoprobe® 6610DT drill rig by Laurel Environmental Associates, Ltd. (Laurel) of Huntington Station, New York, and supplemental borings SB09 through SB17 were advanced with a direct-push Geoprobe® 7822DT drill rig by Aarco Environmental Services Corp. (Aarco) of Lindenhurst, New York. All borings were advanced under the supervision of a Langan field engineer. Boring locations are presented on Figure 4.

Borings were advanced until a potentially confining layer of silt or clay was identified. All except five borings were advanced to 20 feet bgs; borings SB01 and SB06 were advanced to 25 feet bgs, and SB02, SB13, and SB16 were advanced to 15 feet bgs. Boring SB13 was located off-site on the Purves Street sidewalk. There were no borings located off-site on Thomson Avenue and 44th Drive due to the retaining wall spanning the western and southwestern Site boundaries. Continuous soil samples were collected from grade surface to the final depth of each environmental boring. Samples were collected in 5-foot Macro-Core® sample barrels with new, dedicated acetate liners. Each soil sample was screened for visual, olfactory, and instrumental evidence of environmental impacts, and was visually classified for soil type, grain size, texture, and moisture content. Instrument screening for the presence of VOCs was performed with a photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp. Boring logs documenting these observations are included in Appendix E. Following sample collection, all borings were backfilled with soil cuttings and sand or converted to groundwater monitoring wells.

4.2.2 Sampling Methodology

A total of 54 grab soil samples, including three field duplicates, were collected for laboratory analysis. Generally, one sample was collected from the historic fill layer, and a second sample was collected from the interval of the greatest observable impact (staining, odor, elevated PID readings) or at the groundwater interface. During the supplemental investigation, a third sample from each boring was collected at the boring termination depth.

Samples submitted for VOC analysis were collected directly from the acetate sleeve via laboratory-supplied Terra Core® soil samplers. The remaining sample volume was homogenized and placed in appropriate laboratory-supplied containers for all additional analyses. The sample

containers were labeled, placed in a laboratory-supplied cooler and packed on ice (to maintain a temperature of 4±2°C). The samples were picked up and delivered via courier service to York Analytical Laboratories (York), a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory in Stratford, Connecticut under standard chain-of-custody protocol.

All soil samples were analyzed for NYSDEC Part 375 List VOCs by Environmental Protection Agency (EPA) Method 8260C, SVOCs by EPA method 8270D, metals (including hexavalent chromium) by EPA methods 6010C/7473/7196A, pesticides by EPA method 8081B, and polychlorinated biphenyls (PCBs) by EPA method 8082A. Soil samples collected during the supplemental investigation were additionally analyzed for EPA Target Compound List (TCL) VOCs, SVOCs, pesticides, and PCBs, and Target Analyte List (TAL) metals. Eight of nineteen Phase II ESI soil samples and all of the supplemental investigation soil samples were analyzed for total cyanide by EPA method 9014/9010C. A sample log showing samples and sample analyses is provided in Table 1. Analytical reports and chain-of-custody documentation are provided in Appendix D.

4.3 Groundwater Investigation

A total of nine monitoring wells (MW01 through MW04 and MW09 through MW13) were installed during the RI. Monitoring wells were sampled to investigate potential impacts to groundwater associated with the identified AOCs.

4.3.1 Monitoring Well Installation and Development Methodology

Nine soil borings were converted into groundwater monitoring wells by inserting 10 feet of 2-inch diameter, 0.01-inch slotted, schedule 40 PVC screen, with attached risers, into the boreholes. The monitoring wells were screened across the water table to allow for the monitoring of light non-aqueous phase liquid (LNAPL). Each monitoring well ID corresponds to the boring where it was installed (i.e. MW01 was installed in SB01). Monitoring wells MW01 through MW04 were installed and sampled during the Phase II ESI, and MW09 through MW13 were installed and sampled during the supplemental investigation. All wells were installed to a depth of approximately 14 feet bgs. Three monitoring wells (MW01, MW03, and MW04) were installed with 2.0-inch inner diameter (ID) by 3.4-inch outer diameter (OD) prepacked well screens. Prepacked well screens include a stainless steel wire mesh with a 0.011-inch pore size surrounding the slotted PVC and containing 20/40 mesh silica sand. Prepack screen installation required advancing 4-inch ID steel augers to the desired well depth. All other monitoring wells were constructed with a PVC screen with no prepack and were installed by advancing 3-inch OD Macro-Core® sample barrels. The annulus of each well was filled with #2 Morie sand to approximately 1.5 feet above the top of the screen. Hydrated bentonite well

seals were installed above the filter sand. Following installation, each well was developed using a submersible Monsoon pump. Development water was placed into labeled drums. Monitoring well construction details are presented in Table 2 and construction logs are included in Appendix F. Monitoring well locations are shown on Figure 4.

A Langan field engineer completed synoptic groundwater gauging prior to sampling on February 28, 2014 and again on April 24, 2014. Groundwater elevations are presented in Table 3. A groundwater contour map based on the April 24, 2014 groundwater gauging event is presented as Figure 5.

4.3.2 Groundwater Sampling

Monitoring wells were sampled one week after development, in accordance with the EPA's low-flow groundwater sampling procedure to allow for collection of a representative sample ("Low Stress [low flow] Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells", EQASOP-GW 001, January 19, 2010). Immediately before sample collection, a minimum of three well volumes were purged from each well and groundwater parameters (pH, conductivity, turbidity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]) had stabilized and turbidity measurements were below 50 Nephelometric Turbidity Units (NTU). The groundwater parameters at monitoring well MW11 did not stabilize prior to sampling due to a low recharge rate. Groundwater sampling logs are included in Appendix G.

Eleven groundwater samples – one sample from each well and two duplicate samples – were collected into laboratory-supplied glassware and picked up and delivered via courier service to York. Duplicate samples were collected from monitoring wells MW01 and MW13. Groundwater samples were analyzed for TCL VOCs by EPA Method 8260C, TCL SVOCs by EPA method 8270D, pesticides by EPA method 8081B, PCBs by EPA method 8082A, TAL metals by EPA methods 6010C/7470, and hexavalent chromium by EPA method 7196A. Groundwater samples collected during the supplemental investigation were additionally analyzed for NYSDEC Part 375 listed VOCs, SVOCs, Metals, PCBs, and pesticides, and total cyanide by Standard Method 4500.

4.4 Soil Vapor Investigation

NYSDEC DER-10 requires an assessment of soil vapor for contaminated sites to assess the health risk associated with potential exposure to VOCs through vapor intrusion into occupied spaces. Seven soil vapor sample points (SV01 through SV07) were installed and sampled for

the Phase II ESI, and six soil vapor sample points (SV08 through SV13) were installed and sampled for the supplemental investigation. Soil vapor samples collected from SV02 and SV05 were not submitted for analysis because of groundwater intrusion during sample collection. Soil vapor sample locations are shown on Figure 4.

4.4.1 Soil Vapor Point Installation

Soil vapor points SV01 through SV07 were installed by Laurel with a Geoprobe® 6610DT drill rig with 1.25-inch OD steel probe rods to a depth of 4 to 5 feet bgs. Soil vapor points SV08 through SV13 were installed by Aarco with a Geoprobe® 7822DT drill rig with a 2-inch OD Macro-Core® to a depth of 3 to 4 feet bgs. The probes were installed in accordance with the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York and were comprised of a stainless steel screen implant (3/8-inch in diameter, and approximately 6 inches in length) threaded into polyethylene tubing. A sand filter pack was installed around the screen implant by pouring No. 2 Morie sand into the annulus to approximately 1 foot bgs. The remainder of the annulus was filled to grade surface with a bentonite slurry seal.

4.4.2 Air Sampling and Analysis

As a quality assurance/quality control (QA/QC) measure, an inert tracer gas (helium) was introduced into an above-grade sampling chamber to ensure that the soil vapor sampling points were properly sealed above the target sampling depth, thereby preventing subsurface infiltration of ambient air. Direct readings of helium of less than 10 percent prior to sampling were considered sufficient to verify a tight seal. All soil vapor points had sufficiently tight seals.

Each soil vapor point was purged using a PID at a rate of 0.2 liters per minute (L/min) to evacuate a minimum of three sample tubing volumes prior to sample collection. The purged soil vapor was also monitored for VOCs and the value was recorded. After purging was completed, the soil vapor samples were collected into laboratory-supplied, batch-certified Summa® canisters. Phase II ESI samples were collected into 2.7-Liter Summa® canisters that were calibrated for a sampling rate of approximately 0.0225 L/min for 120 minutes of sampling. Supplemental investigation samples were collected into 6-Liter Summa® canisters that were calibrated for a sampling rate of approximately 0.05 L/min for 120 minutes of sampling. An ambient air sample was collected during both sampling events and submitted to the lab for analysis for QA/QC purposes. Soil vapor sampling logs are provided in Appendix H.

The 2.7-Liter Summa® canisters were labeled and picked up by a courier for delivery to Alpha Analytical Laboratories (Alpha), a NYSDOH ELAP-certified laboratory in Westborough,

Massachusetts, under standard chain-of-custody protocol. The 6-Liter Summa® canisters were labeled and picked up by a courier for delivery to York. Soil vapor samples were analyzed for VOCs by EPA Method TO-15. Soil vapor sampling locations are shown on Figure 4, and a summary of collected soil vapor and ambient air samples is included in Table 1.

4.5 Quality Control Sampling

During the RI, field blanks, trip blanks, field duplicate samples, matrix spike/matrix spike duplicate (MS/MSD) samples and ambient air samples were collected and submitted for laboratory analysis. Quality assurance/quality control (QA/QC) samples are summarized in Table 1 and include the following matrix-specific QA/QC samples.

Soil QA/QC samples

- Three field duplicate samples;
- One MS/MSD sample;
- Three field blank samples; and
- Three trip blank samples.

Groundwater QA/QC samples

- Two field duplicate samples;
- One MS/MSD sample;
- Two field blank samples; and
- Two trip blank samples.

Soil Vapor QA/QC Samples

- One field duplicate sample; and
- Two ambient air samples.

Field blanks were collected to determine the effectiveness of the decontamination procedures for the groundwater sampling equipment train and the cleanliness of unused neoprene gloves and acetate liners used to collect soil samples. Field blank samples consisted of deionized, distilled water provided by the laboratory that has passed through the sampling apparatus. Field blank samples were analyzed for same lists as the corresponding sampling event and sample matrix.

MS/MSD samples were collected to assess the effect of the sample matrix on the recovery of target compounds or target analytes.

The field duplicates were collected to assess the precision of the analytical methods relative to the sample matrix. The duplicate was collected from the same material as the primary sample by splitting the volume of homogenized sample collected in the field into two sample containers.

The trip blank samples were collected to assess the potential for contamination of the sample containers and samples during the trip from the laboratory, to the field, and back to the laboratory for analysis. Trip blanks contains approximately 40 milliliters of acidic water (doped with hydrochloric acid) that is sealed by the laboratory when the empty sample containers are shipped to the field, and unsealed and analyzed by the laboratory when the sample shipment is received from the field. The trip blank samples were analyzed for VOCs.

4.6 Data Validation

Data from the RI was validated by a Langan data validator in accordance with EPA and NYSDEC validation protocols. Copies of the data usability summary reports (DUSRs) and the data validator's credentials are provided in Appendix I.

4.6.1 Data Usability Summary Report Preparation

A DUSR was prepared for each sampling matrix. The DUSR presents the results of data validation, including a summary assessment of laboratory data packages, sample preservation and chain of custody procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method. For the soil and groundwater samples, the following items were assessed:

- Holding times
- Sample preservation
- Sample Extraction and digestion
- Laboratory blanks
- Laboratory control samples
- System monitoring compounds
- Matrix spike (MS) and matrix spike duplicate (MSD) recoveries
- Field duplicate, trip blanks, and field blanks sample results

For the air samples, the following items were assessed:

- Holding times
- Canister certification
- Laboratory blanks
- Laboratory control samples
- System monitoring compounds
- Target compound identification and qualification
- Field duplicate sample results

Based on the results of data validation, the following qualifiers may be assigned to the data in accordance with EPA's guidelines and best professional judgment:

- "U" – The analyte was analyzed for but was not detected at a level greater than or equal to the reporting limit (RL) or the sample concentration or the sample concentration for results impacted by blank contamination.

- "UJ" – The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.

- "J" – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

- "NJ" – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associate numerical value represents its approximate concentration.

- "R" – The sample results are not useable due to quality of the data generated because certain criteria were not met. The analyte may and may not be present in the sample.

After data validation activities were complete, validated data was used to prepare the tables and figures included in this report.

4.7 Field Equipment Decontamination

Groundwater sampling equipment including interface probe, water quality meters, and sampling pump were cleaned with Alconox and rinsed with water between sampling locations during groundwater sample collection.

Decontamination occurred at the sampling locations, and all liquids were temporarily contained in 5 gallon buckets. Between rinses, equipment was placed on polyethylene sheets, avoiding contact with the ground. Decontamination wastewater was drummed for disposal.

4.8 Investigation-Derived Waste Management

Investigation-derived wastes (IDW) generated during the RI were containerized. Solid waste generated during drilling of soil borings and soil vapor points and aqueous waste from monitoring well development and purging, and decontamination water were placed into separate United Nations/Department of Transportation (UN/DOT)-approved 55-gallon steel drums with closed tops. The drums were staged in a secured area on-site. The drums will be properly transported by a licensed waste hauler and disposed at a licensed facility.

5.0 FIELD OBSERVATIONS AND ANALYTICAL RESULTS

This section summarizes the field observations and laboratory analytical results from the RI. Soil analytical results are compared to the Part 375-6.8(a) Unrestricted Use (UU) SCOs and Restricted Residential Restricted Use (RRU) SCOs and groundwater analytical results are compared to the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1 AWQS for Class GA groundwater (Class GA AWQS). Soil vapor results are compared to the ambient air sample results from the corresponding sampling event. The nature and extent of contamination is discussed in Section 7.0.

Investigation locations include the following:

- Nineteen soil borings;
- Nine monitoring wells; and
- Thirteen soil vapor points.

Samples collected at these locations include:

- Soil
    - Fifty-four samples, including three duplicate samples, analyzed for VOCs, SVOCs, metals, PCBs, pesticides, and total cyanide.
- Groundwater
    - Eleven samples, including two duplicate samples, analyzed for VOCs, SVOCs, total metals, PCBs, pesticides, and total cyanide
- Soil Vapor
    - Fourteen samples, including two ambient air samples and one duplicate sample, analyzed for VOCs

A description of the soil, groundwater, and soil vapor samples collected is provided in Table 1.

Copies of the laboratory analytical data reports for data generated during the RI are provided in Appendix J. Summaries of the soil, groundwater, soil vapor, and QA/QC sample analytical result detections for samples collected during the RI are provided in the following tables:

- Table 4a: Soil Sample VOC and SVOC Detection Summary
- Table 4b: Soil Sample Pesticide, PCB, Metal, and Cyanide Detection Summary
- Table 5: Groundwater Sample Detection Summary
- Tables 6a and 6b: Soil Vapor and Ambient Air Sample Detection Summary
- Table 7: Trip Blank and Field Blank Sample Detection Summary

The following sections describe the field observations and analytical data associated with the RI.

5.1 Geology and Hydrogeology

Provided below is a description of the geologic and hydrogeologic observations made during the RI. A groundwater contour map is provided as Figure 5. Cross-sectional diagrams showing the depths of each encountered soil type in the overburden are shown on Figure 6A, 6B, and 6C. Boring logs are provided in Appendix E. Langan's May 2014 Geotechnical Engineering Study, which includes subsurface profiles showing the inferred occurrence of historic fill, native soil and bedrock, is included in Appendix C.

5.1.1 Historic Fill

A historic fill layer was observed that extended from surface grade to between approximately 1.5 and 11 feet bgs. The fill layer was deepest in the northwestern part of the Site (borings SB02, SB06, SB14, SB15, and SB16), and in the southeastern part (borings SB17 and SB18). A shallow fill layer (1.5 to 2.5 feet) was observed in the northeastern portion of the Site (borings SB07, SB08, SB12, SB19, and off-site boring SB13). The fill was characterized as predominantly consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood.

5.1.2 Native Soil Layers

The fill layer was underlain by brown, fine- to medium-grained sand. Soil types underlying the sand layer varied in different parts of the site, as follows:

- Western part – borings SB02, SB03, SB06, SB14, SB15, SB16 – layers of silt, peat, and organic clay
- Northeastern part – borings SB01, SB07, SB08, SB11, SB13, and SB19 – layers of silt and clay
- Southeastern part – borings SB04, SB05, SB09, SB10, SB12, SB17, SB18 – layer of silt

5.1.3 Bedrock

Based on the findings of the May 2014 Geotechnical Engineering Study conducted by Langan, bedrock consists of intermediate to hard, gray-white schist bedrock at depths ranging from

approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast, and is deepest in the southeastern part of the Site.

5.1.4 Hydrogeology

Synoptic groundwater level measurements were collected on February 28, 2014, April 24, 2014, and July 9, 2014. Groundwater was encountered between approximately 4 and 6.5 feet bgs during the February gauging event and between approximately 4.8 and 7.1 feet bgs during the April and July gauging events. The higher groundwater elevations during the February gauging event were presumed to be the result of snow melt. The groundwater elevation is highest in the western part of the Site and appears to flow east to northeast toward Purves Street. A summary of groundwater gauging at the Site is presented in Table 3, and a groundwater contour map based on the April 24, 2014 gauging event is presented as Figure 5.

Groundwater flow may be locally affected by the presence of a combined sewer line that runs adjacent to the Site beneath the western Purves Street sidewalk. According to NYCDEP records, the sewer was constructed circa 1911 of reinforced concrete pipe and during the RI construction crews were observed repairing what appeared to be a surficial breach or cave in. Wastewater flows north within the sewer. The sewer is 42 inches in diameter and has an invert elevation of about 3 feet. At the groundwater elevation noted above, the invert of the sewer is below the water table. If there are any cracks or penetrations in the base or sides of the sewer, the sewer will influence groundwater flow. Based on the inferred groundwater flow directions shown on Figure 5, it appears groundwater may be influenced by the sewer.

Depending on the water table elevation and the integrity of the sewer pipe, the sewer will either be a gaining or losing groundwater feature. During the RI, the sewer was likely a gaining feature because the water table was roughly 1.5 feet above the sewer's invert elevation. During the field work conducted in January 2008 for Langan's geotechnical investigation, the sewer was likely a losing feature because the water table was observed to be significantly lower and below the sewer invert elevation.

5.2 Soil Findings

5.2.1 Field Observations

Historic urban fill was encountered from surface grade to depths of 1.5 to 11 feet bgs throughout the Site. The fill material is underlain by glacial till (i.e., silt, clay, silty sand) followed by bedrock.

Petroleum impacts, evidenced by odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, SB05, SB13, SB14, and SB17. No free product was observed. A spill was reported to NYSDEC on February 20, 2014 based on observation in soil boring SB01 and spill number 1310949 was assigned. Observations related to petroleum impacts at the Site are described as follows:

- The geophysical survey conducted during the Phase II ESI identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps in the central southern part of the Site; however, it could not verify the presence of USTs. Refusal encountered during the advancement of boring SB05 may have resulted from contact with a UST-related subsurface structure.
- Boring SB01 (northeastern part of the Site) – Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 14.9 parts per million (ppm) was observed at depths of approximately 7 to 9 feet bgs, and appeared to straddle the water table.
- Boring SB03 (southwestern part of the Site) – Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 91.7 ppm was observed at depths of approximately 6 to 9 feet bgs, and appeared to straddle the water table.
- Boring SB05 (southern/central part of the Site – near suspected USTs) – Petroleum-impacted soil exhibiting staining, odor and PID readings up to 240 ppm was observed at depths of approximately 2 to 3 feet bgs. Refusal was encountered at 3 feet bgs and the location was offset 3 feet to the north. There was no evidence of petroleum impacts observed at the offset location.
- Boring SB13 (Off-site, northeast part, on the Purves Street sidewalk) – Petroleum-impacted soil exhibiting odor and PID readings up to 5.8 ppm was observed at depths of approximately 9 to 10 feet bgs, below the water table.
- Boring SB14 (western part of the Site) – Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 8.9 ppm was observed at depths of approximately 7 to 9 feet bgs, and appeared to straddle the water table.
- Boring SB17 (southern part of the Site – near suspected USTs) – Petroleum-impacted soil exhibiting odor was observed below the water table at a depth of approximately 10 feet bgs.

5.2.2 Analytical Results

A summary of laboratory detections for soil samples collected during the RI is provided in Tables 4a and 4b with comparisons to the Part 375-6.8(a) UU SCOs and the RRU SCOs. Soil sample results that exceed UU and RRU SCOs for samples collected during both investigations are shown on Figure 7. Full laboratory reports for the RI are included in Appendix J. The

following is a summary of soil sample results that exceed their respective UU or RRU SCOs, organized by analytical parameter.

VOCs

Acetone was detected at concentrations above the UU SCO in four samples. Acetone is a common lab contaminant, and was detected in nine of the laboratory batch blank samples. The concentrations detected in the soil samples are likely not an accurate representation of Site conditions.

Chlorinated VOCs (CVOCs) were detected in two soil samples collected from off-site boring SB13 (SB13_9-10 and SB13_14-15) at concentrations above their respective UU SCOs. The following CVOCs were detected at concentrations above their respective UU SCOs:

- cis-1,2-dichloroetheylene in SB13_9-10 and SB13_14-15
- trichloroethylene (TCE) in SB13_9-10 and SB13_14-15
- tetrachloroethene (PCE) in SB13_9-10 and SB13_14-15
- vinyl chloride in SB13_9-10

SVOCs

At least one SVOC was detected at a concentration above its respective UU SCO and/or RRU SCOs in fourteen of fifty-four samples. The following SVOCs were detected at concentrations exceeding their respective UU and RRU SCO in one or more samples:

- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- chrysene
- dibenzo(a,h)anthracene
- indeno(1,2,3-cd)pyrene

Metals

At least one metal was detected at a concentration exceeding its respective UU and RRU SCOs in twenty-two of fifty-four samples. The following metals were detected at concentrations exceeding their respective UU and RRU SCOs in one or more samples:

- arsenic
- barium
- cadmium
- hexavalent chromium
- trivalent chromium
- copper

- lead
- mercury

At least one metal was detected at a concentration exceeding its respective UU SCO in thirty-one of fifty-four samples. The following metals were detected at concentrations above their respective UU SCO, but below the RRU SCO:

- nickel
- selenium
- zinc

PCBs

The concentration of total PCBs in samples SB03_1-3, SB04_4-6, and SB15_0-3 exceeded the UU SCO. Total PCBs exceeded the UU SCO in samples SB03_1-3 and SB04_4-6 due to the presence of Aroclor 1262, and in sample SB15_0-3 due to the presence of Aroclor 1260.

Pesticides

At least one pesticide was detected at a concentration exceeding its respective UU SCO in three of fifty-four samples. The following pesticides were detected at concentrations exceeding their respective UU SCOs in one or more samples:

- 4,4'-DDD
- 4,4'-DDE
- 4,4'-DDT
- dieldrin

Cyanide

Total cyanide was not detected at a concentration above the SCOs in any soil samples.

5.3 Groundwater Findings

5.3.1 Field Observations

All wells were screened for free product with an oil-water interface probe. No evidence of free product was observed on groundwater during the RI. During development of off-site monitoring well MW13, sheen was observed on purged groundwater. PID headspace readings ranged from 0.0 ppm to 64.4 ppm (highest reading in monitoring well MW13) during development and sampling. Refer to section 5.1.4 for a discussion of hydrogeology.

5.3.2 Analytical Data

Eleven groundwater samples, including two duplicate samples, were analyzed for VOCs, SVOCs, total metals (including hexavalent chromium), PCBs, and pesticides. Six of the eleven

samples were also analyzed for total cyanide. A summary of the groundwater sample laboratory detections compared to NYSDEC TOGS 1.1.1 Class GA AWQS is presented in Table 5. Groundwater sample locations and results that exceed their respective Class GA AWQS are presented in Figure 8. The following is a summary of the groundwater sample results that exceed the Class GA AWQS organized by analytical parameter.

VOCs

The following VOCs were detected at concentrations above the Class GA AWQS:

- 1,1,1-trichloroethane in MW01 and MW13 (off-site);
- 1,1-dichloroethane in MW13 (off-site);
- cis-1,2-dichloroethylene in MW01, MW09, and MW13 (off-site);
- PCE in MW01, MW04, and MW13 (off-site);
- TCE in MW01 and MW13 (off-site); and
- vinyl chloride in MW01 and MW13 (off-site).

SVOCs

One SVOC, benzo(a)anthracene was detected at a concentration above its TOGS GA AWQS in monitoring well MW13.

Metals

The following metals were detected at concentrations exceeding their respective Class GA AWQS in five or more samples:

- manganese
- selenium
- sodium

PCBs and Cyanide

PCBs and cyanide were not detected in any of the groundwater samples.

Pesticides

One pesticide, total chlordane, was detected at a concentration exceeding its Class GA AWQS in monitoring well MW13 (off-site).

5.4 Soil Vapor Findings

Twelve soil vapor samples, including one duplicate sample, and two ambient air samples – one for each sampling event – were submitted for laboratory analysis. Results for VOCs were compared to the corresponding ambient air sample results. A summary of laboratory results is provided in Tables 6a and 6b. Full laboratory reports are included in Appendix J.

Total VOCs ranged from 62.71 micrograms per cubic meter (µg/m³) in SV04 to 1,552 µg/m³ in SV13. VOCs detected at a greater concentration in soil vapor than ambient air include:

- 1,1,1-trichloroethane
- 1,1-dichloroethane
- 1,2,4-trimethylbenzene
- 1,3,5-trimethylbenzene
- 1,2-dichloroethane
- 1,3-butadiene
- 2-butanone
- 2-hexanone
- 4-methyl-2-pentanone
- acetone
- bromodichloromethane
- benzene
- carbon disulfide
- carbon tetrachloride
- chloroform
- chloromethane
- cis-1,2-dichloroethene
- cyclohexane
- dichlorodifluoromethane
- ethanol
- ethyl acetate
- ethylbenzene
- Freon-113
- heptane
- isopropanol
- methyl tert-butyl ether
- methylene chloride
- n-hexane
- n-heptane
- o-xylene
- p/m-xylene
- p-ethyltoluene
- styrene
- PCE
- trans-1,2-dichlroethene
- TCE
- tetrahydrofuran
- trichlorofluoromethane
- vinyl chloride

PCE and TCE were detected in the soil vapor samples and are considered soil vapor contaminants of concern. PCE was found in all soil vapor samples and ranged from 8.6 µg/m³ (SV10) to 1,500 µg/m³ (SV13). TCE was found in ten of twelve soil vapor samples and ranged from 2 µg/m³ in SV11 to 200 µg/m³ at SV09. A map showing soil vapor sample locations and results is presented as Figure 9.

5.5 Quality Control Results

Duplicates, field blanks, and trip blanks samples were collected during the RI and are listed in Table 1. Quality control sample results were evaluated during data validation. The analytical results of field blanks and trip blank samples are summarized in Table 7.

5.6 Data Usability

Category B laboratory reports for the soil, groundwater, soil vapor, and air samples were provided by York and Alpha and were forwarded to Langan's data validator for all samples collected during the RI. Copies of the DUSRs are provided in Appendix I. The results of the data validation review are summarized below.

The data were determined to be mostly acceptable. Completeness, defined as the percentage of analytical results that are judged to be valid, is 99%. The following results were flagged as unusable, indicating that the results are not sufficiently valid or technically supportable to be used for data interpretation:

- The continuing calibration analyzed on 2/28/14 displayed continuing relative response factors less than the control limit for hexachlorobenzene and pentachlorophenol. The associated non-detect field blank sample results are qualified as "R" for rejected.

- Caprolactam did not recover (i.e., 0%) in the laboratory control sample/control sample duplicate (LCS/LCSD) associated with sample batch BC40084. The associated sample results were non-detect and are qualified as "R" for rejected.

5.7 Evaluation of Potential Areas of Concern

This section discusses the results of the RI with respect to the AOCs described in Section 3.5.

5.7.1 AOC-1: Historic Fill

During the RI, historic fill was observed from surface grade to between 1.5 and 11 feet bgs. All borings are included within AOC-1, as historic fill encompasses the entire site. Soil sample results are shown on Tables 4a and 4b, and a description of the sampled soil layer is included in Table 1. Twenty-seven samples were collected from the historic fill layer, and the analytical results are summarized as follows:

- SVOCs and metals were detected at concentrations exceeding RRU SCOs. SVOC and metal concentrations were observed to be in the range of typical concentrations found

in New York City historic fill, with the exception of isolated areas of anomalously high metals. Anomalously high concentrations of metals, particularly lead, barium, and mercury, were identified in the borings indicated below:

  - SB02 – lead, barium
  - SB04 – mercury
  - SB05, SB06, SB08, SB12, SB16 – lead

- PCBs and pesticides were detected at concentrations exceeding UU SCOs.

AOC-1 Conclusions

Fill material on the site was found to have one or more exceedances of both the UU and RRU SCOs for SVOCs, metals, pesticides, and PCBs. The presence of historic fill does not appear to be impacting the groundwater and soil vapor on the Site.

The anomalously high concentrations of lead, barium, and mercury are potentially hazardous. Based on the prevalence and magnitude of the lead concentrations, and the relatively higher solubility of lead than barium and mercury, lead is the most likely to exist in hazardous concentrations.

5.7.2 AOC-2: Historic USTs and Petroleum-Impacted Soil

AOC-2 represents the location of two USTs that were identified on the 1947 and 1950 Sanborn maps, and the petroleum-impacted soil identified during Langan's Phase II ESI. Based on the potential presence of USTs, the presumed age of the tanks (at least 67 years), and lack of tank closure documentation, the potential tanks are an AOC. In addition, visual, olfactory, and instrumental evidence of petroleum impacts was observed in three borings (SB01, SB03, and SB05) during Langan's Phase II ESI. Contaminants of concern include petroleum-related VOCs and SVOCs in soil and groundwater and VOCs in soil vapor. Investigation locations include the southern portion of the Site, which incorporates the suspected USTs and observations of petroleum impacts in Phase II ESI borings SB05 and SB03, and the northeastern portion of the Site, which incorporates observations of petroleum impacts in Phase II ESI boring SB01.

A summary of findings associated with AOC-2 is presented below:

AOC-2 USTs

The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. While drilling

boring SB05, refusal was encountered at approximately 3 feet bgs. Refusal may have been caused by a UST structure.

AOC-2 Soil

- Southern Portion of the Site
    - Petroleum-impacted soil exhibiting staining, odor and PID readings up to 240 ppm was observed at depths of approximately 2 to 3 feet bgs in boring SB05, prior to refusal. No evidence of petroleum impacts was observed at the off-site location of SB05. Boring SB10 was advanced within the suspected UST area to the north of SB05, and no evidence of petroleum impacts was observed.
    - In boring SB17, located approximately 25 feet south of the suspected UST area, petroleum-impacted soil exhibiting odor was observed below the water table at a depth of approximately 10 feet bgs.
    - In boring SB03, located approximately 25 feet southwest of the suspected UST area, petroleum-impacted soil exhibiting staining, odor, and PID readings up to 91.7 ppm was observed straddling the water table.
    - Despite field observations of petroleum impacts, there were no VOCs detected at concentrations above the SCOs. Five SVOCs, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and chrysene, were detected at concentrations exceeding UU and/or RRU SCOs in sample SB05_1-3, which was collected at the location where refusal was encountered at 3 feet bgs. There were no SVOCs detected at concentrations above the SCOs in any other samples collected from the off-set location of SB05, SB03, SB10, or SB17.
- Northeastern Portion of the Site
    - Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 14.9 ppm was observed straddling the water table in boring SB01.
    - In boring SB13, advanced off-site and approximately 15 feet east of boring SB01, petroleum-impacted soil exhibiting odor, and PID readings up to 5.8 ppm was observed within the water table at approximately 8 to 10 feet bgs.
    - In boring SB19, advanced approximately 25 feet west of boring SB01, there was no observed evidence of petroleum-impacts.

- Despite the field observations of petroleum impacts, there were no elevated petroleum-related VOCs or SVOCs detected above the SCOs in soil samples collected from these depths.

- Additional Observed Impacts

  - In boring SB14, advanced in the western portion of the Site near the Site boundary, petroleum-impacted soil exhibiting staining, odor, and PID readings up to 8.9 ppm were observed straddling the water table at a depth of approximately 7 to 10 feet bgs. There were no VOCs or SVOCs detected above the SCOs in the soil sample collected at 8 to 9 feet bgs.

AOC-2 Groundwater

There were no petroleum-related VOCs or SVOCs detected at concentrations exceeding their respective Class GA AWQS in any of the groundwater samples. Elevated PID readings were recorded in the well headspace during the sampling of well MW03 (12.8 ppm), and during the development and purging and well MW13 (64.4 ppm). Additionally, a sheen was observed on groundwater purged from well MW13. There was no evidence of petroleum impacts on groundwater during the development and sampling of monitoring well MW10, located within the suspected UST area. The PID headspace reading in MW10 was 0.0 ppm.

AOC-2 Soil Vapor

Several VOCs, including petroleum-related compounds, were detected in soil vapor at concentrations above the anticipated range of background concentrations.

AOC-2 Conclusions

Conclusions relevant to AOC-2 include:

- Although not found during the RI, USTs may still be present;
- Field observations indicate a possible petroleum release from the suspected USTs at the location of boring SB05.
- Field observations indicate the possibility of petroleum impacts resulting from historic use of the Site or off-site sources, since USTs were not found and petroleum impacts were observed up-gradient form the suspected UST location.
- Analytical results indicate VOC impacts to soil vapor and SVOC impacts to soil, however no evidence of petroleum-related VOC or SVOC impacts to groundwater was observed.

5.7.3 AOC-3: Chlorinated VOC Contamination in Groundwater

CVOCs including 1,1,1-trichloroethane, cis-1,2-dichloroethylene, PCE, TCE, and vinyl chloride were identified in groundwater at concentrations exceeding the Class GA AWQS in monitoring wells located along the eastern site border and off-site (MW01, MW04, MW09, MW12 and MW13), with the highest total CVOC concentration (871 µg/L) detected in the off-site well (MW13). Additionally, sheen was observed on groundwater purged from MW13 and a PID reading of 64.4 ppm was recorded in the headspace of MW13. CVOCs were also detected at concentrations above the UU SCO in soil samples collected from within the water table at boring SB13. No on-site soil samples found CVOC concentrations above the UU SCO.

The adjoining site to the north (Block 268, Lot 23) is also in the NYSDEC BCP (Site No. C241164). Data from a December 2013 investigation at this site further delineates the extent of CVOC impacts to groundwater. The sample locations and analytical results for the Lot 23 investigation are shown on Figure 8. The highest total CVOC concentration (3,436 µg/L) from the adjoining site investigation was found at an off-site well in the Purves Street sidewalk (Lot 23 location MW01).

AOC-4 Conclusions

The data, including groundwater, soil, and soil vapor results, show that the highest CVOC concentrations on the Site are in the northeastern corner of the Site and off-site. The data and field observations indicate an off-site CVOC source to the east in the direction of Purves Street.

5.7.4 AOC-4: Potential Soil Vapor Contamination

AOC-4 represents the potential impacts to soil vapor resulting from the use of the Site and surrounding properties for various industrial and manufacturing uses.

Soil vapor analytical results were compared to ambient air sample results collected on each day of sampling. Several VOCs, including petroleum and chlorinated-solvent related VOCs, were detected at concentrations above background ambient air concentrations in all soil vapor samples. Chlorinated VOCs, specifically PCE and TCE, are considered soil vapor contaminants of concern. The highest PCE and TCE concentrations were detected in samples collected on the eastern side of the Site adjacent to Purves Street and the southeastern portion of the Site adjacent to Lot 31. At these locations (SV03, SV06, SV07, SV09, SV12, and SV13), TCE was detected at concentrations up to 200 µg/m^3 (SV09), and PCE was detected at concentrations up to 1,500 µg/m^3 (SV13). The maximum TCE concentration was at least 1,300 times greater than

the ambient air concentration, and the maximum PCE concentration was 1,765 times greater than the ambient air concentration.

AOC-5 Conclusions

Soil vapor at the Site contains VOCs, most notably PCE and TCE. The highest PCE concentrations were detected in soil vapor samples collected on the eastern side of the Site adjacent to Purves Street, which corresponds to PCE detections in groundwater.

6.0 QUALITATIVE HUMAN AND FISH/WILDLIFE EXPOSURE ASSESSMENT

Human health exposure risk was evaluated for both current and future site and off-site conditions, in accordance with the May 2010 NYSDEC Final DER-10 Technical Guidance for Site Investigation and Remediation. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, NYSDEC DER-10 requires an on-site and off-site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. Based on the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, there was no need to prepare an FWRIA for the Site. A completed form of DER-10 Appendix 3C is enclosed in Appendix K.

6.1 Current Conditions

The Site consists of an irregularly-shaped lot that is approximately 27,100 square feet (±0.62 acres). The Site has been a vacant lot for nearly 10 years, since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes.

6.2 Proposed Conditions

The proposed project will include the construction of a 33-story, approximately 263-unit residential apartment building and a one-story building with residential amenity space and retail along Thomson Avenue and 44th Street. One level of approximately at-grade parking will span an area of approximately 14,000 square feet. The anticipated excavation depth necessary for the at-grade first floor slab is approximately 1.2 to 3.4 feet bgs. Additional excavations to facilitate foundation elements and an elevator pit are anticipated but have not been finalized. Proposed development plans are provided in Appendix A.

6.3 Summary of Environmental Conditions

Soil sample analysis revealed SVOCs, metals, pesticides, and PCBs at concentrations that exceeded their respective UU SCOs, with SVOC and metal concentrations also above RRU SCOs. Additionally, VOCs were detected at concentrations above the UU SCOs in samples collected from off-site boring SB13. Soil contaminants of concern (COC) include VOCs, SVOCs, PCBs, pesticides, and metals.

SVOC and metal impacts are widespread on the Site. SVOC concentrations above RRU SCOs were detected in samples collected from 10 of 19 borings (SB02, SB05, SB06, SB07, SB08,

SB09, SB11, SB12, SB16, and SB19) at depths ranging from grade surface to 8 feet bgs. Metal concentrations above RRU SCOs were detected in samples collected from 13 of 19 borings (SB01, SB02, SB03, SB04, SB05, SB06, SB07, SB08, SB12, SB14, SB15, SB16, SB18, and SB19) at depths ranging from surface grade to 13 feet bgs.

Groundwater samples had concentrations of VOCs, SVOCs, pesticides, and metals that exceeded their respective Class GA AWQS. Chlorinated VOCs were detected in groundwater at the highest concentrations in off-site monitoring well MW13, located on Purves Street sidewalk close to the northern boundary of the Site, and MW01, located in the northeast corner of the site near Purves Street. Chlorinated VOCs were also detected in samples from monitoring wells MW04 and MW09 at concentrations above the Class GA AWQS. Metal concentrations above the Class GA AWQS were detected throughout the site, and are likely attributable to regional groundwater conditions. One SVOC, benzo(a)anthracene, and one pesticide, alpha-chlordane, were detected above the Class GA AWQS in off-site monitoring well MW13.

Several VOCs, including chlorinated VOCs, were detected in soil vapor samples at concentrations above background ambient air levels throughout the Site.

6.4 Conceptual Site Model

A conceptual site model has been developed based on the findings of the RI. The purpose of the conceptual site model is to develop a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways, as discussed below.

6.4.1 Potential Sources of Contamination

Potential sources of contamination have been identified in Section 3.3 and are based on previous investigations. The site-wide layer of historic fill has been established as a source of SVOCs, metals, pesticides, and PCBs. Historic fill, however, does not appear to be impacting groundwater. Groundwater appears to be primarily impacted by off-site sources.

6.4.2 Exposure Media

The impacted media include soil, groundwater, and soil vapor. Site soil may have been impacted by former operations, the nature of the historic fill throughout the Site, and by possible historic petroleum releases. Analytical data indicates that the historic fill material underlying the Site contains SVOCs, metals, pesticides, and PCBs. Groundwater impacts include chlorinated VOCs and metals. Soil vapor throughout the Site is impacted with VOCs.

Because VOCs are present at elevated concentrations in soil vapor and portions of the proposed building slabs will be above the groundwater table, there is potential for vapors to accumulate under the proposed building slabs.

6.4.3 Receptor Populations

The Site is currently vacant and locked, preventing public access; therefore, human receptors are limited to occasional site visitors and workers involved in pre-development (e.g., investigation) activities. During site development, human receptors are limited to construction and remediation workers, authorized guests visiting the Site and the public adjacent to the Site. Under future conditions, receptors will include the new building tenants, workers, and visitors to the residential properties including children.

6.5 Potential Exposure Pathways – On-Site

6.5.1 Current Conditions

On-Site soil has been contaminated with SVOCs, metals, PCBs and pesticides. Approximately 55% of the Site is covered with a concrete slab, and the remaining 45% is covered with overgrown vegetation. In areas where human exposure to contaminated soil is possible, the potential migration pathway is likely complete for dermal absorption, inhalation and ingestion. The Site is surrounded by construction fencing and locked, which limits activity within the Site boundary to authorized guests.

On-Site groundwater is contaminated with VOCs and metals. Because groundwater in New York City is not used as a potable water source, there is no completion of the exposure pathway under current Site conditions. There is a potential exposure pathway during groundwater sampling associated with Site investigation. The potential pathway is through dermal absorption, inhalation, and ingestion. Site access is currently limited to authorized guests.

Soil vapor results indicate the presence of VOCs. There is a potential exposure pathway during soil vapor sampling associated with Site investigation. The potential pathway is through inhalation. Site access is currently limited to authorized guests.

6.5.2 Construction/Remediation Condition

Construction and remediation activities may result in potential exposures to Site contaminants in the absence of a Health and Safety Plan (HASP) and a Community Air Monitoring Plan (CAMP). Soil contains SVOCs and metals at concentrations that exceed Unrestricted and

Restricted Residential Use SCOs, and PCBs and pesticides at concentrations that exceed Unrestricted Use SCOs. Construction and remedial activities include construction of foundation components and excavation and off-site disposal of impacted soil. In the absence of a HASP and CAMP, this scenario presents the potential for exposure of soil COCs to construction and remediation workers via dermal absorption, ingestion, and inhalation of particulate matter. In the absence of CAMP, activities may result in exposure to the public adjacent to the Site through potential generation and off-site migration of dust containing Site COCs.

Site groundwater contains VOCs and metals at concentrations that exceed their respective Class GA AWQS. Groundwater will be encountered during excavation activities by workers, and there is potential for exposure to groundwater COCs, in the absence of a HASP, to construction workers via dermal absorption, ingestion, or inhalation.

Soil vapor results indicated the presence of petroleum-related and chlorinated VOCs. During site development, construction and remediation workers may be exposed to soil vapor COCs via inhalation in the absence of a HASP. In the absence CAMP, activities may also result in exposure to the public adjacent to the Site through volatilization of vapors into the air and potential off-site migration.

6.5.3 Proposed Future Conditions

The proposed development will include residential use. Upon completion of the new development, the entire Site will be capped with the concrete building foundation. These barriers will prevent direct human exposure to impacted soil and groundwater.

In the absence of engineering controls (e.g., vapor barrier and/or depressurization system), the presence of VOCs in the groundwater and soil vapor creates potential for VOCs to volatilize and accumulate in the proposed building, completing an exposure pathway for future users. In the absence of engineering controls, routes of exposure may include inhalation of vapors that accumulate in the building.

There is no risk of ingesting groundwater COCs because the Site and surrounding areas obtain their drinking water supply from surface water reservoirs located upstate and not from groundwater; groundwater is not intended for consumption.

6.6 Potential Exposure Pathways – Off-Site

In the absence of CAMP, soil has the potential to be transported off-site by wind in the form of dust or on the tires of vehicles or equipment leaving the Site during development and

remediation activities. Metal impacts to groundwater are considered a regional problem and are not considered a localized concern. Chlorinated VOC impacts to the groundwater in the northeast corner of the Site are likely from an off-site source. The off-site chlorinated VOC impacts migrating onto the Site and are likely migrating onto other properties as well and represent a potential exposure pathway via soil vapor intrusion.

The potential off-site migration of site contaminants is not expected to result in a complete exposure pathway for current, construction and remediation, or future conditions for the following reasons:

- Air monitoring will be conducted for particulates (i.e., dust) and VOCs during all intrusive activities as part of a community air monitoring program. Dust and/or vapor suppression techniques will be employed to limit potential for off-site migration of site soil and vapors.
- Vehicle tires and undercarriages will be washed as necessary prior to leaving the Site to prevent tracking material off-site.
- The Site is located in a highly urbanized area with continuous impervious (i.e. concrete) surface covering.
- Groundwater in New York City is not used as a potable water source.

6.7 Evaluation of Human Health Exposure

Based upon the conceptual site model and the review of environmental data, complete on-site exposure pathways appear to be present, in the absence of institutional and engineering controls, in current, construction and remediation, and future conditions. The complete exposure pathways indicate there is a risk of exposure to humans from Site contaminants via exposure to soil, groundwater, and soil vapor if institutional and engineering controls are not implemented.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the Site is provided below.

6.7.1 Current Conditions

Contaminant sources include historic fill with varying levels of SVOCs, metals, pesticides, and PCBs, two potential USTs, chlorinated VOCs in groundwater, and PCE, TCE, and other VOCs in soil vapor.

Contaminant release and transport mechanisms include contaminated soil transported as dust and volatilization of contaminants from the soil and groundwater matrices to the soil vapor phase, and existing soil vapor contaminants. Under current conditions, the likelihood of exposure to humans is limited, as the Site surface cover, consisting of a partial concrete slab and vegetation, generally prevents contact with soils, groundwater is not currently accessible and soils are not currently being disturbed except during investigation. In addition, the Site property is kept locked and activity is limited to authorized guests. All five elements exist; therefore, the potential for completed exposure pathways is present. However, the risk can be avoided or minimized by applying appropriate health and safety measures during investigation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

In accordance with a HASP and CAMP, measures such as conducting an air-monitoring program, donning PPE, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented. Such measures would prevent completion of these potential migration pathways.

6.7.2 Construction/Remediation Activities

During development and remediation activities, points of exposure include disturbed and exposed soil during excavation, dust and organic vapors generated during excavation activities, and contaminated groundwater that will be encountered during excavation and dewatering operations. Routes of exposure include ingestion and dermal absorption of contaminated soil and groundwater, inhalation of organic vapors arising from contaminated soil and groundwater, and inhalation of dust arising from contaminated soil. The receptor population includes the construction and remediation workers and, to a lesser extent, the public adjacent to the Site. All five elements exist; therefore, the potential for completed exposure pathways is present. However, the risk can be avoided or minimized by applying appropriate health and safety measures during construction and remediation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, maintaining site security, and wearing the appropriate PPE.

In accordance with a HASP, a Soil Management Plan (SMP), and a CAMP, measures such as conducting an air-monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, proper housekeeping, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented. Such measures would prevent completion of these potential migration pathways.

6.7.3 Proposed Future Conditions

For the proposed future conditions, some residual contaminants may remain and may include those listed under current conditions. Contaminant release and transport mechanisms include volatilization of contaminants from soil vapor or the groundwater matrix to the soil vapor phase. If institutional and/or engineering controls are not implemented, points of exposure include potential cracks in the foundation or lower-level slab of the proposed development. Routes of exposure may include inhalation of vapors entering the building; these routes may not exist depending on the effectiveness of the remediation. The receptor population includes the building tenants, residential property employees, and visitors. The possible routes of exposure will be avoided or mitigated by proper installation of soil vapor mitigation measures (e.g., vapor barrier and depressurization system) and the impermeable (concrete) site cap.

6.7.4 Human Health Exposure Assessment Conclusions

The following conclusions were developed from this human health exposure assessment:

1. Under current conditions there is a moderate risk to exposure. Contaminated soil transport off-site as dust is limited by the site cover consisting of a concrete slab and vegetation. The exposure risks can be avoided or minimized by maintaining site security and limiting access to authorized guests, and by following the appropriate health and safety and vapor and dust suppression measures during investigation activities.

2. In the absence of institutional and engineering controls, there is a moderate risk of exposure during the construction and remediation activities. This risk can be avoided or minimized by following the appropriate health and safety, vapor and dust suppression, and site security measures.

3. The existence of a complete exposure pathway for Site contaminants to human receptors during proposed future conditions is unlikely, as a large quantity of soil will be excavated and transported to an off-site disposal facility, groundwater is not used as a potable water source in New York City, and the potential pathway for soil vapor

intrusion into the building would be addressed through the use of soil vapor mitigation measures (e.g., vapor barrier and depressurization system).

4. It is unlikely that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors for current, construction phase, or future conditions. Monitoring and control measures would be used during investigation and construction to prevent completion of this pathway. Under future conditions, the site will be remediated and engineering controls can be implemented to prevent completion of this pathway.

7.0 NATURE AND EXTENT OF CONTAMINATION

This Section evaluates the nature and extent of soil, groundwater and soil vapor contamination at the Site. The nature and extent of the contamination is derived from a combination of field observations and analytical data that were discussed in Section 5.0.

7.1 Historic Fill

The site-wide fill layer extends from surface grade to depths up to approximately 11 feet bgs and contains varying levels of SVOCs, pesticides, PCBs, and metals that are discussed in detail in this Section. The discussion is divided by the following contaminant classifications:

1. SVOC-Contaminated Material
2. Metals-Contaminated Material
3. Pesticide-contaminated Material
4. PCB-contaminated Material

7.1.1 SVOC Contaminated Material

SVOCs were detected at concentrations exceeding UU SCOs in soil samples collected from eleven of nineteen boring locations. At least one SVOC was detected at a concentration above its respective RRU SCO in ten of nineteen borings. There was one historic fill sample, SB14_8-9, that had no SVOC detections. Total SVOC concentrations in historic fill samples with detections ranged from 0.10 mg/kg in sample SB11_2-3.5 to 61 mg/kg in sample SB06_6-8. The contaminants of concern (COCs) include:

- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- chrysene
- dibenzo(a,h)anthracene
- indeno(1,2,3-cd)pyrene

These SVOCs are typically found in historic fill throughout New York City. Although these compounds can be associated with motor vehicle exhausts and fuels, they are likely incomplete combustion byproducts from the burning of wood or coal that were a component of the backfill source use for Site infilling. Each COC was detected above its respective RRU SCO in at least one sample. COCs were detected above the RRU SCOs in samples collected from throughout the Site, at depths ranging from surface grade to 8 feet bgs. The highest concentrations of

COCs were detected in samples collected from the shallow and deep fill in the northwest portion of the Site (borings SB02 and SB06), and the shallow fill in the northeast corner of the Site (SB19). Total SVOC concentrations in these areas are summarized in the following table:

Boring	Layer	Total SVOCs (mg/kg)
SB02	shallow fill	27.19
	deep fill	20.63
SB06	shallow fill	23.78
	deep fill	61.22
SB19	shallow fill	48.41

7.1.2 Metals-Contaminated Material

Metals were detected at concentrations above the UU SCOs in samples collected from all nineteen soil borings, and at concentrations above the RRU SCOs in samples collected from thirteen of nineteen soil borings. Metals that were detected above RRU SCOs are in **bold**. The COCs include (maximum concentration observed and corresponding sample name are shown in parenthesis):

- **arsenic**
  (35.8 mg/kg in SB05A_2-4)
- **barium**
  (4,340 mg/kg in SB02_2-4)
- **cadmium**
  (7.21 mg/kg in SB18_11-13)
- **hexavalent chromium**
  (8.52 mg/kg in SB06_6-8)
- **trivalent chromium**
  (251 mg/kg in SB02_2-4)
- **lead**
  (61,000 mg/kg in SB08_0-2)
- **copper**
  (860 mg/kg in DUP01_022014, parent sample SB04_1-3)
- **mercury**
  (14.9 mg/kg in DUP01_022014, parent sample SB04_1-3)
- nickel
  (54.7 mg/kg in SB08_0-2)
- selenium
  (6.17 mg/kg in SB14_8-9)
- zinc
  (3,260 mg/kg in SB02_2-4)

Metal concentrations above the RRU SCOs were detected within historic fill throughout the Site at depths ranging from surface grade to 9 feet bgs. The potential source of metals contamination is likely the quality of historic fill. The former chromium plating use in the southern-adjoining site (Block 268, Lot 31) may have contributed to the presence of hexavalent

chromium in borings SB09, SB17, SB04, and SB18. The elevated metals concentrations in shallow and deep fill in SB02 may be the result of the former site use as a chemical laboratory. Anomalously high and potentially hazardous concentrations of metals, particularly lead, barium, and mercury, were identified in the borings indicated below:

- Lead – SB02, SB05, SB08, SB12 and SB16
- Barium – SB02
- Mercury – SB04

The highest lead concentrations were observed in samples collected from the shallow fill in borings SB08 and SB12, which are both located in northeastern corner of Lot 1. Potential sources of metal contamination include historical site uses and the quality of fill placed at the Site. Given the magnitude of lead concentration, the Site fill may be been impacted by releases of lead-based paints from demolition of the former buildings or lead paint mixing operations.

7.1.3 Pesticide-Contaminated Material

Pesticides, specifically 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, and dieldrin, exceeded their respective UU SCOs in shallow fill samples (0 to 3 feet bgs) in borings SB10, SB14, SB15 and SB19. There were no pesticides detected at concentrations above their respective RRU SCOs. The elevated pesticide concentrations were scattered throughout the Site with no discernable pattern. Pesticides were not detected in deeper samples within the impacted borings. Sources of the pesticides are likely prior usage by inhabitants of the former buildings or quality of the historic fill.

7.1.4 PCB-Contaminated Material

Two PCBs, Aroclor 1260 and Aroclor 1262, were detected at concentrations exceeding the UU SCO. The PCB concentrations did not exceed the RRU SCO. PCBs were detected in borings SB03 and SB15, located in the southwestern part of the Site, between 0 and 3 feet bgs, and in boring SB04, located the southeastern part of the Site, between 4 and 6 feet bgs.

7.2 Groundwater Contamination

Evaluation of the groundwater analytical results identified the following COCs for groundwater, which are discussed in more detail in this Section:

1. CVOC Contamination
2. Metals Contamination

7.2.1 CVOC Contamination

CVOC concentrations exceeding Class GA AWQS were found in groundwater at monitoring wells MW01, MW04, MW09, and off-site well MW13. CVOCs were also identified in groundwater samples collected from wells on the northern-adjoining site (Lot 23, NYSDEC BCP Site No. C241164), specifically off-site wells MW01 (Purves Street Sidewalk) and MW02 (Lot 23). The COCs include the following: 1,1,1-trichloroethane, 1,1-dichloroethane, cis-1,2-dichloroethene, PCE, TCE, and vinyl chloride.

Monitoring well MW04 and MW09 each contained one CVOC at a concentration above Class GA AWQS: PCE (MW04) and cis-1,2-dichloroethene (MW09). CVOC concentrations in groundwater were highest in the northeast corner of the Site (MW01), on Lot 23 (MW02), and on the Purves Street sidewalk (MW13 and MW01). Total CVOC concentrations in these wells are summarized in the following table:

Well ID	Location	Total CVOCs (µg/L)
MW01	Lot 1	793
MW13	Purves Street Sidewalk	871
MW02	Lot 23	733
MW01	Purves Street Sidewalk	3,436

On-site soil sampling did not reveal a source of CVOCs. CVOCs were detected in multiple on-site soil samples; however, the concentrations did not exceed UU SCOs and were typically one to two orders of magnitude lower than the UU SCO of 1.3 mg/kg. The highest on-site CVOC concentration was found to be 0.32 mg/kg in sample SB19_17-19. PCE, TCE, cis-1,2-dichloroethene, and vinyl chloride, were detected at concentrations above UU SCOs in the two soil samples collected from off-site boring SB13, at depths of 9 to 10 feet bgs and 14 to 15 feet bgs. Petroleum-like odors and elevated PID readings were observed at these depths during sample collection.

Based on soil and groundwater sampling results and field observations, the source of the chlorinated VOC contamination appears to be off-site.

7.2.2 Metals Contamination

Groundwater sample results revealed one or more of the following metals at concentrations that exceed their TOGS Class GA AWQS: manganese, selenium, and sodium. The presence of sodium and selenium is consistent with regional groundwater quality. Concentrations of

manganese were found above the TOGS Class GA AWQS in 7 of the 9 monitoring wells, with concentrations generally higher on the eastern Site boundary, and highest in off-site monitoring well MW13. Manganese concentrations ranged from 17 to 13,400 µg/L and are considered indicative of regional groundwater quality or potential off-site sources. No manganese UU SCO exceedances were found in Site soil samples.

7.3 Soil Vapor Contamination

Total VOCs ranged from 62.71 µg/m³ at SV04 to 1,552 µg/m³ at SV13. PCE and TCE concentrations in soil vapor were prevalent throughout the Site. PCE was found in all soil vapor samples and ranged from 8.6 µg/m³ (SV10) to 1,500 µg/m³ (SV13). TCE was found in ten of twelve soil vapor samples (SV04 and SV08) and ranged from 2 µg/m³ in SV11 to 200 µg/m³ at SV09. The PCE and TCE concentrations were highest along the eastern portion of the Site along Purves Street and in the southeastern portion of the Site adjacent to Lot 31.

Site-wide VOC impacts to soil vapor may result from the potential USTs, historical uses of the Site and surrounding properties, or an unknown off-site source along Purves Street.

8.0 CONCLUSIONS

The RI was implemented between February 20 and April 24, 2014. The findings summarized herein are based on both qualitative data (field observations and instrumental readings), and laboratory analytical results of soil, groundwater, and soil vapor samples. Findings and conclusions are as follows:

1. Stratigraphy: Beneath the partial Site surface cover (i.e., concrete), overburden at the Site includes a historic fill layer, which extends to depths of up to approximately 11 feet bgs. The historic fill layer generally consists of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Underlying the fill is a layer of gray-brown and brown/tan fine- to medium-grained sand, which is underlain by layers of brown silt, gray clay and peat. Bedrock was not encountered during this investigation; however, based on Langan's previous geotechnical investigations, depth to bedrock at the Site ranges from approximately 43 to 61 feet bgs. The top of rock contour generally slopes down from the northwest to the southeast.

2. Hydrogeology: Synoptic groundwater level measurements were collected on February 28, 2014 and April 24, 2014. Groundwater was encountered between approximately 4 and 6.5 feet bgs (el 4.89 feet to el 6.09 feet NAVD88) during the February gauging event and between approximately 4.8 and 7.1 feet bgs (el 4.24 feet to el 5.32 feet NAVD88) during the April gauging event. The groundwater elevation is highest in the western portion of the Site and appears to slope toward the east/northeast across the majority of the Site. Groundwater flow appears to be locally influenced by the sewer beneath the Purves Street sidewalk.

3. Suspected USTs: Two USTs were identified on the Site in the 1947 and 1950 Sanborn Maps and there is no record of UST removal. The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Boring SB05, advanced in the geophysical anomaly, encountered refusal at 3 feet bgs, which may be related to the presence of UST structures. Borings in the vicinity of the UST found petroleum staining, odors, and elevated PID readings. A spill was reported to NYSDEC based on the observation of petroleum impacts. Petroleum impacts were also found in the western and northeastern parts of the Site and may be related to potential site USTs or potential off-site sources. Petroleum impacts are further described below.

4. Soil Impacts:

    a. Historic Fill – The historic fill layer contains concentrations of SVOCs, metals, pesticides, and PCBs at concentrations that exceed their respective UU or RRU SCOs.

        i. SVOCs were detected at concentrations above RRU SCOs within the fill layer throughout the Site at levels considered typical of historic fill found in New York City.

        ii. PCB and pesticide concentrations above the UU SCO, but below the RRU SCOs, were detected in the fill.

        iii. Metals were detected at concentrations above RRU SCOs within the fill layer throughout the Site. Anomalously high and potentially hazardous concentrations of lead were detected in samples from five borings, with the highest concentrations found in the shallow fill of borings SB08 and SB12 located in the northeastern corner of Lot 1, and the shallow and deep fill of boring SB02 in the northwest corner of Lot 1. An anomalously high concentration of barium was detected in the shallow fill of boring SB02, and an anomalously high concentration of mercury was detected in the shallow fill of boring SB04, located in the southeastern portion of the Site.

    b. Petroleum-Impacted Soil: Petroleum impacts, evidenced by odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, SB05, SB13 and SB14. Odors and elevated PID readings were observed in the northeast corner of the Site (boring SB01 and off-site boring SB13), and sheen was observed on groundwater during purging and development of off-site monitoring well MW13. Odors, staining, and elevated PID readings were observed straddling the water table in borings SB03 and SB14 in the western portion of the Site. There was no free product observed in any of the monitoring wells. Potential sources of petroleum-impacted soil on the Site include the various historical industrial and manufacturing uses, the on-site USTs and off-site sources.

5. Groundwater Impacts: Groundwater VOC, SVOC, metal, and pesticide concentrations exceeded Class GA AWQS.

a. Chlorinated VOCs (1,1,1-trichloroethane, PCE, TCE, cis-1,2-dichloroethene, vinyl chloride) were found at concentrations above Class GA AWQS on the northeastern and southeastern parts of the Site, with the highest concentrations in northeastern well MW01 and off-site well MW13. Groundwater data obtained from an investigation at adjacent Lot 23 (NYSDEC BCP Site No. C241164) revealed a total CVOC concentration in groundwater in an off-site well on the Purves Street sidewalk (to the northeast of the Site) that was greater than concentrations in samples collected for this RI. Additionally, CVOC concentrations were detected in soil in off-site boring SB13 at concentrations above Unrestricted Use SCOs, indicating the CVOC impacts are likely originating from an off-site source.

b. Sodium and selenium impacts to groundwater are consistent with regional groundwater quality. Manganese impacts along the western part of the Site are consistent with regional groundwater quality or off-site sources.

c. SVOC and pesticide contaminants were only detected in off-site well MW13, and do not appear to be impacting Site groundwater.

6. Soil Vapor Impacts: Soil vapor sampling results indicate the presence of several VOCs, including CVOC and petroleum-related compounds, above the range of ambient air concentrations. The highest concentrations of TCE and PCE were identified along the eastern boundary of the Site along Purves Street and the southeastern boundary of the Site adjacent to Lot 31. VOCs may be due to historic releases of petroleum and chlorinated solvents originating from former off-site manufacturing/industrial processes.

7. Sufficient analytical data were gathered during the RI to establish site-specific soil cleanup levels and to develop a remedy for the Site. The remedy will be described and evaluated in a Remedial Action Work Plan (RAWP) prepared in accordance with NYS BCP guidelines. The remedy will need to address petroleum-impacted soil, historic fill impacted with metals and SVOCs, the potential for soil vapor intrusion, groundwater impacted with chlorinated VOCs from an off-site source, and a contingency for the removal and closure of unknown USTs.

LEGEND

- SITE BOUNDARY
- SB05 — BORING LOCATION
- SB01/MW01 — BORING AND MONITORING WELL LOCATION
- SV02 — SOIL VAPOR SAMPLE LOCATION
- AA01 — AMBIENT AIR SAMPLE LOCATION

NOTES:

1. DRAWING BASED ON APRIL 11, 2014 SURVEY BY APPLE SURVEYING.
2. AERIAL PHOTO OBTAINED FROM GOOGLE EARTH PRO ON JULY 6, 2014.
3. MONITORING WELL LOCATIONS WERE SURVEYED. BORING LOCATIONS, SOIL VAPOR AND AMBIENT AIR SAMPLE LOCATIONS WERE LOCATED BY FIELD MEASUREMENTS OFF OF SURVEYED STRUCTURES.

LEGEND

SB01/MW01 (EL. 4.24') — BORING AND MONITORING WELL LOCATION (GROUNDWATER ELEVATION IN PARENTHESIS)

SITE BOUNDARY

4.60 — GROUNDWATER CONTOUR

NOTES:

1. DRAWING BASED ON MAY 5, 2014 SURVEY BY APPLE SURVEYING.
2. MONITORING WELL LOCATIONS WERE SURVEYED.
3. ELEVATIONS ARE RELATIVE TO THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88).
4. CONTOUR INTERVAL IS 0.2 FEET.
5. GROUNDWATER ELEVATION WERE MEASURED DURING THE REMEDIAL INVESTIGATION (RI) ON APRIL 24, 2014.
6. SEWER LINE INVERT ELEVATION IS APPROXIMATELY 3 FEET.

LEGEND

- SB05 — BORING LOCATION
- SB01/MW01 — BORING AND MONITORING WELL LOCATION
- SITE BOUNDARY
- (2' - 3') — DEPTH INTERVAL AT WHICH PETROLEUM IMPACTS, INCLUDING ODORS, STAINING, AND PHOTOIONIZATION DETECTOR (PID) READINGS ABOVE BACKGROUND LEVELS, WERE OBSERVED IN THE BORING

NOTES:

1. DRAWING BASED ON MAY 5, 2014 SURVEY BY APPLE SURVEYING.
2. MONITORING WELL LOCATIONS WERE SURVEYED, BORING LOCATIONS WERE LOCATED BY FIELD MEASUREMENTS OFF OF SURVEYED STRUCTURES.
3. SOIL SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TITLE 6 OF THE COMPILATION OF NEW YORK CODES, RULES, AND REGULATIONS (NYCRR) PART 375 UNRESTRICTED USE SOIL CLEANUP OBJECTIVES (SCOS) AND RESTRICTED RESIDENTIAL RESTRICTED USE SCOs.
4. ONLY COMPOUNDS EXCEEDING THEIR RESPECTIVE SCOs ARE SHOWN.
5. CONCENTRATIONS ABOVE THE NYSDEC PART 375 UNRESTRICTED USE SCOs ARE IN BOLD.
5. CONCENTRATIONS ABOVE THE NYSDEC PART 375 RESTRICTED RESIDENTIAL RESTRICTED SCOs ARE HIGHLIGHTED.
6. DUP01_022014 IS A DUPLICATE OF SAMPLE SB04_1-3; DUPR01_041614 IS A DUPLICATE OF SAMPLE SB10_9-10; AND DUPR02_041614 IS A DUPLICATE OF SAMPLE SB16_6.5-8.
7. VOC = VOLATILE ORGANIC COMPOUND
8. SVOC = SEMIVOLATILE ORGANIC COMPOUND
9. PCB = POLYCHLORINATED BIPHENYL
10. mg/kg = MILLIGRAM PER KILOGRAM
11. ND = NOT DETECTED
12. NE = COMPOUND DETECTED AT A CONCENTRATION THAT DID NOT EXCEED THE NYSDEC PART 375 UNRESTRICTED USE SCOs AND RESTRICTED RESIDENTIAL RESTRICTED SCOs .

QUALIFIERS:

J = DETECTED ABOVE THE METHOD DETECTION LIMIT BUT BELOW THE REPORTING LIMIT; THEREFORE, THE RESULT IS AN ESTIMATED CONCENTRATION
B = ANALYTE WAS DETECTED IN THE ASSOCIATED LABORATORY ANALYSIS BATCH BLANK
DI = RESULT IS FOR A DILUTED SAMPLE, # INDICATES THE DILUTION FACTOR

SB01/MW01 — BORING AND MONITORING WELL LOCATION

SB01/MW01 — MONITORING WELL LOCATION SAMPLED FOR BCP SITE No. C241164 REMEDIAL INVESTIGATION

SITE BOUNDARY

NOTES:

1. DRAWING BASED ON MAY 5, 2014 SURVEY BY APPLE SURVEYING.
2. MONITORING WELL LOCATIONS WERE SURVEYED.
3. GROUNDWATER SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TECHNICAL AND OPERATIONAL GUIDANCE SERIES (TOGS) 1.1.1 AMBIENT WATER QUALITY STANDARDS (AWQS) AND GUIDANCE VALUES FOR CLASS GA - DRINKING WATER.
4. OFF-SITE MONITORING WELL DATA FOR BCP SITE No. C241164 WAS OBTAINED FROM THE REMEDIAL INVESTIGATION REPORT FOR 27-21 44TH DRIVE AND 44-18 PURVES STREET, DATED MARCH 26, 2014, PREPARED BY LANGAN.
5. ONLY COMPOUNDS EXCEEDING THEIR RESPECTIVE NYSDEC TOGS AWQS CRITERIA ARE SHOWN.
6. CONCENTRATIONS EXCEEDING THE CRITERIA ARE HIGHLIGHTED AND IN BOLD.
7. DUPRI03_042414 IS A DUPLICATE OF SAMPLE MW13_042414.
8. µg/L = MICROGRAM PER LITER
9. VOC = VOLATILE ORGANIC COMPOUND
10. SVOC = SEMIVOLATILE ORGANIC COMPOUND
11. PCB = POLYCHLORINATED BIPHENYLS
12. NE = COMPOUND DETECTED AT A CONCENTRATION THAT DID NOT EXCEED THE NYSDEC TOGS AWQS OR GUIDANCE VALUE FOR CLASS GA - DRINKING WATER.
13. ND = NOT DETECTED

LEGEND

- SV01 — SOIL VAPOR SAMPLE LOCATION
- AA01 — AMBIENT AIR SAMPLE LOCATION
- SITE BOUNDARY

NOTES:

1. DRAWING BASED ON APRIL 5, 2014 SURVEY BY APPLE SURVEYING.
2. SOIL VAPOR LOCATIONS WERE LOCATED BY FIELD MEASUREMENTS OFF OF SURVEYED STRUCTURES.
3. AMBIENT AIR SAMPLE (AA01_022114 & AA02_041814) CONCENTRATIONS ARE SHOWN FOR REFERENCE.
4. µg/m³ = MICROGRAM PER CUBIC METER
5. VOC = VOLATILE ORGANIC COMPOUND
6. ONLY COMPOUNDS WITH CONCENTRATIONS GREATER THAN AMBIENT AIR CONCENTRATIONS ARE SHOWN.
7. DUE TO GROUNDWATER INFILTRATION, SAMPLES COLLECTED FROM SV02 AND SV05 WERE NOT ANALYZED.

QUALIFIERS:

J = THE ANALYTE WAS POSITIVELY IDENTIFIED AND THE ASSOCIATED NUMERICAL VALUE IS THE APPROXIMATE CONCENTRATION OF THE ANALYTE IN THE SAMPLE.
UJ = THE ANALYTE WAS NOT DETECTED AT A LEVEL GREATER THAN OR EQUAL TO THE REPORTING LIMIT (RL); HOWEVER, THE REPORTED RL IS APPROXIMATE AND MAY BE INACCURATE OR IMPRECISE.
U = THE ANALYTE WAS ANALYZED FOR, BUT WAS NOT DETECTED AT A LEVEL GREATER THAN OR EQUAL TO THE LEVEL OF TEH RL OR THE SAMPLE CONCENTRATION FOR RESULTS IMPACTED BY BLANK CONTAMINATION
B = THE ANALYTE IS FOUND IN THE ASSOCIATED LABORATORY ANALYSIS BATCH BLANK
"-" = THIS COMPOUND WAS NOT DETECTED AT A CONCENTRATION GREATER THAN THE AMBIENT AIR CONCENTRATION DURING THE ASSOCIATED INVESTIGATION.

Notes:
1. Elevations are relative to the North American Vertical Datum of 1988 (NAVD88).
2. USGS (1929 NGVD) Mean Sea Level at Sandy Hook, NJ is 1.095 feet lower than NAVD88 (NAVD88 - 1.095 = NGVD 1929 N
3. Water Elevation = Top of Casing Elevation - Depth to Water.
4. bgs = below ground surface.

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
D# = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor
B = Analyte is found in the associated laboratory analysis batch blank

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination
D[#] = Results for a diluted sample, # indicates the dilution factor

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination
D# = Results for a diluted sample, # indicates the dilution factor

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO) and Restricted Residential Restricted Use SCO.
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are in bold.
4. NYSDEC Part 375 Restricted Residential Restricted Use SCO exceedances are highlighted.
5. Method Detection Limits exceeding SCO Criteria are italicized.
6. DUP01_022014 is a duplicate of sample SB04_1-3.
7. DUPRI01_041614 is a duplicate of sample SB10_9-10.
8. DUPRI02_041614 is a duplicate of sample SB16_6.5-8.
9. mg/kg = milligrams per kilogram
10. NA = not analyzed
11. ~ = No corresponding comparison criteria

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample
UJ = The analyte was not detected at a level greater than or equal to the reporting limite (RL); however, the reported RL is approximate and may be inaccurate or imprecise
U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor

Notes:
1. Groundwater sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards (AWQS) and Guidance Values.
2. Only detected compounds are shown in the table.
3. Concentrations exceeding the NYSDEC TOGS AWQS Criteria are highlighted and in bold.
4. DUP01_022814 is a duplicate of sample MW01_022814.
5. DUPRI03_042414 is a duplicate of sample MW13_042414.
6. µg/L = micrograms per liter
7. PCBs = polychlorinated biphenyls
8. ~ = no corresponding comparison criteria
9. NA = not analyzed

Qualifiers:
U = Analyte included in the analysis, but not detected
J = Detected above the Method Detection Limit but below the Reporting Limit (RL); therefore, the reported result is an estimated concentration
UJ = The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.
B = Analyte is found in the associated laboratory analysis batch blank
$D^{\#}$ = Results for a diluted sample, # indicates the dilution factor

Notes and Qualifiers:

1. Only detected compounds are shown in table.
2. AA01_022114 is an ambient air sample.
3. Soil vapor sample concentrations above the ambient air conentration are in bold.
3. VOC = volatile organic compound
4. µg/m³ = micrograms per cubic meter
5. ~ = This indicates that no regulatory limit has been established for this analyte
6. J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
7. U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the reporting limit or the sample concentration for results impacted by blank contaminati

Notes and Qualifiers:

1. Only detected compounds are shown in table.
2. AA02_041814 is an ambient air sample.
3. Soil vapor sample concentrations above the ambient air conentration are in bold.
3. VOC = volatile organic compound
4. µg/m³ = micrograms per cubic meter
5. J = The analyte was positively identified and the associcated numerical value is the approximate concentration of the analyte in the sample
6. UJ = The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
7. U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
8. B = The analyte was detected in the analysis batch blank

Notes:
1. Field and trip blank sample analytical results are compared to the New York State Department of Environmental Conservation NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1. Ambient Water Quality Standards (AWQS) and guidance values for drinking water (Class GA).
2. Only detected compunds are shown in table.
3. µg/L = micrograms per liter
4. QA/QC Matrix = Corresponding sample matrix/rationale for each quality assurance/quality control sample
5. NA = not analyzed
6. ND = analyte included in the analysis, but not detected
7. ~ = no regulatory limit has been established for this analyte

Qualifiers:
J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

APPENDIX A
PROPOSED DEVELOPMENT PLANS

GENERAL NOTES NEW YORK - NEW SPEC NEW CONSTRUCTION:

I - CODES

1. BUILDING CODE OF THE CITY OF NEW YORK, INCLUDING LATEST AMENDMENTS ("2008 N.Y.C. CODE"), CONSISTING OF THE 2003 INTERNATIONAL BUILDING CODE.
2. AMERICAN CONCRETE INSTITUTE "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" ACI 318-02 ("ACI") AS MODIFIED BY CHAPTER 19 OF THE N.Y.C. BUILDING CODE.
3. AMERICAN CONCRETE INSTITUTE "BUILDING CODE REQUIREMENTS FOR MASONRY STRUCTURES" ACI 530-02 ("ACI 530") AS MODIFIED CHAPTER 21 OF THE N.Y.C. BUILDING CODE.

II - MATERIALS

UNLESS OTHERWISE SHOWN OR NOTED ON DRAWINGS:

1. STRUCTURAL STEEL:
   ALL ROLLED SHAPES: ASTM A572 OR A992, GRADE 50
   ALL PLATES AND CONNECTION MATERIAL: ASTM A36
   ALL TUBULAR SECTIONS: ASTM A500, GRADE B
   ANCHOR BOLTS, U.O.N.: ASTM F1554
2. CAST-IN-PLACE CONCRETE:
   FOUNDATION WALLS & BUTTRESSES: 5000 PSI NORMAL WT. (145 PCF)
   MAT FOUNDATIONS AND PILE CAPS: 6000 PSI NORMAL WT. (145 PCF)
   GRADE BEAMS: 6000 PSI NORMAL WT. (145 PCF)
   FORMED SLABS: AS NOTED ON PLAN DRAWINGS
   COLUMNS AND WALLS: AS NOTED ON COLUMN SCHEDULE
3. REINFORCEMENT:
   DEFORMED BARS: ASTM A615, GRADE 60, GRADE 75 FOR #10 & #11
   WELDED WIRE FABRIC: ASTM A185.
   WELDED DEFORMED WIRE FABRIC: ASTM A467, GRADE 60.
4. WELDING ELECTRODES: E70XX LOW HYDROGEN.
5. BOLTING MATERIALS: ASTM A325 OR F1852 (TWIST-OFFTYPE). OR A490. U.O.N.

III - GENERAL

1. NOTES, TYPICAL DETAILS AND SCHEDULES APPLY TO ALL STRUCTURAL WORK UNLESS OTHERWISE NOTED. FOR CONDITIONS NOT SPECIFICALLY SHOWN, PROVIDE DETAILS OF A SIMILAR NATURE. VERIFY APPLICABILITY BY SUBMITTING SHOP DRAWINGS FOR REVIEW.
2. STRUCTURAL DRAWINGS SHALL BE USED IN CONJUNCTION WITH THE SPECIFICATIONS, ARCHITECTURAL AND MECHANICAL DRAWINGS. IF THERE IS A DISCREPANCY BETWEEN DRAWINGS IT IS THE CONTRACTOR'S RESPONSIBILITY TO NOTIFY THE ENGINEER PRIOR TO PERFORMING WORK.
3. DO NOT SCALE DRAWINGS TO OBTAIN DIMENSIONAL INFORMATION.
4. SEE ARCHITECTURAL DRAWINGS AND SPECIFICATIONS FOR WATER/DAMPROOFING AND FIREPROOFING DETAILS AND REQUIREMENTS.
5. TOP OF CONCRETE SLABS ARE AT FLOOR REFERENCE ELEVATIONS EXCEPT AS NOTED. FOR FLOOR REFERENCE ELEVATIONS SEE COLUMN SCHEDULE.
6. THESE DRAWINGS DO NOT DEFINE SCOPE OF CONTRACTS. SEE CONSTRUCTION MANAGER'S DOCUMENTS.
7. AT ALL TIMES THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR THE CONDITIONS OF THE JOBSITE INCLUDING SAFETY OF PERSONS AND PROPERTY. THE ARCHITECTS OR ENGINEER'S PRESENCE OR REVIEW OF WORK DOES NOT INCLUDE THE ADEQUACY OF THE CONTRACTOR'S MEANS OR METHODS OF CONSTRUCTION.
8. SHORING, BRACING AND PROTECTION OF EXISTING AND ADJACENT STRUCTURES DURING CONSTRUCTION IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR. PROTECT AND MAINTAIN THE INTEGRITY OF ADJACENT STREETS, BUILDINGS AND STRUCTURES.
9. ALL EXISTING DIMENSIONS AND LOCATIONS OF EXISTING STRUCTURES SHOWN ON THE DRAWINGS SHALL BE VERIFIED BY FIELD MEASUREMENTS. ANY DISCREPANCIES SHALL BE REPORTED TO THE ENGINEER.
10. DRAWINGS HAVE BEEN PREPARED BASED ON AVAILABLE KNOWLEDGE OF EXISTING CONDITIONS. IF, DURING DEMOLITION, EXCAVATION OR CONSTRUCTION, ACTUAL CONDITIONS ARE DISCOVERED TO DIFFER FROM THOSE INDICATED ON DRAWINGS, ENGINEER SHALL BINOTIFIED.
11. CONSTRUCTION DOCUMENTS ARE IN COMPLIANCE WITH SECTION BC 1603 OF NEW YORK CITY BUILDING CODE.

IV - FOUNDATION NOTES

1. ALL THE COLUMNS AND SHEAR WALLS SHALL BEAR ON DEEP FOUNDATIONS SUCH AS H-PILES, PIPE PILES, OR CAISSONS.
2. NO BACKFILL SHALL BE PLACED AGAINST FOUNDATION WALLS UNLESS SUPPORTING SLABS ARE IN PLACE AND SET OR THE WALLS ARE ADEQUATELY BRACED.
3. UNDERPINNING OF EXISTING ADJACENT FOUNDATIONS MAY BE REQUIRED. ALL ENGINEERING, DESIGNS AND MEANS AND METHODS OF CONSTRUCTION RELATED TO UNDERPINNING ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR.
4. DEWATERING OF THE SITE DURING CONSTRUCTION IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR. PRECAUTIONS SHALL BE TAKEN BY THE CONTRACTOR NOT TO UNDERMINE EXISTING FOUNDATIONS. METHOD OF DEWATERING AND CALCULATIONS FOR THE APPROPRIATE SYSTEM ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR.
5. ALL PILE CAPS ARE TO BE CENTERED ON COLUMNS ABOVE, U.O.N.
6. PROVIDE DOWELS IN FOUNDATIONS FOR ALL WALLS, COLUMNS, AND SHEAR WALLS OF SAME NUMBER AND SIZE AS THE VERTICAL REINFORCEMENT ABOVE, U.O.N.
7. PROVIDE WATERSTOPS IN ALL VERTICAL CONSTRUCTION JOINTS IN BASEMENT WALLS.
8. SLABS ON GROUND SHALL BE PLACED ON SELECT FILL COMPACTED TO 95 PERCENT MODIFIED PROCTOR MAXIMUM DRY DENSITY (ASTM D1557).

V - UNDERPINNING NOTES

1. CONTRACTOR SHALL RETAIN THE SERVICE OF A PROFESSIONAL ENGINEER REGISTERED IN THE STATE OF NEW YORK TO PREPARE SIGNED AND SEALED DESIGN DRAWINGS AND CALCULATIONS FOR ALL REQUIRED UNDERPINNING OF ADJACENT STRUCTURES. THE CONTRACTOR SHALL FILE THE DRAWINGS WITH THE BUILDING DEPARTMENT.
2. SUBMIT COPY OF FILED DRAWINGS TO DESIMONE FOR INFORMATION ONLY. ALL UNDERPINNING WORK SHALL BE SUBJECT TO SPECIAL INSPECTION IN ACCORDANCE WITH LOCAL CODE REQUIREMENTS.
3. THE FULL SCOPE OF THIS WORK IS TO BE DETERMINED BY THE CONTRACTOR BY THE REVIEW OF ALL AVAILABLE DOCUMENTATION SUCH AS SURVEYS, GEOTECHNICAL REPORTS AND THE LIKE AND BY SITE REVIEW PRIOR TO BIDDING.
4. THE CONTRACTOR IS SOLELY RESPONSIBLE FOR THE SAFETY OF ALL EXISTING ADJACENT BUILDINGS, STRUCTURES, SIDEWALKS, VAULTS AND THE LIKE DURING AND AS A RESULT OF UNDERPINNING OPERATIONS.

VI - CONCRETE NOTES

1. REINFORCING STEEL SHALL HAVE A MINIMUM CLEAR COVER AS FOLLOWS, U.O.N. IN DRAWINGS:

   CONCRETE POURED AGAINST EARTH..... 3"

   CONCRETE EXPOSED TO EARTH OR WEATHER:
   #5 OR SMALLER..... 11/2"
   #6 OR LARGER..... 2"

   CONCRETE NOT EXPOSED TO WEATHER OR IN CONTACT WITH GROUND:
   COLUMNS (TIES AND MAIN REINFORCING)..... 11/2"
   SLABS, WALLS,
   #11 OR SMALLER..... 3/4"
   BEAMS (STIRRUPS AND MAIN REINF)..... 11/2"

   CLEAR COVER SHALL BE CLEARLY SHOWN ON ALL REBAR DETAIL DRAWINGS.
2. ALL REINFORCEMENT SHALL BE SECURELY HELD IN POSITION WHILE PLACING CONCRETE. IF NECESSARY, ADDITIONAL BARS SHALL BE PROVIDED BY THE CONTRACTOR TO FURNISH SUPPORT.
3. THE CONTRACTOR SHALL VERIFY THE DIMENSIONS AND LOCATIONS OF ALL OPENINGS, PIPE SLEEVES, ETC. AS REQUIRED BY ALL TRADES, BEFORE THE CONCRETE IS POURED. THE CONTRACTOR SHALL CONSULT THE ARCHITECTURAL, MECHANICAL, AND ELECTRICAL DRAWINGS, AS WELL AS THE STRUCTURAL DRAWINGS FOR THE LOCATION, NUMBER, AND SIZE OF ALL OPENINGS, SLEEVES, ETC. HOWEVER, OPENINGS NOT SHOWN ON THE STRUCTURAL DRAWINGS SHALL BE INSTALLED ONLY AFTER APPROVAL BY THE STRUCTURAL ENGINEER IS OBTAINED.
4. LOCATION OF ALL CONSTRUCTION JOINTS NOT SHOWN IN DRAWINGS SHALL BE SUBMITTED TO ENGINEER FOR APPROVAL PRIOR TO DETAILING OF REINFORCING. ALL CONSTRUCTION JOINTS TO BE CLEARLY SHOWN IN REBAR DETAIL DRAWINGS. ENGINEER MAY REQUIRE ADDITIONAL REINFORCING AT CONSTRUCTION JOINTS.
5. DIMENSIONS "Ld" AS NOTED ON DRAWINGS SHALL BE AS FOLLOWS:

BEAMS		
BAR SIZE	BOTTOM BARS	OTHER BARS
#3	13	17
#4	17	23
#5	22	28
#6	26	34
#7	38	49
#8	43	56
#9	48	63
#10	54	71
#11	60	78

COLUMNS	
BAR SIZE	Ld

#8	64	64	83
#9	72	72	94
#10	81	81	106
#11	90	90	117

FOR: f'c = 3 ksi Ld =1.29 x TABLE VALUE
f'c = 4 ksi Ld =1.12 x TABLE VALUE
f'c = 6 ksi Ld =0.92 x TABLE VALUE
f'c = 8 ksi Ld =0.79 x TABLE VALUE

6. ALL LAP SPLICES SHALL BE 1.3LD UNLESS NOTED OTHERWISE ON DRAWINGS.
7. FOR LIGHTWEIGHT AGGREGATE CONCRETE, MULTIPLY THE TABULATED VALUES BY 1.3.
8. COMBINATIONS OF EFFECTS DUE TO CONCRETE STRENGTH, CONCRETE WEIGHT ARE CUMULATIVE. Ld SHALL BE MULTIPLIED BY EACH FACTOR TO FIND THE CORRECT VALUE.
9. DOWEL BAR SUBSTITUTIONS SHALL BE PERMITTED PROVIDED THAT MANUFACTURER'S DATA SUPPORTS FULL TENSION SPLICES.
10. ALL SLEEVES AND PENETRATIONS SHALL BE PROVIDED BY THE SUB-CONTRACTOR REQUIRING THE OPENING.
11. CONCRETE COLUMN LENGTH ADJUSTMENT FOR ELASTIC SHORTENING, SHRINKAGE AND CREEP EFFECTS SHALL BE DISCUSSED WITH THE CONCRETE CONTRACTOR.
12. CONDUIT PLACED IN CONCRETE SLABS MUST BE PLACED IN ACCORDANCE WITH THE FOLLOWING GUIDELINES:
    a. CONTRACTOR SHALL NOT INSTALL CONDUIT THAT IS NOT SHOWN ON MECHANICAL DRAWINGS.
    b. DO NOT CROSS MORE THAN ONE LAYER OF CONDUIT OVER ANOTHER IN ANY GIVEN AREA.
    c. PLACE CENTROID OF CONDUIT OR CONDUIT GROUP AT THE MID-HEIGHT OF THE SLAB.
    d. CONDUIT OR CONDUIT GROUP CAN NOT EXTEND OUTSIDE THE MIDDLE 1/3 OF THE SLAB.
    e. MAINTAIN A MINIMUM CLEAR SPACING BETWEEN THE CONDUIT OF 3 DIAMETERS. THIS REQUIREMENT APPLIES EXCEPT WHERE CONDUIT ACCUMULATES AT "TURN DOWNS". THE CONDITIONS AT "TURN DOWNS" LOCATIONS MUST BE EVALUATED AT EACH LOCATION BY THE STRUCTURAL ENGINEER. "TURN DOWNS" CAN NOT OCCUR AT COLUMN OR BUTTRESS LOCATIONS.
    f. DO NOT PLACE ANY CONDUIT IN THE SLAB WITHIN 36" FROM THE EDGE OF ANY COLUMN OR WALL ABOVE OR BELOW THE SLAB.
    g. SLAB REINFORCEMENT MUST NOT BE MOVED, CUT, OR BENT TO ACCOMODATE CONDUIT PLACEMENT.
    h. CONDUIT IS NOT TO RUN THROUGH G/I WITHIN A COLUMN OR WALL.
    i. ALUMINUM CONDUIT SHALL NOT BE EMBEDDED IN A SLAB UNLESS IT IS EFFECTIVELY COATED.

    IF THE ABOVE REQUIREMENTS ARE ALL MET, CONDUIT LOCATIONS NEED NOT BE REVIEWED BY THE STRUCTURAL ENGINEER. ANY DEVIATIONS MUST BE SUBMITTED ON A SHOP DRAWING FOR APPROVAL BY THE STRUCTURAL ENGINEER PRIOR TO CONDUIT PLACEMENT.

    THE FOLLOWING CASES MUST BE SUBMITTED FOR REVIEW BY THE STRUCTURAL ENGINEER:

    a. LOCATIONS OF ANY CONDUIT LARGER THAN 2" IN OUTSIDE DIAMETER.
    b. LOCATIONS OF ANY BUNDLED CONDUITS.

VII - SURVEYING

1. PRIOR TO REMOVING RESHORES THE UNDERSIDE OF THE SLAB SHALL BE SURVEYED TO DETERMINE THE RELATIVE ELEVATION OF THE SLAB. AT A MINIMUM, SURVEY POINTS ARE TO BE LOCATED NEXT TO COLUMNS AND AT CENTER OF COLUMN STRIPS AND MIDDLE STRIPS. SLAB EDGES AND CANTILEVERS ARE TO BE SURVEYED AT POINTS OF THEORETICAL MAXIMUM AND MINIMUM DEFLECTIONS WITHIN EACH SPAN. SURVEYOR IS TO SUBMIT A GENERAL LAYOUT OF POINTS TO ENGINEER FOR APPROVAL PRIOR TO SURVEYING THE SLABS. ADDITIONAL POINTS MAY BE REQUIRED AT ENGINEER'S DISCRETION. THE C.M. IS TO CONTRACT OUT THE SURVEYING SERVICE TO A SURVEYOR NOT AFFILIATED WITH THE CONCRETE CONTRACTOR. THE COST OF THIS SURVEY IS TO BE INCLUDED IN THE CONSTRUCTION COST.

VIII - MASONRY NOTES

1. STRUCTURAL CONCRETE MASONRY, AS SHOWN ON THESE DRAWINGS, SHALL HAVE A COMPRESSIVE STRENGTH (F'M) OF 2,000 PSI.
2. MASONRY UNITS SHALL CONFORM TO ASTM C90, TYPE II, NORMAL WEIGHT, HOLLOW UNLESS SPECIFICALLY NOTED OTHERWISE ON THESE DRAWINGS, WITH A UNIT STRENGTH AS REQUIRED TO ACHIEVE COMPRESSIVE STRENGTH SPECIFIED ABOVE.
3. MORTAR SHALL CONFORM TO ASTM C270, TYPE M OR S FOR ABOVE GRADE, TYPE M FOR BELOW GRADE.
4. GROUT FOR FILLED CELLS SHALL CONFORM TO ASTM C476 WITH 3000 PSI STRENGTH AT 28 DAYS. CELLS SHALL BE GROUTED IN INCREMENTS NOT EXCEEDING 5 FEET VERTICALLY. FILL ALL CELLS BELOW GRADE.
5. VERTICAL REINFORCING SHALL BE ASTM A615, GRADE 60 DEFORMED BARS. MINIMUM LAP SPLICES SHALL BE AS FOLLOWS:

   # 3 BARS - 1'-6"
   # 4 BARS - 2'-0"
   # 5 BARS - 2'-6"
   # 6 BARS - 3'-0"
6. HORIZONTAL REINFORCING SHALL BE NO. 9 GAGE "DUROWALL" OR EQUIVALENT AND SHALL BE PLACED EVERY OTHER COURSE U.O.N.
7. ALL BLOCK SHALL BE PLACED IN RUNNING BOND.

IX - SPECIAL INSPECTIONS

OWNER WILL ENGAGE AND PAY FOR A SPECIAL INSPECTOR AND AN INDEPENDENT TESTING AGENCY TO PERFORM THE FOLLOWING SPECIAL INSPECTION AND TESTING AS SPECIFIED ON THE APPLICABLE SECTIONS OF THE NEW YORK CITY BUILDING CODE, CHAPTER 17, SECTION 1704. TECHNICAL REPORT STATEMENT OF RESPONSIBILITY TR-1 FORM SHALL BE FILLED WITH THE BUILDING DEPARTMENT FOR APPROVAL OF SPECIAL INSPECTOR. IT IS THE CONTRACTOR'S RESPONSIBILITY TO PROVIDE ADEQUATE PRIOR NOTICE FOR COMPLETION OF INSPECTIONS.

1. CONCRETE:
   ALL CONCRETE WORK SHALL BE SUBJECT TO SPECIAL INSPECTION BY OR UNDER THE DIRECT SUPERVISION OF A LICENSED PROFESSIONAL ENGINEER AS REQUIRED BY SUBCHAPTERS 1704.4 AND 1905.3 AND TABLE 1704.4 OF THE N.Y.C. BUILDING CODE.
   A. THE OWNER SHALL ENGAGE A LICENSED PROFESSIONAL ENGINEER, APPROVED BY THE ENGINEER OF RECORD, TO SUPERVISE THE TESTING OF THE MATERIALS AND THE INSPECTION OF CONCRETE CONSTRUCTION.
   B. THE PRELIMINARY TEST FOR CONTROLLED CONCRETE SHALL BE MADE IN ACCORDANCE WITH SUBCHAPTER 1905.3 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE AND THE APPROVED DESIGN MIXES FILED ON TECHNICAL REPORT TR-3. NO CONCRETE SHALL BE PLACED BEFORE ACCEPTANCE BY ENGINEER.
   C. QUALITY CONTROL AND INSPECTION OF MATERIALS AND OF BATCHING SHALL BE MADE IN ACCORDANCE WITH SUBCHAPTER 1905.3 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE.
   D. ALL FIELD TESTS AND INSPECTIONS SHALL BE PERFORMED AS REQUIRED BY SUBCHAPTER 1905.6 OF SECTION 1905 OF THE N.Y.C. BUILDING CODE. CONCRETE TEST CYLINDER RESULTS SHALL BE FILED ON TECHNICAL REPORT TR-2.
   E. PRIOR TO PERMIT OWNER TO ENGAGE CONCRETE TESTING AGENCY FOR TR-2 AND TR-3 FORMS.

F. FINDINGS AND CONCLUSIONS

G. SIGNATURES OF ENVIRONMENTAL PROFESSIONAL

H. PROFESSIONALS QUALIFICATIONS

I. APPENDICES

A. EXECUTIVE SUMMARY:

The subject site is located at 4426/30 Purves Street in Long Island City, New York. The site is approximately .17 acres in size and is vacant land (no buildings on the site).

It was determined from the physical site inspection, records review and interviews that there were recognized environmental conditions with regard to the subject site. Recognized environmental conditions are those conditions that could adversely affect the environmental integrity of the property.

There were no oil fill ports or fuel vents noticed on the subject site (such ports or vents could indicate the presence of an underground storage tank on the site). A review of the New York City Fire Department (NYCFD), storage tank files and New York State Department of Environmental Conservation's (NYSDEC), Petroleum Bulk Storage Tank database did not indicate the presence of any underground storage tanks on the site. A review of available Sanborn Fire Insurance Maps did not indicate the presence of any underground storage tanks on the site.

There were no above ground storage tanks or any above ground electrical transformers noticed on the site. There were several small piles of miscellaneous debris and construction/demolition debris noticed on the site. There were also two (2) 55 gallon drums noticed on this site. It is recommended that these drums and piles of debris be removed from the site prior to any planned construction activities on the property. There were no signs of improper disposal of fill material or any signs of stressed vegetation or soil contamination noticed on the subject site. There were no signs of friable Presumed Asbestos Containing Material (PACM), noticed on the subject site (given the fact that there are no buildings on the site the potential for asbestos exposure is negligible).

There were no signs of wetlands observed on the east side of the property. There were no outside above ground storage tanks noticed on the subject site. There were no signs of stressed vegetation or soil contamination noticed on the subject site.

It is the opinion of Middleton Environmental Incorporated that no further testing (subsurface or otherwise), is required on the subject site.

B. INTRODUCTION:

1. Purpose;

The general purpose of this Phase I Environmental Site Assessment is to determine whether or not the property is subject to certain recognized environmental conditions that may affect property use or increase the risk of liability exposure associated with the property. Recognized environmental conditions include the presence or possible presence of hazardous substances or petroleum related products that indicate an existing release, past release, or a significant threat of a release into structures on the property, into the ground, groundwater or surface water. Recognized environmental conditions can include past uses, disposal practices, spills, off-site contamination, and regulatory compliance.

The findings and conclusions of this report can be found in Sections F. Sections C, D, E describe the property, reviews records related to the property and contains information gathered during site reconnaissance and interviews. MEI Phase I Site Assessments are prepared by environmental professionals, supervised by Professional Engineers. Signatures and qualification statements can be found in Sections G and H of this report.

2. Limiting Conditions and Methodology Utilized;

The limiting conditions and methodology used in preparing this Phase I Environmental Site Assessment Report are those contained in ASTM Standard E1527-00. This practice does not address requirements of any state or local laws or any federal laws other than the appropriate inquiry provisions of CERCLA's "Innocent Landowner Defense". Users are cautioned that federal, state, and local laws may impose environmental assessment obligations that are beyond the scope of this practice. Users should also be aware that there are likely to be other legal obligations with regard to hazardous substances or petroleum products discovered on property that are not addressed in this practice and that may pose risks of civil and/or criminal sanctions for non-compliance.

The report is not, and should not be construed as, a guaranty, warranty, or certification of the presence or absence of any toxic substances, (which can be made only with testing), and contains no formal plans or recommendations to rectify or remediate the presence of any toxic substances, (which may be subject to regulatory approval). No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of this practice under ASTM Standards is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property.

Except for acts and omissions by Middleton Environmental Incorporated (MEI), or its employees which are shown to be grossly negligent and which represent intentional misconduct, Weiss and Company has agreed, to the maximum extent permitted by law, to hold harmless and indemnify MEI from and against any and all claims and liabilities arising in respect to the Environmental Site Assessment performed by MEI on behalf of Weiss and Company All liability on the part of MEI shall be limited solely to the cost of this report. MEI shall have no liability for any other damages, whether consequential, compensatory, punitive, or special arising out of, incidental to, or as a result of this report. MEI assumes no liability for the use of this report by any person or entity other than the client for whom the report was prepared.

C. SITE INFORMATION:

1. Location and Legal Description;

The subject site is located at 4426/30 Purves Street in Long Island City, New York (Block 268 Lots 24, 25 and 26). The site is approximately .17 acres in size is zoned for industrial usage.

2. Site and Vicinity Characteristics;

The property site and vicinity characteristics listed below were analyzed utilizing a current USGS 7.5 Minute Topographic Map. This information is useful in determining the grade and topography of the subject site. It was determined that the property is primarily flat and there were no slopes, depressions or rolling hills observed on the subject site. The site has been graded for commercial usage and slopes on the subject site range from 0 to 3 percent. The groundwater flow beneath the subject site is in a generally southwesterly direction as obtained from groundwater contour maps developed by the United States Geologic Survey (USGS Groundwater Flow and USGS Contour Map).

3. Information Reported by User Regarding Environmental Liens or Specialized Knowledge or Experience;

No information concerning any environmental liens that may be currently recorded against the property was reported to MEI. Moreover, no specialized knowledge or experience related to recognized environmental conditions at the property was reported to MEI prior to site examination.

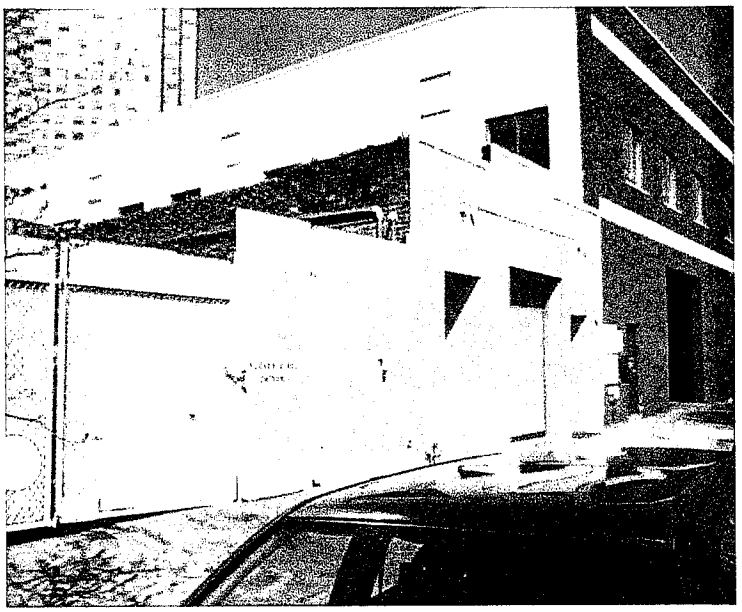
4. Current Uses of the Property;

The current use of the property is vacant. The site is approximately .17 acres in size and is vacant land (no buildings on the site).

5. Historical Usage of the Property;

A review of all reasonably ascertainable standard historical sources from the present to 1900 was conducted in order to identify any prior use of the property or adjoining properties that could lead to the presence of recognized environmental conditions that may adversely affect the property. A review of available Sanborn Fire Insurance Maps indicated that the site originally contained three (3) dwellings that were constructed prior to 1898 and were demolished between 1950 and 1936. The 1950 Sanborn Fire Insurance Map indicated that there were three (3) small buildings on the site that were utilized by a controller manufacturing company, a pine chemical company, an air freight company and these buildings were demolished prior to 1970. The property has been vacant since that time.

6. Current and Past Uses of the Surrounding Properties;

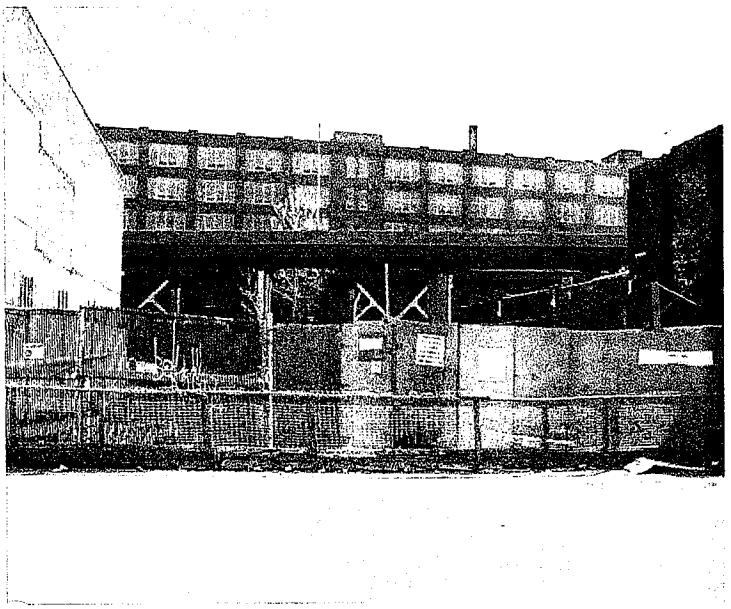


The past and current use of the adjoining properties is industrial. The property is bordered on all sides oy industrial properties. The site borders are as follows:

North - The property is bordered to the north by a vacant lot and a welding company building.

South - The property is bordered to the south by a vacant industrial building.

East - The property is bordered to the east by Purves Street and a building under construction.



West - The property is bordered to the west by an automobile repair facility.

BORDER TO THE NORTH

BORDER TO THE SOUTH

BORDER TO THE EAST

BORDER TO THE WEST

7. General Description of Structure;

A. Improvements;

The subject site is located at 4426/30 Purves Street in Long Island City, New York. The site is approximately .17 acres in size and is vacant land (no buildings on the site).

B. Heating and Cooling System;

There are no buildings on the site and no heating systems.

C. Roads;

The subject site is entered via Purves Street that is located to the east of the site.

D. Potable Water Supply;

There is no potable water supply to the subject site.

E. Sewage Disposal;

There are no sanitary disposal systems on the subject site.

D. RECORD REVIEW:

1. Standard Environmental Record Source, Federal and State;

In preparing this Phase I Environmental Site Assessment Report the following reasonably ascertainable standard environmental record sources were reviewed. Search radii are those that are suggested under ASTM 1527-00.

Federal NPL Site List (Federal Superfund)	-	*Within 1 mile*
Federal RCRA-TSD List (Treatment, Storage or Disposal facilities)	-	*Within 1 mile*
Federal CERCLIS List	-	*Within 1/2 mile*
Federal RCRA Hazardous Waste Generators List	-	*Site & Surrounding Sites*
State List of Inactive Hazardous Waste Disposal Sites	-	*Within 1 mile*
State Leaking Underground Storage Tank (LUST) List	-	*Within 1/2 mile*
State Landfill Site List	-	*Within 1/2 mile*
Local Department of Health Records (if accessible for Underground Storage Tanks and Environmental Data)	-	*Subject Site*
Local Sources	-	*Fire Department, Building Department, Water/Electric/Utility Company*

2. Summary of Environmental Records Review:

NPL;

The National Priorities List did not indicated the presence of any USEPA confirmed hazardous waste facilities within a mile radius of the subject site.

RCRA-TSD;

There were no USEPA RCRA-TSD (Treatment, Storage or Disposal), facilities within a half radius of the subject site.

CERCLIS;

The USEPA CERCLIS (Comprehensive Environmental Responsibility Cleanup Liability Information Systems), database did not indicate the presence of any treatment, storage or disposal facilities within a half mile radius of the subject site.

RCRA HAZARDOUS WASTE GENERATORS LIST;

Neither the subject site nor any of the surrounding sites were identified as RCRA Hazardous Waste Generators.

STATE HAZARDOUS WASTE SITES;

There were six (6) New York State Department of Environmental Conservation Inactive Hazardous Waste Sites within a mile radius of the subject site (National Rubber Adhesives site at 38-31 9th Street, the Amtrak Sunnyside Yard at 39-39 Honeywell Street, Roehr Chemicals at 52-30 37th Street, Standard Motor Products site at 37-18 Northern Boulevard, Quanta Resources at 37-80 Review Avenue and Manhattan Adhesives at 425 Greenpoint Avenue). None of these sites would have an apparent adverse impact on the site based upon the distance to the site and direction of groundwater flow.

STATE HAZARDOUS SUBSTANCE WASTE DISPOSAL SITE STUDY:

A review of the NYSDEC Hazardous Substance Waste Disposal Site Study did not indicate the presence of any known or suspected hazardous waste sites within a half mile radius of the subject site.

STATE LEAKING UNDERGROUND STORAGE TANK DATABASE (LUST)/SPILL LIST:

The NYSDEC Spill Information System Database was searched in order to ascertain whether any spill incidents or leaking underground storage tank (LUST), sites were reported within a half mile radius of the subject site. The search indicated that there have not been any reported incidents with regard to the subject site (property located at 44-30 Purves Street in Long Island City, New York). The search indicated that there were forty (40) leaking underground storage tank sites within a half mile radius of the subject site. The nearest site was located at 42-64 Hunter Street (.12 of a mile northeast of the site). This site has been remedied and the spill file for this incident has been closed. Neither this site nor any of the other LUST sites would have an adverse impact on the subject site (see Environmental Data section in appendix information regarding the above referenced LUST sites).

STATE LANDFILL SITE LIST:

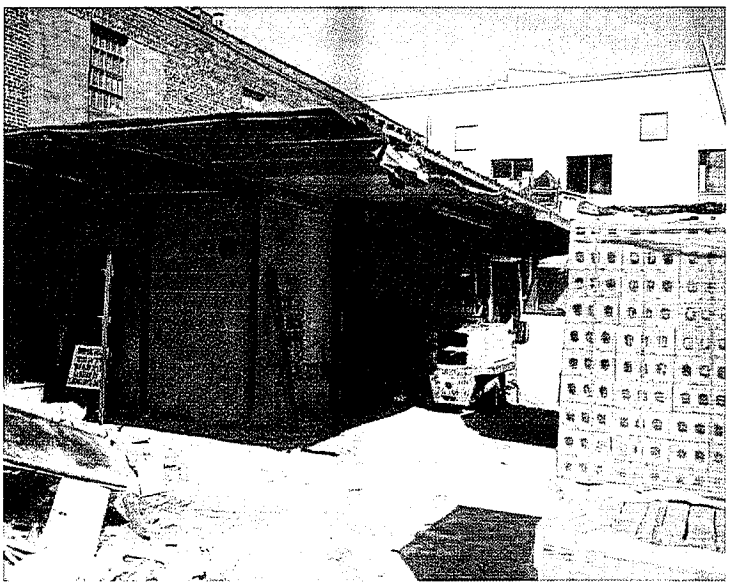
The NYSDEC Landfill List did not indicate the presence of any known or suspected landfill sites within a half mile radius of the subject site.

NEW YORK CITY FIRE DEPARTMENT/NYSDEC PETROLEUM BULK STORAGE DATABASE (PBS):

A review of the NYCFD storage tank files and New York State Department of Environmental Conservation (NYSDEC) PBS database did not indicate the presence of any registered storage tanks on the site (underground or above ground).

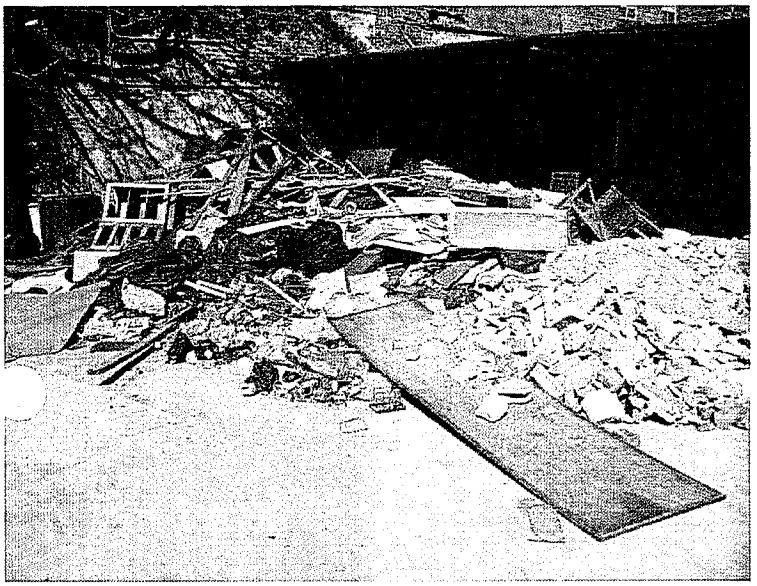
E. INFORMATION FROM SITE RECONNAISSANCE AND INTERVIEWS:

The purpose of site reconnaissance is to identify any recognized environmental conditions that could adversely affect the property. Mr. Donald J. Middleton Jr. conducted the site reconnaissance on April 13, 2006. The site and the periphery of the site were inspected visually and physically.



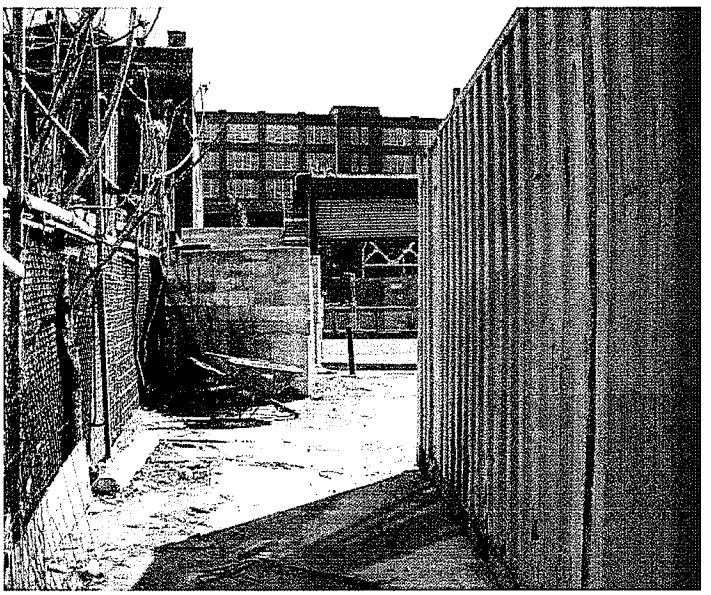
1. Physical Site Inspection;

The subject site is located at 4426/30 Purves Street in Long Island City, New York. The site is approximately .17 acres in size and is vacant land (no buildings on the site).



The first area examined was the outside grounds. There were no oil fill ports or fuel vents noticed on the subject site (such ports or vents could indicate the presence of an underground storage tank on the site). A review of the New York City Fire Department (NYCFD), storage tank files and New York State Department of Environmental Conservation's (NYSDEC), Petroleum Bulk Storage Tank database did not indicate the presence of any underground storage tanks on the site. A review of available Sanborn Fire Insurance Maps did not indicate the presence of any buried tanks on the site.

There were no above ground storage tanks or any above ground electrical transformers noticed on the site. There were several small piles of miscellaneous debris and construction/demolition debris noticed on the site. There were also two (2) 55 gallon drums noticed on this site. It is recommended that these drums and piles of debris be removed from the site prior to any planned construction activities on the property. There were no signs of improper disposal of fill material or any signs of stressed vegetation or soil contamination noticed on the subject site. There were no signs of friable Presumed Asbestos Containing Material (PACM), noticed on the subject site (given the fact that there are no buildings on the site the potential for asbestos exposure is negligible).



There were no signs of wetlands observed on the east side of the property. There were no outside above ground storage tanks noticed on the subject site. There were no signs of stressed vegetation or soil contamination noticed on the subject site.

SITE AREA

DEBRIS ON SITE AREA

SITE AREA

DEBRIS ON SITE AREA

2. Current Uses of the Property:

The current uses are not likely to involve the use, treatment, disposal or generation of hazardous substances or petroleum products.

3. Past Uses of the Property:

To the extent that indications of past uses of the property were visually or physically observed on the site visit, or were identified in the interviews or records review, the past uses were not likely to involve the use, treatment, storage, disposal or generation of hazardous substances or petroleum products. However, there were two (2) small buildings on the site between 1950 and 1970 that were utilized by a small controller manufacturing facility and by a pine chemical company. No determination regarding the usage, storage or disposal of hazardous wastes while these facilities were in operation could be made.

4. Presumed Asbestos Containing Material (PACM):

There were no signs of friable PACM noticed on the subject site.

5. Above Ground Tanks:

There were no above ground storage tanks noticed on the subject site.

6. PCB's:

There were no above ground electrical transformers noticed on the subject site.

7. Drums (Interior or Exterior);

There were also two (2) 55 gallon drums noticed on this site. It is recommended that these drums and piles of debris be removed from the site prior to any planned construction activities on the property.

8. Pavement Stains or Corrosion;

There were no signs of severe staining or corrosion on any floors on the subject site.

9. Pools of Liquid;

There were no unusual pools of liquid or sheens detected on the subject site.

10. Odors;

There were no strong, pungent or noxious odors with regard to the subject site.

11. Interior Wall Coverings (if Lead Based Paint is an issue);

There are no buildings on the subject site and lead based paint is not a concern.

12. Radon;

Radon is a colorless, odorless, radioactive gas. Radon comes from the natural decay of uranium that is found in nearly all soils. Radon typically moves through the ground and into building through cracks and openings in the foundation. The USEPA has developed a "Map of Radon Zones" indicating the levels of radon concentrations from testing and aerial surveys conducted in all counties in New York State. It was determined that Kings County was designated as "Zone 3" areas where the concentrations are the lowest in the state (see "Map of Radon Zones" in Appendix for more information).

13. Underground Storage Tanks;

There were no oil fill ports or fuel vents noticed on the subject site (such ports or vents could indicate the presence of an underground storage tank on the site). A review of the New York City Fire Department (NYCFD), storage tank files and New York State Department of Environmental Conservation's (NYSDEC), Petroleum Bulk Storage Tank database did not indicate the presence of any underground storage tanks on the site. A review of available Sanborn Fire Insurance Maps did not indicate the presence of any buried tanks on the site.

14. Solid Wastes;

All solid wastes generated on-site are carted away by a licensed waste hauler to an approved solid waste facility and are not disposed on-site. There were no areas on site that appeared to be filled or graded by non-natural causes. There were several small piles of demolition debris noticed on the site and it is recommended that these piles be removed from the site prior to any planned construction activities on the property.

15. Stressed Vegetation or Stained Soil;

There were no signs of stressed vegetation or stained soil noticed on the subject site.

16. Sumps, Pits, Ponds, Lagoons or Wetlands;

There were no visible sumps, pits, ponds, lagoons or wetlands noticed on the subject site.

17. Waste Water;

There were no signs of improper disposal of waste water into drains, ditches or streams on the site.

18. Wells;

There were no irrigation wells or any groundwater monitoring wells noticed on the site.

19. Underground Injection Control (floor drains or interior drywells);

The Federal Environmental Protection Agency Underground Injection Control (UIC) Program is Congressionally mandated under the Safe Drinking Water Act. The UIC Program is designed to prevent any contamination of underground sources of drinking water by any man-made well, drywell or other subsurface hole that is deeper than its largest surface dimension. Generally, State and local regulatory programs implement UIC. Currently, regulatory efforts are concentrating on testing and sealing floor drains in industrial, automobile repair and dry cleaning facilities. It is expected that this initial focus will expand in the near future to include other facilities, drywells, etc.. There were no areas on the subject site that would be subject to immediate UIC Protocol.

20. Possibility of Migrating Hazardous Substances;

Due to the distance, groundwater flow direction and nature of the contamination, the nearest known identified hazardous waste site was not judged to have the potential for adversely impacting the subject site.

21. Additional Concerns;

There were no additional concerns with regard to the subject site.

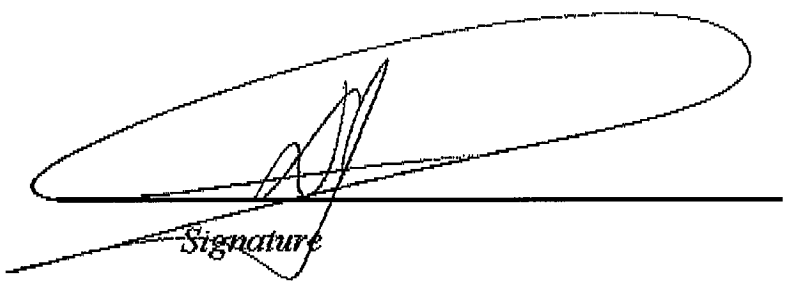
22. Interviews;

The following persons were interviewed with regard to the subject site.

1. *Dani Weiss – Potential buyer of the property (for site inspection)*
2. *Paul Richards – New York City Department of Assessment (for property information)*
3. *Lisa Horsley – New York City Fire Department (for storage tank information)*

F. FINDINGS AND CONCLUSIONS:

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527 on the property located at 4426/30 Purves Street in Long Island City, New York. This assessment has revealed no evidence of recognized environmental conditions in connection with the property.



The site reconnaissance, interviews and review of records have not found the presence or possible presence of hazardous substances or petroleum related products that could indicate an existing release, past release or significant threat of a release into structures on the property, into ground, groundwater or surface water.

It is the opinion of Middleton Environmental Incorporated that no further testing (subsurface or otherwise), is required on the subject site. However, there were several small piles of construction/demolition debris noticed on the site. There were also two (2) 55 gallon drums noticed on this site. It is recommended that these drums and piles of debris be removed from the site prior to any planned construction activities on the property.

G. SIGNATURES OF ENVIRONMENTAL PROFESSIONALS:

This Phase I Environmental Site Assessment report was reviewed by;

H. PROFESSIONALS QUALIFICATIONS:

MEI Phase I Environmental Site Assessment reports are prepared by or under the supervision of the following professionals:

DONALD J. MIDDLETON JR.
PROFESSIONAL PROFILE

Don Middleton Jr. has been a Vice President at Middleton Environmental Incorporated from May 1988 to present. Serves as the manager of the Environmental Site Assessment Program. This program helps lenders to avoid clean-up liability and litigation cost often associated with asbestos and hazardous waste contaminated properties. Conducting and supervising field inspection of the subject property, a regulatory agency search and a survey of past and current property use. A "Phase One" report is then submitted and if analysis shows no sign of contamination, the service is concluded.

If contamination is suspected, air water, and soil samples are collected and a report on the laboratory analyses and findings is then submitted. This "Phase Two" report includes mortgage or loan recommendations and clean up costs. Environmental Site Assessments have been prepared for more than 35 lending institutions on Long Island, in the tri-state area and throughout the country. Assessments have also been conducted for real estate & law firms, the FDIC & RTC.

Don Jr. received his Bachelors of Science from Fordham University College of Business Administration in May of 1988 (where he completed his undergraduate education in three years). Don Jr. attended Iona College in New Rochelle, New York from September 1985 - May 1986. Don Jr. has also attended the NYU School for Continuing Education where he received his New York State Department of Health Asbestos Investigator & Management Planners Licenses in 1993.

THOMAS W. ROBINSON, III
PROFESSIONAL PROFILE

Thomas W. Robinson III has served as a Certified Environmental Inspector at Middleton Environmental Incorporated from November 2003 to present. Thomas has inspected several hundred pieces of commercial, industrial and multi-family apartment buildings for many lending institutions over the past 6 years.

Thomas received his Bachelors of Science in Civil Engineering from Clemson University in 1997. He conducted extensive course work in structural and environmental engineering.

I. APPENDICES:

The following sources were utilized in order to determine the physical setting of the subject site, current and past usage of the site and are researched in order to evaluate and recognized environmental conditions that might have an adverse affect on the subject site.

A. USGS 7.5 Minute Topographic Map

B. Zoning/Land Use Records

C. Department of Assessment Records

D. Sanborn or Belcher-Hyde Fire Insurance Maps (if available)

E. Coles Directory

F. Aerial Photographs

G. Local Street Directories

H. Building Department Records

I. Prior Environmental Site Assessment

J. Soils Conditions Report (from the U.S.G.S. Soil Conservation Service)

K. Groundwater Conditions (U.S.G.S. Groundwater Flow Map)

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to FirstSearch Technology Corp., certain conventions have been utilized in preparing the locations of all federal, state and local agency sites residing in FirstSearch Technology Corp.'s databases. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes; the northern and southern most latitudes. As such, the mapped areas may exceed the actual areas and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual areas of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for such information.

Waiver of Liability

Although FirstSearch Technology Corp. uses its best efforts to research the actual location of each site, FirstSearch Technology Corp. does not and can not warrant the accuracy of these sites with regard to exact location and size. All authorized users of FirstSearch Technology Corp.'s services proceeding are signifying an understanding of FirstSearch Technology Corp.'s searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and or inaccurate site locations.

WASHINGTON NY 20001

OPERATOR(S) DURING DISPOSAL: AMTRAK - SUNNYSIDE YARD
OPERATOR(S) ADDRESS: 39-29 HONEYWELL STREET
LONG ISLAND CITY NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD: 1910 TO unknown

SITE DESCRIPTION:
The site is an active maintenance and storage yard for train locomotives and passenger cars. Several investigations conducted prior to 1986 had found that PCBs were present in soils and a PCBs laden separate phase plume was also present near the former Engine Shop. A remedial investigation was later conducted in multiple phases under NYSDEC oversight pursuant to a consent order. Seventeen specific areas of concern (AOC) have been identified. PCBs, petroleum hydrocarbons, and lead are the main site related contaminants of concern. Onsite soils, groundwater, and sewer sediments are contaminated with one or more of these contaminants. Chlorinated solvents are also present in on site groundwater, but are believed to have originated off site. The sources of the PCBs are believed to be leaks from stationary transformers and locomotive mounted transformers. The main sources of petroleum hydrocarbons are believed to be the diesel USTs and the various leaks and disposals over the years of the Yard activities. The consent order was modified in 1988 to divide the Yard into six operable units (OUs). The operable units (OUs) 1 and 2, the unsaturated soil under and around the High Speed Line building areas have been investigated and remediated. A RI for OU 3, the unsaturated soils and the free product plume (AOC 1) is underway. Portions of OU 4 (remainder of the site) have been completed. The on site sewer system (OU 5) and the groundwater/saturated soils (OU 6) were also investigated during the Phase II, but more work remains to be done. Interim Remedial Measures (IRMs) installed since 1990 have contained and recovered petroleum. These measures were discontinued in 1996. A new IRM consisting of a single collection trench was installed in late 1998 to recover the free petroleum. This IRM continues to operate on and off as permitted by ongoing Yard construction. The Long Island Railroad (LIRR) is planning to construct tunnels through the Yard as part of its East Side Access (ESA) project. Impacts from the proposed construction remain to be assessed.

CONFIRMED HAZARDOUS WASTE DISPOSAL:	QUANTITY:
PCB contaminated oil; polychlorinated biphenyls (pcb)	unknown
Lead	unknown
Xylene	unknown
1,2,4-Trichlorobenzene	unknown
Benzene	unknown
Pyrene	unknown
Fluoranthene	unknown

ACTIVE:	X	**COMPLETE**	

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Soil and groundwater contamination by PCBs has been confirmed. A PCBs laced petroleum plume is also present in one portion of the site. The site has secured access.Exceedances of standards, criteria, and guidance include PCBs, metals (primarily lead), and SVOCs for soil; and metals and SVOCs for groundwater.

ASSESSMENT OF HEALTH PROBLEMS:
Groundwater in the area of the site is not used as a source of potable water. Access to the site is controlled, preventing trespassers from coming in contact with contaminated soils.

LONG ISLAND CITY NY 11385

HAZARDOUS WASTE DISPOSAL PERIOD: unknown TO unknown

SITE DESCRIPTION:
The property is located within an urban industrialized seThe property is located within an urban industrialized section of Long Island City. The site extends 335 feet from the north to the south and 117 feet from the west to the east. The entire site is occupied by a 30,000 square feet, one story building. There is a small courtyard in the central portion of the building, on it s western side. The site is approximately 15 to 20 feet above mean sea level. The nearest surface water body is the East River, approximately one quarter mile west of the site. The property is registered with the USEPA as a small quantity generator of hazardous waste, and is also listed as a registered Petroleum Bulk Storage Facility (PBS) and a Chemical Bulk Storage Facility (CBS). Five underground storage tanks (USTs) were closed in-place, including one toluene, two gasoline, one methyl ethyl ketone (MEK) and one heptane UST. Two USTs with a storage capacity of 1500 gallons are currently in service at the site storing heptane. Site ownership changed in 2002. The new owners originally entered the Volunteer Cleanup Program to address hazardous waste contamination but switched to the Brownfield Cleanup Program (BCP). A BCP application was approved in 2004.

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Previous investigations indicate the site contains a consequential amount of hazardous waste(xylene and toluene). Site impacts to the East River can not be assessed at this time. The site is situated over a sole-source aquifer.

ASSESSMENT OF HEALTH PROBLEMS:
Elevated levels of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals have been identified in soil and groundwater at this site. The area is paved and served by pubic water so exposures to contaminated soils and groundwater are unlikely. Due to the high levels of VOCs in on-site groundwater, there is the potential for exposures related to soil vapor intrusion in surrounding buildings. A soil vapor investigation is planned as part of the ongoing remedial investigation.

HAZARDOUS WASTE DISPOSAL PERIOD: unknown TO unknown

SITE DESCRIPTION:
Standard Motor Products (SMP) is located in an urban area, on the southern side of Northern Boulevard, between 37th and 39th streets. SMP is in the business of producing automobile parts and components. Current manufacturing operations include metal fabrication and machining, plastic injection molding, and assembly. The building on site has been occupied by SMP since the mid 1900s. An investigation in 1990 was initiated after an oily sheen was observed in a puddled area on the southeast side of the property. Soil samples from this area revealed elevated levels of petroleum hydrocarbons and volatile organic compounds (VOCs), primarily 1,1,1-trichloroethane. Approximately 2,700 sq.ft. of soil was excavated to a depth of 18 inches and stockpiled on-site. Further investigation determined that soils in the area of the rear loading platform contained elevated levels of petroleum hydrocarbons and VOCs. Contaminated soils extended beyond the area excavated. Subsequent groundwater samples taken indicated contamination with 1,1,1-trichloroethane and lead. An investigation was performed by the owner and a Delisting Petition was submitted to the NYSDEC in 1994. This petition was denied. A Consent Order has been signed to develop and implement a Remedial Investigation/Feasibility Study (RI/FS). The RI/FS work plan was approved in October 2002. The first phase of the RI fieldwork began in November 2002 and the second phase was conducted in July 2003. A work plan for a supplemental investigation of soil gas and groundwater monitoring is currently being developed.

REMEDIATION

PROPOSED: **DESIGN**
ACTIVE: **COMPLETE**

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Significant levels of 1,1,1-trichloroethane, lead, and petroleum hydrocarbons have been found in groundwater and soil samples. The highest levels of groundwater contamination are adjacent to the loading dock at the back of the building. Groundwater flow is to the adjacent Amtrack property. A gas station upgradient of SMP (on the corner of Northern Blvd and 39th Street) is the source of the petroleum contamination in the groundwater.

ASSESSMENT OF HEALTH PROBLEMS:
The site is situated in an urban and industrial area. On-site workers may contact contaminated surface soils that were not removed as part of a previous soil removal effort. Surface and subsurface soil samples were collected during the remedial ivestigation to delineate the nature and extent of soil contamination. Access to the site is restricted by fences and security personnel. Personnel gain access to the area of concern through a locked gate; thus limiting public exposure. Groundwater near the site is not used for potable water.

OPERATOR(S) DURING DISPOSAL: ROEHR CHEMICALS, INC.
OPERATOR(S) ADDRESS: 50-20 37TH STREET
LONG ISLAND CITY NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD: 1991 TO unknown

SITE DESCRIPTION:
Roehr Chemicals used to be located on 52-20 37th Street, in Long Island City, Queens. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street and Newtown Creek is located approximately 1,750 feet southwest of the site. Roehr Chemicals owned and operated four buildings on five lots - lots 1,8,23, and 28. Lot 28 contained the main building and has been the focus of the current investigation and remediation. Other lots (1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure. The site is presently used as a warehouse for storing packing boxes. Roehr Chemical was a manufacturer of bulk pharmaceuticals and pharmaceutical intermediates such as diet pills, allergy pills and chemicals used in muscle relaxants. Several VOCs such as xylene, benzene and diethyl-ketone were used in the production of these items. During site operations involving the removal of spent xylene, a containment system failed, leaking xylene to the surrounding soil. This release contaminated at least 2,000 cubic yards of on-site soil with xylene. The site has been investigated through multiple phases from Preliminary Site Assessment (PSA) in 1994 to a Remedial Investigation/Feasibility Study (RI/FS), concluded in 2000. The groundwater was found contaminated with xylene and acetone. The RI showed a long narrow xylene plume leaving the site and entering the Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppb. Soil vapor extraction and air sparging systems installed in 1994 as Interim Remedial Measures (IRMs) were further expanded in 1999. A Record of Decision signed in March 2001 selected a No Further Action Remedy with continued Operation, Maintenance and Monitoring (OM&M) of the installed SVE/ AS system. These measures have reduced groundwater concentrations from a high of 105 ppm of xylenes to non-detect levels in most wells. Quarterly groundwater sampling continues under the OM&M program.

TYPE:	
STATUS:	

REMEDIATION

PROPOSED:		**DESIGN**	
ACTIVE:	X	**COMPLETE**	

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
The remedial actions taken todate have adequately addressed significant threat posed by the contamination, and the site reclassification is under consideration. The continuing groundwater monitoring shows that groundwater concentrations of site related contaminants have reduced to non-detect levels in most wells. The installed system is being operated in an on and off pulsing sequence to assess if the reductions in groundwater contaminant levels are permanent or not.

ASSESSMENT OF HEALTH PROBLEMS:
On site groundwater, surface water and soil contamination has been documented. Drinking water supplies are not impacted by contamination from this site. Drinking water contamination is unlikely as groundwater is not used as a potable supply within a five mile radius. Site access is controlled, limiting the potential for direct contact to contaminated surface soils to on site workers. Indoor air sampling in homes immediately west of site did not indicate contamination warranting public health concerns. Air within the main building will be tested prior to occupation by a new tenant. Soil and groundwater contamination continue to diminish as the interim remedial measure progresses.

HAZARDOUS WASTE DISPOSAL PERIOD: TO:

SITE DESCRIPTION:
Manhattan Adhesives is currently an empty factory building that is located at the foot of the Greenpoint Ave., Bridge in Brooklyn. Besides the Manhattan Adhesives factory, about 10 feet from the northeast wall is a manhole (not a sewer or drain) into which liquid waste was allegedly discharged. This waste came from a condemned oil storage site located at the intersection of Rt. 280, and the NJ Turnpike in NJ. The manhole is suspected of being the opening to an underground tank; however, the quantity of the waste allegedly dumped exceeds the capacity of most tanks. This information was obtained from the State Senate Committee on Crime and the Brooklyn District Attorney s office. Phase I State Superfund has been completed. A partial phase II investigation was completed during 1985 and recommended no further action. The Responsible Party has agreed to undertake an investigation in 1986. An investigation has not found hazardous waste on-site.

CONFIRMED HAZARDOUS WASTE DISPOSAL:

OPERATOR(S) ADDRESS: 299 SOUTH STATE STREET
DOVER NY 19901

HAZARDOUS WASTE DISPOSAL PERIOD: 1960 TO 1981

SITE DESCRIPTION:
Quanta Resources operated a waste oil storage and processing facility at 37-80 Review Ave. from 1960 to 1981. The site is located in an industrial/commercial area of Long Island City. The Newtown Creek is about 500 ft. south of the site. After filing for bankruptcy in 1981, the owners abandoned the site. The site has tanks and several buildings on site, and is still abandoned. The surrounding parcels are currently used for a combination of commercial and industrial. A New York City emergency remedial action removed approximately 640,000 gallons of waste oil from the property. Some of the waste oil contained tetrachloroethene, methyl chloride, 1,1,1-trichloroethane and trichloroethene. Sludge, waste oil, and diesel fuel, all contaminated with PCBs from badly deteriorated leaking tanks and drums, were also removed. As part of NYSDEC s Phase II Investigation, three on-site groundwater monitoring wells were installed. During installation it was discovered that there was a four foot layer of oil lying above the groundwater table, which would imply that there are about 500,000 gallons of oil underground. A consent order was signed with numerous PRPs in May 2002 for the undertaking of investigation and remediation activities. Phase I of the Remedial Investigation has been completed. Phase II of the Remedial Investigation is planned for early 2005.

REMEDIATION
PROPOSED:
ACTIVE:
DESIGN
COMPLETE

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Soil and groundwater contamination has been confirmed. The primary contaminants of concern include petroleum hydrocarbons, chlorinated solvents, PCBs, heavy metals and PAHs. Measurable LNAPL was found in 24 of 29 onsite and offsite monitoring wells. The site presents a significant threat due to the soil and groundwater contamination, free product plume and close proximity to Newtown Creek.

ASSESSMENT OF HEALTH PROBLEMS:
Waste oil previously stored on-site has caused widespread contamination of groundwater and soils. Approximately 500,000 gallons of contaminated waste oil remains at the site, floating on the water table. The aquifer of concern is not used as a source for drinking water. Groundwater wells in this area of Queens are used only for commercial and industrial purposes. A fence surrounds the site restricting access and minimizing the potential for direct contact exposures to on-site contaminates. The potential exists for the floating oil plume to migrate into the nearby Newtown Creek which empties into the East River. Further investigation is required.

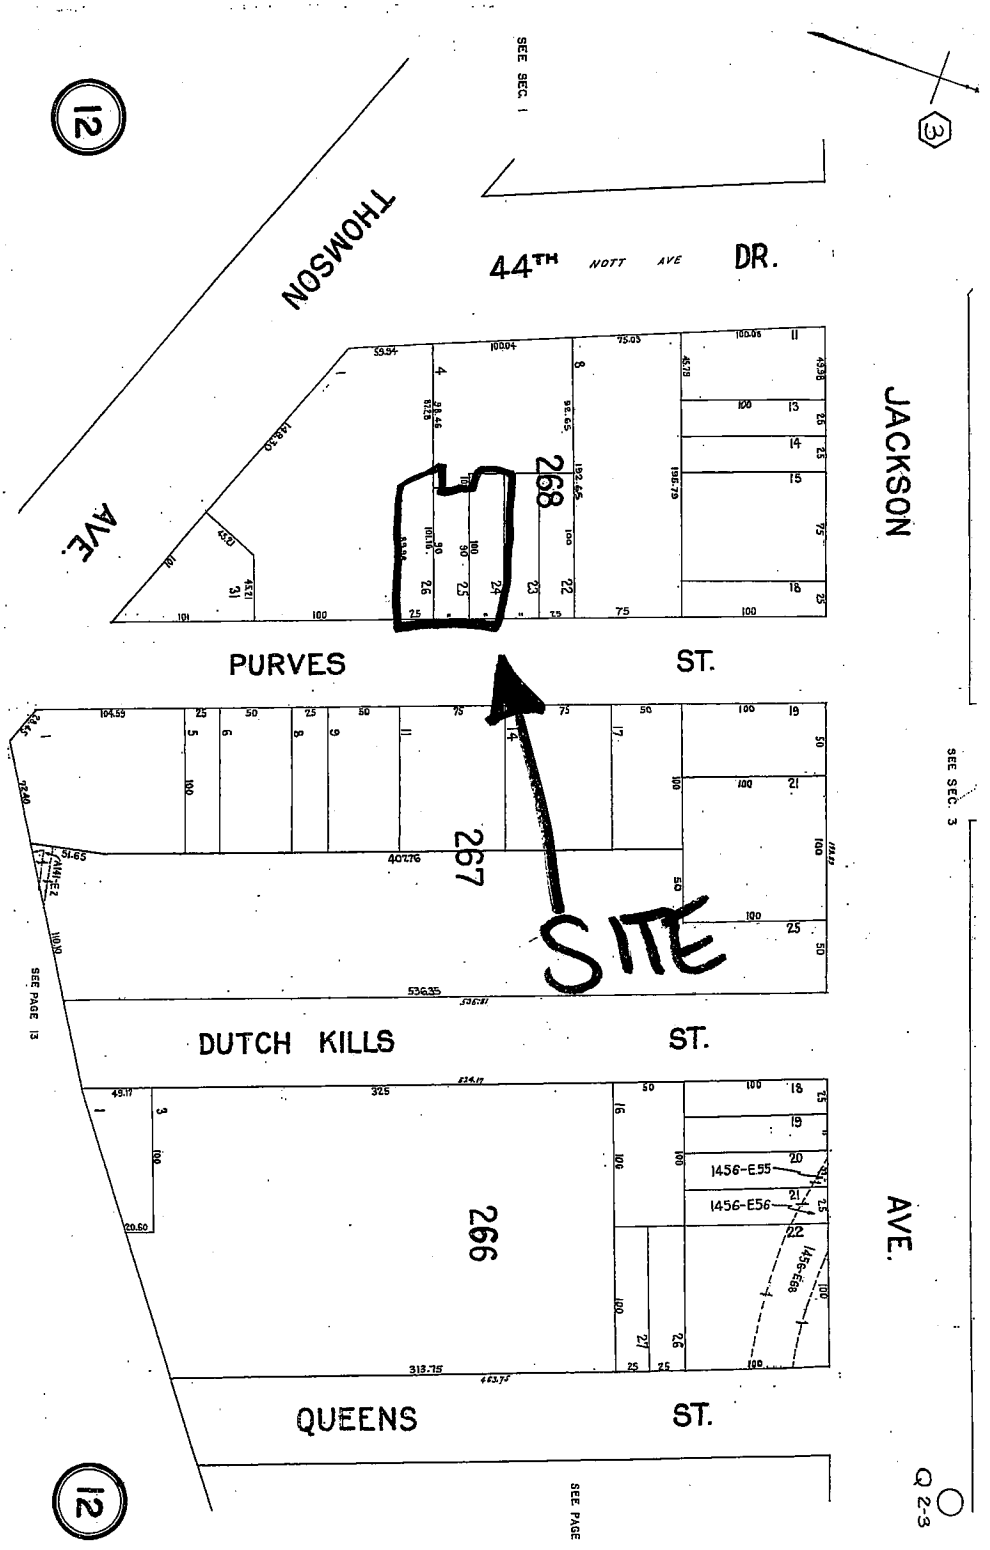
USEPA MAP OF RADON ZONES

NEW YORK - EPA Map of Radon Zones

The purpose of this map is to assist National, State and local organizations to target their resources and to implement radon-resistant building codes.



This map is not intended to determine if a home in a given zone should be tested for radon. Homes with elevated levels of radon have been found in all three zones. ***All homes should be tested, regardless of zone designation.***

Zone 1 Zone 2 Zone 3

IMPORTANT: Consult the publication entitled "Preliminary Geologic Radon Potential Assessment of New York" before using this map. This document contains information on radon potential variations within counties. EPA also recommends that this map be supplemented with any available local data in order to further understand and predict the radon potential of a specific area.

MIDDLETON ENVIRONMENTAL, INC.
Environmental Consultants and Engineers

April 27, 2006

Mr. Dani Weiss
Weiss and Company
22 West 38th Street - 12th Floor
New York, NY 10018

RE: Property located 44-32/38 Purves Street in Long Island City, New York.

Dear Mr. Weiss,

Pursuant to our recent telephone conversation, we have prepared an update to the September 30, 2003 Phase I Environmental Site Assessment by Middleton Environmental Incorporated (MEI), prepared on the above referenced property. An update of this report was conducted in order to determine if there are any recognized environmental conditions with regard to the subject site since the preparation of the original report. The site is approximately 0.43 acres in size and there are two (2) commercial buildings on the site. The main building is approximately 17,860 square feet in size and has two floors and no basement (the main floor of the building is on Thomson Avenue while the lower level is on Purves Street. The building is presently vacant and was formerly utilized as an automobile body repair facility and a carpet storage facility. The rear building is a small two story (plus basement), building that was formerly utilized as a realty office (the carpet storage area, main floor automobile repair area and rear two story former realty office were not accessible during the site inspection).

The building was re-inspected on April 17, 2006. The office area on the main floor (on Thomson Avenue), had carpeted floors, sheetrock walls and 2 by 2 foot ceiling tiles (with concrete ceilings atop the ceiling tiles). The repair areas on the lower level had concrete floors, concrete walls and concrete ceiling. There were four (4) floor drains located on the lower level of the building that did not show any signs of chemical staining. The property owner indicated that these drains are connected to the municipal sewer system and do no discharge to the subsurface (there were no private sanitary systems observed on the subject site). There were two (2) 275 gallon above ground heating oil storage tanks and a 275 gallon above ground waste oil storage tank noticed inside the building (there is also a fill port and vent pipe for a 275 gallon heating oil tank in the former carpet storage area). The observed tanks did not show any signs of staining or leakage. The heating oil tanks are properly registered with the New York City Fire Department (NYCFD). However, the waste oil tank is not presently registered with the NYCFD or the NYSDEC. It is recommended that this tank be properly registered if to be utilized in the future (or be removed if not to be utilized). None of the overhead heating units or any of the overhead pipes inside the building were insulated by friable Presumed Asbestos Containing Material (PACM). There were no signs of friable PACM fireproofing noticed inside the main building. There was one (1) paint spray booth noticed on the lower level of the main building that was properly vented outside the building.

50 PARK AVENUE, BABYLON, NY 11702
631 321-4300 • FAX: 631 321-4349 • middletonenvironmental.com

The last area examined was the outside grounds. There were no oil fill ports or fuel vents for any underground storage tanks noticed on the site. A review of the New York City Fire Department Storage Tank Files and New York State Department of Environmental Conservation (NYSDEC), Petroleum Bulk Storage Database did not indicate the presence of any registered underground storage tanks on the site. A review of the 1950 Sanborn Fire Insurance Map indicated the presence of two (2) buried gasoline storage tanks behind the carpet storage area portion of the building on Purves Street. The site inspection did not indicate the presence of any oil fill ports or vents in the vicinity of this area and it is highly likely that the tanks were removed when the rear portion of the building was constructed (it should be noted that later Sanborn Maps did not indicate the presence of any buried tanks on the site). There were no outside above ground storage tanks, outside 55 gallon drum storage areas or any outside above ground electrical transformers noticed on the site. There were no signs of stressed vegetation or soil contamination noticed on the site.

There were no USEPA National Priority List Sites (Federal Superfund), within a mile radius of the subject site. There were no USEPA CERCLIS Sites or any USEPA RCRA Transportation, Disposal or Storage (TSD), facilities within a half mile radius of the subject site. The subject site was not identified as a RCRA Hazardous Waste Generator. There were six (6) New York State Department of Environmental Conservation Inactive Hazardous Waste Sites within a mile radius of the subject site. None of these sites would have an apparent adverse impact on the subject site based upon the distance to the subject site. A review of the NYSDEC Leaking Underground Storage Tank Database indicated the presence of forty (40) Leaking Underground Storage Tank (LUST), sites within a half mile radius of the site. The subject site was not identified on the LUST site list and none of the reported LUST sites would have an apparent adverse impact on the site.

A review of the New York City Building Department property profile overview and the New York City Department of Assessment files indicated that the portion of the building along Purves Street (where the carpet company is located), and the small portion of the building on the corner of Thompson Street and 44th Drive (that houses the offices for the automobile repair company), were reportedly constructed in 1939, while the larger portion of the building that houses the automobile body repair facility (and connected the two original buildings), was constructed in 1960. A review of available Sanborn Fire Insurance Maps and New York Telephone Address Directories indicated that the original building on Purves Street was utilized as a private garage while the original building on the corner of Thompson Avenue and 44th Drive was originally utilized as a chemical laboratory and automobile radiator repair facility (while the remainder of the property was utilized as a contractors storage yard). The larger portion of the building that was constructed in 1960 was utilized in the past by a heat exchanger company, a filter cleaner company, a hardware warehouse, a paper embossing company and a taxi repair facility. The small two story office building has been utilized as a realty office and by a contracting company and was constructed between 1936 and 1940.

It is the opinion of Middleton Environmental Incorporated that no further testing (subsurface or otherwise), is required on the subject site. Please feel free to contact my office should you have any questions regarding this Physical Site Inspection or if you need any additional information regarding this Transaction Screen Process Report.

Sincerely,

Donald J. Middleton Jr.
President

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to FirstSearch Technology Corp., certain conventions have been utilized in preparing the locations of all federal, state and local agency sites residing in FirstSearch Technology Corp.'s databases. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes; the northern and southern most latitudes. As such, the mapped areas may exceed the actual areas and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual areas of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for such information.

Waiver of Liability

Although FirstSearch Technology Corp. uses its best efforts to research the actual location of each site, FirstSearch Technology Corp. does not and can not warrant the accuracy of these sites with regard to exact location and size. All authorized users of FirstSearch Technology Corp.'s services proceeding are signifying an understanding of FirstSearch Technology Corp.'s searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and or inaccurate site locations.

OPERATOR(S) DURING DISPOSAL: AMTRAK - SUNNYSIDE YARD
OPERATOR(S) ADDRESS: 39-29 HONEYWELL STREET
LONG ISLAND CITY NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD: 1910 TO unknown

SITE DESCRIPTION:
The site is an active maintenance and storage yard for train locomotives and passenger cars. Several investigations conducted prior to 1986 had found that PCBs were present in soils and a PCBs laden separate phase plume was also present near the former Engine Shop. A remedial investigation was later conducted in multiple phases under NYSDEC oversight pursuant to a consent order. Seventeen specific areas of concern (AOC) have been identified. PCBs, petroleum hydrocarbons, and lead are the main site related contaminants of concern. Onsite soils, groundwater, and sewer sediments are contaminated with one or more of these contaminants. Chlorinated solvents are also present in on site groundwater, but are believed to have originated off site. The sources of the PCBs are believed to be leaks from stationary transformers and locomotive mounted transformers. The main sources of petroleum hydrocarbons are believed to be the diesel USTs and the various leaks and disposals over the years of the Yard activities. The consent order was modified in 1988 to divide the Yard into six operable units (OUs). The operable units (OUs) 1 and 2, the unsaturated soil under and around the High Speed Line building areas have been investigated and remediated. A RI for OU 3, the unsaturated soils and the free product plume (AOC 1) is underway. Portions of OU 4 (remainder of the site) have been completed. The on site sewer system (OU 5) and the groundwater/saturated soils (OU 6) were also investigated during the Phase II, but more work remains to be done. Interim Remedial Measures (IRMs) installed since 1990 have contained and recovered petroleum. These measures were discontinued in 1996. A new IRM consisting of a single collection trench was installed in late 1998 to recover the free petroleum. This IRM continues to operate on and off as permitted by ongoing Yard construction. The Long Island Railroad (LIRR) is planning to construct tunnels through the Yard as part of its East Side Access (ESA) project. Impacts from the proposed construction remain to be assessed.

REMEDIATION

PROPOSED:		**DESIGN**	
ACTIVE:	X	**COMPLETE**	

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Soil and groundwater contamination by PCBs has been confirmed. A PCBs laced petroleum plume is also present in one portion of the site. The site has secured access.Exceedances of standards, criteria, and guidance include PCBs, metals (primarily lead), and SVOCs for soil; and metals and SVOCs for groundwater.

ASSESSMENT OF HEALTH PROBLEMS:
Groundwater in the area of the site is not used as a source of potable water. Access to the site is controlled, preventing trespassers from coming in contact with contaminated soils.

HAZARDOUS WASTE DISPOSAL PERIOD: unknown TO unknown

SITE DESCRIPTION:
The property is located within an urban industrialized seThe property is located within an urban industrialized section of Long Island City. The site extends 335 feet from the north to the south and 117 feet from the west to the east. The entire site is occupied by a 30,000 square feet, one story building. There is a small courtyard in the central portion of the building, on it s western side. The site is approximately 15 to 20 feet above mean sea level. The nearest surface water body is the East River, approximately one quarter mile west of the site. The property is registered with the USEPA as a small quantity generator of hazardous waste, and is also listed as a registered Petroleum Bulk Storage Facility (PBS) and a Chemical Bulk Storage Facility (CBS). Five underground storage tanks (USTs) were closed in-place, including one toluene, two gasoline, one methyl ethyl ketone (MEK) and one heptane UST. Two USTs with a storage capacity of 1500 gallons are currently in service at the site storing heptane. Site ownership changed in 2002. The new owners originally entered the Volunteer Cleanup Program to address hazardous waste contamination but switched to the Brownfield Cleanup Program (BCP). A BCP application was approved in 2004.

STATUS:

REMEDIATION
PROPOSED:
ACTIVE:
DESIGN
COMPLETE

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Previous investigations indicate the site contains a consequential amount of hazardous waste(xylene and toluene). Site impacts to the East River can not be assessed at this time. The site is situated over a sole-source aquifer.

ASSESSMENT OF HEALTH PROBLEMS:
Elevated levels of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals have been identified in soil and groundwater at this site. The area is paved and served by pubic water so exposures to contaminated soils and groundwater are unlikely. Due to the high levels of VOCs in on-site groundwater, there is the potential for exposures related to soil vapor intrusion in surrounding buildings. A soil vapor investigation is planned as part of the ongoing remedial investigation.

CURRENT OWNER(S) ADDRESS: ONE HOLLOW LANE
LAKE SUCCESS NY 11042

OPERATOR(S) DURING DISPOSAL: ROEHR CHEMICALS, INC.
OPERATOR(S) ADDRESS: 50-20 37TH STREET
LONG ISLAND CITY NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD: 1991 TO unknown

SITE DESCRIPTION:
Roehr Chemicals used to be located on 52-20 37th Street, in Long Island City, Queens. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street and Newtown Creek is located approximately 1,750 feet southwest of the site. Roehr Chemicals owned and operated four buildings on five lots - lots 1,8,23, and 28. Lot 28 contained the main building and has been the focus of the current investigation and remediation. Other lots (1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure. The site is presently used as a warehouse for storing packing boxes. Roehr Chemical was a manufacturer of bulk pharmaceuticals and pharmaceutical intermediates such as diet pills, allergy pills and chemicals used in muscle relaxants. Several VOCs such as xylene, benzene and diethyl-ketone were used in the production of these items. During site operations involving the removal of spent xylene, a containment system failed, leaking xylene to the surrounding soil. This release contaminated at least 2,000 cubic yards of on-site soil with xylene. The site has been investigated through multiple phases from Preliminary Site Assessment (PSA) in 1994 to a Remedial Investigation/Feasibility Study (RI/FS), concluded in 2000. The groundwater was found contaminated with xylene and acetone. The RI showed a long narrow xylene plume leaving the site and entering the Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppb. Soil vapor extraction and air sparging systems installed in 1994 as Interim Remedial Measures (IRMs) were further expanded in 1999. A Record of Decision signed in March 2001 selected a No Further Action Remedy with continued Operation, Maintenance and Monitoring (OM&M) of the installed SVE/ AS system. These measures have reduced groundwater concentrations from a high of 105 ppm of xylenes to non-detect levels in most wells. Quarterly groundwater sampling continues under the OM&M program.

CONFIRMED HAZARDOUS WASTE DISPOSAL:	**QUANTITY:**
Acetone	unknown
Xylene (Mixed)	unknown
Ethylbenzene	unknown

DEPTH TO GROUNDWATER:	RANGE: 25 TO 30 FEET.

LEGAL ACTION

TYPE:
STATUS:

REMEDIATION

PROPOSED:		**DESIGN**	
ACTIVE:	X	**COMPLETE**	

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
The remedial actions taken todate have adequately addressed significant threat posed by the contamination, and the site reclassification is under consideration. The continuing groundwater monitoring shows that groundwater concentrations of site related contaminants have reduced to non-detect levels in most wells. The installed system is being operated in an on and off pulsing sequence to assess if the reductions in groundwater contaminant levels are permanent or not.

ASSESSMENT OF HEALTH PROBLEMS:
On site groundwater, surface water and soil contamination has been documented. Drinking water supplies are not impacted by contamination from this site. Drinking water contamination is unlikely as groundwater is not used as a potable supply within a five mile radius. Site access is controlled, limiting the potential for direct contact to contaminated surface soils to on site workers. Indoor air sampling in homes immediately west of site did not indicate contamination warranting public health concerns. Air within the main building will be tested prior to occupation by a new tenant. Soil and groundwater contamination continue to diminish as the interim remedial measure progresses.

HAZARDOUS WASTE DISPOSAL PERIOD: unknown TO unknown

SITE DESCRIPTION:
Standard Motor Products (SMP) is located in an urban area, on the southern side of Northern Boulevard, between 37th and 39th streets. SMP is in the business of producing automobile parts and components. Current manufacturing operations include metal fabrication and machining, plastic injection molding, and assembly. The building on site has been occupied by SMP since the mid 1900s. An investigation in 1990 was initiated after an oily sheen was observed in a puddled area on the southeast side of the property. Soil samples from this area revealed elevated levels of petroleum hydrocarbons and volatile organic compounds (VOCs), primarily 1,1,1-trichloroethane. Approximately 2,700 sq.ft. of soil was excavated to a depth of 18 inches and stockpiled on-site. Further investigation determined that soils in the area of the rear loading platform contained elevated levels of petroleum hydrocarbons and VOCs. Contaminated soils extended beyond the area excavated. Subsequent groundwater samples taken indicated contamination with 1,1,1-trichloroethane and lead. An investigation was performed by the owner and a Delisting Petition was submitted to the NYSDEC in 1994. This petition was denied. A Consent Order has been signed to develop and implement a Remedial Investigation/Feasibility Study (RI/FS). The RI/FS work plan was approved in October 2002. The first phase of the RI fieldwork began in November 2002 and the second phase was conducted in July 2003. A work plan for a supplemental investigation of soil gas and groundwater monitoring is currently being developed.

REMEDIATION

PROPOSED:	**DESIGN**
ACTIVE:	**COMPLETE**

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Significant levels of 1,1,1-trichloroethane, lead, and petroleum hydrocarbons have been found in groundwater and soil samples. The highest levels of groundwater contamination are adjacent to the loading dock at the back of the building. Groundwater flow is to the adjacent Amtrack property. A gas station upgradient of SMP (on the corner of Northern Blvd and 39th Street) is the source of the petroleum contamination in the groundwater.

ASSESSMENT OF HEALTH PROBLEMS:
The site is situated in an urban and industrial area. On-site workers may contact contaminated surface soils that were not removed as part of a previous soil removal effort. Surface and subsurface soil samples were collected during the remedial ivestigation to delineate the nature and extent of soil contamination. Access to the site is restricted by fences and security personnel. Personnel gain access to the area of concern through a locked gate; thus limiting public exposure. Groundwater near the site is not used for potable water.

HAZARDOUS WASTE DISPOSAL PERIOD: TO:

SITE DESCRIPTION:
Manhattan Adhesives is currently an empty factory building that is located at the foot of the Greenpoint Ave., Bridge in Brooklyn. Besides the Manhattan Adhesives factory, about 10 feet from the northeast wall is a manhole (not a sewer or drain) into which liquid waste was allegedly discharged. This waste came from a condemned oil storage site located at the intersection of Rt. 280, and the NJ Turnpike in NJ. The manhole is suspected of being the opening to an underground tank; however, the quantity of the waste allegedly dumped exceeds the capacity of most tanks. This information was obtained from the State Senate Committee on Crime and the Brooklyn District Attorney s office. Phase 1 State Superfund has been completed. A partial phase II investigation was completed during 1985 and recommended no further action. The Responsible Party has agreed to undertake an investigation in 1986. An investigation has not found hazardous waste on-site.

CONFIRMED HAZARDOUS WASTE DISPOSAL:

HAZARDOUS WASTE DISPOSAL PERIOD: 1960 TO 1981

SITE DESCRIPTION:
Quanta Resources operated a waste oil storage and processing facility at 37-80 Review Ave. from 1960 to 1981. The site is located in an industrial/commercial area of Long Island City. The Newtown Creek is about 500 ft. south of the site. After filing for bankruptcy in 1981, the owners abandoned the site. The site has tanks and several buildings on site, and is still abandoned. The surrounding parcels are currently used for a combination of commercial and industrial. A New York City emergency remedial action removed approximately 640,000 gallons of waste oil from the property. Some of the waste oil contained tetrachloroethene, methyl chloride, 1,1,1-trichloroethane and trichlorcethene. Sludge, waste oil, and diesel fuel, all contaminated with PCBs from badly deteriorated leaking tanks and drums, were also removed. As part of NYSDEC s Phase II Investigation, three on-site groundwater monitoring wells were installed. During installation it was discovered that there was a four foot layer of oil lying above the groundwater table, which would imply that there are about 500,000 gallons of oil underground. A consent order was signed with numerous PRPs in May 2002 for the undertaking of investigation and remediation activities. Phase I of the Remedial Investigation has been completed. Phase II of the Remedial Investigation is planned for early 2005.

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Soil and groundwater contamination has been confirmed. The primary contaminants of concern include petroleum hydrocarbons, chlorinated solvents, PCBs, heavy metals and PAHs. Measurable LNAPL was found in 24 of 29 onsite and offsite monitoring wells. The site presents a significant threat due to the soil and groundwater contamination, free product plume and close proximity to Newtown Creek.

ASSESSMENT OF HEALTH PROBLEMS:
Waste oil previously stored on-site has caused widespread contamination of groundwater and soils. Approximately 500,000 gallons of contaminated waste oil remains at the site, floating on the water table. The aquifer of concern is not used as a source for drinking water. Groundwater wells in this area of Queens are used only for commercial and industrial purposes. A fence surrounds the site restricting access and minimizing the potential for direct contact exposures to on-site contaminates. The potential exists for the floating oil plume to migrate into the nearby Newtown Creek which empties into the East River. Further investigation is required.

ENVIRONMENTAL BUSINESS CONSULTANTS

November 5, 2006

Mr. Dani Weiss
Weiss & Company
22 West 38th Street – 12th Floor
New York, NY 10018

Re: 44-32 through 44-38 Purves Street, Long Island City, NY

Dear Mr. Weiss:

Environmental Business Consultants (EBC) has prepared the following summary report to document the results of the Phase II Investigation performed on February 21, 2006 at the above referenced site. The investigation consisted of the collection and analysis of soil and groundwater samples from borings located throughout the site.

The scope of work, as defined in our October 16, 2006 proposal, was based upon that as previously specified and agreed to by the lender's consultant, Langan Engineering.

BACKGROUND

The subject site is identified as Block 268 lot 1 in the borough of Queen. It is located at 44-32 through 44-38 Purves Street, 2733 44th Drive and 2801 through 2811 Thomson Avenue in Long Island City, New York (see **Figure 1**). It is improved with six brick and masonry buildings which front on both Purves Street and Thomson Avenue. The buildings are not currently occupied.

According to the Phase I ESA and a preliminary site inspection performed by EBC, the buildings were most recently used as a night club, body shop, contractor's office / storage yard, real estate office and automobile repair shop. Historical uses included an automobile radiator repair shop, chemical laboratory, heat exchanger company, filter cleaner company, hardware warehouse a paper embossing company and a taxi- repair facility. Two underground storage tanks (USTs) were shown on the 1950 Fire Insurance map within what is now the body shop building. Since the body shop building was added in 1960, the Phase I concluded that it was highly likely that the tanks were removed during construction. Although there are no records indicating that the tanks were ever registered or removed, they do not appear on subsequent fire insurance maps.

FIELD ACTIVITIES

Soil Borings

Three soil borings were installed at the site on October 24, 2006, PWGC in accordance with the previously defined scope of work. The borings were located as shown in **Figure 2** with one

boring behind the small 2-story office in the contractor's yard, one located in front of the garage bay doors at the rear of the auto repair shop and one located within the autobody shop adjacent to the location of the former USTs.

At each boring location, soil was collected continuously from grade to a depth of 20 feet, approximately 12 feet below the water table (approximately 7.5 feet below grade). Samples were collected using a Geoprobe direct-push drill rig, with a four-foot macro-core sampler and disposable acetate liners. Non-dedicated sampling equipment was decontaminated with a laboratory grade detergent and clean water rinse.

Soils were field screened for the presence of volatile organic compounds (VOCs) with a photo-ionization detector (PID) and visually inspected for evidence of contamination. Subsurface soils at locations B1 and B3 generally consisted of fill materials to a depth of approximately 2 feet followed by fine to medium sand and silt to 20 feet. At location B2, however, the fill material extended to a depth of 8 feet followed by med-very coarse sand and rock fragments. Thin layers (3-6inches) of peat were also reported at this location at depths of 15.5 and 19 feet. Based upon the lack of PID response and lack of visual evidence of contamination, a shallow (7-8 feet below grade) and deep (17-18 feet below grade) soil sample was collected from each boring in accordance with the agreed upon scope of work. Boring logs are provided in **Appendix A**.

At each boring location a temporary monitoring well was installed to facilitate groundwater sample collection. Temporary wells were constructed of 15 feet 1-inch diameter 0.010 inch slot pvc screen with 5 feet of 1-inch diameter pvc riser. Approximately 2 feet of riser extended above surface grade resulting in a total well depth of approximately 18 feet. Each well was purged with a peristaltic pump to remove sediments before sampling. After purging groundwater samples were collected through dedicated polyethylene tubing, using a stainless-steel ball and check valve.

All samples were collected in pre-cleaned, laboratory supplied glassware, stored in a cooler with ice and submitted for analysis to York Analytical Laboratories of Stratford, Connecticut. Soil samples were analyzed for the presence of VOCs by EPA Method 8260 (STARS), and semi-volatile organic compounds (SVOCs) by EPA Method 8270 (STARS). Groundwater samples were analyzed for the same suite of analysis as for the soil samples.

ANALYTICAL RESULTS

Soil sample results were compared to the Recommended Soil Cleanup Objectives (RSCOs) specified in NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046, *Determination of Soil Cleanup Objectives and Cleanup Levels*, January 1994. Groundwater sample analytical data was compared to the Class GA groundwater standards as specified in the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1, *Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations*, June 1998.

PHONE 631.234.4280
FAX 631.234.4297
Cell Phone 631.357.4927
E-MAIL csosik2@optonline.net

Analytical data is summarized in **Tables 1, and 2** and a copy of the laboratory analytical report is included in **Appendix B**.

Soil Samples

With the exception of pyrene in the shallow sample from SB2 (7-8 ft), SVOCs were not detected above the laboratory method detection limit (MDL) in any of the soil samples. Pyrene in SB2 (7-8 ft) was detected at a concentration of 190 ug/Kg which is well below the recommended soil cleanup objective of 50,000 ug/kg.

No VOCs were detected at concentrations above the laboratory MDL in any of the soil samples submitted for analysis.

Groundwater Samples

No VOCs or SVOCs were detected above the laboratory MDL in any of the groundwater samples submitted for analysis.

CONCLUSIONS

Based on the results of this investigation including the analysis of 6 soil and 3 groundwater samples from targeted locations including the suspected former location of a UST, there are no environmental impacts to the property as a result of past use. As stated in the Phase I report, it is unlikely that the two USTs, as shown on the 1950 fire insurance map are still present. However, a contingency to properly remove and close the tanks should be in place in the event that they are discovered during construction of the new building's foundation.

If you have any questions or require additional information please do not hesitate to contact me.

Very truly yours,

Charles B. Sosik, P.G.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on 10/25/06. The project was identifed as your project "44-32-44-38 Purves St., Long Island City, NY ".

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables .

All samples were received in proper condition meeting the NELAC acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All the analyses met the method and laboratory standard operating procedure requirements except as indicated under the Notes section of this report, or as indicated by any data flags, the meaning of which is explained in the attachment to this report, if applicable.

The results of the analyses, which are all reported on an as-received basis unless otherwise noted, are summarized in the following table(s).

Notes for York Project No. 06100812

1. The MDL (Minimum Detectable Limit) reported is adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. This MDL is the REPORTING LIMIT and is based upon the lowest standard utilized for calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation.
6. All analyses conducted met method or Laboratory SOP requirements.
7. It is noted that no analyses reported herein were subcontracted to another laboratory.

Re: Phase I Environmental Site Assessment
44-26 to 44-30 Purves Street
Queens, New York 11101
IVI Project No.: PC1119280

Dear Mr. Brause:

IVI Assessment Services, Inc. ("IVI") is pleased to submit this copy of our Phase I Environmental Site Assessment on the above-referenced property. This report outlines the findings of IVI's site reconnaissance, historical land use research, review of governmental records, interviews, and our Pre-survey Questionnaire.

I declare that, to the best of my professional knowledge and belief, I meet the definition of *environmental professional* as defined in § 312.10 of 40 CFR 312 and I have the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the *subject property*. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Please contact the undersigned at **914.694.9600 (x-1933)** or by email at michael.kennedy@ivi-intl.com should you have any questions.

Sincerely,

IVI Assessment Services, Inc.

Michael Kennedy
Environmental Professional

City Directory Abstract..... F

This report documents IVI's findings from our Phase I Environmental Site Assessment on 44-26 to 44-30 Purves Street, Queens, New York (the "Subject"). The property, which is situated in an urban area characterized by residential, retail, commercial, industrial/manufacturing, and vacant land, consists of four adjoining parcels of vacant land that total approximately 0.58 acres. Former onsite use included a chemical laboratory, radiator repair and automobile repair, auto body work, controller manufacturing, fine chemical manufacturing, and paper embossing. The Subject was also historically occupied by contracting, freight, and towing companies. Prior to 1940 the Subject was developed with three residential structures on the northeastern portion.

The purpose of this Phase I Environmental Site Assessment was to assess existing site conditions and render an opinion as to the identified or potential presence of recognized environmental conditions in connection with the property within the scope and limitations of ASTM International's Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process E 1527-05 and the limitations identified herein. Exceptions to or deletions from the scope of work are described in Section 2.0.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the Subject except for the following:

Historic Site Use

Historic Sanborn Maps and City Directories indicated past site use that had the potential to negatively impact the Subject. A chemical laboratory and radiator repair structure was identified on the western side of the Subject on Sanborn maps from 1947 to 1970. On maps from 1947 to 1950 were located two gasoline tanks on the south central portion of the Subject in an open area labeled as a contractor's yard. Located on the northeastern portion of the Subject were buildings labeled as repairing, storage, controller manufacturing, and fine chemicals manufacturing. On the 1970 map was a larger structure located on the southern portion of the Subject labeled as a warehouse on the first floor and paper embossing on the second floor. This building was labeled as being constructed in 1960 and was in the location of the gasoline tanks that were identified on the 1947 and 1950 Sanborn Maps. Also on the 1970 map, the building on the northwestern side of the Subject formerly labeled as a chemical lab was labeled as auto repair. On Sanborn maps from 1980 to 2006 the large structure on the southern side of the Subject was labeled as auto repair on the first floor and paper embossing on the second floor. Former listings for the Subject on city directories included a contracting company, machine manufacturer, chemical manufacturer, automobile radiator service, automobile repair shop, paper embossing company, freight company, filter cleaning company, auto body shop, taxi service, limousine service, and towing service.

There is the potential for onsite contamination resulting from former onsite uses including chemical laboratory and chemical manufacturing, radiator repair/automobile repair, auto body work, controller manufacturing, chemical manufacturing, and paper embossing. In addition, it appears that two now inactive gasoline underground storage

tanks (USTs) were located in the vicinity of the south central portion of the Subject and have the potential to still be located onsite. We have no knowledge as to the regulatory and physical status of these underground storage tanks. There is the potential for the USTs to have negatively impacted the Subject.

IVI was provided with a correspondence from the demolition contractor indicating that they did not encounter contaminated soil or any other environmentally hazardous conditions. However, inasmuch as the demolition activities did not include subsurface testing, these observations by the demolition contractor do not alleviate our concerns.

IVI recommends that a subsurface investigation be conducted and that soil and groundwater on the Subject be analyzed for contamination.

Adjacent Site Use

Historic Sanborn Maps indicated adjacent and surrounding industrial and manufacturing land use. The following adjacent site uses that have the potential to have negatively impacted the Subject were identified. On maps from 1936-1950 the adjacent southern building (44-46 Purves Street) was identified as a chromium plating facility and on maps from 1970 to 2006 an auto body shop was identified. On maps from 1936 the adjacent northwestern building (22-19 to 22-27 44th Drive) was identified as a garage with a gasoline tank that may be an underground storage tank (UST). This building was then identified as a photochemical warehouse on the 1947 and 1950 map, a commercial/manufacturing building on the 1970 map, and as an auto repair shop on maps from 1977 to 2006. On the map from 1936 gasoline tanks (possibly USTs) were identified in manufacturing buildings located to the east of the Subject across Purves Street. Manufacturing of textile printing inks was also identified on a building to the east (44-23 to 44-27 Purves Street) on maps from 1947 to 1995 with auto repair identified on maps from 2001 to 2006. An auto repair shop was identified to the east across Purves Street (44-29 to 44-35 Purves Street) on the map from 1995. IVI recommends that the above-recommended a subsurface investigation be expanded in scope to include a determination as to if adjacent former site uses and USTs have negatively impacted the Subject.

2.0 INTRODUCTION

2.1 General

IVI was retained by Pearson Acquisition LLC c/o Brause Realty, Inc. ("Client" or "User") to prepare a Phase I Environmental Site Assessment, in conformance with ASTM International's Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process E 1527-05 on the Subject in accordance with our Agreement dated November 16, 2011.

2.2 Purpose and Scope

2.2.1 Purpose

The purpose of this report is to identify Recognized Environmental Conditions in connection with the property, using the methodology recommended by ASTM International in order to qualify for the innocent landowner defense to CERCLA liability and/or to help understand potential environmental conditions that could materially impact the operation of the business associated with the Subject. Specifically, this methodology is referred to as *Standard Practice for Environmental Site Assessments: Phase l Environmental Site Assessment Process* Designation: E 1527-05.

The term Recognized Environmental Condition is defined by ASTM Standard E 1527-05 as "...the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

2.2.2 Scope

In general, the scope of this assessment consisted of reviewing readily available information and environmental data relating to the property; interviewing readily available persons knowledgeable about the site; reviewing readily available maps, aerial photographs and records maintained by federal, state, and local regulatory agencies; and conducting a site visit.

Of importance, the client is advised that federal, state, and local laws may impose environmental assessment obligations beyond the scope of this practice. Client is also notified that there are likely to be other legal obligations with regard to hazardous substances or petroleum products discovered on the Subject that are not addressed in this practice and that may pose risks of civil and/or criminal sanctions for non-compliance.

The specific scope of this assignment included the following:

2.2.2.1 Performing a site reconnaissance to characterize on-site conditions and assess the site's location with respect to surrounding property uses and natural surface features. In addition, IVI conducted a reconnaissance of the surrounding roads and readily accessible adjacent properties to identify obvious potential environmental conditions on neighboring properties. Photographs taken as part of the site reconnaissance are provided in Appendix A.

The site visit was conducted on December 5, 2011, by Maria Sinnamon representing IVI. The site was not represented. It was partly cloudy and the temperature was approximately 55° F at the time of our site survey. IVI conducted the site reconnaissance in a systematic manner. The Subject, which was vacant land, was surveyed in a grid pattern.

2.2.2.2 Interviewing persons familiar with the property to obtain information on present and previous on-site activities potentially resulting in the environmental degradation of the site or adjoining properties. A Pre-survey Questionnaire to be filled out and returned to IVI by someone knowledgeable about the site was provided to Mr. David Brause. A blank copy of the Pre-survey Questionnaire is provided in Appendix B.

The following table presents a summary of the individuals contacted or to whom requests for documentation were made as part of this assessment:

Name	Affiliation	Telephone No.
Building Information System (BIS)	New York City Department of Buildings	(212) 312-8062
Ms. Marie Dooley	New York City Department of Environmental Protection	(718) 595-6530
Mr. Fawzy Abelsadek	New York State Department of Environmental Conservation	(718) 482-4949
Ms. Rena Bryant	New York City Health Department	(212) 788-5013

Name	Affiliation	Telephone No.
Bureau of Fire Prevention	New York City Fire Department	(718) 999-2442
Mr. David Brause	Subject Property	(212) 697-5454

2.2.2.3 If provided, reviewing of information such as previously prepared appraisals, building plans and specifications, and environmental reports.

2.2.2.4 Reviewing readily available historical documents, such as topographic maps, aerial photographs, city directories, Sanborn Fire Insurance Maps and atlases, to identify previous activities on and in the vicinity of the Subject. Copies of these documents are included in Appendix C.

2.2.2.5 Reviewing readily available environmental databases maintained by federal, state, and local agencies within the approximate minimum search distances as described within the Regulatory Review Section 6.0 of this report. A copy of the Computerized Environmental Report, provided by Environmental Data Resources, Inc. can be referenced in Appendix D.

2.2.2.6 Conducting a visual survey of readily accessible common areas to identify the presence of the most obvious and common types of suspect asbestos containing materials (ACM). The basis for "suspect" determination is taken from the materials listed in Appendix G of the United States Environmental protection Agency (USEPA) publication Managing Asbestos in Place (also known as the Green Book). All building materials listed within Appendix G of the Green Book are considered to be suspect ACMs at the Subject. This screening is not intended to be used for demolition, abatement, renovation, or repair work.

THIS LIMITED SURVEY IS NOT TO BE CONSTRUED AS A COMPREHENSIVE ASBESTOS SURVEY, WHICH OFTEN ENTAILS DESTRUCTIVE TESTING OR THE SURVEY OF AREAS BEHIND WALLS, ABOVE CEILINGS, IN TENANT SPACES AND IN OTHER TYPICALLY INACCESSIBLE AREAS. MOREOVER, IVI DOES NOT WARRANT THAT ALL ACMs AT THE SUBJECT HAVE BEEN IDENTIFIED.

2.2.2.7 Reviewing published radon occurrence maps to determine whether the site is located in an area with a propensity for elevated radon concentrations.

2.2.2.8 An analysis of mold and/or mold issues was beyond the scope of this report.

2.2.2.9 Assessing the age of the Subject to determine whether it is predisposed to contain lead-based paint. During our walkthrough survey, IVI noted the condition of the paint observed. Note, a compliance audit for lead paint was not conducted.

2.2.2.10 Testing, if any, was designed solely to meet the requirements of the client's scope of work, not to meet any local, State or Federal regulations and shall not be utilized as such.

2.3 Data Gaps

According to § 3.3.20 of ASTM Standard E 1527-05 a data gap is a lack of or inability to obtain information required by the ASTM Standard despite good faith efforts to gather same. Data gaps may result from incompleteness in any of the activities required by the ASTM Standard. The following data gaps occurred in connection with this report:

Data Gap	Explanation	Significance of Gap
Site History	History not conducted back to a time when the site was undeveloped land (See § 5)	Low - not likely to alter Report's conclusions due to IVI's search of standard historical sources of information such as aerial photographs, historic topographic maps, city directory abstracts, Sanborn Fire Insurance Maps, reviews of previous investigations and interviews with knowledgeable individuals who were familiar with the property.
Site History	Site history not conducted in 5-year intervals (See § 5)	Low - not likely to alter Report's conclusions due to IVI's search of standard historical sources of information such as aerial photographs, historic topographic maps, city directory abstracts, Sanborn Fire Insurance Maps, reviews of previous investigations and interviews with knowledgeable individuals who were familiar with the property.
User Interview	Pre-Survey Questionnaire not returned to IVI	Unknown. However, if receipt of questionnaires alters the Report's conclusion, the client will be notified
Former Owner or Operator Interview	Unable to interview former site owner or operator due to inability to locate	Low - not likely to alter Report's conclusions

Data Gap	Explanation	Significance of Gap
Governmental Records	FOIAs not returned (See § 8.6)	Unknown. However, if receipt of FOIAs alters the Report's conclusion, the client will be notified

Salient Assignment Information	
IVI Project No.:	PC1119280
Project Name:	44-26 to 44-30 Purves Street
Street Address:	44-26 to 44-30 Purves Street
City, State and Zip:	Queens, New York 11101
Primary Use:	Vacant Land
Year Built and Age of Improvements:	N/A
Site Area:	0.58 Acres
Building Size:	N/A
Reported Number of Units:	N/A
Number of Buildings:	N/A

4.1 Property Location

The Subject is located at 44-26 to 44-30 Purves Street in the Borough of Queens, New York City, New York and is identified on the City of New York tax maps as Block 268, Lots 1, 24, 25, and 26. Refer to the Site Plan provided within Appendix C.

4.2 Surrounding Land Use

The property is located in an urban setting characterized by residential, retail, commercial, industrial/manufacturing and vacant land. The following is a tabulation of surrounding property usage:

Direction	Adjacent Properties	Surrounding Properties
North	Vacant land and former auto repair shop (27-21 44th Drive)	Industrial/manufacturing and commercial properties
South	Auto Repair Shop (44-46 Purves Street)	Thomson Avenue followed by railroad lines and industrial/manufacturing properties beyond
East	Purves Street followed by a condominium tower (44-27 Purves Street), a commercial building utilized as an arts center (44-19 Purves Street), and vacant land	Vacant land, auto repair shop to the southeast (44-43 Purves Street), parking lot, and industrial/manufacturing properties beyond
West	Thomson Avenue followed by a commercial retail and residential building (27-28 Thomson Avenue)	Auto repair shop to the northwest (27-17 44th Drive), commercial and institutional properties beyond

4.3 Physical Site Setting

4.3.1 Size and Shape of Parcel

The property consists of four parcels, is irregular in shape, and totals approximately 0.58 acres in size. The Subject exhibits frontage on Purves Street, Thomson Avenue and 44th Drive. A concrete retaining wall is located on the southern and southwestern sides of the Subject along Thomson Avenue and 44th Drive.

4.3.2 Topography

The Subject is essentially level, however, properties to the northeast are at a higher topographic elevation. The topography of the area is best described as gently sloping. According to the United States Geological Survey (USGS) *Brooklyn, N.Y.* 7.5 Minute Series topographic map, the Subject's topographic elevation is approximately 19 feet above mean sea level (msl).

4.3.3 Surface Waters and Wetlands

Surface Waters

There are no surface water bodies or streams on or adjacent to the Subject. The closest open surface water to the Subject is Dutch Kills, a tributary of the Newtown Creek, which is located approximately 0.21 miles to the south.

Wetlands

IVI reviewed a wetlands map of the Subject area prepared using the US Department of the Interior, Fish and Wildlife Service's Internet Wetland Interactive Mapper. The source material used to produce the National Wetlands Inventory digital data for these maps was prepared primarily by stereoscopic analysis of high altitude aerial photographs. Based on this review, IVI did not identify any federally regulated wetlands on the Subject property. Additionally, IVI did not observe vegetation characteristic of wetlands on the Subject site.

4.3.4 Soils, Geology and Groundwater

Soils

The soil at the Subject is classified as Urban Land. Urban Land complex are those soils in which the soil's original structure and content have been so altered by human activities that it has lost its original characteristics and is thus unidentifiable.

Geology

There are no predominant geological surface features such as rock outcroppings on the Subject. According to previously conducted geotechnical surveys, bedrock is encountered on the Subject at approximately 43 to 61 feet below ground surface (bgs).

According to a report titled "Potentiometric Surface of the Water Table, Magothy and Lloyd Aquifer on Long Island, New York in 1984, Water Resources Investigation Report 86--4189 and published by USGS in 1987, the subsurface geology in the vicinity of the Subject consists of the Upper Glacial Deposits, Gardiners Clay, Jameco Gravel, the Raritan formation, and bedrock.

The unconsolidated Upper Glacial layer, deposited during the Pleistocene, extends to a depth of 175' below grade surface (bgs) and consists of glacial outwash deposits composed of sands and gravel. The permeability of this unit is moderate to high.

The Upper Glacial deposits are underlain by Gardiners Clay consisting of clay, silt, and a few layers of sand. Also deposited during Pleistocene, the Gardiners Clay extends to a depth of 200' below sea level (bsl). The permeability of this unit is very low, so it constitutes a confining unit for the underlying aquifer.

The Gardiners Clay is underlain by the Jameco Gravel unit consisting primarily of sand and gravel with a few layers of clay and silt. This unit extends to a depth of 250' bsl and is moderately to highly permeable.

The Jameco Gravel is underlain by the Raritan formation consisting of the Raritan Confining Unit and the Lloyd Sand Member, deposited during the Cretaceous Period. The Raritan Confining Unit extends to a depth of 300' bsl and is composed of clay (solid and silty), with a few lenses and layers of sand, lignite, and pyrite. The permeability of this unit is very poor. The Lloyd Sand Member extends to a depth of 400' bsl and is composed of sand and gravel within a clayey matrix. The permeability of this layer is poor to moderate.

Underlying the Raritan formation is bedrock. Paleozoic and Precambrian in age, the bedrock consists of metamorphic and metaigneous rocks (muscovite and biotic schist, gneiss and metagranites). The bedrock is poorly permeable to virtually impregnable, and constitutes the lower boundary of groundwater reservoir.

Groundwater

Under natural, undisturbed conditions, shallow groundwater flow generally follows the topography of the land surface and on this basis the topography suggests that groundwater flow across the Subject is in a southwesterly direction. However, localized conditions can alter flow direction and thus the presumed flow may not coincide with the actual in the subject area. According to previously conducted geotechnical surveys groundwater at the Subject is encountered at a depth of approximately 5.5 to 10 feet below ground surface.

4.4 Site Improvements

4.4.1 Utilities

The Subject is served with the following utilities:

Water:	Not provided
Sanitary Sewer:	Not provided
Storm Sewer:	New York City Department of Environmental Protection (NYCDEP)
Electric:	Not provided

As the Subject is vacant land it is not connected to the public water, sanitary sewer, and electric systems that are provided in the Subject area.

Stormwater runoff collected by catch basins is discharged into the municipal stormwater management system.

4.4.2 Building Description

There are no buildings on the Subject.

4.5 Current Property Use

The subject property is currently vacant land with no activities occurring onsite.

4.6 Environmental Permits

Based on our research, no environmental permits such as wastewater discharge, National Pollutant Discharge Elimination System (NPDES), air emissions, or petroleum bulk storage (PBS) tank registrations are required at the Subject.

4.7 Plans and Specifications

Neither building drawings nor specifications were provided for our review.

5.1 Historical Summary

Currently, the subject site is vacant land. The Subject was identified with three dwellings on the northeastern portion of the Subject (Lots 24, 25 and 26) on Sanborn Maps from 1898 to 1936. A chemical lab and radiator repair structure was identified on the western side of the subject on maps from 1947 to 1970. On maps from 1947 to 1950 were two gasoline tanks on the south central portion of the Subject in an open area labeled as a contractor's yard. A storage building was located on the southern portion of the Subject and a garage was located on the southeastern corner. Storage and office buildings were located on the northwestern portion of the Subject. Located on the northeastern portion of the Subject (Lots 24, 25, and 26) were buildings labeled as repairing, storage, controller manufacturing and fine chemicals manufacturing. An addition to the building on the northwest portion of the Subject was identified on the 1970 map. Also on the 1970 map was a larger structure located on the southern portion of the Subject labeled as a warehouse on the first floor and paper embossing on the second floor. This building was labeled as being constructed in 1960 and was in the location of the gasoline tanks that were identified on the 1947 and 1950 Sanborn Maps. The buildings on the northeastern portion of the Subject were not present on the 1970 map and a small structure identified as a contractor's storage warehouse was located on the eastern side of the Subject. On the 1970 map the building on the northwestern side of the Subject formerly labeled as a chemical lab was labeled as auto repair (through the 2006 map) and an addition was added to the small warehouse structure on the eastern side of the Subject. On Sanborn maps from 1980 to 2006 the large structure on the southern side of the Subject was labeled as auto repair on the first floor and paper embossing on the second floor. On maps from 2001 to 2006 the northeastern portion of the Subject (vacant area) was labeled as storage.

Former listings for the Subject from city directories included a contracting company, machine manufacturer, chemical manufacturer, automobile radiator service, automobile repair shop, paper embossing company, freight company, filter cleaning company, auto body shop, taxi service, limousine service, and towing service.

5.2 Topographic Maps

IVI reviewed the USGS *Brooklyn, N.Y.* 7.5 Minute Series topographic map of the Subject area, which was last revised in 1995. The topographic map does not identify individual buildings or development on the Subject property due to the concentration of structures in the highly urbanized area, but rather shows the area to be shaded denoting urbanized land use, and identifies only landmarks as distinct structures. Nevertheless, the topographic map does not identify any industrial complexes, landfills or wetlands on or adjacent to the Subject site. Railroad tracks are identified to the south of the Subject.

5.3 Historical Maps

Sanborn Fire Insurance Maps (Sanborn Maps)

IVI had a search conducted for Sanborn Maps, which reference the property. The findings of this review are summarized below:

Year	Subject Property	Adjacent and Surrounding Properties
1898	The central and southern portion of the Subject (Lot 1) is identified with multiple vacant lots. The northern portion of the Subject (Lots 24, 25, and 26) are identified with two-story dwellings and storage sheds.	Vacant lots and a two story building identified as Kennels is located to the south. Dwellings are located to the north and east. To the north at 16 Purves Street is a two story building labeled as "Vac Wrech." Stores and a junk yard are located further north. To the southeast across Purves Street are buildings identified as a manufacturer of baker's tools, ovens, and mixing and storage. The Long Island Railroad is identified further south. Located to the south and west across Thomson Street is vacant land, a shed and a store. To the north west across Nott Avenue (currently 44th Drive) is a Second Hand Building Material yard with store, contractor building and wagon shed.
1915	Similar to previous map reviewed except that that the present day Lot 1 is divided into two parcels.	Vacant lots are identified to the south of the Subject. Dwellings are located to the north of the Subject followed by junk storage buildings, a junk yard and stores. Dwellings and a Sub-Station are located to the east of the Subject across Purves Street. The Manhattan Steam Bakery is identified to the southeast across Purves Street. The railroad is present further south. Vacant land is present to the southwest across Thomson Avenue. To the west across Nott Avenue is Stevenson's Construction Company (contractors).
1936	Similar to previous map reviewed.	The adjacent southern building is labeled as Bottlers Supplies Manufacturing and Grand Chromium Plating Corporation. The parcel adjacent to the Subject to the north is vacant land and is followed by a building labeled as Controller Manufacturing. A building adjacent to the Subject to the northeast is identified as a Garage with furniture storage and is identified with a gasoline tank. Located further north are structures labeled as iron works, lumber sheds, and stores. Located

Year	Subject Property	Adjacent and Surrounding Properties
		to the east of the Subject across Purves Street are a substation, Anchor Cap and Closure Corp. with a gasoline tank, Welsch Brothers Contractors with a garage and gasoline tank, dwellings, and a junk yard. Located to the southwest across Thomson Avenue is the large commercial building labeled as the Metropolitan Life Insurance Company and built in 1920-21.
1947	The Subject is identified with a chemical lab on the western side (also labeled as radiator repair), a contractors yard with two gasoline tanks in the south-central portion of the Subject, a one story storage building on the southern side, a private garage on the southeast corner, and a storage building and an office building on the northern portion of Lot 1. Located in the vicinity of Lots 24, 25, and 26 are a building labeled as repairing, a storage building, a building labeled as Controller Manufacturing, a second storage building and a building labeled as fine chemicals manufacturing.	The adjacent southern building is labeled as chromium plating. The adjacent building to the northwest is labeled as a paper warehouse and photo chemicals warehouse. Adjacent to the north is a building labeled as controller manufacturing and storage. Further north are buildings labeled as steel storage and machine parts, carton warehouse, Lucite manufacturing, lumber storage, machine shop and stores. Located to the east across Purves Street are buildings labeled as iron works, manufacturing textile printing inks, private garage and paper warehouse, dwellings, stores, and firefighting equipment warehouse. Properties to the south and west across 44th Drive (Nott Avenue) appear similar to the previous map except that a filling station with four gasoline tanks is identified to the west of 44th Drive.
1950	Similar to previous map reviewed.	Similar to previous map reviewed except that the large commercial buildings located across Thomson Avenue is labeled as the Bickford Building.
1970	Lots 24, 25, and 26 appear as vacant land. The chemical lab is identified. The storage buildings on the northwestern portion of the Subject are also labeled as radiator repair and include a building addition. A larger structure labeled as a warehouse on the first floor and paper embossing on the second floor (built in 1960) is located on the southern portion of the Subject and is attached to the structure formerly identified as a garage. This newer structure is also over the location of the gasoline tanks that were identified on previous maps. A small commercial structure remains on the eastern portion of the Subject and is labeled as a	Vacant land and a building labeled as welding and repairs are located to the north of the Subject. The northwestern adjacent building is labeled as commercial/manufacturing. Further north are identified a junk yard, parking garage, vacant lots, lumber sheds, and machine shops. The building adjacent to the south is labeled as auto body repair. Located to the east across Purves Street are buildings labeled as warehouses, manufacturing textile printing inks, hardware manufacturing, offices, and private garage, and parking area. Properties to the south and further to the west appear similar to the previous map.

Year	Subject Property	Adjacent and Surrounding Properties
	contractor's storage warehouse.	
1977	The building formerly labeled as a chemical lab on the northwestern side of the Subject is now labeled as auto repair. The additional north western structures are labeled as warehouses. The large southern structure is labeled as a warehouse on the first floor and paper embossing on the second floor. A small addition has been added to the small warehouse building on the eastern side of the Subject.	Similar to previous map except that the northwestern adjacent building is labeled as an autobody shop. An auto body repair shop is also located further to the northwest across 44th Drive.
1980	Similar to previous map reviewed except that the large building on the southern portion of the Subject is labeled as auto repair on the first floor and paper embossing on the second floor.	Similar to previous map except that the southern adjacent building is labeled as a heating supply warehouse on the first floor and an auto body repair shop on the second floor. Also, the former filling station located to the west of 44th Drive is labeled as an auto repair shop and no gasoline tanks are identified.
1985	Similar to previous map reviewed.	Similar to previous map reviewed.
1990	Similar to previous map reviewed.	Similar to previous map reviewed except that the commercial building located to the south of Thomson Avenue is labeled as Eagle Electric Manufacturing Company, Inc.
1995	Similar to previous map reviewed.	Similar to previous map reviewed except that a building located to the east of Purves Street formerly labeled as a garage is labeled as auto repair.
2001	Similar to previous map reviewed except that the northern vacant portion of the Subject is labeled as storage.	Similar to previous map reviewed except for the following: Located to the east of Purves Street is an auto repair shop and warehouse, contracting company, oil burner utility company, manufacturing building and parking area.
2006	Similar to previous map reviewed.	Similar to previous map reviewed.

5.4 Aerial Photographs

Aerial photographs frequently provide visual documentation of site conditions at the time of the photographs. Activities such as dumping or industrial use of a site can often be discerned through the examination of aerial photographs. Inasmuch

as the Subject has been sufficiently covered by other standard historic information sources, aerial photographs were not consulted as part of this assessment.

5.5 Chain-of-Ownership

A copy of the Subject's Chain-of-Title has not been provided to IVI for review.

5.6 Previous Reports

IVI reviewed previous environmental documents related to the Subject. The information obtained was not verified for accuracy by IVI and a critique of the documents was beyond the scope of this assessment.

- *Update To Phase I Environmental Site Assessment Report, Property located at 44-32/38 Purves Street In Long Island City, New York,* prepared by Middleton Environmental, Inc. on behalf of Weiss and Company and dated April 27, 2006. This report was prepared as an update to the Phase I Environmental Site Assessment (ESA) prepared by Middleton Environmental, Inc. (MEI) and dated September 30, 2003. The September 2003 Phase I was not provided to IVI for review. The update was conducted to determine if there were any recognized environmental conditions with regard to the subject site since the original report. The site was identified as Lot 1 and there were two commercial buildings on site. The main building was approximately 17,860 square feet in size with two floors and no basement. This building was vacant and was formerly utilized as an automobile repair facility and a carpet storage facility. The second building was a small two story building with a basement that was formerly utilized as a realty office. The portion of the building along Purves Street (where a carpet company was located) and a small portion of the building on the corner of Thomson Avenue and 44th Drive (that housed the offices for the automobile repair company) were reportedly constructed in 1939. The larger portion of the building that housed the automobile repair facility and connected the two original buildings was reportedly constructed in 1960. Sanborn Fire Insurance Maps and City Directories indicated that the original building on Purves Street was utilized as a private garage while the original building on the corner of Thompson Avenue and 44th Drive was originally utilized as a chemical laboratory and automobile radiator repair facility (while the remainder of the property was utilized as a contractors storage yard). The larger portion of the building that was constructed in 1960 was utilized in the past by a heat exchanger company, a filter cleaner company, a hardware warehouse, a paper embossing company, and a taxi repair facility. The small two story office had been utilized as a realty office and by a contracting company and was constructed between 1936 and 1940.

Drains were identified in the automobile repair area that the property owner indicated were connected to the municipal sewer system. Two 275 gallon above ground heating oil storage tanks and one 275 gallon above ground waste oil tank were located within the main buildings with no signs of staining or leakage. The heating oil tanks were registered with the New York City Fire Department; however the waste oil tank was not registered. There was one paint spray booth on the lower level of the main building that was properly vented outside the building.

A review of the 1950 Sanborn Fire Insurance Map indicated the presence of two buried gasoline storage tanks behind the carpet storage area portion of the building. No evidence of the tanks was identified during the site inspection. MEI stated that it is highly likely that the tanks were removed when the rear portion of the building was constructed and that later Sanborn maps did not indicate the presence of any buried tanks on the site. MEI concluded that no further testing, subsurface or otherwise, was required on the Subject site.

- *Phase I Environmental Site Assessment Report, Property located at 4426/30 Purves Street in Long Island City, New York,* prepared by Middleton Environmental, Inc. on behalf of Weiss and Company and dated April 26, 2006. The subject was identified as vacant Lots 24, 25, and 26. Sanborn Maps indicated that three dwellings were located on the site prior to 1898 and were demolished between 1936 and 1950. The 1950 Sanborn Map indicated three small buildings on the site utilized by a controller manufacturing company, a pine chemical company, and an air freight company. These buildings were demolished prior to 1970 and the property has been vacant since that time. During the site inspection several small piles of miscellaneous debris and construction/demolition debris were identified on the site. Two 55-gallon drums were also identified. MEI recommended that the drums and piles of debris be removed from the site prior to any planned construction activities on the property. MEI did not identify any recognized environmental conditions associated with the Subject site and no further testing, subsurface or otherwise, was recommended.

- *Review of Environmental Reports, 44-30 Purves Street, Long Island City, New York,* prepared by Steven A. Ciambruschini of Langan Engineering and Environmental Services on behalf of GSO Capital Partners and dated August 4, 2006. This letter report stated that the two previously described Phase I reports were reviewed. The letter report stated that based on the former site use as an automobile repair shop and paper embossing and the former presence of two gasoline underground storage tanks (USTs), acid tanks, and a chemical lab, that contamination may be encountered during site work. The letter also indicated that it should not be assumed that the

gasoline USTs, and any contaminated soil or groundwater associated with the tanks, were removed when the building addition was constructed. Due to the possible presence of USTs and impacted soils, the letter recommended completing a limited subsurface investigation (three test borings finished as monitoring wells) to identify significant impact associated with historic site uses. Note that no subsurface investigation that included analysis of soils and groundwater for contaminants of concern was identified through IVI's assessment.

- *Geotechnical Engineering Study, Proposed Residential Development, 4430 Purves Street, Queens, New York,* prepared by Langan Engineering and Environmental Services (Langan) on behalf of Omni Holding Group and dated February 1, 2008. This geotechnical study was conducted in preparation for the proposed development of two towers on the Subject; one 11-story tower located on Purves Street and one 31-story tower located on Thomson Avenue. The report indicates that three borings, identified as SB-1, SB-2, and SB-3 were installed on the site in 2005 by Soil Mechanics Drilling Corp (a letter report tor this geotechnical study was dated February 25,2005). The 2008 Langan Investigation included seventeen borings (B-1 through B-17). Three groundwater monitoring wells were installed in completed borings B-4, B-10, and B-16. Two test pits (TP-1 and TP-2) were also excavated to determine the type, condition, and depth of the Thomson Avenue and 44th Drive retaining wall foundations. Subsurface conditions encountered in the 2008 study were indicated to be generally consistent with those encountered in the Soil Mechanics 2005 investigation. The general subsurface stratigraphy consisted of a layer of sandy fill overlaying successive strata of silty sands, silts, clays and decomposed rock to the bedrock. A layer of uncontrolled fill, generally consisting of black coarse sand, some gravel with varying amounts of brick and concrete covered the site. The thickness of the fill varied from approximately five feet to nine feet. Bedrock was encountered at depths ranging from approximately 43 feet to 61 feet below ground surface. Groundwater level was measured in the observation wells. The measured groundwater depths averaged approximately 9 to 10 feet below the sidewalk grade. A concrete foundation from a demolished building was encountered during the installation of the test pits. Groundwater was encountered at approximately 7.5 feet below existing grade at TP-1 and at approximately 5.5 feet below grade at TP-2. Langan concluded that the uncontrolled fill and underlying loose sandy and soft silt and clay materials were not suitable for support of a shallow foundation system. A deep foundation system was recommended for the buildings to transfer the building loads to the underlying bedrock. Langan made recommendations regarding feasible foundation systems, permanent groundwater control, and construction.

- IVI was also provided with a correspondence dated January 8, 2008 from DiSano Construction Co. Inc. which indicated that they performed the demolition of former site improvements. During such demolition, they did not encounter contaminated soil, asbestos, PCBs, CFCs or any other environmentally hazardous conditions. However, inasmuch as the demolition activities did not include subsurface testing, these observations by the demolition contractor do not alleviate our concerns.

5.7 City Directories

IVI commissioned EDR to obtain a historical City Directory Abstract for the Subject for the years 1922, 1934, 1939, 1945, 1950, 1962, 1967, 1970, 1976, 1983, 1991, 1996, 2000 and 2005. Refer to Appendix F for City Directory Abstract. IVI also reviewed city directories included in the previous Phase I Environmental Site Assessments conducted for the Subject. The Subject is also identified with addresses along Thomson Avenue and 44th Drive. This review yielded the following information:

Year	Subject Property
1934	Augusta Schwarta (44-30 Purves Street)
1940	Welsh Brothers Contracting Company (trucking) (44-30 Purves Street)
1945	FR Machine Works (44-26 Purves Street) Welsh Brothers Contracting Co. (trucking) (44-30 Purves Street)
1950	Ortho Chemical Corp (44-26 Purves Street) Central Auto Radiator Service, Tru-Synthetics Inc. and Welsh Brothers Contractors (trucking) (44-30 Purves Street) Central Auto Repair Company (28-01 44th Drive)
1960	Freight Company (44-26 Purves Street) Berdell Industries Inc, Roscoe T. Copes, Gertrude Green, Tru Synthetics Inc., and Welsh Brothers Contracting Company (44-30 Purves Street) Berdell Industries Inc (heat exchangers), Central Auto Radiator Co. Inc., Filter Cleaner Co. (28-01 Thomson Avenue) National Announcements, Inc. (28-11 Thomson Avenue)
1962	Gertrude Green, Welsh Brothers Contracting Company (trucking), Roscoe T Copes, and Tru Synthetics Inc. (44-30 Purves Street) Central Auto Radiator Co. Inc., Berdell Industries Inc. (heat exchangers), and Filter Cleaner Co. (28-01 Thomson Avenue) National Announcements Inc. (28-11 Thomson Avenue)
1967	Welsh Brothers Contracting Co (trucking), Gertrude Green and Roscoe T Copes (44-30 Purves Street) Hydro Cote Corp. of America, Berdell Industries Inc. (heat exchangers), Central Auto Radiator Co. Inc., and Filter Cleaner Co. (28-01 Thomson Avenue) National Announcement Inc. and Rosner Card & Paper Co. (28-11 Thomson Avenue)

Year	Subject Property
1970	Berdell Industries Inc. (heat exchangers) and Welsh Brothers Contracting Company (trucking) (44-30 Purves Street) Central Auto Radiator Co Inc., Filter Cleaner Co, and Hydro Cote Corp of America (28-01 44th Drive and Thomson Avenue) National Announcements, Inc., Rosner Card and Paper Company (28-11 44th Drive and Thomson Avenue)
1976	Filter Cleaning Co., Berdell Industries Inc. (heat exchange), and Central Auto Radiator Co Inc. (28-11 Thomson Avenue)
1980	LC Construction and Welsh Brothers Contracting Company (trucking) (44-30 Purves Street) Jema Coach Auto Body (28-01 44th Drive) Taxi Brokers Inc. and Taxi City (28-11 44th Drive)
1983	Welsh Brother Contracting Co and LC Construction (44-30 Purves Street) Jema Coach Auto Body (28-01 Thomson Avenue) Parliament Limousine Service Inc., Taxi City, Timeley Towing Inc. (28-11 Thomson Avenue)
1991	Jema Coach Auto Body (28-01 Thomson Avenue) Marling Auto Repair Inc. (28-11 Thomson Avenue) LC Construction (44-30 Purves Street)
2000	Vincent Barellino (44-26 Purves Street) LLC Construction Inc and Welsh Brothers Contracting (44-30 Purves Street)
2005	Welsh Brothers Contracting Co (44-30 Purves Street)

The Subject is listed as 44-26 and 44-30 Purves Street, 28-01 44th Drive, and 28-01 and 28-11Thomson Avenue. Former listings for the Subject included a contracting company, machine manufacturer, chemical manufacturer, automobile radiator service, automobile repair shop, paper embossing company, freight company, filter cleaning company, auto body shop, taxi service, limousine service, and towing service. There is the potential for former onsite activities to have negatively impacted the Subject. Listings for surrounding properties included chemical manufacturing and auto body listings.

5.8 Municipal Records

Tax Assessor Records

According to the tax assessor records reviewed, the Subject includes the following adjoining lots on Block 268: Lot 1 (0.42 acres), Lot 24 (0.06 acres), Lot 25 (0.05 acres), and Lot 26 (0.05 acres). All four lots are vacant land. The owner is identified as Thomson Purves LLC.

Building Department Records

IVI reviewed building permits and records for the Subject on the New York City Department of Buildings (NYCDOB) database.

The following relevant permits were reviewed:

Permit Number	Date	Purpose of Permit
FO 90-86	2/19/1986	Oil Burner Application for Lot 1
NB 2163-45	1945	Construct new building on Lot 1
NB 2390-07	1907	Construct new building on Lot 1

The previously conducted Phase I update prepared by Middleton Environmental, Inc. identified certificates of occupancy for Lot 1 which was formerly known as 44-38 Purvis Street. The certificate of occupancy is dated January 13, 1961. Permissible use included a factory and loading and unloading of trucks on the first floor and a factory, office, and loading and unloading of trucks on the second floor. A second certificate of occupancy was dated November 5, 1976 also for Lot 1 which was identified as 28-01Thomson Avenue. Permissible use included a biological analysis laboratory, used car sales and auto repair on the first floor and a repair shop, used car sales and auto repair on the second floor.

In addition, a violation for the Lot 1 of the Subject (Violation number 051500C02FS01), listed on the NYCDOB database, was issued on May 15, 2000 for the illegal use of the vacant lot as a junk yard. The material onsite was listed as non-hazardous.

Fire Department Records

The previously conducted Phase I update prepared by Middleton Environmental, Inc. included records from the City of New York Fire Department indicating that one 550 gallon heating oil AST (permit expired on August 31, 1984) was registered at 44-38 Purves Street (Lot 1), one 275 gallon heating oil AST (permit expired on April 14, 1998) was registered at 28-01 Thomson Avenue (Lot 1) and two 275 gallon heating oil ASTs (permits expired on April 21, 1998) were registered for 44-30 Purves Street.

5.9 Internet Search

IVI conducted a cursory internet search for the Subject's name and address using the Google search engine on December 6, 2011. No environmentally related information was identified on the first page of the Google search engine.

A copy of regulatory database information contained within a Computerized Environmental Report (CER) provided by Environmental Data Resources, Inc. (EDR) appears in Appendix D. The CER is a listing of sites identified on select federal and state standard source environmental databases within the approximate minimum search distance specified by ASTM Standard Practice for Environmental Site Assessments E 1527-05. IVI reviewed each environmental database to determine if certain sites identified in the CER are suspected to represent a material negative environmental impact to the Subject. The following table lists the number of sites by regulatory database within the prescribed minimum search distance appearing in the CER.

Databases Reviewed	Approximate Minimum Search Distance (AMSD)	Number of Sites Within AMSD
Federal National Priorities List (NPL) Site List	One-Mile	0
Federal Delisted NPL Site List	One-Half Mile	0
Federal Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS)	One-Half Mile	0
Federal CERCLIS No Further Remedial Action Planned (NFRAP) Sites	One-Half Mile	0
Federal Resource Conservation and Recovery Information System (RCRIS) Treatment, Storage, and Disposal (TSD) List	One-Half Mile	0
Federal RCRIS Generators List	On-Site and Adjoining Properties	1
Federal Corrective Action Tracking System (CORRACTS)	One-Mile	4
Federal Emergency Response Notification System (ERNS) List	On-Site	0
Federal Institutional/Engineering Control Registries	On-Site	0
New York and Tribal Lists of NPL Equivalent Hazardous Waste Sites Identified for Investigation and/or Remediation	One-Mile	0
New York and Tribal Lists of CERCLIS Equivalent Hazardous Waste Sites Identified for Investigation and/or Remediation	One-Half Mile	1
New York and Tribal Landfills or Solid Waste Facilities List	One-Half Mile	2
New York and Tribal Petroleum Bulk Storage Tank List	On-Site and Adjoining Properties	0
New York and Tribal Leaking UST/Spill List	One-Half Mile	46
New York and Tribal Institutional/Engineering Control Registries	On-Site	0
New York and Tribal Voluntary Cleanup Sites	One-Half Mile	3
New York and Tribal Brownfields Sites	One-Half Mile	1

The CER identified 20 "Orphan Sites". "Orphan Sites" are those sites that could not be mapped or "geocoded" due to inadequate address information. Refer to the CER for a list of these "Orphan Sites". IVI attempted to locate these sites via a review of street maps, vehicular reconnaissance and/or interviews with people familiar with the area. "Orphan Sites" that were identified in this manner were analyzed in their respective regulatory database below.

A description of the databases reviewed by IVI and an analysis of sites identified within the prescribed search area are presented below.

6.1 Federal Databases

NPL

The NPL database is a listing of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA or "Superfund"). A site must be on the NPL to receive money from the Trust Fund for Remedial Action.

Analysis/Comment: The CER did not identify NPL sites within the AMSD.

Delisted NPL Site List

The EPA may delete a final NPL site if it determines that no further response is required to protect human health or the environment. Under Section 300.425(e) of the National Contingency Plan (55 FR 8845, March 8, 1990). Sites that have been deleted from the NPL remain eligible for further Superfund-financed remedial action in the unlikely event that conditions in the future warrant such action. Partial deletions can also be conducted at NPL sites.

Analysis/Comment: The CER did not identify Delisted NPL sites within the AMSD.

CERCLIS

CERCLIS is the USEPA's system for tracking potential hazardous-waste sites within the Superfund program. A site's presence on CERCLIS does not imply a level of federal activity or progress at a site, nor does it indicate that hazardous conditions necessarily exist at the location. Within one year of being entered into CERCLIS, the USEPA performs a preliminary assessment of a site. Based upon the results of the preliminary assessment, the USEPA may conduct additional investigation, which could lead to a site being listed on the NPL.

Analysis/Comment: The CER did not identify CERCLA sites within the AMSD.

CERCLIS No Further Remedial Action Planned (NFRAP) Sites

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from the CERCLIS list. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to warrant Federal Superfund Action or NPL consideration.

Analysis/Comment: The CER did not identify CERCLA NFRAP sites within the AMSD.

RCRIS TSD

The RCRIS TSD contains information pertaining to those facilities that treat, store, or dispose of hazardous waste. While these facilities represent some form of hazardous waste activity, they are most significant if determined to be out of compliance or to have violations.

Analysis/Comment: The CER did not identify RCRIS TSD facilities within the AMSD.

RCRIS Generators

IVI reviewed the list of sites, which have filed notification with the USEPA in accordance with RCRA requirements. These sites include generators of hazardous waste regulated under RCRA. Under RCRA, hazardous waste generators are classified by the quantity of hazardous waste generated in a calendar month into the following categories: Large Quantity Generator (LQG), greater than 1,000 kilograms (kg); Small Quantity Generator (SQG), 100 to 1,000 kg; and Conditionally-Exempt Small Quantity Generator (CESQG), less than 100 kg. RCRA Generators, while they represent some form of hazardous waste activity, are most significant if they are determined to have Class I Violations or to be non-compliant.
Analysis/Comment: The CER identified the following RCRA Generator located within the AMSD:

Property Name/ Address	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
A-1 Auto Collision Inc. 2831 Thomson Avenue	South	Upgradient	Compliant/No Violations

The above listed facility is located adjacent to the Subject to the south and is listed as a RCRA Non Generator with EPA ID number NYD986884872. This site was formerly listed as a small quantity generator in 1989. Inasmuch as no violations or compliance infractions were identified in connection with the above-referenced RCRA site, it is not suspected that contamination origination at this site associated with the RCRA listing, if any exists, has encroached upon the Subject.

Corrective Action Tracking System (CORRACTS)

CORRACTS is a list of facilities that are found to have had hazardous waste releases and require RCRA corrective action activity, which can range from site investigations to remediation.

Analysis/Comment: The CER identified the following CORRACTS sites within the AMSD:

Property Name/ Address	Distance (Mile)	Direction	Presumed Hydrogeologic Relationship	Compliance Status
Active Steel Drum Co. Inc. 52-30 34th Street	0.723	South Southeast	Crossgradient	RFA completed
Kosan Industrial Corp. 5-49 49th Avenue	0.616	West	Downgradient	RFA completed
Accurate Associates 5-36 46th Road	0.730	West	Downgradient	RFA completed
Con Edison Ravenwood Generating Station 38-54 Vernon Blvd	0.880	North Northwest	Downgradient	RFA completed

The above-tabulated CORRACTS sites are located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted same.
The sites are also located hydrogeologically crossgradient or downgradient of the Subject. As such IVI does not suspect these sites of having had a negative environmental impact on the Subject.

ERNS

The ERNS is a database of notifications of oil discharges and hazardous substance releases made to the Federal government. These notifications are used by "On-Scene Coordinators" to determine an emergency response and release prevention. When a call is made to the National Response Center or one of the 10 USEPA Regions, a report is created containing all of the release information that the caller provided. This report is transferred to an appropriate agency to evaluate the need for a response and the records are electronically transferred to the ERNS database. As such, if a reported release of oil or a hazardous substance is deemed to require

a response, it should also be listed in the appropriate federal or state environmental database such as CERCLIS, state equivalent CERCLIS, or state leaking underground storage tank or spills lists.

Analysis/Comment: The CER did not identify the Subject on the ERNS database.

Federal Institutional Control/Engineering Control Registries

These Federal registries contain listings of those sites which have either engineering and/or institutional controls in place. Engineering controls include various physical control devices such as fences, caps, building slabs, paved areas, liners and treatment methods to eliminate pathways for regulated substances to enter the environment or affect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions (Activity and Use Limitations) are generally required as part of institutional controls.

Analysis/Comment: The CER did not identify the Subject on the Federal Institutional or Engineering Control registries.

6.2 New York State Department of Environmental Conservation (NYSDEC) and Tribal Databases

Registry of Inactive Hazardous Waste Disposal Sites (IHWDS) and Tribal NPL Equivalent State Hazardous Waste Sites (SHWS)

The IHWDS and Tribal NPL Equivalent SHWS list is an inventory of toxic sites listed by New York and/or Tribal Environmental and Health Authorities. These sites are either under remediation, or are currently under evaluation for further action, if necessary.

Analysis/Comment: The CER did not identify any IHWDS and/or Tribal NPL Equivalent Hazardous Waste sites within the AMSD.

Vapor Intrusion Legacy Site List

"Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, the NYSDEC is currently re-evaluating pre-2003

remedial decisions on IHWDS where chlorinated hydrocarbons were released to determine the possibility of vapor intrusion at the sites. The Vapor Intrusion Legacy Site List is a database of these sites.

Analysis/Comment: The CER identified the following Vapor Intrusion Legacy sites within a mile of the Subject.

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
Standard Motor Products, Inc. 37-18 Northern Boulevard	East Northeast	0.893	Upgradient	Complete

The above-tabulated Vapor Intrusion site is located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted same.

New York and Tribal CERCLIS Equivalent Hazardous Waste Sites

The State HWS is an inventory of dumps, landfills, and other toxic sites listed by Environmental and Health Authorities. The Tribal NPL Equivalent HWS list is an inventory of toxic sites listed by Tribal Environmental and Health Authorities. These sites are either under remediation, or are currently under evaluation for further action, if necessary.

Analysis/Comment: The CER identified the following New York and/or Tribal CERCLIS Equivalent Hazardous Waste site within the AMSD:

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
21-03 44th Avenue	0.356	Northwest	Crossgradient	Active

The above-tabulated state hazardous waste site is classified as a significant threat to the public health or environment and action is required. However, this site is located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted the same.

New York and/or Tribal Solid Waste Facilities (SWF) List

The SWF list is an inventory of landfills, incinerators, transfer stations, and other sites that manage solid wastes.

Analysis/Comment: The CER identified the following SWF sites the AMSD.

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
C&H Sand and Stone, Corp. 21-16 Jackson Avenue	0.352	West Southwest	Downgradient	Inactive
United Waste Removal, Inc. 2116 Jackson Avenue	0.353	West Southwest	Downgradient	Inactive

The above-tabulated SWF sites are located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted same. The sites are also hydrogeologically downgradient from the Subject. As such it is not suspected that the solid waste facilities have had a negative environmental impact upon the Subject.

Petroleum Bulk Storage (PBS) Tanks List and/or Tribal Registered Storage Tanks (RST) Facility List

The PBS Tank list is an inventory of registered liquid bulk storage tanks maintained either by the county or the NYSDEC. Inclusion of a site on the PBS Tank list does not necessarily constitute environmental contamination, but instead merely indicates the presence of registered bulk storage tanks.

Analysis/Comment: The CER did not identify PBS Tank sites within the AMSD.

New York Leaking Underground Storage Tanks (LUST) and Spill Lists

The LUST list is an inventory of spills and leaks, both active and inactive reported to regulatory authorities. They include stationary and non-stationary source spills reported to state and federal agencies, including remediated and contaminated leaking UST sites. The Spills list is a compilation of data collected on spills and reported to the NYSDEC pursuant to either Article 12 of the Navigation Law, or 6 NYCRR Section 595.2.

Analysis/Comment: The CER identified 46 LUST/Spill sites within the prescribed search distance. Of these 46 sites, all are i.) located over one-eighth mile away from the Subject, and based on the general non-sensitivity of the urban setting of the Subject, are not considered to represent a significant environmental concern; and/or ii.) have been granted a “Case Closed” status by the NYSDEC. This classification is granted to those sites that have been remediated to the satisfaction of the NYSDEC or are not suspected to pose a significant threat to human health or the environment. As such, IVI does not suspect that these sites have had a negative environmental impact upon the Subject.

New York and Tribal Institutional Control/Engineering Control Registries

According to the NYSDEC website, Institutional Controls shall mean any non-physical means of enforcing a restriction on the use of real property that limits human or environmental exposure, restricts the use of groundwater, provides notice to potential owners, operators, or members of the public, or prevents actions that would interfere with the effectiveness of a remedial program or with the effectiveness and/or integrity of operation, maintenance, or monitoring activities at or pertaining to a brownfield site.

Engineering Control shall mean any physical barrier or method employed to actively or passively contain, stabilize, or monitor hazardous waste or petroleum, restrict the movement of hazardous waste or petroleum to ensure the long-term effectiveness of a remedial program, or eliminate potential exposure pathways to hazardous waste or petroleum. Engineering controls include, but are not limited to, pavement, caps, covers, subsurface barriers, vapor barriers, slurry walls, building ventilation systems, fences, access controls, provision of alternative water supplies via connection to an existing public water supply, adding treatment technologies to such water supplies, and installing filtration devices on private water supplies.

Features and Requirements of Institutional Controls:

- If an IC/EC is used as a component of a site cleanup plan, the Remedial Work Plan must include: a complete description of the IC/ECs and the mechanisms that will be used to implement, maintain, monitor, and enforce such restrictions and controls, both by the applicant and by any state and local government, and an evaluation of the reliability, viability, and costs of the long-term implementation, maintenance, monitoring, and enforcement of any IC/EC.
- Financial assurance for the long-term maintenance, monitoring, and enforcement of IC/ECs may be required.
- Any EC must be used in conjunction with an IC.
- The final remediation report must include a certification that any IC/ECs are included in an environmental easement that has been duly recorded.
- An annual certification that the IC/ECs are in place and protective of public health and the environment must be submitted to the NYSDEC.
- The NYSDEC must create, update, and maintain a data base available to the public of sites using IC/ECs.
- Any proposal for a change in site use must include an evaluation of the impacts of the change on the viability, reliability, and effectiveness of any IC/ECs.

Analysis/Comment: The CER did not identify the Subject on the New York and Tribal Institutional or Engineering Control registries.

New York and Tribal Voluntary Cleanup Program Sites

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. New York's Voluntary Cleanup Program is a cooperative approach among the NYSDEC, lenders, developers and prospective purchasers to investigate and/or remediate contaminated sites. Under the VCP, a volunteer performs remedial activities pursuant to one or more NYSDEC approved work plans. The volunteer agrees to remediate the site to a level which is protective of public health and the environment for the present or intended use of the property. Investigation and remediation is carried out under the oversight of the NYSDEC and the New York State Department of Health (DOH) and the volunteer pays the State's oversight costs. When the volunteer completes work, a release from liability from the NYSDEC is provided with standard reservations. Once the required remedial actions have been completed, the NYSDEC issues a letter declaring that it agrees that the volunteer has met their obligations and that, barring an event triggering a reopener, the Department does not contemplate further action will need to be taken at the site. Non-PRP volunteers also receive a release that covers natural resource damages. All of the volunteer's successors and assigns (except the site's PRPs) benefit from the release given to the volunteer. The NYSDEC's release binds only itself, and does not bind private parties harmed, does not bind the State's Attorney General, the State's Comptroller, and does not bind the USEPA.

The Release is subject to the following reservations for further investigation or remediation the NYSDEC deems necessary due to:

- Off-site migration of contamination causing significant impacts if the Volunteer is a PRP;
- Environmental conditions or information related to the Site that were unknown when the Release was issued and that indicate that site conditions under the Contemplated Use are not sufficiently protective of human health and the environment;
- Failure to comply with the VCA (e.g., not completing OM&M, not paying State costs, not maintaining use restrictions, etc.);
- Fraud committed by the Volunteer in entering into or implementing the VCA;
- A release, discharge or threat thereof after the effective date of the VCA; or
- A change of use where the new use requires a lower level of residual contamination.

Analysis/Comment: The CER identified the following VCP sites within the AMSD.

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
Outlet City, Queens Blvd and Jackson Avenue	0.268	Northeast	Upgradient	Active
Formerly Acco Brands, Inc. 32-00 Skillman Avenue	0.436	East	Upgradient	Active
21-16 44th Road, LLC 21-16 44th Road	0.343	West Northwest	Downgradient	Active

The above-tabulated VCP sites are located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted same.

New York and Tribal Brownfield Sites

According to the NYSDEC website, brownfields are abandoned, idled, or under-used properties where expansion or redevelopment is complicated by real or perceived environmental contamination. They typically are former industrial or commercial properties where operations may have resulted in environmental contamination. Brownfields often pose not only environmental, but legal and financial burdens on communities. The impediments to contaminated site redevelopment in New York are complex. The existing liability scheme may hold all owners of contaminated property liable for cleanup costs, regardless of when or how the property was acquired. The potential cost of cleanup, which may not be known for certain at the time of purchase, is also a deterrent to parties wishing to build, relocate, or expand businesses. Lenders have been reluctant to extend credit for the purchase and cleanup of contaminated sites, fearing future liability issues.

A Brownfield Cleanup Agreement (BCA) is required for all parties who wish to participate in the Brownfield Cleanup Program. By executing a BCA, an Applicant makes a commitment to undertake certain remedial activities under the NYSDEC's oversight.

Analysis/Comment: The CER identified the following Brownfield site within a one-half mile radius of the Subject.

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
Queens Plaza Residential Development 28-10 Jackson Avenue	0.195	Northeast	Downgradient	Active

The above-tabulated Brownfield site is located a sufficient distance from the Subject so as not to be reasonably suspected of having impacted same. The above tabulated Brownfield site is also located hydrogeolocially downgradient from the Subject. As such, it is unlikely that this Brownfield site has had a significant negative environmental impact upon the Subject.

New York City Building Information System

The City Environmental Quality Review (CEQR) designation "E" on New York City Zoning Maps indicates that environmental requirements pertaining to potential hazardous material contamination or noise or air quality impacts have been established on one or more tax lots. These "E" designations function as indicators of the environmental review that must be conducted when the lots are developed in accordance with the regulations of the rezoned district.

New York City Zoning Resolution § 11-15 provides that the New York City Department of Buildings (NYCDOB) may not issue a building permit for work on a tax lot labeled with an "E" due to potential hazardous material contamination, if the building permit would allow: (1) a development; (2) an enlargement, extension or change of use involving a residential or community facility use; or (3) an enlargement that disturbs the soil. The NYCDOB identifies haz-mat "E" lots on its Building Information System ("BIS").

An "E" designation for potential hazardous material contamination may be satisfied and removed from a zoning map following receipt of a report from the New York City Department of Environmental Protection (NYCDEP) stating that the environmental requirements for the lot have been met. These requirements may include subsurface investigations and/or remediation of contamination to the satisfaction of the NYCDEP.

Analysis/Comments: Based on our review of the NYCDOB BIS and New York City Zoning Maps an "E" designation has not been declared on the Subject.

Drycleaners

A listing of all registered drycleaning facilities.

Analysis/Comments: The CER identified the following Drycleaners site within a one-quarter mile radius of the Subject.

Property Name/ Address	Distance (Miles)	Direction	Presumed Hydrogeologic Relationship	Regulatory Status
Top Star Fabriccare 43-43 Queens Street	0.116	East northeast	Downgradient	Active

The above-tabulated drycleaner site is not listed on any other database indicative of a contamination condition and is located hydrogeolocially downgradient from the Subject. As such, it is unlikely that this drycleaners site has had a significant negative environmental impact upon the Subject.

6.3 EDR Proprietary Databases

EDR Historic Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

Analysis/Comment: The CER did not identify the Subject or any adjacent properties on the historical auto stations database.

EDR Historic Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc.

Analysis/Comment: The CER did not identify the Subject or any adjacent properties on the historical cleaners database.

EDR Manufactured Gas Plants

This database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to the 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of wastes. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

Analysis/Comment: The CER did not identify the Subject or any adjacent properties on the manufactured gas plant database.

7.1 Chemical Storage and Usage

The Subject is vacant land and no chemical storage was identified on the Subject.

7.2 Bulk Storage Tanks

Underground Storage Tanks (USTs)

Common indicators of removed or closed-in-place USTs such as abandoned vent and fill pipes or pavement cuts were not observed during our site survey. However, based on our review of Sanborn maps from 1947 and 1950 it appears that two now inactive gasoline USTs were or are on-site. The USTs were identified on the south central portion of the Subject. We have no knowledge as to the status of these USTs.

Aboveground Storage Tanks (ASTs)

No ASTs were observed and IVI did not identify any equipment, which should require such tanks. IVI did not observe evidence of former on-site ASTs such as secondary containment structures, cradles, or concrete support pedestals. However**,** based on the previously conducted Phase I update prepared by Middleton Environmental, Inc. (MEI), records from the City of New York Fire Department indicated that one 550 gallon heating oil AST (permit expired on August 31, 1984) was registered at 44-38 Purves Street (Lot 1), one 275 gallon heating oil AST (permit expired on April 14, 1998) was registered at 28-01 Thomson Avenue (Lot 1) and two 275 gallon heating oil ASTs (permits expired on April 21, 1998) were registered at 44-30 Purves Street. During MEI's site reconnaissance in 2006 two 275 gallon above ground heating oil storage tanks and one 275 gallon above ground waste oil tank were located within the former main buildings with no signs of staining or leakage.

7.3 Site Waste and Wastewater

Solid Waste

No solid waste is generated on the site and no solid waste dumpsters were located on the Subject. Small piles of brick debris, a tire, a few wooden pallets and wood debris were identified on the Subject. An empty 55 gallon drum of cleaning solution was also identified on the Subject. In addition, large boulders were identified on the southeastern edge of the Subject.

Sanitary Sewage

Sanitary sewage disposal in the Subject area is provided by the municipality. As the Subject is currently vacant it is not connected to the municipal sewer system.

Hazardous Waste

No hazardous waste was observed or reported to be generated on the Subject. Furthermore, IVI's review of the USEPA's database of sites regulated under RCRA did not identify the Subject as a generator of hazardous waste. However, previous site use including auto body/auto repair shops and chemical manufacturers (refer to section 5.1) indicates that hazardous waste may have been generated onsite in the form of solvents, metals and petroleum products.

7.4 Stained Soil, Stained Pavement, or Stressed Vegetation

There was no evidence of significant soil staining, stained pavement, or stressed vegetation observed on-site.

7.5 Liquid Discharges

No visible evidence of liquid discharges, suspected to represent an environmental concern were observed during our survey.

7.6 Pools of Liquid

IVI did not observe significant standing surface water or pools containing liquids likely to be hazardous substances or petroleum products.

7.7 Pits, Ponds, or Lagoons

No pits, ponds or lagoons suspected of containing hazardous substances or petroleum products were identified on-site.

7.8 Wells

Two inactive monitoring wells were observed along the northern portion of the Subject and are associated with a former geotechnical study (refer to section 5.6). Reportedly, the wells were installed to determine groundwater depth. The wells appeared to be damaged and the caps were not secured. Since the wells are no longer in use, we recommend that they be closed in accordance with governmental regulations and good and customary practice.

7.9 On-Site Fill

A geotechnical survey conducted in 2008 indicated that a layer of uncontrolled fill, generally consisting of black coarse sand, some gravel with varying amounts of brick and concrete covered the Subject. Refer to Section 5.6.

7.10 Drums and Containers for Storing Waste

IVI did not identify containers suspected of storing waste.

7.11 Floor Drains and Sumps

The Subject is vacant land and no floor drains or sumps on the Subject were identified. The previously conducted Phase I update prepared by Middleton Environmental, Inc. (MEI) stated that drains were identified in the former automobile repair building and that the property owner indicated they were connected to the municipal sewer system.

7.12 Odors

IVI did not identify strong, pungent, or noxious odors suspected to represent an environmental concern.

7.13 Air Emissions

IVI did not identify processes or equipment that emit noticeable vapors or fumes. The previously conducted Phase I update prepared by Middleton Environmental, Inc. (MEI) stated that there was one paint spray booth on the lower level of the main building that was properly vented outside the building. No evidence of paint was identified on the Subject.

7.14 Polychlorinated Biphenyls (PCBs)

No electrical transformers, capacitors, hydraulic systems or other potentially PCB-containing equipment were observed on-site.

7.15 Asbestos-Containing Material (ACM)

There are no building onsite and asbestos is not a concern on the Subject.

7.16 Lead-in-Drinking Water

As there are no buildings on the Subject, water is currently not supplied to the Subject.

7.17 Radon

Based on statistical information maintained within the U.S. Department of the Interior and U.S. Geological Survey's *Geologic Radon Potential,* dated 1993, radon concentrations in Richmond County average 1.4 picocuries per liter (pCi/L), which is below the 4.0 pCi/L action level established by the USEPA.

Based solely on this data, it is unlikely that radon represents an environmental concern at this time.

7.18 Lead-Based Paint (LBP)

There are no buildings onsite and as such lead-based paint is not a concern.

8.0 INTERVIEWS

8.1 Questionnaires

IVI sent a Pre-survey Questionnaire and an AAI User Questionnaire to the site contact and the User, respectively. The purpose of these questionnaires was to disclose any previous or existing hazardous waste or toxic material conditions, which may not have been apparent at the time of our site reconnaissance and to satisfy the User interview all appropriate inquiry requirements. The AAI User Questionnaire was completed and returned to IVI.

8.2 User

8.2.1 Title Records

A copy of the Subject's Chain-of-Title has not been provided to IVI for review.

8.2.2 Environmental Clean Up Liens and Activity and Use Limitations (AULs)

Pearson Acquisition LLC c/o Brause Realty, Inc. had no knowledge of any environmental liens against the Subject that have been filed or recorded under federal, tribal, state or local law. Moreover, Pearson Acquisition LLC c/o Brause Realty, Inc. was not aware of any AULs, such as engineering controls, land use restrictions, or institutional controls that are in-place at the Subject or have been filed or recorded under federal, tribal, state or local law.

8.2.3 Specialized Knowledge

Pearson Acquisition LLC c/o Brause Realty, Inc. had no specialized knowledge of recognized or potential recognized environmental conditions in connection with the Subject.

8.2.4 Relationship of Purchase Price to Fair Market Value Due to Contamination in Connection with the Subject

Pearson Acquisition LLC c/o Brause Realty, Inc. has indicated they are unaware of any environmental conditions in connection with the Subject that have resulted in the diminution of its purchase price in relation to its Fair Market Value.

8.2.5 Common Knowledge or Reasonably Ascertainable Information

Pearson Acquisition LLC c/o Brause Realty, Inc. had no common knowledge of recognized or potential recognized environmental conditions in connection with the Subject.

8.2.6 Purpose for Conducting the Phase I Environmental Site Assessment

The purpose of conducting this Phase I Environmental Site Assessment was for the acquisition of the parcel.

8.2.7 Proceedings Involving the Property

The User had no knowledge of pending, threatened, or past litigation, administrative proceedings, or notices from governmental agencies regarding violations of environmental laws regarding hazardous substances or petroleum products.

8.3 Key Site Manager

8.3.1 Historic Site Use

Mr. David Brause and Mr. Brian Kim (current owner) provided IVI with reports indicating prior site usage including: automobile repair, carpet storage, chemical laboratory, chemical manufacturing, realty office, contractor's storage yard, heat exchanger company, filter cleaning, hardware warehouse, paper embossing, controller manufacturing, and an air freight company .

8.3.2 Proceedings Involving the Property

Mr. Brause had no knowledge of pending, threatened, or past litigation, administrative proceedings, or notices from governmental agencies regarding violations of environmental laws regarding hazardous substances or petroleum products.

8.4 Occupants

A local police officer indicated that the Subject site had recently been cleared of piles of debris. The officer also warned of the potential for drug paraphernalia (including hypodermic needles) to be located on the Subject.

8.5 Past Owners

IVI was unable to locate the site's former owner.

8.6 Local Regulatory Agency Interviews and/or File Reviews

Fire Department

IVI has sent a request to the New York City Fire Department for environmental information such as underground storage tank registration pertaining to the subject property. As of this writing, the Fire Department has not responded to our request. Should receipt of a response from the Fire Department change the conclusions of this report, Pearson Acquisition will be notified in writing by IVI.

Health Department

IVI has sent a request to the local Health Department for environmental information pertaining to the subject property. As of this writing, the Health Department has not responded to our request. Should receipt of a response from the Health Department change the conclusions of this report, Pearson Acquisition will be notified in writing by IVI.

Building Department

IVI reviewed building permits and records for the Subject on the New York City Department of Buildings (NYCDOB) database. Refer to Section 5.9 for further detail.

Department of Environmental Conservation

IVI has sent a request to the New York State Department of Environmental Conservation (DEC) for environmental information pertaining to the Subject property. As of this writing, the DEC has not responded to our request. Should receipt of a response from the DEC change the conclusions of this report, Pearson Acquisition will be notified in writing by IVI. In addition the Subject property was not listed on the DEC's spill incidents, remedial site, and bulk storage databases.

Department of Environmental Protection

IVI has sent a request to the New York City Department of Environmental Protection (DEP) for environmental information pertaining to the Subject property. As of this writing, the DEP has not responded to our request. Should receipt of a response from the DEP change the conclusions of this report, Pearson Acquisition will be notified in writing by IVI.

9.0 FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

IVI has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Standard Practice E1527-05 of 44-26 to 44-30 Purves Street, Queens, New York. Any exceptions to, or deletions from, the standard practice are described within Section 2.0 of this report.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the Subject except for the following:

Historic Site Use

Historic Sanborn Maps and City Directories indicated past site use that had the potential to negatively impact the Subject. A chemical laboratory and radiator repair structure was identified on the western side of the Subject on Sanborn maps from 1947 to 1970. On maps from 1947 to 1950 were located two gasoline tanks on the south central portion of the Subject in an open area labeled as a contractor's yard. Located on the northeastern portion of the Subject were buildings labeled as repairing, storage, controller manufacturing, and fine chemicals manufacturing. On the 1970 map was a larger structure located on the southern portion of the Subject labeled as a warehouse on the first floor and paper embossing on the second floor. This building was labeled as being constructed in 1960 and was in the location of the gasoline tanks that were identified on the 1947 and 1950 Sanborn Maps. Also on the 1970 map, the building on the northwestern side of the Subject formerly labeled as a chemical lab was labeled as auto repair. On Sanborn maps from 1980 to 2006 the large structure on the southern side of the Subject was labeled as auto repair on the first floor and paper embossing on the second floor. Former listings for the Subject on city directories included a contracting company, machine manufacturer, chemical manufacturer, automobile radiator service, automobile repair shop, paper embossing company, freight company, filter cleaning company, auto body shop, taxi service, limousine service, and towing service.

There is the potential for onsite contamination resulting from former onsite uses including chemical laboratory and chemical manufacturing, radiator repair/automobile repair, auto body work, controller manufacturing, chemical manufacturing, and paper embossing. In addition, it appears that two now inactive gasoline underground storage tanks (USTs) were located in the vicinity of the south central portion of the Subject and have the potential to still be located onsite. We have no knowledge as to the regulatory and physical status of these underground storage tanks. There is the potential for the USTs to have negatively impacted the Subject.

IVI was provided with a correspondence from the demolition contractor indicating that they did not encounter contaminated soil or any other environmentally hazardous conditions. However, inasmuch as the demolition activities did not include subsurface testing, these observations by the demolition contractor do not alleviate our concerns.

IVI recommends that a subsurface investigation be conducted and that soil and groundwater on the Subject be analyzed for contamination.

Adjacent Site Use

Historic Sanborn Maps indicated adjacent and surrounding industrial and manufacturing land use. The following adjacent site uses that have the potential to have negatively impacted the Subject were identified. On maps from 1936-1950 the adjacent southern building (44-46 Purves Street) was identified as a chromium plating facility and on maps from 1970 to 2006 an auto body shop was identified. On maps from 1936 the adjacent northwestern building (22-19 to 22-27 44th Drive) was identified as a garage with a gasoline tank that may be an underground storage tank (UST). This building was then identified as a photochemical warehouse on the 1947 and 1950 map, a commercial/manufacturing building on the 1970 map, and as an auto repair shop on maps from 1977 to 2006. On the map from 1936 gasoline tanks (possibly USTs) were identified in manufacturing buildings located to the east of the Subject across Purves Street. Manufacturing of textile printing inks was also identified on a building to the east (44-23 to 44-27 Purves Street) on maps from 1947 to 1995 with auto repair identified on maps from 2001 to 2006. An auto repair shop was identified to the east across Purves Street (44-29 to 44-35 Purves Street) on the map from 1995. IVI recommends that the above-recommended a subsurface investigation be expanded in scope to include a determination as to if adjacent former site uses and USTs have negatively impacted the Subject.

10.1 This report has been prepared in compliance with the ASTM standard entitled "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" E1527-05.

10.2 The observations described in this report were made under the conditions stated herein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services within the constraints imposed by the client. The work described in this report was carried out in accordance with the Terms and Conditions of the contract.

10.3 In preparing this report, IVI has relied on certain information provided by federal, state, and local officials and other parties referenced therein, and on information contained in the files of governmental agencies, that were readily available to IVI at the time of this assessment. Although there may have been some degree of overlap in the information provided by these various sources, IVI did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this site assessment. Observations were made of the site and of the structures on the site as indicated in this report. Where access to portions of the site or to structures on the site was unavailable or limited, IVI renders no opinion as to the presence of direct or indirect evidence relating to petroleum substances, hazardous substances, or both, in that portion of the site and structure. In addition, IVI renders no opinion as to the presence of indirect evidence relating to hazardous material or oil, where direct observation of the ground surface, interior walls, floors, ceiling or a structure is obstructed by objects or materials, including snow, covering on or over these surfaces.

10.4 As part of this assessment, IVI submitted requests for information via the Freedom of Information Act (FOIA) to various governmental agencies. As of the preparation of this report these requests may not have been fulfilled. The conclusions of this report are subject to change upon receipt of a response from these FOIA requests.

10.5 IVI does not represent that the site referred to herein contains no petroleum or hazardous or toxic substances or other conditions beyond those observed by IVI during the site walkthrough.

10.6 IVI has produced this document under an agreement between IVI and Pearson Acquisition LLC c/o Brause Realty, Inc. All terms and conditions of that agreement are included within this document by reference. Any reliance upon this document, or upon IVI's performance of services in preparing this document, is conditioned upon the relying party's acceptance and acknowledgement of the limitations, qualifications, terms, conditions and indemnities set forth in that agreement, and property ownership/management disclosure limitations, if any. It is not to be relied upon by any party other than Pearson Acquisition LLC c/o Brause Realty, Inc. nor used for any purpose other than that specifically stated in our Agreement or within this Report's Introduction section without IVI's advance and express written consent. The Phase I report is only valid if completed within 180 days of an acquisition or the transaction necessitating the report.

10.7 TIME LIMITATION TO ENACT CLAIM AGAINST IVI If in the opinion of the client, or any third party claiming reliance on IVI's report or services, that IVI was negligent or in breach of contract, such aforementioned parties shall have one year from the date of IVI's site visit to make a claim.

10.8 Unless specifically identified within Section 2, Chinese drywall, indoor air quality and any other non-ASTM scope issues as identified in ASTM E1527-05, Section 13.1.5, are excluded from the scope of this assessment.

IVI Project No. PC1119280

Dear Property Manager:

On behalf of Pearson Acquisition LLC c/o Brause Realty, Inc., IVI has been retained to conduct a Phase I Site Assessment of the above referenced property.

Attached are our Pre-Survey Questionnaire and Document & Information Checklist, which we are requesting that someone knowledgeable with the property complete and return by fax to our office. Your quick response to provide this information will facilitate both the commencement of our survey and the completion of our report. Furthermore, these documents, along with your responses, will appear as exhibits in our report.

Sincerely,

IVI ASSESSMENT SERVICES, INC.

Michael Kennedy

Phase I Environmental Site Assessment
Pre-Survey Questionnaire

Someone familiar with the site should complete this questionnaire prior to our site visit. For those questions that are not applicable, please respond "N/A", and "U/K" for those questions in which the answer is not known. If you have any questions about how to answer any of the questions, please call IVI. If additional pages for responses are necessary, please attach hereto and reference it to the appropriate question number. Upon completing this form, please fax it to the above fax number. This document and your written response will be included as an exhibit in the final report.

Subject Name: 44-26 to 44-30 Purves Street

Project Manager: Montgomery, Charles

Street: 44-26 to 44-30 Purves Street

IVI Project No.: PC1119280

City/State: Queens, New York

Date: November 18, 2011

Key Site Contact:
Telephone:
Fax:

A. GENERAL

PREPARER

1. Name, title and telephone number of person completing this questionnaire:

_____
Name

_____
Title

_____
Signature

_____
Telephone Number

2. How long has the preparer been familiar with the site or facility?
If less than five years, who held the position prior?

3. Property Owner/Occupant Information

_____
Owner's Name

_____
Owner's Address

_____
Occupant's Name

_____
Occupant's Address

VALUATION REDUCTION

Was/is the purchase price of the Subject property significantly less than the purchase price of comparable properties due to environmental conditions? Yes o No o U/K o

If yes, please explain below.

B. Property Description

1. Land

a. Size of Parcel? _____ Acres

b. Shape of Parcel? o Rectangular o Irregular ¨ Other

c. Are there any surface waters or wetlands on the site? Yes o No o U/K o

d. Is there a well on the site? Yes o No o U/K o

If so, what type of well is it?:

Drinking Water	o
Irrigation	o
Monitoring	o
Dry Well	o

Have contaminants in excess of governmental

guidelines been identified in the water? Yes o No o

e. Was or is there a septic system on the property? Yes o No o U/K o

If so, is the septic system currently in use? Yes o No o

f. Has fill been imported onto the Subject? Yes o No o U/K o

g. Are there currently or has there previously been waste treatment or disposal pits, ponds, or lagoons on the site? Yes o No o U/K o

h. Where is the site's stormwater discharged to? _____

B. PROPERTY DESCRIPTION – continued

2. Site Improvements This includes all buildings ¨ N/A

a. Describe the size (square foot) of the existing building(s).

b. How old is the building(s)?

c. Describe the heating and cooling system.

d. Who provides the following utilities?

Water: _____

Sanitary Sewer: _____

Storm Drainage: _____

Natural Gas: _____

Electric: _____

e. Are there any floor drains on the site? Yes o No o U/K o

If so, where do they discharge to?

3. Site History

a. Were there any buildings or other improvements on the property prior to the existing improvements? Yes o No o U/K o

If so, what were they?

b. Is or has the property been used for industrial or agricultural purposes, or as a gasoline station, auto repair, dry cleaner, junkyard, or landfill? Yes o No o U/K o

If so, please describe.

B. PROPERTY DESCRIPTION – continued

4. Site Operations

To the best of your knowledge, do any of the following operations take place on the Subject or have ever taken place on the Subject:

Ÿ	Dry Cleaning:	Yes o	No o
Ÿ	Battery Storage/Sales:	Yes o	No o
Ÿ	Paint Storage/Sales:	Yes o	No o
Ÿ	Petroleum Storage/Sales:	Yes o	No o
Ÿ	Photo or X-Ray Finishing:	Yes o	No o
Ÿ	Electronic Equipment Assembly or Manufacturing:	Yes o	No o
Ÿ	Solvent Storage or Sales:	Yes o	No o
Ÿ	Chemical Manufacturing/Sales:	Yes o	No o
Ÿ	Automobile Storage, Repair, or Disposal:	Yes o	No o
Ÿ	Agriculture:	Yes o	No o
Ÿ	Medical or Dental Offices:	Yes o	No o

5. Previous Studies/Documentation

a. Do you have any knowledge of previously prepared Environmental Site Assessment Reports, asbestos surveys, lead-based paint studies or testing (soil, groundwater, tank tightness testing, lead-based paint testing, asbestos testing, indoor air quality, mold (bacteria and fungi testing), etc.) conducted on the site? If so, please either provide copies of the reports or list the title, date, preparer and recipient of such report(s) below:

o I have no knowledge of any environmental related studies or reports prepared on the Subject.

b. Are you in possession of a title report, site drawings, building drawings and specifications and/or a survey for the site? Yes o No o

If so, please provide copies of same.

Please provide all available environmental information from yours or your Client's records including, but not limited to, documentation in connection with any pending or threatened public or private proceedings or litigation with respect to environmental liability, environmental permits and permit applications, underground and above ground tank registration and information (including removal and testing of such tanks), environmental reports, asbestos, lead-based paint or indoor air quality studies, spill information and compliance information and programs.

C. SURROUNDING PROPERTIES

1. Has any adjoining properties been used for industrial purposes, or as a gasoline station, auto repair shop, junkyard, dry cleaner or landfill? Yes o No o U/K o

If so, please explain.

2. Are you aware of any contamination conditions on adjoining or nearby properties? Yes o No o U/K o

3. Are there any open surface waters or wetlands adjacent to the site? Yes o No o U/K o

4. Are you aware of any active or former waste treatment or disposal pits, ponds, or lagoons on adjacent or nearby sites? Yes o No o U/K o

5. Is any neighboring property engaged in the storing, transporting or disposal of hazardous waste, or chemicals? Yes o No o U/K o

D. REGULATORY

1. Are you aware of any pending, threatened, or past litigation relevant to *harardouse substances* or *petroleum products* in, on, or from the *property*? Yes o No o U/K o

If so, please explain.

2. Are you aware of any pending, threatened, or past administrative proceedings relevant to *hazardous substances* or *petroleum products* in, on, or from the *property*? Yes o No o U/K o

If so, please state the circumstances.

3. Are you aware of any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to *hazardous substances* or *petroleum products*? Yes o No o U/K o

If so, please explain.

E. ASBESTOS

1. Do you have knowledge of any materials or substances on the site that are known or suspected to contain asbestos? Yes o No o U/K o

If so, what materials and where are they located?

E. ASBESTOS – continued

2. Has an inspection for asbestos ever been conducted on the Subject? Yes o No o U/K o

3. Has asbestos been removed from the Subject? Yes o No o U/K o

4. Does the building have:

- Spray-on or troweled-on fireproofing, insulation or finishes? Yes o No o U/K o
- Insulation on piping, boilers, tanks, chillers, or other mechanical equipment? Yes o No o U/K o
- Transite used in cooling towers, exterior walls, ceilings fascia panels, etc.? Yes o No o U/K o
- Resilient floor tile? Yes o No o U/K o
- Suspended acoustical ceiling tiles? Yes o No o U/K o
- A built-up or rolled roofing system? Yes o No o U/K o

F. PCBs

1. Are there any on-site electrical transformers? Yes o No o U/K o

If so, do any of the transformers contain PCBs? Yes o No o U/K o

Who owns the transformers and where are they located?

2. Did any on-site transformers formerly contain PCBs, but later had the dielectric fluid replaced? Yes o No o U/K o

3. Is there any hydraulic equipment such as elevators or automotive lifts on-site? Yes o No o U/K o

If so, who services the equipment?

Are you aware of any hydraulic fluid leaks or evidence of leakage such as unexplained fluid loss in connection with the hydraulic equipment? Yes o No o U/K o

F. Storage Tanks

1. Are there any (active or inactive) Underground Storage Tanks (UST) or Aboveground Storage Tanks (AST) on the site? Yes o No o U/K o

If so, please fill out the following schedule:

Active or Inactive Tanks

Location of Tank	Size of Tank (Gallons)	AST or UST	Tank Contents	Age of Tank (Years)	Does the Tank Have Corrosion Protection? (Yes/No)	Does the Tank Have Leak Detection? (Yes/No)	Is the Tank In-Use? (Yes/No)

Have any of the tanks been tightness tested? Yes o No o U/K o

1. Do you have any knowledge of tanks that were either removed or closed in-place at the site? Yes o No o U/K o

If so, please fill out the following schedule:

Tanks Removed or Closed In-Place

Location of Former Tank	Size of Tank (Gallons)	AST or UST	Tank Contents	Tank Removal Company	Year Tank Was Removed

H. LEAD

1. Are you aware of any lead-based paint (LBP) applications on the site? Yes o No o U/K o

2. Has LBP testing been conducted? Yes o No o U/K o

3. Have there been any reported incidences of children with elevated blood lead levels residing at the site? Yes o No o U/K o

4. Are there any children younger than 7 years old residing at the site or frequenting the site on a daily basis? Yes o No o U/K o

5. Have any LBP abatements been conducted? Yes o No o U/K o

6. Has the water been tested for lead? Yes o No o U/K o

If so, please provide a copy of the results

I. HAZARDOUS MATERIALS

1. Are hazardous materials or chemicals stored or used on-site? Yes o No o U/K o

If so, please fill out the following schedule (attach separate page if more room is required):

Schedule of Hazardous or Toxic Substances Stored On-Site

Material Type	Quantity (Gallons)	Location

2. Are there any hazardous or medical waste or fluids generated or used that employ an outside service for their periodic supply and removal? Yes o No o U/K o

If so, please provide the name, address, & telephone number of the disposal company and the facility generating the waste.

J. INDOOR AIR QUALITY

1. Have strong mold odors and/or mold staining been observed onsite? Yes o No o U/K o

2. Has there been any employee or tenant reports of symptoms consistent with mold contamination or other indoor air quality concerns? Yes o No o U/K o

3. Are you aware of elevated radon gas concentrations on-site? Yes o No o U/K o

K. AAI USER QUESTIONNAIRE

In order to qualify for one of the Landowner Liability Protections (LLP) offered by the Small Business Liability Relief and Brownfield's Revitalization Act of 2001 (the "Brownfield's Amendments"), the user must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

1. Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law? Yes o No o U/K o

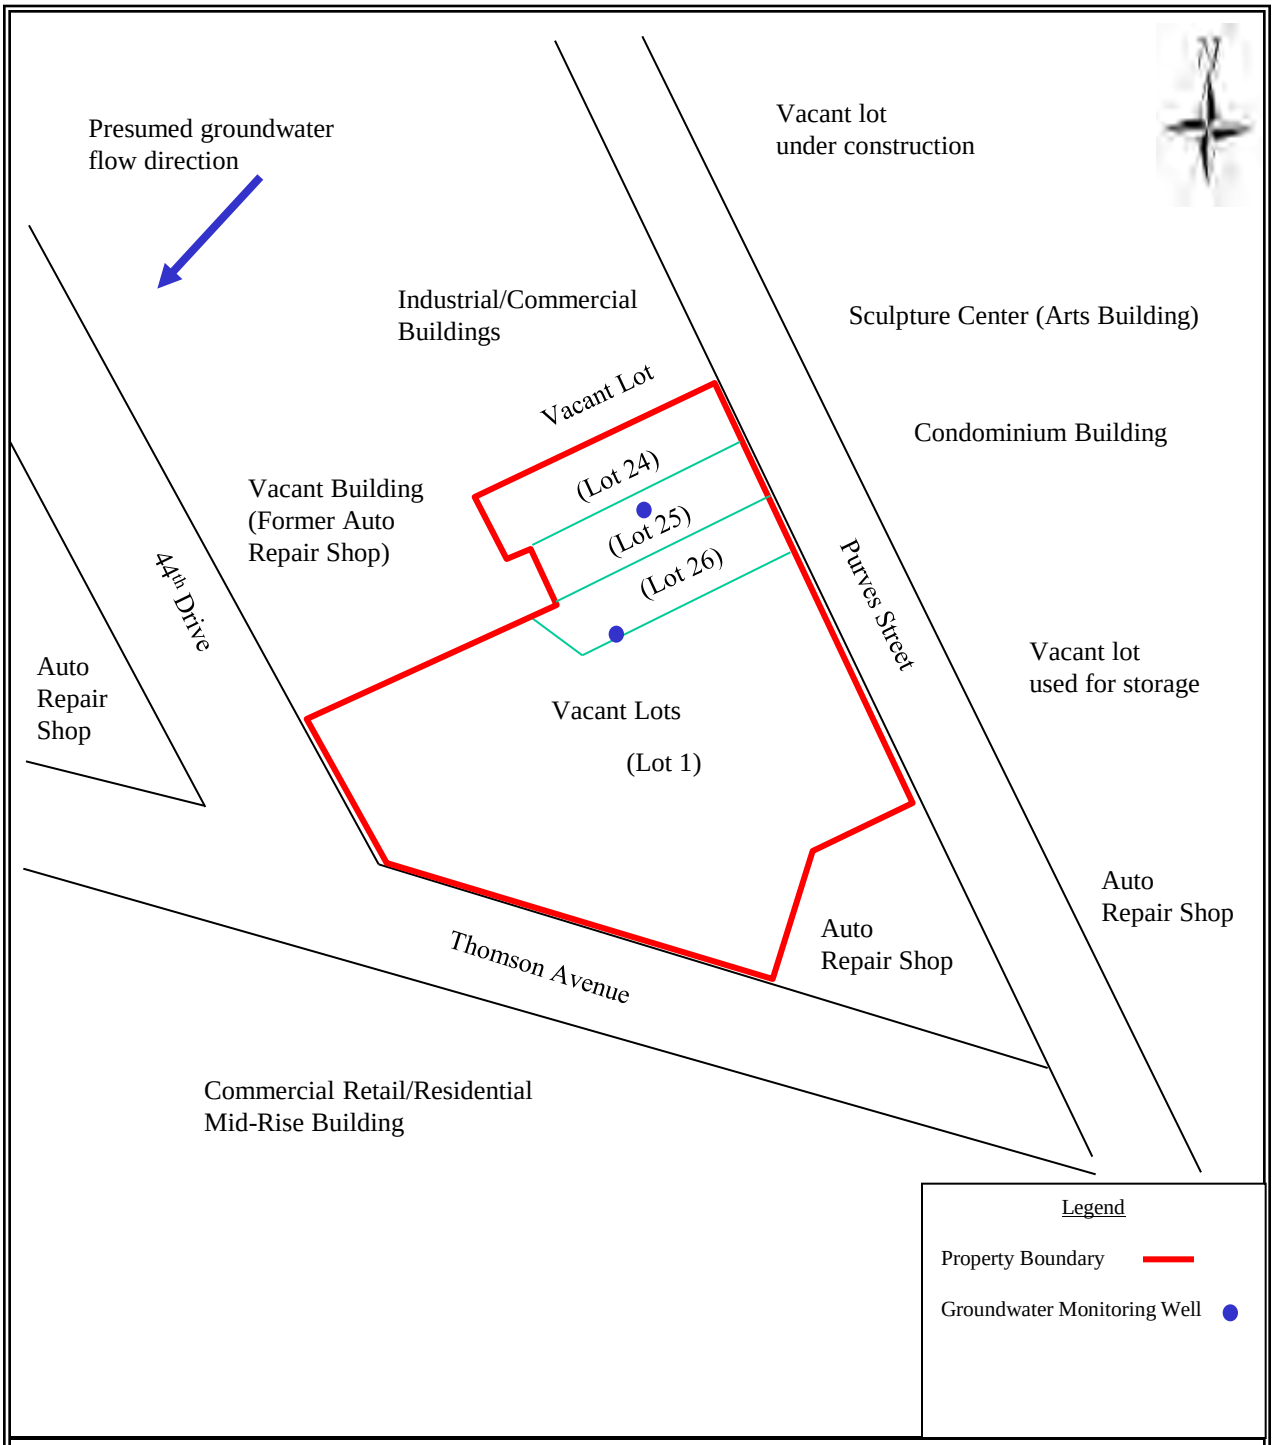
2. Are you aware of any Activity and Use Limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, slate or local law? Yes o No o U/K o

3. Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? Yes o No o U/K o

4. Does/Did the purchase price paid for this property reasonably reflect the fair market value of the property? Yes o No o U/K o

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property? Yes o No o U/K o

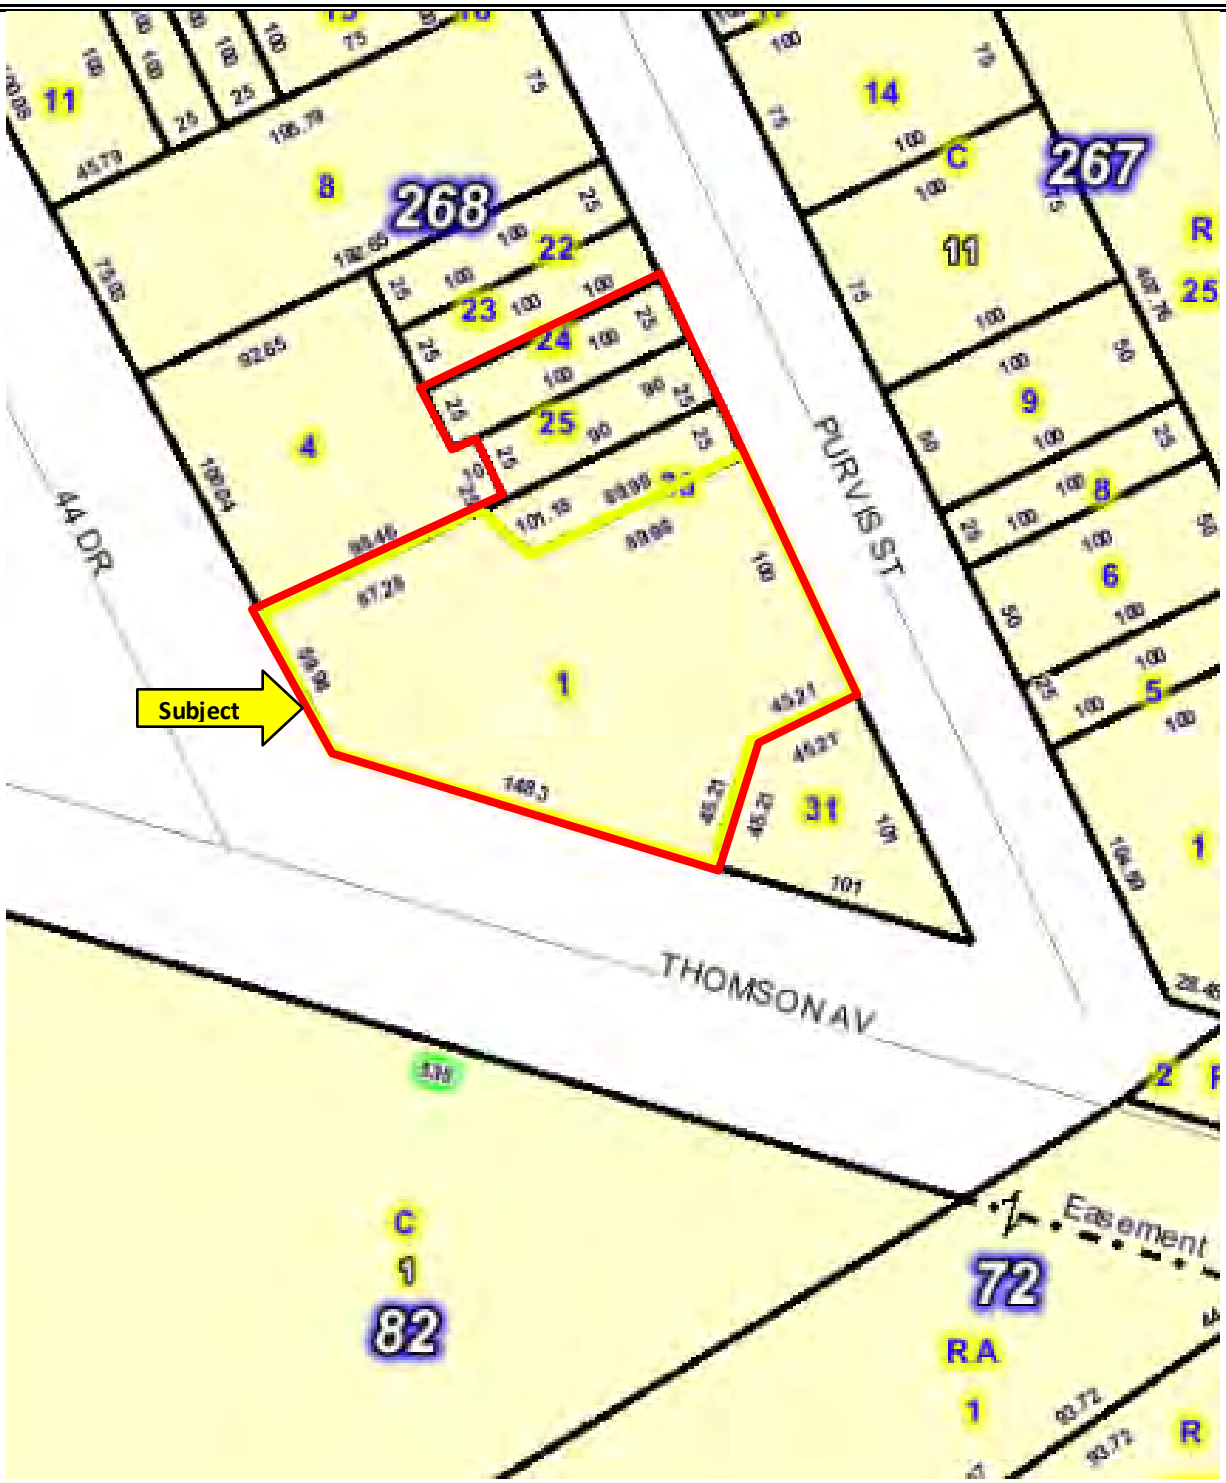
5. Are you aware of commonly known or reasonably ascertainable information about the properly that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:



(a.) Do you know the past uses of the property? Yes o No o U/K o

(b.) Do you know of specific chemicals that are present or once were present at the property? Yes o No o U/K o

(c.) Do you know of spills or other chemical releases that have taken place at the property? Yes o No o U/K o



(d.) Do you know of any environmental cleanups that have taken place at the property? Yes o No o U/K o

6. Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of contamination at the property? Yes o No o U/K o

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/09/2011 has revealed that there are 4 CORRACTS sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/15/2011 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
ROCKROSE CONSTRUCTION CORP	43-29 CRESCENT ST	NNW 1/8 - 1/4 (0.167 mi.)	N65	217

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/15/2011 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

MTA NYCT - VENT PLANT 6406-7	JACKSON AVE & 45TH AVE	W 1/8 - 1/4 (0.149 mi.)	J56	187

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 06/15/2011 has revealed that there are 6 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the SHWS list, as provided by EDR, and dated 09/27/2011 has revealed that there are 6 SHWS sites within approximately 1 mile of the target property.

VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the VAPOR REOPENED list, as provided by EDR, and dated 08/01/2011 has revealed that there is 1 VAPOR REOPENED site within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the SWF/LF list, as provided by EDR, and dated 10/11/2011 has revealed that there are 2

SWF/LF sites within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

State and tribal leaking storage tank lists

LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the LTANKS list, as provided by EDR, and dated 09/27/2011 has revealed that there are 36 LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

HIST LTANKS: A listing of leaking underground and aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills. In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY LTANKS database.

A review of the HIST LTANKS list, as provided by EDR, and dated 01/01/2002 has revealed that there are 21 HIST LTANKS sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the UST list, as provided by EDR, and dated 10/04/2011 has revealed that there are 16 UST sites within approximately 0.25 miles of the target property.

CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 3 CBS AST sites within approximately 0.25 miles of the target property.

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 09/27/2011 has revealed that there are 10 NY Spills sites within approximately 0.125 miles of the target property.

NY Hist Spills: This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database.

A review of the NY Hist Spills list, as provided by EDR, and dated 01/01/2002 has revealed that there are 7 NY Hist Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 06/15/2011 has revealed that there are 37 RCRA-NonGen sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

MANIFEST: Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.

A review of the MANIFEST list, as provided by EDR, and dated 08/01/2011 has revealed that there are 31 MANIFEST sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System

S N B INC (Continued) **1000990347**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL" 2/17/2000 ECO Lum was at the site and wrote a ticket for failure to notify. After Lum issued ticket, this call was received on the Hotline. Rommel said the site appeared to be within standards, tanks were excavated, soil was stock piled and covered. Anticipate sample report to be submitted soon. 07/18/2005: Sent letter to Michael Mazza, site owner, requesting information. M. Brand NYSDEC DER Albany. 07/27/2005: Spoke with Michael Mazza, site owner. Site was completely renovated, 10 old tanks removed, four new tanks installed, 600-700 tons of contaminated soil removed. Mazza will send in information. M. Brand NYSDEC DER Albany. 08/03/2005: Received information from site owner. Information included: - Disposal tickets and invoices for the off-site disposal of 698.01 tons of contaminated soil; - Laboratory analyses for samples of stockpiled soil; - Test results for gasoline dispensers and new tanks dated 09/19/2002 (for new tanks installed in 2000); - Petroleum Bulk Storage Registration Certificate for four new tanks installed on 02/01/2000; and, - Invoice for recent inspection (03/01/2004) of facility and underground tanks by the NYC Fire Department Bureau of Fire Protection. M. Brand NYSDEC DER Albany. 09/07/2005: Information reviewed and determined to be acceptable documentation of site cleanup. Site closed and NFA letter sent to site owner. M. Brand NYSDEC DER Albany.
Remarks:	WHILE UNCOVERING TANKS FOR REMOVAL, CONTAMINATED SOIL WAS DISCOVERED. SAMPLES TAKEN.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D007
Waste name: CHROMIUM

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005

EAGLE ELECTRIC MANUFACTURING COMPANY INCORPORATED (Continued) **1000279162**

Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo: 04/13/10-Hiralkumar Patel. as oil was found on water in subway tunnel underneath the subject building, asked building manager to do tank test on a 2,000 gal #2 oil tank. 2:00 PM:- visited site. met Mr. Sokol, property manager. Eastmond did fill line test and it failed. asked Mr. Sokol, to seal fill port to prevent further release. fill port at the site is about 15 ft away from the area where oil found seeping into subway tunnel. asked Mr. Sokol to do tank only test also to confirm no leak from tank. Court Square LLC. **property owner** c/o Fisher Associates **management office** Carnegie Hall Tower 152 West 57th Street, 12th Floor New York, NY 10019 Attn.: Benny Sokol **property manager** Ph. (212) 315-3390 Ext. 214 (O) (347) 273-0998 (C) Fax (212) 937-8814 email: bsokol@fisherassoc.net 04/15/10-Hiralkumar Patel. received email from Mr. Sokol (at 6:53 PM on 04/13/10) with their insurance company info. Hub International **insurance broker** contact: Cynthia Chin PH. (212) 338-2858 10:09 AM:- spoke with Mr. Sokol. Eastmond is at the site to do tank only test and then will expose the fill line. asked Mr. Sokol to wait for excavation along fill line as may need approval from MTA. 10:14 AM:- spoke with Haroon in System Safety at MTA. Haroon mentioned that contractor doesn't need any approval from MTA for sidewalk breaking or fill line repair. asked Haroon to send someone to the site to guide contractor if deeper excavation is required (due to proximity to the subway structure). Haroon Aslam **spill case manager in MTA** PH. (646) 252-3607 (646) 252-5777 email: haroon.aslam@nyct.com 10:18 AM:- spoke with Mr. Sokol. asked him to finish tank only test first and expose fill line. informed Mr. Sokol that no deeper excavation should be performed until MTA approves the work. 11:45 AM:- visited site. met Mr. Sokol and Haroon. eastmond crew was working to test tank. spoke with Rene at Eastmond. they have applied for DOT permit and expect to start work on 04/19/10. inspected track area with Mr. Sokol and Haroon. area was in same condition with little more oil than previous site visit. some odors at the end of platform in leak area. Haroon asked to contact Rajen Udeshi at MTA about approval for excavation near subway structure. 04/16/10-Hiralkumar Patel. 9:38 AM:- sent email to Mr. Sokol with Mr. Udeshi's contact info. Rajen Udeshi Capital Program Management 2 Broadway, 7th Floor New York, NY 10004 Ph. (646) 252-3673 email: rajen.udeshi@nyct.com 04/16/10-Hiralkumar Patel. 11:01 AM:- received email from Mr. Sokol. after installing new fill and vent line and repairing manhole on tank, Eastmond tested tank system and it passed the test. Mr. Sokol will submit test result, once available. 04/19/10-Hiralkumar Patel. 11:55 AM:- spoke with Jen at MTA. they haven't got fingerprint sample results back yet. 12:47 PM:- received email from Mr. Sokol. they spoke with MTA who approved to excavated up to four feet without any engineer report. so Eastmond will expose old fill line tomorrow. Mr. Sokol also mentioned that their insurance company has hired Tetra Tech. 2:51 PM:- received message from Sandra from Tetra Tech. Sandra Gaurin Tetra Tech EM Inc. Ph. (973) 384-9799 (O) (973) 659-9996 Ext. 245 (201) 572-0835 (C) Fax (973) 659-1287 email: sandra.gaurin@tetratech.com 3:20 PM:- left message for Ms. Gaurin. 04/20/10-Hiralkumar Patel. 2:15 PM:- visited site. met Ms. Gaurin, Mr. Sokol and Rene. Eastmond crew exposed old fill line. when contractor tried to pull out fill line from ground, fill line separated in two pieces from coupling. no broken threads observed on pipe and looks like fill line was not properly installed. found that piece of fill line towards building was anchored in ground at coupling joint. piece of fill line towards building was corroded but

COURT PLAZA (Continued) **S110309405**

no holes found. corrosion holes found in piece of fill line towards sidewalk. fresh oil found under fill line. asked Ms. Gaurin to get DOT and MTA permits before further work. Eastmond will cover excavation with plastic and then backfill with clean sand as need permit for further work. Eastmond collected two soil samples (from same area) for fingerprint and age analysis. inspected subwary track area with Ms. Gaurin. found oil on tracks. asked Ms. Gaurin to submit claim number and insurance claim handler's information. asked Mr. Sokol to submit tank test result. 04/23/10-Hiralkumar Patel. received email from Ms. Gaurin (at 5:24 PM on 04/21/10) with contact info for project manager at insurance company. Ms. Gaurin is preparing work plan for further work and asked whether groundwater sample from temporary geoprobe is sufficient for initial groundwater quality check or permanent well is required. Dawn Krigstin Ironshore Environmental **insurance carrier** Ph. (646) 826-6785 email: Dawn.Krigstin@Ironshore.com spoke with Ms. Gaurin and informed her that permanent well is not required right now, but will be required if finds groundwater contamination in groundwater sample via temporary geoprobe. 04/23/10-Hiralkumar Patel. received email from Mr. Sokol (at 7:51 PM on 04/22/10) with tank test result. 12:34 PM:- received email from Jen from MTA including result of fingerpint analysis. sample collected from subway track area was found #2 oil. 04/26/10-Hiralkumar Patel. 10:18 AM:- received call from Mr. Daniels, environmental person at Chartis insurance which is second insurance company for the site. Mr. Daniels mentioned that both insurance companies are involved in project. asked Mr. Daniels to submit insurance claim project manager's info and clear information about who is going to handle entire cleanup project. Larry Daniels Chartis Insurance AIG Ph. (201) 631-7233 (O) (917) 783-6035 (C) Fax (201) 631-5053 email: larry.daniels@chartisinsurance.com 11:03 AM:- received email from Tanya Crawford, analyst working on insurance claim at Chartis. Tanya Crawford **analyst** Chartis 101 Hudson Street - 29th Floor Jersey City, NJ 07302 Ph. (201) 631-7158 Fax (866) 467-3498 email: tanya.crawford@chartisinsurance.com Chartis Claim Number: 182-111535 1:11 PM:- received email from Mr. Sokol with copy of delivery record from 01/07/08 to 04/01/10. 3:43 PM:- received email from Mr. Sokol with sample results. fingerprint analysis indicates #2 oil and found heavy VOC contamination in soil sample. 04/27/10-Hiralkumar Patel. 4:01 PM:- after discussion with DEC Austin, as fingerprint analysis results match (#2 oil) and proximity of the subject site to the impacted subway area, spill #: 1000435 will be closed and investigated under spill #: 1000528. 3:03 PM:- received email from Mr. Daniels and Ms. Gaurin requesting copy of MTA's fingerprint analysis result. 04/28/10-Hiralkumar Patel. 11:05 AM:- sent email to Mr. Daniels and Ms. Gaurin with copy of MTA's fingerprint analysis result. 11:08 AM:- sent letter to Mr. Sokol requiring soil delineation along remote fill line, endpoint samples and at least one groundwater sample near source area. letter emailed to Mr. Sokol, Ms. Aslam, Mr. Udeshi, Ms. Gaurin, Mr. Krigstin, Mr. Daniels and Ms. Crawford. 05/21/10-Hiralkumar Patel. 1:29 PM:- left message for Ms. Gaurin inquiring updates. 3:59 PM:- received email from Ms. Gaurin. she got drawings from MTA and now will prepare work plan for soil investigation. will submit work plan to DEC and MTA for approval next week. will apply for NYC DOT permit on 05/24/10. 06/01/10-Hiralkumar Patel. received email from Ms. Gaurin (at 9:13 AM on 05/28/10) requesting deadline extension. 11:00 AM:- received call from Ms. Gaurin. she mentioned that currently they are preparing work

COURT PLAZA (Continued) **S110309405**

plan and will submit by end of 06/04/10. she requested 45 days extension as work plan needs to be reviewed/approved by DEC and MTA and also they need permit from DOT. based on available information, approved her request. 06/08/10-Hiralkumar Patel. 10:31 AM:- received work plan from Ms. Gaurin. proposes to install 12 soil borings to a depth of 10-15 ft bg. will collect two soil samples (highest PID and deepest dry) from each boring. will install one temporary well point to collect groundwater water in area where old fill line was located. will collect one more soil sample from the deepest visually impacted material for a forensic fingerprint analysis to find date of the release. work plan is not acceptable as doesn't include work schedule and also site map included in work plan doesn't include the site address and location of old fill line. 06/10/10-Hiralkumar Patel. 1:03 PM:- received email from Jen from MTA. she confirmed that no more oil leak found on tracks. she asked for updates. 1:32 PM:- sent email to Jen informing that the department is currently reviewing the work plan for subsurface investigation. 1:36 PM:- spoke with Ms. Gaurin. asked her to submit revised work plan including timeline for report submission and general site map showing the subject site, old fill line and proposed boring locations. 06/16/10-Hiralkumar Patel. 4:34 PM:- received email from Ms. Gaurin with revised work plan. she proposes to submit report by end of 08/16/10. 06/17/10-Hiralkumar Patel. 2:21 PM:- sent work plan approval letter to Mr. Sokol requiring to submit report by end of 08/16/10. letter emailed to Mr. Udeshi, Mr. Aslam, Ms. Gaurin, Mr. Krigstin and Ms. Crawford. 07/27/10-Hiralkumar Patel. 11:38 AM:- received email from Ms. Gaurin. she mentioned that they have got required NYCDOT permits, but still waiting for approval from MTA. they are revising engineered drawings for MTA this week and hopefully will be in the field on August 9th. due to delay in getting approval from MTA, Ms. Gaurin requested deadline extension, for report submission, till 09/16/10. 07/28/10-Hiralkumar Patel. 11:25 AM:- sent email to Ms. Gaurin approving her request to submit report by 09/16/10. email copied to Mr. Sokol. 08/04/10-Hiralkumar Patel. 11:18 AM:- received email from Ms. Gaurin. she confirmed that work will start on 08/09/10. Francis Ronquillo (cell # 619-602-1745) from tetratech will supervise the field activities. 09/07/10-Hiralkumar Patel. 2:20 PM:- left message for Ms. Gaurin. 4:16 PM:- received message from Ms. Gaurin. she is preparing report and will submit by 09/16/10. she mentioned that contamination found in soil samples and free product found on water. 09/16/10-Hiralkumar Patel. 4:24 PM:- received investigation report from Ms. Gaurin. abstract: - GPR survey indicated another line along the previously excavated remote fill line, which was later found as cable line - installed 12 soil borings to depth of 10-15 ft bg - soil under the sidewalk was poorly graded sandy soil with very little gravel - soil samples were collected either at highest PID reading or deepest dry - one temporary well installed in proximity of the source area - found free product on water sample from temporary well - groundwater was encountered at approx. 15 ft bg - one soil sample was collected at 11 ft depth from boring TTB-1 (closer to source area) forensic fingerprint analysis (results will be submitted once available) - no contamination found in borings installed near the building foundation wall (south side), but contamination found towards the street curb (towards subway) (north side) - recommends further delineation in east and west direction soil analyticals: ----------TTB-1-------TTB-2-------TTB-5-------TTB-6------TTB-7 3-5 ft 3-5 ft 5-6 ft 6-7 ft 4-6 ft

Naphthalene----------16,300----------5,790
09/20/10-Hiralkumar Patel. after discussing with DEC Austin, case transferred to DEC Vadim due to groundwater contamination and impact to the MTA tunnel. **refer to spill # 1000435 also.** 11/8/10 - reassigned from Tibbe to JMOCONNE - sent email to TetraTech (Gaurin) asking for reports/work plans submitted but not reviewed (JOC)
01/14/11 - spoke with Sandra Gaurin, Tetratech. She will prepare and provide two separate documents: work plan for installing permanent well at location of former temp to allow removal of free product in the short term; separate work plan for delineation of contam soil and gw - to be written as dynamic work plan - will include some means to evaluate whether oil migrated down along outside front (north side) of building where fill line enters building; same along inside of wall (basement has soil floor); will include sensitive receptor survey; recognized that MTA approval is needed for all work due to proximity of subway (JOC)

Remarks: leaking fill line/repairs and clean up pending

DER Facility ID:	341415
DEC Memo:	I spoke with Andrew. The tank has been reoved and cont. soil has been stockpiled. This soil needs to be removed due to space limitations. He feels that they are not able to find clean endpoints. A gepprobe will be out on Fri 1/ 11/ 07- 1/9/08 - Raphael Ketani. An abandoned gasoline tank was discovered and contaminated soil beneath it on 1/4/08. The contact is Andrew Rudko of AKRF, Inc. (646) 388-9526. I spoke to Mr. Rudko about the site. The site is a small triangular area. He said that it used to be a car repair replace with one 550 gal. tank and one pump. He said the tank was abandoned in place with concrete. The great majority of the soil has been excavated, but the contractor is waiting to get a hauler for the gasoline contaminated soil. The site will be a temporary parking lot for the building and parking lot across the street. Groundwater is at about 14 feet - he has drilled nearby at another site and hit water there at that depth. I told Mr. Rudko that additional borings will be needed to see whether the contamination had migrated under the streets. He said he will do borings to the edge of the property, and if contamination is found, then he will get the permits and do borings further out. 2/7/08 - Raphael Ketani. I tried to contact Mr. Rudko, but could only leave a message. Mr. Rudko returned my call. He said that they had removed the gas tank and found lots of contamination. Initially, they excavated 9 truck loads of soil and shipped it out. Then, on 2/5/08, they excavated more soil until the site was jammed up with excavated soil. This was also shipped out. Mr. Rudko feels that the contamination extends all the way to the Hunter Street sidewalk and maybe under it. I told him that he needs to delineate the extent of the contamination. Mr. Rudko said that they will use ORC to remediate any soil that can not be removed. I told him that DEC wants all of the contaminated soil either removed or treated. 2/19/08 - Raphael Ketani. I had tried to make an unannounced site visit last thursday, but was unsuccessful. I could not find the site. I called up Mr. Rudko and he told me the site is at the intersection of Crescent Street, Hunter Street, and 44th Road. I will make another attempt at a site visit. I found the site. It consisted of a big water filled pit and a pile of slightly odoress artificial fill material. I met

CONSTRUCTION SITE (Continued) **S108981768**

Mark Accetturi, Environmental Specialist of AKRF (646) 388-9521, at the site. There was no sheen on the water. Mr. Accetturi told me that the pit had been dry until the recent rains. The water level was about 10 feet below grade. I told him that AKRF should get someone to suck out the water. He said that this will be done in the near future. There was a large pile of artificial fill (soil mixed with other material) with slight odor of gasoline. Mr. Accetturi told me that they had taken out the one tank from about the middle of the hole and two lifts from the Citicorp (southwest) side of the hole. A black pipe with a metal clamp was sticking out of the sidewall at the southwest side. It was not apparent where the pipe went to. The area around the hole had concrete pavement. I was told by the excavator operator that 12 trucks were scheduled to come today to take away the soil pile. I took 5 pictures. I noticed a 4 story building across the street with commercial space at the street level and residences above. A commercial building abutted the site property. There was nothing much else to see. So I left. 3/12/08 - Raphael Ketani. Today I received a progress report and remedial action plan dated 3/11/08 from Mr. Rudko, Senior Vice President of AKRF. The report and plan stated that a 550 gal. gasoline tank was discovered on site which was resting on soil. The soil beneath the tank was contaminated, though the tank appeared to be intact. Contaminated soil was removed from the site. Four borings were advanced to the groundwater to delineate the extent of soil contamination. Two sites of contamination were discovered. One to the east and extending from the tank and another separate one to the southwest (maybe related to a broken sewer pipe). Contaminated groundwater was pumped out and the excavation was backfilled after 2/20/08. AKRF will install 4 wells in order to monitor the groundwater conditions. Water and soil treatment will be proposed if the contamination persists. The analytical results were as follows: groundwater; SB-1=no VOCs, few low SVOC hits SB-2=VOC hits to 1394 ppb total xylenes, no SVOCs SB-3=no VOCs and no SVOCs SB-4=VOC hits to 2370 ppb total xylenes, no SVOCs SB-5=no VOCs and no SVOCs soil; EP-1=few low VOCs, combustion SVOCs in thousands of ppb EP-2=no VOCs, combustion SVOCs in high thousands of ppb to 713,300 ppb EP-4=1 significant VOC, naphthalene 6000 ppb, high SVOCs in high thousands to 62000 ppb EP-1S=no VOCs, no SVOCs WC-4=VOCs in tens of thousands ppb to 150,000 ppb with total xylenes at 640,000 ppb, SVOC hits but none significant EP-1B=many very low VOCs, no SVOCs EP-1N=many very low VOCs, no SVOCs EP-1W=many very low VOCs, no SVOCs EP-1E=11 VOCs to 83,100 ppb, 3600 ppb naphthalene, combustion SVOCs, but not significant I spoke to Mr. Rudko. He said that they are not sure how far the contaminated soil extends. So they are not done excavating. If it extends off site, then they will consider using ORC or another treatment solution to remediate the contamination. He said that he also needs to determine the direction of groundwater flow. He said that bedrock dips to the south and so he thinks that's the direction of groundwater flow, but he'll see. 4/1/08 - Raphael Ketani. I spoke to Mr. Rudko (646) 388-9526. He said that nothing is happening right now at the site. He is trying to line up a driller to install borings on all 3 sides of the site. He will take soil and groundwater samples. He will keep me posted. 8/19/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater and soil sampling, and delineation of the extent of the contamination. 9/3/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater and soil sampling, and delineation of the extent of the

CONSTRUCTION SITE (Continued) **S108981768**

contamination. As there has been no contact with Mr. Rudko in 5 months and he is not reachable, I sent a letter to Ivan Moskowitz, Esq. at Swidler Berlin LLP, 405 Lexington Avenue, NY, 10174. He is the lawyer representing the owners of the site, 4329 Crescent LLC, 399 Park Avenue, NY, 10022-4614. The block and lot are 4343 and 0001. The main address is 4319 Crescent Street. 9/11/08 - Raphael Ketani. The letter to 4329 Crescent LLC, c/o Swidler Berlin LLP came back NOT DELIVERABLE AS ADDRESSED. 9/15/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater and soil sampling, and delineation of the extent of the contamination. Also, I sent the 9/3/08 letter to 4329 Crescent LLC at 399 Park Avenue, and to Swidler Berlin LLP the corrected zip code of 10017. 9/22/08 - Raphael Ketani. The letter to Swidler Berlin LLP came back with a Post Office indicating Not Deliverable As Addressed. I called up a phone number for Swidler Berlin (212) 891-9536 and was told that Swidler Berlin no longer exists. One of their offices merged with Bingam McCutchen (the same phone number as above). She said that Mr. Moskowitz works for Bingam McCutchen and that his direct number is (212) 705-7537. I called Mr. Moskowitz, but could only leave a message regarding the site. Mr. Moskowitz called me back. He said that he still represent 4329 Crescent LLC. He will contact them to see why there is no progress with the investigation. 9/25/08 - Raphael Ketani. Patricia Dunphy of Rockrose Development Corp. (212) 984-1795 called earlier this week regarding the site. I tried to return her call, but could only leave a voice mail. Later this morning, I received a call from Steven Eisner (212) 984-1705 of Rockrose. He said that the reason the sidewalk wells weren't installed is because they are doing foundation dewatering across the street to the west at 3000 Crescent Street. The building that was there was knocked down 3 weeks ago. He said that once the foundation is put in, then they will install the wells. I asked him whether they had found any contaminated water. He said no. He said he will let me know when the foundation dewatering is done in 6 to 8 weeks. 10/27/08 - Raphael Ketani. I tried to contact Mr. Eisner regarding the dewatering of the neighboring site, but could only leave a message. Mr. Eisner called me back. He said that the foundation wont be installed until February 2009. Then they will install 4 wells. 2/13/09 - Raphael Ketani. I spoke to Mr. Eisner. He said that the foundation construction and dewatering is still taking place. He said that the wells will probably be installed at the end of February and a report will be submitted to DEC by March 13. I said that would be alright. Mr. Eisner added that Mr. Rudko is no longer with AKRF and the case is now being handled by Kate Bruner of AKRF (646) 388-9525. 2/17/09 - Raphael Ketani. Kate Brunner called me to say that she will give me an update regarding the project at the end of February. 2/26/09 - Raphael Ketani. Ms. Brunner called. She said that the dewatering for the foundation should end in a week. The well installation will take place in mid-March with a 4" geoprobe. 3/16/09 - Raphael Ketani. Mr. Eisner (212) 984-1705 called to say that they are still working on the foundation for the building across the street. They expect to finish in May. Once they're finished, then they will install the wells. 4/23/09 - Raphael Ketani. I talked to Ms. Brunner (212) 696-0670. She said that the construction contractor had finished dewatering the site a couple of weeks ago. She added that applications had been submitted to the City for sidewalk permits. There is a tentative date of 5/4/09 for starting the boring work. 7/13/09 - Raphael Ketani. I spoke to Ms. Brunner. She said that

CONSTRUCTION SITE (Continued) **S108981768**

she had received the soil and groundwater analytical report. However, she was out. So the review couldn't take place until she had a chance to look at it. She said that the results looked very good. Right now, the report is undergoing internal review. Once AKRF is done with it, then the report will be forwarded to DEC. I told her to send the report as soon as possible. 9/11/09 - Raphael Ketani. I left a message for Ms. Brunner that the DEC never received the groundwater analytical report. 9/14/09 - Raphael Ketani. Ms. Brunner (212) 696-0670 called me today. She said that the groundwater survey didn't take place until July 2009 due to access problems. The developer they were working with as a client has split into two entities. One entity is responsible for pursuing the environmental evaluation and reporting. This is the client and this entity is still reviewing the environmental report. However, Ms. Brunner said that she expects to send the DEC the environmental report in two weeks. She added that the analyticals were all non-detect. 9/25/09 - Raphael Ketani. Today I received the Supplemental Subsurface Investigation dated 9/24/09 and submitted by AKRF. I began my review. 9/29/09 - Raphael Ketani. I finished my review. They recovered soil samples from only 2 of the 4 borings that were attempted on 5/11/09. They state that, for technical reasons, they could not recover soil samples from MW-1 and MW-3, but they don't explain what this means. Soil samples were submitted for MW-2 and MW-4. MW-2 is at the eastern corner of the site and MW-4 is at the southwest corner of the site. Groundwater flow is to the east. The soil samples were completely non-detect for VOCs. There were a number of SVOC hits, but they were all below TAGM, except for some benzo series hits which were just slightly above TAGM. Groundwater samples for the four wells were entirely non-detect for VOCs. Samples from wells MW-1 to MW-3 were completely non-detect for SVOCs. The groundwater sample from MW-4 had a number of SVOC hits, but they were below TAGM, except for five combustion product hits (mostly the benzo series) which were slightly above TAGM. From re-reviewing the 3/11/08 investigation report, it appears that there are a lot of ashes and cinders at the site. This was determined by the presence of high concentrations of the combustion product SVOC analytes in soil samples from various locations. From the end point sample results for EP-1N, EP-1S, EP-1W, and EP-1B, it appears that the contaminated soil was removed. However, the results for EP-1E showed several SVOC hits to 4300ppb, including naphthalene and 2-methylnaphthalene, and four other low level SVOCs, but all of the other SVOCs were non-detect. The VOCs were all non-detect, also. It seems as if they did a reasonable job of digging out the contamination. Though questions remain regarding the 03/11/08 report and the 9/24/09 report: 1) the 3/11/08 report lists boring locations SB-1, SB-2, and SB-4, but the data package shows EP-1, EP-2 , and EP-4. Are these the same borings? Also, what happened with the soil sample for SB-3? 2) why were no borings conducted between W SB-1 and MW-2? 3) what does the number "434" mean on Figure 2 from the 3/11/08 report? 4) there is no explanation as to why they couldn't recover soil samples from MW-1 and MW-3, except to say that "for technical reasons" they couldn't do it. What are the technical reasons? 5) a number of VOCs are listed as above TAGM on Figure 3 in the 9/24/09 report for the soil sample from EP-1E. However, these analytes are not in the analytical data report for the end point samples. Where did this information come from and how much above TAGM are the hits? Aside from answering these questions, the DEC requires that they perform one more soil borings. One halfway between W SB-1 and MW-2.

CONSTRUCTION SITE (Continued) **S108981768**

10/9/09 - Raphael Ketani. Ms. Brunner called me back. She answered the five questions: 1) SB-1, SB-2, and SB-4 are EP-1, EP-2, and EP-4. There was some confusion regarding the numbering of the samples due to the previous use of a different numbering system. 2) we agreed to have one more soil boring performed halfway between W SB-1 and MW-2 just to see what the contamination is, if any 3) number "434" is the block number from the block and lot tax maps 4) soil samples couldn't be recovered because they kept hitting refusal. The geoprobe wasn't strong enough to apply enough torque to get a sample and the sampling tool was thin so that a stronger machine would have broken the tool. They stepped out from these locations and sampled elsewhere with a heavier rig. 5) the analytes for EP-1E come from the 2008 report. Ms. Brunner just wanted to show what had been detected PRIOR to excavation of the site. 10/15/09 - Raphael Ketani. I received an e-mail today from Ms. Brunner regarding the location of the additional boring that DEC had requested (see E-docs). I sent a response e-mail in which I approved the location. 11/5/09 - Raphael Ketani. I tried to contact Ms. Brunner (212) 696-0670, but could only leave a voice mail. 11/6/09 - Raphael Ketani. I received the following e-mail from Ms. Brunner: The soil boring was completed at 43-29 Crescent Street as planned. We got the preliminary VOC and SVOC data back and all concentrations are less than TAGM RSCOs so we'll be requesting closure. We are preparing a revised report for submittal to DEC and we are still on-track to get you the report in mid-November. 11/16/09 - Raphael Ketani. Today I received the 11/12/09 Supplemental Subsurface Investigation report from Ms. Brunner at AKRF. I review the report for the soil analyses for SB-5. The results were completely non-detect for VOCs and SVOCs. Based upon the soil and groundwater analytical results in the case file, I have determined that there are minimal impacts to the environment and to people. Therefore, I am closing the spill case.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

BROWNFIELDS:

Program:	BCP
Site Code:	379475
Site Description:	Location: This Brownfield site is approximately 0.5 acres in size and is a portion of the Outlet City VCP site(#V00081) located at 28-10 Jackson Avenue, Long Island City. The site is located in Queens County, on Jackson Ave between Orchard Street to the east, Queens Blvd. to the west and Long Island Railroad yard to the south. The G-Train runs underneath Jackson Avenue bordering the site to the north. The nearest residential structure is located approximately 100ft to the west across Orchard street. Site Features: This 0.5 acre site is an empty lot in a congested commercial/industrial area of Queens County. Current Zoning/Uses(s): The current zoning at the site is Industrial and Retail. The surrounding area is zoned Special Long Island City Mixed Use District (LIC) and is a longstanding mix of residential, commercial, industrial and cultural uses at varying densities. Historical Uses: The site had formerly been used for chemical manufacturing. From 1901-1978, West Chemical Co. owned the property and manufactured commercial and disinfectant products such as disinfectants, insecticides, soaps, floor wax, and paper products dispensing machines. Manufacturing operations employed various chemical substances including creosote, coal and acids, cresylic acids, degreasing solvents, iodine, and assorted oils and pesticides. Metal plating and gasoline filling operations were also conducted at the property. Intended use for this site is to build a multi-tenant high-rise residential apartment building with ground floor commercial space and a basement. The Remedial Work Plan was publicly noticed in June/July 2007 and was approved by the state on August 16,2007. The remedial action has not yet been done (Sept. 2011). Site Geology and Hydrogeology: Site geology consists of mostly sand at varying depths due to presence of shallow bedrock. Groundwater is approximately 8 -10ft below grade.
Env Problem:	The release of approximately 5000 gallons of creosote caused extensive soil and groundwater contamination that includes the presence of LNAPL and residual DNAPL. This site is considered a significant threat to the environment. Contaminants in soil which

QUEENS PLAZA RESIDENTIAL DEVELOPMENT (Continued) **S108524793**

exceed soil cleanup objectives primarily include: Naphthalene, 2-Methylnaphthalene, Acenaphtene, Dibenzofuran, Flourene, Benzene, Ethylbenzene, and total Xylenes. Contaminants in groundwater which exceed groundwater standards primarily include: 2-methylphenol, phenol, Napthalene, 2-methylnaphthalene, benzene, Toluene, Ethylbenzene, and total xylenes.

Health Problem: The remedial investigation documented that subsurface soils and groundwater are contaminated with volatile organic compounds, semi volatile organic compounds, and chlorinated solvents. Exposures via drinking water are not expected because this mixed industrial/residential neighborhood is served by public water. The new building proposed for the site will include a vapor barrier and sub-slab depressurization system to prevent exposures via vapor intrusion. Additionally, the site will be capped with asphalt and managed through the site management plan which minimizes the potential for direct contact with residual soil contamination.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Remarks: Spill cleanup being supervised under voluntary cleanup agreement. IRM is under review. Proposed work plan to enhance IRM submitted to DEC on March 28, 2000. The site was inspected by NYSDOH, and DEC to address elevated levels of VOAs. There is presence of ben ene in soils and groundwater, and seepage into basement level. There is significant amt of free product from historical spill of creosote solvent previously stored at site. DEC Ha Waste and DEC Spills

OUTLET CITY INCORPORATED (Continued) **1000546989**

working on remediation project.Also see spill no. 9600688 for further information.

Spill Cause: CALLER REPORTING THAT DURING SITE INVESTIGATION, MULTIPLE TYPES OF HAZARDOUS MATERIALS WERE FOUND IN SOIL SAMPLES. REQ DEC FOLLOW UP.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

MANHEIMER J INC (Continued) **1000152546**

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DER Facility ID:	373035
DEC Memo:	1/21/2010 Sangesland spoke to Shawn at Crompco. He said the tank failed a test yesterday and a spill report was called in. Today they isolated the tank and retested. He said the tank passed, but the "suction line inside the tank" failed. Sangesland asked Shawn to call back and talk directly to Jake Krimgold to determine if this can be closed out. 1/21/10. J.Krimgold spoke to Shawn from Crompco. Agreed that the failure of the suction line inside the tank could not lead to a release. Case closed.

Site Description: Location: The site is located in Queens County, on Jackson Ave between Orchard Street to the east, Queens Blvd. to the west and Long Island Railroad yard to the south. The G-Train runs underneath Jackson Avenue bordering the site to the north. The nearest residential structure is located approximately 100ft to the west across Orchard street. Site Features: This 2.5 acre site consists of 12 multi-story buildings and associated parking area located in a congested commercial/industrial area of Queens County. The only occupied structure on-site is a NYC Transit Authority building. Current Zoning/Uses(s): The current zoning at the site is Industrial and Retail. The surrounding area is zoned Special Long Island City Mixed Use District (LIC) and is a longstanding mix of residential, commercial, industrial and cultural uses at varying densities. Historical Uses: The site had formerly been used for chemical manufacturing. From 1901-1978, West Chemical Co. owned the property and manufactured commercial and disinfectant products such as disinfectants, insecticides, soaps, floor wax, and paper products dispensing machines. Manufacturing operations employed various chemical substances including creosote, coal and acids, cresylic acids, degreasing solvents, iodine, and assorted oils and pesticides. Metal plating and gasoline filling operations were also conducted at the property. In 11/78, Outlet City acquired title to the property from West Chemical. During Outlet City's ownership, a flea market and various vendor operations have been conducted at the property. The site is being investigated under the Voluntary Cleanup Program (VCP) under a 1997 agreement. Previous investigations in the late 1980's

OUTLET CITY, QUEENS BLVD. & JACKSON AVE. (Continued) **S105684691**

and early 1990's led to the property entering the VCP. Site Geology and Hydrogeology: Site geology consists of mostly sand at varying depths due to presence of shallow bedrock. Groundwater is approximately 8 -10ft below grade

Env Problem: Nature and Extent of Contamination: The site is contaminated with creosote, petroleum, and solvents. Both soil and groundwater are affected. The majority of the contamination is located in Areas D and E where Creosote in the form of both LNAPL (Light Non-Aqueous Phase Liquid) and DNAPL (Dense Non-Aqueous Phase Liquid) is present. Total on-site VOC s (Volatile Organic Compounds) including both chlorinated hydrocarbons and petroleum constituents are present in groundwater from non-detect - 25,000ppb. Total on-site SVOC s (Semi-Volatile Organic Compounds) are present in groundwater from non-detect to over 100,000ppb. An off-site investigation has not been completed at this site. A ventilation IRM is in place in the basement of building No. 4, where creosote LNAPL enters the basement during large rain events. The ventilation system was designed and installed in 2004. The ventilation system was started up on June 8, 2004. The final engineering report for this IRM was approved in September 2006. Bi-annual air testing is collected to evaluate the effectiveness of the ventilation IRM.

Health Problem: Exposures to contaminated groundwater is not expected because the area is served by public water. Soils contaminated with etrachloroethene are beneath the site, however, exposure to this soil is not expected because the site is capped with asphalt. Indoor air samples collected in a portion of the on-site building contained levels of tetrachloroethene that exceeded the New York State Department of Health Guideline for tetrachloroethene in Indoor Air. NYSDOH and NYSDEC will evaluate the need for additional investigations to determine the potential for soil vapor intrusion into structures near the site.

DER Facility ID: 130179
DEC Memo: Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT" 3/1/2002-VOUGHT-Initial tank test performed by ProTest Laboratories. Second and third tank test performed by Federal Electrical Supply Corporation (718-729-5700). The reason for spill report was initial tank test failure. As a result of failure vent line, fill line, suction line and return line were replaced by Petroleum Tank Cleaners. Tank was tested again on 2-6-2002 and failed again because testers failed to close off return line to day tank.

JOMEIRA REALITY (Continued) **S105995090**

Tank and system was tested for third time and passed on 2-14-2002. Isaac Mungra and Anthony (PTC) confirmed that there was no soil or groundwater contamination. Tank tests and repair invoices were provided. Spill closed by Vought.

Updated By: IXMUNTEA
Site Description: Location: The site is located at 21-16 44th Road, LIC, NY 11101 (Tax Block 438, Lot 26). The site occupies the northweastern portion of the block bounded by 44th Rd. to the north, 44th Dr. to the south, 21st St. to the west and 23rd St. to the east. The site is in urban area. The property is approximately 1/2 mile from the East River. Site Features: The Information Technology HS building and its court yard occupy the site. Current Zonning/Use(s): The site is used as a High School. The surrounding area is zoned M3-1 Heavy Manufacturing. The adjacent parcels are currently used for a combination of commercial, manufacturing and residential. Historical Use(s): The site was formerly occupied by a four story, 30,000 square foot warehouse and its court yard. It was historically operated as a cloth manufacturing factory, a metal plating factory, and a 5,000 square foot parking lot. The plating factory had one dry well on the first floor, one in the courtyard, and two in the basement. During the plating processes the waste from the metal cleaning and plating baths were disposed of through these dry wells. Following implementation of remedial actions, the building was renovated and is currently occupied by the Information Technology High School. The remedial systems are operating under a NYSDEC-approved Site Management Plan which has provisions for frequent system monitoring, maintenance, and periodic reporting. Site Geology and Hydrogeology: The site is underlain by 2 to 5 feet of urban fill materials. Below this there are interbeded layers of sand, clay and marl of Cretaceous and Pleistocene age. The bed rock is 17 to 27 feet below grade. The groundwater is 7 to 9 feet below grade and flows generally south.

21-16 44TH ROAD , LIC (Continued) **S109416414**

Env Problem: Nature and Extent of Contamination: a) contaminants: Prior to remediation the Phase I and Phase II Investigation identified the contaminants of concern as chlorinated volatile organic compounds (CVOCs), particularly PCE and its breakdown products in soil, groundwater, and soil vapor; metals in the dry well sediments; and lead-contaminated soil in the parking lot. The site contamination was related to the previous manufacturing industries which operated in the former warehouse building. b) areal/depth extent: The plating factory occupied the first floor and the basement of the building and it had drum storage areas inside and in the court yard adjacent to the building. The sources of contamination under the building in soil and groundwater were determined to be four dry wells and a drum storage area in the court yard. c) concentrations: PCE in soil ranged from 0 to 300 ppm; in groundwater 5 ppb to 36,000 ppb; and 5 ppbv to 80,0000 ppbv in soil gas. Post-Remediation: A Subslab Depressurization system (SSDS), and a groundwater pump and treatment systems are currently operating under a NYSDEC-approved Site Management Plan (SMP). The SMP has provisions for frequent system monitoring and maintenance, and for periodic reporting to NYSDEC. There are Deed Restrictions recorded against the site.

Health Problem: The Site was a former warehouse and has been redeveloped as an Information and Technology High School. Contaminated soils beneath the building have been removed and disposed of off-site. Human exposures to residual contaminated soil is unlikely as the site is covered by the on-site building and pavement. Ingestion of groundwater as a potable drinking water source is not expected since the area is served by public water supply. Potential exposures via soil vapor intrusion into the school have been mitigated by the installation and operation of sub-slab depressurization system, a vapor barrier, a eight-inch thick competent concrete slab, and the building's positive-pressure heating and ventilation system. Monthly sampling of soil vapor and quarterly sampling of groundwater will ensure that remedial systems are working properly.

The sources of contamination under the building in soil and groundwater were determined to be four dry wells and a drum storage area in the court yard. c) concentrations: PCE in soil ranged from 0 to 300 ppm; in groundwater 5 ppb to 36,000 ppb; and 5 ppbv to 80,0000 ppbv in soil gas. Post-Remediation: A Subslab Depressurization system (SSDS), and a groundwater pump and treatment systems are currently operating under a NYSDEC-approved Site Management Plan (SMP). The SMP has provisions for frequent system monitoring and maintenance, and for periodic reporting to NYSDEC. There are Deed Restrictions recorded against the site.

Health Problem: The Site was a former warehouse and has been redeveloped as an Information and Technology High School. Contaminated soils beneath the building have been removed and disposed of off-site. Human exposures to residual contaminated soil is unlikely as the site is covered by the on-site building and pavement. Ingestion of groundwater as a potable drinking water source is not expected since the area is served by public water supply. Potential exposures via soil vapor intrusion into the school have been mitigated by the installation and operation of sub-slab depressurization system, a vapor barrier, a eight-inch thick competent concrete slab, and the building's positive-pressure heating and ventilation system. Monthly sampling of soil vapor and quarterly sampling of groundwater will ensure that remedial systems are working properly.

Site Description: Location: The site is located at 21-16 44th Road, LIC, NY 11101 (Tax Block 438, Lot 26). The site occupies the northweastern portion of the block bounded by 44th Rd. to the north, 44th Dr. to the south, 21st St. to the west and 23rd St. to the east. The site is in urban area. The property is approximately 1/2 mile from the East River. Site Features: The Information Technology HS building and its court

21-16 44TH ROAD , LIC (Continued) **S109416414**

yard occupy the site. Current Zonning/Use(s): The site is used as a High School. The surrounding area is zoned M3-1 Heavy Manufacturing. The adjacent parcels are currently used for a combination of commercial, manufacturing and residential. Historical Use(s): The site was formerly occupied by a four story, 30,000 square foot warehouse and its court yard. It was historically operated as a cloth manufacturing factory, a metal plating factory, and a 5,000 square foot parking lot. The plating factory had one dry well on the first floor, one in the courtyard, and two in the basement. During the plating processes the waste from the metal cleaning and plating baths were disposed of through these dry wells. Following implementation of remedial actions, the building was renovated and is currently occupied by the Information Technology High School. The remedial systems are operating under a NYSDEC-approved Site Management Plan which has provisions for frequent system monitoring, maintenance, and periodic reporting. Site Geology and Hydrogeology: The site is underlain by 2 to 5 feet of urban fill materials. Below this there are interbeded layers of sand, clay and marl of Cretaceous and Pleistocene age. The bed rock is 17 to 27 feet below grade. The groundwater is 7 to 9 feet below grade and flows generally south.

Env Problem: Nature and Extent of Contamination: a) contaminants: Prior to remediation the Phase I and Phase II Investigation identified the contaminants of concern as chlorinated volatile organic compounds (CVOCs), particularly PCE and its breakdown products in soil, groundwater, and soil vapor; metals in the dry well sediments; and lead-contaminated soil in the parking lot. The site contamination was related to the previous manufacturing industries which operated in the former warehouse building. b) areal/depth extent: The plating factory occupied the first floor and the basement of the building and it had drum storage areas inside and in the court yard adjacent to the building. The sources of contamination under the building in soil and groundwater were determined to be four dry wells and a drum storage area in the court yard. c) concentrations: PCE in soil ranged from 0 to 300 ppm; in groundwater 5 ppb to 36,000 ppb; and 5 ppbv to 80,0000 ppbv in soil gas. Post-Remediation: A Subslab Depressurization system (SSDS), and a groundwater pump and treatment systems are currently operating under a NYSDEC-approved Site Management Plan (SMP). The bed rock is 17 to 27 feet below grade. The groundwater is 7 to 9 feet below grade and flows generally south.
Env Problem:	Nature and Extent of Contamination: a) contaminants: Prior to remediation the Phase I and Phase II Investigation identified the contaminants of concern as chlorinated volatile organic compounds (CVOCs), particularly PCE and its breakdown products in soil, groundwater, and soil vapor; metals in the dry well sediments; and lead-contaminated soil in the parking lot. The site contamination was related to the previous manufacturing industries which operated in the former warehouse building. b) areal/depth extent: The plating

21-16 44TH ROAD , LIC (Continued) **S109416414**

factory occupied the first floor and the basement of the building and it had drum storage areas inside and in the court yard adjacent to the building. The sources of contamination under the building in soil and groundwater were determined to be four dry wells and a drum storage area in the court yard. c) concentrations: PCE in soil ranged from 0 to 300 ppm; in groundwater 5 ppb to 36,000 ppb; and 5 ppbv to 80,0000 ppbv in soil gas. Post-Remediation: A Subslab Depressurization system (SSDS), and a groundwater pump and treatment systems are currently operating under a NYSDEC-approved Site Management Plan (SMP). The SMP has provisions for frequent system monitoring and maintenance, and for periodic reporting to NYSDEC. There are Deed Restrictions recorded against the site.

Health Problem: The Site was a former warehouse and has been redeveloped as an Information and Technology High School. Contaminated soils beneath the building have been removed and disposed of off-site. Human exposures to residual contaminated soil is unlikely as the site is covered by the on-site building and pavement. Ingestion of groundwater as a potable drinking water source is not expected since the area is served by public water supply. Potential exposures via soil vapor intrusion into the school have been mitigated by the installation and operation of sub-slab depressurization system, a vapor barrier, a eight-inch thick competent concrete slab, and the building's positive-pressure heating and ventilation system. Monthly sampling of soil vapor and quarterly sampling of groundwater will ensure that remedial systems are working properly.

Record Upd: 10/4/2010 1:08:00 PM
Updated By: JAQUINN
Site Description: The site is located in an urban area of Queens County, NY. The site includes the sidewalk/street area immediately above and in the vicinity of a broken sewer line near the location of three groundwater monitoring points placed on the sidewalk in front of the building at 21-03, along 44th Avenue. The immediate surrounding uses are commercial and industrial. The building at 21-03 44th Avenue is currently in use as commercial office space and as a taxi leasing business, and prior uses of the building include metal plating. A New York City high school is located approximately three hundred fifty feet to the south of the site. There are a few isolated residential properties located approximately five hundred feet to both the southeast and southwest along 44th Drive, and the closest primarily residential block is approximately seven hundred feet to the south along 45th Avenue. Contamination appears to have entered the environment from a broken sewer pipe that connects the building at 21-03 44th Avenue and the main sewer line in the street. The site was listed on the NYS Registry of Inactive Hazardous Waste Sites in August of 2008, and an Interim Remedial Measure to address contaminated groundwater is being developed.

21-03 44TH AVENUE (Continued) **S109209070**

Env Problem:	Investigations conducted during a 2008 site characterization indicated a plume of chlorinated VOCs (primarily PCE) extending from the vicinity of the property at 21-03 44th Avenue to the northern edge of the Technology High School one block to the south, and possibly beyond. Exceedances of standards, criteria, and guidance include PCE at 36,000 ug/l vs. a standard of 5 ug/l and chromium as high as 1,500 ug/l vs. a standard of 50 ug/l. Trichloroethylene, cis-1,2 - dichloroethene and vinyl chloride also exceeded standards, however to a lesser degree. Contamination presents a significant threat to the environment as demonstrated by the magnitude and aerial extent of groundwater impacts. An IRM has been designed to mitigate the impacts to groundwater from the source area believed present in the vicinity of the 21-03 44th Avenue property. An RI/FS is planned.
Health Problem:	On- and off-site groundwater is contaminated with lead, chromium, hexavalent chromium and volatile organic compounds, primarily tetrachloroethene (PCE) and its breakdown products. The area is served by public water, thus exposure via ingestion of contaminated groundwater is not expected. Insufficient data exists for complete evaluation of potential exposures to other site-related contamination.

DEC Memo:	05/22/09 CSL was sent to Getty Petroleum Marketing 1500 Hempstead Turnpike East Meadow, NY 11554 Attn: Scott Hanley 08/31/09- Tyree sent the Subsurface Investigation Report dated June/22/09. The report stated that the piping and the four(4) product dispensers were removed in May 2009. The USTs has been drain of all fuel and are scheduled to be abondoned. On May 22,2009 the subsurface investigation activities were initiated , Based upon recent analytical datas it appears that the source of the soil and groundwater contamination is located in the area of the USTs and pump island. A total of seven (7)soil/groundwater borings were installed as part of the investigation. Soil samples were collested from ground surface to depths ranging from thirty-five(35) feet to forty (40) feet below grade. Groundwater was encountered at (27) feet below grade. The analytical results for soil samples indicate No VOCs exceeding the RSCOs. Some SVOC'S were slighly exceding the RSCOs for the samples ND-W, ND-E, WD-N, WD-S and B-TFE(13-14 ft). The analytical results for grounswater indicate Methyl-tert Butyl Ether and Benzene slighly exceeding the RSCOs. SVOC"s ara not exceding the RSCOs. As per Scott Hanley Getty Marketing (516) 542-5023 and Kevin Shean Getty Realty Corporation (516) 478-5400 there is no plan for developing the site until 20015. The site is going to be used for vehicle repair inside and for storage of vehicle outside. Getty Marketing leased the property. Getty Realty Corporation owns the property. Spill Closed

DEC Memo:	4/25/07 bf: sent ttf letter to: Eric Levor Queens Plaza Realty Corp. 25-12 41 Avenue Long Island City, NY 11101-3882 5/25/07 received passing tightness test results by fax from Eric Lovor. Tried calling him at number on fax:(718)392-2123. No answer. To close this spill, he needs to submit a response to ttf letter. bf 5/29/07 Called E. Levor again and there was no answer. Called Emergency Contact # from PBS facility info (718)263-2418 and left message to call me back. bf 6/4/07 Called E. Levor at (718)392-2123. The number is no longer in service. I then left a message at (718)263-2418. bf 6/5/07 Received 2 messages from Edith Levor to call back. (718)392-2123. Called her at 3:45 Pm and she said that the tank failed the test because there were two sets of vent pipes. The old vent pipe was never disconnected. She said she will call Advanced Tank after she hangs up with me and have them prepare a response to the ttf letter. bf 11/8/07 Called E. Levor. Left message that i still have not received letter from Advanced Tank and to call me back. Called Vinnie the Tank Doctor (718)727-0666. He said that there was an open line from a hot water heater and he plugged the line. No contaminated soil was found. He faxed paperwork to E. Levor. He was not in his office and requested I call him Monday. He will check to see if he still has the fax. bf 11/26/07 Received message from E. Levor. Called her back and left message on her machine. bf 1/22/10 Inspected site and issued NOV for expired registration, failure to monitor unmetered tank for leaks, and failure to contain/reomve petroleum discharge. Administrative settlement conference is scheduled for 2/17/10 at 10:30 AM. bf 2/17/10 PBS Settlement Conference held today. Attended by Edith and Eric levor. Provided 6/7/07 letter from Tank Doctor Inc. stating that 2 unused lines from top of tank were disconnected in building. Removed lines and tank retested and passed. NFA. bf

32-32 QUEENS BLVD/SUNOCO (Continued) **S100145562**

DER Facility ID: 250287
DEC Memo: 3/94: MW-4 had a sheen of product. MW-1 had 7500 ppb, MW-2 had 9600 ppb and MW-3 had 350 ppb of benzene. 8/94: Installed MW-5,6 & 7. MW-4 had 0.19 ft of LPH. Depth to water 13 ft. The SVE system is operable and manifolded to MW-2,3 & 4. MW-1 had 3000 ppb, MW-2 had 5200 ppb, MW-3 had 360 ppb, MW-5 had 1400 ppb, MW-6 had 590 ppb and MW-7 had 24 ppb benzene. Sunoco will investigate and submit current tank test results. 12/10/2003 Reassigned from Tipple to Sun. 02/03/2004-Sun-File Update by Sun: Quarterly Monitoring and Sampling Report (October through December 2003), by EnviroTrac (Anthony Fiorentine, 631-471-1500): On 11/08/2003, liquid phase hydrocarbons (LPH) were detected in MW-4 at a thickness of 0.20 feet (ft.). The depth to water ranged from 22.78 ft. (MW-6) to 26.00 ft. (MW-4) below the surface on 11/8/2003. Six (6) wells (MW-1,2, 3, 5, 6 & 7) were sampled on 11/8/2003. BTEX concentrations ranged from not detected (ND) in 3 of the 7 wells to 58,000 micrograms per liter (ug/l) (MW-2).MTBE concentrations ranged from ND (MW-3) to 3,800 ug/l (MW-7). On 11/8/2003 and 12/21/2003, a three percent Biosolve surfactant and water solution was injected into MW-4. MW-4 was then han surged with a surge block and groundwater was removed from a down-gradient well (MW-7) with a submersible pump. LPH was not detected during the December 2003 short term remediation event (STRE). 03/11/2004-Sun-File Update by Sun: On 03/10/2004, Sun sent a letter and Stipulation Agreement to Russell Hammond of Sunoco requiring complete delineation of soil and groundwater contamination, submittal of an Investigation Summary Report followed by a Remedial Action Plan. The Department set a deadline of March 31, 2004 for signing the Stipulation Agreement by the Respondent. 10/31/05: Project reassigned from Sun to Andersen. Enhanced fluid recovery and Biosolve application are being utilized in two hotspots, MW2 and MW4. 12/8/05: December 8 meeting between Sunoco, DEC, and EnviroTrac. Biosolve remediation is not very successful. EnviroTrac and Sunoco think that source may be present and plan to do soil borings to identify source. Soil is likely very heterogenous. Site is now a pay commuter parking lot, so work can only be done on weekends. 1/4/06: Reviewed the quarterly report dated January 2006. Six wells sampled on November 20, 2005. Trace amounts of LPH in MW-4. Max BTEX 28,300 (MW-2) and 560 ppb (MW-2). Biosolve last used in August 2005. 5/3/06: Reviewed the first quarterly 2006 report. Wells sampled on 1/21/06. LPH is present in MW 4 at a depth of 0.25 ft. Max BTEX 22,900 in MW2. Max MTBE 91 ppb in MW7. Sent RAP required letter, due 7/3/06. 8/18/06: Meeting on 8/17/06 with Sunoco, EAR, and NYSDEC. RAP submitted. Regenox will be used. Three monthly Regenox installations will be completed. Regenox will be injected into twelve temporary borings, with injection span the vertical interval 15 to 35 feet below grade. Monitoring wells will be gauged and sampled monthly during Regenox application. RAP approved. 10/20/06: First mobilization to drill borings for Regenox application will occur on 10/21/06 8am-4pm. 11/9/06: Second mobilization for Regenox application will occur on 11/11/06. 12/18/06: Sent email to Jamie Brown of EAR to followup on status of next quarterly report. Received email from Jamie Brown:"The next report will be completed and submitted to you mid - January 2007. Please let me know if you have any other questions." 2/13/07: Emailed Jamie Brown to followup on the status of the next quarterly report. 2/20/07: Reviewed update report. Regenox in use. Wells sampled on 12/23/06. Max BTEX 58,900 ppb (MW4), max MTBE 220 ppb (MW7). LPH in MW2 at depth of 0.48 ppb. 3/23/07:

32-32 QUEENS BLVD/SUNOCO (Continued) **S100145562**

Meeting on 3/22/07 with Sunoco, NYSDEC, and EnviroTrac. LPH appeared last quarter because the Regenox mobilized contaminants. The second phase of Regenox application may be scheduled for April 2007. 4/13/07: Regenox application scheduled for 4/14/07. 6/11/07: Received update report. Wells sampled on 3/24/07. Max BTEX 37,400 ppb (MW4), max MTBE 120 ppb (MW7). LPH in MW2 at a depth of 0.29 ft. Product recovered from MW2 and an absorbent sock put in well. Overall decrease in contaminant concentration. 10/12/07: Emailed Russell Hammond regarding overdue report. 10/16/07: Received email from Russell Hammond. Report will be submitted by the end of this week. 3/18/08: Reviewed October 2007 - December 2007 Project Status Report. Max BTEX 47,100 ppb (MW4). Max MTBE 140 ppb (MW2). When will the next phase of Regenox application occur? 3/19/08: Received email from Karen Waryas (Waryas@ENVIRO-ASMNT.COM):"Phase 2 of the Regenox application at SUN-LIC32-32 occurred in April and May of 2007. It was mentioned in the June 2007 PSR, but regretfully was not put into the site history section of the September or December 2007 PSRs. I apologize for this oversight, and it will be remedied for future submissions. I put in an inquiry with my supervisor today as to when the third phase is expected to occur and will let you know as soon as I hear any information." 5/15/08 - Carlson: Reviewed January - March 2008 Project Status Report. Wells sampled on 3/22/08. Maximum BTEX concentration 23,600 ppb (MW2). Maximum MTBE concentration 74 ppb (MW2). Geochemical parameters are being monitored to evaluate progress of Regenox. When will third phase of Regenox occur? 9/4/08 - Carlson: Reviewed April - June 2008 Project Status Report. Wells sampled on 6/28/08. Maximum BTEX concentration 31,800 ppb (MW2). Maximum MTBE concentration 110 ppb (MW7). General increase in contaminant concentrations. When will third phase on Regenox application occur? 10/8/08 - Carlson: Meeting with Russell Hammond of Sunoco and Karen Waryas of EAR. Regenox won't be used again. Workplan for soil borings due by 10/30/08. A new RAP will be required afterwards. 11/5/08 - Carlson: Received email with Subsurface Summary letter. Email stated that a workplan will be submitted in two weeks. 12/22/08 - Carlson: Reviewed July 2008 - September 2008 Project Status Report. Wells sampled on 9/20/08. Maximum BTEX concentration 29,700 ppb (MW2). No mention of overdue workplan in report. Emailed Karen to followup on workplan submittal. 12/29/08 - Carlson: Received email from Karen. Workplan will be submitted when Russell Hammond gets back from vacation. 1/8/09 - Carlson: Approved investigation workplan for installation of three soil borings. 1/28/09 - Carlson: Reviewed September 2008 - December 2008 Update Report. Wells sampled on 12/20/08. Maximum BTEX concentration 37,620 ppb (MW4). On-site borings will be completed. 1/29/09 - Carlson: Meeting with Sunoco and Envirotrac. 4/5/09 - Carlson: Received investigation letter-report dated April 8, 2009. Three soil borings installed. High soil impact in all borings. A workplan for additional soil delineation will be submitted by may 8th. 5/22/09 - Carlson: Reviewed update report. Wells sampled on 3/28/09. Maximum BTEX concentration 37,700 ppb (MW4). Maximum MTBE concentration 64 ppb (MW2). Workplan for additional delineation overdue. 6/1/09 - Carlson: Meeting held with Sunoco and EAR. 6/5/09 - Carlson: Reviewed work plan dated 5/29/09. Five soil borings proposed. Sent email requiring revision workplan with 1) deeper minimum boring depth to account for smear zone and 2) continuous sampling of entire boring for all on-site borings except SB1. Revised work plan due in 30 days. 8/6/09 - Carlson: Approved revised work plan. Investigation Report due in 90 days. 10/6/09 -

32-32 QUEENS BLVD/SUNOCO (Continued) **S100145562**

Carlson: Reviewed update report. Wells sampled on June 27, 2009. High dissolved concentrations in MW2 and MW4. No update on work plan implementation provided. 12/3/09 - Carlson: Reviewed update report. Wells sampled on 9/19/09. Trace LNAPL in MW1. Maximum BTEX concentration 27,800 ppb (MW2). Investigation report overdue. 12/8/2009 - Carlson: Meeting with Sunoco. Upgradient source?, access issue on upgradient property. 3/18/2010 - Carlson: Received notification. Field work scheduled for 3/20/2010. 3/19/2010 - Carlson: Reviewed October 2009 - December 2009 Quarterly Update Report. LNAPL sheen in MW1 in October 2009. However, low dissolved concentrations in MW1 in December 2009. Field work cancelled, will probably be rescheduled for next Saturday. 4/7/2010 - Carlson: Received notification - field work scheduled for 4/7 and 4/10. 7/2/2010 - Carlson: Reviewed January - March 2010 update report and RIR. SB4 - SB 6 installed. Soil and gw impact in SB4. Three more borings will be installed, as per 7/17/09 work plan. 9/9/2010 - Carlson: Reviewed April - June 2010 Quarterly Report. SB- 7 - 9 installed. Soil impact in SB- 4, 7, 8, 9. Issued letter requiring work plan for installation of three monitoring wells at SB-4, SB-7, and to the south of SB-9, and one soil boring adjacent to MW1. Due 10/11/2010. 1/31/11 - Obligado - I reviewed an investigation workplan. The workplan didn't propose a well at SB7. I emailed a letter to Jaime Brown and Russel hammond requiring revised work plan with well at SB7. Due within 15 days. 3/30/11 - Obligado - I reviewed a revised work plan which incorporated the changes I requested. Sent approval letter.

Remarks: (5) 550 GALLON TANKS FAILED PETRO TITE WITH A LEAK RATE OF 0.737GPH, WILL EXCAVATE & TEST (5) MORE TANKS ON 8/31/89.

DEC Memo:	2/21/08 Called Dominic Casamento (718)278-0806. left message to call me back. Sent ttf letter to: Dominic Casamento 2403 41st LLC 14-38 31st Drive Long Island City, NY 11106 Mr. Casamento called back later in the day. He said Petroleum Tank Cleaners will be coming back on Monday to make necessary repairs. He said they told him it was a dry leak. I confirmed the above address as his mailing address. He is on vacation and will be returning Monday. bf 4/2/08 received fax from M. Salamack of PTC. Tank was emptied and lines and tank were isolated. vent line was hit by a vehicle as tank is under a driveway area. Vent line was replaced to a different area to prevent future accidents. Tank was retesed 3/10/08 and passed. Test results attached. NFA. bf
Remarks:	DRY PORTION LEAK

Date Record Added: 11/30/2000 4:06:00 PM
Date Record Updated: 8/2/2011 3:54:00 PM
Updated By: JHOCONNE
Site Description: Location: The Site is located in an urban area of Long Island City, Queens at 32-00 Skillman Avenue and is surrounded by mixed commercial, industrial and residential uses. The former ACCO Brands, Inc. (ACCO) facility is bounded by Skillman Avenue and the Sunnyside Rail Yard to the north; 32nd Place to the east; Queens Blvd. to the south; and Van Dam Street to the west. Surrounding land uses include multi-family residential properties, community and educational institutions, and various commercial, industrial, and retail uses.
Site Features: The Site is approximately 1.8 acres in size and the former ACCO facility occupies the entire city block. Current Zoning/Use(s): The site was formerly owned by ACCO Brands Inc., which was a subsidiary of Fortune Brands, Inc. The site is located in an industrial zoned area. The upper floors of the Site are currently used for commercial and light industrial purposes, the basement is unoccupied, and a penthouse which houses a private racquet club, fitness center, spa and restaurant occupies the rooftop of the Site.
Historical Use(s): The facility was constructed in 1950 and ACCO (or its predecessor corporations) occupied the facility from 1952. The

FORMERLY ACCO BRANDS, INC. (Continued) **S104825350**

site was reportedly occupied by several automotive service centers and gasoline stations prior to 1950. During their occupancy of the facility, ACCO manufactured staplers and stapler components. Paints, thinners, solvents and cleaners were used as part of the manufacturing process and may have led to site contamination. Wastes generated included paint filters, sludge, rags, and paint. Operable Units: The Site was divided into two operable units. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination." Operable unit 1 (OU-1) is the on-Site source area which included the basement of the building. Operable unit 2 (OU-2) consists of the off-Site dissolved groundwater plume and associated soil vapor issues. Site Geology and Hydrogeology: The site is underlain by silty sand with varying amounts of gravel, silts and clays. Soil borings indicate a laterally pervasive low permeability layer beneath the entire footprint of and to the west of the Site. Parts of the low permeability layer, which dips to the south-southeast, are compromised by a layer of organic peat. TCE has been detected in the shallow, intermediate and deep aquifer zones at the Site. Depth to groundwater in the shallow aquifer is approximately 10 grade with a flow to the northwest. Depth to groundwater in the intermediate aquifer is 35 below grade with a flow to the west-northwest. Depth to groundwater in the deep aquifer is 60 below grade with a flow to the north-northwest.

Env Problem: Nature and Extent of Contamination: OU-1 Soil - Based upon investigations conducted to date, the primary contaminants of concern for OU-1 soils include trichloroethene (TCE) and its breakdown products that were noted in an unlined pit in the basement of the facility. The extent of impacted soils is confined to the western half of the footprint of the basement. Concentrations of TCE found in soils on site ranged from 79 ppm to 256 ppm, which exceeds the Soil Cleanup Objectives (SCO) for the protection of groundwater (0.47 ppm). Maximum concentrations were noted at a depth of 16-16.5 feet below the basement floor. OU-1 Groundwater - TCE and its breakdown products were encountered in both shallow groundwater samples collected at approximately 15 below grade and deep groundwater samples collected at approximately 49 below grade. Concentrations of TCE in shallow groundwater on site ranged from 108 ppb to 129,000 ppb, which exceeds the Groundwater Standard of 5 ppb. Concentrations of TCE found in deep groundwater on site ranged from 700 ppb to 1280 ppb. Maximum groundwater contaminant concentrations are encountered in the western half of the Site. OU-1 Soil Vapor - The maximum sub-slab soil vapor concentration of TCE found in samples collected beneath the on-site building were 160,000 ug/m3 in the eastern portion of the basement and 260,000 ug/m3 in the northern portion of the basement. OU-2 Groundwater TCE and its breakdown products were encountered in shallow, intermediate and deep groundwater samples. Depth to groundwater is approximately 10 below ground surface (bgs) in the shallow aquifer, approximately 35 bgs in the intermediate aquifer, and approximately 60 bgs in the deep aquifer. Maximum concentrations of TCE found in shallow off-site groundwater samples were 140,000 ppb. Maximum concentrations of TCE found in intermediate off-site groundwater samples were 45,800 ppb. Maximum concentrations of TCE found in deep off-site groundwater samples were 65 ppb. Approximate plume length is 500 down gradient from the site. OU 2

FORMERLY ACCO BRANDS, INC. (Continued) **S104825350**

Soil Vapor - Off-site studies of soil vapor intrusion were conducted at the several locations. Concentrations of TCE in sub-slab and indoor air samples collected in two off-site locations during the Remedial Investigation exceeded the recommended action levels as established by NYSDOH. Vapor mitigation systems have been installed in these buildings.

Health Problem: Direct contact with contaminants in the soil is unlikely because the site is covered with a building and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the area is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for people to inhale site contaminants in the indoor air due to vapor intrusion in the on-site building. A soil vapor extraction system was installed beneath the on-site building, which prevents vapors beneath the slab from entering the building. Sub-slab depressurization systems (systems that ventilate/remove the air beneath the building) have been installed in off-site buildings to prevent inhalation of site contaminants in indoor air due to soil vapor intrusion.
