DEC Memo: Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT" Sent tank test failure letter to Varderame. 11/15/2002 ARS 11/14/2003-Vought-Reviewed report dated 6/26/03 from Verderame Realty (Bruce Bauer 718-786-1100). Site will no longer be using oil and will be converting to gas. Closure of a 2000-gallon #2 fuel oil UST and collection of post excavatin endpoint samples by Bluestone Environmental (Andrew Cozzi 732-469-5188). "The UST excavation base was at approximately 8 to 8.5 feet below the concrete floor". "The soil in the excavation was a fill that consisted of dark brown sand with construction debris such as bricks and pieces of concrete". Five soil samples were submitted for analyses for 8260/8270. Soil analyticals show two 1,3,5-trimethylbenzene exceedances up to 9110ppb, benzo(a)anthracene up to 1010ppb, benzo(a)pyrene up to 631ppb, benzo(b)fluoranthene up to 1110ppb, benzo(k)fluoranthene up to 579ppb, and chrysene up to 1210ppb. These exceedances are attributable to fill material. Spill closed by Vought after conference with DEC Rommel.
Remarks: tank test failure - it will be cleaned and retested next week

Last Date: 19941207
DEC Remarks: DEC Sigona) met on site 12:00 - 2:00 P.M. on 11/25/97 with Andrew Falino Andrea) and Phil Fa in Crown Leak Detection) to Horner E y-Check III test 10,000 gallon underground 2 fuel oil tank. The test removed 110 inches Hg or 4 PSI of pressure from the tank. The gw depth was at least 8 feet below grade. The pressure dropped under static conditions to less than 45 inches Hg, or 2 PSI. The tank system failed. Investigation of piping revealed two sets of suction and return lines to the tank. One of the suction lines was capped indicating there may have been historic leaks in the tank system. Mr. Felino said he would have ABC tank cleaners remove the 9,000 gallons of fuel from the tank. The hotline was notified which generated this report. On 12/4/97, Sigona spoke to Mark Salamack at ABC Tank. ABC installed temporary 2-275 gallon tanks. They would empty the 10K tank and pressure test the lines. They thought there may be problem with gauge or assembly inside tank. Andrea hada work sheet that indicted there had been a lining in the tank, but ABC did not install the lining. On 1/5/98, Phil Fra in tested the 10K tank tight using Horner E y-Chek III. The leaking suction line had been isolated from the operating sytem tankand piping in-service. On 2/5/98, DEC Sigona) met with Andrew Felino Timothy L. Douthit, Land Tech Remedial, Inc. They proposed to investigate the pipeline for the 2 fuel oil UST. This including sampling the wells on the adjoining property for the Professional Building 45-28 21st Street) and the Beam Supply co. 45-40 21st Street). The free product sample was collected from the two wells containing product see spill No. 9708482 - discovery of free product by Fenely Nicol follow-up to spill no. 8900125). On 2/12/98 Tim Douthit, Land Tech Remedial, Inc. was advancing one boring SB-1 3 feet below grade basement floor) at 5 feet south of boiler room along possible pathway of abandoned leaking suction line at Adrea Electronics buildingand discovered free product. DEC Sigona) discussed the required de-lineation of the free product. Also, I requested comparison to free producted sampled in

ANDREA ELECTRONICS (Continued) **S102959964**

wells between 45-40 45-28 21st Street. According to Tim the first test of the wells indicated the presence of kerosene in the wells.

DER Facility ID:	138718
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL" 4/12/04-Vought-Spill transferred from Tomasello to Rommel as per Rommel. 04/11/06 - DER rem Bureau E staff sent out RFI letter to site owner (Rwz LLc). Department gave owner until 4/28/06 to respond. 04/20/06 - Staff received call from Liam Horgan (212.785-0266 liam@art-corp.net), Assessment Resources & Technologies, Inc. (hired by owner), indicated he would send site data to Department. ORC remediation of groundwater is ongoing. 07/19/06 - Staff received remedial summary report from Assessment Resources & Technologies, Inc. (A.R.T., Inc.). Report indicates site has been treated with ORC using injection field of wells since October 2003. The reports indicates that the ORC Injection Field is effectively remediating the

12-12 43RD AVE (Continued) **S103824757**

groundwater contamination. Additional monitoring well sampling is planned for August 2006. 08/14/06 - DER, Bureau E staff received call from Bob Corroon (representing RWZ LLC)requesting status of site closure by Department. Staff indicated project transferred back down to region 2. It is anticipated that they willl review data gathered in August and make a determination as to whether or not site can be closed. 05/29/07 - DER, Bureau E staff received call from Bob Corroon (representing RWZ LLC)(rcorroon@ix.netcom.com and (212)751-4620, ext 103) requesting status of site closure by Dept and an interest to close spill. Evidently, property is up for sale. Staff indicated project transferred back down to Region 2. Staff to provide Mr. Corroon with Regional project contact. Staff provided information to Mr. Corroon, via email, in P.M. on May 29. 10/24/07-Zhune discussed with Randy and based on the data he asked me to transfer this case to the remediation group. 02/20/08 - Debra Shapiro, consultant for the current site owner called and asked about the report prepared by ART company to make further recommendations of investigation, remedy or closure. Debra stated ART's report was prepared by ART for the previous site owner and she does not have it. I asked Zhune to locate report if available. 6/4/2008 Mimi from ELM (212-581-8023 ext 3) called to ask about the status of the report. She sent another copy of her companies plan in early May 2008. After the call Sangesland tracked the report to Vadim's office. Mimi will contact Vadim to set up a new case manager and a file review by DEC. 6/4/08 DEC Case Manager transferred from V. Brevdo to J.A. Maisonave. - JAM 6/26/08 Telephone conversation with Mimi R. from ELM. We discussed rpt dated May 5, 2008. Conceptual remedy is to excavate two areas of soil contamination. Latest GW results are from July 2007, and suggest no adverse impacts to GW. DEC suggests that an up to date round of GW samples be collected to verify. We will schedule a meeting when GW sample results are available. Rpt is uploaded to eDocs as three different files. - JAM 7/18/08 Received a memo today via email from ELM summarizing groundwater sampling results for the July 7, 2008 sampling event. Minor concentrations of VOCs were detected in the wells downgradient of the former tank field (Benzene detected at 363ug/L and total VOCs at 571ug/L in well MW-1(ART)). Memo uploaded to eDocs. - JAM 7/23/08 Meeting held at Region 2 offices on July 22, 2008. Attendence: Joseph Maisonave, NYSDEC Jonathan Kolleeny, NYSDEC Mimi Raygorodetsky, ELM Dik Glass, RLIC Realty Michael DelCioppo, RLIC Realty Meeting was held to discuss future remedial plans for site. ELM's first proposal was to excavate two areas of site; northwest corner and north central areas have soil contamination. Issues: 1) The northwest corner of the site, location of the two former USTs, has residual soil (from 10'-18') and groundwater contamination (Benzene and MTBE detected in July 2008 sampling event). ELM will excavate the area but requests leaving a 1:1 slope on the sidewall adjacent to the sidewalk to eliminate the requirement to shore and stabilize the sidewalk. The NYSDEC does not suggest leaving a 1:1 slope because the most contaminated soil (based on boring logs and analytical sampling) will be left in place. The NYSDEC requests a proposal to fully address soil contamination in the northwest corner. 2) The north-central area of the site contains 2 oil/water separators and petroleum impacts were observed in the field, however, laboratory data were returned with no exceedences for VOCs. ELM requests leaving that soil in place after removing the oil water separators. The NYSDEC requests that two groundwater monitoring wells be installed directly downgradient from the oil water

12-12 43RD AVE (Continued) **S103824757**

separators and sampled to be sure that groundwater is not impacted. Grossly contaminated soil should be removed when removing the oil/water separators and end-point soil samples should be collected. I expect a summary report for the installation of the two wells with groundwater analytical results and a remedial action proposal for the soil in the northwest corner of the site. - JAM 8/25/08 Spoke to Mimi R. today. The current structure foundation was removed as well as two oil water separators and 1 UST. No end-point samples were collected. ELM is proposing doing GPR to locate more potential USTs and installing the 2 downgradiet monitoring wells that the DEC requested in the last meeting. - JAM 9/18/08 Reviewed the Spill Investigation and Remediation Work Plan dated Sept. 3, 2008 submitted by ELM. The work plam proposes the following: 1. Use ground-penetrating radar to conduct a geophysical survey and to determine whether there are any remaining underground tanks. 2. Advance a minimum of 3 soil borings, one in each location of two oil/water separators and one UST, which were removed during deconstruction of the former building. 3. Install two monitoring wells in the northeast portion of the site. 4. Inject RegenOx in the area of the former USTs in the norhtwest portion of the site. I sent an approval letter today with one requirment. Confirmatory soil sampling must be performed subsequent to the RegenOx injections. Soil borings should be advanced as close as possible to former "T" boring locations to collect confirmatory samples. ELM also plans to install a vapor barrier and a passive venting system beneath the foundation of the new structure, which will be built on the northern portion of the site. The rest of the site will be capped with either asphalt, concrete of clean fill. The work plan and the approval letter are uploaded to eDocs. - JAM 9/22/08 ELM notified Dennis McChesney at the EPA about the RegenOx injection, as per EPA UIC Program regulations. EPA will review and respond. - JAM 10/03/08 Visited the site today. ELM advanced 5 soil borings yesterday and installed the two monitoring wells along 43rd Ave today. Visibly contaminated soil and odors were observed in each soil boring, however PID readings were relatively low (max reading was around 200ppm). Soil samples were taken at each boring from the interval with the highest PID reading, which was directly above the water table at each boring location. The RegenOx injection will occur when EPA UIC Program approval is given. - JAM 10/20/08 Spoke with Rich Kampf at ELM. ELM proposes to expand the RegenOx injection area to include the "D-boring" area. I verbally approved this proposal and asked for a formal addendum to the remedial work plan. I requested that ELM submit the supporting calculations for the amount of RegenOx to be injected. I also requested the Investigation Summary Report from work performed in early October 2008 be submitted as well. - JAM 10/29/08 Reviewed the Addendum to Spill Investigation and Remediation Work Plan submitted by ELM dated October 29, 2008. This addendum summarizes investigations performed on October 2 and 3, 2008 as per the approved work plan date September 3, 2008. ELM advanced 5 soil borings (SB-1 through SB-5) and installed 2 monitoring wells at locations SB-4 and SB-5. Evidence of soil contamination was found near the water table (interval 10-15 feet) in all soil borings. Compounds detected were Ethylbenzene, Xylenes and Naphthalene. Groundwater contamination was observed in both wells MW-4 and MW-5. Compounds detected were Benzene, Ethylbenzene, Xylene and Naphthalene. Please see table in report for concentrations. ELM proposes expanding RegenOx injections to address contamination observed in this area (D-boring area). ELM will inject 200lbs of

12-12 43RD AVE (Continued) **S103824757**

RegenOx in each of 23 injection points. A total of 4,200 lbs of RegenOx will be injected at the D-boring area. Rpt is uploaded to eDocs. I sent a letter today approving this work plan. Confirmatory soil and groundwater sampling must be conducted quarterly beginning one month after the RegenOx injections to evaluate its effectiveness. Approval letter uploaded to eDocs. - JAM 10/30/08 RegenOx injections commenced in the T-boring area today. I visited the site to witness the first injection point. ELM estimates the injections will take 8 days for both the T-boring and D-boring areas. - JAM 12/10/08 Received call from Mimi Raygorodetsky and follow-up email was received from Nicole Gorelick. ELM will perform confirmatory soil & GW sampling at site on 12/11/08 and 12/12/08 to evaluate effectiveness of RegenOx injections. Email is uploaded to eDocs. - JAM 12/15/08 Received a call from Nicole Gorelick at ELM. Soil borings were advanced in the T-boring area and the D-boring area on Friday, 12/12/08 to evaluate the effectiveness of the RegenOx injections. When trying to sample wells ELMMW-5 and MW-1 (ART), they appeared to be damaged from construction activities on-site and could not be sampled. Ms. Gorelick said she will be back at the site tomorrow to sample wells MW-2 (ART), MW-3 (ART) and ERMMW-5. A summary report will be submitted when results are available. - JAM 12/16/08 Visited site today. I walked site with Mimi Raygorodetsky and Nicole Gorelick from ELM and saw 5 wells, two of which were damaged by construction activities (MW-1 ART and ELMMW-4). I said that these monitoring wells may need to be reinstalled based on results from other 3 monitoring wells, which were sampled today. A rpt summarizing soil samples collected last week and GW samples collected today will be submitted. - JAM 1/12/09 Received an email report today from ELM titled Post-Injection Effectiveness Monitoring. ELM completed the in-situ chemical oxidation using RegenOx from October 30 through November 12, 2008. The effectiveness monitoring consisted of collecting soil samples from five soil borings and groundwater samples from accessible wells on- and off-site. Monitoring wells ELM MW-4, MW-2(ART) and MW-3(ART) were sampled on December 16, 2008. MW-1 (ART) and ELM MW-5 were not sampled because they were destroyed by construction activities on-site. Groundwater quality improved significantly in well ELM MW-4, however, groundwater quality in MW-2 (ART) showed increases for Benzene and MTBE. VOC concentrations in MW-3(ART) remained non-detect. Soil samples showed some improvement post-injection, however there were also increases in some conpounds that ELM attributes to sample variability and intervals between separate sample events were not exactly duplicated. Since the overall soil and groundwater conditions improved, ELM proposes that no additional injection rounds be performed in the T and D boring areas. ELM says that ELM MW-1 will be replaced within the next two weeks and groundwater monitoring events will continue. Email report uploaded to eDocs. - JAM 1/14/09 Emailed Mimi Raygorodetsky at ELM and said that DEC would like to see GW results from replacement well MW-1 before determining if future injections are not necessary. - JAM 1/15/09 Received a call from Nicole Gorelick at ELM. They will be reinstalling well MW-1 tomorrow morning and sampling the well next Friday. - JAM 2/3/09 Received an email from Mimi Raygorodetsky at ELM on 2/2/09. Monitoring well ELM MW-1R was installed on January 16, 2009 to replace the previously destroyed well ART-MW-1. ELM MW-1R was installed out of the building footprint and approximately 10 feet away from the previous well (see figure). The well was sampled on January 23, 2009 and while purging, petroleum

12-12 43RD AVE (Continued) **S103824757**

odors and a sheen were observed. Groundwater sample results showed eight VOCs detected above TOGS. Most notable was Benzene at 267ug/L. Since sediments was noted in well ELM MW-4 during the last sampling event, ELM attempted to purge the well on January 19. 2009. While purging, petroleum odors and a sheen was observed. I spoke with Mimi today and sent a follow-up email which stated: "I have reviewed the data you have provided in the last two emails. The DEC will not require additional remediation at this time; however, quarterly groundwater monitoring should continue for at least two additional events and monitoring reports should be submitted to the DEC for review. Based on those groundwater results, additional sampling may be required." ELM's email is uploaded to eDocs. - JAM 7/15/09 Received a "Remedial Action Report" prepared by ELM dated June 26. 2009. The report summarizes all investigative and remedial work performed on-site to date, including a summary of the Phase I and Phase II Site Investigations. The following is included in the report: Section 3 REMEDIATION 1. Pre-demolition removal of ASTs, one 1,200-gallon lube oil UST, sediment from trenches and drains within the on-site structures and oil and sludges from the oil-water separators located on-site - Jan 2008. 2. Removal of 2 oil-water separators and an adjacent UST during demolition from the D-boring area - July 2008. 3. RegenOx injection program - Oct 3 - Nov 12, 2008. 4. Effectiveness monitoring of soil and groundwater - Dec 2008. 5. Re-installation and sampling of ELM-1R in the T-boring area - Jan 2009. 6. Soil excavation and removal for construction purposes - Nov 2008 - Feb 2009 7. Installation of passive SSDS - Feb 2009 8. Installation of a 15-ml poly sheeting soil vapor barrier - Feb 2009. 9. Capping of the site with impermeable surfaces and clean fill in landscaped area - Scheduled for Spring 2009. 10 Qrtly GW monitoring - Ongoing. The report is uploaded to eDocs without the Attachments. - JAM 7/21/09 Reviewed the Quarterly Groundwater Sampling Report submitted by ELM on July 1, 2009. On April 24, 2009, groundwater samples were collected from groundwater monitoring wells ART MW-2 and ART MW-3. ELM-MW-1R was found to be filled with sediment and could not be sampled and ELM-MW-5 was destroyed during construction activities. ELM-MW-4 contained 1.1 feet of free product and could not be sampled. Total VOC concentrations from ART-MW-2 and ART-MW-3 are 108ug/L and 46ug/L, respectively. Report uploaded to eDocs. I called Mimi Raygorodetsky at ELM today to discuss future work. Mimi said that on Friday, July 24, 2009, ELM will perform another round of groundwater sampling, collect a sample of the product for fingerprint analysis, and perform the first product recovery event. Product recovery will be performed weekly, thereafter. I also requested that at least 3 monitoring wells be installed. Two to replace the destroyed wells ELM-MW-1R and ELM-MW-5, and one to installed downgradient and across the street of ELM-MW-4 and ELM-MW-5. I also requested that an up-to-date groundwater flow direction be calculated. ELM will submit a work plan to reinstall the wells within 2 weeks. - JAM 8/31/09 Reviewed the Spill Investigation and Remediation Work Plan submitted by ELM dated August 7, 2009 and submitted via email on August 18, 2009. ELM proposed gauging and bailing product from well ELMMW-4 on a weekly basis and to collect a sample of the product for fingerprint analysis. The first gauging and bailing event occurred on July21, 2009. A sample of the product was collected on that date as well. Additional work includes reinstalling monitoring wells ELMMW-1R and ELMMW-5 that were destroyed during construction of the new building. An off-site monitoring well will be

12-12 43RD AVE (Continued) **S103824757**

installed down-gradient and across the street from ELMMW-4. I wrote a letter today approving the work plan with the following adjustments: 1. Vacuum enhanced fluid recovery should be implemented on ELMMW-4. 2. At least one additional monitoring well should be installed approximately 15 to 20 feet to the east of well ELMMW-4 to delineate the free product plume. If product is encountered in this well, another well should be installed further to the east. 3. Soil sampling should be conducted during installation of the well across 43rd Avenue and the well to the east of well ELMMW-4. Soil should be continuously screened with a PID. Two (2) soil samples should be collected from each well for laboratory analysis: one sample from the soil interval with the highest PID reading, and another sample from the interval directly above the water table. If there are no elevated PID readings, only the sample from above the water table need be collected. The work plan and my approval letter are uploaded to eDocs. - JAM 10/1/09 Received Quarterly Groundwater Monitoring Rpt for 3rd Qtr 2009 submitted by ELM via email on 9/30/09 and dated 8/28/09. GW samples were collected from wells ART MW-2 and ATR MW-3 on July 24, 2009. Wells ELM MW-1 and ELM MW-5 were not sampled because they were destroyed and well ELM MW-4 was not sampled because it contained 3.3 feet of free product. Sample results showed very minor levels of dissolved phase VOCs in ART MW-2 and ART MW-3. ELM states that there was an overall reduction in VOCs since RegenOx injection. Report with sample result tables is uploaded to eDocs. ELM has been monitoring the wells weekly for free product and, if free product is detected it is being hand bailed. On 10/1/09 I visited the site to observe the first vacuum enhanced fluid recovery event on well ELM MW-4. Additional wells will be drilled as per my letter dated 8/31/09. A summary report of all product gauging and recovery events will follow. - JAM 10/16/09 Received updated weekly product recovery table submitted by ELM. On October 15, 2009, well ELM-MW-4 contained 0.22ft of free product, which was recovered using a bailer. The delineation wells are scheduled to be installed on Monday, October, 26. - JAM 10/23/09 Received updated weekly product recovery table submitted by ELM. On October 22, 2009, well ELM-MW-4 contained 0.19ft of free product, which was recovered using a bailer. Delineation wells will be installed next week 10/26 through 10/28. - JAM 10/28/09 Visited site today to observe install'n of 4 additional monitoring wells. At time of my visit, three wells were installed and none showed any signs of contamination. Next week all wells will be surveyed and sampled for dissolved phase contamination. - JAM 12/2/09 Reviewed the Product Recovery Table submitted by ELM on 11/20/09 and 12/2/09. The last three recovery events are tabulated below: Date Prod. dpth DTW P.Thck Final DTW Prod Removed 10/29/09 16.35 16.53 0.18 16.86 0.4 11/18/09 14.33 14.46 0.13 14.58 0.2 12/2/09 14.46 14.62 0.16 14.75 1.2 ELM will continue to visit the site to recover product weekly. A report will be submitted summarizing the installation of the additional monitoring wells. - JAM 3/19/10 Reviewed Well Install'n and Quarterly Groundwater Sampling Rpt for 4th Qtr 2009 submitted by ERM, dated Dec. 17, 2009. On October 27 and 28, 2009, 2 new monitoring wells and 2 replacement wells were installed. Soil samples were collected from new wells only because soil data is already available for replacement wells. According to data, no VOCs or SVOCs were detected that exceeded SCOs in either of newly installed monitoring wells. Free product also was not observed in any of 4 newly installed wells. Groundwater samples were collected from all accessible wells without product on November 4, 2009 (ELM

12-12 43RD AVE (Continued) **S103824757**

MW-4 was not sampled because it contained free product). No VOCs or SVOCs were detected in groundwater samples from ELM MW-6 and ELM MW-7 exceeding NYSDEC TOGS. The other wells each contained several VOCs, with some VOC concentrations exceeding TOGS. On October 1, 2009, ERM performed one VEFR event on well ERM MW-4 and removed approx. 50 gallons of free product/water mixture. ERM recommends continuing to sample GW quarterly for at least 2 more quarters. Product continues to be bailed from ERM MW-4 on a weekly basis. Well Installation and Quarterly Groundwater Sampling Report is uploaded to eDocs. - JAM 3/19/10 Received call from Mimi Raygorodetsky and Jesse Mausner at ERM. In Feb. 2010, approx. 1.5 feet of free product was measured in well ERM-MW-4. ERM plans to schedule another VEFR event. I advised ERM to install more wells and/or soil borings in close proximity to well ERM MW-4 to determine where product originated from. Due to heavy rain events, product may have been desorbed from soil column near well ERM MW-4. Recommendations for future work will be included in next quarterly monitoring rpt (to be submitted). - JAM 4/28/10 Reviewed the Quarterly Monitoring Report submitted by ELM dated April 8, 2010 submitted via email on April 16, 2010. Groundwater samples were collected on February 3, 2010 and results continue to show a reduction of VOCs in ELM-MW-1R, ART-MW-2 and ART-MW-3. The report does not summarize free product gauging and recovery events since April 2009. The next sampling event is scheduled for May 2010. Report uploaded to eDocs. I issued an email today notifying the RP that product monitoring and recovery should be performed monthly and that DEC should receive monthly updates. I also requested that the data from the monthly events be summarized in the quarterly monitoring/sampling reports. Email uploaded to eDocs. - JAM 4/29/10 Received Free Product Remdiation Scope of Work submitted by ELM on April 28, 2010 via email. Work plan proposes using Laser Induced Fluorescence / Ultraviolet Optical Scanning Tool (LIF/UVOST) to delineate free product plume around ELM-MW-4. LIF/UVOST will be advanced into subsurface using direct-push geoprobe and will obtain real time scan of subsurface. ELM proposes installing permanent monitoring wells where mobil phase product is detected. I issued an approval letter on April 28, 2010 with the following requirements: 1. Each boring should be extended to a depth 5 feet below the water table or the extent feasible since bedrock is shallow in the area. 2. At any location where residual or free phase petroleum contamination is encountered, a permanent monitoring well should be installed. At a minimum, one monitoring well should be installed between existing wells ELM-MW-4 and ELM-MW-7 3. During monitoring well installation, soil should be continuously screened with a PID. Soil samples should be collected from the soil interval with the highest PID reading, and another sample from the interval directly above the water table. If there are no PID readings but contamination was detected using UVOST, then a soil sample should be collected from depth intervals where UVOST detected contamination. The work plan and approval letter are uploaded to eDocs. - JAM 5/7/10 Site Visit. LIF/UVOST investigation completed today with six borings advanced around ELM-MW-4. Free phase product was observed in four of the six borings around well ELM-MW-4. Three monitoring wells will be installed and soil and grounwater samples will be collected. Product is delineated toward the street. Product most likely extends beneath the building. A summary report will be submitted when soil and groundwater sample results are returned. -JAM 6/8/10 Spoke to Emily from ELM today. All the wells were gauged this month and approx. 5 inches of product was contained

12-12 43RD AVE (Continued) **S103824757**

in well ELM-MW-4. She will submit a letter documenting the gauging event and will include a submission date for the investigation summary report. - JAM 03/01/11: This spill case transferred from J. Maisonave to J. Kolleeny. Reviewed LNAPL Remediation Rpt by ELM, dated 2/17/11 (in eDocs). Rpt presents product gauging data and GW sampling data, showing free product in well ELM-MW4 has been reduced to 0.08 ft; most notable dissolved-phase impact was in well ELM-MW-1R2, which had 100 ug/L of benzene in Oct. 2010 (up from 65 ug/L benzene in July 2010). Rpt requests spill closure. I sent letter (in eDocs) to Michael Del Cioppo, cc's to Dik Glass, Emily Guyer & Mimi Raygorodetsky, saying spill cannot yet be closed due to measurable free product and other impacts; required continued product recovery (suggested by vac truck), and quarterly GW sampling, until no measurable product in wells, at which point spill closure will be reconsidered. - J. Kolleeny 08/23/11: On Aug. 5, 2011, spoke with Emily Guyer of ELM (consultant), discussed various approaches to product recovery and conditions for spill closure. She suggested use of absorbent socks to remove product from well MW-4, which has persistent small amounts of product (several inches). I agreed to give this a try, since she indicated that vac truck was not very effective and constant use would be cost prohibitive. I also requested GW sampling on at least semi-annual basis. On 8/15/11, received email from Ms. Guyer with attached memo (in eDocs) summarizing our discussion and proposing use of absorbent socks and semi-annual sampling as remedial approach moving forward, and stating that once sufficient data are collected, ELM will re-evaluate effectiveness of this approach. On 8/23/11, I sent email (in eDocs) to Michael Del Cioppo, cc's to Emily Guyer, Mimi Raygorodetsky & Pete Zimmerman of ELM, approving this proposal. - J. Kolleeny

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "DEMEO" 12/30/02 TJD International Masonary Institute contacted to provide a summary of activities at site including complete analytical data from sampling event. Fax transmission with incomplete data had been received. Demeo left message with John Cozultini who will have the appropriate individual repond to NYSDEC request for addional information. 1/2/02 TJD Dennis Holaway (International Masonary Institute) called today in response to DEC request for additional information. A complete set of laboratory data faxed to DEC this morning. Lab analysis reveals chemical concentrations above TAGM. Remedial work is required. Tank is reportably a 2,500 gal UST buried inside building. No PBS registration is found for this address. Mr. Hollaway was provided contact information for (5) environmental contractors. A contractor will be selected and a work plan submitted. Based on 11/28/01 tank closure report - which indicated only SVOC contamination - and 10/5/01 DEC Region 2 telephone conference which requested soil borings per approved work plan, additional borings were advanced and analyzed and determined that fill across site

INTERNATIONAL MASONRY INS (Continued) **S105055142**

placed during construction of building was contaminated with low level SVOC's. Case closed.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "K FOLEY" 12/15/03 Letter addressed to Sigona from Environmental Systems Group. On 10/30/03, Crompco conducted precision test on tanks. One 4000gal diesel UST failed the test. Energy Storage Systems reviewed the test data and suggested the test technician failed to plug the air eliminator on the pumps and therefore the tanks failed. On 12/9/03, Crompco retested the tanks and plugged the air eliminator and the tank passed. 12/19/03 Spoke to Andy at Energy Storage systems. As per Sigona's recommendation, he will submit a report summarizing the first and second testing episodes. Rommel 12/23/03 Received letter from Mort Turoff at Energy Storage systems summarizing first and second tests. Diesel tank passed on 12/9/03 retest. Results on file. (KMF) 1/9/04 Sent NFA. (KMF)

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

AMTRAK SUNNYSIDE YARD (Continued) **1000323850**

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Waste code: D018
Waste name: BENZENE

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Biennial Reports:

Last Biennial Reporting Year: 2011

Annual Waste Handled:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 3156

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Site Description: Sunnyside Yard (the Site) is located at 39-29 Honeywell Street, Long Island City, Queens County, New York. The Site is a railroad maintenance and storage facility that currently encompasses approximately 133 acres. Newtown Creek, which defines the border between Queens and Kings Counties, is located less than 0.5 mile south of the western portion of the Site. The Site is bordered by commercial/residential properties, with Northern Boulevard located to the north, 42nd Place located to the east, Thompson Avenue to the west, and Skillman Avenue located to the south. Historic fill on the Site is predominantly comprised of reworked glacial deposits (unstratified sand, silt, clay and gravel) and railroad ballast, with lesser amounts of ash, cinders and construction debris. With the exception of paved areas, land occupied by buildings, and vegetated areas, the railroad ballast is ubiquitous at the land surface throughout the Site. Groundwater beneath the Site occurs in fill deposits, wetlands, or the Upper Pleistocene glacial deposits. The saturated Upper Pleistocene deposits comprise the Upper Glacial aquifer. The depth to groundwater across the Site varies from one to fifteen feet below ground surface. Groundwater within the shallow deposits flows predominantly west across the Site. However, groundwater between Queens Boulevard and Honeywell Street flows northerly and northwesterly toward the buried flow path of the Dutch Kills Creek and/or East River. In the deeper deposits, groundwater predominantly flows west across the Site. An operable unit represents a portion of the site remedy that for technical or administrative reasons can be addressed separately to eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. The operable units for this site are: OU-1: Soil above the water table within the footprint of the High Speed Trainset Facility Service and Inspection (HSTF S&I) Building. A Record of Decision (ROD) was issued for OU-1 in August 1997, and the remedial work was completed in April 1998. OU-2: Soil above the water table within the footprint of the HSTF S&I Building ancillary structures. A No Further Action ROD was issued for OU-2 in November 1997. OU-3: Soil and separate phase petroleum hydrocarbon accumulation above the water table and soil below the water table within 8 acres in the north central portion of the Site. A ROD was issued for OU-3 in March 2007. Remediation is ongoing. OU-4: Soil above the water table (unsaturated zone) at the Site, excluding OU-1, OU-2, and OU-3. A ROD was issued for OU-4 in March 2009. The RAWP is under review. OU-5: Sewer system (water and sediment) beneath the Site. The RI is ongoing. OU-6: Groundwater and saturated soil beneath the Site. A No Further Action ROD was issued for OU-6 in March 2010. The Long Island Railroad (LIRR) is planning to construct tunnels through the Yard as part of its East Side Access (ESA) project. Impacts, if any, of the proposed construction are being addressed through the permit process and the Construction Contamination Site Management Plan (CCSMP). A Remedial Design/Remedial Action (RD/RA) Order on Consent and Administrative Settlement for the site was signed in May 2010 to administer the remainder of the remedial program for the Site.
Env Problem: Remedial investigations have been conducted in multiple phases under

AMTRAK SUNNYSIDE YARD (Continued) **1000323850**

NYSDEC oversight pursuant to the consent order. Seventeen specific areas of concern (AOC) were identified. PCBs, cPAHs, areas of non-aqueous phase liquid (or NAPL), and lead are the main site-related contaminants of concern (COCs). The following environmental exposure pathways and ecological risks have been identified for the Site: The Site poses an environmental threat associated with the potential impacts of contaminants to groundwater from soils impacted by the COC's. Continued migration of contaminated groundwater from off-site sources poses a potential environmental threat to on-site groundwater. Off-site sources will be addressed by remedial programs for the respective neighboring sites, as appropriate. There are no wetlands or other exposure pathways to fish and wildlife receptors in the Site. Remediation has been completed in OU-1 and OU-2, and has been initiated at OU-3 and OU-4. The OU-5 RI is ongoing and the OU-6 ROD (No Action) was issued on March 30, 2010.

Health Problem:	Groundwater in the area of the site is not used as a source of potable water. Access to the site is controlled, preventing trespassers from coming in contact with contaminated soils.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Waste code: D000
Waste name: Not Defined

Waste code: D003

ACCURATE ASSOCIATES (Continued) **1000426821**

Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D004
Waste name: ARSENIC

Waste code: D006
Waste name: CADMIUM

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with

ACCURATE ASSOCIATES (Continued) **1000426821**

a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Site Description: Location: The site is located in a mixed residential/commercial/light industrial area of Long Island City (Borough of Queens, New York City). The location of the site is west corner of the intersection of 24th Street and 37th Avenue. Site Features: The main site features includes single story buildings and an open area. There are three inter connected single story buildings, which occupies three adjacent lots. Approximately one third of the site is open area and occupies another lot. The open area is extended to the west up to 23rd Street. The open area also houses a tractor trailer sized metal storage container. Current Zoning/Use(s): The on-site laundry is currently inactive and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, light industrial, and utility right-of-ways. The nearest residential area is on the upgradient and located on the north of laundry building, other side of 37th Avenue. Residential area at downgradient is approximately 400 feet, south side of 38th Avenue. Historical Use(s): Since 1930 s to until late 1980 s, the site was used as a commercial laundry. The site had been utilized as a commercial dry cleaner from the late 1980 s to the mid 1990 s. Prior uses that appear to have led to site contamination include dry cleaning operation, and poor housekeeping and spills. Adjacent property owner conducted a Phase I Environmental Site Assessment in September 2003, a Phase 2 Limited Subsurface Investigation in October 2003 and a Phase 2 Limited Groundwater Investigation in December 2003. The Department conducted Site Characterization during August 2007 through March 2010. In October 2010, the site was placed on the registry as a Class 2 Inactive Hazardous Waste Disposal site. Operable Units: Currently the site has one operable unit, OU1. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. Site Geology and Hydrogeology: Subsurface material consists of sand and some silt and urban fill. The depth to the groundwater varies from approximately 13 to 15 feet below the ground surface. On-site groundwater flow direction is relatively flat. The general flow direction appears to be towards the southwest. Based on the MIP (Membrane Interface Probe) survey, the PCE plume appears to be spreading south.

Env Problem: Nature and Extent of Contamination: The primary contaminants of concern at the site are tetrachloroethene (PCE) and trichloroethene (TCE). PCE and TCE have been found in on-site soils at concentrations up to 22 ppm, and 2.6 ppm, respectively, near the large metal storage

JUNG SUN LAUNDRY PLUME (Continued) **S110246984**

container in the open area behind the laundry building. The unrestricted use RSCO s for both PCE and TCE have been exceeded. PCE and TCE have been detected in on-site shallow groundwater at concentrations up to 2,000 ppb and 110 ppb respectively. Groundwater standards have been exceeded for both PCE and TCE and also for Vinyl Chloride (VC). Other compounds detected on-site in excess of groundwater standards are Chloroform and cis-1,2-Dichloroethene. Per February 2009 laboratory data, the plume of PCE and TCE-contaminated groundwater has migrated at least 400' off-site at levels up to 13,000 ppb and 1800 ppb, respectively. PCE and TCE were detected in on-site soil vapor at levels up to 560,000 g/m3 and 6400 g/m3 respectively and off-site at levels up to 2600 g/m3 and to 470 g/m3, respectively. Special Resources Impacted/Threatened: The site is located in the urban area and Fish and Wildlife Impact Analysis is not warranted. Investigations are on going to determine if the PCE plume, releases from the site have migrated further downgradient. Significant Threat: The site poses a significant environmental threat because the area overlies a sole-source aquifer and because there is an ongoing release of PCE and TCE from soil into groundwater.

Health Problem:	Contact with contaminated soil is not expected since it is located at depth and covered by buildings, asphalt and concrete. Ingestion of contaminated groundwater is not likely since the area is served with public water. Site-related contaminants are present in soil vapor. Therefore, there is a potential for soil vapor intrusion to occur in on-site and off-site structures. Investigation of this potential pathway is recommended.

Updated By: JAQUINN
Site Description: LOCATION: The site is located in an urban/industrial section of Long Island City at the intersection of 9th Street between 38th Avenue and 40th Avenue. It is located on the east side of 9th Street, approximately 0.4 miles north of the Queensboro Bridge. SITE FEATURES: The property extends 335 feet from the north to the south and 117 feet from the west to the east. The entire property is occupied by a 30,000 square feet, one story, slab-on-grand masonry building. A small courtyard is located in the central portion of the building on the western side. The site and surrounding areas are generally level. CURRRENT ZONING/USE(S): The site is currently zoned commercial. The site is currently used as a marble fabrication shop, an automotive repair shop, and a production studio. Another tenant occupies the other one-third of the building for storage of sheet metal and supplies for an off-site manufacturing business. No metal fabrication, cutting, or manufacturing associated with this business takes place on this site. HISTORICAL USE(S): National Rubber Adhesives, Inc. was a manufacturing facility for adhesives until it went out of business in 1995 and operated at this location for 62 years. (National Rubber Adhesives, Inc. occupied the northern two-thirds of the building.) The property is registered with the USEPA as a small quantity generator of hazardous waste, and is also listed as a registered Petroleum Bulk Storage Facility (PBS) and a Chemical Bulk Storage Facility (CBS). Five underground storage tanks (USTs) were closed in-place, including one toluene, two gasoline, one

NATIONAL RUBBER ADHESIVES, INC. (Continued) **S102239992**

methyl ethyl ketone (MEK) and one heptane UST. A number of previous site investigations were conducted to evaluate the site conditions from 1996 to 2006. None of these investigations provided a comprehensive investigation to determine all the impacts on and off the site; however, information was generated from these investigations to determine that a significant volatile organic contaminant problem exists at this site. A state-funded remedial investigation was initiated in the spring of 2010; however, access issues prevented any on-site work from being performed. OPERABLE UNIT(S): The site is being managed by a single operable unit for both on-site and off-site contamination of the soils and groundwater. Off-site field work is being conducted in 2011 to determine the nature and extent of contamination off-site. Further investigation on-site will be done at a later date. SITE GEOLOGY AND HYDROGEOLOGY: The site is approximately 15 to 20 feet above mean sea level. The nearest surface water body is the East River, approximately one quarter mile west of the site. Groundwater was observed approximately 5 to 10 feet below ground surface and flows in a westerly direction toward the East River.

Env Problem: NATURE AND EXTENT OF CONTAMINATION: Based upon investigations to date, the primary contaminants of concern at the site include toluene. Toluene has been detected at levels as high as 280,000,000 parts per billion (ppb) in groundwater in MW-2, which is above the respective groundwater standard of 5 ppb. Other wells have shown levels of toluene in the 10,000 s ppb. Benzene, ethylbenzene, and xylenes have all been shown to be elevated. These previous investigations have identified exceedances of standards, criteria and guidance for those contaminants in soil as well. Elevated levels of benzene and toluene were also noted in the soil vapor as well. The groundwater plume appears to be migrating off-site however the extent of the plume is unknown.. Possible site impacts to the East River have not been assessed at this time. SPECIAL RESOURCES IMPACTED/THREATENED : None known. SIGNIFICANT THREAT: A significant threat is posed from potential exposure to site related contaminants from soil vapor intrusion both on and off-site structures. Exposures to contaminated groundwater are not expected because public water serves the area residents.

Health Problem: Elevated levels of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals have been identified in soil and groundwater at this site. The area is paved and served by pubic water so exposures to contaminated soils and groundwater are unlikely. Due to the high levels of VOCs in on-site groundwater, there is the potential for exposures related to soil vapor intrusion in surrounding buildings. A soil vapor investigation is planned as part of the ongoing remedial investigation.

Environmental Interest/Information System
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: The former Roehr Chemicals facility is located at 52-20 37th Street, Long Island City, Queens. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street, and Newtown Creek is located approximately 1750 feet southwest of the site. Roehr Chemicals owned and operated four buildings on five Block 310 Lots: 1, 8, 23, 24 and 28. Lot 28 contained the main building and has been the focus of the current investigation and remediation. Other lots (1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure. The site is presently used as a warehouse for storing packing boxes. Roehr Chemicals was a manufacturer of bulk pharmaceuticals and pharmaceutical intermediates such as diet pills, allergy pills and chemicals used in muscle relaxants. Several VOCs such as xylene, benzene and diethyl-ketone were used in the production of these items. During site operations involving the removal of spent xylene a containment system failed, leaking xylene to the surrounding soil. This release contaminated at least 2,000 cubic yards of on-site soil. The site has been investigated through multiple phases from Preliminary Site Assessment (PSA) in 1994 to a Remedial Investigation/Feasibility Study (RI/FS), concluded in 2000. The groundwater was found to be contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. The maximum concentration of total xylenes in these wells was 19 ppb. Soil vapor extraction and air

ROEHR CHEMICALS INC (Continued) **1000243997**

sparging systems installed in 1994 as Interim Remedial Measures (IRMs) were further expanded in 1999. A Record of Decision signed in March 2001 selected a No Further Action Remedy with continued Operation, Maintenance and Monitoring (OM&M) of the installed SVE/AS system. These measures have reduced groundwater concentrations from a high of 105 ppm of xylenes to non-detect levels in most wells. Quarterly groundwater sampling continues. The remedial system was pulsed in Sept-Dec 2007 and was reactivated in Dec 2007. Remediation system operation and groundwater monitoring continues. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.

Env Problem:	The Remedial Investigation/Feasibility Study (RI/FS) found groundwater contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering the Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppb. The remedial actions taken to date have adequately addressed environmental significant threat posed by the contamination, and the site has been reclassified to Class 4 status (continued monitoring required). The continuing groundwater monitoring shows that groundwater concentrations of site related contaminants have reduced to non-detect levels in most wells. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.
Health Problem:	On-site groundwater, surface water and soil contamination has been documented. Drinking water supplies are not impacted by contamination from this site. Drinking water contamination is unlikely as groundwater is not used as a potable supply within a five mile radius. Site access is controlled, limiting the potential for direct contact to contaminated surface soils to on-site workers. Indoor air sampling in homes immediately west of site did not indicate contamination warranting public health concerns. Soil and groundwater contamination continue to diminish as the remedial measure progresses.

Updated By:	SRHEIGEL
Site Description:	The former Roehr Chemicals facility is located at 52-20 37th Street, Long Island City, Queens. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street, and Newtown Creek is located approximately 1750 feet southwest of the site. Roehr Chemicals owned and operated four buildings on five Block 310 Lots: 1, 8, 23, 24 and 28. Lot 28 contained the main building and has been the focus of the current investigation and remediation. Other lots (1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure. The site is presently used as a warehouse for storing packing boxes. Roehr Chemicals was a manufacturer of bulk pharmaceuticals and pharmaceutical intermediates such as diet pills, allergy pills and chemicals used in muscle relaxants. Several VOCs such as xylene, benzene and diethyl-ketone were used in the production of these items. During site operations involving the removal of spent xylene a containment system failed, leaking xylene to the surrounding soil. This release contaminated at least 2,000 cubic yards of on-site soil. The site has been investigated through multiple phases from Preliminary Site Assessment (PSA) in 1994 to a Remedial Investigation/Feasibility Study (RI/FS), concluded in 2000. The groundwater was found to be contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of Calvary

ROEHR CHEMICALS INC (Continued) **1000243997**

Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. The maximum concentration of total xylenes in these wells was 19 ppb. Soil vapor extraction and air sparging systems installed in 1994 as Interim Remedial Measures (IRMs) were further expanded in 1999. A Record of Decision signed in March 2001 selected a No Further Action Remedy with continued Operation, Maintenance and Monitoring (OM&M) of the installed SVE/AS system. These measures have reduced groundwater concentrations from a high of 105 ppm of xylenes to non-detect levels in most wells. Quarterly groundwater sampling continues. The remedial system was pulsed in Sept-Dec 2007 and was reactivated in Dec 2007. Remediation system operation and groundwater monitoring continues. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.

Env Problem: The Remedial Investigation/Feasibility Study (RI/FS) found groundwater contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering the Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppb. The remedial actions taken to date have adequately addressed environmental significant threat posed by the contamination, and the site has been reclassified to Class 4 status (continued monitoring required). The continuing groundwater monitoring shows that groundwater concentrations of site related contaminants have reduced to non-detect levels in most wells. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.

Health Problem: On-site groundwater, surface water and soil contamination has been documented. Drinking water supplies are not impacted by contamination from this site. Drinking water contamination is unlikely as groundwater is not used as a potable supply within a five mile radius. Site access is controlled, limiting the potential for direct contact to contaminated surface soils to on-site workers. Indoor air sampling in homes immediately west of site did not indicate contamination warranting public health concerns. Soil and groundwater contamination continue to diminish as the remedial measure progresses.

A series of geoprobe borings and four monitoring wells were installed along Review Avenue. The maximum concentration of total xylenes in these wells was 19 ppb. Soil vapor extraction and air sparging systems installed in 1994 as Interim Remedial Measures (IRMs) were further expanded in 1999. A Record of Decision signed in March 2001 selected a No Further Action Remedy with continued Operation, Maintenance and Monitoring (OM&M) of the installed SVE/AS system. These measures have reduced groundwater concentrations from a high of 105 ppm of xylenes to non-detect levels in most wells. Quarterly groundwater sampling continues. The remedial system was pulsed in Sept-Dec 2007 and was reactivated in Dec 2007. Remediation system operation and groundwater monitoring continues. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.

Env Problem: The Remedial Investigation/Feasibility Study (RI/FS) found groundwater contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering the Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppb. The remedial actions taken to date have adequately addressed environmental significant threat posed by the contamination, and the site has been reclassified to Class 4 status (continued monitoring required). The continuing groundwater monitoring shows that groundwater concentrations of site related contaminants have reduced to non-detect levels in most wells. The AS part of the remedial system is currently being pulsed and the SVE is operating continuously.

Health Problem: On-site groundwater, surface water and soil contamination has been documented. Drinking water supplies are not impacted by contamination from this site. Drinking water contamination is unlikely as groundwater is not used as a potable supply within a five mile radius. Site access is controlled, limiting the potential for direct contact to contaminated surface soils to on-site workers. Indoor air sampling in homes immediately west of site did not indicate contamination warranting public health concerns. Soil and groundwater

ROEHR CHEMICALS INC (Continued) **1000243997**

contamination continue to diminish as the remedial measure progresses.

Site Description: The former Roehr Chemicals facility is located at 52-20 37th Street, Long Island City, Queens. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street, and Newtown Creek is located approximately 1750 feet southwest of the site. Roehr Chemicals owned and operated four buildings on five Block 310 Lots: 1, 8, 23, 24 and 28. Lot 28 contained the main building and has been the focus of the current investigation and remediation. Other lots (1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure. The site is presently used as a warehouse for storing packing boxes. Roehr Chemicals was a manufacturer of bulk pharmaceuticals and pharmaceutical intermediates such as diet pills, allergy pills and chemicals used in muscle relaxants. Several VOCs such as xylene, benzene and diethyl-ketone were used in the production of these items. During site operations involving the removal of spent xylene a containment system failed, leaking xylene to the surrounding soil. This release contaminated at least 2,000 cubic yards of on-site soil. The site has been investigated through multiple phases from Preliminary Site Assessment (PSA) in 1994 to a Remedial Investigation/Feasibility Study (RI/FS), concluded in 2000. The groundwater was found to be contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering Calvary Cemetery. An off-site investigation was conducted in October 2000 to determine the impact of on-site contamination on the groundwater quality downgradient of Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. The maximum concentration of total xylenes in these wells was 19 ppb. Site Description: Location: The site is located at 37-18 Northern Boulevard, Long Island City, Queens County, New York in the northwestern section of the county. Bordering the Site is Northern Boulevard to the north; Amtrak s Sunnyside Railroad Yard (Sunnyside Yard) to the south; 39th Street, an automobile dealership, and a Hess (formerly Merit) gasoline station to the east; and commercial and industrial properties to the west. Site Features: The Site is approximately rectangular in shape and occupies approximately one acre of land. The Site contains a six-story industrial building with approximately 42,000 square feet per floor. A narrow strip of land on the south side of the property contains a loading dock and a dirt access path for vehicles. This strip of land is owned by the Metropolitan Transportation Authority (MTA) and is part of a long-term lease to Standard Motor Products. Current Zoning/Use(s): The site is being used for commercial office space. There is a commercial vegetable farm occupying part of the building s roof. Historical Use(s): The Site has historically been involved in industrial and manufacturing activities since 1919. A small plating line for chrome plating of

STANDARD MOTOR PRODUCTS, INC. (Continued) **S101008344**

small machine parts operated from approximately 1975 to 1984. The site was previously used for painting automobile parts prior to distribution. In 1984, aqueous based paints replaced the previously used solvent-based paints. All painting operations were gradually eliminated between 1990 and 1991. The site also housed several other processes and included die-casting operations that ceased in the 1970s; rubber production that was eliminated around 1985; and degreasing which utilized chlorinated solvents that ended in 1990. Until March 2008, automobile parts and components at the site were primarily manufactured in the basement within recent years. The manufacturing operations included metal fabrication and machining, plastic injection molding, and assembly. A small photography laboratory for production of newsletters, brochures also operated. Hazardous or toxic materials involved in plant operations are lubricating oils for machinery, caustics for degreasing, phenolics used in molding processes, epoxies for coil production, and water-based inks involved in their small-scale printing. All wastes were temporarily stored on-site in secure containers prior to off-site disposal at a licensed treatment, storage, and disposal (TSD) facility. The Record of Decision was issued on March 23, 2009, and the Remedial Design/Remedial Action Order on Consent was signed in April 2010. Site Geology and Hydrogeology: The Site is underlain by the following units (in order by increasing depth): urban fill, Upper Pleistocene glacial deposits (including both till and channel deposits), and bedrock. The fill is predominantly comprised of reworked glacial deposits (sand, silt, clay, and gravel) and railroad ballast with minor amounts of construction debris and other materials. The Upper Pleistocene glacial deposits consist mainly of ground moraine deposits (unstratified, poorly sorted mixture of sand, silt, clay, and gravel). Bedrock was encountered at a depth of 74 feet below land surface (i.e. 53 feet below mean sea level). The groundwater beneath the Site occurs under water table (unconfined) conditions. The depth to groundwater in the vicinity of the Site is approximately 5 feet below ground surface (bgs) but may be influenced by surface runoff that results in standing water across most of the Site during rain events. The water table occurs in either fill or glacial deposits. Groundwater elevation data show that flow is primarily from east to west beneath the Site. Due to the proximity to the East River, the hydraulic gradients are gentle which is consistent with the regional groundwater contour map and the groundwater contours present on the adjacent Sunnyside Yard property. Vertical groundwater movement is restricted by the Gardiners Clay where present or by the Precambrian bedrock which is considered to be the bottom hydrogeologic boundary of the groundwater flow system. The groundwater flow rate was estimated to be 0.78 feet/day.

Env Problem: Nature and Extent of Contamination: A site investigation in 1990 was initiated after an oily sheen was observed in a puddled area on the southeast side of the property. Soil samples from this area revealed elevated levels of petroleum hydrocarbons and volatile organic compounds (VOCs), primarily 1,1,1-trichloroethane. Approximately 2,700 sq. ft. of soil was excavated to a depth of 18 inches and stockpiled on-site. Further investigation determined that soils in the area of the rear loading platform contained elevated levels of petroleum hydrocarbons and VOCs (trichloroethane TCA, triclhoroethene - TCE and other related chlorinated VOCs). Contaminated soils extended beyond the area excavated. Subsequent groundwater samples taken indicated contamination with TCA and lead. The highest levels

STANDARD MOTOR PRODUCTS, INC. (Continued) **S101008344**

of groundwater contamination are adjacent to the loading dock at the back of the building. Soil- Arsenic was detected at 19 ppm, which is above the applicable soil cleanup objectives (SCOs). Groundwater- For PCE, two monitoring well samples contained concentrations which exceeded the groundwater standard of 5 ppb. The sample from MW06 contained PCE concentration that has increased from 10 ppb in 2003 to 17 ppb in 2008. The sample from MW14D contained PCE at a level of 5.8 ppb. For TCE, four monitoring wells contained concentrations which exceeded the groundwater standard of 5 ppb. TCE concentration in MW06 has increased from 6 to 8.2 ppb between 2003 and 2008. MW11S detections declined slowly from 13 ppb to non-detect from 2003 to 2008. MW11D detections declined from 18 ppb in 2003 to non-detect in 2008 with a spike of 78 ppb in 2005. MW14D detected TCE at 5.1 ppb. For cis-1,2-DCE, 10 monitoring wells contained concentrations which exceeded the groundwater standard of 5 ppb. MW09D sample contained detections that fluctuated between 2003 and 2006, the concentrations ranged from 48 to 36 ppb. The sample from MW11S contained cis-1,2-DCE concentrations that declined slowly from 71 ppb in 2003 to non-detect in 2008. The sample from MW11D contained concentrations that declined from 93 ppb in 2003 to 43 ppb in 2005 and 2008. The sample from MW12 contained cis-1,2-DCE concentrations that declined slowly from 64 ppb in 2003 to non-detect in 2008. The samples from MW13S and MW13D contained concentrations that declined from 44 ppb in 2003 to 17 ppb in 2005, and 34 ppb in 2003 to 20 ppb in 2005, respectively. The samples from MW14S and MW14D contained detected cis-1,2-DCE concentrations at 14 and 21 ppb, respectively. The samples from MW15 and MW16 contained detected concentrations of 19 and 9.4 ppb, respectively. For VC, 7 monitoring wells yielded samples whose concentrations exceeded the groundwater standard of 2 ppb. The sample from MW09S contained VC at 11 ppb in 2003 and 0.1 ppb in 2006. The sample from MW09D contained VC at a constant concentration of 4 ppb from 2003 to 2006. The sample from MW11S contained VC concentrations that declined slowly from 31 ppb in 2003 to non-detect in 2008. The sample from MW11D contained detections that fluctuated between 2003 and 2008, the concentrations ranged from 12 ppb in 2003, 6 ppb in 2006, and 8.5 ppb in 2008 The sample from MW12 contained VC concentrations that declined slowly from 13 ppb in 2003 to non-detect in 2008. The sample from MW13S contained VC concentrations that declined from 3 ppb in 2003 to 0.5 ppb in 2008. The sample from MW15 contained a VC concentration of 19 ppb in 2008. For 1,1,1-TCA, 2 monitoring wells yielded samples whose concentrations exceeded the groundwater standard of 5 ppb. The sample from MW10 contained 1,1,1-TCA at 13 ppb in 2003 to non-detect in 2005, and increased to 9.2 ppb in 2008. The same well, MW10 also detected 1,1-DCA at 74 ppb in 2005, but the concentration decreased to 8.2 ppb in 2008. The relatively flat gradient may cause more outward dispersion than advection. MW10 is also located underneath the 39th Street Bridge which could be a potential source for this relatively low contamination. The sample from MW11D contained 1,1,1-TCA at 6 ppb in 2003 and increased to 180 ppb in 2008. Significant Threat: The site presents a significant environmental threat. An Interim Remedial Measure (IRM) consisting of a sub-slab depressurization system (SSDS) has been installed in the building and is currently in operation.

Health Problem: The on-site structure will have an active sub-slab depressurization system which will prevent contamination from entering the building via soil vapor intrusion. A air sparge/soil vapor extraction system will address contaminants present in the groundwater. Exposure to

STANDARD MOTOR PRODUCTS, INC. (Continued) **S101008344**

site-related contaminants in drinking water are not expected because public water serves the area.

Site Description:	Manhattan Adhesives is currently an empty factory building that is located at the foot of the Greenpoint Ave., Bridge in Brooklyn. Besides the Manhattan Adhesives factory, about 10 feet from the northeast wall is a manhole (not a sewer of drain) into which liquid waste was allegedly discharged. This waste came from a condemned oil storage site located at the intersection of Rt. 280, and the NJ Turnpike in NJ. The manhole is suspected of being the opening to an underground tank; however, the quantity of the waste allegedly dumped exceeds the capacity of most tanks. This information was obtained from the State Senate Committee on Crime and the Brooklyn District Attorney's office. Phase I State Superfund has been completed. A partial phase IIinvestigation was completed during 1985 and recommended no further action. The Responsible Party has agreed to undertake an investigation in 1986. An investigation has not found hazardous waste on-site.
Confirmed HW:	Waste oil alleged to contain PCB's: Over 400,000 gal.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RES DECL: Restrictive Declarations Listing

A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

State and tribal Brownfields sites

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Telephone: N/A
Last EDR Contact: 09/19/2011
Next Scheduled EDR Contact: 01/02/2012
Data Release Frequency: Annually

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Day Care Providers
Source: Department of Health
Telephone: 212-676-2444

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Most Recent Revision:	1995

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

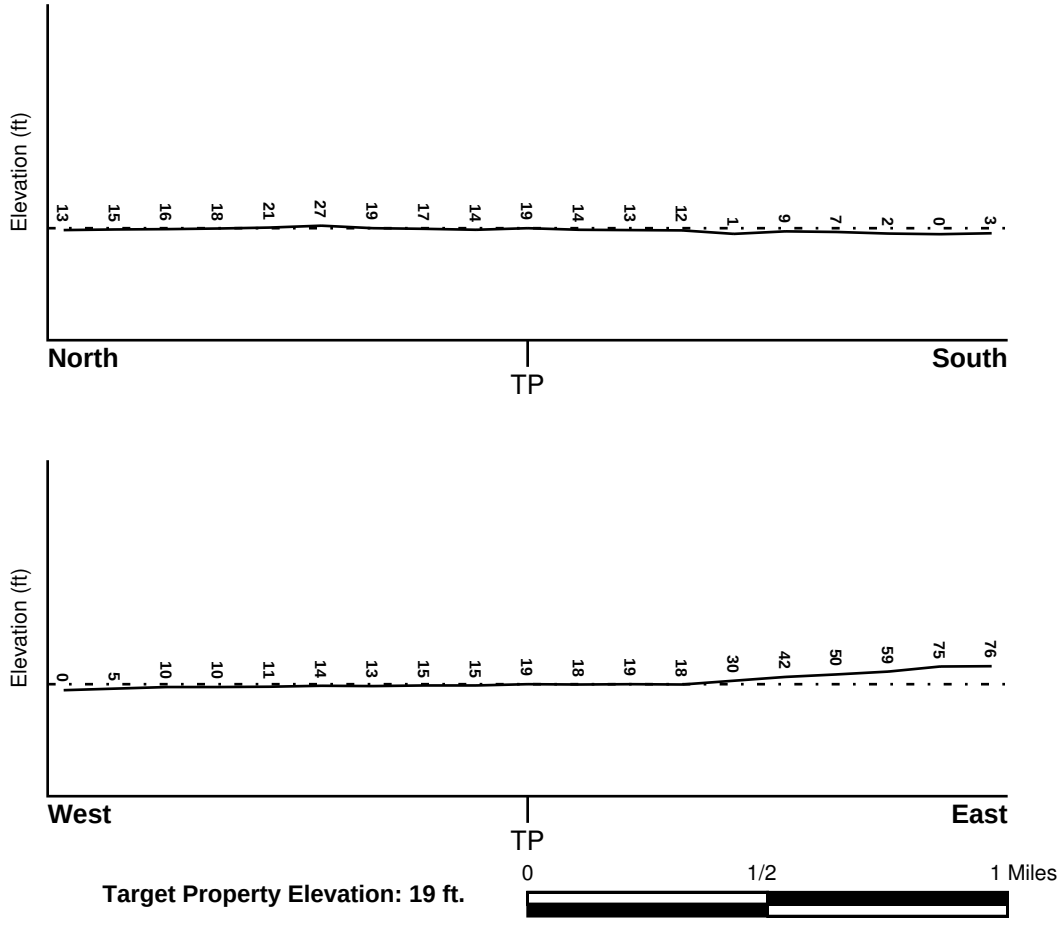
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 19 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
QUEENS, NY	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 360497 - FEMA DFIRM Flood data

Additional Panels in search area:
3604970032B - FEMA Q3 Flood data
3604970040B - FEMA Q3 Flood data
3604970039B - FEMA Q3 Flood data
3604970048B - FEMA Q3 Flood data
3604970047B - FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
BROOKLYN	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site--specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Paleozoic
System:	Ordovician
Series:	Ordovician
Code:	Oe *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Eugeosynclinal Deposits

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy sand
sandy loam
fine sandy loam

Surficial Soil Types: silt loam
loamy sand
sandy loam
fine sandy loam

Shallow Soil Types: sandy loam

Deeper Soil Types: unweathered bedrock
very gravelly - loamy sand
stratified
sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

New York Public Water Wells
Source: New York Department of Health
Telephone: 518-458-6731

OTHER STATE DATABASE INFORMATION

Oil and Gas Well Database
Department of Environmental Conservation
Telephone: 518-402-8072
These files contain records, in the database, of wells that have been drilled.

RADON

State Database: NY Radon
Source: Department of Health
Telephone: 518-402-7556
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2005. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

1.0 INTRODUCTION

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) prepared this Phase II Environmental Site Investigation (ESI) Report on behalf of Purves Street Owners, LLC, for 44-30 Purves Street in Long Island City, New York (the "Site"). The purpose of this ESI was to investigate potential environmental concerns identified in previous Phase I Environmental Site Assessments (ESA) in support of proposed site development.

The Phase II ESI was implemented between February 19 and 28, 2014 in accordance with Langan's January 17, 2014 Proposal for Environmental and Geotechnical Services. The investigation consisted of a geophysical survey, advancement of soil borings, installation of groundwater monitoring wells and soil vapor sampling points, and collection and laboratory analysis of soil, groundwater, and soil vapor samples.

The remainder of this ESI Report is organized as follows:

- Section 2.0 describes the site setting, physical characteristics of the site, proposed development and summarizes previous investigations.
- Section 3.0 presents the ESI field procedures.
- Section 4.0 describes the RI field observations and analytical results.
- Section 5.0 presents conclusions and recommendations pertaining to the nature and extent of contamination in all site media as determined through the field investigation and analysis of environmental samples.

2.0 BACKGROUND

2.1 Site Location and Description

The Site is located at 44-30 Purves Street in Long Island City, New York (Block 268, Lots 1, 24, 25, and 26), and is bounded by Purves Street to the east, Lot 31 with a two-story brick building to the south, Thomson Avenue to the southwest, 44th Drive to the west, and lots 4 and 23 to the north. Lot 4 has an existing two-story brick building and Lot 23 has no structures. The Site is irregularly shaped and encompasses an area of approximately 26,900 square feet. According to survey data, the site grade is at approximately elevation (el) 9 feet[1]. The sidewalk grade of Thomson Avenue and 44th Drive is elevated above site grade, and slopes upward from north to south from approximately el 18 to el 28. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The Site has been a vacant lot nearly 10 years, since circa 2006, and was previously improved with multiple buildings and used for various manufacturing and industrial purposes. A Site Location Map is provided as Figure 1.

2.2 Previous Environmental Reports

Available environmental reports are included in Appendix A and summarized below in chronological order.

April 27, 2006 Phase I ESA Report, Middleton Environmental, Inc.
Middleton Environmental, Inc. prepared a Phase I ESA Report for the property located at 44-26/30 Purves Street (Block 268, Lots 24, 25, and 26), and a Phase I ESA update that included 44-32/38 Purves Street (Block 268, Lot 1). The Phase I ESA reports concluded the following:

- No recognized environmental conditions (RECs) were identified.
- At the time of this Phase I ESA, two buildings were present at the Site. The buildings were vacant, and had most recently been used for automobile repair and carpet storage. The site was previously used by a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company and an air freight company.
- At the time of this Phase I ESA, surrounding property usage included a welding company, an automobile repair facility, a construction site, and vacant industrial buildings.

[1] Elevations are with respect to the Borough President of Queens Datum (BPQD) which is 2.725 feet above the U.S. Coast and Geologic Survey Datum (Mean Sea Level at Sandy Hook, New Jersey, 1929) [BPQD = USGS – 2.725]

- A review of the 1950 Sanborn Fire Insurance Map indicated the presence of two underground storage tanks (UST) at the Site. There were no oil fill ports or fuel vents observed at the Site.

November 5, 2006 Phase II ESI Report, Environmental Business Consultants

Environmental Business Consultants conducted a limited Phase II ESI that included the advancement of three soil borings, the installation of three temporary monitoring wells, and the collection and laboratory analysis of six soil and three groundwater samples.

Three soil borings were advanced to 20 feet below grade surface (bgs). Historic urban fill material was observed from surface grade to depths of 2 to 9 feet bgs. Native layers consisting of fine- to medium-grained sand, silt, and peat were observed underlying the fill layer. No evidence of impacts was observed based on photoionization detector (PID) screening of soils. Soil samples were collected from the 7 to 8 and 17 to 18 foot depth intervals in each boring. Soil samples were analyzed for the New York State Department of Environmental Conservation (NYSDEC) Spills Technology and Remediation Series (STARS)-listed volatile organic compounds (VOC) and semivolatile organic compounds (SVOC). One SVOC, pyrene, was detected in the shallow sample in boring SB2; however, the concentration did not exceed the Technical and Administrative Guidance Memorandum (TAGM) 4046 Recommended Soil Cleanup Objective (RSCO). The TAGM RSCOs have subsequently been superseded by Title 6 of the New York Codes, Rules and Regulations (NYCRR) Part 375. Under Part 375, the pyrene detection would still be below the corresponding Unrestricted Use Soil Cleanup Objective (SCO). There were no other VOC or SVOC detections in soil samples.

Three 1-inch diameter temporary monitoring wells were installed at a depth of 18 feet bgs with 15 feet of 0.010-inch slotted polyvinyl chloride (PVC) screen attached to PVC riser that extended approximately 2 feet above grade surface. Groundwater samples were collected from each well and analyzed for NYSDEC STARS-listed VOCs and SVOCs. No VOCs or SVOCs were detected in groundwater samples.

December 9, 2011 Phase I ESA Report, IVI Assessment Services, Inc.

The Phase I ESA identified the following RECs:

- Historical Site Use: Historical Site uses included a chemical laboratory, automobile repair, controller manufacturing, fine chemicals manufacturing, storage, paper embossing, machine manufacturing, automobile radiator servicing, and a contractor's yard. Two gasoline USTs were identified on the 1947 and 1950 Sanborn maps and may be still present. The historic site usage may have negatively impacted soil and/or groundwater at the Site.
- Adjacent Site Use: Properties adjacent and surrounding the Site were previously used for chromium plating, auto body/repair shops, a photochemical warehouse and textile

printing ink manufacturing. The 1936 Sanborn map shows a UST in a garage on an adjacent property, and gasoline tanks in manufacturing buildings to the east of the Site across Purves Street. The adjacent usage may have negatively impacted soil and/or groundwater at the Site.

2.3 Previous Geotechnical Engineering Study

Langan conducted a geotechnical subsurface investigation in February 2008. The subsurface investigation consisted of drilling 17 borings into bedrock, excavating two test pits to investigate the Thomson Avenue and 44th Drive retaining wall foundations, and installing three observation wells in completed borings. The borings were completed to depths of approximately 53 to 75 feet bgs. The borings revealed an approximately 5- to 9-foot-thick layer of historic fill above a 7- to 14-foot-thick layer of sand that overlies a 5- to 27-foot-thick layer of silt, overlying a 10- to 15-foot-thick layer of clay. Decomposed rock was encountered from about 44 to 48 feet bgs in four borings, and bedrock was encountered between approximately 43 and 61 feet bgs in all borings. Groundwater was measured in the three observation wells at depths of 9 to 10 feet bgs. The Geotechnical Engineering Report is included in Attachment A.

2.4 Proposed Development

The proposed development will be separated into two structures. The first is a one-story building with residential amenity space and retail along Thomson Avenue and 44th Street. The second will be a 33-story residential building along Purves Street. There is expected to be one level of approximately at-grade parking spanning approximately 14,000 square feet. The area between the two buildings and above the parking lot will be decked over to provide additional amenity space. The total site area will be about 26,900 square feet.

2.5 Geology

Predominant geological surface features were not observed on the Site. The USGS "Bedrock and Engineering Geologic Maps of New York County and Parts Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" indicates that the bedrock underlying the site consists of fine- to coarse-grained, gray to tan, weathering quartzofeldspathic, muscovite-biotite-garnet schist.

Based on the February 19, 2008 Geotechnical Engineering Report and this Phase II ESI, the subsurface strata at the Site consists of historic urban fill extending to depths ranging from 1.5 to 11 feet bgs, underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths ranging from

approximately 44 to 48 feet bgs during the Geotechnical Engineering Study. Gray and white schist bedrock was observed at depths ranging from approximately 43 to 61 feet bgs.

2.6 Hydrogeology

Depth to groundwater at the Site ranged from 4.0 to 6.4 feet bgs. The well casing elevations were not yet surveyed; however, based on previous survey data, the groundwater depths correspond to elevations ranging from approximately el 4.3 to el 3.4. The groundwater elevation is highest in the west and appears to slope downward toward the east. Depth to groundwater during the February 2008 Langan Geotechnical Study was observed to be between 8 and 10 feet bgs. The apparent change between these two excavations may be the result of several precipitation events and snow melt percolation into the water table prior to and during the ESI groundwater sampling event.

Groundwater flow may also be influenced locally by tides and the presence of underground man-made structures (pipes, foundations, etc.). Groundwater in this area of New York City is not used as a potable (drinking) water source. The potable water supply is provided by the City of New York and is derived from surface impoundments in the Croton, Catskill, and Delaware watersheds.

3.0 FIELD INVESTIGATION

3.1 Geophysical Survey

On February 19, 2014, prior to boring activities, Nova Geophysical Services of Douglaston, New York, conducted a geophysical investigation. A Langan field engineer was on-site to document the survey. The survey used ground penetrating radar (GPR) to identify the potential presence of USTs and locate buried utilities. Borings were relocated as necessary to avoid subsurface utilities and anomalies (other subsurface impediments). A geophysical report presenting the findings is included in Appendix B.

3.2 Soil Investigation

The soil investigation included eight environmental soil borings (SB01 through SB08). The borings were completed by Laurel Environmental Associates, Ltd. of Huntington Station, New York, under the supervision of a Langan field engineer. All borings were advanced using a direct-push Geoprobe® 6610DT drill rig. Borings SB01 and SB06 were advanced to a depth of 25 feet bgs, borings SB03, SB04, SB07, and SB08 were advanced to 20 feet bgs, and boring SB02 was advanced to 15 feet bgs. Refusal was encountered at approximately 3 feet bgs in boring SB05. Offset boring SB05A was advanced to 20 feet bgs 3 feet north of SB05. Boring locations are shown on Figure 2.

Soil samples were collected continuously throughout each environmental boring. Samples were collected in 5-foot Macro-Core® sample barrels with new, dedicated acetate liners. Soil samples retrieved from each boring were visually classified for soil type, grain size and texture. Each sample was screened for visual, olfactory and instrumental evidence of anthropogenic impacts. Instrument screening for the presence of VOCs was performed with a PID equipped with a 10.6 electron volt (eV) lamp. Following sample collection, all borings were backfilled with soil cuttings and sand or converted to groundwater monitoring wells. Boring logs documenting these observations are included as Appendix C.

A total of 19 soil grab samples, including one duplicate sample, were collected for laboratory analysis. Samples were collected from the historic fill layer and the interval of the highest observable impact (staining, odor, elevated field instrument readings), if observed. Soil samples were collected into laboratory-supplied containers and were picked up and delivered via courier service to York Analytical Laboratories, a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory in Stratford, Connecticut under standard chain-of-custody protocol. Grab soil samples were analyzed for NYSDEC Part 375 List VOCs by EPA Method 8260C, SVOCs by EPA method 8270D, metals (including hexavalent chromium) by EPA methods 6010C/7473/7196A/9014/9010C, pesticides by EPA method 8081B, and PCBs by EPA method 8082A. A sample log showing samples and

sample analysis is provided as Table 1. Analytical reports and chain-of-custody documentation are provided in Appendix D.

3.3 Groundwater Investigation

Four soil borings were converted into groundwater monitoring wells by inserting 10 feet of 2-inch diameter, 0.01-inch slotted, schedule 40 PVC screen, with attached risers, into the boreholes. Each monitoring well number corresponds to the boring where it was installed (SB01/MW01, SB02/MW02, SB03/MW03, and SB04/MW04). The wells were installed to a depth of approximately 14 feet bgs. Three monitoring wells (MW01, MW03, and MW04) were installed with 2.0-inch inner diameter (ID) by 3.4-inch outer diameter (OD) prepacked well screens. Prepacked well screens include a stainless steel wire mesh with a 0.011-inch pore size surrounding the slotted PVC and containing 20/40 mesh silica sand. Prepack screen installation required advancing 4-inch ID steel augers to the desired well depth. Monitoring well MW02 was constructed with a PVC screen with no prepack and was installed by advancing 3-inch OD Macro-Core® sample barrels. The annulus of each well was filled with #2 Morie sand to approximately 1.5 feet above the top of the screen. Hydrated bentonite well seals were installed above the filter sand. Following installation, each well was developed using a submersible Monsoon pump. Well construction logs are included in Appendix E. Monitoring well locations are shown on Figure 2.

Prior to sampling, the wells were allowed to sit for one week after development. Immediately before sample collection, a minimum of three well volumes were purged from each well and groundwater parameters (pH, conductivity, turbidity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]) had stabilized and turbidity measurements were below 50 Nephelometric Turbidity Units (NTU). Groundwater sampling logs are included in Appendix F.

Five groundwater samples, a sample from each well and one duplicate sample, were collected into laboratory supplied glassware and picked up and delivered via courier service to York. Groundwater samples were analyzed for TCL VOCs by EPA Method 8260C, TCL SVOCs by EPA method 8270D, pesticides by EPA method 8081B, PCBs by EPA method 8082A, TAL metals by EPA methods 6010C/7470, and hexavalent chromium by EPA method 7196A.

3.4 Soil Vapor Investigation

Seven soil vapor probes (SV01 through SV07) were installed using a Geoprobe® 6610 direct-push drill rig with 1.25-inch OD steel probe rods to a depth of 4 to 5 feet bgs. Probe locations are shown on Figure 2. The probes were installed in accordance with the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York and were comprised of a stainless steel screen threaded into polyethylene tubing. A sand filter pack was installed around the

screen implant by pouring No. 2 Morie sand into the annulus to approximately 3 feet above the probe. The remainder of the annulus was filled to grade surface with a bentonite slurry seal.

As a quality assurance/quality control (QA/QC) measure, an inert tracer gas (helium) was introduced into an above-grade sampling chamber to ensure that the soil vapor sampling points were properly sealed above the target sampling depth, thereby preventing subsurface infiltration of ambient air. Direct readings of helium of less than 10 percent prior to sampling were considered sufficient to verify a tight seal. Each sub-slab soil vapor point was purged using a PID at a rate of 0.2 liters per minute (L/min) to evacuate a minimum of three sample tubing volumes prior to sample collection. Soil vapor samples were collected into laboratory-supplied, batch-certified 2.7-Liter Summa® canisters that were calibrated for a sampling rate of approximately 0.0225 L/min for 120 minutes of sampling. The samples collected from soil vapor points SV02 and SV05 were not analyzed due to groundwater infiltration. One ambient air sample was collected and submitted to the lab for analysis for QA/QC purposes. Soil vapor sampling logs are provided in Appendix G.

The Summa® canisters were labeled and picked up by a courier for delivery to Alpha Analytical Laboratories, an NYSDOH ELAP-certified laboratory in Westborough, Massachusetts, under standard chain-of-custody protocol. Soil vapor samples were analyzed for VOCs by EPA Method TO-15.

3.5 Field QA/QC Sample Description

The field quality assurance/quality control (QA/QC) samples consisted of field duplicates, trip blanks, and field blanks.

Two duplicate samples, including one from soil and one from groundwater were collected. The purpose of duplicate samples is to examine the variability of the samples. One trip blank was collected per shipment of VOC samples. The purpose of the trip blank was to examine the potential for cross-contamination of samples during shipping. Two field blanks were collected for non-dedicated soil sampling equipment used. The purpose of the field blank was to examine the cleanliness of the disposable sampling equipment.

Trip blank and field blank samples were collected into laboratory-supplied glassware and picked up and delivered via courier service to York. The trip blanks were analyzed for VOCs by EPA Method 8260C. The field blanks were analyzed for VOCs by EPA Method 8260C, TCL SVOCs by EPA method 8270D, pesticides by EPA method 8081B, PCBs by EPA method 8082A, TAL metals by EPA methods 6010C/7470, and hexavalent chromium by EPA method 7196A.

4.0 OBSERVATIONS AND RESULTS

4.1 Geophysical Survey

The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Several scattered minor anomalies were identified throughout the Site. Due to snow cover at the Site, Nova could not verify the nature of these anomalies.

Boring locations were adjusted prior to drilling to avoid the identified anomalies. The Geophysical Survey Report is included as Appendix B.

4.2 Subsurface Observations

The Site is covered with a weathered concrete slab, and on approximately 50% of the Site, the concrete is covered with a thin (<6-inch) layer of sand, gravel, and vegetation. Beneath the concrete slab, the soil was observed to be historic urban fill material, predominately consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. The fill layer extended to between approximately 1.5 to 11 feet bgs and was deepest in the northwestern portion of the Site (borings SB02 and SB06). The fill layer was underlain by brown, fine- to medium-grained sand. In borings located within the western portion of the Site (SB02, SB03, and SB06), the sand layer was underlain by layers of silt, peat, and clay. In borings located in the southeastern portion of the Site (SB04 and SB05), the sand layer was underlain by silt. In borings located in the northeastern portion of the Site (SB01, SB07, SB08), the sand layer was underlain by a silt layer followed by a clay layer.

Petroleum impacts, including odors, staining, and PID readings above background levels, were observed in borings SB01, SB03, and SB05. Observations are described as follows:

- Boring SB01 (northeastern portion of the Site) – Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 14.9 parts per million (ppm) was observed at depths of approximately 7 to 9 feet bgs, and appeared to straddle the water table. The headspace of monitoring well MW01 did not exhibit elevated PID readings.

- Boring SB03 (southern portion of the Site) – Petroleum-impacted soil exhibiting staining, odor, and PID readings up to 91.7 ppm was observed at depths of approximately 6 to 9 feet bgs, and appeared to straddle the water table. The PID reading in the headspace of monitoring well MW03 was 12.8 ppm.

- Boring SB05 (southern portion of the Site – Near suspected USTs) – Petroleum-impacted soil exhibiting staining, odor and PID readings up to 240 ppm was observed at depths of approximately 2 to 3 feet bgs. Refusal was encountered at 3 feet bgs and the

location was offset 3 feet to the north. There was no evidence of petroleum impacts observed at the offset location.

- All wells were screened for free product with an oil-water interface probe. No evidence of free product was observed. During development purging and sampling, free product was not observed on the purged groundwater.

Based on the visual, olfactory, and instrumental evidence of petroleum contamination of soil at the Site, a spill was called in to NYSDEC and spill number 1310949 was assigned.

4.3 Analytical Results

A summary and discussion of analytical results is provided in the following section by matrix. A sample summary is presented in Table 1. Analytical laboratory reports are provided in Appendix D.

4.3.1 Soil Sample Results

Nineteen soil samples, including one duplicate sample, were submitted for laboratory analysis. Analytical results were compared to 6 NYCRR Part 375 Unrestricted Use SCOs. The analytical results are presented in Table 2. Results exceeding the SCOs are highlighted on Table 2, illustrated spatially on Figure 3 and summarized below.

VOCs

- SB02_11-13: acetone
- SB03_6-8: methylene chloride
- SB06_6-8: acetone

Note: Acetone and methylene chloride are common lab contaminants; as such, the detections may be attributable to interference from laboratory cross-contamination.

SVOCs

- SB02_2-4: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene
- SB02_6-8: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene
- SB04_4-6: benzo(k)fluoranthene
- SB05_1-3: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene

- SB06_3-5: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene
- SB06_6-8: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene
- SB07_1-3: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene
- SB08_0-2: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene

PCBs

- Total PCBs exceeded the SCOs in samples SB03_1-3 and SB04_4-6 due to the presence of Aroclor 1262.

Metals

- Arsenic in SB02_2-4, SB03_1-3, duplicate of SB04_1-3, SB05_1-3, and SB05A_2-4
- Barium in SB02_2-4, SB02_6-8, and SB03_1-3
- Cadmium in SB02_2-4, SB03_1-3, and duplicate of SB04_1-3
- Hexavalent Chromium in SB02_2-4, SB02_6-8, SB04_1-3, duplicate of SB04_1-3, SB06_6-8, and SB08_0-2
- Trivalent Chromium in SB01_4-6, SB02_2-4, SB02_6-8, SB02_11-13, and SB03_1-3
- Copper in all samples, with the exception of SB01_7-9, SB03_6-8, SB05A_11-13, SB07_1-3, SB07_5-7, and SB08_15-17
- Lead in all samples, with the exception of SB01_7-9, SB03_6-8, SB05A_11-13, SB07_5-7, and SB08_15-17
- Mercury in all samples, with the exception of SB01_7-9, SB03_6-8, SB05A_11-13, SB07_5-7, and SB08_15-17
- Nickel in SB01_4-6, SB02_2-4, SB02_11-13, SB03_1-3, duplicate of SB04_1-3, and SB08_0-2
- Zinc in all samples, with the exception of SB03_6-8, SB05A_11-13, SB07_5-7, and SB08_15-17

4.3.2 Groundwater Results

Five groundwater samples, including one duplicate sample, were submitted for laboratory analysis. Analytical results were compared to the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards (AWQS) and Guidance Values for class GA groundwater. Analytical exceedances of the AWQS are presented in Table 3, illustrated spatially on Figure 4 and summarized below.

VOCs

- MW01 and duplicate of MW01: 1,1,1-trichloroethane (1,1,1-TCA), cis-1,2-dichloroethene (cis-1,2-DCE), tetrachloroethene (PCE), trichloroethene (TCE), and vinyl chloride
- MW04: PCE

Metals

- MW01 and duplicate of MW01: manganese, selenium, sodium
- MW03: manganese
- MW04 manganese, selenium, and sodium

4.3.3 Soil Vapor Results

Soil vapor sample results were compared to the results of the ambient air sample, which was collected simultaneously with the soil vapor samples. Soil vapor sample results are summarized in Table 4 and presented on Figure 5. Thirty-two different VOCs were found in the soil vapor samples that exceeded the ambient air samples, included VOCs related to petroleum and chlorinated solvents.

4.3.4 QA/QC Sample Results

The following compounds were detected in QA/QC samples:

- Acetone was detected in two of the four trip blank samples and both field blank samples submitted for analysis. Acetone is a common lab contaminant; as such, the detections may be attributable to interference from laboratory cross-contamination.

- Methylene chloride was detected in the laboratory method blank for the soil samples; therefore, the detection of methylene chloride in soil samples may be attributable to interference from laboratory cross-contamination.

- PCE was detected in the groundwater field blank sample at 0.5 parts per billion (ppb), which is approximately 34 times lower than the lowest exceedance found in the groundwater samples.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the ESI, we conclude and recommend the following:

Conclusions

- Potential USTs – The geophysical survey identified an anomaly at the location where two USTs are shown on the 1947 and 1950 Sanborn maps; however, it could not verify the presence of USTs. Additionally, refusal encountered during the advancement of boring SB05 may have resulted from contact with a UST-related subsurface structure.
- Soil –
    - *Petroleum-Impacted Soil* – Material exhibiting staining, odor, and elevated VOC concentrations based on field screening with a PID was observed at three boring locations: SB01, SB03, and SB05. Petroleum impacts in borings SB01 and SB03 were observed straddling the water table. Petroleum impacts in boring SB05 were observed at a depth of 2 to 3 feet bgs, above an obstruction that resulted in refusal. Impacts were observed in the northern and southern portions of the Site, included the area adjacent to potential USTs. A spill was reported to NYSDEC.
    - *Historic Fill* – A layer of historic fill extending to between approximately 1.5 and 11 feet bgs was identified throughout the Site. The fill was characterized as predominately consisting of brown, fine- to coarse-grained sand with varying amounts of gravel, brick, silt, rock fragments, slag, ash, and wood. Anomalously high concentrations of metals, particularly lead, were identified in the borings indicated below. Fill from the area around these borings may potentially be hazardous or require a premium cost to dispose.
        - Barium – Boring SB02
        - Trivalent chromium – Boring SB02
        - Lead – Borings SB02, SB05, SB06, and SB08
        - Mercury – Borings SB03 and SB04
- Groundwater –
    - Measurements collected during the ESI found groundwater ranged from 4.0 to 6.4 feet bgs. Depth to groundwater during the February 2008 Langan Geotechnical Study was observed to be between 8 and 10 feet bgs. The apparent change between these two excavations may be the result of several

precipitation events and snow melt percolation into the water table prior to and during the ESI groundwater sampling event.

- *Chlorinated Solvent-Impacted Groundwater* – Chlorinated VOCs (CVOC) including 1,1,1-TCA, cis-1,2-DCE, PCE, TCE, and vinyl chloride were identified in groundwater at concentrations exceeding the Class GA TOGS AWQS. Groundwater exceedances were observed in the eastern portion of the Site.

- Soil Vapor – Soil vapor results revealed concentrations of VOCs, included those related to petroleum and chlorinated solvents, above concentrations found in the ambient air sample.

Recommendations

A plan should be prepared and implemented during development of the Site that describes potential remediation and/or mitigation measures for the impacts identified by this report that are protective of human health and the environment. The plan should include procedures for materials management and disposal, contingencies for additional impacts that can be reasonably anticipated, and a construction health and safety plan. To the extent that the Site is still an active spill site or in another regulatory program (e.g., New York State Brownfield Cleanup Program), the plan should be tailored to the applicable remedial program.

6.0 LIMITATIONS

This Phase II ESI report was prepared expressly for Purves Street Owners, LLC for the proposed development at the properties located at 44-30 Purves Street, Long Island City, New York and for the objectives defined herein. Langan cannot assume responsibility for the use of this Report for any property other than the specific site addressed in this report, or by any third party without specific written authorization from Langan.

The conclusions, opinions, and recommendations provided in this report are based on subsurface conditions ascertained from the analysis of a limited number of samples and from environmental reports prepared by other professionals that were provided by "the Client". Recommendations provided are contingent upon one another and no recommendation should be followed independent of the others. Actual conditions encountered may differ substantially from those presented herein and should be brought to our attention whereby we may determine how such changes may affect our conclusions, opinions and recommendations.

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO).
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are highlighted and in bold.
4. Method Detection Limits Exceeding SCO Criteria are italicized.
5. DUP01_022014 is a duplicate of sample SB04_1-3
6. mg/kg = milligrams per kilogram
7. ND = not detected
8. NA = not analyzed
9. ~ = No corresponding comparison criteria

Qualifiers:
U = Analyte included in the analysis, but not detected
J = Detected above the Method Detection Limit but below the Reporting Limit; therefore, result is an estimated concentration
B = Analyte is found in the associated laboratory analysis batch blank
D$^{\#}$ = Results for a diluted sample, # indicates the dilution factor

Table 2
Summary of Detected VOCs, SVOCs, Metals, Pesticides, and PCBs in Soil Samples
Phase II ESI Report

Notes:
1. Soil sample analytical results are compared to the New York State Department of Environmental Conservation (NYSDEC) title 6 of the official compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use Soil Cleanup Objectives (SCO).
2. Only detected compounds are shown in the table.
3. NYSDEC Part 375 Unrestricted Use SCO exceedances are highlighted and in bold.
4. Method Detection Limits Exceeding SCO Criteria are italicized.
5. DUP01_022014 is a duplicate of sample SB04_1-3
6. mg/kg = milligrams per kilogram
7. ND = not detected
8. NA = not analyzed
9. ~ = No corresponding comparison criteria

Qualifiers:
U = Analyte included in the analysis, but not detected
J = Detected above the Method Detection Limit but below the Reporting Limit; therefore, result is an estimated concentration
B = Analyte is found in the associated laboratory analysis batch blank
$D^{\#}$ = Results for a diluted sample. # indicates the dilution factor

Table 3
Summary of Detected VOCs, SVOCs, Pesticides, PCBs and Metals in Groundwater Samples
Phase II ESI Report
44-30 Purves Street

Notes and Qualifiers:

1. Only detected compounds are shown in table.
2. AA01_022114 is an ambient air sample.
3. Soil vapor sample concentrations above the ambient air conentration are in bold.
3. VOC = volatile organic compound
4. µg/m³ = micrograms per cubic meter
5. ~ = This indicates that no regulatory limit has been established for this analyte
6. U = Analyte included in the analysis, but not detected

- SITE BOUNDARY

NOTES:

1. DRAWING BASED ON JANUARY 4, 2005 SURVEY BY BIG APPLE LAND SURVEYORS, P.C. FORMER BUILDING FOOTPRINTS SHOWN FOR REFERENCE; NO STRUCTURES ABOVE THE FORMER SLAB EXIST ON THE SITE.
2. SAMPLE LOCATIONS ARE APPROXIMATE.
3. SOIL SAMPLE ANALYTICAL RESULTS ARE COMPARED TO THE NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION (NYSDEC) TITLE 6 OF THE COMPILATION OF NEW YORK CODES, RULES, AND REGULATIONS (NYCRR) PART 375 UNRESTRICTED USE SOIL CLEANUP OBJECTIVES (SCO).
4. ONLY COMPOUNDS EXCEEDING THEIR RESPECTIVE SCOs ARE SHOWN.
5. NYSDEC PART 375 UNRESTRICTED USE SCO EXCEEDANCES ARE HIGHLIGHTED AND IN BOLD.
6. DUP01_022014 IS A DUPLICATE OF SAMPLE SB04_1-3.
7. mg/kg = MILLIGRAM PER KILOGRAM
8. ND = NOT DETECTED
9. NE = COMPOUND DETECTED AT A CONCENTRATION THAT DID NOT EXCEED THE NYSDEC PART 375 UNRESTRICTED USE SCO.

QUALIFIERS:

J = DETECTED ABOVE THE METHOD DETECTION LIMIT BUT BELOW THE REPORTING LIMIT; THEREFORE, THE RESULT IS AN ESTIMATED CONCENTRATION
B = ANALYTE WAS DETECTED IN THE ASSOCIATED LABORATORY ANALYSIS BATCH BLANK
D# = RESULT IS FOR A DILUTED SAMPLE, # INDICATES THE DILUTION FACTOR

NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives

Re: Geophysical Survey Report
Commercial Property-
4430 Purves Street
Long Island City, New York 11101

Dear Mr. McMahon:

Nova Geophysical Services (NOVA) is pleased to provide findings of our geophysical survey at the above referenced project site located at 4430 Purves Street, Long Island City, New York (the "Sites"). Please see attached Geophysical Survey map for more details.

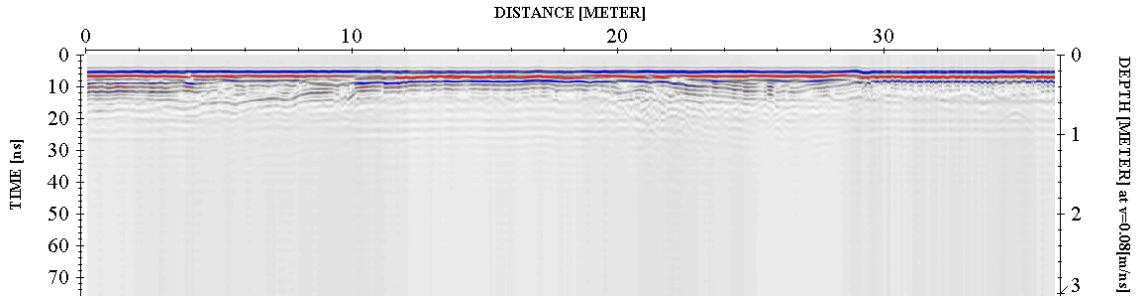
INTRODUCTION TO GEOPHYSICAL SURVEY

NOVA performed a Geophysical survey consisting of Ground Penetrating Radar (GPR), Electromagnetic (EM) surveys and comprehensive subsurface utility (CSUL) surveys at the project Site. The purpose of this survey is to clear and marked proposed environmental boring areas and to identify any anomalies, and subsurface structures located at the project site on February 19th, 2014.

The equipment selected for this investigation will be included a CSUL Pipe and Cable Locator (a magnetic detector), Ditch-Witch utility locator, Electromagnetic detector (Geonics EM61), Software and Sensor's 250 MHz ground-penetrating radar (GPR).

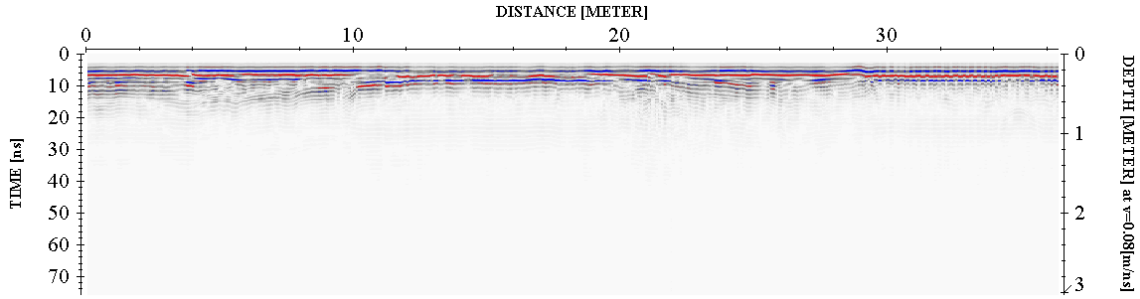
A GPR system consists of a radar control unit, control cable and a transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulses into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

GEOPHYSICAL METHODS



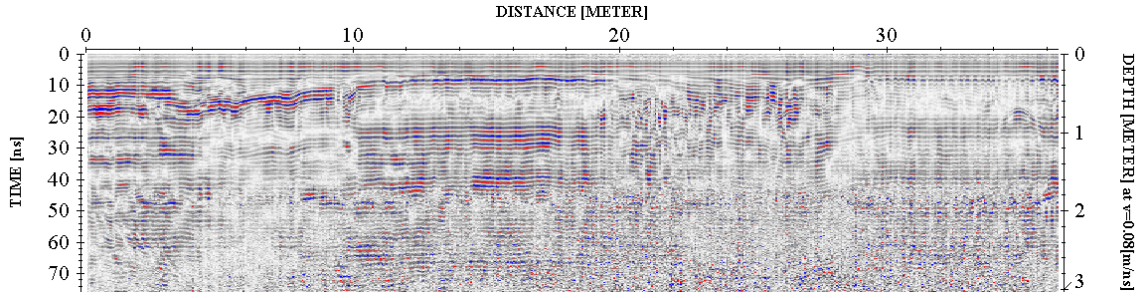
The project site was screened using the GPR by carrying the instrument over the project area at the site in 4' x 4' traverses. When evidence of anomalies were observed, they were clearly marked for further evaluation. A Ditch-witch(tm) utility locator would then be used to determine if the anomalies were utilities or other large sub-surface metal objects. Finally, GPR profiles were collected over each metal-detector anomaly and inspected for reflections, which could be indicative of major anomalies.

GPR data profiles were collected for the areas of the Site specified by the client. The surveyed area consisted of paved areas with concrete (interior of the site building) and none paved areas.

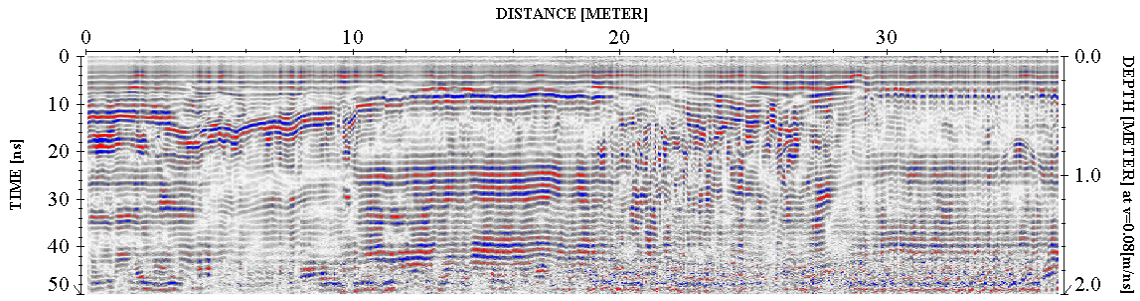


DATA PROCESSING

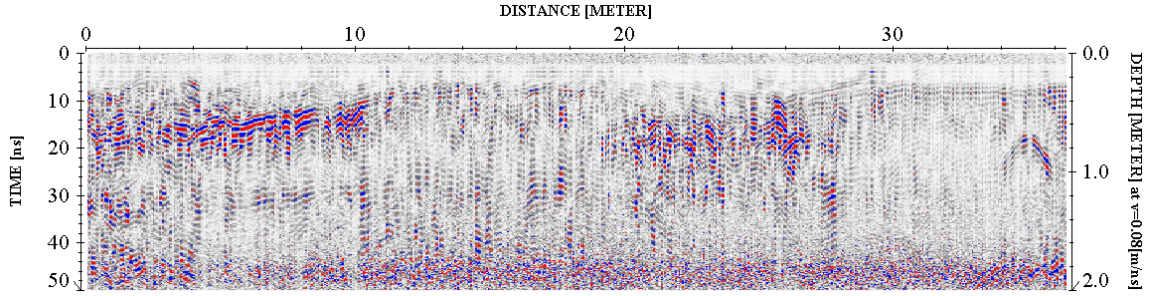
In order to improve the quality of the results and to better identify subsurface anomalies NOVA processed the collected data. The processes flow is briefly described at this section.



Step 1. Import raw RAMAC data to standard processing format



Step 2. Remove instrument noise *(dewow)*



Step 3. Correct for attenuation losses *(energy decay function)*

Step 4. Remove static from bottom of profile *(time cut)*

Step 5. Mute horizontal ringing/noise *(subtracting average)*

The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and describes the subsurface anomalies more accurately.

PHYSICAL SETTINGS

Nova observed following physical conditions at the time of the survey:

The weather: Mostly sunny
Temp: 22 degrees
Surface: None paved. Covered with approximately 2 feet of snow.
Geophysical Noise Level (GNL): Geophysical Noise Level (GNL) low to medium (existing snow and unseen dumped materials) at the time of the survey.

RESULTS

The results of the geophysical survey identified following at the project Site:

- Geophysical survey identified anomalies with the EM located along the center of the project site. Due to excessive amount of snow and other geophysical noises, Nova could not verify the nature of these anomalies. All of the identified anomalies were clearly marked during the survey.

- Geophysical survey identified minor anomalies located throughout of the project areas.

- Geophysical survey identified scattered anomalies located throughout of the project areas. All of these anomalies were consistent with surficial (approximately 1 feet bgs) metal containing materials (such as nails, jersey barriers, metal sticks, and etc.)

- Geophysical survey identified utilities located throughout of the project area. All of these anomalies (utilities) were clearly marked during the survey.
- Nova cleared and marked all of the proposed boring locations at the time of the survey.
- Geophysical Survey Plan portrays the areas investigated during the geophysical survey.

If you have any questions please do not hesitate to contact the undersigned.
Sincerely,

NOVA Geophysical Services

Levent Eskicakit, P.G., E.P.
Project Engineer

Report Date: 02/27/14

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Volatile Organics in Air

Canisters were released from the laboratory on February 20, 2014. The canister certification results are provided as an addendum.

The sample designated SV01_022114 (L1403948-01) had a RPD for the pre- and post-flow controller calibration check (39% RPD) that was outside of the control limit (20% RPD). The initial flow rate for the flow controller was 18 mL/minute; the final flow rate was 12.1 mL/minute. The final pressure recorded by the laboratory of the associated canister was -11.3 inches of mercury.

The sample designated SV04_022114 (L1403948-03) had a RPD for the pre- and post-flow controller calibration check (32% RPD) that was outside of the control limit (20% RPD). The initial flow rate for the flow controller was 18 mL/minute; the final flow rate was 13.1 mL/minute. The final pressure recorded by the laboratory of the associated canister was -3.4 inches of mercury.

There was a note on the chain of custody form to not analyze the samples designated SV02_022114 and SV05_022114.

Sample L1403948-02 has elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

Samples L1403948-03 and -06 results for Acetone should be considered estimated due to co-elution with a non-target peak.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Christopher J. Anderson

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
C	- Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
D	- Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
E	- Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
G	- The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.
H	- The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
I	- The lower value for the two columns has been reported due to obvious interference.

Report Format: Data Usability Report

Project Name:	Not Specified	**Lab Number:**	L1403948
Project Number:	170282501	**Report Date:**	02/27/14

Data Qualifiers

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

J - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the reporting limit (RL) for the sample.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

Last revised December 11, 2013

The following analytes are not included in our NELAP Scope of Accreditation:

Westborough Facility
EPA 524.2: Acetone, 2-Butanone (Methyl ethyl ketone (MEK)), Tert-butyl alcohol, 2-Hexanone, Tetrahydrofuran, 1,3,5-Trichlorobenzene, 4-Methyl-2-pentanone (MIBK), Carbon disulfide, Diethyl ether.
EPA 8260C: 1,2,4,5-Tetramethylbenzene, 4-Ethyltoluene, Iodomethane (methyl iodide), Methyl methacrylate, Azobenzene.
EPA 8330A/B: PETN, Picric Acid, Nitroglycerine, 2,6-DANT, 2,4-DANT.
EPA 8270D: 1-Methylnaphthalene, Dimethylnaphthalene,1,4-Diphenylhydrazine.
EPA 625: 4-Chloroaniline, 4-Methylphenol.
SM4500: Soil: Total Phosphorus, TKN, NO2, NO3.
EPA 9071: Total Petroleum Hydrocarbons, Oil & Grease.

Mansfield Facility
EPA 8270D: Biphenyl.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

The following analytes are included in our Massachusetts DEP Scope of Accreditation, Westborough Facility:

Drinking Water
EPA 200.8: Sb,As,Ba,Be,Cd,Cr,Cu,Pb,Ni,Se,Tl; **EPA 200.7**: Ba,Be,Ca,Cd,Cr,Cu,Na; **EPA 245.1:** Mercury;
EPA 300.0: Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B**
EPA 332: Perchlorate.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, Enterolert-QT.**

Non-Potable Water
EPA 200.8: Al,Sb,As,Be,Cd,Cr,Cu,Pb,Mn,Ni,Se,Ag,Tl,Zn;
EPA 200.7: Al,Sb,As,Be,Cd,Ca,Cr,Co,Cu,Fe,Pb,Mg,Mn,Mo,Ni,K,Se,Ag,Na,Sr,Ti,Tl,V,Zn;
EPA 245.1, SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2340B, SM2320B, SM4500CL-E, SM4500F-BC, SM426C, SM4500NH3-BH, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **SM4500NO3-F, EPA 353.2**: Nitrate-N**, SM4500NH3-BC-NES, EPA 351.1, SM4500P-E, SM4500P-B, E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, SM14 510AC, EPA 420.1, SM4500-CN-CE, SM2540D.**
EPA 624: Volatile Halocarbons & Aromatics,
EPA 608: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs
EPA 625: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045**: PCB-Oil.
Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9222D-MF**.

Technical Report

prepared for:

Langan Engineering & Environmental Services (NYC)
21 Penn Plaza, 360 West 31st Street
New York NY, 10001
Attention: Gerald Nicholls

Report Date: 02/28/2014
Client Project ID: 170282501
York Project (SDG) No.: 14B0579

Report Date: 02/28/2014
Client Project ID: 170282501
York Project (SDG) No.: 14B0579

Langan Engineering & Environmental Services (NYC)
21 Penn Plaza, 360 West 31st Street
New York NY, 10001
Attention: Gerald Nicholls

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on February 21, 2014 and listed below. The project was identified as your project: **170282501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14B0579

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
GC-Surr	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the alternate surrogate.
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on February 21, 2014 and listed below. The project was identified as your project: **170282501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14B0543

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

S-06	The recovery of this surrogate is outside control limits due to sample dilution required from high analyte concentration and/or matrix interferences.
S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
Rep-01	The Reporting Limit for this analyte has been raised to account for matrix interference.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on February 20, 2014 and listed below. The project was identified as your project: **170282501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14B0504

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-MISpk	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The SRM was within acceptance limits, therefore data are acceptable.
M-BCCB	Analyte in CCB > MDL. Sample conc. >10 X blank conc.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
GC-Surr	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the alternate surrogate.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for averge Rf or >20% Drift for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis

Low Bias — Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

WELL CONSTRUCTION SUMMARY

Well No. MW01

PROJECT 4430 Purves Street	**PROJECT NO.** 170282501
LOCATION Long Island City, NY	**ELEVATION AND DATUM** Approx. 9.9 feet BPQD
DRILLING AGENCY Laurel Environmental Services, Ltd.	**DATE STARTED** 2/19/2014 **DATE FINISHED** 2/19/2014
DRILLING EQUIPMENT Geoprobe 6610DT	**DRILLER** Steve Bitetto
SIZE AND TYPE OF BIT 4" I.D. Auger	**INSPECTOR** Paul McMahon

METHOD OF INSTALLATION

Advance augers to 14 feet bgs. Insert 10' PVC prepack screen and 4' PVC riser into the borehole. Pour #2 Morie filter sand into the annulus to a depth of 2.5 ft bgs. Install 1.5' hydrated bentonite seal above the sand filter. Backfill and place well cover in cement mix.

METHOD OF WELL DEVELOPMENT

Surged and purged with a Monsoon pump until recharge was observed and water became clear. Total purge volume = 15 gallons

TYPE OF CASING PVC	**DIAMETER** 2"	**TYPE OF BACKFILL MATERIAL** Soil Cutttings and filter sand

9:54	6.75	1.590	10.9	1.32	12.64	104	800	6.40	Average Purge Rate ~ 600 mL/min
9:56									Start Sampling

NOTES:

1. Stabilization is achieved after all parameters have stabilized for three successive readings.
2. Dissolved Oxygen stabilization = 10% for values greater than 0.5 mg/L, if three Dissolved Oxygen values are less than 0.5 mg/L, consider the values as stabilized)
3. Turbidity (10% for values greater than 5 NTU; if three Turbidity values are less than 5 NTU, consider the values as stabilized)
4. The pump's flow rate must be able to "turn over" at least one flow-through-cell volume between measurements (every five minutes). Flow cell volume for the Horiba U-52 is 250 mL.

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.

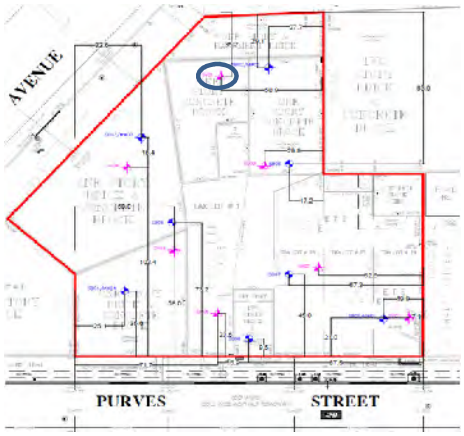
APPENDIX G

SOIL VAPOR SAMPLING LOG SHEET

Sample Number: SV01

PROJECT: 4430 Purves Street	**PROJECT NO.:** 170282501
LOCATION: Long Island City, New York	**SURFACE ELEVATION AND DATUM:** Approx. 8.3 feet BPQD
DRILLING FIRM OR LANGAN INSTALLER: Laurel Environmental Services, Ltd.	**INSTALLATION DATE STARTED:** 2/21/2014 **DATE FINISHED:** 2/21/2014
INSTALLATION FOREMAN: Steve Bitetto	**SAMPLE DATE STARTED:** 2/21/2014 **DATE FINISHED:** 2/21/2014
INSTALLATION EQUIPMENT: Geoprobe 6610DT	**TYPE OF SAMPLING DEVICE:** 2.7-Liter Summa® Canisters
INSPECTOR: Paul McMahon	**SAMPLER:** Patrick Farnham
POTENTIAL SAMPLE INTERFERENCES: Drill Rig Activity, high moisture content in soil due to significant snow melt	**WEATHER CONDITIONS (PRECIP., TEMP., PRESS., WIND SPEED AND DIR.):** 30's °F, Fog, Humidity=93%



METHOD OF INSTALLATION AND PURGING:
Drill a 1.25-inch diameter steel probe rod to 4 feet bgs. Insert 6" steel soil vapor implant with attached tubing. Pour #2 Morie filter sand into the annulus to approximately 1 foot bgs. Seal with hydrated bentonite. Purge with a miniRAE 3000 PID at a rate of 200 mL/min for approximately 1 minute.

TUBING TYPE/DIAMETER: Poly (1/4" OD, 3/16" ID)	**TYPE OF MATERIAL ABOVE SEAL:** N/A
IMPLANT SCREEN TYPE/LENGTH/DIAMETER: 6" Stainless Steel	**SEAL MATERIAL (Bentonite, Beeswax, Modeling Clay, etc.):** Bentonite
BOREHOLE DIAMETER: 1"	**FILTER PACK MATERIAL (Sand or Glass Beads):** #2 Morie Sand

PURGE VOLUME (L):	0.20
PURGE FLOW RATE (ML/MIN):	200
PID AFTER PURGE (PPM):	0.0

INTRODUCTION

This geotechnical engineering study was prepared by Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) to provide recommendations for the foundation design and construction for the proposed residential/commercial building at 4430 Purves Street in Long Island City, NY. All services were performed in accordance with our original proposal dated 5 December 2012 and subsequent proposal dated 1 May 2014.

Elevations presented herein, are taken from a topographic and boundary survey prepared by Apple surveying dated 11 April 2014, and are with respect to the North American Vertical Datum of 1988 (NAVD88[1]).

The evaluation and recommendations presented herein are based on a review of conceptual plans received from FXFOWLE Architects and Gotham, borings performed by Soil Mechanics Drilling Corp in 2006, and results of our field investigation in 2008. Proposed building elevations were taken from the schematic architectural drawings dated 14 March 2014, which are reference to BPQD and project datum.

The following sections provide a description of the project and subsurface conditions, and an evaluation of the conditions with respect to the geotechnical aspects of the proposed construction. Analyses and recommendations presented herein are in accordance with the New York City Construction Codes, LL33/2007 and LL99/2005, that became effective in July 2008 (the Building Code).

PROJECT DESCRIPTION

Existing Conditions

The irregular-shaped site is located in the southern part of the city block bordered by Purves Street on the east, Thomson Avenue on the south, Jackson Avenue on the north, and 44th Drive on the west. The site is currently a vacant lot with a total footprint of about 26,800 square feet. The sidewalk grades drop south from about el 11 to el 9.5 NAVD88 along Purves Street, and about el. 31 to el. 23.5 NAVD88 along Thomson Avenue and 44th Drive, dipping north. The site grade is generally at about el 11 NAVD88. A site location map is presented as Drawing No. 1.

[1] North American Vertical Datum (NAVD88), which is 1.095 feet above National Geodetic Vertical Datum (NGVD29) at Sandy Hook, New Jersey (NAVD 88 = NGVD1929 - 1.095).

Adjacent Structures

The site is abutted on the northwest by a 2-story building (27-21 44th Drive), on the northeast by an open vacant lot, on the southeast by a 3-story building (44-46 Purves Street), on the southwest and west by existing retaining walls.

From the test pit excavation findings, the bottom of foundation at the 27-21 44th Drive building was at about el 4.5 NAVD88. The bottom of foundation at the 44-46 Purves Street building was between about el 4.5 and el 6 NAVD88. Along the southwest retaining wall, a 1-foot-thick remnant building foundation, which extended 4 feet perpendicularly from the retaining wall, was encountered; the bottom of this remnant was at about el 2.5 NAVD88. Along the west retaining wall, a 2.5-foot-thick remnant building pile cap, which extended 3 to 5 feet perpendicularly from the retaining wall, was encountered. Below the bottom of this remnant, timber piles of about 10- to 12-inch-diameter were exposed. The bottom elevation of this remnant was at about el 5.5 NAVD88. The bottom of the retaining walls was not exposed and not determined during the test pit excavation.

From the historical record drawings prepared by Pennsylvania Tunnel & Terminal Railroad Company dated 31 December 1910, which showed the bottom elevation of the retaining walls along Thomson Avenue and 44th Drive to be at el 297 (Pennsylvania Railroad Tunnels Datum[2]), corresponding to el -1.5 NAVD88. Three to five rows of timber piles, which were about 3-foot center-to-center, were shown below the retaining walls. The historical contract and record drawings are presented in Appendix A.

FEMA Flood Maps

In December 2013, FEMA released preliminary Flood Insurance Rate maps (FIRM) which incorporate updated flood hazard models. In January 2014 Local law 96/2013 from the New York City Department of Buildings (DOB) went into effect and allows the base flood elevation to be designed from the worst case between the FEMA FIRM 2007 and preliminary FIRM. According to the FIRM, the site is within Flood Zone X, which is an area with a 0.2% chance of having the 100-year flood (every year). The base flood elevation (BFE) for the nearby Zone AE (about 1 block southwest of the site) was shown to be at el 10 NAVD88. Considering this proximity, we recommend that the Design Flood Elevation (DFE) for this site is equal to the BFE at el 10 NAVD88. A copy of the FIRM is presented as Drawing No. 2.

[2] Pennsylvania Railroad Tunnels Datum (PRTD), which is 298.375 feet above North American Vertical Datum of 1988 (NAVD88) (NAVD88 = PRTD - 298.375).

Proposed Construction

According to the schematic design, the proposed development will consist of two buildings – Building A, a 33-story tower facing Purves Street, and Building B, a 3-story building facing Thomson Avenue and 44th Drive. The two buildings will be connected by an enclosed passageway and outdoor terrace. The buildings will not have cellar levels. The ground floor elevation is about el 10.625 NAVD88.

According to the schematic design sketch of the foundation plan, updated 3 March 2014, the column loads for Building A range between 1,600 and 2,800 kips. The shear wall loads have not been determined for Building A. The column loads for Building B range between 400 and 800 kips. The shear wall loads have not been determined for Building B, but these are smaller areas comparing to the Building B footprint. We estimate total load for Building B is about 200,000 kips and averaged pressure of about 1.2 kips per square feet (ksf).

Site Geology

The site is located in the Borough of Queens which lies within the Atlantic Coastal lowlands physiographic province of New York State, an area which includes all of Long Island. The last glacial advance and retreat in New York City are primarily responsible for the present day surface features and topography. The southern most advance of the glacial ice sheet through Queens County is marked by the Harbor Hill moraine, a ridge or mound composed of unsorted, unstratified glacial drift, formed by the direct action of the glacial ice. The area to the north of the moraine is underlain by deposits known as ground moraine that consists of glacial outwash till, a mixture of rock debris ranging in size from clay to boulders.

The USGS "Bedrock and Engineering Geologic Maps of New York County and Parts Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" indicates that the bedrock underlying the site consists of fine to coarse grained, gray to tan-weathering, quartzofeldspathic, muscovite-biotite-garnet schist. A site geology map is presented as Drawing No. 3.

SUBSURFACE INVESTIGATION

The following sections describe the subsurface investigation consisted of drilling borings, installing observation wells, excavating test pits, performing seismic cone penetration tests, and laboratory tests on selected soil samples. A subsurface investigation plan is presented as Drawing No. 4.

Borings

2006 – Soil Mechanics Drilling Corp.

Three borings, identified as SB-1, SB-2 and SB-3, were performed in 2006 by Soil Mechanics Drilling Corp. The borings were advanced to a depth of 47 to 52 feet below existing grade. Groundwater level was measured inside the drill casing at the completion of each borehole.

2008 – Langan

Langan's 2008 investigation consisted of drilling 17 borings, and installing 3 observation wells.

Soil samples were examined visually and classified in the field in accordance with the Unified Soil Classification System (USCS), and assigned classification numbers in accordance with the 2008 New York City Building Code (Building Code). Soil classifications, Standard Penetration Resistances (N-values), and other field observations were recorded on field logs. Langan's borings logs are presented in Appendix B.

Seventeen borings, identified as B-1 through B-17 were drilled with Mobile B-61 truck-mounted drill rigs. Standard Penetration Tests (SPT)[3] and split spoon sampling (ASTM D1586-99) were performed continuously in the upper 12 feet (or through the fill layer) and at 5-foot intervals thereafter to the termination depth of the borings. Boring depths ranged between 53 and 75 feet below existing ground surface. A subsurface investigation location is presented as Drawing No. 4.

Rock was cored in all borings using an NX-sized double core barrel with a diamond cutting bit. Rock type, percent core recoveries (REC)[4], and Rock Quality Designation (RQD)[5] values were determined based on the length and quality of the rock core retrieved from each core run.

Observation Wells

Three groundwater observation wells were installed in completed borings B-4 (OW), B-10 (OW) and B-16 (OW). The observation wells consisted of a 10-foot-long section of 2-inch-diameter PVC screen and about 18- to 25-foot-long section of solid 2-inch-diameter PVC riser pipe. The completed wells were backfilled with No. 1 sand, and sealed with a 2-foot-long bentonite plug

[3] The Standard Penetration Test is a measure of the soil density and consistency. The SPT N-value is defined as the number of blows required to drive a 2-inch-outer-diameter split-spoon sampler 12 inches, after an initial penetration of 6 inches, using a 140-pound hammer free falling from a height of 30 inches.

[4] The core recovery is the ratio of the length of rock recovered to the total core run length, expressed as a percent.

[5] The RQD is defined as the ratio of the summation of each rock piece greater than 4 inches for NX-cores to the total core run length, expressed as a percent.

to prevent surface runoff from influencing the wells. The remaining sections of the wells were backfilled with soil cuttings. Well construction logs are also presented in Appendix B.

Test Pit Investigation

In 2008, two test pits, TP-1 and TP-2, were excavated to determine the type, condition and depth of the Thomson Avenue and 44th Drive retaining wall or remnant building foundations. Test pit locations are shown on Drawing No. 4. The conditions were documented in the field with sketches and photographs.

In 2014, eight additional test pits, TP-3 through TP-10, were excavated to determine the type, condition and depth of the remnant building foundation along Thomson Avenue and 44th Drive retaining wall, as well as adjacent building foundations. The conditions were documented in the field with sketches and photographs.

The test pit locations are shown on Drawing No. 4. Refer to Appendix C for test pit descriptions, sketches, and photographs.

Laboratory Testing

Ten selected soil samples from the borings were sent to the laboratory to determine their engineering properties. The laboratory testing program consisted of:

- Six sieve analyses (ASTM D6913)
- Ten water-content determinations (ASTM D2216)
- Four liquid and plastic limit determination - Atterberg Limits (ASTM D4318).

The laboratory data is presented in Appendix D.

Seismic Cone Penetration Tests

Seismic cone penetration tests (SCPT[6]) and cone penetration tests (CPT[7]) were performed at six locations to evaluate the in situ geotechnical criteria of the soils underlying the proposed new building. The tests are denoted as SCPT-1 through SCPT-4, CPT-5, and CPT-6. All tests were performed in accordance with ASTM 5778 by ConeTec, Inc. on 15 April 2013. The test locations were pushed to refusal to depths ranging from 44.6 to 49.5 feet below existing grade.

[6] Seismic testing to measure shear wave velocity (V_s) was performed at CPT locations at 3.3-foot intervals by generating vibrations at the ground surface and recording seismic signals at a geophone mounted with the cone apparatus.

[7] Cone penetration testing consists of pushing an instrumented stainless-steel cone through soil using hydraulic pressure, while collecting data continuously. Data collected includes tip resistance, side friction along the cone, and pore water pressure.

CPT and SCPT locations are shown on Drawing No. 4. The ConeTec SCPT data report is provided in Appendix E.

SUBSURFACE CONDITIONS

The general subsurface stratigraphy consists of a layer of sandy fill, overlaying successive strata of silty sands, silts, clays, decomposed rock, and finally bedrock. The 2008 Langan borings were all terminated in bedrock. Representative subsurface profiles are provided in Drawings No. 5 through 8. A detailed description of each stratum is given below in order of increasing depth.

Fill [Class 7][8]

A layer of the uncontrolled fill, generally consisting of black coarse sand, some gravel with varying amounts of brick and concrete covered the site. The thickness of the fill layer varies from about 5 to 9 feet. N-values for the fill varied from about 3 to 72 blows per foot (bpf), averaging 7 bpf. The large N-values are due to the variable nature of the uncontrolled fill, and the presence of obstructions that impeded the split spoon sampler (i.e., gravel, concrete, brick, etc.).

Shear-wave velocities were not recorded in the top part of the fill layer because the cone tip is not able to advance past obstructions. The measured shear wave velocities in the bottom part of the fill layer varied from about 270 to about 450 feet per second (fps) with an average of about 400 fps.

The uncontrolled fill is designated as Building Code Class 7 material, controlled and uncontrolled fills (formerly Class 11-65).

Sand [Classes 3b and 6]

Underlying the fill is a layer of brown loose to medium-dense sand with varying amounts of silt and gravel. This stratum is about 7- to 14-foot thick. N-values vary from about 0 to 17 bpf, with an averaged N-value of about 5 bpf, indicating a loose to medium dense deposit. Shear wave velocities recorded in this layer varied from about 400 to 550 fps with an average of about 475 fps.

[8] Numbers in brackets that follow the material designation indicate classification of soil and rock materials in accordance with the NYC Building Code.

Sieve analysis and water content determination were performed on representative samples. Based on the sieve tests, the silty fine sand has a fine content averaging about 19%. The water content ranges from 14% to 25%, averaging about 21%.

The sand is classified as SM, in accordance with USCS and is designated as Building Code Classes 3b and 6, medium to loose granular soil (formerly Class 7-65).

Silt [Classes 5b and 6]

Brown silt to clayey silt was found underlying the sand. This stratum is about 5- to 27-foot thick, with an average thickness of about 20 feet. N-values range from about 2 to 27 bpf, with an averaged N-value of about 8 bpf, which is indicative of a soft to medium-stiff deposit. Shear wave velocities recorded in this layer varied from about 490 to 930 fps with an average of about 710 fps.

Water content determination and sieve analysis were performed on a representative sample. The water content was about 30%. Based on the sieve tests, the silt has a fine content averaging about 40%.

The soil is classified as ML, clayey silt to silt in accordance with USCS and is designated as Building Code Classes 5b and 6, Medium to loose silt (formerly Class 10-65).

Clay [Classes 4b, 4c, and 6]

Underlying the silt and above the rock a layer of brown clay was encountered. This stratum is about 10- to 15-foot thick and was encountered in all borings except B-17. N-values varied from 1 to 24 bpf, with an averaged N-value about 9 bpf, indicating a soft to medium stiff deposit. Shear wave velocities recorded in this layer varied from about 670 to 1300 fps with an average of about 830 fps.

Water content determination and liquid and plastic limits performed on representative samples. Water content ranged from 22% to 31%, averaging about 26%. The liquid limit values ranges from 25 to 39, averaging about 33 and plastic index values ranged from 5 to 15, averaging about 8.

The clay is classified as CL, clay, in accordance with USCS and is designated as Building Code Classes 4b to 6, stiff to soft clay (formerly Class 9-65).

Decomposed Rock [Class 1d]

Decomposed rock was encountered in borings B-9, B-10 (OW), B-11 and B-14 from about 44 to 48 feet below grade. The decomposed rock is a very dense fine to medium sand and mica residual soil that results from weathered of the rock mass. The weathered rock displays the visual characteristics of the parent rock (color, grain size, etc.), but easily breaks down to soil type material. The thickness of the decomposed rock varied from 4 to 10 feet. Shear-wave velocities were not recorded in the till layer because the cone tip could not advance through this layer.

The decomposed and weathered rock stratum is designated as Building Code Class 1d, soft rock (formerly Class 4-65).

Bedrock [Classes 1a, 1b, 1c]

Gray white schist bedrock was encountered at depths ranging between about 43 and 61 feet below the ground surface. The top of rock elevation roughly ranged between about el -35 and el -55 NAVD88. A rock contour plan is presented as Drawing No. 9. The rock core recovery ranged between 35 and 100%, with an average of 97% and the associated RQD values ranged between 25 and 100%, with an average of 94%.

The bedrock is designated as Building Code Classes 1a, 1b and 1c material, Hard sound rock to intermediate rock (formerly Classes 1-65, 2-65 and 3-65).

Groundwater

The groundwater level was measured in borings B-4 (OW), B-10 (OW), and B-16 (OW). The measured groundwater depths ranged between 8 and 10 feet below the sidewalk grade, corresponding to el 3 and el 1 NAVD 88.

RECOMMENDATIONS

The following sections discuss the subsurface conditions identified by the geotechnical investigation as they relate to, or impacted by, the proposed foundation design and construction. Our recommendations for foundation systems, seismicity, foundation walls, and groundwater control are presented herein.

Seismic Evaluation

This section presents the results of our seismic evaluation for the site relative to the provisions outlined in the Building Code. The following subsections provide recommended parameters for use in seismic design of the propose structure.

Mapped Spectral Accelerations

Per section 1615.1 of the Building Code, the mapped maximum considered earthquake response spectra for the short period (Ss) is 0.365g and the 1-second period (S1) is 0.071g.

Site Class

The shear wave velocities ranged between 275 and 1306 feet per second (fps), with averaged shear wave velocities of 744 to 807 fps. These average shear wave velocities correspond to site class D in accordance with Table 1615.1.1 of the Building Code, and the site coefficients for short period (F_a) is 1.51 and for 1-second period (F_v) is 2.4. It's our judgment that the SCPTs data reflects the actual seismic condition more than that of the SPTs result. Therefore, site class D should be used for seismic design.

Design Spectral Response Accelerations and Seismic Design Category

Design spectral accelerations were determined in accordance with section 1615.1.3 of the Building Code. The design spectral acceleration at short periods (S_{DS}) is 0.367g and 1-second period (S_{D1}) is 0.114g.

Based on the above design spectral acceleration and the use group/occupancy category of the structure (identified as Seismic Use Group I and Structural Occupancy Category II by the Design Team), the correspondent Seismic Design Category (SDC) is identified as "C", in accordance with section 1616.3 of the Building Code.

Liquefaction Potential

The Building Code requires that non-cohesive soils below the groundwater table and less than 50 feet below the ground surface be assessed for potential soil liquefaction. The uncorrected SPT N-values versus depth were plotted on the Building Code liquefaction assessment diagram presented as Drawing No. 10. More than half of the applicable SPT N-values fall within the Building Code "Liquefaction Probable" category.

The potential for soil liquefaction was then evaluated using the procedure outlined by Youd et al. (2001). The Youd et al. evaluation is currently considered to be the state-of-practice procedure for liquefaction evaluation, as recommended by the National Earthquake Hazard Reduction Program (NEHRP). This evaluation employs an empirical relationship between the earthquake demand, represented by the Cyclic Stress Ratio (CSR), and the soil's resistance to dynamic loading, represented by the Cyclic Resistance Ratio (CRR). The CSR is correlated to the Peak Ground Acceleration (PGA) of the design earthquake event, as well as the in-situ soil stresses, whereas the CRR is correlated to SPT N-values obtained in the field and corrected as required. The field N-values are converted to $N_{1,60,cs}$ by applying various correction factors to account for soil overburden pressure, hammer energy efficiency, borehole diameter, rod length, sampler lining, and percent fines.

Our analysis parameters included a Magnitude 5.71 earthquake event, a Peak Ground Acceleration of 0.147g, and a Magnitude Scaling Factor of 2.0. A plot of the factor of safety with depth using the Youd et al. (2001) procedure is presented as Drawing No. 11. Most data points have a factor of safety greater than 1.25. Therefore, in our judgment, the potential for liquefaction need not be considered in the foundation design.

Foundation System

The uncontrolled fill and the underlying loose sandy, soft silt, and clay materials are not suitable for support of a shallow foundation system; excessive total and differential settlements may develop.

A deep foundation system is recommended for the buildings to transfer the building loads to the underlying bedrock. Small-diameter caisson piles (mini-caissons) socketed into the bedrock or end bearing piles driven to bedrock are feasible foundation. Various sizes and allowable design capacities are presented in Table 1:

Table 1:

Design Compressive Capacity (tons)	Design Tensile Capacity (tons)	Casing Outside Diameter (inch)	Minimum Casing Wall Thickness (inch)	Rock Socket Length (ft)	Concrete Fill 28-day Strength (psi)	Reinforcing (Grade 75)
500	165	18	1/2	10	6,000	6 #18
750	250	24	1/2	10	6,000	3 #24
1000	330	24	1/2	15	6,000	6 #24

* The rock socket length does not include the first foot for fractured/uneven rock

Drilled Caissons

A drilled caisson socketed into rock would provide both axial compression and tension resistance. Drilled caissons are installed by drilling an open-ended pipe (casing) through the overburden soils, installing steel casing sections as the borehole is advanced. The casing should be seated at least 1 foot into sound schist bedrock and then the rock socket continued (uncased) to the design depth. In competent rock, the socket diameter is generally slightly smaller than the inside diameter of the casing. The casing and socket are then filled with concrete and steel reinforcing core (rebar and/or beam) is added as required to achieve the structural capacity. The Building Code limits the structural capacity of a caisson to 33% of the grout design compressive strength, and 50% of the reinforcing core steel yield strength. The pile should be proportioned assuming the entire pile load is transferred to the rock socket.

For rock socket design, an allowable grout/rock adhesion of 200 psi should be used for compressive capacity of the sound schist bedrock (Class 1b or better). For uplift resistance, a side shear of 100 psi should be used.

The drilled caissons should be installed in the areas that are within 25 feet of the existing adjacent buildings.

Considerations for dewatering, cleaning, and inspection of the drilled sockets must be addressed by the Contractor. The bottom of the drilled sockets must be cleaned of all loose debris and sediment prior to grout placement. Internal videotaping of the caisson rock socket can be performed in lieu of a static load test. During the grout placement within the caissons, it is also important that no air voids occur. Prior to any foundation work, the contractor should submit shop drawings for the drilled caisson, including casing size, wall thickness, socket length, and methods of cleaning and inspection procedures.

Driven Piles

Driven piles are one of the most commonly used types of deep foundation systems in the New York City area. Driven piles typically consist of steel, concrete or composite members ranging from 8 to 18 inches in diameter, and are installed into the ground by repeated impacts with a high energy hammer. Possible piles are:

Grade 50 HP14x89 H-pile should provide a 150-ton capacity and HP14x117 H-pile should provide a 200-ton capacity when driven to bedrock. All H-piles should be fitted with protective points such as the Hard-Bite manufactured by Associated Pile Fitting Corp., or equivalent.

As discussed herein, the uplift capacity of the driven piles will be derived from the shear resistance between the pile and the uncontrolled fill, sand, silt and clay. The uplift capacity of the piles will be minimal due to the loose to medium dense materials. Therefore, we recommend a pile uplift capacity of 10 tons, with drilled tie-down anchors providing the balance of the required resistance (see below). Load tests could be performed to verify the pile uplift capacity.

Index Piles and Load Tests

The use of driven piles as a foundation element will require axial compression load tests. Index piles should be installed to the required tip elevation, and pile load tests should be performed prior to installation of production piles. The index piles are necessary to more accurately determine pile lengths, identify unusual conditions, and establish production installation criteria. We recommend a minimum of 10 index piles are installed.

Based on the proposed building footprint, two compression load tests are necessary to satisfy the requirements of the Building Code, to be performed in accordance with ASTM D1143 and the requirements of the Building Code. The test load must be applied in seven increments to a proof load of twice the design load, and sustained for a period of not less than 12 hours for the 150-ton piles and 24 hours for the 200-ton piles.

Drilled piled will not require axial compressive load testing, provided:

1) the piles are socketed into bedrock; and

2) the rock sockets are video inspected prior to concrete / grout placement.

Pile Uplift Capacity

We estimate that the recommended driven pile will develop an allowable axial tension (uplift) capacity of about 10 to 15 percent of axial capacity. The recommended drilled-in pile will develop an allowable uplift capacity of about 30 to 35 percent of axial capacity. The uplift capacity of the piles will also need to be substantiated with at least one static uplift test performed in accordance with ASTM D3689. The proof load shall be twice the design load. The load should be applied in seven increments of at least 1 hour, with the proof load sustained for a period of at least 12 hours. The pile butt movement during the last hour of sustained loading shall not exceed 0.01 inch.

Pile Lateral Capacity

Per the Building Code, the maximum allowable lateral load of a pile is 1 ton, unless verified by lateral load test. If an allowable lateral capacity greater than 1 ton is required, then load-tests performed in accordance with ASTM D3966 should be performed. The maximum allowable lateral load shall not be more than one-half the test load producing a gross lateral movement of 1 inch at the ground surface.

The recommended allowable lateral capacities of an 18-inch-diameter caisson pile are 3 tons for the free-head condition and 8 tons for the fixed-head condition. The recommended allowable lateral capacities of a 24-inch-diameter caisson pile are 6 tons for the free-head condition and 14 tons for the fixed-head condition. The recommended allowable lateral capacities of the HP14x89 and HP14x117 are 2 tons for the free-head condition and 6 tons for the fixed-head condition. Capacities will need to be re-evaluated for group effects after the pile locations are finalized by the structural engineer.

Waterproofing

The groundwater level was measured to be at about 9 feet below ground surface or about el 2 NAVD88. We recommend waterproofing the slabs and walls with sheet-membranes (product such as those manufactured by Grace) to the DFE of el 10 NAVD88. The use of bentonite waterproofing or negative side crystalline waterproofing is not recommended.

The substrata to receive horizontal waterproofing should be a 3-inch-thick concrete working surface (mud-mat). Vertical waterproofing should be protected with a rigid barrier to prevent damage during backfilling operations. Outboard of the membrane waterproofing, the foundation walls should be protected with drainage panels for the full height of the wall. The drainage panels must be secured in place with the filter fabric side against the soil. Joints in the filter material should be carefully taped to prevent concrete or soil from entering the drainage matrix. Any punctures or tears in the drainage panels and waterproofing membrane must be repaired, and penetrations by utilities should be carefully sealed in accordance with the manufacture's recommendations.

Slab Support

The ground floor slab should be designed as a structural slab that integrated with the pile foundations. The structural slab must be designed to resist the hydrostatic uplift pressures resulting from the DFE of el 10 NAVD88.

Permanent Below Grade Walls

Permanent below grade walls should be designed to resist static and dynamic earth pressures, surcharge and hydrostatic pressures associated with a utility break or periods of heavy precipitation. The static lateral earth pressure diagrams are shown in Drawing No. 12.

Static Earth Pressures

The recommended design lateral earth pressure diagram has a triangular distribution using an equivalent fluid weight of 60 psf per foot of depth of soil. An equivalent fluid unit weight of 100 psf per foot of depth should be used below the design groundwater level. We recommend that a vertical surcharge load of 600 psf be considered for all perimeter below-grade walls (fire-truck loading). Lateral pressures from surcharge loads should have a uniform distribution based on a pressure equal to 50 percent of the vertical pressure acting against the full height of the wall.

The foundation walls along the Thomson Avenue and 44th Drive retaining walls should be able to withstand the abovementioned static earth pressures in the case of future retaining wall failures or removal.

Dynamic Earth Pressure

In accordance with Section 1802.2 of the Building Code, dynamic earth pressures need not be considered in design for structures assigned to SDC C.

Temporary Support of Excavation

The proposed parking garage along the retaining walls will be at the ground floor level. From the referenced architectural drawings, the top of slab elevation is at el 10.625 NAVD88, however, the team is currently considering lowering the garage floor 1 foot. With the thickness of the proposed floor slab, the general excavation in front of the existing retaining wall is assumed to be at about el 8.5 NAVD88, which is about 2.5 feet below existing grade. It's our judgment that there's no stability issue of the retaining wall with this excavation depth. However, any proposed changes in the excavation depths should be brought to Langan's attention as soon as possible so that we can re-assess the stability of the retaining walls.

Also, the extents of excavation for environmental remediation were not determined at this time. A support of excavation system of the existing retaining walls will have to be designed if the soil in front of the wall is not sufficient to provide adequate lateral earth pressure for the existing retaining wall.

Utility Support

Utilities constructed below ground-level floor slabs may be subjected to settlement resulting from consolidation of the underlying compressible organic clay layer. Therefore, we recommend that integrated utility chases (trenches) be cast into the slab to accommodate the utilities. Alternately, utilities could be hung from the structural slabs. In the later case, utility lines and their supports would require adequate strength to carry the weight of the utility and soil cover. At the locations where utility pipes transition from the pile-supported building to on-grade support, flexible connections should be considered.

OTHER GEOTECHNICAL RECOMMENDATIONS

Backfill and Compaction

Fill used for backfill under the floor slabs, around pile caps or pits should be free of organic, frozen, and other deleterious materials, and should have a maximum particle size no greater than 4 inches. It should also contain no more than 10 percent by dry weight passing the No. 200 sieve. The existing on-site uncontrolled fill is unsuitable for reuse as controlled fill.

Controlled fill should be placed in uniform 12-inch-thick loose lifts and compacted to at least 95 percent of its maximum dry unit weight as determined by ASTM D1557. In restricted areas where only hand-operated compactors can be used, the maximum loose lift thickness should be limited to about 6 to 8 inches. No fill should be placed on areas with free-standing water or frozen subsoil.

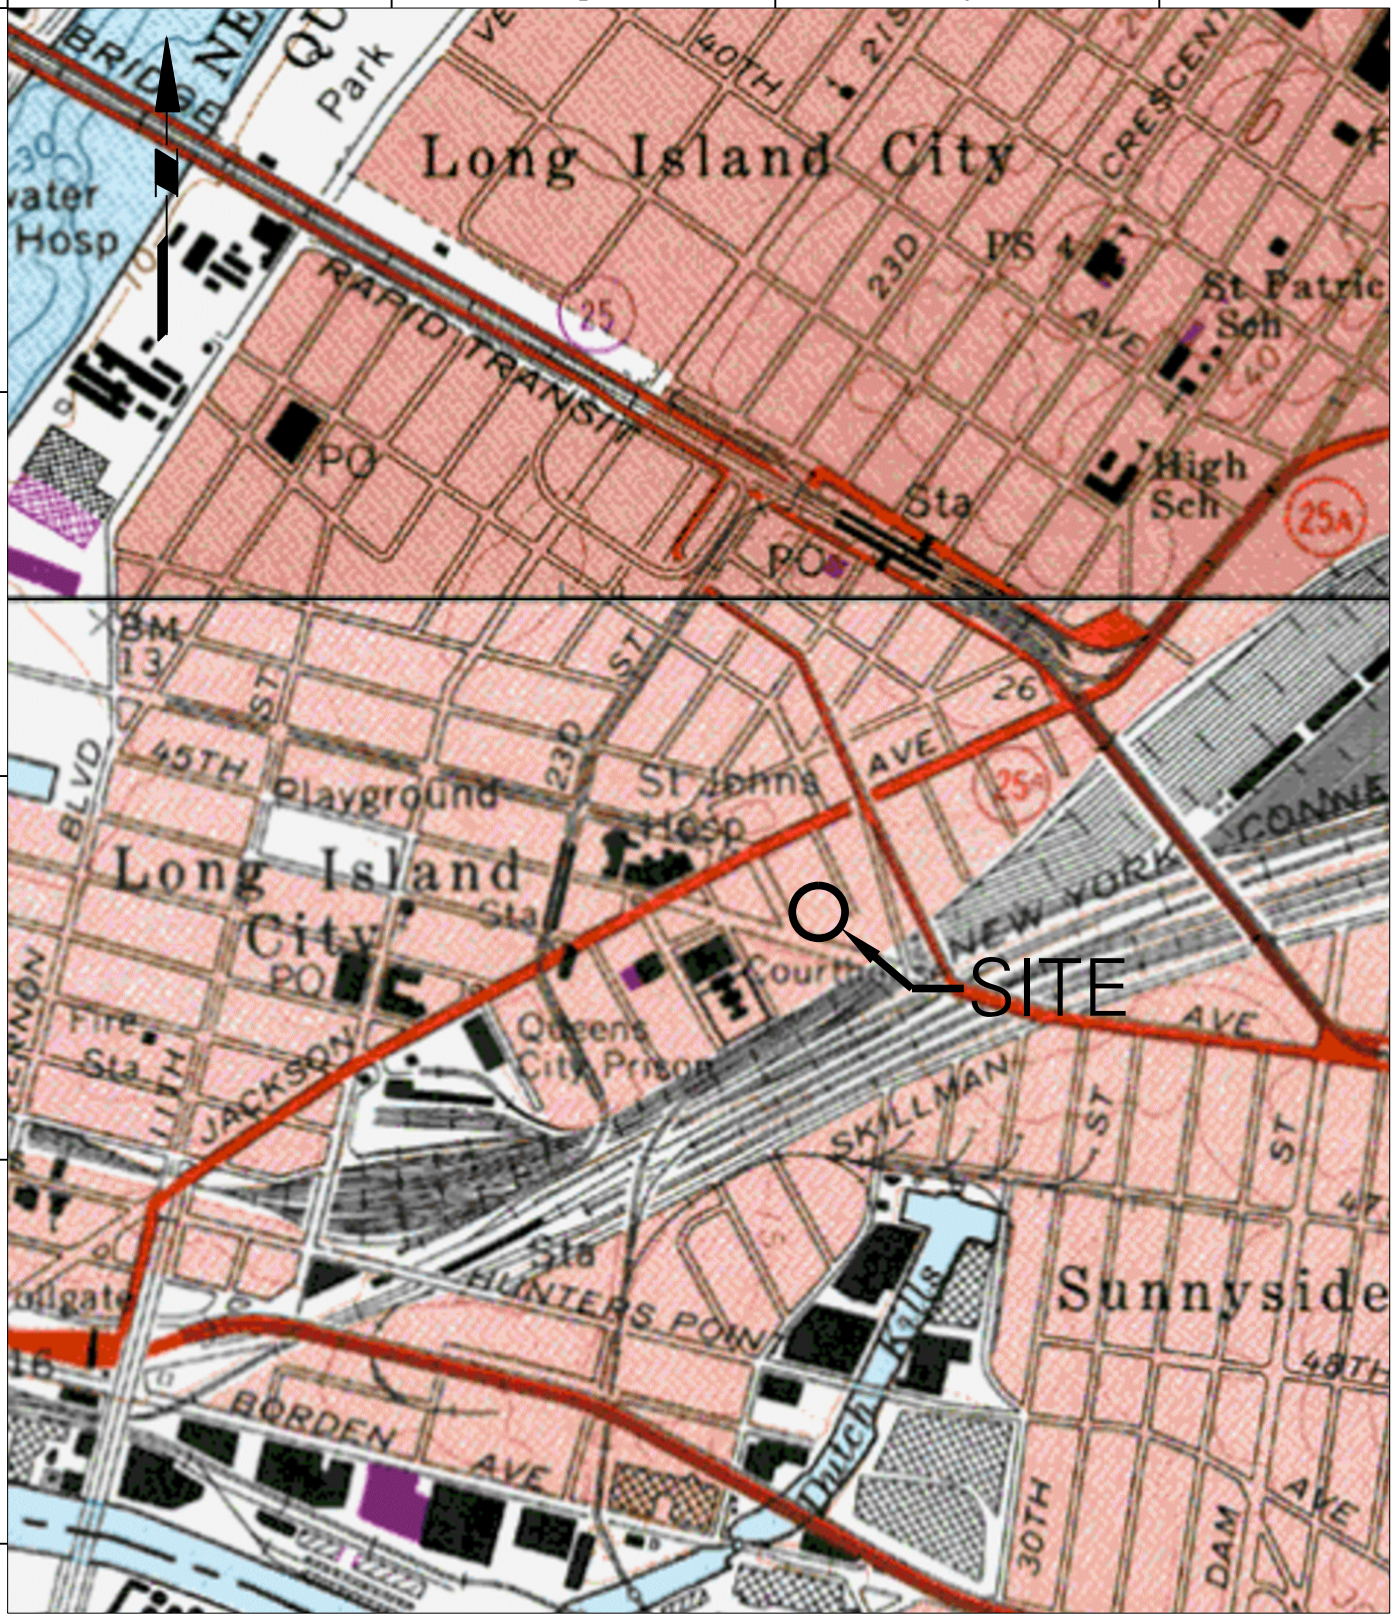
Pre-construction Conditions Documentation and Monitoring

A pre-construction Conditions Documentation of the neighboring buildings should be performed. The documentation would provide the owner with documentation of the existing conditions as a base line for in the event of a future damage claim. On the basis of this documentation, an observational and instrumentation program should be designed for monitoring the performance of adjacent structures and evaluating construction procedures.

During excavation support construction and active pile installation, an optical survey program should be implemented to monitor for vertical and horizontal movements of surrounding structures and the excavation support system. The survey should be performed every other week, with measurements taken to the nearest 0.005 feet. The survey should be performed by a licensed surveyor. The recommended allowable lateral movement of the perimeter walls is ¾ inch, and the allowable ground settlement behind the wall is ¾ inch. Work should be temporarily stopped if movements (vertical or horizontal) exceed about ¼ inch over two

readings or a movement trend develops over several readings. Criteria for allowable movements of structures should be finalized after a building's preconstruction conditions documentation is completed. The status of the excavation support system should be reviewed when the vertical or lateral movements reach one-half the threshold limits.

LIMITATIONS



The conclusions and recommendations provided in this report are based on subsurface conditions inferred from a limited number of borings, as well as architectural and structural information provided by FXFOWLE Architects and DeSimone Consulting Engineers, respectively. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others.

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, as they may affect our recommendations.

This report has been prepared to assist the Owner, architect and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties which are beyond the limits of that which is the specific subject of this report.

Environmental issues (such as potentially contaminated soil and groundwater) are outside the scope of this study and should be addressed in a separate study.

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X, ZONE D — Areas determined to be outside the 0.2% annual chance floodplain. Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- Limit of Moderate Wave Action
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988

- Cross section line
- Transect line
- Culvert, Flume, Penstock or Aqueduct
- Road or Railroad Bridge
- Footbridge
- 97°07'45", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
- 4276000 N — 1000-meter Universal Transverse Mercator grid values, zone 18
- 600000 FT — 5000-foot grid values: New York State Plane coordinate system, Long Island zone (FIPSZONE 3104), Lambert Conformal Conic projection
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

NOTES

1. ELEVATIONS CONTAINED WITHIN THIS MAP ARE REFERENCED TO THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD 88).
2. REFERENCE: FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM), CITY OF NEW YORK, NEW YORK, PANEL 202 OF 457, REVISED 5 DECEMBER 2013, MAP NO. 3604970202G.

Hartland Formation (Middle Ordovician to Lower Cambrian)— *West of the East River*—Interbedded units of the following:

1. Gray and gray-weathering, fine-grained quartz-feldspar granulite containing minor biotite and garnet;
2. Fine- to coarse-grained, gray- to tan-weathering, quartzofeldspathic, muscovite-biotite-garnet schist. The muscovite flakes are commonly large and may give outcrops a "spangled" or shiny metallic look; some outcrops have knotty kyanite surfaces;
3. Dark-greenish-black quartz-biotite-hornblende amphibolite; weathers black or rusty along fractures.

Much of the schist is magnetic. The Hartland here is in thrust-fault contact with the underlying Manhattan Schist on the Cameron's Line thrust, which goes beneath the Jurassic and Triassic Newark basin sediments (see sections *C–C′* and *D–D′*).

NOTES

1. BASE PLAN WAS TAKEN AND REVISED FROM THE DRAWING TITLED "TOPOGRAPHIC & BOUNDARY SURVEY", JOB NO. 14169, PREPARED BY APPLE SURVEYING, DATED 11 APRIL 2014.
2. ELEVATIONS ARE REFERENCED TO NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD 88), WHICH IS 1.095 FEET ABOVE THE NATIONAL GEODETIC SURVEY DATUM AT SANDY HOOK, NEW JERSEY (NGVD 29).
3. LOCATIONS OF BORINGS, TEST PITS, AND SEISMIC CONE PENETRATION TESTS ARE APPROXIMATE.
4. 2006 BORINGS, SB-1, SB-2 AND SB-3, WERE DRILLED BY SOL MECHANICS DRILLING CORP.
5. 2008 BORINGS, B-1 THROUGH B-17, WERE DRILLED BY CRAIG TEST BORING UNDER THE FULL TIME SPECIAL INSPECTION OF A LANGAN ENGINEER BETWEEN 4 AND 24 JANUARY 2008.
6. TEST PITS TP-1 AND TP-2 WERE EXCAVATED BY SOUTH SHORE PAVING UNDER THE FULL TIME SPECIAL INSPECTION OF A LANGAN ENGINEER BETWEEN 6 AND 7 FEBRUARY 2008..
7. TEST PITS TP-3 THROUGH TP-10 WERE EXCAVATED BY MAC-WAY CONTRACTING OF NEW YORK UNDER THE FULL TIME SPECIAL INSPECTION OF A LANGAN ENGINEER BETWEEN 7 AND 8 APRIL 2014.
8. SEISMIC CONE PENETRATION TESTS WERE CONDUCTED BY CONTEC INC. UNDER THE FULL TIME SPECIAL INSPECTION OF A LANGAN ENGINEER ON 15 APRIL 2014.

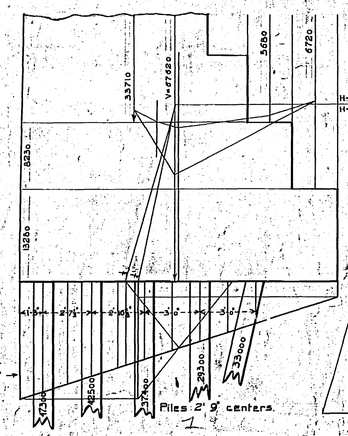
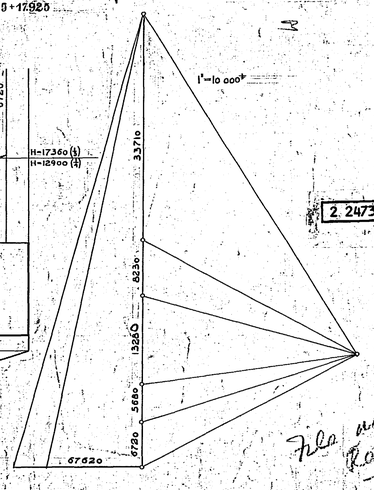
Typical Finish of Concrete
Girder Protection at Pier No. 2





Formula for H:

$H = \frac{1}{2} \cdot 105 \cdot h \times \frac{1}{3} h.$

h = dept of section.

Weight of Concrete 140# per cub. ft.

" " Earth 105 " "

2.24730 C51 077

APPENDIX C

TEST PIT DESCRIPTIONS

Test Pit #1

Test Pit #1 was excavated, from about el 11 NAVD88, next to the 16.5-foot-high Thomson Avenue retaining wall approximately 25 feet west of the existing two story brick building on Purves Street. The test pit had approximate plan dimensions of 10 by 2.5 feet and was excavated to a depth of about 8.5 feet below ground surface. The ground surface consisted of about 1.5 feet of fill material of brown medium to fine sand, some silt, some gravel and brick. The fill is designated as Building Code Class 7. At a depth of about 1.5 feet below the surface, a 6-inch-thick concrete slab was encountered. Underlain the concrete slab brown coarse to medium sand with some silt and gravel was encountered. This material is designated as Building Code Class 3, sands. Groundwater was encountered at about 7.5 feet below existing grade, corresponding to el 3.5 NAVD88.

At a depth of about 2 feet below the concrete slab, or 4 feet below the ground surface, the remnant concrete extended about 9 inches beyond the face of the retaining wall. A 10-inch-diameter wood pile in relatively good condition was encountered at the bottom of the remnant pile cap. At a distance of about 2.4 feet northeast of the retaining wall and directly below the concrete slab, a 1-foot-thick concrete remnant foundation wall was encountered.

Test Pit #2

Test Pit #2 was excavated, from about el 10 NAVD88, next to the 15.5-foot-high 44th Drive retaining wall, about 30 feet south of the existing 2-story brick building to the north. The test pit had approximate plan dimensions of 12.5 by 14.5 feet and was excavated to a depth of about 13.5 feet below the ground surface. The surface materials consisted of about 1.5 feet of brown medium to fine sand, some silt, some gravel and trace brick and is classified as fill material, designated as Building Code Class 7. Underlain the fill material is about 3 feet of brown medium to fine sand, some silt. This material is classified as Building Code Class 3. Underlain the sand is about 1.5 feet of brown fine sand and then a black clayey silt (Building Code Class 5) to the bottom of the excavation. Groundwater was encountered about 5.5 feet below the existing ground surface, corresponding to el 4.5 NAVD88.

A 2-foot-thick remnant concrete pile cap located about 1.5 feet below the existing grade. The cap extends 5 feet into the site from the face of the retaining wall. The retaining wall extends down behind this remnant pile cap. The bottom of pile cap elevation is at el 6.5 NAVD88, and it is supported by either 10- or 12-inch-diameter wood piles. The wood piles were spaced about 3 feet center-to-center (east-west) and about 12 feet center-to-center (north-south). The excavation was continue to a depth of about 13 feet below the ground surface, but was not able to determine the bottom of the retaining wall because of shallow groundwater conditions.

Test Pit TP-3

Test pit TP-3 was excavated adjacent to the 16.5-foot-high retaining wall near the intersection of Thomson Avenue and 44th Drive at about el 10.5 NAVD88. The test pit had the approximate

plan dimensions of 16 feet along Thomson Avenue, 8 feet along 44th Drive, and 12 feet perpendicular from the retaining wall along both streets in the intersection. Excavation stopped at about 5 feet below ground surface where groundwater was encountered, which was about el 5.5 NAVD88. Material encountered in the excavation was fill, which consisted of brown coarse to fine sand, some coarse to fine gravel, and trace amounts of silt, boulder fragments, and brick fragments. A four-inch-thick concrete slab was encountered at the ground surface. About 1.5 feet below ground surface was a 2.5-foot-thick remnant pile cap that was along the retaining wall. The plan dimensions of the pile cap measured to be 2.5 to 5 feet perpendicular to the retaining wall. Below the pile cap was an existing 10-inch-diameter wood pile that was about 1 foot from the face of the pile cap. The extents of the retaining wall were not encountered. The test pit was backfilled with excavated material and compacted upon completion.

Test Pit TP-4

Test pit TP-4 was excavated at the intersection at the 16.5-foot-high retaining wall near 44th Drive and the adjacent two-story building (27-21 44th Drive) at the northwest corner of the site from about el 10.5 NAVD88. The test pit had approximate plan dimensions of 12 feet in the east-west direction, and 16.5 feet in the north-south direction. Excavation stopped about 5 feet below the ground surface, corresponding to about el 5 NAVD88. Groundwater was encountered at about el. 5 NAVD88. Material encountered in the excavation was brown coarse to fine sand, some coarse to fine gravel, with trace amounts of boulder fragments. A four-inch-thick concrete slab was encountered at the ground surface. About 1 foot below ground surface was a remnant 1.5- to 2-foot-thick pile cap that followed the length of the retaining wall. The plan dimensions of the pile cap were 2 to 6.7 feet perpendicular to the retaining wall. Below the pile cap were existing 10- and 12-inch-diameter wood piles, uncovered 6 to 24 inches from the face of the pile cap. The extents of the retaining wall were not encountered. The test pit was backfilled with excavated material and compacted upon completion.

Test Pit TP-5

Test pit TP-5 was excavated from about el 11.5 NAVD88at the south side of the existing two-story brick building (27-21 44th Drive), about 52 feet from the retaining wall. The test pit had the approximate plan dimensions of 9 by 9 feet. The excavation stopped at about 5.5 feet below ground surface where groundwater was encountered, which was at about el. 5 NAVD88. Materials encountered in the excavation were fill, which consisted of brown coarse to fine sand, some coarse to fine gravel, and trace amounts of silt, boulder fragments, building debris, and brick fragments. A four-inch-thick concrete slab was encountered at the ground surface. About 2.5 feet below the ground surface was an existing 2-foot-thick remnant concrete foundation wall that bisects the test pit. The depth of the wall could not be determined. About 4 feet below ground surface, the top of the adjacent building foundation was encountered. The foundation extends 4 inches horizontally from the face of the wall, and the bottom of foundation is about el 5 NAVD88. The test pit was backfilled with excavated material and compacted upon completion.

Test Pit TP-6

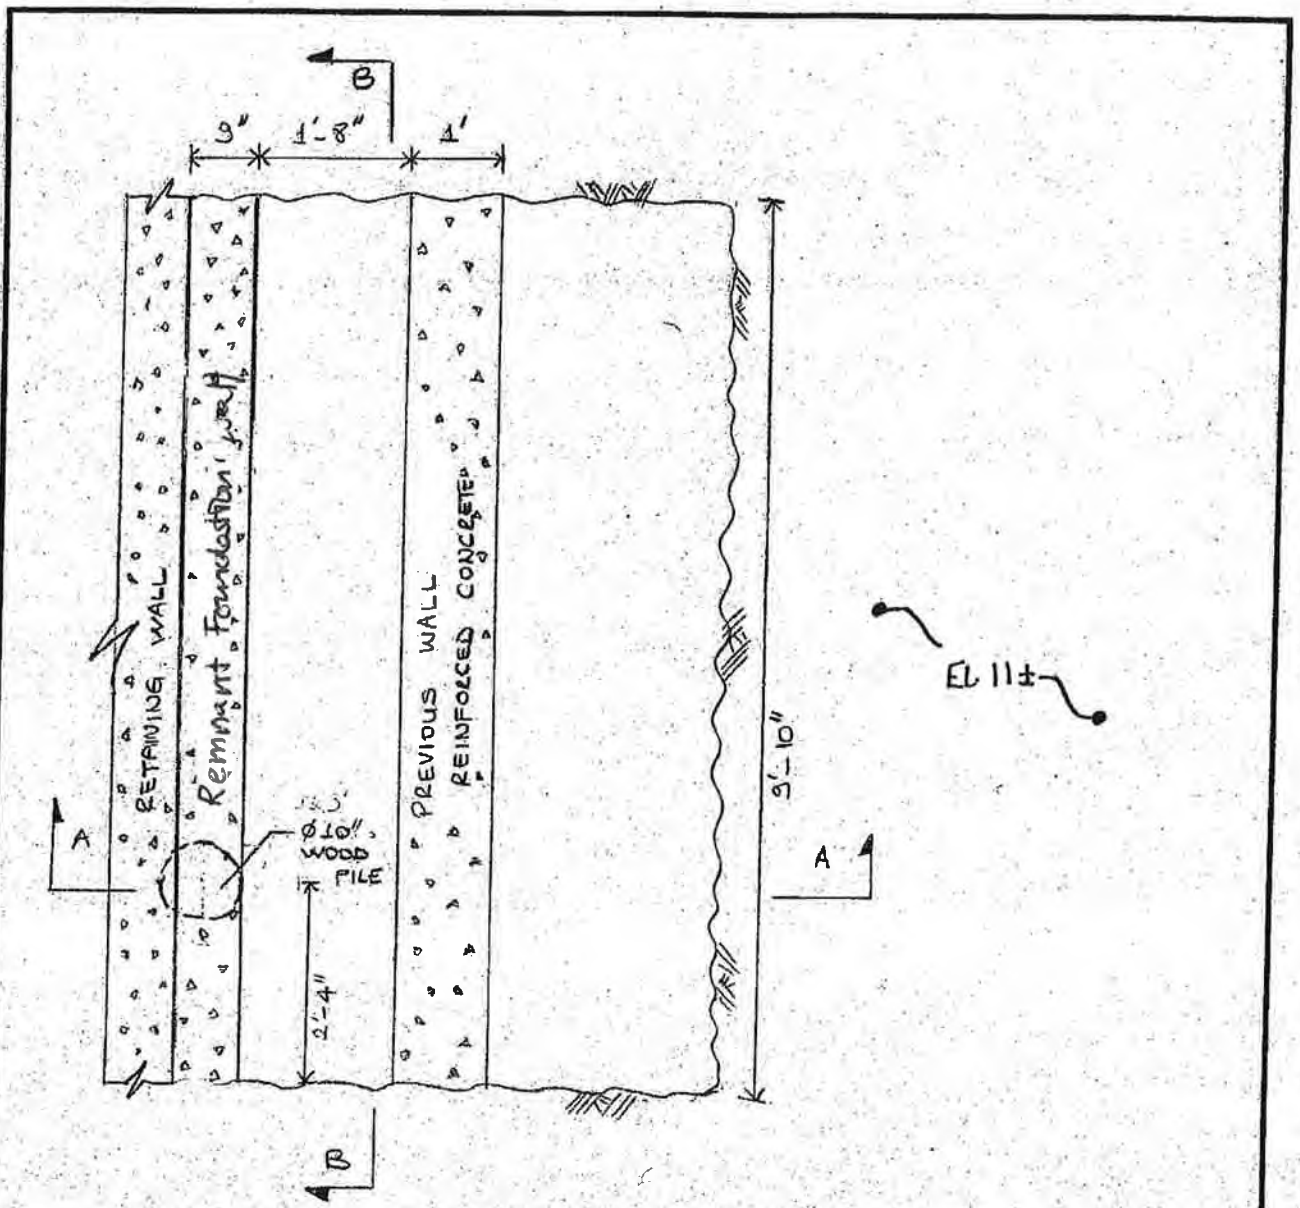
Test pit TP-6 was excavated from about el 11.5 NAVD88 at the east side of the two-story brick building (27-21 44th Drive), about 95 feet from the west property line. The test pit had the approximate plan dimensions of 8 feet in the east-west direction, and 5 feet in the north-south direction. Excavation stopped at about 7 feet below ground surface where groundwater was encountered at about el 4.5 NAVD88. Materials encountered in the excavation were brown coarse to fine sand, some coarse to fine gravel, with trace amounts of silt, boulder fragments, and tree roots. An approximately 9-inch-thick concrete slab was encountered from ground surface. The test pit exposed a concrete strip footing for the adjacent building, which ended at about el 5 NAVD88. The test pit was backfilled with excavated material and compacted upon completion.

Test Pit TP-7

Test pit TP-7 was excavated from about el 11 NAVD88 at the northeast face of the two-story brick building (44-46 Purves Street), about 23-feet from the west property line. The test pit had the approximate plan dimensions of 8 by 8 feet. The excavation stopped at 6 feet below ground surface where groundwater was encountered at about el 5 NAVD88. Materials encountered in the excavation were brown coarse to fine sand, some coarse to fine gravel, with trace amounts of boulder fragments. A four-inch-thick concrete slab was encountered at ground surface. The test pit slightly exposed the bottom of the building's strip footing at about el 5 NAVD88. The test pit was backfilled with excavated material and compacted upon completion.

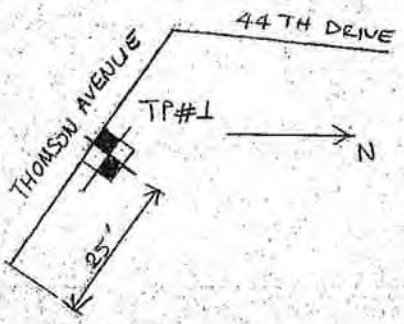
Test Pit TP-8

Test pit TP-8 was excavated from about el 11 NAVD88 at the northwest face of the two-story brick building (44-46 Purves Street), about 33 feet from the east property line. The test pit had the approximate plan dimensions of 10 by 7 feet. The excavation stopped at about el. 4 NAVD88, after the bottom of adjacent building foundation was exposed. Materials encountered in the excavation were fill, which consisted of brown coarse to fine sand, some coarse to fine gravel, and trace amounts of silt, boulder fragments, and brick fragments. A four-inch-thick concrete slab was encountered at ground surface. The test pit uncovered the bottom of the adjacent building's brick wall, at about el. 9 NAVD88, and the bottom of the building's strip footing, at about el. 6 NAVD88. The test pit was backfilled with excavated material and compacted upon completion.



Test Pit TP-9

Test pit TP-9 was excavated from about el 11 NAVD88 at the southwest corner of the site at the intersection of the two-story brick building (44-46 Purves Street), and the retaining wall fronting Thomson Avenue. The test pit had the approximate plan dimensions of 15 by 12 feet. The excavation went to about 7 feet below ground surface where groundwater was encountered at about el. 4 NAVD88. Materials encountered in the excavation were brown coarse to fine sand, some coarse to fine gravel, with trace amounts of silt and boulder fragments. The test pit uncovered the remnant foundation. The remnants were unearthed at various depths, and extended to about 3.4 feet from the face of the retaining wall. The extents



of the retaining wall were not uncovered. The test pit was backfilled with excavated material and compacted upon completion.

Test Pit TP-10

Test pit TP-10 was excavated from about el. 11 NAVD88 adjacent to the 16.5-foot-high retaining wall fronting Thomson Avenue, and about 106 feet from the south property line. The test pit had the triangular dimensions of 24 and 21 feet from the retaining wall, 25 feet along the retaining wall. The excavation went to about 8 feet below grade, corresponding to about el 3 NAVD88. Groundwater was encountered a foot above the bottom of excavation, at about el. 4 NAVD88. Material encountered in the excavation was brown coarse to fine sand, some coarse to fine gravel, with trace amounts of silt, boulder fragments, and tree roots. A four-inch-thick concrete slab was encountered at ground surface. Remnants of the existing foundation were encountered, which consisted of a 1-foot-thick concrete foundation wall, and a 1-foot thick concrete pile cap that extended up to 3 feet from the retaining wall. The extents of the retaining wall were not uncovered. The test pit was backfilled with excavated material and compacted upon completion.

1.0 INTRODUCTION

This report presents the results of a geotechnical site investigation program conducted by ConeTec, Inc. (ConeTec) of West Berlin, New Jersey for Langan Engineering on April 15th, 2014. The work took place at the 4430 Purves Street Site located in Long Island City, New York. The program consisted of two cone penetration tests (CPTs) and four seismic cone penetration tests (SCPTs).

2.0 FIELD EQUIPMENT AND PROCEDURES

2.1 Cone Penetration Test

Cone penetration testing (CPT) was conducted by ConeTec using an integrated electronic cone penetration testing and data acquisition system. A ConeTec cone penetrometer (Figure 1) was used during this investigation. The CPT soundings were completed in accordance with ASTM D5778. The cone was deployed using one of ConeTec's 25 ton, unitized, purpose-built, truck-mounted CPT rigs. The cone and rods were pushed into the ground using hydraulic ramset inside the rig at a steady rate of two centimeters per second.

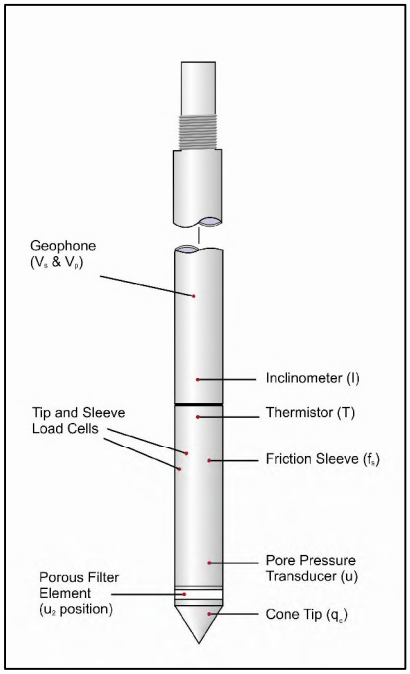

Figure 1 – Cone Penetrometer

The cone that was used had a maximum tip capacity of 1,500 bar, a tip area (A_c) of 15 cm^2, a friction sleeve area (A_s) of 225 cm^2, and a pore pressure transducer capacity of 500 psi. A pore pressure filter located directly behind the cone tip in the "u_2" position was also used (Figure 2). The six millimeter thick pore pressure filter, which is composed of porous plastic, enables the cone penetrometer to measure dynamic pore pressures during penetration, and record pore pressure dissipations at selected depths. The function of the filter is to allow rapid movements of the extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage. Each pore pressure filter was saturated in silicone fluid under vacuum pressure prior to testing and the pore pressure cavity within the cone was filled with silicone fluid to maintain a compliant pore pressure measuring system. A viscous fluid is used to try to maintain saturation of the system. The data acquisition system automatically records and displays the pore pressure dissipation traces in real time (at five second intervals) during pauses in penetration.

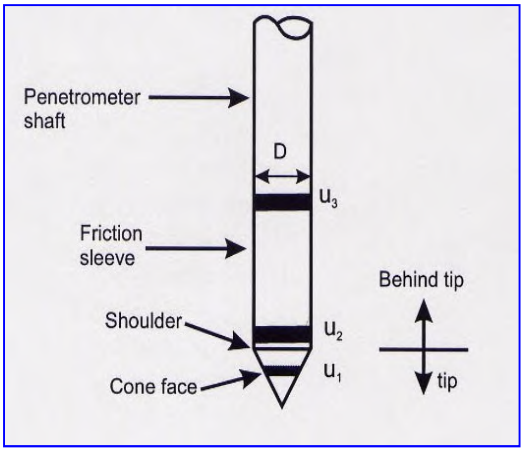

Figure 2 – Pore Pressure Filter Locations

ConeTec compression cones are designed with an equal end area friction sleeve; hence no corrections are required for friction sleeve data. ConeTec compression cones experience unequal area effects on the tip resistance due to the tip and load cell geometry. The unequal area is represented by the cone net area ratio (a) of 0.80. The net area ratio of ConeTec's compression cone has been verified through laboratory testing by subjecting the cone to a known pressure then measuring the load recorded on the tip. Refer to section 3.1 Cone

Penetration Test Results for a detailed explanation of the use of the net end area ratio in correcting CPT data.

The cone system used during the program recorded the following parameters in units selected by the client at five centimeter depth increments:

- Tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u_2)

A complete set of baseline readings were taken before and after each sounding to determine if a zero load offset had occurred due to a temperature change in the probe. Establishing the presence of temperature shifts and load offsets enables the operator to make corrections to the cone data as necessary. Since the probes are temperature compensated, load shifts due to changes in probe temperature are only a problem when extreme temperature changes occur.

2.2 Seismic Cone Penetration Test

The seismic cone penetration test (SCPT) equipment and procedures used for determining seismic wave velocities were generally the same as those reported by Robertson et al. (1986). The procedure was incorporated with CPT testing and conducted when penetration was stopped at the end of each one meter stroke. Within the first few meters (depending on the ground conditions), initial shear wave velocity measurement was made and subsequent measurements were typically made at one meter intervals until refusal. Before taking any seismic wave measurements, the rods were decoupled from the CPT rig, serving to minimize any rig induced background noise.

The shear waves were generated using an automated hydraulic seismic beam that was coupled to the ground using a hydraulic cylinder in the CPT rig (Figure 3). An automated piston hammer striking each end of the beam acted as an electrical contact trigger, initiating the recording of the seismic wave traces. The offset of the beam from the cone was taken into account during calculation of the seismic wave velocities.

Multiple hits were recorded to enable the operator to check the consistency of the waveforms. The wave receiver used was a horizontally active geophone located in the body of the cone

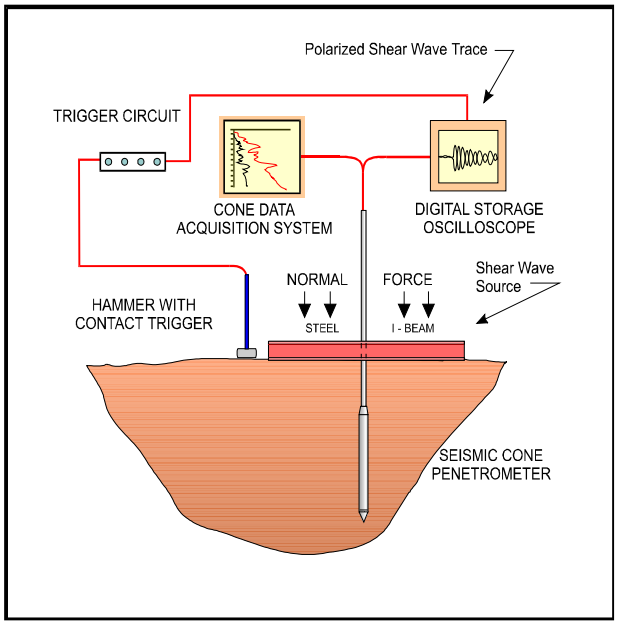

Figure 3 - Seismic CPT

penetrometer. The geophone is located 0.2 meters behind the cone tip. This offset was accounted for in all calculations. Shear wave data was sampled at a frequency of 20 kHz (i.e. 20,000 samples per second). Because the shear wave signals experienced attenuation in the soils, input sensitivity (gain) of the receiver was increased with depth to maintain the desired signal resolution.

3.0 TEST RESULTS

3.1 Cone Penetration Test Results

A summary of the cone penetration testing work is provided in Appendix A. The penetration depths are referenced to the existing ground surface at the time of the investigation.

All of the CPT data are presented in graphical form in the attached appendices and stored in Excel™ format in the release folder. A detailed set of CPT interpretations were generated and

are provided in Excel™ format files in the release folder. The CPT interpretations are based on values of corrected tip (q_t), sleeve friction (f_s) and pore pressure averaged over a user specified interval (this interval is specified in the header of each file). Data from equilibrium and dynamic pore pressure profiles were used to interpret phreatic surface depths that are used in the interpretation tables. Further details on the description of parameters and methods used for the interpretations are provided in Appendix B. The contents of the release folder and file formats are detailed in Appendix E.

The CPT plots presented in Appendix A consist of corrected tip resistance (q_t), sleeve friction (f_s), friction ratio (R_f), dynamic pore pressure (u_2) and Soil Behavior Type (SBT) are plotted versus depth. The measured readings may or may not be averaged in these plots. The averaging interval is specified in the plot footnotes.

The cone tip (q_t) reading is the total force acting on the cone tip divided by the projected plan area of the tip. It indicates the relative density, or stiffness, of the soil. The sleeve friction (f_s) is the frictional force the soil is imposing on the friction sleeve divided by the surface area of the friction sleeve. The friction ratio (R_f), expressed as a percentage, is a ratio of the sleeve friction readings divided by the cone tip readings. The friction ratio gives an indication of the grain size characteristics of the material. Generally, fine-grained soils have a higher friction ratio than coarse-grained soils. The dynamic pore pressures generated behind the cone tip, during cone penetration, are recorded by a pore pressure transducer. In freely draining soils the dynamic pore pressure will often be similar to the equilibrium pore pressure, while in fine grained soils penetration is undrained and the dynamic pore pressure will deviate from the equilibrium pore pressure profile. To record equilibrium or static water pressures, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this will occur is a function of the permeability of the soil.

Due to the inner geometry of the cone penetrometer, the ambient pore water pressure will act on the shoulder area behind the cone tip and on the ends of the friction sleeve. This results in an imbalance of stresses and is known as the “unequal area effect”. This effect influences the total stress determined from the cone and friction sleeve. For the cone resistance, the unequal area is represented by the cone net area ratio ‘a’, which is approximately equal to the ratio of

the cross-sectional area of the load cell or shaft divided by the projected area of the cone. The corrected total cone resistance, q_t, is given by the equation:

$$q_t = q_c + u_2 (1-a)$$

As stated earlier in the report, the net area ratio for ConeTec's compression cone penetrometers is 0.80. All of the calculations and plots use the corrected cone resistance, q_t.

The stratigraphic interpretations included on the plots are based on a soil behavior chart described in Robertson (1990) as illustrated in Figure 4. The chart relates cone tip resistance to friction ratio in order to determine Soil Behavior Type (SBT). It should be noted that it is not always possible to clearly identify a soil type based on these parameters. In these situations, experience, judgment, the use of auxiliary modules and an assessment of pore pressure dissipation data should be used to infer Soil Behavior Type.

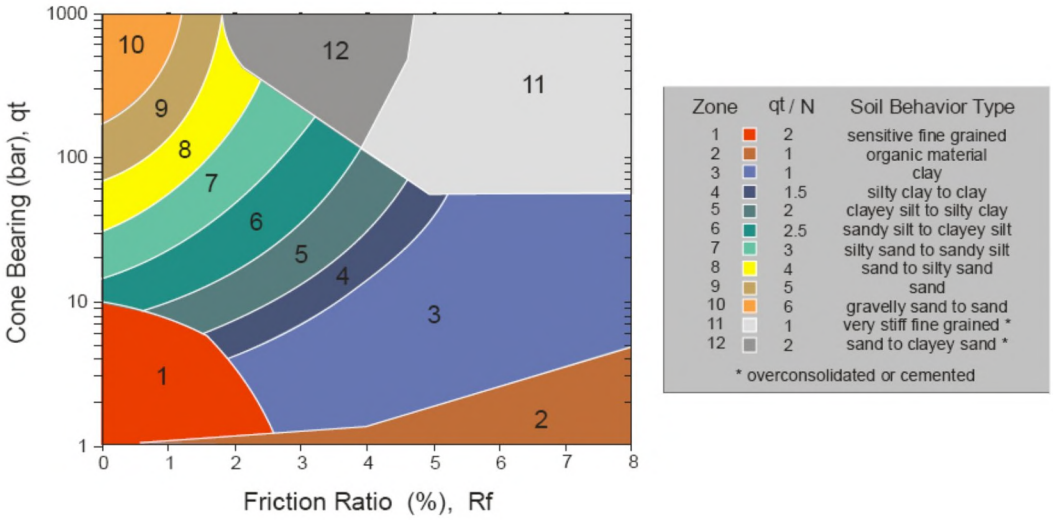

Figure 4 - Soil Behavior Type Chart, Robertson (1990)

3.2 Pore Pressure Dissipation Test Results

The penetration of the piezocone was halted at specific depths to carry out pore pressure dissipation tests. The variation of the pore pressure (u) with time was measured and recorded. All pore pressure data was recorded immediately behind the cone tip at the u_2 location. A tabular summary of these results is provided along with the individual pore pressure dissipation

plots in Appendix C. All of the dissipation data is provided in the release folder along with a summary of the results in both Excel™ and PDF format.

3.3 Seismic Cone Penetration Test Results

Tabular shear wave velocity results are presented in Appendix D and the seismic CPT (SCPT) plots are presented in Appendix A. The calculated shear wave velocities (Vs) are plotted against depth together with tip (q_t), friction sleeve (f_s), dynamic pore pressure (u_2) and SBT.

The shear wave velocity is directly related to the small strain shear modulus and can be used with Poisson's Ratio to calculate the small strain Elastic Modulus. These parameters are used as input variables to analyze soil deformation under both static and dynamic loads.

4.0 ABANDONMENTS

The annular space of all CPT soundings was grouted in accordance with the regulations.

5.0 CLOSING

Thank you very much for the opportunity to perform this work. We trust that the information presented in this report is sufficient for your purposes. If you have any questions regarding the contents of this report, please contact our office.

Sincerely,

ConeTec, Inc.

CONETEC INTERPRETATION METHODS

A Detailed Description of the Methods Used in ConeTec's CPT Interpretation and Plotting Software

Revision SZW-Rev 05A
April 8, 2011

Prepared by Jim Greig

CONETEC

ConeTec Interpretations as of April 8, 2011

ConeTec's interpretation routine provides a tabular output of geotechnical parameters based on current published CPT correlations and is subject to change to reflect the current state of practice. The interpreted values are not considered valid for all soil types. The interpretations are presented only as a guide for geotechnical use and should be carefully scrutinized for consideration in any geotechnical design. Reference to current literature is strongly recommended. ConeTec does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the program and does not assume liability for any use of the results in any design or review. Representative hand calculations should be made for any parameter that is critical for design purposes. The end user of the interpreted output should also be fully aware of the techniques and the limitations of any method used in this program. The purpose of this document is to inform the user as to which methods were used and what the appropriate papers and/or publications are for further reference.

The CPT interpretations are based on values of tip, sleeve friction and pore pressure averaged over a user specified interval (e.g. 0.20m). Note that q_t is the tip resistance corrected for pore pressure effects and q_c is the recorded tip resistance. Since all ConeTec cones have equal end area friction sleeves, pore pressure corrections to sleeve friction, f_s, are not required.

The tip correction is: $q_t = q_c + (1\text{-}a) \cdot u_2$

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the cone (typically 0.80 for ConeTec cones)

The total stress calculations are based on soil unit weights that have been assigned to the Soil Behavior Type zones, from a user defined unit weight profile or by using a single value throughout the profile.

Effective vertical overburden stresses are calculated based on a hydrostatic distribution of equilibrium pore pressures below the water table or from a user defined equilibrium pore pressure profile (this can be obtained from CPT dissipation tests). For over water projects the effects of the column of water have been taken into account as has the appropriate unit weight of water. How this is done depends on where the instruments were zeroed (i.e. on deck or at mud line).

Details regarding the interpretation methods for all of the interpreted parameters are provided in Table 1. The appropriate references cited in Table 1 are listed in Table 2. Where methods are based on charts or techniques that are too complex to describe in this summary the user should refer to the cited material.

The Soil Behavior Type classification charts (normalized and non-normalized) shown in Figures 1 and 2 are based on the charts developed by Dr. Robertson and Dr. Campanella at the University of British Columbia. These charts appear in many publications, most notably: Robertson, Campanella, Gillespie and Greig (1986); Robertson (1990) and Lunne, Robertson and Powell (1997). The Bq classification charts shown in Figures 3a and 3b are based on those described in Robertson (1990) and Lunne, Robertson and Powell (1997). The Jefferies and Davies SBT chart shown in Figure 3c is based on that discussed in Jefferies and Davies, 1993.

Where the results of a calculation/interpretation are declared *'invalid'* the value will be represented by the text strings "-9999" or "-9999.0". In some cases the value 0 will be used. Invalid results will occur because of (and not limited to) one or a combination of:

1. Invalid or undefined CPT data (e.g. drilled out section or data gap).

2. Where the interpretation method is inappropriate, for example, drained parameters in an undrained material (and vice versa).

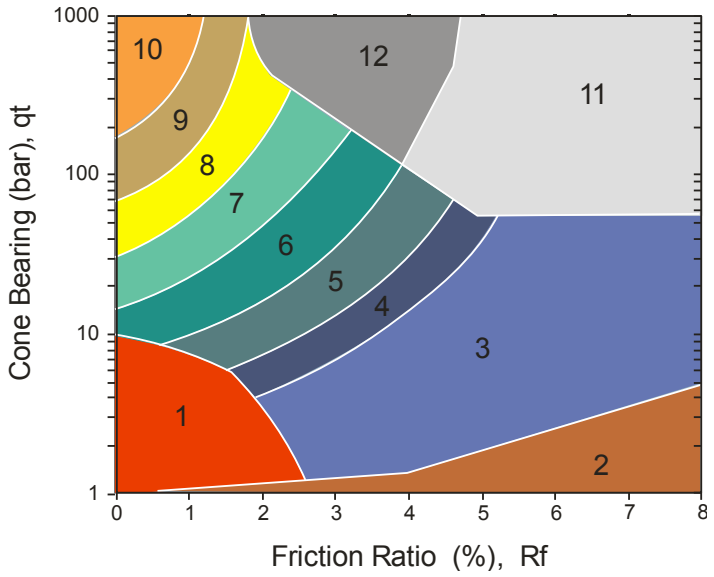
3. Where interpretation input values are beyond the range of the referenced charts or specified limitations of the interpretation method.

4. Where pre-requisite or intermediate interpretation calculations are invalid.

The parameters selected for output from the program are often specific to a particular project. As such, not all of the interpreted parameters listed in Table 1 may be included in the output files delivered with this report.

The output files are provided in Microsoft Excel XLS format. The ConeTec software has several options for output depending on the number or types of interpreted parameters desired. Each output file will be named using the original COR file basename followed by a three or four letter indicator of the interpretation set selected (e.g. BSC, TBL, NLI or IFI) and possibly followed by an operator selected suffix identifying the characteristics of the particular interpretation run.

Table 1
CPT Interpretation Methods

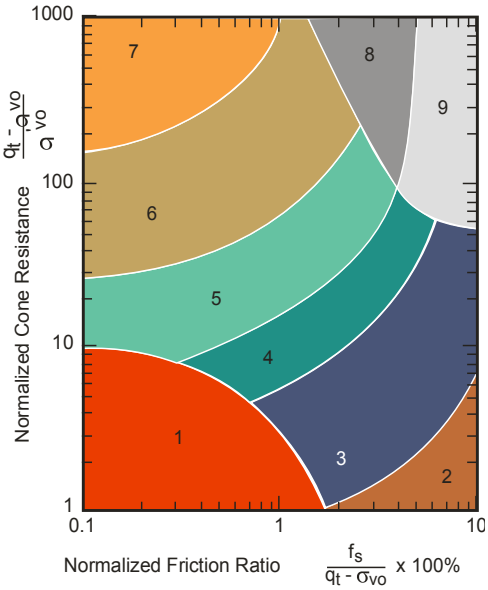


Interpreted Parameter	Description	Equation	Ref
Depth	Mid Layer Depth *(where interpretations are done at each point then Mid Layer Depth = Recorded Depth)*	*Depth (Layer Top) + Depth (Layer Bottom) / 2.0*	
Elevation	Elevation of Mid Layer based on sounding collar elevation supplied by client	Elevation = Collar Elevation - Depth	
Avgqc	Averaged recorded tip value (q_c)	$Avgqc = \frac{1}{n}\sum_{i=1}^{n} q_c$ *n=1 when interpretations are done at each point*	
Avgqt	Averaged corrected tip (q_t) where: $q_t = q_c + (1-a) \bullet u$	$Avgqt = \frac{1}{n}\sum_{i=1}^{n} q_t$ *n=1 when interpretations are done at each point*	
Avgfs	Averaged sleeve friction (f_s)	$Avgfs = \frac{1}{n}\sum_{i=1}^{n} fs$ *n=1 when interpretations are done at each point*	
AvgRf	Averaged friction ratio (Rf) where friction ratio is defined as: $Rf = 100\% \bullet \frac{fs}{qt}$	$AvgRf = 100\% \cdot \frac{Avgfs}{Avgqt}$ *n=1 when interpretations are done at each point*	
Avgu	Averaged dynamic pore pressure *(u)*	$Avgu = \frac{1}{n}\sum_{i=1}^{n} u_i$ *n=1 when interpretations are done at each point*	
AvgRes	Averaged Resistivity (this data is not always available since it is a specialized test requiring an additional module)	$Avgu = \frac{1}{n}\sum_{i=1}^{n} RESISTIVITY_i$ *n=1 when interpretations are done at each point*	
AvgUVIF	Averaged UVIF ultra-violet induced fluorescence (this data is not always available since it is a specialized test requiring an additional module)	$Avgu = \frac{1}{n}\sum_{i=1}^{n} UVIF_i$ *n=1 when interpretations are done at each point*	
AvgTemp	Averaged Temperature (this data is not always available since it is a specialized test)	$Avgu = \frac{1}{n}\sum_{i=1}^{n} TEMPERATUR\,E_i$ *n=1 when interpretations are done at each point*	

Interpreted Parameter	Description	Equation	Ref
AvgGamma	Averaged Gamma Counts (this data is not always available since it is a specialized test requiring an additional module)	$Avgu = \frac{1}{n}\sum_{i=1}^{n} GAMMA_i$ *n=1 when interpretations are done at each point*	
SBT	Soil Behavior Type as defined by Robertson and Campanella	See Figure 1	2, 5
U.Wt.	Unit Weight of soil determined from one of the following user selectable options: 1) uniform value 2) value assigned to each SBT zone 3) user supplied unit weight profile	See references	5
T. Stress σ_v	Total vertical overburden stress at Mid Layer Depth. *A layer is defined as the averaging interval specified by the user. For data interpreted at each point the Mid Layer Depth is the same as the recorded depth.*	$TStress = \sum_{i=1}^{n} \gamma_i h_i$ *where* γ_i is layer unit weight h_i is layer thickness	
E. Stress σ_v'	Effective vertical overburden stress at Mid Layer Depth	*Estress = Tstress - u_{eq}*	
Ueq	Equilibrium pore pressure determined from one of the following user selectable options: 1) hydrostatic from water table depth 2) user supplied profile	For hydrostatic option: $u_{eq} = \gamma_w \cdot (D - D_{wt})$ where u_{eq} is equilibrium pore pressure γ_w is unit weight of water D is the current depth D_{wt} is the depth to the water table	
Cn	SPT N_{60} overburden correction factor	*$Cn=(\sigma_v')^{-0.5}$* where *σ_v' is in tsf* *$0.5 < C_n < 2.0$*	
N_{60}	SPT N value at 60% energy calculated from qt/N ratios assigned to each SBT zone. This method has abrupt N value changes at zone boundaries.	*See Figure 1*	4, 5
$(N_1)_{60}$	SPT N_{60} value corrected for overburden pressure	*$(N_1)_{60} = Cn \cdot N_{60}$*	4
$N_{60}I_c$	SPT N_{60} values based on the Ic parameter	(qt/pa)/ N_{60} = 8.5 (1 – Ic/4.6)	5
$(N_1)_{60}$Ic	SPT N_{60} value corrected for overburden pressure (using N_{60} I_c). User has 2 options.	*1) $(N_1)_{60}Ic = Cn \cdot (N_{60}\, Ic)$* 2) q_{c1n}/ *$(N_1)_{60}Ic$* = 8.5 (1 – Ic/4.6)	4 5
$(N_1)_{60cs}$Ic	Clean sand equivalent SPT $(N_1)_{60}$Ic. User has 3 options.	1) $(N_1)_{60cs}Ic = \alpha + \beta((N_1)_{60}Ic)$ 2) $(N_1)_{60cs}Ic = K_{SPT} * ((N_1)_{60}Ic)$ 3) q_{c1ncs})/ $(N_1)_{60cs}Ic = 8.5 (1 – Ic/4.6)$ FC ≤ 5%: α = 0, β=1.0 FC ≥ 35% α = 5.0, β=1.2 5% < FC < 35% $\alpha = \exp[1.76 – (190/FC^2)]$ $\beta = [0.99 + (FC^{1.5}/1000)]$	10 10 5
Su	Undrained shear strength based on q_t Su factor N_{kt} is user selectable	$Su = \frac{qt - \sigma_v}{N_{kt}}$	1, 5
Su	Undrained shear strength based on pore pressure Su factor $N_{\Delta u}$ is user selectable	$Su = \frac{u_2 - u_{eq}}{N_{\Delta u}}$	1, 5
k	Coefficient of permeability (assigned to each SBT zone)		5

Interpreted Parameter	Description	Equation	Ref
Bq	Pore pressure parameter	$Bq = \frac{\Delta u}{qt - \sigma_v}$ *where:* $\Delta u = u - u_{eq}$ *and u = dynamic pore pressure* *u_{eq} = equilibrium pore pressure*	1, 5
Q_t	Normalized q_t for Soil Behavior Type classification as defined by Robertson, 1990	$Qt = \frac{qt - \sigma_v}{\sigma'_v}$	2, 5
F_r	Normalized Friction Ratio for Soil Behavior Type classification as defined by Robertson, 1990	$Fr = 100\% \cdot \frac{fs}{qt - \sigma_v}$	2, 5
Net qt	Net tip resistance	$qt - \sigma_v$	
qe	Effective tip resistance	$qt - u_2$	
qeNorm	Normalized effective tip resistance	$\frac{qt - u_2}{\sigma'_v}$	
SBTn	Normalized Soil Behavior Type as defined by Robertson and Campanella	See Figure 2	2, 5
SBT-BQ	Non-normalized Soil Behavior type based on the Bq parameter	See Figure 3	2, 5
SBT-BQn	Normalized Soil Behavior based on the Bq parameter	See Figure 3	2, 5
SBT-JandD	Soil Behaviour Type as defined by Jeffries and Davies	See Figure 3	7
SBT-BQn	Normalized Soil Behavior base on the Bq parameter	See Figure 3	2, 5
I_c	Soil index for estimating grain characteristics	$Ic = [(3.47 - \log_{10}Q)^2 + (\log_{10} Fr + 1.22)^2]^{0.5}$ *Where:* $Q = \left(\frac{qt - \sigma_v}{P_{a2}}\right)\left(\frac{P_a}{\sigma'_v}\right)^n$ *And Fr is in percent* *P_a = atmospheric pressure* *P_{a2} = atmospheric pressure* *n varies from 0.5 to 1.0 and is selected in an iterative manner based on the resulting I_c*	3, 8
FC	Apparent fines content (%)	*FC=1.75($Ic^{3.25}$) - 3.7* *FC=100 for Ic > 3.5* *FC=0 for Ic < 1.26* *FC = 5% if 1.64 < Ic < 2.6 AND F_r<0.5*	3
Ic Zone	This parameter is the Soil Behavior Type zone based on the Ic parameter (valid for zones 2 through 7 on SBTn chart)	Ic < 1.31 Zone = 7 1.31 < Ic < 2.05 Zone = 6 2.05 < Ic < 2.60 Zone = 5 2.60 < Ic < 2.95 Zone = 4 2.95 < Ic < 3.60 Zone = 3 Ic > 3.60 Zone = 2	3
PHI ϕ	Friction Angle determined from one of the following user selectable options: a) Campanella and Robertson b) Durgunoglu and Mitchel c) Janbu d) Kulhawy and Mayne	See reference	5 5 5 11

Interpreted Parameter	Description	Equation	Ref
Dr	Relative Density determined from one of the following user selectable options: a) Ticino Sand b) Hokksund Sand c) Schmertmann 1976 d) Jamiolkowski - All Sands	See reference	5
OCR	Over Consolidation Ratio	a) Based on Schmertmann's method involving a plot of S_u/σ_v' /($S_u/\sigma_v')_{NC}$ and OCR where the Su/p' ratio for NC clay is user selectable	9
State Parameter	The state parameter is used to describe whether a soil is contractive (SP is positive) or dilative (SP is negative) at large strains based on the work by Been and Jefferies	See reference	8, 6, 5
Es/qt	Intermediate parameter for calculating Young's Modulus, E, in sands. It is the Y axis of the reference chart.	Based on Figure 5.59 in the reference	5
Young's Modulus E	Young's Modulus based on the work done in Italy. There are three types of sands considered in this technique. The user selects the appropriate type for the site from: a) OC Sands b) Aged NC Sands c) Recent NC Sands Each sand type has a family of curves that depend on mean normal stress. The program calculates mean normal stress and linearly interpolates between the two extremes provided in the Es/qt chart.	Mean normal stress is evaluated from: $\sigma_m' = \frac{1}{3}(\sigma_v' + \sigma_h' + \sigma_h')$ where σ_v'= vertical effective stress σ_h'= horizontal effective stress and $\sigma_h = K_o \cdot \sigma_v'$ with Ko assumed to be 0.5	5
q_{c1}	q_t normalized for overburden stress used for seismic analysis	$q_{c1} = q_t \cdot (Pa/\sigma_v')^{0.5}$ where: Pa = atm. Pressure q_t is in MPa	3
q_{c1n}	q_{c1} in dimensionless form used for seismic analysis	$q_{c1n} = (q_{c1} / Pa)(Pa/\sigma_v')^n$ where: Pa = atm. Pressure and n ranges from 0.5 to 0.75 based on Ic.	3
K_{SPT}	Equivalent clean sand factor for $(N_1)60$	$K_{SPT} = 1 + ((0.75/30) \cdot (FC - 5))$	10
K_{CPT}	Equivalent clean sand correction for q_{c1N}	$K_{cpt} = 1.0$ for $I_c \leq 1.64$ $K_{cpt} = f(I_c)$ for $I_c > 1.64$ (see reference)	10
q_{c1ncs}	Clean sand equivalent q_{c1n}	$q_{c1ncs} = q_{c1n} \cdot K_{cpt}$	3
CRR	Cyclic Resistance Ratio (for Magnitude 7.5)	$q_{c1ncs} < 50$: $CRR_{7.5} = 0.833\ [(q_{c1ncs}/1000] + 0.05$ $50 \leq q_{c1ncs} < 160$: $CRR_{7.5} = 93\ [(q_{c1ncs}/1000]^3 + 0.08$	10



Interpreted Parameter	Description	Equation	Ref
CSR	Cyclic Stress Ratio	$CSR = (\tau_{av}/\sigma_v') = 0.65\ (a_{max} / g)\ (\sigma_v/ \sigma_v')\ r_d$ $r_d = 1.0 - 0.00765\ z$ $\quad z \leq 9.15m$ $r_d = 1.174 - 0.0267\ z$ $\quad 9.15 < z \leq 23m$ $r_d = 0.744 - 0.008\ z$ $\quad 23 < z \leq 30m$ $r_d = 0.50$ $\quad z > 30m$	10
MSF	Magnitude Scaling Factor	See Reference	10
FofS	Factor of Safety against Liquefaction	$FS = (CRR_{7.5} / CSR)\ MSF$	10
Liquefaction Status	Statement indicating possible liquefaction	Takes into account FofS and limitations based on I_c and q_{c1ncs}.	10
Cont/Dilat Tip	Contractive / Dilative qc1 Boundary based on $(N_1)_{60}$	$(\sigma_v')_{boundary} = 9.58 \times 10^{-4}\ [(N_1)_{60}]^{4.79}$ qc1 is calculated from specified qt(MPa)/N ratio	13
Cq	Normalizing Factor	$Cq = 1.8 / (0.8 + ((\sigma_v'/Pa))$	12
qc1 (Cq)	Normalized tip resistance based on Cq	$q_{c1} = C_q * q_t$ (some papers use q_c)	12
Su(Liq)/s'v	Liquefied Shear Strength Ratio	$\frac{Su(Liq)}{\sigma_v'} = 0.03 + 0.0143(q_{c1})$	13

Zone	qt / N	Soil Behavior Type
1	2	sensitive fine grained
2	1	organic material
3	1	clay
4	1.5	silty clay to clay
5	2	clayey silt to silty clay
6	2.5	sandy silt to clayey silt
7	3	silty sand to sandy silt
8	4	sand to silty sand
9	5	sand
10	6	gravelly sand to sand
11	1	very stiff fine grained *
12	2	sand to clayey sand *

* overconsolidated or cemented

Electronic Data Files

The released data contains the following folders:

1. CPT Data - .cor files in ASCII format, and or .xls files.
2. Pore Pressure Dissipation Data - .ppd files in Excel format
3. CPT Plots - .pdf files
4. Data Interpretation - .xls files contain common engineering values
5. Shear Wave Velocity Data - .pdf files of tabular and graphical seismic data.

[illegible] (O [illegible])

ConeTec data files are stored in ASCII text files that are readable by almost any text editor. ConeTec CPT data files are named such that the first 3 characters contain the job number, the next two characters are CP followed by two characters indicating the sounding number. The last 8th character position is reserved for the letters a, b, c, d etc to uniquely identify multiple soundings at the same location. The CPT sounding file has the extension COR, and pore pressure dissipation files have the extension PPD or PPF. As an example, for job number 06-127 the first sounding will have file names 127CP01.COR and 127CP01.PPD.

The sounding (COR) file consists of the following components:

1. Two lines of header information
2. Data records
3. End of data marker
4. Units information

[illegible]

Line 1: Columns 1-6 may be blank or may indicate the version number of the recording software
Columns 7-21 contain the sounding Date and Time
Columns 22-36 contain the sounding Operator

Line 2: Columns 1-16 contain the Job Location
Columns 17-31 contain the Cone ID
Columns 32-47 contain the sounding number

[illegible]

The data records contain 4 or more columns of data in floating point format. A comma (and spaces) separates each data item:

Column 1: Sounding Depth (meters)
Column 2: Tip (q_c) data uncorrected for pore pressure effects. Recorded in units selected by the operator.
Column 3: Sleeve (f_s) data. Recorded in units selected by the operator
Column 4: Dynamic pore pressure readings. Recorded in units selected by the operator
Column 5: Empty, Resistivity, UVIF or Gamma data

[illegible]

After the last line of data there will be a line containing ASCII 26 (CTL-Z) and a newline (carriage return/ line feed) character. This is used to mark the end of data.

[illegible]

The last section of the file contains information about the units that were selected for the sounding. A separator bar makes up the first line. The second line contains the type of units used for depth, q_c, f_s and u. The third line contains the conversion values required for ConeTec's software to convert the recorded data to an internal set of base units (bar for q_c, bar for f_s and meters for u).

CPT Dissipation Files (PPD, PPF, PPM)

CPT Dissipation files have the same naming convention as the CPT sounding files and have the extension PPD, PPF or PPM. PPF (PPM and PPD) files consist of the following components:

1. Two lines of header information
2. Data records

Header Records (Line 1 and Line 2)

Line 1: Columns 1-6 may be blank or may indicate the version number of the recording software
Columns 7-21 contain the sounding Date and Time
Columns 22-36 contain the sounding Operator

Line 2: Columns 1-16 contain the Job Location
Columns 17-31 contain the Cone ID
Columns 32-47 contain the sounding number

Data Records

The data records immediately follow the header lines. Each data record can occupy several lines in the file and is a complete record of a dissipation test at a particular depth. Each data record starts with a line containing two values separated by spaces; the first value being an index number (not currently used by the Software) and the second being the dissipation test depth in meters. Following this line are the dissipation pore pressure values stored at 5 second intervals with a maximum of 12 entries per line. The last line of the dissipation record may not contain a full 12 entries. The data record is terminated with an ASCII 30 character (appears as a triangle in some editors).

This sequence is repeated for every dissipation test in the sounding. No marker is used to indicate end of file. Units information is not stored in this file. Users need to check the CPT file for the units that were used.

Basic Interpretation Files (Basic Interpretation)

ConeTec's basic CPT interpretation output files are generally delivered in text files with a TBL extension. The root file name is the same as the COR files. A number of calculated geotechnical parameters are presented in these files. The files are stored as ASCII text files that can be viewed using any text editor such as Notepad or Wordpad. The files do not contain any page formatting. These files are not distributed if the enhanced interpretation files are provided.

Enhanced Interpretation Files (Enhanced Interpretation)

ConeTec's enhanced CPT interpretation output files are delivered in several formats, each file type containing the exact same information but formatted slightly differently. The files typically have any of the following file extensions:

1. IFI — an importable TAB delimited ASCII text file containing approximately 47 data columns of geotechnical interpretations. The file is designed for easy import to Excel. A companion document describes the techniques used for the interpretations (usually reproduced at the beginning of the Interpretation Appendix). Text editors can be used to view the file contents, however, they may remove the tabs or replace the tabs with spaces upon saving the file destroying the feature that makes them easy to import into Excel.

   Because Excel imports the data as text and the sheet is protected two steps may be necessary to modify the data or use the values in certain Excel functions:

   a) Under Tools (Excel 2000) Select the Protection Option and then Unprotect the sheet
   b) Select the entire sheet, copy and then use Paste Special to paste as values to a second sheet.

   Future versions of our interpretation routine will address these inconveniences.

2. IFP — a printable ASCII text file containing the same 47 columns of geotechnical interpretations as the IFI file. This file type has been formatted as a multi-page document with up to 132 characters per line and up to 68 lines per page. Each page has been separated into multiple sections to accommodate all the data fields. Each physical page has a header section and a page/section number. The file is designed for direct printing to laser printers set into compressed font mode. This output is typically provided in the Interpretation Appendix.

   An abbreviated set of interpretations (containing 36 columns of output) may be generated instead. These files usually have the extensions NLI and NLP. XLS files can be generated from these as well.

3. XLS — an Excel format file that has been generated directly from the corresponding IFI file. IFI and IFP files are not distributed if the XLS files are generated. The XLS files may have been generated from abbreviated NLI interpretation files.

In each case root file name is the same as the COR files.

[illegible] (Excel Format)

ConeTec's latest software (September 2007) outputs CPT interpretations directly to Excel format (XLS extension) without creating intermediate ASCII files. Because of the desires of various clients, there are several different configurations of output parameters in ConeTec's interpretation files. Since the Excel format file must have the XLS extension a suffix is used after the basename of the source CPT data file (COR) to identify the format of the file. The configurations still follow the formats described above and use the same extensions but now as suffixes. To allow for various runs (e.g. using a different water table, or user supplied equilibrium profile, or different methods for a particular parameter) of the same data an additional suffix may be specified by the engineer post processing the data to identify each particular run. This suffix will follow the one used to identify the format of the file.

For example:

If the selected format is ConeTec's TBL configuration and each run is identified by a run number. The resultant files generated for 278CP01.COR would be:

78CP01-TBL-RUN01.XLS
78CP01-TBL-RUN02.XLS
78CP01-TBL-RUN03.XLS

[illegible] Excel Format

ConeTec can now provide the equivalent of the ASCII COR files in Excel Format. These files will have the same basename as the COR files and an XLS extension.

[illegible] Excel Format

ConeTec can now provide the equivalent of the ASCII PPD format files in Excel format. These files will contain each dissipation trace that exceeds a minimum duration (selected by the engineer during post-processing) in a particular Excel spreadsheet column. The first column (Column A) will contain the time in seconds and the second column (Column B) will contain the time in minutes. Subsequent columns will contain dissipation trace data. The time columns will extend to the longest trace of the data set.

Detailed header information is provided at the top of the spreadsheet. The test depth in meters and feet, the number of points in the trace and the particular units are identified at the top of each trace column.

The Excel format file names will have the same basename as the original PPD format file followed by the suffix -PPD and then followed by a second suffix that the engineer doing the post processing can specify. Because the engineer can select various types of units for the dissipation data output (which can be different from the units used in the original recording) the secondary suffix is often used to identify the units in the XLS file, however, the original recorded units and the output units are clearly identified within the XLS spreadsheet file.

Re: Geophysical Survey Report
Commercial Property-
4430 Purves Street
Long Island City, New York 11101

Dear Mr. McMahon:

Nova Geophysical Services (NOVA) is pleased to provide findings of our geophysical survey at the above referenced project site located at 4430 Purves Street, Long Island City, New York (the "Sites"). Please see attached Geophysical Survey map for more details.

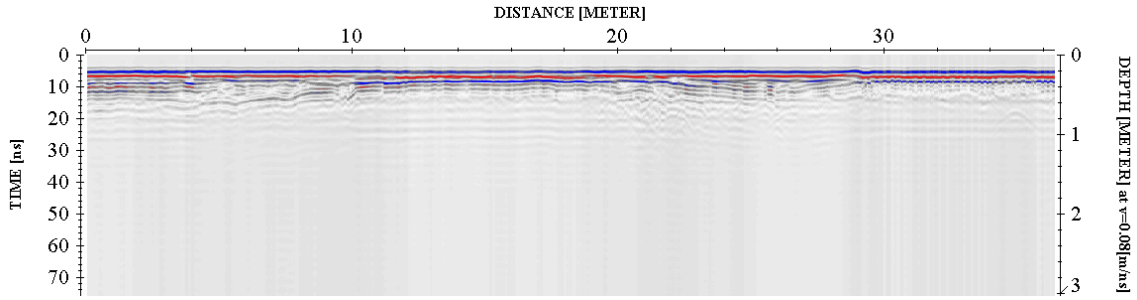
INTRODU□TION TO □EOPH□SI□A□ SURVE□

NOVA performed a Geophysical survey consisting of Ground Penetrating Radar (GPR), Electromagnetic (EM) surveys and comprehensive subsurface utility (CSUL) surveys at the project Site. The purpose of this survey is to clear and marked proposed environmental boring areas and to identify any anomalies, and subsurface structures located at the project site on February 19th, 2014.

The equipment selected for this investigation will be included a CSUL Pipe and Cable Locator (a magnetic detector), Ditch-Witch utility locator, Electromagnetic detector (Geonics EM61), Software and Sensor's 250 MHz ground-penetrating radar (GPR).

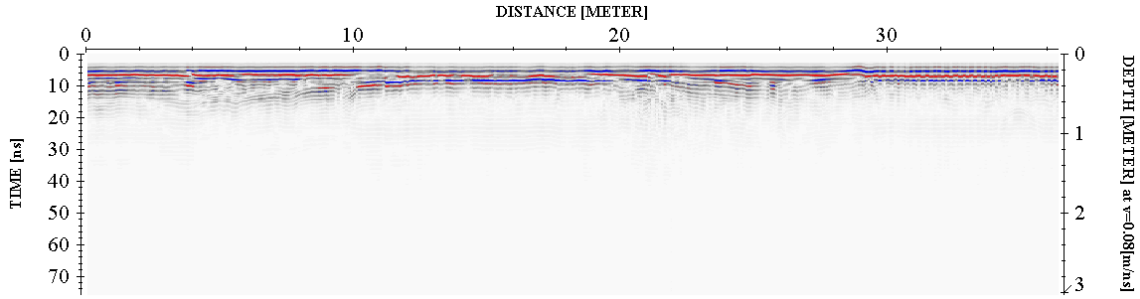
A GPR system consists of a radar control unit, control cable and a transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 250 MHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulses into bipolar pulses that are radiated to the surface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit and are represented as color graphic images for interpolation.

□EOPH□SI□A□ METHODS



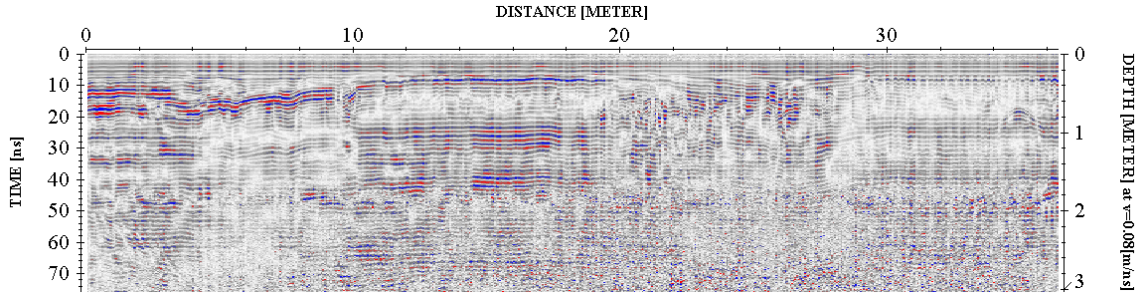
The project site was screened using the GPR by carrying the instrument over the project area at the site in 4' x 4' traverses. When evidence of anomalies were observed, they were clearly marked for further evaluation. A Ditch-witch(tm) utility locator would then be used to determine if the anomalies were utilities or other large sub-surface metal objects. Finally, GPR profiles were collected over each metal-detector anomaly and inspected for reflections, which could be indicative of major anomalies.

GPR data profiles were collected for the areas of the Site specified by the client. The surveyed area consisted of paved areas with concrete (interior of the site building) and none paved areas.

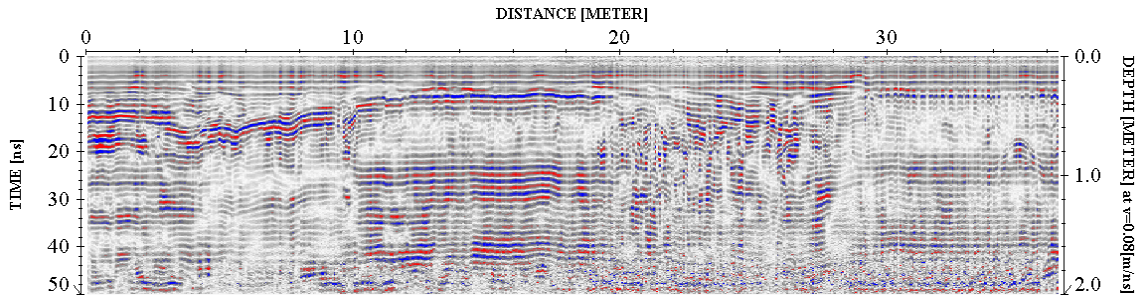


DATA PRO□ESSIN□

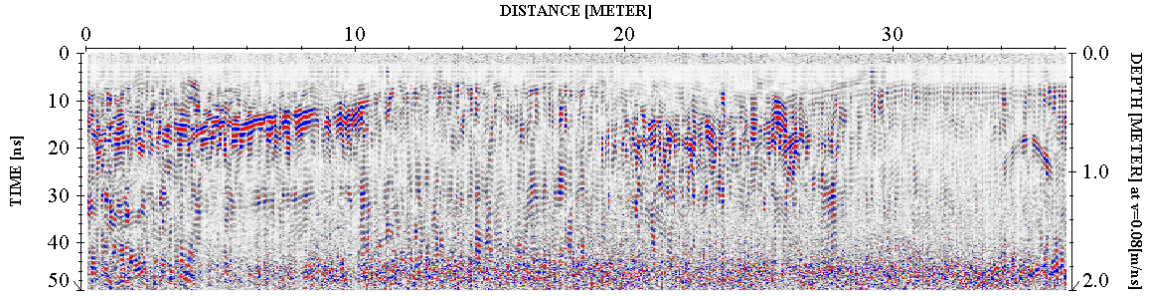
In order to improve the quality of the results and to better identify subsurface anomalies NOVA processed the collected data. The processes flow is briefly described at this section.



S□□□ □□Import raw RAMAC data to standard processing format



S□□□ □□Remove instrument noise *(dewow)*



S□□□ □□Correct for attenuation losses *(energy decay function)*

S□□□ 4□Remove static from bottom of profile *(time cut)*

S□□□ □□Mute horizontal ringing/noise *(subtracting average)*

The above example shows the significance of data processing. The last image (step 5) has higher resolution than the starting image (raw data – step 1) and describes the subsurface anomalies more accurately.

PH□SI□A□ SETTIN□S

Nova observed following physical conditions at the time of the survey:

T□□ □ □□□□r: Mostly sunny
T□□ □□22 degrees
S□r□□□□None paved. Covered with approximately 2 feet of snow.
□ □□□□□□□□**N**□□□ □□□□□□**N**□□□Geophysical Noise Level (GNL) low to medium (existing snow and unseen dumped materials) at the time of the survey.

RESU□TS

The results of the geophysical survey identified following at the project Site:

- Geophysical survey identified anomalies with the EM located along the center of the project site. Due to excessive amount of snow and other geophysical noises, Nova could not verify the nature of these anomalies. All of the identified anomalies were clearly marked during the survey.

- Geophysical survey identified minor anomalies located throughout of the project areas.

- Geophysical survey identified scattered anomalies located throughout of the project areas. All of these anomalies were consistent with surficial (approximately 1 feet bgs) metal containing materials (such as nails, jersey barriers, metal sticks, and etc.)

- Geophysical survey identified utilities located throughout of the project area. All of these anomalies (utilities) were clearly marked during the survey.
- Nova cleared and marked all of the proposed boring locations at the time of the survey.
- Geophysical Survey Plan portrays the areas investigated during the geophysical survey.

If you have any questions please do not hesitate to contact the undersigned.
Sincerely,

NOVA □ □□□□□□□□□□□S□r□□□□

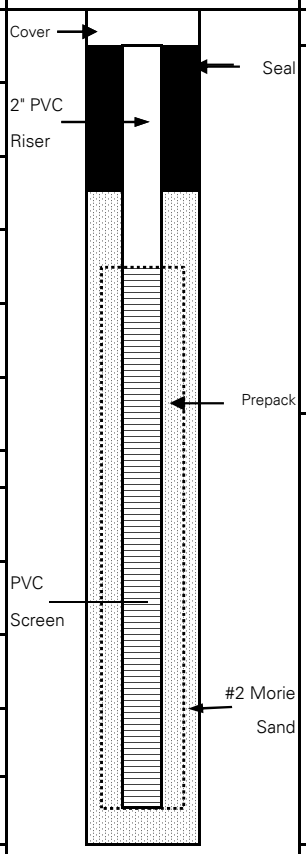
APPENDIX F
MONITORING WELL CONSTRUCTION LOGS

WELL CONSTRUCTION SUMMARY

Well No. MW01

PROJECT 4430 Purves Street	**PROJECT NO.** 170282501
LOCATION Long Island City, NY	**ELEVATION AND DATUM** 11.62 feet NAVD88
DRILLING AGENCY Laurel Environmental Services, Ltd.	**DATE STARTED** 2/19/2014 **DATE FINISHED** 2/19/2014
DRILLING EQUIPMENT Geoprobe 6610DT	**DRILLER** Steve Bitetto
SIZE AND TYPE OF BIT 4" I.D. Auger	**INSPECTOR** Paul McMahon

METHOD OF INSTALLATION



Advance augers to 14 feet bgs. Insert 10' PVC prepack screen and 4' PVC riser into the borehole. Pour #2 Morie filter sand into the annulus to a depth of 2.5 ft bgs. Install 1.5' hydrated bentonite seal above the sand filter. Backfill and place well cover in cement mix.

METHOD OF WELL DEVELOPMENT

Surged and purged with a Monsoon pump until recharge was observed and water became clear.
Total purge volume = 15 gallons

TYPE OF CASING PVC	**DIAMETER** 2"	**TYPE OF BACKFILL MATERIAL** Soil Cutttings and filter sand	
TYPE OF SCREEN Prepack PVC	**DIAMETER** 2"	**TYPE OF SEAL MATERIAL** Hydrated bentonite

9:56									Start Sampling

NOTES:

1. Stabilization is achieved after all parameters have stabilized for three successive readings.
2. Dissolved Oxygen stabilization = 10% for values greater than 0.5 mg/L, if three Dissolved Oxygen values are less than 0.5 mg/L, consider the values as stabilized)
3. Turbidity (10% for values greater than 5 NTU; if three Turbidity values are less than 5 NTU, consider the values as stabilized)
4. The pump's flow rate must be able to "turn over" at least one flow-through-cell volume between measurements (every five minutes). Flow cell volume for the Horiba U-52 is 250 mL.

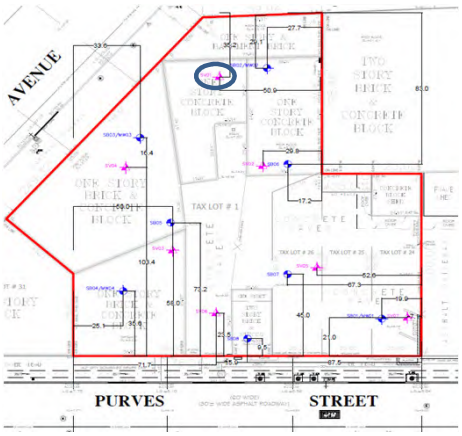
APPENDIX H
SOIL VAPOR CONSTRUCTION AND SAMPLE LOGS

SOIL VAPOR SAMPLING LOG SHEET

Sample Number: SV01

PROJECT: 4430 Purves Street	**PROJECT NO.:** 170282501
LOCATION: Long Island City, New York	**SURFACE ELEVATION AND DATUM:** Approx. 10.39 feet NAVD88
DRILLING FIRM OR LANGAN INSTALLER: Laurel Environmental Services, Ltd.	**INSTALLATION DATE STARTED:** 2/21/2014 **DATE FINISHED:** 2/21/2014
INSTALLATION FOREMAN: Steve Bitetto	**SAMPLE DATE STARTED:** 2/21/2014 **DATE FINISHED:** 2/21/2014
INSTALLATION EQUIPMENT: Geoprobe 6610DT	**TYPE OF SAMPLING DEVICE:** 2.7-Liter Summa® Canisters
INSPECTOR: Paul McMahon	**SAMPLER:** Patrick Farnham
POTENTIAL SAMPLE INTERFERENCES: Drill Rig Activity, high moisture content in soil due to significant snow melt	**WEATHER CONDITIONS (PRECIP., TEMP., PRESS., WIND SPEED AND DIR.):** 30's °F, Fog, Humidity=93%



METHOD OF INSTALLATION AND PURGING:
Drill a 1.25-inch diameter steel probe rod to 4 feet bgs. Insert 6" steel soil vapor implant with attached tubing. Pour #2 Morie filter sand into the annulus to approximately 1 foot bgs. Seal with hydrated bentonite. Purge with a miniRAE 3000 PID at a rate of 200 mL/min for approximately 1 minute.

TUBING TYPE/DIAMETER: Poly (1/4" OD, 3/16" ID)	**TYPE OF MATERIAL ABOVE SEAL:** N/A
IMPLANT SCREEN TYPE/LENGTH/DIAMETER: 6" Stainless Steel	**SEAL MATERIAL (Bentonite, Beeswax, Modeling Clay, etc.):** Bentonite
BOREHOLE DIAMETER: 1"	**FILTER PACK MATERIAL (Sand or Glass Beads):** #2 Morie Sand

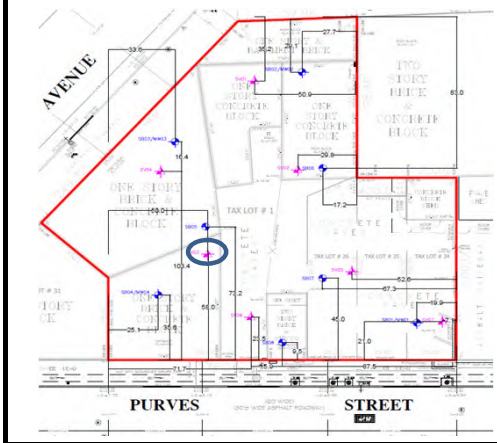
POTENTIAL SAMPLE INTERFERENCES: Drill Rig Activity, high moisture content in soil due to significant snow melt	**WEATHER CONDITIONS (PRECIP., TEMP., PRESS., WIND SPEED AND DIR.):** 30's °F, Fog, Humidity=93%



METHOD OF INSTALLATION AND PURGING:
Drill a 1.25-inch diameter steel probe rod to 4 feet bgs. Insert 6" steel soil vapor implant with attached tubing. Pour #2 Morie filter sand into the annulus to approximately 1 foot bgs. Seal with hydrated bentonite. Purge with a miniRAE 3000 PID at a rate of 200 mL/min for approximately 1 minute.

TUBING TYPE/DIAMETER: Poly (1/4" OD, 3/16" ID)	**TYPE OF MATERIAL ABOVE SEAL:** N/A
IMPLANT SCREEN TYPE/LENGTH/DIAMETER: 6" Stainless Steel	**SEAL MATERIAL (Bentonite, Beeswax, Modeling Clay, etc.):** Bentonite
BOREHOLE DIAMETER: 1"	**FILTER PACK MATERIAL (Sand or Glass Beads):** #2 Morie Sand

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Soil Samples Collected February 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected on February 19 and 20, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, hexavalent chromium (Cr6+), and percent solids.

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7473
- Cyanide by SW-846 Method 9010C
- Hexavalent chromium by SW-846 Method 7196A
- Percent solids by Method SM 2540G

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Table 1: Sample Summary

SDG	***Lab Sample ID***	***Client Sample ID***	***Sample Date***	***Analytical Parameters***
14B0504	14B0504-01	SB01_4-6	2/19/2014	VOCs, SVOCs, PCBs, Pest, Metals, Hg, Cr6+

SDG	Lab Sample ID	Client Sample ID	Sample Date	Analytical Parameters

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and trip blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- **NJ –** The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. The section below describes the major deficiencies that were identified.

SVOCs by SW-846 Method 8270D:

The continuing calibration analyzed on 2/28/14 displayed continuing relative response factors less than the control limit for hexachlorobenzene and pentachlorophenol. The associated non-detect field blank sample results are qualified as "R" for rejected.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Sample SB04_1-3 displayed a surrogate recovery greater than the upper control limit (i.e., 118%) for toluene-d8 at 138%. The associated positive detections are qualified as "J."

Laboratory control sample/control sample duplicate (LCS/LCSD) BB40810-BS1 displayed recoveries greater than the upper control limits for 1,2,4-trimethylbenzene (117%), 2-butanone (158% and 157%), acetone (151% and 168%), and o-xylene (112%). The associated positive detections were qualified as "J."

Method blank sample BB40810-BLK1 displayed a positive detection for methylene chloride at 0.0092 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BB40891-BLK1 displayed positive detections for methylene chloride at 0.0027 mg/kg and acetone at 0.010 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Sample SB04_1-3 displayed internal standard area counts less than the lower control limit (i.e., 50%) for 1,2-dichlorobenzene-d4 at 30%. The associated target compounds were qualified as estimated.

SVOCs by SW-846 Method 8270D:

The initial calibration analyzed on 1/17/14 displayed a percent relative standard deviation (RSD) greater than the control limit (i.e., 20%) for phenanthrene at 20.52%. The associated positive detections are qualified as "J" and non-detects are qualified as "UJ."

The initial calibration analyzed on 2/28/14 displayed RSDs greater than the control limit for pentachlorophenol at 99.19% and dibenz(a,h)anthracene at 20.53%. The associated dibenz(a,h)anthracene non-detect in the field blank sample is qualified as "UJ." The pentachlorophenol result was previously rejected; no further action is needed.

The continuing calibration analyzed on 2/24/14 at 9:02 displayed percent deviations (%Ds) greater than the control limit with positive biases for chrysene (38.8%), indeno(1,2,3-cd)pyrene (58.4%), dibenz(a,h)anthracene (62.9%), and benzo(g,h,i)perylene (59.4%). The associated positive detections are qualified as "J."

Pesticides by SW-846 Method 8081B:

Samples SB06_3-5 and SB06_6-8 displayed surrogate recoveries for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 27.2% and 13.9%, respectively. The associated sample results were non-detect and are qualified as "UJ."

PCBs by SW-846 Method 8082A:

Sample SB06_6-8 displayed a surrogate recovery for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 26.1%. The associated sample results were non-detect and are qualified as "UJ."

Metals by SW-846 Method 6010C:

Matrix spike sample SB01_7-9 displayed recoveries less than the lower control limit (i.e., 75%) for beryllium and silver at 70.8% and 44.4%, respectively. The associated sample results were non-detect and are qualified as "UJ."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

LCS/LCSD BB40817-BS1 displayed recoveries greater than the upper control limit for 1,4-dioxane (379% and 342%) and 1,2-dichlorobenzene (121%). The associated sample results were non-detect; no qualification is required.

Method blank sample BB40817-BLK1 displayed a positive detection for 1,4-dioxane at 680 µg/L. The associated trip blank and field blank samples were non-detect; no qualification is required.

SVOCs by SW-846 Method 8270D:

LCS/LCSD sample BB40798-BSD1 displayed relative percent differences (RPDs) greater than the control limit (i.e., 30%) for benzo(a)anthracene (54.4%), dibenzofuran(35.6%), and naphthalene (46.5%). The LCS and LCSD recoveries were within control; no qualification is necessary.

Metals by SW-846 Method 6010C:

Continuing calibration blank Y4B2401-CCB3 displayed a positive detection for lead at 8 µg/L. The associated sample results are orders of magnitude greater than the blank concentration; no qualification is necessary.

Comments:

A field duplicate and parent sample pair (SB04_1-3 and DUP01_022014) was collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than ±2X the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 50%. Tetrachloroethene, 1,1,1-trichloroethane, mercury, nickel, arsenic, barium, cadmium, copper, zinc, and trichloroethene failed the precision criteria. The associated positive detections were qualified as "J."

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Soil Samples Collected February 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected on February 20, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, hexavalent chromium (Cr6+), and percent solids.

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7473
- Cyanide by SW-846 Method 9010C
- Hexavalent chromium by SW-846 Method 7196A
- Percent solids by Method SM 2540G

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and trip blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

R – The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

J – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.

U – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

NJ – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Client Sample ID	*Analysis*	*Analyte*	*CAS #*	*Validator Qualifier*
SB03_1-3	VOCs	Acetone	67-64-1	U (0.011)
SB03_1-3	SVOCs	Indeno(1,2,3-cd)pyrene	193-39-5	J

SB05A_2-4	VOCs	sec-Butylbenzene	135-98-8	UJ
SB05A_2-4	VOCs	1,3-Dichlorobenzene	541-73-1	UJ
SB05A_2-4	VOCs	1,2-Dichlorobenzene	95-50-1	UJ
SB05A_2-4	VOCs	n-Butylbenzene	104-51-8	UJ
SB05A_2-4	SVOCs	Indeno(1,2,3-cd)pyrene	193-39-5	J
SB05A_2-4	SVOCs	Benzo(g,h,i)perylene	191-24-2	J

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BB40913-BLK1 displayed a positive detection for methylene chloride at 0.0039 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BB40948-BLK1 displayed a positive detection for methylene chloride at 0.0027 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BB41008-BLK1 displayed positive detections for methylene chloride at 0.0025 mg/kg and acetone at 0.0029 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Sample SB05A_2-4 displayed internal standard area counts less than the lower control limit (i.e., 50%) for 1,2-dichlorobenzene-d4 at 43%. The associated target compounds were qualified as estimated.

SVOCs by SW-846 Method 8270D:

The continuing calibration analyzed on 2/25/14 at 9:24 displayed a percent deviation (%D) greater than the control limit (i.e., 25%) with a negative bias for pentachlorophenol at 26.1%. The associated sample result was non-detect and is qualified as "UJ."

The continuing calibration analyzed on 2/24/14 at 9:22 displayed %Ds greater than the control limit with positive biases for indeno(1,2,3-cd)pyrene at 34.3% and 55.4%, respectively. The associated positive detections are qualified as "J."

The initial calibration analyzed on 1/17/14 displayed a percent relative standard deviation greater than the control limit (i.e., 20%) for phenanthrene at 20.52%. The associated positive detection is qualified as "J."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Sample SB05A_2-4 displayed a surrogate recovery greater than the upper control limit for toluene-d8 at 123%. The associated target compounds were non-detect; no qualification is required.

Laboratory control sample/control sample duplicate (LCS/LCSD) BB40945-BSD1 displayed a recovery greater than the upper control limit for 1,4-dioxane at 146%. The LCS/LCSD relative percent difference for 1,4-dioxane was also greater than the control limit at 43.5%. The associated sample results were non-detect; no qualification is required.

Method blank sample BB40945-BLK1 displayed a positive detection for acetone at 1.4 µg/L. The associated trip blank sample was non-detect; no qualification is required.

The continuing calibration analyzed on 2/27/14 displayed %Ds greater than the control limit with positive biases for 1,4-dioxane and m,p-xylenes. The associated trip blank sample results were non-detect; no qualification is required.

SVOCs by SW-846 Method 8270D:

Sample SB03_6-8 displayed a surrogate recovery greater than the control limit (i.e., 148%) for nitrobenzene-d5 at 182%. No target compounds are associated with the surrogate; qualification is not necessary.

Comments:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Soil Samples Collected February 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected on February 21, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, hexavalent chromium (Cr6+), and percent solids.

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7473
- Cyanide by SW-846 Method 9010C
- Hexavalent chromium by SW-846 Method 7196A
- Percent solids by Method SM 2540G

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and trip blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

R – The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

J – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.

U – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

NJ – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BB40945-BLK1 displayed a positive detection for acetone at 1.4 µg/L. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BB40948-BLK1 displayed a positive detection for methylene chloride at 0.0027 mg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BB41008-BLK1 displayed positive detections for methylene chloride and acetone at 0.0025 mg/kg and 0.0029 mg/kg, respectively. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Sample SB02_2-4 displayed internal standard area counts less than the lower control limit (i.e., 50%) for chlorobenzene-d5 at 49.4% and 1,2-dichlorobenzene-d4 at 21.4%. The associated target compounds were qualified as estimated.

SVOCs by SW-846 Method 8270D:

The continuing calibration analyzed on 2/25/14 displayed a %D greater than the control limit (i.e., 20%) with a negative bias for pyrene at 30.1%. The associated sample results were non-detect and are qualified as "UJ."

Pesticides by SW-846 Method 8081B:

Samples SB02_6-8 and SB02_11-13 displayed surrogate recoveries for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 27.2% and 24.6%, respectively. The associated sample results were non-detect and are qualified as "UJ."

PCBs by SW-846 Method 8082A:

Samples SB02_11-13 displayed a surrogate recovery for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 29.1%. The associated sample results were non-detect and are qualified as "UJ."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Sample SB02_2-4 displayed surrogate recoveries greater than the upper control limit for p-bromofluorobenzene at 172% and toluene-d8 at 138%. The associated target compounds were non-detect; no qualification is required.

Laboratory control sample/control sample duplicate (LCS/LCSD) BB40945-BSD1 displayed a recovery greater than the upper control limit for 1,4-dioxane at 146%. The LCS/LCSD RPD for 1,4-dioxane was also greater than the control limit at 43.5%. The associated sample results were non-detect; no qualification is required.

The continuing calibration analyzed on 2/27/14 displayed %Ds greater than the control limit with positive biases for 1,4-dioxane and m,p-xylenes. The associated sample results were non-detect; no qualification is required.

SVOCs by SW-846 Method 8270D:

LCS/LCSD BB40902-BSD1 displayed a RPD greater than the control limit for pentachlorophenol at 43%. The LCS and LCSD recoveries were within control; no qualification is required.

Comments:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP

#HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and trip blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- **NJ –** The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BD40893-BLK1 displayed a positive detection for acetone at 4.3 µg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Method blank sample BD41005-BLK1 displayed a positive detection for acetone at 6.0 µg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

SVOCs by SW-846 Method 8270D:

The initial calibration analyzed on 4/9/14 displayed a percent relative standard deviation greater than the control limit for pentachlorophenol at 27.22%. In addition, the continuing calibration analyzed on instrument BNA#1 displayed a percent differenc greater than the control limit with a positive bias for pentachlorophenol at 35.6%. The associated sample results were non-detect and were qualified as "UJ" on the basis of the initial calibration anomaly.

Sample SB17_0-2 displayed a surrogate recovery for 2,4,6-tribromophenol less than the lower control limit at 8.61%. The non-detect result for pentachlorophenol was qualified as "UJ."

Sample SB18_17-19 displayed a surrogate recovery for 2-fluorobiphenyl less than the lower control limit at 9.48%. The non-detect results acenaphthene. acenaphthylene, and flourene were qualified as "UJ."

Pesticides by SW-846 Method 8081B:

Sample SB14_14-15 displayed surrogate recoveries for decachlorobiphenyl and tetrachloro-m-xylene less than the lower control limit (i.e., 30%) at 12.5% and 15.7%, respectively. The associated sample results were non-detect and are qualified as "UJ."

PCBs by SW-846 Method 8082A:

Sample SB14_14-15 displayed surrogate recoveries for decachlorobiphenyl and tetrachloro-m-xylene less than the lower control limit (i.e., 30%) at 12.5% and 15.7%, respectively. The associated sample results were non-detect and are qualified as "UJ."

Metals by SW-846 Method 6010C:

Matrix spike sample SB18_17-19 displayed a recovery less than the lower control limit (i.e., 75%) for silver at 61.2%. The associated sample results were non-detect and are qualified as "UJ."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

SVOCs by SW-846 Method 8270D:

Matrix spike/spike duplicate (MS/SD) sample SB17_0-2 did not recover (i.e., 0%) for pentachlorophenol. Data is not qualified on the basis of MS/SD recoveries alone.

Metals by SW-846 Method 6010C:

Continuing calibration blanks Y4D1801-CCBC and Y4D1801-CCBD displayed positive detections for lead at 3 μg/L. The associated sample results are orders of magnitude greater than the blank concentration; no qualification is necessary.

Comments:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Soil Samples Collected April 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected on April 16, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, hexavalent chromium (Cr6+), and percent solids.

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7471/7470
- Cyanide by SW-846 Method 9010C
- Hexavalent chromium by SW-846 Method 7196A
- Percent solids by Method SM 2540G

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and trip blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

NJ – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BD40896-BLK1 displayed a positive detection for acetone at 3.8 µg/kg. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

The continuing calibration analyzed on 4/18/14 displayed a percent deviation (%D) greater than the control limit with a negative bias for vinyl chloride at 39.3%. The associated sample results were non-detect and are qualified as "UJ."

SVOCs by SW-846 Method 8270D:

The initial calibration analyzed on 4/14/14 displayed percent relative standard deviations (RSDs) greater than the control limit for hexachlorobenzene and pentachlorophenol at 40.09% and 40.38%, respectively. The associated field blank sample results are qualified as "UJ." Hexachlorobenzene was reported from BNA#2 and was not qualified.

The initial calibrations analyzed on 3/28/14 and 4/9/14 displayed RSDs greater than the control limit for pentachlorophenol at 32.68% and 27.22%, respectively. In addition, the continuing calibration analyzed on instrument BNA#1 displayed a %D greater than the control limit with a positive bias for pentachlorophenol at 65.9%. The associated sample results were non-detect and were qualified as "UJ" on the basis of the initial calibration anomaly.

Pesticides by SW-846 Method 8081B:

Sample SB16_14-15 displayed a surrogate recovery for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 20.7. The associated sample results were non-detect and are qualified as "UJ."

Laboratory control sample (LCS) BD409055-BS1 displayed recoveries less than the lower control limit for gamma-BHC (39.3%), alpha-Chlordane (39.5%), 4,4'-DDD (38.8%), 4,4'-DDE (39.0%), and heptachlor (39.9%). Associated positive detections were qualified as "J" and non-detects are qualified "UJ."

LCS BD409011-BS1 displayed recoveries less than the lower control limit for aldrin (30.6% and 31.7%), alpha-BHC (36.3% and 38.2%), delta-BHC (35.4% and 34.6%), gamma-BHC (38.0%

and 39.6%), and heptachlor (37.3% and 39.1%). The associated sample results were non-detects are qualified "UJ."

PCBs by SW-846 Method 8082A:

Sample SB16_14-15 displayed a surrogate recovery for decachlorobiphenyl less than the lower control limit (i.e., 30%) at 20.7%. The associated sample results were non-detect and are qualified as "UJ."

Metals by SW-846 Method 6010C:

Matrix spike sample SB10_19-20 displayed a recovery less than the lower control limit (i.e., 75%) for silver at 61.3%. The associated sample results were non-detect and are qualified as "UJ."

The ICP serial dilution for sample DUPRI02_041614 displayed a %D greater than the control limit (i.e., 10%) for nickel at 31.3%. The associated positive sample result is qualified as "J."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BD40989-BLK1 displayed a positive detection for sec-butylbenzene at 0.21 µg/L. The associated samples were non-detect; no qualification is required.

The field blank sample displayed positive detections for acetone at 4.0 µg/L and methylene chloride at 1.3 µg/L. The associated soil results were either non-detect or orders of magnitude greater than the blank amount; no qualification is required.

SVOCs by SW-846 Method 8270D:

Matrix spike/spike duplicate (MS/SD) sample SB10_19-20 displayed recoveries less than the lower control limit for pentachlorophenol at 6.66% and phenol at 2.96%. In addition, the MS/SD RPDs for pentachlorophenol and phenol were greater than the control limit at 174% and 185%, respectively. Data is not qualified on the basis of MS/SD recoveries or RPDs alone.

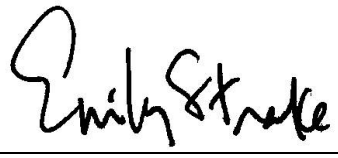
LCS/LCSD BD40881-BSD1 displayed a RPD greater than the control limit for benzo(b)fluoranthene at 24.9%. The LCS and LCSD recoveries were within control; no qualification is required.

The continuing calibration analyzed on 4/18/14 displayed a %D greater than the control limit with a positive bias for hexachlorobenzene at 52.6%. The associated sample result was previously qualified; no further action is required.

Metals by SW-846 Method 6010C:

Continuing calibration blanks Y4D1802-CCBC and Y4D1802-CCBD displayed positive detections for lead at 3 µg/L. The associated sample results are orders of magnitude greater than the blank concentration; no qualification is necessary.

The field blank sample displayed positive detections for lead at 3.0 µg/L and zinc at 10 µg/L. The associated soil results were either non-detect or orders of magnitude greater than the blank amount; no qualification is required.



Comments:

A field duplicate and parent sample pair (SB10_9-11 and DUPRI01_041614) was collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than ±2X the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 50%. All analytes met the precision criteria. A second field duplicate sample pair (SB16_6.5-8 and DUPRI02_041614) was collected and analyzed for all parameters. Anthracene, pyrene, benzo(b)fluoranthene, fluoranthene, benzo(k)fluoranthene, chrysene, benzo(a)pyrene, benzo(a)anthracene, acetone, barium, cadmium, zinc, and phenanthrene failed the precision criteria. The associated positive detections were qualified as "J."

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Soil Samples Collected April 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected on April 17, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, hexavalent chromium (Cr6+), and percent solids.

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7471/7470
- Cyanide by SW-846 Method 9010C
- Hexavalent chromium by SW-846 Method 7196A
- Percent solids by Method SM 2540G

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, and field blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

R – The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

J – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.

U – The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.

NJ – The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Method blank sample BD40995-BLK1 displayed a positive detection for acetone at 3.6 µg/L. The associated positive field blank detection was qualified as "U" and was not used to assess contamination resulting for field activities.

Method blank sample BD41003-BLK1 displayed a positive detection for acetone at 16 µg/kg. The associated positive detections were qualified as "U" at the reporting limit or sample concentration.

Method blank sample BD41143-BLK1 displayed a positive detection for acetone at 5 µg/kg. The associated positive detections were qualified as "U" at the reporting limit or sample concentration.

Laboratory control sample/control sample duplicate (LCS/LCSD) BD40995-BS1 displayed recoveries less than the lower control limit for ethylbenzene (84.9%), o-xylene (76.5%/81.6%), and m,p-xylenes (80.8%/81.3%). The associated non-detect field blank sample results are qualified as "UJ."

SVOCs by SW-846 Method 8270D:

The initial calibrations analyzed on 3/28/14 and 4/14/14 displayed percent relative standard deviations (RSDs) greater than the control limit for pentachlorophenol at 32.68% and 40.38%, respectively. The initial calibration on 3/28/14 also displayed a RSD greater than the control limit for fluorine at 20.20%. In addition, the continuing calibration analyzed on instrument BNA#4 displayed percent deviations (%Ds) greater than the control limit with a negative biases for indeno(1,2,3-cd)pyrene at 41.4%, dibenz(a,h)anthracene at 37.8%, and benzo(g,h,i)perylene at 56.8%. The associated sample results were non-detect and were qualified as "UJ."

Pesticides by SW-846 Method 8081B:

LCS BD409011-BS1 displayed recoveries less than the lower control limit for aldrin (30.6% and 31.7%), alpha-BHC (36.3% and 38.2%), delta-BHC (35.4% and 34.6%), gamma-BHC (38.0% and 39.6%), and heptachlor (37.3% and 39.1%). The associated field blank sample results were non-detects are qualified "UJ."

Metals by SW-846 Method 6010C:

The ICP serial dilution for sample SB13_14-15 displayed %Ds greater than the control limit (i.e., 10%) for nickel at 10.1%, lead at 18.7%, and zinc at 11.9%. The associated positive sample results are qualified as "J."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

LCS/LCSD BD40995-BS1 displayed recoveries greater than the upper control limit for benzene and cis-1,2-dichloroethene. The associated sample results were non-detect; no qualification is required.

LCS/LCSD BD41003-BS1 displayed a relative percent difference (RPD) greater than the control limit (i.e., 30%) for methylene chloride at 45.5%. The LCS and LCSD recoveries were within control; no qualification is required.

SVOCs by SW-846 Method 8270D:

LCS/LCSD BD40959 associated with the field blank sample displayed RPDs greater than the controllimit for acenaphthene, acenaphthylene, anthracene, benzo(k)fluoranthene, and fluorene. The associated LCS/LCSD recoveries were within control; no qualification is required. Napthalene displayed a LCSD recovery greater than the upper control limit at 103% and a RPD greater than the control limit at 21.7%. The associated sample results were non-detect; no qualification is required.

Comments:

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and quantification, chromatograms, overall system performance, serial dilutions, dual column performance, field duplicate, trip blank, and field blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- **NJ –** The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Client Sample ID	*Analysis*	*Analyte*	*CAS #*	*Validator Qualifier*

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. The section below describes the major deficiencies that were identified.

SVOCs by SW-846 Method 8270D:

Caprolactam did not recover (i.e., 0%) in the laboratory control sample/control sample duplicate (LCS/LCSD) associated with sample batch BC40084. The associated sample results were non-detect and are qualified as "R" for rejected.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Laboratory control sample/control sample duplicate (LCS/LCSD) BC40169-BS1 displayed recoveries less than the lower control limit for 1,4-dioxane at 33.2% and 39.7% respectively. The associated non-detect sample results are qualified as "UJ."

Method blank sample BC40231-BLK1 displayed a positive detection for acetone at 1.2 µg/L. The associated positive trip blank sample result is qualified as "U" at the reporting limit.

Method blank sample BC40169-BLK1 displayed a positive detection for acetone at 1.2 µg/L. The associated positive field blank sample result is qualified as "U" at the reporting limit.

Field blank sample FB02_022814 displayed a positive detection for Tetrachloroethene at 0.50 µg/L. The associated sample results less than the reporting limit are qualified as "U" at the reporting limit.

The continuing calibration analyzed on 3/5/2014 displayed a percent deviation (%D) greater than the control limit (i.e. 40%) with a negative bias for 1,4-dioxane at -66.7%. The associated non-detect results are qualified as "UJ."

SVOCs by SW-846 Method 8270D:

The initial calibration analyzed on instrument BNA 4 displayed a percent relative standard deviation (%RSD) greater than the control limit (i.e., 40%) for 2,4-dinitrophenol at 42.5%. The associated sample results were non-detect and are qualified as "UJ."

The initial calibration analyzed on instrument BNA 5 displayed a %RSD greater than the control limit (i.e., 20%) for pentachlorophenol at 40.38%. The associated sample results were non-detect and are qualified as "UJ."

Pesticides by SW-846 Method 8081B:

Samples MW03_022814 and DUP01_022814 displayed surrogate recoveries less than the lower control limit for decachlorobiphenyl at 24.7% and 28%, respectively. The associated sample results were non-detect and are qualified as "UJ."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

LCSD BC40169-BSD1 displayed recoveries greater than the upper control limit for 1,2,3-trichlorobenzene (119%) and 4-methyl-2-pentanone (115%). The associated sample results were non-detect no qualification is required.

LCS/LCSD BC40129-BS1/NSD1 displayed recoveries greater than the upper control limit for 1,2-dibromo-3-chloropropane, 2-hexanone, and 4-methyl-2-pentanone. The associated sample results were non-detect no qualification is required.

Trip blank sample TB04_022814 displayed a positive detection for methylene chloride at 1.5 µg/L. The associated sample results were non-detect; no qualification is required.

The continuing calibration analyzed on 3/4/2014 at 11:26 displayed %Ds greater than the control limit with positive biases for 2-butanone and 2-hexanone at 52.2% and 49.5%, respectively. The associated sample results were non-detect; no qualification is required.

SVOCs by SW-846 Method 8270D:

The LCS/LCSD relative percent difference (RPD) for phenol was greater than the control limit at 28.4%. The LCS and LCSD recoveries were within control; no qualification is required.

The continuing calibration analyzed at 8:59 displayed %Ds greater than the control limit with positive biases for 2-methylphenol and pentachlorophenol. The associated sample results were non-detect; no qualification is required.

The continuing calibration analyzed at 6:39 displayed a %D greater than the control limit with a negative bias for pentachlorophenol at 58.1%. The associated samples were previously qualified on the basis of initial calibration anomalies; no further action is required.

Pesticides by SW-846 Method 8081B:

LCSD BC40040-BSD1 displayed a recovery less than the lower control limit (40%) for delta-BHC at 39.6%. On the basis of professional judgment, no qualification is required.

Comments:

A field duplicate and parent sample pair (MW01_022814 and DUP01_022814) was collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than ±1X the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 35%. All analytes in the field duplicate sample met the precision criteria.

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Groundwater Samples Collected April 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected on April 24, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by York Analytical (NYSDOH ELAP registration # 10854) for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, mercury (Hg), cyanide, and hexavalent chromium (Cr6+).

- NYSDEC Part 375 VOCs by SW-846 Method 8260C
- NYSDEC Part 375 SVOCs by SW-846 Method 8270D
- PCBs by SW-846 Method 8082A
- Pesticides by SW-846 Method 8081B
- NYSDEC Part 375 Metals by SW-846
- Mercury by SW-846 Method 7470
- Cyanide by SM 4500 CN C/E
- Hexavalent chromium by SW-846 Method 7196A

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-34, "Trace Volatile Data Validation" (February 2013, Revision 3), USEPA Region II SOP #HW-35, "Semivolatile Data Validation" (March 2013, Revision 2), USEPA Region II SOP #HW-36, "Pesticide Data Validation" (May 2013, Revision 4), USEPA Region II SOP #HW-37, "PCB Aroclor Data Validation" (May 2013, Revision 3), USEPA Region II SOP #HW-2a, "ICP-AES Data Validation" (December 2012, Revision 15), USEPA Region II SOP #HW2c, "Mercury and Cyanide Data Validation," the USEPA Contract Laboratory Program "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008), and the "National Functional Guidelines for Inorganic Superfund Data Review" (USEPA-540R-10-011, January 2010).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, sample preservation, sample extraction and digestion, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, matrix spike/spike duplicate recoveries, target compound identification and

quantification, chromatograms, overall system performance, serial dilutions, dual column performance, field duplicate, trip blank, and field blank sample results.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- **NJ –** The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by SW-846 Method 8260C:

Laboratory control sample/control sample duplicate (LCS/LCSD) BD41477-BS1 displayed recoveries less than the lower control limit for 1,2-dichlorobenzene (81.1% and 80.2%), and 1,2-dibromo-3-chloropropane (58%). The associated non-detect sample results are qualified as "UJ."

Method blank sample BD41477-BLK1 displayed positive detections for 1,2,4-trichlorobenzene (0.68 µg/L), 1,2,4-trimethylbenzene (0.20 µg/L), acetone (3.9 µg/L), hexachlorobutadiene (0.49 µg/L), n-butylbenzene (0.40 µg/L), p-isopropyltoluene (0.27 µg/L), and sec-butylbenzene (0.24 µg/L). The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

The trip blank sample displayed positive detections for cis-1,2-dichloroethene (0.24 µg/L), methylene chloride (4.9 µg/L) and tetrachloroethene (0.31 µg/L). The associated positive detections were qualified as "U" at the reporting limit or the sample concentration, including the field blank sample results.

SVOCs by SW-846 Method 8270D:

The initial calibration analyzed on instrument BNA 1 displayed percent relative standard deviations (%RSD) greater than the control limit (i.e., 40%) for 2,4-dinitrophenol at 68.22% and hexachlorocyclopentadiene at 44.61%. The associated sample results were non-detect and are qualified as "UJ."

The field blank sample displayed a positive detection for bis(2-ethylhexyl)phthalate at 0.973 µg/L. The associated positive detections were qualified as "U" at the reporting limit or the sample concentration.

Pesticides by SW-846 Method 8081B:

LCS BD41318-BS1 displayed a recovery less than the lower control limit (40%) for aldrin at 38.9%. The associated sample results were non-detect and are qualified as "UJ."

Metals by SW-846 Method 6010C:

The field blank sample displayed a positive detection for aluminum at 40 µg/L. The associated positive detections were qualified as "U" at the sample concentration.

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by SW-846 Method 8260C:

The QA/QC samples associated with batch BD 41477 displayed slightly low recoveries for surrogate spike 1,2-dichloroethane-d4. The associated sample surrogates were within control; no qualification is required.

MS/SD sample MW13_042414 (batch BD41477) displayed recoveries greater than the upper control limit for the majority of analytes. The recoveries of cis-1,2-dichloroethene, tetrachloroethene, and trichloroethene, were less than the lower control limit due to an initial sample concentration greater than 4X the spiked amount; no qualification is required.

MS/SD sample MW13_042414 (batch BE40073) displayed recoveries less than the lower control limit for 1,1,1-trichloroethane, 1,1-dichloroethane, 1,2-dichlorobenzene, cis-1,2-dichloroethene, dibromochloromethane, tetrachloroethene, trichloroethene and vinyl chloride. Recoveries of 2-butanone, acrylonitrile, bromomethane, carbon disulfide, chloroethane, and methyl acetate were greater than the upper control limits. In addition, the MS/SD RPD for 4-methyl-2-pentanone was greater than the control limit at 38.8%. Data is not qualified on the basis of MS/SD recoveries and RPDs alone.

LCS/LCSD BE40073-BS1 displayed recoveries outside of control limits for 1,2-dibromo-3-chloropropane, acetone, benzene, bromodichloromethane, and chloromethane. In addition, the LCS/LCSD RPD was greater than the control limit for 4-methyl-2-pentanone and acetone. The sample batch is not associated with any reported results; no qualification is required.

LCS/LCSD BD41477-BS1 displayed recoveries greater than the upper control limit for 1,4-dioxane and chloromethane. The associated sample results were non-detect; no qualification is required.

The method blank sample associated with sample batch BE40073 displayed several low-level positive detections for target analytes. The method blank is not associated with investigative samples; no qualification is required.

The continuing calibration analyzed on 4/29/2014 displayed %Ds greater than the control limit (i.e., 30%) with positive biases for bromomethane (32.3%) and acrylonitrile (46.7%). The continuing calibration analyzed on 5/1/2014 displayed %Ds greater than the control limit with positive biases for bromomethane (42.7%) and acrolein (66.0%). The associated sample results were non-detect; no qualification is required.

SVOCs by SW-846 Method 8270D:

MS/SD sample MW13_042414 displayed recoveries less than the lower control limit for caprolactam at 7.94% and 7.62%, respectively. The MS/SD RPDs for bis(2-chloroethylether), 4-chlorophenyl phenyl ether, isophorone, 1,2,4-trichlorobenzene, and 4-nitrophenol were greater than the control limit. Data is not qualified on the basis of MS/SD recoveries alone.

The continuing calibration analyzed on 4/30/2014 at 9:31 displayed %Ds greater than the control limit with positive biases for 2-nitrophenol, naphthalene, caprolactam, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol. The associated sample results were non-detect; no qualification is required.

Comments:

A field duplicate and parent sample pair (MW13_042414 and DUPRI03_042414) was collected and analyzed for all parameters. For results less than 5X the RL, analytes meet the precision criteria if the absolute difference is less than ±1X the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 35%. Iron failed the precision criteria with a RPD of 72.2%. The associated positive detections were qualified as "J."

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Re: Data Usability Summary Report
For 44-30 Purves Street
Queens, New York
Ambient Air and Soil Gas Samples Collected February 2014
Langan Project No.: 170282501

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of six ambient air and soil gas samples collected on February 21, 2014 by Langan Engineering and Environmental Services ("Langan") at 44-30 Purves Street located in Queens, New York ("the Site"). The samples were analyzed by Alpha Analytical (NYSDOH ELAP registration # 11627) for volatile organic compounds (VOCs) using the analytical method specified below.

- Full List VOCs by EPA Compendium Method TO-15 (1/1999)

Table 1, below, summarizes the laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review.

Validation Overview

This data validation was performed in accordance with USEPA Region II Standard Operating Procedure (SOP) #HW-31, "Validating Volatile Organic Analysis of Ambient Air in Canister by Method TO-15" (June 9, 2014, Revision 6), and the USEPA Contract Laboratory Program, "National Functional Guidelines for Superfund Organic Methods Data Review" (USEPA-540R-08-01, June 2008).

Validation includes reconstruction of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Items subject to review in this memorandum include holding times, canister certification, canister pressure, instrument tuning, instrument calibration, laboratory blanks, laboratory control samples, system monitoring compounds, internal standard area counts, target compound identification and quantification, chromatograms, and overall system performance.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the USEPA's guidelines and best professional judgment:

- **R –** The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- **J –** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- **UJ –** The analyte was not detected at a level greater than or equal to the reporting limit (RL); however, the reported RL is approximate and may be inaccurate or imprecise.
- **U –** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the RL or the sample concentration for results impacted by blank contamination.
- **NJ –** The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

If any validation qualifiers are assigned these qualifiers should supersede any laboratory-applied qualifiers. Data that is not qualified as a result of this data validation is considered acceptable on the basis of the items specified for review. Data that is qualified as "R" are not sufficiently

valid and technically supportable to be used for data interpretation. Data that is otherwise qualified due to minor data quality anomalies are usable, as qualified.

Table 2: Validator-applied qualification

Client Sample ID	*Analysis*	*Analyte*	*CAS #*	*Validator Qualifier*
SV04_022114	VOCs	Acetone	67-64-1	J
AA01_022114	VOCs	Acetone	67-64-1	J

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by USEPA TO-15:

Acetone could not be accurately quantitated in samples SV04_022114 and AA01_022114 due to the presence of an interfering analyte co-eluting from the chromatography column at approximately the same retention time. The associated sample results were positive detections and are qualified as "J."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by USEPA TO-15:

Tetrachloroethene was detected during the batch canister certification (CAN 373 SHELF 4) at a concentration of 0.258 $\mu g/m^3$. The associated sample results were more than an order of magnitude greater than the batch canister result; no qualification is required.

Comments:

The laboratory performed verification of the flow controller calibration as a performance standard under the Massachusetts Department of Environmental Protection Bureau of Waste Site Cleanup's quality control requirements. Samples SV01_022114 and SV04_022114 displayed relative percent differences greater than the control limit (i.e., 20%) for the pre- and post- flow rates at 39% and 32%, respectively. This may indicate uncertainty in the flow rates during the sampling period. Flow controller leak checks and clean canister certifications are provided as part of the standard analytical report.

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Major Deficiencies:

Major deficiencies include those that grossly impact data quality and necessitate the rejection of results. No major deficiencies were identified.

Minor Deficiencies:

Minor deficiencies include anomalies that directly impact data quality and necessitate

qualification, but do not result in unusable data. The section below describes the minor deficiencies that were identified.

VOCs by USEPA TO-15:

The following analytes were reported by the laboratory without contemporary certification and the results are qualified as estimated: tetrahydrofuran, propylene, p-ethyltoluene, ethyl acetate, 2-hexanone. Demonstration of capability to perform the testing was completed through the successful analysis of laboratory control samples for the above-listed compounds.

Sample SV09_041814 displayed concentrations greater than the linear range of the instrument calibration at a 2.06X dilution for tetrachloroethene and acetone. The reported results are qualified as "J."

Laboratory control sample BD41071-BS1 displayed recoveries greater than the upper control limit for trichlorofluoromethane at 106% and dibromochloromethane at 126%. The associated positive detections are qualified as "J."

Samples SV11_041814 and SV12_041814 displayed concentrations greater than the linear range of the instrument calibration for 1,1,1-trichloroethane at a 1.87X and 4.03X dilution, respectively. The reported results are qualified as "J."

Other Deficiencies:

Other deficiencies include anomalies that do not directly impact data quality and do not necessitate qualification. The section below describes the other deficiencies that were identified.

VOCs by USEPA TO-15:

Method blank samples BD41071 and BD41109 displayed positive detections for acetone at 0.27 $\mu g/m^3$ and 0.24 $\mu g/m^3$, respectively. The associated sample concentrations were orders of magnitude greater than the blank amounts; no qualification is required.

Comments:

A field duplicate and parent sample pair (SV13_041814 and SVDUPRI_042414) was collected and analyzed for VOCs. For results less than 5X the RL, analytes meet the precision criteria if

the absolute difference is less than ±1X the RL. For results greater than 5X the RL, analytes meet the precision criteria if the RPD is less than or equal to 35%. Styrene and acetone did not meet the precision criteria and the associated sample results were qualified as estimated.

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given fraction is not mentioned above, that means that all specified criteria were met for that parameter. All sample holdtimes were met and the data packages met ASP Category B requirements.

All data are considered usable, as qualified. In addition, completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Re: Supplemental Sampling Results
44-30 Purves Street
Long Island City, NY 11101
Brownfield Cleanup Program Site No. C241162
Langan Project No.: 170282501

Dear Mr. Magloire:

This letter provides the results associated with the supplemental soil borings and sampling performed at 44-30 Purves Street, Long Island City, NY (the "Site"). The supplemental borings and sampling were performed at the direction of the New York State Department of Environmental Conservation (NYSDEC) to determine whether chlorinated volatile organic compound (CVOC) source material exists within the Site boundaries. This letter contains a summary of sample collection methodology, analytical results, and discussion of the results. As explained below, we conclude that the supplemental soil sampling supports the conceptual site model offered in the RIR and demonstrates the absence of CVOC source material within the Site.

FIELD ACTIVITIES SUMMARY

On 23 September 2014, Langan field personnel observed and documented field activities in the presence of an NYSDEC representative. The scope of the supplemental investigation was preapproved by the NYSDEC on 18 September 2014 and consisted of two borings (SB20 and SB21) advanced to 25 feet below Site grade. The boring locations were chosen to further investigate potential CVOC soil contamination in the northeast Site corner. The sample collection depths were based on the following: 1) Field screening results and evidence of contamination; 2) comparable depths to remedial investigation boring SB-13; and, 3) boring termination depth.

The extracted sample cores were field screened for visual, olfactory or instrumental evidence (photoionization detector [PID]) of contamination. The PID used to screen the soil cores was equipped with a 10.6-electron Volt (eV) lamp and was calibrated using a 100-ppm isobutylene gas. Field screening observations were recorded on the attached soil boring logs (Attachment A). The supplemental boring locations are shown with previously-advanced soil boring locations

in the subject area on the enclosed Figure 1. Three soil samples were collected from SB20 and four soil samples were collected from SB21 for CVOC analysis. Two samples from each boring were also collected for fraction organic carbon (FOC) analysis. Sample collection depths are shown on Figure 1, listed in Table 1 and recorded in the attached soil boring logs.

RESULTS AND DISCUSSION

Results and observations are discussed in context to the results provided in the NYSDEC-approved September 2014 Remedial Investigation Report (RIR) and the associated conceptual site model. Sample results are summarized in the enclosed Table 1.

Field Screening and Geology

There was no visual or olfactory evidence of contamination in borings SB20 or SB21. Total organic vapor concentrations measured via a PID ranged from a non-detect to 21 parts per million (ppm) in SB20 and 11.5 ppm in SB21. Tetrachloroethene (PCE) and trichloroethene (TCE) have PID isobutylene correction factors of 0.57 and 0.55, respectively. As such, if the PID concentrations observed are attributable to PCE and TCE, then the results are biased high by more than 40%.

The observed geology in SB20 and SB21 is consistent with previous Site observations. SB20 found historic fill to 8 feet, sandy silt and sand layers to about 13.5 feet, and silts and clays to boring termination at 25 feet. SB21 found historic fill to roughly 2.25 feet, sand to 13 feet, and layers of silty clay and sand to 24.25 feet. SB21 was terminated in roughly 1 foot of sandy clay.

Analytical Results

Chlorinated Volatile Organic Compounds

The CVOC results are provided on Table 1 with comparison to the NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives (UU SCO). The analytical service protocol category B-compliant data package is provided in Attachment B. All reported data was validated and a data usability summary report is enclosed in Attachment C. The following three CVOCs were detected in one or more samples at concentrations exceeding their respective UU SCOs (maximum concentrations are shown for each boring):

Compound	UU SCO	SB-20	SB-21
DCE	0.25	NE	0.45
PCE	1.3	4.40	12
TCE	0.47	NE	1.1

DCE – cis-1,2-dichloroethene
NE – no exceedance
All concentrations shown in mg/kg

The samples with CVOC concentrations were collected below the water table and were saturated. As required by laboratory protocol, sample results are dry-weight adjusted, which for a saturated sample biases the concentrations high as a function of the percent solids. Percent solids are shown on Table 1 and range between 77 % and 88 %. When saturated samples are

prepared by U.S. Environmental Protection Agency (EPA) method 5035 and analyzed by method 8260, there is no discrimination between dissolved concentrations in the soil pore water or the absorbed onto the soil matrix, which can also bias results higher.

Fraction Organic Carbon

Fraction organic carbon (FOC) samples were collected from four distinct geologic layers to assess the potential for groundwater-to-soil contaminant partitioning. The FOC was highest at 1 % for the silty clay encountered at 13.5 feet in SB20 and the silty clay in SB21 encountered at 13 feet. For the sandy layers, FOC was measured to be 0.4 for medium to coarse sand and 1.1 % for fine to medium sand. For reference the U.S. Environmental Protection Agency recommends a general screening value of 0.2% to evaluate potential groundwater-to-soil contaminant partitioning.

Partitioning of CVOCs onto Soil or Aquifer Organic Carbon

Organic compounds dissolved in groundwater adsorb onto solid surfaces by what is referred to as the hydrophobic effect (Roy and Griffin 1985). When dissolved in water, hydrophobic compounds, such as PCE and TCE, tend to be attracted to surfaces that are less polar than water. The partitioning of a dissolved compound on saturated soil is almost exclusively a function of FOC. Values for FOC range from 0.2 % to 3% for sand, silt and clay The partition coefficient with respect to the organic fraction, Koc, can be defined as Koc = Kd/foc, where Kd is partition or distribution coefficient.

Assuming that adsorption is linear with respect to concentration, the sorbed concentration (Cs) onto Site soil can be calculated by Cs = Kd*Cw, where Cw is the contaminant concentration in water. For example, SB-01/MW-01 for PCE:

$Kd = Koc \times foc = 364\ L/kg \times 0.01 = 3.64\ L/kg$
$Cs = Kd \times Cw = 3.64\ L/kg \times 0.6\ mg/L = 2.1\ mg/kg$

Based on the above calculation, which assumes a conservative groundwater concentration of 0.6 mg/L, roughly 2 mg/kg of PCE is the result of partitioning. During periods of CVOC discharge through the sanitary sewer, groundwater concentration would likely have been substantially higher and thus resulted in higher soil concentrations.

CONCLUSIONS

According to our analysis of the supplemental data, we made the following conclusions:

- The supplemental soil sampling supports the conceptual site model offered in the RIR and demonstrates the absence of CVOC source material within the Site. Specifically, CVOC concentrations in SB21, which is approximately 5 feet from the Site boundary, are higher than in SB20, which is approximately 16 feet from the Site. The CVOC

concentrations in soil are likely the result of long-term releases of chlorinated solvents from unidentified, off-site sources. Potential off-site sources include:

  - As shown on Sanborn fire insurance maps from 1936 through 2006, upstream to this Site, are historic and recent Site uses on Lot 33 for chromium plating and auto body. Chlorinated solvents were and are extensively used in the chromium plating industry to clean and degrease metal substrates before plating and before polishing. Chlorinated solvents are used by the auto body repair industry to clean and degrease parts, thin paints, and clean paint spray lines.

  - The sanitary sewer beneath the Purves Street sidewalk was constructed circa 1911 of reinforced concrete pipe. Given the industrial history of the Site's surrounding neighborhood, there are likely upstream chlorinated solvent sources that could be impacting Site groundwater and soil through breaches in the sewer.

- The concentrations of CVOC found in Site do not exceed the Part 375 Restricted Residential SCOs, which constitute the Track 4 remedial objectives for this Site, and are not considered source material as defined in 6 NYCRR Part 375-1.2(au); the soil concentrations are not sufficient to migrate, release significant levels of contaminants to another environmental medium, or pose a threat to public health or the environment. The conclusion that the CVOC concentrations are not indicative of source material is further supported by the following:

  - CVOC soil concentrations are likely biased high because samples were water-saturated and dry-weight adjusted.

  - In SB20, the only CVOC concentration that exceeded the UU SCO was PCE at 4.4 mg/kg from the silty clay sample at 14 to 15 feet. This concentration is likely the result of groundwater contamination and groundwater-to-soil contaminant partitioning.

  - In SB21, analysis of the sandy clay layer at the boring termination interval of 24 to 25 feet revealed PCE and TCE concentrations in excess of the UU SCO. These concentrations are consistent with conceptual site model, which attributes onsite soil and groundwater contamination to the infiltration of chlorinated solvent discharges from an off-site source to the east.

- This area of the Site does not have a historic use that would typically be associated with chlorinated solvent environmental impacts. Sanborn fire insurance maps from 1947 and 1950 show a small structure labeled with "Fine Chemical Manufacturing." Fine chemicals traditional did not use degreasing agents or chlorinated solvents. Rather, fine chemicals typically involve small quantities of highly pure chemicals uses as catalysts, intermediaries or additives. Fine chemical manufacturers typically support the pharmaceutical, cosmetic, flavors, fragrances, food additives, and specialty chemical industries, which are not traditional sources of chlorinated solvent contamination. (Reference: A. Cybulski et al. *Fine Chemicals Manufacture: Technology and Engineering*, Elsevier, December 2001)

CLOSURE

Based on the supplemental sample results and the conclusions provided herein, we recommend no additional remedial action in relation to the off-site CVOC issue. We respectfully request that NYSDEC approve the Remedial Action Work Plan in its current form once it leaves public comment on 3 November 2014.

We appreciate the NYSDEC's attention and commitment to this project. If you have question, please contact the undersigned at 212.479.5427.

Sincerely,

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.

Technical Report

prepared for:

Langan Engineering & Environmental Services (NYC)
21 Penn Plaza, 360 West 31st Street
New York NY, 10001
Attention: Gerald Nicholls

Report Date: 10/09/2014
Client Project ID: 170282501
York Project (SDG) No.: 14I0908

Report Date: 10/09/2014
Client Project ID: 170282501
York Project (SDG) No.: 14I0908

Langan Engineering & Environmental Services (NYC)
21 Penn Plaza, 360 West 31st Street
New York NY, 10001
Attention: Gerald Nicholls

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on September 23, 2014 and listed below. The project was identified as your project: **170282501**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14I0908

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Case Narrative

Client: Langan Engineering & Environmental Services (NYC)
Client Project ID: 170282501
Prepared for: Gerald Nicholls

Introduction

This Case Narrative applies only to the following samples submitted to our laboratory on **9/23/2014 6:15:00 PM** :

SB20_14-15 Soil
SB20_24-25 Soil
SB20_9-10 Soil
SB21_11-12 Soil
SB21_14-15 Soil
SB21_24-25 Soil
SB21_9-10 Soil

The 7 sample(s) were received intact in a custody-sealed cooler(s) unless otherwise noted. Upon receipt, cooler temperature(s) was determined using a NIST traceable digital infrared thermometer. The cooler temperature(s) was acceptable (2-6oC) and documented as:

Cooler 4.3 C

Chain-of-custody was maintained from receipt through analysis in the laboratory.

Methodology

All preparation and analyses were conducted according to the methods referenced in the body of the lab report.

Sample and Analysis Qualifiers

SB20_14-15 Soil Qualifiers
pH - HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.

SB20_24-25 Soil Qualifiers
pH - HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.

SB20_9-10 Soil No Qualifiers

SB21_11-12 Soil Qualifiers
pH - HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.

SB21_14-15 Soil Qualifiers
pH - HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.

SB21_24-25 Soil No Qualifiers

SB21_9-10 Soil Qualifiers

Volatile Organics, 8260 Halogenated List for cis-1,2-Dichloroethylene and tetrachloroethylene - The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate. The sample was initially run at a 1x dilution and exceeded the calibration range. The sample was rerun at the next available dilution (medium level methanolic samples at 100x) however the data for these target analytes was slightly below the reporting limits. The initial data was uploaded.

Analysis Issues (Calibration, Others)

No problems encountered other than dilutions required due to levels of target analytes.

York Project/SDG no.: 14I0908 Statement

We certify that these data are in compliance with SOP requirements both technically and for completeness for other than the conditions stated above. Release of the data contained in the hard copy report and any electronic deliverables has been authorized by the Laboratory Manager as verified by the signature on this laboratory report.

Laboratory Director

York Analytical Laboratories, Inc.

Formulae Used for Sample Calculations

VOLATILE ORGANICS

1. Volatiles in Air-ppbv

Cx (ppbv) = Compound concentration, ppbv (parts per billion by volume)

$$Cx = \frac{(Ax)(Cis)(DF)}{(Ais)(RRF)}$$

2. Volatiles in Air-ug/m3

Cx (ug/m3)= Compound concentration in ug/m3

$$Cx\ (ug/m3) = \frac{(ppbv \times Molecular\ wt.)}{(24.040)}$$

3. Volatile Organics (water and soil), ug/L or ug/kG

Soils/Waters

$$Cx = \frac{(Ax)(IS)(DF)}{(Ais)(RRF)(V)(\%solids)}$$

Medium Level Soils

$$Cx = \frac{(Ax)(IS)(VT)(1000)(DF)}{(Ais)(RRF)(VA)(V)(\%solids)}$$

4. Semi-Volatiles (waters and soils)

$$Cx = \frac{(Ax)(IS)(VE)(DF)}{(Ais)(RRF)(Volume\ injected,\ uL)(V)(\%solids)}$$

5. Pesticides/PCB (waters and soils), DRO, CTETPH

$$Cx = \frac{(Ax)(VE)(DF)}{(CF)(Volume\ injected,\ uL)(V)(\%solids)}$$

WHERE:

Cx = concentration of analyte as ug/L or ug/kG
Ax = Area of the characteristic ion for the compound to be measured, counts.
Ais = Area of the characteristic ion for the specific internal standard, counts.
IS = Concentration of the internal standard spiking mixture, ng
RRF= Mean relative response factor from the initial calibration.
DF = Dilution factor calculated as described in section 2. If no dilution is performed, DF= 1
V= Volume for liquids in ml, weight for soils/solids in grams.
VA= volume of MeOH aliquot for medium level soils
VE= final volume of concentrated extract
VT= volume of MeOH for volatiles medium level soils
CF= calibration factor for external calibration used in GC pest/pcb
Cis = Concentration of the internal standard spiking mixture, ppbv

Notes and Definitions

J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
HT-pH	HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.

---

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two.
For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

Laboratory Chain-of-Custody Record
