Appendix H Laboratory Data Reports
Appendix I Completed Fish and Wildlife Resources Impact Analysis Decision Key and Memo

LIST OF ACRONYMS

Acronym	Definition
AOC	Area of Concern
AGV	Air Guideline Values
ASP	Analytical Services Protocol
AST	Aboveground Storage Tank
ASTM	ASTM International
BCP	Brownfield Cleanup Program
bgs	below grade surface
BTEX	Benzene, Toluene, Ethylbenzene, Xylenes
CAMP	Community Air Monitoring Plan
COC	Contaminant of Concern
CSM	Conceptual Site Model
CVOC	Chlorinated Volatile Organic Compounds
DER	Division of Environmental Remediation
DUSR	Data Usability Summary Report
el	Elevation
ELAP	Environmental Laboratory Approval Program
ESA	Environmental Site Assessment
eV	electron volt
FEMA	Federal Emergency Management Agency
FWRIA	Fish and Wildlife Resources Impact Analysis
HASP	Health and Safety Plan
IDW	Investigation-Derived Waste
L/min	liters per minute
mg/kg	milligrams per kilogram
mg/l	milligrams per liter
µg/L	micrograms per liter
$\mu g/m^3$	micrograms per cubic meter
MS/MSD	Matrix Spike/Matrix Spike Duplicate
NAPL	Non-Aqueous Phase Liquid
NAVD88	North American Vertical Datum of 1983
NYC	New York City
NYCRR	New York Codes, Rules, and Regulations
MTA	Metropolitan Transit Authority
NYSDOH	New York State Department of Health
NYSDEC	New York State Department of Environmental Conservation
OER	NYC Mayor's Office of Environmental Remediation
ORP	Oxidation-Reduction Potential

Acronym	Definition
PBS	Petroleum Bulk Storage
PCB	Polychlorinated Biphenyls
PCE	Tetrachloroethene
PFA	Per- and polyfluoroalkyl substances
PFC	Perfluorinated Chemical
PGW	Protection of Groundwater
PID	Photoionization Detector
PPE	Personal Protective Equipment
ppm	parts per million
ppt	parts per trillion
PVC	Polyvinyl Chloride
QA/QC	Quality Assurance/Quality Control
RAWP	Remedial Action Work Plan
REC	Recognized Environmental Condition
RI	Remedial Investigation
RIR	Remedial Investigation Report
RL	Reporting Limit
RURR	Restricted-Residential Use
SCO	Soil Cleanup Objective
SGV	Standards and Guidance Values
SMP	Site Management Plan
SVOC	Semivolatile Organic Compound
TAL	Target Analyte List
TCE	Trichloroethene
TCL	Target Compound List
TOGS	Technical and Operational Guidance Series
UN/DOT	United Nations / Department of Transportation
USDA	U.S. Department of Agriculture
USEPA	United States Environmental Protection Agency
UST	Underground Storage Tank
UU	Unrestricted Use
VOC	Volatile Organic Compound

CERTIFICATION

I, Jason Hayes, certify that I am currently a Qualified Environmental Professional as defined in 6 NYCRR Part 375 and that this Remedial Investigation Report was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the Division of Environmental Remediation (DER) Technical Guidance for Site Investigation and Remediation (DER-10).

Jason Hayes, PEE, LEED AP

1.0 INTRODUCTION

This Remedial Investigation Report (RIR) was prepared on behalf of 26-32 Jackson Ave LLC (the Volunteer) for the property located 26-32 Jackson Avenue in the Long Island City neighborhood of Queens, New York (the site). The Volunteer will remediate the site concurrent with site redevelopment under the New York State Brownfield Cleanup Program (BCP), pursuant to a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC), executed on February 1, 2019, for Site No. C241217.

This RIR presents environmental data and findings from the Remedial Investigation (RI) conducted by Langan Engineering, Environmental, Surveying, Landscape Architecture and Geology, D.P.C. (Langan) in April and May 2019. The RI was conducted in accordance with Title 6 of the New York Codes, Rules and Regulations (6 NYCRR) Part 375-1, 3.8, 6.8, NYSDEC Division of Environmental Remediation (DER) Program Policy: Technical Guidance for Site Investigation and Remediation (DER-10), and the New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006, with updates. The objectives and goals of this RIR are to:

- Define the nature and extent of contamination in all media at or emanating from the site
- Generate sufficient data to evaluate remedial action alternatives and prepare a Remedial Action Work Plan (RAWP) to be implemented concurrently with site redevelopment
- Generate sufficient data to evaluate actual and potential threats to human health and the environment

The remainder of this report is organized as follows:

- Section 2.0 describes the setting and physical characteristics of the site
- Section 3.0 describes the site background including results of previous investigations and identified areas of concern (AOCs)
- Section 4.0 presents the Remedial Investigation (RI) field procedures
- Section 5.0 describes the RI field observations and analytical results
- Section 6.0 presents an assessment of the exposure risks of site contaminants to human, fish, and wildlife receptors
- Section 7.0 presents the nature and extent of contamination in site media as determined through the field investigation and analysis of environmental samples from the RI and the May 2018 Subsurface Investigation
- Section 8.0 summarizes the results of the RI and May 2018 Subsurface Investigation and presents conclusions based on field observations and analytical results

- Section 9.0 presents the references used in preparation of this report

2.0 SITE PHYSICAL CHARACTERISTICS

2.1 Site Description

The site is located at 26-32 Jackson Avenue in the Long Island City neighborhood of Queens, New York and is identified on the Queens Borough Tax Map as Block 267, Lot 21. The lot is 10,000 square feet in area and is located on the northern part of the city block bound by Jackson Avenue followed by a vacant lot to the north, a vacant lot and the Ed Koch Queensboro Bridge on-ramp (elevated) followed by a two-story industrial building to the east, vacant land and the Ed Koch Queensboro Bridge on-ramp (elevated) followed by a 15-story residential building to the south, and a 14-story mixed-use commercial and residential building followed by Purves Street to the west. A one-story building with a loft and partial cellar used as a construction field office and materials storage space spans the entire site footprint. A site location map is provided as Figure 1.

2.1.1 Description of Surrounding Properties

The site is located in a mixed-use area with multi-story industrial, commercial, and residential buildings, active construction sites, and vacant lots. The following is a summary of surrounding property usage:

Direction	Adjoining and Adjacent Properties			Surrounding Properties
	Block No.	Lot No.	Description	
North	N/A	N/A	Jackson Avenue	Multi-family residential buildings, manufacturing buildings, Hunter Street, vacant land
	432	21	Vacant land (27-01 Jackson Avenue)	
East	267	25	Vacant land and the Ed Koch Queensboro Bridge on-ramp (elevated)	Multi-story commercial, residential and mixed-use buildings, industrial buildings, and vacant land
South	267	25	Vacant land and the Ed Koch Queensboro Bridge on-ramp (elevated)	Vacant land, institutional buildings, multi-family residential buildings
		7503	15-story residential building (44-15 Purves Street)	
West	267	7502	12-story mixed-use commercial and residential building (26-26 Jackson Avenue)	Purves Street followed by multi-family residential, manufacturing, and mixed use buildings

Land use within a half-mile radius includes residential, commercial, institutional, and light industrial uses and vacant land. A New York City Transit Authority (NYCTA) subway tunnel for the "E" and "M" lines are located beneath Jackson Avenue directly north of the site. Sensitive receptors, as defined in DER-10, located within a half-mile of the site include those listed below:

Number	Name (Approximate distance from site)	Address
1	Heaven & Isabella Intelligent Kids Tutoring Center (approximately 0.01 miles west of the site)	26-14 Jackson Avenue Long Island City, NY 11101
2	Bright Horizons at Long Island City (approximately 0.15 miles northeast of the site)	44-02 23rd Street Long Island City, NY 11101
3	NYC Leadership Academy (approximately 0.18 miles west of the site)	45-18 Court Square West Long Island City, NY 11101
4	Information Technology High School (approximately 0.29 miles northwest of the site)	21-16 44th Road Long Island City, NY 11101
5	Academy of American Studies (approximately 0.29 miles northeast of the site)	28-04 41st Avenue Long Island City, NY 11101
6	Newcomers High School (approximately 0.33 miles northeast of site)	28-01 41st Avenue Long Island City, NY 11101
7	Long Island City Family Daycare, Inc. (approximately 0.35 miles northeast of site)	40-34 28th Street Long Island City, NY 11101
8	LaGuardia Community College Early Childhood Learning (approximately 0.35 miles southeast of site)	30-10 Thomson Avenue Long Island City, NY 11101
9	Middle College High School (approximately 0.44 miles northeast of site)	3101 Thomson Avenue Long Island City, NY11101
10	Growing up Green Charter School (approximately 0.46 miles south of site)	39-37 28th Street Long Island City, NY 11101
11	Robert F. Wagner Jr. Secondary School for Arts and Technology (approximately 0.46 miles southeast of site)	47-07 30th Place Long Island City, NY 11101

A map showing the surrounding land uses and the locations of sensitive receptors within 1,000 feet of the site is included as Figure 2.

2.1.2 Topography

Based on the survey created by Haynes Land Surveyors, dated December 8, 2017, the elevation of the site is about 12.5 feet, referenced to the North American Vertical Datum of 1988 (NAVD88). The property slopes gently to the south towards the Dutch Kills located about 1,500 feet south of the site.

2.1.3 Surface Water and Drainage

The site footprint is covered by a concrete building slab; therefore, the majority of runoff from the site is expected to drain to the city sewers via roof and storm drains located throughout the existing building. If rainwater was to infiltrate the ground, it would percolate downwards toward

the water table and join the anticipated regional groundwater flow, which is estimated to flow west-southwest towards an old tributary of the Dutch Kills.

According to preliminary Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) No. 3604970202F (revised September 5, 2007), the site falls within Zone X, which is designated for areas of 0.2 percent annual chance of flood; areas of one percent annual chance flood with average depths of less than one foot or with drainage areas less than one square mile; and areas protected by levees from one percent annual chance flood.

2.1.4 Wetlands

Wetlands on or near the site were evaluated by reviewing the National Wetlands Inventory and NYSDEC regulated wetlands map. There are no wetlands on or adjacent to the site. The nearest wetland is associated with the Dutch Kills and is located about 1,500 feet to the south.

2.2 Geology and Hydrogeology

2.2.1 Regional Geology

According to the U.S. Department of Agriculture (USDA) Soil Conservation Service (SCS), the regional soil composition is predominantly urban land underlain by glacial till. According to the USGS "Bedrock and Engineering Geologic Maps of New York County and Parts of Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" dated 1994, the bedrock formation underlying the site is part of the Ravenswood Granodiorite, which generally consists of gray sillimanite-garnet-microcline gneiss.

2.2.2 Regional Hydrogeology

Groundwater flow is usually typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeologic network often governs groundwater flow. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth-to-bedrock, the presence of fill, and variability in local geology and groundwater sources or sinks. Regional groundwater flow is generally to the west-southwest.

Groundwater in this area of New York City is not used as a potable water source. Potable water provided to the City of New York is derived from surface impoundments in the Croton, Catskill, and Delaware watersheds.

3.0 SITE BACKGROUND

This section describes historical site use, the proposed redevelopment, and the findings from previous environmental investigations. AOCs were developed based on this information and are detailed at the end of the section.

3.1 Historical Site Use

Historical Sanborn Fire Insurance Maps indicate that between 1898 and 2006, the site was occupied by residences, offices, and various commercial uses including a garage with a gasoline tank (1922 to 1936) and an electric supplies warehouse (1947 to 1994). The one-story building was most recently occupied by an automotive parts center (1994 to 2006) and is currently used as a construction field office and materials storage space.

3.2 Proposed Redevelopment Plan

The proposed redevelopment project will include construction of a 51-story structure with a cellar level. The new building footprint will span the entire 10,000-square-foot lot, and will include residential units, commercial space, and community space. The site will be excavated to about 18 feet below grade surface (bgs) to accommodate the construction of a new cellar level and foundation components.

3.3 Previous Environmental Reports and Documents

The following previous environmental reports and investigations were reviewed as part of this RIR and are summarized below. The reports are included in Appendix A.

December 2006 Phase II Environmental Site Assessment (ESA) for 26-32 Jackson Avenue, prepared by Impact

This letter report summarizes a limited Phase II subsurface investigation conducted at the site on November 10, 2006. The purpose of this investigation was to evaluate possible impacts to soil and groundwater from historical use of the site as a garage with a gasoline tank. The investigation included advancement of four soil borings and installation of one groundwater monitoring well in the presumed vicinity of the former gasoline tank, located in the northern part of the site. Ten soil samples and one groundwater sample were collected and analyzed for volatile organic compounds (VOCs). VOCs were not detected in either soil or groundwater. Soil vapor samples were not collected as part of this investigation.

December 2014 Phase I ESA or 26-32 Jackson, prepared by HiRise

HiRise prepared a Phase I ESA in December 2014 in general conformance with American Society for Testing and Materials (ASTM) International's Standard Practice for Environmental Site

Assessments E1527-13 and the United States Environmental Protection Agency (USEPA) All Appropriate Inquiries (AAI) Rule, for the purpose of identifying Recognized Environmental Conditions (RECs) in connection with the site.

The following REC was identified in the Phase I ESA:

- Historical Use of Northern-Adjoining Property: The northern adjoining property (across Jackson Avenue) operated as a gasoline filling station circa 1945 to 2015. Open NYSDEC Spill No. 9913082 was assigned to the site after petroleum impacts to soil and groundwater were identified in a previous investigation. Based on its close proximity to the site and the unknown extent of groundwater impacts associated with the spill, HiRise concluded that historical operation of the gasoline station on the northern-adjoining property may have adversely affected groundwater or soil vapor beneath the site.

June 2017 Phase I ESA for 26-32 Jackson Avenue (Block 432, Lot 21) prepared by Langan

Langan prepared a Phase I ESA in June 2017 in general conformance with ASTM International's Standard Practice for Environmental Site Assessments E1527-13 and the USEPA AAI Rule, for the purpose of identifying RECs in connection with the site.

The following RECs were identified in the Phase I ESA:

- Historical Site Operations: Historical operations at the site include a garage with gasoline tank (1922 to 1936) and an automotive parts shop (1994 to 2006).
- Historical Use of Adjoining and Surrounding Properties: Historical uses of adjoining and surrounding properties include a welding machine shop, auto repair shops, a tool manufacturer and sub-station. Historical operation on nearby properties to the north and east may have resulted in releases of petroleum products, solvents, chemicals, and/or other hazardous substances that may have affected groundwater or soil vapor beneath the site.
- Nearby Up-Gradient Chlorinated Volatile Organic Compound (CVOC) Impacts to Groundwater and Soil Vapor: Two NYSDEC BCP sites (44-18 and 44-30 Purves Street) are located less than 300 feet and hydraulically up-gradient of the site. Remedial investigations identified CVOC impacts to groundwater and soil vapor in the northeastern parts, and directly east-northeast of both those off-site properties. CVOC concentrations warranted the installation of active vapor mitigation systems in the new developments.

May 2018 Subsurface Investigation Letter Report prepared by Langan

A subsurface investigation was conducted on behalf of American Lions to investigate RECs identified during the June 2017 Phase I ESA. The scope of the investigation included:

- A geophysical survey to locate potential underground storage tanks (USTs) and other subsurface structures
- Advancement of eight borings to depths of up to 20 feet bgs and collection of 18 soil samples
- Installation of four monitoring wells and collection of four groundwater samples
- Installation of five sub-slab soil vapor points and collection of five sub-slab soil vapor samples and one ambient air sample.

The investigation provided the following findings:

- Site soil contains semivolatile organic compounds (SVOCs), pesticides, and metals at concentrations exceeding Title 6 of the New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use (UU) and/or Restricted Use Restricted-Residential Use (RURR) Soil Cleanup Objectives (SCOs).
- Petroleum impacts were observed in one boring location, EB2, from about 6 to 12 feet bgs.
- Groundwater samples site-wide contained VOCs, SVOCs, polychlorinated biphenyls (PCBs) and metals exceeding NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1. Ambient Water Quality Standards and Guidance Values (SGVs) for Class GA Groundwater.
- Multiple VOCs, including petroleum-related VOCs and CVOCs, were identified in soil vapor samples above ambient air concentrations. Tetrachloroethene (PCE) and Trichloroethene (TCE) were detected above their respective Air Guidance Value (AGV) in the soil vapor sample collected from the northern part of the site.

Petroleum and chlorinated VOC impacts in site groundwater and soil vapor are likely associated with releases from historical on-site petroleum bulk storage, historical site use or an unidentified off-site source. Analytical data from the May 2018 Report is included in Appendix A.

3.4 Summary of Potential Areas of Concern

Based on the history of the site and the findings of previous environmental investigations, the AOCs further investigated during the RI include the following (note that AOCs 3 and 4 listed in the RIWP have been merged as a result of their associated scope and investigation findings):

AOC 1: Historic Fill Material

Material from unknown sources may have been used as backfill during various phases of the site development history. According to boring logs from previous investigations, the fill layer extends to depths ranging from 1 to 7 feet bgs across the site. Previous environmental investigations documented the presence of historic fill material containing SVOCs, pesticides and metals at concentrations above the UU and RURR SCOs.

AOC 2: Chlorinated Volatile Organic Compounds in Groundwater and Soil Vapor

CVOCs were detected in groundwater samples at concentrations exceeding NYSDEC SGVs, with the highest concentrations identified near the center of the property. CVOCs were also detected in soil vapor samples at concentrations above those detected in the ambient air sample. When applied to the NYSDOH Decision Matrices, concentrations of cis-1,2-dichloroethene, PCE, TCE, and vinyl chloride in soil vapor yield recommendations ranging from "no further action" to "mitigation". CVOC impacts may be associated with the historical use of the site or historic operations of adjoining or surrounding properties.

AOC 3: Historical Site Operations with Petroleum Bulk Storage

Historical operations included a garage with a gasoline tank (1922 to 1936) and an automotive parts shop (1994 to 2006). No additional information regarding the tank removal is available; however, petroleum impacts to soil were identified during the previous subsurface investigation. CVOC impacts to groundwater and soil vapor may be a result of these former site operations. Undocumented spills or releases of solvents, petroleum, chemicals, and/or other hazardous substances associated with these historical operations may have adversely affected soil, groundwater, and/or soil vapor beneath the site.

AOC 4: Historical Operations of Adjoining and Surrounding Properties

Historical uses of adjoining and surrounding properties include a contractor's yard with petroleum bulk storage and a mechanical repair shop (1936 to 2005), a substation (1936 to 1947), a welding machine shop (1945 to 2005), a tool manufacturer (1947 to 1950), an electronics and electrochemical facility (1950 to 2004), an iron works facility (1950 to 1980), and an auto repair shop (2002 to 2006). Additionally, two NYSDEC BCP sites (44-18 and 44-30 Purves Street) are located less than 300 feet and hydraulically up-gradient of the site. Remedial investigations identified CVOC impacts to groundwater and soil vapor at and directly east-northeast of both sites. CVOC concentrations warranted the installation of active vapor mitigation systems in the new developments.

An AOC location map is included as Figure 3.

4.0 REMEDIAL INVESTIGATION

The RI was completed between April 26 and May 3, 2019, to investigate AOCs and to determine, to the extent practical, the nature and extent of contamination in soil, groundwater, and soil vapor. A second sampling event was conducted on January 28 and 29, 2020 in response to a request from the New York City Department of Environmental Conservation (NYCDEP) dated January 3, 2020. The RI included the advancement of soil borings, installation of groundwater monitoring wells and soil vapor probes, and collection of soil, groundwater, and soil vapor samples. A sample summary is included as Table 1.

The RI consisted of the following:

- Completion of a geophysical survey to identify potential USTs, underground structures, and utilities
- Advancement of 8 soil borings and collection of 24 grab soil samples and two duplicate samples
- Installation of three new groundwater monitoring wells and collection of fourteen groundwater samples and two duplicate samples from the three newly installed wells and the four wells installed during the May 2018 Subsurface Investigation
- Surveying and synoptic gauging of seven groundwater monitoring wells for the evaluation of local groundwater flow direction
- Installation of four sub-slab soil vapor points and collection of four soil vapor samples with four co-located indoor air samples and one ambient air sample.

Langan completed the RI in accordance with 6 NYCRR Part 375-3.8, NYSDEC DER-10 (May 2010), the NYSDEC Draft BCP Guide (May 2004), and the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006 and subsequent updates).

4.1 Geophysical Survey and Utility Location

On April 26, 2019, NOVA Geophysical & Environmental, Inc. of Douglaston, New York completed a geophysical survey under observation by Langan field personnel. NOVA used ground-penetrating radar (GPR) and electromagnetic (EM) survey equipment in an attempt to identify potential USTs and locate buried utilities across the site and to clear the vicinity of each boring location. Borings were relocated as necessary to avoid subsurface utilities and anomalies. A copy of the geophysical survey report presenting these findings is included in Appendix B.

4.2 Soil Investigation

4.2.1 Investigation Methodology

Langan field personnel documented the advancement of 8 soil borings (EB-9 through EB-16) by AARCO Environmental Services Corp. (AARCO) of Lindenhurst, New York. Boring locations were selected to investigate the potential AOCs. Soil borings EB-10 and EB16 were advanced using a Geoprobe 420M® drill rig. The remaining soil borings were advanced using a Geoprobe® 6610DT direct-push drill rig. Borings were advanced to depths ranging from about 16 to 24 feet bgs.

Soil was recovered continuously from the surface to the completion depth of each boring. Samples were collected into 3- or 4-foot dedicated long acetate liners using a 2-inch diameter Macro-Core® sampler. The soil was screened for visual, olfactory, and instrumental evidence of a chemical or petroleum release, and was visually classified for soil type, grain size, texture, and moisture content. Instrument screening for the presence of organic vapors was performed using a photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp. Following sample collection, borings were backfilled with soil cuttings that did not display evidence of environmental impacts, and patched with concrete; or borings were converted to groundwater monitoring wells. Boring locations are shown on Figure 3 and boring logs are included in Appendix C.

4.2.2 Sampling Methodology

A total of 24 soil samples, including two duplicate samples, were collected for laboratory analysis from the following intervals:

1. The 0- to 2-foot depth interval (i.e., shallow fill)
2. The interval exhibiting the greatest degree of contamination, where observed (based on the presence of staining, odor, and/or PID readings above background), or within the historic fill layer
3. The first underlying depth interval without evidence of impacts or at/near the boring termination depth, which was generally about 20 feet bgs or about five feet beneath the observed groundwater table

Soil samples were analyzed for Part 375 List and Target Compound List (TCL) VOCs, SVOCs, and PCBs, Target Analyte List (TAL)/Part 375 metals (including cyanide and hexavalent and trivalent chromium), and Part 375 pesticides and herbicides. Five soil samples were also analyzed for NYSDEC 21-List Perfluorinated Chemicals (PFC) and 1-4 dioxane. Four samples were analyzed for Toxicity Characteristics Leachate Procedure (TCLP) lead.

Samples submitted for VOC analysis were collected directly from the acetate liner into laboratory-supplied Terra Core® soil samplers. The remaining sample volume was placed in laboratory-supplied containers for additional analyses. The sample containers were labeled, placed in a laboratory-supplied cooler, and packed on ice to attempt to maintain a temperature of about 4°C. The samples were picked up and delivered via courier service under standard chain-of-custody protocol to Alpha Analytical Inc. (Alpha) in Westborough, Massachusetts. Alpha is a NYSDOH Environmental Laboratory Approval Program (ELAP)-certified laboratory.

4.3 Groundwater Investigation

4.3.1 Monitoring Well Installation and Development Methodology

Langan field personnel documented conversion of three soil borings into permanent groundwater monitoring wells by AARCO. One groundwater sample was collected from the newly installed monitoring wells and from the four existing monitoring wells (MW-2, MW-3, MW-5 and MW-7), installed during the February 2018 subsurface investigation, to characterize groundwater conditions and to investigate potential groundwater impacts associated with the potential AOCs.

Soil borings EB-9, EB-11, and EB-12 were converted into groundwater monitoring wells by inserting 10 feet of 2-inch diameter, schedule 40, 0.01-inch slotted polyvinyl chloride (PVC) screen at the base of the well, and attaching a PVC riser to grade. The 10-foot screened PVC length was installed from about 10 to 20 feet bgs in monitoring wells MW-9 and MW-12, and from about 12 to 22 feet bgs in monitoring well MW-11. The annulus of each groundwater monitoring well was filled with No. 2 sand to a depth of about 2 feet above the top of the screen followed by a bentonite seal to grade surface. Following installation, the wells were developed using a surge block across the well screen to agitate and remove sediment and pumped using a peristaltic pump until the water ran clear. Purged groundwater was containerized in labeled 55-gallon drums and disposed of at a permitted facility on May 24, 2019.

The top of casing elevations of monitoring wells were surveyed by Langan on May 20, 2019. Synoptic groundwater levels were measured using a Solinst 122 oil/water interface probe on May 1, 2019.

Monitoring well construction details and groundwater elevations are included in Table 2, well locations are shown on Figure 3, and well construction logs are included in Appendix D.

4.3.2 Groundwater Sampling

Groundwater sampling was conducted at least one week following well development on May 3 and 8, 2019. Additional sampling per the request of the NYCDEP was conducted on January 28 and 29, 2020. Samples were collected in accordance with the USEPA's low-flow groundwater sampling procedure ("Low Stress [low-flow] Purging and Sampling Procedure for the Collection

of Groundwater Samples from Monitoring Wells", dated July 30, 1996 and revised January 19, 2010) to allow for collection of representative samples. Prior to sample collection, groundwater was purged from each well while monitoring physical and chemical groundwater parameters (i.e., pH, conductivity, turbidity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]). Prior to sample collection, physical and chemical parameters were allowed to stabilize at all monitoring wells, with the exception of MW-5 and MW-12. During both sampling events, these monitoring wells were pumped dry and allowed to recharge prior to sample collection.

Groundwater samples were collected into labeled, laboratory-supplied containers, placed in a laboratory-supplied cooler, and packed on ice to attempt to maintain a temperature of about 4°C. The samples were picked up and delivered via courier service to Alpha under standard chain-of-custody protocol. Groundwater samples collected in May 2018 were analyzed for TCL VOCs plus 1,4-dioxane, SVOCs, PCBs, TAL metals (total and dissolved), trivalent chromium, hexavalent chromium, total cyanide, and the 21-compound list of PFCs. Groundwater samples collected in January 2020 were analyzed for pesticides, only.

Groundwater sampling logs are included in Appendix E.

4.4 Soil Vapor Investigation

4.4.1 Sub-Slab Soil Vapor Probe Installation

Langan field personnel documented installation of four sub-slab soil vapor probes (SVP-6 through SVP-9) by AARCO. The sub-slab soil vapor probes were installed about 2 inches below the concrete floor slab using a hammer drill.

Sub-slab soil vapor probes were installed in accordance with the 2006 NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York and were comprised of polyethylene implants (1-7/8-inch long) threaded into 3/16-inch-diameter polyethylene tubing. The annulus of each probe was filled with No. 2 sand and sealed at the surface using hydrated bentonite.

Soil vapor probe locations are shown on Figure 3, and soil vapor probe construction/sampling logs are included in Appendix F.

4.4.2 Soil Vapor Sampling and Analysis

As a quality assurance/quality control (QA/QC) measure, an inert tracer gas (helium) was introduced into an above-grade sampling chamber before and after sub-slab sampling to verify that soil vapor probes were properly sealed above the target sampling depth, thereby preventing subsurface infiltration of ambient air. Direct readings of less than 10 percent helium in the sampling tube were considered sufficient to verify a tight seal at each sample point.

Each sub-slab vapor probe was purged using a MultiRAE meter at a rate of 0.2 liters per minute (L/min) to evacuate a minimum of three sampling tube volumes prior to sample collection. The purged vapor was also monitored for VOCs. After purging was complete, sub-slab vapor samples were collected into laboratory-supplied, batch-certified, 6-Liter Summa® canisters that were calibrated for a sampling rate of about 0.0125 L/min over about 8 hours of sampling. One indoor air sample was collocated with each sub-slab soil vapor sample location. One ambient air sample was collected concurrently with the sub-slab/indoor air samples to provide background concentrations. The canisters were labeled and retrieved by a courier for delivery to Alpha under standard chain-of-custody protocol. Soil vapor samples were analyzed for VOCs by USEPA Method TO-15.

Soil vapor construction/sampling logs are included in Appendix F.

On March 3 and June 2, 2020, Langan requested access to the western (26-26 Jackson Avenue) and southern (44-15 Purves Street) adjoining buildings and the northwestern adjoining building across Jackson Avenue (27-26 Jackson Avenue) to conduct a soil vapor intrusion assessment. Letters were sent to the owner and/or management of each building to request access to collect up to two sub-slab vapor samples from each building. Access was denied to buildings by their respective management representatives.

4.5 Quality Control Sampling

During the RI, field blanks, trip blanks, field duplicate samples, matrix spike/matrix spike duplicate (MS/MSD) samples, and indoor and ambient air samples were collected and submitted for laboratory analysis. QA/QC samples include the following quality control samples:

Soil QA/QC samples

- Two field blanks
- Six trip blank samples
- Two field duplicate samples
- Two MS/MSD samples
- One rinse blank sample

Groundwater QA/QC samples

- Two field blank samples
- Two trip blank samples
- Two field duplicate samples

- Two MS/MSD duplicate sample

Soil Vapor QA/QC Samples

- Four indoor air samples
- One ambient air sample

The field duplicates were collected to assess the precision of the analytical methods relative to the sample matrix. The duplicates were collected from the same material as the primary sample by splitting the volume of homogenized sample collected in the field into two sample containers.

The trip blank samples were collected to assess the potential for contamination of the sample containers and samples during the trip from the laboratory, to the field, and back to the laboratory for analysis. Trip blanks contain approximately 40 milliliters of acidic water (doped with hydrochloric acid) that is sealed by the laboratory when the empty sample containers are shipped to the field, and unsealed and analyzed by the laboratory when the sample shipment is received from the field. The trip blank samples were analyzed for VOCs.

Field blank samples were collected to determine the cleanliness of unused neoprene gloves, groundwater sampling equipment, and acetate liners used to collect soil samples. Field blank samples consisted of deionized, distilled water provided by the laboratory that has passed through the sampling apparatus. Field blank samples were analyzed for same lists as the corresponding sampling event and sample matrix.

A rinse blank sample was collected to determine the effectiveness of the decontamination procedures for the drill the cutting head. The rinse blank sample consisted of deionized, distilled water provided by the laboratory that has passed through the drill rig cutting head. The rinse blank sample was analyzed for PFCs, only.

MS/MSD samples were collected to assess the effect of the sample matrix on the recovery of target compounds or target analytes. MS/MSD samples were collected from the same material as the primary sample by splitting the volume of the homogenized sample collected in the field into three sample containers.

An ambient air sample was collected to assess ambient air conditions and determine whether conditions existed at the site during soil vapor sampling that could have potentially interfered with sampling results. The ambient air sample was analyzed for the same parameter list as the soil vapor samples.

4.6 Data Validation

Data from the RI and March 2018 Subsurface Investigation were validated by a Langan data validator in accordance with USEPA and NYSDEC validation protocols. Copies of the data usability summary reports (DUSRs) and the data validator's credentials are included in Appendix G.

4.6.1 Data Usability Summary Report Preparation

A DUSR was prepared for each sampling matrix. The DUSR presents the results of data validation, including a summary assessment of laboratory data packages, sample preservation and chain-of-custody procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method.

For each of the organic analytes, the following was assessed:

- Holding times
- Instrument tuning
- Instrument calibrations
- Blank results
- System monitoring compounds or surrogate recovery compounds (as applicable)
- Internal standard recovery results
- MS/MSD results
- Target compound identification
- Chromatogram quality
- Pesticide cleanup (if applicable)
- Compound quantization and reported detection limits
- System performance
- Results verification

For each of the inorganic analytes, the following was assessed:

- Holding times
- Calibrations
- Blank results
- Interference check sample

- Laboratory check samples
- Duplicates
- Matrix Spike
- Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES) QC
- ICP serial dilutions
- Results verification and reported detection limits

Based on the results of data validation, the validated analytical results reported by the laboratory were assigned one of the following usability flags:

- "U" – The analyte was analyzed for but was not detected at a level greater than or equal to the reporting limit (RL) or the sample concentration for results was impacted by blank contamination.
- "UJ" – The analyte was not detected at a level greater than or equal to the RL; however, the reported RL is approximate and may be inaccurate or imprecise.
- "J" – The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample.
- "R" – The sample results are not useable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

After data validation was complete, validated data was used to prepare the tables and figures included in this report.

4.7 Field Equipment Decontamination

Handheld sampling equipment, including the interface probe, water quality meter, and sampling pump, was decontaminated by hand using an Alconox-based solution and triple rinsed with distilled water. Liquids were temporarily contained in 5-gallon buckets, and between rinses, equipment was placed such that contact with the ground was avoided. Decontamination wastewater was drummed and disposed of at a permitted facility on May 24, 2019.

4.8 Investigation-Derived Waste Management

Investigation-derived wastes (IDW) generated during the RI were containerized, as necessary. Aqueous waste from monitoring well development and purging and decontamination water were placed into United Nations/Department of Transportation (UN/DOT)-approved 55-gallon steel drums with sealed tops. Drums were removed on May 24, 2019 and disposed of off-site at Dale Transfer Corporation, in West Babylon, NY.

5.0 FIELD OBSERVATIONS AND ANALYTICAL RESULTS

This section summarizes the field observations and laboratory analytical results from the May 2018 Subsurface Investigation and RI. Soil analytical results are compared to the Part 375 UU, Protection of Groundwater (PGW) and RURR SCOs. Groundwater analytical results are compared to the SGVs. Soil vapor and collocated indoor air results are compared the May 2017 Decision Matrices issued as an update to the 2006 NYSDOH Soil Vapor Intrusion Guidance. The nature and extent of contamination are discussed in Section 7.0.

A summary of the RI soil, groundwater, and soil vapor samples is included in Table 1. Copies of the laboratory analytical reports are included in Appendix H. Summaries of the analytical results for the soil, groundwater, and soil vapor samples from the May 2018 Subsurface Investigation and RI are provided in the following tables:

- Table 3A - Soil Sample Analytical Results Summary - VOCs & SVOCs
- Table 3B - Soil Sample Analytical Results Summary - Pesticides, Herbicides, PCBs, and Metals
- Table 3C - Soil Sample Analytical Results Summary - Emerging Contaminants
- Table 3D - Soil Sample Analytical Results Summary - TCLP Lead
- Table 4A - Groundwater Sample Analytical Results Summary - VOCs and SVOCs
- Table 4B - Groundwater Sample Analytical Results Summary - PCBs and Metals
- Table 4C - Groundwater Sample Analytical Results Summary - Emerging Contaminants
- Table 4D - Groundwater Sample Analytical Results Summary - Pesticides
- Table 5 - Soil Vapor Sample Analytical Results Summary

The following sections describe the May 2018 Subsurface Investigation and RI field observations and analytical data.

5.1 Geology and Hydrogeology

Geologic and hydrogeologic observations are described below. A groundwater contour map is provided as Figure 4. A cross-sectional diagram showing inferred soil profiles are included as Figures 5A and 5B and soil boring logs are included in Appendix C.

5.1.1 Historic Fill Material

Historic fill was encountered across the majority of the site footprint beneath the surface cover, except below the partial cellar, to depths ranging from about 1 to 7 feet bgs. The historic fill predominantly consisted of brown, fine- to medium-grained sand with varying amounts of silt,

gravel, concrete, brick, coal, and slag. Coal and slag were identified in RI borings from 0 to 3 feet bgs.

5.1.2 Native Soil

Historic fill was underlain by a heterogeneous glacial till that predominantly consists of discontinuous layers of fine-grained sandy silt with varying amounts of gravel and clay; and fine- to medium-grained sand with varying amounts of silt, gravel, and clay. The glacial till extends to the termination depth at each RI boring.

5.1.3 Bedrock

Bedrock was not encountered during the May 2018 Subsurface Investigation or RI; however, gneiss bedrock was encountered at depths ranging from 18 to 36.5 feet bgs during Langan's Geotechnical Investigation performed in April and May 2018. The bedrock surface is irregular and generally slopes downward to the northwest. Boring data indicates bedrock is shallowest at the southeastern part of the site.

5.1.4 Hydrogeology

Synoptic groundwater measurements were collected on May 1, 2019. Groundwater elevations range between el -1.45 and el 3.43 feet, which corresponds to depths of about 13.20 to 14.58 feet bgs. Groundwater flow is to the northwest.

5.2 Soil Findings

5.2.1 Field Screening Observations

Evidence of petroleum impacts (e.g., odors and PID readings above background) were observed from about 6 to 12 feet bgs in boring EB-2 and from about 7 to 10.5 feet bgs in boring EB-16 located on the northeastern part of the site. Maximum PID readings of 160 parts per million (ppm) and 456 ppm were observed at about 7 feet bgs at each of the borings, respectively. Visual, olfactory, and PID readings indicative of chemical or petroleum impacts were not observed in the other borings.

5.2.2 Analytical Results

In total, 42 soil samples, plus three duplicate samples, were collected and analyzed for Part 375/ TCL VOCs, SVOCs, PCBs, pesticides, herbicides, and Part 375/TAL metals including cyanide and hexavalent and trivalent chromium. Five of the samples were analyzed for NYSDEC 21-List PFCs and 1-4 dioxane. Soil samples were compared to the UU and RURR SCOs. Because SVOCs were detected in both soil and groundwater above applicable standards, SVOCs were also compared to the PGW SCOs. A summary of laboratory detections for soil samples collected

during the RI is included in Tables 3A through 3D and shown on Figure 6. The analytical results are summarized below.

VOCs

Three VOCs were detected in soil at concentrations above the UU SCOs. Petroleum-related VOCs were detected from 6 to 12 feet bgs in EB-2 and from 7 to 10.5 feet bgs in EB-16 located in the northeastern part of the site. The list below provides a summary of each VOC that was detected above the UU SCOs. VOCs were not detected above RURR SCOs. SCOs are shown in parentheses:

- **1,2,4-Trimethylbenzene**: 8.2 milligram per kilogram (mg/kg) in EB-16_7-9 (UU SCO of 3.6 mg/kg; RURR SCO of 52 mg/kg)
- **Total Xylenes**: 0.36 mg/kg in EB-16_7-9 (UU SCO of 0.26 mg/kg; RURR SCO of 100 mg/kg)

Acetone was detected in seven soil samples from 0.052 mg/kg to 0.088 mg/kg in EB-10_0-2 above the UU SCO of 0.05 mg/kg. Although not detected in the laboratory batch blank, acetone is a common laboratory contaminant and its presence in soil is not likely indicative of an acetone release.

SVOCs

Ten SVOCs were detected in historic fill material at concentrations above the UU, PGW, and/or RURR SCOs. The list below provides a summary of each SVOC that was detected above UU, PGW, and/or RURR SCOs and the range of concentrations above the SCOs. The maximum concentrations of analytes detected at concentrations above the RURR SCOs are shown in bold and analytes detected at concentrations above the PGW SCOs are underlined. SCOs are shown in parentheses.

- **3-Methylphenol/4-Methylphenol:** 0.37 mg/kg in EB-15_0-2 and 0.51 mg/kg in EB3_0-2 (UU SCO of 0.33 mg/kg and RURR SCO of 100 mg/kg)
- **Benzo(a)anthracene**: **1.1 mg/kg** in EB-16_0-2 to **76.9 mg/kg** in EB3_0-2 (UU, PGW, and RURR SCO of 1 mg/kg)
- **Benzo(a)pyrene**: **1.4 mg/kg** in duplicate sample of EB-16_0-2 to **65.9 mg/kg** in EB3_0-2 (UU and RURR SCO of 1 mg/kg and PGW SCO of 22 mg/kg)
- **Benzo(b)fluoranthene**: **1.1 mg/kg** in EB-10_0-2 to **65.9 mg/kg** in EB3_0-2 (UU and RURR SCO of 1 mg/kg and PGW SCO of 1.7 mg/kg)
- **Benzo(k)fluoranthene**: 1.5 mg/kg in EB-10_2-3 to **45.8 mg/kg** in EB13_0-2 (UU SCO of 0.8 mg/kg, PGW SCO of 1.7 mg/kg, and RURR SCO of 3.9 mg/kg)

- **Chrysene**: 1.4 mg/kg in duplicate sample of EB-16_0-2 to **66.6 mg/kg** in EB3_0-2 (UU and PGW SCO of 1 mg/kg and RURR SCO of 3.9 mg/kg)
- **Dibenzo(a,h)anthracene**: **0.35 mg/kg** in EB8_0-2 to **15.9 mg/kg** in EB3_0-2 (UU and RURR SCO of 0.33 mg/kg and PGW SCO of 1,000 mg/kg)
- **Fluoranthene: 125 mg/kg** in EB3_0-2 (UU and RURR SCO of 100 mg/kg and PGW SCO of 1,000 mg/kg)
- **Indeno(1,2,3-cd)pyrene**: **0.53 mg/kg** in EB-16_7-9 to **34.9 mg/kg** in EB3_0-2 (UU and RURR SCO of 0.5 mg/kg and PGW SCO of 8.2 mg/kg)
- **Pyrene: 144 mg/kg** in EB3_0-2 (UU and RURR SCO of 100 mg/kg and PGW SCO of 1,000 mg/kg)

PCBs

PCBs did not exceed UU SCOs in soil samples.

Herbicides

Herbicides were not detected in soil samples.

Pesticides

Two pesticide, 4,4'-DDE and 4,4'-DDT, were detected in soil samples at concentrations above the UU SCOs in three soil borings. Pesticides were not detected at concentrations above the RURR SCOs. SCOs are shown in parentheses:

- **4,4'-DDE:** 0.00427 mg/kg in EB5_15-16 and 0.0118 mg/kg in EB4_0-2 (UU SCO of 0.0033 mg/kg; RURR SCO of 8.9 mg/kg)
- **4,4'-DDT:** 0.0041 mg/kg in EB5_15-16 to 0.0192 mg/kg in EB-16_7-9 (UU SCO of 0.0033 mg/kg; RURR SCO of 7.9 mg/kg)

Metals

Thirteen metals were detected at concentrations above the UU and/or RURR SCOs. Metals were detected in the historic fill layer across the site. The list below provides a summary of each metal that exceeded the UU and/or RURR SCOs and the range of concentrations above the SCOs. Analytes detected at concentrations above the RURR SCOs are shown in bold. SCOs are shown in parentheses.

- **Arsenic:** 14.1 mg/kg in EB4_0-2 to **26.8 mg/kg** in EB5_0-2 (UU SCO of 13 mg/kg; RURR SCO of 16 mg/kg)

- **Barium:** 361 mg/kg in EB-14_0-2 to **1,910 mg/kg** in EB8_0-2 (UU SCO of 350 mg/kg; RURR SCO of 400 mg/kg)
- **Cadmium:** 2.73 mg/kg in EB6_0-2to **13.2 mg/kg** in EB-9_0-2 (UU SCO of 2.5 mg/kg; RURR SCO of 4.3 mg/kg)
- **Hexavalent chromium:** 1.08 mg/kg in EB-13_2-4 to 3.5 mg/kg in EB-14_10-12 (UU SCO of 1 mg/kg; RURR SCO of 110 mg/kg)
- **Trivalent chromium:** 31 mg/kg in EB-13_8-10 to 124 mg/kg in EB-5_0-2 (UU SCO of 30 mg/kg; RURR SCO of 180 mg/kg)
- **Copper:** 50.2 mg/kg in duplicate sample of EB-12_0-2 to **766 mg/kg** in EB8_0-2 (UU SCO of 50 mg/kg; RURR SCO of 270 mg/kg)
- **Lead**: 80.2 mg/kg in duplicate sample of EB-12_0-2 to **8,470 mg/kg** in EB5_0-2 (UU SCO of 63 mg/kg; RURR SCO of 400 mg/kg)
- **Manganese**: 1,630 mg/kg in EB-9_2-4 (UU SCO of 1,600 mg/kg; RURR SCO of 2,000 mg/kg)
- **Mercury**: 0.338 mg/kg in the duplicate sample of EB5_15-16 to **17.5 mg/kg** in EB5_0-2 (UU SCO of 0.18 mg/kg; RURR SCO of 0.81 mg/kg)
- **Nickel**: 30.1 mg/kg EB2_7-9 to 53.6 mg/kg in EB-14_0-2 (UU SCO of 30 mg/kg; RURR SCO of 310 mg/kg)
- **Selenium:** 4.77 mg/kg EB8_0-2 to 10.6 mg/kg in EB5_0-2 (UU SCO of 3.9 mg/kg; RURR SCO of 180 mg/kg)
- **Silver:** 2.56 mg/kg in EB5_0-2 (UU SCO of 2 mg/kg; RURR SCO of 180 mg/kg)
- **Zinc**: 142 mg/kg in EB-16_0-2 to 1,830 mg/kg in EB5_0-2 (UU SCO of 109 mg/kg; RURR SCO of 10,000 mg/kg)

Lead and/or mercury were detected at concentrations above those typically found in NYC urban fill in samples collected from the following borings: EB-9, EB-11, EB-12 and EB-16. These samples were analyzed for TCLP lead and/or mercury via USEPA Method 1311. TCLP mercury concentrations did not exceed the USEPA Resource Conservation and Recovery Act (RCRA) Hazardous Waste Regulatory Level (HWRL) of 0.2 milligrams per liter (mg/L). TCLP lead concentrations exceeded the USEPA RCRA HWRL of 5 mg/L in the sample collected from EB-15 from the 0 to 2 foot bgs interval.

PFCs (21-compound list) and 1,4-Dioxane

There are currently no soil standards for per- and polyfluoroalkyl substances (PFAS) in New York State. Total PFAS compounds were detected in four soil samples, including the duplicate. PFOA

and PFOS combined were detected in two soil samples at concentrations of 0.072 micrograms per kilogram (ug/kg) (72 parts per trillion [ppt]) in EB-16_0-2 and 0.286 ug/kg (286 ppt) in EB-13_0-2. The USEPA has a lifetime health advisory (HA) of 70 ppt for the combined concentrations of PFOA and PFOS. 1,4-dioxane was not detected in soil samples. Note that the PFAS analytical method, EPA Method 537, was developed and validated for the analysis of finished drinking water from surface water and groundwater sources. Laboratories have modified Method 537 to enable the analysis of groundwater and soil, and to incorporate PFAS analytes not currently addressed by the promulgated method. NYSDOH offers certification for PFOA and PFOS in the drinking water category. Non-potable water and soil certification is not available; however, the method describes acceptable modifications. EPA recommends that modified methods be assessed relative to project goals and data quality objectives.

5.3 Groundwater Findings

5.3.1 Field Observations

Monitoring wells were gauged for non-aqueous phase liquid (NAPL) with an oil-water interface probe. NAPL and PID headspace readings above background levels were not detected in monitoring wells. Groundwater elevations across the site range from el 3.43 to el -1.45 and groundwater generally flows to the northwest.

5.3.2 Analytical Results

Groundwater samples were collected from both the newly installed monitoring wells and the existing monitoring wells installed during the May 2018 Subsurface Investigation. Groundwater samples were analyzed for TCL VOCs, SVOCs plus 1,4-dioxane, PCBs, TAL metals (total and dissolved), trivalent chromium, hexavalent chromium, total cyanide, and the 21-compound list of PFCs. A summary of the laboratory detections for groundwater samples is included on Tables 4A through 4C, and shown on Figure 7 with comparisons to the SGVs. The analytical results are summarized below.

VOCs

Fifteen VOCs, including CVOCs, were detected above the SGVs in one or more of the monitoring wells located across the site. The list below provides a summary of each VOC that exceeded the SGVs and the range of concentrations above the SGVs. SGVs are shown in parentheses.

- **1,1-Dichloroethane**: 5.45 microgram per liter (µg/L) in MW-7 to 150 µg/L in MW-2 (5 µg/L)
- **1,1-Dichloroethene**: 9.6 µg/L in MW-9 to 34 µg/L in MW-2 (5 µg/L)
- **1,2,3-Trichlorobenzene**: 8.4 µg/L in MW-9 (5 µg/L)

- **1,2,4-Trichlorobenzene**: 35 µg/L in MW-9 (5 µg/L)
- **1,2-Dichlorobenzene:** 5.9 µg/L in MW-9 (3 µg/L)
- **1,2-Dichloroethane**: 0.94 µg/L in MW-9 to 1.6 µg/L in MW-2 (0.6 µg/L)
- **1,3-Dichlorobenzene**: 15 µg/L in MW-9 (3 µg/L)
- **1,4-Dichlorobenzene**: 9.2 µg/L in MW-9 (3 µg/L)
- **Acetone:** 51.4 µg/L in MW-5 (50 µg/L)
- **Benzene**: 2.3 µg/L in MW-2 (1 µg/L)
- **Chloroform:** 11.9 µg/L in MW-5 (7 µg/L)
- **cis-1,2-Dichloroethene**: 16.1 µg/L in MW-3 to 1,300 µg/L in MW-2 (5 µg/L)
- **PCE**: 5.5 µg/L in MW-2 to 300 µg/L in MW-12 (5 µg/L)
- **TCE**: 6.2 µg/L in MW-3 to 141 µg/L in the duplicate sample of MW-7 (5 µg/L)
- **Vinyl chloride**: 46 µg/L in MW-2 (2 µg/L)

SVOCs

Ten SVOCs were detected above the SGVs in monitoring wells MW-3 and MW-5 located in the southern part of the site. The list below provides a summary of each SVOC that exceeded the SGVs and the range of concentrations above the SGVs. SGVs are shown in parentheses.

- **1,2,4-Trichlorobenzene:** 25 µg/L in MW-9 (5 µg/L)
- **1,2-Dichlorobenzene:** 4.2 µg/L in MW-9 (3 µg/L)
- **1,3-Dichlorobenzene:** 10 µg/L in MW-9 (3 µg/L)
- **1,4-Dichlorobenzene:** 6 µg/L in MW-9 (3 µg/L)
- **Benzo(a)anthracene**: 0.06 µg/L in MW-5 to 0.189 in MW5_021418 (0.002 µg/L)
- **Benzo(a)pyrene:** 0.09 µg/L in MW-5 to 0.133 in MW5_021418 (0 µg/L)
- **Benzo(b)fluoranthene**: 0.08 in MW-3 to 0.16 µg/L in MW-5 (0.002 µg/L)
- **Benzo(k)fluoranthene:** 0.07 µg/L in MW-5 to 0.1 in MW5_021418(0.002 µg/L)
- **Chrysene**: 0.06 µg/L in MW5_021418 to 0.167 in MW-5 (0.002 µg/L)
- **Indeno(1,2,3-cd) pyrene:** 0.0667 in MW5_021418 to 0.15 µg/L in MW-5 (0.002 µg/L)

PCBs

Total PCBs were detected above the SGV (0.09 µg/L) at a concentration of 0.564 µg/L in monitoring well MW-7 located near the center of the site.

Pesticides

Dieldrin was detected above the SGV (0.004 µg/L) at a concentration of 0.005 µg/L in monitoring well MW-9 located at the northwestern corner of the site.

Metals

Groundwater samples collected from each well contained total and dissolved metals at concentrations above the SGVs. The list below provides a summary of each metal that exceeded the SGVs and the range of concentrations above the SGVs. SGVs are shown in parentheses.

Total Metals

- **Chromium**: 63.68 µg/L in MW-7 and 98.29 µg/L in MW-5 (50 µg/L)
- **Iron**: 334 µg/L in MW-3 to 27,600 µg/L in MW-5 (300 µg/L)
- **Lead**: 36.56 µg/L in MW-12 and 893 µg/L in MW-5 (25 µg/L)
- **Magnesium**: 53,600µg/L in MW-2 (35,000 µg/L)
- **Manganese**: 523 µg/L in duplicate sample of MW-7 and 1,549 µg/L in MW-12 (300 µg/L)
- **Mercury**: 3.91 µg/L in MW-5 (0.7 µg/L)
- **Selenium**: 12.5 µg/L in MW-5 and 17 µg/L in MW-3 (10 µg/L)
- **Sodium**: 70,300 µg/L in MW-5 to 362,000 µg/L in MW-2 (20,000 µg/L)

Dissolved Metals

- **Magnesium**: 39,200 µg/L in MW-7 and 60,300µg/L in MW-2 (35,000 µg/L)
- **Manganese**: 431 µg/L in MW-3 to 2,188 µg/L in MW-12 (300 µg/L)
- **Selenium**: 16.1 µg/L in MW-3 (10 µg/L)
- **Sodium**: 87,700 µg/L in MW-5 to 401,000 µg/L in MW-2 (20,000 µg/L)

PFCs (21-compound list) and 1,4-Dioxane

There are currently no groundwater standards for PFAS in New York State. Total PFAS compounds were detected in the seven monitoring wells at concentrations ranging from 104 ppt in MW-2 to 352 ppt in MW-3. The USEPA has a HA of 70 ppt for the combined concentrations of PFOA and PFOS. PFOA was detected in the groundwater samples collected from MW-3, MW-5, MW-7, MW-9, MW-11 and MW-12 at concentrations between 0.0775 µg/L (77.5 ppt) in MW-11 and 0.314 µg/L (314 ppt) in MW-3. PFOS was not detected in groundwater samples above the USEPA HA of 70 ppt.

There are currently no groundwater standards for 1,4-dioxane in New York State. 1,4-dioxane was detected in five monitoring wells, MW-2, MW-5, MW-7, MW-9 and MW-11 at concentrations between 218 ppt in MW-5 and 1,460 ppt in MW-2. The USEPA has a lifetime HA of 350 ppt.

5.4 Soil Vapor Findings

During the May 2018 Subsurface Investigation five sub-slab soil vapor points and one ambient air sample were collected. During the RI four co-located sub-slab vapor/indoor air samples and one ambient air sample were collected. Sub-slab soil vapor and ambient air samples were submitted for laboratory analysis of USEPA TO-15 VOCs. No standard currently exists for soil vapor samples in New York State. Sub-slab vapor samples were evaluated using the Soil Vapor Decision Matrices established by the May 2017 update to the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York. Sub-slab vapor, indoor air, and ambient air sample results are summarized in Table 5 and shown on Figure 8.

VOCs detected in sub-slab vapor samples include:

1,1,1-Trichloroethane (1,1,1-TCA)	Chloroform	n-Hexane
1,1,2-Trichloro-1,2,2-Trifluoroethane	Chloromethane	o-Xylene
1,1-Dichloroethene	Cis-1,2-Dichloroethene	Propylene
1,2,4-Trimethylbenzene	Cyclohexane	Styrene
1,2-Dichloropropane	Dichlorodifluoromethane	Tert-Butyl Alcohol
1,3,5-Trimethylbenzene	Ethanol	PCE
1,3-Butadiene	Ethyl Acetate	Tetrahydrofuran
2,2,4-Trimethylpentane	Ethylbenzene	Toluene
2-Hexanone	Isopropanol	Total Xylenes
4-Ethyltoluene	M,P-Xylene	Trans-1,2-Dichloroethene
Acetone	Methyl Ethyl Ketone	TCE
Benzene	Methyl Isobutyl Ketone	Trichlorofluoromethane
Bromodichloromethane	Methyl Methacrylate	Vinyl Chloride
Carbon Disulfide	Methylene Chloride	
Carbon Tetrachloride	n-Heptane	

Sub-slab vapor results were evaluated based on decision matrices in the NYSDOH Guidance. The matrices address eight VOCs (TCE, PCE, 1,1,1-TCA, 1,1-dichloroethene, cis-1,2-DCE, carbon tetrachloride, methylene chloride, and vinyl chloride) using three matrices that evaluate the relationship between soil vapor and indoor air concentrations and provide recommendations for actions such as monitoring or mitigation. In the absence of indoor air samples the Decision

Matrices can still provide guidance based on soil vapor concentrations as they relate to ranges of possible indoor air concentrations.

Total VOC concentrations ranged from about 157 µg/m^3 in SV-5 to 1,915 µg/m^3 in SVP-9. Seven of the eight VOCs addressed in the matrices were detected in sub-slab vapor samples. The list below provides a summary of the seven VOCs and the range of detected soil vapor concentrations. NYSDOH Decision Matrices Minimum Concentrations requiring mitigation are shown in parentheses.

- **1,1,1-TCA:** Non-detect in to 2.66 µg/m^3 in SVP-9 (100 µg/m^3)
- **Carbon tetrachloride:** Non-detect to 0.31 µg/m^3 in SV2 (6 µg/m^3)
- **Cis-1,2-dichloroethene:** Non-detect to 14 µg/m^3 in SV1 (6 µg/m^3)
- **Methylene chloride:** Non-detect to 8.7 µg/m^3 in SV5 (100 µg/m^3)
- **PCE:** 3.1 µg/m3 in SV-13 to 121 µg/m^3 in SVP-9 (100 µg/m^3)
- **TCE:** Non-detect to 21.2 µg/m^3 in SVP-9 (6 µg/m^3)
- **Vinyl chloride:** Non-detect to 1,100 µg/m^3 in SV1 (6 µg/m^3)

Sub-slab vapor and co-located indoor air concentrations were applied to the NYSDOH decision matrices. The detected concentrations of 1,1,1-TCA, carbon tetrachloride, PCE, and methylene chloride warrant no further action; however, the detected concentrations of cis-1,2-dichloroethene, TCE, and vinyl chloride warrant mitigation in future development.

Petroleum-related compounds, including benzene, toluene, ethylbenzene and xylenes (BTEX), were detected in all sub-slab soil vapor, indoor air samples, and ambient air samples. BTEX concentrations detected in sub-slab soil vapor samples ranged from 22.53 µg/m^3 in SVP-8 to 1,512 µg/m^3 in SVP-9. BTEX concentrations detected in collocated indoor air and ambient air samples ranged from 7.01µg/m^3 in the AA01 to 20.84 µg/m^3 in IA06.

5.5 Quality Control Results

Quality control sample results were evaluated during data validation. The duplicates, field blanks, and MS/MSD sample pairs for soil and groundwater were collected at a frequency of 1 per 20 primary samples. Full RI laboratory reports are provided in Appendix H.

5.6 Data Usability

New York Analytical Services Protocols (ASP) Category B laboratory reports for the soil, groundwater, soil vapor, and indoor air sample were provided by Alpha and reviewed by a Langan data validator for samples collected during the RI and March 2018 Subsurface Investigation. Data

qualifiers were updated following completion of the DUSRs. The DUSRs are included in Appendix G.

The data were determined to be mostly acceptable. Completeness, defined as the percentage of analytical results that are judged to be valid is as follows:

Report	Sampled Media	Completeness (%)
March 2018 Subsurface Investigation Letter Report	Soil	99.9
	Groundwater	99.0
	Soil Vapor	87.6
September 2019 RIR	Soil	100
	Groundwater	100
	Soil Vapor	100

The following results were flagged as unusable, indicating that the results are not sufficiently valid or technically supportable to be used for data interpretation:

<u>March 2018 Subsurface Investigation</u>

Soil

- The laboratory control sample (LCS) for batch BB80519 exhibited a percent recovery less than 10% for chromium, hexavalent (4.85%). The associated results in sample FB01_021318 are rejected due to significant variance.

Groundwater

- The LCS for batch BB80592 exhibited a percent recovery less than 10% for chromium, hexavalent (4.05%). The associated results in samples GWDUP01_021418, GWFB01_021418, MW3_021418, MW5_021418, and MW7_021418 are rejected due to significant variance.

Soil Vapor

- The sample SV1_021318 exhibited an internal standard area count below 60% for internal standards bromochloromethane (33%) and d5-chlorobenzene (45%). The associated non-detections are rejected based on potential loss of instrument sensitivity.

- The sample SV2_021318 exhibited an internal standard area count below 60% for the internal standard d5-chlorobenzene (59%). The associated non-detections are rejected based on potential loss of instrument sensitivity.
- The sample SV3_021318 exhibited an internal standard area count below 60% for the internal standard d5-chlorobenzene (59%). The associated non-detections are rejected based on potential loss of instrument sensitivity.

5.7 Evaluation of Potential Areas of Concern

This section discusses the RI results with respect to the potential AOCs described in Section 3.4. The RURR SCOs are the applicable soil standards for comparison based on the anticipated use of the site as a mixed-use residential and commercial development. The results were also compared to the UU SCOs to evaluate whether unrestricted land use is practical. The PGW SCOs were applied to the comparison of SVOCs in soil based on the presence of SVOCs in both soil and groundwater. Groundwater analytical results are compared to the NYSDEC TOGS SGVs for Class GA. Soil vapor and collocated indoor air results are compared the May 2017 Decision Matrices issued as an update to the 2006 NYSDOH Soil Vapor Intrusion Guidance. AOC and sample locations are shown on Figure 7.

5.7.1 AOC 1: Historic Fill

Historic fill material contains SVOCs, metals, and pesticides at concentrations above the Part 375 UU, PGW, and/or RURR SCOs. The historic fill layer ranges from surface grade to about 1 to 7 feet bgs and predominantly consists brown, fine- to medium-grained sand with varying amounts of silt, gravel, concrete, brick, coal, and slag.

Ten SVOCs (3-Methylphenol/4-Methylphenol, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene) were detected above the UU, PGW, and/or RURR SCOs in samples collected from the historic fill layer in nine soil borings located across the site. Two pesticides, 4,4'-DDE and 4,4'-DDT, were detected at a concentration above the UU SCOs in samples collected from the historic fill layer in soil borings EB-4 and EB-16. Thirteen metals, including arsenic, barium, cadmium, hexavalent and trivalent chromium, copper, lead, manganese, mercury, nickel, selenium, silver, and zinc, were detected above the UU and/or RURR SCOs in historic fill samples collected across the site. Trivalent chromium was detected above UU SCOs in six native soil samples collected from soil borings EB-13 (8 to 10 feet bgs), EB-14 (2 to 3 feet and 8 to 10 feet bgs), EB-15 (7 to 9 feet bgs) and EB-16 (7 to 9 feet and 14 to 16 feet bgs). Hexavalent chromium was detected above UU SCOs in one native sample collected from soil boring EB-14 (10 to 12 feet bgs). SVOCs were detected in two native soil samples collected from directly below the historic fill layer in soil borings EB-15 and EB-16. Concentrations

of hazardous lead exceeding the USEPA HWRL were identified in the surficial soil sample collected from soil boring location EB-15.

Ten SVOCs (1,2,4-trichlorobenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, ,4-dichlorobenzene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene), total PCBs, eight metals (chromium, iron, lead, magnesium, manganese, mercury, selenium and sodium), and one pesticide (dieldrin) were detected at concentrations above the SGVs in groundwater samples at the site.

AOC 1 Conclusions

Historic fill, which is ubiquitous across the site footprint with the exception of the partial cellar, was encountered to depths ranging from 1 to 7 feet bgs. SVOCs, pesticides, and metals were detected at concentrations above the UU, PGW and/or RURR SCOs in samples of historic fill. SVOCs were detected in two samples of native soil at the interface of the historic fill and native material. These detections are likely related to the comingling of historic fill into the native soil during placement. Concentrations of hexavalent chromium in one sample of native soil is likely the result of infiltration of historic fill material into the borehole during sample collection. The detections of trivalent chromium above the SCOs in native samples appears to be characteristic of naturally-occurring soil conditions and not indicative of fill material.

Chromium, iron, lead, and mercury were not detected in groundwater samples at dissolved concentrations; therefore, the detections of these metals as well as SVOCs, pesticides and total PCBs in unfiltered samples are likely the result of entrained sediment in groundwater derived from historic fill. Magnesium, manganese, selenium, and sodium were detected in dissolved groundwater samples above SGVs and are characteristic of naturally-occurring groundwater conditions.

5.7.2 AOC 2: Chlorinated Volatile Organic Compounds in Groundwater and Soil Vapor

CVOCs were not identified above UU SCOs in soil samples collected from the site and were not detected in soil samples collected above the groundwater table. CVOCs including 1,1-dichloroethane, 1,1-dichloroethene, 1,2-dichloroethane, cis-1,2-dichloroethene, PCE, TCE, and vinyl chloride were detected above the SGVs in six monitoring wells, MW-2, MW-3, MW-7, MW-9, MW-11, and MW-12, across the site. VOCs including benzene, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, acetone, and chloroform were also identified in one or more of these wells. 1,4-dioxane was detected above the USEPA lifetime HA in the monitoring wells MW-2, MW-3, MW-7, MW-9 and MW-11.

CVOCs were identified in sub-slab vapor samples collected site-wide. TCE, PCE, 1,1,1-TCA, cis-1,2-DCE, carbon tetrachloride, methylene chloride, and vinyl chloride were identified in one or

more sub-slab vapor samples. Sub-slab vapor and co-located indoor air concentrations were applied to the NYSDOH decision matrices. The detected concentrations of 1,1,1-TCA, carbon tetrachloride, PCE, and methylene chloride warrant no further action; however, the detected concentrations of cis-1,2-dichloroethene, TCE, and vinyl chloride warrant mitigation in future development.

AOC 2 Conclusions

CVOCs were identified in groundwater and soil vapor across the site footprint; however, CVOCs were not identified in soil above the UU SCOs, were not detected in unsaturated soil, and an on-site source of CVOCs was not identified. CVOC impacts in groundwater may be associated with the historical adjoining and surrounding property operations or an unknown off-site source.

5.7.3 AOC 3: Historical Site Operations and Petroleum Bulk Storage

Note that in relation to AOC 3, two AOCs listed in the RIWP have been merged as a result of their associated scope and investigation findings (RIWP AOC 3: Historical Site Operations and RIWP AOC 4: Historical Petroleum Bulk Storage).

Historical operations included a garage with a gasoline tank (1922 to 1936), an electric supplies warehouse (1947 to 1994), and an automotive parts shop (1994 to 2006). No additional information regarding the tank operation or its removal are available. COCs associated with AOC 3 include petroleum-related VOCs and CVOCs.

Field evidence of petroleum impacts was observed from about 6 to 12 feet bgs in boring EB-2 and about 7 to 10.5 feet bgs in boring EB-16 located in the northeastern part of the site. Maximum PID readings of 160 and 456 ppm were observed at about 7 feet bgs in EB-2 and EB-16, respectively. Petroleum-related VOCs including 1,2,4-trimethylbenzene and total xylenes were detected at concentrations above UU SCOs in the sample collected from 7 to 9 feet bgs in soil boring EB-16. PFOA was identified in two soil samples above the USEPA lifetime HA.

As previously discussed, CVOCs were not detected in unsaturated soil samples; however, they were detected in groundwater above their SGVs site-wide with the exception of MW-5. The petroleum-related VOC, benzene, was detected above its SGV in monitoring well MW-2 located on the northeast part of the site. PID headspace readings above background levels and petroleum or chemical-like odors were not observed.

PFOA and PFOS were identified in monitoring wells across the site at concentrations above the USEPA lifetime HA. Note that the PFAS analytical method, EPA Method 537, was developed and validated for the analysis of finished drinking water from surface water and groundwater sources. Laboratories have modified Method 537 to enable the analysis of groundwater and soil, and to incorporate PFAS analytes not currently addressed by the promulgated method. NYSDOH

offers certification for PFOA and PFOS in the drinking water category. Non-potable water and soil certification is not available; however, the method describes acceptable modifications. EPA recommends that modified methods be assessed relative to project goals and data quality objectives.

Petroleum-related VOCs were identified in soil vapor across the site, with the highest concentration of benzene, toluene, ethylbenzene and xylenes (BTEX) in SV-2 located in the southeastern part of the site. As previously discussed, CVOCs were also identified in soil vapor across the site.

AOC 3 Conclusions

Petroleum-related impacts to soil and groundwater are localized to the northeastern part of the site, between the partial cellar that contains two out-of-service aboveground storage tanks (ASTs) and the area that formerly contained a gasoline tank. Petroleum-impacts in EB-16 and MW-2 are likely associated with the former operation of the gasoline tank or the fuel oil ASTs. Petroleum impacts in soil vapor may also be attributed to historic on-site operations with historic petroleum bulk storage or may be from off-site sources. CVOC impacts were identified site-wide in groundwater and sub-slab vapor; however, an on-site source of CVOCs was not identified. PFAS was identified in soil and groundwater; however, a historic use of PFAS was not identified in the site history.

5.7.4 AOC 4: Historical Operations of Adjoining and Surrounding Properties

Historical uses of adjoining and surrounding properties include a scientific instruments manufacture (1947 to 2005), contractor's yard with petroleum bulk storage and a mechanical repair shop (1936 to 2005), a substation (1936 to 1947), a welding machine shop (1945 to 2005), a tool manufacturer (1947 to 1950), an electronics and electrochemical facility (1950 to 2004), an iron works facility (1950 to 1980), and an auto repair shop (2002 to 2006). Additionally, two NYSDEC BCP sites are located less than 300 feet hydraulically up-gradient of the site. COCs associated with AOC 4 include petroleum-related VOCs and CVOCs.

As previously discussed, CVOCs and 1,4-dioxane were not identified in site soil; however, they were identified in groundwater across the site footprint above their SGVs and USEPA lifetime HA, respectively. CVOCs detected in groundwater were generally higher on the northeastern part of the site with a decreasing trend moving south and west. The CVOCs TCE, PCE, 1,1,1-TCA, cis-1,2-DCE, carbon tetrachloride, methylene chloride, and vinyl chloride were also identified in sub-slab vapor samples. Based on comparison of the sub-slab vapor and co-located indoor air samples using the NYSDOH Decisions Matrices, the recommendation ranged from "no further action" to "mitigate".

AOC 4 Conclusions

CVOC impacts to groundwater and/or soil vapor are observed site-wide; however, CVOCs were not detected above the UU SCOs in soil and were not identified in unsaturated soil. A source of CVOC impacts to groundwater and soil vapor was not identified at the site and may be related to releases associated with the historical use of hydraulically upgradient adjoining and/or surrounding properties. Petroleum impacts to soil vapor in the southern and eastern parts of the site may also be associated with a potential off-site source.

6.0 QUALITATIVE HUMAN AND FISH/WILDLIFE EXPOSURE ASSESSMENT

Human health exposure risk was evaluated for both current and future on-site and off-site conditions, in accordance with NYSDEC DER-10. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, NYSDEC DER-10 requires an on-site and off-site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. According to the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, there was no need to prepare an FWRIA for the site. A completed form of DER-10 Appendix 3C is included in Appendix H.

6.1 Current Conditions

The site is located in a densely developed part of Long Island City, New York. The site is currently used as a construction field office and materials storage space.

6.2 Proposed Conditions

The proposed redevelopment includes construction of a 51-story structure with a cellar level that will span the entire 10,000-square-foot lot. The site will be excavated to about 18 feet bgs to accommodate the construction of the new cellar and foundation components. The building is anticipated to be a mixed-use commercial and residential building with community space.

6.3 Summary of Environmental Conditions

Based on field and sampling data obtained during the RI and during previous environmental investigations, the following contaminants of concern (COCs) were identified:

- VOCs, SVOCs, pesticides, and metals in soil
- VOCs in groundwater
- Petroleum-related VOCs and CVOCs in soil vapor

Soil

Petroleum Impacted Soil

Petroleum-impacted soil, as evidenced by odors, staining, PID readings above background, and/or detections of petroleum-related VOCs above the UU SCOs, was identified in two borings (EB-2 and EB-16) on the northeastern parts of the site. Petroleum-impacted soil extends from about 6 to 12 feet bgs. Petroleum-impacted soil was not observed at or below the water table. The source of the contamination appears to be from the historical gasoline tank and/or the out-of-service ASTs located in the partial cellar.

Soil Impacted with SVOCs, Pesticides and Metals

Several SVOCs, metals and pesticides were detected at concentrations above the UU, PGW, and/or RURR SCOs in historic fill samples collected from across the site. SVOCs were also detected at concentrations above the UU, PGW, and/or RURR SCOs in two native soil samples collected from directly below the fill, which are likely related to mixing of historic fill and native soil during placement. The detected concentrations of SVOCs, metals and pesticides are consistent with those found in typical historic fill in New York City, with the exception of mercury and lead which were identified above those typically found in NYC urban fill in boring locations EB-9, EB-11, EB-12 and EB-16, . TCLP lead concentrations exceeded the USEPA RCRA HWRL in one sample collected from EB-15. Hexavalent chromium detections in one native sample may be a result of infiltration of historic fill material into the borehole during sample collection. Trivalent chromium detections in native soil appear to be characteristic of naturally-occurring soil conditions.

Groundwater

CVOC-Impacted Groundwater

The following CVOCs were identified above their TOGS SGVs in one or more monitoring wells across the site footprint: 1,1-dichloroethane, 1,1-dichloroethene, 1,2-dichloroethane, 1,2,4-trichlorobenzene, 1,2-dichlorobenzene, 1,2-dichloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, cis-1,2-dichloroethene, PCE, TCE, chloroform and vinyl chloride. CVOC concentrations were highest in northeastern part of the site, with a decreasing trend towards the west and south. An on-site source of CVOCs was not identified. CVOC impacts in groundwater may be associated with the historical adjoining and surrounding property operations or an unknown off-site source.

Petroleum-Impacted Groundwater

One petroleum-related VOC, benzene, was identified in monitoring well MW-2. Petroleum impacts may be associated with the former gasoline tank or historical gasoline tank previously identified in the Phase I ESI and/or ASTs previously identified in the partial cellar during the subsurface investigation.

Soil Vapor

Petroleum- and CVOC-Impacted Soil Vapor

Sub-slab vapor samples collected from across the site contained the following CVOCs: 1,1,1-TCA, cis-1,2-dichloroethene, carbon tetrachloride, methylene chloride, PCE, TCE, and vinyl chloride. Cis-1,2-Dichloroethene, TCE, and vinyl chloride were detected in sub-slab soil vapor at concentrations above their respective NYSDOH minimum mitigation threshold criteria. The source of the CVOCs in soil vapor are likely associated with CVOC impacts in groundwater. BTEX was identified in soil vapor samples at the site, with the highest concentrations identified in the southeastern part of the site. The source of petroleum-related VOCs in soil vapor may be associated with historical operations of the site.

6.4 Conceptual Site Model

A conceptual site model (CSM) has been developed based on the RI findings. The purpose of the CSM is to develop a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways.

6.4.1 Potential Sources of Contamination

Potential sources of contamination include historic fill, historical on-site petroleum bulk storage, and the historical on-site and off-site uses.

Historic fill material throughout the site contains SVOCs, pesticides and metals exceeding UU, PGW, and/or RURR SCOs. Hazardous concentrations of lead were identified in one surficial historic fill sample; however, it does not appear to be associated with historic site operations. The concentrations of metals (e.g., copper, zinc, nickel and trivalent chromium) detected in native soil samples may be naturally occurring while others (e.g., hexavalent chromium and mercury) and SVOCs may be from infiltration of historic fill material into the borehole during sample collection or from the mixing of historic fill and native soil during placement.

The findings of the RI indicate that CVOC impacts to groundwater and soil vapor are present site-wide. CVOC impacts were not identified in soil samples; therefore, CVOC impacts are likely associated with historic operations of adjoining and surrounding properties or an unknown off-site source.

Petroleum-related impacts in soil and groundwater in the northeastern part of the site are likely associated with the former gasoline tank or out-of-service ASTs located in the partial cellar of the site. Petroleum-impacts to soil vapor may be attributed to on-site historic operations or an unknown off-site source.

6.4.2 Exposure Media

The impacted media include soil, groundwater, and soil vapor.

Petroleum Impacts in Soil

Petroleum-related nuisance conditions and VOC detections above UU SCOs in soil were identified between about 6 and 12 feet bgs on the northeastern part of the site.

Soil Impacted with SVOCs, Pesticides, and Metals

SVOCs, metals, and pesticides were detected at concentrations above the UU, PWG SCOs and/or RURR SCOs in soil samples throughout the site. Lead was detected at concentrations above the USEPA HWRL in one historic fill sample on the northern part of the site.

Petroleum-Related VOC and CVOC Impacts in Groundwater

Groundwater samples collected from monitoring wells throughout the site contained CVOC concentrations above TOGS SGVs, with the highest concentration in the northern part of the site. The petroleum-related VOC, benzene, was identified above its TOGS SGVs in the northeastern part of the site.

Petroleum-Related VOC and CVOCs in Soil Vapor

CVOCs and petroleum-related VOCs were identified site-wide in sub-slab vapor samples. Cis-1,2-Dichloroethene, TCE, and vinyl chloride were detected in the northeastern part of the site at concentrations above their respective NYSDOH minimum mitigation threshold criteria. CVOC impacts to soil vapor are likely associated with CVOC impacts to groundwater. Petroleum-related VOC impacts are likely associated with historical on-site operations, historical petroleum bulk storage or unknown off-site source.

6.4.3 Receptor Populations

The site is covered by a concrete slab in the one-story building and partial cellar. The building is currently used as a construction field office and materials storage space. Current receptor populations include employees of the construction company and individuals completing pick ups, drop-offs, or inspections at the site. During site development, human receptors will be limited to construction and remediation workers, authorized guests visiting the site, and to a lesser

extent, the public and pedestrians adjacent to the site. Under future conditions, receptors will include the residential and commercial use occupants, employees, and the nearby community, including children.

6.5 Potential Exposure Pathways – On-Site

6.5.1 Current Conditions

The site is covered by an impervious concrete building slab. Human exposure to contaminated soil through dermal absorption, inhalation, and ingestion is minimal and controlled through the presence of the impervious surface. There is a potential exposure pathway through dermal absorption, inhalation of dust, and ingestion during soil associated with site investigations. These exposure pathways are minimized through the implementation of the Health and Safety Plan (HASP) during soil disturbance activities.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely. Any future site investigation activities would be conducted under a HASP, which would control human exposure to on-site contaminants.

The results of the RI indicate that there is a potential for off-site vapor migration. Between March and June of 2020, requests to conduct a vapor intrusion assessment were made to the ownership/management of the northwestern (across Jackson Avenue), western and southern adjoining structures. Access to the adjoining buildings was denied for this assessment. Exposure pathways are minimized through the implementation of the HASP.

The indoor air samples collected in building contained concentrations of VOCs similar to ambient air sample concentrations. No exposure pathway through inhalation of indoor air was identified. Any future site investigation activities would be conducted under a HASP, which would control human exposure to on-site contaminants.

6.5.2 Construction/Remediation Conditions

Construction and remediation may result in potential exposures to site contaminants in soil, groundwater and soil vapor in the absence of a HASP and a Community Air Monitoring Plan (CAMP). Remedial activities include demolition, the excavation and off-site disposal of impacted soil, construction dewatering and pre-treatment if necessary and construction of an on-site capping system, if a Track 4 remedy is required. In the absence of a HASP and CAMP, this scenario presents the potential for exposure of soil COCs to construction and remediation workers via dermal absorption, ingestion, and inhalation of soil, groundwater, and/or vapors. This exposure pathway will be marginalized through the implementation of the HASP, CAMP, and vapor and dust suppression techniques.

6.5.3 Proposed Future Conditions

The proposed development will encompass the entire site footprint and include residential and commercial use. Upon completion of the new development, historic fill and contaminated soil will be excavated to accommodate the cellar and sub-cellar levels and the site will be covered by concrete building slabs and foundations with a waterproofing membrane/vapor barrier. The capping with waterproofing membrane/vapor barrier will prevent direct human exposure to residual impacted media that may be left in place or may migrate to the site from an off-site location and mitigate the potential exposure pathways for future users. Additionally, there is no risk of ingesting groundwater COCs, because the site and surrounding area will continue to obtain municipally-supplied drinking water originating from upstate surface water reservoirs. As such, there is no complete exposure pathway for future users.

6.6 Potential Exposure Pathways – Off-Site

The potential off-site migration of site soil, groundwater, and/or soil vapor contaminants is not expected to result in a complete exposure pathway for current, construction-phase, or future conditions for the following reasons:

- The site is located in an urban area
- During site excavation, foundation construction, and remediation the following protective measures will be implemented:
    - Air monitoring will be conducted for particulates (dust) and VOCs during ground-intrusive work as part of a CAMP. Dust and/or vapor suppression techniques will be employed to limit the potential for off-site migration of soil and vapors.
    - Vehicle tires and undercarriages will be washed as necessary prior to leaving the site to prevent tracking material off-site.
    - A soil erosion/sediment control plan will be implemented during construction to control off-site migration of soil.
    - Removal of source material will prevent future off-site migration of contaminants.
- A continuous impervious surface covering comprised of the proposed building slab with waterproofing membrane/vapor barrier will span the site footprint.
- Groundwater in New York City is not used as a potable water source and the nearest ecological receptor, the Dutch Kills, is located about 1,500 feet south of the site.

6.7 Evaluation of Human Health Exposure

Based on the CSM and the review of environmental data, complete on-site exposure pathways appear to be present, in the absence of engineering controls, in current and construction-phase

conditions. The complete exposure pathways indicate there is a risk of exposure to humans from site contaminants via exposure to soil, groundwater, and soil vapor if mitigation and controls are not implemented. A potential for off-site migration of soil vapor also exists. Attempts to assess potential soil vapor intrusion in adjoining structures was requested however, access was not granted by respective building's ownership/management to complete the assessment.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the site is provided below.

6.7.1 Current Conditions

Contaminant sources include historic fill with varying concentrations of petroleum-related VOCs, SVOCs, metals, and pesticides in soil; petroleum-related VOCs and CVOCs in groundwater; and VOCs and CVOCs in soil vapor.

Contaminant release and transport mechanisms include potential release and transport from the uncovered site for soil, groundwater, and soil vapor. The potential receptor is any on-site personnel and the nearby public. Under current conditions, the likelihood of exposure to humans is limited due to the following:

- The site footprint is covered by a continuous concrete building slab, which prevents direct contact with soil, groundwater, and soil vapor.
- Sampling activities are completed in accordance with a HASP and CAMP that is designed to monitor and prevent exposure to soil, groundwater, and soil vapor contaminants.
- Groundwater at the site is not a potable water source.

6.7.2 Construction/Remediation Activities

During the site remediation and construction for the proposed redevelopment, points of exposure include disturbed and exposed soil and groundwater and exposure to dust and potential organic vapors during excavation and/or dewatering operations. Routes of exposure include ingestion and dermal absorption of contaminated soil and groundwater, inhalation of potential organic vapors arising from contaminated soil vapor, and inhalation of dust originating from contaminated soil. The receptor population includes remediation and construction workers and, to a lesser extent, the public adjacent to the site.

The potential for completed exposure pathways is present since all five elements exist; however, the risk can be avoided or minimized by applying appropriate health and safety measures during construction and remediation, such as monitoring the air for organic vapors and dust, using vapor

and dust suppression measures, cleaning truck undercarriages and securing tarp covers before they leave the site to prevent off-site soil tracking, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

A HASP and a CAMP that include measures such as conducting an air-monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, maintaining a secure construction entrance, proper housekeeping, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction will be implemented. Such measures will prevent completion of potential migration pathways for soil, groundwater, and soil vapor.

6.7.3 Proposed Future Conditions

For the proposed future conditions, residual contaminants may remain on-site, depending on the efficacy of the remedy. If residual impacts exist and engineering/institutional controls are not implemented, points of exposure could include potential cracks in the foundation of the proposed development, exposure during any future ground-intrusive work, or inhalation of vapors entering the building. The receptor population includes residential and commercial use occupants, employees, and the nearby community, including children. The possible routes of exposure can be avoided or mitigated by removal of contaminated soil or construction and maintenance of a site capping system (e.g., concrete building slab or at least 2 feet of clean soil in landscaped areas), installation of a waterproofing membrane/vapor barrier, and implementation of a Site Management Plan (SMP), if necessary depending on the remedy.

6.7.4 Human Health Exposure Assessment Conclusions

1. Human exposure to site contaminants is limited under current conditions due to the surface cover, and access is limited to investigation workers and staff. The primary exposure pathways are dermal contact, ingestion, and inhalation of soil, groundwater, or soil vapor by site investigation workers and, to a lesser extent, the nearby public. The exposure risks can be avoided or minimized by following the appropriate HASP and vapor and dust suppression measures, and by implementing a CAMP during any soil disturbance activities.
2. In the absence of mitigation and controls, there is potential for exposure during the construction-phase activities. The primary exposure pathways are:
    a. Dermal contact, ingestion, and inhalation of contaminated soil, groundwater, or soil vapor by construction workers.
    b. Dermal contact, ingestion, and inhalation of soil (dust) and inhalation of soil vapor by the community in the vicinity of the site.

These can be avoided or minimized by implementing CAMP and by following the appropriate HASP, vapor and dust suppression, site security measures, and following a NYSDEC-approved RAWP.

3. The existence of a complete exposure pathway for site contaminants to human receptors during proposed future conditions is unlikely, as contaminated soil will be excavated and transported to an off-site disposal facility, and any residual soil left in place will be capped, with an impermeable cover or 2 feet of clean soil in landscaped areas. Regional groundwater is not used as a potable water source in New York City. The potential pathway for soil vapor intrusion into the building would be addressed by installation of a waterproofing membrane/vapor barrier, which will minimize soil vapor infiltration. A sub-membrane depressurization system cannot be installed since the foundation will be beneath the water table.

4. It is possible that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors during current, construction-phase, and future conditions. Monitoring and control measures have been and will continue to be used during remediation and future ground-intrusive activities to prevent completion of this pathway. Under future conditions, the site will be remediated and engineering and institutional controls will be implemented, if necessary, to prevent completion of this pathway.

7.0 NATURE AND EXTENT OF CONTAMINATION

This section evaluates the nature and extent of soil, groundwater, and soil vapor contamination. The nature and extent of the contamination is derived from a combination of field observations and analytical data that were discussed in Section 5.0.

7.1 Soil Contamination

Historic Fill

Historic fill predominantly consisting of brown, fine- to medium-grained sand with varying amounts of silt, gravel, concrete, brick, coal, and slag was encountered across the majority of the site footprint beneath the surface cover to depths ranging from about 1 to 7 feet bgs. Historic fill was not identified below the partial cellar on the northeastern part of the site. SVOCs, pesticides, and metals detected at concentrations above the UU, PGW, and/or RURR SCOs are indicative of the concentrations typically found in historic fill in New York City, with the exception of mercury and lead which were identified above those typically found in NYC urban fill in boring locations EB-9, EB-11, EB-12 and EB-16. TCLP lead concentrations exceeded the USEPA RCRA HWRL in one sample collected from EB-15.. SVOCs, pesticides, and metals were also detected at concentrations above the UU, PGW, and/or RURR SCOs in two native soil samples collected directly below the fill layer, and are likely the result of mixing of historic fill with native soil during placement. Metals were detected at concentrations exceeding UU SCOs in native soil samples collected from 8 to 18 feet bgs across the site. The concentrations of some metals (e.g., trivalent chromium, copper, zinc, and nickel) detected in native soil samples may be naturally occurring while others (e.g., hexavalent chromium and mercury) may be from infiltration of historic fill material into the borehole during sample collection.

Petroleum Impacts

Petroleum-related VOCs detected above UU SCOs on the northeastern part of the site are likely associated with the historic petroleum bulk storage. The impacts are localized to the northeastern part of the site. The vertical extent of petroleum-impacted soil was delineated (as evidenced by the absence of visual/olfactory observations, PID readings above background, and/or analytical data indicating the absence of petroleum-related VOCs) from about 6 to 12 feet bgs. Petroleum impacted soil was not observed at or below the water table. The horizontal extent of petroleum impacts were delineated to the north, south and west by soil borings EB-1, EB-10, EB-7, and EB-12. Nuisance petroleum impacts could not be delineated east of EB-2 due to access limitations; however, petroleum-related VOCs were below UU SCOs in soil samples collected from EB-2.

Emerging Contaminants

PFAS compounds were detected in two samples above the USEPA lifetime HA. An on-site source of PFAS compounds was not identified.

7.2 Groundwater Contamination

VOCs

CVOCs were detected at concentrations above the TOGS SGV in six of the seven monitoring wells across the site. CVOCs detected in groundwater were generally higher on the northeastern part of the site with a decreasing trend moving south and west. CVOCs were not identified in unsaturated soil. In addition, benzene was detected in one groundwater sample beneath the location of the former petroleum storage area. An on-site source of CVOCs was not identified. CVOC contamination is likely associated with an off-site source. The presence of petroleum-related VOCs in groundwater is associated with the historical petroleum bulk storage at the site and potential off-site sources

SVOCs and Pesticides

SVOCs and pesticides were detected at concentrations above the SGVs in groundwater samples collected the southeast and northwest parts of the site, respectively, and are likely related to entrained sediments from historic fill.

Metals

Dissolved metals (including iron, magnesium, manganese, and sodium) were detected at concentrations above the SGVs in groundwater samples collected throughout the site. Magnesium, manganese, selenium and sodium are attributable to regional groundwater conditions and are not indicative of a release.

Emerging Contaminants

PFAS compounds were detected in the seven monitoring wells across the site. PFOA was detected in six wells at concentrations exceeding the USEPA combined HA of 70 ppt. An on-site source of PFAS compounds was not identified.

1,4-Dioxane was detected in the five monitoring wells. 1,4-Dioxane was detected in four wells at concentrations exceeding the USEPA HA of 350 ppt.

7.3 Soil Vapor Contamination

Thirty-three VOCs, including petroleum-related VOCs and CVOCs, were detected in soil vapor samples. Total VOC concentrations ranged from about 204 µg/m^3 in SVP-8 to 3,111 µg/m^3 in SVP-9. Of the eight VOCs addressed by the NYSDOH decision matrices, 1,1,1-TCA, cis-1,2-dichloroethene, carbon tetrachloride, methylene chloride, PCE, TCE, and vinyl chloride were detected in sub-slab soil vapor samples. Cis-1,2-dichloroethene, TCE, and vinyl chloride were detected in one sub-slab soil vapor sample from the northeastern part of the site at concentrations exceeding their respective NYSDOH minimum mitigation threshold criteria.

The results of the RI indicate that there is a potential for off-site vapor migration. Between March and June of 2020, requests to conduct a vapor intrusion assessment were made to the ownership/management of the northwestern (across Jackson Avenue), western and southern adjoining structures. Access to the adjoining buildings was denied for this assessment.

8.0 CONCLUSIONS

The conclusions are based on data collected during the May 2018 Subsurface Investigation and the RI. The findings summarized herein are based on qualitative data (field observations and instrumental readings) and laboratory analytical soil, groundwater, and soil vapor sample results. Findings and conclusions are as follows:

1. Stratigraphy: Historic fill predominantly consisting of brown, fine- to medium-grained sand with varying amounts of silt, gravel, concrete, brick, coal, and slag was encountered across the majority of the site from depths ranging from about 1 to 7 feet bgs. Historic fill was not identified below the partial cellar on the northeastern part of the site. Native soil encountered below historic fill predominantly consists of heterogeneous glacial till that composed of discontinuous layers of fine-grained sandy silt with varying amounts of gravel and clay and fine- to medium-grained sand with varying amounts of silt, gravel, and clay. Bedrock was not encountered during the RI; however, based on previous investigations, the top of bedrock ranges from about 18 to 36.5 feet bgs. The bedrock surface is irregular and generally slopes down to the northwest. Boring data indicates bedrock is shallowest within the southeastern part of the site.
2. Hydrogeology: Synoptic groundwater measurements were collected from each of the seven on-site monitoring wells on May 1, 2019. Groundwater elevations range from el -1.45 to el 3.43 feet, which corresponds to depths of about 13.11 to 14.58 feet bgs. Groundwater flow is to the northwest. Underground utilities and other subsurface structures may locally influence the direction of groundwater flow
3. Historic Fill: Laboratory analytical results indicate that the historic fill contains SVOCs, metals, and pesticides at concentrations above the UU, PGW, and/or RURR SCOs in samples collected throughout the site. The detected concentrations are typical of historic fill material in New York City, with the exception of mercury and lead which were identified above those typically found in NYC urban fill in four boring locations. TCLP lead concentrations exceeded the USEPA RCRA HWRL in one sample collected from EB-15..
4. Native Soil: SVOCs, pesticides, and metals were detected at concentrations above the UU, PGW, and/or RURR SCOs in two native soil samples collected directly below the fill layer. These detections are likely attributed to the mixing of historic fill with native soil during placement. Copper, zinc, nickel and trivalent chromium were also detected above the UU SCOs in native soil samples; however, these metals are likely naturally occurring and not indicative of a release. The detection of hexavalent chromium in native soil is likely the result of infiltration of historic fill material into the borehole during sample collection.
5. Petroleum-Impacted Soil and Groundwater: Soil exhibiting petroleum-like odors and organic vapors above background concentrations (i.e., nuisance conditions) was identified

in two borings, EB-2 and EB-16, from about 6 to 12 feet bgs on the northeastern parts of the site. Concentrations of petroleum-related VOC above UU SCOs were identified in soil from boring EB-16. Petroleum-impacted soil was not observed at or below the water table; however, benzene was detected above its TOGS SGV in monitoring well MW-2. Petroleum-related VOCs were also identified in soil vapor site-wide. Petroleum-related impacts are related to the historical petroleum bulk storage at the site and potential off-site sources.

6. CVOC Impacts in Groundwater and Soil Vapor: CVOCs were detected at concentrations above the SGVs in groundwater samples collected from monitoring wells throughout the site, with the highest concentration in the northeastern part of the site; however, CVOCs were not identified in unsaturated soil and were detected at concentrations below the UU SCOs within the groundwater table. Cis-1,2-Dichloroethene, TCE, and vinyl chloride were detected in one sub-slab soil vapor sample from the northeastern part of the site at concentrations warranting mitigation in future development. A source of CVOCs was not identified at the site and is likely attributed to an off-site source.

7. Emerging Contaminants: Total PFAS compounds were detected in two soil samples ranging from 72 ppt in EB-16 to 286 ppt in EB-016, and in the seven monitoring wells sampled during the RI at concentrations between 104 ppt in MW-2 and 352 ppt in MW-3. PFOA was identified in four monitoring wells at concentrations exceeding the USEPA lifetime HA of 70 ppt. 1,4-dioxane was identified in five monitoring wells at concentrations exceeding the USEPA HA of 350 ppt. 1,4-dioxane concentrations ranged between 410 ppt in MW-7 and 1,460 ppt in MW-2. An on-site source or historic on-site use of PFAS compounds and 1,4-dioxane was not identified at the site.

Sufficient analytical data were gathered to establish site-specific soil cleanup levels and to develop a remedy for the site. The remedy will be described and evaluated in the RAWP prepared in accordance with New York State BCP guidelines. The remedy will address impacts to soil, groundwater, and soil vapor described in this RIR.

ITEM NO.	ITEM DESCRIPTION	QUANTITY	UNIT	UNIT PRICE	TOTAL COST
CONTRACTOR FEES					
1	Remediation Facilities, Mobilization, Demobilization, and Site Maintenance - Remediation and decontamination facilities, site fencing, trailer, truck cleaning facilities, etc.	Lump Sum			$ 100,000
2	Management and Handling of Excavated Materials	6,700	CY	$ 45.00	$ 301,500
3	Perimeter Support of Excavation (SOE) and Hydraulic Barrier	Lump Sum			$ 2,800,000
4	Off-Site Transport and Disposal of Historic Fill Material	2,750	Ton	$ 40.00	$ 110,000
5	Off-Site Transport and Disposal of Native Soil	7,040	Ton	$ 30.00	$ 211,200
6	Off-Site Transport and Disposal of Petroleum-Impacted Material	250	Ton	$ 76.00	$ 19,000
7	Off-Site Transport and Disposal of Hazardous Lead Impacted Historic Fill Material	10	Ton	$ 250.00	$ 2,500
8	Underground Storage Tank (UST) contingency (assumes registration, cleaning, removal and disposal)	1	Each	$ 10,000.00	$ 10,000
9	Dewatering and Groundwater Treatment - Accounts for the design, installation, and for cost to operate and maintain the dewatering treatment system	Lump Sum			$ 350,000
10	In-situ Groundwater Treatment	Lump Sum			$ 200,000
11	Dust, Odor, and Vapor Control	6	Months	$ 5,000.00	$ 30,000
				REMEDIAL ACTION CONTRACTOR FEES SUBTOTAL	**$ 4,135,000**
ENGINEERING FEES					
12	Community Air Monitoring - This cost includes equipment rental fees associated with implementation of CAMP, which will be performed during excavation, backfill, and concrete slab restoration.	6	Months	$ 3,000.00	$ 18,000
13	Confirmation Sampling - To confirm source material removal (assumes analysis for VOCs, SVOCs, PCBs, pesticides and metals for each sample), incldues Quality Assurance/Quality Control (QA/QC) samples	15	Samples	$ 1,000.00	$ 15,000
14	Post-remediation Groundwater Monitoring (assume quarterly monitoring over 2 years)	8	Event	$ 15,000.00	$ 120,000
15	BCP Engineering Services - Work Plans, Remedial Investigation, Remedial Design, Remedial Oversight, Closure Reporting	Lump Sum			$ 750,000
				ENGINEERING FEE SUBTOTAL:	**$ 903,000**
				Remediation Contingency (10% of Contractor Fee Subtotal)	**$ 414,000**
				Total Estimated Cost	**$ 5,452,000**
				ESTIMATED REMEDIATION COST - ON-SITE ALTERNATIVE I	**$5.5 MM**

GENERAL NOTES AND ASSUMPTIONS

General Assumptions

1. The density used for conversion from cubic yards to tons was 1.5 tons per cubic yard.
2. Excavation depths were calculated using Remedial Investigation and Waste Characterization soil sample results, field observations, and observed fill depths.
3. This estimate has been prepared for the purposes of comparing potential remedial alternatives. The information in this cost estimate is based on the available information regarding the site investigation and the anticipated scope of the remedial alternative. This cost estimate is expected to be within -30% to +50% of the actual cost. Utilization of this cost estimate information beyond the stated purpose is not recommended. Langan is not licensed to provide financial or legal consulting services; as such, this cost estimate information is not intended to be utilized for complying with financial reporting requirements associated with liability services.
4. A 6 month period is assumed for remediation and soil handling.

Item No.

1	Includes mobilization and demobilization of equipment and materials necessary to excavate, transport, and dispose the targeted soil per the Remedial Action Work Plan. Also includes labor and any project related permit or regulation fees (excludes potential hazardous waste fees).
2	Management and handling of contaminated material assumes 11% increase in labor costs for OSHA trained labor. Baseline labor fees assume $40 per cubic yard. Soil handling includes excavation for off-site disposal.
3	Perimeter support assumes sheeting along the Site extents to support excavation of soils above Track 1 Soil cleanup objectives and hydraulically isolate the site. Remedial excavations along Site boundaries cannot be sloped and thus require excavation support.
4-7	The unit rate provided reflects construction labor to be OSHA certified.
10	Assumes treatment of residual groundwater impacts across a 10-foot treatment zone across the site. Based on the stratigraphy observed during the April and May 2019 Remedial Investigation
11	Dust, odor and vapor control will be required throughout the duration of soil excavation. This cost estimate includes costs associated with equipment and material necessary to monitor and mitigate vapor/odor emission.
12	The assumed duration of the community air monitoring program (CAMP) is 6 months during remediation. CAMP costs include full-time equipment rental to facilitate perimeter dust and VOC monitoring.
13	The cost assumes collection of 12 samples plus quality assurance/quality control samples. Sample analysis will be for Part 375 parameters. Costs include subcontracted laboratory analysis by a NYSDOH ELAP-certified laboratory.
14	Cost based on Langan's experience. Post-remediation monitoring for up to 2 years.
15	Costs are based on Langan's experience with regulatory programs and includes the preparation of a Final Engineering Report (FER), Community Participation Plans (CPP) and periodic daily and monthly reporting.

Remedial Action Work Plan
Alternative II Remedial Cost Estimate - Track 2

26-32 Jackson Avenue
Long Island City, New York
Langan Project No. 170472001
BCP No.: C241217

ITEM NO.	ITEM DESCRIPTION	QUANTITY	UNIT	UNIT PRICE	TOTAL COST
CONTRACTOR FEES					
1	Remediation Facilities, Mobilization, Demobilization, and Site Maintenance - Remediation and decontamination facilities, site fencing, trailer, truck cleaning facilities, etc.		Lump Sum		$ 100,000
2	Management and Handling of Excavated Materials (Contaminated and Hazardous Materials)	3,900	CY	$ 20.00	$ 78,000
3	Perimeter Support of Excavation ([SOE] Soldier Piles and Lagging)		Lump Sum		$ 1,000,000
4	Off-Site Transport and Disposal of Historic Fill Material	2,750	Ton	$ 40.00	$ 110,000
5	Off-Site Transport and Disposal of Native Soil	2,840	Ton	$ 30.00	$ 85,200
6	Off-Site Transport and Disposal of Petroleum-Impacted Material	250	Ton	$ 76.00	$ 19,000
7	Off-Site Transport and Disposal of Hazardous Lead Impacted Historic Fill Material	10	Ton	$ 250.00	$ 2,500
8	Underground Storage Tank (UST) contingency (assumes registration, cleaning, removal and disposal)	1	Each	$ 10,000.00	$ 10,000
9	Waterproofing/Vapor Barrier	8,200	SF	$ 14.00	$ 114,800
10	Dust, Odor, and Vapor Control	4	Months	$ 5,000.00	$ 20,000
				REMEDIAL ACTION CONTRACTOR FEES SUBTOTAL	$ 1,540,000
ENGINEERING FEES					
11	Community Air Monitoring - This cost includes equipment rental fees associated with implementation of CAMP, which will be performed during excavation, backfill, and concrete slab restoration.	4	Months	$ 3,000.00	$ 12,000
12	Confirmation Sampling - To confirm removal of material that exceeds the Track 2 Soil Cleanup Objectives or evaluate soil to remain in place after the development	15	Samples	$ 1,000.00	$ 15,000
13	BCP Engineering Services - Work Plans, Remedial Investigation, Remedial Design, Remedial Oversight, Closure Reporting, Site Management Plan, Environmental Easement, post-excavation survey		Lump Sum		$ 750,000
14	Institutional and Engineering Control Certification - Accounts for fees associated with annual on-site inspections and preparation and submission of annual Periodic Review Reports for ten years.	10	Years	$7,000	$ 70,000
				ENGINEERING FEE SUBTOTAL:	$ 847,000
				Remediation Contingency (10% of Contractor Fee Subtotal)	$ 231,000
				Total Estimated Cost	$ 2,618,000
				ESTIMATED REMEDIATION COST - ON-SITE ALTERNATIVE II	**$2.6 MM**

Langan Project No. 170472001
BCP No.: C241217

GENERAL NOTES AND ASSUMPTIONS

General Assumptions

1. The density used for conversion from cubic yards to tons was 1.5 tons per cubic yard.
2. Excavation depths were calculated using Remedial Investigation and Waste Characterization soil sample results, field observations, and observed fill depths.
3. This estimate has been prepared for the purposes of comparing potential remedial alternatives. The information in this cost estimate is based on the available information regarding the site investigation and the anticipated scope of the remedial alternative. This cost estimate is expected to be within -30% to +50% of the actual cost. Utilization of this cost estimate information beyond the stated purpose is not recommended. Langan is not licensed to provide financial or legal consulting services; as such, this cost estimate information is not intended to be utilized for complying with financial reporting requirements associated with liability services.
4. A 4 month period is assumed for remediation and soil handling.

Item No.

1	Includes mobilization and demobilization of equipment and materials necessary to excavate, transport, and dispose the targeted soil per the Remedial Action Work Plan. Also includes labor and any project related permit or regulation fees (excludes potential hazardous waste fees).
2	Management and handling of contaminated and potentially hazardous material assumes 11% increase in labor costs for OSHA trained labor. Baseline labor fees assumes $40 per cubic yard. Soil handling includes excavation for off-site disposal.
3	Perimeter support assumes soilder piles and lagging along the Site extents where applicable. Remedial excavations along Site boundaries cannot be sloped and thus require excavation support.
4-7	The unit rate provided reflects construction labor to be OSHA certified.
9	Assumes a waterproofing/vapor barrier will be installed throughout the entire site footprint of approximately 10,000 square feet, and will extend 18 feet along the building cellar level sidewalls.
10	Dust, odor and vapor control will be required throughout the duration of soil excavation. This cost estimate includes incremental costs associated with equipment and material necessary to monitor and mitigate vapor/odor emission.
11	The assumed duration of the community air monitoring program (CAMP) is 4 months during remediation. CAMP costs include full-time equipment rental to facilitate perimeter dust and VOC monitoring.
12	The cost assumes collection of 12 samples plus quality assurance/quality control samples. Sample analysis will be for Part 375 parameters. Costs include subcontracted laboratory analysis by a NYSDOH ELAP-certified laboratory.
13	Costs are based on Langan's experience with regulatory programs and includes the preparation of a Final Engineering Report (FER), Site Management Plan (SMP), Community Participation Plans (CPP) and periodic daily and monthly reporting.
14	This task will be completed annually until such a time that the Environmental Easement is extinguished.

APPENDIX A

SITE SURVEY

SURVEY NO. 80662 | BLOCK: 267 | TAX LOT: 21

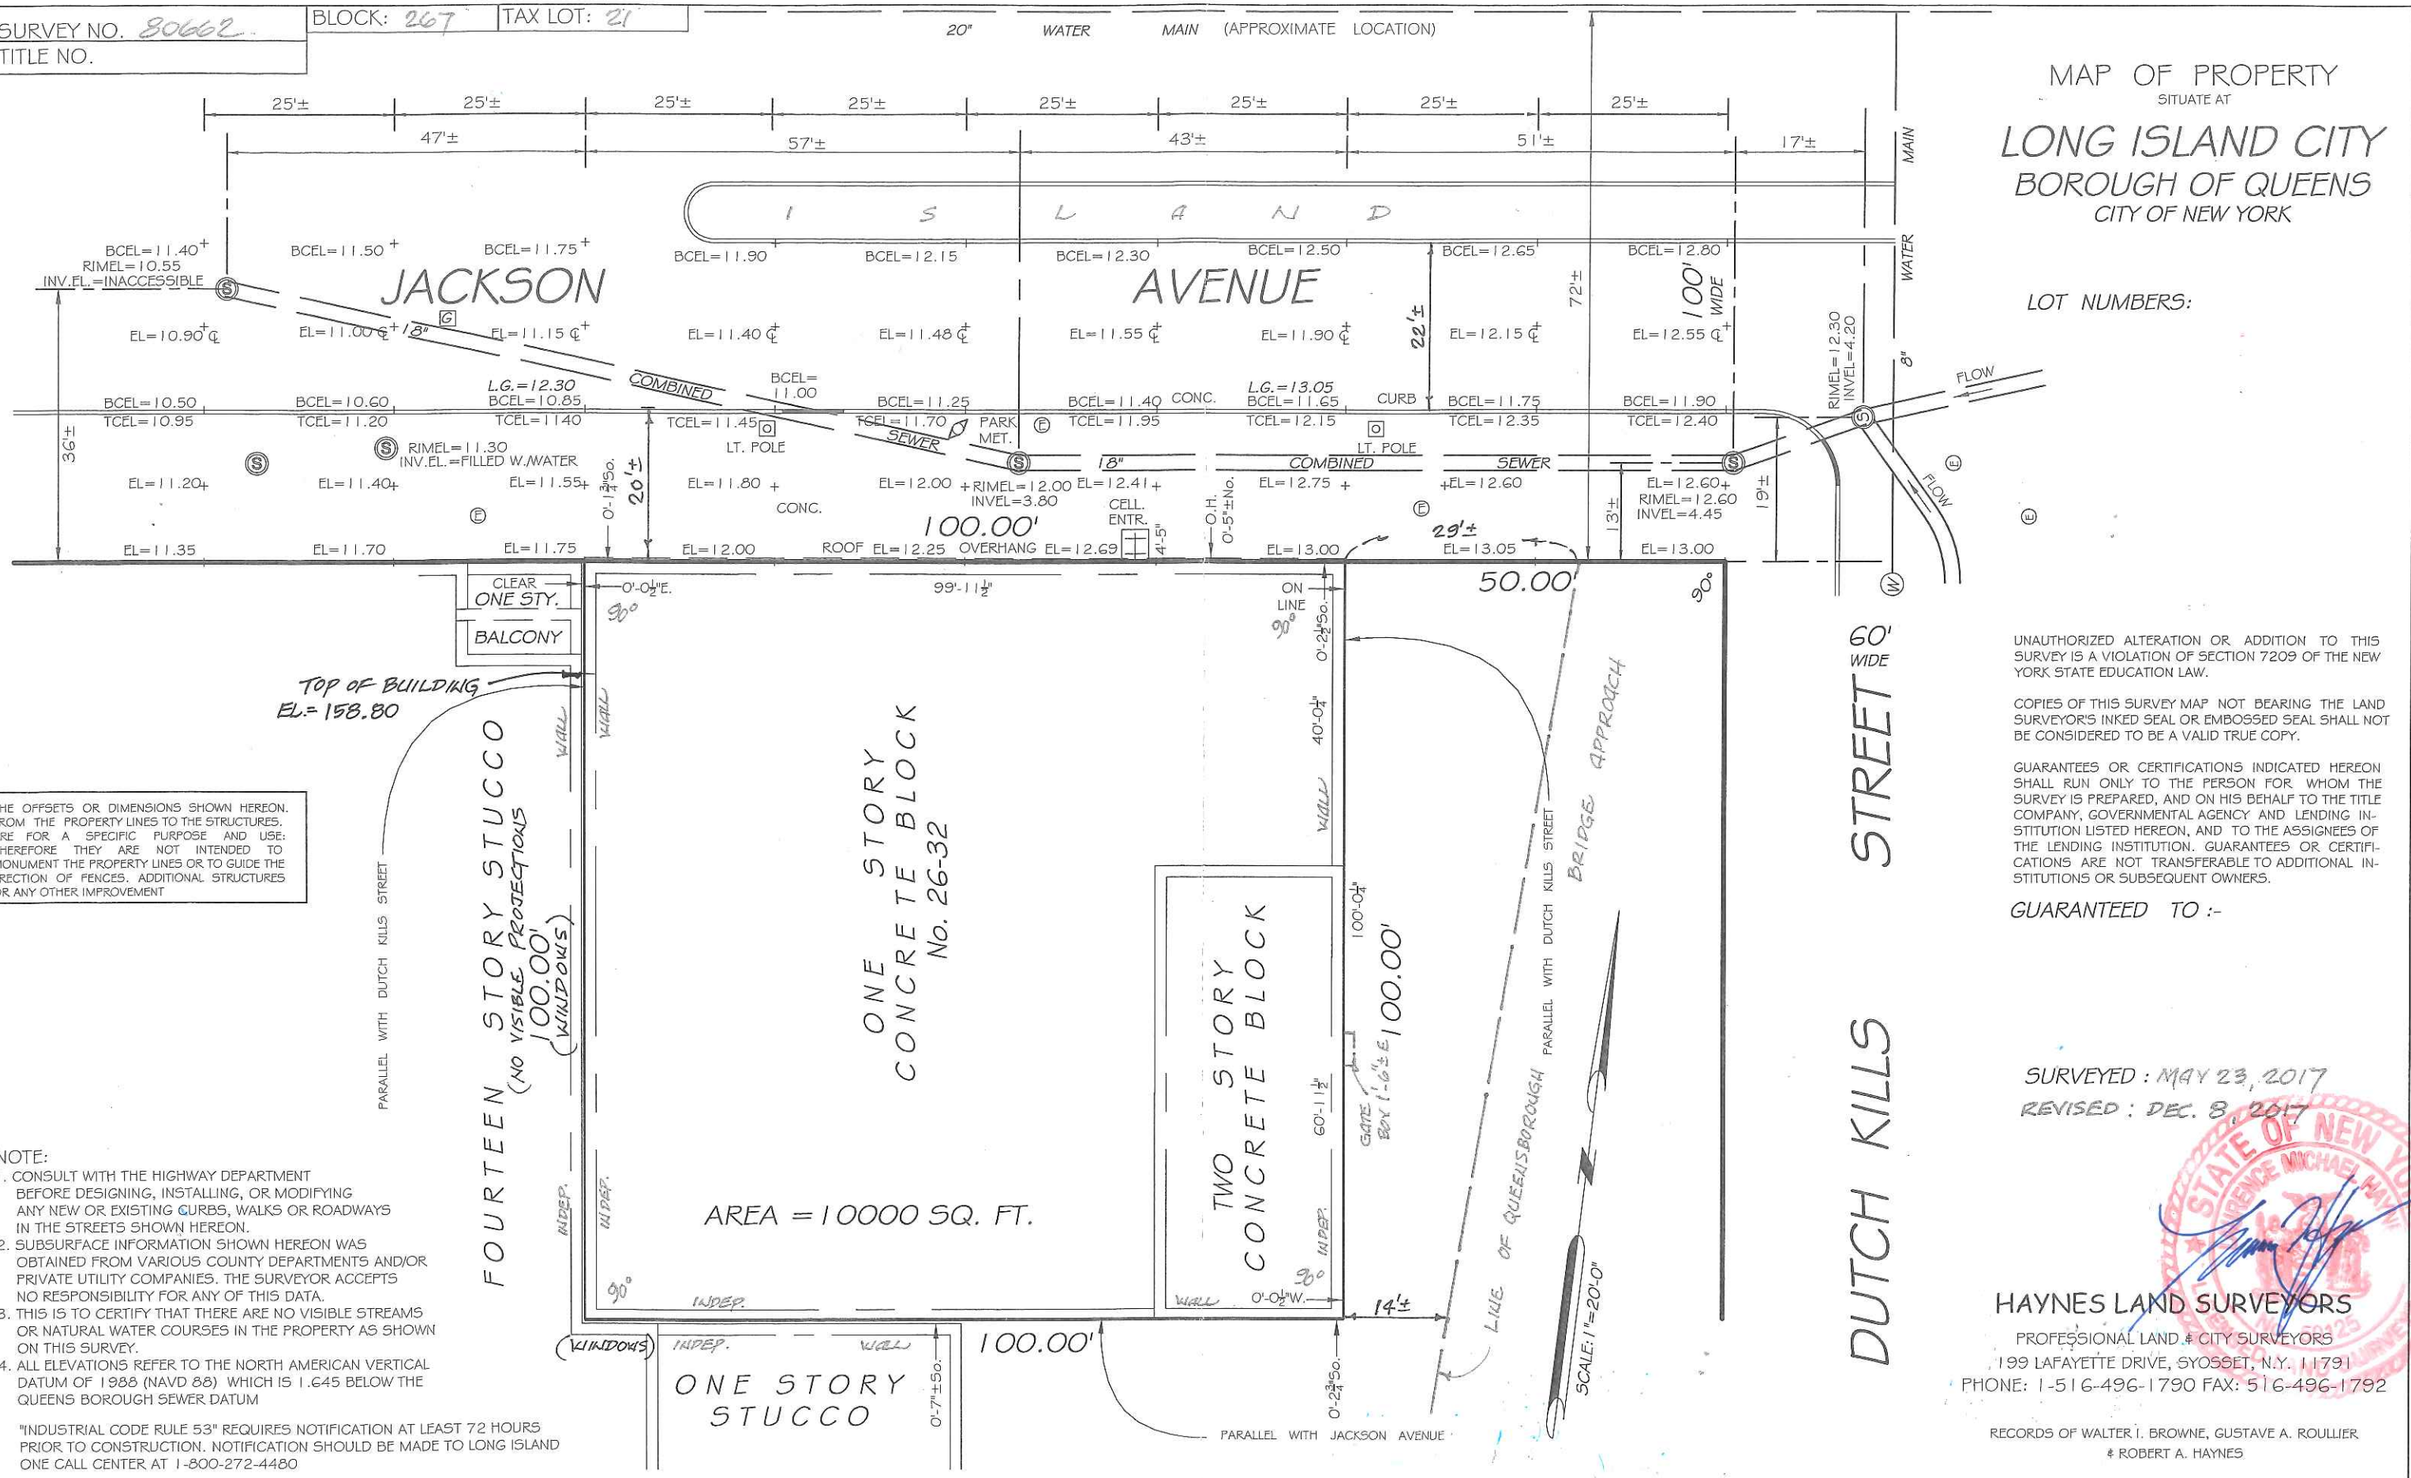
TITLE NO.

MAP OF PROPERTY

SITUATE AT

LONG ISLAND CITY
BOROUGH OF QUEENS
CITY OF NEW YORK

LOT NUMBERS:



THE OFFSETS OR DIMENSIONS SHOWN HEREON. FROM THE PROPERTY LINES TO THE STRUCTURES, ARE FOR A SPECIFIC PURPOSE AND USE: THEREFORE THEY ARE NOT INTENDED TO MONUMENT THE PROPERTY LINES OR TO GUIDE THE ERECTION OF FENCES, ADDITIONAL STRUCTURES OR ANY OTHER IMPROVEMENT

NOTE:

1. CONSULT WITH THE HIGHWAY DEPARTMENT BEFORE DESIGNING, INSTALLING, OR MODIFYING ANY NEW OR EXISTING CURBS, WALKS OR ROADWAYS IN THE STREETS SHOWN HEREON.
2. SUBSURFACE INFORMATION SHOWN HEREON WAS OBTAINED FROM VARIOUS COUNTY DEPARTMENTS AND/OR PRIVATE UTILITY COMPANIES. THE SURVEYOR ACCEPTS NO RESPONSIBILITY FOR ANY OF THIS DATA.
3. THIS IS TO CERTIFY THAT THERE ARE NO VISIBLE STREAMS OR NATURAL WATER COURSES IN THE PROPERTY AS SHOWN ON THIS SURVEY.
4. ALL ELEVATIONS REFER TO THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD 88) WHICH IS 1.645 BELOW THE QUEENS BOROUGH SEWER DATUM

"INDUSTRIAL CODE RULE 53" REQUIRES NOTIFICATION AT LEAST 72 HOURS PRIOR TO CONSTRUCTION. NOTIFICATION SHOULD BE MADE TO LONG ISLAND ONE CALL CENTER AT 1-800-272-4480

UNAUTHORIZED ALTERATION OR ADDITION TO THIS SURVEY IS A VIOLATION OF SECTION 7209 OF THE NEW YORK STATE EDUCATION LAW.

COPIES OF THIS SURVEY MAP NOT BEARING THE LAND SURVEYOR'S INKED SEAL OR EMBOSSED SEAL SHALL NOT BE CONSIDERED TO BE A VALID TRUE COPY.

GUARANTEES OR CERTIFICATIONS INDICATED HEREON SHALL RUN ONLY TO THE PERSON FOR WHOM THE SURVEY IS PREPARED, AND ON HIS BEHALF TO THE TITLE COMPANY, GOVERNMENTAL AGENCY AND LENDING INSTITUTION LISTED HEREON, AND TO THE ASSIGNEES OF THE LENDING INSTITUTION. GUARANTEES OR CERTIFICATIONS ARE NOT TRANSFERABLE TO ADDITIONAL INSTITUTIONS OR SUBSEQUENT OWNERS.

GUARANTEED TO :-

SURVEYED : MAY 23, 2017

EXECUTIVE SUMMARY

HiRise Engineering, P.C. (HiRise) has performed this Phase I Environmental Site Assessment (ESA) at the request of Popular Community Bank in general accordance with the ASTM E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM 2013) for the property located at 26-32 Jackson Avenue in the neighborhood of Long Island City, Borough and County of Queens, and State of New York, herein referred as "the Property".

This Phase I ESA is designed to satisfy due diligence requirements for Popular Community Bank prior to providing financing for the Property.

The Property is identified as Block 267 Lot 21 in a primarily commercial and industrial area of Long Island City in Queens, New York. The Property is improved with a 2-story, commercial building that occupies the entire footprint of the Property. The western commercial unit was occupied by a perfume store showroom and warehouse. The eastern unit was unoccupied and used for storage.

The purpose of the ESA is to identify recognized environmental conditions (REC), controlled recognized environmental conditions (CREC), historical recognized environmental conditions (HREC), and *de minimis* conditions in connection with the Property including the presence, or likely presence, of any hazardous substances or petroleum products on the Property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the Property or into the ground, ground water, or surface water of the Property. Through site reconnaissance performed at the Property and surrounding areas, this assessment included an evaluation to the extent practicable of the past and present land uses.

- Gasgo is located across Jackson Avenue to the north of the Property at 27-01 Jackson Avenue. According to the EDR report, a spill was reported on February 17, 2000 when former USTs were excavated and soil was removed. A No Further Action (NFA) letter was issued and sent to the owner on September 7, 2005. The file was reopened in May 2013 when soil and groundwater contamination was identified based on the possible off-site migration that was unknown at the time of the tank closure. Wells were installed and sampled on June 24, 2014; however, the results were not yet received by the NYSDEC. Based on the close proximity of this site to the Property and the unknown extent of the plume of the groundwater contamination, the soil and groundwater impacts are considered to pose a REC. HiRise recommends conducting an additional file review of this NY Spills incident to determine if the groundwater plume has potentially impacted the Property.

- Two (2) 275-gallon, steel aboveground storage tanks were observed in the basement utility room. The two (2) tanks were empty and no staining was observed on the tanks or on the ground. No odors were noted in the basement. The two (2) tanks observed are not considered to pose a REC to the Property. HiRise recommends removing and properly disposing the tanks.

- Suspect ACM materials in the form of pipe insulation, sheetrock walls/joint compound, wall and ceiling plaster, floor tiles and mastic and roofing materials was observed at the Property. All suspect materials appeared to be in

good condition at the time of the site visit. Based on the age of the building (1920), ACMs may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive asbestos survey should be conducted at the Property.

- Based on the age of the building (1920), lead-based paint may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive lead-based paint survey should be conducted at the Property.

This Executive Summary is presented for convenience only and should not be used in lieu of reading the entire report, including appendices.

1.0 INTRODUCTION

Popular Community Bank requested that HiRise Engineering (HiRise) perform this Phase I Environmental Site Assessment (ESA) in anticipation of providing financing for the parcel located at 26-32 Jackson Avenue in the neighborhood of Long Island City, Borough and County of Queens, and State of New York, herein referred to as the Property. The Phase I ESA services performed include information obtained from practically reviewable records including historical aerial photographs, historical topographic maps, governmental databases, and previous environmental reports (where available); the site reconnaissance conducted on November 20, 2014; and interviews with personnel familiar with the Property.

1.1 PURPOSE

The purpose of this Phase I Environmental Site Assessment (ESA) is to identify recognized environmental conditions (REC), controlled recognized environmental conditions (CREC), historical recognized environmental conditions (HREC), and *de minimis* conditions in connection with the Property as defined by the ASTM E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM 2013). This includes the presence, or likely presence, of any hazardous substances or petroleum products on the Property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the Property or into the ground, ground water, or surface water of the Property. The term REC is not intended to include *de minimis* conditions which does not generally present a threat to human health or the environment and would not generally be subject of an enforcement action if brought to the attention of the appropriate governmental agencies. Conditions determined to be *de minimis* are not considered RECs or CRECs.

This assessment included an evaluation to the extent practicable of the past and present land uses at the Property and on adjacent properties. Site reconnaissance was performed at the Property and surrounding area to identify obvious indications of present or past activities that have or could have contaminated the Property. Conditions observed are subject to change. Indications of the presence or likely presence of hazardous substances and petroleum products that were not observable at the time of the most recent site reconnaissance may subsequently become present or observable.

1.2 DETAILED SCOPE-OF-SERVICES

Client contracted HiRise to conduct this Phase I ESA on November 10, 2014 in general accordance with the ASTM E1527-13 Standards, including:

- The Property history in an attempt to identify any possible ownership(s) and/or uses that would suggest an impact to the environmental integrity of the Property as identified through review of reasonably ascertainable standard historical sources.

- Physical characteristics of the Property as identified through review of reasonably ascertainable topographic, wetlands, floodplain, soils, geology, and groundwater data.

- Current Property conditions as they pertain to the presence or absence of facility storage tanks, drums, above or below ground containment units and similar vessels; transformers and other electrical equipment that may utilize fluids containing Polychlorinated Biphenyls (PCB); and the use of hazardous materials/chemicals and petroleum products, and/or the generation, treatment, storage, or disposal of hazardous, regulated, or medical wastes.

- A review of publicly available and reasonably ascertainable records from state and local regulatory officials.

- High-risk neighboring properties and the potential for known or suspected contamination to migrate onto the Property.

1.3 SIGNIFICANT ASSUMPTIONS

In conducting this Phase I ESA, the following assumptions were made:

- The Property contact was knowledgeable about the Property and its history. The contact would be available to interviews, and would provide access to the Property to complete the necessary scope of work.

- Timely, unrestricted access necessary to complete the scope-of-work would be provided.

- Groundwater flow was assumed to mimic the local topographic gradient unless other site-specific data was provided or referenced.

1.4 LIMITATIONS AND EXCEPTIONS

The lack of evidence of the presence of hazardous substances and petroleum products following the completion of this scope of work does not guarantee the absence of such conditions. The lack of evidence only indicates that none were identified as a result of the services provided. The limited scope of work precludes a warranty or guarantee regarding the presence or absence of hazardous materials that could potentially affect the Property. HiRise has provided its best professional opinion regarding the presence of RECs and performed the practices generally accepted.

The opinions presented in this report are based on the completed disclosure and collection of facts and findings determined during the process of conducting this report from visually observable on-site and offsite conditions; a review of regulatory records; and other historical information. The opinions are based on limited data. This report is not a comprehensive site characterization and should not be construed as such.

This ESA does not include non-scope items such as asbestos-containing building materials, biological agents, cultural and historic resources, ecological resources, endangered species, health and safety, indoor air quality unrelated to release of hazardous substances or petroleum products into the environment, industrial hygiene, lead-based paint, lead in drinking water, mold, radon, regulatory compliance, and/or wetland delineation. Upon request, these services may be provided under a separate cover.

HiRise has attempted to ascertain, but does not guarantee, the authenticity or reliability of the information received from outside sources.

The following limitations were encountered during this assessment:

- A complete inspection of the surface was limited based on the presence of the building on the entire footprint of the Property.
- An interview with the Property owner was not conducted.

1.5 RELIANCE

This Phase I ESA was prepared for the sole use of Popular Community Bank and its representatives, respective agents, successors, and assigns as required to complete the property transaction. No other parties should rely on the findings and opinions contained herein without prior written consent of HiRise. Reliance on this report by other parties may result in misinterpretation and unwise actions based on those misinterpretations.

2.0 SITE DESCRIPTION

2.1 LOCATION AND LEGAL DESCRIPTION

The approximate latitude and longitude of the Property are 40° 44' 50.64" North and 73° 56' 27.24" West. The Property is located on the north side of Jackson Avenue, west of the Brooklyn Queens Expressway. The Property is identified as Block 267 Lot 21.

2.2 SITE VICINITY AND CHARACTERISTICS

The Property is located in a primarily commercial and industrial area of the Long Island City in Queens, New York. Access to the Property is available from Jackson Avenue.

2.3 CURRENT USE OF THE PROPERTY

The Property building consisted of two (2) commercial units. The western half was occupied by a perfume store with a showroom and warehouse. The eastern half of the building was unoccupied.

2.4 DESCRIPTIONS OF STRUCTURES, ROADS, AND UTILITIES

The Property was improved with a two-unit slab on-grade commercial warehouse building. The entire building consisted of approximately 9,612 square feet on a 10,000 square foot parcel. The building consisted of two (2) commercial units, one on each half of the building. The eastern commercial unit had a second floor with vacant offices. A small utility basement exists which could be accessed from the front of the building along Jackson Avenue.

Water and sewer are provided to the Property by the City of New York. Electricity and natural gas is provided to the Property by Con Edison.

2.5 CURRENT USES OF THE ADJOINING PROPERTIES

The current uses of the properties adjoining the Property are as follows:

North - Jackson Avenue and a gas station (27-01 Jackson Avenue)
East - Vacant lot and the Brooklyn-Queens Expressway (26-46 Jackson Avenue)
South - Vacant lot (26-46 Jackson Avenue)
West - Office/Apartment Building (26-26 Jackson Avenue)

3.0 USER PROVIDED INFORMATION

The purpose of this section is to describe tasks to be performed by the user.

3.1 TITLE RECORDS

The user did not provide title records for the Property.

3.2 ENVIRONMENTAL LIENS OR ACTIVITY AND USE LIMITATIONS (AUL)

The user did not provide any information regarding environmental liens or AULs against the Property.

3.3 SPECIALIZED KNOWLEDGE

Specialized knowledge pertaining to any environmental concerns associated with the Property was not provided by the user.

3.4 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION

Commonly known or reasonably ascertainable information was not provided by the user regarding any environmental concerned at the Property.

3.5 VALUATION REDUCTION FOR ENVIRONMENTAL ISSUES

Information regarding a valuation reduction for environmental issues was not provided by the user regarding the Property.

3.6 OWNER, PROPERTY MANAGER, AND/OR OCCUPANT INFORMATION

The Property owner information was not provided by the user. The Property was occupied by a perfume store and warehouse used to store perfume merchandise.

3.7 REASON FOR PERFORMING THE PHASE I ESA

HiRise performed this Phase I ESA to satisfy due diligence for Popular Community Bank in anticipation of providing financing for the Property.

4.0 RECORDS REVIEW

The purpose of a records review is to obtain and review archives that will help identify RECs in connection with the Property.

4.1 ENVIRONMENTAL RECORDS SOURCES

This section includes a summary of environmental regulatory record lists available from federal, state, and local environmental regulatory agencies. Record lists include environmental permits, incidents, complaints, violations, response actions, and remedial activities pertaining to the Property and surrounding properties within the search radii recommended by the ASTM Standard.

EDR was contracted to provide a database search of the available records. The records provided were reviewed and reasonable efforts were taken to identify obvious mistakes or insufficiencies in the data.

4.1.1 SUMMARY OF PROPERTY IN THE EDR REPORT

The Property was not identified in the regulatory databases in the EDR report (EDR 2014a).

4.1.2 REGULATORY DATABASE SUMMARY OF THE SURROUNDING PROPERTIES

The following sections provide a discussion of the Property and surrounding properties identified in the EDR report.

4.1.2.1 NATIONAL PRIORITIES LIST (NPL)

Also known as Superfund, the NPL database is a subset of Comprehensive Environmental Response Compensation, and Information System (CERCLIS) and identifies over 1,200 sites for priority cleanup under the Superfund program. This information comes from the Environmental Protection Agency (EPA).

According to the EDR report, no NPL sites were identified within 1 mile of the Property.

4.1.2.2 COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY INFORMATION SYSTEM (CERCLIS)

The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

According to the EDR report, no CERCLIS listings were identified within 1 mile of the Property.

4.1.2.3 CERCLIS NO FURTHER REMEDIAL ACTION PLANNED (CERC-NFRAP)

The CERCLIS No Further Remedial Action Planned Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

According to the EDR report, no CERC-NFRAP listings were identified within ½ mile of the Property.

4.1.2.4 RESOURCE CONSERVATION AND RECOVERY ACT CORRECTION ACTION ACTIVITY (CORRACTS)

The CORRACTS database contains a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

According to the EDR report, three CORRACTS listings were identified within 1 mile of the Property. Information regarding the listings is discussed below.

Active Steel Drum Co. Inc. is located approximately 0.77 mile south-southeast and cross-gradient from the Property at 52-30 34th Street. According to the EDR report, this facility was identified as a metal container manufacturing and other personal and household goods repair and maintenance facility. This facility was also identified in the RCRA-NonGen/NLR, FINDS, and NY MANIFEST databases. Based on the distance and gradient, this facility is not considered to pose a REC to the Property.

Kosan Industrial Corp is located approximately 0.62 mile west and down-gradient from the Property at 5-49 49th Avenue. According to the EDR report, the property is used for paint and coating manufacturing and has an EPA ID of NYD061949228. The property is also listed in the RCRA NonGen / NLR, and NY MANIFEST databases. No violations are associated with the listing. Based on the distance and regulatory status, this CORRACTS listing is not considered to pose a REC to the Property.

Ravenswood PCB Storage Fac. is located approximately 0.75 mile north-northwest and down-gradient from the Property at 40th Ave & Vernon Blvd. According to the EDR report, this facility is a Con Edison generating station and does not have any outstanding violations. Based on the distance and hydraulic gradient, this CORRACTS listing is not considered to pose a REC to the Property.

4.1.2.5 RESOURCE CONSERVATION AND RECOVERY ACT TREATMENT STORAGE AND DISPOSAL FACILITIES (RCRA-TSDF)

The RCRA-TSDF database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

According to the EDR report, no RCRA-TSDF listings were identified within ½ mile of the Property.

4.1.2.6 RESOURCE CONSERVATION AND RECOVERY INFORMATION SYSTEM (RCRIS) LIST

RCRIS is the EPA databases of facilities that generate, transport, treat, store, or dispose of hazardous wastes as defined by the Resource Conservation and Recovery Act (RCRA).

According to the EDR report, three (3) RCRA-LQGs, six (6) RCRA-SQG, and nine (9) RCRA-CESQGs were identified within 0.25 mile of the Property. The Property, nor adjoining properties, were identified in the database. Based on the distance from the Property, the RCRA generator listings are not considered to pose a REC at the Property.

4.1.2.7 EMERGENCY RESPONSE NOTIFICATION SYSTEM (ERNS)

ERNS is a national database used to collect information regarding reported releases of petroleum products and/or hazardous substances. The database contains information from spill reports submitted to Federal agencies, including the EPA, the U.S. Coast Guard, the National Response Center, and the U.S. Department of Transportation. A review of this database was conducted in order to determine whether any spills or incidents involving releases of hazardous substances or petroleum products have occurred at the Subject Property.

According to the EDR report, the Property was not identified in the ERNS database.

4.1.2.8 FEDERAL INSTITUTIONAL CONTROLS (US ENG CONTROLS AND US INST CONTROL)

US ENG CONTROLS/US INST CONTROL contains a listing of sites with engineered or institutional controls in place.

According to the EDR report, no US ENG CONTROL/INST CONTROLS sites were identified within ½ mile of the Property.

4.1.2.9 STATE- AND TRIBAL- EQUIVALENT CERCLIS (NY SHWS)

The NY SHWS database contains a list of sites that may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using the state funds (state equivalent of Superfund) are identified along with states where cleanup will be paid for by the potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous Waste Disposal Sites in New York State.

According to the EDR report, 14 NY SHWS sites were identified within 1 mile of the Property. Of the 14 NY SHWS sites, 13 were located down-gradient or greater than ½ mile away. Based on the distance and/or hydraulic gradient, the 13 NY SHWS sites are not considered to pose a REC to the Property. Information regarding the other listing is discussed below.

Fresh Cleaners & Laundry Inc. is located approximately 0.47 mile northeast and up-gradient from the Property. According to the EDR report, groundwater at this site and off-site is contaminated with solvents from drycleaner operations. Groundwater was determined to flow to the northeast and southwest. Based on the distance from the Property, this listing is not considered to pose a REC to the Property.

4.1.2.10 NY VAPOR REOPENED

"Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion. According to the EDR report, three (3) NY SWF/LF sites were identified within ½ mile of the Property. Information regarding the listing is discussed below.

Standard Motor Products, Inc. is located approximately 0.82 mile east-northeast and up-gradient from the Property at 37-18 Northern Boulevard. According to the VAPOR REOPENED database, the site code is 241016 and the status is

complete. Based on the regulatory status and distance from the Property, this listing is not considered to pose a REC to the Property.

4.1.2.11 SOLID WASTE FACILITIES/LANDFILL (NY SWF/LF) SITES

The NY SWF/LF database typically contains an inventory of solid waste disposal facilities or landfills in a particular state.

According to the EDR report, two (2) NY SWF/LF sites were identified within ½ mile of the Property. Both facilities are identified at 21-16 Jackson Avenue which is approximately 0.38 mile away and down-gradient from the Property. Based on the distance and hydraulic gradient, these listings are not considered to pose a REC to the Property.

4.1.2.12 STORAGE TANKS INCIDENTS (NY LTANKS) SITES

The NY LTANKS database includes records containing an inventory of reported leaking storage tank incidents that have been reported from April 1, 1986 through the most recent update of the database. This database contains a list of both underground storage tanks (UST) and aboveground storage tanks (AST). Causes of the incidents reported include tank test failures, tank failures, and tank overfills.

According to the EDR report, 50 NY LTANKS listings were identified within ½ mile of the Property. Two (2) of the 50 listings are reported as active. None of the incidents are associated with the Property or adjoining properties. Based on the regulatory status, the remaining 48 NY LTANKS listings identified as closed are not considered to pose a REC to the Property. Information regarding the open listings is discussed below.

Court Plaza is located approximately 0.10 mile west-southwest and down-gradient of the Property at 5 Court Square. According to the EDR report, a tank test failure was reported on April 13, 2010. Based on the hydraulic gradient, this listing is not considered to pose a REC to the Property.

32-32 Queens Blvd/Sunoco is located approximately 0.43 mile east-southeast and cross-gradient from the Property. According to the EDR report, the tank test failure was reported on August 30, 1989 and the groundwater was determined to be impacted. Remediation has been underway. Based on the distance and hydraulic gradient, this listing is not considered to pose a REC to the Property.

4.1.2.13 UNDERGROUND STORAGE TANK SITES (NY UST)

The NY UST database contains an inventory of registered USTs. USTs are regulated under Subtitle I of RCRA. The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database.

According to the EDR report, 21 NY UST listings were identified within ¼ mile of the Property. The northern adjoining property across Jackson Street was identified in this database.

Corner Petroleum Inc. is located across Jackson Avenue to the north of the Property at 27-01 Jackson Avenue. According to the EDR report, this facility was identified a Facility ID 2-090565 in the NYSDEC PBS database. This facility was identified as a retail gas station with three (3) 4,000 gallon gasoline USTs and one (1) 4,000 gallon diesel UST. Ten (10) former USTs were identified as closed or removed. No spills or releases are associated with this Property. Based on the lack of any releases associated with this facility, the NY UST listing is not considered to pose a REC.

4.1.2.14 ABOVEGROUND STORAGE TANK SITES (NY AST)

The NY AST database contains registered ASTs. The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database.

According to the EDR report, 30 NY AST listings were identified within ¼ mile of the Property. The adjoining properties were not identified in the database. Based on the distance, the NY AST listings are not considered to pose a REC to the Property.

4.1.2.15 VOLUNTARY CLEANUP PROGRAM (VCP)

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

According to the EDR report, three (3) VCP listings were identified within ½ mile of the Property. The VCP listings are located greater than 0.21 mile away or greater. Based on the nature of this database, the VCP listings are not considered to pose a REC to the Property.

4.1.2.16 BROWNFIELDS SITE LIST (NY BROWNFIELDS)

A Brownfield is any property where redevelopment or reuse may be complicated by the presence or potential presence of a hazardous waste, petroleum, pollutant, or contaminant. Leaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment.

According to the EDR report, five (5) NY BROWNFIELDS listings were identified within ½ mile of the Property. The listings are located 0.13 mile away or greater. Based on the nature of this database and distance from the Property, these listings are not considered to pose a REC to the Property.

4.1.2.17 SPILL SITES (NY SPILLS)

The NY Spill sites database contains data collected on spills reported to NYSDEC. It includes spills active as of April 1, 1986, as well as spills occurring since this date.

According to the EDR report, 27 NY Spill listings were identified within ⅛ mile of the Property. Two of the 27 incidents are identified as active (EDR 2014b). Based on one or more of the following: distance, hydraulic gradient, and regulatory status, the 25 closed NY Spills listings identified are not considered to pose a REC to the Property. Information regarding the open listing is discussed below.

VS# 2196 is located approximately 0.08 mile east and up-gradient from the Property. According to the EDR report, the spill was reported on March 1, 2011 when 50 gallons of di-electric fluid from a transformer was found on 200 gallons of water contained in a vault. Based on the lack of release into the environment, this listing is not considered to pose a REC to the Property.

Gasgo is located across Jackson Avenue to the north of the Property at 27-01 Jackson Avenue. According to the EDR report, the spill was reported on February 17, 2000 when former USTs were excavated and soil was removed. A No Further Action (NFA) letter was issued and sent to the owner on September 7, 2005. The file as reopened in May 2013 when soil and groundwater contamination was identified based on the possible off-site migration that was unknown at the time of the tank closure. Wells were installed and sampled on June 24, 2014; however, the results were not yet received by the NYSDEC. Based on the close proximity of this site to the Property and the unknown extent of the plume of the groundwater contamination, the soil and groundwater impacts are considered to pose a REC. HiRise recommends conducting an additional file review of this NY Spills incident to determine if the groundwater plume has potentially impacted the Property.

4.1.2.18 RESOURCE CONSERVATION AND RECOVERY ACT NON GENERATORS/NO LONGER REGULATED (RCRA-NONGEN/NLR)

RCRA-NonGen/NLRs do not presently generate hazardous waste.

According to the EDR report, 42 RCRA-NonGen/NLR listings were identified within ¼ mile of the Property. The Property was not identified in the RCRA-NonGen/NLR database. Based on the nature of this database and distance from the Property, the RCRA-NonGen/NLR listings are not considered to pose a REC to the Property.

4.1.2.19 MANIFEST INFORMATION (NY MANIFEST)

The MANIFEST database contains an inventory of manifest information. Manifest is a document that lists and tracks hazardous waste from the generator through transportation to a Treatment, Storage, and Disposal (TSD) facility.

According to the EDR report, 42 NY MANIFEST listings and nine NJ MANIFEST were identified within ¼ mile of the Property. The Property was not identified in the MANIFEST database. Based on the nature of this database, the listings in the surrounding area are not considered to pose a REC to the Property.

4.1.2.20 REGISTERED DRY-CLEANING FACILITIES (NY DRYCLEANERS)

The NY DRYCLEANERS database contains a list of all registered dry-cleaning facilities.

According to the EDR report, one NY DRYCLEANERS was identified within ¼ mile of the Property.

Top Star Fabricare is located approximately 0.08 mile east-southeast and cross-gradient with the Property at 43-43 Queens Street. No violations are associated with this facility. Based on the regulatory status, the NY DRYCLEANERS listing is not considered to pose a REC to the Property.

4.1.2.21 E DESIGNATION (NY E DESIGNATION)

The NY E Designation provides notice of the presence of an environmental requirement pertaining to potential hazardous materials contamination, high ambient noise levels, or air emission concerns on a particular tax lot. NY E Designations are established in connection with a change in zoning or an action pursuant to a provision of the Zoning Resolution that would allow additional development to occur on property, or would permit uses not currently allowed. A NY E Designation is not a building violation (NYC Planning 2014).

According to the EDR report, the Property was not identified as an E-Designation Site.

4.1.2.22 EDR PROPRIETARY MANUFACTURED GAS PLANTS (EDR US MGP) DATABASE

The EDR MGP database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the US from the 1800s to 1950s to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils, and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, service as a continuous source of soil and groundwater contamination.

According to the EDR report, no EDR MGP listings were identified within 1 mile of the Property.

4.1.2.23 EDR EXCLUSIVE HISTORIC GAS STATIONS (EDR US HIST AUTO STAT) DATABASE

The EDR US Hist Auto Stat database is an inventory of facilities searched by EDR from national collections of business directories and identified as potential gas stations/filling stations/service stations. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. EDR considers this database to contain unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

According to the EDR report, 38 EDR US Hist Auto Stat listings were identified within ¼ mile of the Property. The Property was not identified in this database. Based on the nature of this database, this listing is not considered to pose a REC to the Property.

4.1.2.24 EDR PROPRIETARY HISTORIC DRY CLEANERS (EDR US HIST CLEANERS) SITES

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, Laundromat, cleaning/laundry, wash & dry etc. EDR considers this database to contain unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

According to the EDR report, seven (7) EDR US HIST CLEANERS was identified within ¼ mile of the Property. The Property was not identified in this database. Based on the nature of this database, this listing is not considered to pose a REC to the Property.

4.1.2.25 EDR RECOVERED GOVERNMENT ARCHIVE STATE HAZARDOUS WASTE SITES (NY RGA HWS)

The NY RGA HWS database provides a list of State Hazardous Waste Site (SHWS) incidents derived from historical databases and includes many records that no longer appear in current government lists.

According to the EDR report, no RGA HWS sites were identified within 1 mile of the Property**.**

4.2 ADDITIONAL ENVIRONMENTAL RECORDS

The Property address of 26-32 Jackson Avenue, Queens, NY was searched using the U.S. Environmental Protection Agency (EPA) Envirofacts Data Warehouse and the U.S. EPA Enforcement and Compliance History Online (ECHO) Database on November 21, 2014 (EPA 2014a and 2014b). The Property was not identified in either database.

Freedom of Information Law (FOIL) requests were submitted to the New York State Department of Environmental Conservation (NYSDEC), New York City Department of Environmental Protection (NYCDEP), the New York City Department of Health and Mental Hygiene (DOH), and the New York City Fire Department (NYFD) on November 10, 2014 regarding any environmental records associated with the Property. Responses were not received within the timeframe of the preparation of this report. Any pertinent information will be forwarded, if received.

4.3 PHYSICAL SETTINGS

The following sections describe the topography, geology, soils, and groundwater hydrogeology.

4.3.1 TOPOGRAPHY

The Property is depicted on the Brooklyn, NY Quadrangle United Station Geological Survey (USGS) 7.5-minute topographic series (USGS 1981). According to the most recent topographic map reviewed, the Property has an elevation of approximately 15 feet above mean sea level (msl) and is generally flat with a slight gradient west-southwest (EDR 2014b).

4.3.2 FLOODPLAIN

According to the EDR report, the Property is not in the 100- or 500-year floodplains; however, the 500-year floodplain was identified adjacent to the south of the Property (EDR 2014b).

4.3.3 GEOLOGY

According to the EDR report, the geology of the area consists of stratified sequence deposits from the Paleozoic Era, Ordovician System, and Ordovician Series carbonate rocks (EDR 2014b). No site-specific geologic information was provided.

4.3.4 SOILS

According to the EDR report, the predominant soil component is Urban Land. Urban Land refers to soils that have been altered by urban development such as buildings and streets, where at least 85% of the surface is covered with asphalt, concrete, and/or impervious building materials. According to the EDR report, the soil at the Property does not meet the requirements for hydric soil (EDR 2014b). No site-specific soils information was provided.

4.3.5 GROUNDWATER HYDROGEOLOGY

The shallow hydrogeologic flow is assumed to mimic the local topographic gradient in the vicinity of the Property. Based on a review of topographic maps, the groundwater likely flows west-southeast towards the East River (EDR 2014b).

4.3.6 RADON

The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action limit of 4.0 picoCuries per Liter (pCi/L). It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures. Review of the EPA Map of Radon Zones places the Site in Zone 2, where average predicted radon levels are between 2.0 and 4.0 pCi/L. and Zone 3, where average predicted radon levels are less than 2.0 pCi/L.

According to the US EPA, the radon zone level for the Property area is Zone 3, which has a predicted average indoor screening level below 2 pCi/L, below the action level of 4.0 pCi/L set forth by the EPA; therefore, radon is not considered an environmental concern to the Property.

4.3.7 WETLANDS

According to the U.S. Fish and Wildlife Service National Wetlands Inventory Mapper, no wetlands are located at the Property (USFWS 2014). No indication of wetlands were observed at the Property during the site reconnaissance.

According to the NYC Department of Buildings web site, the Property is not located in an area that may be affected by tidal wetlands, freshwater wetlands, or coastal erosion hazards (NYC DOB 2014).

4.4 HISTORICAL USE INFORMATION

The purpose of this section is to develop a history of the previous uses of the Property and surrounding area to identify the likelihood of past uses having led to RECs in connection with the Property. Copies of the records discussed below are included in Appendix B.

4.4.1 AERIAL PHOTOGRAPH REVIEW

Aerial images were provided for the Property from EDR as early as 1924 and as late as 2011.

Based on a review of the historical aerial images, the Property appeared to be developed with the current building in 1924. The surrounding area appeared to be developed similar to present conditions as early as 1924 (EDR 2014c). Based on a review of historical aerial images, the historical uses of the Property could not be discerned.

4.4.2 FIRE INSURANCE MAP REVIEW

Historical Sanborn Fire Insurance Maps were available for the Property as early as 1898 through 2006.

In 1898 and 1915, the Property was identified as 298, 300, and 302 Jackson Avenue. The 298 lot was depicted with a small store; the 300 lot was vacant; and two (2) dwellings were depicted on the 302 lot. In 1936, the Property was depicted with the current building and identified as 2636 and 2638 Jackson Avenue and the building was labeled as an auto garage with a cement floor, wire glass skylights, and the former 298 lot was identified as 2632 and 2634 with the same store from the previous maps. In addition, a gas tank was depicted near the northern boundary within the portion of the building on the 2636 lot as depicted in the Sanborn map.

In 1946, the main building was labeled as electric supplies and the small office was expanded and connected to the main building and labeled as an office. The Property was depicted similarly until 1995 when it was no longer labeled for electrical supplies and labeled as one (1) commercial building through 2007.

A Phase II ESA was conducted at the Property as a result of the gas tank identified in the historical fire insurance maps in a prior Phase I ESA dated October 4, 2006. The soil samples and groundwater samples were collected to determine if any adverse impacts occurred at the Property related to the former gasoline tank. The results of the analysis did not detect any volatile analytes above minimum laboratory detection limits (Impact Environmental 2006).

The area surrounding the Property was primarily depicted with stores. In 1898 and 1915, a junkyard was depicted to the west across the street. In 1915, a substation was depicted to the south. In 1936, a garage with a 20 car capacity was depicted on the western adjoining property; hand laundry was depicted across Jackson Avenue to the north; and auto repair and rubber manufacturing to the northeast. Since 1970, a filling station was depicted on the northern adjoining property across Jackson Avenue. Additional information regarding the filling station is discussed in Section 4.1.2.17.

Based on the conclusions determined in the Phase II ESA, the historical use of the Property is not considered to pose a REC.

4.4.3 PROPERTY TAX FILE REVIEW

According to NY Oasis web site, the Property is identified as Block 267 Lot 21 (NY Oasis 2014).

4.4.4 RECORDED LAND TITLE RECORDS REVIEW

Recorded land title records were not provided by the user.

4.4.5 TOPOGRAPHIC MAP REVIEW

Topographic maps were obtained and reviewed from EDR for the Property from the Brooklyn, New York Quadrangle from 1900, 1924, 1947, 1956, 1967, 1979, and 1995.

The Property was depicted as urban land with no distinct structures or features depicted in any of the maps. The area surrounding the Property was depicted as a developed, urban area with surrounding roadways. No distinct structures or features are depicted to indicate an environmental impact to the Property. The East River is depicted to the west of the

Property and rail yards were depicted to the east (EDR 2014f). Based on a review of historical topographic maps, the Property and surrounding area are not considered to pose a REC to the Property.

4.4.6 LOCAL STREET DIRECTORIES REVIEW

According to the EDR-City Directory Abstract Report, the Property was identified as residential in 1939 and 1934; Bridge Place Electrical Supply Co. Inc. and Starobin Morris Office in the 1939, 1945, 1962, 1967, 1970, and 1983 directories(Plaza Fluorescent Inc. was identified in 1970 as well); Bridge Plaza Electrical Supply in 1976; and Queens Plaza Auto Parts in 2005 (EDR 2014g).

Based on a review of the city directories, the historical uses of the Property are not considered to pose a REC to the Property.

4.4.7 BUILDING DEPARTMENT RECORDS REVIEW

According to the NYC Department of Buildings (DOB) web site, no open Environmental Control Board (ECB) violations or complaints were identified at the Property. Eleven DOB violations were identified. A new building permit was identified at the Property in 1920. Three Certificates of Occupancy were issued for the Property; however, two of the three could not be read. The CO from 1980 identified the Property for warehouse, office, and car garage use (NYC DOB 2014). Copies of the Certificated of Occupancy identified on the NYC DOB web site are included in Appendix D.

Records identified on the NYCDOB website are not considered to pose a REC to the Property.

4.4.8 ZONING/LAND USE RECORDS

According to NYC Oasis, the Property is zoned M1-5/R9 with no commercial overlay (NY Oasis 2014).

4.4.9 OTHER HISTORICAL SOURCES

Other historical sources take account any source or sources that are credible to a reasonable person and that identify past uses of the Property. These can include miscellaneous maps, newspaper archives, internet sites, community organizations, local libraries, historical societies, current owners or occupants of neighboring properties, or records in the files and/or personal knowledge of the Property owner and/or occupants. No other historical sources were researched as part of this assessment.

A Phase II ESA was prepared for the Property by Impact Environmental on November13, 2006. This was performed based on recommendations presented in a prior Phase I ESA dated October 4, 2006 by JJ Blake Technical Services, LLC when a gasoline tank was identified on the 1936 fire insurance map. The Phase II ESA included a limited subsurface soil and groundwater investigation to determine if the former tank impacted the Property. Soil and groundwater samples did not detect any volatile analytes above the minimum laboratory detection limits and the former gasoline tank was not considered to have impacted the Property. In addition, the report noted that a geophysical survey was not possible, due to site limitations.

4.4.10 SUMMARY OF THE HISTORICAL USES OF THE PROPERTY

Based on a review of historical sources, the Property appears to have been developed as early as 1898 with a store and dwellings. The current warehouse commercial building was constructed in 1920 and initially used as a 30-car garage with a gasoline tank. By 1935, the Property was used for electrical supplies and offices until approximately 1994. The Property was used for retail sales of auto supply parts in 2005. Evidence of the former auto supply store was observed during the site reconnaissance, including stored merchandise. According to the site contact, the perfume store and warehouse has occupied the western portion of the building since 2010. Based on a review of the historical sources, the historical uses of the Property is not considered to pose a REC.

4.4.11 SUMMARY OF THE HISTORICAL USES OF THE AREAS SURROUNDINGS THE PROPERTY

The surrounding area was depicted primarily for commercial and manufacturing use historically. Gasgo is located across Jackson Avenue to the north of the Property at 27-01 Jackson Avenue. According to the EDR report, a spill was reported on February 17, 2000 when former USTs were excavated and soil was removed. A NFA letter was issued and sent to the owner on September 7, 2005. The file as reopened in May 2013 when soil and groundwater contamination was identified based on the possible off-site migration that was unknown at the time of the tank closure. Wells were installed and sampled on June 24, 2014; however, the results were not yet received by the NYSDEC. Based on the close proximity of this site to the Property and the unknown extent of the plume of the groundwater contamination, the soil and groundwater impacts are considered to pose a REC. HiRise recommends conducting an additional file review of this NY Spills incident to determine if the groundwater plume has potentially impacted the Property.

Based on a review of historical sources, the other historical uses of the surrounding area for light manufacturing and warehousing are not consider to pose a REC to the Property.

4.4.12 DATA GAPS

The following data gaps were identified are not considered significant as to the findings and conclusions of this report:

- Data gaps of more than five (5) years exist.

5.0 SITE RECONNAISSANCE

The objective of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the Property.

5.1 METHODOLOGY AND LIMITING CONDITIONS

The Property was inspected for evidence of current or past use, storage, or generation of hazardous materials and/petroleum products, evidence of release or threat of a release of hazardous materials or petroleum products to the environment on or in the vicinity of the Property.

The inspection was conducted by Ms. Chelsea Gittle on November 20, 2014. At the time of the site reconnaissance, the weather was approximately 40ºF and sunny. A complete inspection of the Property surface was limited based on the presence of the building on the entire footprint of the Property.

5.2 GENERAL SITE SETTING

The Property is located in a commercial area of Long Island City in Queens, New York.

5.2.1 HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS IN CONNECTION WITH IDENTIFIED USES

No hazardous substances or petroleum products in connection with identified uses were observed.

5.2.2 STORAGE TANKS

Two 275-gallon, steel aboveground storage tanks were observed in the basement utility room. The two tanks were empty and no staining was observed on the tanks or on the ground. No odors were noted in the basement. The two tanks observed are not considered to pose a REC to the Property. HiRise recommends removing and properly disposing the tanks.

5.2.3 ODORS

No odors of environmental concern were noted during the site reconnaissance.

5.2.4 POOLS OF LIQUID

No pools of liquid were observed at the Property during the site reconnaissance.

5.2.5 DRUMS AND OTHER CONTAINERS

No drums or other containers were observed during the site reconnaissance.

5.2.6 UNIDENTIFIED SUBSTANCE CONTAINERS

No unidentified substance containers were observed at the Property during the site reconnaissance.

5.2.7 PCBS

No potential PCB-containing equipment was observed.

5.2.8 HEATING

The Property was heated using a natural gas fired boiler and ceiling mounted space heaters in the warehouse space.

5.2.9 STAINING OR CORROSION

No staining or corrosion was observed at the time of the site reconnaissance.

5.2.10 DRAINS OR SUMPS

A drain was observed in the utility basement of the building. A water pipe was observed to be leaking and draining into the drain. No sheens or odors were noted in association with the drain. The drains at the Property are connected to the municipal sewer system and are not considered to pose a REC to the Property.

5.2.11 PITS, PONDS, OR LAGOONS

No pits, ponds, or lagoons are located at the Property.

5.2.12 STAINED SOIL OR PAVEMENT

No stained soil or pavement was observed during the site reconnaissance.

5.2.13 STRESSED VEGETATION

No stressed vegetation was observed at the Property.

5.2.14 WELLS

No wells were identified at the Property during the site reconnaissance. Water is provided to the Property by the City of New York.

5.2.15 SEPTIC SYSTEMS

No septic systems are located at the Property. The Property is connected to the municipal sewer system.

5.2.16 ASBESTOS

HiRise performed a screening for the presence of asbestos, including the identification of all suspect materials in accessible areas (interior and exterior). This screening approach is not a comprehensive (i.e., AHERA-Style) asbestos survey, nor is it intended to fulfill the NESHAP requirements for demolition/renovation purposes, but is intended to identify the potential for an asbestos hazard in accessible areas. This screening is not intended to be used for demolition, abatement, renovation, or repair work.

The basis for "suspect" determination is taken from the materials listed in Appendix G of the United States Environmental Protection Agency (USEPA) publication Managing Asbestos in Place (the "Green Book"). Therefore, all materials listed in the Green Book which were installed prior to 1981 are considered suspect with the exception of resilient floor tile, asbestos-cement board (transite), and roofing felt, which are considered suspect regardless of installation date (these materials continue to be manufactured and installed in the United States).

The federal definition of an Asbestos Containing Material (ACM) is any material containing more than 1% asbestos by weight.

Suspect ACM materials in the form of pipe insulation, sheetrock walls/joint compound, wall and ceiling plaster, floor tiles and mastic and roofing materials was observed at the Property. All suspect materials appeared to be in good condition at the time of the site visit. Based on the age of the building (approximately 1920), ACMs may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive asbestos survey should be conducted at the Property.

5.2.17 LEAD-BASED PAINT

Lead was banned from household-type paints in the late 1970s. Painted surfaces appeared to be in good condition during the site reconnaissance with some minor observation of peeling. Based on the age of the building (approximately 1920), lead-based paint may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive lead-based paint survey should be conducted at the Property.

5.2.18 MOLD

As part of this assessment, HiRise performed a limited visual assessment for the significant presence of mold. A class of fungi, molds have been found to cause a variety of health problems in humans, including allergic, toxicological, and infectious responses. Molds are decomposers of organic materials, and thrive in humid environments, and produce tiny spores to reproduce, just as plants produce seeds. When mold spores land on a damp spot indoors, they may begin growing and digesting whatever they are growing on in order to survive. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or unaddressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation and carpeting often play host to such growth.

No obvious visual indications of the presence of mold were observed.

6.0 INTERVIEWS

The objective of the interviews is to obtain information indicating RECs in connection with the Property.

6.1 INTERVIEW WITH OWNER

An interview with the Property owner was not conducted.

6.2 INTERVIEW WITH KEY SITE MANAGER

Mr. Kamal Uddin, was identified as the Key Site Manager. Mr. Uddin provided access to the Property and answered questions to the best of his knowledge regarding the historical and current uses of the Property. Mr. Uddin indicated that he has been familiar with the Property since 2010. He stated that the auto parts store occupied the Property prior to the perfume store. He also said that the Property was going to be developed with apartments. Mr. Uddin was not aware of any environmental concerns associated with the Property. He was also unaware of how long the tanks observed in the basement had been stored.

6.3 INTERVIEW WITH OCCUPANTS

Interviews with occupants were not conducted as part of this assessment.

6.4 INTERVIEW WITH OTHERS

No others were interviewed as part of this assessment.

7.0 FINDINGS AND CONCLUSIONS

HiRise performed this Phase I Environmental ESA for Popular Community Bank for the parcel located at 26-32 Jackson Avenue, Long Island City, in the Borough and County of Queens, and State of New York in general conformance with the scope and limitations of ASTM Standard E1527-13. The findings and conclusions are based on information obtained from practically reviewable records including historical aerial photographs, historical topographic maps, governmental databases, and previous environmental reports (where available); the site reconnaissance conducted on November 20, 2014; and interviews with other personnel familiar with the Property.

- Gasgo is located across Jackson Avenue to the north of the Property at 27-01 Jackson Avenue. According to the EDR report, a spill was reported on February 17, 2000 when former USTs were excavated and soil was removed. A No Further Action (NFA) letter was issued and sent to the owner on September 7, 2005. The file as reopened in May 2013 when soil and groundwater contamination was identified based on the possible off-site migration that was unknown at the time of the tank closure. Wells were installed and sampled on June 24, 2014; however, the results were not yet received by the NYSDEC. Based on the close proximity of this site to the Property and the unknown extent of the plume of the groundwater contamination, the soil and groundwater impacts are considered to pose a REC. HiRise recommends conducting an additional file review of this NY Spills incident to determine if the groundwater plume has potentially impacted the Property.

- Two (2) 275-gallon, steel aboveground storage tanks were observed in the basement utility room. The two (2) tanks were empty and no staining was observed on the tanks or on the ground. No odors were noted in the basement. The two (2) tanks observed are not considered to pose a REC to the Property. HiRise recommends removing and properly disposing the tanks.

- Suspect ACM materials in the form of pipe insulation, sheetrock walls/joint compound, wall and ceiling plaster, floor tiles and mastic and roofing materials was observed at the Property. All suspect materials appeared to be in good condition at the time of the site visit. Based on the age of the building (1920), ACMs may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive asbestos survey should be conducted at the Property.

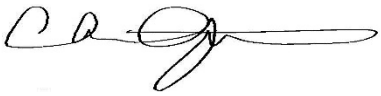
- Based on the age of the building (1920), lead-based paint may pose a concern at the Property. Prior to any planned demolition, renovation, or reconstruction activities, a comprehensive lead-based paint survey should be conducted at the Property.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

The following environmental professionals certify that they participated in the Phase I ESA of the Property:

Ms. Lauren Peavey performed the site investigation portion of this Phase I ESA on November 20, 2014 and authored this report. Ms. Chelsea Gittle is a HiRise professional with a B.S. in Ecology and Natural Resource Management and eight years of experience. Scott A. Cameron, R.A., AIA performed the Senior Review of this report. Mr. Cameron is a HiRise professional with a B.S. in Architecture and 25 years of experience.

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional (EP) as defined in §312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a Property of the nature, history, and setting of the Property. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.



Chelsea Gittle
Environmental Scientist

Scott A. Cameron, R.A., AIA
Senior Reviewer

Mr. William Goldkranz
Queens Plaza Auto Parts
2636 Jackson Avenue
Long Island City, New York

Re: 2636 Jackson Avenue, Long Island City, New York

Dear Mr. Goldkranz:

This letter serves as a Phase II Environmental Site Assessment (ESA) report prepared with respect to the above referenced Site. This assessment was performed in accordance with the recommendations presented in the Limited Phase I ESA report performed for the Site by JJ Blake Technical Services, LLC (JJ Blake) dated October 4, 2006. Said assessment identified the presence of a *recognized environmental condition* (as defined by ASTM) that have the potential to adversely impact the environmental quality of the Site.

Based on the JJ Blake Phase I ESA, the Site was formerly occupied by a 30-car garage in 1936. The garage was depicted as maintaining a gasoline tank during this time. It was unknown whether the "gasoline tank" was situated aboveground or below ground. No documentation was available regarding the proper abandonment of the tank.

The scope of this Phase II ESA was designed by JJ Blake and included a limited subsurface soil, and groundwater investigation to determine what, if any, contaminants have impacted the environmental quality of the Site as a result of the former "gasoline tank". A total of four (4) soil probes were installed using a Geoprobe for the purpose of obtaining subsurface soil samples (see attached site map for probe locations). The probes were installed to depths ranging from grade to sixteen feet below existing grade. Soil samples were collected continuously and screened for hydrocarbons using a photo ionization detector. No concentrations of hydrocarbons were detected from any of the soil samples collected from the probes. One (1) soil sample was secured from each of the probe from a depth range of nine (9) to ten (10) or ten (10) to eleven (11) feet below existing grade. Further, one (1) groundwater sample was secured to investigate the Site for possible groundwater contamination. It should be noted that a geophysical survey was not possible, due to site limitations; therefore an assessment of whether the gasoline tank is still present could not be performed under the scope of this investigation.

Each soil and groundwater sample was containerized, labeled, preserved, and transported under an active chain of custody to a New York State Department of Health Certified Commercial Laboratory. The soil samples secured were subject to laboratory analysis using USEPA Method 8260 for volatile organic analytes. The groundwater samples were also subject to laboratory analysis using EPA Method 8260 testing for volatile organic analytes. The results of the analysis (see attached laboratory analytical report) failed to indicate the presence of any target volatile analytes above minimum laboratory detection limits.

Impact Environmental has performed a Phase II Environmental Site Assessment, on the Site in accordance with good commercial and customary practice and generally accepted protocols within the consulting industry. The investigation consisted of the sampling and analysis of subsurface soil and groundwater to further define the environmental quality of the Site with respect to the recognized environmental condition referenced above.

Based upon this assessment, dated November 13, 2006, Impact Environmental concludes that the historic on-site gasoline tank has not acted to degrade the environmental quality of the Site. Accordingly, no further activities are recommended to further define and/or enhance the environmental quality of the Site with regard to this issue.

Please feel free to call me with any questions.

Sincerely,
Impact Environmental

Christopher O'Leary
Environmental Biologist

EXECUTIVE SUMMARY

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) was retained by American Lions (the User) to prepare a Phase I Environmental Site Assessment (ESA) for the property located at 26-32 Jackson Avenue in the Long Island City neighborhood of Queens, New York (the Subject Property). The Subject Property is identified on the Queens Borough Tax Map as Block 267, Lot 21, and is situated on the northern part of the block bound by Jackson Avenue to the north, Dutch Kills Street to the east, the Long Island Railroad (LIRR) to the south, and Purves Street to the west. A one-story building with a loft and partial cellar spans the about 10,000-square-foot Subject Property footprint. The one-story building was most recently occupied by an automotive parts center, and is currently used as a construction field office and materials storage space.

This Phase I ESA was performed for the User in general accordance with ASTM International's (ASTM) Standard E1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process) and the United States Environmental Protection Agency's (USEPA) All Appropriate Inquires (AAI) Rule. The objective of this Phase I ESA was to identify the presence or likely presence, use, or release on the Subject Property of hazardous substances or petroleum products as defined in ASTM E1527-13 as a Recognized Environmental Condition (REC).

Based on information obtained during the visual inspection of the Subject Property; review of environmental databases and historic information; and contact with federal, state, and local agencies; one on-site REC, two off-site RECs, one de minimis condition, and one non-ASTM consideration were identified for the Subject Property. Business environmental risks (BER), controlled recognized environmental conditions (CRECs), and historic recognized environmental conditions (HRECs) were not identified.

RECs

A REC is defined by ASTM E1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property due to any release to the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment. The Phase I ESA identified the following RECs:

<u>REC 1 – Historical Site Operations</u>

Historical operations on the Subject Property included a garage with a gasoline tank (1922 to 1936) and an automotive parts shop (1994 to 2006). Undocumented spills or releases of

solvents, chemicals, and/or other hazardous substances associated with these historical operations may have adversely affected soil, groundwater, and/or soil vapor beneath the Subject Property.

REC 2 –Historical Use of Adjoining and Surrounding Properties

Historical uses of adjoining and surrounding properties include:

- A western-adjoining welding machine shop (1945 to 2005) and auto repair shop (2002 to 2006),
- A southwestern-adjoining contractor's yard with petroleum bulk storage and a mechanical repair shop (1936 to 2005),
- A southern-adjoining tool manufacturer (1947 to 1950), and
- A nearby substation (1936 to 1947), iron works (1950 to 1980), and auto repair shop (2001 to 2007).

These historical operations may have resulted in inadvertent releases of petroleum products, solvents, chemicals, and/or other hazardous substances that may have affected soil vapor or groundwater beneath the Subject Property.

REC 3 – Nearby Up-Gradient Chlorinated Volatile Organic Compound (CVOC) Impacts to Groundwater and Soil Vapor

Two New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) sites (44-18 and 44-30 Purves Street) are located less than 300 feet and hydraulically up-gradient of the Subject Property. Remedial investigations identified CVOC impacts to groundwater and soil vapor in the eastern parts of the sites and directly east-northeast of both sites. CVOC concentrations warranted the installation of active vapor mitigation systems in the new developments. Based on proximity and hydraulic relationship to the Subject Property, CVOC impacts to groundwater and soil vapor identified during the nearby remedial investigations have the potential to affect soil vapor and groundwater beneath the Subject Property.

De Minimis Conditions

A de minimis condition is defined as a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an

enforcement action if brought to the attention of appropriate governmental agencies. The following de minimis condition was identified for the Subject Property:

Staining was observed on the concrete slab in the vicinity of two abandoned aboveground storage tanks (ASTs) located in the partial cellar. The concrete slab appeared to be in good condition during the site reconnaissance.

Non-ASTM Consideration

A Non-ASTM Scope Consideration is identified by ASTM E1527-13 as an environmental issue or condition at a property that parties may wish to assess in connection with commercial real estate that are outside the scope of ASTM E1527-13. The following non-ASTM consideration was identified for the Subject Property:

The building was constructed circa 1920, potentially with asbestos-containing material (ACM), lead based paint (LBP), and polychlorinated biphenyls (PCB)-containing materials. An intrusive survey to identify ACM, LBP, and PCB-containing material was not conducted as part of this Phase I ESA.

1.0 INTRODUCTION

Langan was retained by American Lions (the User), to prepare a Phase I Environmental Site Assessment (ESA) for the property located at 26-32 Jackson Avenue in the Long Island City neighborhood of Queens, New York (the Subject Property). This Phase I ESA was performed for the User in general accordance with ASTM International's (ASTM) Standard E1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process) and the United States Environmental Protection Agency's (USEPA) All Appropriate Inquires (AAI) Rule. The purpose of this Phase I ESA is to accomplish the following:

1. Identify Recognized Environmental Conditions (RECs) in connection with the Subject Property, as defined in The Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, Designation E1527-13, which states: The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

2. Provide services consistent with the USEPA 40 Code of Federal Regulations (CFR) Part 312 Subpart C Standards and Practices §312.20 AAI Rule.

1.1. Scope of the ESA

This Phase I ESA was conducted using a standard of good commercial and customary practice that is consistent with ASTM E1527-13. No significant scope-of-work additions, deletions, or deviations to ASTM E1527-13 were made in connection with this report, as described in Section 8.0. In general, the scope of this assessment consisted of obtaining information from the User; reviewing reasonably ascertainable information and environmental data relating to the Subject Property; reviewing maps and records maintained by federal, state, and local regulatory agencies; interviewing persons knowledgeable about the Subject Property; and conducting a site inspection. The specific scope of this assessment included the following:

1. A site reconnaissance to characterize conditions and assess the Subject Property's location with respect to adjoining and surrounding property uses and natural surface

features. The reconnaissance included the surrounding roads and observations of surrounding properties from public rights-of-way to identify obvious potential environmental conditions on neighboring properties. The site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Subject Property and then progressing to adjoining and surrounding properties. Photographs taken as part of the site reconnaissance are included in Appendix A.

2. A review of the response to the User/Client Questionnaire. The completed User/Client Questionnaire is included in Appendix B.
3. A review of available previous environmental reports completed for the Subject Property. Copies of the reports are included in Appendix C.
4. A review of environmental databases maintained by the USEPA, state, and local agencies within the approximate minimum search are. The environmental database report was provided by Environmental Data Resources, Inc. (EDR), and is included in Appendix D.
5. Filing of Freedom of Information Act (FOIA) requests with federal, state, and local agencies. Copies of the FOIA requests are included in Appendix E.
6. A review of New York City Department of Buildings (NYCDOB) records and a Planning Commission Zoning Map. Available NYCDOB records and the Zoning Map are included in Appendices F and G, respectively.
7. A review of physical characteristics of the Subject Property through a review of referenced sources for topographic, geologic, soils, and hydrologic data.
8. A review and interpretation of aerial photographs, Sanborn® Fire Insurance Maps (Sanborn® Maps), historical topographic maps, and city directories to identify previous activities on and in the vicinity of the Subject Property. Copies are included in Appendices H, I, J, and K, respectively.
9. A review of an environmental lien search for the Subject Property. A copy of the environmental lien search report is included in Appendix L.
10. A review of published radon occurrence maps to evaluate whether the Subject Property is located in an area with a propensity for elevated radon levels.

1.2. Assumptions, Limitations, and Exceptions

This Phase I ESA report was prepared for American Lions for the Subject Property located at 26-32 Jackson Avenue in Long Island City, New York. The report is intended to be used in its entirety. Excerpts taken from this report are not necessarily representative of the assessment

findings. Langan cannot assume responsibility for use of this report for any property other than the Subject Property addressed herein, or by any other third party without a written authorization from Langan.

Langan's scope of services, which is described in Section 1.1, was limited to that agreed to with the User and no other services beyond those explicitly stated are implied. The services performed and agreed upon for this effort comports to those prescribed in the ASTM Standard E1527-13. Intrusive sampling (i.e., soil borings and groundwater sampling) was not performed as part of this Phase I ESA.

This Phase I ESA was not intended to be a definitive investigation of possible environmental impacts at the Subject Property. The purpose of this investigation was limited to determining if there are any RECs affecting the Subject Property. It should be understood that even the most comprehensive Phase I ESA might fail to detect environmental liabilities at a particular Subject Property. Therefore, Langan cannot "insure" or "certify" that the Subject Property is free of environmental impacts. No expressed or implied representation or warranty is included or intended in this report, except that our services were performed, within the limits prescribed by our client, with the customary standard of care exercised by professionals performing similar services under similar circumstances within the same jurisdiction.

The conclusions, opinions, and recommendations provided in this report are based solely on the specific activities as required for the performance of ASTM E1527-13 and are intended exclusively for the purpose stated herein, at the specified Subject Property, as it existed at the time of our site visits.

2.0 SITE DESCRIPTION

2.1. Location and Description

The Subject Property is located at 26-32 Jackson Avenue in the Long Island City neighborhood of Queens, New York, and is identified on the Queens Borough Tax Map as Block 267, Lot 21. The about 10,000-square-foot parcel is situated on the northern part of the block bound by Jackson Avenue to the north, Dutch Kills Street to the east, the Long Island Railroad (LIRR) to the south, and Purves Street to the west. A one-story building with a loft and partial cellar spans the Subject Property footprint. The one-story building was most recently occupied by an automotive parts center, and is currently used as a construction field office and materials storage space. A Subject Property Location Map is included as Figure 1.

According to the United States Geological Survey (USGS) Brooklyn Quadrangle 7.5-minute Series Topographic Map, the Subject Property sits at an elevation of about 15 feet above mean sea level (msl), and the surrounding area slopes gradually to the south towards the Dutch Kills. Based on visual observations of the surrounding area during the site reconnaissance, the Subject Property is located within an urban area characterized by multi-story industrial, commercial, and residential buildings, active construction sites, and vacant lots. The Metropolitan Transit Authority (MTA) "E" and "M" subway lines are located beneath Jackson Avenue directly north of the Subject Property. Site reconnaissance photographs are included in Appendix A.

Surrounding property use is summarized in the following table:

Direction	Adjoining Properties	Surrounding Properties
North	Jackson Avenue	A vacant lot, formerly operated as a gas station, followed by multi-story commercial buildings
East	Vacant lot	Dutch Kills Street and the Ed Koch Bridge Upper Roadway followed by multi-story industrial, commercial, and residential buildings
South	15-story residential building and a vacant lot	A sculpture center followed by multi-story residential buildings
West	12-story mixed-use commercial/ residential building	Purves Street followed by a five-story residential building, a 14-story mixed-use commercial/residential building, and vacant land

2.2. Description of Site Improvements

Improvements at the Subject Property are summarized in the following table:

SITE IMPROVEMENTS	
Size of the Subject Property	About 10,000 square feet
Buildings/Spaces/Structures	One-story building with a loft and partial cellar
Surface Water	None
Potable Water Source	Municipal
Sanitary and Storm Sewer Utilities	Municipal
Electrical Utilities	Con Edison
Construction Completion Date	Circa 1920
General Construction Type	Concrete masonry
Cooling and Ventilation System Type	Ceiling fans
Heating System Type	Electric heating
Emergency Power	None

2.3. Title Records

Langan researched ownership records for the Subject Property on the Automated City Register Information System (ACRIS) website (https://a836-acris.nyc.gov/DS/DocumentSearch/Index). According to ACRIS, the Subject Property is owned by 2632 Jackson LLC. Not all prior deed records could be obtained via ACRIS; however, available title information is summarized below.

Date	Document Type	First Party	Second Party
09/09/2015	DEED	B&G Associates	2632 Jackson LLC
10/27/2006	SATISFACTION OF MORTGAGE	B&G Associates	Prime Automotive Parts Co Inc.
11/30/1994	MORTGAGE	B&G Associates	Prime Automotive Parts Co Inc.
09/28/1994	DEED	Morris L. Starobin Revocable Trust	B&G Associates
06/06/1988	DEED	Dutch Kills Realty CP	Morris L. Starobin Revocable Trust

Langan's review of ownership/occupant records indicate that the property was occupied by an automotive parts shop from at least 1994 to 2006. It is unknown whether auto parts were installed on-site or whether the parts were new or used, and therefore, undocumented spills or releases of solvents, petroleum products, chemicals, or other hazardous substances associated with installation of or cleaning of used automotive parts may have adversely impacted soil, groundwater, and/or soil vapor at the Subject Property. Therefore, historical use of the Subject Property as an automotive parts shop is considered a REC.

3.0 USER PROVIDED INFORMATION

3.1. User Questionnaire

Per ASTM E1527-13, a User questionnaire was provided to the User to inquire about specialized information related to the Subject Property. Aaron Shirian of American Lions, completed the user questionnaire. Mr. Shirian stated that he is not aware of any environmental cleanup liens or land use limitations at the Subject Property. According to Mr. Shirian, the purchase price of the Subject Property reasonably reflects fair market value and is not attributable to any contamination known or believed to be present at the Subject Property. The completed User questionnaire is included in Appendix B.

3.2. Previous Environmental Reports

The following previous environmental report was provided for the Subject Property. A copy of the report is available in Appendix C.

November 13, 2006 Phase II Environmental Site Assessment (ESA) Letter Report, prepared by Impact Environmental (Impact)

This letter report summarizes a limited Phase II ESA conducted at the Subject Property on November 10, 2006. The purpose of this investigation was to evaluate possible impacts to soil and groundwater related to historical use of the site as a garage with a gasoline tank. The investigation included advancement of four soil borings and installation of one groundwater monitoring well in the presumed vicinity of the former gasoline tank in a limited area in the northern part of the site and collection of ten soil samples and one groundwater sample. Samples were analyzed for volatile organic compounds (VOCs); however VOCs were not detected in either soil or groundwater. Soil vapor samples were not collected as part of this investigation.

Review of the previous environmental report did not reveal any RECs associated with the Subject Property.

4.0 ENVIRONMENTAL RECORDS

A regulatory database search was provided by EDR and is included in Appendix D. The EDR report provides a listing of sites identified on select federal and state standard source environmental databases within the approximate search radius specified by ASTM E1527-13. Langan reviewed each environmental database on a record-by-record basis to evaluate whether the identified sites represent a potential for environmental impact to the Subject Property. Langan also reviewed "Orphan Sites" listed within the report. Orphan Sites are those sites that could not be mapped due to inadequate address information. Any Orphan Sites that were identified by Langan within the ASTM search radii, either during the site reconnaissance or by cross-referencing to mapped listings, are addressed in the discussion below.

The following table lists the number of sites identified in standard and additional environmental record databases, within the prescribed search area and appearing in the EDR Report.

DATABASE RECORD SUMMARY			
Database Reviewed (Date of government version)	**Minimum Search Area**	**Subject Property listed**	**Number of Sites Within Minimum Search Area**
USEPA DATABASES			
National Priorities List (NPL) (12/05/2016)	1 Mile Radius	No	0
Delisted NPL (12/05/2016)	1 Mile Radius	No	0
Superfund Enterprise Management System (SEMS, formerly CERCLIS) and SEMS-Archive (formerly known as CERCLIS-NFRAP) (10/10/2016)	1/2 Mile Radius	No	0
Resource Conservation and Recovery Act (RCRA) Corrective Reports (CORRACTS) (12/12/2016)	1 Mile Radius	No	4
RCRA Treatment, Storage, and Disposal Facilities (TSDF) (12/12/2016)	1/2 Mile Radius	No	0
RCRA Generators (Large Quantity Generator [LQG], Small Quantity Generator [SQG], Conditionally Exempt Small Quantity Generator [CESQG], Non-Generators [NonGen]) (12/12/2016)	Subject Property and Adjoining Properties	No	0
Facility Index System (FINDS) (07/15/2016)	Subject Property	No	0

DATABASE RECORD SUMMARY			
Database Reviewed (Date of government version)	**Minimum Search Area**	**Subject Property listed**	**Number of Sites Within Minimum Search Area**
USEPA DATABASES (Continued)			
Environmental Response Notification System (ERNS) (09/26/2016)	Subject Property	No	0

NYSDEC – New York State Department of Environmental Conservation
N/A – Not Applicable; databases are reviewed as part of the Phase I ESA but not required as per ASTM E1527-13.

A description of the reviewed databases is included in the EDR Report (Appendix D). A summary of sites identified within the prescribed search area is presented below.

4.1. Federal Agency Database Findings

The Subject Property and/or sites within the respective minimum search distances as specified by ASTM E1527-13 were not listed in the following Federal Agency databases: NPL, delisted NPL, SEMS, SEMS-Archive, RCRA TSDF, RCRA Generators, FINDS, ERNS, US ENG CONTROLS, and US INST CONTROLS.

RCRA CORRACTS

The RCRA generators/transporters database is USEPA's comprehensive information system, providing access to data supporting the RCRA of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database included selective information on sites that generate, transport, store, treat, and/or dispose of hazardous waste as defined by RCRA. RCRA CORRACTS is a listing of these RCRA generators with Corrective Action Activity. The Subject Property was not listed in the CORRACTS database; however, four sites were identified within the minimum search area of 1 mile. All sites are located hydraulically down-gradient and over 3,000 feet from the Subject Property, and are therefore not considered RECs.

4.2. State Agency Database Findings

The Subject Property and/or sites within the respective minimum search distances as specified by ASTM E1527-13 were not listed in the following state agency databases: NY ENG CONTROLS, NY INST CONTROLS, SWRCY, CBS, and MOSF.

SHWS Database

The SHWS records are the states' equivalent to SEMS and may or may not already be listed on the federal SEMS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The Subject Property was not listed in the SHWS database; however, 19 SHWS sites were identified within the minimum search area of 1 mile. All sites are located over 1,300 feet from the Subject Property and are therefore not considered RECs.

SWL/LF

The SWF/LF database is a comprehensive listing of state-permitted/recorded solid waste facilities. The Subject Property was not listed in the SWF/LF database; however, three sites were identified within the minimum search area of 1/2 mile. All sites are located hydraulically down-gradient and over 2,000 feet from the Subject Property and are therefore not considered RECs.

Leaking Storage Tanks Database

The LTANKS database contains an inventory of reported leaking storage tank incidents, including leaking USTs and ASTs. The minimum search area for the LTANKS database includes the Subject Property and any sites within a 1/2-mile radius. The Subject Property is not listed in the LTANKS database. Forty-seven sites within the minimum search area were listed in the database. The listed incidents were primarily caused by tank test failures, tank failures, and tank overfills, and all but one of the LTANKS listings have been granted closed status by the NYSDEC, indicating that NYSDEC is satisfied with spill remediation. The remaining site with an open LTANKS listing is located hydraulically down-gradient and over 2,000 feet from the Subject Property and is therefore not considered a REC.

Spills Database

The Spills database, maintained and updated by NYSDEC, is an inventory of sites where spills have been identified and reported to the NYSDEC. The Subject Property was not listed in the Spills database; however, 35 spills associated with sites within the minimum search area of 1/8

mile were identified. All but one of the spills associated with the surrounding sites have been granted closed status by the NYSDEC, indicating that NYSDEC is satisfied with spill remediation. The closed spills are not considered RECs based on their current regulatory status and their distance and location relative to the Subject Property. The open spill is located about 110 feet north of the Subject Property across Jackson Avenue and was reported to the NYSDEC following the discovery of petroleum-impacted soil and groundwater during a tank removal at the former gas station (NYSDEC Spill No. 9913082). This spill is not considered a REC as the release is hydraulically down-gradient of the Subject Property and an MTA subway tunnel in Jackson Avenue may act as a hydraulic barrier to any localized southerly groundwater flow.

VCP

The VCP uses private funds to remediate contaminated sites to levels allowing for the sites' productive use. The program covers virtually any kind of site and contamination. The Subject Property was not listed in the VCP database; however, four listings were identified within the minimum search area of 1/2 mile. Three listings are located over 1,500 feet from the Subject Property and are therefore not considered RECs. The remaining listing, Outlet City, was removed from the VCP in 2015 and entered into the NYSDEC Brownfield Cleanup Program (BCP) as Queens Plaza Residential Development – Site A, which is discussed in the following section (NY Brownfields).

NY Brownfields

Brownfield sites are any real property where a contaminant is present at levels exceeding the soil cleanup objectives or other health-based or environmental standards, criteria, or guidance adopted by the NYSDEC that are applicable based on the reasonably anticipated use of the property, in accordance with applicable regulations. The Subject Property was not listed in the database; however, 18 listings were identified within the minimum search area of 1/2 mile. Thirteen listings are located hydraulically down-gradient to and/or over 1,000 feet from the Subject Property and are therefore not considered RECs. The five remaining listings, three of which are associated with the same development, are discussed below:

Site Name: Purves Street Development
Site Address: 44-18 Purves Street
Location: 160 feet southwest of the Subject Property
Description: Purves Street Development was entered into the NYSDEC BCP in July 2014 (BCP Site No. C241164). The September 2014 Remedial Investigation Report (RIR) indicated that chlorinated VOC (CVOC) impacts to groundwater and soil vapor

identified on-site and directly east of the site were likely related to an off-site source. CVOC concentrations warranted installation of an active vapor mitigation system beneath the site. Based on proximity and hydraulic relationship to the Subject Property, CVOC impacts to groundwater and soil vapor identified during the September 2014 RIR have the potential to affect media beneath the Subject Property and are therefore considered a REC.

Site Name: 44-30 Purves Street
Site Address: 44-30 Purves Street
Location: 290 feet southwest of the Subject Property
Description: 44-30 Purves Street was entered into the NYSDEC BCP in July 2014 (BCP Site No. C241162). CVOC impacts to groundwater and soil vapor identified on-site and directly northeast of the site during the remedial investigation were likely related to an off-site source, and the identified CVOC concentrations warranted installation of an active vapor mitigation system beneath the site. Based on proximity and hydraulic relationship to the Subject Property, CVOC impacts to groundwater and soil vapor identified during the remedial investigation have the potential to affect media beneath the Subject Property and are therefore considered a REC.

Site Name: Queens Plaza Residential Development – Sites A, B and C
Site Address: 28-02, 28-10, 28-30 Jackson Avenue
Location: 620 feet west of the Subject Property
Description: Site A was entered into the NYSDEC BCP in May 2016 (BCP Site No. C241105) and Sites B and C were entered into the NYSDEC BCP in June 2016 (BCP Site Nos. C241151 and C241169, respectively). Based on the results of the remedial investigations, which identified non-aqueous phase liquid (NAPL) impacts to groundwater as well as VOC and SVOC impacts to subsurface media related to a historical creosote release, Sites A and B were determined to represent a significant threat to public health and the environment. Following the significant threat determination, Off-Site A and Off-Site B were entered into the NYSDEC BCP (Site Nos. C241105A and C241151A, respectively). Remediation of Sites A, B, and C, which included removal of source material, was completed in 2016. Remediation of Off-Site A, which included hydraulic containment and control of groundwater contamination, was also completed in 2016. Remediation of Off-Site B is ongoing. Based on distance and hydraulically cross-gradient relation to the Subject Property, these listings are not considered RECs.

NY Drycleaners and EDR Historic Cleaners Databases

The NY Drycleaners database is a listing of registered dry cleaning facilities. The EDR Historic Cleaners database is a proprietary database that is a listing of potential dry cleaner facilities based on a review of business directories. Dry cleaning facilities are associated with the use of tetrachloroethylene (PCE), a solvent that has the potential to infiltrate groundwater and can readily migrate to surrounding properties. The Subject Property was not listed in either the NY Drycleaners or EDR Historical Cleaners databases; however, three sites were identified within the minimum search area of 1/4 mile. Two of the sites are located over 500 feet north of the Subject Property across Jackson Avenue, and are not considered RECs because the MTA subway tunnel beneath Jackson Avenue acts as a hydraulic barrier preventing the migration of groundwater. The remaining site is over 500 feet from the Subject Property and was not listed as a RCRA generator, and is therefore not considered a REC.

4.3. Other Database Findings

U.S. Historical Auto Stations

The U.S. Historical Auto Stations database is a proprietary database that includes records of historical auto stations compiled by EDR. The Subject Property was not listed in the U.S. Historical Auto Stations database; however, 25 listings were identified within the minimum search area of 1/4 mile. Twenty-three listings are not considered RECs because of their distance from and/or hydraulic relationship to the Subject Property. The remaining two listings, 26-26 Jackson Avenue and 44-27 Purves Street, are located on the same city block as the Subject Property and are considered RECs.

4.4. Local Regulatory Agency Findings

FOIA Requests

FOIA requests were submitted on May 8, 2017 to the following federal, state, and local agencies via written correspondence:

- New York City Department of Environmental Protection (NYCDEP);
- New York City Department of Health (NYCDOH);
- New York City Fire Department (FDNY);
- New York State Department of Health (NYSDOH);
- NYSDEC; and

- USEPA Region 2.

Complete responses have not yet been received. Should future responses alter the conclusions of this Phase I ESA, an addendum will be issued. Copies of the FOIA requests and any responses received are included in Appendix E.

NYCDOB

Langan conducted a records search through the NYCDOB online query system on May 11, 2017. The Subject Property is identified as Block 267, Lot 21 with Building Identification Number (BIN) 4003503. The Subject Property has the Department of Finance classification of E9-Warehouse. A total of fourteen active NYCDOB violations and one closed Environmental Control Board (ECB) violation are listed for the Subject Property, all of which are related to inspection of the boiler. Two Certificates of Occupancy (COs) are listed for the Subject Property, for the years 1929 (illegible) and 1980. According to the CO from 1980, the Subject Property was occupied by a warehouse, offices, and a one-car garage on the first floor; office space on the second floor; and a boiler room in the cellar. A copy of the NYCDOB records is included in Appendix F.

Zoning Department

According to the New York City Planning Commission Zoning Map 9b, the Subject Property is located within the Special Long Island City Mixed Use Paired District (M1-5/R9). This paired district promotes development and expansion of the longstanding mix of residential, commercial, industrial, and cultural use throughout the area. M1 districts typically include light industrial uses such as woodworking shops, repair shops, and wholesale service and storage facilities. The Subject Property does not have an E-designation from the Department of City Planning. A copy of the zoning map is included in Appendix G.

4.5. Physical Setting Sources

4.5.1. Topography

According to the USGS Brooklyn Quadrangle 7.5-minute Series Topographic Map, the Subject Property sits at an elevation of about 15 feet above msl. The immediate area surrounding the Subject Property is relatively flat and the general topographic gradient of the surrounding area slopes south towards Dutch Kills.

4.5.2. Geology

Pleistocene glacial activity modified the landscapes and surficial features of Brooklyn, Queens, and the remainder of Long Island. The glaciation scoured upland areas and deposited varying amounts of till (an unsorted mixture of sand, clay, and boulders) across the lowlands and valleys. The Subject Property is within the bounds of the former glacial Lake Flushing in the Coastal Plain geologic province. Lake Flushing deposits consist of inter-layered fine sand, silt, and clay. Boulder-laden glacial till and below that, bedrock, underlay the lacustrine deposits. Geological surface features (e.g., rock outcroppings) were not observed on the site.

According to the USGS Bedrock and Engineering Geologic Maps of New York County and Parts of Kings and Queens Counties, New York, and parts of Bergen and Hudson Counties, New Jersey, dated 1994, the site is underlain by Ravenswood Granodiorite, which generally consists of gray sillimanite-garnet-microcline gneiss.

4.5.3. Hydrology

Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeologic network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks. Groundwater is inferred to flow toward the north-northwest because of the Subject Property's proximity to the MTA subway tunnel beneath Jackson Avenue, which is actively being dewatered.

The current Federal Emergency Management Agency (FEMA) Advisory Base Flood Elevation Maps include new advisory flood zone boundaries and advisory base flood elevations. This map indicates that the Subject Property falls within Zone X, which is determined to be outside the 0.2% annual chance floodplain.

4.6. Historical Use Information

Langan reviewed available historical resources (including aerial photographs, Sanborn and topographic maps, and city directories) dated 1897 to 2014. Findings of the review are presented below.

4.6.1. Aerial Photographs

Langan reviewed aerial photographs of the Subject Property and surrounding areas for the years 1924, 1941, 1951, 1954, 1961, 1966, 1974, 1980, 1984, 1991, 1994, 2006, 2009, and 2011. The photographs indicate that the Subject Property was located in a densely developed urban area as early as 1924. The Subject Property appears relatively unchanged between 1924 and 2011. The LIRR appears south of the Subject Property as early as 1924, and by 1941, the Ed Koch Bridge Upper Roadway appears to the east of the Subject Property. The aerial photographs did not reveal any RECs associated with the Subject Property. Copies of aerial photographs are included in Appendix H.

4.6.2. Sanborn® Fire Insurance Maps

A search for historical fire insurance maps for the Subject Property and surrounding properties was conducted by EDR and reviewed by Langan. Sanborn® Maps constitute a database of prior site uses of real property for many cities and towns in the United States. Langan reviewed Sanborn® Maps for the Subject Property for the years 1898, 1915, 1936, 1947, 1950, 1970, 1977, 1979, 1980, 1985, 1986, 1988 through 1996, 1999, and 2001 through 2006. Copies of Sanborn® Fire Insurance Maps are included in Appendix I.

Langan's review revealed that the Subject Property was located in a densely developed urban area as early as 1898. Between 1898 and 2006, the Subject Property was occupied by residences, offices, and various commercial uses including a garage with a gasoline tank (1936) and an electric supplies warehouse (1947 to 1994). Undocumented releases or spills of petroleum products, solvents, chemicals, or other hazardous substances associated with the operation of a garage with a gasoline tank may have adversely affected soil, groundwater, and/or soil vapor beneath the Subject Property; therefore, historical use of the Subject Property is considered a REC.

Adjoining and surrounding properties generally housed multi-story residential, commercial, and industrial buildings. Nearby historical commercial and industrial uses include a contractor's yard with a gasoline UST and mechanical repair shop (1936 to 1999), an electricity company substation (1936 to 1947), a welding equipment manufacturing shop (1947 to 1999), a tool manufacturing facility (1947 to 1950), and an iron works (1950 to 1980). Undocumented releases or spills of petroleum products, solvents, chemicals, or other hazardous substances associated with historical use of nearby properties may have adversely affected groundwater and/or soil vapor beneath the Subject Property; therefore, historical use of adjoining and surrounding properties is considered a REC.

4.6.3. Historical USGS Topographic Quadrangles

Langan reviewed historical USGS Topographic Quadrangle maps obtained from EDR for information regarding past uses of the Subject Property. Quadrangle maps were available for the Subject Property for the years 1897, 1898, 1900, 1947, 1956, 1966, 1967, 1979, 1995, 1997, and 2013. Copies of the topographic maps are included in Appendix J.

Based on a review of the historical topographic maps, the Subject Property has been located in a moderately developed urban area since at least 1897. The urban grid surrounding the Subject Property appears relatively unchanged between 1897 and 2013, with the exception of the widening of Jackson Avenue between 1900 and 1947.

4.6.4. City Directories

The City Directory Abstract, obtained from EDR, is a review of available business directories, including city, cross-reference, and telephone directories, at approximately five-year intervals for the years spanning 1922 through 2014. The directory was obtained for the Subject Property and surrounding area. A copy of the City Directory Abstract report is included in Appendix K.

A garage, discussed previously in this report, operated at the Subject Property from at least 1922 to 1936 and is considered a REC. Businesses identified at nearby properties include a contracting company (1945 to 2005), a welding shop (1945 to 2005), and a tool manufacturing facility (1950). Undocumented releases or spills of petroleum products, solvents, chemicals, or other hazardous substances associated with these uses may have adversely affected groundwater and/or soil vapor beneath the Subject Property; therefore, historical use of adjoining and surrounding properties is considered a REC.

4.6.5. Environmental Lien Search

Langan contracted EDR to conduct an environmental lien search for the Subject Property. The result of the search, which included a compilation of available data and verification of the findings with the appropriate regulatory authorities, revealed that there are no environmental liens or other Activity and Use Limitations (AUL) associated with the Subject Property. A copy of the Environmental Lien Search is included in Appendix L.

5.0 SITE RECONNAISSANCE

The site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Subject Property and progressing to the adjoining and surrounding properties. The assessment of the adjoining and surrounding properties was limited to identifying, if possible, any indications of past or current use that may involve the use, storage, disposal, or generation of hazardous substances or petroleum products; noting the general type of current use; the general topography of the surrounding area; and providing a general description of adjoining and surrounding structures.

The site reconnaissance was performed at 10:00 AM on May 15, 2017, by Kimberly Del Col of Langan. Ms. Del Col was accompanied during the site reconnaissance by Mr. Aaron Shirian, a representative from Lions Group NY. The weather at the time of the inspection was partly sunny and approximately 60 degrees Fahrenheit (°F).

5.1. General Site Setting and Reconnaissance Observations

The Subject Property is situated on an about 10,000-square-foot parcel improved with a one-story building that has a loft and partial cellar. The one-story building was most recently occupied by an automotive parts center, and is currently used as a construction field office and materials storage space. The partial cellar, which is accessible through a hatch in the Jackson Avenue sidewalk, contains two abandoned 550-gallon ASTs. The northern part of the first floor is used as office space, and the remainder of the footprint is used as storage space for construction materials and equipment including insulation, concrete, windows, mirrors, paint, electrical appliances, generators, and power tools. The loft, which was formerly used as office space, contained furniture and office supplies left behind by the previous owner/tenant. The roof, which was accessible from the loft, housed the heating, ventilation, and air conditioning (HVAC) system, as well as, a chimney that was used as a vent for the boiler in the partial cellar.

5.2. Pits, Ponds, Lagoons

Pits, ponds, or lagoons were not observed on the Subject Property.

5.3. Pools of Liquid

Pools of liquid, which were related to a recent rain event, were observed on the northern and western portions of the roof. Pools of liquid were also observed in the cellar beneath gaps in the Jackson Avenue sidewalk hatch and were likely related to the same rain event.

5.4. Storm Drains, Wells, and Cisterns

A floor drain was observed in the building's cellar. The discharge point of the drain could not be confirmed. Staining was not observed in the vicinity of the drain. Wells and cisterns were not observed on the Subject Property.

5.5. Transformers and Other Suspect Equipment

Transformers and other suspect equipment were not observed on the Subject Property.

5.6. Storage Containers, Drums, and Chemical Storage Areas

Langan observed about 35 five-gallon containers of fibered emulsion, several palettes of concrete mix, about 10 one-gallon containers of paint, and about 30 to 35 less than one-gallon containers of various cleaning agents and chemicals including lacquers, inks, lubricants, paint thinners, spray paint, adhesives, contact cement, and epoxies stored throughout the one-story building. Two 20-pound propane and two 5-gallon gasoline containers were also observed in the vicinity of generators and construction equipment. Chemicals were neatly stored and no evidence of leaks were observed. Drums and chemical storage areas were not observed on the Subject Property.

5.7. Sewage Ejector Pits and Sumps

One out-of-operation sump pump was observed in the cellar during the site reconnaissance. Staining was not observed in the vicinity of the sump. Sewage ejector pits were not observed on the Subject Property.

5.8. Waste Generation, Storage, and Disposal

Several 55-gallon buckets and other plastic trashcans containing household refuse were observed throughout the Subject Property.

5.9. Air Emissions or Wastewater Discharges

A chimney that was used as a vent for the boiler room in the partial cellar was observed on the roof during the site reconnaissance. Wastewater discharges were not observed on the Subject Property.

5.10. USTs or ASTs

Two abandoned 550-gallon fuel oil ASTs were observed in the partial cellar. Corrosion and staining were observed on the bottom of the ASTs, and staining was observed on the concrete slab in the vicinity of the ASTs. The concrete slab appeared to be in good condition. The staining is considered a de minimis condition.

5.11. Monitoring Wells or Remedial Activities

Monitoring wells and evidence of remedial activities were not observed at the Subject Property.

5.12. Stained or Discolored Soil

No staining or discolored soil was observed at the Subject Property.

5.13. Leachate or Seeps

Evidence of leachate or seeps was not observed at the Subject Property.

5.14. Adjoining and Surrounding Property Uses

The Subject Property is bound to the north by Jackson Avenue followed by a vacant lot; to the east by a vacant lot followed by Dutch Kills Street and the Ed Koch Bridge Upper Roadway; to the south by a 15-story residential building and a vacant lot; and to the west by a 12-story mixed-use commercial/residential building followed by Purves Street. A monitoring well was observed in front of the western-adjoining property in the Jackson Avenue and Purves Street sidewalks. The well is associated with the spill investigation at 27-01 Jackson Avenue.

6.0 INTERVIEWS

6.1. Site Owner

Mr. Aaron Shirian, a representative of Lions Group NY, escorted Langan during the site reconnaissance. Mr. Shirian stated that the Subject Property was used as a field office and construction material storage area for development projects the User is involved with in the surrounding area.

6.2. Site Occupants

The site occupants were not interviewed as a part of this Phase I ESA.

6.3. Owners/Tenants of Adjoining Properties

Owners/tenants of adjoining properties were not interviewed as part of this Phase I ESA.

7.0 ADDITIONAL SERVICES

7.1. Radon

Radon is a colorless, odorless radioactive gas that results from the natural breakdown of uranium minerals in soil, rock, and water, which subsequently enters the atmosphere. It can concentrate in buildings, entering through cracks and other penetrations of a building foundation. Some areas are more likely to have elevated concentrations of radon than others, reflecting subsurface lithological conditions.

The USEPA has established a recommended radon action level of 4.0 pico Curies per liter (pCi/L). According to the USEPA Radon Zone Map, the Subject Property is located in Zone 3, which indicates a predicted average indoor radon screening level less than 2 pCi/L. The NYSDOH maintains a database of radon test results on a local and county level. According to the NYSDOH, 1,449 radon tests have been conducted in basements in Queens with results indicating that about 3.5 percent of basements have radon concentrations above the USEPA action level of 4 pCi/L. Based on this information, it is unlikely that elevated levels of radon gas are present at the Subject Property.

7.2. ACM, LBP, and PCBs

A formal survey to identify asbestos-containing material (ACM), lead based paint (LBP), and polychlorinated biphenyls (PCB)-containing material was not conducted as part of the Phase I ESA. Due to the age of the on-site building, ACM, LBP, and PCB-containing materials may be present. If identified, ACM, LBP, and PCB-containing materials must be abated prior to any renovations at or redevelopment of the Subject Property.

8.0 DEVIATIONS AND DATA GAPS

8.1. Deviations

Langan performed a Phase I ESA of the Subject Property using a standard of good commercial and customary practice that is consistent with the ASTM E1527-13 and the 40 CFR Part 312 Standards and Practices for AAI. Significant deviations were not made to the above referenced standards.

8.2. Data Gaps

In order to address data gaps, additional sources of information may be consulted. According to AAI, Section 312.20 (g), "to the extent there are data gaps (as defined in section 312.10) in the information developed…that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps." According to ASTM E1527-13, Section 8.3.2.3, "historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. If data failure is encountered, the report shall document the failure, and if any of the standard historical sources were excluded, give the reasons for the exclusion."

This Phase I was completed without significant data gaps except that responses to FOIA letters have not been received from all recipients. Sufficient information was provided from other sources to enable conclusions regarding RECs at the Subject Property. As such, these data gaps are not expected to alter the results of the Phase I ESA. If information becomes available that alters the conclusions of this report, an addendum will be issued.

9.0 FINDINGS, OPINIONS, AND CONCLUSIONS

This Phase I ESA was conducted in accordance with ASTM E1527-13 and the USEPA AAI Rule. The objective of this Phase I ESA was to identify the presence or likely presence, use, or release on the Subject Property of hazardous substances or petroleum products as defined in ASTM E1527-13 as a REC.

Based on information obtained during the visual inspection of the Subject Property; review of environmental databases and historic information; and contact with federal, state, and local agencies; one on-site REC, two off-site RECs, one de minimis condition, and one non-ASTM consideration were identified for the Subject Property. Business environmental risks (BERs), controlled recognized environmental conditions (CRECs), and historic recognized environmental conditions (HRECs) were not identified.

RECs

A REC is defined by ASTM E1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property due to any release to the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment. The Phase I ESA identified the following RECs:

<u>REC 1 – Historical Site Operations</u>

Historical operations on the Subject Property included a garage with a gasoline tank (1922 to 1936) and an automotive parts shop (1994 to 2006). Undocumented spills or releases of solvents, chemicals, and/or other hazardous substances associated with these historical operations may have adversely affected soil, groundwater, and/or soil vapor beneath the Subject Property.

<u>REC 2 –Historical Use of Adjoining and Surrounding Properties</u>

Historical uses of adjoining and surrounding properties include:

- A western-adjoining welding machine shop (1945 to 2005) and auto repair shop (2002 to 2006);
- A southwestern-adjoining contractor's yard with petroleum bulk storage and a mechanical repair shop (1936 to 2005);
- A southern-adjoining tool manufacturer (1947 to 1950); and

- A nearby substation (1936 to 1947), iron works (1950 to 1980), and auto repair shop (2001 to 2007).

These historical operations may have resulted in inadvertent releases of petroleum products, solvents, chemicals, and/or other hazardous substances that may have affected soil vapor or groundwater beneath the Subject Property.

REC 3 – Nearby Up-Gradient CVOC Impacts to Groundwater and Soil Vapor

Two NYSDEC BCP sites (44-18 and 44-30 Purves Street) are located less than 300 feet and hydraulically up-gradient of the Subject Property. Remedial investigations identified CVOC impacts to groundwater and soil vapor in the eastern parts of the sites and directly east-northeast of both sites. CVOC concentrations warranted the installation of active vapor mitigation systems in the new developments. Based on proximity and hydraulic relationship to the Subject Property, CVOC impacts to groundwater and soil vapor identified during the nearby remedial investigations have the potential to affect soil vapor and groundwater beneath the Subject Property.

De Minimis Conditions

A de minimis condition is defined as a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The following de minimis condition was identified for the Subject Property:

Staining was observed on the concrete slab in the vicinity of two abandoned aboveground storage tanks (ASTs) located in the partial cellar. The concrete slab appeared to be in good condition during the site reconnaissance.

Non-ASTM Consideration

A Non-ASTM Scope Consideration is identified by ASTM E1527-13 as an environmental issue or condition at a property that parties may wish to assess in connection with commercial real estate that are outside the scope of ASTM E1527-13. The following non-ASTM consideration was identified for the Subject Property:

The building was constructed circa 1920, potentially with asbestos-containing material ACM, LBP, and PCB-containing materials. An intrusive survey to identify ACM, LBP, and PCB-containing material was not conducted as part of this Phase I ESA.

11.0 STATEMENT OF QUALIFICATIONS AND SIGNATURES

Langan declares that, to the best of its professional knowledge and belief, the personnel who performed this Phase I ESA meet the definition of Environmental Professional as defined in Subsection 312-10 of 40 CFR Part 312 and that they have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. They have developed and performed the AAIs in conformance with the standards and practices set forth in 40 CFR Part 312. Resumes outlining the qualifications of the Environmental Professionals who performed this Phase I ESA are included in Appendix M.

APPENDIX B
User Questionnaire

LANGAN

ASTM PRACTICE E 1527-13: USER/CLIENT QUESTIONNAIRE

Please complete the below form and return to
Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.

In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"), the User must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The User is defined as the party seeking to use Practice E1527 to complete an environmental site assessment of the property. A User may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. These inquiries must also be conducted by the EPA Brownfield Assessment and Characterization grantees. The User should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquires" is not complete.

Title: Managing Director

Company: American Lions/Lions Group

Date: May 31, 2017

	Yes	No
(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25). Did a search of recorded land title records (or judicial records, where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?	☐	☑
(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and (vi)). Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?	☐	☑
(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28). Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	☐	☑
(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).		
(a.) Does the purchase price being paid for this property reasonably reflect the fair market value of the property? [If no, proceed to Part 5.]	☑	☐
(b.) If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?	☐	☐
(5.) Commonly known or reasonably known or reasonably ascertainable information about the property (40 CFR 312.30). Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,	☑	☐
(a.) Do you know the past uses of the property?	☑	☐
(b.) Do you know of specific chemicals that are present or once were present at the property?	☑	☐
(c.) Do you know of spills or other chemical releases that have taken place at the property?	☑	☐
(d.) Do you know of any environmental cleanups that have taken place at the property?	☑	☐
(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31). Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?	☐	☑

Note 1 – In certain jurisdictions, federal, tribal, state or local statutes or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

Mr. William Goldkranz
Queens Plaza Auto Parts
2636 Jackson Avenue
Long Island City, New York

Re: 2636 Jackson Avenue, Long Island City, New York

Dear Mr. Goldkranz:

This letter serves as a Phase II Environmental Site Assessment (ESA) report prepared with respect to the above referenced Site. This assessment was performed in accordance with the recommendations presented in the Limited Phase I ESA report performed for the Site by JJ Blake Technical Services, LLC (JJ Blake) dated October 4, 2006. Said assessment identified the presence of a *recognized environmental condition* (as defined by ASTM) that have the potential to adversely impact the environmental quality of the Site.

Based on the JJ Blake Phase I ESA, the Site was formerly occupied by a 30-car garage in 1936. The garage was depicted as maintaining a gasoline tank during this time. It was unknown whether the "gasoline tank" was situated aboveground or below ground. No documentation was available regarding the proper abandonment of the tank.

The scope of this Phase II ESA was designed by JJ Blake and included a limited subsurface soil, and groundwater investigation to determine what, if any, contaminants have impacted the environmental quality of the Site as a result of the former "gasoline tank". A total of four (4) soil probes were installed using a Geoprobe for the purpose of obtaining subsurface soil samples (see attached site map for probe locations). The probes were installed to depths ranging from grade to sixteen feet below existing grade. Soil samples were collected continuously and screened for hydrocarbons using a photo ionization detector. No concentrations of hydrocarbons were detected from any of the soil samples collected from the probes. One (1) soil sample was secured from each of the probe from a depth range of nine (9) to ten (10) or ten (10) to eleven (11) feet below existing grade. Further, one (1) groundwater sample was secured to investigate the Site for possible groundwater contamination. It should be noted that a geophysical survey was not possible, due to site limitations; therefore an assessment of whether the gasoline tank is still present could not be performed under the scope of this investigation.

Each soil and groundwater sample was containerized, labeled, preserved, and transported under an active chain of custody to a New York State Department of Health Certified Commercial Laboratory. The soil samples secured were subject to laboratory analysis using USEPA Method 8260 for volatile organic analytes. The groundwater samples were also subject to laboratory analysis using EPA Method 8260 testing for volatile organic analytes. The results of the analysis (see attached laboratory analytical report) failed to indicate the presence of any target volatile analytes above minimum laboratory detection limits.

Impact Environmental has performed a Phase II Environmental Site Assessment, on the Site in accordance with good commercial and customary practice and generally accepted protocols within the consulting industry. The investigation consisted of the sampling and analysis of subsurface soil and groundwater to further define the environmental quality of the Site with respect to the recognized environmental condition referenced above.

Based upon this assessment, dated November 13, 2006, Impact Environmental concludes that the historic on-site gasoline tank has not acted to degrade the environmental quality of the Site. Accordingly, no further activities are recommended to further define and/or enhance the environmental quality of the Site with regard to this issue.

Please feel free to call me with any questions.

Sincerely,
Impact Environmental

Christopher O'Leary
Environmental Biologist

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/12/2016 has revealed that there are 4 CORRACTS sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
KOSAN INDUSTRIAL COR	***5-49 49TH AVE***	***WSW 1/2 - 1 (0.739 mi.)***	***331***	***1171***

ACCURATE ASSOCIATES	***5-36 46TH RD***	***W 1/2 - 1 (0.685 mi.)***	***329***	***1151***
CON EDISON - RAVENSW	***3854 VERNON BLVD NW***	***NNW 1/2 - 1 (0.808 mi.)***	***AY334***	***1199***

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 11 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 9 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 9 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 11/14/2016 has revealed that there are 19 NY SHWS sites within approximately 1 mile of the target property.

NY VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the NY VAPOR REOPENED list, as provided by EDR, and dated 06/01/2016 has revealed that there is 1 NY VAPOR REOPENED site within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 02/06/2017 has revealed that there are 47 NY LTANKS sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 29 NY UST sites within approximately 0.25 miles of the target property.

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 2 NY CBS AST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 02/06/2017 has revealed that there are 35 NY Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/12/2016 has revealed that there are 46 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 25 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Registry ID: 110004362715

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	"ERT desk reports Location- e/s Purves St., 500 ft s/o Jackson Ave, Queen, LIC - Vactor vehicle #60624 inadvertently released 1500 gallons of oil/water substance onto street and sewer. The back latch was not fully engaged, thus when the vactor reached it capacity (1500 gallons) and the vacuum stopped, the seal from the rear latched opened thus releasing it contents. Con Edison crews quickly repaired rear vactor and then vacuumed the affected sewer pumping 1500 gallons + 500 gallons from another vactor = 2000 gallons. I responded to location along with DEC Tim DeMeo & DEP Keith Williams. There were NO signs of oil in the affected sewer. Both DEC & DEP were satisfied with Con Edison's cleanup operations to the affected street & sewer. DEP Williams indicated that this sewer was a combination type which leads to a sewer treatment plant. Cleanup operation completed. "
Remarks:	"BROKEN SEAL ON VACTOR TRUCK LEAKED 1500 GAL WHICH RAN INTO A STORM DRAIN. CLEAN UP PENDING - CREWS ON SITE. eMIS # 154890."

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was ROMMEL 2/17/2000 ECO Lum was at the site and wrote a ticket for failure to notify. After Lum issued ticket, this call was received on the Hotline. Rommel said the site appeared to be within standards, tanks were excavated, soil was stock piled and covered. Anticipate sample report to be submitted soon. 07/18/2005: Sent letter to Michael Mazza, site owner, requesting information. M. Brand NYSDEC DER Albany. 07/27/2005: Spoke with Michael Mazza, site owner. Site was completely renovated, 10 old tanks removed, four new tanks installed, 600-700 tons of contaminated soil removed. Mazza will send in information. M. Brand NYSDEC DER Albany. 08/03/2005: Received information from site owner. Information included: - Disposal tickets and invoices for the off-site disposal of 698.01 tons of contaminated soil; - Laboratory analyses for samples of stockpiled soil; - Test results for gasoline dispensers and new tanks dated 09/19/2002 (for new tanks installed in 2000); - Petroleum Bulk Storage Registration Certificate for four new tanks installed on 02/01/2000; and, - Invoice for recent inspection (03/01/2004) of facility and underground tanks by the NYC Fire Department Bureau of Fire Protection. M. Brand NYSDEC DER Albany. 09/07/2005: Information reviewed and determined to be acceptable documentation of site cleanup. Site closed and NFA letter sent to site owner. M. Brand NYSDEC DER Albany. 5/10/13-Vought-Received email from NYCOER Shaminder Chawla (Ph:212-442-3007 email ShaminderC@dep.nyc.gov) that I have one Pre-App meeting today at 10 AM. Site is an old Gas station with closed spill #9913082. BTEX in soil: 139,000 ppb BTEX in gw: 353,700 ppb Attached figure indicates gw plume migration. If you are available, I like to talk about this around 9.45 AM . Attached to email was PDF with site plan and soil and groundwater data that was recently collected in 5/3/13. Vought spoke with RSE and spill reopened due to possible off-site migration of petroleum contaminants that was unknown at the time of this closure, Environmental conditions related to this spill case which were unknown to the Department at the time of this closure and information received, in whole or part, after the Department s spill case closure, which indicates the corrective action was not sufficiently protective of human health and/or the environment. Spill assigned to DEC Kann as per RSE and Vought provided information for Kann to NYCOER Chawla. Groundwater analyticals recently collected show up to 353,700ppb BTEX and soil up to 139,000ppb BTEX. OER Chawla noted that a new purchaser has three weeks to decide to buy the site and their decision is partially based on DEC requirements and would like to set up a

GASGO (Continued) **S104510008**

meeting on 5/13 to discuss. OER Chawla noted that they are looking to develop site with a slab on grade foundation with ground floor retail shops. OER Chawla noted that tank location was excavated to 11'bg to groundwater and sidewalk along 43rd Street was also excavated to 11'bg as part of a utility installation. Vought noted that a RAP must be approved prior to site development. 5/10/13: J.Kann - left a phone message for Shaminder Chawla (OER) and also sent an email to him requesting any additional information that he may have on the site (i.e. is there a complete report that was prepared by Advanced Cleanup Technologies?). 5/13/13: J.Kann - received a Phase II from ACT. A tank closure report from 2000 was also submitted. Scheduled a meeting for Wednesday may 15 at 9am. Spoke to Shaminder Chawla at OER and Paul Stewart of ACT. Meeting time is acceptable. 5/15/13: J.Kann - met with potential buyer of the property, their attorney and environmental consultant. Shaminder Chawla of OER was also present. Sign in sheet is edoced. Discussed steps in moving forward and possible requirements for remediation (which includes off-site gw well installation and sampling, as well as on-site excavation below groundwater). 5/23/13: J.Kann - recvd a work plan from ACT on 5/22/13 which included the installation of 5 off site wells. Approval letter was sent on 5/23 noting that one proposed well was on the other side of a subway line (edoced). 6/24/14: J.Kann - based on emails - a site visit was made on 6/12/13 while wells were installed/sampled. A follow up email was sent to ACT on 7/29/13 to Raul. No update was ever provided and results of groundwater sampling have not been submitted. Will need to follow up. 9/25/14: J.Kann - sent a follow up email to Paul Stewart at ACT regarding the site. Also cced Raul, but got a undeliverable return email from him. Received a call from Madeline Eng of IVI (914)740-1904 requesting info on the site. Called her back today, spoke with her and she told me she received the info she needed and had no more questions. 12/4/14: J.Kann - received the supplemental subsurface investigation report (Report) on October 20 via email. Responded on November 6 requesting additional info from ACT regarding a comment of PBS decommissioning that was made in the email. No response was received. A call was received on 12/3/14 from Chelsea Little (917) 620-1687. A return call to Chelsea was attempted this morning at 9:15AM. A message was left. The Report is now under review. Spoke with Chelsea at 10:45AM. She is doing a Phase I for the site across Jackson Avenue. I informed her that a well was installed (MW-5) in the sidewalk between the Koch bridge ramp and the new building on the corner. There was no exceedences of T.O.G.S at that location. 8/25/15: J.kann - Theresa Burkard resent the SSIR to the Department on March 3, 2015. On June 23, 2015 an email was received stating that the storage tanks would be removed from the site. A visit will be made to the site this week to confirm site conditions. An email was sent to ACT today asking for a site update. The file is under review and a comment letter drafted in the next two weeks. 9/22/15: J.Kann - the following email was sent to Paul Stewart and NYlionsgroup was cced: Paul A Remedial Action Work Plan (RAP) for the referenced site has not yet been received by the Department. Based on my review of the Subsurface Investigation Report (Report) prepared by ACT, and the site file, I have the following comments: 1.Significant soil and groundwater contamination is present at the referenced site. Impacted soil and groundwater also exist beneath the sidewalk in the vicinity of MW1, MW-2 and MW-3. In addition to recommendations in the Report, impacted soils under the sidewalk must be remediated. 2.An attempt was made to sample on the north-north east side of the

GASGO (Continued) **S104510008**

property in 2013 and soil recovery was low. Based on review of reports in the Department files, contamination has not been delineated in this area. The RAP must include proper endpoint sampling and additional work if all contaminated soils are not removed. 3.The Department requires the submission of development plans for the site including depths of planned buildings, site plans showing future building locations and discussion of vapor mitigation techniques used in the development of the site, such as sub-slab depressurization systems, vapor barriers and /or moisture barriers. Note that plans for vapor mitigation may be forwarded to the New York State Department of Health for review and approval. 4.Development of this site prior to remediation may pose a health risk to future site occupants and employees. A RAP must be approved by the Department prior to site development. If you have any questions, please let me know. 12/14/15: J.Kann - received the RAWP from Paul Stewart on 12/1/15 and it is under review. Comments are being drafted and will be sent by the end of the week. 12/15/15: J.Kann - As per discussion with Jeff, comments sent to Paul Stewart were prepared and sent out today. The comments were edoced. 3/2/16: J.Kann - revised RAWP was submitted 12/23/2015. RAWP was reviewed and approved via email to Paul Stewart today. All DEC comments were addressed."

Remarks: "WHILE UNCOVERING TANKS FOR REMOVAL, CONTAMINATED SOIL WAS DISCOVERED. SAMPLES TAKEN."

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	"5/14/15 TJD Site visit as per DLE (ECO Gates) request. At time of inspection a large construction project was in progress at an adjoining parcel which is part of the BCP Program (C241162). No odors were detected in the vicinity of the reported address and the BCP site was gated and inactive during the inspection. The physical address of the reported complaint is an adjacent commercial building currently undergoing redevelopment - no environmental conditions were observed at this property. A construction management company had a small office on the second floor - DeMeo made contact with management representatives who provided a background regarding the BCP parcel next door. As per the construction management personnel, they have received multiple visits from various regulatory agencies regarding similar noise and odor complaints over the previous months - this is reportedly due to the stenciled address on the mailbox immediately adjacent to the BCP site. As per the construction management representatives interviewed their site has no known environmental conditions. The management office is located on the side of the building facing the BCP site which provided a good vantage point to observe the current site conditions - a large partially covered soil pile was observed as well as an open test pit and a 550 UST which was staged on site pending disposal. Upon return to the office, DeMeo spoke with DEC BCP project managers (Magloire and Mecomber) who were familiar with the BCP site. A site inspection was performed by aforementioned Section A staff in the following days - at which time the soil pile had been removed and no significant violations were identified. Based upon the inspection findings and the history of the adjacent parcels the address provided to DLE was incorrect and DEC staff are provideing proper oversight of the BCP project. No further action is warranted by spills and Section A remedial staff authorized closure of the spill case. Inspection photos have been uploaded to DECDOCS. Spill closed."
Remarks:	"Officer Gates received an anonomous report regarding petroleum odors eminating from an former auto repair business currently being

PURVES STREET DEVELOPMENT (Continued) **S118372412**

Updated By: RXSCHICK

Site Description: Location: The site is located at 27-21 44th Drive and 44-18 Purves Street in the Long Island City section of Queens County. It is denoted on New York City tax maps as Block 268, Lots 4 and 23. The site is bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. Lot 22 is immediately north of Lot 23 and is also part of the proposed development, but is not included in the Brownfield Cleanup Program. It should be noted that the property immediately adjacent and upgradient from the site is also in the BCP (see site no. C241162).Site Features: The site is approximately 0.27 acres in size and consists of two parcels, both of which are currently vacant. Lot 4 is occupied by a vacant one-story garage/warehouse building with a full basement. Lot 23 is vacant and partially covered with a deteriorating concrete slab overgrown with vegetation. There is an egress easement benefiting Lot 4 permitting access to Purves Street across Lot 23. Current Zoning and Land Use: The site is located in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The site's zoning designation is M1-5/R9, which allows residential development at 8.0x floor area ratio (FAR).Past Use of the Site: In 1936 a garage with a gasoline filling pump island was operated on Lot 4. Previous uses of Lot 4 include a paper warehouse and photo chemical warehouse. Lot 4 was improved with one-story buildings since approximately 1941. Lot 23 was used for manufacturing, labs, leather goods business, and a plating equipment business.Geology and Hydrogeology: Groundwater underlying the site ranges from approximately 3.26 feet to 7.95 feet below grade surface (bgs) and flows to the north-northeast toward Purves Street. Beneath the site surface, material was observed to be urban fill predominately comprised of medium-brown to reddish-brown fine to coarse sand with varying amounts of clay, silt, gravel, brick, concrete, ash and coal. The urban fill layer extends to approximately 8 to 11 feet bgs in Lot 23 and 5 to 11 feet bgs in Lot 4. Beneath the fill was a gray-brown to gray-black silt or clay with some silt, trace fine sand, and trace organics. Bedrock is estimated to range from 50 feet to 70 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern are volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and disposal of soil, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from the eastern excavation sidewall, and from two UST removal excavations that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, herbicides, polychlorinated biphenyls (PCBs), and metals. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, the following SVOCs have been detected at concentrations above their RRUSCOs: benzo(a)anthracene detected at a maximum concentration of 10 parts per million (ppm), benzo(a)pyrene at a maximum concentration of

PURVES STREET DEVELOPMENT (Continued) **S118372412**

8.1 ppm, benzo(b)fluoranthene at a maximum concentration of 8.3 ppm, chrysene at a maximum concentration of 10 ppm, dibenzo(a,h)anthracene at a maximum concentration of 0.9 ppm and indeno(1,2,3-cd)pyrene at a maximum concentration of 4.1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 1,200 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 27 ppm compared to the RRUSCO of 16 ppm; barium detected at a maximum concentration of 430 ppm compared to the RRUSCO of 400 ppm; mercury detected at a maximum concentration of 7.8 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, SVOCs in groundwater exceeded the ambient water quality standards (AWQS). After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Code:	493090
Site Description:	Location: The site is located at 27-21 44th Drive and 44-18 Purves Street in the Long Island City section of Queens County. It is denoted on New York City tax maps as Block 268, Lots 4 and 23. The site is bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. Lot 22 is immediately north of Lot 23 and is also part of the proposed development, but is not included in the Brownfield Cleanup Program. It should be noted that the property immediately adjacent and upgradient from the site is also in the BCP (see site no. C241162).Site Features: The site is approximately 0.27 acres in size and consists of two parcels, both of which are currently vacant. Lot 4 is occupied by a vacant one-story garage/warehouse building with a full basement. Lot 23 is vacant and partially covered with a deteriorating concrete slab overgrown with vegetation. There is an egress easement benefiting Lot 4 permitting access to Purves Street across Lot 23. Current Zoning and Land Use: The site is located in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The site's zoning designation is M1-5/R9, which allows residential development at 8.0x floor area ratio (FAR).Past Use of the Site: In 1936 a garage with a gasoline filling pump island was operated on Lot 4. Previous uses of Lot 4 include a paper warehouse and photo chemical warehouse. Lot 4 was improved with one-story buildings since approximately 1941. Lot 23 was used for manufacturing, labs, leather goods business, and a plating equipment business.Geology and Hydrogeology: Groundwater underlying the site ranges from approximately 3.26 feet to 7.95 feet below grade surface (bgs) and flows to the north-northeast toward Purves Street. Beneath the site surface, material was observed to be urban fill predominately comprised of medium-brown to reddish-brown fine to coarse sand with varying amounts of clay, silt, gravel, brick, concrete, ash and coal. The urban fill layer extends to approximately 8 to 11 feet bgs in Lot 23 and 5 to 11 feet bgs in Lot 4. Beneath the fill was a gray-brown to gray-black silt or clay with some silt, trace fine sand, and trace organics. Bedrock is estimated to range from 50 feet to 70 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.
Env Problem:	Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern are volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and

PURVES STREET DEVELOPMENT (Continued) **S116550039**

disposal of soil, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from the eastern excavation sidewall, and from two UST removal excavations that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, herbicides, polychlorinated biphenyls (PCBs), and metals. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, the following SVOCs have been detected at concentrations above their RRUSCOs: benzo(a)anthracene detected at a maximum concentration of 10 parts per million (ppm), benzo(a)pyrene at a maximum concentration of 8.1 ppm, benzo(b)fluoranthene at a maximum concentration of 8.3 ppm, chrysene at a maximum concentration of 10 ppm, dibenzo(a,h)anthracene at a maximum concentration of 0.9 ppm and indeno(1,2,3-cd)pyrene at a maximum concentration of 4.1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 1,200 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 27 ppm compared to the RRUSCO of 16 ppm; barium detected at a maximum concentration of 430 ppm compared to the RRUSCO of 400 ppm; mercury detected at a maximum concentration of 7.8 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, SVOCs in groundwater exceeded the ambient water quality standards (AWQS). After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Code: 493090
Site Description: Location: The site is located at 27-21 44th Drive and 44-18 Purves Street in the Long Island City section of Queens County. It is denoted on New York City tax maps as Block 268, Lots 4 and 23. The site is bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. Lot 22 is immediately north of Lot 23 and is also part of the proposed development, but is not included in the Brownfield Cleanup Program. It should be noted that the property immediately adjacent and upgradient from the site is also in the BCP (see site no. C241162).Site Features: The site is approximately 0.27 acres in size and consists of two parcels, both of which are currently vacant. Lot

PURVES STREET DEVELOPMENT (Continued) **S116550039**

4 is occupied by a vacant one-story garage/warehouse building with a full basement. Lot 23 is vacant and partially covered with a deteriorating concrete slab overgrown with vegetation. There is an egress easement benefiting Lot 4 permitting access to Purves Street across Lot 23. Current Zoning and Land Use: The site is located in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The site's zoning designation is M1-5/R9, which allows residential development at 8.0x floor area ratio (FAR).Past Use of the Site: In 1936 a garage with a gasoline filling pump island was operated on Lot 4. Previous uses of Lot 4 include a paper warehouse and photo chemical warehouse. Lot 4 was improved with one-story buildings since approximately 1941. Lot 23 was used for manufacturing, labs, leather goods business, and a plating equipment business.Geology and Hydrogeology: Groundwater underlying the site ranges from approximately 3.26 feet to 7.95 feet below grade surface (bgs) and flows to the north-northeast toward Purves Street. Beneath the site surface, material was observed to be urban fill predominately comprised of medium-brown to reddish-brown fine to coarse sand with varying amounts of clay, silt, gravel, brick, concrete, ash and coal. The urban fill layer extends to approximately 8 to 11 feet bgs in Lot 23 and 5 to 11 feet bgs in Lot 4. Beneath the fill was a gray-brown to gray-black silt or clay with some silt, trace fine sand, and trace organics. Bedrock is estimated to range from 50 feet to 70 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern are volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and disposal of soil, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from the eastern excavation sidewall, and from two UST removal excavations that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, herbicides, polychlorinated biphenyls (PCBs), and metals. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, the following SVOCs have been detected at concentrations above their RRUSCOs: benzo(a)anthracene detected at a maximum concentration of 10 parts per million (ppm), benzo(a)pyrene at a maximum concentration of 8.1 ppm, benzo(b)fluoranthene at a maximum concentration of 8.3 ppm, chrysene at a maximum concentration of 10 ppm, dibenzo(a,h)anthracene at a maximum concentration of 0.9 ppm and indeno(1,2,3-cd)pyrene at a maximum concentration of 4.1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 1,200 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 27 ppm compared to the RRUSCO of 16 ppm; barium detected at a maximum concentration of 430 ppm compared to the RRUSCO of 400 ppm; mercury detected at a maximum concentration of 7.8 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, SVOCs in groundwater exceeded the ambient water quality standards

PURVES STREET DEVELOPMENT (Continued) **S116550039**

(AWQS). After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Code: 493090
Site Description: Location: The site is located at 27-21 44th Drive and 44-18 Purves Street in the Long Island City section of Queens County. It is denoted on New York City tax maps as Block 268, Lots 4 and 23. The site is bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. Lot 22 is immediately north of Lot 23 and is also part of the proposed development, but is not included in the Brownfield Cleanup Program. It should be noted that the property immediately adjacent and upgradient from the site is also in the BCP (see site no. C241162).Site Features: The site is approximately 0.27 acres in size and consists of two parcels, both of which are currently vacant. Lot 4 is occupied by a vacant one-story garage/warehouse building with a full basement. Lot 23 is vacant and partially covered with a deteriorating concrete slab overgrown with vegetation. There is an egress easement benefiting Lot 4 permitting access to Purves Street across Lot 23. Current Zoning and Land Use: The site is located in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The site's zoning designation is M1-5/R9, which allows residential development at 8.0x floor area ratio (FAR).Past Use of the Site: In 1936 a garage with a gasoline filling

PURVES STREET DEVELOPMENT (Continued) **S116550039**

pump island was operated on Lot 4. Previous uses of Lot 4 include a paper warehouse and photo chemical warehouse. Lot 4 was improved with one-story buildings since approximately 1941. Lot 23 was used for manufacturing, labs, leather goods business, and a plating equipment business.Geology and Hydrogeology: Groundwater underlying the site ranges from approximately 3.26 feet to 7.95 feet below grade surface (bgs) and flows to the north-northeast toward Purves Street. Beneath the site surface, material was observed to be urban fill predominately comprised of medium-brown to reddish-brown fine to coarse sand with varying amounts of clay, silt, gravel, brick, concrete, ash and coal. The urban fill layer extends to approximately 8 to 11 feet bgs in Lot 23 and 5 to 11 feet bgs in Lot 4. Beneath the fill was a gray-brown to gray-black silt or clay with some silt, trace fine sand, and trace organics. Bedrock is estimated to range from 50 feet to 70 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern are volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and disposal of soil, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from the eastern excavation sidewall, and from two UST removal excavations that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, herbicides, polychlorinated biphenyls (PCBs), and metals. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, the following SVOCs have been detected at concentrations above their RRUSCOs: benzo(a)anthracene detected at a maximum concentration of 10 parts per million (ppm), benzo(a)pyrene at a maximum concentration of 8.1 ppm, benzo(b)fluoranthene at a maximum concentration of 8.3 ppm, chrysene at a maximum concentration of 10 ppm, dibenzo(a,h)anthracene at a maximum concentration of 0.9 ppm and indeno(1,2,3-cd)pyrene at a maximum concentration of 4.1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 1,200 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 27 ppm compared to the RRUSCO of 16 ppm; barium detected at a maximum concentration of 430 ppm compared to the RRUSCO of 400 ppm; mercury detected at a maximum concentration of 7.8 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, SVOCs in groundwater exceeded the ambient water quality standards (AWQS). After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination

PURVES STREET DEVELOPMENT (Continued) **S116550039**

remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

BROWNFIELDS:

Program:	BCP
Site Code:	493090
Acres:	0.265
HW Code:	C241164
SWIS:	4101
Town:	New York City
Record Added Date:	03/27/2014
Record Updated Date:	01/08/2016
Update By:	JHOCONNE
Site Description:	Location: The site is located at 27-21 44th Drive and 44-18 Purves Street in the Long Island City section of Queens County. It is denoted on New York City tax maps as Block 268, Lots 4 and 23. The site is bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. Lot 22 is immediately north of Lot 23 and is also part of the proposed development, but is not included in the Brownfield Cleanup Program. It should be noted that the property immediately adjacent and upgradient from the site is also in the BCP (see site no. C241162).Site Features: The site is approximately 0.27 acres in size and consists of two parcels, both of which are currently vacant. Lot 4 is occupied by a vacant one-story garage/warehouse building with a full basement. Lot 23 is vacant and partially covered with a deteriorating concrete slab overgrown with vegetation. There is an egress easement benefiting Lot 4 permitting access to Purves Street across Lot 23. Current Zoning and Land Use: The site is located in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The site's zoning designation is M1-5/R9, which allows residential development at 8.0x floor area ratio (FAR).Past Use of the Site: In 1936 a garage with a gasoline filling pump island was operated on Lot 4. Previous uses of Lot 4 include a paper warehouse and photo chemical warehouse. Lot 4 was improved with one-story buildings since approximately 1941. Lot 23 was used for manufacturing, labs, leather goods business, and a plating equipment business.Geology and Hydrogeology: Groundwater underlying the site ranges from approximately 3.26 feet to 7.95 feet below grade surface (bgs) and flows to the north-northeast toward Purves Street. Beneath the site surface, material was observed to be urban fill

PURVES STREET DEVELOPMENT (Continued) **S116550039**

predominately comprised of medium-brown to reddish-brown fine to coarse sand with varying amounts of clay, silt, gravel, brick, concrete, ash and coal. The urban fill layer extends to approximately 8 to 11 feet bgs in Lot 23 and 5 to 11 feet bgs in Lot 4. Beneath the fill was a gray-brown to gray-black silt or clay with some silt, trace fine sand, and trace organics. Bedrock is estimated to range from 50 feet to 70 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern are volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and disposal of soil, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from the eastern excavation sidewall, and from two UST removal excavations that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, herbicides, polychlorinated biphenyls (PCBs), and metals. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, the following SVOCs have been detected at concentrations above their RRUSCOs: benzo(a)anthracene detected at a maximum concentration of 10 parts per million (ppm), benzo(a)pyrene at a maximum concentration of 8.1 ppm, benzo(b)fluoranthene at a maximum concentration of 8.3 ppm, chrysene at a maximum concentration of 10 ppm, dibenzo(a,h)anthracene at a maximum concentration of 0.9 ppm and indeno(1,2,3-cd)pyrene at a maximum concentration of 4.1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 1,200 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 27 ppm compared to the RRUSCO of 16 ppm; barium detected at a maximum concentration of 430 ppm compared to the RRUSCO of 400 ppm; mercury detected at a maximum concentration of 7.8 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, SVOCs in groundwater exceeded the ambient water quality standards (AWQS). After the remediation, benzo(b)fluoranthene was the only SVOCs that was detected in documentation soil samples at concentrations that exceed the protection of groundwater soil cleanup objective. The presence of benzo(b)fluoranthene in groundwater reflects the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling is needed to determine if soil vapor intrusion is a concern for off-site buildings.

DEC Memo:	"SCA parking lot going to be a parking lot for school vehicles. Found a tank, registered and removed the tank. Clean under the tank, but some groundwater had some VOC hits. Contact for this case is: Charles Gudder 212-221-7822 ext 103 09/19/2011-TRC sent the Spill Closure Report dated july 27, 2011. During excavation associated with the construction of the parking lot , one carbon 1000-gallon UST that formerly contained diesel was encountered. On may 17,2011 Franklyn excavated and removed the UST. There were no piping or accesories with the UST noted during the excavation. On May 17,2011, six(6)soil

CITY SCHOOL PARKING LOT (Continued) **S111063976**

endpoint samples were collected. One soil sample was collected from each sidewall and two(2) soil sample were collected from the base of the excavation. The soil analytical results indicated that there were not detectable concentrations of VOCs. SVOCs were detected in one (1) sample collected from the base of the excavation (bottom -W-6'); however, none of the detected concentrations exceeded the NYSDEC Commissioner Policy, CP-51. The groundwater analytical reults indicated that five petroleum constituents (1,2,4- Trimethylbenzene 22 ug/l, 1,3,5 Trimethylbenzene 22 ug/l, Ethylbenzene 12 ug/l, m/p-xylene 60ug/l, 0-xylene 45 ug/l, Total xylenes 110) were detected at concentrations exceeding the standards. Since a parking lot is going to be constructed at the site. No potential for exposure exists. Spill Closed. "

Remarks: "UST was found, removed, soil under was clean, but groundwater had minor VOC hit."

Updated By: MXMAGLOI
Site Code: 492842
Site Description: Location: The site is located at 44-30 Purves Street in Long Island City, New York. The site is an irregular-shaped parcel and is denoted on New York City tax maps as Block 268, Lot 1 (formerly Lots 1, 26, 25, 24). The site is on the southern portion of the city block bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. It should be noted that the property immediately adjacent to the site is also in the BCP (see site no. C241164).Site Features: The site is

44-30 PURVES STREET (Continued) **S116550037**

approximately 0.62 acres in size and is currently vacant. It is currently covered with a concrete slab and overgrown vegetation. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The site was previously improved with multiple buildings and was used for various manufacturing and industrial purposes.Current Zoning and Land Use: The site is in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The zoning designation is M1-5/R9 (manufacturing with a residential overlay). The site has been vacant since around 2006.Past Use of the Site: The site most recently was used for automobile repair and carpet storage. Previous uses also include a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company, and a freight company.Site Geology and Hydrogeology: Depth to groundwater has been measured at 4.5 to 7 feet below ground surface and flows to the east-northeast toward Purves Street. The subsurface strata at the site consists of historic urban fill extending to depths from 1.5 to 11 feet below ground surface (bgs), underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths from approximately 44 to 48 feet bgs. Gray and white schist bedrock was observed at depths ranging from approximately 44 to 61 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium

44-30 PURVES STREET (Continued) **S116550037**

	detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.
Health Problem:	Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

Updated By: MXMAGLOI
Site Code: 492842
Site Description: Location: The site is located at 44-30 Purves Street in Long Island City, New York. The site is an irregular-shaped parcel and is denoted on New York City tax maps as Block 268, Lot 1 (formerly Lots 1, 26, 25, 24). The site is on the southern portion of the city block bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. It should be noted that the property immediately adjacent to the site is also in the BCP (see site no. C241164).Site Features: The site is approximately 0.62 acres in size and is currently vacant. It is currently covered with a concrete slab and overgrown vegetation. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The site was previously improved with multiple buildings and was used for various manufacturing and industrial purposes.Current Zoning and Land Use: The site is in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The zoning designation is M1-5/R9 (manufacturing with a residential overlay). The site has been vacant since around 2006.Past Use of the Site: The site most recently was used for automobile repair and carpet storage. Previous uses also include a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company, and a freight company.Site Geology and Hydrogeology: Depth to groundwater has been measured at 4.5 to 7 feet below ground surface and flows to the east-northeast toward Purves Street. The subsurface strata at the site consists of historic urban fill extending to depths from 1.5 to 11 feet below ground surface (bgs), underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths from approximately 44 to 48 feet bgs. Gray and white schist bedrock was observed at depths ranging from approximately 44 to 61 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.
Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at

44-30 PURVES STREET (Continued) **S116550037**

concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Code: 492842
Site Description: Location: The site is located at 44-30 Purves Street in Long Island City, New York. The site is an irregular-shaped parcel and is denoted on New York City tax maps as Block 268, Lot 1 (formerly Lots 1, 26, 25, 24). The site is on the southern portion of the city block bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. It should be noted that the property immediately adjacent to the site is also in the BCP (see site no. C241164).Site Features: The site is approximately 0.62 acres in size and is currently vacant. It is currently covered with a concrete slab and overgrown vegetation. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The site was previously improved with multiple buildings and was used

44-30 PURVES STREET (Continued) **S116550037**

for various manufacturing and industrial purposes.Current Zoning and Land Use: The site is in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The zoning designation is M1-5/R9 (manufacturing with a residential overlay). The site has been vacant since around 2006.Past Use of the Site: The site most recently was used for automobile repair and carpet storage. Previous uses also include a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company, and a freight company.Site Geology and Hydrogeology: Depth to groundwater has been measured at 4.5 to 7 feet below ground surface and flows to the east-northeast toward Purves Street. The subsurface strata at the site consists of historic urban fill extending to depths from 1.5 to 11 feet below ground surface (bgs), underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths from approximately 44 to 48 feet bgs. Gray and white schist bedrock was observed at depths ranging from approximately 44 to 61 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant

44-30 PURVES STREET (Continued) **S116550037**

threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.
Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Code: 492842
Site Description: Location: The site is located at 44-30 Purves Street in Long Island City, New York. The site is an irregular-shaped parcel and is denoted on New York City tax maps as Block 268, Lot 1 (formerly Lots 1, 26, 25, 24). The site is on the southern portion of the city block bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. It should be noted that the property immediately adjacent to the site is also in the BCP (see site no. C241164).Site Features: The site is approximately 0.62 acres in size and is currently vacant. It is currently covered with a concrete slab and overgrown vegetation. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The site was previously improved with multiple buildings and was used for various manufacturing and industrial purposes.Current Zoning and Land Use: The site is in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The zoning designation is M1-5/R9 (manufacturing with a residential overlay). The site has been vacant since around 2006.Past Use of the Site: The site most recently was used for automobile repair and carpet storage. Previous uses also include a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company, and a freight company.Site Geology and Hydrogeology: Depth to groundwater has been measured at 4.5 to 7 feet below ground surface and flows to the east-northeast toward Purves Street. The subsurface strata at the site consists of historic urban fill extending to depths from 1.5 to 11 feet below ground surface (bgs), underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths from approximately 44 to 48 feet bgs.

44-30 PURVES STREET (Continued) **S116550037**

Gray and white schist bedrock was observed at depths ranging from approximately 44 to 61 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.

Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm.

44-30 PURVES STREET (Continued) **S118372411**

	The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.
Health Problem:	Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

Site Description: Location: The site is located at 44-30 Purves Street in Long Island City, New York. The site is an irregular-shaped parcel and is denoted on New York City tax maps as Block 268, Lot 1 (formerly Lots 1, 26, 25, 24). The site is on the southern portion of the city block bordered by Jackson Avenue to the north, Purves Street to the east, Thomson Avenue to the south, and 44th Drive to the west. It should be noted that the property immediately adjacent to the site is also in the BCP (see site no. C241164).Site Features: The site is approximately 0.62 acres in size and is currently vacant. It is currently covered with a concrete slab and overgrown vegetation. A retaining wall supports the Thomson Avenue and 44th Drive sidewalks. The sidewalk grade of Purves Street is at approximately site grade. The site was previously improved with multiple buildings and was used for various manufacturing and industrial purposes.Current Zoning and Land Use: The site is in the Special Long Island City Mixed Use District within Area B of Queens Plaza Subdistrict. The zoning designation is M1-5/R9 (manufacturing with a residential overlay). The site has been vacant since around 2006.Past Use of the Site: The site most recently was used for automobile repair and carpet storage. Previous uses also include a chemical laboratory, a filter cleaner company, a hardware warehouse, a paper embossing company, a taxi repair facility, a controller manufacturing company, a pine chemical company, and a freight company.Site Geology and Hydrogeology: Depth to groundwater has been measured at 4.5 to 7 feet below ground surface and flows to the east-northeast toward Purves Street. The subsurface strata at the site consists of historic urban fill extending to depths from 1.5 to 11 feet below ground surface (bgs), underlain by sand with varying amounts of silt and gravel. Sandy silt to clayey silt was found underlying the sand layer, and the silt is underlain by clay and/or peat above bedrock. Decomposed and weathered rock was observed at depths from approximately 44 to 48 feet bgs. Gray and white schist bedrock was observed at depths ranging from approximately 44 to 61 feet bgs.The nearest body of water is the Dutch Kills, located approximately 0.25 miles south-southeast of the site.
Env Problem: Nature and Extent of Contamination:Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination remaining in soil and groundwater is being managed under a Site Management Plan.Following excavation and soil disposal, and removal of four underground storage tanks (USTs), documentation samples were collected from the base of excavation, from northern, eastern, and southeastern excavation sidewall and from one UST removal excavation that extended the planned remedial

excavation depth. Documentation samples were analyzed for Part 375 List and Target Compound List (TCL)/Target List (TAL) VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Four documentation samples collected from the UST removal excavations were analyzed for Part 375 and TLC-listed VOCs and SVOCs only. Soil - Prior to remediation, SVOCs and metals were detected at concentrations above their restricted residential use soil cleanup objectives (RRUSCOs). Since the completion of the remedial work, benzo(a)anthracene was the only metal that was detected at concentrations above the RRUSCOs. Benzo(a)anthracene was detected at a maximum concentration of 1.89 ppm compared to the RRUSOC of 1 ppm. The metals that have been identified in soil include: lead detected at a maximum concentration of 745 ppm compared to the RRUSCO of 400 ppm; arsenic detected at a maximum concentration of 88.5 ppm compared to the RRUSCO of 16 ppm; mercury detected at a maximum concentration of 11.9 ppm compared to the RRUSCO of 0.81 ppm. All remaining contamination is below the existing site cover.Groundwater - Prior to remediation, metals were detected in groundwater at concentrations exceeding the ambient water quality standard (AWQS) include selenium detected at 17 ppb compared to the AWQS of 10 ppb. After the remediation, selenium was detected in document soil samples at concentrations that exceed its protection of groundwater soil cleanup objective (PGWSCO). The presence of selenium in groundwater is consistent with the quality of regional groundwater.Significant threat:NYSDEC and NYSDOH have determined that this site does not pose a significant threat to human health or the environment.

Health Problem: Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Additional sampling will be completed to determine if soil vapor intrusion is a concern for off-site buildings.

DEC Memo:	"11/27/2015: Rashad Duty Desk 45-02 Queens Blvd has PBS#2-156647 with 5 active tanks all of which are 4,000 gallon underground gasoline tanks which are vaulted with no access for inspection. Called and spoke with Hector, he indicated driver gauged tank level with stick but used wrong numbers , driver stopped pump immediately when overfill occurred and the result was 2-3 gallons on surface. Hector said nothing went into soil or drain and it was cleaned with pads immediately. Case will be closed due to no soil/drain impact and spill cleaned. Spill #8900605 is open and active on this site managed my Hagger. "

Tank Info:

Tank Number: 001
Tank Id: 27004
Material Code: 0003
Common Name of Substance: #6 Fuel Oil (On-Site Consumption)

Equipment Records:

E02 - Piping Secondary Containment - Vault (with Access)
I04 - Overfill - Product Level Gauge (A/G)
C01 - Pipe Location - Aboveground
D01 - Pipe Type - Steel/Carbon Steel/Iron
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
J02 - Dispenser - Suction Dispenser
K00 - Spill Prevention - None
A00 - Tank Internal Protection - None
L09 - Piping Leak Detection - Exempt Suction Piping
B00 - Tank External Protection - None
F00 - Pipe External Protection - None
G02 - Tank Secondary Containment - Vault (w/access)
I05 - Overfill - Vent Whistle

Tank Location: 6
Tank Type: Steel/Carbon Steel/Iron
Tank Status: Closed - Removed
Pipe Model: Not reported
Install Date: 10/01/1990
Capacity Gallons: 10000

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Town:	New York City
Acres:	2.5
Date Record Added:	11/30/2000
Date Record Updated:	06/28/2016
Updated By:	KALEWAND
Site Description:	Location: The site is located in Queens County, on Jackson Ave between Orchard Street to the east, Queens Blvd. to the west and Long Island Railroad rail yard to the south. A subway (E,G,R,V) runs underneath Jackson Avenue bordering the site to the north. Site Features: Prior to demolition, the 2.5 acre site consisted of 9 buildings and associated parking areas. The property is currently being redeveloped.Current Zoning and Land Use: The site is zoned M1-6/R10 (Manufacturing and Residential) under the special Long Island City Mixed Use District. According to the NYC Department of City Planning website, The Special Long Island City Mixed Use District (LIC) promotes the development and expansion, at varying densities, of the longstanding mix of residential, commercial, industrial and cultural uses found in its four subdistrictsCourt Square, Queens Plaza, Hunters Point and Dutch Kills.Historical Uses: The site had formerly been used for chemical manufacturing. From 1901-1978, West Chemical Co. owned the property and manufactured commercial and disinfectant products such as disinfectants, insecticides, soaps, floor wax, and paper products dispensing machines. Manufacturing operations employed various chemical substances including creosote, coal and acids, cresylic acids, degreasing solvents, iodine, and assorted oils and pesticides. Metal plating and gasoline filling operations were also conducted at the property. In November 1978 Outlet City acquired title to the property

OUTLET CITY, QUEENS BLVD. & JACKSON AVE. (Continued) **S105684691**

from West Chemical. During Outlet City's ownership, a flea market and various vendor operations were operated at the property. Previous investigations in the late 1980's and early 1990's led to the property entering the Voluntary Cleanup Program. The Voluntary Agreement was terminated in August 2015. Site Geology and Hydrogeology: Site geology consists of sand and silt at varying depths. Bedrock (gneiss) encountered at depths from elevation 10 North American Vertical Datum (NAVD) to -30 NAVD. Groundwater is approximately 8-10ft below grade.Remediation Status:Remediation of Outlet City will be addressed under the Brownfield Cleanup Program (BCP). Refer to Queens Plaza Residential Development - Site A (C241105) and Queens Plaza Residential Development - Site B (C241151). For offsite contamination, refer to Queens Plaza Residential Development - Site A Offsite (C241105A) and Queens Plaza Residential Development - Site B Offsite (C241151A).

Env Problem: Nature and Extent of Contamination: The site is contaminated with creosote, petroleum, and solvents. Both soil and groundwater are affected. The majority of the contamination is located in Areas D and E where a large scale creosote spill took place.Total on-site VOCs (Volatile Organic Compounds) including both chlorinated hydrocarbons and petroleum constituents are present in groundwater from non-detect - 30,000ppb. Total on-site SVOCs (Semi-Volatile Organic Compounds) are present in groundwater from non-detect to over 100,000ppb. An initial off-site investigation was completed in 2013. Contamination, both VOCs and SVOCs has migrated off-site to the west and north. Due to flooding event caused by a homeless person removing piping in Building 10 to sell for scrap, the monitoring well in the narrow strip of land between the on-site buildings and the Sunnyside Yard could not be sampled.

Health Problem: Exposures to contaminated groundwater is not expected because the area is served by public water. Soils contaminated with etrachloroethene are beneath the site, however, exposure to this soil is not expected because the site is capped with asphalt. Indoor air samples collected in a portion of the on-site building contained levels of tetrachloroethene that exceeded the New York State Department of Health Guideline for tetrachloroethene in Indoor Air. NYSDOH and NYSDEC will evaluate the need for additional investigations to determine the potential for soil vapor intrusion into structures near the site.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Contact Phone:	(646) 388-9526
DEC Memo:	"I spoke with Andrew. The tank has been reoved and cont. soil has been stockpiled. This soil needs to be removed due to space limitations. He feels that they are not able to find clean endpoints. A gepprobe will be out on Fri 1/ 11/ 07- 1/9/08 - Raphael Ketani. An abandoned gasoline tank was discovered and contaminated soil beneath it on 1/4/08. The contact is Andrew Rudko of AKRF, Inc. (646) 388-9526. I spoke to Mr. Rudko about the site. The site is a small triangular area. He said that it used to be a car repair replace with one 550 gal. tank and one pump. He said the tank was abandoned in place with concrete. The great majority of the soil has been excavated, but the contractor is waiting to get a hauler for the gasoline contaminated soil. The site will be a temporary parking lot for the building and parking lot across the street. Groundwater is at about 14 feet - he has drilled nearby at another site and hit water there at that depth. I told Mr. Rudko that additional borings will be needed to see whether the contamination had migrated under the streets. He said he will do borings to the edge of the property, and if contamination is found, then he will get the permits and do borings further out. 2/7/08 - Raphael Ketani. I tried to contact Mr. Rudko, but could only leave a message. Mr. Rudko returned my call. He said that they had removed the gas tank and found lots of contamination. Initially, they excavated 9 truck loads of soil and shipped it out. Then, on 2/5/08, they excavated more soil until the site was jammed up with excavated soil. This was also shipped out. Mr. Rudko feels that the contamination extends all the way to the Hunter Street sidewalk and maybe under it. I told him that he needs to delineate the extent of the contamination. Mr. Rudko said that they will use ORC to remediate any soil that can not be removed. I told him that DEC wants all of the contaminated soil either removed or treated. 2/19/08 - Raphael Ketani. I had tried to make an unannounced site visit last thursday, but was unsuccessful. I could not find the site. I called up Mr. Rudko and he told me the site is

CONSTRUCTION SITE (Continued) **S108981768**

at the intersection of Crescent Street, Hunter Street, and 44th Road. I will make another attempt at a site visit. I found the site. It consisted of a big water filled pit and a pile of slightly odoress artificial fill material. I met Mark Accetturi, Environmental Specialist of AKRF (646) 388-9521, at the site. There was no sheen on the water. Mr. Accetturi told me that the pit had been dry until the recent rains. The water level was about 10 feet below grade. I told him that AKRF should get someone to suck out the water. He said that this will be done in the near future. There was a large pile of artificial fill (soil mixed with other material) with slight odor of gasoline. Mr. Accetturi told me that they had taken out the one tank from about the middle of the hole and two lifts from the Citicorp (southwest) side of the hole. A black pipe with a metal clamp was sticking out of the sidewall at the southwest side. It was not apparent where the pipe went to. The area around the hole had concrete pavement. I was told by the excavator operator that 12 trucks were scheduled to come today to take away the soil pile. I took 5 pictures. I noticed a 4 story building across the street with commercial space at the street level and residences above. A commercial building abutted the site property. There was nothing much else to see. So I left. 3/12/08 - Raphael Ketani. Today I received a progress report and remedial action plan dated 3/11/08 from Mr. Rudko, Senior Vice President of AKRF. The report and plan stated that a 550 gal. gasoline tank was discovered on site which was resting on soil. The soil beneath the tank was contaminated, though the tank appeared to be intact. Contaminated soil was removed from the site. Four borings were advanced to the groundwater to delineate the extent of soil contamination. Two sites of contamination were discovered. One to the east and extending from the tank and another separate one to the southwest (maybe related to a broken sewer pipe). Contaminated groundwater was pumped out and the excavation was backfilled after 2/20/08. AKRF will install 4 wells in order to monitor the groundwater conditions. Water and soil treatment will be proposed if the contamination persists. The analytical results were as follows: groundwater; SB-1=no VOCs, few low SVOC hits SB-2=VOC hits to 1394 ppb total xylenes, no SVOCs SB-3=no VOCs and no SVOCs SB-4=VOC hits to 2370 ppb total xylenes, no SVOCs SB-5=no VOCs and no SVOCs soil; EP-1=few low VOCs, combustion SVOCs in thousands of ppb EP-2=no VOCs, combustion SVOCs in high thousands of ppb to 713,300 ppb EP-4=1 significant VOC, naphthalene 6000 ppb, high SVOCs in high thousands to 62000 ppb EP-1S=no VOCs, no SVOCs WC-4=VOCs in tens of thousands ppb to 150,000 ppb with total xylenes at 640,000 ppb, SVOC hits but none significant EP-1B=many very low VOCs, no SVOCs EP-1N=many very low VOCs, no SVOCs EP-1W=many very low VOCs, no SVOCs EP-1E=11 VOCs to 83,100 ppb, 3600 ppb naphthalene, combustion SVOCs, but not significant I spoke to Mr. Rudko. He said that they are not sure how far the contaminated soil extends. So they are not done excavating. If it extends off site, then they will consider using ORC or another treatment solution to remediate the contamination. He said that he also needs to determine the direction of groundwater flow. He said that bedrock dips to the south and so he thinks that’s the direction of groundwater flow, but he’ll see. 4/1/08 - Raphael Ketani. I spoke to Mr. Rudko (646) 388-9526. He said that nothing is happening right now at the site. He is trying to line up a driller to install borings on all 3 sides of the site. He will take soil and groundwater samples. He will keep me posted. 8/19/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater

CONSTRUCTION SITE (Continued) **S108981768**

and soil sampling, and delineation of the extent of the contamination. 9/3/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater and soil sampling, and delineation of the extent of the contamination. As there has been no contact with Mr. Rudko in 5 months and he is not reachable, I sent a letter to Ivan Moskowitz, Esq. at Swidler Berlin LLP, 405 Lexington Avenue, NY, 10174. He is the lawyer representing the owners of the site, 4329 Crescent LLC, 399 Park Avenue, NY, 10022-4614. The block and lot are 4343 and 0001. The main address is 4319 Crescent Street. 9/11/08 - Raphael Ketani. The letter to 4329 Crescent LLC, c/o Swidler Berlin LLP came back NOT DELIVERABLE AS ADDRESSED. 9/15/08 - Raphael Ketani. I tried to reach Mr. Rudko, but could only leave a message regarding groundwater and soil sampling, and delineation of the extent of the contamination. Also, I sent the 9/3/08 letter to 4329 Crescent LLC at 399 Park Avenue, and to Swidler Berlin LLP the corrected zip code of 10017. 9/22/08 - Raphael Ketani. The letter to Swidler Berlin LLP came back with a Post Office indicating Not Deliverable As Addressed. I called up a phone number for Swidler Berlin (212) 891-9536 and was told that Swidler Berlin no longer exists. One of their offices merged with Bingam McCutchen (the same phone number as above). She said that Mr. Moskowitz works for Bingam McCutchen and that his direct number is (212) 705-7537. I called Mr. Moskowitz, but could only leave a message regarding the site. Mr. Moskowitz called me back. He said that he still represent 4329 Crescent LLC. He will contact them to see why there is no progress with the investigation. 9/25/08 - Raphael Ketani. Patricia Dunphy of Rockrose Development Corp. (212) 984-1795 called earlier this week regarding the site. I tried to return her call, but could only leave a voice mail. Later this morning, I received a call from Steven Eisner (212) 984-1705 of Rockrose. He said that the reason the sidewalk wells weren't installed is because they are doing foundation dewatering across the street to the west at 3000 Crescent Street. The building that was there was knocked down 3 weeks ago. He said that once the foundation is put in, then they will install the wells. I asked him whether they had found any contaminated water. He said no. He said he will let me know when the foundation dewatering is done in 6 to 8 weeks. 10/27/08 - Raphael Ketani. I tried to contact Mr. Eisner regarding the dewatering of the neighboring site, but could only leave a message. Mr. Eisner called me back. He said that the foundation wont be installed until February 2009. Then they will install 4 wells. 2/13/09 - Raphael Ketani. I spoke to Mr. Eisner. He said that the foundation construction and dewatering is still taking place. He said that the wells will probably be installed at the end of February and a report will be submitted to DEC by March 13. I said that would be alright. Mr. Eisner added that Mr. Rudko is no longer with AKRF and the case is now being handled by Kate Bruner of AKRF (646) 388-9525. 2/17/09 - Raphael Ketani. Kate Brunner called me to say that she will give me an update regarding the project at the end of February. 2/26/09 - Raphael Ketani. Ms. Brunner called. She said that the dewatering for the foundation should end in a week. The well installation will take place in mid-March with a 4 geoprobe. 3/16/09 - Raphael Ketani. Mr. Eisner (212) 984-1705 called to say that they are still working on the foundation for the building across the street. They expect to finish in May. Once they're finished, then they will install the wells. 4/23/09 - Raphael Ketani. I talked to Ms. Brunner (212) 696-0670. She said that the construction contractor had finished dewatering the site a couple of weeks ago. She added

CONSTRUCTION SITE (Continued) **S108981768**

that applications had been submitted to the City for sidewalk permits. There is a tentative date of 5/4/09 for starting the boring work. 7/13/09 - Raphael Ketani. I spoke to Ms. Brunner. She said that she had received the soil and groundwater analytical report. However, she was out. So the review couldn't take place until she had a chance to look at it. She said that the results looked very good. Right now, the report is undergoing internal review. Once AKRF is done with it, then the report will be forwarded to DEC. I told her to send the report as soon as possible. 9/11/09 - Raphael Ketani. I left a message for Ms. Brunner that the DEC never received the groundwater analytical report. 9/14/09 - Raphael Ketani. Ms. Brunner (212) 696-0670 called me today. She said that the groundwater survey didn't take place until July 2009 due to access problems. The developer they were working with as a client has split into two entities. One entity is responsible for pursuing the environmental evaluation and reporting. This is the client and this entity is still reviewing the environmental report. However, Ms. Brunner said that she expects to send the DEC the environmental report in two weeks. She added that the analyticals were all non-detect. 9/25/09 - Raphael Ketani. Today I received the Supplemental Subsurface Investigation dated 9/24/09 and submitted by AKRF. I began my review. 9/29/09 - Raphael Ketani. I finished my review. They recovered soil samples from only 2 of the 4 borings that were attempted on 5/11/09. They state that, for technical reasons, they could not recover soil samples from MW-1 and MW-3, but they don't explain what this means. Soil samples were submitted for MW-2 and MW-4. MW-2 is at the eastern corner of the site and MW-4 is at the southwest corner of the site. Groundwater flow is to the east. The soil samples were completely non-detect for VOCs. There were a number of SVOC hits, but they were all below TAGM, except for some benzo series hits which were just slightly above TAGM. Groundwater samples for the four wells were entirely non-detect for VOCs. Samples from wells MW-1 to MW-3 were completely non-detect for SVOCs. The groundwater sample from MW-4 had a number of SVOC hits, but they were below TAGM, except for five combustion product hits (mostly the benzo series) which were slightly above TAGM. From re-reviewing the 3/11/08 investigation report, it appears that there are a lot of ashes and cinders at the site. This was determined by the presence of high concentrations of the combustion product SVOC analytes in soil samples from various locations. From the end point sample results for EP-1N, EP-1S, EP-1W, and EP-1B, it appears that the contaminated soil was removed. However, the results for EP-1E showed several SVOC hits to 4300ppb, including naphthalene and 2-methylnaphthalene, and four other low level SVOCs, but all of the other SVOCs were non-detect. The VOCs were all non-detect, also. It seems as if they did a reasonable job of digging out the contamination. Though questions remain regarding the 03/11/08 report and the 9/24/09 report: 1) the 3/11/08 report lists boring locations SB-1, SB-2, and SB-4, but the data package shows EP-1, EP-2 , and EP-4. Are these the same borings? Also, what happened with the soil sample for SB-3? 2) why were no borings conducted between W SB-1 and MW-2? 3) what does the number 434 mean on Figure 2 from the 3/11/08 report? 4) there is no explanation as to why they couldn't recover soil samples from MW-1 and MW-3, except to say that for technical reasons they couldn't do it. What are the technical reasons? 5) a number of VOCs are listed as above TAGM on Figure 3 in the 9/24/09 report for the soil sample from EP-1E. However, these analytes are not in the analytical data report for the end point samples. Where

CONSTRUCTION SITE (Continued) **S108981768**

did this information come from and how much above TAGM are the hits? Aside from answering these questions, the DEC requires that they perform one more soil borings. One halfway between W SB-1 and MW-2. 10/9/09 - Raphael Ketani. Ms. Brunner called me back. She answered the five questions: 1) SB-1, SB-2, and SB-4 are EP-1, EP-2, and EP-4. There was some confusion regarding the numbering of the samples due to the previous use of a different numbering system. 2) we agreed to have one more soil boring performed halfway between W SB-1 and MW-2 just to see what the contamination is, if any 3) number 434 is the block number from the block and lot tax maps 4) soil samples couldn't be recovered because they kept hitting refusal. The geoprobe wasn't strong enough to apply enough torque to get a sample and the sampling tool was thin so that a stronger machine would have broken the tool. They stepped out from these locations and sampled elsewhere with a heavier rig. 5) the analytes for EP-1E come from the 2008 report. Ms. Brunner just wanted to show what had been detected PRIOR to excavation of the site. 10/15/09 - Raphael Ketani. I received an e-mail today from Ms. Brunner regarding the location of the additional boring that DEC had requested (see E-docs). I sent a response e-mail in which I approved the location. 11/5/09 - Raphael Ketani. I tried to contact Ms. Brunner (212) 696-0670, but could only leave a voice mail. 11/6/09 - Raphael Ketani. I received the following e-mail from Ms. Brunner: The soil boring was completed at 43-29 Crescent Street as planned. We got the preliminary VOC and SVOC data back and all concentrations are less than TAGM RSCOs so we'll be requesting closure. We are preparing a revised report for submittal to DEC and we are still on-track to get you the report in mid-November. 11/16/09 - Raphael Ketani. Today I received the 11/12/09 Supplemental Subsurface Investigation report from Ms. Brunner at AKRF. I review the report for the soil analyses for SB-5. The results were completely non-detect for VOCs and SVOCs. Based upon the soil and groundwater analytical results in the case file, I have determined that there are minimal impacts to the environment and to people. Therefore, I am closing the spill case. "

DEC Memo:	"04/13/10-Hiralkumar Patel. as oil was found on water in subway tunnel underneath the subject building, asked building manager to do tank test on a 2,000 gal #2 oil tank. 2:00 PM:- visited site. met Mr. Sokol, property manager. Eastmond did fill line test and it failed. asked Mr. Sokol, to seal fill port to prevent further release. fill port at the site is about 15 ft away from the area where oil found seeping into subway tunnel. asked Mr. Sokol to do tank only test also to confirm no leak from tank. Court Square LLC. **property owner** c/o Fisher Associates **management office** Carnegie Hall Tower 152 West 57th Street, 12th Floor New York, NY 10019 Attn.: Benny Sokol **property manager** Ph. (212) 315-3390 Ext. 214 (O) (347) 273-0998 (C) Fax (212) 937-8814 email: bsokol@fisherassoc.net 04/15/10-Hiralkumar Patel. received email from Mr. Sokol (at 6:53 PM on 04/13/10) with their insurance company info. Hub International **insurance broker** contact: Cynthia Chin PH. (212) 338-2858 10:09 AM:- spoke with Mr. Sokol. Eastmond is at the site to do tank only test and then will expose the fill line. asked Mr. Sokol to wait for excavation along fill line as may need approval from MTA. 10:14 AM:- spoke with Haroon in System Safety at MTA. Haroon mentioned that contractor doesn't need any approval from MTA for sidewalk breaking or fill line repair. asked Haroon to send someone to the site to guide contractor if deeper excavation is required (due to proximity to the subway structure). Haroon Aslam **spill case manager in MTA** PH. (646) 252-3607 (646) 252-5777 email: haroon.aslam@nyct.com 10:18 AM:- spoke with Mr. Sokol. asked him to finish tank only test first and expose fill line. informed Mr. Sokol that no deeper excavation should be performed until MTA approves the work. 11:45 AM:- visited site. met Mr. Sokol and Haroon. eastmond crew was working to test tank. spoke with Rene at Eastmond. they have applied for DOT permit

COURT PLAZA (Continued) **S110309405**

and expect to start work on 04/19/10. inspected track area with Mr. Sokol and Haroon. area was in same condition with little more oil than previous site visit. some odors at the end of platform in leak area. Haroon asked to contact Rajen Udeshi at MTA about approval for excavation near subway structure. 04/16/10-Hiralkumar Patel. 9:38 AM:- sent email to Mr. Sokol with Mr. Udeshi's contact info. Rajen Udeshi Capital Program Management 2 Broadway, 7th Floor New York, NY 10004 Ph. (646) 252-3673 email: rajen.udeshi@nyct.com 04/16/10-Hiralkumar Patel. 11:01 AM:- received email from Mr. Sokol. after installing new fill and vent line and repairing manhole on tank, Eastmond tested tank system and it passed the test. Mr. Sokol will submit test result, once available. 04/19/10-Hiralkumar Patel. 11:55 AM:- spoke with Jen at MTA. they haven't got fingerprint sample results back yet. 12:47 PM:- received email from Mr. Sokol. they spoke with MTA who approved to excavated up to four feet without any engineer report. so Eastmond will expose old fill line tomorrow. Mr. Sokol also mentioned that their insurance company has hired Tetra Tech. 2:51 PM:- received message from Sandra from Tetra Tech. Sandra Gaurin Tetra Tech EM Inc. Ph. (973) 384-9799 (O) (973) 659-9996 Ext. 245 (201) 572-0835 (C) Fax (973) 659-1287 email: sandra.gaurin@tetratech.com 3:20 PM:- left message for Ms. Gaurin. 04/20/10-Hiralkumar Patel. 2:15 PM:- visited site. met Ms. Gaurin, Mr. Sokol and Rene. Eastmond crew exposed old fill line. when contractor tried to pull out fill line from ground, fill line separated in two pieces from coupling. no broken threads observed on pipe and looks like fill line was not properly installed. found that piece of fill line towards building was anchored in ground at coupling joint. piece of fill line towards building was corroded but no holes found. corrosion holes found in piece of fill line towards sidewalk. fresh oil found under fill line. asked Ms. Gaurin to get DOT and MTA permits before further work. Eastmond will cover excavation with plastic and then backfill with clean sand as need permit for further work. Eastmond collected two soil samples (from same area) for fingerprint and age analysis. inspected subwary track area with Ms. Gaurin. found oil on tracks. asked Ms. Gaurin to submit claim number and insurance claim handler's information. asked Mr. Sokol to submit tank test result. 04/23/10-Hiralkumar Patel. received email from Ms. Gaurin (at 5:24 PM on 04/21/10) with contact info for project manager at insurance company. Ms. Gaurin is preparing work plan for further work and asked whether groundwater sample from temporary geoprobe is sufficient for initial groundwater quality check or permanent well is required. Dawn Krigstin Ironshore Environmental **insurance carrier** Ph. (646) 826-6785 email: Dawn.Krigstin@Ironshore.com spoke with Ms. Gaurin and informed her that permanent well is not required right now, but will be required if finds groundwater contamination in groundwater sample via temporary geoprobe. 04/23/10-Hiralkumar Patel. received email from Mr. Sokol (at 7:51 PM on 04/22/10) with tank test result. 12:34 PM:- received email from Jen from MTA including result of fingerpint analysis. sample collected from subway track area was found #2 oil. 04/26/10-Hiralkumar Patel. 10:18 AM:- received call from Mr. Daniels, environmental person at Chartis insurance which is second insurance company for the site. Mr. Daniels mentioned that both insurance companies are involved in project. asked Mr. Daniels to submit insurance claim project manager's info and clear information about who is going to handle entire cleanup project. Larry Daniels Chartis Insurance AIG Ph. (201) 631-7233 (O) (917) 783-6035 (C) Fax (201)

COURT PLAZA (Continued) **S110309405**

631-5053 email: larry.daniels@chartisinsurance.com 11:03 AM:- received email from Tanya Crawford, analyst working on insurance claim at Chartis. Tanya Crawford **analyst** Chartis 101 Hudson Street 29th Floor Jersey City, NJ 07302 Ph. (201) 631-7158 Fax (866) 467-3498 email: tanya.crawford@chartisinsurance.com Chartis Claim Number: 182-111535 1:11 PM:- received email from Mr. Sokol with copy of delivery record from 01/07/08 to 04/01/10. 3:43 PM:- received email from Mr. Sokol with sample results. fingerprint analysis indicates #2 oil and found heavy VOC contamination in soil sample. 04/27/10-Hiralkumar Patel. 4:01 PM:- after discussion with DEC Austin, as fingerprint analysis results match (#2 oil) and proximity of the subject site to the impacted subway area, spill #: 1000435 will be closed and investigated under spill #: 1000528. 3:03 PM:- received email from Mr. Daniels and Ms. Gaurin requesting copy of MTA's fingerprint analysis result. 04/28/10-Hiralkumar Patel. 11:05 AM:- sent email to Mr. Daniels and Ms. Gaurin with copy of MTA's fingerprint analysis result. 11:08 AM:- sent letter to Mr. Sokol requiring soil delineation along remote fill line, endpoint samples and at least one groundwater sample near source area. letter emailed to Mr. Sokol, Ms. Aslam, Mr. Udeshi, Ms. Gaurin, Mr. Krigstin, Mr. Daniels and Ms. Crawford. 05/21/10-Hiralkumar Patel. 1:29 PM:- left message for Ms. Gaurin inquiring updates. 3:59 PM:- received email from Ms. Gaurin. she got drawings from MTA and now will prepare work plan for soil investigation. will submit work plan to DEC and MTA for approval next week. will apply for NYC DOT permit on 05/24/10. 06/01/10-Hiralkumar Patel. received email from Ms. Gaurin (at 9:13 AM on 05/28/10) requesting deadline extension. 11:00 AM:- received call from Ms. Gaurin. she mentioned that currently they are preparing work plan and will submit by end of 06/04/10. she requested 45 days extension as work plan needs to be reviewed/approved by DEC and MTA and also they need permit from DOT. based on available information, approved her request. 06/08/10-Hiralkumar Patel. 10:31 AM:- received work plan from Ms. Gaurin. proposes to install 12 soil borings to a depth of 10-15 ft bg. will collect two soil samples (highest PID and deepest dry) from each boring. will install one temporary well point to collect groundwater water in area where old fill line was located. will collect one more soil sample from the deepest visually impacted material for a forensic fingerprint analysis to find date of the release. work plan is not acceptable as doesn't include work schedule and also site map included in work plan doesn't include the site address and location of old fill line. 06/10/10-Hiralkumar Patel. 1:03 PM:- received email from Jen from MTA. she confirmed that no more oil leak found on tracks. she asked for updates. 1:32 PM:- sent email to Jen informing that the department is currently reviewing the work plan for subsurface investigation. 1:36 PM:- spoke with Ms. Gaurin. asked her to submit revised work plan including timeline for report submission and general site map showing the subject site, old fill line and proposed boring locations. 06/16/10-Hiralkumar Patel. 4:34 PM:- received email from Ms. Gaurin with revised work plan. she proposes to submit report by end of 08/16/10. 06/17/10-Hiralkumar Patel. 2:21 PM:- sent work plan approval letter to Mr. Sokol requiring to submit report by end of 08/16/10. letter emailed to Mr. Udeshi, Mr. Aslam, Ms. Gaurin, Mr. Krigstin and Ms. Crawford. 07/27/10-Hiralkumar Patel. 11:38 AM:- received email from Ms. Gaurin. she mentioned that they have got required NYCDOT permits, but still waiting for approval from MTA. they are revising engineered drawings for MTA this week and hopefully will be in the field on August 9th.

COURT PLAZA (Continued) **S110309405**

due to delay in getting approval from MTA, Ms. Gaurin requested deadline extension, for report submission, till 09/16/10. 07/28/10-Hiralkumar Patel. 11:25 AM:- sent email to Ms. Gaurin approving her request to submit report by 09/16/10. email copied to Mr. Sokol. 08/04/10-Hiralkumar Patel. 11:18 AM:- received email from Ms. Gaurin. she confirmed that work will start on 08/09/10. Francis Ronquillo (cell # 619-602-1745) from tetratech will supervise the field activities. 09/07/10-Hiralkumar Patel. 2:20 PM:- left message for Ms. Gaurin. 4:16 PM:- received message from Ms. Gaurin. she is preparing report and will submit by 09/16/10. she mentioned that contamination found in soil samples and free product found on water. 09/16/10-Hiralkumar Patel. 4:24 PM:- received investigation report from Ms. Gaurin. abstract: - GPR survey indicated another line along the previously excavated remote fill line, which was later found as cable line - installed 12 soil borings to depth of 10-15 ft bg - soil under the sidewalk was poorly graded sandy soil with very little gravel - soil samples were collected either at highest PID reading or deepest dry - one temporary well installed in proximity of the source area - found free product on water sample from temporary well - groundwater was encountered at approx. 15 ft bg - one soil sample was collected at 11 ft depth from boring TTB-1 (closer to source area) forensic fingerprint analysis (results will be submitted once available) - no contamination found in borings installed near the building foundation wall (south side), but contamination found towards the street curb (towards subway) (north side) - recommends further delineation in east and west direction soil analyticals:

09/20/10-Hiralkumar Patel. after discussing with DEC Austin, case transferred to DEC Vadim due to groundwater contamination and impact to the MTA tunnel. **refer to spill # 1000435 also.** 11/8/10 - reassigned from Tibbe to JMOCONNE - sent email to TetraTech (Gaurin) asking for reports/work plans submitted but not reviewed (JOC) 01/14/11 - spoke with Sandra Gaurin, Tetratech. She will prepare and provide two separate documents: work plan for installing permanent well at location of former temp to allow removal of free product in the short term; separate work plan for delineation of contam soil and gw - to be written as dynamic work plan - will include some means to evaluate whether oil migrated down along outside front (north side) of building where fill line enters building; same along inside of wall (basement has soil floor); will include sensitive receptor survey; recognized that MTA approval is needed for all work due to proximity of subway (JOC) 11/28/11 - Raphael Ketani. I reviewed the Tetra Tech Inc. 11/23/11 response letter to the DEC 10/11/11 letter commenting on the additional Site Investigation Work Plan and the Interim Remedial Measure Work Plan dated April 2010. The letter

COURT PLAZA (Continued) **S110309405**

described the tentative work schedule. During this week, the NYCDOT permit applications are supposed to be processed. I spoke to Sandra Gaurin (gor-in) of Tetra Tech (973) 630-8040 about this. She said that some changes were required. So the applications were resubmitted. She is hopeful that the applications will finally be accepted so that December 12 field activities can commence. I also asked her why Tetra Tech was going to use the Membrane Inter Phase screening. She said that this was Mr. O'Connell's suggestion so that Tetra Tech doesn't have to go back and forth with doing many rounds of soil sampling and taking many soil samples that need to be sent off for analysis. She said that the vapor analysis from the penetration points will tell them where the worst contamination is. I told her that the DEC will still require that soil end points be taken after all of the soil that can be excavated has been removed. She said that she expected to do in-situ treatment due to the close location to the subway. I asked her what type of building was being serviced by the fuel system. She said that it's a residential/commercial building near the court house. The letter also dealt with vertical delineation of the contamination and soil and groundwater sampling. I approved the 11/23/11 Tetra Tech letter in an e-mail to Ms. Gaurin. 12/5/11 - Raphael Ketani. Ms. Gaurin (973) 630-8040 sent me an e-mail. The MIP investigation will take place between 12/19 and 12/22, and the recovery well installation will take place on 1/3/12. 3/7/12 - Raphael Ketani. Today I received the TetraTech March 2012 Remedial Investigation Report. The soil and groundwater were sampled on 12/21/11. Four MIPS and two soil borings (SB-1 and SB-2) were installed. MIP-1 was installed next to the old fuel line. MIP-2 was 15 feet southwest of MIP-1 and MIP-4 was 6 feet to the northeast. The soil results for MIP-2 did not have any VOC exceedences and no BNA (bases-neutral-acid) hits. The soil results for MIP-4 at 9 feet bgs were: 3360 ppb ethylbenzene, 5310 ppb toulene, and 59,300 ppb total xylenes. The deeper soil results for MIP-4 had only one exceedence, 945 ppb of total xylenes. The great majority of the soil contamination at MIP-1 was in the 10.5 foot to 12 foot interval. These results were up to: 10,800 ppb ethylbenzene, 6240 ppb toluene, 67,100 ppb total xylenes, 23,700 ppb naphthalene, and 284 ppb benzene. There were no significant detections for the BNA analytes. The other MIP results and the results from the regular soil borings were either without exceedences or non-detect. A groundwater sample was taken at MIP-3, which is about 35 away from the old fuel line. The results were entirely non-detect. The RIR also included the figures from the 2010 soil testing and sampling. The testing and sampling locations defined the limits of the investigation area. The results indicated that there were significant exceedences at TTB-1, 2, 5, 6, 8 and 10. I spoke to Ms. Gaurin (973) 630-8040 about the RIR. I told her that soil removal or remediation should take place at the locations of MIP-1, MIP-4, and TTB-1, 2, 5, 6, 8 and 10. I also told her that the groundwater sample which was taken at MIP-3 didn't reflect the groundwater conditions near the spill site as it was too far away (about 35 feet distance). Ms. Gaurin said that there had been a few inches of product on the water table, but it had disappeared. I asked her why the MIP-3 sampling didn't find the product. She responded that the MTA had been collecting the product that had seeped into the subway. So she assumed it had all gone there. I told her that the DEC didn't believe that this was true and that there should be some product near the old fuel pipe. I asked Ms. Gaurin to submit a work plan for excavating the contaminated soil in

COURT PLAZA (Continued) **S110309405**

the affected areas. She said that excavation couldn't be done as there were too many utilities. I then told her to try treatment solutions. She said that she wasn't sure they would work. Lastly, I told Ms. Gaurin to submit a site plan showing where the utilities are in relationship to the MIP locations and the TTB locations. She said that she will. In the end, I determined that soil treatment and the installation of a well right next to MIP-1 would be necessary. I sent an e-mail to Ms. Gaurin (973) 630-8040 stating that the second investigation had been inadequate regarding the delineation of the soil contamination. I mentioned in the e-mail that high soil contamination was found at TTB-1, 2, 5, 6, 8 and 10, and at MIP-1 and MIP-4. I also stated that borings should have been performed extending away from these locations until the limit of the soil contamination had been found. Lastly, I asked for a scaled drawing showing where all of the utilities were. Ms. Gaurin responded by e-mail that the TTB series of borings were meant for only internal TetraTech use in order to evaluate the MIP responses. That is why they were in the appendices. She also stated that they were performed in 2010 and don't reflect current conditions. 12/11/12 - Raphael Ketani. Ms. Gaurin (973) 630-8040 called to say that she just recently realized that the DEC hadn't been sent the information that was requested some time ago. She said that the project manager had left and so things came to a standstill regarding the project. She will send the DEC the information very soon. 12/24/12 - Raphael Ketani. I reviewed the Addendum to the Remedial Investigation Report dated April 2012 and revised December 2012. The information in the revised Addendum confirmed the results of the earlier March 2012 Remedial Investigation Report and contained additional data. The additional information and data consisted of the fact that only 4 Membrane Interface Probe MIP locations could be installed due to the presence and density of the utilities. In the Addendum, it is stated that there is universal refusal at 20 feet bgs. However, it is not mentioned whether this is due to the presence of the subway tunnel. Also, the silt content of the soil markedly increased from about 14 to 15 feet bgs. Again, this may be due to the method of subway tunnel construction - the silt acting as a protective layer from ground vibration from the street above. Groundwater recovery was limited to 11 to 14 feet bgs. MIP-1 had a strong Flame Ionization Detection (FID) response at 12 feet, but less below 12.5 feet. MIP-2 near the former TTB-5 location had an FID response starting at 5 feet with the strongest response at 10 to 12 feet bgs. The response declined below this horizon. MIP-3, which is 35 feet to the west of the former fill pipe location, had lower FID responses than MIP-2 at 12 and 16 feet below grade. MIP-4 near the former location of TTB-10 had FID responses starting at 6.5 feet bgs. There was no FID response at 12 feet bgs. Soil impacts appear to diminish to the west. A soil sample taken where the fill line had entered the building did not indicate contamination. There were no reports of product in the subway since the line was replaced during April 2010. There were significant VOC exceedences at TTB-1, 2 and 5 to 10 (but not at TTB-4 and 11 to 13). There were also significant VOC exceedences at the locations of MIP-1, MIP-4. This implies that there is still high soil contamination along the west and north sides of the 15 foot by 15 foot main impact area. The highest soil contamination was found between 3 feet and 8 feet bgs. VOC groundwater results were high at TTGW-1 (15 feet bgs). The groundwater sample which was taken at MIP-3 didn't reflect the groundwater conditions near the spill site as it

COURT PLAZA (Continued) **S110309405**

was too far away (about 35 feet distance). TetraTech recommended allowing Monitored Natural Attenuation to remediate the remaining contamination. They would also conduct groundwater monitoring. 12/26/12 - Raphael Ketani. A letter was drafted and submitted to Hassan Hussein, EE III and supervisor of Unit C in Region 2, for his review. In the letter, the DEC requested that a method be determined for remediating the soil contamination at TTB-1, 2 and 5 to 10, and at MIP-1 and MIP-4. It was also requested that they find a way to reduce the VOC contamination in the groundwater. Court Square LLC was given until January 18, 2013 to submit a remedial action work plan. The latest ownership information for 5 Court Square (block and lot 81 and 9) is: Court Square LLC, c/o Fisher Associates Real Estate, 152 West 57th Street, 12th Floor, NY, 10019. 12/27/12 - Raphael Ketani. Mr. Hussein approved the letter and it was sent out. 1/18/2013 - Raphael Ketani. I received the January 2013 Remedial Action Work Plan and began my review. 1/23/13 - Raphael Ketani. I finished my review of the RAWP. TetraTech will use RegenoOx to reduce or remove the soil contamination at TTB-1, 2, 5 and 10 and MIP-1 and MIP-4. Seven temporary injection points will be installed 10 feet apart. About 1440 lbs. of solution will be injected between 3 to 8 feet below grade. ORC Advanced will be used to remediate the groundwater at TT-GW1. They will inject 120 lbs. of solution at 4 temporary points. The solution will be injected between 15 and 20 feet below grade. Two sampling events will be performed on a quarterly basis after the injections are completed. Soil and groundwater samples will be taken from 4 temporary points within the injection area. The soil and groundwater samples will be tested for VOCs and SVOCs. The work schedule will be submitted after they get approvals from the NYC DOT and the MTA. The Remedial Action Report will be submitted after the treatments and sampling are completed. CP-51 standards will be used to compare the soil results. TOGS 1.1.1 standards will be used to compare the groundwater results. I found the RAWP to be deficient for the following reasons: (1) they intend to address the soil contamination at TTB-1, 2, 5 and 10. However, the DEC's letter approving the revised April 2012 Remedial Investigation Report Addendum (Revised December 2012) dated 12/27/12 instructed Court Square LLC to remediate the soil contamination at TTB-1, 2 and 5 TO 10, not 5 and 10. (2) there is no discussion regarding the siltyness of the soil and its impact on the movement of the solution (3) the site is near the subway tunnel, will the MTA only give approval to the injections if the solution is in a weak form? if so, then the solution may not be effective (4) Figure 2 - Treatment Area Map = the actual solution injection locations are not shown Additionally, Court Square LLC must consider the following before the injections take place: (1) they need to comply with the Federal underground injection control (UIC) regulations. Also, they should review the DEC guidance (IGP-22); (2) information is needed regarding the dosing of the solutions (i.e. mass of chemical per mass of VOCs and SVOCs); (3) how will the conditions in the subsurface be kept oxic? (4) it is recommended that groundwater be extracted from the proposed injecton area to minimize displacement of the dissolved plume. The pre-extracted water could be used to prepare the treatment solutions; (5) how will the treatment solutions be prevented from migrating off site? are there downgradient control wells? A response letter was drafted for the review of Mr. Hussein. The letter stated the above deficiencies and listed the 5 above pre-injection items. The submission of a revised Remedial Action Work Plan was requested with

COURT PLAZA (Continued) **S110309405**

a due date for the work plan of March 1, 2013. Mr. Hussein approved the letter and it was sent out. 3/1/13 - Raphael Ketani. Ms. Gaurin (973) 630-8040 sent an e-mail requesting an extension of the submission deadline for the work plan to March 15, 2013. She said that they needed to get additional contractor quotes. I granted the extension. 3/21/13 - Raphael Ketani. I received and reviewed the revised Remedial Action Work Plan dated March 2013. Tetra Tech plans to inject the treatment solutions at the 10 locations indicated in the DEC 1/25/13 letter. These are TTB-1, TTB-2, TTB-5 to TTB-10 and MIP-1 and MIP-4. About 1440 lbs. of RegenOx will be injected at a depth of 3 to 8 feet bgs. A 5% solution will be used. There will be two rounds of injections two weeks apart. About 120 lbs. of ORC Advanced will be injected into the saturated zone at 15 to 20 feet bgs at the locations TTGW-1, TTB-5 to TTB-7 and TTB-9. The treatment solutions will be allowed to work for 9 to 12 months. After this period of time, there will be two rounds of confirmatory soil and groundwater sampling on a quarterly basis. The samples will be tested for VOCs and SVOCs. If the MTA doesn't approve the plan, then excavation will take place in order to remove the contamination. A USEPA form 40 CFR Part 144 will be submitted to the EPA. I approved the revised work plan in an e-mail to Ms. Gaurin and indicated that the DEC would like the work to proceed as soon as possible. 5/15/13 - Raphael Ketani. I tried to contact Ms. Gaurin (973) 630-8040 regarding progress at the site, but could only leave a voice message and send an e-mail. Later, Ms. Gaurin sent me an e-mail stating: We submitted draft engineering drawings to the MTA just after receiving your approval and we only heard back from them last week. We need to pick up the marked up copies of our drawings and address their comments. Then we will resubmit the drawings for review/approval which may take MTA several weeks. We will contact you as soon as we receive MTA approval and are ready to schedule the injection. 8/23/13 - Raphael Ketani. I hadn't received any correspondences from Ms. Gaurin regarding progress at the site. Therefore, I sent her an e-mail requesting an update. 8/24/13 - Raphael Ketani. Ms. Gaurin sent me an e-mail today stating that Tetra Tech received the comments on the drawings from the MTA. Tetra Tech intends to resubmit the drawings with the responses to the comments sometime during September 2013. Until the drawings are finalized, a drilling contractor will not be retained or scheduled. It is expected that no work will take place until October or later. 10/18/13 - Raphael Ketani. I tried to contact Ms. Gaurin (973) 630-8040 by phone in order to receive a progress update. However, I could only leave a phone message. Therefore, I sent her an e-mail requesting information. Ms. Gaurin responded back with the following e-mail: We have sent back the revised drawings and received a voice mail requesting the marked up copies being sent back to them. It is our understanding that these copies were submitted to them with the revised drawings, we don t have these anymore in the office and we left several voice mails to MTA to that effect. No responses to date from them, we asked them to review the revised drawings without the marked up and provide approval to proceed. I don t know what else to state, I will call again to try to make things progress at some point. 10/30/13 - Raphael Ketani. Ms. Gaurin sent me an e-mail stating that she had called the MTA and they told her they will re-start their review of the plans again. 11/1/13 - Raphael Ketani. Ms. Gaurin sent me an e-mail stating that she had just received a phone call from the MTA approving their remediation plan. She will contact the drilling

COURT PLAZA (Continued) **S110309405**

company very soon. 2/13/14 - Raphael Ketani. As there has been no contact from Ms. Gaurin (973) 630-8040 in some months, I sent her an e-mail wherein I requested a progress update. Later, Ms. Gaurin sent me the following e-mail: I thought I had send you the proposed dates for the two rounds of injection at the site. They were both completed in December and we have scheduled the first performance sampling event for March 11, 2014. The next sampling event will be scheduled in June 2014 after which we will submit the results of both rounds of sampling and any conclusion on the performance of the injection. 5/20/14 - Raphael Ketani. I sent Ms. Gaurin (973) 630-8040 an e-mail requesting the March 11, 2014 sampling results. Later, Ms. Gaurin sent me the April 2014 analytical results report. I reviewed the report. The post injections soil VOC results were such that the samples from TTB-14 and MIP-2 were completely non-detect. The sample for TTB-5 had 9 non-detects and 6 low hits. MILP-4 had 6 non-detects, 8 low hits and 1 low exceedence. TTB-12 had 3 non-detects, 10 low hits and 3 low to moderate exceedences. TTB-1 and TTB-6 had 5 and 4 low to moderate exceedences, respectively, and many low hits. The exceedences with the highest concentrations were 1,2,4-trimethylbenzene to 24.5 ppm, naphthalene to 17.6 ppm and total xylenes to 21.5 ppm. Soil BNA analyses were non-detect for the great majority of analytes. However, MIP-2MS and MIP-2MSD had 1.1 ppm exceedences for the benzo series of analytes and their combustion products. There was only 1 groundwater sample analyzed. The majority of the groundwater VOC results were non-detect, except for 2-methylnaphthalene at 2200 ppb, fluorene at 320 ppb, naphthalene at 180 ppb and some low hits. The next round of groundwater sampling will take place during June 17 and 18, 2014. 8/20/14 - Raphael Ketani. As there has been no contact from Ms. Gaurin (973) 630-8040 regarding progress at the site, I sent her an e-mail requesting an update. 8/27/14 - Raphael Ketani. Today I talked to Paul Stewart of Advanced Cleanup Technologies (516) 441-5800, ext 103. He said that the property was going to be sold. He did not state whether he represented the prospective buyer. However, he wanted to know the present environmental conditions beneath the site. I read the case notes to him regarding the April 2014 soil and groundwater sampling results. I told him that I wasn't sure what more could be done to lower the soil analytical concentrations as there were many utilities in the area and the subway tunnel was very nearby. He thanked me for the information and the conversation ended. 9/9/14 - Raphael Ketani. I reviewed the TetraTech 7/2/14 soil and groundwater analytical report. The samples had been taken during 6/17/14. Soil VOCs were either non-detect or very low hits for the samples from MIP-2, TTB-5 and MIP-4. The sample from TTB-1 (next to the source - the fill line) had 7 low to high exceedences. The sample from TTB-6 had 1 moderate and 1 high exceedence. TTB-12 had 3 low to high exceedences. For the soil SVOCs, the results were almost entirely non-detect. The groundwater VOCs consisted of 4 exceedences, but only the total xylenes was deemed significant at 212 ppb. The groundwater SVOCs were 74.2 ppb naphthalene, 2 low exceedences and several low hits. There were high iron and manganese hits for the groundwater. 9/12/14 - Raphael Ketani. I had a phone conversation with Ms. Gaurin (973) 630-8040 regarding the latest soil and groundwater analytical results. I commented to her that the results for the soil were still high at TTB-1. She said that this boring was performed right at the old fill line. She said that there was a quarter size hole in the old pipe and this is why the oil leaked out and why the contamination is

COURT PLAZA (Continued) **S110309405**

much higher here than elsewhere on site. However, she also said that there is no oil on the water table. I asked her which treatment chemical was used. She said that it was ORC as the subway tunnel is too close for persulfate and the MTA wouldn't approve its use. I asked her whether she felt the ORC had done its job and whether another treatment round would help. She said that the last time they did the injections, some of the ORC flowed quickly through the soil and into the basement of the building. The basement is in bad shape with many cracks. I asked her whether digging could take place. Ms.Gaurin commented that there were many utilities in the affected area. So the workers would have to use shovels to dig around the electrical and gas utilities. I told her this sounded dangerous and that the Department would not ask Tetra Tech to do such work. Also, I commented, I didn't believe that Con Ed would like the idea of people getting so close to their utilities. Next, I stated that I would present the spill case to my supervisor, Mr. Hussein, for closure. However, I needed an analytical summary table for the soil and groundwater results. Ms. Gaurin stated that she will send me one with everything. With that, the conversation ended. 9/15/14 - Raphael Ketani. Mr. Gaurin ((973) 630-8040/sandra.gaurin@tetratech.com) sent me the Excel data tables for the soil and groundwater data for the various locations from August 2010 to June 2014. The soil VOC tables show high (PPM) exceedences of the CP-51 unrestricted residential (UR)soil standards for samples taken during 2010 and 2011. A comparison of the March 2014 and June 2014 results show a mixed response to the ORC treatment application which took place during December 2013. In other words, some analyte concentrations fell while others increased. The soil SVOC tables show very few analyte exceedences of the CP-51 UR standards accompanied by some low hits for most locations. The results for March 2014 and June 2014 were almost entirely non-detect, but the MIP-2MS and MIP-2MSD results were strangely higher even though the MIP-2 results were all non-detect. The groundwater VOC tables show a few very high exceedences of the TOGS 1.1.1 standards for the 2010 results and all non-detects for the 2011 results. However, the March and June 2014 results 5 low to high exceedences with the June results being generally slightly lower. The groundwater SVOC tables show low to high results for the sample taken in 2010, but no hits for the 2011 results. March 2014 post injection results had one high exceedence and a number of low hits. The June 2014 results had two low exceedences and a small number of low hits. The reasons for the variation in the soil and groundwater results were not clear. It may be that another round of ORC injections is necessary in order to bring down the soil results. 9/17/14 - Raphael Ketani. A closure meeting took place today. Staff attending the meeting requested additional information from the consultant, Ms. Gaurin, regarding the excavation of the contaminated soil below the old fill pipe. So, I sent Ms. Gaurin ((973) 630-8040/sandra.gaurin@tetratech.com) an email requesting this information. 9/18/14 - Raphael Ketani. Ms. Gaurin responded and sent me pictures of the fill line dig out and other activities, a work proposal from A.L. Eastmond, a map with VOC and SVOC exceedences and a Tetra Tech letter consisting of a 2010 field report. One of the pictures showed a seep of oil and water which had entered the MTA G Line subway tunnel at the passenger platform. White absorbent pads were visible under the third rail.In her 4/20/10 letter to IronShore Environmental, she stated that 200 gals. of oil and water were removed on the same day. I contacted A.L. Eastmond (718)378-3000 and

COURT PLAZA (Continued) **S110309405**

spoke to Neal Tomasetti, project manager. He said that he didn't remember the job, but that he will look into the files back to 2010 and send me any information he has regarding the dig out of the contamination. 9/22/14 - Raphael Ketani. A closure meeting took place amongst Region 2 DER staff. The outcome of the meeting was that staff denied the request to close the spill case. Instead, they asked to see the MTA inspection reports for the oil spill location in the tunnel and a map showing where the seep was in relationship to 5 Court Square. 9/23/14 - Raphael Ketani. As of today, I have not heard back from Mr. Tomasetti. I tried calling him again, but could only leave a voice message. Next, I contacted Francine Maibauer (646) 252-5768/francine.maibauer@nyct.com and asked her for the MTA inspection reports for the part of the G Line tunnel that was next to 5 Court Square. I also asked her for a map showing the location of the seep in relationship to 5 Court Square. She said that she will send an inspector out to check and see whether there is any more seepage of oil and she will also send the map. 9/29/14 - Raphael Ketani. Mr. Tomasetti called me back. He said that the only document he had in the site file was the original spill report form. 9/30/14 - Raphael Ketani. During a meeting with staff from the NYCT, Ms. Maibauer informed me that the subway station inspection had not yet taken place. She said that she will send her inspector, Daniel Yu, into the station platform area to look for any oil seeps this week. 10/9/14 - Raphael Ketani. Mr. Yu (646) 252-5763 called me to inquire regarding what type of information the DEC wanted as a result of the station inspection. I told Mr. Yu to send the DEC a picture of the seep, determine whether oil is still coming in, measure the seep distance from the station entrance and to submit a map to scale showing the location of the in relationship to 5 Court Square. Mr. Yu said that he will go to the station tomorrow and conduct his inspection. 10/17/14 - Raphael Ketani. I spoke to Mr. Yu today regarding his inspection of the G subway line Court Square platform area and its walls. He said that he made his inspection on 10/10/14, but he didn't see anything that looked like oil on the wall nearest 5 Court Square or at the base of the wall. However, he did he see a large rust stain at the tunnel (northeast) end of the wall. His PID meter registered 0.50 ppm to 0.80 ppm VOCs in the platform area ambient air. However, he said that this was normal. He will send the DEC a report concerning his inspection. Subsequent to his inspection, I made my own site inspection at 9:30AM. I located the store at 5 Court Square and found the new fill port, which was next to the neighboring store with the red border. I measured the distance from the grating in front of the red bordered store to the fill port. This distance was 11 feet. I then went down to the platform to look at the wall nearest to 5 Court Square. I took 8 pictures of the site and the platform area. I could see the large rust stain on the wall, but this stain was under the greatest that was furthest from the fill port. The wall under the grating nearest the fill port had some light staining. The wall under the fill port was clean and there was no sign that oil was sitting at the base of the wall (see pictures). The rest of the wall looked clean. There were no oil odors in the ambient platform air. After this, I left the site. 10/28/14 - Raphael Ketani. Staff at the DEC met to discuss the information in the case file as it regards the remediation of the spill. The results of the inspection by Mr. Yu and myself were also discussed. Based upon all of the information together, Mr. Hussein agreed that with closing the spill case. The spill case was officially closed today, 10/28/14. The

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

QUEENS PLAZA RESIDENTIAL DEVELOPMENT-SITE A (Continued) **S118950486**

Site Description: Location: The site is located at 28-02/ 28-30 Jackson Avenue in Long Island City, Queens County and is approximately 0.470 acres in size. The site is bounded by Jackson Avenue to the north, Orchard Street to the west, a related off-site property known as Queens Plaza Residential Development Site A Off-site (Site No. C241105A) to the east and by another Brownfield Cleanup Program (BCP) site known as Queens Plaza Residential Development - Site B (Site No. C241151) to the south. Site Features: Currently a multi-tenant high-rise residential apartment building with ground floor commercial space is under construction. Current Zoning and Land Use: The site is currently unoccupied and under development. The site is zoned M1-6/R10 (Manufacturing and Residential) under the special Long Island City Mixed Use District. According to the NYC Department of City Planning website, The Special Long Island City Mixed Use District (LIC) promotes the development and expansion, at varying densities, of the longstanding mix of residential, commercial, industrial and cultural uses found in its four subdistrictsCourt Square, Queens Plaza, Hunters Point and Dutch Kills.Past Use of the site: The West Chemical Company operated at the site from the early 1900s until their closure in 1977. The company manufactured commercial and household products such as disinfectants, insecticides, soaps, floor wax and paper product dispensing machines. Bulk quantities of pine oil, mineral oil, hydrochloric acid, cresylic acid, tar acid, caustic potash, terpene solvent, Shell E-407 solvent, ortho nitro toluene, kerosene and creosote were stored and used on-site. In 1978, property ownership was transferred to the Modell Company and used for commercial purposes under the company name Outlet City. Multiple previous environmental investigations were conducted on-site since the mid-1980's leading up to the property owner at the time, Outlet City, signing Voluntary Cleanup Agreements with the Department on February 10, 1997 and again on April 18, 2001. The site entered the BCP on August 3, 2007 by TST LIC Development, LLC as a potential purchaser of the property. The former West Chemical/ Outlet City property now consists of two BCP sites: Queens Plaza Residential Development Site A (Site No. C241105) and Queens Plaza Residential Development Site B (Site No. C241151).Site Geology and Hydrogeology: A surface fill layer approximately 5 - 10 feet thick is present on-site. The fill is a mixture of sand, silt and gravel with traces of brick, cinders, concrete, cobbles, and wood. The fill is underlain by silty sand with lenses of silt and clay. Additionally, a glacial till layer is present over much of the site beginning from approximately 20 feet below grade and extends to the top of bedrock. Bedrock consists un-weathered to moderately-weathered gray gneiss at depths ranging from 10 - 40 feet below grade. Groundwater flow is to the southwest and is approximately 10 - 12 feet below grade.

Env Problem: Nature and Extent of Contamination Prior to Remediation:A large on-site creosote release in the 1950's caused extensive soil and groundwater contamination. Based on the previous investigations of the property while in the Voluntary Cleanup Program, the primary contaminants of concern are Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs) related to the creosote release however chlorinated VOCs, metals and pesticides contamination were present. Also, both Light Non-Aqueous Phase Liquid (LNAPL) and Dense Non-Aqueous Phase Liquid (DNAPL) were present on-site.Groundwater:Total VOCs in groundwater range from 55 - 25,000 parts per billion (ppb). Compounds detected exceeding Ambient Water

QUEENS PLAZA RESIDENTIAL DEVELOPMENT-SITE A (Continued) **S118950486**

Quality Standards and Guidance Values (AWQSGVs) include benzene up to 4,100 ppb (compared to a groundwater standard of 1 ppb) and 1,2-dichloroethane up to 4,320 ppb (compared to a groundwater standard of 0.6 ppb).Total SVOCs in groundwater range from 10 - 112,000 ppb. Compounds detected exceeding AWQSGVs include naphthalene up to 9,100 ppb (compared to a groundwater guidance value of 10 ppb), and 2-methylphenol up to 8,940 ppb (compared to a groundwater standard of 1 ppb).Several metals were detected over AWQSGVs including arsenic up to 102 ppb (compared to a groundwater standard of 25 ppb) and lead up to 152 ppb (compared to a groundwater standard of 25 ppb).Pesticides and Polychlorinated Biphenyls (PCBs) were not analyzed for in groundwater.During the remedial investigation, contaminated groundwater was confirmed to be migrating off-site. Soil: Total VOCs in soil range from non-detect to 400 parts per million (ppm). Compounds exceeding their restricted-residential soil cleanup objectives (RRSCOs) include xylene up to 190 ppm (RRSCO of 100 ppm) and benzene up to 9.5 ppm (RRSCO of 4.8 ppm).Total SVOCs in soil range from non-detect to 7,000 ppm. Compounds exceeding their RRSCO's include acenaphthene up to 390 ppm (RRSCO of 100 ppm) and naphthalene up to 2,500 ppm (RRSCO of 100 ppm).Several metals exceeded their RRSCOs including copper up to 3,330 ppm (RRSCO of 270 ppm) and lead up to 2,190 ppm (RRSCO of 400 ppm). The only pesticide detected above RRSCOs was alpha-BHC at 0.93 ppm (RRSCO of 0.48 ppm).PCBs were not detected in soil above RRSCOs.Soil Vapor:Sub-slab and indoor air samples were collected in two on-site buildings. Petroleum VOCs were detected however no standards, criteria and guidance values exist for these compounds. No chlorinated VOCs were detected.Significant Threat Determination:The site was determined to represent a significant threat to public health and the environment.Post-Remediation:Remediation at the site is complete. Remedial actions have successfully achieved soil cleanup objectives for restricted-residential use. A Site Management Plan (SMP) will be implemented to manage remaining contamination in the future. An environmental easement will limit the future use of property, restrict the use of groundwater and require compliance with the SMP. All engineering controls (containment/ capture wells, vapor mitigation, soil cover/ cap) of the remedy will be operated and maintained under the SMP.

Health Problem:	Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining on the site. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

Site Description:	Location: The Queens Plaza Residential Development - Site B Off-site is located in an urban area surrounding 28-10 Jackson Avenue in Long Island City. This site is the off-site project for Site No. C241151: Queens Plaza Residential Development - Site B and includes the surrounding land in all directions excluding three properties (Site No. C241105: Queens Plaza Residential Development, Site No. C241105A Queens Plaza Residential Development - Offsite and C241169: Queens Plaza Residential Development - Site C). The precise boundaries of this site will be identified after the remedial investigation has been conducted.Current Zoning and Land Use: This area of Long Island City is zoned M1-6/R10 (Manufacturing and Residential) under the special Long Island City Mixed Use District. According to the NYC Department of City Planning website, The Special Long Island City Mixed Use District (LIC) promotes the development and expansion, at varying densities, of the longstanding mix of residential, commercial, industrial and cultural uses found in its four subdistrictsCourt Square, Queens Plaza, Hunters Point and Dutch Kills.Site Geology/Hydrogeology: Based on the information collected on Site No. C241151, depth to bedrock varies from approximately 5 - 50 feet below grade (fbg) and consists predominantly of gray gneiss with varying degrees of weathering. Surface soils consist of a fill layer approximately 4 12 feet in thickness. This fill is a mixture of fine to medium sand, with some silt and gravel and traces of brick, cinders, concrete, cobbles, and wood. The fill is underlain by silty sand and glacial deposits followed by a layer of fine sand with intermittent seams of silt and clay. The groundwater table ranges from approximately 3 to 12 fbg over the site. Based on groundwater elevation data collected in 2014, groundwater appears to flow west, south and north.
Env Problem:	Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available.
Health Problem:	Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

DEC Memo:	"Spill occurred from/onto Outlet City, Inc. (V00081). The Voluntary site consists of several large abandoned buildings. Prior to 1978, the site was known as West Chemical Company. The site is predominately contaminated with creosote. Spill occurred water being discharged from a pipe inside one of the abandoned buildings on-site. The leak could be due to disrepair or vandalism. Water eventually flooded the southernmost part of the site adjacent to the Sunnyside Yard (specifically LIRR property). The flood extended onto the LIRR by approximately 60ft. Spoke with: Gloria G. Russo, LEED Green Associate Manager Environmental Planning & Compliance Corporate Safety & Training Department Long Island Rail Road 144-41 94th Avenue JCC Building, MC 1944 Jamiaca, NY 11435 Tel 347-494-6034 Cell 516-369-4889 Refer to C241151A: Queens Plaza Residential Development Site B off-site 5/21/13 - required work plan to investigate Spill within 30 days July 12, 2013 - approved work plan to investigate the flooded area (both on-site and off-site) LIRR and Outlet City need an access agreement to implement Department's plan to investigate the Spill area (350ft by 70ft) through surface soil sampling October 2013 - Outlet City currently has no environmental consultant to implement the approved work plan and no plan to May 2013 - Haggerty: The BCA to remediate the on-site contamination at Outlet City (formerly West Chemical) was executed 5/20/14. The remediation of off-site contamination at this time is under negotiation between the Volunteer and Outlet City"
Remarks:	"Watre pipe broke on a prior contaminated site and it feared that water is spreading contamination. Mike Haggarty of DEC Spills is aware of situation."

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110004491292

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

QUEENS PLAZA RESIDENTIAL DEVELOPMENT - SITE C (Continued) **S118950490**

Record Added Date:	12/18/2014
Record Updated Date:	08/16/2016
Update By:	SXDEWES
Site Description:	Location: The site is a narrow plot of land perpendicular to Jackson Avenue in Long Island City (Queens County) approximately 150 feet west of Queens Boulevard. The site is bordered by Jackson Avenue to the north and surrounded by Queens Plaza Residential Development - Site B (Site No. C241151) on the east, west and south.Site Features: Prior to excavation under the approved IRM, the site is covered by asphalt and concrete sidewalks. Current Zoning and Land Use: The Site is located in the Special Long Island City Mixed Use District and is zoned M1-6/R-10 (manufacturing and residential). According to the NYC Planning website, the Special Long Island City Mixed Use District "promotes the development and expansion, at varying densities, of the longstanding mix of residential, commercial, industrial and cultural uses found in its four subdistrictsCourt Square, Queens Plaza, Hunters Point and Dutch Kills."Past Use of the Site: Prior to November 18 2014, the property was a dedicated NYC street operated by the NYCDOT. Previously known as Barn Street from 1898 to 1936 and West Street from 1947 to 2014.Site Geology and Hydrogeology: The subsurface soils consist of a fill layer approximately 6 to 8 feet in thickness. The fill is a mixture of fine to medium sand, with some silt and gravel and traces of brick, concrete and cobbles. The fill is underlain by silty sand and glacial deposits followed by a layer of fine sand with intermittent seams of silt and clay. Bedrock is present at approximately 33 to 50 ft. bg. Depth to the groundwater table is approximately 8 ft. bg. at the site. Regional groundwater flow to the southwest.
Env Problem:	As of April 2016, all soil within the top 15 feet below grade which exceeded restricted-residential Soil Cleanup Objectives (SCOs) was removed and properly disposed of off-site. A Site Management Plan (SMP) will be implemented to managed remaining contamination in the future. An environmental easement will limit the future use of property, restrict the use of groundwater and require compliance with the SMP.Prior to remediation, soil and groundwater samples were collected for Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), pesticides and metals. Contamination encountered on-site appeared related to historic urban fill:Soil:No VOCs exceeded restricted-residential soil cleanup objectives (RRSCOs)Several SVOCs exceeded RRSCOs in soil. For example, benzo(a)anthracene was detected up to 3 parts per million (ppm) and the benzo(b)fluoranthene was detected up to 3 ppm (the RRSCO for both compounds is 1 ppm).Two metals exceeded RRSCOs. One sample for mercury at 0.84 ppm (the RRSCO is 0.81ppm). One sample for lead at 1,900 ppm (the RRSCO is 400 ppm). PCBs and pesticides were not detected above RRSCOs.Groundwater:One groundwater sample was collected on-site. VOC, SVOC, PCB and pesticide concentrations were below groundwater standards. The metals iron, manganese and sodium exceeded groundwater standards.No soil vapor data was submitted.
Health Problem:	Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining on the site. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Program:	BCP
Site Code:	532742
Acres:	0.78
HW Code:	C241190
SWIS:	4101
Town:	New York City
Record Added Date:	09/20/2016
Record Updated Date:	10/21/2016
Update By:	MSHOQUE
Site Description:	Location:The site is located at 42-50 24th Street in Long Island City, New York (Queens County) and is denoted on the New York City Tax Map as Block 428, Lot 1. Alternative addresses for the site include 42-63 23rd Street and 23-17 43rd Avenue. The site is located on the city block bound by 43rd Avenue to the south, 23rd Street to the west, 42nd Road to the north, and 24th street to the east. An access ramp to the Queensboro Bridge borders the site to the north.Site Features:The site occupies an area of about 34,000 square feet and consists of two interconnected, one-story buildings and an asphalt-paved storage, fueling, and parking area. The site is currently operated by Midtown Operating Corporation as a taxi dispatch and repair facility. An NYCTA subway easement for the R train transects the site from north to south.Current Zoning and Land Use:The site, which is currently operated as a taxi dispatch and repair facility, is located in the Special Long Island City Mixed Use District and designated as a M1-5/R9 (manufacturing/residential) district, which permits a maximum development FAR of 8.0. The site is

QUEENS PLAZA TAXI (Continued) **S118950511**

also located in an area that will be zoned for Mandatory Inclusionary Housing; therefore, a percentage of the proposed residential development must include affordable housing units. The project is consistent with the goals of the City Council as embodied in the NYC zoning districts. The New York City Department of Buildings classifies the site buildings as G-1, which includes buildings with garage and gasoline station usage. The current site owner, QPT 24th Street Development LLC, will undertake the proposed development. The New York City Department of City Planning has assigned the site a restrictive E designation for hazardous materials contamination and noise concerns (E-104, City Environmental Quality Review [CEQR] No. 00DCP055Q). As such, the project will receive approval from the New York City Mayors Office of Environmental Remediation prior to construction.Past Use of the Site:The site was vacant until at least 1915 and was partially developed with a lumber yard containing a shed, office and garage by 1936. A store was located on the southwestern portion of the site in 1947. A gasoline tank was located on the southern portion of the property adjacent to the office and garage in the 1936, 1947, and 1950 Sanborn Maps. By 1970, the lumber yard was replaced with a taxi cab garage and service center, which contained a garage building in the northeastern portion of the site. The garage building was extended to encompass the northern third of the site in 1977, and the site, which is currently operated as a taxi dispatch and repair facility, has remained unchanged since.Site Geology and Hydrogeology:Based on borings advanced by Langan during the May 2016 subsurface investigations (environmental and geotechnical), the subsurface strata consists of a layer of historic fill material that extends to depths of up to 20 feet below grade surface (bgs) in the exterior portions of the site and extends about 5 feet below the basement slab of the building. The historic fill consists of brown, fine- to coarse-grained sand with varying amounts of clay, gravel, brick, glass, and organic material. Native soil consisting of brown, fine sand with varying amounts of silt and gravel was encountered beneath the historic fill layer. Native soil in this area of Queens consists of glacial (ground moraine) sediments that typically encompass an unsorted mixture of clay, sand and boulders. The glacial strata are underlain by the Middle Ordovician to Lower Cambrian-Ordovician Hartland Formation, which generally consists of muscovite-biotite-quartz schist. The top of bedrock was observed at about 20 feet bgs in borings advanced along the bordering 24th Street and 43rd Avenue sidewalks during a 2016 geotechnical investigation. Groundwater was observed at about 10 to 11 feet bgs. Groundwater beneath the site is inferred to flow southeast towards the Dutch Kills. Groundwater in this area of New York City is not used for consumption, and the New York City water supply is derived from watersheds in the Catskills. Contaminated groundwater is therefore not expected to impact the drinking water supply.

Env Problem: based upon investigations conducted to date, the primary contaminations of concern include benzene, ethylbenzene, toluene.Soil: Multiple VOCs(1,2,4-Trimethylbenzene,1,3,5-Trimethylbenzene, ethylbenzene, toluene and xylene, total) and SVOCs were found in sallow soil(0-2.5 feet throughout the on-site both shallow and deeper depths. Highest toluene and xylenes concentrations in a soil samples collected from 0-2.5 feet bgs at EB-07 detected as 370 ppm and 920 ppm respectively, which are above residential use SCOs(toluene 100 ppm and xylenes 100 ppm) but below commercial use SCOs(500 ppm) at the eastern side of

QUEENS PLAZA TAXI (Continued) **S118950511**

	the site. Metals include arsenic, lead, and mercury were found at a depths of 10 to 11 feet bgs. Highest concentration of lead was found at 1,720 ppm. Groundwater: Petroleum-related VOCs (e.g., benzene, ethylbenzene, toluene, methyl tert butyl ether [MTBE], and o- and p/m-xylene) were detected in groundwater samples collected from inside the garage (northern portion of the site) and near the USTs and refueling area (central and eastern portions of the site) at concentrations above their respective TOGS AWQS. SVOCs(1,2,4-Trimethylbenzene, benzene, ethylbenzene, toluene, xelenes) and metals(Lead, magnesium, sodium) were detected in groundwater throughout the site at concentrations above their respective TOGS AWQS. Highest concentrations of toluene(610 ppb) and ethylbenzene(410 ppb) were found at the central portion(MW-09)of the site. Lead was found at highest concentration 1,990 ppm at MW-03 southern side of the site above RRUSCOs(400ppm) and commercial use SCOs(1,000 ppm).Soil Vapor and Indoor Air: Multiple VOCs were detected in soil vapor at elevated concentrations throughout the on-site. The highest concentrations of toluene and tetrachloroethylene(PCE)were found 8,288 um/m3 and 13 um/m3 respectively at the central portion(SV-08)of the site.
Health Problem:	Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

DER Facility ID: 373035
DEC Memo: "1/21/2010 Sangesland spoke to Shawn at Crompco. He said the tank failed a test yesterday and a spill report was called in. Today they isolated the tank and retested. He said the tank passed, but the suction line inside the tank failed. Sangesland asked Shawn to call back and talk directly to Jake Krimgold to determine if this can be closed out. 1/21/10. J.Krimgold spoke to Shawn from Crompco. Agreed that the failure of the suction line inside the tank could not lead to a release. Case closed."
Remarks: "TANK TEST FAILURE ON A 4000 GALLON UST"

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Tank Info:

Tank Number:	001
Tank Id:	24945
Material Code:	0001
Common Name of Substance:	#2 Fuel Oil (On-Site Consumption)

Equipment Records:

45-17 PEARSON ST 45-18 CRT SQ (Continued) **U000406504**

A00 - Tank Internal Protection - None
G00 - Tank Secondary Containment - None
C00 - Pipe Location - No Piping
I04 - Overfill - Product Level Gauge (A/G)
D01 - Pipe Type - Steel/Carbon Steel/Iron
J02 - Dispenser - Suction Dispenser
H99 - Tank Leak Detection - Other
B00 - Tank External Protection - None
F00 - Pipe External Protection - None

Tank Location:	6
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Closed - Removed
Pipe Model:	Not reported
Install Date:	Not reported
Capacity Gallons:	6700
Tightness Test Method:	NN
Date Test:	Not reported
Next Test Date:	Not reported
Date Tank Closed:	08/01/1990
Register:	True

Owner/operator country:	US
Owner/operator telephone:	(212) 555-1212
Legal status:	Private
Owner/Operator Type:	Operator
Owner/Op start date:	Not reported
Owner/Op end date:	Not reported

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No

MATSON MFG CO INC (Continued) **1000384219**

Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 01/01/2006

Site name: MATSON MFG CO INC
Classification: Large Quantity Generator

. Waste code: F001
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F007
. Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS.

. Waste code: F008
. Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

. Waste code: F009
. Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

Violation Status: No violations found

Evaluation Action Summary:
Evaluation date: 04/17/1986
Evaluation: COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation: Not reported
Date achieved compliance: Not reported
Evaluation lead agency: State

Registry ID: 110009468931

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Updated By:	JAMORAS
Site Description:	Location: The BCP site is located in Long Island City at 23-01 42nd Road, Queens County. It is bordered to the north by Queens Plaza South, 24th Street to the east, 42nd Road to the south, and 23rd Street to the west.Site Features: The Site encompasses an area of approximately 0.342 acres which was formerly occupied by a vacant two-story concrete building. The building was demolished in March 2014 for development purposes.Current Zoning and Land Use: A 44-story residential apartment building is being constructed on the Site which is located in the Special Long Island City Mixed Use District within Area B of the Queens Plaza Subdistrict. It is part of the M1-5/R9 zone, which allows for light industrial use and moderate to high density residential use.Past Use of the Site: Prior to becoming vacant, the on-site building was used for industrial processes from at least 1947, including metal stamping and fabrication of metal parts for electrical switches and fuses. Discoloration and staining of the basement floors from the on-site metal fabrications machines was noted. A Phase II investigation was conducted in September 2012. Groundwater and soil samples were collected and the results showed groundwater standards were exceeded for Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs) and metals. The turbidity of the groundwater samples, which were collected from temporary well points, is unknown. As a consequence, the representativeness of the historical groundwater data is unclear. The results also showed levels above unrestricted Soil Cleanup Objectives for SVOCs, and metals. Based on the Phase II Environmental Site Investigation Report, a petroleum spill was reported to the Department on June 14, 2013 (Spill No. 13-02811). This open spill was closed by the Department on September 1, 2015.Site Geology and Hydrogeology: Historic urban fill is the surficial unit, predominantly consisting of brown and gray, coarse to fine sand with varying amounts of silt, gravel and concrete fragments. The historic fill layer extends to depths of up to approximately 15 feet below sidewalk grade (approximately el. 1.6 relative to the Queens Highway Datum). A layer of gray and brown silt with varying amounts of gravel, sand and clay (i.e., glacial till) exists below the historic fill.Bedrock was encountered at depths ranging from approximately 16 feet to 25 feet below sidewalk grade (approximately el. -3.4 to el. -10.4).The groundwater depth ranged from approximately 7 feet to 13 feet below sidewalk grade (approximately el. 3.5 to el. 5.80) and flows to the west towards the East River which is located approximately 0.5 miles from the Site.
Env Problem:	Post-RemediationRemediation of the Site is complete. Prior to remediation, the primary contaminants of concern were trichloroethylene in soil vapor; benzene in groundwater; and carcinogenic polyaromatic hydrocarbons and metals in soil. Remedial

23-01 42ND ROAD (Continued) **S113813706**

	actions have successfully achieved soil cleanup objectives for restricted-residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.
Health Problem:	Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system (system that ventilates/remove air beneath the building) is installed on-site to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building. Sampling indicated soil vapor intrusion is not a concern for off-site buildings.

Remedial actions have successfully achieved soil cleanup objectives for restricted-residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system (system that ventilates/remove air beneath the building) is installed on-site to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building. Sampling indicated soil vapor intrusion is not a concern for off-site buildings.

Site Code: 484397
Site Description: Location: The BCP site is located in Long Island City at 23-01 42nd Road, Queens County. It is bordered to the north by Queens Plaza South, 24th Street to the east, 42nd Road to the south, and 23rd Street to the west.Site Features: The Site encompasses an area of approximately 0.342 acres which was formerly occupied by a vacant two-story concrete building. The building was demolished in March 2014 for development purposes.Current Zoning and Land Use: A 44-story residential apartment building is being constructed on the Site which is located in the Special Long Island City Mixed Use District within Area B of the Queens Plaza Subdistrict. It is part of the M1-5/R9 zone, which allows for light industrial use and moderate to high density residential use.Past Use of the Site: Prior to becoming vacant, the on-site building was used for industrial processes from at least 1947, including metal stamping and fabrication of metal parts for electrical switches and fuses. Discoloration and staining of the basement floors from the on-site metal fabrications machines was noted. A Phase II investigation was conducted in September 2012. Groundwater and soil samples were collected and the results showed groundwater standards were exceeded for Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs) and metals. The turbidity of the groundwater samples, which were collected from temporary well points, is unknown. As a consequence, the representativeness of the historical groundwater data is unclear. The results also showed levels above unrestricted Soil Cleanup Objectives for SVOCs, and metals. Based on the Phase II Environmental Site Investigation Report, a petroleum spill was reported to the Department on June 14, 2013 (Spill No. 13-02811). This open spill was closed by the Department on September 1, 2015.Site Geology and Hydrogeology: Historic urban fill is the surficial unit, predominantly consisting of brown and gray, coarse to fine sand with

23-01 42ND ROAD (Continued) **S113813706**

varying amounts of silt, gravel and concrete fragments. The historic fill layer extends to depths of up to approximately 15 feet below sidewalk grade (approximately el. 1.6 relative to the Queens Highway Datum). A layer of gray and brown silt with varying amounts of gravel, sand and clay (i.e., glacial till) exists below the historic fill.Bedrock was encountered at depths ranging from approximately 16 feet to 25 feet below sidewalk grade (approximately el. -3.4 to el. -10.4).The groundwater depth ranged from approximately 7 feet to 13 feet below sidewalk grade (approximately el. 3.5 to el. 5.80) and flows to the west towards the East River which is located approximately 0.5 miles from the Site.

Env Problem: Post-RemediationRemediation of the Site is complete. Prior to remediation, the primary contaminants of concern were trichloroethylene in soil vapor; benzene in groundwater; and carcinogenic polyaromatic hydrocarbons and metals in soil. Remedial actions have successfully achieved soil cleanup objectives for restricted-residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system (system that ventilates/remove air beneath the building) is installed on-site to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building. Sampling indicated soil vapor intrusion is not a concern for off-site buildings.

Site Code: 484397
Site Description: Location: The BCP site is located in Long Island City at 23-01 42nd Road, Queens County. It is bordered to the north by Queens Plaza South, 24th Street to the east, 42nd Road to the south, and 23rd Street to the west.Site Features: The Site encompasses an area of approximately 0.342 acres which was formerly occupied by a vacant two-story concrete building. The building was demolished in March 2014 for development purposes.Current Zoning and Land Use: A 44-story residential apartment building is being constructed on the Site which is located in the Special Long Island City Mixed Use District within Area B of the Queens Plaza Subdistrict. It is part of the M1-5/R9 zone, which allows for light industrial use and moderate to high density residential use.Past Use of the Site: Prior to becoming vacant, the on-site building was used for industrial processes from at least 1947, including metal stamping and fabrication of metal parts for electrical switches and fuses. Discoloration and staining of the basement floors from the on-site metal fabrications machines was noted. A Phase II investigation was conducted in September 2012. Groundwater and soil samples were collected and the results showed

23-01 42ND ROAD (Continued) **S113813706**

groundwater standards were exceeded for Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs) and metals. The turbidity of the groundwater samples, which were collected from temporary well points, is unknown. As a consequence, the representativeness of the historical groundwater data is unclear. The results also showed levels above unrestricted Soil Cleanup Objectives for SVOCs, and metals. Based on the Phase II Environmental Site Investigation Report, a petroleum spill was reported to the Department on June 14, 2013 (Spill No. 13-02811). This open spill was closed by the Department on September 1, 2015.Site Geology and Hydrogeology: Historic urban fill is the surficial unit, predominantly consisting of brown and gray, coarse to fine sand with varying amounts of silt, gravel and concrete fragments. The historic fill layer extends to depths of up to approximately 15 feet below sidewalk grade (approximately el. 1.6 relative to the Queens Highway Datum). A layer of gray and brown silt with varying amounts of gravel, sand and clay (i.e., glacial till) exists below the historic fill.Bedrock was encountered at depths ranging from approximately 16 feet to 25 feet below sidewalk grade (approximately el. -3.4 to el. -10.4).The groundwater depth ranged from approximately 7 feet to 13 feet below sidewalk grade (approximately el. 3.5 to el. 5.80) and flows to the west towards the East River which is located approximately 0.5 miles from the Site.

Env Problem: Post-RemediationRemediation of the Site is complete. Prior to remediation, the primary contaminants of concern were trichloroethylene in soil vapor; benzene in groundwater; and carcinogenic polyaromatic hydrocarbons and metals in soil. Remedial actions have successfully achieved soil cleanup objectives for restricted-residential use. Residual contamination in the soil, groundwater, and soil vapor is being managed under a Site Management Plan.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system (system that ventilates/remove air beneath the building) is installed on-site to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building. Sampling indicated soil vapor intrusion is not a concern for off-site buildings.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo: "On 7/14/05, J Peck called RIR Com. Cynthia Roby doesn't work there now. Left mesasage to return call concerning spill. Could not determine owner of property from Property Shark or Acris. Called George Falidas on 7/14/05, left message to call back. On 1/19/05, reattempted to determine owner of property. No success. 3/30/07 - Austin - Trasferred to Ketani for further review - end 5/21/07 - Raphael Ketani. I reactiviated the case today. There was very little in the case file. Some printed pages for spill #0305345 (which

FALIDAS ASSCOCIATES (Continued) **1007264881**

doesn't pertain to the case, except the memo from Mr. Sigona to Mr. Hassan), an 11/7/05 letter from Joseph Peck of DEC to George Faildas regarding the spill, printouts from Google Earth and Property Shark, and a printout of the spill report for this case. I did a search of ACRIS, the NYC Property Tax database, and Property Shark and determined that 25-15 Queens Plaza North is just one part of the range of properties (25-01 to 25-27 Queens Plaza North) owned by Falidas Associates. It is also known by Bridge Plaza North. The block and lot are: 00415 and 0004. I called up George Falidas (718) 392-0514 of Falidas Associates and was connected to his brother, John Falidas. I made a field visit and met John Falidas. He showed me the basement of one of the properties owned by Falidas Associates and which is near to where the tank failed 2 buildings away. We entered a work room rented by a garment making company. The floor and walls and bathroom were clean. There were no signs of oil and no oil odors. Mr. Falidas said that he had paid lots of money to get the oil cleaned up years ago and the responsible party never paid anything to him. Mr. Falidas had a package of documents from the EPA and the DEC and showed them to me. These were the RCRA Subtitle C Site Identification Form, letters from South Mall Analytical Labs to PTC, and a DEC Spill Report. He gave me copies of these documents. I was particularly interested in the old DEC spill report form as this document wasn't in the case file. Next, I visited the 2 story building between Mr. Falidas' building and the site of origin of the spill. I met Sandro Cestaro of Atlantic Precious Metal Casting, Inc. (718) 937-7100. He showed me his basement. There were some signs of a thin film of mud in one corner of the basement, but no signs or odors of oil, even though this was the building where the oil first entered. Lastly, I went to the site of the oil spill. The auto parts service place had burned completely, according to the old spill report case notes. This site was 41-22 to 41-30 27 Street. The site was sold to developers who later built an apartment building that was finished in early 2007. This building is listed as 41-28 27 Street. I met the super., Leonardo Colon. He took me to the lowest point in the building. This was a parking garage. There were no signs of oil nor any odors. He said he was new here and didn't know much about the building. The building management company is Golden Management and the contact person is Brandon Wechsler (718) 230-2600, ext 111. I took 3 pictures of the apartment building and the neighboring properties. I remember seeing the dig out for the foundation for the building when I passed by the site many months back. They went down below the bottom of the foundation for the neighboring building which contains Atlantic Precious. This is a depth of about 15 feet or so. Based upon my site visits and the fact that the old auto parts area has been dug out, and the lack of evidence of a spill, I am closing the spill case. "

Remarks: "SPILL AT A COMMERCIAL BLD CALLER IS A TENANT AND REQ A CALL FROM DEC SPILL HAS NOT BEEN CLEANED UP BEEN SMELLING THIS FOR ABOUT 3 WEEKS "

BROWNFIELDS:

Program:	BCP
Site Code:	491518
Acres:	0.624
HW Code:	C241160
SWIS:	4101
Town:	New York City
Record Added Date:	02/10/2014
Record Updated Date:	05/26/2015
Update By:	JAMORAS
Site Description:	Location: The Site is on the city block bordered by Queens Plaza South to the north, 24th Street to the east, 42nd Road to the south, and 23rd Street to the west. The site is approximately 0.624 acres in size.Site Features: The Site is occupied by a vacant four-story

23-10 QUEENS PLAZA SOUTH (Continued) **U003393329**

concrete building with a basement and partial sub-basement. Sidewalk grades generally increase from the southwest corner of the site to the northeast corner. Sidewalk grades along 23rd Street range from about el. 13.4 at the southwest corner to about el. 15.5 at the northwest corner. Sidewalk grades along Queens Plaza South range from about el. 15.5 at the northwest corner to about el. 20.6 at the northeast corner. Sidewalk grades along 24th Street range from about el. 20.6 at the northeast corner to about el. 16.7 at the southeast corner.Current Zoning and Land Use: The site is currently vacant and is located in a M1-5/R9 mixed-used district characterized by mixed commercial and industrial use with light residential use.Past Use of the Site: The site has been used for industrial manufacturing and a garage since as early as 1936. The industrial activities included metal stamping and fabrication of metals parts, and lacquer spraying. Oil staining from the former on-site metal fabrication machines was observed on the cellar floor. Based on a November 8, 2012 Phase II Environmental Site Investigation Report, a spill was reported to the NYSDEC (Spill No. 13-02812). Geology and Hydrogeology: The surface soil immediately beneath the concrete slab of the existing building (at el. 11) is a historic fill layer, generally consisting of brown and gray coarse to fine sand with varying amounts of silt, gravel and concrete fragments. This layer extends to about 8 feet below slab grade (bsg). A glacial till layer of gray and brown silt with varying amounts of gravel, sand and clay is present below the historic fill. Bedrock consists of hard to very hard, slightly weathered to fresh, coarse- to fine- grained, quartz-mica-garnet gneiss of the Ravenwood Granodiorite and is present at depths ranging from approximately 9 to 19 feet bsg. The groundwater depth ranges from approximately 4 to 6 feet bsg and flows to the west towards the East River which is located approximately 1/2 mile from the Site.

Env Problem:

Nature and Extent of Contamination:Based upon the investigation conducted to date, the primary contaminants of concern include tetrachloroethylene (PCE) in groundwater and soil vapor; trichloroethylene (TCE) in soil vapor; chrysene and benzo(a)anthracene in groundwater; and certain metals in soil.Soil - During the July 2013 Site Investigation, metals, including copper and lead were found in subsurface soil above Commercial Soil Cleanup Objectives (SCOs) in the 7- to 8-foot depth interval below the foundation slab in the western portion of the site. Additionally, benzo(a)anthracene was found in subsurface soil slightly above RRSCOs in the same 7- to 8-foot depth interval in the western portion of the site. The maximum concentrations of copper (1,560 ppm) and lead (1,080 ppm) exceed the Commercial SCOs of 270 ppm and 1,000 ppm, respectively. The maximum concentration of benzo(a)anthracene (1.11 ppm) only slightly exceeds the 1 ppm RRSCO.Groundwater - Petroleum-like odors were apparent in monitoring wells MW-06 and MW-11 (located in the eastern and southwestern portions of the site, respectively) during well installation and groundwater sampling. Free product was not observed during the July 2013 Site Investigation (SI), but about 4 inches of free product was measured in MW-11 during the supplemental October 2014 groundwater sampling event. However, no detectable levels of petroleum-related volatile organic compounds (VOCs) were detected in MW-06, and except for toluene which was detected in MW-11 at a concentration of 48 ppb, no other petroleum-related VOCs were detected above groundwater standards in this well. The groundwater standard for toluene is 5 ppb. PCE, however, was found in the groundwater underlying the site at elevated

23-10 QUEENS PLAZA SOUTH (Continued) **U003393329**

concentrations (150 ppb to 490 ppb) which exceeded the groundwater standard (5 ppb). Benzo(a)anthracene (up to 3 ppb) and chrysene (up to 7 ppb) were found in groundwater at levels that significantly exceeded (by three orders of magnitude) their groundwater standard (0.002 ppb). During the July 2013 SI, lead was found in unfiltered samples at levels up to 5,150 ppb which exceeded its groundwater standard (25 ppb) by two orders of magnitude. However, during the October 2014 supplemental sampling event, the highest lead concentration in unfiltered samples was 199 ppb. Lead was not found above groundwater standards in the corresponding filtered samples. Therefore, lead is not considered a contaminant of concern for groundwater.Soil Vapor - Elevated levels of PCE (up to 3,500 micrograms per cubic meter) and TCE (up to 1,700 micrograms per cubic meter) were found in soil vapor across the site. In addition, 1,1,1-Trichloroethane was detected at concentrations ranging from 60 micrograms per cubic meter to 24,000 micrograms per cubic meter. Based on the presence of PCE in on-site groundwater (up to 490 ppb) and soil vapor (up to 3,500 migrograms per cubic meter), and the investigation conducted at the adjacent Site (23-01 42nd Road, Site No. C241152), it is believed that contaminants (primarily PCE) are migrating away from the 23-10 Queens Plaza South Site in soil vapor. Therefore, the PCE contamination in the groundwater and vapors constitute a significant threat to public health and the environment.

Health Problem: Direct contact with contaminants in subsurface soil is unlikely because the site is covered with a building. People are not drinking contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion should the building become reoccupied. Furthermore, environmental sampling indicates that there is a potential for soil vapor intrusion to affect off-site structures.

Record Added Date:	03/04/2015
Record Updated Date:	06/06/2016
Update By:	MJKOMORO
Site Description:	Location: The Queens Plaza North site is located in an urban area and is comprised of two contiguous lots: 29-27 Queens Plaza North (Block 403, Lot 21) and 29 37 41st Avenue (Block 403, Lot 26). The site is bordered by the Metropolitan Transit Authority (MTA) East Side Access (ESA) tunnel project to the north; Northern Boulevard and commercial buildings to the east; Queens Plaza North and a public plaza (Queens Plaza) to the south; and 41st Avenue and commercial mid and high rise buildings to the west. Elevated and underground subway lines border the site to the east along Northern Boulevard. Site Features: Lot 21 is about 12,600 square feet and is improved with a 10 story commercial office building with a basement and an exterior asphalt paved parking lot. Lot 26 is an Lshaped, about 16,900 square foot parcel that consists of vacant land covered with sand, gravel, vegetative overgrowth, and construction debris. A security fence surrounds the site perimeter.Current Zoning/Use: The site is located in the Queens Plaza Subdistrict of the Special Long Island City Mixed Use District. The site's zoning designation is M1-6/R10 (mixed-use manufacturing/residential). The existing building on Lot 21 is currently occupied by multiple commercial office tenants while Lot 26 is vacant.Historical Use: A multiple story commercial bank building occupied the western portion of Lot 26 from approximately 1921 to 2006. The lot included a portion of an automotive repair facility (1936-1970), multiple story buildings of indeterminate use, gymnasium, bowling alley and part of a dance hall in late 1800s and early 1900s. The existing 10-story building on Lot 21 was constructed in 1926 and is currently occupied by multiple commercial office tenants specializing in a variety of services.Site Geology and Hydrogeology: Subsurface strata at the site consist of historic fill characterized by sand with varying amounts of gravel, brick, asphalt and concrete fragments. Historic fill varies in thickness from approximately 4 feet bgs on the southeastern portion to 18 feet bgs on the southwestern portion of the Site. Brown fine to medium grained sand, typical of glacial outwash, underlies the fill. Bedrock exists at depths between 65 and 80 feet below sidewalk grade and consists of gneiss associated with the Ravenswood Grandiorite formation.Based on the general topography of the surrounding area, the inferred direction of groundwater flow is to the south towards Dutch Kills, which is about 2,600 feet from the site. Dewatering in conjunction with the adjoining MTA ESA tunnel project may depress groundwater levels and alter flow direction at the site and nearby properties.
Env Problem:	Nature and Extent of Contamination:Phase I Environmental Site Assessment (ESA) conducted on March 10, for 29-27 Queens Plaza North, Phase I ESA conducted on August 7, 2014 for 29-37 41st Avenue, Phase

QUEENS PLAZA NORTH (Continued) **S117851113**

II Environmental Site Investigation (ESI) conducted on November 3, 2014 for 29-37 41st Avenue and 29-27 Queens Plaza North, and Limited Asbestos Survey Report South Faade conducted on November 10, 2014 for 29-27 41st Avenue. Phase I ESA found slightly elevated levels of semi volatile organic compounds (SVOC) near the removal area of UST. Phase II Environmental Site Investigation (ESI) for 29-37 41st Avenue and 29_27 Queens Plaza North found multiple SVOCs, metals and pesticides were detected at concentrations above the 6 NYCRR Part 375 Unrestricted Use and Restricted Residential Use Soil Cleanup Objectives (SCO). Multiple petroleum related VOCs were detected in the Phase II soil vapor samples.Soil: The VOC Acetone (maximum 0.18 mg/kg) were detected at concentrations above the Part 375 Unrestricted Use SCOs. The following SVOCs were detected at concentrations above Part 375 Restricted Residential Use SCOs: Benzo(a)anthracene (maximum 9.1 mg/kg), Benzo(a)pyrene (maximum 7.8 mg/kg), Benzo(b)fluoranthene (maximum 9.4 mg/kg), Chrysene (maximum 8.1 mg/kg), Dibenzo(a,h)anthracene (maximum 1.2 mg/kg), Indeno(1,2,3_cd)pyrene (maximum 5 mg/kg), The following pesticides were detected at concentrations above Part 375 Unrestricted Use SCOs: 4,4_ DDE (maximum 0.0124 mg/kg), 4,4_ DDT (maximum 0.0151 mg/kg), metals were also detected at concentrations above Part 375 Restricted Residential Use SCOs.Groundwater: The SVOCs Benzo(a)anthracene (maximum 0.54 ?g/L), Benzo(a)pyrene (maximum 0.59 ?g/L), Benzo(b)fluoranthene (maximum 0.67 ?g/L), Benzo(k)fluoranthene (maximum 0.23 ?g/L), Chrysene (maximum 0.49 ?g/L), Indeno(1,2,3_cd)pyrene (maximum 0.29 ?g/L) were detected above TOGS AWQS. Dissolved metals Iron (maximum 2,670 ?g/L), magnesium (maximum 64,700 ?g/L), manganese (maximum 437.1 ?g/L), sodium (maximum 400,000 ?g/L) were detected above TOGS AWQS.Soil Vapor: A multiple chlorinated (i.e. PCE and TCE) and petroleum_related (i.e. benzene, toluene, ethylbenzene and xylene [BTEX]) VOCs found in the soil vapor. PCE and TCE were detected in multiple soil vapor samples at maximum concentrations of 10.2 micrograms per cubic meter (?g/m3) and 4.28 ?g/m3, respectively. BTEX concentrations ranged from approximately 36.1 ?g/m3 to 1,341.6 ?g/m3.

Health Problem:	Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Updated By:	SRHEIGEL
Site Description:	Location: The site is located at 21-16 44th Road, LIC, NY 11101 (Tax Block 438, Lot 26). The site occupies the northweastern portion of the block bounded by 44th Rd. to the north, 44th Dr. to the south, 21st St. to the west and 23rd St. to the east. The site is in urban area. The property is approximately 1/2 mile from the East River. Site Features: The Information Technology HS building and its court yard occupy the site. Current Zonning/Use(s): The site is used as a High School. The surrounding area is zoned M3-1 Heavy Manufacturing. The adjacent parcels are currently used for a combination of commercial, manufacturing, and residential.Historical Use(s): The site was formerly occupied by a four story, 30,000 square foot warehouse and its court yard. It was historically operated as a cloth manufacturing factory, a metal plating factory, and a 5,000 square foot parking lot. The plating factory had one dry well on the first floor, one in the courtyard, and two in the basement. During the plating processes the waste from the metal cleaning and plating baths were disposed of through these dry wells. Following implementation of remedial actions, the building was renovated and is currently occupied by the Information Technology High School. The remediation at the site has been completed. The remedial system is operating under a NYSDEC-approved Site Management Plan which has provisions for frequent system monitoring, maintenance, and periodic reporting.Site Geology and Hydrogeology: The site is underlain by 2 to 5 feet of urban fill materials. Below this there are interbeded layers of sand, clay and marl of Cretaceous and Pleistocene age. The bed rock is 23 to 29 feet below grade. The groundwater is 12 to 15 feet below grade and flows generally south.

21-16 44TH ROAD , LIC (Continued) **S103560285**

Env Problem:	Nature and Extent of Contamination: Prior to Remediation:a) contaminants: The Phase I and Phase II Investigation identified the contaminants of concern as chlorinated volatile organic compounds (CVOCs), particularly PCE and its breakdown products in soil, groundwater, and soil vapor; metals in the dry well sediments; and lead-contaminated soil in the parking lot. The site contamination was related to the previous manufacturing industries which operated in the former warehouse building. b) areal/depth extent: The plating factory occupied the first floor and the basement of the building and it had drum storage areas inside and in the court yard adjacent to the building. The sources of contamination under the building in soil and groundwater were determined to be four dry wells and a drum storage area in the court yard.c) concentrations: PCE in soil ranged from 0 to 300 ppm; in groundwater 5 ppb to 36,000 ppb; and 5 ppbv to 80,0000 ppbv in soil gas. Post-Remediation: The remediation at the site has been completed. The SMP has provisions for system monitoring and maintenance, and for periodic reporting to NYSDEC. There are Deed Restrictions recorded against the site.
Health Problem:	The Site was a former warehouse and has been redeveloped as an Information and Technology High School. Contaminated soils beneath the building have been removed and disposed of off-site. Human exposures to residual contaminated soil is unlikely as the site is covered by the on-site building and pavement. Ingestion of groundwater as a potable drinking water source is not expected since the area is served by public water supply. Potential exposures via soil vapor intrusion into the school have been mitigated by the installation and operation of sub-slab depressurization system, a vapor barrier, a eight-inch thick competent concrete slab, and the building's positive-pressure heating and ventilation system. Monthly sampling of soil vapor and quarterly sampling of groundwater will ensure that remedial systems are working properly.
