RE: Level 2 Environmental Site Assessment
Commercial Property
27-10 Hunter Point Avenue
Long Island City, New York
ATC Project No. 15.14853.0194

Dear Mr. Viswanathan:

Attached is the Level 2 Environmental Site Assessment Report for the above referenced Site. The report includes the following sections: Executive Summary, Introduction, Summary of Previous Environmental Site Assessments, Scope Investigation, Results of Soil Sampling / Analysis, Results of Groundwater Sampling / Analysis, Conclusions, References, and Limitations. This report also includes a Site Plan and Laboratory Analysis Results as appendices.

If you have any questions regarding this report, please do not hesitate to call our office.

Sincerely,

ATC ASSOCIATES INC.

Levent Eskicakit, P.G.

1.0 EXECUTIVE SUMMARY

FleetBoston Financial (Fleet) authorized ATC Associates Inc. (ATC) to perform a Level 2 Environmental Site Assessment (Level 2 ESA) of the property located at 27-10 Hunters Point Avenue, Long Island City, New York (the "Site"). The Site is bound to the north by Hunters Point Avenue, to the west by 27th Street, to the south industrial/commercial properties, and to the east by Dutch Kills Creek. Black Bear Company, Inc. and Carey Limousine NY, Inc. currently occupy the Site.

A previous Level 1 Environmental Site Assessment (Level 1 ESA) report, prepared by Freudenthal & Elkowitz Consulting Group, Inc. (FECG), on behalf of Fleet, dated December 11, 2002, identified the following recognized environmental conditions warranting additional investigation at the Site:

- The former presence of five (5) 4,000-gallon gasoline underground storage tanks (USTs) and associated piping, for which no documentation related to their removal was available.
- Interior oil/water separator, floor drains and catch basins.
- The active 7,500-gallon UST.
- An exterior truck scale, oil/water separator and concrete pad.
- The possible presence of additional USTs throughout the Site.
- Historic fill materials.

Based on these concerns, a Level 2 ESA was conducted by ATC, on March 11-12, 2003 to evaluate soil and/or groundwater quality beneath the Site. As part of the Level 2 ESA, ATC conducted a geophysical survey and a soil/groundwater investigation.

The geophysical survey did not identify the presence of any additional USTs other than one (1) in service 7,500-gallon fuel oil UST and one (1) in service 550-gallon waste oil UST. Due to the poor quality of the Site fill material, ATC was unable to evaluate the presence of any underground piping associated with the former USTs.

According to the Site personnel, and documents provided to ATC at the time of the Site investigation, the five (5) 4,000-gallon USTs were removed from the Site by Tone Tank and Pump, Inc. in 1990. The documents indicated that these USTs were successfully tightness tested prior to removal.

During the course of the geophysical study ATC determined that an oil/water separator was located outside the Site building. An additional oil/water separator was also located next to the boiler room within the Site building.

ATC advanced a total of sixteen (16) borings throughout the Site and collected a total of sixteen (16) soil samples and six (6) groundwater samples for laboratory analysis during the Level 2 ESA.

The Site soils consist of approximately nine (9) feet of fill material containing brick, concrete, fly ash, slag, fine silty sands, clay and fine gravels. Native material, consisting of fine to medium sands with some silt, was observed at depths greater than nine (9) feet bgs.

Field screening of soil samples with a photoionization detector (PID), indicated that the Site soils exhibited no field evidence of petroleum contamination.

Laboratory results indicated that no petroleum-related volatile organic compounds (VOCs) were detected above the New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandum # 4046 (NYSDEC TAGM Memo) – Soil Cleanup Objectives, in any of the soil samples collected from the Site. Total VOCs ranged from non-detect to 110 parts per billion (ppb).

Semivolatile organic compounds (SVOCs) were detected above the NYSDEC TAGM Memo Soil Cleanup Objectives in six (6) of the sixteen (16) soil samples collected for laboratory analysis. Total SVOCs ranged from non-detect to 104,140 ppb.

Soil samples B-8 and B-14 collected from the vicinity of the interior floor drain and exterior oil/water separator, respectively, contained 1,780 parts per million (ppm) and 557 ppm of lead respectively. These concentrations are above the NYSDEC TAGM Eastern USA Background Levels of 500 ppm for this substance.

No polychlorinated biphenyls (PCBs) were detected above the laboratory methods detection limits (LMDL) in the soil samples collected adjacent to the oil/water separators.

The laboratory results for groundwater sample, GW-1 collected from soil boring (B-2) within the vicinity of the former gasoline USTs area, indicated that Benzene was detected slightly above the NYSDEC Division of Water Technical and Operational Guidance Series (1.1.1) *Ambient Water Quality Standards and Guidance Values* (NYSDEC TOGS Standards and Guidance Values). Benzene was detected at 5.6 ppb, slightly above the NYSDEC TOGS Standards and Guidance Value of 1 ppb for this compound. None of the remaining groundwater samples collected from the Site (GW-2, GW-3, GW-4, GW-5 and GW-6) contained VOCs or SVOCs above the LMDL.

2.0 INTRODUCTION

This Level 2 Environmental Site Assessment (Level 2 ESA) was conducted on March 11and 12, 2003 by ATC in order to investigate potential releases of contamination as a result of historical usage of the Site. The Site is located at 27-10 Hunters Point Avenue, in Long Island City, New York. This report was prepared by Levent Eskicakit, P.G. at the request of Mr. Subbu Viswanathan of FleetBoston Financial.

- The Site is a 387,000 square foot commercial property currently utilized for vehicle maintenance and petroleum products storage by Black Bear Company, Inc. The northwest portion of the Site building is utilized by Carey Limousine NY, Inc. as an office space.

3.0 SUMMARY OF PREVIOUS ENVIRONMENTAL SITE ASSESSMENTS

According to a Level I ESA, prepared by FECG, on behalf of Fleet, dated December 11, 2002, the Site was historically utilized for industrial purposes including, a truck sales and service facility, a truck depot for a shipping company and a warehouse to drum and store petroleum and vehicle related products (i.e., motor oil, antifreeze and greases, etc.). The Level I ESA report identified USTs, oil/water separators, subsurface scales and floor drains were identified at the Site. Additionally, five (5) 4,000-gallon gasoline USTs were reportedly removed from the Site in 1990.

The following areas of concern warranting additional investigation were identified by FECG at the Site:

- AOC-1: The presence of five (5) 4,000-gallon gasoline USTs and associated piping, for which no documentation related to their removal was available.
- AOC-2: Interior oil/water separator, floor drains and catch basins.
- AOC-3: An active 7,500-gallon UST.
- AOC-4: An exterior truck scale, oil/water separator and concrete pad.
- AOC-5: The possible presence of additional USTs at the Site.
- AOC-6: Historical fill material.

4.0 SCOPE OF INVESTIGATION

The scope of work for this Level 2 ESA focused on the above areas of concern that were identified by the prior Level 1 ESA. A geophysical survey was conducted to investigate the presence of any additional potential USTs and underground piping. Following the geophysical survey, ATC conducted soil and groundwater sampling using hydraulic direct push methods.

4.1 Scope of Work

ATC conducted the following scope of work for the Level 2 ESA:

Task 1 – Preliminary Work

- Contacting "One-Call" subsurface utility mark-out service;
- Preparation of a site-specific health and safety plan (HASP) for the Level II ESA work at the Site;

Task 2 – Geophysical Investigation

An Electromagnetic (EM) Survey followed by a Ground Penetrating Radar (GPR) Survey were conducted to locate any potential USTs, and piping runs in the areas characterized by former and present petroleum storage. A Geonics EM-61 time domain metal-detector and a GSSI SIR 3 GPR in conjunction with a 300-megahertz antenna were used. The EM-61 induces an electromagnetic field and measures the response to both ferrous and non-ferrous metallic objects using a two-coil receiver system. A grid of north-south traverses was established across the Site at five-foot intervals. GPR was used to further characterize the source of any magnetic anomalies that were detected.

Task 3 – Subsurface Soil and Groundwater Evaluation

A total of sixteen (16) soil borings were advanced at Site using Geoprobe techniques. One (1) soil sample was collected from each of the sixteen (16) soil borings and submitted to a New York State ELAP certified laboratory. The soil samples were collected from each boring from the soil horizon showing the highest apparent contamination. If no field evidence of soil contamination was detected, then a sample from six inches above the water table was retained for laboratory analysis. All soil samples were analyzed for VOCs and SVOCs in accordance with EPA Methods 8260 and 8270, respectively. In addition, the soil samples collected adjacent to the oil/water separators were analyzed for PCBs and RCRA metals in accordance with EPA Methods 8082 and 6000/7000 series, respectively.

ATC also collected six (6) groundwater samples from the Site. The grab samples were collected using "hydropunch" type water sampling units. The groundwater samples were

analyzed for VOCs, and SVOCs, in accordance with EPA Method 8260 and 8270, respectively.

4.2 Geophysical Survey

The results of the geophysical survey did not identify the presence of any additional USTs at the Site. Due to poor quality of the Site fill material, ATC was unable evaluate the presence of any underground piping associated with the former USTs. Figure 2 portrays the areas investigated during the geophysical survey.

4.3 Soil Sampling and Field Observations

Vertical soil samples were obtained via Geoprobe® technology utilizing a Macro Core (MC) open sampler to collect discrete soil cores. Disposable acetate sampling sleeves were inserted into the Geoprobe® equipment in order to obtain soil samples from selected depths. These samplers utilize open tube design and are capable of retrieving a 1.5" diameter by 44" long soil sample.

ATC advanced a total of sixteen (16) soil borings throughout the Site. The Site soils consisted of approximately nine (9) feet of fill material containing brick, concrete, fly ash, slag, fine silty sands, clay and fine gravels. Native material, consisting of fine to medium sands with some silt, was observed at depths greater than 9 feet bgs. Groundwater was observed at depths of 9 to 13 feet bgs.

Soil cores were continuously collected for field screening at all boring locations. Each soil core collected was screened with a pre-calibrated PID. Upon calibration, the PID registered a background reading of zero to 0.1 ppm. The soil was screened a minimum of one reading per foot during the soil logging process and the readings recorded on the corresponding boring log (see Appendix 1). PID readings ranged from non-detect to 1 part per million (ppm).

ATC collected one soil sample from each of sixteen (16) soil borings for laboratory analysis. Soil samples were collected from the interval characterized by the greatest field evidence of contamination. If no field evidence of contamination was detected then soil samples were collected six (6) inches above the groundwater table at the Site.

Selected soil samples were placed in proper, laboratory-supplied glassware, labeled, and then placed in a cooler with ice, and later submitted to Scilab Boston, Inc., a New York-certified laboratory (Certification No. 5974). The soil analyses included: analysis of VOCs and SVOCs, with additional analysis for PCBs and RCRA Metals performed on two (2) of the soil samples. The analytical parameters were selected based on the review of previous reports, and on the types of contaminants suspected to be present based on Site history.

4.4 Groundwater Sampling and Field Observations

ATC collected a total of six (6) groundwater samples utilizing a Geoprobe® groundwater sampling unit. A dedicated flexible polyethylene tube was inserted through the hollow push rods to groundwater at borings B-2 (GW-1), B-3 (GW-2), B-5 (GW-3), B-6 (GW-4), B-11 (GW-5) and B-15 (GW-6). These borings were selected for groundwater samples due to the presence of possible sources of groundwater contamination and to assess off-site migration of contaminants onto the Site. Water was pumped to appropriate sample containers using a peristaltic pump. All sampling equipment which contacted soil or groundwater was decontaminated between soil borings using an alconox wash, water rinse, second alconox wash and water rinse. Depth to groundwater at the Site was found to be approximately nine (9) feet to thirteen feet bgs.

The collected groundwater samples were submitted to Scilab Boston, Inc. for analysis under EPA Method 8260 (VOCs) and EPA Method 8270 (SVOCs).

5.0 GROUNDWATER FLOW DIRECTION

Based upon Site topography and drainage patterns, groundwater is expected to flow to the west towards Dutch Kills Creek.

6.0 RESULTS OF SOIL SAMPLING / ANALYSIS

The results of the soil laboratory analyses are summarized in Table 1. The complete laboratory report is provided in Appendix 3.

As indicated in Table 1, no VOCs were detected above the NYSDEC TAGM Memo Soil Cleanup Objectives. Total VOCs ranged from non-detect to 110 ppb in the samples collected from all soil borings.

SVOCs were detected above the NYSDEC TAGM Memo Soil Cleanup Objectives in six (6) of the sixteen (16) soil samples. Specifically, soil samples from borings B-4, B-5, B-8, B-9, B-12 and B-13 contained elevated SVOCs above their respective Cleanup Objectives. Total SVOCs ranged from non-detect to 104,140 ppb. These samples were collected from historical fill horizons at the Site.

No PCBs above laboratory method detection limits were detected in the soil samples collected from soil borings B-9 and B-13.

Soil samples B-8 and B-14 collected from the vicinity of the interior floor drain and exterior oil/water separator, contained 1,780 ppm and 557 ppm of lead respectively, which is slightly above the NYSDEC TAGM Eastern USA Background levels of 500 ppm for this substance. No other RCRA metals were detected above the NYSDEC TAGM Eastern Background levels in the remaining soil samples at the Site. These samples were collected from the historical fill horizons at the Site.

7.0 RESULTS OF GROUNDWATER SAMPLING / ANALYSIS

The results of the groundwater laboratory analyses are summarized in Table 2. The laboratory report is presented in Appendix 3.

Analysis of the groundwater sample GW-1 collected from soil boring B-2 within the vicinity of the former gasoline USTs identified Benzene slightly above the NYSDEC TOGS Standards and Guidance Values. Total VOCs range from non-detect to 5.6 ppb in all groundwater samples analyzed.

No other VOCs or SVOCs were detected above the LMDL in the remaining groundwater samples collected from the Site.

8.0 CONCLUSIONS

Based upon the results of the Level 2 ESA, ATC concludes the following:

The Site soils consisted of approximately nine (9) feet of urban fill material containing brick, concrete, fly ash, slag, fine silty sands, little clay and fine gravels. Native material, consisting of fine to medium sands with some silt, was observed at depths greater than 9 feet bgs. Groundwater was observed at depths of 9 to 13 feet bgs.

Laboratory results indicated that no VOCs were detected above the NYSDEC TAGM Memo Soil Cleanup Objectives in any of the soil samples collected for laboratory analysis from the Site. However, SVOCs were detected above NYSDEC TAGM Memo Soil Cleanup Objectives in six (6) of the sixteen (16) soil samples collected from the Site. The elevated concentrations are typical of urban fill materials and are attributed to fill components such as ash and asphalt. ATC concludes that the results do indicte evidence of a release of petroleum product.

The laboratory results indicated that groundwater samples GW-2, GW-3, GW-4, GW-5 and GW-6 from borings B-3, B-5, B-6, B-11 and B-15, respectively, contained no VOCs or SVOCs above the laboratory methods detection levels. However, the laboratory results indicated that groundwater sample (GW-1) collected from soil boring (B-2) within the vicinity of the former gasoline USTs contained concentration of Benzene at 5.6 ppb, slightly above the NYSDEC TOGS standards and guidance value of 1 ppb for this compound. Although the Benzene maybe attributed to the former gasoline USTs, the level is relatively minor and limited in extent. Additionally, no benzene was detected in soil samples from this location. Based on these results, ATC concludes that the detected Benzene does not represent an environmental concern for the Site.

10.0 LIMITATIONS

Limitations of this Level 2 Environmental Site Assessment

ATC has prepared this Level 2 Environmental Site Assessment in accordance with the contract scope of work, using reasonable efforts to attempt to identify areas of potential liability associated with soil and groundwater contamination at the Site. Any survey for the soil or groundwater contamination in the Site was limited in nature. The survey may not be relied upon as a comprehensive investigation for the presence of such contamination in all areas of the Site, or as meeting any standards established for conducting such surveys. ATC has made no independent investigation of the accuracy of these secondary sources and has assumed them to be accurate and complete. ATC does not warrant the accuracy or completeness of information provided by secondary sources. ATC does not warrant that contamination that may exist on the Site has been discovered, that the Site is suitable for any particular purpose or that the Site is clean or free of liability. Any cost estimates are based on general comparisons with past projects of similar scope and size, and actual costs or design-phase estimates may vary substantially from these estimates.
