A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- The subject property was formerly utilized as a bulk petroleum storage facility occupied by The Texas Company from 1917 to 1971 and was equipped with multiple bulk storage tanks. The subject property was reportedly vacant and out-of-use from 1961 until 1971 when it was redeveloped into the current configuration. Since 1971, the subject property has operated as a truck and vehicle storage facility, with auto repair and refueling activities. Six spill cases were reported to the New York State Department of Environmental Conservation (NYSDEC) in association with the subject property between 1990 and 2008 (further discussed in Section 4.2.2), all of which have been closed by the NYSDEC. According to prior Phase I Environmental Site Assessments (ESAs) prepared by Partner in September 2015 and Impact Environmental Closures, Inc. (IEC) in April 2014 (further discussed in Section 5.2.6), the most recent spill case dated 2008, was addressed via a Monitored Natural Attenuation Plan, for which case closure was issued in 2010. Based on the regulatory closure of the former releases obtained from the NYSDEC, the historical operations and bulk storage of petroleum onsite are considered an HREC for which no additional investigation appears to be warranted at this time.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following were identified during the course of this assessment:

- Partner observed six aboveground storage tanks (ASTs) for the storage of diesel, heating oil, motor oil and used oil on the subject property. Partner notes that our onsite observations of

these ASTs do not directly correlate with the tank records on file with the NYSDEC. However, based on the aboveground location of the tanks and the absence of observed spills, leaks or releases in their vicinity, the presence of these ASTs is not expected to represent a significant environmental concern at this time.

- Partner observed localized areas of staining throughout the subject property. Specifically, Partner noted staining in the repair garage identified as Building D and on the exterior asphalt-paved parking areas. Based on the surficial nature of the staining, with no conduits (i.e. cracks, drains, etc.) to the subsurface identified in the vicinity of the staining, the staining is not expected to represent a significant environmental concern at this time.
- Due to the age of the subject property buildings, there is a potential that asbestos-containing materials (ACMs) are present on site. Overall, suspect ACMs were observed to be in good condition and do not pose a health and safety concern to the occupants of the subject property at this time. The overall interior condition of the subject was observed to be in fair to good condition, with the exception of widespread damage to the drywall systems in Buildings A, B and E.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 28-90 Review Avenue in Long Island City, Queens County, New York (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed evidence of an HREC and environmental issues in connection with the subject property. Based on the conclusions of this assessment, Partner recommends the following:

- Should future redevelopment require the excavation of soils, additional subsurface investigation, including a ground-penetrating radar (GPR) survey, may be warranted to address former onsite operations and the possible presence of closed-in place USTs and monitoring wells.
- According to Mr. Aaron Milazzo of Pine River Capital Management L.P., future plans for the subject property will include the complete demolition of Buildings A, B, C, E and F. Only Buildings D and G will remain onsite for automobile repair use. After demolition is complete, an open-walled steel canopy will be constructed over the northern section of the lot for vehicle storage and parking. All ASTs located in buildings that are slated for demolition should be properly decommissioned and removed in accordance with applicable State regulations.
- Best management practices, including improved housekeeping and secondary containment for tanks, drums and/or containers of hazardous substances, should be considered in order to mitigate potential future subsurface impacts.
- Continue to follow the existing Operations and Maintenance (O&M) Program in order to safely manage the suspect ACMs located at the subject property. A comprehensive survey for ACMs should be conducted prior to any planned renovation or demolition activities. A licensed

asbestos abatement contractor and/or a Certified Asbestos Consultant should perform removal of identified ACMs in accordance with applicable regulations, including the preparation of specifications.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located at 28-90 Review Avenue in the City of Long Island City, Queens County, New York in general conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

28-90 Review Avenue
Long Island City, New York 11101

Date Issued: September 23, 2015
Partner Project No. 15-147222.1

Prepared For

The Bancorp Bank
712 Fifth Avenue, 11th Floor
New York, New York 11101

PARTNER

September 23, 2015

Ms. Kinzie Geldbach
The Bancorp Bank
712 Fifth Avenue, 11th Floor
New York, New York 11101

Subject: **Phase I Environmental Site Assessment**
28-90 Review Avenue
Long Island City, New York 11101

Partner Project No. 15-147222.1

Dear Ms. Geldbach:

Partner Assessment Corporation (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (ESA) report of the above-mentioned address (the "subject property"). This assessment was performed in general conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

This assessment included a site reconnaissance, as well as research and interviews with representatives of the public, property ownership, site manager and regulatory agencies. An assessment was made, conclusions stated and recommendations outlined.

We appreciate the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact Melissa Dahl at (201) 984-3651 or mdahl@partneresi.com.

Sincerely,

DRAFT
Melissa Dahl
Relationship Manager

EXECUTIVE SUMMARY

Partner Assessment Corporation (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 28-90 Review Avenue in the City of Long Island City, Queens County, New York (the "subject property"). This ESA is designed to provide The Bancorp Bank with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the west side of Review Avenue, within a heavily industrial area of Queens County. Please refer to the table below for further description of the subject property:

Subject Property Data	
Address:	28-90 Review Avenue, Long Island City, New York
Additional Address:	53-02 Review Avenue
Property Use:	Industrial
Land Acreage (Ac):	4.43
Number of Buildings:	7 (herein referenced as Buildings A thru G)
Number of Floors:	1-2
Gross Building Area (SF):	37,462 (Total)
Date of Construction:	*1917 (with additions circa* 1970 and 2010)
Assessor's Parcel Number (APN):	Block 294, Lot 106
Type of Construction:	Concrete / Steel / Brick
Current Tenants:	AA Truck Renting Corporation
Site Assessment Performed By:	Ryan Reynics of Partner
Site Assessment Conducted On:	September 16, 2015

The subject property is currently developed with seven buildings consisting of the following: a vacant two-story structure (Building A); a two-story structure utilized for car storage (Building B); a warehouse structure with double-height ceilings for woodworking (Building C); a warehouse structure for automotive repair (Building D); a one-story office building (Building E); the former fueling station canopy (Building F); a warehouse structure for automotive repair (Building G); and several office trailers. The remainder of the subject property is comprised of asphalt-paved parking areas utilized by month-to-month tenants for vehicle storage. Vehicles range from passenger cars to tractor trailers. On-site operations consist of vehicle storage, parking and repair. In addition to the current structures, the subject property is improved with a diesel fuel dispenser, associated landscaping and drainage features.

According to available historical sources, the subject property was formerly undeveloped from as early as 1898 to 1915; developed with "The Texas Company" (Texaco) oil terminal from at least 1917 to 1971; and redeveloped with the current configuration by 1971. Tenants on the subject property have included The Texas Company (1917-1971) and AA Truck Renting Corp (1971-Present).

The immediately surrounding properties consist of a parking lot to the north; railroad tracks and a self-storage facility to the south; an industrial building and a construction site to the east; and the Dutch Kills Creek to the west.

According to a previous subsurface investigation conducted on the subject property (2010), the depth of groundwater in the vicinity of the subject property is inferred to be approximately 5 to 10 feet below ground surface (bgs) and the direction of flow is toward the northwest.

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Partner did not identify any CRECs during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following HREC was identified during the course of this assessment:

- The subject property was formerly utilized as a bulk petroleum storage facility occupied by The Texas Company from 1917 to 1971 and was equipped with multiple bulk storage tanks. The subject property was reportedly vacant and out-of-use from 1961 to 1971, before being converted to the current use in 1971. From 1971 to the present, the subject property has operated as a truck and vehicle storage facility, with auto repairing and refueling activities. The subject property is associated with six spill cases (refer to Section 4.2.2 for a complete discussion), all of which have been closed by NYSDEC. The most recent spill case was addressed via Monitored Natural Attenuation Plan, and case closure was issued in 2010. Therefore, all of the wells on the site associated with the Monitored Natural Attenuation Plan can now be abandoned. Well abandonment must take place in accordance with the environmental regulations and laws of New York State. Based on the regulatory closure obtained from the NYSDEC, the historical operations and bulk storage of petroleum on-site is considered by Partner to represent an HREC for which no additional investigation appears warranted.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following environmental issues were identified during the course of this assessment:

- Partner observed six ASTs for the storage of diesel, heating oil and propane on the subject property. Partner notes that our on-site observations of these ASTs do not directly correlate with the tank records on file with the NYSDEC. However, based on the aboveground location of the tanks and the absence of observed spills, leaks or releases in their vicinity, the presence of these ASTs are not expected to represent a significant environmental concern to the subject property at this time.
- Partner observed localized areas of staining throughout the subject property. Based on the surficial nature of the staining, with no conduits (i.e. cracks, drains, etc.) to the subsurface identified in the areas of the staining, the staining is not expected to represent a significant environmental concern to the subject property at this time.
- Due to the age of the subject property buildings, the potential exists that asbestos-containing materials (ACMs) are present on site. Overall, suspect ACMs were observed to be in good condition and do not pose a health and safety concern to the occupants of the subject property at this time.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 28-90 Review Avenue in the City of Long Island City, Queens County, New York (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs at the subject property, and no further action is recommended at this time. However, environmental issues were identified in connection with the subject property. As such, the following should be considered:

- The out-of-use, 5,000-gallon heating oil AST located in Building C should be properly decommissioned in accordance with applicable requirements.
- Implementation of improved housekeeping strategies should be considered in order to eliminate potential, future impacts to the subsurface.
- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs located at the subject property.

1.0 INTRODUCTION

Partner Assessment Corporation (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 28-90 Review Avenue in the City of Long Island City, Queens County, New York (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential RECs (as defined by ASTM Standard E1527-13) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances.

The information contained in the ESA Report will be used by Client to: 1) evaluate its legal and financial liabilities for transactions related to foreclosure, purchase, sale, loan origination, loan workout or seller financing; 2) evaluate the subject property's overall development potential, the associated market value and the impact of applicable laws that restrict financial and other types of assistance for the future development of the subject property; and/or 3) determine whether specific actions are required to be performed prior to the foreclosure, purchase, sale, loan origination, loan workout or seller financing of the subject property.

This ESA was performed to permit the *User* to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"). ASTM Standard E1527-13 constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

1.2 Scope of Work

The scope of work for this ESA is in general accordance with the requirements of ASTM Standard E1527-13. This assessment included: 1) a property and adjacent site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments in order to determine any current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property. Additionally, Partner researched information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-13, AULs are the legal or physical

restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil or groundwater on the property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

The Bancorp Bank engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope and purpose of the work as well as other matters critical to the engagement. All reports, both verbal and written, are for the sole use and benefit of The Bancorp Bank. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

This report has been completed under specific Terms and Conditions relating to scope, relying parties, limitations of liability, indemnification, dispute resolution, and other factors relevant to any reliance on this report. Any parties relying on this report do so having accepted the Terms and Conditions for which this report was completed. A copy of Partner's standard Terms and Conditions can be found at http://www.partneresi.com/terms-and-conditions.php

1.5 Limiting Conditions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM E1527-13.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past or current owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources (as discussed in Section 3.0), this data gap is not expected to alter the findings of this assessment.
- Partner requested information relative to deed restrictions and environmental liens, a title search, and completion of a pre-survey questionnaire from the Report User. This information was not provided at the time of the assessment.
- Partner was not able to document the historical use of the subject property prior to 1898. The following sources were reviewed during the course of this assessment and found to be limited: aerial photographs were not available prior to 1954; city directories were not available prior to 1976; topographic maps prior to 1898; and fire insurance maps were no available prior to 1898. This data failure is not considered critical and does not change the conclusions of this report, as the 1898 fire insurance maps revealed the subject property to be predominantly undeveloped.

- Partner was unable to determine the property use at 5-year intervals, which constitutes a data gap. Except for property tax files and recorded land title records, which were not considered to be sufficiently useful, Partner reviewed all standard historical sources and conducted appropriate interviews.
- Partner submitted Freedom of Information Act (FOIA) requests to the NYSDEC, New York City Fire Department (FDNY), New York City Department of Health (NYCDOH) and New York City Department of Environmental Protection (NYDEP) for information pertaining to hazardous substances, USTs, releases, inspection records, etc. for the subject property and/or adjacent properties. As of this writing, these agencies have not responded to Partner's request. Based on information obtained from other historical sources, this limitation is not expected to alter the overall findings of this assessment.
- Partner's view of the ground during the site assessment was obstructed due to excessive interior storage, and excessive exterior vehicle storage. Based on information obtained from other historical sources, this limitation is not expected to alter the overall findings of this assessment.

Due to time constraints associated with this report, the Client has requested the report despite the above-listed limitations.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at 28-90 Review Avenue in Long Island City, New York is located on the west side of Review Avenue. According to the New York City Department of Finance (NYCDOF), the subject property is identified as Block 294 Lot 106, and ownership is currently vested in 28-90 Review Avenue Associates, L.L.C. since 2007.

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property is currently developed with seven buildings consisting of the following: a vacant two-story structure (Building A); a two-story structure utilized for car storage (Building B); a warehouse structure with double-height ceilings for woodworking (Building C); a warehouse structure for automotive repair (Building D); a one-story office building (Building E); the former fueling station canopy (Building F); a warehouse structure for automotive repair (Building G); and several office trailers. The remainder of the subject property is comprised of asphalt-paved parking areas utilized by month-to-month tenants for vehicle storage. Vehicles range from passenger cars to tractor trailers. On-site operations consist of vehicle storage, parking and repair.

The subject property is designated for industrial development by the City of New York.

The subject property is identified as a NY Underground Storage Tank (NY UST), NY Aboveground Storage Tank (NY AST), Resource Conservation Recovery Act- Small Quantity Generator (RCRA-SQG), NY Manifest, NJ Manifest, Facility Index System (FINDS), NY Spills and NY Leaking Storage Tank Incident Reports (NY LTANKS) site in the regulatory database report, as further discussed in Section 4.2.

2.3 Current Use of Adjacent Properties

During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties

North: Parking lot (28-26 Borden Avenue)
South: Railroad tracks and Access Self Storage (29-00, 29-08 Review Avenue)
East: Industrial (28-44 – 28-50 Borden Avenue; 28-39 – 28-45 Review Avenue); construction site (52-09 – 52-19 29th Street; 29-01 – 29-05 Review Avenue)
West: Dutch Kills Creek

The adjacent properties are identified as NY AST, NY HIST AST, NY UST, NY HIST UST, Resource Conservation Recovery Act Non-Generator/No Longer Regulated (RCRA NonGen/NLR), FINDS, NY Spills, EDR US Historical Auto Station and NY Manifest sites in the regulatory database report of Section 4.2.

2.4 Physical Setting Sources

2.4.1 Topography

The United States Geological Survey (USGS) *Brooklyn, New York* Quadrangle 7.5-minute series topographic map was reviewed for this ESA. According to the contour lines on the topographic map, the subject property is located at approximately 5 feet above mean sea level (MSL). The contour lines in the area of the subject property indicate the area is sloping gently toward the northwest. The subject property is depicted on the 1995 map as developed with seven structures likely for industrials use.

A copy of the most recent topographic map is included as Figure 3 of this report.

2.4.2 Hydrology

According to topographic map interpretation, the direction of groundwater in the vicinity of the subject property is inferred to flow toward the northwest. The nearest surface water in the vicinity of the subject property is the Dutch Kills, which is located adjacent to the west of the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

According to available information, a public water system operated by the New York City Department of Environmental Conservation (NYCDEP) serves the subject property vicinity. According to a representative of the NYCDEP, shallow groundwater directly beneath the subject property is not utilized for domestic purposes. The sources of public water for the City of New York are surface water from the Catskill/Delaware System, located in Delaware, Green Schoharie, Sullivan, and Ulster Counties; and the Croton System, located in Putnam, Westchester and Dutchess counties.

According to a previous subsurface investigation conducted on the subject property (2010), the depth of groundwater in the vicinity of the subject property is inferred to be approximately 5 to 10 feet bgs.

2.4.3 Geology/Soils

The subject property is situated within the Atlantic Coastal Plains physiographic province of the State of New York. The uppermost geologic formation underlying the soils at the subject property is the Late Pleistocene Age Wisconsin glacial deposits. The area consist of moraine deposits, glacial drift and outwash materials. The topography slopes southward and is characterized by large glacial erratic and scattered deposits of glacial till, consisting of a mix of silt, sand, gravel, and large boulders.

Soils in the vicinity of the Property are classified as Urban Land. Urban Land complex are those soils in which the soil's original structure and content have been so altered by human activities it has lost its original characteristics and is thus unidentifiable. Urban soils consist of nearly level to moderately steep areas where the soils have been altered or obscured by urban works and structures. Buildings and pavement cover more than 85 percent of the surface. Included in this unit in mapping are many small areas where the original soil material has been disturbed by construction and areas where fill has been added. Also included are small areas of undisturbed soils. The soil properties and characteristics of this

unit vary. Onsite investigation is needed to determine the suitability for specific uses and the limitations affecting those uses.

2.4.4 Flood Zone Information

Partner performed a review of the Flood Insurance Rate Map (FIRM), published by the Federal Emergency Management Agency (FEMA). According to Community Panel Number 3604970202F, dated September 5, 2007, the subject property appears to be located in Zone AE, areas subject to 100-year flood with base flood elevation determined.

A copy of the reviewed flood map is not included in Appendix B of this report.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. A chronological listing of the historical data found is summarized in the table below:

Historical Use Information		
Period/Date	**Source**	**Description/Use**
1898-1915	Topographic Maps, Sanborn Maps	Undeveloped
1917-1971	Aerial Photographs, Building Records, City Directories, Previous Report, Sanborn Maps, Topographic Maps	Bulk Petroleum Storage
1971-Present	Aerial Photographs, Building Records, City Directories, Interviews, Previous Report, Sanborn Maps, Topographic Maps, On-site Observations	Vehicle Storage/Auto Repair

According to available historical sources, the subject property was formerly undeveloped from as early as 1898 to 1915; developed with "The Texas Company" (Texaco) oil terminal from at least 1917 to 1971; and redeveloped with the current configuration by 1971. Tenants on the subject property have included The Texas Company (1917-1971) and AA Truck Renting Corp (1971-Present).

3.1 Aerial Photograph Review

Partner obtained available aerial photographs of the subject property and surrounding area from NETR Online on September 18, 2015. The following observations were noted to be visible on the subject property and adjacent properties during the aerial photograph review:

Date:	***1954, 1966***	***Scale:***	***1"=500'***
Subject Property:	Appears to be developed with six structures located throughout the subject property likely for industrial use		
North:	Appears to be developed with a large structure likely for industrial use		
South:	Appears to be developed with railroad tracks		
East:	Appears to be developed with a large structure likely for industrial use		
West:	Appears to be the Dutch Kills Creek		

Date:	***1974, 1980, 1994, 2004, 2006, 2008-2009, 2011-2013***	***Scale:***	***1"=500'***
Subject Property:	Appears to be developed with several structures likely for industrial use along with parking for vehicle storage; a larger structure in the southern portion of the subject property is no longer visible		

North:	No significant changes visible
South:	No significant changes visible
East:	No significant changes visible
West:	No significant changes visible

Due to copyright restrictions, copies of the reviewed aerial photographs are not included in Appendix B of this report.

3.2 Fire Insurance Maps

Partner reviewed the collection of Sanborn Fire Insurance (Sanborn) Maps from Environmental Data Resources, Inc. (EDR) on September 3, 2015. The following observations were noted to be depicted on the subject property and adjacent properties during the Sanborn Map review:

Date: 1898	
Subject Property:	Depicted as developed with two sheds; the majority of the subject property is depicted as undeveloped; the western portion of the subject property is depicted a canal basin
North:	Depicted as developed with a one- to two-story foundry, a four-story fitting shop, a two-story office building, and a four-story storage facility
South:	Depicted as developed with railroad tracks and undeveloped across Marsh Street
East:	Insufficient map coverage
West:	Depicted as undeveloped land followed by a railroad

Date: 1915	
Subject Property:	Depicted as undeveloped in the eastern portion of the subject property; depicted as developed with a draw bridge and a structure in the center of the subject property and a portion of a store in the western portion of the subject property
North:	Depicted as developed with a vacant one-story building, a one-story building labeled as Ed Buhler's Cement Storage, and a Indian Refinery Co for the storage of oils and gasoline in a two-story structure
South:	No significant changes depicted; depicted as developed with a two-story structure and a four-story industrial structure with a basement across Marsh Street
East:	Insufficient map coverage
West:	No significant changes depicted

Date: 1928	
Subject Property:	Depicted as developed with a bulk oil storage terminal consisting of six ASTs, associated piping, and eight structures for use by The Texas Company
North:	No significant structural changes, except identified as occupied by Howells, Field & Goddard
South:	No significant changes depicted
East:	No significant changes depicted
West:	No significant changes depicted

Date: 1936	
Subject Property:	No significant changes depicted, except additional bulk storage consists of two 20,000-gallon USTs in the western portion of the property, a gas tank in the northern portion of the property, and four 15,000-gallon UST in the eastern portion of the subject property
North:	No significant changes, except now identified as a warehouses
South:	No significant changes depicted
East:	No significant changes depicted
West:	Depicted as Dutch Kills Creek

Date: 1947	
Subject Property:	No significant changes depicted
North:	No significant changes, except now identified as Porcelain Metals Inc.
South:	No significant changes depicted
East:	No significant changes depicted
West:	No significant changes depicted

Date: 1950	
Subject Property:	No significant changes depicted
North:	No significant changes, except now identified as Seaporcel Metals Inc.
South:	No significant changes depicted
East:	No significant changes depicted
West:	No significant changes depicted

Date: 1970	
Subject Property:	No significant changes depicted
North:	No significant changes, except now identified as a paper bag manufacturer
South:	No significant changes depicted
East:	No significant changes depicted
West:	No significant changes depicted

Date: 1977, 1979	
Subject Property:	The 275,000-gallon ASTs, 15,000-gallon USTs and gas tank are no longer depicted on the property; the property is identified as commercial use
North:	No significant changes depicted
South:	No significant changes depicted
East:	No significant changes depicted
West:	No significant changes depicted

Date:	*1980, 1985, 1986, 1988-1996, 1999, 2001-2007*

Subject Property: The subject property is identified as a trucking terminal, with the current structures depicted

North: No significant changes depicted

South: No significant changes depicted

East: No significant changes depicted

West: No significant changes depicted

Copies of reviewed Sanborn Maps are included in Appendix B of this report.

3.3 City Directories

Partner reviewed historical city directories obtained from EDR on September 3, 2015 for past names and businesses that were listed for the subject property and adjacent properties. The findings are presented in the following table:

City Directory Search for 28-90 Review Avenue (Subject Property)

Year(s)	Occupant Listed
1976	AA Truck Renting Corp (28-90 Review Avenue)
1983	AA Truck Renting Corp (28-90 Review Avenue)
1991	AA Truck Renting Corp (28-90 Review Avenue)
2005	AA Truck Renting Corp, Joseph Eletto Transfer Inc. (28-90 Review Avenue)
2008	AA Truck Renting Corp, Joseph Eletto Transfer Inc., Review Maintenance Corp (28-90 Review Avenue)
2013	AA Truck Renting Corp, Joseph Eletto Transfer Inc., Metro Express Services Inc. (28-90 Review Avenue)

According to the city directory review, the subject property has been occupied by AA Truck Renting Corp from 1976 to 2013. Environmental concerns associated with the subject property are further discussed in Sections 4.2.2 and 5.2.6.

City Directory Search for Adjacent Properties

Year(s)	Occupant Listed
1934	East: Jaros Arth C pres Kompollte Corp, John J Jaros v pres floors, Lester Henry M sec Kompolite Co. (28-44 Borden Avenue)
1939	East: Slater Robbins Co Inc. chemicals, Bab Co, Natl Scorchless Steam Iron Corp (28-44 Borden Avenue), Internatl Mailing Tube & Wrapper Co (29-05 Review Avenue)
1945	East: Bab Co, Slater Robbins Co Inc. chemicals, Natl Scorchless Steam Iron Corp (28-44 Borden Avenue), Zimmer Thomson Corp fcty, Aircraft Specialties Div Zimmer Thomson (29-05 Review Avenue)

1950 South: DEL-PAK CO Inc. EXPT PCKNG, Duane Machy Corp Conveyers, Horowitz Bros & Margareten Kosher Foods, Margareten Jerome B (29-00 Review Avenue)
East: PLANT (29-05 Review Avenue)

1962 South: Uncrated Storage Inc., Mural Transport Inc., Horowitz Bros 7 Margareten Kosher Foods (29-00 Review Avenue)
East: Mitchell Papr Stock Co, Drew Papr Stock Co, Drew Papr Prods Corp ofc, (29-05 Review Avenue)

1967 South: Horowitz Margareten Kosher Foods, Amer Calmal Corp (29-00 Review Avenue)
East: Drew Papr Prods Corp ofc (29-05 Review Avenue)

1970 South: Horowitz Margareten Kosher Foods, Amer Calmal Lorp (29-00 Review Avenue)
East: Drew Papr Prods Corp ofc, Mitchell Paper Stock Co (29-05 Review Avenue)

1976 South: Horowitz Margareten Kosher Foods, Dars Met All Industries (29-00 Review Avenue)
East: Benson Body & Fender Reprs (28-44 Borden Avenue), Flash Graphix (28-39 Review Avenue), Drew Papr Prods Corp ofc (29-05 Review Avenue)

1983 South: Horowitz Margareten Kosher Foods, Dars Met All Industries Inc. (29-00 Review Ave)
East: Anchor Autp Electric Svce Inc. (28-44 Borden Avenue), Mazztronics, Roxie Sound Studios Inc., Second Story Sound, Roxy Rehersal Studio, Erics Photos (28-39 Review Avenue), Arrowsmith Paper Corp, Drew Papr Prods Corp ofc, Mitchell Paper Stock Co (29-05 Review Avenue)

1991 South: Margareten Enterprises, Baisden Raymon (29-00 Review Avenue)
East: Anchor Autp Electric Svce Inc. (28-44 Borden Avenue), Roxie Sound Studios Inc., Roxie Rehearsal Studio, Mazztronics, Gee Dee Genl Auto Repr Co (28-39 Review Avenue), Arrowsmith Paper Corp, Drew Papr Prods Corp ofc, Grand Waste Papr Corp, Mitchell Paper Stock Co (29-05 Review Avenue)

2005 South: Access Self Storage, Gomez Soraya vo (29-00 Review Avenue)
East: Mondial Automotive Inc. (28-44 Borden Avenue), Gee Dee General Auto Repair Co, Roxy Sound Studios 1 s (28-39 Review Avenue), Mountain Air Mechanical Inc., Ro Youn Soo, Acosta Artdeco (29-01 Review Avenue), Steel Welding Gates Corp, Modal, Big Apple Printing, Barone Brothers Marble & Crmc (29-05 Review Avenue)

2008 South: Access Big Key Self Storage (29-00 Review Avenue)
East: Mondial Automotive Inc. (28-44 Borden Avenue), Roxy Studios, Killer Sounds Inc., Gee Dee General Auto Repair Co. (28-39 Review Avenue), Steel Welding Gate Corp, Gym Tech Inc. (29-05 Review Avenue)

2013 South: Access Big Key Self Storage (29-00 Review Avenue)
East: Dartom Construction LLC (28-44 Borden Avenue), King Royal Auto Repair, Roxy Studios (28-39 Review Avenue), Big Apple Printing, Modal (29-05 Review Avenue)

According to the city directory review, the adjacent properties have been occupied by multiple commercial and industrial occupants from 1934 to 2013. Environmental concerns associated with the adjacent properties are further discussed in Section 4.2.3.

Copies of reviewed city directories are included in Appendix B of this report.

3.4 Historical Topographic Maps

Partner reviewed historical topographic maps obtained from NETR Online on September 18, 2015. The following observations were noted to be depicted on the subject property and adjacent properties during the topographic map review:

Date:	***1898, 1906, 1916, 1924, 1931, 1938***
Subject Property:	Depicted as developed with a small structure in the eastern portion of the subject property
North:	Depicted as developed with two structures
South:	Depicted as developed railroad tracks
East:	Depicted as undeveloped
West:	Depicted as a river

Date:	***1947***
Subject Property:	Depicted as developed with two structures likely for industrial use
North:	Depicted as developed with a structure likely for industrial use
South:	No significant changes depicted
East:	Depicted as developed with two structures across Review Avenue likely for industrial use
West:	No significant changes depicted

Date:	***1958, 1967, 1979, 1999***
Subject Property:	Depicted as developed with five structures likely for industrial use
North:	Depicted as developed with a large structure likely for industrial use
South:	No significant changes depicted
East:	Depicted as shaded pink indicating an area of dense urban development
West:	No significant changes depicted

Due to copyright restrictions, copies of reviewed topographic maps are not included in Appendix B of this report.

4.0 REGULATORY RECORDS REVIEW

4.1 Regulatory Agencies

4.1.1 State Department

Regulatory Agency Data	
Name of Agency:	New York State Department of Environmental Conservation (NYSDEC)
Point of Contact:	NYSDEC
Agency Address:	47-40 21st Street, Long Island City, New York
Agency Phone Number:	(718) 482-4900
Date of Contact:	April 2, 2015
Method of Communication:	Email
Summary of Communication:	As of the date of this report, Partner has not received a response from the NYSDEC for inclusion in this report. However according to records online the subject property holds records for nine current or former petroleum bulk storage (PBS) tanks under the New York State Department of Environmental Conservation PBS site number 2-238643. Additionally, the subject property is associated with six closed spill case numbers. Detail pertaining to the registered PBS tanks and spills can be found in Section 4.2.2 and 5.2.6.

4.1.2 Health Department

Regulatory Agency Data	
Name of Agency:	New York City Department of Health and Mental Hygiene (NYCDOH)
Point of Contact:	Records Access Officer
Agency Address:	125 Worth Street, New York, New York
Agency Phone Number:	(646) 632-6006
Date of Contact:	April 2, 2015
Method of Communication:	Faxed Request
Summary of Communication:	As of the date of this report, Partner has not received a response from the NYCDOH for inclusion in this report.

4.1.3 Fire Department

Regulatory Agency Data	
Name of Agency:	New York City Fire Department (FDNY)
Point of Contact:	Public Records Unit/Tanks Section
Agency Address:	9 MetroTech Center, Brooklyn NY 11201
Agency Phone Number:	(718) 999-2441
Date of Contact:	April 2, 2015

Regulatory Agency Data	
Method of Communication:	Mailed Request
Summary of Communication:	As of the date of this report, Partner has not received a response from the FDNY for inclusion in this report.

4.1.4 Building Department

Regulatory Agency Data	
Name of Agency:	New York City Building Department (NYCDOB)
Point of Contact:	Online
Agency Address:	N/A
Agency Phone Number:	N/A
Date of Contact:	April 18, 2015
Method of Communication:	Online
Summary of Communication:	Records were available for review, as further discussed in the following table:

Building Records Reviewed for 28-90 Review Avenue (Subject Property)		
Year(s)	**Owner/Applicant**	**Description**
1908, 1987	N/A	Alteration
1918, 1988	N/A	New Building

4.1.5 Planning Department

Regulatory Agency Data	
Name of Agency:	New York City Zoning and Land Use (NYC ZOLA)
Point of Contact:	Online
Agency Address:	N/A
Agency Phone Number:	N/A
Date of Contact:	September 18, 2015
Method of Communication:	Online
Summary of Communication:	According to records reviewed, the subject property is zoned M3-1 for manufacturing development by the City of New York.

4.1.6 Oil & Gas Exploration

Regulatory Agency Data	
Name of Agency:	New York State Department of Environmental Conservation (NYSDEC)
Point of Contact:	Environmental Resource Mapper
Agency Address:	N/A

Regulatory Agency Data	
Agency Phone Number:	N/A
Date of Contact:	September 18, 2015
Method of Communication:	Online
Summary of Communication:	According to the NYSDEC Environmental Resource Mapper, no oil or gas wells are located on or adjacent to the subject property.

4.1.7 Assessor's Office

Regulatory Agency Data	
Name of Agency:	New York City Department of Finance (NYCDOF)
Point of Contact:	Online
Agency Address:	N/A
Agency Phone Number:	N/A
Date of Contact:	September 18, 2015
Method of Communication:	Online review
Summary of Communication:	According to records reviewed, the subject property is identified as Block 294 Lot 106, and ownership is currently vested in 28-90 Review Avenue Associates, L.L.C. since 2007.

4.1.8 City Department of Environmental Protection

Regulatory Agency Data	
Name of Agency:	New York City Department of Environmental Protection (NYCDEP)
Point of Contact:	Records Officer
Agency Address:	59-17 Junction Boulevard, 19th Floor, Flushing NY 11373
Agency Phone Number:	(718) 595-6543
Date of Contact:	April 2, 2015
Method of Communication:	Faxed Request
Summary of Communication:	As of the date of this report, Partner has not received a response from the NYCDEP for inclusion in this report.

A copy of pertinent documents is included in Appendix B of this report.

4.2 Mapped Database Records Search

Information from standard federal, state, county, and city environmental record sources was provided by EDR. Data from governmental agency lists are updated and integrated into one database, which is updated as these data are released. The information contained in this report was compiled from publicly available sources and the locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet.

4.2.1 Regulatory Database Summary

Radius Report Data				
Database	**Search Radius (mile)**	**Subject Property**	**Adjacent Properties**	**Sites of Concern**
Federal NPL or Delisted NPL Site	1.00	N	N	N
Federal CERCLIS Site	0.50	N	N	N
Federal CERCLIS-NFRAP Site	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	N	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, CESQG)	0.25	**Y**	**Y**	**Y**
Federal IC/EC Registries	0.50	N	N	N
Federal ERNS Site	Subject Property	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N
State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	N	N
State/Tribal Leaking Storage Tank Site	0.50	**Y**	N	**Y**
State/Tribal Registered Storage Tank Sites (UST/AST)	0.25	**Y**	**Y**	**Y**
State/Tribal Voluntary Cleanup Sites (VCP)	0.50	N	N	N
State/Tribal Spills	0.50	**Y**	**Y**	**Y**
Federal Brownfield Sites	0.50	N	N	N
State Brownfield Sites	0.50	N	N	**Y**
EDR MGP	Varies	N	N	N
EDR US Hist Auto Station	Varies	N	**Y**	**Y**
EDR US Hist Cleaners	Varies	N	N	N
Facility Index System (FINDS)	Varies	**Y**	**Y**	**Y**
NJ Manifest	Varies	**Y**	N	N
NY Manifest	Varies	**Y**	**Y**	**Y**

4.2.2 Subject Property Listings

The subject property is identified as a NY UST, NY AST, RCRA-SQG, NY Manifest, NJ Manifest, FINDS, NY Spills, and NY LTANKS site in the regulatory database report, as discussed below:

- The subject property, identified as AA Truck Renting Corps at 28-90 Review Avenue, is listed with the following tanks registered with the NYSDEC via PBS No. 2-238643:
  - *TANK-001:* A 4,000-gallon diesel UST installed in 1971 and closed-in-place on April 28, 1999.
  - *TANK-002:* A 4,000-gallon diesel UST installed in 1971 and closed-in-place on April 28, 1999.
  - *TANK-003:* A 4,000-gallon diesel UST installed in 1971 and was closed/removed on April 28, 1999.

- *TANK-004:* A 5,000-gallon #2 fuel oil UST installed in 1971 and is listed as currently "In Service." *Partner notes that this tank is physically located aboveground within Building C and has not been used since Hurricane Sandy.*
- *TANK-005:* A 275-gallon lube oil AST, with no soil contact, installed in 1971 and is listed as currently "In Service."
- *TANK-006:* A 500-gallon waste oil AST, with no soil contact, installed in 1971 and is listed as currently "In Service."
- *TANK-007:* A 275-gallon lube oil AST, with no soil contact, installed in 1971 and is listed as currently "In Service."
- *TANK-008:* A 275-gallon AST with the contents listed as "Other" and with no soil contact, installed in 1971 and was closed/removed on April 28, 1999.
- *TANK-009:* A 4,000-gallon diesel AST installed on May 17, 1999 and is listed as currently "In Service."

Furthermore, this site reported six spills under the NYSDEC Spill Numbers: as discussed below:

- *Spill No. 9010146:* This release was reported to the NYSDEC on December 18, 1990. According to the regulatory database report 40-gallons of #2 Fuel Oil were released onto the ground as a result of overfill caused by a faulty gauge. "Tyree Bros" were notified to perform clean up. The spill obtained regulatory closure from the NYSDEC on November 11, 1991.
- *Spill No. 9311731:* This release was reported to the NYSDEC on January 3, 1994. According to the regulatory database report less than one gallon of #2 Fuel Oil was released and contained on pavement. DEC response took corrective action and sorbent was applied to pick up the spilled contaminants. The spill obtained regulatory closure from NYSDEC on January 3, 1994.
- *Spill No. 9313946:* This release was reported to the NYSDEC on February 26, 1994. According to the regulatory database report less than one pound of diesel fuel was released due to "tank test failure." The tank test was deemed "inconclusive" and was retested the same day and was found to be tight. No repairs were made and no excavations were performed. The spill obtained regulatory closure from the NYSDEC on September 9, 2006.
- *Spill No. 9600032:* This release was reported to the NYSDEC on April 1, 1996. According to the regulatory database report, the spill was called in as a result of human error, "the driver was told to fill the wrong tank." The spill was classified as a known release with minimal potential for fire hazard. Reportedly, the spill impacted the sewer system which discharges off-site. Cleanup was reportedly performed by "RP." The spill obtained regulatory closure from the NYSDEC on May 8, 1996.
- *Spill No. 0803348:* This release was reported to the NYSDEC on June 6, 2008. According to the regulatory database report four gallons of diesel/ waste oil/ motor oil were released due to

housekeeping and was found during an inspection. The spill obtained regulatory closure from the NYSDEC on July 28, 2008.

- *Spill No. 0807459:* This release was reported to the NYSDEC on October 2, 2008. According to the regulatory database report there was a concern of contaminated soil. The spiller also reported that he found groundwater onsite with floating product on it. Initial soil borings found some VOC hits and SVOC hits that were well below or slightly above the TAGM. Six oil recovery wells were installed on the property. The spill obtained regulatory closure from the NYSDEC on September 27, 2010.

Based on the regulatory oversight, closed regulatory status of documented releases, identification of responsible parties and the reported clean ups related to releases, these listings are not expected to represent a significant environmental concern.

Additionally, this site is identified on the RCRA and Manifest databases under the EPA ID: NYD012473583. This site was identified as a RCRA small quantity generator generated small quantity in 1986 and 2006. Historical hazardous waste generated at the subject property was identified as EPA Waste Codes: D000, and D001. No violations were reported regarding the generator of hazardous materials. Additionally, this site was identified on the NY Manifest database for the removal of hazardous materials from 2007 to 2015. Based on the currently regulatory status and lack of active violations, these listings are not expected to represent a significant environmental concern.

4.2.3 Adjacent Property Listings

The adjacent property to the east is identified as a NY Spill site in the regulatory database report, as discussed below:

- The adjacent property, identified as Street Spill at 28901 Review Avenue, is presumed to be located in the roadway adjacent to the east of the subject property. This site reported a release (Spill No. 0504537) on July 15, 2005, which reportedly was limited to the road way. The release occurred as a result of a moving vehicle and was reported to the NYSDEC. According to the regulatory database report, "Minor spill on asphalt from moving vehicle. No recoverable spill and only stain present. No soil or groundwater affected. No sewer or grains affected. Regulatory closure was obtained on July 18, 2005. Based on the closed regulatory status, and lack of impacted media, this listing is not expected to represent a significant environmental concern.

The adjacent property to the north is identified as a NY Spill, Resource Conservation Recovery Act Non-Generator/No Longer Regulated (RCRA NonGen/NLR), Facility Index System (FINDS), and NY Manifest site in the regulatory database report, as discussed below:

- The adjacent property, identified at 28-20 Borden Avenue, is located adjacent to the north of the subject property. This site reported a three releases (Spill No. 9702480, 1009365, and 1204192) as discussed below:

- *Spill No. 9702480:* This release was reported to the NYSDEC on May 23, 1997. According to the regulatory database report 3,000-sqaure feet of asbestos containing materials contaminated soils during a roof removal. The site was cleaned up and impacted soils were removed. The spill obtained regulatory closure from the NYSDEC on May 28, 1997.
- *Spill No. 1009365:* This release was reported to the NYSDEC on November 30, 2010. According to the regulatory database report the source of the release was a 2,000-gallon UST inside a building. Approximately 2,000-cubic yards of soil was impacted however groundwater was not significantly impacted. Approximately 213-tons of soils were removed from the property and end point samples indicated that the impacted soils were removed. The spill obtained regulatory closure from the NYSDEC on September 18, 2012.
- *Spill No. 1204192:* This release was reported to the NYSDEC on July 27, 2012. According to the regulatory database report "active spill on site 1009365. (sr)" and "2nd tank- cleanup pending." This listing appears to be a part of the previous spill mentioned above. The spill obtained regulatory closure from the NYSDEC on September 18, 2012.

Based on the closed regulatory status and removal of impacted soils, these spill listings are not expected to represent a significant environmental concern.

Additionally, this site is identified on the RCRA and Manifest databases under the EPA ID: NY0000100735. This site was identified as a RCRA small quantity generator generated small quantity in 1994, a conditionally exempt small quantity generator in 2006, and a large quantity generator in 2003 and 2012. The site was further identified as verified non-generator in 1999, 2004, and 2007. Historical hazardous waste generated at the subject property was identified as EPA Waste Codes: D001, D002, F003, F005 and D008. This site received a notices of violations from in 2004 however compliance was achieved later in 2004. Additionally, this site was identified on the NY Manifest database for the removal of hazardous materials from 1994 to 2003. Based on the presence of the currently regulatory status and lack of active violations, these listings are not expected to represent a significant environmental concern.

The adjacent property to the east is identified as an EDR US Historical Auto Station site in the regulatory database report, as discussed below:

- The adjacent property, at 2844 Borden Avenue, is identified as an EDR US Historical Auto Station for the tenants identified as Anchor Auto Electric Svce Incorporated from 1999 to 2000 and Mondial Automotive Inc. from 2006 and 2008. Although hazardous substances and petroleum products were likely associated with the former auto repair operations conducted on the adjacent property, no improper storage or handling of these materials was reported to the local regulatory agencies. The adjacent property is not listed for any spills or releases in connection with the use or handling of these materials. Based on this lack of document releases, and lack of hazardous materials listings, this listing is not expected to represent a significant environmental concern.

The adjacent property to the east is identified as an EDR US Historical Auto Station site in the regulatory database report, as discussed below:

- The adjacent property, at 2839 Review Avenue, is identified as an EDR US Historical Auto Station for the tenants identified as Gee Dee Genl Auto Repr Company from 1999 to 2008 and King Royal Auto Repair from 2009 and 2012. Although hazardous substances and petroleum products were likely associated with the former auto repair operations conducted on the adjacent property, no improper storage or handling of these materials was reported to the local regulatory agencies. The adjacent property is not listed for any spills or releases in connection with the use or handling of these materials. Based on this lack of document releases, and lack of hazardous materials listings, this listing is not expected to represent a significant environmental concern.

The adjacent property to the east is identified as a NY AST, NY HIST AST site in the regulatory database report, as discussed below:

- The adjacent property, at 29-05 Review Avenue, is located adjacent to the east of the subject property. This site this site reportedly operated a 2,500-gallon #2 fuel oil AST (PBS: 2-082627) which was installed on an unknown date and closed-removed January 1, 1995. According to the regulatory database, the tank type was steel/carbon steel/iron, and equipped with a product level gauge, suction dispenser, and was not in contact with the soil. Based on the location of the tank, and lack of documented releases, this listing is not expected to represent a significant environmental concern.

The adjacent property to the south is identified as a NY AST, NY HIST AST, NY UST, NY HIST UST, Resource Conservation Recovery Act Non-Generator/No Longer Regulated (RCRA NonGen/NLR), FINDS, and NY Manifest site in the regulatory database report, as discussed below:

- The adjacent property, identified as Access Self Storage at 29-00 Review Avenue, is located adjacent to the south of the subject property. This site holds records for nine current and former PBS tanks under the NYSDEC PBS site number 2-083887 as discussed below:
    - *TANK-001:* One 10,000-gallon #2 fuel oil AST that was installed in 1946 and is active
    - *TANK-1:* One 10,000-gallon #2 fuel oil AST that was installed on an unknown and closed-removed on November 1, 1993.
    - *TANK-2 & 3:* Two 550-gallon gasoline USTs that was installed on an unknown and closed-removed on November 1, 1993.

  Based on the removal of the USTs, location of the active tank aboveground, and lack of documented releases, these listings are not expected to represent a significant environmental concern.

  Additionally, this site is identified on the RCRA and Manifest databases under the EPA ID: NYD056410178. This site was identified as a RCRA small quantity generator generated small quantity in 1997 and a verified non-generator in 1997, and 2006. Historical hazardous waste generated at the subject property was identified as EPA Waste Codes: D001, and D018 with no violation reported. This site was identified on the NY Manifest database for the removal of hazardous materials from 1993 to

2007. Based on the presence of the current regulatory status and lack of active violations, these listings are not expected to represent a significant environmental concern.

4.2.4 Sites of Concern Listings

Based on their distance, down-gradient location and/or completion of remedial action, none of these facilities identified within the search radii are expected to be of environmental significance for the subject property.

4.2.5 Orphan Listings

A total of twenty-two (22) orphan listings are identified in the regulatory database report, however, none were identified to be at the subject property or an adjacent property.

A copy of the regulatory database report is included in Appendix C of this report.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30 and 312.31. The *User* should provide the following information to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiries* is not complete. The *User* is asked to provide information or knowledge of the following:

- Review Title and Judicial Records for Environmental Liens and AULs
- Specialized Knowledge or Experience of the User
- Actual Knowledge of the User
- Reason for Significantly Lower Purchase Price
- Commonly Known or *Reasonably Ascertainable* information
- Degree of Obviousness
- Reason for Preparation of this Phase I ESA

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

Pursuant to ASTM E1527-13, Partner requested the following site information from The Bancorp Bank (User of this report).

User Responsibilities				
Item	**Provided By User**	**Not Provided By User**	**Discussed Below**	**Does Not Apply**
User Questionnaire		**X**		
Title Records, Environmental Liens and AULs			**X**	
Specialized Knowledge			**X**	
Actual Knowledge			**X**	
Valuation Reduction for Environmental Issues			**X**	
Identification of Key Site Manager	**Section 5.1.3**			
Reason for Performing Phase I ESA	**Section 1.1**			
Prior Environmental Reports			**X**	
Other				**X**

5.1 Interviews

5.1.1 Interview with Owner

Mr. Eric Roberts, subject property owner, was not aware of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on or from the subject property; any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the subject property; or any notices from a governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

According to Mr. Roberts, the subject property was developed in 1917 for use by the Texas Company (Texaco) as an oil storage terminal. Mr. Roberts stated that the subject property was vacated for approximately ten years prior to his purchase of the property in 1971. From 1972 the subject property has operated as a storage and repair facility for large commercial vehicles. Mr. Roberts also stated that the subject property has been the subject of various subsurface investigations from 1990 through 2010 as further discussed in Section 5.2.6.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User. The information requested was not received prior to the issuance of this report. Because the Report User (Client) is a lender, it is understood that the Report User would not have knowledge of the property that would significantly impact our ability to satisfy the objectives of this assessment. The lack of this information is not considered to represent a significant data gap.

5.1.3 Interview with Key Site Manager

See Section 5.1.1.

5.1.4 Interviews with Past Owners, Operators and Occupants

Interviews with past owners, operators and occupants were not conducted since information regarding the potential for contamination at the subject property was obtained from other sources.

5.1.5 Interview with Others

As the subject property is not an abandoned property as defined in ASTM 1527-13, interview with others were not performed.

5.2 User Provided Information

5.2.1 Title Records, Environmental Liens and AULs

Partner was not provided with title records or environmental lien and AUL information for review as part of this assessment.

5.2.2 Specialized Knowledge

The User of this report provided Partner with a copy of a previous Phase I ESA, which was conducted for the subject property. Please reference Section 5.2.6 below for a summary of this historical ESA report. No other specialized knowledge of environmental conditions associated with the subject property was provided by the User at the time of the assessment.

5.2.3 Actual Knowledge of the User

No actual knowledge of any environmental lien or AULs encumbering the subject property or in connection with the subject property was provided by the User at the time of the assessment.

5.2.4 Valuation Reduction for Environmental Issues

No knowledge of valuation reductions associated with the subject property was provided by the User at the time of the assessment.

5.2.5 Commonly Known or Reasonably Ascertainable Information

The User did not provide information that is commonly known or *reasonably ascertainable* within the local community about the subject property at the time of the assessment.

5.2.6 Previous Reports and Other Provided Documentation

The following information was provided to Partner for review during the course of this assessment:

Phase I Environmental Site Assessment, Impact Environmental Closures, Inc. (April 22, 2014/Updated June 25, 2014)

IEC prepared this report on behalf of AA Truck Renting. The assessment was performed in general accordance with ASTM Standard E1527-13. The assessment consisted of a site reconnaissance, interviews with knowledgeable personnel, review of historical information, a review of federal, state and local regulatory databases and included a limited asbestos survey, and a limited lead paint survey. Pertinent information contained in this report is summarized below:

- At the time of the 2014 assessment, the subject property was occupied by several month to month tenants in the trucking industry. The subject property reportedly consists of one commercial building and three vacant two-story buildings. Onsite operations consisted of truck and bus repair with storage for new parts.
- According to the IEC report, the subject property formerly undeveloped in 1898 and 1915, and occupied by "The Texas Company" (Texaco) oil terminal from 1936 to 1972, and AA Truck Renting from 1973 to 2014.
- IEC identified the following ASTs during were observed the site reconnaissance:
    - One 275-gallon waste oil AST in the auto repair facility
    - One 150-gallon waste oil AST in the auto repair facility
    - One 500-gallon fuel oil AST in a shed abutting the repair space

  - One (empty) 5,000-gallon fuel oil AST in the vacant building to the southwest of the repair shop
  - Two 275-gallon motor oil ASTs in vacant building southwest of the repair shop
  - One 3,000-gallon diesel AST on the eastern side of the subject property with an associated fuel dispenser
- No USTs were identified on the subject property during the site reconnaissance
- IEC identified several 55-gallon drums of motor oil, E synthetic CD-50 Lubricants, Transmission fluid, Hydraulic Oil, Anti-freeze, and other unidentified automotive fluid
- IEC identified one part washer in the repair space which was reportedly serviced by Safety Kleen
- IEC identified two aboveground hydraulic automotive lifts in the repair space
- IEC identified six drainage structures of solid construction which appeared to outfall to the Newtown Creek District Sewer System
- IEC identified several monitoring wells located throughout the subject property which pertained to sub-surface investigations
- IEC reviewed the following previous reports and correspondence as part of the 2014 Phase I Environmental Site Assessment:
  - Subsurface Investigation by Tyree Brothers Environmental Services Inc. dated May 1990
  - Correspondence between Tyree Brothers Environmental Services Inc. and Eugene Sullivan of the NYSDEC dated October 17, 1991
  - Correspondence between Tyree Brothers Environmental Services Inc. and Eugene Sullivan of the NYSDEC dated November 8, 1991
  - Phase I ESA by Tyree Brothers Environmental Services Inc. dated June 15, 1999
  - Tank Affidavit prepared by William Klein, The Franklin Company dated May 11, 1999
  - A Remote Sensing Survey: GPR Investigation prepared by Impact Environmental dated July 28, 1999
  - Tank Affidavit, prepared by Stuart Levy, Alvin Petroleum Systems, dated August 5, 1999
  - Subsurface Investigation Report was prepared for NYSDEC Spill # 08-07459 by Impact Environmental dated October 2, 2008
  - Investigation Summary Report was prepared for NYSDEC Spill # 08-07459 by Impact Environmental dated June 24, 2009
  - Quarterly Monitoring Report (1st Qtr 2010) was prepared by Impact Environmental, dated March 12, 2010

- Quarterly Monitoring Report (2nd Qtr 2010) was prepared by Impact Environmental, dated June 11, 2010
- Quarterly Monitoring Report (3rd Qtr 2010) was prepared by Impact Environmental, dated September 9, 2010
- NYSDEC issued No Further Action correspondence on October 1, 2010
- Well Decommissioning Report was prepared by Impact Environmental, August 9, 2011
- A letter prepared by Impact Environmental to AA Truck Renting, dated December 20, 2011 was issued in response to a Notice of Violation received on November 4, 2011 from the NYSDEC

- Details pertinent to the previous reports and correspondence are discussed below:
  - According to the 1990 Tyree Subsurface investigation, soil samples showed high concentration of aromatic hydrocarbons. Floating product was also reported in a well created from a soil boring. Tyree recommended having all USTs and lines tightness tested in order to identify the point of contamination. On October 17, 1991 Tyree provided Eugene Sullivan of the NYSDEC with a report outline the remedial word conducted onsite and analytical results showing that an optimal volume of floating product was recovered and any trace floating product would have minimal or no environmental impact on the surrounding areas. Subsequently, correspondence between Tyree and the NYSDEC indicated that spill case 9010146 was closed.
  - According to 1999 Tyree Phase I ESA, one UST was identified in the large center building west of the office space, a potential UST was identified by the presence of a suspected fill pipe. The pipe cap could not be removed at the time of inspection. Additionally numerous ASTs were reported in the building, including a 4,000-gallon #2 fuel oil AST for on-site heating and two active 275-gallon motor oil ASTs.
  - The May 1999 Tank Affidavit stated three 4,000-gallon diesel USTs were sealed by being filled with inert matter.
  - The 1999 Remote Sensing Survey: GPR Investigation concluded that one significant subsurface anomaly adjacent to the southwest corner of the 1,000-square foot building was consistent with the size and shape of a UST. The GPR imaging failed to identify the presence of anomalies consistent with a UST in the interior of the 23,000-square foot building.
  - The August 1999 Tank Affidavit stated two 550-gallon USTs located in front of the two-story masonry building on the northern boundary were abandoned in place to proper standards. A no further action letter was received preceding the tank abandonments.
  - According to the 2008 IEC Subsurface Investigation Report and 2009 Investigation Summary Report which were prepared for spill case 08-07459, strong petrochemical odor, oil sheen and high PID reading were detected throughout the subject property. The laboratory analysis of the soil and ground water samples reportedly failed to detect any significant target VOC or SVOC levels. These finding are reportedly consistent with other investigation conducted by IEC in 2008.

It was concluded that surface petroleum product is aged and degraded and accumulated during decades of historical petroleum storage on the subject property. The remaining residual contaminated reportedly has a strong petroleum odor however it does not exhibit high levels of VOCs and SVOCs. Reportedly the levels of VOCs and SVOCs onsite were marginally above NYSDEC guidance criteria and based on the land use, geology and hydrology of the subject property is it unlikely for the residual degraded petroleum product to impose a significant risk to human health and the environmental. Subsequently, the NYSDEC required a MNA plan which included quarterly sampling an analysis of ground water from onsite monitoring well to achieve closure.

- According to Quarterly Monitoring Reports from 2010 prepared by IEC, groundwater samples from MW-2, MW-3, MW-5, and MW-6 failed to detect target VOCs and SVOCs however 0.01-feet free-phase product was observed in the MW-7H in the first two quarters of 2010. According the Quarterly Monitoring Report dated September 9, 2010 laboratory analysis performed of groundwater samples MW-1 and MW-5 failed to detect target VOCs and SVOCs, however gasoline related target volatile organic analytes were reported marginally above the NYSDEC ambient water quality standard in MW-2, MW-3, MW-5, MW-6, and MW-7H. The VOC concentration was less than 0.1 ppm. A sump skimmer was reportedly installed in MW-7H for the free-phase product recovery.
- On October 1, 2010 the NYSDEC issued No Further Action correspondence indicating that "According to the data that the Department has received, there is no longer any free product on the water table, nor dissolved contamination. Therefore, the Department is closing the spill case. All of the wells of the site can now be abandoned. Well abandonment must take place in accordance with the environmental regulations and laws of New York State.."
- The 2011 Well Decommissioning Report prepared by IEC stated that the monitoring wells associated with the NYSDEC spill case 08-07459 onsite were decommissioned in accordance with NYSDEC CP-43.
- The December 2011 letter prepared by Impact Environmental to AA Truck Renting was issued in response to a Notice of Violation received on November 2011. The violation letter required the removal of liquids from a secondary containment area associated with the exterior diesel AST, removal of surface staining in the area of an exterior waste oil AST, removal of sediments and/or petroleum liquids from several catch basins maintained on the subject property. Waste manifest generated during the cleanup activities by IEC were provided in the appendix of the 2014 IEC report and a tank tightness test was reportedly performed by a tank contractor.

IEC identified no recognized environmental conditions as part of the 2014 report.

IEC identified the six NYSDEC closed spill cases and one Notice of Violation (NOV) on the subject property as HRECs, as they have all received regulatory closure and have been remediated to the satisfaction of the NYSDEC. Reportedly, any current levels of contamination which may be present in the subsurface are

being allowed to naturally attenuate as they do not represent a significant threat to human health or the environmental. According to the IEC report, no active remediation is required by NYSDEC at this time.

6.3.2fore, no additional activities were recommended with respect to the HRECs.

IEC made the following recommendations pertaining to "Business Environmental Risks":

- In the case of redevelopment, excavation activities will encounter the presence of urban fill, possibly abandoned USTs, and possible residual contamination from HREC's and/or off-site sources identified above. Urban fill is found throughout the New York metropolitan area is considered a regulated waste in the State of New York, and is therefore required to be managed in accordance with the State Solid Waste Regulations. This would require that any impacted soil be excavated, handled, transported and disposed of in accordance with NYS waste regulations. Onsite buildings may require engineering controls (e.g. vapor barrier, SSDS). As part of future site redevelopment, increase to the elevation of the site and/or future buildings may be required due to the current NYC DOB and/or proposed FEMA regulations.
- In the case the site remains in its current use, NYSDEC PBS Regulations (6NYCRR Part 612) needs to be to be properly updated with all six (6) ASTs located onsite. Part 612 of this regulation requires of all facilities with a combined storage capacity of more than 1,100 gallons. Minor staining was observed throughout the repair space. These area of staining should be properly cleaned to avoid any possible introduction into the Sites subsurface. Visual indication of mold were observed in the storage portions of the repair facility, and the vacant buildings resulting from hurricane Sandy. If these portions of the Site are to be utilized by work inhabitants on a daily basis the mold should be removed and cleaned to prevent human health problems.

IEC also identified the following De Minimis conditions:

- If the site is redevelopment in the future or if the land use changes, the registration for RCRA EPA ID number for the Site should be administratively closed.
- If the building(s) are to be renovated or demolished in the future, full lead and asbestos surveys should be conducted prior to the initiation of any work.
- Delivery slips and disposal manifests must be maintained on-site to document the types and quantities of chemicals being used during facility operations, and to establish proof of proper disposal of any spent hazardous wastes that may be found. It is noted that due to hurricane Sandy, many corporate records were lost.
- Spent absorbent materials ("Speedy Dry") observed on the interior floor of the automotive repair shop should be cleaned and stored in sealed plastic bags and/or 55-gallon steel drums for proper disposal.

Partner generally agrees with the findings and recommendations of the previous IEC report from 2014.

Copies of pertinent pages reviewed are included in Appendix B of this report.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was sunny and clear, with a temperature of approximately 85° Fahrenheit. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details:

Site Assessment Data	
Site Assessment Performed By:	Ryan Reynics
Site Assessment Conducted On:	September 16, 2015

The table below provides the subject property personnel interviewed during the field reconnaissance:

Site Visit Personnel for 28-90 Review Avenue (Subject Property)			
Name	**Title/Role**	**Contact Number**	**Site Walk* Yes/No**
Eric Roberts	Owner	(917) 562-9830	Yes

** Accompanied Partner during the field reconnaissance activities and provided information pertaining to the current operations and maintenance of the subject property.*

Environmental concerns were identified during the on-site reconnaissance related to current/former USTs, the storage, use, and generation of hazardous substances, signs of a release, indications of former subsurface investigations, etc., as further discussed in Sections 6.1 and 6.2.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Solid waste generated at the subject property is disposed of in commercial dumpsters located throughout the subject property. Independent solid waste disposal contractors remove solid waste from the subject property. According to property personnel, only household trash is collected in the onsite solid waste dumpsters. Waste oil from auto repair activities is removed from third part contractors. No evidence of illegal dumping of solid waste was observed during the Partner site reconnaissance.

6.1.2 Sewage Discharge and Disposal

Sanitary discharges on the subject property are directed into the municipal sanitary sewer system. The City of New York services the subject property vicinity. No wastewater treatment facilities or septic systems are observed or reported on the subject property.

6.1.3 Surface Water Drainage

Storm water is removed from the subject property primarily by sheet flow action across the paved surfaces towards storm water drains located throughout the subject property. The subject property storms drains reportedly discharge to the Newton Creek located adjacent to the west of the subject property.

The subject property does not appear to be a designated wetland area, based on information obtained from the United States Department of Agriculture (USDA); however, a comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No surface

impoundments, wetlands, natural catch basins, settling ponds or lagoons are located on the subject property. No drywells were identified on the subject property.

6.1.4 Source of Heating and Cooling

Heating and cooling systems, as well as domestic hot water equipment, are fueled by electricity and natural gas provided by Consolidated Edison. The mechanical system is comprised of a split system, natural-gas fired furnaces located in the office building and auto repair garage. Hot water is provided by individual natural gas and electric hot water heaters.

6.1.5 Wells and Cisterns

Partner observed two groundwater monitoring wells associated with previous subsurface investigations as further discussed in Section 5.2.6. No additional aboveground evidence of wells or cisterns was observed during the site reconnaissance.

6.1.6 Wastewater

Domestic wastewater generated at the subject property is disposed by means of the sanitary sewer system. No industrial process is currently performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

No additional, general site characteristics were observed during the site reconnaissance.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

Partner identified hazardous substances used, stored and/or generated on the subject property as noted in the following table:

Hazardous Substances and/or Petroleum Products Noted Onsite

Substance	Container Size	Location	Nature of Use	Disposal Method
New Motor Oil	Several 55-gallon drums	Maintenance shop (Building D)	Auto Repair Activities	N/A
Truck Wash	Several 55-gallon drums	Maintenance shop (Building D)	Routine Maintenance	N/A
Auto Maintenance Supplies	Various retail sizes	Maintenance shop (Building D)	Auto Repair Activities	N/A
Diesel	1x 4,000-gallon AST	Northeast portion of parking lot	Refueling	N/A
Waste Oil AST	2x 275-gallon	Maintenance shop (Building D)	Auto Repair Activities	Safety Kleen
Waste Oil Tote	275-gallons	Maintenance shop (Building D)	Auto Repair Activities	Safety Kleen

Hazardous Substances and/or Petroleum Products Noted Onsite				
Substance	**Container Size**	**Location**	**Nature of Use**	**Disposal Method**
Lube Oil	275-gallons	Maintenance shop (Building D)	Auto Repair Activities	N/A
Unknown Drums	Several 55-gallon drums	Throughout the subject property	Unknown	N/A

Partner observed various hazardous materials located throughout the subject property. Many of the materials were observed to be improperly labeled and stored at the time of assessment with surficial staining in the asphalt paved parking areas, and in the auto repair garage. Based on the surficial nature of the staining and connection to the municipal sewer system, the hazardous materials on-site are not expected to represent a significant environmental concern at this time.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

Partner observed six ASTs for the storage of diesel, heating oil and propane on the subject property. The tanks consist of the following: one, 4,000-gallon diesel AST (*Tank-009* described above) with secondary containment located in the northeast portion of the subject property, to the south of Building A; one, 5,000-gallon heating oil AST (*Tank-004* described above) staged over a concrete floor located in Building C (reportedly no longer used); two, 275-gallon waste oil ASTs staged over a concrete floor located in Building D; one, 275-gallon waste oil plastic tote staged over a concrete floor located in Building D; and one, 275-gallon lube oil AST staged over a concrete floor located in Building D. Partner notes that our on-site observations of these ASTs do not directly correlate with the tank records on file with the NYSDEC. However, based on the aboveground location of the tanks and the absence of observed spills, leaks or releases in their vicinity, the presence of these ASTs are not expected to represent a significant environmental concern to the subject property at this time.

6.2.3 Evidence of Releases

Partner observed localized areas of heavy staining throughout the subject property. Specifically, Partner noted staining in the repair garage identified as Building D. Speedy dry absorbent material was observed on the concrete in the vicinity of the staining. Partner also observed staining throughout the asphalt paved parking areas.

6.2.4 Polychlorinated Biphenyls (PCBs)

Older transformers and other electrical equipment could contain PCBs at a level that subjects them to regulation by the United States Environmental Protection Agency (USEPA). PCBs in electrical equipment are controlled by USEPA regulations 40 CFR, Part 761. Under the regulations, there are three categories into which electrical equipment can be classified: 1) Less than 50 parts per million (ppm) of PCBs – "*Non-PCB;*" 2) 50 ppm-500 ppm – "*PCB-Contaminated;*" and 3) Greater than 500 ppm – "*PCB-Containing.*" The manufacture, process or distribution in commerce or use of any PCB in any manner other than in a totally enclosed manner was prohibited after January 1, 1977.

The subject property currently utilizes two above-ground hydraulic lifts located in the truck repair building on the subject property. At the time off assessment he lift were observed to be in good condition with not leaking or staining in vicinity of the equipment. Based on the good nature of the equipment and lack of observed releases, the aboveground hydraulic lifts are not expected to represent as significant environmental concern.

No other potential PCB-containing equipment (interior transformers, oil-filled switches, hoists, lifts, dock levelers, hydraulic elevators, balers, etc.) was observed on the subject property during Partner's reconnaissance.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps and Clarifiers

No drains, sumps, or clarifiers, other than those associated with storm water removal, were observed on the subject property during the site reconnaissance.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards

Partner observed a pile of trash along the northern border of the subject property. The trash included empty five-gallon buckets of motor. As best business practice Partner recommends proper removal of trash from the subject property. No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

Asbestos is the name given to a number of naturally occurring, fibrous silicate minerals mined for their useful properties such as thermal insulation, chemical and thermal stability and high tensile strength. The Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101 requires certain construction materials to be *presumed* to contain asbestos, for purposes of this regulation. All thermal system insulation (TSI), surfacing material and asphalt/vinyl flooring that are present in a building constructed prior to 1981, and have not been appropriately tested, are "presumed asbestos-containing material" (PACM).

The subject property buildings were originally constructed *circa* 1917. Partner has conducted a limited, visual evaluation of accessible areas for the presence of suspect ACMs at the subject property. The objective of this visual survey was to note the presence and condition of suspect ACM observed. Please refer to the table below for identified suspect ACMs:

Suspect ACMs

Suspect ACM	Location	Friable Yes/No	Physical Condition
Drywall Systems	Throughout Building Interiors	No	Good-Poor
Ceiling Tiles	Throughout Building Interiors	No	Good
Floor Tiles	Building B	No	Good-Poor
Roofing Materials	Roofs	No	Good
Pipe Insulation	Throughout Building Interiors	Yes	Good

The overall interior of the condition of the subject was observed to be in fair to good condition with widespread damage to floor tiles and drywall systems in Building B and damage to drywall systems and floor tiles in Building E.

The limited visual survey consisted of noting observable materials (materials which were readily-accessible and visible during the course of the site reconnaissance) that are commonly-known to potentially contain asbestos. This activity was not designed to discover all sources of suspect ACM, PACM or asbestos at the site; or to comply with any regulations and/or laws relative to planned disturbance of building materials such as renovation or demolition, or any other regulatory purpose. Rather, it is intended to give the User an indication if significant (significant due to quantity, accessibility or condition) potential sources of ACM or PACM are present at the subject property. Additional sampling, assessment, and evaluation will be warranted for any other use.

Partner was not provided building plans or specifications for review, which may have been useful in determining areas likely to have used ACM.

According to the USEPA, ACM and PACM that is intact and in good condition can, in general, be managed safely in-place under an O&M Program until removal is dictated by renovation, demolition or deteriorating material condition. Prior to any disturbance of the construction materials within this facility, a comprehensive ACM survey is recommended.

6.3.2 Lead-Based Paint (LBP)

Due to the commercial nature of use of the subject property, LBP was not considered within the scope of this assessment.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The USEPA has prepared a map to assist National, State and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA Radon Zones		
EPA Zones	**Average Predicted Radon Levels**	**Potential**
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate
Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the USEPA has found homes with elevated levels of radon in all three zones, and the USEPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not conducted as part of this assessment. Review of the USEPA Map of Radon Zones places the subject property in Zone 3. Based upon the radon zone classification, radon is not considered to be a significant environmental concern.

6.3.4 Lead in Drinking Water

According to available information, a public water system operated by the NYCDEP serves the subject property vicinity. According to a representative of the NYCDEP, shallow groundwater directly beneath the subject property is not utilized for domestic purposes. The sources of public water for the City of New York are surface water from the Catskill/Delaware System, located in Delaware, Green Schoharie, Sullivan, and Ulster counties; and the Croton System, located in Putnam, Westchester and Dutchess counties.

According to the City of New York and the 2013 Annual Water Quality Report, water supplied to the subject property is in compliance with all State and Federal regulations pertaining to drinking water standards, including lead and copper. Water sampling was not conducted to verify water quality.

6.3.5 Mold

Molds are microscopic organisms found virtually everywhere, indoors and outdoors. Mold will grow and multiply under the right conditions, needing only sufficient moisture (e.g. in the form of very high humidity, condensation, water from a leaking pipe, etc.) and organic material (e.g. ceiling tile, drywall, paper or natural fiber carpet padding).

Partner observed accessible, interior areas for the subject property building for significant evidence of mold growth, with the exceptions detailed in Section 1.5 of this report. However, this ESA should not be used as a mold survey or inspection. Additionally, this limited assessment was not designed to assess all areas of potential mold growth that may be affected by mold growth on the subject property. Rather, it is intended to give the client an indication as to whether or not conspicuous (based on observed areas) mold growth is present at the subject property. This evaluation did not include a review of pipe chases, mechanical systems or areas behind enclosed walls and ceilings.

No obvious indications of water damage or mold growth were observed during Partner's visual assessment.

6.4 Adjacent Property Reconnaissance

The adjacent property reconnaissance consisted of observing the adjacent properties from the subject property premises. No items of environmental concern were identified on the adjacent properties during the site assessment, including hazardous substances, petroleum products, ASTs, USTs, evidence of releases, PCBs, strong or noxious odors, pools of liquids, sumps or clarifiers, pits or lagoons, stressed vegetation, or any other potential environmental hazards.

7.0 FINDINGS AND CONCLUSIONS

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Partner did not identify any CRECs during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following HREC was identified during the course of this assessment:

- The subject property was formerly utilized as a bulk petroleum storage facility occupied by The Texas Company from 1917 to 1971 and was equipped with multiple bulk storage tanks. The subject property was reportedly vacant and out-of-use from 1961 to 1971, before being converted to the current use in 1971. From 1971 to the present, the subject property has operated as a truck and vehicle storage facility, with auto repairing and refueling activities. The subject property is associated with six spill cases (refer to Section 4.2.2 for a complete discussion), all of which have been closed by NYSDEC. The most recent spill case was addressed via Monitored Natural Attenuation Plan, and case closure was issued in 2010. Therefore, all of the wells on the site associated with the Monitored Natural Attenuation Plan can now be abandoned. Well abandonment must take place in accordance with the environmental regulations and laws of New York State. Based on the regulatory closure obtained from the NYSDEC, the historical operations and bulk storage of petroleum on-site is considered by Partner to represent an HREC for which no additional investigation appears warranted.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following environmental issues were identified during the course of this assessment:

- Partner observed six ASTs for the storage of diesel, heating oil and propane on the subject property. Partner notes that our on-site observations of these ASTs do not directly correlate with the tank records on file with the NYSDEC. However, based on the aboveground location of the tanks and the

absence of observed spills, leaks or releases in their vicinity, the presence of these ASTs are not expected to represent a significant environmental concern to the subject property at this time.

- Partner observed localized areas of staining throughout the subject property. Based on the surficial nature of the staining, with no conduits (i.e. cracks, drains, etc.) to the subsurface identified in the areas of the staining, the staining is not expected to represent a significant environmental concern to the subject property at this time.
- Due to the age of the subject property buildings, the potential exists that asbestos-containing materials (ACMs) are present on site. Overall, suspect ACMs were observed to be in good condition and do not pose a health and safety concern to the occupants of the subject property at this time.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 28-90 Review Avenue in the City of Long Island City, Queens County, New York (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs at the subject property, and no further action is recommended at this time. However, environmental issues were identified in connection with the subject property. As such, the following should be considered:

- The out-of-use, 5,000-gallon heating oil AST located in Building C should be properly decommissioned in accordance with applicable requirements.
- Implementation of improved housekeeping strategies should be considered in order to eliminate potential, future impacts to the subsurface.
- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs located at the subject property.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment (ESA) of the property located at 28-90 Review Avenue in the City of New York, Queens County, New York (the "subject property") in general conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training and experience to assess a *property* of the nature, history and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

1 EXECUTIVE SUMMARY

Impact Environmental Closures, Inc. ("Impact Environmental") has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of 28-90 Review Avenue, Long Island City, New York, ("The Site") under contract to by AA Truck Renting ("The Client"). Any exceptions to, or deletions from, this practice are described in Section 2.2 of this report.

The Site is a single lot parcel located in a heavily industrial area. The extent of the Site is approximately 4.0 acres and is situated on the west side of Review Avenue in Queens County, New York. According to the Property Detail Report provided by CoreLogic RealQuest, the Site is located within the M3-1 zoning district and has been assigned the New York City (NYC) Tax Map Designation: Block – 294 and Lot – 106. The site is bound to the north by Commercial/industrial properties; to the south by the Long Island Railroad tracks; to the west by Dutch Kills Creek; and to the east by a commercial self-storage center.

The Site is developed with an existing one-story double high commercial building, and three two-story vacant buildings all comprised of cement block, and brick. The active on-site building is currently being utilized as a truck and bus repair shop with storage of new parts. The interior construction of the buildings was observed to contain a combination of masonry cement block, and brick, and cement flooring. The active building is heated by fuel oil, and serviced by NYC municipal sewer and water. The exterior portions of the Site consist of asphalt paved parking, exposed soils, and natural scrub vegetation. The Site exhibits low topographic relief (less than three percent slope). A review of historic municipal records in conjunction with Sanborn fire insurance maps indicates that the building has been utilized by AA Truck Renting since 1973. Prior to 1973 the Site maintained "The Texas Company" (Texaco) oil terminal since approximately 1936. The Site was depicted as undeveloped in the 1898 and 1915 Sanborn maps.

Impact Environmental has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of 28-90 Review Avenue, Long Island City, New York, the Site. Any exceptions to, or deletions from, this practice are described in Section 2.2 of this report. This assessment has revealed no evidence of Recognized Environmental Conditions (REC's) associated with the Site. Accordingly, no Phase II or Remediation activities are recommended. However, this assessment has revealed evidence of Historic Recognized Environmental Conditions (HREC's), Business Environmental Risks (BER's), and De Minimus conditions associated with the Site. The additional activities recommended with respect to the Phase I ESA, BER's and De Minimus conditions should be performed, where applicable, as outlined in Sections 8.2, 8.5 and 8.6.

2 INTRODUCTION

2.1 Purpose

This assessment is intended, where applicable to the standard of care, to satisfy the requirements of the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments, as published in ASTM E 1527-13. Banks, insurance companies, and prospective property purchasers require an understanding of existing and past property conditions and uses in order to assess the potential liabilities associated with a property. This assessment has been completed by a qualified environmental professional as defined in ASTM Standards.

This report is not intended to present any legal opinions. The data and all conclusions presented in this report should be verified by the Client's and User's legal counsel.

The objectives of this Environmental Site Assessment are stated as follows:

- Establish a basis of understanding of the past and present land uses of the Site in order to identify potential environmental and/or public health risks.

- Establish a basis of understanding of the past and present surrounding land uses and environmental resources in order to determine their impact on the environmental quality of the Site.

- Constitute an all appropriate inquiry suitable for establishing innocent landowner, contiguous property owner, or bona fide prospective purchaser (also referred to as "land owner liability protections" or "LLPs") pursuant to 42 U.S.C. § 9601 (35) (B), 40 CFR Part 312 and the Brownfield Revitalization and Environmental Restoration Act of 2001 (Brownfield Act).

- Provide information that can be used to evaluate CERCLA liability and "good neighbor" responsibilities for contaminants migrating onto or under the Site from contiguous properties in consideration of the Brownfield Act.

- Identify, to the extent feasible, *recognized environmental conditions* (RECs) in connection with the Site and surrounding properties. The term r*ecognized environmental conditions* means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment (2) under conditions indicative of a release to the environment; or (3) under conditions indicative of a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimus are not recognized environmental conditions.

2.2 Limitations and Exceptions

This Phase I Environmental Site Assessment was conducted solely to permit Impact Environmental to render a professional opinion about the likelihood of regulated contaminants being present on, in, or beneath the Site in question at the time services were conducted. No matter how thorough a Phase I Environmental Site Assessment study may be, findings derived from its conduct are limited, and Impact Environmental cannot know or state for an absolute fact that a site, or a portion of the site, is unaffected by reportable quantities of regulated contaminants. Furthermore, even if Impact Environmental believes that reportable quantities of regulated contaminants are not present, there still exists a risk that such contaminants may be present or may migrate to the site after the study is complete. This assessment is dated, and is only valid for activities that occurred prior to the date of the site visit. Activities, liabilities, and alterations to the Site subsequent to the date of the site visit are not included in the assessment.

ASTM has developed a variety of prescriptive professional practice standards (standard practices and standard guides), identify specific methods professionals could or should use to attain results. Such prescriptive professional practice standards fail to consider the unique needs of a client, the client's project-specific expectations, or the requirements and obligations of the professionals engaged to provide service, nor do they consider more effective techniques that may have been developed subsequent to the issuance of such standards. These ASTM standards are generic and general in nature and, therefore, do not always constitute, nor are they tantamount to the applicable standard of care, which necessarily is defined and must consider project-specific contractual terms and other particular needs, expectations, circumstances, and requirements of the project and the professional engagement. Full adherence to ASTM's prescriptive professional practice standards may not be appropriate or in the best interests of the client or the project Impact Environmental's instruments of service. Impact Environmental has worked to develop a scope of service specifically for this project, in accordance with client's needs and preferences and Impact Environmental's professional and contractual obligations.

The ASTM Standards provide specific guidance with regard to radon, asbestos, lead in drinking water, lead based paint, and polychlorinated biphenyls (PCBs). Analysis of the CERCLA implications with regard to the innocent landowner defense under Superfund finds that naturally occurring radon is not subject to CERCLA liability and is appropriately considered as a non-scope issue. Accordingly, this assessment will only provide general guidance on this issue, and will not involve or recommend air monitoring for radon gas.

Similarly, the ASTM Standards do not recognize liability with regard to asbestos that is part of the building materials of a structure, in accordance with CERCLA innocent landowner defense under Superfund. In the interest of serving the client and addressing the needs of the *user*, this assessment will identify possible observed asbestos containing materials (ACMs), may pose a health threat. This assessment is not a full asbestos survey as would be required for building demolition, or identification of all possible sources of ACM, regardless of health danger.

Lead in drinking water and lead based paint are also issues that are considered to be non-scope under CERCLA innocent landowner defense under Superfund. Lead based paint was in use for many years, and it is likely that many older buildings will have surfaces coated with lead based paint. As a general rule, painted surfaces should be maintained and

ingestion of paint products should be avoided. If disposal of these materials were involved, disclosure of this practice would be subject to the scope of this environmental assessment. In the interest of serving the user, this report may include limited field-testing of surface paints and the observations on the condition of the painted surfaces. Lead in drinking water generally occurs as a result of past use of high lead content solder. Water left stagnant in pipes overnight or longer may leach lead from these joints and affect drinking water quality. As a general rule, water should be run for several minutes in the morning where such plumbing may be present.

This assessment will not identify all potential sources of PCB containing oils. Common sources of these materials include transformers and fluorescent lamp ballasts. Electric service transformers may include ground level or pole mounted units. These transformers are owned and maintained by regional public utilities. Transformers are inventoried and periodically inspected. Public utility company representatives have reported that transformers were not manufactured to contain PCB contaminated oils. Aggressive and destructive testing, which would be required for definitive identification of PCB containing oils, is beyond the scope of this study.

In addition to these non-scope considerations, ASTM also lists other issues that are beyond the scope of the standard practice for Phase I Environmental Site Assessments. These include vapor intrusion assessments, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, molds, urban fill containing non-point source related contaminants and high voltage power-lines. However, it is noted that this list is not intended to be all-inclusive. Identification and interpretation of several of these issues will be addressed by Impact Environmental as necessary to meet the standard of care.

It must be noted that the accuracy of any assessment is limited to the information available during the time of the site visit; the records, files, and drawings provided by the owner and released by governmental agencies; and the accuracy and completeness of the information provided during interviews.

2.3 Special Terms and Conditions

It is the responsibility of the *user* of this report (the party seeking to use this Environmental Site Assessment; i.e., the purchaser, lender, owner, potential tenant, or property manager) to provide certain information utilized in the report. This would include reporting of any *environmental liens* (for example, consideration against the property for response action, cleanup, or remediation of hazardous substances or petroleum products) encumbering the property or specialized knowledge or experience that would assist in identifying *recognized environmental conditions*.

The standard of care is uniform in each Phase I Environmental Site Assessment (ESA); however, the availability of information, relevance, and quality of information can vary. As per ASTM Standards, the "*environmental professional* is not required to verify independently the information provided, but may rely on information provided unless he or she has actual knowledge that certain information is incorrect or unless it is obvious that certain information is incorrect based on other information obtained in the Phase I ESA or otherwise actually known to the environmental

professional." Personnel involved in report preparation will make judgments on the accuracy of *user* provided information and conduct additional research as necessary in order to meet the requirement of identifying *recognized environmental conditions* on the Site.

ASTM provides a number of standard sources of historic information. Impact Environmental will seek to research historic information as may be available as a means of cross confirmation. According to ASTM's Standard Practice for Environmental Site Assessments (E 1527-13), the "environmental professional is required to review only record information that is *reasonably ascertainable*," whereby *reasonably ascertainable* is defined as:

- Information that is *publicly available*.
- Information that is obtainable from its source within *reasonable time* and cost constraints.
- Information that is *practically reviewable.*
- If the review is permitted by the source within 20 days of request.

ASTM defines *reasonable time and cost constraints* as information being provided by the source within twenty calendar days of receiving a written, telephone, or in-person request at no more than a nominal cost intended to cover the source's cost of retrieving and duplicating the information. *Practically reviewable* means that "the information is provided by the source in a manner and in a form that, upon examination, yields information relevant to the property without the need for extraordinary analysis of irrelevant data." Publicly available means "that the source of the information allows access to the information to anyone upon request."

Based on ASTM Standards, the Phase I ESA is not intended to include any sampling and analysis of materials associated with the Site (i.e., soil, water, air, or building materials). However, if it has been noted by Impact Environmental that certain non-scope issues may be of concern to the *user*, a limited sampling and analysis program may be included under the scope of this assessment (lead surface paints and friable asbestos). Radon test results published by the USEPA Office of Radiation and Indoor Air in conjunction with the USGS were reviewed in lieu of sampling.

2.4 User Reliance

This assessment was performed at the request of AA Truck Renting utilizing methods and procedures consistent with good commercial or customary practices. This assessment is intended, where applicable to the standard of care, to satisfy the requirements of the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments, as published in ASTM E 1527-13 and 40 CFR Part 312. The independent conclusions represent the best professional judgment of the Environmental Professional based on the conditions that existed and the information and data available to Impact Environmental during the course of this assignment. Factual information regarding operations and conditions provided by the client, owner, or the representative has been assumed to be correct and complete. The report may be distributed and relied upon by AA Truck Renting Reliance on the information and conclusions presented in this report by other party(ies) is not authorized by Impact Environmental.

Project Information:

Contract activation date:	March 27, 2014
Project deadline:	April 22, 2014

3 SITE DESCRIPTION

The Site is a single lot parcel located in a heavily industrial area. The extent of the Site is approximately 4.0 acres and is situated on the west side of Review Avenue in Queens County, New York (see **Site Location Map-Plate 1**). According to the Property Detail Report provided by CoreLogic RealQuest, the Site is located within the M3-1 zoning district and has been assigned the New York City (NYC) Tax Map Designation: Block – 294 and Lot – 106 (see **Appendix A**).

The Site is developed with an existing one-story double high commercial building, and three two-story vacant buildings all comprised of cement block, and brick. The active on-site building is currently being utilized as a truck and bus repair shop with storage of new parts. The interior construction of the buildings was observed to contain a combination of masonry cement block, and brick, and cement flooring. The active building is heated by fuel oil, and serviced by NYC municipal sewer and water. The exterior portions of the Site consist of asphalt paved parking, exposed soils, and natural scrub vegetation. The Site exhibits low topographic relief (less than three percent slope).

3.1 Topography

The Pleistocene glaciation created the hilly Ronkonkoma moraine along Long Island's "spine" and south fork, and the Harbor Hill Moraine along the North shore and the North fork (see Figure 1). Erosion of these morainal deposits (as the glacier melted away from Long Island) created extensive outwash plains of sand and gravel in the intermorainal area and south to the Atlantic Ocean. These highly permeable deposits comprise the upper glacial aquifer and represent the majority of Long Island's surficial sediments. Some local confining clay units were also formed from glacial materials in intermorainal lakes and tidal lagoons. Since the end of glaciation, about 12,000 years ago, Holocene beach and marsh deposits have been formed along the marine edge, and within stream corridors and ponds. The elevation of the Site, as presented on the United States Geologic Survey (USGS), Brooklyn Quadrangle Map, approximates 10 feet above sea level. The USGS Map, which was base dated 1967, photorevised in 1979, and did depict structures on the Site. The **Site Topographic Map** is included as **Plate 2.**

3.2 Subsurface Geology

The geology of Long Island consists of thick deposits of unconsolidated, water bearing sediments resting upon a relatively impermeable, crystalline bedrock surface. The sequence of events that shaped Long Island's geology is not known with certainty, but it probably began with the formation of the original basement rocks in early Paleozoic to Precambrian time. These basement rocks were heated and compressed (metamorphosed) by folding and faulting, producing a rugged, mountainous topography. During the subsequent period ending with the late Cretaceous Epoch 100 million years ago, erosion reduced the land to a nearly planer surface that gently tilted to the southeast.

During the late Cretaceous Epoch (60-100 million years ago), streams brought sediments from the north and the west to the Long Island area on the continental margin, forming a permeable sand layer (Lloyd Sand Member of the Raritan

Formation) and overlying clay member (clay member of the Raritan Formation) upon the bedrock surface. After a short period of erosion or non-deposition, thick, permeable beds of river delta clay, sand, and gravel were deposited on the Raritan Formation; these deposits comprise the Magothy Aquifer. Toward the close of the Late Cretaceous period (approximately 60 million years ago), a sand and clay unit (Monmouth Group) of low permeability was deposited in shallow marine waters in the area that now constitutes Long Island's south shore.

A long period of non-deposition, or possibly deposition followed by erosion, occurred after the Cretaceous era. Geologic activities during this time left few sedimentary traces, but streams flowing across Long Island cut deep valleys into the Magothy. It was not until late Pleistocene (Wisconsinian) glaciation- some 20 to 200 thousand years ago- that there were any significant additions to Long Island's geologic record. Valleys were filled and the other deposits were almost completely buried by glacial deposits. Prior to the southward movement of the Pleistocene ice sheets to Long Island, an extensive clay unit (Gardiners Clay) was deposited in shallow marine and brackish waters along the shores of what is now Suffolk County. This unit rested upon the Magothy and Monmouth Group, and acted as a confining layer. The northern portions of the Gardiners were subsequently eroded by advancing ice and glacial meltwaters, and Gardiners Clay beds are now found only in the south shore area.

3.3 Soil Component Identification

The Site lies within an area classified as Urban Land. This soil type consists of urbanized areas where the majority of the surface is covered with buildings, roads, driveways, parking lots, and other manmade structures. Further classification of the soils in these areas is impractical.

3.4 Hydrology

Queens and Kings Counties are underlain by two confined aquifers, the Magothy and the Lloyd, that have similar physical and chemical characteristics. A third aquifer, known as Upper Glacial, overlies portions of the Magothy and the Lloyd. The system these aquifers form is termed the Northern Atlantic Coastal Plain Aquifer (see Figure 2). Production from the system is minimal. Industrial production wells generally draw from the Upper Glacial. Potable water used within Queens and Kings Counties is drawn from surface water reservoir systems that have its source off of Long Island (Westchester County). However, there are small portions of Queens that utilize the Magothy for potable water. Production yields from all of these aquifers are very high.

The water quality of the Upper Glacial is impaired in areas due to heavy industrial and commercial development. However, the water quality of the Magothy and Lloyd is excellent due to thickness and horizontal continuity of the confining layers.

3.5 Groundwater Characteristics

Comparison of the water table elevation of 5 feet amsl in the Upper Glacial Aquifer, western Long Island-Plate 1A, dated April 2000, to the topographic map indicates that depth to groundwater in the area is approximately 5 feet below grade surface (bgs). It should be noted, that there may be localized variations in subsurface hydrology created by sewers, wells and other anthropogenic structures. Further, hydrologic conditions in the vicinity may be subject to variations in seasonal precipitation and geological conditions not evident during review of publicly available records. Based on groundwater investigations conducted at the Site by Impact Environmental in 2009 and 2010, the site-specific groundwater flow direction was measured northwest toward the Dutch Kills Creek.

4 SITE VISIT

A site visit was conducted by Hallie Fitzsimons and Dan Fruhauf of Impact Environmental on April 8, 2014, to observe and document site conditions. Impact Environmental was accompanied by Mr. Jose Garcia during the inspection. Site photographs are included in **Appendix B**.

4.1 Interior Inspection

The interior inspection revealed the following information relevant to the environmental quality of the Site:

1. No underground storage tanks (USTs) were identified in the building.

2. Six (6) above ground storage tanks (ASTs) were observed in the buildings. One (1) 275 gallon waste oil AST and one (1) 150 gallon waste oil AST was observed in the repair facility. One (1) 500 gallon fuel oil AST was observed in a shed abutting the repair space. One (1) empty 5,000 gallon fuel oil AST that was decommissioned after hurricane Sandy flooding, and two (2) 275 gallon bulk motor oil ASTs were observed in the vacant building to the southwest of the repair shop. Additionally, storage of portable chemical containers was noted in the repair space. Said storage included 55 gallon drums of motor oil, E synthetic CD-50 Lubricants, Transmission fluid, Hydraulic Oil, Anti-freeze and other unidentified automotive fluids.

3. No electrical transformers suspected of containing polychlorinated biphenyl (PCB) bearing dielectric fluid were observed in the buildings.

4. Surface petrochemical staining was noted on the floor of the operational area. Said staining appeared to be the result of releases that were below the volume requiring notification of the NYSDEC. Speedy Dry was observed in several areas of the repair space and the vacant building to the southwest of the repair shop.

5. One part washer was observed in the repair space. Safety Kleen reportedly handles waste disposal for the parts washers and used oil filters every 6 to 8 weeks.

6. Electric hook-ups, fuse boxes and meters were found in an exterior utility room adjoining the vacant two story masonry building in the northeastern corner of the property nearest to Review Ave. All components were in excellent condition after being replaced due to hurricane sandy.

7. No floor drains were observed in the building. However, it should be noted that due to the amount of storage in the building, the entire floor area could not be inspected.

8. Two (2) aboveground hydraulic automotive lifts were observed in the repair space. Both maintained small hydraulic fluid reservoirs and were in good working order.

9. Four (4) air compressors were observed on site; two (2) were located in the repair space, and two (2) were observed in the vacant building to the southwest of the repair shop. No significant staining requiring notification to NYSDEC was observed in the vicinity of said compressors.

10. Several cylinders of Acetylene were observed in the repair space.

11. Used truck parts were observed throughout the entire interior extent of the repair shop. Surface staining was observed proximal to said parts, however, did not appear to be of the volume requiring notification to NYSDEC.

12. All building sanitary discharge reportedly discharged to the NYC sewer system.

4.2 Exterior Inspection

The exterior inspection of the Site revealed the following information relevant to the environmental quality of the Site:

1. No underground storage tanks (USTs) were identified on the Site.

2. One (1) 4,000 gallon diesel fuel above ground storage tank (AST) was observed on the eastern portion of the Site. Said AST was reportedly installed in December 1998. Minor sheening was observed on surface water proximal to said AST, and was expected to be evident due to a heavy rain event that occurred prior to the Site visit. Said sheening appeared to be the result of releases that were below the volume requiring notification of the NYSDEC.

3. One (1) dedicated diesel fuel dispenser was observed associated with the 4,000 gallon diesel fuel AST. Minor sheening was observed on surface water proximal to said AST, and was expected to be evident due to a heavy rain event that occurred prior to the Site visit. Said sheening appeared to be the result of releases that were below the volume requiring notification of the NYSDEC.

4. No electrical transformers suspected of containing PCB bearing dielectric fluid were observed on the Site.

5. There was no visible evidence of the illegal storage or dumping of asbestos containing materials on the Site.

6. Six (6) drainage structures of solid construction (catch basins) were observed on the Site. Said catch basins appeared to outfall to the Newtown Creek District Sewer system. It should be noted that due to high volume of vehicles parked in the paved parking areas all the catch basins were not observed or inspected.

7. A former loading rack was identified on the eastern portion of the property. The system was dismantled in 1998.

8. Several monitoring wells were located throughout the property. These wells pertained to sub-surface investigations conducted in 1990 and in 2008. The wells were observed to be decommissioned in accordance with NYSDEC regulations.

9. Several steel roll off containers and 55 gallon polyethylene drums were observed on the western portion of the Site. Said steel containers and drums maintained scaffolding equipment.

10. All vegetation on the Site appeared in good condition relative to seasonal parameters.

11. Surficial petrochemical staining was noted on the asphalt surface of the Site. Said staining appeared to be the result of releases that were below the volume requiring notification of the NYSDEC.

12. A pallet of masonry paints and primers were observed adjacent to the brick building on the northeastern portion of the property. No staining was observed proximal to these containers

13. Multiple truck rooftop refrigeration units and other miscellaneous truck parts were located to the west of the repair shop.

4.3 Surrounding Properties

Land uses occurring on the surrounding properties may have an effect on the environmental quality of the Site. Accordingly, Impact Environmental performed a general survey of the adjacent and surround properties in an attempt to identify visual evidence of apparent or potential sources of environmental concern. Surrounding properties include the following:

Direction	Land Use	Evidence of any storage, handling, or discharge of hazardous substances
North	Commercial/industrial	None identified from limited visual inspection from property border
East	Commercial self-storage center	None identified from limited visual inspection from property border
South	Long Island Railroad tracks	None identified from limited visual inspection from property border
West	Dutch Kills Creek	None identified from limited visual inspection from property border

4.4 Limited Scope Identification of Possible Lead Containing Surface Paints

The element of lead has no function in the body. It can have poisonous effects on human organs and the nervous system, causing a variety of toxic reactions. Since lead accumulates in the body more rapidly than it can be removed, repeated exposures, even to small amounts, may produce lead poisoning. In addition, deteriorating lead components may allow lead to become airborne [CAS# 7439-92-1]. Threshold limit values have been established at 0.15 mg/m^3 (of air) by the American Conference of Governmental Industrial Hygienists. A non-destructive survey was performed. Said survey was not intended to constitute a full lead paint survey, which is beyond the scope of this report.

1. Based on the age of the building, it is possible that lead containing paints exist below the surface layer in portions of the building, however no samples were secured.

4.5 Limited Scope Identification of Possible Friable Asbestos Containing Materials

Asbestos has been linked to various types of lung diseases. Various regulatory agencies have tolerance limits of 1% by weight for asbestos in materials. Any material that contains asbestos levels above this limit may be considered hazardous and may have to be abated. A non-destructive survey was performed. Said survey was not intended to constitute a full asbestos survey, which is beyond the scope of this report. The results of the survey are listed below:

1. No suspected friable asbestos containing materials were observed, and no samples were secured.

2. Based on the age of the building, it is possible that asbestos containing materials may exist in the building materials.

4.6 Limited Scope Identification of Possible Mold

As part of this assessment, Impact Environmental performed a limited visual inspection for the significant presence of mold. A class of fungi, molds has been found to cause a variety of health problems in humans, including allergic, toxicological and infectious responses. Molds are decomposers of organic materials which thrive in humid environments and produce tiny spores to reproduce, just as plants produce seeds. When mold spores land on a damp spot indoors, they may begin growing and digesting whatever they are growing on in order to survive. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or unaddressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation and carpeting often play host to such growth.

Impact Environmental observed interior areas of the Site structures for the significant presence of mold. Impact Environmental observed obvious visual indications of the presence of mold, in addition to obvious indications of significant water damage. No bulk sampling of suspect surfaces was conducted as part of this assessment. This activity was not designed to discover all areas that may be affected by mold growth on the Site. Rather, it is intended to give the client an indication if significant (based on observed areas) mold growth is present at the Site. Additional areas of mold not observed as part of this limited assessment, possibly in pipe chases, HVAC systems and behind enclosed walls and ceilings, may be present on the Site.

4.7 Radon Investigation

Radon is a colorless, odorless, inert gas which has become an air contaminant in certain geographic areas. Radon is a natural isotope which is most commonly present in association with crystalline bedrock and occasionally other geologic deposits. Naturally occurring isotope decay can emit radiation, which when converted to radioactive metal oxide deposits in the lungs, causes health concerns from inhalation. Radon levels generally increase in areas where bedrock is close to the land surface, and generally only creates a health related problem where underground basements are constructed. A basement can allow radon gas to accumulate in a manner that could cause exposure. The existing buildings located on the Site were not constructed with basements or sub-cellars. Geographically, radon may be of concern in certain parts of Queens and points further west. Absent these conditions, radon gas presents less of a concern. The only way to determine concretely if radon gas is present is to perform air monitoring. Said monitoring is beyond the scope of this report.

The EPA issued a publication entitled “Map of Radon Zones dated September 1993”. Office of Radiation and indoor Air, in conjunction with the Unite States Geological Survey (USGS). According to said publication, 1123 sites were tested for indoor radon concentrations in the five boroughs of New York City between the years 1985 and 1993. The following information was revealed (based on an action level for radon of 4 pCi/L).

Average Activity	% <4 pCi/L	% 4-20 pCi/L	% >20 pCi/L
1.4 pCi/L	95%	5%	0%

5 REVIEW OF PROVIDED INFORMATION AND INTERVIEWS

Impact Environmental requested that the Client provide certain information that is relevant to the environmental quality of the Site; including site history information, recorded land title reports, title reports, environmental liens, Activity and Use Limitations (AULs), specialized knowledge, and previous environmental reports. This information was evaluated by Impact Environmental for this Phase I ESA. The following table summarizes the information that was provided by the client.

Item	User Response
Phase I Questionnaire	Provided
Title Records	Not provided
Environmental Liens or Activity and Use Limitation	No known liens or AULs
Specialized Knowledge	No known specialized knowledge
Valuation Reduction for Environmental Issues	Not applicable
Identification of Key Site Manager	Provided in Phase I questionnaire
Reason for Performing Phase I ESA	Provided
Corporate Records	Provided

5.1 Owner, Property Manager, and Occupant Information

The Site is currently owned, and managed by 28-90 Review Avenue Associates LLC, and occupied by AA Truck Renting. Mr. Eric Roberts and Mr. Jose Garcia was identified as the key on-site contact.

5.2 Title Records

At the time of this assessment, the Client did not provide any title records for the Site.

5.3 Environmental Liens

The Phase I Questionnaire was completed by Mr. Gregory Steven with RCG Longview Debt Fund V, L.P., and is included in **Appendix C**. Mr. Steven indicated that he had no knowledge of environmental liens against the Site, or limitations related to the environmental conditions.

5.4 Specialized Knowledge

Mr. Steven completed the Phase I Questionaire and reported spill case 0807459, a known HREC associated with the Site. Mr. Steven also indicated that an Investigation Summary Report was prepared for the Site by Impact Environmental.

5.5 Valuation Reduction for Environmental Issues

Mr. Steven indicated that this transaction is a refinance and the property value of purchase price has no bearing.

5.6 Interviews

Impact Environmental performed interviews with individuals having limited knowledge about the Site property use, as listed below. The interview(s) revealed the following information relevant to the environmental quality of the Site.

Contact Interviewed	Date	Relationship to Site	Relevant Information
Mr. Jose Garcia	4/8/14	On-site contact	Please see below
Mr. Gregory Steven	4/7/14	Client Contact	Please see below
Mr. Eric Roberts	4/18/14	Site Contact	Please see below

1. According to Mr. Jose Garcia, the Site is heated by fuel oil and an on-site sanitary system and serviced by NYC municipal water.

2. According to Mr. Gregory Steven, the future plans for the Site are unknown.

3. According to Mr. Garcia, they occupied the building for at least 45 years.

4. According to Mr. Eric Roberts, records of a tank tightness test in response to a NOV (Notice of Violation) dated November 4, 2011 were lost due to hurricane Sandy.

5. According to Mr. Eric Roberts, the on-site buildings and exterior drainage structures are connection to the NYC sewer system.

5.7 Corporate Records

1. A Subsurface Investigation prepared for the Site by Tyree Brothers Environmental Services Inc. dated May 1990, was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site:

Analyzed soil samples showed high concentrations of aromatic hydrocarbons. Floating product was identified in the well created from a new boring. It was recommended to have all USTs and lines have tightness tests done to determine if the current system is failing and causing discharge of product into the subsurface soils.

2. Correspondence dated October 17, 1991 between Tyree Brothers Environmental Services Inc. and Eugene Sullivan of the NYSDEC was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: Tyree Brothers Environmental services provided remedial work conducted and analytical results showing that an optimal volume of floating product has been recovered and any trace floating product found would have minimal or no environmental impact on the surrounding areas.

3. Correspondence dated November 8, 1991 between Tyree Brothers Environmental Services Inc. and Eugene Sullivan of the NYSDEC was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: As per Tyree's Letter dated October 17, 1999 NYSDEC has closed spill case 9010146.

4. A Phase I ESA report, prepared for the Site by Tyree Brothers Environmental Services, Inc. dated June 15, 1999, was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: One UST was identified in the large center building west of the office space. A potential UST was identified by the presents of a suspected fill pipe. The pipe cap could not be removed for further inspection. Numerous ASTs were observed in the buildings. This included an active vaulted 4,000gal #2 fuel oil AST used for onsite heating as well as two active 275gal motor oil ASTs.

5. A Tank Affidavit, prepared by William Klein, The Franklin Company, dated May 11, 1999 was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: On April 28, 1999 three 4000gal diesel tanks were sealed by being filled with inert matter.

6. A Remote Sensing Survey: GPR Investigation prepared for the Site by Impact Environmental dated July 28, 1999, was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: It was concluded that one significant subsurface anomaly adjacent to the southwest corner of the 1,000 sf building was consistent with the size and shape of a UST. The GPR imaging failed to identify the presence of anomalies consistent with an UST in the interior of the 23,000 sf building.

7. A Tank Affidavit, prepared by Stuart Levy, Alvin Petroleum Systems, dated August 5, 1999 was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: Two 550 gallon USTs located in front of the two-story masonry building on the northern

boundary were abandoned in place to proper standards. A no further action letter was received preceding the tank abandonments.

8. A Subsurface Investigation Report was prepared for NYSDEC Spill # 08-07459 by Impact Environmental dated October 2, 2008. The report summarized the findings of sampling and analysis of subsurface soil and groundwater, the installation of large diameter groundwater monitoring wells, a groundwater elevation survey and a hydraulic conductivity investigation. Strong petrochemical odor, oil sheen and high PID readings were detected throughout the Site. However, the laboratory analysis of the soil and groundwater samples failed to detect any significant target VOC or SVOC levels. This is consistent with the results of the previous investigation conducted by Impact Environmental in 2008. It is concluded that the observed subsurface petroleum product is aged and degraded. It probably has accumulated during the decades of historical petroleum product storage on the Site. Gasoline and fuel oil have been mixed (potentially due to tidal influence) and created a commingled plume. Over time, the plume has been degraded due to natural attenuation. The majority of the volatile organic and semi-volatile organic compounds have been removed from the subsurface system, either by physical advection or biochemical reaction. The residual petroleum product is mainly degraded. It still has a strong petroleum odor; however, it does not exhibit high levels of VOCs and SVOCs. Relatively low concentrations of target VOCs and SVOC are present in subsurface soil and groundwater at levels marginally above NYSDEC guidance criteria. However, based on the land use, the geology and the hydrology of the Site, it is unlikely for the residual degraded petroleum product to impose a significant risk to human health and the environment.

9. An Investigation Summary Report was prepared for NYSDEC Spill # 08-07459 by Impact Environmental dated June 24, 2009. The scope of work was performed to determine the extent of petroleum related soil and/or groundwater contamination associated with the NYSDEC Spill # 08-07459. Strong petrochemical odor, oil sheen and high PID readings were detected throughout the Site. However, the laboratory analysis of the soil and groundwater samples failed to detect any significant target VOC or SVOC levels. Based upon the results of this investigation, historical petroleum operations on the Site impacted the subsurface soil and groundwater. However, it was determined by NYSDEC that active remedial action in regard to NYSDEC Spill #08-07459 was not required. A Monitored Natural Attenuation (MNA) plan, which included quarterly sampling and analysis of groundwater from on-site monitoring wells was requested from NYSDEC to achieve closure of the spill case.

10. A Quarterly Monitoring Report (1st Qtr 2010) was prepared by Impact Environmental, dated March 12, 2010. The report revealed the following information relevant to the environmental quality of the Site: Analysis performed on the groundwater samples MW-2, MW-3, MW-5 and MW-6 failed to detect any target VOCs or SVOCs. 0.01 ft free-phase product was observed in the MW-7H.

11. A Quarterly Monitoring Report (2nd Qtr 2010) was prepared by Impact Environmental, dated June 11, 2010. The report revealed the following information relevant to the environmental quality of the Site: Analysis performed on the groundwater samples MW-2, MW-3, MW-5 and MW-6 failed to detect any target VOCs or SVOCs. 0.01 ft free-phase product was observed in the MW-7H.

12. A Quarterly Monitoring Report (3rd Qtr 2010) was prepared by Impact Environmental, dated September 9, 2010, was reviewed under the scope of this assessment. The report revealed the following information relevant to the environmental quality of the Site: The laboratory analysis performed on the groundwater samples MW-1 and MW-5 failed to detect any target VOCs or SVOCs. The laboratory analysis performed on the groundwater sample MW-2, MW-3, MW-4, MW-6 and MW-7H detected concentrations of gasoline related target volatile organic analytes marginally above the NYSDEC ambient water quality standards. The detected total VOC concentration was less than 0.1 ppm. A sump skimmer was installed in MW-7H for the free-phase product recovery.

13. The NYSDEC issued No Further Action correspondence on October 1, 2010. The correspondence indicated that “According to the data that the Department has received, there is no longer any free product on the water table, nor any dissolved contamination. Therefore, the Department is closing the spill case. All of the wells on the site can now be abandoned. Well abandonment must take place in accordance with the environmental regulations and laws of New York State.”.

14. A Well Decommissioning Report was prepared by Impact Environmental, August 9, 2011. The report revealed the monitoring wells associated with NYSDEC # 08-07459 on site were decommissioned in accordance with NYSDEC CP-43.

15. A letter prepared by Impact Environmental to AA Truck Renting, dated December 20, 2011 was issued in response to a Notice of Violation received on November 4, 2011 from the NYSDEC for the Site. Said violation letter required; 1) removal of liquids from a secondary containment area associated with the exterior diesel AST; 2) removal of surface staining in the area around an exterior waste oil AST; and 3) removal of sediments and/or petroleum liquids from several catch basins maintained on the Site. Waste manifests generated from these activities completed by Impact Environmental are provided in the appendix. Completion of a tank tightness test was performed by a tank contractor.

6 RECORDS REVIEW

The federal Freedom of Information Act (FOIA) provides rights of access to all government documents not exempt from disclosure. Accessible records include paper documents and items such as video/audio tape recordings, microfilm, and computer disks. Impact Environmental examined relevant government documentation so as to define implicit parameters affecting the environmental quality of the Site. The appropriate Freedom of Information requests were submitted and are included in the appendix of this document.

Information from standard federal, state, county and local environmental record sources was provided by Toxics Targeting Environmental Report, Inc. (TT) Data from governmental agency lists are updated and integrated into one database, which is periodically updated as these data are released. This integrated database also contains postal service data in order to enhance address matching. Records from one government source are compared to records from another to clarify any address ambiguities. The demographic and geographic information available provides assistance in identifying and managing risk. In some cases, location information supplied by the regulatory agencies is insufficient to allow the database companies to geocode facilities locations. These facilities are listed under the unmappables section within the TT Report.

Regulatory information from the following database sources regarding possible recognized environmental conditions, within the ASTM minimum search distance from the Site was reviewed. Specific facilities are discussed below if determined likely that a potential recognized environmental condition has resulted at the Site Property from the listed facilities. Please refer to **Appendix D** for a complete listing.

6.1 Federal Environmental Record Review

Impact Environmental submitted a FOIA request to the United States Environmental Protection Agency (USEPA) on April 7, 2014. A response was received on May 13, 2014 indicating that no records were found. See **Appendix F**.

6.1.1 National Priorities List (NPL)

The National Priorities List (NPL) is the Environmental Protection Agency (EPA) database of uncontrolled or abandoned hazardous waste sites identified for priority remedial actions under the Superfund Program.

1. The Site is not listed as a NPL facility.
2. One NPL site is located within one-mile of the Site.

A)

NEWTOWN CREEK SOUTH END OF IVY HILL ROAD BROOKLYN, QUEENS, NY 11222
Located: 1068 feet to the SSE of the Site
Facility ID: NYN000206282

6.1.2 CERCLIS List

The Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) list is a compilation of sites that the EPA has investigated or is currently investigating for a release or threatened release of hazardous substances.

1. The Site is not listed as a CERCLIS facility.
2. One CERCLIS site is listed within ½-mile of the Site.

A)

NEWTOWN CREEK SOUTH END OF IVY HILL ROAD BROOKLYN, QUEENS, NY 11222
Located: 1068 feet to the SSE of the Site
Facility ID: NYN000206282

6.1.3 Federal CERCLIS NFRAP Sites List

The CERCLIS No Further Remedial Action Planned (NFRAP) List is a compilation of sites that the EPA has investigated, and has determined that the facility does not pose a threat to human health or the environment, under the CERCLA framework.

1. The Site is not listed as a CERCLIS-NFRAP facility.
2. Three (3) CERCLIS-NFRAP sites are listed within ½-mile of the Site.

A)

MANHATTAN ADHESIVES PLANT 425−459 GREENPOINT AVENUE BROOKLYN, NY 11222
Located 1689 feet to the S of the Site
Facility ID: NYD980780811

B)

BROOKLYN TERM /MOBIL OIL CORP
300 NORTH HENRY ST BROOKLYN, NY 11222
Located 1727 feet to the SSW of the Site
Facility ID: NYD000824540

C)

ROEHR CHEMICALS INC
52−20 37TH ST LONG ISLAND CITY, NY 11101
Located: 2274 feet to the ESE of the Site
Facility ID: NYD000764936

6.1.4 Federal Resource Conservation & Recovery Act (RCRA) CORRACTS Facilities List

The EPA Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The CORRACTS database is the EPA's list of treatment storage or disposal facilities subject to corrective action under RCRA.

1. The Site is not listed as a RCRA CORRACTS TSD facility.
2. Four (4) RCRA CORRACTS TSD facilities are listed within one-mile of the Site.

A)

ACTIVE STEEL DRUM
52−30 34TH ST LONG ISLAND CITY, NY 11101
Located: 1625 feet to the ESE of the Site
Facility ID: NYD003933355

B)

QUANTA SITE ADMIN GRP
37−80 REVIEW AVE LONG ISLAND CITY, NY 11101
Located: 2773 feet to the SE of the Site
Facility ID: NYD980592562

C)

KOSAN INDUSTRIAL CORP
5−49 49TH AVENUE LONG ISLAND CITY, NY 11101
Located: 3879 feet to the WNW of the Site

Facility ID: NYD061949228

D)

OCONNER CAPITAL PARTNERS
5−36 46TH ROAD QUEENS, NY 11101
Located 4449 feet to the NW of the Site
Facility ID: NYD001264191

6.1.5 Federal Resource Conservation & Recovery Act (RCRA) TSD Facilities List

The EPA Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA TSD database is a compilation by the EPA of reporting facilities that treat, store or dispose of hazardous waste.

1. The Site is not listed as a RCRA TSD facility.
2. Three (3) RCRA TSD sites are listed within ½-mile of the Site.

A)

ACTIVE STEEL DRUM
52−30 34TH ST LONG ISLAND CITY, NY 11101
Located: 1625 feet to the ESE of the Site
Facility ID: NYD003933355

B)

A PHILIP HUNT CHEMICAL CORP
47−50 30TH ST LONG ISLAND CITY, NY 111013404
Located: 1633 feet to the NE of the Site
Facility ID: NYD072731730

C)

CITY WASTE OIL CO

Facility ID: NYD991290974

6.1.6 Federal Resource Conservation & Recovery Act (RCRA) Generator List

The RCRA program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Generators database is a compilation by the EPA of reporting facilities that generate hazardous waste.

1. The Site is listed as a SQG under RCRA with EPA ID #NYD 012473583.

A)

AA TRUCK RENTING CORPORATION 28–90 REVIEW STREET QUEENS, NY 11101				
Facility ID: NYD012473583				
Code	Description	Amount	Transaction type	Year
D039	Tetrachloroethylene	72gal	Generated	2014
	More than one waste code was reported for the following waste amount:	90gal	Generated	2011
D001	Solid waste that exhibits the characteristic of ignitability	-	-	-
D018	BENZENE	-	-	-
D039	Tetrachloroethylene	-	-	-
D040	Trichlorethylene	-	-	-
D001	Solid waste that exhibits the characteristic of ignitability	268gal	Generated	2006
D011	Silver	28 pounds	Generated	2002
D001	Solid waste that exhibits the characteristic of ignitability	455 pounds	Generated	1987

1. Seven (7) RCRA Generator facilities are listed on the adjacent properties.

A)

GREAT EASTERN INDUSTRIES 28–20 BORDEN AVE LONG ISLAND CITY, NY 11101				
Located: 213 feet to the NE of the Site

Code	Description	Amount	Transaction type	Year
B003	Petroleum oil or other liquid containing 500 ppm or greater of PCBs.	55gal	Generated	1989
B001	PCB Oil (concentrated) from transformers, capacitors, etc.	250gal	Generated	1987
B007	Other PCB Wastes including contaminated soil, solids, sludges, clothing, etc.	96 pounds	Generated	1987

6.1.7 Federal Emergency Response Notification System (ERNS)

The Emergency Response Notification System (ERNS) is a national database used to collect information on reported release of oil or hazardous substances.

1. No ERNS sites are listed on the Site or on the adjacent properties.

6.2 State Environmental Record Review

A FOIA request was submitted to the New York State Department of Environmental Conservation (NYSDEC) on April 7, 2014. No response has been received to date.

6.2.1 Inactive Hazardous Waste Disposal Sites

New York's Inactive Hazardous Waste Disposal Site Registry is also known as the State Superfund. According to State authorities, these active or abandoned sites can pose serious environmental or health hazards that require investigation or clean up. Sites include toxic dumps, garbage landfills, factories, dry cleaners or illegal disposal sites that have caused extensive air, water, groundwater or soil contamination.

Classification System:

- Class 1 - Causing or presenting an imminent danger of causing irreversible or irreparable damage to public health or the environment - immediate action required.
- Class 2 - Significant threat to the public health or environment - action required.
- Class 2a – This temporary classification has been assigned to sites where there is inadequate data to assign them to the five classifications specified by law.
- Class 3 - Does not present a significant threat to the environment - action may be deferred.
- Class 4 - Site properly closed - requires continual management.
- Class 5 - Site properly closed, no evidence of present or potential adverse impact - no further action required.
- Class D1, D2, D3 – Delisted Site (D1-Hazardous waste not found; D2-Remediated; D3-Consolidated site or site incorrectly listed)

1. The Site is not listed as an inactive hazardous waste disposal site.
2. There are twenty-two (22) sites within a one-mile radius of the Site that appear in the NYSDEC publication, Inactive Hazardous Waste Disposal Sites in New York State.

6.2.2 Hazardous Substance Waste Disposal Sites

These properties often pose serious environmental or health hazards, but they may have been low priorities for investigation or clean up because on-site contamination may not constitute "hazardous waste." Sites include utility coal tar facilities, wood tar sites and properties polluted with petroleum that have caused extensive air, water, groundwater or soil contamination.

1. The Site is not listed as a hazardous waste disposal site.
2. There are two (2) sites within a ½-mile radius of the Site that appear in the NYSDEC publication, Hazardous Substance Waste Disposal Site Study.

A)

MANHATTAN ADHESIVES 425–459 GREEN POINT AVENUE BROOKLYN, NY 11222
Located 1749 feet to the S of the Site
Facility ID: HS2035

B)

BROOKLYN TERMINAL/MOBILE OIL 300 N. HENRY STREET BROOKLYN, NY 11222
Located: 2257 feet to the SSW of the Site
Facility ID: N/A

6.2.3 Brownfield Sites

These properties are a listing of site that are abandoned, idled, or under-used industrial and commercial sites where expansion or redevelopment is complicated by real or perceived environmental contamination. The Voluntary Cleanup Program involves hazardous waste sites that have had their listing in the (above referenced publication) deferred while being investigated and remediated voluntarily under NYSDEC supervision. Coal tar sites may have previously been listed in the publications, but they were removed as a result of a Departmental legal review that revealed that most coal gasification wastes do not meet the New York State definition of hazardous waste. These sites are currently being

investigated and remediated in conjunction with the regional utility companies, and it is possible that some of these sites may qualify as hazardous waste sites as information becomes available. In addition, the NYSDEC lists sites that fall under the 1996 Clean Water / Clean Air Bond Act Environmental Restoration Program (Brownfields Program). The Brownfields Program involves sites that are currently vacant or only partially utilized, have an industrial or commercial history, and are suspected or confirmed to have soil and / or groundwater contamination

1. The Site is not listed as Environmental Restoration Program (Brownfields Program) site.
2. There are two (2) sites within a ½-mile radius of the Site that appear in the NYSDEC Brownfields Cleanup Program.

A)

REVIEW AVENUE DEVELOPMENT I 37–30 REVIEW AVENUE LONG ISLAND CITY, NY 10111

Located: 2598 feet to the NNW of the Site
Facility ID: C241138

3. There is one (1) site within a ½-mile radius of the Site that appears in the NYSDEC Voluntary Cleanup Program listing.

A)

ARCH STREET YARDS (LIRR) ARCH STREET AND JACKSON AVENUE LONG ISLAND CITY, NY 11101
Located: 2436 feet to the NW of the Site
Facility ID: V00733

6.2.4 Historic Utility Facilities

These are power generating structures, manufactured gas plants, gas storage facilities, maintenance yards and other gas and electric utility sites.

1. The Site is not listed as an NYSDEC Historic Utility site.
2. There are no sites within a 1/8-mile radius of the Site that appear in the NYSDEC Historic Utility Site listing.

6.2.5 Solid Waste Management Facilities

The NYSDEC maintains a listing of all registered and permitted landfills, transfer stations, and solid waste disposal sites within New York State. A review of this listing has revealed the following information relevant to the environmental quality of the Site:

1. The Site is not listed as a Solid Waste Management Facility.
2. There are twenty-four (24) sites within a ½-mile radius of the Site that appear on the listing.

A)

6.2.6 State Pollutant Discharge Elimination System Permits (SPDES)

In 1973, New York passed the State Pollutant Discharge Elimination System (SPDES) Act, which provides for state permits for point source discharges to surface and ground waters. The USEPA delegated authority to NYSDEC to regulate the issuance of all National Pollution Discharge Elimination Systems (NYPES) permits as stipulated under sections 307, 318, 402, and 405 of the Clean Water Act, under the state SPDES program. A review of SPDES permit listings in New York City revealed the following information relevant to the environmental quality of the Site:

1. No SPDES permits are listed for the Site.
2. One SPDES permit is listed for the contiguous with the Site.

A)

Buckeye Pipline CO., L.P. No facility address provided
Located: 363 feet to the S of the Site
Facility ID: NY0200441 Facility Type: Industrial Facility Status: Active Permit Issued date: 11/08/1995

6.2.7 Major Oil Storage Facilities (MOSF)

Major Oil Storage Facilities have at least 400,000 gallons of storage capacity (as per Article 12 of the Navigation Law, 6 NYCRR Part 610, and 17 NYCRR Part 30) and often experience leaks, spills or other uncontrolled releases that can cause extensive air, water, groundwater or soil contamination that threatens the environment or the public health. Please note that New York has withheld public release of this database since January 2002.

1. The Site did not appear on the MOSF listing.
2. There are no sites within a 1/8-mile radius of the Site that appear on the MOSF listing.

6.2.8 Chemical Bulk Storage (CBS) Sites

Sites storing hazardous substances listed in 6 NYCRR Part 597 in aboveground tanks with capacities of 185 gallons or more and/or underground tanks of any size. It should be noted that New York has withheld public release of this database since January 2002.

1. The Site did not appear on the CBS listing.
2. There are no sites within 1/8-mile of the Site that appear on the CBS listing.

6.2.9 Petroleum Bulk Storage (PBS) Sites

These are sites with more than a 1,100 gallon capacity for storing petroleum products. It should be noted that New York has withheld public release of this database since January 2002.

1. The Site appeared on the PBS listing.

A)

Notes:

a) Tank 004- The 5,000-gal #2 Fuel Oil "Underground" tank is a vaulted AST. It is customary for NYSDEC to register vaulted above-ground tanks as USTs. This tank is currently out of service due to hurricane Sandy.

b) Tank 009 – This AST currently maintains proper secondary containment, but was registered as "in-contact with soil".

2. Eight (8) sites are listed on the PBS database within ¼-mile of the Site. Of these, all are listed as being within ⅛-mile of the Site. One site is noted to be contiguous with the Site.

6.2.10 Spill Logs

The New York State Department of Environmental Conservation routinely responds to petroleum product spill/discharge incidents so as to perform and/or supervise in their remediation. The agency currently maintains a log (Spill Log) of all reported incidents that have occurred within specific regions of the State of New York. Typical events that would be listed on the log include motor vehicle accidents involving the release of petroleum products; discharges of petroleum products from underground storage tanks; discharges of PCB contaminated oils from electrical transformers; and events involving the abandonment of petroleum products. A review of the NYSDEC Spill Log revealed the following information relevant to the environmental quality of the Site.

1. There are six (6) spill incidents listed as “closed” in the NYSDEC Spill Log as having occurred on the Site.

A)

AA TRUCK RENTING 28−90 REVIEW AVE LONG ISLAND CITY, NY	
Spill Number: 9600032	Spill Date: 04/01/1996
Cause of Spill: HUMAN ERROR	Resource Affected: SEWER
Meet Cleanup Standards: no	Material Spilled: #2 FUEL OIL

Quantity Spilled: 100gal	Close Date: 05/08/1996
REMARKS: THE DRIVER WAS TOLD TO FILL THE WRONG TANK – A CLEAN UP CREW FROM MELRO ASSOCIATES IS ON THE WAY TO THE SCENE	

B)

28–90 REVIEW AVE/QUEENS 28–90 REVIEW AVENUE LONG ISLAND CITY, NY

REMARKS: FAULTY GAUGE CUASED OVERFILL, OIL ON GROUND & PLUG STORM SEWER, TYREE BROS NOTIFIED TO DO CLEAN UP.	

C)

TRUCKING RENTAL CORP 28–90 REVIEW AVENUE LONG ISLAND CITY, NY	
Spill Number: 0803348 Cause of Spill: HOUSEKEEPING Meet Cleanup Standards: no Quantity Spilled: 12gal	Spill Date: 06/20/2008 Resource Affected: SOIL Material Spilled: DIESEL, MOTOR OIL, WASTE OIL/USED OIL Close Date: 07/28/2008
REMARKS: FOUND DURING AN INSPECTION AND CLEAN UP WILL BE TAKEN CARE OF...	

D)

28–90 REVIEW AVENUE 28–90 REVIEW AVENUE LONG ISLAND CITY, NY	
Spill Number: 9311731 Cause of Spill: UNKNOWN Meet Cleanup Standards: no Quantity Spilled: –1.00gal	Spill Date: 01/03/1994 Resource Affected: SOIL Material Spilled: #2 Fuel Oil Close Date: 01/03/1994
REMARKS: CONTAINED ON PAVAMENT FILL – SORBENT APPLIED & PICKED UP.	

E)

AA TRUCK RENTING CORP 28−90 REVIEW AVE LONG ISLAND CITY, NY 11101	
Spill Number: 0807459 Cause of Spill: UNKNOWN Meet Cleanup Standards: no Quantity Spilled: 0gal	Spill Date: 10/02/2008 Resource Affected: Groundwater Material Spilled: #2 Fuel Oil Close Date: 09/27/2010
REMARKS: Results of an analytical test revealed historic contamination at above site. Based upon the data in the Third Quarter Monitoring Report, It has been determined that any residual contamination that is present will not be a threat to the public or the environment. Therefore, I am closing the spill case.	
STREET SPILL 28901 REVIEW AVE LONG ISLAND CITY, NY	
Spill Number: 0504537 Cause of Spill: UNKNOWN Meet Cleanup Standards: no Quantity Spilled: Unknown	Spill Date: 07/15/2005 Resource Affected: Groundwater Material Spilled: UNKNOWN Close Date: 07/18/2005
REMARKS: CALLER FOLLOWED THE OIL SLICK ON THE ROAD, GOES DOWN THE ROAD, INTO A YARD, AND INTO AA TRUCK RENTAL. THE CALLER STATES THAT HE ALMOST HIT ANOTHER CAR ON THE ROADWAY BECAUSE IT IS VERY SLIPPERY.	

F

)

There are a significant number of spill incidents listed in the NYSDEC Spill Log as having occurred within ½-mile of the Site. The significant number of listings is not uncommon for heavily industrialized areas. Accordingly, the *approximate minimum search distance* (as defined by ASTM) was reduced to ¼-mile in order to make the data *practically reviewable*. Seventy five (75) spill incidents are listed in the NYSDEC Spill Log as having occurred within ¼-mile of the Site see **Appendix D**. Review of these incidents has revealed that fifty-three (53) are listed as having occurred between ¼ to ⅛-mile and twenty-two (22) are listed as having occurred within ⅛-mile. There are ten (10) spills incidents that have occurred within 500 feet of the Site.

A)

COMMERCIAL 2820−2826 BORDEN AVE QUEENS, NY	
Located: 247 feet to the NE of the Site

Spill Number: 8605941 Cause of Spill: EQUIPMENT FAILURE Meet Cleanup Standards: no Quantity Spilled: 0gal	Spill Date: 12/18/1986 Resource Affected: SURFACE WATER Material Spilled: GASOLINE Close Date: 12/18/1986
REMARKS:CONTAMINATION FOUND DURING TWICE MONTHLY INSPECTION OF MONITORING WELLS IN FACILITY. POSSIBLY EITHER HYDRAULIC OIL OR FUEL OIL. TESTING AND FURTHER INVESTIGATION TO FOLLOW. GROUND WATER PUMP AND TREAT SYSTEM ALREADY IN PLACE AT FACILITY. NEW TOWN CREEK IS NOT AFFECTED BY THIS.	

Several of the spill incidents reviewed are considered to have the potential to significantly impact regional groundwater quality of this area. This determination was made based on such factors as the local groundwater flow direction, the spill incident statuses, the quantities of materials spilled, the distances between the spill sources and the Site, and the resources affected.

6.3 City Environmental Record Review

6.3.1 New York City Department of Environmental Protection

The Bureau of Water Pollution Control and the Bureau of Sewers of the New York City Department of Environmental Protection has put forth the document, Rules and Regulations Relating to the Use of the Public Sewers, Including Sewer Surcharges, pursuant to Section 1403 of the New York City Charter and by Sections 683a4-1.0 through 683a4-19.0, 687-1.0 and 689-1.0 of the Administrative Code of the City of New York and in compliance with Section 1105 of the New York City Charter. This document covers such topics as the disposal of wastewater, stormwater, and groundwater, the materials and substances excluded from public sewers, the toxic substances accepted conditionally, the terms and conditions for the issuance of a permit, the removal, transportation, and disposition of scavenger wastes, and the imposition and computation of sewer surcharge. The New York City DEP was contacted regarding the Site. The following information was made available:

1. A Freedom of Information request was submitted to the NYCDEP on April 7, 2014 for the Site, but no response has been received to date.

6.3.2 New York City Fire Department

The New York City Fire Department oftentimes maintains records of underground storage tanks and the storage of hazardous materials. The New York City Fire Department was contacted about the Site and provided the following information:

1. A Freedom of Information request was submitted to the FDNY on April 7, 2014 for the Site, but no response has been received to date.

6.3.3 New York City Building Department

The New York City Building Department maintains records regarding permits issued for the construction of a building, renovations of the building, boiler specifications, and violations. The department also maintains a record of those lots with an "E" designation on the Zoning Maps of the Zoning Resolution of the City of New York for potential hazardous material contamination ("haz-mat E lots"), as determined by the NYCDEP. Lots with said designation may not be issued a building permit allowing: 1) any development; 2) an enlargement, extension or change of use involving residential or community facility use; or 3) and enlargement that disturbs the soil on said lot unless and until the Department is provided with a report from DEP stating that the environmental requirements for the lot have been met. The New York City Building Department was contacted about the Site and provided the following information:

1. The Site was not listed with an "E" designation.

2. The Site zoned as M3-1, listed as Industrial and Manufacturing in the NYC Building Department database.

3. The following Environmental Control Board (ECB) Violations were on file for the Site.

ECB #	Issued Date	Issues of Concerns
NO ECB RECORDS FOUND		

4. The following Certificates of Occupancy were on filed for the Site.

CO #	Issued Date	Issues of Concerns
THERE ARE NO CERTIFICATES OF OCCUPANCY ON FILE FOR THIS ADDRESS		

5. The following New Building permits were on file for the Site.

NB #	Issued Date	Issues of Concerns
NB 1852-18	00/00/1918	New Building
NB 2557-15	12/06/1988	New Building
NB 3472-09	12/06/1988	New Building
NB 2447-15	12/07/1988	New Building
NB 2446-15	08/08/1988	New Building
NB 2448-15	08/08/1988	New Building
NB 2449-15	12/07/1988	New Building
NB 2460-15	08/08/1988	New Building
NB 2461-15	08/08/1988	New Building

NB 2462-15	08/08/1988	New Building
NB 2463-15	08/08/1988	New Building
NB 2464-15	08/08/1988	New Building
NB 2558-15	08/08/1988	New Building
NB 2559-15	08/08/1988	New Building
NB 2560-15	08/08/1988	New Building
NB 2980-15	08/08/1988	New Building
NB 2556-15	08/08/1988	New Building
NB 2561-15	08/08/1988	New Building
NB 2562-15	08/08/1988	New Building
NB 2563-15	08/08/1988	New Building

6. Several permits for fuel storage tanks were on file for the Site.

Permit number	Date
401537574-01-EW-FB-OIL	10/18/2002
401537574-01-EW-FS	10/18/2002
401537574-01-EW-MH	10/18/2002
400881621-01-EW-OT	12/22/1998

7. No other records of any environmental concerns were on file for the Site.

7 REVIEW OF HISTORIC DATA

7.1 City Directories

The TT Report includes City Directories, which are reverse telephone directories that include listings by address and telephone number. As such, it can be a valuable instrument in determining potential pollution sources and/or sensitive receptors in an area of study. Information contained on the directory includes the name, telephone number, land use, geographic location, wealth rating, street construction date and date of telephone service connection. This data can be interpreted so as to yield relevant information regarding past land uses that might have affected the environmental quality of the Site and/or the surrounding properties. Listings for the Site (reviewed on a periodic interval) revealed the following information relevant to the former occupants at the Site:

Address	Listing	Date Listed
28-90 Review Avenue, Long Island City	AA Truck Renting	1973- Present

7.2 Sanborn Maps

The TT Report includes Sanborn Maps, which were historic fire insurance maps that typically documented commercial property use, building structure, and fuel/chemical storage. These maps are updated on a rotating basis. The maps were inspected to determine past uses of the Site and surrounding properties. The Sanborn Maps for the Site revealed the following information see **Appendix I**.

Year	*Site Historic Uses*
1898, 1915	The Site appears to be primarily undeveloped land one small structure is present. A basin from Dutch Kills Creek extending eastward into the Site.
1936, 1947, 1950	The Site appears to be operating as an oil terminal owned by The Texas Company. The facility has a tank farm of six (6) 275,000 gallon tanks; two of which contain gasoline one containing naphtha, one containing kerosene, one containing navy fuel oil and one containing Mexican crude oil. Four 15,000 gallon USTs were located east of the tank farm. Two 20,000 gallon ASTs were located on the western portion of the property. One gasoline UST was depicted adjacent to a large brick garage in the center of the property. Pipelines, a, three other brick buildings and 3 small storage structures were also depicted. One gas tank was depicted on the property south of the building on the northern boundary. A possible gas tank was noted within the western portion of the tank farm, this is unconfirmed due to eligibility.
1980, 1991, 1992, 1993, 1995, 1996	The site appears to be operating as a Trucking Terminal with the pre-existing buildings and one iron framed cement building addition to the pre-existing garage.

Direction	1898- Surrounding Property Uses
North	The property appears to be an Iron Factory owned by Richey, Bronne and Donald- Architecture Iron NMS.
East	The property appears to be undeveloped land.
South	The property is depicted as a railway yard.
West	Dutch Kills Creek is abutting the Site to the west.

Direction	1915 - Surrounding Property Uses
North	The property is depicted as a vacant factory
East	Marsh St.is visible beyond is depicted as undeveloped land not maintaining any structures.
South	The property is depicted as a railway yard.
West	Dutch Kills Creek is abutting the Site to the west.

Direction	1936- Surrounding Property Uses
North	The property is labeled as an unidentified wood related factory with office rooms and storage rooms noted.
East	Marsh St. now named 29th St. is visible the property to the east has four commercial buildings on it two are identified as a Chair manufacturing company.
South	The property is depicted as a railway yard maintaining a small storage structure in addition to a 500 gallon gasoline UST.
West	Dutch Kills Creek is abutting the Site to the west.

Direction	1947- Surrounding Property Uses
North	The property is labeled as maintaining Porcelain Metals Inc. Factory which manufactures enamel ware.
East	29th St. is visible the property to the east maintains four commercial buildings. One utilized by Horowitz Bros. & Margareten and a second utilized by Duane Machinery Corp.
South	The property is depicted as a railway yard maintaining a small storage structure in addition to a 500 gallon gasoline UST.
West	Dutch Kills Creek is abutting the Site to the west.

Direction	1950- Surrounding Property Uses
North	The property is labeled as maintaining Seaporcel Metals Inc. Factory which manufactures enamel ware. There is possible suspect UST located on the property however it is illegible.
East	29th St. is visible the property to the east maintains five commercial buildings with unidentified occupants.
South	The property is depicted as a railway yard maintaining a small storage structure in addition to a 500 gallon gasoline

	UST.
West	Dutch Kills Creek is abutting the Site to the west.

Direction	1980-1996 - Surrounding Property Uses
North	The property is depicted as maintaining a Paper Bag Manufacturing factory with office space and multiple storage rooms.
East	29th St. is visible the property to the east maintains five commercial buildings with unidentified occupants
South	The property is depicted as a railway yard maintaining a small storage structure in addition to a 500 gallon gasoline UST.
West	Dutch Kills Creek is abutting the Site to the west.

8 EVALUATION OF DATA AND RECOMENDATIONS

An evaluation of the data obtained under the scope of this Phase I ESA was performed to identify RECs, CRECs, and HRECs associated with the Site. The evaluation included a review of the reasonably ascertainable data collected under the scope of this assessment. The evaluation considered the significance of data gaps that were inherent to site-specific sources of information consulted for this Phase I ESA. The absence of certain information that can affect the ability of the environmental professional to identify RECs, CRECs, or HRECs is considered a data gap. A data gap is the lack of or inability to obtain information required by the All Appropriate Inquiries ruling despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to site visit, user-provided information, available sources of historic information and interviews.

8.1 Data Gaps

1. One data gap was identified under the scope of this assessment. Access to the two-story building located on the eastern portion of the Site was not possible. Said building has been reportedly vacant and boarded up for the past 43 years. Therefore, a visual inspection could not be performed. This data gap is not expected to significantly affect the results of this assessment.

2. Responses to the Freedom of Information requests submitted to the, the New York State Department of Environmental Conservation, the New York City Department of Environmental Protection, and the New York City Bureau of Fire Prevention has not been received to date. In addition, the chain-of-title records were not provided at the time of this assessment. This absence of this information represents a data gap.

8.2 Recommended Phase I ESA Activities

1. No further Phase I activities are recommended at this time.

8.3 Recommended Phase II ESA Activities

1. No Phase II activities are recommended at this time. This determination is made with respect to the following factors:

    A. No *recognized environmental conditions* were identified during a visual inspection of the Site that warrants additional investigation.

B. A review of available documentation revealed historic environmental conditions associated with the Site. According to public records, NYSDEC spill cases #96-00032, #90-10146, #08-03348, #93-11731, #08-07459, and #05-04537 and one (1) NOV were associated with the Site. However, said spill cases and/or files have been closed or remediated to the satisfaction of the NYSDEC. The remediation of the historic spills was performed to the extent practical. Residual levels of contamination that may be present in the subsurface will continue to naturally attenuate, and do not represent a significant threat to human health or the environment. No active remediation is required by NYSDEC at this time. Therefore, no additional activities are recommended with respect to the HRECs.

C. Several off-site confirmed or potential contamination sources were identified to exist within the ASTM search radius. However, according to the USEPA Small Business Liability Protection Act indicates that "a person that owns real property that is contiguous to or otherwise similarly situated with respect to, and that is or may be contaminated by a release or threatened release of a hazardous substance from, real property that is not owned by that person shall not be considered to be an owner or operator of a vessel or facility under paragraph (1) or (2) of subsection (a) solely by reason of the contamination if— ''(i) the person did not cause, contribute, or consent to the release or threatened release; ''(ii) the person is not— ''(I) potentially liable, or affiliated with any other person that is potentially liable, for response costs at a facility through any direct or indirect familial relationship or any contractual, corporate, or financial relationship (other than a contractual, corporate, or financial relationship that is created by a contract for the sale of goods or services); or ''(II) the result of a reorganization of a business entity that was potentially liable; ''the person takes reasonable steps to ''(I) stop any continuing release; ''(II) prevent any threatened future release; and prevent or limit human, environmental, or natural resource exposure to any hazardous substance released on or from property owned by that person; ''(iv) the person provides full cooperation, assistance, and access to persons that are authorized to conduct response actions or natural resource restoration at the vessel or facility from which there has been a release or threatened release (including the cooperation and access necessary for the installation, integrity, operation, and maintenance of any complete or partial response action or natural resource restoration at the vessel or facility); ''(v) the person— ''(I) is in compliance with any land use restrictions established or relied on in connection with the response action at the facility; and integrity of any institutional control employed in ''(II) does not impede the effectiveness or connection with a response action; ''(vi) the person is in compliance with any request for information or administrative subpoena issued by the President under this Act; ''(vii) the person provides all legally required notices with respect to the discovery or release of any hazardous substances at the facility; and ''at the time at which the person acquired the property, the person— ''(I) conducted all appropriate inquiry within the meaning of section 101(35)(B) with respect to the property; and ''(II) did not know or have reason to know that

the property was or could be contaminated by a release or threatened release of one or more hazardous substances from other real property not owned or operated by the person." Accordingly, no Phase II activities are recommended regarding these sites at this time.

8.4 Recommended Remedial Activities

1. No remedial activities are recommended at this time.

8.5 Business Environmental Risks

1. In the case of redevelopment;
    a. Excavation activities will encounter the presence of urban fill, possibly abandoned underground storage tanks, and possible residual contamination from HREC's and/or off-site sources identified above. Urban fill is found throughout the New York metropolitan area is considered a regulated waste in the State of New York, and is therefore required to be managed in accordance with the State Solid Waste Regulations. This would require that any impacted soil be excavated, handled, transported and disposed of in accordance with NYS waste regulations.

    b. On-site buildings may require engineering controls (e.g. vapor barrier, SSDS). As part of future site redevelopment, increase to the elevation of the site and/or future buildings may be required due to current NYC DOB and/or proposed FEMA regulations.

2. In the case the site remains in its current use;
    a. NYSDEC PBS Regulations (6NYCRR Part 612) needs to be properly updated with all six (6) ASTs located on-site. Part 612 of this regulation requires registration of all facilities with a combined storage capacity of more than 1,100 gallons.

    b. Minor staining was observed throughout the repair space, these areas of staining should be properly cleaned to avoid any possible introduction into the Sites subsurface.

    c. Visual indications of mold were observed in the storage portions of the repair facility, and the vacant buildings resulting from hurricane Sandy. If these portions of the Site are to be utilized by work inhabitants on a daily basis the mold should be removed and cleaned to prevent human health problems.

8.6 De Minimis conditions

1. If the Site is redeveloped in the future or if the land use changes, the registration for RCRA EPA ID number for the Site should be administratively closed.

2. If the building(s) are to be renovated or demolished in the future, full lead and asbestos surveys should be conducted prior to the initiation of any work.

3. Delivery slips and disposal manifests must be maintained on-site to document the types and quantities of chemicals being used during facility operations, and to establish proof of proper disposal of any spent hazardous wastes that may be found. It is noted that due to hurricane Sandy, many corporate records were lost.

4. Spent absorbent materials (“Speedy Dry”) observed on the interior floor of the automotive repair shop should be cleaned and stored in sealed plastic bags and/or 55-gallon steel drums for proper disposal.

9 CONCLUSIONS

This report has been prepared for the sole benefit of AA Truck Renting. The report may not be relied upon by any other person or entity without the express written consent of Impact Environmental and AA Truck Renting. Where applicable, the assessment included a thorough visual inspection of the property, the examination of reasonably ascertainable records concerning the current and prior uses of the Site, and interviews with the current owners and/or operators of the Site. The findings presented in this site assessment are based on data obtained under the scope of this investigation. The conclusions represent the professional judgment of qualified Impact Environmental staff members using available information.

Impact Environmental has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of 28-90 Review Avenue, Long Island City, New York, the Site. Any exceptions to, or deletions from, this practice are described in Section 2.2 of this report. This assessment has revealed no evidence of Recognized Environmental Conditions (REC's) associated with the Site. Accordingly, no Phase II or Remediation activities are recommended. However, this assessment has revealed evidence of Historic Recognized Environmental Conditions (HREC's), Business Environmental Risks (BER's), and De Minimus conditions associated with the Site. The additional activities recommended with respect to the Phase I ESA, BER's and De Minimus conditions should be performed, where applicable, as outlined in Sections 8.2, 8.5 and 8.6.

I certify that this assessment was performed under my direction and supervision, that I have reviewed and approved the report, and that the methods and procedures employed in the development of the report conform to industry standards. I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Site. I have developed and performed the all appropriate inquires in conformance with the standards and practices set forth in 40 CFR part 312.

11 DISCLAIMER

The purpose of this investigation was to identify potential sources of contamination at the Site, and to satisfy the all appropriate inquiry standard set forth by CERCLA liability and establishing innocent landowner, contiguous property owner, or bona fide prospective purchaser (also referred to as “land owner liability protections” or “LLPs”) and the Brownfield Revitalization and Brownfield Act. The findings and conclusions set forth in this report are based upon information that was available to Impact Environmental during its inspection of the property. If new information becomes available concerning the property after this date, or if the property is used in the future in a manner other than that which is identified in this report, the findings and conclusions contained herein may have to be modified. Additionally, while this investigation was performed in accordance with good commercial and customary practice and generally accepted protocols within the consulting industry, Impact Environmental can not guarantee that the property is completely free of hazardous substances or other materials or conditions that could subject the Client to potential liability. The presence or absence of any such condition can only be confirmed through the collection and analysis of soil and groundwater samples, which was beyond the scope of this investigation.

PHASE I QUESTIONNAIRE

In order to qualify for one of the Landowner Liability Protections (LLPs) [35] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments") [36], the user must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

In addition, certain information should be collected, if available, and provided to the environmental professional selected to conduct the Phase I. This information is intended to assist the environmental professional but is not necessarily required to qualify for one of the LLPs. The information includes:

1. Why is the Phase I required?

   In connection with refinancing a loan.

2. What type of Site and type of Site transaction? (i.e. sale, purchase, exchange, etc.)

   Refinance

3. What is the complete and correct address for the Site? (a map or other documentation showing Site location and boundaries is helpful).

   28-90 review Ave Long Island City, NY
   Block 294 Lot 106

4. Are there any other scope of services desired for the Phase I beyond the requirements of Practice E 1527 are to be considered?

   No

5. What are future plans for the Site? (remain as is, demolition, construction, etc) If development changes are to be completed please include a site plan/survey.

   Unknown

6. Identification of all parties who will rely on the Phase I report..

   RCG Longview Debt Fund V, L.P. and/or its successors and assigns

7. Identification of the site contact and how the contact can be reached.
(Name, Phone, Fax and/or Email) Eric Roberts
   aqtruck@gmail.com

8. Are there any environmental cleanup liens against the Site that are filed or recorded under federal, tribal, state or local law? Do you have a copy of a Title search? (please provide a copy)

Unknown

9. Are there any activity and use limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

unknown

10. As the user of this ESA do you have any specialized knowledge or experience related to the Site or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the Site or an adjoining Site so that you would have specialized knowledge of the chemicals and processes used by this type of business?

NO

11. Does the purchase price being paid for this Site reasonably reflect the fair market value of the Site? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the Site?

NA

12. Is there any commonly known or reasonably ascertainable information about the Site that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,

(a.) Do you know the past uses of the Site?

No

(b.) Do you know of specific chemicals that are present or once were present at the Site?

No

(c.) Do you know of spills or other chemical releases that have taken place at the Site?

NYS DEC Spill # 0807459

(d.) Do you know of any environmental cleanups that have taken place at the Site?

yes. See Investigation Summary Report prepared by FuPact Environmental

13. As the user of this ESA, based on your knowledge and experience related to the Site are there any obvious indicators that point to the presence or likely presence of contamination at the Site?

None current

14. Any special terms and conditions which must be agreed upon by the environmental professional?

NO

15. Any other knowledge or experience with the Site that may be pertinent to the environmental professional?

NO

Examples including but not limited to: Site plans, site maps, site surveys, title searches, environmental site assessment/compliance reports, permits, registration and/or removal documents for tanks (AST/UST), disposal records, chemical storage records, letters from regulatory agencies, e-designations, etc

16. Additional information?

Signature: _____ Date: 4/7/2014

Print Name: Gregory Steven-

Title: Director

[35] Landowner Liability Protections, or LLPs, is the term used to describe the three types of potential defenses to Superfund liability in EPA's Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Site Owner, or Innocent Landowner Limitations on CERCLA Liability ("Common Elements" Guide) issued on March 6, 2003.

TOXICS TARGETING

Phase I
Environmental Database Report

28-90 Review Avenue
Long Island City, NY 11101

April 04, 2014

Privileged and Confidential.

LIMITED WARRANTY AND DISCLAIMER OF LIABILITY

Who is Covered

This limited warranty is extended by Toxics Targeting, Inc. only to the original purchaser of the accompanying Environmental Report ("Report"). It may not be assigned to any other person.

What is Warranted

Toxics Targeting, Inc. warrants that it uses reasonable care to accurately transcribe the information contained in this Report from the sources from which it is obtained. This limited warranty is in lieu of all other express warranties which might otherwise arise with respect to the Report. No one is authorized to change or add to this limited warranty.

What We Will Do

If during the warranty period there is shown to be a material error in the transcription of the information contained in this Report from the sources from which it was obtained, Toxics Targeting, Inc. shall refund to the original purchaser the full purchase price paid for the Report. The remedy stated above is the exclusive remedy extended to the Purchaser by Toxics Targeting, Inc. for any failure of the Report to conform with this Warranty, or otherwise for breach of this Warranty or any other warranty, whether expressed or implied.

What We Won't Cover

Toxics Targeting, Inc. has not and can not verify the accuracy, correctness or completion of the information contained in this Report. Information is obtained from government agencies, site owners, and other sources, and errors are common in such information. Because Toxics Targeting, Inc. can not control the accuracy of the information contained in this Report, or the uses which may be made of the information, TOXICS TARGETING, INC. DISCLAIMS LIABILITY TO ANYONE FOR ANY EVENTS ARISING OUT OF THE USE OF THE INFORMATION. TOXICS TARGETING, INC. SHALL NOT BE LIABLE FOR ANY DAMAGE CAUSED BY THIS REPORT, WHETHER DIRECT OR INDIRECT, AND WHETHER OR NOT TOXICS TARGETING, INC. HAS BEEN ADVISED OF OR HAS KNOWLEDGE OF THE POSSIBILITY OF SUCH DAMAGES. TOXICS TARGETING, INC. EXPRESSLY DISCLAIMS ANY AND ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so the above exclusion or limitation may not apply to you.

Period of Warranty

The period of warranty coverage is ninety days from the date of purchase of this Report. There shall be no warranty after the period of coverage. ANY AND ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR PARTICULAR USE SHALL HAVE NO GREATER DURATION THAN THE PERIOD OF WARRANTY STATED HERE, AND SHALL TERMINATE AUTOMATICALLY UPON THE EXPIRATION OF SUCH PERIOD. Some jurisdictions do not allow limitations on how long an implied warranty lasts, so the above exclusion or limitation may not apply to you.

PLEASE REFER TO PAGES ONE AND FIVE FOR A DESCRIPTION OF SOME OF THE LIMITATIONS OF THIS ENVIRONMENTAL REPORT.

Introduction

Toxics Targeting has combined environmental database searches, extensive regulatory analysis and sophisticated mapping techniques to produce your *Environmental Report.* It checks for the presence of 25 categories of government-reported toxic sites and provides detailed, up-to-date information on each identified site. The findings of your report are presented in an easy-to-understand format that:

1. ***Maps*** the approximate locations of selected government-reported toxic sites identified on or near a specified target address.

2. ***Estimates*** the distance and direction between the target address and each identified toxic site.

3. ***Reports*** air and water permit non-compliance and other regulatory violations.

4. ***Profiles*** some aspects of the usage, manufacture, storage, handling, transport or disposal of toxic chemicals at individual sites.

5. ***Summarizes*** some potential health effect information and drinking water standards for selected chemicals reported at individual sites.

The Three Sections Of Your Report

The first section highlights your report's findings by summarizing identified sites according to: **a)** distance intervals, **b)** direction, **c)** proximity to the target address and **d)** individual site categories. In addition, the locations of all identified toxic sites are illustrated on individual maps for each radius search distance used in your report. A close-up map illustrates the locations of all identified toxic sites, at the shortest radius search distance used in your report. Finally, a map of tax parcels and a table of selected information about those parcels are included.

The second section of your report contains *Toxic Site Profiles* that provide detailed information on each identified toxic site. The information in each *Toxic Site Profile* varies according to its source. Some toxic site categories have extensive information and some have limited information. All the information is updated on a regular basis.

The third section of the report contains appendices that identify: **1)** on-site spills reported to the national Emergency Response Notification System (ERNS), **2)** NY Dept. of Health Radon Data by zipcode, **3)** various toxic sites that cannot be mapped due to incomplete or erroneous addresses or other mapping problems, **4)** codes that characterize hazardous wastes reported at various facilities, **5)** methods used to map toxic sites identified in your report and **6)** information sources used in your report.

How to Use Your Report

- Check Table One to see the number of identified sites by distance intervals.

- Check Table Two to see identified sites sorted by direction.

- Check Table Three to see identified sites ranked by proximity to the target address.

- Check Table Four to see identified sites sorted by site categories.

- Use Table Five to get info for the subject parcel and every parcel found on the Tax Parcel Map
- Refer to the various maps to see the locations of identified toxic sites. Refer to the *Toxic Site Profile* and *Appendix* sections for additional information.

Toxic Site Databases Analyzed In Your Report

Search Radius

One-Mile 
1) ***National Priority List for Federal Superfund Cleanup****:* a listing of sites known to pose environmental or health hazards that are being investigated or cleaned up under the Federal Superfund program.

Half-Mile 
2) ***Delisted National Priority List Sites****:* a listing of NPL sites that have been removed from the National Priority List.

One-Mile 
3) ***New York Inactive Hazardous Waste Disposal Site Registry****:* a state listing of sites that can pose environmental or public health hazards requiring investigation or clean up.

One-Mile 
4) ***New York Inactive Hazardous Waste Disposal Site Registry Qualifying****:* a state listing of sites that qualify for possible inclusion to the NYDEC Inactive Haz. Waste Disposal Site Registry.

One-Mile

5) ***RCRA Corrective Action Activity (CORRACTS):*** waste facilities with RCRA corrective action activity reported by the USEPA.

Half-Mile 
6) ***CERCLIS*** (Comprehensive Environmental Response, Compensation and Liability Information System): a federal listing of Non-NFRAP sites that can pose environmental or public health hazards requiring investigation or clean up.

Half-Mile 
7) ***CERCLIS NFRAP:*** a federal listing of CERCLIS sites that have no further remedial action planned.

Half-Mile

8) ***New York State Brownfield Cleanup Sites****:* a listing of sites that are abandoned, idled or under-used industrial and commercial sites where expansion or redevelopment is complicated by real or perceived environmental contamination.

Half-Mile 
9) ***New York Solid Waste Facilities Registry****:* active and inactive landfills, incinerators, transfer stations or other solid waste management facilities.

Half-Mile 
10) ***New York City 1934 Solid Waste Sites****:* a listing of solid waste disposal sites operated by New York City municipal authorities circa 1934.

Half-Mile

11) ***New York and Federal Hazardous Waste Treatment, Storage or Disposal Facilities****:* sites reported by the NYS manifest system and the USEPA's Resource Conservation and Recovery Act Information System (RCRIS). Also includes the following database:

- ***RCRA violations:*** waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.

Half-Mile

12) ***Toxic Spills: active and inactive or closed*** spills reported to state environmental authorities, including *remediated* and *unremediated* leaking underground storage tanks. This database includes the following categories:

- Tank Failures
- Tank Test Failures
- Unknown Spill Cause or Other Spill Causes
- Miscellaneous Spill Causes

Eighth-Mile

13) ***New York State Major Oil Storage Facilities****:* sites with more than a 400,000 gallon capacity for storing petroleum products.

Eighth-Mile

14) ***New York State Petroleum Bulk Storage Facilities****:* sites with more than an 1,100 gallon capacity for storing petroleum products.

Eighth-Mile

15) ***New York City Fire Dept Tank Data****:* tank data from 1997.

Eighth-Mile

16) ***New York and Federal Hazardous Waste Generators and Transporters****:* sites reported by the NYS manifest system and the USEPA's Resource Conservation and Recovery Act Information System (RCRA). Also includes the following database:

- ***RCRA violations:*** waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.

Eighth-Mile

17) ***New York Chemical Bulk Storage Facilities****:* sites storing hazardous substances listed in 6 NYCRR Part 597 in aboveground tanks with capacities of 185 gallons or more and/or underground tanks of any size

Eighth-Mile

18) ***Historic New York City Utility Sites (1890's to 1940's)****:* power generating stations, manufactured gas plants, gas storage facilities, maintenance yards and other gas and electric utility sites.

Half-Mile 
19) ***New York Hazardous Substance Disposal Site Draft Study****:* a state listing of sites contaminated with toxic substances that can pose environmental or public health hazards. These sites were not eligible for state clean up funding programs.

Eighth-Mile

20) ***Federal Toxic Release Inventory Facilities****:* discharges of selected toxic chemicals to air, land, water or treatment facilities.

Eighth-Mile

21) ***Federal Air Discharges****:* air pollution point sources monitored by U.S. EPA and/or state and local air regulatory agencies.

Eighth-Mile

22) ***Federal Permit Compliance System Toxic Wastewater Discharges:*** permitted toxic wastewater discharges.

Eighth-Mile

23) ***Federal Civil and Administrative Enforcement Docket****:* judiciary cases filed on behalf of the U. S. Environmental Protection Agency by the Department of Justice.

On-site only (250 ft)

24) ***New York City Environmental Quality Review (CEQR) – E Designation Sites****:* parcels assigned a special environmental ("E") designation under the CEQR process. E designation requires specific protocols that must be followed.

Property only

25) ***ERNS: Federal Emergency Response Notification System Spills****:* a listing of federally reported spills.

Limitations Of The Information In Your Report

The information presented in your *Environmental Report* has been obtained from various local, state and federal government agencies. Please be aware that: **1)** additional information on individual sites may be available, **2)** newly discovered sites are continually reported and **3)** all map locations are approximate. As a result, this report is intended to be the FIRST STEP in the process of identifying and evaluating possible environmental threats to specific properties and can only serve as a guide for conducting on-site visits or additional, more detailed toxic hazard research.

Toxics Targeting tries to ensure that the information in your report is presented accurately and with minimal alteration. Systematic changes are made to correct obvious address errors in order to allow sites to be mapped. Any address changes that are made are noted in the map information section at the top of each corresponding *Toxic Site Profile*. Some information that has been withheld by government authorities remains included in Toxic Site Profiles and is identified as archival information. Since the information presented in your report is not edited, please be aware that it can contain reporting errors or typographical mistakes made by the site owners/operators or government agencies that produced the information. Also please be aware of some other limitations of the information in your report:

- The digital map used by *Toxics Targeting* is the same one used by the U. S. Census or local authorities in New York City. While the map is generally accurate, no map is perfect. In addition, *Toxics Targeting's* mapping methods estimate where toxic site addresses are located if the address is not specifically designated. FOR THESE REASONS, ALL MAP LOCATIONS OF ADDRESSES AND REPORTED TOXIC SITES SHOULD BE CONSIDERED APPROXIMATE AND SHOULD BE VERIFIED BY ON-SITE VISITS;

- UNDISCOVERED, UNREPORTED OR UNMAPPABLE TOXIC SITES MIGHT NOT BE IDENTIFIED BY THIS REPORT'S CHECK OF 25 TOXIC SITE CATEGORIES. TOXIC SITES REPORTED IN OTHER GOVERNMENT DATABASES MIGHT ALSO EXIST. FOR THESE REASONS, YOUR REPORT MIGHT NOT IDENTIFY ALL THE TOXIC SITES THAT EXIST IN THE AREA IT SEARCHES;

- The appendix of your report contains a listing of sites that could not be mapped due to incomplete or erroneous address information or other mapping problems. This listing includes unmappable toxic sites in the zip codes searched for the report as well as toxic sites without zip codes reported in the same county. IF YOU WOULD LIKE INFORMATION ON ANY OF THE LISTED SITES, PLEASE CONTACT *TOXICS TARGETING AND REFER TO THE SITE ID NUMBER.*

- New York State Department of Environmental Conservation Remediation Site Borders are approximate and may not align with tax parcel boundaries mapped by local authorities or the digital map used by the US Census Bureau. As a result, Remediation Site Borders may overlap parcels that do not involve site remediation activities. Selected parcels also can involve multiple Remediation Site Borders. Refer to individual site profiles for more information. Sites without profiles include potential new sites or sites that have not yet been publicly listed by DEC.

- Some toxic sites identified in your report may be classified as **known hazards**. Most of the toxic sites identified in your report involve **potential hazards** related to the on-site use, manufacture, handling, storage, transport or disposal of toxic chemicals. Some of the toxic sites identified in your report may be the addresses of parties responsible for toxic sites located elsewhere. YOU SHOULD ONLY CONCLUDE THAT TOXIC HAZARDS ACTUALLY EXIST AT A SPECIFIC SITE WHEN GOVERNMENT AUTHORITIES MAKE THAT DETERMINATION OR WHEN THAT CONCLUSION IS FULLY DOCUMENTED BY THE FINDINGS OF AN APPROPRIATE SITE INVESTIGATION UNDERTAKEN BY LICENSED PROFESSIONALS;

- Compass directions and distances are approximate. Compass directions are calculated from the subject property address to the mapped location of each identified toxic site. The compass direction does not necessarily refer to the closest property boundary of an identified toxic site. The compass direction also can vary substantially for toxic sites that are located very close to the subject property address.

- The information presented in your report is a summary of the information that *Toxics Targeting* obtains from government agencies on reported toxic sites. YOU MAY BE ABLE TO OBTAIN ADDITIONAL INFORMATION ABOUT REPORTED SITES WITH THE FREEDOM OF INFORMATION REQUEST FORM LETTERS THAT ARE PROVIDED ON THE INSIDE OF THE BACK COVER.

Section One:

Report Summary

- *Table One: Number of Identified Toxic Sites By Distance Interval*
- *Table Two: Identified Toxic Sites By Direction*
- *Table Three: Identified Toxic Sites By Category*
- *Table Four: Identified Toxic Sites By Proximity*
- *Map One: One-Mile Radius Map*
- *Map Two: Half-Mile Radius Map*
- *Map Three: Eighth-Mile Radius Map*
- *Map Four: Eighth-Mile Radius Close up Map*
- *Map Five: Tax Parcel Map*
- *Table Five: Tax Parcel Map Information Table*

Section Two: Toxic Site Profiles

The heading of each *Toxic Site Profile* refers to the site's map location and details:

- The facility name, address, city, state, and zip code.
- Any changes that were made to a site's address in order to map its location.
- The site mapping method that was used (see ***How Sites are Located***, at the end of this section for more information).

Toxic Site Profiles summarize information provided by site owners or operators and government agencies regarding various toxic chemical activities reported at each site, such as:

- Whether chemicals were stored, produced, transported, discharged or disposed of.
- The name of chemicals and their Chemical Abstract Series (CAS) numbers.
- The amount of chemicals and the units (gallons/pounds) the chemical was measured in.
- Whether the site or storage tanks at the site are currently active or inactive.
- Special codes used by government agencies to regulate hazardous waste activities at some sites, or a complete description of the codes follows the profiles section.

For selected individual chemicals reported at various toxic sites, some potential health effect summary information appears below the site profile. Each potential health effect summary identifies chemicals by name and by Chemical Abstract Series (CAS) Number. An "x" under each potential health effect heading indicates positive toxicity testing results reported by the National Institute of Occupational Safety and Health's Registry of Toxic Effects of Chemical Substances (RTECS). Some chemicals (mostly appearing in profiles of Hazardous Waste facilities), are reported as mixtures, and RTECS health effect information is only available for individual chemicals. In addition, RTECS only provides information on approximately 100,000 common chemicals. Consequently, the absence of potential health effect summary information for a particular chemical identified in a Toxic Site Profile does not necessarily mean that the chemical does not pose potential health effects.

The Maximum Contaminant Level (MCL) in drinking water allowed for selected chemicals is also noted. In most cases, the only applicable MCL has been set by the New York State Department of Health (NYSDOH). Where NYSDOH has not set an MCL, the federal standard, if one exists, is listed and is marked by an asterisk.

Presented below are column headings that describe the health effect definitions used in RTECS and applicable New York State and federal drinking water standards. Reference sources for information presented in this section are also provided.

ACUTE TOX: **Acute Toxicity**: Short-term exposure to this chemical can cause lethal and non-lethal toxicity effects not included in the following four categories.

TUMOR TOX: **Tumorigenic Toxicity**: The chemical can cause an increase in the incidence of tumors.

MUTAG TOX: **Mutagenic Toxicity**: The chemical can cause genetic alterations that are passed from one generation to the next.

REPRO TOX: **Reproductive Toxicity**: May signify one of the following effects: maternal effects, paternal effects, effects on fertility, effects on the embryo or fetus, specific developmental abnormalities, tumorigenic effects, or effects on the newborn (only positive reproductive effects data for mammalian species are referenced).

IRRIT TOX: **Primary Irritant**: The chemical can cause eye or skin irritation.

MCL: **Drinking Water Standard - Maximum Contaminant Level** (MCL) listed under Drinking Water Supplies, 10 NYCRR Part 5, Subparts 1.51(f),(g), and (h) for NYDOH MCL's and under the Safe Drinking Water Act, 40 CFR 141, Subparts B and G, (* indicates value for total trihalomethanes) for federal MCL's.

Reference Source for Toxicity Information: Registry of Toxic Effects of Chemical Substances (RTECS), NIOSH (on-line database); For further information, contact: NIOSH, 4676 Columbia Parkway, Cincinnati, OH, 45226, 800/35-NIOSH.

Reference Source for Drinking Water Standards: New York State Department of Health, Bureau of Toxic Substances Assessment, 2 University Place, Room 240, Albany, NY 12203, 518/458-6373.

U.S. Environmental Protection Agency, Office of Drinking Water, 401 M St SW, Mailstop WH-556, Washington, DC, 20460, 202/260-5700.

Inactive Hazardous Waste Disposal Site Classifications:

1 -- Causing or presenting an imminent danger of causing irreversible or irreparable damage to the public health or the environment -- immediate action required;
2 -- Significant threat to the public health or environment -- action required;
3 -- Does not Present a significant threat to the environment or public health -- action may be deferred;
4 -- Site properly closed --requires continued management;
5 -- Site properly closed, no evidence of present or potential adverse impact -- no further action required;
2a -- This temporary classification has been assigned to sites where there is inadequate data to assign them to the five classifications specified by law;
A -- Work underway and not yet complete;
P -- Potential Site;
$D_{1, 2, 3}$ -- Delisted Site (1: hazardous waste not found; 2: remediated; 3: consolidated site or site incorrectly listed);
C -- Remediation Complete (formerly D2).

Newtown Creek
New York
EPA ID#: NYN000206282
EPA REGION 2
Congressional District(s): 12,14
Queens, Kings Counties

NPL LISTING HISTORY
Proposed Date: 9/23/2009
Final Date: 9/29/2010

Site Description
Newtown Creek is a 3.8−mile long tidal water body located in the City of New York, having five principal tributaries (Dutch Creek, Whale Creek, Maspeth Creek, East Branch and English Kills) and is itself a tributary of the East River. The creek is a part of the New York ˘ New Jersey Harbor Estuary that forms the north−south border between the New York City boroughs of Brooklyn and Queens. In the mid 1800s, the area adjacent to the 3.8 mile Newtown Creek was one of the busiest hubs of industrial activity in New York City. More than 50 refineries were located along its banks, including oil refineries, petrochemical plants, fertilizer and glue factories, sawmills, and lumber and coal yards. The creek was crowded with commercial vessels, including large boats bringing in raw materials and fuel and taking out oil, chemicals and metals. In addition to the industrial pollution that resulted from all of this activity, the city began dumping raw sewage directly into the water in 1856. During World War II, the creek was one of the busiest ports in the nation. Currently, factories and facilities still operate along the creek. Various contaminated sites along the creek have contributed to the contamination at Newtown Creek. Many businesses along Newtown Creek still operate without city−provided sewer services.

Water flow into Newtown Creek currently consists mostly of storm water runoff, combined sewer overflows (CSO), and discharges from permitted and unpermitted pollution sources. The creek rises and falls with the tide, but it is mostly

stagnant. Newtown Creek is a navigable waterway under the jurisdiction of the Coast Guard, and the channel must be maintained for shipping purposes.

Various sediment and surface water samples have been taken along the creek. Hazardous substances, including pesticides, metals, PCBs, and volatile organic compounds (VOCs), have been detected at the creek. The New York City Department of Environmental Protection has sampled sediment and surface water at a number of locations in creek sediments since 1980. Investigations and remediation under state or federal programs have also been conducted at properties adjacent to the creek to abate continued discharges of pollution to the creek from those facilities.

The majority of the upland area bordering Newtown Creek is within one of three Industrial Business Zones of the City of New York, and the majority of Newtown Creek has also been designated by the City of New York as one of the Citys six Significant Maritime and Industrial Areas. However, the creek is also currently used occasionally for recreational purposes by kayakers and there is fishing access along the banks.

Threat and Contaminants
EPA conducted an Expanded Site Investigation (ESI) of Newtown Creek in 2009 as part of the Hazard Ranking System scoring process for NPL listing under Superfund. Based on the ESI, which was focused on Newtown Creek itself and not its tributaries, EPA concluded that metals, volatile organic compounds, and semi−volatile organic compounds (including polycyclic aromatic hydrocarbons and polychlorinated biphenyls) were present in Creek sediments at elevated concentrations. The variety and distribution of the detected contaminants suggests that they originated from a variety of sources. Previous environmental investigations of Newtown Creek, or specific portions of the Creek, also disclosed that sediments in Newtown Creek are contaminated by a wide variety of hazardous substances. Environmental investigations of upland parcels adjacent to or nearby the Creek have disclosed contamination of those parcels by hazardous substances similar to hazardous substances found in sediments in Newtown Creek.

Cleanup Approach
Following the ESI in 2009, Newtown Creek was proposed by EPA for listing on the National Priorities List under Superfund on September 23, 2009. Field work for the Remedial Investigation/Feasibility Study (RI/FS) in the creek began in November 2011. The RI/FS process will characterize environmental conditions at Newtown Creek and connecting tributaries, determine the nature of the waste, assess risk to human health and the environment, and evaluate potential cleanup alternatives.

At present, EPA has identified six Potentially Responsible Parties (PRPs) for the Newtown Creek site: BP America, Inc., The Brooklyn Union Gas Company d/b/a National Grid NY, ExxonMobil Oil Corporation, Phelps Dodge Refining Corporation, Texaco, Inc. −known as the Newtown Creek Group and the City of New York. These parties are believed by EPA to have contributed hazardous substances into Newtown Creek through operations conducted along the creek. EPA has completed the negotiations with these parties to perform the RI/FS under EPA oversight. The Administrative Order on Consent was signed on July 7, 2011. EPA anticipates that additional PRPs will be identified and that they will be given the opportunity of joining as respondents under the Order. Under Superfund, responsible parties are liable for the cost of investigating and remediating sites where hazardous substances have been released or have come to be located.

EPA has approved several documents submitted by Anchor QEA, the environmental consulting firm hired by the PRPs. These documents include the Quality Assurance Project Plan (QAPP), the Field Sampling and Analysis Plan (FSAP), the Data Collection Plan (DCP), and the Data Management Plan (DMP) and are found on the regional EPA web page for Newtown Creek. As other documents are approved, they will be added to the web page.

EPA held two public information sessions in Brooklyn, N.Y. at St. Nicks Alliance on Kingsland Ave., and in Queens, N.Y. at LaGuardia Community College in Long Island City to answer questions from the public and discussed the timeline of the Remedial Investigation/Feasibility Study (RI/FS) process.

A Community Advisory Group (CAG) was ratified in May 2012.

Cleanup Progress
Newtown Creek was proposed for NPL site listing on September 23, 2009 and finalized on the NPL on September 29, 2010. EPA has completed been negotiating with the Newtown Creek Group and the City of New York on the implementation of the RI/FS for the Site. The PRPs are currently conducting field work for a multi−year phased remedial investigation. Field work began in November 2011 and continues on through the summer of 2012. Field activities included: the shoreline assessment, creek−bed surveys (bathymetric, magnetic, side−scan sonar), fish community surveys, sediment sampling (sub−surface coring and surface grab samples) and surface water sampling. All Phase 1 sampling efforts are expected to finish in the fall of 2012. The data from these sampling events will be reviewed and used to guide the development of the next phase of sampling.

SITE DESCRIPTION:

LOCATION:
Newtown Creek is an estuarine waterbody that forms a portion of the boundary between the boroughs of Brooklyn and Queens in New York City. The site definition includes all the waters, shoreline, channel, tidal−affected zones, and sediments of Newtown Creek, and its tributaries (natural, created, and controlled), from its headwaters to its confluence with the East River. Tributaries include Whale Creek (and the Whale Creek Overflow Canal), Dutch Kills, Maspeth Creek, East Branch, and the English Kills.

SITE FEATURES:
The entire creek system extends approximately 3.8 miles from the English Kills to the East River. A substantial portion of the creek is contained by bulkheads or riprap and its width averages 200−300 feet. Average depth in the navigable channels is 20 feet below mean low water level. Total surface area of the creek is approximately 170 acres.

CURRENT ZONING/USE:
The Newtown Creek is primarily used for the transport of materials and goods produced and consumed by the industry, businesses and development projects along its banks. A small amount of recreational boating also occurs there. Various forms of fishing have been documented in the creek despite applicable fishing restrictions in place for the creek waters.

The surrounding area is still very diverse in terms of land use and potential contaminant contributors. Upland areas adjacent to the creek that are contributing to its flow and contaminant loading include oil storage facilities, inactive hazardous waste disposal sites, active manufacturing facilities, spills, and other uncontrolled sources. The total original natural drainage area of the creek and tributaries encompassed nearly 7,650 acres.

HISTORICAL USES:
Newtown Creek is a waterway that has served as a conduit for the transportation of raw materials and products dating back nearly 200 years. It has also been used for the disposal of numerous wastes, including sewage, industrial, and commercial wastes, through outfalls flowing into the creek. Direct releases of wastes have also entered Newtown Creek from the creek banks.

The area immediately surrounding the creek has been, and remains, the location of many forms of industrial and commercial

activity. Such historic industrial uses include shipbuilding, textiles, metal smelting, and oil refining.

SITE GEOLOGY & HYDROGEOLOGY:
The original watershed has been permanently altered by urbanization such that there is virtually no freshwater flow to the creek other than stormwater and municipal combined sewer overflows (CSOs) during wet weather. There are 20 CSO outfalls and over 100 stormwater discharges to the Creek. Significant outfalls are located in the English Kills, East Branch, Maspeth Creek, and Dutch Kills. Inflow is estimated to be in excess of 1.4 billion gallons annually. Much of this flow contains significant concentrations of contaminants, including polychlorinated biphenyls (PCBs), metals, oil and grease, coliform bacteria, and solid waste.

The creek is classified by New York State as Class SD saline surface water with best uses designated for fishing and fish survival. Class SD waters have natural or man−made conditions limiting attainment of higher standards. The creek does not attain these standards at present. Documented water quality problems include low dissolved oxygen, odors, and solid waste. Sediments on the creek bottom are contaminated with PCBs, heavy metals such as lead, mercury, and copper, and petroleum hydrocarbons.

OTHER:
The NYSDEC nominated the creek and its tributaries to the National Priorities List (NPL) in January 2009. The site was formally proposed to the NPL on September 23, 2009 and was added to the NPL by rule−making notice in the Federal Register of September 29, 2010.

To document the site’s eligibility for the NPL and prepare a Hazard Ranking Score, EPA initiated an Expanded Site Investigation in the creek in February 2009. The investigation included extensive sampling of sediment. The Expanded Site Inspection effort and report were completed in July 2009.

The USEPA is the lead agency and has negotiated and developed an RIFS work plan and adminstrative order on consent with identified responsible parties. The DEC provided comments on the RIFS work plan in February 2011 and the work plan was finalized in July 2011.

RI field activities were initiated in April 2012 and are progressing in accordance with the WP.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
LEAD	UNKNOWN
ZINC	UNKNOWN
PCB−AROCLOR 1254	UNKNOWN
MERCURY	UNKNOWN
POLYCHLORINATED BIPHENYLS (PCB)	UNKNOWN
PCB−AROCLOR 1242	UNKNOWN
COPPER	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Newtown Creek has a history of intensive industrial use dating back nearly 200 years. Historic industrial uses include shipbuilding, textiles, metal smelting, and oil refining. The surrounding area is still very diverse in terms of land use and

potential contaminant contributors. Upland areas adjacent to the creek that are contributing to its flow and contaminant loading include oil storage facilities, inactive hazardous waste disposal sites, active manufacturing facilities, spills, and other uncontrolled sources.

The original watershed has been permanently altered by urbanization such that there is virtually no freshwater flow to the creek other than stormwater and municipal combined sewer overflows (CSOs) during wet weather. There are 20 CSO outfalls and over 100 stormwater discharges to the Creek. Significant outfalls are located in the English Kills, East Branch, Maspeth Creek, and Dutch Kills. Inflow is estimated to be in excess of 1.4 billion gallons annually. Much of this flow contains significant concentrations of contaminants, including polychlorinated biphenyls (PCBs), metals, oil and grease, coliform bacteria, and solid waste.

The creek is classified by New York State as Class SD saline surface water with best uses designated for fishing and fish survival. Class SD waters have natural or man−made conditions limiting attainment of higher standards. The creek does not attain these standards at present. Documented water quality problems include low dissolved oxygen, odors, and solid waste.

Newtown Creek was added to the NPL on September 29, 2010. EPA listed the site based on surface water contamination and heavily contaminated sediment. Sampling has detected a variety of pollutants in excess of sediment criteria, including the metals antimony, arsenic, cadmium, chromium, copper, lead, nickel, selenium, silver, and zinc; polycyclic aromatic hydrocarbons (PAH); total petroleum hydrocarbons (TPH); polychlorinated biphenyls (PCBs); and volatile organic contaminants (VOC). The extent of contamination traverses the entire length of the Creek. The contaminants of greatest concern in sediment are:

1) Polycyclic aromatic hydrocarbons(PAHs), including several carcinogenic compounds, are ubiquitous in the creek at levels from low ppm up to thousands of ppm in the areas of highest impact.

2) Metals, including Lead with levels up to 2,400 ppm (sediment criteria median effect level (MEL) = 218); Mercury with typical levels in the 1−4 ppm range (MEL= 0.71); Copper with levels from 500 to 39,200 ppm(MEL=270); Zinc with levels up to 15,500 ppm (MEL= 410).

3)Polychlorinated biphenyls (PCBs) are present in accumulated sediments at total concentrations ranging from 1 to 106 ppm, with an average concentration of >3 ppm (DEC sediment criteria is 0.1 ppm).

4) TPH: Petroleum hydrocarbons are ubiquitous,at levels up to 74,000 ppm.

Sediment contamination constitutes a significant threat to the environment.

ASSESSMENT OF HEALTH PROBLEMS:

People using the creek for recreational purposes such as swimming and boating may come into direct contact with chemical contaminants and harmful biological organisms. People may come in contact with contaminants present in the shallow creek sediments while entering or exiting the creek during recreational activities. Fish and shellfish in the creek are likely to contain the same chemical contaminants that are present in surface water and shallow creek sediments; therefore, people who consume fish and shellfish from the creek are likely to be consuming these contaminants as well. People are not drinking the contaminated creek water because the area is served by a public water supply that obtains its water from a different source.

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
The site did not qualify for addition to the Registry of Inactive Hazardous Disposal Sites. Manhattan Adhesives is currently an empty factory building that is located at the foot of the Greenpoint Ave., Bridge in Brooklyn. Besides the Manhattan Adhesives factory, about 10 feet from the northeast wall is a manhole (not a sewer or drain) into which liquid waste was allegedly discharged. This waste came from a condemned oil storage site located at the intersection of Rt. 280, and the NJ Turnpike in NJ. The manhole is suspected of being the opening to an underground tank; however, the quantity of the waste allegedly dumped exceeds the capacity of most tanks. This information was obtained from the State Senate Committee on Crime and the Brooklyn District Attorney’s office. Phase I State Superfund has been completed. A partial phase II investigation was completed during 1985 and recommended no further action. The Responsible Party has agreed to undertake an investigation in 1986. An investigation has not found hazardous waste on−site.

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
The Site is located at 460 Kingsland Avenue in the northernmost section of Brooklyn within a commercial/industrial area and is approximately 3.5 acres in size. It is bordered by Newtown Creek to the east, Kingsland Avenue to the west, Greenpoint Avenue to the north (adjacent to Newtown Creek WPCP), and the Former ExxonMobil Brooklyn Terminal (Mobil Brooklyn Refinery) to the south. Topographic elevations at the Site are approximately 7 feet above mean sea level (amsl) within the southeastern portion of the Site and gradually rise to approximately 11 ft amsl within the northwestern portion of the Site.

The Site is currently vacant but was most recently used as a trucking distribution hub. The site has two abutting one−story buildings divided into storage and office space. Exterior areas are paved and used for delivery and shipping purposes, as well as the staging of delivery vehicles. The Site was historically operated as part of the former Mobil Brooklyn Refinery (SOCONY), which itself was a continuation of petroleum refining and storage operations that were prevalent in Greenpoint since the mid−Nineteenth Century. As part of the earlier petroleum refining and storage operations, the southern region of the Site was used for petroleum bulk storage purposes whereas improvements in the northern region of the Site included a distillery and a boiler works storage yard. Under former operations, the Site also served as a petroleum bulk storage yard that included three petroleum bulk storage tanks, two chemical bulk storage tanks containing acids, and an API−type oil/water separator along the southern Site boundary. The site was reportedly used by Mobil?s Technical Services Division (TSD) for study of petroleum product

uses.

After refinery operations at the former Mobil Brooklyn Refinery ceased in 1966, the Site was sold in 1967 and redeveloped with the existing commercial building in 1968 and occupied by miscellaneous trucking operations. In addition, fifteen underground storage tanks containing diesel fuel, heating oil, and waste oil were maintained during the operation of the commercial/transfer facilities and were removed in 1994. A spill (#9402812) reported during the tank removal initiated site investigation and characterization activities. In addition, ExxonMobil has performed some investigation of the site as part of the remediation of the former Mobil Brooklyn Refinery.

The initial investigation activities indicated petroleum−impacted soils existed within the shallow subsurface beneath the Site and that free−phase petroleum product was also located within the shallow subsurface. More recent sampling seeking to close the open spill identified PCB contamination in shallow soil under the asphalt pavement and indicated limited groundwater contamination from PCBs exists.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Soil sampling indicates that hazardous waste disposal has occurred at the site. Groundwater sampling at the site indicates that PCBs may be present in the shallow groundwater at levels above the NYSAWQS. Additional site characterization is necessary to examine complete nature and extent in groundwater and soil and to determine if a significant amount of waste is present.

Petroleum impacts are present in site in shallow and deeper soils, and in groundwater from former refining operations on and near the site.

ASSESSMENT OF HEALTH PROBLEMS:
As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

ADDRESS: 52−28 37th Street
Long Island City, NY 11101
Operator Type: Corporate or Commercial

HAZARDOUS WASTE DISPOSAL PERIOD: from 1991 to unknown

SITE DESCRIPTION:

Location:
The former Roehr Chemicals facility is located in an urban area at 52−20 37th Street, Long Island City, Queens, at the corner of Starr Avenue. Roehr Chemicals operated four buildings on five lots described as Queens County Tax Map Block 310, Lots 1, 8, 23, 24 and 28. The Site is identified as Block 310, Lot 28.

Current Zoning and Land Use:
The site is located in a mixed−use area with industrial, commercial and residential uses. The Long Island Expressway (Interstate 495) is located about 1200 feet north of the site. Calvary Cemetery is located immediately east of the site across 37th Street, and Newtown Creek is located approximately 1750 feet southwest of the site.

Site Features:
The site consists of a one story building on a 100 feet x 100 feet property. The building is presently used as a warehouse for storing packing boxes, and the adjacent partial yard is used for storage and parking.

Past Uses of the Site:
On this site bulk pharmaceuticals and pharmaceutical intermediates were manufactured from 1957 to 1991. Several VOCs, such as xylene, benzene and diethyl−ketone, were used in the production of these items. During site operations involving the removal of spent xylene, a containment system failed, leaking xylene to the surrounding soil. Lot 28 contained the main building and has been the focus of the investigation and remediation. Other lots that were part of Roehr Chemical (Block 310, Lots 1, 8, 23, & 24) were investigated and closed in August 1992 under RCRA closure.

Geology and Hydrogeology:
Groundwater flows to the southwest, toward Cavalry Cemetery and eventually toward Newtown Creek. Groundwater is approximately 25−30 feet below ground surface.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
ACETONE	UNKNOWN
XYLENE (MIXED)	UNKNOWN
ETHYLBENZENE	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamintion:
Prior to Remediation, the Remedial Investigation/Feasibility Study (RI/FS) found groundwater contaminated with xylene and acetone. The RI showed an elongate and narrow xylene plume leaving the site and entering the Calvary Cemetery. An off−site investigation was conducted in October 2000 to determine the impact of on−site contamination on the groundwater quality downgradient of the Calvary Cemetery. A series of geoprobe borings and four monitoring wells were installed along Review Avenue. Total xylenes in many of these wells were found to be at a maximum concentration of 19 ppm.

Post−Remediation − The remedial actions taken to date have adequately addressed the significant threat posed to the environment by the contamination. The continued monitoring required includes the operation of a soil vapor extraction and air sparging system and groundwater monitoring. With the operation of a AS/SVE system, the groundwater concentrations of site related contaminants were reduced to non−detect levels in most wells. The AS part of the remedial system has been pulsed and the SVE was shut off in June 2013. It was determined that a significant reduction in groundwater concentrations of xylene and ethylbenzene have been achieved.

ASSESSMENT OF HEALTH PROBLEMS:
People are not expected to contact contaminated soil because buildings and pavement cover most of the site and residual contamination exists beneath the surface. People may contact contaminated soils if they dig below surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply system that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor

intrusion. Actions have been taken to address the potential for soil vapor intrusion to occur on−site and sampling indicates that the potential for soil vapor intrusion in off−site structures is not a concern.

Green Point, NY 11222

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:
The Site is located across multiple addresses in the Greenpoint section of Brooklyn, NY. The addresses for the Site include 257, 259, 263, & 269 Freeman Street and 230, 238, 242 Eagle Street. 269 Freeman Street is also known as 105 Provost Street. The Newtown Creek Water Pollution Control Plant (WPCP) is located directly east of the Site.

Site Features:
The original Site encompassed five separate buildings and three yards that occupy seven separate lots. The buildings are no more than 2 stories in height. The entire Site is approximately 1.2 acres in size. There are manufacturing buildings to the north, south and west of the Site.

Current Zoning/Uses:
The area (and properties) is zoned M3−1 which includes heavy manufacturing and industrial uses along with certain commercial uses. Properties on the site are currently used for the manufacturing of air conditioning duct work, a distribution center for paint and varnish, parking, and staging of various contracting equipment.
− 263−269 Freeman and 242 Eagle Street are currently used for the manufacturing of air conditioning duct work and accessories
− 238 Eagle street is currently used for the distribution of paint and varnish.
− The Yard portion east of 238 Eagle Street is currently an unused dirt yard.

Historical Uses:
In the early 1900?s the site was used as a cooperage for wooden barrel and cask production. From approximately 1942 to 1982, the property was occupied by Reliable Machine Company that had numerous paint spraying locations on the property. In 1982, Ney Smelting and Refining Company took ownership of the property in 1982 and renovated the buildings and used the property for smelting of lead, tin and zinc. Smelting operations ceased in 2003.

Site Geology and Hydrogeology:
Shallow boring logs indicate the Site overlies historic fill. The soil type below the fill is not known. Depth to groundwater is approximately 10 feet below grade and may be tidally influenced due to the close proximity to the Newtown Creek. Groundwater flow may also be affected by the adjacent Newtown Creek WPCP. Groundwater flow direction is estimated to be to the northeast

Miscellaneous:
There are no PBS, CBS records for the multiple addresses of the Site.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
The site is covered with multiple buildings and parking facilities. One small area of the site contains a dirt construction yard that is largely underlain by a concrete slab.

The shallow subsurface soil is comprised of historic fill that contains building debris such as brick and concrete, ash, and soil. This material contains elevated concentrations of inorganics that are generally below allowable concentrations at industrial sites. SVOCs are also present in the soil at the site but also do not exceed standards for industrial areas. No VOCs were detected at levels that cause concern. Data from TCLP analyses were all below hazardous waste thresholds.

Groundwater is sporadically impacted by PCE and breakdown products. There is no continuous plume of impacted groundwater as would be observed if a source of PCE was present.

ASSESSMENT OF HEALTH PROBLEMS:
None provided

PROJECT COMPLETIONS:

Dover, DE 19901

HAZARDOUS WASTE DISPOSAL PERIOD: from 1960 to 1981

SITE DESCRIPTION:
The Quanta Resources Site is an approximately 2 acre parcel located at 37−80 Review Avenue, within a highly industrialized area of Long Island City, Queens, New York. Zoning in this area is designated as heavy manufacturing.

The site is bounded on the northeast by Review Avenue and on the southwest by the Southern Line of the Long Island Rail Road (LIRR). On the northwest it is bounded by an alley (Preston Street) that runs from Review Avenue to the LIRR tracks. On the southeast it is bounded by the property currently owned by Phoenix Beverages (an imported beer distributor). Farther to the northeast, across Review Avenue, is Calvary Cemetery. Farther to the northwest, across the alley, is the "North Capasso" property, also referred to as Review Avenue Development I (RADI). Farther to the southwest, across the LIRR tracks, is the "South Capasso" property. Newtown Creek lies beyond the South Capasso property farther to the southeast approximately 450 feet from the site. Fencing bounds the property on all sides.

A Consent Order was signed with numerous PRPs in May 2002 for the undertaking of investigation and remediation activities. An RI/FS was completed. Soil and groundwater contamination has been confirmed. The primary contaminants of concern include petroleum hydrocarbons, chlorinated solvents, PCBs, heavy metals and PAHs. Measurable LNAPL was found in 24 of 29 onsite and offsite monitoring wells. The Site was accepted into BCP. The BCA agreement was executed on 12/2/05 (see C241005). A PRAP was issued in June 2006. A PRAP Public Meeting was held on June 28, 2006 and the public comment period closed on August 3, 2006. The ROD was signed 2/9/07 requiring a $15,560,000 remedy which includes an LNAPL recovery system. Remedial Design is underway.

The Quanta Resources property and surrounding properties have been used for a variety of industrial purposes since the late 19th century. A Sanborn Fire Insurance Map from 1898 indicates that the site was partially occupied by vacant and dilapidated brick wrecks of an oil refinery. Available information indicates the earliest recorded actual owner of the property was American Agricultural Chemical Company. In 1931 the property was transferred to Triplex Oil. Triplex Oil used the property for refining of used crank case oil for approximately 40 years. From 1972 until 1980 the facility was operated by several different owners including Pentalic Corporation, Sea Lion Corporation, Ag−met Oil Service, Inc., Hudson Oil Refining Corp., and Portland Holding Corp. In 1980 Quanta Resources acquired the property, and used the property for the re−refining of used crankcase oil and other liquid recycling before filing for bankruptcy on October 6, 1981.

The site has been inactive since being abandoned in November 1981. Tanks and several buildings remain on site.

A number of potential LNAPL source areas existed on the Quanta Resources Site throughout its operational history, however, the

primary suspected source area is the tank farm area located in the northeastern portion of the site.

A New York City emergency remedial action removed approximately 640,000 gallons of waste oil from the property. Some of the waste oil contained tetrachloroethene, methyl chloride, 1,1,1−trichloroethane and trichloroethene. Sludge, waste oil, and diesel fuel, all contaminated with PCBs, were also removed from badly deteriorated leaking tanks and drums. As part of NYSDEC's Phase II Investigation, three on−site groundwater monitoring wells were installed. During installation it was discovered that there was a seven foot layer of oil lying above the groundwater table.

A Consent Order was signed with numerous PRPs in May 2002 for the undertaking of investigation and remediation activities. An RI/FS was completed. Soil and groundwater contamination has been confirmed. The Site was accepted into BCP. The BCA agreement was executed on 12/2/05 (see C241005). A PRAP was issued in June 2006. A PRAP Public Meeting was held on June 28, 2006 and the public comment period closed on August 3, 2006. The ROD was signed 2/9/07 requiring a $15,560,000 remedy which includes an LNAPL recovery system.

See Site Code C241005 for post ROD updates.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
HYDROCARBONS HEAVY METALS.	UNKNOWN
TETRACHLOROETHENE	UNKNOWN
METHYL CHLORIDE	UNKNOWN
1,1,1−TRICHLOROETHANE	UNKNOWN
TRICHLOROETHENE	UNKNOWN
TOLUENE	UNKNOWN
1,1,1 TCA	UNKNOWN
BENZENE	UNKNOWN
TOLUENE 2,4−DIISOCYANATE	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

The site presents a significant threat due to the soil and groundwater contamination, free product LNAPL plume and close proximity to Newtown Creek.

An RI/FS was completed. Soil and groundwater contamination has been confirmed. The primary contaminants of concern include petroleum hydrocarbons, chlorinated solvents,heavy metals and PAHs. Measurable LNAPL was found in 24 of 29 onsite and offsite monitoring wells.

ROD signed 2/07. Site has transitioned into the Brownfield program. Site is now tracked as Review Avenue Development II − Site # C241089

ASSESSMENT OF HEALTH PROBLEMS:

Waste oil previously stored on−site has caused widespread contamination of groundwater and soils. Approximately 500,000 gallons of contaminated waste oil remains at the site, floating on the water table. The aquifer of concern is not used as a source for drinking water. Groundwater wells in this area of Queens are used only for commercial and industrial purposes. A fence

surrounds the site restricting access and minimizing the potential for direct contact exposures to on−site contaminates. The potential exists for the floating oil plume to migrate into the nearby Newtown Creek which empties into the East River. Further investigation is required.

OPERATOR(S) DURING DISPOSAL:
NAME: Greenpoint Manufacturing & Design Center
Paul Parkhill

ADDRESS: 1155 Manhattan Avenue
Brooklyn, NY 11222

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
LOCATION: The Greenpoint Manufacturing and Design Center (GMDC) property is located at 1155−1205 Manhattan Avenue which is an urban area of Brooklyn (Kings County) in New York City.

SITE FEATURES: The property is nearly entirely covered by structures, with only one small area covered with other impervious material located along the northern edge of the property along Newtown Creek. There are eight contiguous four to six−story building on the property. The property borders Newtown Creek on the north side.

CURRENT ZONING/USE: This property is currently in use for many separate commercial uses, primarily by small businesses and artisans. The surrounding uses are varied − the property adjacent to the west is indicated as having residential and commercial use but appears commercial; the properties to the east across Manhattan Avenue are indicated as being factory/industrial uses, but appear to be commercial with residential above.

HISTORICAL USE(s): The property has a long industrial/commercial history, but went through an extensive remedial effort overseen by local agencies in the 1990's. The property owners have done significant renovations on the buildings and have conducted at least two recent investigations which identified limited groundwater contamination, but did not identify any significant soil contamination.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
NATURE AND EXTENT OF CONTAMINATION: Only two (of ten) temporary groundwater sampling wells located in the basement of the structure at 1155 Manhattan Avenue showed evidence of contamination. Each contained one chlorinated VOC slightly above standards. Tetrachloroethylene was identified at 21ppb; chloroform was identified at 12 ppb. Groundwater standards are 5 ppb and 7 ppb respectively. Soil samples from these borings were below unrestricted standards for the same compounds. Samples taken from permanent wells did not identify any VOC contamination. Based on professional judgment, the slight exceedances of groundwater standards, adjacent to the Newtown Creek Superfund Site, do not constitute a significant threat to the environment. No further investigations are warranted at this time. Site designation was changed from "P" to "N."

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:

The site is located in the Greenpoint section of Kings County (Borough of Brooklyn, New York City). The site is located on the southwest corner of the intersection of Kingsland and Norman Avenues.

Site Features:

The site is completely covered by multiple buildings of varying construction and height. Numerous other commercial and industrial properties are located to the north, east, and west of the site. A large residential area is located immediately south of the site, and extends south along both Kingsland Avenue and Monitor Street. A large sewage treatment plan is ~1/2 mile north of the site.

Current Zoning/Use(s):

The site is zoned for both residential and light manufacturing. The site is partially occupied, and is utilized for a variety of purposes (residential, warehousing, etc.).

Historical Use(s):

The Department began a Site Characterization in this area during the Spring of 2007 as part of a plume trackdown investigation (Meeker Avenue Plume Trackdown, DEC Site ID No. 224121). This particular location was specifically targeted for investigation based on Sanborn fire insurance map data indicating that the site was operated by Spic and Span Cleaners and Dyers, Inc. (a.k.a. Eastern District Dye Works) from the early 1900's until the mid−1960's. This investigation was conducted in several phases, and was completed in the Summer of 2009.

Site Geology and Hydrogeology:

The site is underlain by a fill unit (0.5−10' thick), a stratified sand unit with some to no fines (over 120' thick), a discontinuous glacial till unit within the sand unit (0.5−50' thick), a discontinuous clayey silt unit within the sand unit (0.5−25' thick), and the Raritan Formation (~138.5' below ground surface).

Groundwater is approximately 11−25' below ground surface in the vicinity of the site. Groundwater flows north to northeast toward Newtown Creek, which lies approximately 1,300' northeast of the site.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
TETRACHLOROETHYLENE (PCE)	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Nature and Extent of Contamination:

− Groundwater

The primary contaminant of concern at the site is tetrachloroethene (PCE). PCE has been found in shallow groundwater at concentrations up to 39,000 ppb, and in deep groundwater at concentrations up to 120,000 ppb, well above the Part 703.5 class GA standard of 5 ppb. PCE DNAPL has also been found on−site at concentrations up to 730,000 ppm (73%) in deep monitoring wells. Trichloroethene (up to 5,000 ppb), cis−1,2−dichloroethene (up to 14,000 ppb), and vinyl chloride (up to 3,200 ppb) have also been found in shallow groundwater at concentrations above their respective Part 703.5 class GA standards (5 ppb each).

− Soil

PCE has been found in soil up to 290,000 ppm, well above the soil cleanup objective for unrestricted use (1.3 ppm).

−Soil Vapor and Indoor Air

Concentrations of PCE in soil vapor have been found up to 8,200,000 ug/m^3, and in indoor air up to 170 ug/m^3. Concentrations of TCE in soil vapor have been found up to 32,000 ug/m^3, and in indoor air up to 12 ug/m^3.

Significant Threat:

The site poses a significant environmental threat due to ongoing release of PCE from source areas into soil and groundwater.

ASSESSMENT OF HEALTH PROBLEMS:

Exposure to site−related contamination in drinking water and soil is unlikely since area homes and businesses are supplied with public water and contaminants are below the ground surface. Since the possibility exists for vapors from site−related chemicals to migrate into nearby homes and businesses, soil vapor intrusion sampling will continue in the area and data evaluated as they become available.

SITE OWNER/OPERATOR/REPOSITORY INFORMATION:
None reported

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
The site is an area of groundwater contamination located in the vicinity of 44th Road, east of 21st St. in Long Island City, NY, approximately half a mile from the East River. Site characterization occurred along 44th Road and 44th Avenue (one block north) as well as in the surrounding area, and was performed in an effort to find the source of observed groundwater contamination at the Information Technologies High School, located at 21−16 44th Road.

The topography of the area is generally level and is approximately 15 ft above msl (mean sea level). The area is highly urbanized and generally consists of poured concrete and asphalt pavement. The neighborhood is currently mixed commercial and industrial, with some residential and educational uses.

The site characterization was successful in locating a source area of PCE (perchloroethylene) contamination in the vicinity of 21−03 44th Avenue.

As all future work relative to the groundwater contamination will be addressed under site 241107, site 241112 has been changed from a P−classification to an N−classification.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Investigations conducted during the 2008 site characterization indicated a plume of chlorinated VOCs (primarily PCE)extending from the 21−03 44th Ave. site (site #241107) to the northern edge of the Technology High School one block to the south, and possibly beyond.

Exceedances of standards, criteria, and guidance include PCE at 36,000 ug/l vs. a standard of 5 ug/l and chromium as high as 1,500 ug/l vs. a standard of 50 ug/l. Trichloroethylene, cis− 1,2 ? dichloroethene and vinyl chloride also exceeded standards, however to a lesser degree.

ASSESSMENT OF HEALTH PROBLEMS:
None provided

OWNER(S) DURING DISPOSAL:

OPERATOR(S) DURING DISPOSAL:

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:

The site is located immediately south of, and adjacent to, the building located at 21−03 44th Avenue in Long Island City, Queens, NY.

Site Features:

The site includes the sidewalk/street area immediately above and in the vicinity of a broken sewer line near the location of three groundwater monitoring points placed on the sidewalk in front of the building at 21−03, along 44th Avenue.

Current Zoning/Uses:

The site area is zoned as M1−4, which allows for manufacturing, commercial and certain community uses. In the immediate vicinity of the site, there are manufacturing and commercial businesses. The nearest residential area is approximately four hundred feet south of the site, along 44th Road.

Historical Uses:

Prior uses of the building at 21−03 44th Avenue include metal plating and the painting of radium dials. Light to medium grade manufacturing has been conducted immediately to the north and east of the site for over fifty years, and warehousing and frame manufacturing are conducted to the south. A New York City high school is located approximately three hundred fifty feet to the south of the site.

Contamination appears to have entered the environment from a broken sewer pipe that connects the building at 21−03 44th Avenue and the main sewer line in the street.

Site Geology and Hydrogeology:

Soil at the site consists of historic fill mixed with silty sands to a depth of approximately nineteen feet, with bedrock below this depth. Groundwater is encountered at approximately twelve feet below ground surface, and the flow is generally to the south.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
TETRACHLOROETHYLENE (PCE)	UNKNOWN
CHROMIUM	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Nature and Extent of Contamination:

Investigations conducted during a 2008 site characterization indicated a plume of chlorinated VOCs (primarily PCE) extending from the vicinity of the property at 21−03 44th Avenue to the northern edge of the Technology High School one block to the south, and possibly beyond. Chromium is also present in site groundwater.

Exceedances of standards, criteria, and guidance in groundwater include PCE at 36,000 ug/l vs. a standard of 5 ug/l and chromium as high as 1,500 ug/l vs. a standard of 50 ug/l. Trichloroethylene, cis− 1,2 − dichloroethene and vinyl chloride also exceeded standards, however to a lesser degree.

Significant Threat:
Contamination presents a significant threat to the environment as demonstrated by the magnitude and aerial extent of groundwater impacts.

ASSESSMENT OF HEALTH PROBLEMS:
On− and off−site groundwater is contaminated with lead, chromium, hexavalent chromium and volatile organic compounds, primarily tetrachloroethene (PCE) and its breakdown products. The area is served by public water, thus exposure via ingestion of contaminated groundwater is not expected. Insufficient data exists for complete evaluation of potential exposures to other site−related contamination.

SITE DESCRIPTION:
Location:
The site is located at 21−03 44th Avenue in Long Island City, Queens, NY.

Site Features:

The site primarily consists of the building located at 21−03 44th Avenue, which is currently used as a taxi dispatch and a taxi medallion brokerage.

Current Zoning/Uses:
The site area is zoned as M1−4, which allows for manufacturing, commercial and certain community uses. In the immediate vicinity of the site, there are manufacturing and commercial businesses. The nearest residential area is approximately four hundred feet south of the site, along 44th Road.

Historical Uses:
Prior uses of the building at 21−03 44th Avenue include metal plating and the painting of radium dials. Light to medium grade manufacturing has been conducted immediately to the north and east of the site for over fifty years, and warehousing and frame manufacturing are conducted to the south. A New York City high school is located approximately three hundred fifty feet to the south of the site.

Site Geology and Hydrogeology:
Soil at the site consists of historic fill mixed with silty sands to a depth of approximately nineteen feet, with bedrock below this depth. Groundwater is encountered at approximately twelve feet below ground surface, and the flow is generally to the south.

Entered Brownfield Cleanup Program on February 10, 2014 as C241144.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:
Investigations conducted during a 2008 site characterization indicated a plume of chlorinated VOCs (primarily PCE) extending from the vicinity of the property at 21−03 44th Avenue to the northern edge of the Technology High School one block to the south, and possibly beyond. Chromium is also present in site groundwater.

Exceedances of standards, criteria, and guidance in groundwater include PCE at 36,000 ug/l vs. a standard of 5 ug/l and chromium as high as 1,500 ug/l vs. a standard of 50 ug/l. Trichloroethylene, cis− 1,2 − dichloroethene and vinyl chloride also exceeded standards, however to a lesser degree.

Soil vapors beneath the building have been tested and are well above the NYSDOH guidance levels for PCE.

ASSESSMENT OF HEALTH PROBLEMS:
As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

OWNER(S) DURING DISPOSAL:

OPERATOR(S) DURING DISPOSAL:

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
Location:
The site is located at 43−01 21st Street in Long Island City, Queens, NY.

Site Features:
The site primarily consists of the building located at 43−01 21st Street, which is currently used to house many small businesses, including dental labs, furniture makers, uniform sales and upholstery shops, among others.

Current Zoning/Uses:
The site area is zoned as M1−4, which allows for manufacturing, commercial and certain community uses. In the immediate vicinity of the site, there are manufacturing and commercial businesses. The nearest residential area is approximately flve hundred feet south of the site, along 44th Road.

Historical Uses:
Prior uses of the building include manufacturing of X−ray equipment in the 1930’s, as well as several smaller industries. Light to medium grade manufacturing has been conducted immediately to the south and east of the site for over fifty years. A New York City high school is located approximately four hundred fifty feet to the south of the site.

Site Geology and Hydrogeology:
Soil at the site consists of historic fill mixed with silty sands to a depth of approximately fifteen feet, with bedrock below this depth. Groundwater is encountered at approximately ten feet below ground surface, and the flow is generally to the south.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Nature and Extent of Contamination:
Data collected during the investigation of the 21−03 44th Avenue site RI, located immediately south of the Wills Bbuilding, indicated the Wills building to potentially be a contributing source of VOC contamination to that site.

Wells were placed upgradient of the Wills building, and data from those wells was assessed relative to wells immediately down gradient of the Wills building, but upgradient of the 21−03 44th Avenue site. Results indicate that contamination at the downgradient location is over an order of magnitude greater than the upgradient locations, with PCE contaminant levels as high as 2700 ug/l in the overburden wells (vs. an overburden upgradient value of 190 ug/l), and 23,000 ug/l in the bedrock wells (vs. an upgradient value of 760 ug/l).

Sub−slab and indoor air data was also collected at the Wills building and results are substantially above guidance. Sub−slab PCE levels are as high as 3,700,000 ug/cubic meter; and indoor air showed levels above the NYSDOH matrix values.

ASSESSMENT OF HEALTH PROBLEMS:
As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

PROJECT COMPLETIONS:
None reported

BROOKLYN, NY 11211

NAME: REGION 2 HEADQUARTERS
ADDRESS: 47−40 21ST STREET
LONG ISLAND CITY, NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:
The site is located in the Greenpoint section of Brooklyn in a mixed industrial/commercial/ residential area. The approximately 1 acre site is described on the county tax map as Block No. 2487, Lots No. 1, 10, 12, 72 and 78.

Site Features:
The dimensions of the site are approximately 240 feet by 200 feet. The building consists of a number of smaller buildings that have been joined together. A line of row houses is situated across the street to the south. Commercial buildings are situated directly across the street to the north. To the west is a park and to the northwest is a paved lot which is used for truck storage.

Current Zoning/Use:
The Site zoned M1−2/R6 which designates the site as manufacturing with a residential overlay. It is currently owned by 49 Dupont Realty Corporation and is used for storage of plastic wrapping and resin pellets.

Historical Use:
The site has been in existence since 1887. It has been used for manufacturing, as an office, for storage, and for shipping and receiving. Prior to the late 1940s, the site and the surrounding lots were used as a boiler shop for Logan Ironworks, two stables, a gas and light fixture factory, a sheet metal works, a soap factory, a waterproofing factory, and a scrap metal facility. The subject property was developed for plastic manufacturing purposes in the late 1940s to early 1950s, and has remained relatively unchanged since that time. From 1983 to 2004, NuHart and Company made vinyl siding and sheeting at the site. After 2004, NuHart removed all of their equipment and offices.

There are 12 underground storage tanks (USTs) located on the Site. According to records, these tanks were emptied and closed as part of an Interim Remedial Measure (IRM). There are also two large aboveground silos on site. The Petroleum Bulk Storage (PBS) number is 2−608875, and the Chemical Bulk Storage (CBS) number is 2−000444. Liquid plasticizers stored included bis(2−ethylhexyl)phthalate, bis(2−ethylhexyl)adipate, and palatinol 711P phthalate.

Site Geology and Hydrogeology:
Measurements of the groundwater elevation indicated groundwater flow is generally north and west towards the East River.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY

FLUORENE	UNKNOWN
PHENANTHRENE	UNKNOWN
BENZO(B)FLUORANTHENE	UNKNOWN
Chrysene	UNKNOWN
NAPHTHALENE	UNKNOWN
DIOCTYL PHTHALATE	UNKNOWN
BIS(2−ETHYLHEXYL)PHTHALATE	UNKNOWN
BENZO(A)PYRENE	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:
The plasticizers bis(2−ethylhexyl)phthalate, Di−n−Octyl phthalate, as well as high boiling, paraffinic, petroleum oil have been found in groundwater (both as non−aqueous phase liquid and in the dissolved phase) and in soil.

From 1983 to 2004 NuHart and Company (the tenant) manufactured vinyl siding and sheeting at the factory. After manufacturing ceased in 2004, environmental investigations were performed. The investigations identified soil and groundwater contamination consisting of liquid plasticizers and petroleum. The amount of each material that was released is unknown. Soil concentrations as high as 20,000 ppm of bis(2−ethylhexyl)phthalate were detected in soil boring SB−44. Non−aqueous phase liquid (NAPL) was found at thicknesses of up to 5 feet in one well.

According to the Interim Investigation Report dated April 2010, a large plume of plasticizer NAPL mixture consisting of phthalates and paraffinic petroleum was identified under the western end of the factory where the plasticizer USTs were located. A small plume of NAPL consisting primarily of phthalate was identified beneath Lot 12 near one of the plasticizer tanks. The large plume has migrated off−site in a northwesterly direction under the sidewalk.

Previous interim remedial measures (IRMs) implemented under the spill program involved cleaning the floors of the factory, cleaning out the USTs, cleaning all sumps and pipe gallery wells, installing monitoring wells, and installing NAPL collection wells and recovery equipment. NAPL recovery has been ongoing since 2007. As of December 2008, the total NAPL recovered was 8,356 gallons.

Gauging data from April 2010 indicates the thickness of the NAPL ranges from 0.15 feet to 4.87 feet.

ASSESSMENT OF HEALTH PROBLEMS:
It is unlikely that people will drink contaminated groundwater since the area is provided with public water. It is also unlikely that area residents will come in contact with contaminated soil since it is under the ground surface, however, if the site is redeveloped, construction workers or future site occupants may come in contact with site related contamination in soil if it is not handled properly. Also, the potential for nearby residents and building occupants to breathe site−related contaminants that may migrate into nearby structures via soil vapor intrusion needs to be evaluated.

PROJECT COMPLETIONS:
None reported

43−06 Greenpoint Avenue
Long Island City, NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD: from 1910 to unknown

SITE DESCRIPTION:

Location:
Sunnyside Yard (the Site) is located at 39−29 Honeywell Street, Long Island City, Queens County, New York.

Site Features:
The Site is a railroad maintenance and storage facility that currently encompasses approximately 133 acres. Newtown Creek, which defines the border between Queens and Kings Counties, is located less than 0.5 mile south of the western portion of the Site. The Site is bordered by commercial/residential properties, with Northern Boulevard located to the north, 42nd Place located to the east, Thompson Avenue to the west, and Skillman Avenue located to the south.

Current Zoning/Use:
The Site is located in Manufacturing Zone (M1−1) and used as a railroad maintenance and storage facility

Historic Use:
The Yard was originally constructed in the early 1900's by the Pennsylvania Tunnel and Terminal Company, a subsidiary of Pennsylvania Railroad (later known as the Penn Central Transportation Company). On April 1, 1976, the Consolidated Rail Corporation (Conrail) acquired the Site, and the same day conveyed it to Amtrak, which has continued to operate it as a storage and maintenance facility for railroad rolling stock. Prior to September 29, 1961, a portion of the yard was owned by Long Island Rail Road (LIRR). Today, the LIRR maintains a right−of−way through the Yard. The Long Island Railroad (LIRR) is constructing tunnels through the Yard as part of its East Side Access (ESA) project. An extensive cleanup program was completed in 1996 to remove PCB contaminated sediment from impacted sewer manholes with subsequent sampling to identify sewer segments and manholes with recurring PCB contaminated sediment impacts.

Operable Units:
The site is divided into six operable units. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. The operable units for this site are:

Operable unit 1 (OU1) is the soil above the water table within the footprint of the High Speed Trainset Facility Service and Inspection (HSTF S and I) Building.

Operable unit 2 (OU2) is the soil above the water table within the footprint of the HSTF S and I Building ancillary structures.

Operable unit 3 (OU3) is the soil and separate phase petroleum hydrocarbon accumulation above the water table and soil below the water table within 8 acres in the north central portion of the Site.

Operable unit 4 (OU4) is the soil above the water table (unsaturated zone) at the Site, excluding OU−1, OU−2, and OU−3.

Operable unit 5 (OU5) is the sewer system (water and sediment) beneath the Site.

Operable unit 6 (OU6) is the groundwater and saturated soil beneath the Site.

Site Geology and Hydrology:
Historic fill on the Site is predominantly comprised of reworked glacial deposits (unstratified sand, silt, clay and gravel) and railroad ballast, with lesser amounts of ash, cinders and construction debris. With the exception of paved areas, land occupied by buildings, and vegetated areas, the railroad ballast is ubiquitous at the land surface throughout the Site.

Groundwater beneath the Site occurs in fill deposits, wetlands, or the Upper Pleistocene glacial deposits. The saturated Upper

Pleistocene deposits comprise the Upper Glacial aquifer. The depth to groundwater across the Site varies from one to fifteen feet below ground surface.

Groundwater within the shallow deposits flows predominantly west across the Site. However, groundwater between Queens Boulevard and Honeywell Street flows northerly and northwesterly toward the buried flow path of the Dutch Kills Creek and/or East River. In the deeper deposits, groundwater predominantly flows west across the Site.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:

Prior to Remediation:
Remedial investigations have been conducted in multiple phases under NYSDEC oversight pursuant to the consent order. Seventeen specific areas of concern (AOC) were identified of concern (COCs). The following environmental exposure pathways and ecological risks have been identified for the Site:
* The Site poses an environmental threat associated with the potential impacts of contaminants to groundwater from soils impacted by the COC’s.
* Continued migration of contaminated groundwater from off−site sources poses a potential environmental threat to on−site groundwater. Off−site sources will be addressed by remedial programs for the respective neighboring sites, as appropriate.
* There are no wetlands or other exposure pathways to fish and wildlife receptors in the Site.

Operable Unit 1: Polychlorinated biphenyls (PCBs) were detected in 16 of 19 soil samples; all but one were less than 1 parts per million (ppm). The maximum concentration was 2 ppm. Six semi−volatile organic compounds (SVOCs), specifically carcinogenic polycyclic aromatic hydrocarbons (cPAHs), were detected above Technical and Administrative Guidance Memo (TAGM) 4046 Recommended

Soil Cleanup Objectives (RSCOs) at depths up to three feet below ground surface (bgs). However, there was only one exceedance of the site specific soil cleanup level (SSSCL) of 10 ppm.

Operable Unit 2: The soil above groundwater was sampled at depths up to three feet bgs. PCBs were detected in 15 of the 20 samples at a maximum concentration of 4.5 ppm. The other compounds of concern (COCs), lead and total cPAHs, were also detected at levels below the SSSCLs of 1000 ppm and 25 ppm respectively. Therefore, No Action was selected in the Record of Decision (ROD).

Operable Unit 3:
Surface Soil − The SSSCLs were exceeded for PCBs (2 out of 102 samples); lead (3 out of 3) and cPAHs (2 out of 27). The maximum concentration for PCBs was 73 ppm; for lead it was 1,080 ppm and cPAHs 108 ppm. Additionally, half an acre of visible petroleum contaminated surface soil was delineated at an average depth of one foot bgs.

Subsurface Soil − There were no exceedances of the SSSCLs for the COCs.

Waste Materials − The waste material onsite consists of PCB contaminated petroleum present in: (1) surface soils as mentioned above; (2) a potentially mobile separate phase hydrocarbon (SPH) plume floating over the groundwater surface; (3) a residual SPH trapped in soil pores below the water table; and (4) residues in underground structures. Sixty−five samples of SPH were collected and analyzed for PCBs. The maximum concentration was 360 ppm. SPH and sludge samples taken from underground structures contained PCB concentrations of 512 and 517 ppm respectively.

Operable Unit 4:
Surface Soil − There were exceedances of the SSSCLs for PCBs (60 out of 786 samples); lead (52 out of 471); and cPAHs (31 out of 436). The maximum PCB concentration was 25,000 ppm; cPAH was 113 ppm and lead was 7,020 ppm.

Subsurface Soil − There were exceedances in soil samples for the SSSCLs viz. PCBs (13 of 455); lead (17 of 354) and cPAHs (18 of 376). The maximum PCB concentration was 3500 ppm; lead was 2600 ppm and cPAH was 119 ppm.

Operable Unit 5:
Sewer Sediment − PCBs were detected in 29 samples of sediment from the sewers at concentrations ranging from 0.053 ppm at MH−69 to 120 ppm at MH−6. PCB concentrations at MH−6 (one sample) and MH−38 (two samples) exceeded the 25 ppm NYSDEC−approved site specific soil cleanup level. MH−6 was remediated as an IRM in October 2011.

Sewer Water − Discrete water samples (filtered and unfiltered) were collected from 12 manhole locations and analyzed for PCBs during performance of the OU−5 RI. PCBs were detected in 17 of 39 unfiltered samples with concentrations ranging from 0.14 parts per billion (ppb) to a high of 83 ppb. Five of the unfiltered samples, one from MH−3, three from MH−6 and one from MH−40 exceeded the 1 ppb waste water effluent limit. The waste water effluent limit is appropriate since the sewer discharges to a Waste Water Treatment Plant. Only one of the 39 filtered samples (MH−3) contained PCBs at a concentration (1.8 ppb) slightly exceeding the 1 ppb waste water effluent limit.

Operable Unit 6:
Saturated Subsurface Soil − A total of 159 samples of soil were collected from 29 boring locations. There were no exceedances of the SSSCLs for the COCs.

Groundwater − Three plumes of chlorinated volatile organic compounds (CVOCs) were defined at the site. However, none of these

were attributable to site operations, but are attributable to off−site sources. No site related groundwater contamination of concern was identified.

Post Remediation:

Remediation has been completed in OU−1 where 472 tons of contaminated soil, fill and debris were excavated and disposed of along with 280 cubic yards of concrete and asphalt and 2,450 gallons of liquid. A No Action ROD was issued for OU−2. Remediation has been initiated at OU−3 and OU−4. The OU−5 ROD for cleaning the sewers was issued on March 27, 2011, and the OU−6 ROD (No Action) was issued on March 30, 2010.

ASSESSMENT OF HEALTH PROBLEMS:

Groundwater in the area of the site is not used as a source of potable water. Access to the site is controlled, preventing trespassers from coming in contact with contaminated soils.

ADDRESS: 435 GRAHAM AVENUE
BROOKLYN, NY 11222

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:

The site is located in the Greenpoint and East Williamsburg sections of Brooklyn. The area currently being investigated is bounded by the former Mobil Brooklyn Refinery/current British Petroleum (BP) Terminal to the north along Norman Avenue and Bridgewater Street, Newtown Creek to the east, Lombardy and Withers Streets to the south, and Kingsland (aka Grandparents) Avenue to the west.

Site Features:

The elevated Brooklyn−Queens Expressway (I−278) bisects the site. Residential areas are located in both the northwest and southern portions of the investigation area. The rest of the area is primarily used for both commercial and industrial purposes, and includes a little league ballfield complex.

Current Zoning/Use(s):

The site is zoned for commercial, manufacturing, and residential uses. Buildings where mixed use exists generally have commercial space on the 1st floor, and residential space above.

Historical Use(s):

Initial investigations conducted by the Exxon Mobil Corporation and the New York State DOT between 2005 and 2006 indicated the presence of chlorinated solvents (primarily tetrachloroethene and trichloroethene) in soil, soil gas, and groundwater at several different locations throughout the study area immediately adjacent to the Exxon Mobil petroleum plume. Based on this information, the Department began investigations in 2007 in order to determine the source(s) of this contamination.

To date, four (4) distinct sources of contamination have been identified − Former Spic and Span Cleaners and Dyers (DEC ID No. 224129), Former Klink Cosmo Cleaners (DEC ID No. 224130), ACME Steel/Metal Works (DEC ID No. 224131), and ACME Steel/Brass Foundry (DEC ID No. 224132). All four (4) locations have been listed in the Registry of Inactive Hazardous Waste Disposal Sites as Class 2 sites.

Based on investigations conducted to date, four (4) additional areas of interest exist within the site and will have additional investigation work performed by the Department. These areas are located along the east side of Kingsland Avenue near its intersection with Norman Avenue, along the south side of Bridgewater Street between Varick Street and Meeker Avenue, along the east side of Varick Avenue in between Cherry Street and Lombardy Street, and the area south of Division Place west of Morgan Avenue.

Site Geology and Hydrogeology:

The site is underlain by a fill unit (0.5−11’ thick), and then the following textural units with varying thicknesses throughout the site in descending order − a sandy unit or a silty sand unit (depending on the location), a discontinuous clayey silt unit or a discontinuous glacial till unit (depending on the location), a sand and gravel unit, and the Raritan Formation (located 108−138’ below ground surface).

Groundwater flow direction within the site tends to generally flow towards the northeast, in the direction of Newtown Creek.

Depth to water ranges from 11 − 55’ below ground surface.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:

−Groundwater

Concentrations of tetrachloroethene (PCE), trichloroethene (TCE), cis−1,2−dichloroethene (DCE), and vinyl chloride (VC) have been found well above Part 703.5 class GA standards. Specifically, PCE was found at concentrations up to 120,000 ppb (5 ppb standard), TCE was found at concentrations up to 70,000 ppb (5 ppb standard), DCE was found at concentrations up to 95,000 ppb (5 ppb standard), and VC was found at concentrations up to 3,200 ppb (2 ppb standard).

−Soil

Concentrations of PCE have been found in soil up to 290,000 ppm, well above the soil cleanup objective for unrestricted use (1.3 ppm).

−Soil Vapor and Indoor Air

Concentrations of PCE in soil vapor have been found up to 48,200,000 ug/m^3, and in indoor air up to 170 ug/m^3. Concentrations of TCE have been found in soil vapor up to 230,000 ug/m^3, and in indoor air up to 13 ug/m^3.

ASSESSMENT OF HEALTH PROBLEMS:
As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

4th Floor − cell 516 369−4889/ 9959
Jamaica, NY 11435

Applicant Type: PRP − Non−Registry HazSubs

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
Location: The Arch Street Yard Site is located in an urban area of Long Island City, Queens County, NY. The site is part of an approximately eight acres in size property. This property is owned by the Long Island Rail Road (LIRR).

Site Features: The Site currently houses a train repair facility that is not operational. In addition, several sets of train tracks traverse the site.

Current Zoning/Use(s): The site is zoned for industrial use. The surrounding parcels are currently used for a combination of residential, commercial, light industrial and utility right−of−ways.

Historical Use(s): The site has historically been used as a rail road yard. In December 2003, an LIRR contractor discovered contaminated soil while excavating a utility trench under the 21st Street Bridge at the site. New York State Department of Environmental Conservation (NYSDEC) was notified and Spill No. 0310802 was opened. In April 2004, the LIRR's East Side Access Department (ESA) performed an environmental investigation of the impacted area in an attempt to delineate the extent of the contamination. Based on the results of this investigation, it was determined that the majority of the impacted surface/shallow subsurface soil had been excavated and removed during the utility trenching. However, several contaminants were detected in the groundwater. In 2009, ESA advanced seven groundwater monitoring wells at the site. In 2009, ESA advanced seven groundwater probes throughout the area of concern, in order to further define the extent of the contamination. Further horizontal and vertical delineation of groundwater contamination is required. In September 2011, LIRR requested to add this site to an existing Voluntary Cleanup Agreement (index no. W2−0994−04−04).

Site Geology and Hydrogeology: Soil boring logs from the 2005 investigation identified urban fill consisting of fine sand and silt with some gravel, wood and railroad ties in the upper 5 to 8 feet below grade (bg). Beneath that, to a depth of approximately 12 feet bg, the borings identified wet organic silt with plant fibers. Borings were terminated at 12 feet bg. Groundwater occurs at approximately 8 feet bg.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
METHYL−TERT−BUTYL ETHER (MTBE)	UNKNOWN
TETRACHLOROETHYLENE (PCE)	UNKNOWN

BENZENE	UNKNOWN
VINYL CHLORIDE	UNKNOWN
TRICHLOROETHENE (TCE)	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:

a) Contaminants of concern at the site include tetrachloroethene (PCE), various semi−volatile organic compounds (SVOCs) and metals in soil, and benzene, PCE and trichloroethene (TCE) in groundwater.

b) Areal/depth extent:
Part of the soil contamination was excavated to a depth of 8 feet along the utility line. The groundwater accurs at 8 feet below grade.

c) Concentrations:
The maximum soil concentration of TCE was 6 ppm, and PCE was 89 ppm. The maximum groundwater concentration of TCE is 1,600 ppb, and PCE is 14,000 ppb. The horizontal and vertical extent of the contamination has not been delineated.

ASSESSMENT OF HEALTH PROBLEMS:
None provided

PROJECT COMPLETIONS:
None reported

DAVID KUSHNER
ADDRESS: 380 LEXINGTON AVENUE
NEW ROCHELLE, NY 10168

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:

Location:
The Review Avenue Development I (RAD I) property located at 37−30 Review Avenue, Long Island City, Queens County. This site is 3 acres in size and is northwest and adjacent to the Review Avenue Development II (aka Former Quanta Resources C241005) Site, seperated only by Preston Alley which is a access alley/paper street. The Long Island Railroad tracks boarder the property along the southwest.

Site Features:
The entire site is paved. There are two brick buildings on site. The larger building, refered to as Building #1 is located toward the back of the property near the Long Island Railroad tracks. It has large overhead doors and is a commercial/industrail building. The smaller building, refered to as building # 2, is loacted at the front of the property, on Review Avenue, and is a two story commercial office building.

Current Zoning/Uses:
The site is currently zoned for commercial and industrial uses. The site is currently being leased by a truck repair shop and movie set construction company.

An IRM UST removal was conducted on site in May 2006.

Historic Uses:
The site was used for various industrial purposes dating back to the 19th century. In recent years it has been used truck repair, office space, truck and contracting storage.

Site Geology and Hydrogeology:
The site is underlain by several feet of urban fill. The fill overlies unconsolidated glacial deposits, predominately interbedded fine to course sand with some laterally discontinuous layers of silt and clay. Groundwater occurs at a depth of about 15 to 20 feet below ground surface. The general direction of groundwater flow is to the south−southwest, toward the Newtown Creek. A light non−aqueous phase liquid (LNAPL) is present at the watertable over much of the site.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Nature and Extent of Contamination:
Known or suspected contaminants include: petroleum, Chlorinated solvents, Other VOCs, metal and PCBs and are impacting the soil and groundwater. A light nonaqueous phase liquid (LNAPL) is present above the watertable under most of the site. The LNAPL is a weathered petroleum.

Significant Threat:
The site is not a significant threat site due to the fact that free product LNAPL orignated predominately from the adjacent RAD II site.

ASSESSMENT OF HEALTH PROBLEMS:
Direct contact with contaminants in the soil is unlikely because the site is covered with a building and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Sampling indicates soil vapor intrusion is not a concern for the on−site building based on its current use.

DOCUMENT REPOSITORY(S):
NAME: Queens Library, Long Island City Branch
ADDRESS: 37−44 21 Street
Long Island City, NY 11101

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
Location:
The site is comprised of an entire city block, and is bounded by Jason Avenue to the north, Davis Street to the east, Crane Street to the west and Long Island Railroad tracks to the south in Long Island City, Queens County, New York. It is identified on the local Tax Maps as block 86, Lots: 1, 6, 7, 8, 22 and Block 72, Lot 80.

Site Features:
The site is 2.92 acres in size. It is currently occupied by twelve one− to five−story buildings and two parking lots. Two 550−gallon and one 6000−gallon inactive aboveground storage tank were present in the basement of the building. One 1080 gallon fuel oil tank was also present at the site.

Current Zone/Use:
The general use at the site included clothing manufacturing/distribution, residential, artist spaces, warehouse storage for street vendor carts, and other commercials uses.

Historical Use:
The site was developed around the late 1800's and primarily provided manufacturing, warehousing, and other commercial uses with some residential space at the north end of the block. Occupants included a brass foundry, northeast portion of the block from around 1915, water meter manufacturing, located around the west side of the block from around 1898 up to 1970 with machine shop and independent power plant, utility warehousing, food warehouse, and plumbing warehouse.

Site Geology and Hydrogeology:
Soil at the site consists of a layer of fill material to approximately five feet below grade underlain by layers of fine to medium silty sands and silt. Groundwater is approximately 10 feet below grade surface and flows toward the east−northeast.

CONFIRMED HAZARDOUS WASTE DISPOSED:

TYPE	QUANTITY
CADMIUM	UNKNOWN
LEAD	UNKNOWN
XYLENE (MIXED)	UNKNOWN
COPPER	UNKNOWN
ACETONE	UNKNOWN

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Nature and Extent of Contamination:
Based on investigations conducted to date at the site, known contaminants including volatile organic compounds (VOCs), semi−volatile organic compounds (SVOCs) and metals are present in the subsurface soil.

Soil − Soil sample results from phase II investigation indicated that VOCs (primarily xylene, acetone, and n−propylbenzene) were detected in soil exceeding their respective unrestricted use soil cleanup objective (UUSCOs). Xylene was detected at 0.495 mg/kg, acetone at 0.056 mg/kg, and n−propylbenzene at 11.9 mg/kg in soil sample. Heavy metal detected in soil samples with concentration exceeding UUSCOs included cadmium, chromium, copper, lead, nickel and zinc. Concentration of total lead detected range from 69 ppm to 2090 ppm.

Groundwater − No groundwater data is currently available.

Soil Vapor − No soil vapor data is currently available.

ASSESSMENT OF HEALTH PROBLEMS:
Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

PROJECT COMPLETIONS:
None reported

HAZARDOUS WASTE DISPOSAL PERIOD:

SITE DESCRIPTION:
This facility is being tracked because it once held status as a RCRA interim status facility. DEC is currently evaluating whether there is any need for additional environmental investigation at this facility.

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
Information regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

It has not been determined whether any environmental releases of concern have occurred at this facility.

ASSESSMENT OF HEALTH PROBLEMS:
As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

PROJECT COMPLETIONS:
None reported

HAZARDOUS MATERIAL SPILLS INTRODUCTION

The Hazardous Material Spills in this section are divided into eight spill cause groupings. These include:

Active Spills Section: Spills with incomplete paperwork that may or may not be cleaned up (See Date Cleanup Ceased)

1) Tank Failures
2) Tank Test Failures
3) Unknown Spill Cause or Other Spill Cause Hazardous Spills
4) Miscellanous Spill Causes: Equipment Failure, Human Error, Tank Overfill, Deliberate Spill, Traffic Accidents, Housekeeping, Abandoned Drum, Vandalism and Storms.

Closed Status Spills Section: Spills with completed paperwork that may or may not be cleaned up (See Date Cleanup Ceased)

5) Tank Failures
6) Tank Test Failures
7) Unknown Spill Cause or Other Spill Cause Hazardous Spills
8) Miscellanous Spill Causes: Equipment Failure, Human Error, Tank Overfill, Deliberate Spill, Traffic Accidents, Housekeeping, Abandoned Drum, Vandalism and Storms.

All spills within each spill cause category are presented in order of proximity to the subject site address.

Please note that spills reported within 0.25 mile (or one−eighth mile in New York City) are mapped and profiled.

Between 0.25 mile (or one−eighth mile in New York City) and 0.5 mile, only the following spills are mapped and profiled:

* Tank Failures;

* Tank Test Failures;

* Unknown Spill Cause or Other Spill Cause;

* Spills greater than 100 units of quantity; and

* Spills reported in the NYSDEC Fall 1998 MTBE Survey.

A table at the end of each section presents a listing of reported Miscellanous Spills with less than 100 units located between 0.25 mile (or one−eighth mile in Manhattan) and 0.5 mile. These spills are neither mapped nor profiled.

NO ACTIVE TANK FAILURES IDENTIFIED WITHIN 1/2 MILE SEARCH RADIUS

ACTIVE TANK TEST FAILURES IDENTIFIED WITHIN 1/2 MILE SEARCH RADIUS

Please Note: * − Compass directions can vary substantially for sites located very close to the subject property address.

Caller Remarks:

Line test failure.

DEC Investigator Remarks:

Spoke with Bill.Underground line failed test.Investigation required.(sr)

06/25/12 Rec’d Work Plan to investigate the horizontal and vertical extent of subsurface petroleum impacts.(sr)

08/07/12 LNAPL delineation work completed, summary report will be sent to DEC shortly.(sr)

02/06/13 Remedial Investigation Report in edocs.The site is an active scrap metal recyling facility located at the confluence of Dutch Kills and Newtown Creek.The Dutch Kills is located to the west of the site.Newtown Creek is located to the south of the site, property to the north is rail road track operated by LIRR.The adjoining properties to the east of the site are utilized by others for commercial and or industrial operations.Spill was identified when the pressure test of the underground line failed(AST 150,000 gallon).Leak was identified.Franklin Company disconnected the feed and return line.Integral Engineering performed remedial investigation.Twenty five soil borings and twenty one monitoring wells were installed through out the site.Monitoring wells were installed in soil borings with significant impacts and visible LNAPL at the groundwater interface.Five permanent monitoring wells were installed in phase I.Petroleum impacted soil/fill was observed in SB−6/MW−2 at 7−10 ft bgs in the northern corner of the Site, adjacent to the rip−rap bulkhead along the Dutch Kills Basin.

Three separate plumes of LNAPL are present at the site.Plume A consists of weathered and biodegraded diesel fuel, located to the northwest of AST and west of the underground pipeline trench in the vicinity of MW−1(3.81ft), MW−2(2.28ft), MW−9(0.11 ft), MW−10(0.37 ft), MW−11(0.38ft) and MW−13(2.62ft). Plume A is believed to be downgradient of the source of the diesel fuel release.
Plume B consists of weathered and biodegraded diesel fuel, concentrated in the former pipeline trench, in the vicinity of MW−19(0.12 ft) and MW−20(0.28 ft).Plume B is also appears to be result of an additional segments of corroded and impaired pipings.There are no active sources for Plume A and Plume B as the underground pipelines were removed.
Plume C consists of a more viscous and highly weathered unidentified LNAPL in the vicinity of MW−15(0.50 ft) and MW−16(0.43 ft).
The following wells are identified with no LNAPL and are being used to illustrate the outer limits of Plume A, B and C:MW−3, MW−4, MW−5, MW−6, MW−7, MW−8, MW−12, MW−14, MW−17, MW−18, MW−21.
Ground water was encountered at depth of 5 ft bgs throughout the site.
Recovery effort was performed on Plume A to remove product and monitor for product recharge to evaluate the optimal locations for long term recovery efforts. Plume area A appears to be the greatest available volume of recoverable LNAPL.
The proposed IRM includes installation of recovery wells and electric belt skimmers. Three recovery wells(RW−1, RW−2 and RW−3)were installed in Plume A. Additional recovery wells/belt skimmers setups are anticipated for plume B and C as part of the IRM.

03/01/13 Rec’d email from Kevin Mccarthy(212−962−439x314) regarding Offsite investigation on LIRR proerty.They are checking the issue with their attorney.(sr)

Caller Remarks:

Caller reporting a historical spill. Clean up is pending.

DEC Investigator Remarks:

11/16/10−Hiralkumar Patel.
10:09 AM:− left message for Mimi.

11/22/10−Hiralkumar Patel.
2:00 PM:− left message for Mimi.

3:57 PM:− received call from Mimi. she mentioned that site has a large vacant industrial building. currently, a potential tenant is looking to rent this place and hired Langan for environmental investigation. Langan installed borings around previously abandoned two 5,000 gal #4 oil USTs. during boring work, heavily contaminated soil (with strong petroleum odors/high PID readings/staining) was encountered between 4 to 8 ft depth. Langan installed a temporary well and collected soil, groundwater and soil−vapor sample. ELM Group is working for property owner. Mimi is waiting for lab data from Langan which will probably be available by next week. based on results of recent sampling, ELM group will develope a work plan for complete delineation and remediation.

12/30/10−Hiralkumar Patel.
10:11 AM:− left message for Mimi.
10:18 AM:− left message for Michael.
10:24 AM:− spoke with Mr. Corroon. he owns the property. currently, site has one story warehouse building. Mr. Corroon is renting this place and new tenant will demolish the existing building and redevelop. Mr. Corroon refuse to provide info about future use. asked Mr. Corroon to provide complete contact info of the future tenant. Mr. Corroon mentioned that they owns property for long time and they abandoned two 5,000 gal tanks about 7 years ago. during recent investigation, oily soil found near the boiler at 5−6 ft depth. Mr. Corroon suspects an old drywell in the area. asked Mr. Corroon to submit available reports for environmental investigation.
11:39 AM:− received email from Mr. Corroon. they are still negotiating the lease agreement and will provide futuer tenant’s info, once lease is signed.

01/05/11−Hiralkumar Patel.
10:33 AM:− left message for Mr. Corroon to submit report(s).

01/10/11−Hiralkumar Patel.
12:38 PM:− received message from Mr. Corroon. he will talk to Keith at ELM group and ask to submit documents.

01/20/11−Hiralkumar Patel.
12:52 PM:− received call from Mr. Corroon. he will submit documents by 01/24/11.

01/21/11−Hiralkumar Patel.
3:57 PM:− received call from Mimi. she mentioned that due to confidentiality agreement between the owner and future tenant, they can not release the full langan report, but will include work summary in their report. Mimi mentioned that during field work,

they found high PID, staining and product on tip of 1 inch diameter piezometer installed in boring. but no contamination found in soil or groundwater samples. Mimi will submit report on 01/24/11.

01/25/11−Hiralkumar Patel. received email from Mimi (at 5:40 PM on 01/24/11). she mentioned that owner is reviewing the report and she will send report by tomorrow.
4:16 PM:− received call from Mike from Langan. they did Phase I and Phase II investigations. asked him to submit copies of these reports. he will talk to his client and will send copies, if gets approval.

01/26/11−Hiralkumar Patel.
2:12 PM:− received letter report from Mimi including summary of reports prepared by Langan.
3:14 PM:− sent email to Mimi. asked her to submit complete Phase I and Phase II reports, prepared by Langan, for review.
3:27 PM:− received email from Keith from ELM. they got approval to release Langan's reports and will submit tomorrow.

01/31/11−Hiralkumar Patel.
11:00 AM:− received copy of Phase I and Phase II reports.

abstract of Phase I:
− prepared a Phase I for two properties: 29−01 Borden Ave (Block/Lot: 292/1) and 29−10 Hunters Point Ave (Block/Lot: 292/27)
− Dutch Kills to the west of the property
− Lot 1 is improved with an approx. 172,000 sq. ft. 1−story manufacturing building and Lot 27 is improved with an approx. 161,480 sq. ft. 1−story manufacturing building
− both buildings are vacant
− abandoned, generally east−west oriented railroad tracks are located in an overgrown vegetated area between the buildings
− proposed development will include the demolition of existing structures and the construction of a FedEx warehouse/distribution facility
− proposed design includes a one−story steel frame building with mezzanine level
− a new 132,000 sq. ft. building will be located in the eastern section of the site
− the first floor will consist of a 10−inch concrete slab that will be used primarily for vehicle parking and a partial mezzanine level will be used primarily as office and mechanical shop
− the western section of the site will be paved parking area which extends to the western property line along the Dutch Kills
− Lot 1 was occupied by Radio Engineering Laboratories from 1962−1970, by Warner Lambert Co., Inc−American Chiclet Division from 1977−1986, Waldes Truarc Inc. (a retaining ring manufacturer) in 1991 and Acosta Artdeco (concrete precast facility), Mountain Air Mechanical Inc. (cooling and heating sales and servicing) in 2005
− Lot 27 was occupied by the National Envelope corp. from approx. 1981−2006 <−−−−−−−−−−−
− black staining was observed in the main interior loading dock of the building at Lot 1
− black staining on the wall of the boiler room in building at Lot 27
− the center of the property (an area between two lots) was excavated to construct a basin with access to the Dutch Kills
− the basin was filled in for development purposes between 1900 and 1924
− hazardous waste was generated at the site between 1994−2007
− on RCRA database, the subject property was listed as a large quantity generator in 1994−1996 and a small quantity generator from 2000−2007 in relation to waste generated at National Envelope at 29−10 Hunters Point Ave (Lot 27) <−−−−−−−−−−
− waste types included non−listed ignitable wastes, unknown waste, PCE and silver <−−−−−−−−−
− eight violation related to generation of hazardous waste were issued by US EPA to National Envelope (EPA ID# NYD001344886) between 1998 and 2007 (one on 10/06/1998, three on 05/19/2000 and four on 05/09/2007) <−−−−−−−−−−

− according to USGS maps, the subject property is relatively flat and the surrounding area slopes gently towards the west
− groundwater at the site is approx. 8 ft bg and is presumed to flow west towards teh Dutch Kills
− the subject site was not listed in the drycleaner database; however, one dry cleaner was identified 900 ft east, northeast of the site and is no longer in operation <−−−−−−−−−−
− 1898 Sanborn Map: the subject property is undeveloped; a proposed slip of the Dutch Kills extends through the center of the property
− 1915 Sanborn Map: the subject site unchanged, except that the proposed slip is now labeled a basin
− 1970 Sanborn Map: Lot 1 is improved with a one−story buiding constructed between 1956 and 1957 that is occupied by Radio Engineering Laboratories, Inc.; Lot 27 is improved with a one−story building, including a loft, offices and an electrical appliance warehouse, constructed between 1951 and 1952; the basin connected to the Dutch Kills was filled and the center of the property is occupied by railroad tracks that run east−west and then curve southeast along 30th street <−−−−−−−−
− according to sanborn maps, the basin was apparently filled in the late 1940s for development purposes; however, based on 1924 aerial photograph, the basin was filled some time before 1924
− as per 1962 City Directory, Lot 1 was listed as AmerTran Transformers Division of Radio Engineering Lab <−−−−−−−−−−
− as per 1983 City Directory, Lot 1 was listed as Warner Lambert Company, which is a manufacturer of pharmaceuticals, gum, and candy
− as per 1991 City Directory, Lot 1 was listed as Waldes Truarc Inc. (a retaining ring manufacturer)
− multiple saw cut markings and steel plates observed in both buildings (indicating old sub−surface pits, drainage pit, hydraulic lifts etc.)
− on lot 27, bank of four slop sinks (which is roller wash sink area) is located immediately east of the boiler room at the western extent of the manufacturing floor. sections of piping below the sinks were broken; however, a drain below one of the sinks discharged into a bucket fixed into the concrete floor <−−−−−−−−
− additional slop sink is located, on lot 27, along the northern wall near the center of the building (this sink in area close to ink storage). slop sink drained through a hose into an area below 2 ft by 3 ft metal plate
− the loading dock in Lot 1 contains two approx. 10 ft by 20 ft concrete pads, two 8 inch by 8 inch dry wells, and four steel plates ranging in size from 2 ft by 2 ft to 2 ft by 3 ft in the eastern portion of the loading dock; as per owner’s representative, these area may be related to a decommissioned UST
− two fill ports and two vent pipes were observed along the southern exterior wall of the building on Lot 1
− a fill port and vent pipe were observed along the center of the western exterior wall in the parking lot adjacent to the boiler room in Lot 27

abstract of Phase II:
− groundwater measurements recorded during the Phase II ranged from 6 to 11 ft bg and are likely influenced by tidal fluctuations of the Dutch Kills
− conducted geophysical survey; confirmed location of 20,000 gal UST in western portion of the building on Lot 27 and identified two approx. 5,000 gal USTs in the central southernmost portion of the building on Lot 1
− scattered geophysical anomalies, indicative of unconsolidated soil, were identified throughout the site
− installed 12 soil borings (SB1 through SB12) to depths ranging from 12 to 16 ft bg
− two soil samples were collected per boring, except SB2 where recovery was limited
− soil was observed to be historic urban fill material predominately of brown or grey−brown medium to fine sand with some silt, gravel, brick, wood and concrete
− fill material extended into groundwater, upto 16 ft bg
− petroleum−related odors and staining, residual petroleum in unsaturated soil, and PID readings ranging from 29.1 to 9,999 ppm were identified in boring SB−7 adjacent to the USTs in Lot 1

− heterogeneous fill material included creosote−impacted wood near the center of the subject property (in area of former basin) in borings SB5 and SB6 at depths between 10 and 12 ft bg; PID readings at this interval ranged from 60 to 96.1 ppm in SB5, but no PID readings detected in SB6
− heavy SVOC contamiantion found in sample at 10−12 ft in SB5, at 8−10 ft in SB6, at 6−8 ft in SB7, at 2−4 and 6−8 ft in SB9 and at 2−4 and 8−10 ft in SB10
− each of the 12 borings were converted into 1 inch diameter temporary monitoring wells with 10 ft of screen and groundwater samples were collected
− petroleum related sheen was observed on the groundwater at SB7 <−−−−−−−−−−
− temporary well were not surveyed
− found 530 ppb Naphthalene in groundwater from TMW−5
− eight sub−slab soil vapor samples were collected by drilling 6 inches beyond the floor slab
− ambient air sample was collected in the parking lot of Lot 27 along the Dutch Kills
− PCE contamination not found in samples, but TCE found in eight soil samples from seven borings (out of 12 boring) and two groundwater samples
− reporting limit of TCE and PCE were 260 ppb for soil sample at 6−8 ft bg in SB7 and were 530 ppb for soil sample at 10−12 ft bg in SB5 <−−−−−−−

TCE in soil samples (in ppb):

	SB2	SB3	SB3	SB4	SB5	SB6	SB10	SB11
	2−4 ft	2−4 ft	8−10 ft	8−10 ft	2−4 ft	2−4 ft	8−10 ft	2−4 ft
TCE	3.2	51	5.3	3.6	3.7	5.0	5.7	4.4

TCE in groundwater samples (in ppb):

	TMW2	TMW3
TCE	4.9	1.3

soil−vapor analyticals (in ug/m3)

	SV3	SV5	SV6
Acetone	150	711	32
Benzene	6	9	6
Toluene	103	24	61
1,1,1−Trichloroethene	557	439	738
Chloroform	194	6	1,460
Tetrachloroethene	99	6	291
Trichloroethene	5,880	7	1,790

1. Lot 1: 29−01 Borden Ave:

− alternate addresses for 29−01 Borden Ave (Lot 1): 29−01 to 29−25 Borden Ave, 49−52 to 49−70 30th Street
− PBS #: 2−304263. as per PBS record, site has two 5,000 gal USTs closed−in place. these USTs were installed in Apr. 1957 and closed in July 2006 and were being used to store #4 oil. as per record, these tanks were tested on 01/28/03.

− no other spills found for lot 1.

2. Lot 27: 29−10 Hunters Point Ave
− alternate address: none
− PBS #: 2−311774. as per PBS record, site has one 20,000 gal #2 oil UST in−service. UST installed in Jun 1952 and tested on 05/13/06.
− spills on property: 9604370, 0102148, 0209638 and 0601095
− spill #: 9604370 was reported on 07/01/1996 due to 75 gal #2 oil spill during delivery due to defective gauge. case closed.
− spill #: 0102148 was reported on 05/25/2001 due to tank test failure. case was closed based on passing retest result on 06/11/01.
− spill #: 0209638 was reported on 12/19/2002 by FDNY due to findings of an unknown amount of ink spilled into Dutch Kills. as per DEC Zhao, a drain discharge found into Kills and dye test was planned (either by NYS DLE, NYC DEP or Coast Guard). spill closed.
− spill #: 0601095 was reported on 04/28/2006 due to tank test failure. case was closed based on passing retest result.

3:33 PM:− sent email to Keith at ELM. asked him to send details about violation issued to National Envelope by EPA. email copied to Mike at Langan.

4:10 PM:− received call from Mimi. discussed project with Mimi and Keith. Mimi requested that Langan should not be included on any future correspondence. informed her that Langan was included as they prepared Phase I and Phase II reports, but as Langan works for potential tenant, agreed with Mimi's request. she will contact Langan to get more details aboout EPA violations issued to National Envelope. during discussion, asked Mimi to confirm integrity of the 20,000 gal tank by having tank tightness test (which is due in May 2011). also informed her that the department requires complete delineation of soil and groundwater (if applicable) contamination around the two 5,000 gal USTs in Lot 1, site−specific groundwater flow direction (via installation of minimum of three permanent at least 4 inch wells) and tidal survey. also informed her that if owner choose to remove the previously abandoned 5,000 gal USTs from Lot 1 then the wells may not be needed based on endpoint sample results. asked Mimi to provide following information by 02/11/11:
− details about EPA violation on Lot 27
− schedule for tightness test for 20,000 gal UST on Lot 27
− whether soil/gw investigation or tanks removal on Lot 1

4:38 PM:− received email from Mike from Langan. Mike mentioned that EDR report only indicate about number of violations and its categories and doesn't have any further details. EPA violations were issued for the following categories:
− pre−transport
− preparedness and prevention
− state statute or regulation
− general
− manifest

02/07/11−Hiralkumar Patel.
11:26 AM:− received call from Mimi. she spoke with Mr. Corroon. she mentioned that the 20,000 gal UST will be tested soon to confirm its integrity. she also mentioned that they are planning to do some geoprobes to delineate the contamination and will remediate the area when the exsiting building will be demolished. informed her that if building demolition occurs by end of April 2011 then the Department can wait for remediation at that time, otherwise onwer has to start remediation in May 2011. informed

her that the property owner has to submit written document confirming that the remediation will start by May 2011 (whether building demolished or not). informed Mimi that the new building foundation must not be poured in contaminated zone until remediation is completed or a remedial action plan is approved.

no CBS record found on any lot.

DEC Vought will check haz−waste databases for any record.

2/15/11−Vought−Site also referred to Section A due to concentrations of up to 5880ug/m3 PCE found in soil vapor samples. Site was formerly occupied by National Envelope who left site (and also had documented on−site use of solvents). DEC Spills unit is currently managing investigation and remedation of #6 free product found at on−Site USTs. Owner is currently seeking to sell property to Federal Express so that they may demolish onsite structures and construct new onsite distribution center. A full file review needs to be performed to aid in site classification.

3/9/11−Vought−Meeting with RHWRE to discuss possible tranafer of chlorinated solvent issue to another PM in Section A due to heavy workload.

03/21/11−Hiralkumar Patel.
4:33 PM:− sent email to Mimi inquiring update.

03/22/11−Hiralkumar Patel.
4:29 PM:− received email from Mimi. she mentioned that owner is still discussing about either investigation now or tank removal when building demolition occurs. Mimi will call back by next week with confirmed answer.

04/05/11−Hiralkumar Patel. received email from Mimi (at 6:27 PM on 04/01/11). she mentioned that on−site building will be demolished in 8−9 months and at that point, old UST and associated contamination will be removed.

discussed with DEC Austin about delineation of soil/gw contamination and high PCE/TCE in soil−vapor samples. Austin asked to send email with brief discription about the project for possible transfer to Section A due to PCE/TCE concentration and historical use of chlorinated solvents on site.

2:49 PM:− sent email to DEC Austin with site description.

04/06/11−Hiralkumar Patel.
9:09 AM:− received response from DEC Jane indicating that as no contamination found in soil or groundwater samples, site would not require any further investigation under the superfund program. she mentioned that the department may require investigation if, during future work (petroleum investigation/remediation), any additional data is generated that identifies chlorinated solvents in soil or groundwater.

discussed with DEC Austin. he asked for further investigation regarding chlorinated solvents. he asked to find out location of chlorinated solvent storage, operation, discharge points, drain structures etc. he mentioned that if the property owner doesn’t know about storage/use/discharge location of chlorinated solvents, then the department requires soil/groundwater sampling on both lots with multiple borings/wells.

1:49 PM:− left message for Mimi.
1:51 PM:− left message for Mr. Corroon.
2:09 PM:− sent email Mimi and Mr. Corroon informing that the department requires further investigation of petroleum and chlorinated solvent contamination. asked them to call back to discuss further.
3:48 PM:− received call from Mimi. informed her that as building demolition would occur after 9 months, petroleum remediation would not occur for another year and the department does not agree with this time frame. as such the department requires complete delineation of petroleum contamination.
also discussed about chlorinated solvent issue. Mimi mentioned that the property's insurance company is covering all issues except petroleum so any investigation under the spill number will be paid by property owner. and owner wants to investigate chlorinated solvent issue under other program so they can get coverage from insurance company. Mimi asked to send copy of regulation which allows spills section to require investigation of non−petroleum substance.

discussed with DEC Austin. he mentioned that the department, not the spills section, requires the investigation of chlorinated solvent contamination. he mentioned that if responsible party refuse to do such investigation and inquires about authority of spills section, then case will be referred to legal.

4:18 PM:− left message for Mimi.
4:59 PM:− received message from Mimi.

04/07/11−Hiralkumar Patel.
10:46 AM:− received message from Mr. Corroon.

04/08/11−Hiralkumar Patel.
10:35 AM:− left message for Mimi.

04/11/11−Hiralkumar Patel.
11:57 AM:− received call from Mimi and Keith from ELM. Mimi asked about regulation for PCE investigation. informed Mimi that the department (not the spill section) requires PCE investigation and all DEC rules/regulation applies in this matter. informed her that after getting preliminary data, this case may be transferred to other section. Mimi mentioned that after findings of PCE use on property and PCE concentration in soil vapor samples, they did further investigation to locate locations of chemical storage/process/discharge/drains etc. and now instead of collecting soil samples, they wants to use other technique which reads only halogenated compounds in soil and groundwater during delineation work. this way they don't need to wait for lab results. asked Mimi to submit details about this technique so can be discussed with supervisor.
Mimi also inquired about delineation of petroleum contamination. as discussed earlier, approved Mimi's request for visual delineation via geoprobe and not requiring soil/groundwater sampling as it is #6 oil and expecting to see stained soil if area is contaminated.

04/13/11−Hiralkumar Patel.
9:56 AM:− received message from Mr. Corroon.

04/14/11−Hiralkumar Patel.
2:05 PM:− spoke with Mr. Corroon. informed him about required investigation for petroleum as well as chlorinated solvent. during conversation Mr. Corroon mentioned that currently they don't have any insurance so there is no issue about covering cost of chlorinated spill investigation.

04/22/11−Hiralkumar Patel. received email from Mimi (at 7:16 PM on 04/21/11) including soil vapor contour map. she mentioned that heavy PCE contamination in soil−vapor samples were found on western side in southern lot (Lot 1), but as per Phase I, chlorinated solvent was used in northern building only (Lot 27). Mimi proposed visual observation of both properties, potential geophysical survey on western portion of the two properties and delineation of chlorinated solvent contamination around potential release points. she proposed to collect soil sample with most significant evidence of impact (PID/staining/odor etc.), if present or else collection of soil sample right above the water table. she also proposed collection of groundwater sample if contamination observed in boring.

04/29/11−Hiralkumar Patel. discussed proposed PCE investigation method with DEC Austin. before approving sampling strategy, Austin asked to inspect the site to find out possible PCE release areas (storage/process/discharge/drains/pit/damanged floor/stains etc.).
2:46 PM:− sent email to Mimi and asked her to schedule a site visit with full access to every rooms on property. email copied to Keith and Mr. Corroon.

05/03/11−Hiralkumar Patel. scheduled a site visit at 11 AM tomorrow.
05/04/11−Hiralkumar Patel.
11:00 AM:− visited site. met with Mr. Corroon, Keith (ELM) and Kenny (Midcounty Mechanical). Kenny mentioned that his company was contracted since 1971 to maintain/service electrical/mechanical parts.

Kenny
Midcounty Mechanical
Ph. (347) 386−2891
email: midcountymechanical@verizon.net

Kenny mentioned that the company was primarily making plain envelopes (cutting papers, applying glue and fold it). national envelope was also using three printing machines to print some utility company envelopes. three parallel printing machines were located in central western portion of lot 27 starting with one machine close to western foundation wall and close to 20,000 gal UST. former boring SB1 installed in parking lot, in area on other side of western foundation wall. no contamination found in boring SB1.

as per Kenny, the company was storing ink in about 5−6 55 gal drum. inspected drum storage area, which is located close to former boring SB8. found sewage injection pit not far from the ink storage area. as per Kenny, all the drains inside the building is connected to this sewage injection pit and from this pit, sewage pumped out into city sewer system (pump was needed as city sewer is at higher elevation than pit inside the building). Kenny mentioned that about 6−7 years ago, company changed from oil based ink to water based ink. the former boring SB8 was installed in area between the ink storage and sewage injection pit. as no soil/groundwater/soil−vapor contamination found in SB−08, Keith mentioned that no further investigation is needed in former ink storage area.

also inspected a machine shop where internal machines were being repaired. no sign of spills (odor or stain on concrete) observed in machine shop area.

while discussing about EPA violations, Kenny mentioned that company received EPA violations due to illegal discharge of roller wash waste into city sewer system. inspected roller wash sink area. Kenny mentioned that workers were dumping roller washing

waste into sewer system but was stopped after EPA's violation.

during inspection, found pit in floor and found paper waste into the pit. Kenny mentioned that there was a paper waste compactor located on this pit. there was no use of any chemical in the pit. this pit was found closer to loading area closer to former boring SB2.

inspected area of former 5,000 gal USTs in Lot 1. Kenny mentioned that their company changed from oil to gas heating system. Kenny remembers that both 5,000 gal tanks were cleaned and tested tight prior to abandoning in place. found two concrete pads where old boilers were located. found a dry well pit (0.5 ft by 0.5 ft) adjacent to both boiiler pads. Kenny suspect that oil found in SB7 could be result of oil dumping into two dry well pits. Keith will conduct a geoprobe investigation to delineation petroleum contamination.

based on observations during the site visit, asked Keith to investigate in three areas: area around SB3, roller washing sink and area along the drain structure from the roller wash sink. also suggest him to conduct a soil−vapor delineation starting from SB3. Keith will discuss with his supervisor and submit work plan next week. asked Kenny to submit documents regarding testing of 5,000 gal tanks prior to abandoning.

4:49 PM:− sent email to Kenny and asked him to submit documents regarding cleaning/testing/abandoning of two 5,000 gal USTs in Lot 1. email copied to Keith and Mr. Corroon.

05/19/11−Hiralkumar Patel.
2:03 PM:− spoke with Mimi. they are currently reviewing the work plan and once client approves it, she will submit work plan by 05/23/11.

05/20/11−Hiralkumar Patel.
4:08 PM:− received eamil from Mimi. she hasn't got chance to review the work plan. she will send work plan soon after client's review.

05/24/11−Hiralkumar Patel.
11:06 AM:− spoke with Keith and asked him to submit work plan by 05/31/11.

06/01/11−Hiralkumar Patel. received work plan from Keith (at 1:08 PM on 05/31/11). abstract:
− two 5,000 gal USTs on Lot 1 were closed−in−place on 07/27/06
− as per tanks closing firm, both tanks were pressure tested prior to closure and both tanks passed the test, but no documentation is available
− two drains (or dry wells) were noted within the boiler room slab that appear to connect together with piping
− there is an outflow pipe in one of the drains that leads to an unknown discharge point <−−−−−−−−
− proposes to advance four soil borings to a depth of 12 ft bg, in the boiler room, in the vicinity of fomer boring SB7: one to the east, one to the west, one to the northeast and one to the northwest
− soil samples from borings around SB7 will not be analyzed in a lab

− highest concentration of TCE detected in soil was 55 ppb at 2−4 ft bg in SB3 and in groundwater was 4.9 ppb in TMW2
− two highest concentrations in soil−vapor samples, are located within the lot 1 building
− the vapor concentration gradient increases in the direction of SV3, suggesting that any source for chlorinated solvents might

be west of SV3
− even though several potential release points exist on lot 27, the chlorinated solvent contamination investigation focuses on the western loading dock/parking area in lot 1, west of SV3
− proposes installation of three soil borings in the parking lot to the west of SV3
− two soil samples (one with highest PID and one from six−inch interval above groundwater interface) and one groundwater sample will be collected from each boring in area of former SV3 and samples will be analyzed for chlorinated compounds via EPA method 8260B and 8260C

the submitted work plan is not acceptable as requires investigation in following areas also:
− soil/gw delineation on south side of the former boring SB7
− soil/gw investigation at the discharge point of an outflow pipe from one of the drain (dry well) in boiler room on lot 1 (area near former boring SB7)
− soil/gw (soil−vapor, if possible) delineation at the former roller wash sink and along the drainage structure from the sink

reviewed Phase II lab results again for TCE/PCE values in soil/groundwater samples. PCE contamination not found in samples, but TCE found in eight soil samples from seven borings (out of 12 boring) and two groundwater samples.

TCE in soil samples (in ppb):

	SB2	SB3	SB3	SB4	SB5	SB6	SB10	SB11
	2−4 ft	2−4 ft	8−10 ft	8−10 ft	2−4 ft	2−4 ft	8−10 ft	2−4 ft
TCE	3.2	51	5.3	3.6	3.7	5.0	5.7	4.4

TCE in groundwater samples (in ppb):

	TMW2	TMW3
TCE	4.9	1.3

06/08/11−Hiralkumar Patel. discussed with DEC Austin requesting case transfer to section A due to former on−site ink (which contains chlorinated solvents) use, former EPA violations, improper discharge of a waste water to on−site drains, shallow soil samples with TCE contamination, sub−slab (6 inches below floor) soil−vapor samples contaminated with TCE and PCE. Austin asked for case summary.

06/14/11−Hiralkumar Patel.
11:36 AM:− sent email to DEC Austin with case summary.

DEC Austin discussed case with DEC Paul. as the site was listed as large quantity gnerator of hazardous waste, Austin asked to contact DEC Hussein for further information regarding the site.

06/15/11−Hiralkumar Patel.
1:57 PM:− sent email to DEC Hussein requesting further information regarding RCRA violations and other RCRA issues.

06/21/11−Hiralkumar Patel.
10:37 AM:− spoke with DEC Hussein. he mentioned that there is no open case against National Envelope, but they have large file.

he asked to come and check file for any information.

06/27/11 after discussing with DEC Austin, DEC Hassan and DEC Linda Ross, case transferred to DEC Ross.

7/25/2011−Linda Ross
Meeting at Region 2 headquarters. Sign up sheet is electronicaly filed.

Attendees
Linda Ross−DEC
Paul John−DEC
Keith Brodock, ELM
Robert Corroon, Owner, COO Richard Zirinsky Associates
Michael Bogin, Esq. for Owner
Jordan Barringer, DEC intern
Erick Kraemer, DEC intern
Lou Oliva, Esq. DEC
Hassan Hussein−DEC

Planning to demolish the two buldings and remove the slabs. The buildings were built in the 1950s.

Federal Express (Fed Ex) is planning a sorting facility for the site. Fed Ex wants the facility to be operational by the holiday season 2012. There will be a new building built for the site, with a new slab and a parking garage.

Lot 1−Boiler room−2 4,000 gallon #4 fuel oil tanks which have been closed in place−they passed their last tightness test. Therefore, not sure where the DNAPL in area is from. The DNAPL did not have any analytical exceedances. Might be severely weathered. There are two floor drains in the boiler room. Additional soil sampling is proposed for the boiler room and to delineate the CVOC soil vapor beneath the slab beneath part of the building. The CVOC soil vapor is seperate from the boiler room DNAPL.

Lot 27 (former National Envelope)− There is a 2,000 gallon UST, still in place. DEC discussed that a Closure Plan is necessary for the hazardous waste storage area. Clean closure is required and there needs to be a public notice. Sewer testing is also required for the sewer injection pit since there were discharges to the sewer and possible the sewer injection pit.

Entire Site − Discussed the possiblity of putting a vapor barrier and sub−slab depressurization system in the new Fed Ex building − LR to contact Health Depart and discuss.

Relevant guidance document is CP−51 and for other constituents will use industrial numbers from Part 375.

Demolition and asbestos removal are planned for the end of August.

Agree for site visit for next day at 1:00 pm on site.

7/26/2011 Site visit 1:00 pm

Attendees

Hassan Husssein, DEC−phots taken
Linda Ross, DEC
Bob Corroon, Owner
Keith Bradock, ELM

Walk through the two buildings, first, 29−01 Bordon Avenue and second National Envelope 29−10 Hunters Point Avenue.

First Building (29−01 Bordon Avenue−Lot 1) has a subslab vapor issue that exceeds the NYS Department of Health guidelines. Agreed to collect two soil samples out side of the loading docks near the high vapor reading to determine if there was a relase of VOCs to the soil in this area. The additional requested boring is in the train track area which is heavily treed and it would be difficult to get a rig in for sampling, so a soil sample will be taken below the organic debris with a hand sampling device. This sample will only be analyzed for VOCs to determine the source of the VOC vapor. Looked at the corrosion around the steel beams discussed in Phase I. The cement floor was intact and unstained and so no pathway to soil and groundwater is expected. The boiler room which had the DNAPL with no analytical exceedances was discussed and it was agreed that the two floor drains will be sampled for VOCs and an additional boring will be placed to the north of the floor drains.

Second Building (29−10 Hunters Point Avenue−Lot 27, former National Envelope)needs a closure plan for the hazardous waste storage area. Staining in the hazardous waste storage area. Discussed how the sewer injection pit and the sewer needs to have a leak test to see if there was a release to soil and groundwater on th site. If there is a leak in either the sewer or the sewer injection pit, additional delineation may be required.

8/2/2011 Monthly Internal Progress Report for July 2011 prepared by L.Ross:Internal meeting was held on June 27, 2011 with Kumar Patel and Randy Austin to transfer the site to Linda Ross. This is a spill site that will be redeveloped for a Federal Express facility. Fed Ex will be renting the property. There is a petroleum contaminated area and TCE vapor area. The site needs additional study regarding the sewer system pathway and greater delineation of contamination. On July 5, 2011 the Spills unit contacted the Former National Envelope team to inform them that the new project manager is Linda Ross. A meeting was held on Monday, July 25, 2011 to discuss the site. The meeting notes and signup sheet are listed in the DEC notes and Edoc. OGS, DER and the site owner, consultant and attorney attended the meeting. The topics covered were: introductions, overview of the proposed redevelopment, review of the environmental investigations to date and discussion of proposed work plan. On July 26, 2011 Hassan Hussein and Linda Ross performed a site walkthrough to discuss sampling locations and to see the interiors of the buildings. On July 26, 2011 ELM the site consultant submitted an engineering drawing and a brief discussion of the air exchange. On July 28, 2011 ELM asked questions via email regarding the investigation work plan.

03/20/12−Hiralkumar Patel. DEC Paul and DEC Hussein went to the site for inspection and found free product on water in former heating oil tank location on Lot 1. DEC Paul asked for site visit.
2:00 PM:− visited site with DEC Vought. met with Gregory Wyka from ELM Group. inspected excavation of former heating oil tanks on lot 1. found layer of product on water and impacted soils at the groundwater interface. DEC Paul asked Gregory to report a new spill number based on findings of product on water. informed Gregory that the department requires complete delineation and remediation of petroleum contamination.

Gregory Wyka
The ELM Group

3:51 PM:− a spill report (# 1114115) created as wan't reported by RP yet.

4−27−12 − Hassan Hussein recieved a letter from Dawn Hetrick of NYSDOH regarding vapor intrustion at the Borden Ave site.

5−23−12 − Hassan Hussein received a letter from Michael Burke date 5−23−12 responding to DEC letter of September 16, 2011.

5−23−12 − Hassan Hussein reponded Michael Burke's letter of 5−23−12 in an email correspondence.

6−01−12 − Hassan Hussein received a email from Michael Burke containing another copy of the 5−23−12 letter and additional information on the proposed Stego Wrap vapor barrier. Hassan responded with an email to Mr. Burke explaining that he will review the submitted information and get back to him some time following week. Later the same day, Mr. Burke sent a copy of his email to Dawn Hetrick of NYSDOH. Dawn responded with an email that same day explain the DOH concerns and explained what she will follow up with NYCDEP to get further guidance on the city's review procedure.

6−08−12 − Hassan Hussein completed his review of Michael Burke's 6/1/12 sbumittal. Hassan's alo sent Dawn Hetrick email on 6/8/12 asking her if she has an update. She responded with an update regarding her efforts to contact the city and explained that the approach taken by the company is reasonable.

6−08−12 − Hassan Hussein sent Michael Burke an email approving the proposed approach outlined in his 5/23/12 letter.

10/5/12: Issued letter requiring completion of the second round of delineation proposed in the previously approved 11/17/11 workplan. Subsurface Investigation Report due 11/16/12.

12/11/12 − Carlson: Received phone message from Peter Zimmerman, 212−962−4308, 917−952−9068. He is the new project manager. Progress report to be submitted.

1/15/2013 − Carlson: Left voice message for Peter Zimmerman. Investigation report overdue.

2/1/13 − Carlson: Reviewed letter dated 1/24/13 − only one proposed reinstallation of MW1. DEC requires four wells as per 2011 workplan, left voice message for Peter Zimmerman.

2/4/13 − Carlson: Spoke to Peter Zimmerman, a two part workplan will be submitted, they will mobilize twice, first to reinstall MW−1, and then mobilize again to install delineation wells.

CLEAN UP IN PROGRESS

DEC Investigator Remarks:

12/12/11− Bryan Tiskowtz(Project Environmental Scientist)from Gannett Fleming emailed the following:

Gannett Fleming Engineers & Architects, P.C., is a partner firm of the Shaw / Baker / Gannett Fleming joint venture (JV) that is under contract with the NYC Department of Environmental Protection (NYCDEP) to provide construction management services for upgrades to the Newtown Creek Waste Water Treatment Plant (WWTP) located in Kings County, New York, located at 329 Greenpoint Avenue. During the WWTP improvement process, at times it becomes necessary for the contractors to conduct dewatering operations while excavating soil beneath the regional groundwater table. During the dewatering operations, the JV's staff scientists conduct weekly groundwater monitoring well gauging activities in order to ascertain that the dewatering operations are not contributing to the migration of the existing Exxon Mobil petroleum plume originating from the former Exxon Mobil Terminal located on Kingsland Avenue (I do not have any further information/knowledge regarding this open Exxon Mobil spill case.)

On December 08, 2011, at approximately 15:10, Gannett Fleming's staff had discovered approximately 0.6 feet of an unknown petroleum product within a 4 inch groundwater monitoring well (NCM−9/S), which is located near the southwest corner of N. Henry Street and Greenpoint Avenue. Recoverable product in the monitoring well was removed with a disposable, dedicated bailer, and containerized by the JV on December 9, 2011 at approximately 07:30. Approximately five (5) gallons of an oil/water mixture was evacuated from groundwater monitoring well NCM−9/S. Upon closer observation, the oil/water mixture had a strong cooking oil odor, had congealed, and appeared to contain remnants of food. It should be noted that a fleet of catering vehicles are usually parked approximately twenty−five yards from the monitoring well. A catering truck was observed on December 9, 2011 at 14:40 in front of the monitoring well. Samples of the product were collected and submitted for laboratory analysis.

DISCOVERED IN TANK PULL

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL C"
4/12/04−Vought−Spill transferred from Miller to Rommel as per Rommel.

3/28/05 − also see 8804104. KST

12/29/05 Transferred to E. Hampston via Spills Initative. Wrote letter to owner requesting update/information.

11/02/06 Reassigned to Sun.(MS)

12/18/06 Sun sent letter certified mail to Jean Satoski (LIC Service Station), 49−01 Van Dam Street, on 12/14/06 requiring that the following be submitted to the NYSDEC by 1/14/07:

1. Tank closure assessment report.
2. Locations of tank and/or line test failure.
3. Subsurface investigation report, including current and historical soil and groundwater analysis.
4. Surrounding property sketch: A surrounding property sketch including property layout and usage must be submitted to NYSDEC. North arrow and scale must also be included on the site plan.
If no tank closure report was prepared or no subsurface investigation was conducted before, the Department requires the following be performed and submitted:
1. Submission of a Tank Closure & Site Assessment Including Soil and Groundwater Investigation Results. (JS/MS)

2/27/07: Based on TCR results Sun/Sellberg sent a letter to Alex Javic of LIC Service Station requiring additional investigation be performed, and a report sent to the DEC by 4/13/2007. Letter is as follows:
"The investigation at a minimum must include the installation of soil borings/wells: around the area of the the former nine (9) 550−gallon underground storage tanks. Groundwater monitoring wells should be installed to the south (former location of S6), east (former location of S1) and west (former location of S4) of this area and groundwater flow direction will be determined.

During drilling, the soil must be screened continuously with a PID. The deepest dry soil sample and the sample with the highest PID reading in each boring/well will be sent for EPA Method 8260/8270 analyses and the results will be sent to the Department. Following well installation, a water sample must be obtained and submitted for EPA Method 8260/8270 analyses. Note that MTBE must be included on all soil and groundwater analyses. Prior to drilling activities, all utilities must be located and marked out. A report summarizing the findings of the subsurface investigation including boring logs, soil and groundwater sample analyses, site plan, and conclusions and recommendations must be submitted to the Department by April 13, 2007." (JS/MS)

4/5/07: MS spoke to Jill Haimson of Preferred Environmental (516)647−4211. She will submit a SIWP by 4/16/07. (JS/MS)

4/24/07: DEC received and approved the SIWP. SIR to be submitted by 7/16/07. Sent letter certified mail to RP and faxed same to consultant (Jill Haimson). (JS/MS)

6/6/07: MS called J. Haimson to check status of site investigation. Due to difficulties in obtaining on−site access, work had been delayed. SIR will be submitted later than original timeline.(JS/MS)

6/27/07: Preliminary results (field observations) were discussed by the DEC and the consultant via telephone on June 11th, and again on June 21st, 2007. RP is claiming an upgradient source to be the problem. (JS/MS)

9/21/07: An additional visit was done by the consultant in mid September to better assess surrounding properties as additional investigation is warranted. This investigation will include the evaluation of a suspected up−gradient source which may/may not be contributing to on−site groundwater contamination. (JS/MS)

10/18/07: Upon threat of legal action, Preferred finally submitted SIR (apparently RP had not given consent to submit?). DEC is currently reviewing. Onsite contamination exists in both soil and mainly groundwater across the site. Additional delineation will be necessary as well as possible ORC injection/treatment. (JS/MS)

11/14/07: Alex Javick met with JS and MS today to sign STIP and discuss remedial options. Plan is to start with ORC (iSOCS) − 6months, if not effective use chemical injection. Monitoring will take place quarterly. Submit signed stip to regional director

on 11/15/07. (JS/MS)

11/26/07: STIP executed on 11/16/07 and returned on 11/21/07. Sent copy to owner via mail and consultant via email today. MS to discus remediation details with Jill Haimson of Preferred. (JS/MS)

11/28/07: MS spoke to Jill. She will submit a RAP by 12/7/07 detailing use and placement of iSOCS as well as injection of regen−ox to boost remediation. (JS/MS)

12/17/07: DEC approved RAP as follows:
"...The RAP proposes the application of Regen−Ox (manufactured by Regenesis) to address petroleum related soil and groundwater contamination at the site. In addition, Preferred proposed the installation of In−Situ submerged Oxygen Curtain (inFusionTM/iSOC) probes within four (4) onsite well locations. Pursuant to the Stipulation Agreement signed and dated effective November 16, 2007, the Department requires that within 45 days of the Department's approval of the RAP, Respondent shall implement the work outlined in the RAP. The Department approves the RAP with the following condition:

· Please specify the number, location and spacing between all proposed Regen−Ox injection points."

RP has 45 days from RAP approval to perform the work outlined in the RAP. MS sent letter today to RP and will email Preferred tomorrow regarding injection points follow−up. (JS/MS)

1/17/08: Alex Javick in to meet about remedial systems. Will send STIP to Ms. Jean Satoski once received address from Mr. Javick. (JS/MS)

1/22/08: Stip #2 sent today to Ms Jean Satoski at 84 Gun Club Road, Northport, NY 11768. Signed stip is due by 2/5/08. Added following to original letter to include operator's cooperation and Ms. Satoski's roles as RP:
"Presently, the operator of your station has initiated the required actions to address the above and has been fully cooperating with the Department. However, according to Department records, you are the certified property owner of 49−01 Van Dam Street, LIC, NY 11101 and therefore, also a responsible party."
Signed STIP is due by 2/5/08. (JS/MS)

2/27/08: Received signed Stip from Satoski. Signed by Regional Director, Region 2 (JS/MM)

3/4/08: Sent photocopy of executed Stip to Satoski. Informed J. Hamison from Preferred about executed stip signed by both parties. (JS/MM)

4/17/08: RAP not executed yet. Satoski and Javic have not agreed on payment. Sent out violation of stip letters. Waiting for responses. (JS/MM)

4/22/08: Called Javic, not in office. Expecting phone call today. (JS/MM)

5/18/08: Received already approved RAP from Preferred. (JS/MM)

6/23/08: No info received from Preferred. (JS/MM)

08/11/08: Transferred to Kolleeny/Mandac (JK/MM)

12/12/08: Received Quarterly Groundwater Sampling/Baseline Sample Report from Bill Schlageter of Preffered Environmental dated 11−19−08. Under review. Next sampling event in December 2008. (JK/KG)

12/16/08: RAP implemented.
May 28 and 29, 2008 − 14 wells were installed (4 groundwater monitoring wells, 4 solinst emitter wells, 6 chemical injection wells)
July 24 and 25, 2008 − Regen−Ox injected into 6 injection wells
August 21, 2008 − Solinst Waterloo Oxygen Emmitter Probes were installed in 4 wells
September 8, 2008 − Groundwater samples were collected at MW−1, 2, 3, 4 and IW−1.

Total VOCS:
MW−1 2,192 ug/L, MW−2 11,950 ug/L, MW−3 19,898 ug/L, MW−4 7,963 ug/L, IW−1 3,070 ug/L

IW−6 and E−2 were found to have product, 1.47 ft and 0.04 ft respectively. Wells are checked biweekly for product. If product is encountered it is hand balied. Dissolved oxygen concentrations have increased since oxygen emmitters were installed. Next sampling event is scheduled for December 2008. (JK/KG)

12/18/08: Spoke with Bill Schalageter (Prefferred Env.). I asked him about the well with 1.47 ft of product. He said Alex Javic is still checking the well twice a week. He is bailing the product and disposing of it into the waste oil tank on site. Bill said the product is about an inch to a couple of inches. He will send someone out within the next week to verify how many inches of product are in the well and will send me an email with the details. Based on the amount of product they will need to be more aggressive in removing the product. I suggested a vac truck. I also asked Bill to have the wells surveyed and include GW flow direction, gradient, and scale on the map. (JK/KG)

12/30/08: Spoke with Jill Haimson (Preferred Env.) about product in well. She will talk to Bill and find out if someone went to the site to gauge the product. She will email me the details. If no one went to the site she will have someone go this week. (JK/KG)

01/29/09: Have not received details about product in well or product recovery. Emailed Jill and Bill requesting an update. (JK/KG)

02/02/09: Rec'd following email from Schalageter on 1/29/08.
"Since we spoke, Preferred was out the site twice including a quarterly sampling event conducted January 23, 2009.
During the first visit (January 5, 2009) , approximately eight inches of product was present in well (IW−6), none was detected in any other of the wells. The product was bailed from IW−6 and disposed of, subsequent to bailing, Preferred gauged the wells for twenty minutes and no product recharge was observed.
During the January 23, 2009 sampling event, approximately 4 inches of product was detected in IW−6, again no recharge of product was observed subsequent to removal. No product was detected in any of the other wells on January 23, 2009.
A complete description of monitoring and sampling events will be provided in the Quarterly sampling report to be submitted upon receipt of sampling data.
Please feel free to contact me with any questions or concerns.
Regards,

Bill" (JK/KG)

02/03/09: Responded to Bill, "After talking with Jon, please continue with product recovery on a regular basis. If the amount of product increases or doesn't appear to be decreasing, a more aggressive remedial measure will be necessary. Based on the VOC concentrations in MW−2 and MW−3, further delineation or more injections may be necessary. First, I will need to review the results of the latest sampling event (when they are ready). (JK/KG)

04/14/09: Rec'd pdf of Quarterly Groundwater Sampling Report on 4/13/09; under review. (JK/KG)

04/15/09: Rec'd hardcopy of QMR. Wells were surveyed; groundwater flow direction is to the southwest. Weekly product recovery will continue and the next quarterly event is scheduled for April 2009.

Groundwater on 1/23/09:
MW−1: BTEX − 1,422 ug/L, Total VOCs − 2,533 ug/L, MTBE − 170 ug/L
MW−2: BTEX − 3,590 ug/L, Total VOCs − 4,909 ug/L, MTBE − 180 ug/L
MW−3: BTEX − 15,150 ug/L, Total VOCs − 21,338 ug/L, MTBE − 2,700 ug/L
MW−4: BTEX − 11,174 ug/L, Total VOCs − 21,425 ug/L, MTBE − 1,600 ug/L
IW−1: BTEX − 1,715 ug/L, Total VOCs − 2,739 ug/L, MTBE − 280 ug/L
IW−4: BTEX − 1,652 ug/L, Total VOCs − 2,501 ug/L, MTBE − 200 ug/L
E−4: BTEX − 4,664 ug/L, Total VOCs − 8,201 ug/L, MTBE − 1,700 ug/L (JK/KG)

04/20/09: Spoke to Schlageter on 4/16/09. I asked him to include historical analytical data in future reports. We discussed the product in IW−6; he said it appears to be old gasoline and the station manager is still hand bailing it. The product is being disposed of in the on−site waste oil tank. I told Schlageter that the product can not be disposed of in the waste oil tank. Preferred has gauged the wells since the January sampling event. I asked him to send me the gauging data by Monday (4/20). (JK/KG)

04/28/09: Rec'd March gauging data (in eDocs). On 3/6 product in IW−6 was about 6 inches and on 3/27 it was about 0.25 inches. (JK/KG)

05/04/09: Letters sent to J. Satoski and A. Javik on 4/30/09. A more aggressive approach to product recovery should be implemented by using mobile vacuum extraction. A RAP should also be prepared and submitted. It should propose additional remedial actions, such as another round of RegenOx injections. The next QMR is due 6/19/09. (JK/KG)

05/07/09: Spoke to Mr. Javick, he said he doesn't have the money to pay for the cleanup. He was reminded that he signed the Stipulation Agreement and that a report is due in June. (JK/KG)

06/22/09: Rec'd call from Bill Schlageter. He said quarterly monitoring has not been performed and Mr. Javick is not willing to pay for the cleanup. I called Mr. Javick and he said Ms. Satoski will pay 100%. I then spoke to Ms. Satoski and she confirmed that she has agreed to pay for remediation of the site. She will advise Preferred to proceed with site work once some checks clear in her bank account. Preffered is prepared to submit a supplemental RAP. (JK/KG)

06/23/09: Rec'd Supplemental Remedial Action Work Plan dated 6/23/09 and submitted by Preferred Environmental. Under review. (JK/KG)

06/25/09: Rec'd revised SRAWP dated 6/24/09. SRAWP proposes proposes additional injections of RegenOx into the existing on−site injection wells, monitoring of groundwater field parameters, continued groundwater treatment via in−situ emitter probes, continued quarterly groundwater monitoring, and submission of monitoring reports to NYSDEC. A round of groundwater samples will be collected from monitoring wells MW−1, MW−2, MW−3, and MW−4 prior to the RegenOx injections. If free−phase product is detected in well IW−6, the product will be removed using vacuum−enhanced fluid recovery prior to the injections.

The SRAWP was approved and letters were sent to Satoski and Javick. The deadline for submission of a groundwater monitoring report, with the results of the pre−injection samples from the four on−site monitoring wells, is August 7, 2009. The deadline for submission of a report summarizing the remedial injections and presenting the follow−up quarterly groundwater sampling results is September 25, 2009.

Email for Satoski is williamtaggard@mac.com (JK/KG)

07/20/09: Rec'd the following email from Schlageter:
"We will be conducting the injection this week (Monday−Wednesday) at 49−01 Van Dam Street, LIC. Prior to the injection, the required pre−injection sampling will be conducted from monitoring wells.
Bryan from our office will be on−site and as always, you can contact me or
Jill with any questions.
Thank You,
Bill" (JK/KG)

08/31/09: Spoke to Haimson. She didn't realize a report with the results of the baseline sampling was due 8/7/09. The report will be prepared and submitted next week. (JK/KG)

09/30/09: Follow−up with Preferred as the groundwater monitoring report, with the results of the pre−injection samples from the four on−site monitoring wells, and the report summarizing the remedial injections and presenting the follow−up quarterly groundwater sampling results have not been submitted. (JK/KG)

11/03/2009: This spill case was transferred to A. Doronova. − AD

03/23/2010: Received a pdf copy of Quarterly Monitoring Report for October 2009. DL to eDocs. Will review. AD

07/27/2010: Received an e−mail from Mr. Schlageter:

"Ainura:

As we discussed, attached is the supplemental RAP for the above−referenced project. Please review and contact me to discuss.

Thank you

Bill

William J. Schlageter
Operations Manager/Senior Hydrogeologist"

Will review. AD

08/24/2010: Reviewed the supplemental work plan. It proposes to conduct EFR on a weekly basis for two months period on the site wells exhibiting a free product (wells IW−6 and E−4); to continue employment of 3 out of 4 oxygen emmiters; to conduct monthly monitoring activities; to perform air sparging of aquifer; and once free product has been addressed, to rehabilitate and re−install emmiter probe into E−4 and reconnect oxygen supply to this well. Discussed this work plan with J. Kolleeny of DEC. As it was noted, air sparging method usually combained with SVE to control vapors in unsatutated zone. Since SVE is not proposed here, implementation of air sparging alone is questionable. AD

08/26/2010: Called and spoke with B. Schlageter of Prefferred. Requested to revise the work plan. AD

08/11/2010: Received a pdf copy of the 1st quarter 2010 GW monitoring report. DL the report to eDocs. AD

09/16/2010: Received an e−mail from Bill:

"Ms. Doronova:

As we discussed, attached is the revised Supplement to the Remedial Action for the above−referenced property. The Supplemental action has been revised to omit the mobile air−spare treatment upon your request.

Please review and contact me with any comments. Upon your approval, we will implement the proposed action within one week.

Thank you,

Bill

William J. Schlageter
Operations Manager/Senior Hydrogeologist

Cell: (917) 715−0752
www.preferredenv.com"

DL the work plan to eDocs. Will review. AD

09/17/2010: Reviewed the revised work plan. It proposes to conduct weekly VEFR on two site wells (IW−6 and E−4) which exhibit

free product, for a period of two months. Operation and maintenance of three oxygen emitters at the site will continue on a monthly basis. Preferred also recommends to suspend quarterly GW monitoring for a six months. AD

09/20/2010: Discussed this WP with J. Kolleeny of DEC. AD

09/21/2010: Issued and sent an approval letter to Ms. Joan Satowski with the following comments:

" Although Preferred requests that quarterly groundwater monitoring at the site be suspended for six months, the Department requires that quarterly groundwater monitoring continue;

Following completion of the VEFR events, quarterly groundwater monitoring data should be evaluated. If the results do not indicate significant improvement of groundwater quality at the site, and/or if free product continues to appear in the two affected wells, then an alternative remedial measure should be proposed to DEC."

Dl pdf copy of the letter to eDocs. AD

04/11/2011: Received an e−mail from Bill:

"Ainura:

Attached is the quarterly sampling report for February 2011 for the above−referenced property. The report summarizes activities conducted from November 2010 through February 2011.

Results of the quarterly sampling are favorable − significant reduction of dissolved phase VOCs, however some residual free product remains present within IW−6. The next quarterly sampling is scheduled for May 2011.

Please feel free to contact me with any questions.

Thank you

Bill
William J. Schlageter"

DL the report to eDocs. Will review. AD

06/30/2011: Reviewed the report. It states that on February 2011 sampling, thirteen of the fourteen on−site wells were observed to be free of floating product however, free product was observed in IW−6 during the February 2011 quarterly sampling event (.49 ft). Floating product was also observed during the prior monitoring events in October 2010(.06 ft), November 2010 (.02 ft), and December 2010 (.21 ft). An absorbent pad was installed within IW−6 to address free product. Free product had previously been detected in the E−4 well location, however, product removal activities has successfully mitigated the free product.

Depth to GW water ranged from 6.48 ft. (E−2) to 8.37 ft. (MW−4) bgs. Groundwater flow has historically been determined to have a westerly influence within both northwesterly and south westerly flows historically observed.

A total of seven (MW−1 through MW−4, IW−1, IW−4 and E−4) of the 14 on−site wells were selected for on−site sampling. Gasoline−related VOCs were detected in all of the groundwater samples at concentrations exceeding NYSDEC SGVs. The highest TVOCs was detected in MW−3 (7,625ug/L), which is located crossgradient of the tank farm and downgradient of the Luk Oil Station to the southeast. Concentrations of BTEX detected in groundwater samples ranged from 5,110 ug/L in the MW−3 to 61.5 ug/L in the MW−1 at an upgradient location, MTBE concentrations ranged from 17 ug/L in the IW−1 (crossgradient) location to 1,100 ug/L in the MW−3 location.

Preferred states that TVOCs have dropped across the site by up to 94% and by more than 50% since the implementation of the supplemental remedial action. They report that MTBE concentrations have also significantly decreased across the site and conclude that the RegenOx injection and oxygen emitters are successfully providing mitigation of the gasoline−related impacts.

The next quarterly sampling suppose to be conducted in May of 2011. AD

11/2011: Did not received ane reports. AD

01/12/2012: Called and spoke with B. Schlageter of Preferred. Requested to submit all missing reports for 2011. Later received an e−mail from him saying:

"Ms. Doronova:

As we discussed attached is the report from October. Please note that due to construction at the station property, we were forced to delay the next sampling event sampling until January 2012.

Further, although concentrations continue to decrease, we have identified that there is an off−site contribution to the groundwater impacts − believed to be the Luk Oil property across Gale Avenue (currently AmeriGas ??) − Owner is Leelimits Petroleum.

We are petitioning to drop the sampling to a bi−annual schedule.

Thank you,

Bill"

DL the report to eDocs. Will review. AD

03/09/2012: Reviewed the report. It states that quarterly sampling activities resumed on August 2011 subsequent to the supplemental remedial efforts, which including VEFR activities and continued oxygen injection. The August 2011 quarterly sampling event included the following:

Measurement for floating product;
Measurement of water table elevation, temperature, and dissolved oxygen;
Purging and sampling of four monitoring wells, two injection wells and one emitter well;
Laboratory analysis of seven groundwater samples; and
Preparation of summary report including data summary and a groundwater flow map.

Groundwater flow in August of 2011 was determined to be to the northwest towards Newtown Creek.

During the August 2011 sampling, thirteen (13) of the fourteen (14) on−site wells were observed to be free of floating product however, free product was observed in IW−6 during the February 2011 quarterly sampling event (.50 ft). Floating product was also observed during the prior monitoring events in February 2011 (.49 ft.), October 2010 (.06 ft), November 2010 (.02 ft), and December 2010 (.21 ft). Free product had previously been detected in the E−4 well location, however, product removal activities has successfully mitigated the free product.

A total of seven (MW−1 through MW−4, IW−1, IW−4 and E−4) of the 14 on−site wells were selected for sampling. Gasoline−related VOCs were detected in all of the groundwater samples at concentrations exceeding NYSDEC SGVs. Concentrations of BTEX detected in groundwater samples ranged from 2,129 ug/L in the MW−4 to 54.1 ug/L in the MW−1. MTBE concentrations ranged from 220 ug/L in the MW−2 to 7.1 ug/L in the IW−1 location.

The consultant states that August 2011 groundwater quality data was compared to the historic groundwater data developed for the property. To date since the initiation of remedial activities at the Subject Property, TVOCs have dropped by more than 61% since the last quarterly sampling event in February 2011. BTEX and MTBE concentrations have also significantly decreased across the site. This indicates that the RegenOx injection and oxygen emitters are successfully providing mitigation of the gasoline−related impacts. AD

09/19/2012: Sent an e−mail to B. Schlageter requiring submission of all missing reports. AD

12/2012: Did not receive the reports. Called and left a message. AD

02/2013: Spoke with B. Schlageter regarding reports submission. The property owner is very sick and Preferred did not visited the site for several months. He will get back with the site status update. AD

06/04/2013: Called and spoke with Bill of Preferred regarding this site. The site owner contacted them recently, so they are planning to start groundwater monitoring soon. Bill will look for unsubmitted reports and will give an update. AD

01/17/2014: Called and spoke with B. Schlageter of Preferred Env. No GW monitoring was done at the site since we spoke last time. Site owner was uncooperative. Requested to submit the most recent owner's contact information. Suggested to visit the site, sample all site wells and submit a summary report with conclusions and recommendations for further actions. AD

Spoke to Liam. He is working for the owner, the landlord previously had LAW Enmtl install temp mw in which they found product − no spill reported. Liam will fax owner info and info from previous investigations. I told him to start with the installation of three wells. JMR

6/20/05 Heitzman: Liam Horgan, consultant for owner, reports that monitoring of the site continues and that levels are just above groundwater standards. The site is just downgradient of 32−69 Gale Aveune (Spill #9813012), and some of the contamination may be coming from that site. The next round of sampling is scheduled for late July 2005.

4/12/06 − Results of the July 2005 sampling, if it ever occurred, have not been received.

NEXT STEP: The site is a long term spill that will require on−going monitoring to determine if the ORC injection was successful.

07/14/09: Assigned to Kolleeny/Green.
Consultant is Environmental Liability Management (ELM). ELM stated that a RAP will be submitted for the site and remediation of the site will coincide with the adjacent site (spill no. 9813012).

RobertZ50@aol.com (JK/KG)

08/20/09: Spoke to Keith Brodock about the historical data from the 3 existing monitoring wells. He sent a pdf with VOC concentration graphs for the wells. The last round of groundwater samples were collected in July 2008. Based on the graphs, all 3 wells have VOC concentrations above regulatory standards. (JK/KG)

08/25/09: The remedial action plan proposes in−situ chemical oxidation to address petroleum contamination at the site, and includes collection of a round of groundwater samples to provide baseline data, installation of injection wells, injection of RegenOx, and quarterly groundwater monitoring and reporting. The remedial action plan was not approved. A round of groundwater samples must be collected first, to assess current groundwater conditions. A summary report with conclusions and recommendations is due 10/9/09. The email sent to Brodock is in eDocs.

I spoke to Broddock and told him that if the contaminant plume is not delineated, additional wells/borings will need to be installed. The plume should be delineated prior to proposing remedial action. Broddock sent PDFs of the LAW Gibb Site Assessment dated March 16, 2001, the LAW Gibb Geotechnical Exploration dated March 12, 2001, and the letter from ART to DEC PBS dated April 15, 2002.(eDocs).

Abstract of LAW reports:
Between 2/19 and 2/22/2001 9 borings were conducted at the site. The borings were converted to temporary monitoring wells to monitor the depth to groundwater. Petroleum−like odors were observed during the drilling of boring 8. On 2/27/01 groundwater samples were collected from 4 of the temporary monitoring wells (MW−1B, MW−2B, MW−3B, and MW−8). During GW sampling at MW−8, free−phase product was observed. A soil sample from the drummed drill cuttings from MW−8 was collected and analyzed. Petroleum−related hydrocarbons were detected above regulatory standards in groundwater samples MW−3 and MW−8, and from the MW−8 soil sample. Low levels of petroleum−related hydrocarbons were detected in the MW−2 groundwater sample. (JK/KG)

09/28/09: Rec'd Groundwater Sampling Report dated 9/28/09 and submitted by ELM. Groundwater samples were collected on 8/27/09. GW flow direction is west−southwest. Note: the wells were mislabeled in the ESI/RAP and were corrected after the August sampling. ELM recommends installation of 2 additional monitoring wells in addition to the injection wells proposed in the RAP, collection of soil samples, and collection of a round of GW samples as baseline data. ELM also requests approval of the RAP dated 8/14/09.

Overview of GW sampling:
MW−1: Benzene − 4,800 ug/L, Toluene − 170 ug/L, m&p−xylenes − 710 ug/L, Ethylbenzene − 540 ug/L
MW−2: Benzene − 10,000 ug/L, m&p−xylenes − 370 ug/L, Ethylbenzene − 1,100 ug/L, Napthalene − 980 ug/L
MW−3: 1,2,4−Trimethylbenzene − 2,500 ug/L, total xylenes − 5,400, Toluene − 1,200 ug/L, Ethylbenzene − 2,600 ug/L, Napthalene − 860 ug/L

(JK/KG)

09/29/09: A letter was sent conditionally approving the RAP and the recommendation to install 2 additional monitoring wells. An additional well should be installed at the SE corner of the intersection of Hunters Point Ave. and 32nd Place. If this well is contaminated an additional well should be installed at the SW corner of the intersection of Hunters Point Ave. and 32nd Place. An investigation summary report with the results of the pre−injection soil and groundwater sampling should be submitted by 12/4/09. A remediation summary and first quarterly groundwater monitoring report should be submitted within 30 days of the first quarterly groundwater sampling event. (JK/KG)

11/03/2009: This spill case was transferred to A. Doronova. − AD

12/04/2009: Received a phone call from Mr. Keith Brodock of Environmental Liability Menagement. He asked for a time extension to perform the approved RAP. Told him to submit an official request to DEC. AD

12/08/2009: Received an e−mail from Mr. K. Brodock of ELM saying:

"Ms. Doronova,

With the attached letter, The ELM Group, on behalf of Hunters Point Realty Co., respectfully requests a 60−day extension in order to complete the soil and groundwater sampling and investigation summary report for the above site.

KEITH P. BRODOCK, LEED AP BD+C
Tel 212.962.4301 ext 302 | Fax 212.962.4302 | Cell 646.895.3325"

DL the letter to eDocs. Will discuss the request with J. Kolleeny. AD

12/10/2009: Discussed the extension request with J. Kolleeny of DEC. Will issue an approval letter. AD

12/11/2009: Sent the approval letter to Mr. R. Zirinsky of Hunters Point Realty Co. DL to eDocs. AD

02/03/2010: Received a phone call from Mimi Raygorodetzky of ELM. She said that the investigation report cannot be submitted on time due to payment issues with the client and asked for another time extention for the report submission. I requested to submit a letter request. Will discuss this with J. Kolleeny of DEC. AD

02/11/2010: Issued an approval letter for a deadline extention. Report is due April 13, 2010. AD

03/24/2010: Received an e−mail from M. Raygorodetsky saying:

"Ainura,

As per our conversation yesterday, please find attached a Supplemental Site Investigation Work Plan for the 32−50 Hunters Point Avenue spill site. This Work Plan outlines the proposed FFD sampling within the on−site structure.

Please let me know if you have any questions.

Thanks,

Mimi

MIMI S. RAYGORODETSKY | Associate
Tel 212.962.4301 ext 311 | Fax 212.962.4302 | Cell 917.952.9906"

DL the work plan to eDocs. Reviewed the Supplemental Site Investigation Work Plan, which proposed additional soil investigation in the basement of the on−site building by advancing five to ten soil borings and screening them using a fuel fluorescence detector (FFD) to better delineate the contamination and determine if any remaining soil contamination maybe impacting the

regional groundwater. Discussed the work plan with J. Kolleeny of DEC. Soil and groundwater samples should be collected during this investigation. AD

03/25/2010: Spoke with Mimi regarding sampling for analytical analysis. AD

03/26/2010: Issued an approval letter with some modifications regarding soil and groundwater sampling, and intervals of soil sampling. DL to eDocs. AD

The work plan was approved on March 26, 2010 with some modifications: A summary report will be submitted to DEC. (A. Doronova)

04/09/2010: Received an e−mail from M. Raygorodetsky saying:

"Ainura,

We have been in contact with our FFD contractor, S2C2, regarding scheduling our approved investigation. The earliest they are available is the week of June 7. We are, however, on a wait list in the event that there are any openings in their schedule in advance of that date.

As you may be aware, very few contractors have an FFD probe. And, S2C2 is the only contractor that has it that we are aware of in the tri−state area.

We will keep you appraised of any changes in schedule, if they occur.

Thank you,

Mimi Raygorodetsky

09/07/2010: called and spoke with M. Raygorodetsky regarding site status update info. She will get back with this information till the end of the week. AD

10/07/2010: Still did not receive a response from ELM. Called M. Raygorodetsky and left a message. AD

10/18/2010: Called and left a message to M. Raygorodetsky of ELM. AD

01/04/2011: called and spoke with M. Raygorodetsky regarding implementation of additional investigation. She told me that they re−evaluated their data, and now they are putting together a summary report, which will state that gasoline contamination found in the basement of the on−site building is coming from an off−site source. Asked her to send me an e−mail with a brief update summary. AD

07/12/2011: Received an e−mail from Keith Brodock saying:

"Hi Ainura,

Please find attached the "Site Forensic & Spatial Data Review" for the site located at 32−50 Hunters Point Ave, Long Island City, NY, Spill #00−12739, without Attachment B. Attachment B is the EDR Report and Sanborn Maps, which are too large to email. The full document, including Attachment B, is being FedEx'd to you this evening for delivery tomorrow.

We're available to discuss the contents of this letter at your convenience. Please let me know if you have questions during your review.

KEITH BRODOCK, PE, LEED AP
Tel 212.962.4301 x 302 | Fax 212.962.4302 | Cell 646.895.3325"

AD

07/14/2011: Received the report. DL pdf copy of the submitted report to eDocs. Will review. AD

10/05/2011: Reviewed the report. It states that a forensic analysis of groundwater data collected at the Site indicates that results are inconsistent with any potential release sources at the Site. The ELM Group, on behalf of the property owner, Hunters Point Realty Co., conducted a chemical forensics review of the current and historical analytical data and reviewed a regulatory database report dated November 8, 2010 and Sanborn Maps, both from Environmental Data Resources, Inc. to identify potential off−Site sources of contamination at the Site. The results of this analysis indicate that the dissolved−phase petroleum constituents identified in Site groundwater are not related to petroleum products used at the Site, and likely originated off−Site.

ELM Group states in the report that there are multiple facilities that involve the use, storage, release, generation or disposal of reformate or distillate fuels in the immediate area and upgradient to the Site with respect groundwater flow direction, including a gasoline station, a jet fuel line, active gasoline spill sites, and facilities that used and disposed of ignitable wastes (likely petroleum). Based on the multiple lines of evidence discussed herein, ELM Group have concluded that the VOCs, including gasoline−related constituents, in dissolved−phase groundwater at the Site originated from an off−Site source.

As a result of this analysis, ELM Group concludes that the obligation of the property owner to investigate this release has been satisfied (since the only potential on−Site source has been fully investigated and confirmed to have not released petroleum to the Site's subsurface). The consultant formally requests that this release be closed by the Department.

To discuss this request with J. Kolleeny of DEC. AD

12/13/2011: Discussed the spill closure request with J. Kolleeny of DEC. It was decided that additional data should be submitted to DEC for review. AD

12/14/2011: Sent the following response to K. Brodock of ELM:

"Hi Keith:

The Department has reviewed the Site Forensic & Spatial Data Review Report pertaining to the above−referenced site, submitted by the ELM Group (ELM)on behalf of Hunters Point Realty Co.

The report states that ELM conducted a chemical forensics review of the current and historical analytical data and reviewed a regulatory database report dated November 8, 2010 and Sanborn Maps, both from Environmental Data Resources, Inc. to identify potential off−site sources of contamination at the Site. According to the report, the results of this analysis indicate that the dissolved−phase petroleum constituents identified in the site groundwater are not related to petroleum products used at the Site, and likely originated off−site.

ELM Group states in the report that there are multiple facilities that involve the use, storage, release, generation or disposal of fuels in the immediate area and upgradient to the site with respect to groundwater flow direction, including a gasoline station, a jet fuel line, active gasoline spill sites, and facilities that used and disposed of ignitable wastes (likely petroleum). Based on the multiple lines of evidence discussed herein, ELM Group had concluded that the VOCs, including gasoline−related constituents, in dissolved−phase groundwater at the site originated from an off−site source.

As a result of this analysis, ELM Group concludes that the obligation of the property owner to investigate this release has been satisfied (since the only potential on−Site source has been fully investigated and confirmed to have not released petroleum to the Site’s subsurface) and formally requests that this release be closed by the Department.

Please submit the following documents to assist DEC’s decision regarding a spill case closure request:

1. A complete and readable 5,000−gallon UST Closure Report with end−point soil sampling locations map and soil analytical data;

2. A site plan with locations of all associated active and former tanks;

3. A complete Limited Site Assessment Report prepared by LawGibb Group and dated March 16, 2001, with site plan depicting soil boring locations and with soil and groundwater analytical data and soil boring logs;

4. A Site subsurface investigation report prepared by ART in 2001 for installation of three groundwater monitoring wells with soil boring logs, soil and groundwater analytical data;

5. Information regarding fuel oil supplier’s company (name, address, phone numbers);

6. Historical analytical groundwater tables indicating all detected gasoline and fuel oil related compounds with TVOCs column.

Please submit the required documentation by mail (for each document: one hard copy and PDF copy on a CD).

Also, if ELM is still a consultant for 32−69 Gale Avenue, Long Island City site (NYSDEC Spill No. 9813012), please be aware that a RAR submission is overdue for this site.

Thank you.

Please feel free to contact me if you have any questions or comments.

Sincerely,

Ainura Doronova
Environmental Engineer
Division of Environmental Remediation
NYSDEC Region 2"

AD

11/13/2012: called and left a message for M. Raygorodetzky with a request to submit all required data by December 13, 2012. AD

01/23/2013: Called and left a message to RP − R. Zirinsky and to his consultant K. Brodock. ELM changed name to Integral Consulting with the same phone numbers. AD

07/2013: Called and spoke with K. Brodock of Integral Consulting regarding the site. Will issue a letter to RP. AD

12/17/2013: Called and left a message to Cathy Stafford of Sprint PCS − company which currently occupies the site. Received the response call from Sprint's James Lucci − Sprint EHS North Territories Manager. They are leasing the property. Mr. Lucci will get back to DEC with some info regarding their contract. Called and spoke with Mr. Zirinsky. According to him, Sprint is one who is responsible for the spill cleanup, and they were leasing the site for around 15 years. Will wait for Sprint's response.

2:38 PM − Received call from James Lucci.
Phone: (718)494−0538
e−mail: james.lucci@sprint.com

Requested to verify the Sprint contract responsibilities regarding environmental issues, and start date of the property lease. AD

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "DEMEO"

03/31/05: Transferrd from Demmeo to Tibbe.

11/12/10 − spill re−assigned from Tibbe to Joe O'Connell

07/18/2011 − The spill is reassigned from Joe O'Connell to Linda Ross.

2/23/12 − Raphael Ketani. The Wen−Lar LIRR site spill has been assigned to me. The primary Wen−Lar contact is George Bassil, Director Environmental and Lead Programs, gbassil@mtabt.org. The secondary contact is Pashko Camaj, Manager Environmental and Lead Management, pcamaj@mtabt.org.

5/3/12 − Raphael Ketani. Today I received the Quarterly Monitoring Report for the period February 2012 to April 2012 from Martin Wesolowski of LiRo Engineering Inc. (718) 321−3136, ext 242. I reviewed the report.

The site address is 11−09 to 11−11 Borden Avenue and is situated on 0.91 acres. The site is a triangular area just to the east of where one would enter the Long Island Expressway from Borden Avenue. This area is bounded on the south by Borden Avenue, and is between the L.I.E. entrance on the west and 11th Place on the east. It was originally owned by the LIRR, but was transfered to the MTA B&T. While owned by the LIRR, it was leased from about 1965 to 1992 to Wen−Lar Corporation which ran a gas station. There were 12 550 gal. gas USTs, 1 550 gal. fuel oil UST, 1 550 gal. waste oil UST and 1 4,000 gal. diesel UST.

In 1994, Franklin Company documented a plume that had moved south from the site. In 2000, the LIRR had FPM do a Phase I and a Phase II. Contamination was found around the USTs and around the pump islands. The soil contamination was confined to the site. The groundwater contamination was confined to the site on the north, west and east sides, but had left the site to the south. Low levels of MTBE were detected in an off site well.

FPM had recommended additional off site investigation and excavation at the tanks and the pump islands. Later, they recommended

groundwater treatment with ORC and continued monitoring after excavation.

The MTA B&T leased the site from the LIRR and has a lease until 2016. The site will have an office trailer and a 3 bay garage. The MTA agreed to a supplemental investigation several years ago. The LIRR is aware that they are still a responsible party regarding the remediation of the site.

LiRo Engineering Co. gauged the wells during 11/1/11, 12/14/11, 1/19/12 and 1/20/12. MW−11 had 0.03 feet of product during this quarter. MW−3 and SB−3 were dry. On 1/19/12 to 1/20/12, 8 of the 14 wells were sampled (MW−1, 2, 4, 5, 7, 9, 10, 12). SB−1 and SB−2 had damaged risers, MW−3 and SB−3 were dry, MW−8 was covered by a gravel pile, and MW−11 had product.

During the January 2012 groundwater sampling, the results were non−detect to 6,378 ppb of total VOCs at MW−5. Total VOCs were decreasing at MW−5 over the past 3 quarters. However, total VOCs increased at MW−12 over the past 3 quarters. The rest of the wells showed a decreasing trend when compared to the past quarter or no change. Regarding the total SVOCs, MW−5 had the highest concentrations at 190 ppb while the rest of the samples showed a decrease or no change. In the majority of instances, there were no hits for SVOCs. In addition, the RAP was submitted during this quarter and approved by the DEC.

During the present quarter, gauging was conducted on 2/7/12, 3/21/12, 4/18/12 and on 4/19/12. MW−8 was again inaccessible, SB−1 and SB−2 were destroyed, and MW−3 and SB−3 were dry. MW−11 had 0.02 feet of product. MW−5 also had product in February. Seven of the 14 wells were sampled by LiRo on 4/18/12 and 4/19/12 (MW−2, 4, 5, 7, 9, 10, 12). MW−4, 9 and 10 were analyzed for VOCs only due to slow recharge. Groundwater sampling was not completed MW−3, 8, 11, and SB−1 to SB−3 for the same reasons as the previous quarter (LiRo doesn't state why MW−1 wasn't completed).

Groundwater was sampled on 4/12/12. The total VOCs were 1.8 ppb at MW−7 to 5,820 ppb at MW−5. Benzene was at 2400 ppb in MW−5, with 4 other VOCs from 290 ppb to 990 ppb. Many VOCs were above standards at MW−2, 4, 5, 9, 10 and 12. The results for MW−12 increased compared to last quarter while those from MW−2, 4, 9, and 10 decreased. Total SVOCs were non−detect at MW−12 and MW−7 to 330 ppb at MW−5. MW−5 and MW−2 increased compared to last quarter. While MW−7 and MW−12 were non−detect.

LiRo recommends: discontinuing 8270 testing for SVOCs, except at MW−11, as the they are usually almost entirely non−detect; continued monthly gauging and monitoring; close and seal SB−1 and SB−2.

5/14/12 − Raphael Ketani. The only comments the DEC had regarding the February to April 2012 report is that soil excavation must take place in order to alleviate the groundwater contamination, further groundwater contamination delineation must take place, a groundwater flow map must be submitted and that all future analyses should be compared to CP−51 standards.

I submitted a draft letter to Hassan Hussein, head of the Hazardous Materials Unit, for his review. I set a deadline of June 22 for the submission of a work plan.

5/16/12 − Raphael Ketani. Mr. Hussein approved the letter and it was sent out.

5/18/12 − Raphael Ketani. Mr. Wesolowski of LiRo Engineering (718) 321−3136, ext 242 called me regarding my 5/16/12 letter concerning the Quarterly Monitoring Report and the DEC's request that the site be dug out and that the groundwater contamination be further delineated.

He said that Linda Ross had previously approved the LiRo 12/22/11 RAP in which the tank field excavation, 8% hydrogen peroxide

injection and biological treatment were proposed. He said that Ms. Ross had approved the RAP in a 1/20/12 letter. So he was confused as to why the DEC was changing the approved plan. I told him that there was no record of this RAP in the e−docs. However, I checked the e−docs and found the approval letter. I asked Mr. Wesolowski for a copy of the RAP. He said that he will send it. I also told him that I will talk to my supervisor about the 12/22/11 RAP and about the 1/20/12 approval letter.

I asked Mr. Wesolowski why excavation will take place only in the tank field. He said that an area 30'x40'x15' deep will be excavated. However, it was too expensive to excavate the entire site (about 120' diameter). A wide diameter pumping well will be installed before the soil treatment and any recoverable product will be removed. He said that the total cost for the contract for all of the approved work is over one million dollars. He said that hydrogen peroxide treatment for the rest of the contaminated soil was cheaper. I told him that the hydrogen peroxide may not take care of all of the soil contamination. He said that biological treatment will follow for any residual contamination. I reminded him that even if the soil in the tank field is removed, LiRo has to follow the contamination and dig out more soil and take end point samples. He said that he was aware of this. He added that the contract has already been awarded and work will start in a few weeks. After this, the conversation ended.

Later, Mr. Wesolowski sent me the 12/22/11 Revised RAP. I entered it into the e−docs. I then reviewed the RAP. A pilot test had been performed. It was found that the hydrogen peroxide was reacting too quickly to be effective in the pilot test area. Also, there was a concern that the treatment solution would channel through the soil. So, the full treatment plan was changed so that instead of 10 to 12 foot radius of influence injection sites, the injection sites would be closer together with a 5 foot radius of influence. The post−pilot test injection results for SS−05 and SS−06 showed very high analyte concentrations in the tens to hundreds of thousands of parts per billions of different gasoline analytes. The full remediation plan will involve the removal of 500 tons of contaminated soil from the tank field, the tanks themselves (if they are there) and 20,000 gals. of contaminated groundwater. Following this, there will be 3 rounds of hydrogen peroxide injections. I finished my review and had no comments regarding the Revised RAP.

6/26/12 − Raphael Ketani. Mr. Wesolowski sent me a response letter dated 6/22/12 regarding the comments in the DEC letter dated 5/16/22. In his letter, he stated that the hydrogen peroxide injection plan would be followed, the soil would be dug out in the tank field and the groundwater flow will be further delineated.

I drafted a response letter in which I indicated that the DEC requested that the LIRR forego the solution injection program in favor of excavating the entire site. I added that additional groundwater wells will still need to be installed in order to delineate the groundwater flow. I set a deadline of August 14 for receipt of the revised RAP.

The draft letter was submitted to Mr. Hussein for his approval.

6/27/12 − Raphael Ketani. The letter was approved by Mr. Hussein and was sent out today by e−mail and regular mail.

6/28/12 − Raphael Ketani. Mr. Wesolowski responded by e−mail that the LIRR would not accept the DEC's plan for excavation of the entire site, rather than doing solution treatment injections over most of the site. He said that the money had already been made available for the injection project and the contractor has already been notified that the injections were supposed to start in a few weeks. He asked for a meeting with the DEC and stated that the former DEC case manager, Linda Ross, had previously approved the 12/22/11 Revised Remedial Action Plan − which contained a plan to do site wide injections. So the DEC had to allow the LIRR and LiRo do the injections.

6/29/12 − Raphael Ketani. I reviewed the case file and the 12/22/11 Revised Remedial Action Plan that Ms. Ross had previously

approved. I found the Revised RAP to be grossly deficient with a plan to do site wide solution treatment injections based upon a faulty Pilot Study with invalid results and a poor understanding of the subsurface geologic and geochemical conditions. I wrote a draft rebuttal letter in response to Mr. Wesolowski's 6/28/12 e−mail with an explanation regarding why the DEC found the Revised RAP to be deficient during this review. I ended the letter by again requesting site wide excavation.

The draft letter was submitted to Mr. Hussein for his approval.

Mr. Hussein approved the letter and it was sent out.

7/10/12 − Raphael Ketani. Jan Bellow of GVA, an environmental company, called regarding the site and what had happened with the solution injections. I asked him how he was related to the site. He said that his company and Navilus had bid on the contract to do the injections. However, GVA had concerns about doing injections at the site. He asked whether LiRo was successful in conducting the injections. I told him they were not as the treatment solution had breached the surface in a number of locations. Mr. Bellow said that he was just curious to know what had transpired and the conversation ended.

7/19/12 − Raphael Ketani. Mr. Wesolowski of LiRo Engineering (718) 321−3136, ext 242 had contacted the DEC about having a meeting to discuss the site. I tried to contact him in response, but could only leave a voice mail message stating which days would be good for a meeting.

I made an unannounced site visit. The site is a roughly triangular fenced lot that is covered by weeds and gravel. The site is about 95 feet in length from any side of the triangle to the opposite apex. However, from the drawings in the report, the area to be treated is about 60 feet from edge to apex. The only structues are two billboards. A truck parking and storage area is adjacent to the east of site. I found two sidewalk monitoring wells on the south side of the site. The steel covers did not have bolts to hold them down. There was nothing much else to see.

8/8/12 − Raphael Ketani. I received the Quarterly Monitoring Report, dated 8/7/12, for the period May to July 2012. Groundwater gauging took place on 5/18/12, 6/19/12 and 7/17/12. This quarter, SB−3 and MW−8 were inaccessible, SB−1 and SB−2 were damaged so no samples were taken from these wells. MW−2 had sheen in May. MW−4 had free product − the probe had oil, but the thickness could not be measured. In July, MW−1 was inaccessible and MW−3 was dry. During the quarter, MW−11 had 0.03 feet of product. This well is somewhat downgradient from the tank field. Groundwater was found to vary from 3.5 feet to 17 feet below grade and was flowing to the northwest to the East River. Sampling took place on 7/17/12 and 7/18/12 at MW−2, 4, 5, 7, 9, 10, and 12. Groundwater activities could not be completed at MW−1, 3, 8, 11, and SB−1 to SB−3 for various reasons. Total VOCs varied from non−detect to 1580 ppb. The concentrations in the sample from MW−5 (in the tank field) dropped dramatically from those of the last quarter. Still, there were numerous low single digit to middle triple digit exceedences amongst the samples. SVOCs were not tested for by DEC agreement.

LiRo recommends continued monitoring and sampling.

8/9/12 − Raphael Ketani. The technical meeting took place as scheduled. In attendance were 6 representatives from the MTA, Mr. Wesolowski, Mr. Hussein and myself. The various representatives from the MTA explained that the solution injection work plan (12/22/11 Revised Remedial Action Plan) had previously been approved. They stated that planning for the solution treatment of the site had been going on since 2007 and that the contracts had been established and funded with solution treatment in mind, not excavation. They insisted that the plan of action could not be changed. They said that, previously, they had been working with Mark Tibbe of the DEC and Linda Ross of the DEC. The solution injection program had been approved by them and they were told to

proceed. I pointed out that the 12/22/11 work plan had indicated that the solution had breached the surface in two places, despite the low injection pressure of 15 psi. I added that the plan also included information that the soil was silt and clay. Lastly, I said that this site was not amenable to solution treatment. However, they insisted that solution injection would work. They added that even if they take no action whatsoever, they will still owe the contractor a penalty of 10% of the contract by the end of the 60 day standby period. It had already been 30 days and the standby period would end 30 days from today. They asked that the DEC allow the injection plan to go forward.

In the end, an agreement was reached. The DEC would abide by the previously approved injection work plan. The plan called for 3 rounds of injections. After this, the data and information would be collected and submitted in a final report. However, the DEC asked for a report at the end of each injection round. We also asked that the MTA keep the DEC informed regarding the progress of the program and let our staff know in advance when each injection round will start. Mr. Wesolowski stated that in the event the solution treatments are not successful after the first round, then the MTA will include excavation as an option in any new proposed remedial action. It was also agreed that if the results did not meet the unrestricted standards after conducting the three rounds of treatment, then an alternative remedial work plan will be submitted to the DEC which will include excavation as an alternative. The work plan will also include a feasibility study for the proposed options.

I drafted a letter for the review of Mr. Hussein. In the letter, I indicated that the Department was approving the May to July quarterly report. I also included the details regarding the above approved agreement.

The letter was approved by Mr. Hussein and was sent out today.

11/13/12 − Raphael Ketani. Today, Mr. Wesolowski sent me an e−mail with the 11/13/12 Quarterly Monitoring Report for August 2012 to October 2012. Gauging took place on 8/21, 9/11, and 10/17 to 10/18. During August to October wells SB−3, MW−3, MW−8 were inaccessible for various reasons. Petroleum odors were noticed in wells MW−4 and MW−5. During August MW−11 had 0.01 feet of oil. A light sheen of oil was present in MW−11 during October.

Groundwater sampling took place during October 17 and 18 from 8 of the 14 wells (MW−1, 2, 4, 5, and 9 to 12). MW−2 had several double digit VOC exceedences but no SVOC hits. MW−4 had 190 ppb of benzene and 91 ppb of MTBE with other VOCs as low exceedences but no SVOCs. MW−5 had 2300 ppb benzene, 3 high triple digit VOC exceedences, 7 low to high VOC exceedences but no SVOCs. MW−9 had 240 ppb benzene and 7 low to moderate VOC exceedences but no SVOCs. MW−10 had 200 ppb benzene and 6 low to moderate VOC exceedences, but no SVOCs. MW−11 had 11 high to extremely high VOC exceedences to 12,000 ppb total xylenes and 7 low to moderate SVOC exceedences. MW−12 had 100 ppb benzene and 3 low to moderate VOC exceedences and no SVOCs. Well MW−1 results were almost entirely non−detect. Groundwater flow was due west−northwest.

On October 23, Navillus (using GZA Environmental as the drilling contractor) did 4 borings to 15 feet bgs and 2 temporary wells (GZA−1 and GZA−2) to 21 feet bgs. A radar survey was conducted, but was unable to locate the 12 USTs. On October 24, GZA installed 2 more temporary wells (GZA−3 and GZA−4). These wells had petroleum odors. On October 25, Able Environmental disposed of the drilling cuttings. On October 26, GZA and ADT installed 1 extraction well to 22 feet bgs. Work was stopped on October 30 due to Hurricane Sandy and was scheduled to resume the third week of November. Due to the groundwater results, LiRo recommended continuing monthly gauging and quarterly sampling prior to and after soil remediation.

The August to October 2012 Quarterly Monitoring Report was approved. However, the number of wells that couldn’t be sampled was comparatively high. A draft letter was submitted to Mr. Hussein for his review. In the letter, it was stated that before the next scheduled sampling round, LiRo must work to make all of the necessary repairs to the damaged wells in the monitoring array and

remove all obstructions which are preventing the sampling of the other wells.

11/18/12 − Raphael Ketani. Mr. Wesolowski (718) 321−3136, ext 242 sent me an e−mail stating that the first full round of solution injections will take place starting on 11/26/12. He also attached a two week work schedule pdf to the e−mail. According to the schedule, the tank removal work will be done by Coastal and will start on 11/19/12 and run for 3 days.

11/19/12 − Raphael Ketani. Mr. Hussein approved the letter and it was sent out today.

11/20/12 − Raphael Ketani. I made an unannounced site visit today. I met James Bellew of GZA Environmental, project manager for the solution injection activity only (212) 594−8140/cell (347) 640−2759, Emily Snead of GZA, Scientist II (973) 774−3321/cell (201) 452−8529 and Eva Jakubowska of LiRo Engineers, Inc. (718) 782−0267/cell (718) 986−8399.

Digging had already taken place where the USTs were allegedly buried. However, no tanks were found. A number of 3 inch diameter PVC pipes were sticking up in the former tank area. The stickups and the pit had been filled with bluestone gravel. There was also a 6 inch diameter pipe to the west of the former tank area. Ms. Snead told me that the smaller diameter stickups were injection wells and the large diameter stickup was an extraction well.

A backhoe was present on site. Digging commenced at a location in the eastern third of the property and north of the former tank area. I took pictures. Pieces of dark timber, steel electrical pipes, old roofing shingles and black soil were dug up. The soil had moderate odors of gasoline and hydraulic oil. A foundation was discovered directly below the backhoe. One part was 5 feet thick. Mr. Bellew said that another similar foundation had been discovered in the former tank area. It was late in the day and so the digging stopped when the pit was 13’ by 13’ by 7 feet deep. Mr. Bellew told me that the soil that had been dug up will be covered and removed tomorrow. I told him to be aware of the odors and to use odor suppressant foam if they get stronger. I also told him to make sure the cover is on properly in order to prevent dust from escaping. He said that the cover will be secure and that he has dust and odor detection monitors at three locations around the site. After this, I left the site.

12/13/12 − Raphael Ketani. I spoke to Mr. Bellew (212) 594−8140/cell (347) 640−2759 about progress at the site. He said that the first round of solution injecting started on 11/29/12 and is scheduled to end on 12/14/12. There were a few surface break outs, but they put more bentonite down the annulus of the affected injection wells. The solution did not leave the site.

2/14/13 − Raphael Ketani. I tried to contact Martin Wesolowski at LiRo (718) 321−3136, ext 242 (project manager for the site) regarding progress at the site, but I could only leave a voice message.

2/15/13 − Raphael Ketani. Mr. Wesolowski called to say that the quarterly progess report for the site will be submitted next week and the full remediation report will be submitted during the second week in March.

3/14/13 − Raphael Ketani. I received the fourth quarter 2012 post soil treatment and groundwater monitoring report dated 2/26/13 for the period November 2012 to January 2013. Between 11/1312 and 11/21/12, excavating took place in order to locate the USTs. However, they were never found. About 425 cu. yds. of contaminated soil was removed. From 11/27/12 to 12/14/12, GZA, Zebra Environmental and Environmental Remediation and Financial Services, LLC conducted the first round of hydrogen peroxide injections. Eighteen thousand gallons of treatment solution with an iron catalyst was injected. On 1/16/13 and 1/17/13, the first round of soil confirmatory sampling and groundwater sampling took place.

On 1/17/13, 11 of the 18 wells were sampled. Wells MW−3, MW−8, SB−1 and SB−2 were not sampled due to being inaccessible or

damaged. MW−11 was not sampled, but it is not explained why in the report. The groundwater level was found to be at −9.58 feet to +3.00 feet bgs. Flow was determined to be to the northwest. Only VOCs were tested for. The results for the samples from MW−1 and MW−7 were completely non−detect. The results for the samples from MW−2, MW−10, MW−12 and GZA−1 were almost entirely non−detect. MW−9 had 7 low hits and the rest were non−detect. MW−5R, GZA−3 and GZA−4 had some moderate hits and up to 3 high hits to 420 ppb. MW−4R had 7 high hits to 2070 ppb.

LiRo recommends abandoning wells SB−1 to SB−3, MW−3 and MW−8 as they are dry, damaged or inaccessible and as other wells can be substituted for them in their respective areas. They also recommend monthly monitoring and quarterly sampling.

I finished my review and indicated that I had approved the report and the recommendations contained therein via an e−mail response.

Later, Mr. Wesolowski responded by e−mail that well MW−11 was damaged during the excavating and will be replaced.

4/2/13 − Raphael Ketani. I reviewed the 3/22/13 In Situ Chemical Oxidation Data Validation Report which was submitted by LiRo Engineers. This report included the GZA 2/25/13 Fenton's Injection Summary Report and the GZA 2/26/13 Revised Excavation and Underground Storage Tank Closure Report. The GZA reports were also reviewed at the same time.

An 8% hydrogen peroxide solution with soluble iron and a phosphoric solution was injected into 60 temporary wells each of which was separated by 10 foot centers. The depths of injection were from 4 to 20 feet bgs. The injections took place from 11/29/12 to 12/14/12. Post injection soil samples were collected from 10 locations (PR−1 to PR−10) during 1/16/13 to 1/17/13. Post injection groundwater samples were collected on 1/17/12 from 11 wells (GZA−1, GZA−3, MW−1, MW−2, MW−4R, MW−5R, MW−7, MW−9, MW−10 and MW−12).

The GPR survey didn't find any USTs, but found a concrete slab which was 5 feet below grade on the east side of the site. The slab was removed and the excavation was continued to 17 feet bgs. A fuel line was discovered along the southern edge of the site (just south of the former tank mat) and was removed. During the excavating, product was found associated with the pea gravel in the north side wall. Therefore, the size of the excavation was increased northward to investigate the free product. Post excavations sidewall samples REP−1 to REP−4 were collected at 8 feet down and bottom sample REP−5 was collected at 15 feet down. Breakouts of the treatment solution occurred at IP−14, IP−15, IP−33, IP−34, IP−42 and IP−52.

Post injection soil results show a reduction in the VOC concentrations, but there still were many results above the CP−51 unrestricted standards. Ten post injection groundwater samples were collected. In general, the groundwater results showed a decrease in the VOC concentrations across the site, but there were many hits above the TOGS 1.1.1 standards.

LiRo recommends that another round of solution injections take place. The injection levels would be changed to 6 to 20 feet below grade. The injections along the Borden Avenue sidewalk would take place at 10 to 20 feet bgs under gravity flow. The volume of iron sulfate would be increased from 25 to 50 gals. per injection and a 1% phosphoric solution would be added.

Of the results for the tank soil excavation end points, those for REP−1, REP−3 to REP−5 had very low VOC hits. The results for REP−2 at the eastern edge of the former tank mat had very high exceedences to 200,000 ppb. Regarding the SVOC results, those for REP−1 to REP−4 had very high exceedences. However, the SVOC results for REP−5 were all non−detect.

For the post remediation confirmatory soil sampling results, PR−1A (shallow) to PR−2B (deep), PR−3B, PR−4B, PR−5B, PR−7A&B, PR−8B and PR−9B were mostly non−detect with a few high hits. The results for the samples from PR−3A, PR−4A, PR−5A, PR−6A&B, PR−8A,

PR−9A and PR−10A&B were mostly high exceedences to 920,000 ppb. With respect to the SVOC results, PR−1A to PR−2B, PR−3B, PR−4B, PR−5B to PR−7B, PR−8B, PR−9B and PR−10B were all non−detect to low hits. PR−3A, PR−4A, PR−5A, PR−8A, PR−9A and PR−10A were mostly high exceedences.

The groundwater results for VOCs for MW−1, MW−2, MW−7, MW−9, MW−10, MW−12 and GZA−1 were mostly non−detect with a few low hits. MW−4R, MW−5R, GZA−3 and GZA−4 had a few to many high VOC exceedences to 2070 ppb. Not all of the samples were analyzed for SVOCs. However, where the sample was analyzed, the results were non−detect, except for the one from MW−2 which had a few high benzo series exceedences to 2.8 ppb.

Figure 2: the east edge of the former UST mat (REP−2), the area south of the mat (PR−9 and PR−10), the northeast part of the site (PR−4) and the central area (PR−3, PR−5, PR−6, PR−8) all still had high soil contamination after the treatment solution injections.

Figure 3: wells MW−4R, MW−5R and GZA−3 in the vicinity of the main soil contamination area had high VOC exceedences. GZA−4, which is on the western edge and downgradient to the soil contamination area, also had high exceedences.

In light of the information in the documents, I drafted a letter for the review of Mr. Hussein in which I approved a second round of solution injections and directed the MTA to treat the soil under the northeast, central and southern parts of the site as depicted in the DEC revised Figure 2. The letter was submitted to Mr. Hussein for his approval.

4/9/13 − Raphael Ketani. Mr. Hussein approved the letter with a deadline of May 31, 2013 for submission of the second round solution injections work plan.

4/12/13 − Raphael Ketani. Mr. Wesolowski (718) 321−3136, ext 242 sent me the 4/11/13 work plan for conducting the second round of solution injections. This will be a focused round whereby the injections will take place in the northeastern, central and southern areas of the site as requested by DEC. Monitoring wells MW−2, MW−4R, MW−10 and MW−11 will be used to monitor the reactions of the solutions with the contaminants. About 18,000 gals. of solution will be injected. The solution will consist of an 8% solution of hydrogen peroxide with a ferrous iron catalyst. There will be 51 injections, each receiving 353 gals. of solution. The second round of injections will take 3 weeks to complete. Performance soil sampling will take place 30 days after the injections at 10 locations and will involve the taking of 20 samples. The sample collecting will vary in depth down to 20 feet bgs. The samples will be tested via methods 8260 and 8270.

I found the plan to be acceptable and sent an e−mail to Mr. Wesolowski to proceed with the injections.

5/10/13 − Raphael Ketani. Today I received the LiRo 5/10/13 Quarterly Monitoring Report for the period February 2013 to April 2013. On 4/10/13, LiRo did monthly gauging. Wells GZA−2, MW−3 and MW−8 were not gauged due to being dry or an obstruction preventing access. MW−11 was found to be occluded due to the previous injections, but was reopened on 4/10/13. Product was not present in any of the wells during the 3 gauging events. On 4/11/13, groundwater was collected from 11 of the 15 available wells. These wells were MW−1, MW−2, MW−5R, MW−7, MW−9 to MW−12, GZA−3, GZA−4 and RW−1. The total VOC results varied up to 37,410 ppb at MW−11. The total VOCs increased from the results of the previous quarter in wells MW−2, MW−10 to MW−12 and GZA−4. The total VOC results decreased from the results of the previous quarter in wells MW−5R, MW−9 and GXZA−3. There were numerous analyte exceedences in the samples from wells MW−9, GZA−4 and RW−1. The results for MW−1 and MW−7 were within historical values. MW−4R, GZA−1 and GZA−2 were dry during this sampling round. Samples could not be taken from MW−3, MW−8, SB−1 to SB−3 due to either obstructions or damage. On 4/11/13, MW−3 was abandoned, but MW−8, SB−1 to SB−3 could not be abandoned either due to damage to the

wells, inability to locate the wells or because of obstructions. From 4/15 to 4/26, the second round of hydrogen peroxide injections took place. About 18,000 gals. of 8% hydrogen peroxide was injected. Confirmatory soil and groundwater sampling took place during 5/29 to 5/31. The ISCO Second Round Injection Summary Report will be submitted during July 2013. LiRo recommends monthly gauging and quarterly groundwater sampling.

The April 2013 VOC results for MW−11 were very high with many analytes in the thousands of parts per billion. Total xylenes were 18,000 ppb. GZA−4 was non−detect to 2 digit hits and 2 three digit hits. The results for MW−2, MW−5R, MW−10, MW−12 and RW−1 were generally mostly non−detect to low hits with up to several moderate double digit hits. The results for MW−1, MW−7 MW−9 and GZA−3 were from completely non−detect to almost entirely non−detect with just a couple of very low hits.

I approved the report, but had some comments. First, another hydrogen peroxide injection should take place at MW−11. Also, a well should be installed at the former location of MW−4 as this well had high total VOCs in the past. The location of MW−4R is not in the same location and the well is dry. LiRo should monitor wells MW−2, MW−12, GZA−4 and RW−1 and see whether the analyte concentrations drop significantly over time. If they don't, then LiRo should conduct VEFR events. Wells MW−8, SB−1 to SB−3 must be found and abandoned properly even if this means moving any obstructions. Otherwise, contaminants may enter the subsurface. MTA Bridges and Tunnels is legally responsible for the abandonment of the wells.

I sent an e−mail to Mr. Wesolowski with the above comments.

6/13/13 − Raphael Ketani. I tried to reach Mr. Wesolowski (718) 321−3136, ext 242 by phone regarding progress at the site. However, I could only leave a voice message. I also sent him an e−mail requesting a progress update.

Later, Mr. Wesolowski sent me an e−mail stating that the second round solution injections took place from 4/15/13 to 4/26/13. Soil and groundwater confirmatory sampling took place from 5/22/13 to 5/24/13. The second round injections report will be submitted during July 2013.

8/26/13 − Raphael Ketani. As there have been no updates since Mr. Wesolowski's last e−mail on June 13, 2013, and as the second round injections results report has not been submitted, I sent Mr. Wesolowski and e−mail requesting an update and the results report.

8/27/13 − Raphael Ketani. Mr. Wesolowski sent me an e−mail stating that the next results report will be submitted on September 6, 2013. The remediation of the site will resume at the end of September.

9/13/13 − Raphael Ketani. I reviewed the In Situ Chemical Oxidation Data Evaluation Round 2 report dated 9/9/13. This report also contained the GZA 7/3/13 Fenton's Reagent Injection Summary Report. An 8% hydrogen peroxide solution with the catalyst ferrous sulfate heptahydrate was injected on 4/15/13 and on 4/24/13 at 51 temporary injection points. Confirmatory soil samples were collected on 5/22/13 and on 5/23/13. Groundwater samples were collected on 5/22/13 from 8 monitoring wells. Groundwater was also collected on 7/23/13 and on 7/24/13 for the third quarter groundwater sampling event. There were surface breakouts of the treatment solution at many locations on site and in the street where the sidewalk curb met the asphalt. The road was closed temporarily due to the street breakout. The treatment solution was diluted with water and vacuumed up.

The groundwater results remained relatively unchanged from round one. The second round of injections had minimal impact. As a result of the limited effectiveness of the second round of injections, LiRo recommends the vacuuming of the contaminated groundwater from the locations where the analytical concentrations are above standards. This would be done twice a week for 4

weeks. After this, the results will be reviewed and the best remedial approach will be determined. LiRo also recommends doing two test pits on site. One where the previously unknow pipe was found and one where the former building foundation was found in the central part of the site. This would be done in order to determine whether there is additional soil contamination present.
Lastly, it is recommended that shallow soil excavation take place to 10 feet below grade in order to remove the most contaminated soil which could not be effectively treated.

Significant soil confirmatory sampling VOC results for 5/22/13:
PR−3C (17.5'− 18.5') = 6 exceedences of CP−51 unrestricted standards to 6800 ppb
PR−4A (6'− 8') = 10 very high exceedences of standards to 95,000 ppb
PR−4C (17'− 18') = several very high exceedences
PR−5A (6'− 8') = 10 very high exceedences to 520,000 ppb
PR−5B (19'−20') = several high exceedences
PR−6B (6'− 8') = a few very high exceedences
PR−7A (6'− 8') = a few moderate exceedences
PR−7B (19'− 20') = a couple of high exceedences
PR−8A (6'− 8') = 10 exceedences to 1,100,000 ppb and 3 analytes above 100,000 ppb
PR−9A (6'− 8') = a few moderate exceedences
PR−10A (6'− 8') = 8 very high exceedences to 100,000 ppb

The confirmatory sampling results for the SVOCs were either completely non−detect in the sample or had all low hits generally at or below the standards. However, in some instances, SVOCs were not tested for.

Regarding the groundwater sampling results for the 5/22/13 round of samples, RW−1, MW−5R−A, Duplicate of MW−5R−A, MW−4R had many high VOC exceedences of the TOGS 1.1.1 standards. GZA−4, MW−2A, GZA−3 and MW−10 had many low VOC exceedences. The SVOC results were mostly non−detect or below the standards.

Third quarter groundwater sampling took place on 7/23/13 and 7/24/13 for the wells in the array that were still intact. MW−1 was completely non−detect. MW−2 had 6 very low exceedences. MW−5R had 8 high VOC exceedences of the TOGS standards. MW−7 was completely non−detect. MW−9 had 7 very low to low exceedences. MW−10 had 1 high exceedence and 8 other low exceedences. GZA−3 had 3 low exceedences. GZA−4 had 1 very low exceedence. RW−1 had 5 low exceedences. MW−12 had 1 high exceedence and 8 low exceedences.

I found the report to be acceptable and approved of the recommendations contained in the report. However, I determined that there was still very high shallow soil contamination at PR−7A, PR−9A and PR−10A that needed to be excavated and also deep contamination that needed to be removed at PR−4C, PR−5B and PR−7B.

I drafted a letter for the approval of Mr. Hussein in which I approved the report and the recommendations contained therein, but also required the excavation of the contamination at the above listed additional locations. They must also follow the soil contamination and remove it until the remaining contamination is at or below the unrestricted residential standards. Then end point samples must be taken. I also warned LiRo that all spills, whether they are oil, chemicals or treatment solutions, must be reported as a spill to the DEC. Otherwise, this is a violation of Article 12 of the Navigation Law, Section 173 − Causing a Spill, and Section 175 − Failure to Report a Spill. Such violations are subject to fines of $37,500 per day per violation.

9/16/13 − Raphael Ketani. Mr. Hussein approved the letter and it was sent out.

10/23/13 − Raphael Ketani. I tried to reach Mr. Wesolowski (718) 321−3136, ext 242 in order to find out when the excavating will start, but I could only leave a phone message. I also sent him an e−mail requesting this piece of information.

Mr. Wesolowski sent me a response e−mail. He stated that the excavating had started on 10/22/13 and was continuing today. He expected to be done by the end of the week. Starting last week, they had been pumping contaminated groundwater from RW−1. Wells MW−11 and MW−4R are in the excavation area and will be replaced. Once the wells are installed, then VEFR work will take place. Excavation at the 6 sites that DEC had requested is being taken under consideration.

Later, I visited the Wen−Lar site. I met Emily Snead of GZA Environmental (subcontractor to LiRo; (973) 774−3321/cell (201) 452−8529). She said that she expected to finish the excavating for the today. She added that a few trucks containing contaminated soil had already left the site. They are all going to a disposal facility in Carteret, NJ.

I watched the excavating and saw dry, gray brown soil being uncovered and removed. There were occasional moderate odors of gasoline. There was no water in the pit. I commented that these odors could be a concern to the public. Ms. Snead stated that there are 3 ambient air monitors on site and they are sampling continuous. She has checked the data from the results and there are no exceedences for dust or total VOCs. I continued to watch the digging, but did not see any dust issues.

I continued to watch the digging. The excavator was about medium size. It had an arm that could not reach any deeper than 12 feet below grade. This was too short to dig out the contamination that was located as much as 20 feet below grade at PR−4C, PR−5B and PR−7B. I told Ms. Snead that I had sent Mr. Wesolowski an e−mail requesting that the deep contamination be dug out at these locations. Ms. Snead mentioned that contaminated soil had previously been dug out to 17 feet below grade almost to the east and south property fence lines. She said that GZA can not change the work order. She added that LiRo is the design engineering company and they will follow whatever LiRo tells them to do. So, right now, they are digging only to 10 feet. I watched the digging a little longer and met Bill Bradican, Sr. Client Manager, from SCE (855) 877−5605, ext 15 (environmental subcontractor to GZA for all construction jobs). We talked a little bit about the issues regarding digging in general. There was nothing noteworthy to see so I left the site.

10/28/13 − Raphael Ketani. Mr. Wesolowski sent me an e−mail today:

Groundwater extraction using a whaler pump from RW−1 was conducted on the following days.
10/9/13 − 20 gallons recovered
10/10/13 − 15 gallons recovered
10/11/13 − 15 gallons recovered
10/15/13 − 10 gallons recovered

All events purged the well over the course of an 8 hour day. Quarterly groundwater sampling and water levels were conducted on 10/22 and 10/23. Excavation work was conducted from 10/22 thru 10/24. Replacement of MW−11 and MW−4R is scheduled to take place on 10/31. Following completion of the installation of MW−11 and MW−4R the EFVR events will start.

Mr. Wesolowski also included an attachment in his e−mail which contained the 10/28/13 Quarterly Monitoring Report for the Period May 2013 to July 2013. On 5/22, 6/19, 6/27, 7/23 and 7/24 groundwater level measurements were performed. MW−11 couldn’t be gauged as it was damaged during the ISCO. MW−4R couldn’t be sampled as recovery was slow. GZA−1 and GZA−2 couldn’t be sampled as they were dry during May and July. On 7/23 and 7/24 groundwater was sampled from 10 wells. These were: MW−1, MW−2, MW−5R, MW−7, MW−9, MW−10, MW−12, GZA−3, GZA−4 and RW−1. The depth to groundwater was from −9.63 feet to 2.57 feet below grade. Groundwater flow was

southwest to the East River. LiRo recommended quarterly groundwater monitoring, performing VEFR events, abandoning MW−8, and SB−1 to SB−3, and re−installing MW−11 and MW−4.

The groundwater VOC sampling results were: MW−1 had only 1 low hit, MW−7 was entirely non−detect, MW−2 had low hits and mostly low exceedences, MW−10 and MW−12 had mostly non−detects and low exceedences with 1 high exceedence, GZA−3 and GZA−4 had mostly non−detects and low its with 3 low exceedences each, MW−9 and RW−1 had mostly non−detects and low hits with 7 low exceedences each, and MW−5R had mostly non−detects and low exceedences with 3 high hits from 180 ppb to 490 ppb. No samples were collected for SVOC testing. I approved the report.

11/11/13 − Raphael Ketani. Today I received a letter from Mr. Wesolowski dated 11/11/13 which was written in response to the DEC letter dated 9/16/13. In the letter, it was stated that there are complicating factors involved in excavating at PR−9A or PR−10A. This is partly due to the presence of a fence and a utility pole with overhead electrical lines which are adjacent to the sidewalk. Additional permits would be required and coordination with City agencies. Excavation at these locations would be re−evaluated after the approved excavating, test pitting, EFVR and third round solution injections take place. The same arguments were given for not excavating at PR−7A, PR−7B, PR−4C and PR−5B. It was also stated that it was not possible to return the site to an unrestricted use or residential standard (referring to the CP−51 unrestricted soil standards) due to the presence of urban fill and the former presence of the gas station. Additionally, the future use of the site is as a parking lot. Also, Mr. Wesolowski stated that the asphalt covering, source removal, EFVR, solution injections and groundwater removal will be protective of human health. He indicated that the efforts are consistent with CP−51 and protective of public health and the environment.

11/15/13 − Raphael Ketani. I visited the site today. I saw the power pole and the overhead wires. One of the wires provided power to a billboard.

I wrote a draft response letter to LiRo’s 11/11/13 letter. In the DEC letter, I stated that LiRo should conduct the approved excavating. However, I also stated that staff at the Department had re−reviewed the In Situ Chemical Oxidation Data Evaluation Round 2 Report and had decided that excavation at PR−5B, PR−7A and PR−7B will not have to take place. (This was because the individual VOC results do not exceed the residential or restricted residential standards and because the total VOCs are, comparatively, not very high). Also, excavating at PR−9A will not have to take place as this location is right at the power pole. Though, I stated, excavation will still have to take place at PR−4C and PR−10A due to the very high individual VOC exceedences. I added that while the site will still be used commercially, all remedial efforts must attempt to reach the unrestricted residential soil cleanup standards and that the excavating must follow the contamination. Once the approved and required excavating has taken place and the test pitting, EFVR, third round injections and confirmatory sampling have been performed, then the Department will make a determination regarding whether additional work needs to take place.

I submitted the letter to Mr. Hussein for his approval.

He approved the letter and it was sent out today.

11/25/13 − Raphael Ketani. I reviewed the Quarterly Monitoring Report dated 11/25/13 for the period August to October 2013. Excavating and test pitting took place on 10/23 and 10/24. Wells MW−4R, MW−11 and MW−R1 were removed due to the excavating. On 10/31/13, wells MW−4R and MW−11 were installed. Bedrock was encountered at MW−4R at 18.8’ bgs and at 20’ bgs at MW−11. LiRo recommends monthly gauging with quarterly sampling and VEFRng in December 2013.

Groundwater was gauged on 8/29, 9/26 and 10/15 and flow was to the southwest. Product was not found in any well. Groundwater

sampling took place on 10/22/13 at wells MW−1, MW−2, MW−5R, MW−12, GZA−3 and RW−1. The other wells were dry or not accessible.

MW−1: all VOCs non−detects
MW−2: several non−detects, very low hits, many very low exceedences
MW−5R: several non−detects, very low hits, some very low exceedences
MW−12: some non−detects, very low hits, some low to moderate exceedences
GZA−3: some non−detects, very low hits, very low exceedences
RW−1 (middle of site): 4 non−detects, 6 triple digit exceedences, 3 very high exceedences to 4300 ppb total xylenes

12/2/13 − Raphael Ketani. Mr. Wesolowski sent me an e−mail containing a document showing the 4 VEFR events that will take place during the next 2 weeks. The first VEFR event is expected to take place today.

12/20/13 − Raphael Ketani. Mr. Wesolowski sent me an e−mail stating that the next VEFR and gauging events will take place on 12/23/13.

1/16/14 − Raphael Ketani. I spoke to Mr. Wesolowski (718) 321−3136, ext 242 regarding progress at the site. He said that the soil excavation in the most contaminated areas took place on 10/23/13 and 10/24/13. This was followed by VEFR events starting on 12/2/13. The ninth VEFR event will take place on 1/17/14. Quarterly groundwater sampling will take place on 1/27 and 1/28/14.

SEND ALL CORRESPONDENCES TO MS RUSSO (347) 494−6034

ACTIVE HAZARDOUS SPILLS − MISC. SPILL CAUSES − EQUIPMENT FAILURE, HUMAN ERROR, TANK OVERFILL, DELIBERATE SPILL, TRAFFIC ACCIDENT, HOUSEKEEPING, ABANDONED DRUM, VANDALISM AND STORMS − IDENTIFIED WITHIN 1/2 MILE SEARCH RADIUS.
All spills mapped and profiled within 1/8 mile. Between 1/8 mile and 1/2 mile search radius, spills reported to be greater than 100 units and spills reported in the NYSDEC Fall 1998 MTBE Survey are mapped and profiled. Spills reported to be less than 100 units are listed in a table at the end of this section.

Please Note: * − Compass directions can vary substantially for sites located very close to the subject property address.

Map Identification Number 81 **BUCKEYE PIPELINE** **Spill Number: 9813881** **Close Date:**

GASOLINE SPILL − 20−30 BARRELS OF FUEL INVOLVED

DEC Investigator Remarks:

This spill site cleanup has been consolidated under Spill No. 9813881.

DEC (sigona) responded with DEC (Austin). Arrived on scene at 12 Noon on 2/16/99 found a large puddle of product (unl gasoline) on the east side of property. The spill was caused by leak through flange at pig exit section. The product did not enter creek. There is an existing gw remediation system and spill assigned to DEC (O'Dowd). Product was contained on surface near leaking flange, ground and parking lot.

Vac truck arrived at 1:45 PM 2/16/99 and began pumping gasoline mixed with foam into truck. Buckeye will make arrangements to continue removing free product until fluid is picked up. They will have bulldozer remove soil and gravel tommorrow. DEC (Sigona) will return for further direction. Buckeye & DEC (Sigona) monitored vapor levels using HNu and respirator.

DEC (Sigona) conducted follow−up inspection on 2/17/99 found that Buckeye's contractors EMS & CCS excavated 40' x 15' section down 0.5−1.5 ft below grade loaded in 20 cu yd roll off.

Monitoring well next to spilled area on southeast side of property contained 1.5" fresh product. Soil was contaminated to depth of 6 ft below grade based on GW depth. There was slight sheen in two distinct locations on west and east side of property. West side there is sheen south of surge tank, on east side sheen is south of parking area. Buckeye deployed a 150−ft hard boom and is deploying two sorbant booms to absorb product.

Buckeye will dig a recovery trench 6−8 feet below grade on south side of parking lot and near surge tank near shoreline to recover free product. Requested soil samples with EPA 8021 + MTBE for endpoint analysis.

DEC (Sigona) will follow−up.
This gasoline spill case has been reassigned from DEC (Sigona) to Rommel on January 7, 2004.
see spill nos. 9813884

05/12/04
Transferred from Rommel to Foley. Current status: 330gal LNAPL recovered since 1992. Ten monitoring wells and one recovery well on site. Detected 0.02' LNAPL on 3/31/04. No data on monitoring wells.

5/13/04 Mailed letter to M. Mengel, Buckeye. Required VOC/MTBE quarterly sampling, replacement of MW−3 and addition of well northwest of recovery system, monitoring of retaining boom, scaled site map and groundwater contour map. Deadline 6/30/04.

5/21/04 Copy of 5/13 letter sent to Kurt Trumbauer (EMS Envt'l) returned as not deliverable as addressed at 5 Highland Ave, Bethlehem PA. Resent to 602 E High St, Carlisle PA.

5/25/04 Spoke with Martin Mengel, Buckeye Pipe Line, and EMS contractor− Planning on doing sampling, 8260 + MTBE. Possibly putting well at corner of bulkhead. A lot of interference due to fuel lines. MW−3 is between fuel lines and will be reinstalled. Ordered phase 1 property usage from EDR to get surrounding property usage. Car recycling yard nearby(Prolerized−Schiabo Neu Company). Extended deadline to receive sampling report expected by 7/15/04. Buckeye will evaluate results of existing wells and surrounding landuse data to determine off−site well locations if necessary. Data from new wells would be submitted after they are installed, surveyed, mapped and results evaluated. Will document inspections of retaining boom

twice monthly.

5/27/04 Received email from M.Mengel documenting our discussion on 5/25/04.

6/21/04 VM from M. Mengel. Will be sending DMR to Reg. Water Eng. and myself. Will not copy M. Tipple or A. Sigona. Wells were sampled a couple of weeks ago and rpt will be in by 7/15.

6/28/04 Update report received. 0.02' LNAPL in RW in 5/04. The boom was inspected and was found with no accumulation of product.

7/13/04 Received report summarizing the initial groundwater sampling results(2Q04). Sampling will continue on a quarterly basis. The wells were surveyed and sampled for VOCs/MTBE on 6/10/04. MW−3 is scheduled for repairs and MW−11 will be installed soon along with a few test borings to evaluate soil conditions near the recovery well. MW−3 was dry. BTEX ranged from ND(MW−2, MW−9, MW−10)to 10260ppb(MW−7). MTBE ranged from ND(MW−1, MW−9, MW−10) to 3300ppb(MW−7). No product has been detected within the retaining boom area. Area is tidal and a tidal study will be completed during upcoming remedial investigation activities.

7/15/04 Monitoring wells MW−3R (replacement for MW−3), MW−11 and MW−12 were installed.

7/16/04 Site is inspected twice per month for system functionality and well gauging. Received report. 0.02' LNAPL in RW in 6/04.

8/20/04 Well gauging/functionality report received. 0.02' LNAPL in RW in 7/04. Two additional wells (MW−11, MW−12) were installed on 7/15/04 as part of the assessment activities. MW−3 was replaced with MW−3R. Well logs and construction diagrams will be included in the upcoming Site Characterization Report.

9/23/04 Received August 2004 well gauging/functionality report. Addt'l well (MW−11) was installed as close as practical(due to presence of product piping) to bulkhead west of RW−1. Also installed MW−12 adjacent to bulkhead to more closely investigate that area. MW−12 contained 0.11'(8/5/04) and 0.22'(8/19/04) of product which appeared to be old. EMS indicates that recharge is very slow, that thickness may build up in well as tide fluctuates, and that product recharge rate when well is bailed is very slow. EMS installed passive product collection bailer on 8/19/04. Retaining boom was observed to be satisfactory. MW−1,6,&8 were inaccessible on 8/5/04 and MW−1,6,8&2 were inaccessible on 8/19/04.

10/8/04 Spoke to M. Mengel. Site Characterization Report expected by 10/22.
10/20/04 Received Sept 2004 well gauging/functionality report. MW−12 contained 0.21' product during the 9/14/04 event. Product was not observed 9/30 nor 10/5. A passive recovery bailer was installed on 8/19/04.

10/21/04 Received site characterization report prepared by EMS Environmental. Six soil borings(P−1 thru P−6) and eight excavations(H−1 thru H−8) completed. The borings were advanced around RW−1 to a depth of 5'bgs or refusal. The excavations were to 5'bgs for footers for a new cable run tray. Soil samples were collected from P−1, P−3, H−1, H−4 and H−6. Trace LPH was detected in P−1, P−2 and P−5 and 0.2" was detected in P−6. Contaminated soil noted in MW−12.

Slug tests were also performed. Tidal study concluded that wells are impacted by the tides. Fluctuation between high and low tide ranged from 0.5 to over 1'.

11/12/04 3Q04 monitoring rpt received. BTEX ranged from ND(MW−2,5,9,10) to 5300ppb(MW−12). MTBE ranged from ND(MW−2,5,9,10,11) to 3700ppb(MW−7). MW−1 and MW−8 were not accessible.

11/17/04 Approved delineation. RAP due 1/3/05.

12/6/04 3Q04 monitoring report received. 0.02' LNAPL detected in RW−1. MW−1 and MW−8 not sampled due to inaccessibility. BTEX ranged from ND(MW−2, MW−5, MW−10, MW−11) to 5300ppb(MW−12). MTBE from ND(MW−2, MW−5, MW−10, MW−11) to 3700ppb(MW−7). GW is approx 1−4'bgs.

12/16/04 Spoke to Haz, EMS Env. They will be submitting a RAP which will propose pump and treat with a trench which will run along the bulkhead. Requested they include info on areas of influence.

12/20/04 Spoke to Tom Dalton, EMS Env.(610−866−7799) Expect RAP to be late due to review by Buckeye Pipeline Co. Extended deadline to 2/3/05. He will send letter documenting this. (Rec'd 12/22/04)

1/27/05 Spoke to T. Dalton, EMS Env. Requested deadline extension to 4/3/05. He will send letter formally requesting extension.

2/1/05 Received 4Q04 monitoring results from 12/30/04. (MW−1 and MW−8 were not sampled since they were covered due to construction activities.) RW−1 had an avg of 0.02' of LNAPL. BTEX ranged from ND(MW−2, MW−5, MW−9, MW−10) to 8225ppb(MW−7). MTBE ranged from ND (MW−2, MW−5, MW−9, MW−10, MW−11, MW−12) to 210ppb(MW−7).

2/1/05 Denied request to reducing sampling frequency to twice a year.

3/24/05 M. Mengel will be mailing RAP today.
3/28/05 Received RAP.

7/22/05 2Q05 monitoring report (samples collected 6/13/05)− MW−1 was covered with rock due to construction and was not gauged/sampled. MW−8 was filled with dirt and was not gauged/sampled. Repair is scheduled for second visit in July. LNAPL not observed in MWs. 0.01' in RW−1. DTW was observed at 2.42'bgs(MW−6) to 4.90'bgs(MW−11). BTEX ranged from ND(MW−2,9,10) to 7585ppb(MW−7). MTBE ranged from ND(MW−2,5,9,10,11,12) to 161ppb(MW−3R).

12/14/05 3Q05 monitoring report received. Results from 9/27/05. LNAPL was observed in RW−1 at an average thickness of 0.02'. In−well Scavenger system continues to operate in the well to remove product and treat groundwater. No dissolved concentrations in MW−2,5,8,9,10. Benzene detections ranged from 17.2ppb(MW−11) to 257ppb(MW−7). Total BTEX ranging 1892ppb(MW−4)to 7295ppb(MW−7). MTBE detected in MW−6 at 158ppb.

2/24/06 Received 4Q05 monitoring report for samples collected from nine monitoring wells(MW−2 and MW−4 thru MW−11) on 12/30/05. No LNAPL was present in MWs during gauging. Recovery well, RW−1, contained an average thickness of 0.02' during twice monthly gauging. DTW was measured between 0.00ft(MW−8, water level was at top of well) and 4.69ft(MW−11) bgs. GW flow is toward the NE and NW with avg hydraulic gradient of 0.006ft/ft and is tidally influenced. No exceedances of GWQS in wells MW−2, MW−5, MW−6, MW−8, MW−9 and MW−10. Total BTEX concentrations were 2ppb(MW−4), 7127ppb(MW−7) and 499ppb(MW−11).

5/5/06 Received 1Q06 monitoring report. Gauged nine MWs and a reference point on the bulkhead(BP−1). MW−1, MW−3R and MW−12 were not gauged or sampled due to equipment located over the wells. LPH was observed in RW−1 at 0.01ft on 3/8/06 and 0.02' on 3/27/06. A cone of depression was observed to be localized to RW−1.

6/30/06 DEC lead transferred from K. Foley to J.A. Maisonave. − JAM

8/23/06 Received 2Q06 monitoring report dated Aug 14, 2006 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on June 29, 2006. An immeasurable amount of free product was observed and removed from MW−1. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from MW−1 and MW−10. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in 7 of the twelve wells. Currently the groundwater pump in RW−1 is under repairs and should be reinstalled by the end of August. − JAM

10/20/06 Received 3Q 2006 monitoring rpt dated Oct 16, 2006, prepared by EMS Env. Twelve monitoring wells (MW−1 thru MW−12) were gauged on Sept 15, 2006. An unmeasurable amount of free product was observed and removed from MW−3R, MW−6 and MW−7. Product was observed in recovery well RW−1 at thickness of 0.01 ft. A cone of depression was observed due to pumping from RW−1. During this monitoring event, GW flow was moving in radial direction from MW−1 and MW−10. GW flow is tidally influenced. Analytical results showed exceedences of VOCs in seven of twelve wells (wells MW−1 and MW−8 were not sampled due to site flooding). − JAM

2/8/07 Received 4Q06 monitoring report dated Feb 5, 2007 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on Dec 6, 2006. Product was observed in recovery well RW−1 at a thickness of 0.02 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from MW−6. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in seven of the twelve wells. − JAM

4/26/07 Received 1Q07 monitoring report dated Apr 26, 2007 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on Mar 22, 2007. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−1, MW−6 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in nine of the twelve wells. − JAM

8/3/07 Received 2Q07 monitoring report dated July 27, 2007 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on June 12, 2007. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−1, MW−6 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in nine of the twelve wells. − JAM

11/8/07 Received 3Q07 monitoring report dated October 30, 2007 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on Sept 5, 2007. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from Mw−1, MW−6 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in eight of the twelve wells. − JAM

2/19/08 Received 4Q07 monitoring report dated Feb 7, 2008 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on Dec 10, 2007. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in nine of the twelve wells. − JAM

3/11/08 Spoke to Danielle Trittenbach today. RAP was never implemented. I will review RAP and speak with consultant to discuss

any modifications if possible or necessary. −JAM

6/17/08 Received 1Q08 monitoring rpt dated May 15, 2008, prepared by EMS Env. Twelve monitoring wells (MW−1 thru MW−12) were gauged on March 25, 2008. Product was observed in recovery well RW−1 at thickness of 0.01 ft. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−1, MW−6 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences of VOCs in eight of the twelve wells. Report uploaded to eDocs. − JAM

9/22/08 Received 2Q08 monitoring report dated August 14, 2008 and prepared by EMS Env. Eleven monitoring wells (MW−1 through MW−11) were gauged on June 23, 2008. MW−12 was not sampled because of construction equipment on top of it. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from well MW−6. Groundwater flow is tidally influenced. Analytical results showed exceedences for VOCs in eight of the eleven wells sampled. Report uploaded to eDocs. − JAM

1/13/09 Received 3Q08 monitoring rpt dated October 27, 2008 and prepared by EMS Env. twelve monitoring wells (MW−1 through MW−12) were gauged on June 23, 2008. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from well MW−6. Groundwater flow is tidally influenced. Analytical results showed exceedences for VOCs in nine of the eleven wells sampled. Report uploaded to eDocs. − JAM

7/24/09 Reviewed 4Q08 monitoring report dated January 23, 2009 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on December 15, 2008. Product was observed in recovery well RW−1 at a thickness of 0.02 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−1 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences for VOCs in eight of the twelve wells sampled with a maximum concentration of 6,313ug/L for total VOCs in MW−7. Report uploaded to eDocs. − JAM

7/24/09 Reviewed 1Q09 monitoring report dated April 30, 2009 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on March 16, 2009. Product was observed in recovery well RW−1 at a thickness of 0.02 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−6 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences for VOCs in ten of the twelve wells sampled with a maximum concentration of 5,123ug/L for total VOCs in MW−7. Report uploaded to eDocs. − JAM

10/15/09 Reviewed 1Q09 monitoring report dated September 3, 2009 and prepared by EMS Env. Twelve monitoring wells (MW−1 through MW−12) were gauged on June 25, 2009. Product was observed in recovery well RW−1 at a thickness of 0.01 feet. A cone of depression was observed due to pumping from RW−1. During this monitoring event, groundwater flow was moving in a radial direction from wells MW−1, MW−6, MW−7 and MW−8. Groundwater flow is tidally influenced. Analytical results showed exceedences for VOCs in 9 of the 12 wells sampled with a maximum concentration of 6,232ug/L for total VOCs in MW−6. Report uploaded to eDocs. − JAM

05/31/11: This spill case transferred from J. Maisonave to J. Kolleeny. Changed priority ranking to P2, because remedial system is operating and site in in monitoring phase. − JK

06/25/12: On 6/19/12, contacted Michael Serfes of EMS Envt'l, Buckeye's consultant for this spill, and requested monitoring rpts

from 3rd quarter 2009 to present on a CD. On 6/25/12, received CD with quarterly rpts from 3rd quarter 2009 to 1st quarter 2012. Will review. − JK

08/09/12: Reviewed GW Monitoring Progress Rpt for 1st Quarter 2012 by EMS Envt'l, Inc., dated 5/2/12 (in eDocs). Rpt summarizes operation of remedial system during 1st quarter 2012 and gives results of 3/7/12 GW monitoring & sampling event. Site has GW extraction system with separate−phase hydrocarbon (SPH) scavenger. System recovered 0.05 gals SPH during this quarter, has recovered 599.28 gals to date. System recovered and treated 2,200 gals of GW during quarter, with avg. flow rates 32.3 gals/day in Jan., 55.2 gals/day in Feb., and 19.3 gals/day in March 2012. Rpt states that no free product has been detected in any monitoring wells since Dec. 2006; however, recovery well RW−1 had 0.01 ft of product on 3/7/12. GW sample results show MW−7 had 3,329 ug/L total BTEX (up from 3,171 ug/L in Dec. 2011), MW−11 had 160 ug/L tBTEX (up from 30 ug/L in Dec. 2011), MW−12 had 515 ug/L tBTEX (up from 145 ug/L in Dec. 2011). Other wells had low levels of dissolved contam or no contam. Rpt states that quarterly GW monitoring & sampling will be conducted in June 2012. − J. Kolleeny

08/27/12: On 8/22/12, received hard copy of 2nd quarter 2012 mon rpt; but with no CD with pdf file of rpt. On 8/23, sent email to Mike Serfes of EMS Envt'l (mserfes@emsenv.com) requesting pdf file of rpt. On 8/24/12, sent email to Mike: "Mike, I've looked over 2nd quarter 2012 progress rpt, and noticed that Site History section of rpt ends at preparation of March 2005 Remedial Action Plan by EMS Envt'l. I also saw mention in our spills database that RAP was received, but there is no mention of whether or not DEC approved RAP, and I also do not have electronic version of RAP in database. Do you know if RAP was formally approved by DEC? Does entire remedial system consist of one GW recovery well (plus 500−gal product holding tank and two 250−lb carbon treatment vessels)? Also, would it be possible to provide a pdf file of RAP? Let's talk about this spill site once you're back in office." On 8/27/12, received reply from Mike: "Jon, LIC 2nd Q 2012 is attached [in eDocs]. Your question: Does entire remedial system consist of one GW recovery well (plus 500−gal product holding tank and two 250−lb carbon treatment vessels)?... Yes! I'll check on RAP history and get back to you." − JK

08/28/12: Reviewed Site Monitoring & Sampling Rpt for 2nd Quarter 2012 by EMS Envt'l, Inc., dated 7/31/12 (in eDocs). Rpt summarizes operation of remedial system (i.e., GW extraction system with separate−phase hydrocarbon (SPH) scavenger) during 2nd quarter 2012 and gives results of 6/7/12 GW monitoring & sampling event. System recovered 0.11 gals SPH during this quarter, and has recovered 599.39 gals to date. System recovered and treated 6,600 gals of GW during quarter, with avg. flow rates 86.6 gals/day in April, 54.8 gals/day in May, and 76.66 gals/day in June 2012. Rpt states that no free product has been detected in any monitoring wells since Dec. 2006; however, recovery well RW−1 had 0.01 ft of product on 6/7/12. GW sample results show MW−7 had 1,573 ug/L total BTEX (down from 3,329 ug/L in March 2012), MW−8 had 431 ug/L tBTEX (up from 47 ug/L in March 2012), MW−11 had 275 ug/L tBTEX (up from 160 ug/L in March 2012), and MW−12 had 112.5 ug/L tBTEX (down from 515 ug/L in March 2012). Other wells had low levels of dissolved contam or no contam. Rpt states that quarterly GW monitoring & sampling will be conducted in September 2012. − J. Kolleeny

09/20/12: On 9/19/12, spoke with Michael Serfes of EMS Envt'l, Inc., who confirmed that RAP had been submitted to DEC, but that RAP had never been implemented. He agreed to forward pdf file of RAP for DEC's records. I asked that EMS also prepare a rpt summarizing history of this project and proposing actions to move spill towards closure. He agreed to do so. − JK

11/01/12: Received email from Devin Shay of GES, in response to email from Vadim Brevdo of DEC inquiring about impacts from Hurricane Sandy to sites with remedial systems: "Vadim, I see from your email that you are seeking updates on remediation projects that may have been affected by storm. As of this week, Buckeye has asked us to assume consulting and remediation duties for their project in Long Island City (DEC Spill #9813881). We had a crew on site this morning to assess small pump & treat system that operates at that site. Based on our check, site was flooded and 500−gal product recovery tank was turned up on end,

resulting in release of recovered product. I just received confirmation from previous consultant that tank contained 55 gals of recovered product. Our field crew estimated about 10 gals of product remaining in tank, so there is a reportable release of an estimated 45 gals. There is no longer any product leaking from tank. There is visual evidence that product impacted surface soil in vicinity of tank. Our remediation plan for this as of right now is to hand−shovel surface soils in vicinity of release and drum them for disposal. Our crew shut down system and disconnected controls. Tomorrow Buckeye will have a backhoe on site to right tank. Piping and electrical for system appear to have sustained serious damage. We will have to continue our assessment of this to determine if/when and restart of system is applicable. Please advise me if Dept will require notification of this release via spill hotline, or if you would rather update record from this email. Typically we would call this in but I'm sure you are experiencing an influx of new records. I don't want to assume anything. We will proceed as you direct." I sent email reply: "Devin, Although under normal circumstances I would recommend reporting this as a new spill and then consolidating it with existing spill number, I think in this case you have a good point and there's no need to alert our spill response staff since you seem to have situation well under control, and they probably have other more urgent situations to deal with at the moment. So, you can refrain from calling in a new spill rpt and I will update existing spill remarks with your summary of this incident. Thanks for being proactive on this, and let's discuss this site in near future." − J. Kolleeny

11/05/12: Reviewed Site Monitoring & Sampling Rpt for 3rd Quarter 2012 by EMS Envt'l, Inc., dated 11/5/12 (in eDocs). Rpt summarizes operation of on−site GW extraction system with separate−phase hydrocarbon (SPH) scavenger during 3rd quarter 2012 and gives results of 9/27/12 GW monitoring & sampling event. System recovered ~1.39 gals SPH during this quarter, and has recovered 600.78 gals to date. System recovered and treated 13,600 gals of GW during quarter, with avg. flow rates of 316.7 gals/day in July, 23.3 gals/day in Aug., and 113.3 gals/day in Sept. 2012. Rpt states that no free product has been detected in any monitoring wells since Dec. 2006; however, recovery well RW−1 had 0.02 ft of product on 9/27/12. GW sampling results for 9/27/12 show well MW−7 had 2,539 ug/L total BTEX (up from 1,573 ug/L in June 2012), MW−8 had 1,527 ug/L tBTEX (up from 431 ug/L in June 2012), MW−11 had 284 ug/L tBTEX (up slightly from 275 ug/L in June 2012), and MW−12 had 548 ug/L tBTEX (up from 112.5 ug/L in June 2012). Other wells had low levels or no dissolved contam. Rpt states that quarterly GW monitoring & sampling will be conducted in December 2012. − J. Kolleeny

11/08/12: On 11/7/12, I sent email to Devin Shay of GES: "Devin, Can you provide an update on this situation? Has visually impacted soil near overturned product recovery tank been dug out? If so, was an end−point soil sample collected? Has tank been returned to an upright position? If soil has not yet been dug out, then please collect one or more end−point soil samples when impacted soil is removed. Also, today I received 3rd quarter 2012 monitoring rpt for this site from EMS Envt'l. Are they still working on this project, or are they just fulfilling a last requirement or two? I have been trying (so far, without success) to obtain an electronic copy (pdf file) of a RAP they submitted for this site in 2005, which was never implemented. I had been in contact with Michael Serfes of EMS. I had also asked that EMS prepare a rpt with a comprehensive history of all investigative and remedial activities performed at site, with an evaluation of existing remedial system and proposal for further remedial actions leading to spill closure. Is this something that GES can now take on? Please let me know." On 11/8/12, received reply from Devin: "Jon, We were out there last Friday to right tank and we hand−dug out 4 drums of soil. We did not collect an end point sample. I will get back to you ASAP on other issues − very soon." − J. Kolleeny

11/13/12: Spoke with Devin Shay of GES, asked if they were able to use PID to determine area of impacted soil when they dug out recent surface spill caused by Hurricane Sandy. He said that background readings on PID were too high for it to be useful for delineation of soil impacts, but he stated that they could see lateral and vertical extent of impacts based on soil staining, and he was confident they had removed virtually all impacted soil. He also stated that GES intends to perform a site−wide soil investigation to evaluate current conditions, and they will prepare site summary rpt with further remedial proposals as per my request. I asked that a work plan be submitted for soil investigation. − J. Kolleeny

11/19/12: On 11/16/12, received email from Devin Shay of GES with attached March 2005 RAP prepared by EMS Envt'l (received by Kerry Foley, see 3/28/05 entry above). RAP in eDocs. − JK

12/20/12: Received email from Devin Shay of GES: "Jon, Attached is copy of letter sent to Central Office regarding DMR for Buckeye LIC project. Please let me know if you have any questions on this." Attached letter (in eDocs) states that on−site remed system was damaged by Hurricane Sandy and is shut down, so system had no discharge for November 2012. − JK

01/11/13: On 1/8/13, I received phone call from Karen Baker, SPDES Compliance Coordinator at DEC Central Office, explaining that Buckeye is in violation of SPDES permit by not submitting a Discharge Monitoring Rpt (DMR) for November 2012, even though they did not treat/discharge any GW. She explained there is a box on DMR form that should be checked to indicate no discharge. She asked that I contact Buckeye's consultant GES and explain this to them, ask them to submit DMR. I contacted Devin Shay of GES by phone (left messages), he called back and left mssg saying he'd already sent DMR to Albany. I then sent him email: "Devin, I got your phone message replying to my phone messages, thanks. However, I am confused. In your message, you said you had sent Albany same DMR rpt that you sent me. However, I don't have any record of receiving a DMR rpt prepared by GES. All I received was a letter stating that remedial system at site is off and no water has been treated or discharged since October 29, 2012. This is not what they need; they still need to receive DMR rpt, which I'm told has a box you can check for "system not operating" or something to that effect. I received a phone call from Karen Baker, from Division of Water in Central Office, and she said that while they are not requiring facilities impacted by Hurricane Sandy to submit DMRs for October 2012, they are requiring them for November 2012 and if rpts are not received, Notices of Violation are automatically generated and sent out. She also advised that it would be better to also submit a rpt for Oct. 2012 if that's possible. Please give me another call to discuss. Also, Ms. Baker's number is 518−402−8174, if you want to discuss this issue with her, which seems like a good idea." Spoke with Devin on 1/9/13, he said he would prepare & submit DMR as requested. On 1/10/13, received email from Devin with updated Nov. 2012 DMR (in eDocs). − JK

01/28/13: Received Discharge Monitoring Rpt for December 2012 by GES, dated 1/25/13 (in eDocs). Rpt notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and no GW was treated or discharged by system in Dec. 2012. − J. Kolleeny

02/01/13: On 1/22/13, received email from Devin Shay of GES with attached pdf file of work plan for subsurface investigation. After review, I contacted Devin and requested revisions to plan and submission of hard copy plus CD with pdf file. Devin agreed to this. − JK

02/12/13: Received revised Subsurface Investigation Work Plan by GES, dated 2/6/13 (in eDocs). Plan proposes 15 soil borings to top of water table, using "soft dig technologies," to delineate shallow soil impacts. Soil samples will be collected and sent for lab analysis, and results will be presented in rpt of findings. I sent approval letter (in eDocs) to Ms. Krista Snyder (Remediation Specialist, Buckeye Partners, 5 TEK Park, 9999 Hamilton Blvd., Breinigsville, PA 18031, ksnyder@buckeye.com), cc to Devin Shay of GES, noting that results of investigation should be used to evaluate current on−site remedial system, and if it is determined that system is not adequate to address site conditions, then rpt of findings should include new remedial proposal to address all petroleum impacts at site. − J. Kolleeny

03/11/13: Reviewed Discharge Monitoring Rpt for January 2013 by GES, dated 2/25/13 (in eDocs). Rpt notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and no GW was treated or discharged by system in Jan. 2013. − J. Kolleeny

10/18/13: I was copied on email from Suzanne Rowlett of DEC Region 2 Div. of Water to Krista Snyder of Buckeye Partners, L.P.: "Thank you for forwarding DMR reports to me. As discussed on phone on this date I conducted a Reconnaissance inspection of above listed site. I was accompanied by Mr. Selvin Southwell and Ms. Jean Occidental, both of Division of Water in Region 2 Office. Facility has received a Satisfactory rating. Attached is a copy of inspection rpt. Hard copy available upon your request." I uploaded rpt to eDocs. − J. Kolleeny

10/21/13: Received Discharge Monitoring Rpt for September 2013 (dated 10/10/13) via email from Krista Snyder of Buckeye Partners, L.P. (in eDocs). Reviewed rpt, which notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and that no GW was treated or discharged by system in Sept. 2013. − J. Kolleeny

11/07/13: Reviewed Site Monitoring Rpt for January−August 2013 by GES, dated 10/22/13 (in eDocs). Rpt presents results of well gauging and sampling in Feb., May and August 2013, and shallow soil sampling in March 2013. Well gauging in Feb. 2013 showed MW−1 had 0.04 ft of product, MW−11 had 0.03 ft, and MW−12 had 0.04 ft; gauging in May found MW−1 had 0.01 ft of product; gauging in Aug. 2013 showed no free product in wells. Feb. 2013 GW sampling showed well MW−7 had 1,689 ug/L total BTEX (down from 2,539 ug/L tBTEX in Sept. 2012) and 3,962.5 ug/L total VOCs (no tVOC data prior to Feb. 2013); well MW−8 had 1,479 ug/L tBTEX (down from 1,527 ug/L in Sept. 2012) and 1,729 ug/L tVOCs (no tVOC data prior to Feb. 2013). May 2013 GW data show well MW−1 had 621 ug/L tVOCs; well MW−7 had 4,421 ug/L tVOCs; well MW−8 had 784 ug/L tVOCs; well MW−11 had 1,066 ug/L tVOCs; well MW−12 had 1,050 ug/L tVOCs. Aug. 2013 GW sampling showed well MW−1 had 535 ug/L tVOCs; well MW−7 had 4,386.5 ug/L tVOCs; well MW−8 had only 14 ug/L tVOCs; well MW−11 had 854 ug/L tVOCs; well MW−12 had 1,279 ug/L tVOCs. March 2013 soil sampling results show numerous sampling locations with VOCs detected significantly above CP−51 cleanup objectives. Rpt states that quarterly GW monitoring & sampling will be conducted in Nov. 2013. I contacted Devin Shay of GES to point out that rpt does not make any recommendations for further investigative or remedial action, as requested in my 2/12/13 work plan approval letter. Devin requested a meeting to discuss investigation results and remedial options. I scheduled a meeting at R2 office for Dec. 10, 2013. − J. Kolleeny

12/04/13: On 11/25/13, received Discharge Monitoring Rpt for October 2013 (dated 11/15/13) via email from Krista Snyder of Buckeye Partners, L.P. (in eDocs). Reviewed rpt, which notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and that no GW was treated or discharged by system in Oct. 2013. − J. Kolleeny

12/27/13 On 12/20/13, received Discharge Monitoring Rpt for November 2013 (dated 12/19/13) via email from Krista Snyder of Buckeye Partners, L.P. (in eDocs). Reviewed rpt, which notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and that no GW was treated or discharged by system in Nov. 2013. − J. Kolleeny

01/16/14: Received Discharge Monitoring Rpt for December 2013 (dated 1/7/14) via email from Krista Snyder of Buckeye Partners, L.P. (in eDocs). Reviewed rpt, which notes that on−site remedial system has been off−line since 10/29/12 due to damage by Hurricane Sandy, and that no GW was treated or discharged by system in Dec. 2013. − J. Kolleeny

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL"
3/11/03 − SAMUEL− File available in active unassigned spill files.

6/20/05 Heitzman: Spoke with Liam Horgan, consultant for owner. Groundwater monitoring indicates that levels continue to exceed standards. ORC was deployed in 2004, and 6−month milestone sampling indicates that levels are declining. The next sampling round is scheduled for July 2005.

4/12/06 − Results of the July 2005 sampling, if it ever occurred, have not been received.

NEXT STEP: The site is a long term spill that will require on−going monitoring to determine if the ORC injection was successful.

11/27/07: Reassigned to Sun/Sellberg. (JS/MS)

12/28/07: Acris shows property owner as Gale Associates/VP− R. Zirinsky. Requested correspondance by 1/31/08. (JS/MS)

4/14/08: Received documentation from Horgan, planned to do supplemental site investigation SB+GW (JS/MM)

7/7/08: No documentation received as of yet. (JS/MM)

08/11/08: Transferred to Kolleeny/Mandac (JK/MM)

10/27/08: ART has sent documents regarding the site. Letter of failure to comply should be sent (JK/MM)

11/13/08: On 11/12/08, received call from Lori Battaglia, with consultant AAI Env'tl Corp., who reportedly now represent RP for this site, asking for information regarding spill. I sent her pdf's of spill report and March 2008 Site Investigation Rpt by A.R.T., Inc., with email: "Here is copy of spill report and March '08 Site Investigation Report by A.R.T., Inc., as we discussed on phone today. I hope these documents are helpful. As I mentioned, please send site status report / investigation work plan with recommendations regarding what needs to be done to address this open spill as soon as possible. Report should be submitted both as hard copy and as pdf file. Feel free to contact me if you have any more questions." − JK

02/03/09: No documents rec'd. Sent email to Battaglia requesting an update on report/work plan. (JK/KG)

02/27/09: Tried to call L. Battaglia at 323−284−8263, but answering machine hung up and couldn't leave a message. Called AAI Env headquarters and left message (615−469−0677).(JK/KG)
Rec'd phone call from AAI, they stated that they have not been hired by the RP to perform the work. Will need to contact RP. (JK/KG)

03/03/09: Tried to call Richard Zirinsky at 212−751−4625. This is the number for his brother Robert Zirinsky. I was told to call 212−751−4620. No one was in the office. (JK/KG)

03/04/09: Left voice message for Richard Zirinsky(212−751−4620 ext. 101). (KJ/KG)

03/11/09: Left voice message for Richard Zirinsky. (KJ/KG)

03/17/09: Left voice messages for L. Battaglia (AAI Env.) and Liam Horgan (A.R.T.) requesting any information they may have regarding this site. (JK/KG)

03/18/09: Sent letter to Richard Zirinsky requiring a supplemental subsurface investigation work plan be submitted by 4/17/09. The work plan should also include all historical soil and groundwater data, including tank closure documentation and sampling results.

Rec'd call from Liam Horgan (A.R.T.). He stated that monitoring at the site has continued and the worked proposed in the March 28, 2008 letter was performed. I informed him that the RP was sent a letter requesting all historical and current data be submitted as well as a work plan for additional investigation.(JK/KG)

04/20/09: Rec'd call from Mimi Raygorodetsky and Keith Brodock of Environmental Liability Management, LLC (ELM). ELM has been hired by Gale Associates and has prepared a work plan and a report summarizing site history and work completed to date. ELM would like to expedite the work plan and perform any obstrusive site work prior to May 1, 2009, when the property will be leased to Nestle. The contract between Gale Associates and Nestle, states that the clean−up can not disrupt Nestle's operations. The report and work plan will be submitted within the next few days.

Mimi Raygorodetsky − mray@elmofny.com Ext. 302
(JK/KG)

04/27/09: Rec'd hardcopy and pdf of Environmental Site Investigation Report and Remedial Action Plan from ELM dated 4/24/09. ELM proposes installation of 11 injection wells, performance of a pilot injection study, injection of RegenOx, and quarterly monitoring and reporting. SIR/RAP approved with modifications. Three addt'l wells should be installed, a round of groundwater samples should be collected prior to the injection of RegenOx, and a round of groundwater samples should be collected within 60 days of the application of RegenOx. The investigation summary report and first quarterly monitoring report are due 9/4/09.

SIR/RAP without Attachment A uploaded to eDocs. Attachment A contains historical reports, data, and field notes. It has been uploaded to eDocs in 13 parts. (JK/KG)

08/17/09: ELM provided updated contact info for the site owner.

rcorroon@ix.netcom.com (JK/KG)

08/31/09: Rec'd Interim Remedial Investigation Report dated 8/31/09 submitted by ELM. Under review. (JK/KG)

09/01/09: Left a message for Brodock. Requested well construction logs and a groundwater contour map. (JK/KG)

09/03/09: Summary of RIR: 10 injection wells and 3 monitoring wells were installed between 4/29 and 5/8/09. Soil samples were collected from the monitoring well borings. Detected PID readings were encountered below the water table in most of the wells. All wells are 4" in diameter and were completed to a depth of 25'. The screened interval is between 10' and 25' bgs. Depth to

water is around 13' bgs. The wells were surveyed and groundwater flow was determined to be westerly. The 6 monitoring wells were sampled on 5/22/09. Implementation of RegenOx injections has not taken place. ELM has requested that remediation of this site and the adjacent open spill 0012739 occur simultaneously, if remediation is necessary at the adjacent site.

Soil samples:
MW−4: Total VOCs − 0.0089 mg/kg, Total SVOCs − 80.2 mg/kg
MW−5: Total VOCs − ND, Total SVOCs − 0.015 mg/kg
MW−6: Total VOCs − 0.0068 ug/kg, Total SVOCs − 30.7 mg/kg

GW Samples:
MW−1: Total VOCs − ND, Total SVOCs − ND
MW−2: Total VOCs − 18 ug/L, Total SVOCs − ND
MW−3: Total VOCs − 0.8 ug/L, Total SVOCs − 0.63 ug/L
MW−4: Total VOCs − 10,541 ug/L, Benzene − 4,600 ug/L, m&p−xylenes − 2,600, Total SVOCs − 174 ug/L
MW−5: Total VOCs − 97 ug/L, Benzene − 62 ug/L, Total SVOCs − 7.6 ug/L
MW−6: Total VOCs − 10,950 ug/L, Benzene − 150 ug/L, m&p−xylenes − 3,300, Total SVOCs − 171 ug/L

Spoke to Brodock, an additional well downgradient to MW−6 will need to be installed to further delineate the contaminant plume. The location will be determined once the groundwater contour map is submitted. (JK/KG)

09/09/09: On 09/08/09, rec'd a letter containing well construction logs and groundwater contour map. A letter was sent to Corroon approving ELM's request to postpone RegenOx injections until remedial action is approved at the adjacent property, Spill 0012739. In addition, installation of an additional monitoring well is required. The well should be installed west−southwest of ELM−MW−6, on the west side of Gale Avenue. A remedition summary is due 30 days after the first quarterly sampling event. (JK/KG)

09/29/09: The RAP for the adjacent site (spill 0012739) was approved on 9/29/09. Implementation of the RAP for this spill (9813012) will begin after the wells are installed at the adjacent site. Installation of the additional well DEC required on 9/9 will be installed during installation of the wells at the adjacent site.
Email addresses for ELM have changed − kbrodock@elminc.com and mraygorodetsky@elminc.com. (JK/KG)

11/03/2009: This spill case was transferred to A. Doronova. − AD

Refer to Spill 0012739. Implementation of the RAP for this spill (9813012) will begin after the wells are installed and remediation begin at the adjacent site. AD

07/14/2011: Received the Site Forensic & Spatial Data Review Report submitted by the ELM Group (ELM) or adjacent site at Hunters Point Avenue, Queens, NY. Will review. AD

11/2011: Reviewed the report. The report states that ELM conducted a chemical forensics review of the current and historical analytical data and reviewed a regulatory database report dated November 8, 2010 and Sanborn Maps, both from Environmental Data Resources, Inc. to identify potential off−site sources of contamination at the Site. According to the report, the results of this analysis indicate that the dissolved−phase petroleum constituents identified in the site groundwater are not related to petroleum products used at the Site, and likely originated off−site.

ELM states in the report that there are multiple facilities that involve the use, storage, release, generation or disposal of fuels in the immediate area and upgradient to the site with respect to groundwater flow direction, including a gasoline station, a jet fuel line, active gasoline spill sites, and facilities that used and disposed of ignitable wastes (likely petroleum). Based on the multiple lines of evidence discussed herein, ELM Group had concluded that the VOCs, including gasoline−related constituents, in dissolved−phase groundwater at the site originated from an off−site source.

As a result of this analysis, ELM concludes that the obligation of the property owner to investigate this release has been satisfied (since the only potential on−Site source has been fully investigated and confirmed to have not released petroleum to the Site's subsurface) and formally requests that this release be closed by the Department.

So, no additional investigation was perfored for the adjacent site and the approved by DEC RAP was not implemented. The consultant requested spill closure. This means that remediation for this site is no longer tied to the remediation of the adjacent property and should proceed separatly. AD

12/14/2011: Sent a response to ELM with a remainder that if ELM is still a consultant for 32−69 Gale Avenue, Long Island City site (NYSDEC Spill No. 9813012), that a RAR submission is overdue for the site. AD

01/10/2012: Did not receve any response from ELM. To issue a letter to the site owner. His info is:

AD

01/19/2012: Issued and sent a Remediation Needed letter to Mr. Corroon by certified mail (#7006 0100 0006 2620 3528). RAP submission is due March 1, 2012.

03/02/2012: Received the following e−mail from K. Brodock saying:

"Hi Ainura,

As requested, I'm sending this email as a follow up to our phone conversation last month. As we discussed, 32−69 Gale Avenue Realty Co., LLC will implement the remainder of its Remedial Action Plan (dated April 24, 2009; approved by NYSDEC on April 27, 2009) and will install the additional groundwater monitoring well described in NYSDEC's letter dated September 9, 2009. Below is our current schedule for implementation:

Well Installation
March/April − One day of installation

Baseline Groundwater Sampling
April − One day of groundwater sampling, two weeks after the development of the well

RegenOxT Application (consisting of three initial parts)
May − Three days of RegenOxT Part B Application (750 lbs)

May − Three days of RegenOxT Part B Application (750 lbs)

May − Three days of RegenOxT Part A Application (1500 lbs)

Initial Groundwater Monitoring
August/September − One day of quarterly groundwater sampling

RegenOxT Application
October − Three days of RegenOxT Part A Application (1500 lbs)

Continued Groundwater Monitoring
January 2013 − One day of quarterly groundwater sampling

May 2013 − One day of quarterly groundwater sampling

September 2013 − One day of quarterly groundwater sampling.

Please do not hesitate to contact me with any questions or comments.

KEITH BRODOCK, PE, LEED AP
Tel 212.962.4301 x 302 | Fax 212.962.4302 | Cell 646.895.3325
KBrodock@elminc.com | www.ExploreELM.com"

Changed site priority to P1. AD

11/13/2012: Sent an e−mail to Mr. Brodock with a request to submit September GW monitoring report by 11/30/2012. AD

12/2012: Did not receive any response from Mr. Brodock. AD

01/2013: Called and left a message to Mr. Brodock. AD

03/2013: called and left a message to Mr. K. Brodock. AD

07/2013: Called and spoke with K. Brodock. Requested submission of the remediation report. I was told that the remediation was postponed, but it’s about to start. The summary report will be submitted to DEC. AD

11/01/2013: Received the following e−mail from James L’Esperance of Integral Consulting Inc.:

"Ainura,

I’m sending this email to update you of the progress at 32−69 Gale Avenue, Queens, NY (Spill No. 98−13012). The Remedial Action Plan (dated April 24, 2009; approved by NYSDEC on April 27, 2009) is being implemented by 32−69 Gale Avenue Realty Co., LLC. This email is an update on the actions completed since the last update we sent you on July 19, 2013.

The following additional remedial activities have been completed:

· Monitoring Well Installation

An additional monitoring well was installed across Gale Avenue to the west of the site, as requested by the NYSDEC in its letter dated September 9, 2009. Two soil samples were collected during the installation. The samples were analyzed for VOCs and SVOCs. The results are attached and are consistent with the observations of historic fill (boring log attached).

· Baseline Groundwater Sampling

Prior to the RegenOx injection, a baseline sampling event was performed, as requested by the NYSDEC in its letter dated April 27, 2009. Samples were collected from the five on−site monitoring wells, as well as the two off−site monitoring wells (which includes the newly−installed well). The samples were analyzed for VOCs and SVOCs. The results are attached and generally show a decrease in groundwater concentrations since this last monitoring in May 2009.

The schedule going forward is as follows:

RegenOx Application (consisting of three initial parts)
November 5−7 − Part B Application (500 lbs)

November 12−14 − Part B Application (500 lbs)

November 19−21 − Part A Application (1500 lbs)

Initial Groundwater Monitoring
February/March 2014 −Quarterly groundwater sampling event

RegenOx Application (if necessary)
June 2014 − RegenOxT Part A Application (1500 lbs)

Continued Groundwater Monitoring
September 2014 − Quarterly groundwater sampling event

December 2014 − Quarterly groundwater sampling event

March 2015 − Quarterly groundwater sampling event

Integral will be providing oversight for the RegenOx application that is starting next week.

Please don’t hesitate to contact me with any questions or comments.

James L’Esperance
Integral Consulting Inc. | www.integral−corp.com
61 Broadway, Suite 1601 | New York, NY 10007
Tel: 212.962.4301, ext. 708 | Cell: 646.285.4808 | Fax: 212.962.4302"

Looked at the submissions. Thereare three pages with soil analytical data, soil boring logs and site plan. No summaru report was submitted. AD

11/04/2013: Called and spoke with James L’Esperance regarding the site. Requested to submit GW monitoring and wells installation report by December 6, 2013. AD

12/12/2013: Called and left a message to J. L’Esperanse of Integral. AD

12/13/2013: Called and spoke with J. L’Esperance. He said that the report was sent to DEC via e−mail on December 6, 2013. Informed him that I did not receive it. Mr. L’Esperance resent the report by e−mail.

DL the report to eDocs. Will review. AD

01/24/2014: Reviewed the report. It summarizes the following remedial events that have occurred at the site:
The additional off−site well installation across Gale Avenue;
Soil samples collected during the off−site well installation;
The baseline groundwater sampling conducted in September 2013; and
The RegenOx injection program completed in November 2013.

Well installation:
On July 22, 2013, an additional monitoring well (MW #7) was installed across Gale Avenue to the west of the site. The groundwater surface was approximately 13.5 feet bgs.

Soil Sampling Results:
The soil samples were taken from two different depth intervals within the MW #7 boring,
analyzed for VOCs and SVOCs, and compared to the CP−51 Soil Cleanup Levels (SCLs) for
Gasoline/Fuel Oil Contaminated Soils.
The shallower sample, taken from the 3 ft to 5 ft interval, did not exceed CP−51 SCLs for
any constituents. The deeper sample, taken from just above the water table, exceeded CP−51 SCLs for seven SVOCs, which is consistent with past soil results at the Site and indicate historic fill characteristics. This sample did not exceed CP−51 SCLs for any VOCs.

Baseline Groundwater Sampling:
On September 9, 2013, a baseline groundwater sampling event was performed. Samples were collected from the five on−site monitoring wells, as well as the two off−site monitoring wells (which included the newly−installed MW #7). The samples were analyzed for VOCs and SVOCs.

Various VOCs exceeded their TOGS AWQS in five of seven samples, which are consistent with past groundwater data at the site. Only

two SVOCs exceeded their TOGS guidance values in one sample. Chrysene was detected at a concentration of 0.09 flg/L, which exceeded its guidance value of 0.002 flg/L. Benzo(b)fluoranthene was detected at a concentration of 0.1 flg/L, which exceeded its guidance value of 0.002 flg/L.

GW data − TVOCs (ppb):
1. MW−1 − ND;
2. MW−2 − 44;
3. MW−3 − 13;
4. MW−4 − 648;
5. MW−5 − 517;
6. MW−6 − ND;
7. MW−7 − 34.

Most contaminated wells are MW−4 and MW−5.

GW contour map indicates generally westerly groundwater flow direction at the site.

RegenOx Injection Program:
From November 5,2013, to November 21,2013, a three−part RegenOx injection was performed at the Site. The RegenOx application consisted of three separate injections (two injections of Part B and one injection of Part A) in the ten previously−installed injection wells. The injections were performed by Intex Environmental Group, Inc. (Intex) with oversight by Integral.
An Underground Injection Control (UIC) permit was submitted to the EPA for the
RegenOx injection program.

UPCOMING ACTIVITIES:

Untegral Consulting Inc. is planning to perform site activities according to this schedule:
Post−Injection Groundwater Monitoring
January/February 2014 − Quarterly groundwater sampling event
Reporting
April 2014 − Remedial Update Letter Report
RegenOx Application (if necessary)
June 2014 − RegenOxT Part A Application (1500 lbs)
Continued Groundwater Monitoring (if necessary)
September 2014 − Quarterly groundwater sampling event
December 2014 − Quarterly groundwater sampling event
March 2015 − Quarterly groundwater sampling event

AD

THE FOLLOWING ACTIVE SPILLS FOR THIS CATEGORY WERE REPORTED BETWEEN 1/8 MILE AND 1/2 MILE SEARCH RADIUS FROM THE SUBJECT ADDRESS. THESE SPILLS WERE REPORTED TO BE LESS THAN 100 UNITS IN QUANTITY AND CAUSED BY: EQUIPMENT FAILURE, HUMAN ERROR, TANK OVERFILL, DELIBERATE SPILL, TRAFFIC ACCIDENT, HOUSEKEEPING, ABANDONED DRUM, VANDALISM, OR STORMS. THESE SPILLS ARE NEITHER MAPPED NOR PROFILED IN THIS REPORT.

FULL TANK TRUCK WAS LEAKING WHILE DRIVING THROUGH BROOKLYN. STOPPED BY POLICE AT GREENPOINT AVE BRIDGE. AWAITING DEC CALLBACK WATERWAYS ARE AFFECTED AND COAST GUARD IS ENROUTE. 347−386−3072

DEC Investigator Remarks:

06/19/06−Hiralkumar Patel. visited site on Saturday night. when i reached at site, fire department had put speedy dry over spilled area. coast guard was on scene.

spoke to NYPD Lt. Kerner (94 PCT), TAX # 913415, Ph. (718) 383−4427. PD had secured area.

spoke to Jim Laznovsky (Cell: 631−484−3769), owner of tanker. company name was Eastcoast Fueling Services (631−225−2853). as per Jim, spill happened because of loose cap on top of tanker. oil spilled on asphalt road over the bridge. PD had stopped tanker on Queens side. driver tighten cap and cleaned tanker from outside. no soil affected. as tanker passed over bridge, oil ran to waterways and coast guard was handling that.

Jim Laznovsky
Eastcoast Fueling
717 south 9th Street
Linderhurst, NY 11757

spoke to Dan Leone from Miller environmental, who has been hired by responsible party for cleanup.

Dan Leone
Miller Environmental Group, INc.
Ph. (516) 876−7940 (O)
(516) 805−5944 (C)
FAX (516) 876−7946

Left site after meeting Dan.

while coming to work, visited site again today morning. bridge was open again. Miller has removed all speedy dry. there are still some stains over bridge. no odor. roads are cleaned up.

observed sheen in water under bridge. coast guard working for water cleanup. Left message for Kelly Dentry (917−682−0375) at coast guard.

06/20/06−Hiralkumar Patel. spoke to Mr. Dentry (718−354−4151) at coast guard. they visited site yesterday at around 9:00 AM and found little oil left as sheen. as per Mr. Dentry they are done and will not do any further cleanup.

case closed.

>>> Jennifer Rommel 10/28/03 11:14AM >>>

Hi Brenda.

. . .I am looking at a spill reported on 06/23/00, (spill 0003594) by Charles Guder of Gannett Flemming regarding a #4 fuel oil tank.

Caller remarks: petroleum impacts noted to subsurface soil. . . samples taken and results will be forwarded when available.

Let me know if you can provide any info on this spill, or if I should contact Gannett Flemming.

Thanks.

>>> "O'Shea, Brenda" <boshea@NewtownCreek−cm.com> 10/28/03 11:52AM >>>

Jennifer,

I spoke with Ellen and Winnie about this, Winnie recollects that Gannett

called in the spill and performed a satisfactory cleanup immediately. I

would contact Gannett directly for all information.

Regards,
Brenda

This spill case reassigned from CO to Region 2.

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL C"
4/12/04−Vought−Spill transferred from Tibbe to Rommel as per Rommel.

Spill transferred to Greco as part of Spills Closure Initiative in July, 2005.

Contacted original callers company and determined the spill name and address was originally put into system incorrectly as 20−90 Review Ave. (also incorrectly listed as 20090 Review Ave.). Neither of the above addresses is an actual address in Queens County, however, 28−90 is, and 28−90 has two tanks similar to the ones referenced in the spill report. 28−90 is also a the home of a company that is a client of the tank test company which called in the tank test failures. Spill name and address were changed to 28−90 Review Ave. The company at that addres is AA Truck Rental. JDG 8/3/05

Contacted Mr. PJ McDermott 718− 937−8611 at AA Trucking. Mr. McDermott is checking records and will get back to me. JDG 8/3/05

11/21/05 Tried to recontact Mr. McDermott, but he was unavailable. JDG

12/30/05 Tried to recontact Mr. McDermott, but he was unavailable. Left message. JDG

01/04/06 Insufficient documentation was received following several attempts. Have documentation that the tanks passed tightness tests in 1998, and were later closed in place in 1999, however, there is no record of a cleanup. Project needs further work, as release was characterized as requiring a "major excavation." Should be returned to region 2 for further investigation at end of Spill Closure Initiative.

9/8/06 − Jon Greco of Central Office sent an email stating:
"Most recently, the owner’s representative (Mr. Michael Paskoff, who has been performing tank tests at the site for many years, and it was his firm that called in the release 13 years ago) has asked that I close the spill, as it was called in solely due to an "inconclusive" tank test. He has copied me on a letter to the owner (Mr. Eric Roberts) and the letter reports that while the original tests were inconclusive, the tanks were retested later that day and were found to be tight. He goes on to say that no repairs were made and no excavations were performed by his firm. Finally, he claims the tests were observed by Inspector Geldman, of the NYC Fire Department." Reviewed PBS records, confirmed tank tested tight. Spills Closed. _ KST

UNCOVER ISOLATE AND RETEST

DEC Investigator Remarks:

6/18/08. J. Krimgold reviewed the letter−report submitted by ROUX Associate inc. dated June 2, 2008 with request to close the spill case. The letter−report contains no new info besides what the Department has already in its files. The 12 pages attached to the letter is nothing but printouts from our website or copies of documents (application, failed test reports, etc.) that was already submitted to the Department. Nothing in the letter−report points to the investigation of the cause of the test failure or removal of the release. Request for the spill case closure was denied. JMK.

12−27−2011 This spill was assigned to Leszek Zielinski on 06/28/10. Then this spill was reassigned from V. Brevdo to Alex

Zhitomirsky on 12−27−2011, as per V. Brevdo instructions. Emailed LiRo and received the following response by S. Frank: "We will pull together whatever information we have and forward it to you." AZ

2−7−2012 Site demolition and construction completed at site by May 2011. On 7/22/11 LiRo met with the site personnel and gathered additional information relevant to spill 0012519. LiRo prepared a letter to address DEC concerns from the July 2008 spill closure denial and submitted to DEC on January 23, 2012. Received and filed e−copies from LiRo. AZ

4−19−2012 Received on January 26, 2012, and reviewed Tank Closure Sample Results and Spill Closure Request dated January 23, 2012. The report stated that in August 2005, EMTEQUE Corp. oversaw Safeway Environmental perform closure and removal of tank#001. Approximately 15 cubic yards and four 55−gallon drums of soil were removed during excavation of the UST. No visible discoloration within the excavation was noted. No petroleum odors or elevated PID readings were recorded. EMTEQUE collected a total of five soil samples from the excavation pit. No VOCs were reported in any sample. SVOCs were reported above TAGM Levels in all five samples. The SVOCs reported were mainly polycyclic aromatic hydrocarbons (PAH)typically indicative of urban fill material. The site layout has changed significantly due to demolition and construction activities. Because of this, the former tank location is unknown.

Based on this information, LiRo requested closure of spill#0012519. This spill was closed and a letter was sent to S. Frank/F. Ashkan/V. brevod:"Dear Steve,

I have reviewed tank closure sample results and spill closure request for the above spill number submitted to DEC on January 26, 2012.000

A tank test failure of the tank#1 was recorded at this site. As a result, a spill #0012519 was issued.

EMTEQUE Corp. oversaw Safeway Environmental perform closure and removal of tank#001 in August 2005. Approximately 15 cubic yards and four 55−gallon drums of soil were removed during excavation of the UST. No visible discoloration within the excavation was noted. No petroleum odors or elevated PID readings were recorded. EMTEQUE collected a total of five soil samples from the excavation pit. No VOCs were reported in any sample. SVOCs were reported above TAGM levels in all five samples. The SVOCs reported were mainly polycyclic aromatic hydrocarbons (PAH) typically indicative of urban fill material.

Based on this information, this spill number is closed. All wells associated with this spill should be properly abandoned.

The Department hereby reserves all of its rights concerning, and such forbearance shall not extend to, any further investigation or remedial action the Department deems necessary due to:

I. The off−site migration of petroleum contaminants that was not addressed by this evaluation.

II. Environmental conditions related to the Site which were unknown to the Department at the time of this approval.

III. Information received, in whole or in part, after the Department’s spill case closure, which indicates that the corrective action was not sufficiently protective of human health for the reasonably anticipated use(s) of the site; or

IV. Fraud in obtaining this approval for inactivation.

Please be advised that you should maintain a permanent file of all documentation and correspondence regarding this case for future use. The Department's files regarding this release may not be maintained indefinitely.

Sincerely,
Alex Zhitomirsky

tank test failure − it will be cleaned and retested next week

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"
Sent tank test failure letter to Varderame. 11/15/2002 ARS

11/14/2003−Vought−Reviewed report dated 6/26/03 from Verderame Realty (Bruce Bauer 718−786−1100). Site will no longer be using oil and will be converting to gas. Closure of a 2000−gallon #2 fuel oil UST and collection of post excavatin endpoint samples by Bluestone Environmental (Andrew Cozzi 732−469−5188). "The UST excavation base was at approximately 8 to 8.5 feet below the concrete floor". "The soil in the excavation was a fill that consisted of dark brown sand with construction debris such as bricks and pieces of concrete". Five soil samples were submitted for analyses for 8260/8270. Soil analyticals show two 1,3,5−trimethylbenzene exceedances up to 9110ppb, benzo(a)anthracene up to 1010ppb, benzo(a)pyrene up to 631ppb, benzo(b)fluoranthene up to 1110ppb, benzo(k)fluoranthene up to 579ppb, and chrysene up to 1210ppb. These exceedances are attributable to fill material. Spill closed by Vought after conference with DEC Rommel.

This spill case reassigned from Central Office to Region 2.

CONTRACTOR BEING CALLED IN TO LOCATE PROBLEM WITH TANK−SOIL TO BE STOCKPILED FOR CLEAN UP. HOWARD KATZ 2ND CONTACT PERSON 718−937−9000.

DEC Investigator Remarks:

9/14/06 − Zielinski
Visited the site. The tank was closed in place on April 1, 2000. Received from Joe Epifane of ABCO Supply a copy of a manifest that 7 cubic yards of oil−soaked soil, blacktop, and concrete had been removed from the site in September 1998. The tank was repaired and subsequetly passed the tightness test performed by Fenley and Nicol Environmental on September 19, 1998(eDocs).

The case is closed.

9/11/06 − Zielinski
The spill transferred from CO.

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ZHAO"
10/24/00 originally assigned to tomasello. reassigned to zhao.

12/29/05 Transferred to E. Hampston via Spill Initative. PBS indicates tank closed in place. Need to contact possible owner George Moncher (#718−937−9000) to determine investigation and cleanup status.

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"
3/1/2002−VOUGHT−Initial tank test performed by ProTest Laboratories. Second and third tank test performed by Federal Electrical Supply Corporation (718−729−5700). The reason for spill report was initial tank test failure. As a result of failure vent line, fill line, suction line and return line were replaced by Petroleum Tank Cleaners. Tank was tested again on 2−6−2002 and failed again because testers failed to close off return line to day tank. Tank and system was tested for third time and passed on 2−14−2002. Isaac Mungra and Anthony (PTC) confirmed that there was no soil or groundwater contamination. Tank tests and repair invoices were provided. Spill closed by Vought.

DEC Investigator Remarks:

Need to send a CSL

02/07/06. Feroze talked Mr.Alex 718−786−7438. He informed that they repaired the system and tested the tank. Test result passed.
They will submit DEC the result soon.TTF is sent to:
Alex Javich
LIC Service Station

49−01 Vandam Street
Long Island City.
NY 11101.

02/14/06.Feroze, Mr.Bob Laga 718−762−5200 , Called & told me taht they replaced the vent line and tested the tank. The test is passed. He will submit the documents soon.

02/28/06 Feroze, received documents from The Franklin Company, NY (718−672−5200) that they removed and replaced the vent lines and tested the tanks again on 01/20/06. The tanks and sysyem passed the test. They also certified that the leak was in vent pipe and there was no siol contamenation. The spill is closed.

DRY PORTION LEAK;

DEC Investigator Remarks:

11/27/07 bf: Spoke to Nancy Galasso. She plans on repairing the tank and is waiting for proposal from Petroleum Tank Cleaners.
Confirmed mailing address and sent ttf letter to:
Nancy Galasso
Wickersham Realty
79 Wheatley Road
Old Westbury, NY 11568

1/2/08 On 12/27/07, received 12/11/07 passing tightness test for tank only. Included was a note requesting a response.

1/3/08 Called Nancy Galasso (516)626−3487. She told me tank failure was due to pipes. PTC is handling. Called M. Salamack of PTC. Tank emptied. Running on temp tank. No contamination found so far. Piping is both aboveground and underground. Company leasing building is giving PTC hard time. They were sent away when trying to make repairs. Lessee wants to remove tank and install AST. Owner wants to keep UST. PTC caught in middle and has to call lessee prior to doing work at the site (as per lessee). Mark will call lessee today. bf

5/22/2008 Sangesland sent a TTF 2nd Notice letter to:
Nancy Galasso
Wickersham Realty
79 Wheatley Road
Old Westbury, NY 11568

5/23/08 Received message from N. Galasso Wickershaw (516)626−3487. She said tank was closed, which according to DEC records was closed in 2008. I told her to close the spill case a letter/report is required. bf

5/28/08 Yesterday, M. Salamack left message stating no contamination found. Piping fittings were loose. He will send report to me by the end of the week. bf

7/24/08 received letter from Mark Salamack on 7/16/08. Suction line Cuase of failure was exposed pipe inside the building. Buried prtion of pie examioned and no sign of cantamination. Old tank abandoned and new 1080 gallon AST installed. Passing tightness test for tank included. Review of PBS file shows that tank was closed. NFA. bf

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"
AUSTIN − SPILL ORIG. ASSIGNED TO BATTISTA

11/04/93: MID COUNTY MECH. PERMANENTLY TOOK TANK OUT OF SERVICE 12/88 AND INSTALLED A NEW TANK 6/89.

12/19/2001 Sangesland spoke with Stephine Davis from FPM Group (631−737−6200 ext228). She called asking what can be done to close out this spill report. Apparently FPM Group started working on the site in 1993. At that time the "Free Product" plume (from a buried heating oil tank) was defined. Property is approx 1 acre and is a picture framing company in a 5 story building

Two belt skimmer wells were installed in 1993 and have been operating ever since. Product was skimmed off, separated, water has been drummed and removed from the site and product piped back into the heating oil tank to be used in the building burner.

The building owner has been operating the system and now says there is very little product in the skimmers.

Sangesland told Ms. Davis to submit a report (with as much DEC correspondance as possible in the appendix). The report should include a write up (1−2 page) of what the original problem was, what investigation/delineation was done and how the system has operated for the last 8 years. Sangesland said the area needs to once again be delineated to confirm the plume is gone. Suggested geo−probe in the area of the plume. Finally the environmental consultant will need to define how the dissolved product will be addressed from now on.

11/19/2003 Sangesland reviewed a report by Gregory Scott of Roux Associates (631−232−2600) The report outlines the work done on the site between 1988 and 2002. Belt skimmers were installed in 2 wells and pulled out 150 gallons of oil over a period of years. These skimmers were shut down in 2002 and this letter was requesting formal approval to shut them down. Since the floating product was removed, Roux would like the DEC to close out the case..... NO.

DEC is requesting GW samples from each of the existing wells tested to method 8270 and 8021. Depending on the concentration levels, additional remedial work may be required.

2/10/2004 Roux Associates Inc submitted a report dated 1/29/04. This report stated that "slight traces of measurable floating product is present in the onsite wells". This statement requires the DEC to maintain this as an open case.

3/4/2004 Roux Associates stated that they will do another round of sampling of the wells and submit the results "soon".

3/23/2004 Roux submitted a letter dated 3/22/2004 which states "no measurable floating product is present in the onsite wells. Though monitoring well MW−4 contained an absorbent sock with minimal product staining" No testing of these groundwater samples was done.

June 2004 − Sangesland and Austin made a site visit and concluded the spill should be closed out. DEC requested a final report with certain information documented.

7/19/2004 − Sangesland reviewed a report from Roux associates. All of the requested information was included. Based on this report, the former problem at the site has been remediated and now the site has very minor trace "hits" which may or may not be related to the original problem or from off site locations. Based on the industrial nature of the site and the fact that there are no impacts to human contact the DEC has closed out this case.

Caller Remarks:

Results of an analytical test revealed historic contamination at above site.

DEC Investigator Remarks:

10/7/08 − Raphael Ketani. The spill was called in on 10/2/08. It comprised the discovery of oil contaminated soil. The contact is Kevin Kleaka of Impact Environmental (631) 269−8800, ext 304. According to Property Shark, the site is block and lot 294 and 106. The main address is 5302 Review Avenue. The alternate address is 2890 Review Avenue. Property Shark contains pictures of a one story garage for trucks. According to ACRIS, the seller was Eric W. Roberts, 145 E. 81 Street, Apt. PH−A, Manhattan, 10028. The buyer is 2890 Review Avenue Associates, LLC, 2890 Review Avenue, LIC, 11101.

I sent a CSL.

Mr. Kleaka called me back. He said that they did some borings and found urban fill. He also found groundwater with floating product on it. However, he does not believe that the contamination in the fill is the same contamination as the floating product on the water. The site is on Newtown Creek and he suspects that oil made its way from the creek to the site. The site was an oil terminal and there was a spill in 1990, which was closed. He will send me a report soon.

There are five other spill cases for the site. All of them are closed. The cases are: 9010146; 9311731; 9313946; 9600032; 0803348.

10/10/08 − Raphael Ketani. I received the hard copy of the October 7, 2008 Subsurface Investigation Report on 10/8/08. I began my review today.

There was an aerial photograph with an overlay showing where six large fuel tanks had been and some railroad tracks. Head space analyses were high to very high for SP−1 and SP−6 from almost at grade to 10 feet below grade. The other borings, SP−3 to SP−5, had high head space hits only at the 8 foot to 10 foot interval. An approximately one foot thick layer of oil was found on top of the water table in all of the wells. Six wells were installed. All six soil samples were almost completely non−detect for VOCs and SVOCs. There were some VOC hits and SVOC hits, but they were either well below TAGM or slightly above TAGM. The groundwater samples for all six wells were almost completely non−detect for VOCs. There were a few very low exceedences and one hit of 310 ppb of sec−butylbenzene. No SVOC analyses were performed.

I contacted Mr. Kleaka and told him that he will need to do a round of groundwater sampling for SVOCs and that he will need to install more and larger diameter wells for oil recovery. I told him that it was strange that the groundwater was so contaminant free when a thick layer of oil was sitting on top. He said that he thought it was strange, too, and had no explanation for the lack of contaminants. He said that he will send DEC a plan for installing more wells and for an oil recovery approach.

10/20/08 − Raphael Ketani. I received a letter dated 10/17/08 from E. Gail Suchman (attorney) of Stroock (attorneys at law; (212) 806−6656). The letter stated that they were "developing an investigation work plan that will more clearly define the product layer and identify appropriate strategies for addressing it." "As soon as the work plan is completed, we will forward it to you for review."

11/21/08 − Raphael Ketani. I tried to contact Ms. Suchman, but could only leave a message.

Ms. Suchman called me back. She said that the client reviewed the draft workplan. The plan will be finished on monday and sent to DEC next week. The money to do the work is coming from the client’s insurance. Impact Environmental will be submitting the plan.

12/2/08 − Raphael Ketani. I reviewed the partial work plan submitted by e−mail last week by Impact Environmental. Only 3 soil borings were planned. The most contaminated sample will be sent to the laboratory for analysis, or a sample from the groundwater−soil interface. Six groundwater wells are planned and more may be installed as needed. My only comment was that they should sample the soil at each well location, besides installing the wells. I called up Ms. Suchman, but could only leave a message that soil samples must be taken from each well location, also. I tried to contact Mr. Kleaka (631) 269−8800, ext 304, but could only leave a message with his assistant, Wenqing (wen−ching) Fang, stating that soil samples will have to be taken at each well location.

I received the hard copy today. It was the same document as the one that I had received via the e−mail.

12/23/08 − Raphael Ketani. I tried to reach Ms. Suchman (212)806−6656 and Mr. Kleaka, but could only leave messages regarding progress for installing the borings and wells.

Later, Mr. Fang called back and said that Impact Environmental had not moved forward with the installation of the additional wells as they were waiting for comments from DEC. I told him that DEC had already commented on the work plan back on 12/2/08. He requested that I send a letter to show the client. I told him that I will send the letter.

I sent the letter by e−mail to Randall Austin, Chief of the Spills Unit, and I had Jeff Vought, acting Chief review the letter. The letter was sent out today.

12/30/08 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800, but could only leave a message.

1/12/09 − Raphael Ketani. Today I received the following e−mail:

Impact has received your approval letter for the proposed work plan regarding 2890 Review Avenue, LIC (NYSDEC Spill #0807459). Impact would like to propose that the Investigation Summary Report be completed within 90 days from the date of your approval letter (dated December 23, 2008). Let me know if you have any questions. Thanks!

Wenqing Fang
Environmental Engineer
Impact Environmental
170 Keyland Ct
Bohemia, NY 11716
Tel: (631) 269−8800

I responded back that this would be fine. The deadline for submission of the SIR is 3/23/09.

3/13/09 − Raphael Ketani. I received the following e−mail from Mr. Fang:

I tried to call you this morning regarding 2890 Review Avenue Site. Basically, our client had some financial issue with the insurance company, which led to the delay of the project. Now the issue is resolved and we had schedule the field work for the site from March 30 to April 1, which is the earliest date available for us. Subsequent to the field work, laboratory analysis and report generation will take approximately 3 weeks. We expect to submit the investigation summary report by April 23. Please let me know if this change is acceptable for the department.

I e−mailed him back that this schedule was acceptable.

4/3/09 − Raphael Ketani. Mr. Fang sent me the following e−mail:

This email is sent as an update for 2890 Review Avenue project. It has taken longer than expected to install the 4−inch wells at the Review Ave Site. This is mainly due to the presence of fill material on the site. We were basically doing one well per day. We expect to finish all the wells by next Tuesday, followed by well development. Groundwater sampling will be performed two weeks after the well development.

Low−flow technique will be utilized as per your request. However, please be advised that significant clay and silt was encountered during the well installation. Therefore, low−flow might turn out to be impractical for this site. If so, traditional purging and sampling method will be utilized.

4/23/09 − Raphael Ketani. I tried to contact Mr. Fang (cell (631) 790−3338 regarding whether the groundwater samples were taken, but could only leave a message.

4/24/09 − Raphael Ketani. Mr. Fang sent me the following e−mail response:

On April 23, Impact conducted groundwater sampling, well survey and slug test at Review Avenue Site (two weeks after well development). It will take approximately two week for the laboratory analysis. After that, I will need approximately 10 days to prepare the report and have our client review it before I can send it to the DEC.

5/20/09 − Raphael Ketani. I received the following e−mail from Mr. Fang:

This email is an update for the 2890 Review Ave project. A total of 6 4−inch wells are installed on the Site by 4/6/09. Well development was finished on 4/10/09. On 4/23/2009, two weeks after the development as required by the DEC, wells were gauged and sampled. No free−phase product was observed in any of the wells. This contradicts with the previous observations via 1−inch wells. Therefore, Impact propose to re−gauge the wells next week (4 weeks after sampling). Upon finishing of the second gauging, Impact will release the Investigation Summary Report for the Site.

6/25/09 − Raphael Ketani. I received the June 24, 2009 Investigation Summary Report. I reviewed the report. The site is on the east side of Dutch Kills and a little south of Borden Avenue. Groundwater is at 5 to 7 feet below the surface and flow is to the northwest. Measureable product was originally detected in the 1 inch wells from 0.8 to 1.4 feet. The product is a mix of gasoline and #6 oil. PID hits for MW−1 and MW−2 were the highest at about 15 feet below the surface. MW−3 had PID hits of 665 ppm and 645 ppm at from 2 to 5 feet with low readings below this. Groundwater was collected below the product. Analyte speciation indicates that this is weathered oil. No source of petroleum was identified in the soil. After development, the 4 inch wells were gauged on 4/23/09 and 6/5/09. No measureable product was found in any of the wells. On 6/12/09, all of the 1 inch wells, all of the 4 inch wells, and a pre−existing 4 inch well (MW−7H) were gauged. MW−7H had 0.01 feet of oil. All of the other wells didn't have oil. Soil analytical results for the 1 inch wells were almost completely non−detect. Soil analytical results for the 4 inch wells were almost completely non−detect with two hits just over TAGM limits. Groundwater analytical results for the 4 inch wells were almost entirely non−detect with MW−4 having 10 VOC hits, with two of the hits slightly above TAGM limits.

6/30/09 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800 in order to discuss the report, but could only leave a voice mail. I stated in the voice mail that soil removal wasn't necessary, but that groundwater should be evacuated from MW−4 in order to bring the analytical levels down, and that another round of groundwater sampling should take place during the next quarter.

I sent Mr. Fang an e−mail (wfang@impactenvironmental.com) requesting the following:
1) a copy of any historical documents regarding the site
2) a copy of any documents describing past remediation efforts

I also asked him the following:
1) is the site to be sold in the near future
2) what will be the future use of the site

8/5/09 − Raphael Ketani. I tried to contact Mr. Fang via his cell (631) 664−6115 regarding groundwater monitoring and remediation, but could only leave a message.

8/6/09 − Raphael Ketani. I made a very quick unannounced site visit. The site was loaded with trucks of all kinds and there was some type of construction material storage facility along the Borden Avenue side (see pictures in E−docs). A tanker truck fuel loading structure was still situated a little ways inside the property. Otherwise, there was nothing to note.

8/10/09 − Raphael Ketani. I tried to contact Mr. Fang by his cell and by his desk phone, but could only leave a message with the receptionist.

Mr. Fang called me back. He said that he had been away for two weeks and that is why DEC hasn't heard anything regarding progress at the site. He also said that he is working with the attorney for the owners of the site on a response document to DEC's latest comments. He said that DEC should receive the document soon.

9/22/09 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800/cell (631) 664−6115, but I could only leave a voice mail asking him why the DEC hadn't received any documentation regarding the continued monitoring and remediation of the site.

10/1/09 − Raphael Ketani. I reached Mr. Fang on his cell. I asked him where the response letter was addressing DEC's comments regarding the June 2009 report. Mr. Fang said that he remembered that he owes DEC a letter. He said that he has to get back to his boss and the client's lawyer regarding the June report and a response for DEC. I told Mr. Fang that the DEC still considers the spill to be unresolved and the site to be in violation. He said that he is aware of this. He asked for some time to send a response to DEC's comments. I asked him whether October 16 would be a reasonable deadline. He said it is and that he will get me a letter.

10/30/09 − Raphael Ketani. Mr. Fang sent me an e−mail with 6 attachments. These attachments were: a collection of Sanborn maps for the site; a tank affidavit; a Septmeber 2001 Tyree Brothers Phase I Report; an e−mail containing the May 1990 Tyree SIR and an October 1990 Tyree site status report; a collection of correspondences and reports ("spill closure reports") up to November 2001 between Mr. Sullivan of DEC and Tyree Brothers Environmental; and a response letter dated October 30, 2009 from Mr. Fang.

11/2/09 − Raphael Ketani. I reviewed the 6 e−mails. The only one requiring a response was the 10/30/09 letter from Mr. Fang. Large above ground oil storage tanks were present on the site from 1936 to 1970. During this time, the site was operated as a storage terminal by Texaco. The current owner bought the site about 1971 and found the tanks to be clean. The tanks were removed. In the mean time, the owner will continue to use the site as a trucking company. The future use of the site is industrial. Mr. Fang responded that the wells were screened within the tidal range. The groundwater will be sampled at the next quarterly round. However, Mr. Fang stated that Impact Environmental will not excavate the contaminated soil at SP−1, SP−3, and SP−6. His reasoning

was that this contamination represents an old spill with degraded oil and that the contamination is below the guidance values. He went on to state that no source area had been identified and that natural attentuation will take care of the matter. He referred to DEC's request to do excavation at these locations as "random excavation", and added that they would be unlikely to find the source area.

I drafted a response letter for Mr. Austin's approval. The response letter stated that the DEC is requiring that the oil at MW−7H be collected, and that Impact Environmental resample all of the 4 inch wells.

The letter was approved by Mr. Austin and went out today.

12/23/09 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800/cell (631) 664−6115, but could only leave a message regarding oil collection at MW−7H and resampling the 4 inch wells.

1/8/10 − Raphael Ketani. I tried to contact Mr. Fang at his office phone and at his cell, but could only leave messages that the DEC needed to receive updated information regarding the site, and that the oil must be collected from MW−7H. I tried to contact Mr. Kleaka (631) 269−8800, ext 304 (Mr. Fang's boss), but could only leave a message stating that the oil needed to be collected and that groundwater sampling needs to take place.

I contacted Mr. Fang. He said that he is waiting for the owners of the property to sign the new contract with Impact Environmental. He said that he expects the contract to be signed no later than the end of January. I told him to do the groundwater sampling and oil collection as soon as Impact can. He said that he will.

2/10/10 − Raphael Ketani. I tried to contact Mr. Fang, but could only leave a message that the DEC wanted the oil collected and the groundwater sampled.

2/18/10 − Raphael Ketani. I tried to contact Mr. Fang, but could only leave a message that the DEC wanted the oil collected and the groundwater sampled.

2/22/10 − Raphael Ketani. I tried to contact Mr. Kleaka (631) 269−8800, ext 304, but could only leave a message requesting oil collection and groundwater sampling.

3/2/10 − Raphael Ketani. I tried to contact Mr. Kleaka, but he was in a meeting. So I left a voice mail that if the DEC doesn't receive a response by phone, or e−mail, or by letter regarding progress on the project, then we will take legal action. I could not contact Mr. Fang as he was not in the office. I tried contacting him by cell (631) 664−6115, but could only leave a message.

Mr. Fang returned my call. He said that work at the site is scheduled for the week of 3/1/10.

3/4/10 − Raphael Ketani. Mr. Fang sent me the following e−mail today:

Groundwater wells at Review Avenue were gauged and sampled today. No
free−phase product was detected in any of the six 4−inch wells installed
by Impact (MW−1 through MW−6). Approximately 0.1 inch of free−phase
product was detected in one old well (MW−7H) installed by Tyree.
Groundwater samples from MW−1 through MW−6 will be analyzed from 8260

and 8270. I will send you a letter report when I have the results.

3/29/10 − Raphael Ketani. Today I received the First Quarter Monitoring Report from Impact Environmental dated 3/12/10. I reviewed the report. The groundwater analytical results were almost entirely non−detect. There were several hits, but they were just above the TAGM limits, with the exception of one 54 ppb hit. Well MW−7H showed 0.01 feet of oil. I e−mailed Mr. Fang that he should do an EFR event for MW−7H and then sample all of the wells for the second quarterly round.

5/24/10 − Raphael Ketani. I contacted Mr. Fang (631) 269−8800/cell (631) 664−6115. He said that the groundwater sampling will take place this week. The oil at MW−7H will be collected using a sump skimmer. He said that he should be able to get DEC this round's analytical results in about 3 weeks.

6/22/10 − Raphael Ketani. Today I received the Second Quarter 2010 Groundwater Monitoring Report from Impact Environmental. I reviewed the report. All of the analytical results were non−detect, except those for MW−4 and MW−5. The samples from these wells had gasoline range VOCs that were up to 119 ppb of n−propylbenzene. I wrote back in response that the contaminated groundwater may be removed by pumping. I added that the report did not mention how successful Impact Environmental was in collecting oil from MW−7H. I also wrote that, as a result of the elevated VOC hits, another round of sampling will be needed in the third quarter of 2010.000

7/14/10 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800, ext 325/cell (631) 664−6115 regarding progress at the site, but could only leave a message.

7/26/10 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800, ext 325/cell (631) 664−6115 regarding progress at the site, but could only leave a message.

I contacted Ms. Suchman (212) 806−6656 and explained that I haven't heard anything from Mr. Fang in a month regarding the groundwater and oil pumping. She said that she thought this would take place during the next sampling round (third sampling quarter). I told her that these were tasks that the DEC expected to be performed very soon after the 6/22/10 letter was sent. She said that she will call Mr. Kleaka and Mr. Fang and have them get on top of the situation.

7/26/10 − Raphael Ketani. Mr. Fang sent me the following e−mail today:

Absorbing well sock was installed in MW−7H
about a month ago. Last time we checked, the well has no free−phase
product in it. We recently changed the sock and will wait for another
month to go back to see if there is any additional product. If not, we
will properly develop and sample that well.

7/28/10 − Raphael Ketani. Mr. Fang (631) 269−8800 called me today. He said that they recently took out the sock from MW−7H. It was slightly dark, but not saturated with oil. He put another sock in. He will wait for a month and then check the new sock. If the sock has little or no oil, and if there is no visible sheen, then he will develop the well for sampling. I commented that MW−4 and MW−5 had slightly elevated analytes. He said that he will evacuate about 55 to 100 gals. of water from these wells and then sample them. Mr. Fang asked that, in the future, if I need to contact him, I should send an e−mail or contact his supervisor, Mr. Kleaka.

9/23/10 − Raphael Ketani. I tried to contact Mr. Fang (631) 269−8800, but I could only leave a message.

9/27/10 − Raphael Ketani. I received the Third Quarter Monitoring Report dated 9/9/10 from Impact Environmental. I reviewed the report and found that the results for the third quarter were almost entirely non−detect. The few hits that were present were not far above the TAGM limits. The report also mentioned that there was no product in the wells.

Based upon the data in the Third Quarter Monitoring Report, I have determined that any residual contamination that is present will not be a threat to the public or the environment. Therefore, I am closing the spill case.

8/10/11 − Raphael Ketani. Today I received a letter from Mr. Fang indicating that the wells at the site had been plugged and abandoned.

Historical Spill− Odor in soil. Phase 2.

DEC Investigator Remarks:

Sangesland spoke to Jill Guerra at GCI. Her firm did a Phase 2 for a sale and found old contaminated soil. She is going to check the current status on the case and call Sangesland back with details.

07/05/11 As per Langan, the source of the spill is a UST. Underground piping was traced from a petrometer inside the site building.Approx 2,000 cubic yards of soil was affected as a result of the spill of which 450 cubic yards contain hazardous concentration of lead. GW was not significantly impacted. Seven soil borings were advanced in the UST locations.Soil borings log were provided.VOCs were not detected in any of the soil samples.Twenty two metals were detected in soil samples.Copper, Lead, nickel concentration exceeded DEC Part 375 RSCOs. Based on high concentration of lead, approx. 450 cubic yards of soil will be considered as RCRA hazardouse waste.Site remediation tasks include: closure of the UST via removal, removal of petroleum contaminated soil, collection of end point samples, placement of clean fill to restore the Site conditions, air monitoring during the remediation.(sr)

7/10/12 − Austin − Received phone call from Ms. Armstrong of Langan. They wished to proceed with the excavation plan as outlined

by the RAP and approval issued last year. DEC Rahman was out of the office for an extended period, so I sent Ms. Armstrong via e−mail the RAP approval letter and the original schedule for implementation submitted by Langan on 7/14/12. I requested that a new schedule be submitted to us for implementation, before Langan could proceed. − end

09/18/12 Closure report in edocs. As per the report, Area A: USTs and associated piping were not detected. The source of spill 1009365 was not identified and is likely related to historic site use or poor housekeeping. About 213 tons of petroleum contaminated soil was removed.Ground water was not impacted. End point soil sample result indicate that petroleum impacted soil has been removed.Source of spill 1204192 was a historic 1,250 gallon UST.The UST was removed in accordance with regulations.Approx 99 tons of petroleum impacted soil was removed and disposed.Ground water was not impacted. End point soil samples result indicate that residual contamination within acceptable limit.Case closed.(sr)

BARGE SUNK AND NO SHEEN AT THIS TIME AND UNLOADI9NG SCRAP METAL FROM BARGE AT THIS TIME;

DEC Investigator Remarks:

3/5/07 − Raphael Ketani. I called up Fred Cornell of Sims Hugoneu (cell (201) 739−9687). He said that the barge had been sitting overnight when it sunk. He suspects there is a hole in the hull, but he doesn't know for sure. He said that, sometimes, when the tug boat operator pushes a barge, he hits or bumps into something.

The barge didn't contain oil or oil holding tanks. It is a non−motorized barge. It just had scrap metal and this was unloaded. There is no sheen from the barge. The Coast Guard has been notified. The barge will be refloated and repaired.

I asked him why this was called into the Spill Response Hotline when there was no oil in or on the barge. He said that he was

just being cautious about the incident.

Based upon my conversation with Mr. Cornell and the information above, I am closing the spill case.

Caller Remarks: NO REMARKS GIVEN FOR THIS SPILL

DEC Investigator Remarks:

4/21/10 − Notifier contacted DEC Public Affairs − Complained of oil film on personal vehicle parked at that location − unk. source − requesting investigation by DEC

4/21/10 − Raphael Ketani. I met Robert Grubman (516) 567−2436 at the site, 34−02 Review Avenue. The site was a parking area between two buildings owned by Storage Plus, a personal storage company that provides storage cubicle space to the public. The parking spot for Mr. Grubman's silver Jeep Cherokee was in the back of the parking area and against a fence separating the parking area from the railroad. There were no electrical transformers nearby, nor any heavy equipment in the vicinity that might have hydraulic systems.

Mr. Grubman showed me the material that was on his car. It looked like sprayed oil, but my PID meter didn't register any volatiles. The fine droplets didn't have an odor (see E−docs). the droplets were more numerous on the driver's side of the car, the top, and the back. He said that he had washed the droplets off of the windshield as he couldn't see out. There were no droplets on the ground, or on the chain link fence or the sign on the fence. There were no droplets on the black car parked next to his on the passenger side and no droplets on the silver SUV parked next to his car on the driver's side. I asked Mr. Grubman how long his car had been parked here. He said two days. I asked him whether the cars on either side had been parked her as long.

He said that the black car had been here two days, also. Mr. Grubman said that a train had parked on the tracks next to his car. I told him that it was possible that the train had a pinhole hydraulic line leak, but that I didn't see any evidence of this as there were no signs of droplets on the fence or the ground. He said that he didn't want to have something potentially toxic on the car. I told him to go to a car wash and get the car cleaned. He said that he was going to contact AMTRAK and have them deal with the "oil" or whatever it is. I told him that was his choice. I added that if this happens again, then he can contact DEC again and we will investigate the incident. After this, I left the site.

The source of the droplets is unknown. They may have landed on his car when he was parked somewhere else, but he didn't notice them until he saw them now in the daylight. As there doesn't appear to be a threat to people or the environment from the limited presence of the droplets, and as the source is unknown, I am closing the spill case.

GASOLINE	PETROLEUM	0	GALLONS	0	GALLONS	SOIL

Caller Remarks:

THIS WAS A SOIL SAMPLE THAT FOUND CONTAMINATION.

DEC Investigator Remarks:

07/21/06−Hiralkumar Patel. spoke with Ron (FAX: 718−762−0545) at Core Environmental. he has been hired by bank to do phase I and Phase II investigation. during PHase I investigation, he found two 3000 gal USTs which was in use to store #6 oil. owner abandoned these tanks after test. bank asked Ron to do limited PHase II investigation and during soil boring in front of tank, Ron found contaminated soil right above groundwater table. groundwater is approx. 11 ft bg. Ron took soil and groundwater sample and will get lab results by Tuesday July 25, 2006. Ron will fax owner's information.

PBS#: 2−610272.
08/23/06 Rahman− I had a site meeting yesterday with Mr. Taffel and Mr. tramposch.After the discussion, it was decided that extensive delineation of soil/ground water is required for that site,specifically, ground water flow directions/and extent of contamination.A csl was sent to
Review Realty Associates, LLP
362 Kingsland Avenue
Brooklyn, NY 11222
Attn: Mendy Taffel
08/31/06 Rahman− Temporarily assigned case manager for this site is Raphael Ketani.
01/24/07 Rahman− Limited Phase II ESI by Core Environmental.Eleven soil borings were advanced for soil sampling and later on,ten borings were converted to monitoring wells, ground water was sampled for analysis.VOCs were not detected above the TAGM values in soil samples.There were some SVOCs exceedances in soil that are typical to New York city fill which include ash and burned material.Among VOCs, only Toluene exceeded the limit slightly in ground water,all other VOCs were nondetect.No SVOCs found in ground water. 2 USTs were closed in place on June,2006.Considering the industrial nature of the local area and absence of sensitive receptor, no further action is recommended.

Caller Remarks:

Large oil slick on creek, by Nature Walk Park − trailing west towards Manhattan Ave. park

DEC Investigator Remarks:

11/10/09 − Austin responded to site, and got there at 15:20. Met with Laura Hoffman and Christina Hallowitz at park − observed 50 x 12 foot slick of weathered oil, leaf debris, and other earthen materials. Slick spreading out into silvery sheen and hugging top western corner of Whale Creek, and streamed past park nature steps, westward. Appears to ba an isolated slug of material. No source found − material dissipated. Discussed DEC's strategy in our trackdown effort with two complainants. Departed scene. Photos taken in eDocs. − end

Caller Remarks:

CALLER STATES THAT THERE IS FREE PRODUCT WITH A SHEEN IN THE CREEK.

DEC Investigator Remarks:

06/19/09−HRAHMED−Responded to the scene as day time runner. DEC R2 RSE Randall Austin also present on−scene. Met Laura Hoffman. She showed us the sheen area. There were unrecoverable degraded oil sheen with some debris around it, in an approx 400'X 20' area. These might come from sewer overflow. DEC Solid Waste Section need to do some investigation in the surrounding Solid Waste Management Facilities. Some picture were uploaded to eDocs.

6/22/09 − Raphael Ketani. As acting head of the Spills Unit in Mr. Austin's absence, I sent Sharif Rahman, EEI of Spills, out to the site to check out the current situation of Newtown Creek and Whale Creek Park. I E−doc'd the pictures he sent me. He didn't see any sheens. The locations of the pictures he took and below:

586, 587,589,590,592 taken from underneath the Pulaski Bridge on Queens side.There are two DEP outfalls under the Bridge on Queens side.
602,603,604 taken from Manhattan Ave street end park.
616 to 621 taken from 100 Paidge Ave Waterfront Nature walk.

No sheen or oil slick observed.

A meeting was held this morning to discuss the repeated appearances of sheen on Newtown Creek in the vicinity of Manhattan Avenue and Whale Creek Park. In attendance were Suzanne Mattei, Tony Morenzi − Regional Direction, Amar Nagi, Jacob Krimgold, Hasan Ahmed, Raphael Ketani − DER and Spills, Robert Elburn and Selvin Southwell − Division of Water, and Martin from Central Office.

The occurrences and possible origins of the sheens were discussed. The meeting concluded with Ms. Mattei asking that Spills, Water, and Solid Waste conduct site inspections of the sites in the vicinity of Manhattan Avenue and Whale Creek Park and monitor the effects of the barge traffic on the creek.

Notes from the meeting were put in the E−docs.

06/24/09−HRAHMED−Inspected some facilities around the Whale Creek with Edward Rossan of Water Division. Noticed oil sheen and floating debris in four location in New Town Creek, a map was uploaded to eDOC marking the oil sheen observation locations and some facilities info. Uploaded some pictures to eDocs.

12/16/09 − Austin − Received phone call from Christina Halowicz (718−349−0150) regarding complaint she received from Chris Hancan (941−726−0721). He observed a plastic pipe discharging oil/water into Newtown Creek. Called in under #0910221. Investigated by Rahman − unfounded − pipe referred to DOW (had SPDES permit sign) for followup − end

5/5/10−HRAHMED−No complaint received since Jan 2010. Case closed.

CALLER STATES THAT THERE IS A SHEEN ON THE WATER.

DEC Investigator Remarks:

Sangesland spoke to Laura Hoffman. She is a private citizen who is in the Newtown Creek Watch Group. She says there are clumps of brown oil floating in the creek along with a sheen. Unknown source.
Go to corner of Paidge & Provost and walk down the nature trail to the water.

05/19/09 Performed site visit today and walked down the natural trail to the creek. No oil sheen observed on the water,only debris in some places.Case closed.(sr)

AND WASHING UP ONTO THE NATURE WALK STEPS; THERE ALSO APPEARS TO BE PILE DRIVING IS GOING ON IN NEW TOWN CREEK SO IT MAY BE

RELATED;

DEC Investigator Remarks:

left was no longer in service. No report from any other locality. Closed.

8/20/08 − Austin (previously assigned to Piper) − Reopened to investigate several complaints in this area about an oil spill on Newtown Creek. Unable to contact complainant, so staff (Austin and Patel) proceeded to location to invrestigate allegation.

On 8/14/08, we initially went to the Newtown Creek shoreline via the yard at Paidge Asphalt, 91 Paidge Ave., Greenpoint. This location is immediately west of the Nature Steps site. The water had some leaf debris and a weathered organic sheen (no color or rainbow associated with it), but no other indications of oil, or stressed/dead biota. We then entered 100 Paidge Ave., a.k.a.Nature Steps, the NYCDEP shoreline walkway built by the NYCDEP that adjoins their sewage treatment facility, and runs along the southern shoreline on Newtown Creek, west of a tidal inlet . We walked along the shoreline of Newtown Creek, then traveled south along the western shoreline of tidal inlet. We again saw some leaf debris and some floatables, but nothing that resembled fresh/emulsified oil or sheens. No dead crabs or other biota were found. Floating debris had accumulated at the head of the tidal inlet, but this material was not oil tainted or sheening.

Coming back to the office, I examined the photos from Laura Hofmann. The light brown material appears to be either raw sewage or benthic organic material that had become waterborne, and floated to the surface. This latter circumstance, in turn, may have come from gas generation in the benthic sediments, which, due to the high water temperatures and resulting oxygen sag in the water column, could have been generated by anaerobic decomposition. This would have "burped" the benthic material up to the surface. Since water bodies are most anoxic in their deepest areas, organisms such as crabs would be the ones that would be impacted the greatest (we have had reports of crabs crawling out of the water in droves at this time of year, due to the low oxygen conditions). It could have also come from sewer bypasses during the recent storm events we have had in the area, and that may be why there is trash and leaf debris associated with this mass in the water. The water clarity along the steps that lead into the water seemed clear.

We are closing this matter out, and have reported back to the RD/RRE/Tony Morenzi and the DEC Regional Public Affairs Office of our findings, forresponding back to the complaints and inquiries aboout this event − end

Caller Remarks:

SHEEN IS VERY BIG RIGHT NOW AND GETTING BIGGER; COAST GUARD HAS BEEN NOTIFIED: STILL INVESTIGATING:

DEC Investigator Remarks:

10/17/05−Vought−Received call from Ed Waldron (Tyree 631−300−5285). Spill called in due to gasoline and in creek behind terminal. Waldron discovered that source is from leaking underground line. Terminal and pipeline shut down to prevent further release. Excavation of soil resulted in 10'x10' pit with groundwater at bottom. Vac truck onsite to remove free product. Spill transferred to Zhao. Vought called Waldron and informed him that spill was transferred to Zhao. Waldron indicated that gasoline was still entering excavation.

10/17/05−Vought−Off hours duty responder. Received second call from hotline that FDNY Hazmat on scene and problem was "happening again". Vought performed site visit. FDNY onscene due to odor complaints from neighborhood of gasoline fumes. Source of fumes was open excavation in which gasoline has accumulated. Odor complaints were of outdoor ambient air and not sewer impact. Onscene was Getty Petroleum (James Geraci), Tyree (Ed Waldron), NYCDEP (John Wilson) and FDNY Hazmat. USCG notified and responded but left scene by time of DEC site visit. Small amount of free product (approximately 15'x5 entering Newton Creek but was not contained due to possible fire hazard. Tyree will remain onsite entire night ensuring continued performance of recovery pump. Approximately 4000−gallons of product/water mix recovered so far. Free product entered Newton Creek via impacted sewer (total length of approx 150'). Boom and pads placed in sewer to recover free product. Pipeline was repaired with collar however Getty awaiting DEC policy on whether collar can be used permanently or entire line needs to be replaced. Getty willing to perform tightness test of line. Line is currently empty and entire terminal shut down. Impacted soil from excavation to be removed tonight by Clean Harbors.

11/8/2005 − jz: Zhao performed an investigation on site on 10/17/2005. Three monitoring wells were installed. Re−visit on 11/3/2005. Line was pressure tested in 11/2003 and all passed. Pipes are in dood condition with no sign of corrosion besides the

hole. No more free product in the area. Pipe has been fixed, tested and back in service.

1/31/2006 − JZ: Three monitoring wells show clear samples with free product. Free product was recovered from the near by sewer manhole. No further action is required.

SOIL BORING AND WELL INSTALLATION JUST INSIDE BAY DOOR ALONG PROVOST STREET CAME UP WITH PETROLEUM CONTAMINATED SOILS AND POSSIBLY GROUNDWATER. SITE IS ADJACENT TO FORMER EXXON TERMINAL.

06/16/06: This spill is transferred from Mike Mulqueen to Mr. Koon Tang.

10/13/10 − Austin − Spill being transfered from Tang to Region 2 Spills staff − end

10/19/10−Hiralkumar Patel.
no alternate addresses.
other spill #: 9210719. spill was reported on 12/16/1992 by coast guard. possibly spill in water. case closed.
PBS #: 2−600039. as per the PBS record, site has following tanks:

− one 550 gal diesel AST on saddles, installed in Mar. 1990
− one 1,080 gal diesel AST on saddles, installed in Mar. 1990
− one 10,000 gal #2 oil AST in contact with imprevious barrier, installed in Sep. 2002

1:06 PM:−spoke with Mr. Sokolow, controller of Perez Interboro Asphalt. Mr. Sokolow mentioned that they did further investigation and some remediation. lateron they filed claim against ExxonMobil as part of greenpoint plume. Mr. Sokolow mentioned that reports were submitted to DEC and an attorney who is handling claim of Newtown Creek residents against ExxonMobil.

Perez Interboro Asphalt Co., Inc. **property owner**
99 Paidge Avenue
Brooklyn, NY 11222
Attn.: Joshua Sokolow
Controller
Ph. (718) 383−4198
Fax (718) 383−9164

Lyssa Roberts **attorney representing Newtown Creek residents**
Girardi & Keese
1126 Wilshire Boulevard
Los Angeles, CA 90017
Ph. (213) 977−0211
Fax (213) 481−1554
email: lroberts@girardikeese.com

1:40 PM:− spoke with DEC Edward Hampston in Albany office. Ed mentioned that area around 99 Paidge Ave was part of ExxonMobil's terminal and not any refining process in the area. Ed asked to check Exxon's files on E−docs.

reviewed one of the report and found that Exxon's Marketing Terminal No. 3020 was located immediately south and east side of Perez Asphalt (see map on e−doc).

2:02 PM:− spoke with Ms. Roberts at Girardi and Keese and asked her to send copy of reports for property 91−99 Paidge Ave.
2:11 PM:− sent email to Ms. Roberts requesting copy of available documents/reports for the subject site.

02/07/11−Hiralkumar Patel.
4:07 PM:− received email from DEC Hampston. Hampston is handling ExxonMobil remediation and was contacted by a potential buyer looking for spill closure based on recent Phase I investigation results.
4:19 PM:− sent email to Hampston. asked him to inform the buyer to submit any phase I and phase II for review.

02/09/11−Hiralkumar Patel.
9:06 AM:− received email from Hampston. he mentioned that buyer will submit Phase I shortly.
9:07 AM:− sent email to Hampston requesting buyer's contact info.
9:30 AM:− received email from Hampston including buyer's contact info.

Kevin Lumpe
Steel Equities
700 Hicksville Road
Bethpage, NY 11714
Ph. (516) 576−3165
email: klumpe@steelequities.com

12:52 PM:− left message for Mr. Lumpe to submit available environmental investigation reports.

03/21/11−Hiralkumar Patel. received letter from ERM. ERM conducted a Phase I investigation for the subject site. based on following information, ERM claims that the subject spill is not associated with 99 Paidge Ave:
− original spill was reported for Williamsburg Steel, but as per 1995 and 1996 Sanborn Maps, Williamsburg Steel was located at 59 Paidge Ave
− in 1996, 99 Paidge Ave was owned by Diamond Asphalt Co.
− as per initial notes from DEC Mulqueen: "soil boring and well installation just inside bay door along Provost Street came up with petroleum contaminated soils and possibly groundwater"; as per ERM, 99 Paidge Ave has no frontage on Provost Street
− as per 1995 and 1996 Sanborn Maps, Williamsburg Steel was located at 59 Paidge Ave and on a triangular shape parcel across the street from 59 and 99 Paidge Ave; this triangular shape parcel fronts Provost Street
− exact address of the triangular shpae parcel is unknown
− triangular shape parcel now owned by NYC DEP and is part of sewage treatment plant

discussed with DEC Austin. he asked to contact BBL, DEP consultant who reported the spill to confirm the address and to get any reports available.

BBL is now owned by Arcadis.

Arcadis U.S., Inc.

655 Third Avenue, 12th Floor
New York, NY 10017−9118
Ph. (212) 682−9271
Fax (212) 682−9275
Website http://www.arcadis−us.com

4:07 PM:− left message for Janet at Arcadis.

03/22/11−Hiralkumar Patel.
8:52 AM:− received call from Janet. Janet doesn't know anything about this site. she asked to contact Vatche Minassian, a person working since 2001 and handling NYC DEP projects.

Vatche Minassian
Ph. (212) 682−9271 Ext. 17
email: vatche.minassian@arcadis−us.com

9:04 AM:− sent email to Mr. Minassian and asked him to call to discuss further.

03/24/11−Hiralkumar Patel.
12:53 PM:− left message for Mr. Minassain.

04/27/11−Hiralkumar Patel. received message from Christopher (at 1:54 PM on 04/26/11) from ERM

Christopher O'Leary
Environmental Resources Management
Ph. (631) 756−8903

2:53 PM:− spoke with Chris at ERM and informed him that the case is still open as the department is waiting for response from Arcadis.
2:57 PM:− spoke with Mr. Minassian. he wasn't with company in 1996 and they only keep records for 10 years. so they don't have any records.

04/28/11−Hiralkumar Patel. after discussing with DEC Austin, case closed as no information (lab data or report) available to confirm the spill at 99 Paidge Ave.

Caller Remarks:

received e−mail (no text) with attached photos from Ms. Holowacz. Photos indicated oil sheens and debris, including oil saturated items, flaoting along the southern shoreline of Newtown Creek, fronting Nature Walk Park. No other info provided by e0mail, originaly sent by Holowacz to Regional Director.

DEC Investigator Remarks:

10/3/11 − Austin − I went with DEC Vought to park arriving at 330 PM, 1/2 hour after receiving report. Debris was found along the shoreline at park (tide was high slack), but no oil soaked materials or sheens were observed. Replied to e−mail from holowacz, and requested further info on photos. − end

10/13/11? − Austin − Spoke with Dr. Sarah Durand, Envir. Science professor at LaGuardia Comm. college, Thompson Pl., Queens (718−482−5743), who was the original person who spotted the oil soaked debris and sheen in this event. She indicated that she and her students did routine sampling in Newtown Creek for tranditional parameters, and spotted the material/sheen. I told her about the Spill hotline, in case she came across any other such situations, so that she could report them to us for immediate response. Case closed − end

Caller Remarks:

DEC (Saccacio) found ten 550 gallon USTs being removed from the ground by a contractor. The soil around the tanks were contaminated with an unkown petroleum.

DEC Investigator Remarks:

A search of previous spill at that address turned up spill # 9712326. This spill was a report of contaminated soils discovered on 2/4/98 during a phase II site assessment. The spill was assigned to DEC (Sigona) who closed the spill out on 3/28/00

1/18/2006 − Haggerty − Noel Biscone from Bridgedale (718−965−6450), property manager, submitted Subsurface Investigation Report for review. The sampling dates may be sufficent to close this spill # as well

Ten 550 gallon deisel USTs (See PBS# 2−233404) and 630 tons of contaminated soil were removed in August 2004. The site is in an industrial area next to the LIE and a large railyard.

Spill closed 01/25/06

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"
CROSS REF WITH # 8900343 & 9206718

2/11/2003 Sangesland reviewed a closure report prepared by Walden Associates (516−624−7200). Report states that the contaminated soil at this site was caused by a broken fill line. When this area was opened, the soil was heavily contaminated. The contractor excavated out an area 16ft x 36ft x 6ft (35 cubic yds of concrete debris & 102 tons of contaminated soil removed)

End point samples − VOC's below TAGM, SVOC's slightly elevated.

Status shifted to No Further Action.

ANTIFREEZE	OTHER	0	UNKNOWN	0	UNKNOWN	SURFACE WATER

Caller Remarks:

1233 The caller advised dispatch there was an unknown amount of green anti−freeze under the Green Point Bridge. Clean up has not been conducted. The New Town Creek was affected. The caller is requesting spills to follow up on spill.

DEC Investigator Remarks:

Caller says there is a pool of green liquid on the South West Corner under the Greenpoint Ave Bridge on the Brooklyn side of the Newtown Creek.
Piper responded to the site for inspection.

DEC PIPer− I repsonded ot site and did not notice any green liquid on surface. In the stagnant water there was a film though it is common to the creek. The tide was moving and could have dissipated the callers observation. Spill closed.

Caller Remarks:

Robert Giddens of NYC DEP reported to NRC about unknown sheen on the water. Cause is unknown.

DEC Investigator Remarks:

02/22/13−Hiralkumar Patel. visited creek. inspected area from Nature Walk Park (at the end of Paidge Ave) on east of Pulaski bridge to end of Green St on west of Pulaski bridge. heavy sheen noted on water that starts at the park to and end little west of Manhattan Ave. petroleum odors, like diesel fuel, noted in entire area. no recoverable product. low tide during site visit.

spoke with US Coast Guard and informed them about the inspection. Coast Guard is at site investigating.

5:30 PM:− another spill (# 1215801) reported by DEC Jessie Kries regarding sheen in creek. DEC Austin asked to inspect site tomorrow again.

02/23/13−Hiralkumar Patel.
12:50 PM:− another spill (# 1215804) reported by Dewey Thompson, private citizen. he noticed oil sheen on water under the bridge.

spoke with Mr. Thompson. he mentioned sheen with petroleum odors in area.

1:45 PM:− visited site. inspected area between Nature Walk Park (where heaviest sheen noted yesterday) and end of Green St (on west side of bridge). also observed creek from the bridge. heavy sheen with petroleum odors noted only between Motiva (on east of bridge) and end of Manhattan ave (on west of bridge). could not find source. sheen only found along south side of the creek.

spoke with Lee (718−213−8106) at US Coast Guard, who was in area investigating the issue. Coast Guard checked creek on both sides, but could not find source. Coast Guard also checked Motiva facility and no issues found.

discussed with DEC Austin. he asked to check area again on 02/25/13.

02/25/13−Hiralkumar Patel.
11:00 AM:− inspected area between Nature Walk Park and end of Manhattan Ave. no sheen or petroleum odors noted.

based on available information, case closed after discussing with DEC Austin.

OLD SPILL, BUT NYCDEP WANTS DEC TO INVESTIGATE IT ANYWAY, DUE TO SOMEONE TELLING DEP THAT THERE IS AN ADDITIONAL PIPE THAT LEADS TO WATERWAYS THAT THEY ARE NOT AWARE OF: WAS IN COURT: FOR FURTHER PLEASE CALL DENNIS AND HE'LL EXPLAIN FURTHER:

DEC Investigator Remarks:

04/03/06 Sharif Rahman− Left a messege for Dennis Huacon,DEP to get more information about the site.
04/26/06 Sharif Rahman− I spoke with Dennis Huacon of NYCDEP,(718)595−4722. As per Dennis, there was an oil spill from two diesel pumps located at NY Paving ,Inc.NYS DEC was not notified that time.Spill was not significant but light oil sheen was observed on newtown creek water.DEP wants DEC to investigate the spill event and NY Paving's storm water catch basin.
I spoke to RSE in presence of Jeff vought and as per conversation among us it is impractical to investigate the spill cause and impact now almost after six months.There is no evidence on water or surface now. spill is closed.

10/10/95: This is additional information about material spilled from the translation of the old spill file: HEAVY FUEL OIL.

03/29/04
Related to Mobil Greenpoint spill
Transferred from Miller to Rommel.

10/12/04
Received call from John Harrison, EcolSciences, Rockaway, NJ, 973−366−9500, representing potential buyer. Plans to FOIA the file. Rommel

3/4/05 − Mr. Arthur Max, a consultant representing the current owner called to inquire about what it takes to close out the case. His Number is 201−867−6777. Transfer it to Alex Zhitomirsky. − KST

3/31/2005 According to Arthur Max Yellow Freight pulled some tanks in 1994. They found and removed most of the soil contamination. DEC asked to remove more contamination around the perimeter. Woodward Clyde stated that due to the Mobil spill and high background contamination there is no point in removing more soil. Weintraub real estate company was hired by Yellow Freight. Alex Zhitomirsky requested on March 4, 2005, that the responsible party should submit documentation supporting their case to NYSDEC. AZ

9/26/2005 Conversation with Arthur Max. They want to buy this property and inquired what should be done in order to close this spill. I responded that site assessment should be performed. Gw wells installed at the property and along the perimetr of the property in order to compare background contamination with the site contamination. AZ

1/17/2006 I left a message for Arthur Max. Investigation/delineation is pending. AZ

1/18/2006 I contacted Arthur Max (Weintraub, Casey − Realtors 201−876−6777). He informed me that they sold this property in

November 2005 to Sagres, LLC 2 Galasso Place, Maspeth, NY 11378 718−456−1800(?)(they are in the same building as Galasso Trucking).
I contacted Frank Galasso (partner) at 718−456−1800. He said that I should talk to Phil Galasso (partner)516−965−7766. He will ask him to contact me ASAP. AZ

4/3/2006 I contacted Phil Galasso (Reveal New Sag LLC.)516−965−7766. He will file for FOIL and have his consultant contact me. AZ

6/13/2006 I left a message for John Urda (DEC Legal)requesting his assistance with this case. AZ

6/14/2006 Jon Kolleeny recommended to refer this case to J. Urda. J. Urda recommended to send RP a short form STIP. J. Kolleeny supported this recommendation. A short form STIP was sent to Phil Galasso, Sagres LLC, 2 Galasso Place, Maspeth, NY 11378 AZ

6/27/2006 Received a message from Steve Russo (212−421−2150). Left a message for Steve Russo. AZ

6/27/2006 Conversation with Steve Russo, attorney for the owner (Reveal New Sag). He works for Sive Paget company(212−421−2150). They will send me report for review. I will get back to them when I review the report. AZ

6/28/2006 The report does not contain a map showing the locations of the old excavated tanks (15 USTs). No borings were installed near the old tank field. Fingerprint analyses were not attached. AZ

7/27/2006 Left a message for Steve Russo (Sive, Paget & Riesel). AZ

8/2/2006 Conversation with Steve Russo (212−421−2150). I conveyed to him that the report lacks essential information:borings/wells were not installed near the old tank field; there is no map showing the old excavated tanks (15 USTs), fingerprint analyses were not attached to the report. DEC requested new borings/wells installation, mointoring of the new wells and fingerprint analyses of the free phase. He will get back to me with a plan of actin in a week. AZ

8/10/06 I sent e−mail to Steven Russo Sive, Paget & Riesel, P.C. at 460 Park Avenue New York, New York 10022(212) 421−2150 confirming the additional items that should be submitted to DEC:
1. A sampling plan providing for the installation of groundwater wells and collection of soil samples proximate to the area where the former Yellow Freight USTs were excavated 2. Reflect the former UST location on the map or maps accompanying the supplemental sampling plan 3. Provide results of historic and new fingerprint analysis of petroleum, if any, collected from the newly installed monitoring wells or, if no free product is collected from the wells, from soil samples. AZ

1/31/2007 I contacted Steven Russo @ (212) 421−2150 (Sive, Paget & Riesel). Exxon Mobil is preparing an extensive sampling plan for this site which will be submitted within a month. He will send me fingerprint analyses and a map with tank locations. He will forward a sampling plan as soon as it will be available. AZ

2/6/2007 Received historical and current fingerprint analyses from Steve Russo. He stated that "we are hoping to finalize access issues with Exxon Mobil in the next week so that a work plan to more fully investigate the site can be submitted shortly." AZ

4/13/2007 Received e−mail from Ed Hampston (DER Albany). He received proposed investigation plan (part of investigations associated with the former Mobil Refinery/Terminal from Exxon) and forwarded it to Reg. 2. E. Hampston will likely to request some of their borings go beyond the first impermeable layer they encounter (or nest wells) to see if there is deeper

contamination. I reviewed the Exxon proposals and discussed the work plan with Ed. I suggested increasing the number of wells (they initially suggested 3 wells), advancing wells at the locations of the former Yellow Freight tanks, advancing wells near the Exxon plume boundaries, performing fingerprint analyses on all samples, compiling detailed groundwater and soil plume maps. AZ

11/1/2007 Reviewed Investigation Report by Roux Associates dated August 2, 2007 and received on August 21, 2007. Nine soil borings and three new shallow aquifer wells wells and three new regional aquifer monitoring wells were completed. SVOC and metals were detected at concentrations greater than the NYSDEC Restricted Commercial Use Criteria in the shallow subsurface beneath the property. with the highest concentrations present in the vicinity of SB−4, SB−7, SB−9. PCBs were also detected at three soil borings with the highest concentrations observed at SB−6. Although petroleum staining was observed throughout the shallow subsurface, only globules of free product were observed at two locations that were associated historic petroleum storage operations. There were no observed visual impacts within the regional aquifer. VOC and SVOCs are present in groundwater above the NYSDEC AWQSGV within the shallow aquifer. PCB were detected in one location within the sallow aquifer at monitoring well KNW−4. Within the regional aquifer, only minor concentrations of petroleum and chlorinated compounds were observed in gw above the guidance level. According to the report, data indicated that the free product plume present within the regional aquifer beneath the Exxon Mobil Brooklyn Terminal to the south of the property does not extend to the north beneath the property. AZ

12−27−2007 Letters to Phil Galasso and Exxon Mobil were sent out by DEC (Ed Hampston − Central Office). The DEC letters required further investigation and remediation of the site. AZ

1−9−2008 Meeting with Philip Galasso (Revael New Sag), John Urda, Ed Hapston, Alan Michaels (by phone NYSDEC), Michael Bogin (Steve, Paget), Dan Buget. AZ

8−12−2008 The owner is proceeding with the sale of the property. The existing building will be demolished for a "clean fill" recycling operation. As part of the demo, they intend to dig out around the building footprint, and want to know if this will be enough to close the UST spill. I recommended taking the end point samples. Also, a work plan containing a site map with UST locations, hot spots (based on the previous investigations), the excavation area and proposed sampling locations should be submitted to DEC. I conveyed my suggestions to John Urda and Ed Hampston. AZ

10−27−2008 I have received an e−mail from Ed Hampston who forwarded a request for spill closure by Leggette, Brashears @ Graham. I e−mailed my response to John Urda and Ed Hampstead. AZ

10−29−2008 Conference call with John Urda and Michael Bogin. DEC requested that New Sag investigate and remediate area in front of the building at the locations of the former USTs (diesel, waste oil and heating oil tanks). According to September 19, 1994 closure report, waste oil tank had 3 holes and soil in the USTs area exhibited VOC exceedances. Also, VOC concentrations in the former USTs area exceeded the background concentrations. DEC (Mike Mulqueen 2−27−1995) requested further investigation and remediation. AZ

1−8−2008 A conference call with Central office was held (V.Brevdo, J. Urda, Ed Hampston, Alan Michaels, Joseph White). The site was discussed. Central Office will work with Exxon Mobil to address PCB contamination. AZ

2/4/2009 A meeting was held among Alex Zhitomirsky, John Urda, Vadim Brevdo, Allan Michaels, Ed Hampston of DEC and Phil Galasso and Michael Bogin representing Mr. Galasso. Phil Galasso and Michael Bogin presented information that appears to support their conviction that PCB contamination and remaining petroleum contamination plums are part of a greater Exxon Mobil plume (Greenpoint plume) and, therefore, should be investigated/remediated by Exxon Mobil. It was decided that Albany (Ed Hempston and Allan

Michaels) will call a meeting with Exxon Mobil so the other party can present their case. If information presented by 460 Kingsland owners is confirmed then this spill number will be closed and referred to a main spill number of Greenpoint (Exxon Mobil)spill for further investigation/remediation. AZ

3−27−2009 After consultation with V. Brevdo, J. Urda and Ed Hampston this spill number is closed. According to Ed Hampston, all further activities for this site will be tracked under spill #8800244 (this is the spill Central Ofiice has PIN attached). Ed Hampston intends to create a P site for 460 Kingsland. AZ

CALLER STATES FUEL TANKS WERE REMOVED AND TEST RESULTS SHOWED SOIL CONTAMINATION

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"
Michelle Tipple was working this case − transfered to Sangesland

2 − 4,000 GAL TANKS REMOVED

At the time, no end point samples were taken from the excavation. Samples were taken from the pile of excavated soil(they were hot)

A.L. Eastmond sent a driller back to the site (after it was backfilled) and drilled for 5 soil samples at 15ft depth (approx 4 − 5ft below the bottom of the former tanks).

Report was submitted to DEC with the results of this testing. While they are not "clean", Eastmond says they believe they are within DEC standards. Sangesland needs to retrieve the file from Tipple and review the findings.

7/18/2001 Sangesland reviewed the soil results taken at 15ft depth (5' below bottome of the former tank area). Samples were tested to 8021B (Starts Memo Volatiles) by Environmental Testing Laboratories Inc. (Tyree) (631−249−1456) (sample J9757−1) Almost all were below allowable limits with a couple of minor exceptions. Based on this, the DEC believes any residual contamination will degrade naturally and the spill can be classified as "no further action".

GASOLINE	PETROLEUM	0	GALLONS	0	GALLONS	GROUNDWATER

Caller Remarks:

WHILE FIXING A SEWER LINE , THE PIPE BROKE AND HE SMELLED GASOLINE:

DEC Investigator Remarks:

Sangesland spoke to plumber at the site. He says the smell of gasoline was coming out of the sewer pipe itself, not from the open soil around the hole. Problem is in the DEP Sewer system and is probably caused by someone in the neighborhood dumping gasoline down a drain. DEP is aware of the problem and says this is a transient problem.

A check was made of PBS or Spills in the area, none were found.

Caller Remarks:

Unknown green dye in Newtown Creek coming from culvert. May be owned by Amtrak.

DEC Investigator Remarks:

DEC Piper investigated green dye in Newtown Creek. It appears it was coming from a culvert adjacent ot concrete plant. Higher concercentrations (darker) were observed exiting culvert. Tide appeard to be coming in and keeping dye on NW corner of creek. Interviews with concrete plant reps revealed LIRR was on property Sun night asking to look at outfall.

I spoke with GLoria Russo of LIRR. She informed me LIRR does not have property near there and that Sunnyside yard is owned by Amtrak. She has a call into a contact at the LIRR East side access to determine additional info.

I spoke with Ms. Russo again, they have no contractors performing dye tests. Dye dissipated by 3/16/10. Closed.

Subject: RE: 143441/ 1−− MH71429 − FOUND APPROX

RON:

WHEN I TALKED TO THE ENVIRONMENTAL DESK, I HAD TOLD THEM THAT THE SUMP WAS CEMENTED AND WATER WAS COMING IN FROM THE SIDES OF IT. I THEN TOLD THEM THAT I RECEMENTED THE SUMP AND THE WATER HAD STOPED COMING IN FROM THE SUMP, BUT IT WAS STILL COMING IN WHERE THE FLOOR MEETS THE WALLS OF THE MANHOLE. IT WAS ALSO COMING IN THROUGH THE DUCTS. I DID NOT FIND ANY SEWER DRAIN AT THE TIME I WAS THERE . THIS WAS TOLD TO THE ENVIRONMENTAL DESK AT THE TIME I WAS THERE.

Caller Remarks:

caller saw this while doing work were bridge work is going on

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"
SPILL IS COMING FROM THE REAR OF: MARTIAL ENTERPRISES,

21−01 51ST AVE, LIC, NY 11101 − JOEL BERGER 718−784−3000

NEXT TO REAR LOADING DOCK IS THE BUILDING BOILER ROOM. THIS ROOM HAS A LARGE OIL TANK ALONG WITH BOILER, PUMP, AND PIPING. IT LOOKS LIKE EVERYTHING IS LEAKING. THE SUMP IS FILLED WITH OIL AND THEY PUMP THE OIL OUT TO THE REAR YARD.

SANGESLAND GAVE A 30 DAY ORDER(8/18/99) TO DO THE FOLLOWING WORK:

1) EXISTING OIL TANK WILL BE TESTED FOR SOUNDNESS.

2) OUTSIDE PLATFORM WILL BE CLEANED AND MATERIAL "PROPERLY" DISPOSED

3) BOILER ROOM WILL BE CLEANED (POWER WASH), PUMPS/FITTINGS/LEAKS FIXED.

4) SUMP WILL BE CLEANED AND OIL/WATER SEPERATOR INSTALLED FOR WATER DISCHARGE

9/13/99

Letter from Joel Berger − Martial Enterprises 718−784−3000

Trade Winds Environmental was hired to clean up the boiler room and outside loading dock area.

ProTest performed a tank test and the tank is OK

The primary problem at the site was a leaking oil pump. This pump has been replaced and a large metal tray has been made and installed under this pump.

Spill Closed

DEC Investigator Remarks:

1/12/06−Vought−Called Winnie Lanham and spill date was 12/06/05 and she will return call tomorrow with spill information.

1/30/06−Vought−Called Winnie Lanham and left message to return call to DEC.

2/1/06−Vought−Received message from Winnie to return call.

2/3/06−Vought−Returned call to Winnie (718−609−8715) and left message with requirements of method of cleanup, spill on concrete

and if any sewers or drains were affected.

2/6/06−Vought−Received message from Winnie that spill was to stone and soil around generators spill was cleanup up via scraping of surface. Soil awaiting disposal. Removed soil was 1/4 of 55−gallon drum. No sewers or drains were affected. All contaminated was removed and spill closed due to minor spill amount and non−continuous source. Spill closed by Vought.

6/12/2002−VOUGHT−Non−regulated material. Facility is permmitted for bulkhead construction as per NYSDEC Permits. Spill closed by Vought.

07/16/02

Picone was installing new timber fenders along the east side of Whale Creek using creosote treated fenders. The cresote from newly installed fenders bled for a time into the water, thereby causing a sheen on the water surface. DEC instructed Picone to install an oil boom along the fender and a second containment boom to the north of the work zone. The fender installation is now complete and a sheen is no longer visible. Picone is due to switch out the booms again this week. The work is complete and a

sheen is no longer visible. jmr

9/17/02

The 5,000 gallon tank (approximately 20 feet west and perpendicular to the sheeting line in Whale Creek Canal) appears to have been damaged by the installation of sheeting. The Contractor has pumped out the contents of the tank, and is in the process of removing it. The contents of the tank appear to waste oil. A sample of the oil has been collecteed and test results should be back soon, including Full RCRA characterization.

This is within the excavation area for Contract 32, and as such impacted soils will be excavated and disposed along with all the other contaminated soils at the site. We already have data that demonstrates that the surrounding soils are non−hazardous contaminated.

12/1/03

Analysis confirmed materlead not haz waste, oil and water mixture from excavation disposed at New York Oil Recovery, Inc.

Tank removed and two soil endpoint samples and one groundwater (bottom) collected. Soil and water OK. spill closed.

Caller Remarks:

"Historic leaking tank ans lines probably"

DEC Investigator Remarks:

Old gas station is being converted to a natural gas fueling station for natural gas powered taxi cabs. In 1990 there was a spill that was not followed up and was eventually closed out. 3 wells and new soil borings were done in Jan 2012 and they found diesel, coal ash and gasoline spill contamination. They have a report detailing how much contamination there is and then they want a meeting to discuss under CP51 rules how much needs to be removed. Tanks will be pulled later this spring.
David Cook will e−mail a copy of this report to Sharif Rahman for review.

07/27/12 Soil investigation report in edocs.(sr)

Consultant: Megan, High Point 516−777−4320.

07/24/13 − Closure report in edocs.Three UST gasoline tanks(2 4,000 gallon and one 2,000 gallon) and an abandoned tank were removed from 48−02 Van Dam Street in fall 2012. No VOCs detected in soil samples collected from the pump/line excavation. After

removal, the tanks appeared sound with no indication of leakage. Soil in the graves was subsequently excavated as part of tank replacement project. The abandoned tank had an approx capacity of 300 gallons.No VOCs were detected in soil samples collected from the grave. A total of 839 tons of soil removed from excavations.(sr)

Caller Remarks:

A drain that comes out at above property line has an unknown petroleum sheen on the water. Booms were put in place.

DEC Investigator Remarks:

Sangesland spoke to Steve Trifiletti. Spill came from a drainage pipe which starts on an adjoining property (trucking company NOT Exxon). Spill apprears to have been approx 1 pint of antifreeze or oil run off which got flushed out into the storm drain into the water. No ongoing problem. Exxon spread the boom to collect the sheen. Event was minor.

Caller Remarks:

OIL SHEEN FOUND NEW TOWN CREEK; HAS BEEN CONTAINED; ED HAMPSTON IS DEC CASE MANAGER;

DEC Investigator Remarks:

7/25/07 (1:25pm) Steve Trifiletti also reported spill to Greenpoint Petroleum Remediation Project Manager in Albany (Ed Hampston) via phone call. Reported as heavy oil in stringy form with thickness of 1−2" and less than a pint evident. Oil was reportedly hugging the bulkhead at the Exxon Terminal and being caught in bulkhead webs. Deployment of collection/containment is underway. Initial observation reportedly occured around low tide.

(3:10pm) Steve T. reports that adsorbent and soft boom in place. No additional product noted and source not evident. Lower end of BP boom reportedly hung up which could allow movement of water/product beyond their boom. (Ed Hampston).

From email R. Austin to E. Hampston on 7/25/07: We were out at the creek yesterday, respondig to the BP recovery system spill (Note: 0704599), and noted that there was a weathered slick of oil at the northern end of the shoreside containment boom (at the BP/Exxon boundary line) that had nothing to do with yesterday's spill. We instructed BP reps to capture the slick, which was hugging the shore, and tighten up the connection of the boom so that minimal oil escaped from behind it. It may related to what Exxon is calling in today.

Response E. Hampston to R. Austin on 7/25/07: The observation today was around low tide (I think low was around 12:20). I have observed the BP boom doesn't actually allow containment at low tide due to the undercut on their wood bulkhead. The downstream anchorage end doesn't have a seal for the undercut of the bulkhead and product in the boom can follow the boom to the downstream end and then go around the boom, into the undercut, and be released.

10/28/09 E. Hampston (From ExxonMobil Onsite Progress Report 3rd Q 2007 dated October 31, 2009). "On July 25, 2007, a sheen was observed emanating into Newtown Creek from the
Brooklyn Terminal bulkhead (NYSDEC Spill Number 0704658). It appeared the sheen may have been coming through the bulkhead, adjacent to the future location of monitoring well S−33. Roux Associates immediately installed 200 feet of 6−inch soft boom along the southeastern portion of the bulkhead. Roux Associates then installed approximately 200 feet of rigid containment boom fastened to the bulkhead on steel runners, allowing for the boom to adjust with the tidal swings of Newtown Creek. The containment boom restricted the migration of the sheen into the main channel of Newtown Creek.

As part of ongoing assessment activities being performed at the Brooklyn Terminal and unrelated to this recent observation of the sheen, HPA Engineers (HPA) performed an inspection of the structural elements of the bulkhead and fender system from the top of

the cap to the mudline on July 30 and 31, 2007. HPA observed that the steel bulkhead was in good condition, and the only structural issues present were at three tie−back locations. The welds between the tie−backs and the steel sheeting were corroded, resulting in spaces between the tie−backs and the steel sheeting. .
Following identification of the bulkhead issues, D'Onofrio General Contractors Corporation (D'Onofrio) mobilized divers to seal the voids in the bulkhead on August 3, 2007. Once sealing was complete, a follow−up inspection of the bulkhead was conducted and it was determined that additional grout injection work was required on the landward side of the bulkhead. Structural Preservation Systems (SPS), under the direction of D'Onofrio, injected a total of over 6,100 gallons of concrete−bentonite grout at five locations. The grout was injected at five injection points from the high water elevation to below the low water line. The purpose of the grout injection was to create an area of low permeability adjacent to the bulkhead and to fill any subsurface voids around each injection point." Additional details in report placed in edocs.

E. Hampston 10/27/09: Containment and recovery efforts completed. Close and consolidate under Mobil Brooklyn Terminal Spill 8800244 work being completed to remediate spill under refinery property.

Caller Remarks:

THIS SPILL MAY HAVE HAPPENED OVER 10 YEARS AGO AND POSSIBLY AS LONG AS 50 YEARS AGO

DEC Investigator Remarks:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"
Sangesland spoke with Ashley Bell of Certified Environment Inc.

She says soil borings done around 2 different tank areas show some slight hits. Groundwater sample shows non detect.

DEC requested a closure report including: photos, writeup, soil & water sample results compared to DEC standards.

Probably OK to close with a "No Further Action" & require a Health & Safety plan if any future work is done at the site.

8/22/2003 Sangesland reviewed a report submitted by Certified Environments Inc (CEI). Report was complete and included all of the documentation requested. Some slight exceedences exist in SVOC's below the basement level of a 10 story building.

Based on the soil and groundwater sampling provided, the NYSDEC will list this site as "No Further Action"

UNKNOWN WHO CAUSED , NOT A DEP PROBLEM, DEP FOUND WHILE FIXING A HYDRANT: THEY WILL NOT BE CLEANING IT UP

DEC Investigator Remarks:

2/10/06−Vought−Responded to site with DEC Patel as per DEC Austin. Spill is diesel on puddle of water at end of dead end street. No adjacent fills, vents or USTs and no known source. Spill covering one combined sewer drain with unknown impact and one adjacent drain (with lower water level) has no impact. Vought and Patel met DEP onsite and as per DEC Austin, Royal Environmental was contacted to perform liquid recovery under drum run. Vought called Scari (718−595−5308) and left message to return call. Royal and DEC Vought onsite at approximately 1pm to recover product (most likely #4 fuel oil). Royal recovered approximately 526 gallons of oil water mix and used one bag of speedy dry for impact to concrete. Adjacent catch basin was dry with no impact to soil. Cleanup okayed by NYCDEP Enviro Health and Safety. Costs of PIN contractor (Royal) to be included in drum run as per DEC Austin (see spill #9930008) and PIN #01036. Spill closed due to spill on asphalt and no sewers or drains affected.

CLOSED STATUS HAZARDOUS SPILLS − MISC. SPILL CAUSES − EQUIPMENT FAILURE, HUMAN ERROR, TANK OVERFILL, DELIBERATE SPILL, TRAFFIC ACCIDENT, HOUSEKEEPING, ABANDONED DRUM, VANDALISM AND STORMS − WITHIN 1/2 MILE SEARCH RADIUS.
All spills mapped and profiled within 1/8 mile. Between 1/8 mile and 1/2 mile search radius, spills reported to be greater than 100 units and spills reported in the NYSDEC Fall 1998 MTBE Survey are mapped and profiled. Spills reported to be less than 100 units are listed in a table at the end of this section.

Please Note: * − Compass directions can vary substantially for sites located very close to the subject property address.

Caller Remarks:

indoor spill to containment area

DEC Investigator Remarks:

11/2/12 THIS SPILL IS A RESULT OF HURRICANE SANDY. Spoke to Dennis Hunt of TW Cable (917)337−09078. Tank and two 55 gallon drums were upended and spilled product (waste/used oil) due to the storm surge. He told me that it appears that most of the product was contained in the secondary containment area. No stainaing was visible on the ground. Clean up was completed by 3 E.

12/10/96 MMM: TYREE PULLED TANKS, UPGRADED STATION AND DID INVESTIGATION. NO FREE PRODUCT LEFT ON GW. HIGH DISSOLVED BEING ADDRESSED WITH SVES SYSTEM. STIP RETURNED SIGNED.3/14/03 REASSIGNED FROM ROMMEL TO VOUGHT.

12/17/2003−Vought−See closed diesel spill #0106824 at same location.

3/19/04−Vought−File review by vought:

Summary of Underground Tank Removals (Tyree Org)−April 1994. Tanks removed as part of "station rebuild activities". A total of eighteen underground storage tanks were cleaned and removed from the site. Twelve were gasoline USTs, two were diesel USTs, one was waste oil and the remaining three are of unknown contents. Groundwater at ten feet below grade. A total of 625 tons of soil was removed from the excavation. Five endpoint soil samples were collected. "Method 8021 was inadvertently ommitted from the analysis request". A soil vapor extraction trench was constructed along Van Dam street, two feet from the sidewalk so that the "venting system would create a barrier for the potential migration of soi vapoprs based on the reported regional westerly groundwater flow". Four monitoring wells were installed as per DEC. One fuel oil tank remains to be removed and upon remova, one additional monitoring well will be installed. Soil analyticals from well installation show 7200ppb benzene(MW2), 72400ppb napthalene(MW−2), 1435000ppb xylene(W−2), 2490ppb benzene(MW−4), 10770ppb xylene(MW−4).

Groundwater Monitoring Report (Tyree Org)−1−16/95. "A one thousand(1000) gallon fuel oil tank was removed in June 1995." "A monitoring well, MW−5, was installed at this location in August". No free product was encountered. "The groundwater flow direction comes onto the site from the north and travels southerly. Once on site, the water flow turns a little to the south−southeasterly direction". Groundwater analyticals show 105ppb benzene(MW−1), 3260ppb benzene(MW−2) and 86400ppb MTBE(MW−2). Report recommends installation of upgradient well and performance of a soil vapor extraction test.

Letter from DEC(Mulqueen) to Getty(Ochotorena)−6/26/95. Stipulation Agreement sent to Getty.

Stipulation Agreement from Getty−6/30/95. Stipulation signed by Getty.

Corrective Action Plan from Tyree−10/5/95.

Summary of Underground Fuel Oil tank Removal Activities−January 1996. Removal of one (1000−gallon) fuel oil UST. Five endpoint soil samples were collected for analysis. "A groundwater sample will have to be collected to determine if the groundwater is protected". "The background soil sampling will be performed once the location is reviewed by the DEC and sidewalk opening permits are obtained". Three Geoprobe borings will be performed. "This location is reported to be located in a former refinery". Soil analyticals show minor SVOC exceedences (646ppb benzo(a)anthracene, 595ppb benzo(a)pyrene).

Quarterly Monitoring Reports from Tyree (October 1995 thru March 1996). Five monitoring wells onsite. Groundwater at depth of 8−10' and flows to the south. Groundwater analyticals show 145ppb benzene(W−1), 4150ppb benzene(W−2), 5.19ppb xylene(W−3), 437ppb toluene(W−5).

Remedial Action Plan (Tyree Org)−July 1996. "The soil is intermixed with occasional charred material up to 6" inch in diameter and ashy soil located at the north end of the site". Soil venting pilot test performed on 4/18/96. "The results of monitoring and the well survey indicate that groundwater on site flows predominantley west". "The groundwater flow was previously incorrectly shown to flow southerly". Surrounding area is commercial. Pilot test results indicate "that an approximate radius of infulence between 16 and 22 feet can be achieved with an applied cacuum of 34 to 53 inches". "Since the contamination is minimal and localized no groundwater remediation is proposed at this time".

Quarterly Monitoring Reports from Tyree (April 1996 thru March 1996). Five monitoring wells onsite. Groundwater at depth of 8−10' and flows to the east−southeast. Groundwater analyticals show 146ppb benzene(W−1), 793ppb benzene(W−2) and 437ppb toluene(W−5).

Quarterly Monitoring Reports from Tyree (March 1996 thru December 2000). Five monitoring wells onsite. Groundwater at depth of 8−10' and flows to the west. Groundwater analyticals show 17ppb benzene(W−1) and 4ppb benzene(W−2). Remedial activities described as "none".

Letter from Tyree to DEC(Rommmel)−6/15/01. Letter sent requesting removal of wells 3 and 4 from the monitoring/sampling regimen leaving wells 1,2 and 5. "These changes will be effected as of July 1, 2001. If there are any objections to these changes, please notify us in writing".

Quarterly Monitoring Reports from Tyree (March 2001 thru June 2001). Five monitoring wells onsite. Groundwater at depth of 8−10' and flows to the west. Groundwater analyticals show 30ppb benzene(W−1) and 24ppb benzene(W−2). Remedial activities described as "none".

Quarterly Monitoring Reports from Tyree (July 2001 thru September 2001). Three monitoring wells sampled. Groundwater at depth of 8−10' and flows to the west. Groundwater analyticals show 31ppb benzene(W−2). Remedial activities described as "none".

Historical Data Compilation (Tyree Org)−December 2001. Compilation including request for no further action.

Quarterly Monitoring Reports from Tyree (January 2002 thru December 2003). Three monitoring wells sampled. Groundwater at depth of 8−10' and flows to the west. Groundwater analyticals show 43.3ppb benzene(W−1) and 63ppb MTBE(W−2). Remedial activities described as "none".

3/23/04−Vought−DEC requires: 1)groundwater samples from downgradient locations of W−1 and W−2 2)submission of a soil and groundwater remediation plan. Vought sent letter with requirements on 3/23/04.

08/31/2005 − Feng − Project transferred from Vought to Feng.

10/20/2005 − Feng − Geoprobe Investigation Report by Tyree, dated November 29, 2004. on 11/10/2004 Tyree did two (2) groundwater sampling, B−1 and B−2, downgradient to W−1 and W−2, and four (4) soil samples, B−3 to B−6, in the vicinity of the former gasoline tankfield as per DEC Vought's letter on 3/23/2004. Groundwater analyticals show that some VOCs and SVOCs were slightly high and exceeded TAGM 4046. and soil samples collected from B−3 to B−6 show slightly high VOCs in B−3. Based on this report, Tyree recommended "further remediation at this site is not necessary. groundwater monitoring wells be sampled on a quarterly basis and be monitored for natural attenuation".

10/18/2005 − Feng − Quarterly Monitoring Report, by Tyree, 4/2005 − 6/2005. 3 MWs onsite. downward trend in concentration. Groundwater flow in west direction. 90ppb BTEX and 20ppb MTBE in W−1. keep monitoring.

11/2/2005 − Feng − Quarterly Monitoring Report, by Tyree, 7/2005 − 9/2005. 3 MWs onsite. downward trend in concentration. Groundwater flow in west direction. W−1, increasing, 143ppb BTEX and 21ppb MTBE. W−2, 1 BTEX and 5 MTBE. W−3, 6 MTBE.

12/19/2005 − Feng − Quarterly Monitoring Report, by Tyree, 9/2005 − 11/2005. Active Lukoil gasoline retail/service station. 3 MWs onsite. downward trend in concentration. Groundwater flow in west direction. W−1, decreased and 68 ppb BTEX and 11 ppb MTBE. W−2, non−detected BTEX and 3 ppb MTBE. W−3, non−detected BTEX, 4 ppb MTBE. EFR on W−1, 0.01 gallon of gasoline has been removed.

05/25/06−Sun−Based on the Quarterly Monitoring Report, prepared by Tyree,dated April 6, 2006, Total BTEX ranged from Non−detect to 29 ppb, and MTBE concentrations ranged from 3 ppb to 9 ppb. No free product was detected in any monitoring wells. Based on these low concentrations of BTEX and MTBE and Sensitive Receptor Survey conducted for this site, the spill is closed and NFA letter will be issued. (Sun)

CONSTRUCTION CREWS THOUGHT PIPE WAS EMPTY AND CUT THROUGH IT RELEASING THE MATERIAL; CLEAN UP IN PROGRESS;

DEC Investigator Remarks:

DEC Hassan Ahmed made a site visit.

07/03/08−HRAHMED−Ahmed went for investigation. DEP John Rosso, James Pynn and Brian Alford from Bidwell Environmental were present at the site. As per DEP Pynn, during the Construction crews were cutting the pipe that ran between the abundant tank and the building, some resudual oil spilled on the excavation area due to gravity. The contractor immidiately pump the spilled oil into steel drums. Ahmed took some pictures, minor stain on the soil was observed. Ahmed told DEP Pynn that the contractor has to excavate more to take out all contaminated soil, atleast using a PID to determine the extent of excavation. DEP Pynn told he will send a report summerizing the excavation work along with some pictures which will be taken after the excavation.

07/17/08−HRAHMED−Ahmed received email from DEP John Russo and some pictures taken after the excavation work. As per John, "a CM EH&S Inspector took PID readings in the excavation area after clean−up was performed. The readings were taken at the north, south, east, and west side walls of the excavation using a MultiRAE multi−gas meter which includes a PID. The readings were all non−detect (zero) for VOCs." As per the picture the excavation looks clean.

This case is closed.

Material Spilled	Material Class	Quantity Spilled	Units	Quantity Recovered	Units	Resource(s) Affected
#2 FUEL OIL	PETROLEUM	500.00	GALLONS	0.00	GALLONS	IMPERVIOUS SURFACE, UTILITY

Caller Remarks:

2251 THE CALLER STATED A REPORT OF A LARGE SPILL WAS CAUSED BY A FAILED UNIT. WATER WAS IMPACTED. THE SPILL IS NOT CONTAINED. THE CLEAN UP IS PENDING THE CALLERS ARRIVAL ON SCENE. THE CALLER WILL UPDATE NYSDEC UPON ARRIVAL.

DEC Investigator Remarks:

8/6/12−Vought−Primary off−hours responder. Vought called Peter Jayaseaara (Ph:347−865−1291) and spoke to Joeseph who noted that that approximately 500 gallons of #2 fuel oil was released from a 200−gallon #2 fuel oil AST in a vault and that the oil was leaking out of secondary contaiment vault and was impacted a drain in the boiler room in sub−basement of LaGuardia Community College. Jayaseaara noted that FDNY Hazmat was on−scene and that he also called Triumvirate Inc (response company) and they were enroute to the site. Vought called RSE and DEC Demeo (secondary responder) who performed site visit. This spill assigned to Vought as Demeo not an option in UIS (as Demeo recently transferred). Spill to be transferred to Demeo upon availability in UIS.

8/8/12−Vought−Spill transferred from Vought to DEC Demeo as now available as PM in UIS.

8/4/12 TJD
Recall − 2K AST for emergency generator leaked from supply piping feeding 100 gallon day tank on roof of structure. Leaking piping was uncapped return line inside secondary containment. Estimated 1500 gallons of diesel fuel leaked inside secondary containment. Containment vault was not tight − allowed product to migrate into adjoining sub−basement rooms. Building personnel shut power to affected areas of building which shut down transfer pump to rooftop day tank. Drainage trenches in basement had minor impacts due to migration of product − prior to DEC arrival absorbents were put in place to prevent further migration of

product to sump pit. Facility owner retained Triumvirate Environmental for emergency cleanup − they responded with vac truck and recovered seperate phase product from tank vault and affected adjoining rooms. DEC required trenches and sump pit to be cleaned prior to putting sump pump back in service. Needs follow−up inspection.

8/7/12 TJD
Site inspection. DEC was contacted by Laguardia College EH&S personnel requesting reinspection as cleanup was reported to have been completed and required repairs had been made. At time of inspection, DEC met with EH&S Manager (Michael Spath from CUNY) and Triumvirate Environmental personnel. All required cleanup actions have been completed − affected concrete surfaces, trenches and sump pit have been degreased and pressure washed. Standing water in trenches and sump pit appear free of seperate phase product and sheen. DEC authorized EH&S staff to return sump pump to service. As per Laguardia College personnel, 2K AST is to remain out of service as a determination is made regarding the need for this tank. Required cleanup actions have been completed. Awaiting closure documentation.

9/10/12 TJD
File review. All required closure documentation has been received. A total of 6 drums (contaminated absorbents) and 5,237 gallons of oil/water mixture were recovered and properly disposed of as part of remedial process. No further action is required. Spill closed.

Site City: BROOKLYN
Site Zip: 11222
Region: 2

Site Number: HS2035
Registry: Delisted
Registry Site ID: 224009
RCRA: Unknown
EPA ID: NYD980780811

US EPA No Further Remedial Action Planned? Unknown

Site Code: 1
Description: INDUSTRIAL SITE

Acres: 0.00
Completed Investigation? Phase 1
Is Site Active: No
Years of Operation: 1970 to 1972

Quadrangle: BROOKLYN
HRS Score: 10.10
HRS Date: 05/26/83

Site Description:

Records obtained from Mansanto Indusrtial Chemical Co. (of St. Louis Missouri) indicate that from 1970 to 1972, Manhattan Adhesives bought the following PCB products. Aroclor 1221 (9880 lbs), Aroclor 1221B (2080 lbs), Aroclor 5460 (306,6000 lbs), and PCB/PCT mixture (42,000 lbs). Court testimony given in 1982 revealed that about 400,000 gallons of waste oils and PCB's were dumped down a manhole on−site. It is unknown where the manhole leads. The waste material reportedly came from a chemical spill in New Jersey. The sewers were tested and no contamination was found.

THREAT TO THE ENVIRONMENT OR PUBLIC HEALTH

Threat to the Environment or the Public Health: Environment/Public Health

Threat Posed by Disposed Hazardous Substance:
Allegations existed to the fact that Manhattan Adhesives poured about 400,000 lbs of PCB contaminated wastes into the sewers. If PCB's entered the eco−system there would be a potential for

bio−accumulation and associated impacts to the flora and fauna of Newton Creek and the East River. The sewers were tested and no contamination was found.

HAZARDOUS SUBSTANCES DISPOSED:

VOCs: No Semi−VOCs: No PCBs: Yes Pesticides: Yes Metals: No Asbestos: No

Hazardous Substances Disposed:
alleged − Aroclor 1221, Aroclor 1221B, Aroclor 5460, PCB/PCT mixture, subsequent testing found no contamination in the sewers

Hazardous waste codes presented in individual Toxic Information Profiles are defined below.

B001 PCB Oil (concentrated) from transformers, capacitors, etc.

B003 Petroleum oil or other liquid containing 500 ppm or greater of PCBs.

B005 PCB Articles containing 500 ppm or greater of PCBs, excluding small capacitors.

B007 Other PCB Wastes including contaminated soil, solids, sludges, clothing, rags, and dredge material.

D001 Solid waste that exhibits the characteristic of ignitability, but is not listed under any other hazardous waste code.

D002 Solid waste that exhibits the characteristic of corrosivity, but is not listed under any other hazardous waste code.

D008 Lead

D011 Silver

D039 Tetrachloroethylene

F001 The following spent halogenated solvents used in degreasing: Tetrachloroethylene, trichloroethylene, methylene chloride, 1,1,1−trichloroethane, carbon tetrachloride, and chlorinated fluorocarbons; all spent solvent mixtures/blends used in degreasing containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (T)

F003 The following spent non−halogenated solvents: Xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n−butyl alcohol, cyclohexanone, and methanol; all spent solvent mixtures/blends containing, before use, only the above spent non−halogenated solvents; and all spent solvent mixtures/blends containing, before use, one or more of the above non−halogenated solvents, and, a total of ten percent or more (by volume) of one or more of those solvents listed in F001, F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (I)*

F007 Spent cyanide plating bath solutions from electroplating operations. (R, T)

F009 Spent stripping and cleaning bath solutions from electroplating operations where cyanides are used in the process. (R, T)

U226 Ethane, 1,1,1−trichloro−

Source: U. S. Environmental Protection Agency

How Toxic Site Locations Are Mapped

Toxics Targeting maps toxic site locations on a digital version of the U. S. Census map or those used by local authorities using addresses and map coordinates provided by site owners/operators or government agencies. In order to allow site locations to be verified independently, the information used to map each site is presented in the first section of each Toxic Site Profile, along with a description of the mapping technique used and any address corrections that were made in order to locate toxic sites with incomplete or inadequate site location information. The mapping process is explained below.

Map Identification Number: 12 Site Name: Acme World Manufacturing, Inc.

Site Address: 55 Main Street Anytown, NY 11797

MAP LOCATION INFORMATION

Site location mapped by:

Address Matching

1) Most toxic sites are mapped by matching addresses provided by site owners/operators or government agencies with locations on a digital version of the street or parcel map. These site locations are identified with the method used to map them.

Note: Some sites have an address match location and a map coordinate location. Both locations are mapped because they can be equally correct.

or Map Coordinate

2) Some toxic sites are located using map coordinates provided by site owners/ operators or government agencies. These site locations are identified "map coordinate." Map coordinates for Toxic Wastewater Discharges, Toxic Release Inventory sites and Major Oil Storage Facilities should be considered suspect.

or Manual Mapping

or Site Visit

3) Incomplete addresses or map coordinates require some site locations to be determined by commercial street maps (manual mapping), site visits, map coordinates from other databases and address location services. Application of any of these methods is identified accordingly.

ADDRESS CHANGE INFORMATION

Revised Street: NO CHANGE

Revised zip code: NO CHANGE

4) Site addresses are sometimes corrected to eliminate obvious errors that prevent sites from being mapped. All address corrections are noted here.

Information Source Guide

Toxics Targeting's Environmental Reports contain government and other information compiled on 21 categories of reported known or potential toxic sites. Each toxic site database is described below with information detailing a) the source of the information, b) the date when each database is covered to and c) when *Toxics Targeting* obtained the information..

1) **National Priority List for Federal Superfund Cleanup:** Toxic sites nominated for cleanup under the Federal Superfund program. Annual compilation of special two-page detailed profiles of NPL sites. Also includes delisted NPL sites.
ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.[1]
Data attributes updated from: 1/7/2014. Data obtained by Toxics Targeting: 1/7/2014.
New Facilities updated through: 1/7/2014. Data obtained by Toxics Targeting: 1/7/2014.

2) **Inactive Hazardous Waste Disposal Site Registry:** New York State database that maintains information and aids decision making regarding the investigation and cleanup of toxic sites. The Registry's data includes two-page profiles noting site name, ID number, description, classification, cleanup status, types of cleanup, owner information, types and quantities of contaminants, and assessment of health and environmental problems. Also included are sites that qualify for possible inclusion on the Registry. These Registry Qualifying sites may or may not be on the Site Registry.

1.0 Purpose & Scope

This investigation was performed to identify the presence of any abandoned underground storage tanks (USTs) on the site located at 28-90 Review Avenue, Long Island City, New York, herein identified as the subject property.

The investigative protocols used for this assessment were based upon the following documents: 1) United States Environmental Protection Agency's A Compendium of Superfund Field Operations Methods; and 2) the Geophysical Survey Systems, Inc. SIR System-2 Operation Manual.

- **Site Description**
- **Survey Plan**
- **Presentation of Imagery**
- **Evaluation of Results**

Presented herein are the results of the Remote Sensing Survey conducted by Impact Environmental Consulting, Inc. on the subject property [see ***Plate #1:*** *Project Location Map, Long Island City, New York*].

Plate#1: Project Location Map, Long Island City,

2.0 Site Description

2.1 Topography

The areal extent of the subject property was approximately 185,000 square feet. The subject property contained one two-story, masonry building with an approximate footprint of 1,000 square feet; one two-story, masonry building with an approximate footprint of 3,000 square feet; one single-story, masonry building with an approximate footprint of 23,000 square feet; and one single-story, masonry building with an approximate footprint of 2,000 square feet. The surface area of the subject property consisted of asphalt parking areas, concrete pads, and natural scrub vegetation. The subject property exhibited low topographic relief (less than three percent slopes), except for slightly steeper slopes along the western border of the subject property (where the property dips down to the Dutch Kills Creek) and along the southwestern border (where the property slopes up to the LIRR). The subject property lies within New York City manufacturing zoning district M3-1.

2.2 Land Use

The interiors of the buildings were utilized as office and operational space by AA Truck Renting Corp. The first floor of 1,000 sf building was utilized for the storage of a truck washing machine and chemicals. The second floor of this building was reportedly abandoned, and was inaccessible (sealed). The first floor of the 3,000 sf building was utilized for the storage of truck parts. The second floor was utilized for file storage. The23,000 s.f. building facilitated office space, truck repair space, truck engine rebuilding space, and truck parts storage space. The 2,000 s.f. building facilitated chemical storage, utilities, and a former truck body repair shop (reportedly no longer in operation).

3.0 Survey Plan

A survey plan was designed to identify the presence of any routes or mechanisms for the migration of contaminants released at target locations on the subject property. Potential routes and mechanisms included abandoned underground storage tanks. The survey was performed with a ground penetrating radar (GPR) unit.

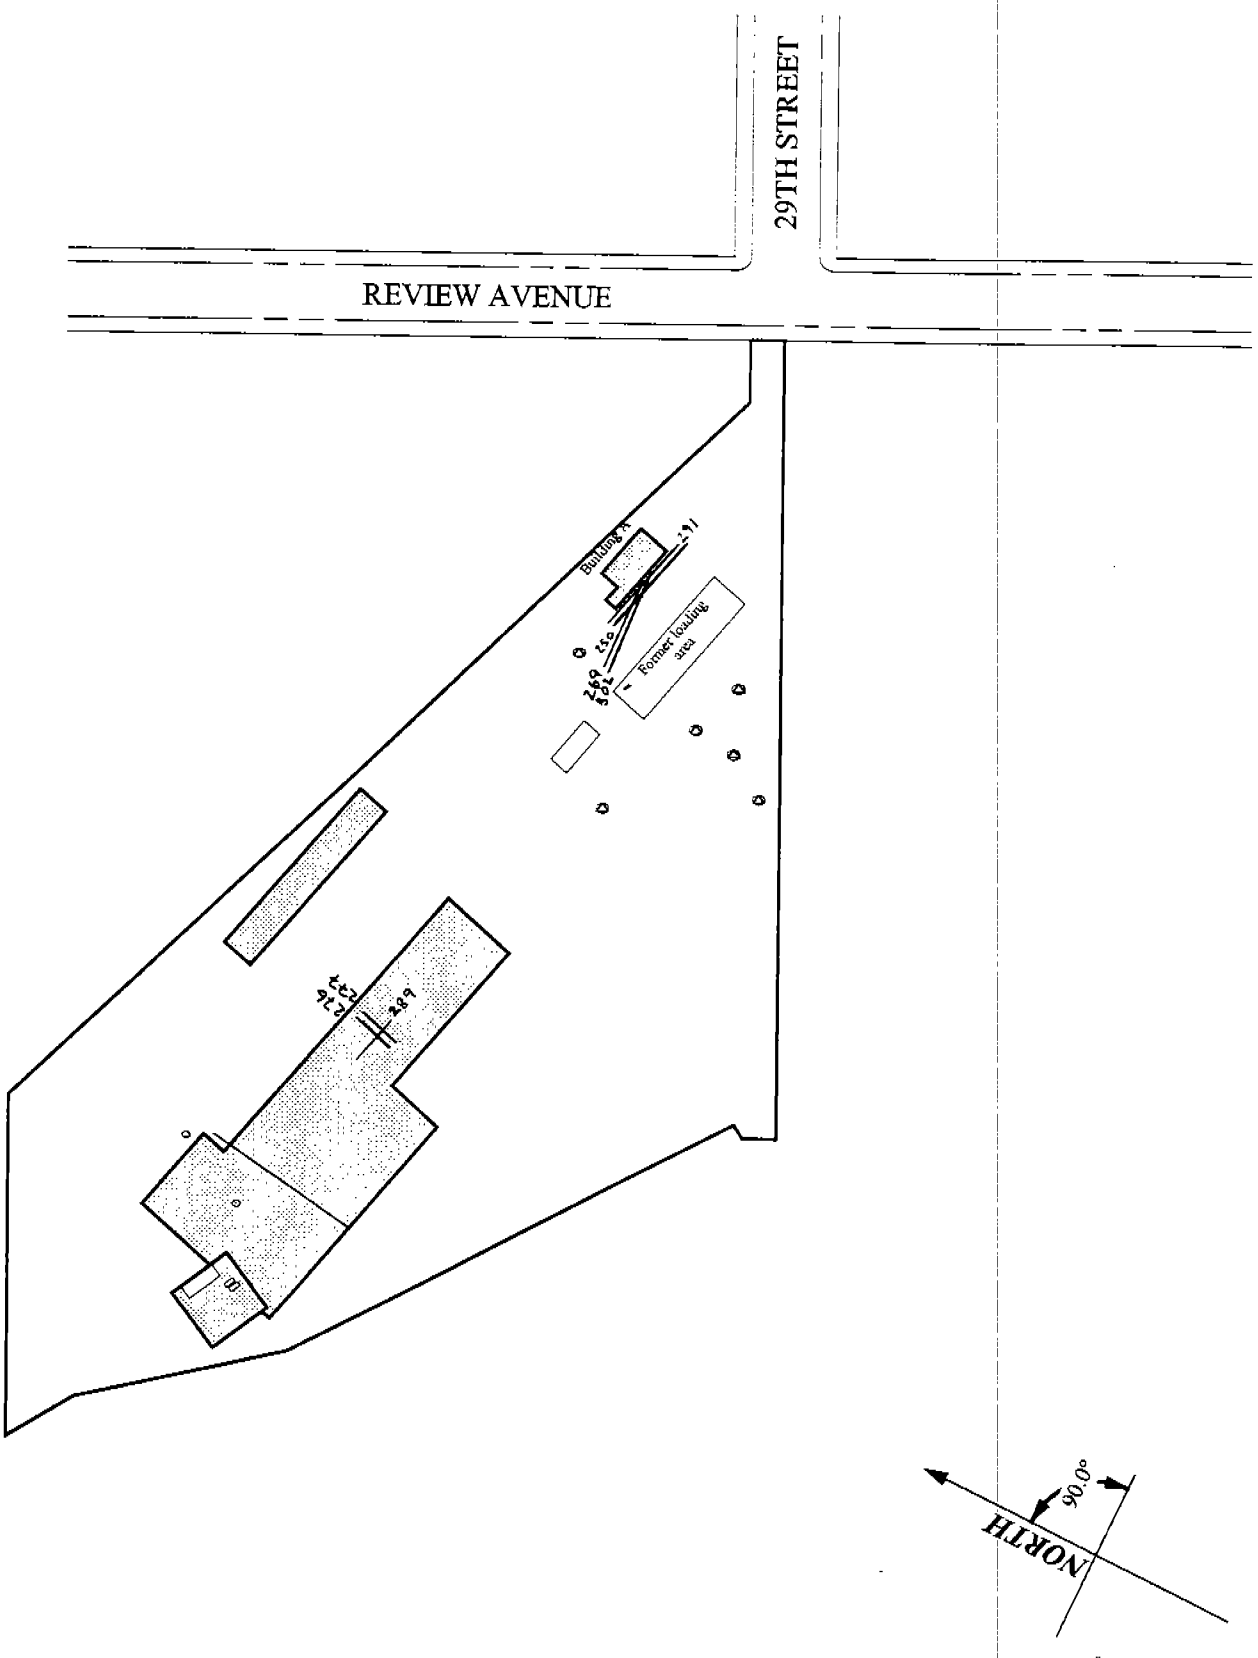
3.1 Remote Survey

A remote survey on target locations of the subject property was performed on July 21, 1999. An interpretation of GPR imagery obtained from the target locations on the subject property exhibited one anomalous feature consistent with that of an underground storage tank (adjacent to the southwestern corner of the 1,000s.f. building). This feature is discussed in detail below and mapped on ***Plate #2:*** *GPR Scan Map, Long Island City, New York.* The second target survey location (interior of 23,000s.f. building) failed to exhibit any GPR imagery consistent with that of USTs. References contained within each discussion pertain to GPR image files that are presented in section 4.0 of this report.

One underground storage tank (UST) was located adjacent to the southwestern corner of the 1,000 s.f. building (see Scan Files 250, 269, 291 and 302). The orientation of the UST appeared to be such that the long axis ran north-south). Based on the apparent UST dimensions, the capacity was estimated at being between one and three-thousand gallons.

3.1.1 GPR Procedures

The GPR system consists of a radar control unit, control cable and a transducer (antenna). The control unit transmits a trigger pulse at a normal repetition rate of 50 KHz. The trigger pulse is sent to the transmitter electronics in the transducer via the control cable. The transmitter electronics amplify the trigger pulses into bipolar pulses that are radiated to the subsurface. The transformed pulses vary in shape and frequency according to the transducer used. In the subsurface, variations of the signal occur at boundaries where there is a dielectric contrast (void, steel, soil type, etc.). Signal reflections travel back to the control unit represented as color graphic images for interpolation. This system is capable of transmitting electromagnetic energy in the frequency range of 16MHz to 2000MHz.



Impact Environmental Consulting, Inc. *1 Village Plaza* *Kings Park New York 11754*	**99-309** **Plate # 2: GPR Scan Map** *Long Island City, New York*	KEY ○ Groundwater monitoring well

A qualified Impact Environmental Consulting, Inc. technician specified a coordinate system on the planimetric surface of the subject property to map any subsurface dielectric anomalies detected on the premises. The operator used knowledge of the subsurface soil composition to calibrate the SIR-2 system to site specific conditions. Factor settings such as range, gain, number of gain points, and scans per unit, were modified to yield the most accurate data to describe the subsurface conditions.

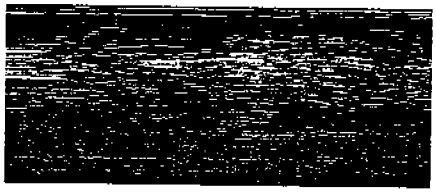
Where an anomaly was encountered, a more spatially specific coordinate system was plotted over the area to determine its size, shape and orientation. The data collected during the survey was reviewed by the operator and compared against past experience, technical judgment and prior site knowledge to classify the anomalies.

4.0 Presentation of Imagery

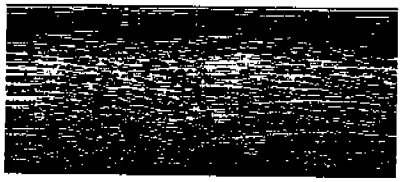
The following index identifies the GPR Scan Files and their respective interpretations. Following the index are printed graphic files downloaded from the GPR.

Scan File Code	Interpretation of Image	Reasons for Interpretation
276	No UST anomalies	No significant dielectric change
277	No UST anomalies	No significant dielectric change
289	No UST anomalies	No significant dielectric change
250	UST	Parabolic curve, low profile
269	UST	Parabolic curve
291	Product Vent	Parabolic curve, high profile
302	UST	Parabolic curve

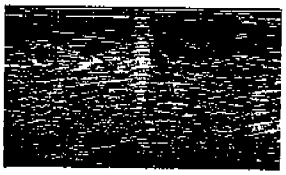
File 276



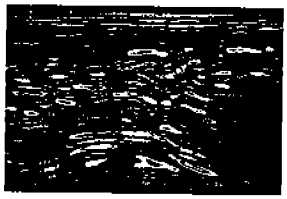
File 277



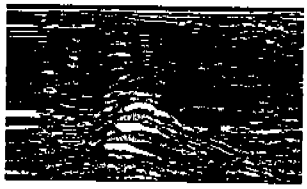
File 289



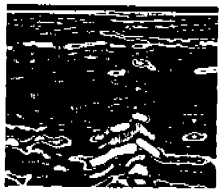
File 250



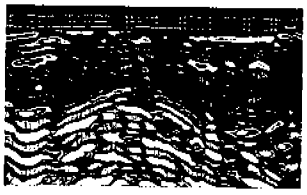
File 269



File 291



File 302



5.0 Evaluation of Results

An interpretation of GPR imagery identified the presence of one significant subsurface anomaly adjacent to the southwestern corner of the 1,000 s.f. building on the subject property. Said anomaly was consistent with that of the size and shape of USTs.

An interpretation of GPR imagery failed to identify the presence of any anomalies consistent with that of USTs in the interior of the 23,000 s.f. building.

1.3 Limitations and Exceptions

This assessment is dated, and is only valid for activities which occurred prior to the date of the site visit. Activities, liabilities, and alterations to the subject property subsequent to the date of the site visit are not included in the assessment.

This assessment is intended to assess the potential for public health or environmental liabilities based upon examination of the subject property in accordance with ASTM Standards. The ASTM Standards provide specific guidance with regard to radon, asbestos, lead in drinking water, lead based paint, and polychlorinated biphenyls (PCBs). This report conforms to ASTM standards with the exception of not satisfying the requirements for documentation of historical use for the past fifty years.

Analysis of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) implications with regard to the innocent landowner defense under Superfund finds that naturally occurring radon is not subject to CERCLA liability and is appropriately considered as a non-scope issue. Accordingly, this assessment will only provide general guidance on this issue, and will not involve or recommend air monitoring for radon gas.

Similarly, the ASTM Standards do not recognize liability with regard to asbestos that is part of the building materials of a structure, in accordance with CERCLA innocent landowner defense under Superfund. If asbestos containing material is disposed of on a property, however, such practice would be subject to Superfund response actions and should be identified. In the interest of serving the client and addressing the needs of the *user*, this assessment will identify observed asbestos containing materials (ACMs) which may pose a health threat. This assessment is not a full asbestos survey as would be required for building demolition, or identification of all possible sources of ACM, regardless of health danger.

Lead in drinking water and lead based paint are also issues which are considered to be non-scope under CERCLA innocent landowner defense under Superfund. Lead based paint was in use for many years, and it is likely that many older buildings will have surfaces coated with lead based paint. As a general rule, painted surfaces should be maintained and ingestion of paint products should be avoided. If disposal of these materials is involved, disclosure of this practice would be subject to the scope of this environmental assessment. In the interest of serving the user, this report may include limited field testing of surface paints and the observations on the condition of the painted surfaces. Lead in drinking water generally occurs as a result of past use of high lead content solder. Water left stagnant in pipes overnight or longer may leach lead from these joints and affect drinking water quality. As a general rule, water should be run for several minutes in the morning where such plumbing may be present.

This assessment will not identify all potential sources of PCB containing oils. Common sources of these materials include transformers and fluorescent lamp ballasts. Electric service transformers may include ground level or pole mounted units. These transformers are owned and maintained by regional public utilities. Transformers are inventoried and periodically inspected. Public utility company representatives have reported that transformers were

10. EVALUATION OF DATA OBTAINED DURING THE ASSESSMENT

10.1 Recommendations

The following recommendations should be considered to further define the environmental quality of the subject property. These recommendations will define data which falls outside the scope of this investigation.

10.1.1 Recommended Phase I ESA Activities

Additional activities may be required as a result of the Phase I investigation. Generally, these apply to surrounding uses observed during the site inspection.

1. Responses to the Freedom of Information requests submitted to the New York State Department of Environmental Conservation and the New York City Fire Department have not been received to date. ASTM establishes that a diligent Phase I Environmental Site Assessment must consider all information obtained from a public agency within twenty days of receipt of a Freedom of Information request. Accordingly, information obtained from the above-mentioned agencies before the twenty day period has passed will be addressed in an addendum to this assessment.

10.1.2 Recommended Phase II ESA Activities

Additional activities may be required as a result of the Phase I investigation. These include the performance of sampling and analysis plans.

GPR

1. A trench drain system was identified in building B. The outfall location of this drain system is not known. The use of this building and the presence of petroleum contaminated sludge and surficial petrochemical staining in and in the immediate vicinity of the trench drain system represent recognized environmental conditions. Accordingly, it is recommended that a remote sensing survey be performed to determine the outfall location of the drain system. In addition, it is recommended that a limited subsurface investigation be performed to determine if this outfall has received any discharges that may have affected the environmental quality of the subject property.

2. Two (2) UIWs were identified in the truck repair space in building C. Based on the use of this building, the potential for petroleum release into these UIWs represents a recognized environmental condition. Consequently, it is recommended that a limited subsurface investigation be performed to determine if the UIWs have received any discharges that may have affected the environmental quality of the subject property.

3. Tyree Brothers observed evidence of one (1) UST, by the presence of a fill port and vent line adjacent south of building A. This UST was reportedly out of service at the time of the inspection. Based on the fact that

there is no documentation on the contents of the tank, the capacity, the structural integrity, and installation date of the tank, this represents a recognized environmental condition. Accordingly, it is recommended that a limited subsurface investigation be performed to determine if the UST actuated a release of product to the subsurface soils and / or groundwater of the subject property. This work can be performed in conjunction with the proper abandonment of the UST (see section ~~11~~ 10.1.3).

Pipes elevated slightly above grade and pipes cut at grade were noted throughout the eastern portion of the subject property. It is possible that some of these pipes are associated with former USTs on the subject property. The potential presence of additional USTs represents a recognized environmental condition. Accordingly, it is recommended that a remote sensing survey be performed to confirm or refute the presence of these USTs on the subject property. If any USTs are identified, it is recommended that a limited subsurface investigation be performed to determine if the operation of the USTs actuated a release of product to the subsurface soils and / or groundwater of the subject property. This work can be performed in conjunction with the abandonment of the USTs (see section ~~11~~ 10.1.3).

5. Several on-site catch basins were observed to be impacted by petroleum releases. The outfall locations of these basins could not be confirmed under the scope of this assessment. These petroleum impacted basins represent a recognized environmental condition. Accordingly, it is recommended that a remote sensing survey be performed to determine the outfall locations of the basins. If the basins discharge to an on-site outfall, it is recommended that a limited subsurface investigation be performed to determine if this outfall has received any discharges that may have affected the environmental quality of the subject property.

6. Tyree Brothers observed evidence of a UST within building C, by the presence of a suspect fill pipe. Based on the fact that there is no documentation on the contents of the tank, the capacity, the structural integrity, and installation date of the tank, this represents a recognized environmental condition. Accordingly, it is recommended that a remote sensing survey be performed to confirm or refute the presence of this UST. If the presence of an interior UST is confirmed, it is recommended that a limited subsurface investigation be performed to determine if the UST actuated a release of product to the subsurface soils and / or groundwater of the subject property. This work can be performed in conjunction with the abandonment of the UST (see section ~~11~~ 10.1.3).

7. A subsurface investigation performed in 1990 identified the presence of floating product on groundwater underlying the subject property. In addition, Tyree Brothers observed several areas throughout the subject property that exhibit substantial surficial petroleum staining. This investigation and on-site observations confirms the need for the above-referenced Phase II activities.

8. Several off-site confirmed or potential contamination sources were identified to exist within the ASTM search radius. The need for the above-recommended on-site investigative activities is further supported by the presence of these sources.

10.1.3 Recommended Phase III ESA Activities

Additional activities may be required as a result of the Phase I investigation. These include the performance of remediation activities. It should be noted that the scope of these activities may be modified based on a Phase II investigation.

1. Should the remote sensing surveys recommended in section 10.1.1 confirm the presence of any USTs, they would need to be removed/abandoned in accordance with NYSDEC protocol.

2. Suspect friable asbestos containing materials were identified on the subject property. Laboratory analysis results indicated that the material contained >1% asbestos. TBES recommends that all pipe insulation in poor condition be properly abated. Additionally, it is recommended that an Operations and Maintenance (O&M) Plan be implemented to manage any remaining suspect or confirmed asbestos containing materials on the subject property.

3. Painted surfaces in buildings A, B, and D were identified to contain lead-based paint. Most of these paints were in very poor condition (severely peeling). It is recommended that the paint in these areas should be properly abated. Additionally, it is recommended that an Operations and Maintenance (O&M) Plan be implemented to manage any remaining lead containing paints on the subject property.

4. All petroleum contaminated releases observed on the subject property should be properly remediated.

10.1.4 Recommended Compliance Activities

Compliance activities may be required based on the Phase I investigation. These include the performance of compliance activities that currently do not directly affect the environmental quality of the subject property.

1. The UIWs observed in building C need to be registered / permitted with the USEPA under the Underground Injection Control Program or abandoned in accordance with Underground Injection Well Closure parameters. This also applies to any other potential UIWs on the subject property (i.e., the outfall associated with the trench drain system in building B).

2. Should the buildings be renovated or demolished in the future, full lead and asbestos surveys should be conducted prior to the initiation of any work.

3. Documentation regarding the proper disposal of regulated wastes should be maintained on-site for periodic review.

4. Better housekeeping practices should be implemented to prevent any future releases of petroleum products to the surface of the subject property.

Long Island City

Spill #: 9010146

Dear Mr. Svinterud,

As per Tyree's letter dated October 17, 1991, New York State Department of Environmental Conservation is in agreement for the closure of the following spill number (9010146) at the above mentioned site.

New York State Department of Environmental Conservation has based this decision after reviewing the submitted environmental site assessment, analytical results and field inspection for the above mentioned site.

This does not relieve owner of the responsibility of any future environmental problems that may occur at this site.

Sincerely,

Eugene P. Sullivan

Re: Closure request
AA Truck Rental
28-90 Review Avenue
Long Island City, New York

Dear Gene:

At the above-referenced location, Tyree Brothers Environmental Services have been monitoring site observation wells since July, 1990. The wells were monitored for depth to water and depth to product.

For the first 7-8 months (July 90 - February 91) free-phase petroleum product was present on top of the water table. This product was recovered through manual bailing during every visit.

Since the sedimentation in the area are of a fine silty character, the hydraulic conductivity is very low. This has made it possible for Tyree to effectively recover the product in a short time.

On September 30, 1991, our field technician developed and sampled the observation wells. The samples were analyzed for EPA-602 and from the analysis report, we can see that the dissolved levels are very low.

Based on these analyticals and the fact that Tyree effectively recovered the petroleum product, we safely feel that this location can be closed.

Please inform Mr. Eric Roberts and myself about your and the NYSDEC's decision.

Should you have any questions, please feel free to contact me at your convenience at (516) 249-3150, extension 229.

Sincerely,

Bjorn T. Svinterud

Re: AA Truck Renting Corporation
28-90 Review Avenue
Long Island City, New York

Dear Mr. Sullivan:

As per our phone conversation today, please find the updated graphs showing free-phase petroleum thickness in well #1 and #3.

These results confirm my earlier recommendations of site closure in the letter dated May 23, 1991. Based on these latest results, I feel that NYSDEC have an even better background for approving a site closure.

Please inform Mr. Eric Roberts of AA Truck Renting Corporation and myself in writing with your decision.

If I could be of any further assistance in this matter, please feel free to contact me at (516) 249-3150, extension 229.

Sincerely,

Bjorn T. Svinterud

RE: AA Truck Renting Corporation
28-90 Review Avenue
Long Island City, New York

Dear Mr. Sullivan:

Tyree Brothers Environmental Services, Inc. has monitored the on site water observation wells on a bi-weekly basis since July 13, 1990.

Free-phase floating product has been observed in both well #1 and #3. The amount of product observed had a peak with 12" in well #1 on September 24, 1990, but a decline has been observed ever since. Well #3 had a peak with approximately 1.5" in October 1990.

When free-phase petroleum product was observed, it was bailed out and properly disposed of.

For the last three (3) months, free-phase petroleum product was not observed in well #3 and in well #1 none or low levels of product was observed as seen on the product thickness graph. Further, the water table rose 1/4-1/2 foot, which is normal when an extra overburden pressure is removed, in this case, free-phase petroleum product. This clearly indicated that our bi-weekly monitoring and bailing, which was reduced to weekly as of April first have been very successful.

Member
Tyree Environmental Technologies

Based on this information, Tyree believes that an optimal volume of floating product is recovered. Whatever trace of floating product that is left in the saturated and unsaturated zone, should have minimal or no environmental impact on the surrounding areas.

My recommendations is that the New York State Department of Environmental Conservation with Eugene Sullivan are viewing this site for closure.

Please inform Mr. Eric Roberts of AA Truck Renting Corporation and myself in writing.

If I can be of any assistance in this matter, please feel free to contact me at (516) 249-3150, extension 229.

Re: AA Truck Renting Corporation
28-90 Review Avenue
Long Island City, New York

Dear Mr. Sullivan:

Since our last written communication of June 6, 1990, Tyree Brothers Environmental Services installed additional monitoring wells at the referenced location to determine the limits of free floating product. A site map showing all monitoring well locations is attached.

Initially two monitoring wells (W-1 and W-2) were installed on the property to investigate groundwater impacts possibly resulting from previously identified soil contamination from petroleum products. One of the wells, W-1, located in the vicinity of a former terminal loading rack and an existing underground diesel fuel storage tank system area was found to contain approximately three (3) inches of floating petroleum product.

Four additional monitoring wells were installed during June, 1990. (Copies of all well logs are attached.) The monitoring wells have been checked on four separate occasions for the presence of floating petroleum product. To date only one of the six installed wells, W-1, has been found to contain a measurable amount of floating petroleum product. The thickness of floating product in the well has ranged from three (3) to six and three quarter (6 3/4) inches. A summary of all well gauging data is attached.

A sample of the product was collected from well W-1 on May 17, 1990 and forwarded to a state certified laboratory for product identification. The product appeared dark in color possibly indicating an aged petroleum. Laboratory analysis of the product identified it as being either a number 2 fuel oil or a diesel fuel.

As indicated in our original correspondence to you, a leak was found at the suction pump in the diesel fuel dispenser. Following a repair, the tank system was petrotite tested and found to be tight in accordance with NFPA criteria.

The presence of floating product is limited to the immediate area of the existing underground storage tank area. The possible causes of the identified release are as follows:

1. Past spillage resulting from the transfer of product at the former terminal loading rack area.
2. Spillage occurring from normal operation of the existing underground storage tank systems, or
3. Release from the noted suction pump leak at the dispenser pump.

Our recommendation at this time is to monitor the existing wells on a biweekly basis. Depth to product and depth to water measurements will be taken and product thicknesses will be recorded. Any wells containing floating product will be hand bailed to recover the product. Recovered product volumes will also be recorded.

Monitoring and bailing of the site is currently in progress and will continue on a biweekly basis. Based upon the data, no further remedial action is warranted at this time. Please contact this office with any comments you may have regarding our findings and proposed recommendations.

Sincerely,

William Tyree

Re: AA Truck Renting Corp
28-90 Review Avenue
Long Island City, New York

Dear Mr. Sullivan:

I am writing on behalf of AA Truck Renting Corporation to notify you of a discovered release of petroleum to the groundwater.

During May 1990, Tyree Bros. Environmental Services was retained by AA Truck Renting Corporation to perform a subsurface investigation at the referenced location for the purpose of preparing an environmental analysis for mortgage purposes. The scope of the investigation included the drilling of four soil borings to groundwater and laboratory analysis of collected soil samples from each boring. The analysis indicated the presence of petroleum hydrocarbons and aromatic hydrocarbons at all of the boring locations.

Two monitoring wells were subsequently installed to investigate groundwater impact. While one well was clean, the other well was found to contain approximately three inches of floating petroleum product. Laboratory analysis of a sample of the floating product identified the product as being either a number 2 fuel oil or diesel fuel. The well containing the floating product is in the vicinity of a former terminal loading rack, three operating underground diesel fuel tanks, and a diesel fuel dispenser.

On Saturday, June 2, 1990 the three underground storage tank systems were Petro-tite tested. All three tanks were determined to be tight;

however, a leak was found at the suction pump in the diesel fuel dispenser prior to testing the tanks. Following a repair to eliminate the leak, a systems test was performed on all three tanks. The tank systems are confirmed to be tight.

Tyree Brothers Environmental Services is now being retained to install additional monitoring wells to determine the extent of the floating product plume. Four monitoring wells will be installed around this area. Following installation, the wells will be monitored to investigate the presence of floating petroleum product. This information will be made available for your review.

It is our client's intent to fully investigate and remediate the discovered spill as deemed to be necessary. Appropriate actions will be undertaken to immediately recover floating product. The selected method of recovery will depend upon the extent and thickness of the observed floating product.

Sincerely,

William Tyree

1 - Net Volume Change at Conclusion of Precision Test ____ gph

Signature of Tester _____

Date _____

2 Statement

[ ] Tank and product handling system has been tested tight according to the Precision Test Criteria as established by N.F.P.A. publication 329. This is not intended to indicate permission of a leak.

OR

[ ] Tank and product handling system has failed the tank tightness test according to the Precision Test Criteria as established by N.F.P.A. publication 329.

It is the responsibility of the owner and/or operator of this system to immediately advise state and local authorities of any implied hazard and the possibility of any reportable pollution to the environment as a result of the indicated failure of this system. Heath Consultants Incorporated does not assume any responsibility or liability for any loss of product to the environment.

Tank Owner/Operator _____

Date _____

Name of Supplier Owner or Dealer	Address No. and Street(s)	City	State	Date of Test

15. TANK TO TEST

#2 West of pumps
Identify by position

Diesel Fuel
Brand and Grade

15a. BRIEF DIAGRAM OF TANK FIELD

16. CAPACITY

Nominal Capacity: 4000 Gallons

By most accurate capacity chart available: 4000 Gallons

From
- ☐ Station Chart
- ☐ Tank Manufacturer's Chart
- ☐ Company Engineering Data
- ☐ Charts supplied with
- ☒ Other

17. FILL-UP FOR TEST

Stick Water Bottom before Fill-up: 0 in. to "s"

0 Gallons

72 steel in. Tank Diameter

	Gallons	Total Gallons as Reading
Inventory	72	4000
Topoff		+10
Transfer total to line 25a		4010

18. SPECIAL CONDITIONS AND PROCEDURES TO TEST THIS TANK

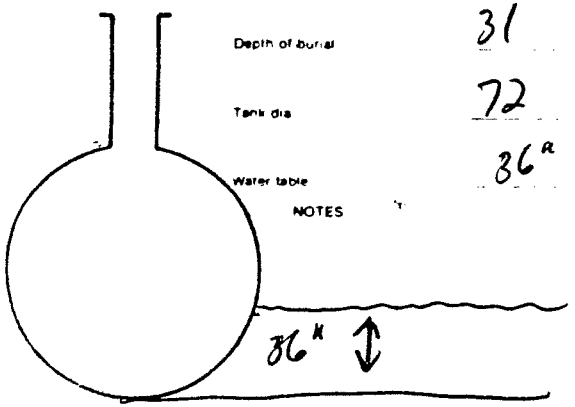
☐ Water in tank ☐ Line(s) being tested with LVLLT ☒ High water table in tank excavation

See manual sections applicable. Check below and record procedure in log (27)

Use maximum allowable test pressure for all tests
Four pound rule does not apply to doublewalled tanks

Complete section below

1. Is four pound rule required? Yes ☒ No ☐
2. Height to 12" mark from bottom of tank: 170 in
3. Pressure at bottom of tank: 5.27 PSI
4. Pressure at top of tank: 3.038 PSI



The above calculations are to be used for dry soil conditions to establish a positive pressure advantage, or when using the four pound rule to compensate for the presence of subsurface water in the tank area

Refer to N F P A 30, Sections 2-3.2.4 and 2-7.2 and the tank manufacturer regarding allowable system test pressures

19. TANK MEASUREMENTS FOR TSTT ASSEMBLY

Bottom of tank to grade*: 103 in
Add 30" for "T" probe assy: 30 in
Total tubing to assemble — approximate: 144 in

20. EXTENSION HOSE SETTING

Tank top to grade*: 31 in
Extend hose on suction tube 6" or more below tank top: ____ in

*If Fill pipe extends above grade, use top of fill

22. Thermal-Sensor reading after circulation: 16372 Digits

23. Digits per °F in range of expected change: Between 64 70 °F = 326 digits

COEFFICIENT OF EXPANSION (Complete after circulation)

24a. Corrected A P I Gravity
Observed A P I Gravity
Hydrometer employed ____ H
Observed Sample Temperature ____ °F
Corrected A P I Gravity @ 60°F, From Table A
Coefficient of Expansion for Involved Product From Table B
Transfer COE to Line 25b

21. VAPOR RECOVERY SYSTEM ☐ Stage I ☐ Stage II

24b. COEFFICIENT OF EXPANSION RECIPROCAL METHOD

Type of Product	Diesel Fuel
Hydrometer Employed	4 H
Temperature in Tank After Circulation	69.0 °F
Temperature of Sample	65.0 °F
Difference (+/-)	-4 °F
Observed A P I Gravity	33.3

Reciprocal 2187 Page # 37

4010 ÷ 2187 = 1.8335619
Total quantity in full tank (16 or 17) ÷ Reciprocal = Volume change in this tank per °F
Transfer to Line 26a

24c. FOR TESTING WITH WATER see Table C & D

Water Temperature after Circulation Table C ____ °F
Coefficient of Water Table D
Added Surfactant? ☐ Yes ☐ No Transfer COE to Line 25b

25. (a) Total quantity in full tank (16 or 17) × (b) Coefficient of expansion for involved product = (c) Volume change in this tank per °F ____ gallons

26. (a) 1.8335619 × 326 = 0.0056244 Volume change per °F = This is .0056 test
Volume change per °F (25 or 24b) ÷ Digits per °F in test = Volume change per digit
16657 ÷ 325 = 0.0066417 .0056

Signature of Tester _____

Date _____

2 Statement

[ ] Tank and product handling system has been tested tight according to the Precision Test Criteria as established by N.F.P.A. publication 329. This is not intended to indicate permission of a leak.

OR

[ ] Tank and product handling system has failed the tank tightness test according to the Precision Test Criteria as established by N.F.P.A. publication 329.

It is the responsibility of the owner and/or operator of this system to immediately advise state and local authorities of any implied hazard and the possibility of any reportable pollution to the environment as a result of the indicated failure of this system. Health Consultants Incorporated does not assume any responsibility or liability for any loss of product to the environment.

Tank Owner/Operator _____

Date _____

14. A.H. Trucking dba TO — Name of Supplier or Dealer — Academy Ave Long Island City — Address (No. and Street) — City — NY — State — 6 07 10 — Date of Test

Transfer total to line 25a

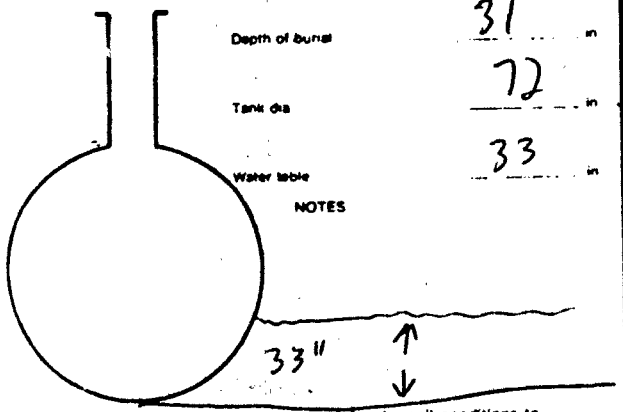
18. SPECIAL CONDITIONS AND PROCEDURES TO TEST THIS TANK
- [ ] Water in tank
- [ ] Line(s) being tested w ith LVLLT
- [ ] High water table in tank excavation

See manual sections applicable. Check below and record procedure in log (27)

Use maximum allowable test pressure for all tests
Four pound rule does not apply to doublewalled tanks

Complete section below

1 Is four pound rule required? Yes [X] No [ ]
2 Height to 12" mark from bottom of tank 167 in
3 Pressure at bottom of tank 5.177 PSI
4 Pressure at top of tank 2.945 PSI



The above calculations are to be used for dry soil conditions to establish a positive pressure advantage, or when using the four pound rule to compensate for the presence of subsurface water in the tank area

Refer to NFPA 30, Sections 2-3.2.4 and 2-7.2 and the tank manufacturer regarding allowable system test pressures.

19. TANK MEASUREMENTS FOR TSTT ASSEMBLY
Bottom of tank to grade* 103 in
Add 30" for "T" probe assy 30 in
Total tubing to assemble — approximate ____ in

20. EXTENSION HOSE SETTING
Tank top to grade* 31 in
Extend hose on suction tube 6" or more below tank top ____ in
*If Fill pipe extends above grade, use top of fill

22. Thermal-Sensor reading after circulation 13072 digits

	Gallons	Total Gallons as Reading
Inventory	72	4000
Topoff		+10
		4010

Transfer total to line 25a

18. SPECIAL CONDITIONS AND PROCEDURES TO TEST THIS TANK

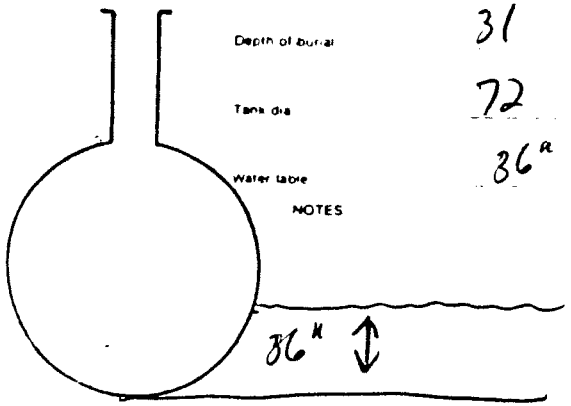
- [ ] Water in tank
- [ ] Line(s) being tested with LVLLT
- [X] High water table in tank excavation

See manual sections applicable Check below and record procedure in log (27)

Use maximum allowable test pressure for all tests
Four pound rule does not apply to doublewalled tanks

Complete section below

1. Is four pound rule required? Yes [X] No [ ]
2. Height to 12" mark from bottom of tank 170 in
3. Pressure at bottom of tank 5.27 PSI
4. Pressure at top of tank 3.038 PSI



The above calculations are to be used for dry soil conditions to establish a positive pressure advantage, or when using the four pound rule to compensate for the presence of subsurface water in the tank area

Refer to N F P A 30 Sections 2-3 2 4 and 2-7 2 and the tank manufacturer regarding allowable system test pressures

19. TANK MEASUREMENTS FOR TSTT ASSEMBLY

Bottom of tank to grade* 103 in
Add 30" for "T" probe assy 30 in
Total tubing to assemble — approximate 149 in

20. EXTENSION HOSE SETTING

Tank top to grade* 31 in
Extend hose on suction tube 6" or more below tank top ____ in
*If Fill pipe extends above grade use top of fill

22. Thermal-Sensor reading after circulation 15372 Digits
69.70 °F Between

23. Digits per °F in range of expected change 326 digits

COEFFICIENT OF EXPANSION (Complete after circulation)

24a. Corrected A P I Gravity
Observed A P I Gravity
Hydrometer employed H
Observed Sample Temperature °F
Corrected A P I Gravity @ 60°F From Table A
Coefficient of Expansion for Involved Product From Table B
Transfer COE to Line 25b

21. VAPOR RECOVERY SYSTEM [ ] Stage I [ ] Stage II

24b. COEFFICIENT OF EXPANSION RECIPROCAL METHOD

Type of Product	Diesel Fuel
Hydrometer Employed	4 H
Temperature in Tank After Circulation	69.0 °F
Temperature of Sample	65.0 °F
Difference (+/-)	-4 °F
Observed A P I Gravity	33.3

Reciprocal 2187 Page # 37

4010 (Total quantity in full tank (16 or 17)) . 2187 (Reciprocal) . 1.8335619 (Volume change in this tank per °F)

Transfer to Line 26a

24c. FOR TESTING WITH WATER see Table C & D

Water Temperature after Circulation Table C °F
Coefficient of Water Table D
Added Surfactant? [ ] Yes [ ] No Transfer COE to Line 25b

25. (a) Total quantity in full tank (16 or 17) × (b) Coefficient of expansion for involved product = (c) Volume change in this tank per °F gallons

26. (a) 1.8335619 Volume change per °F (25 or 24b) . (b) 326 Digits per °F in test = 0.0056244 Volume change per digit

This is test .0056

1 Purpose & Scope

This Investigation Summary Report was prepared to document the investigative activities conducted to define the extent of contaminants that have impacted the environmental quality of the property located at 2890 Review Avenue, Long Island City, New York, herein identified as the Site. The scope of this investigation is based upon the Investigation Work Plan, dated November 14, 2008 prepared by Impact Environmental and approved by the New York State Department of Environmental Conservation (NYSDEC). The NYSDEC requirements were outlined in a letter, dated October 7, 2008. The objectives of this investigation are: 1) to determine the extent of petroleum related soil and/or groundwater contamination associated with the NYSDEC Spill # 0807459; 2) to determine the site-specific groundwater flow direction; and 3) to conduct a hydrogeology investigation in preparation for future remediation.

The investigative protocols proposed for this assessment were based, in part, upon the following documents: 1) the New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandum (TAGM) #4046, Determination of Soil Cleanup Objectives; 2) the New York State Department of Environmental Conservation, Technical Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Limitations; 3) the New York State Department of Environmental Conservation, Sampling Guidelines and Protocols, Technical Background and Quality Control Assurance for the New York State Department of Environmental Conservation Spill Response Program, dated September 1992; and 4) the New York State Department of Environmental Conservation, Division of Environmental Remediation, Draft DER-10 Technical Guidance For Site Investigation and Remediation, dated December 25, 2002. The activities performed under the scope of this investigation have been summarized in this report in the following sections.

- **Site Description**
- **Sampling and Analysis Plan**
- **Laboratory Analysis**
- **Evaluation of Results**

Presented herein are the results of the Subsurface Investigation conducted by Impact Environmental on the Site [see **Plate 1:** Project Location Map, *Long Island City, NY*].

2 Site Description

2.1 Topography

The areal extent of the Site is approximately 192,792 square feet. The Site contains four one-story masonry buildings with a combined footprint of 37,462 square feet. The surface area of the Site consists of asphalt pavement, exposed soils, and vegetative landscaping. The Site exhibits low topographic relief (less than three percent slopes).

2.2 Site Background

The Site lies within New York City zoning district M3-1. The interior space of the existing building was divided into office space and operational space by the AA Truck Renting. The office spaces were utilized for general administrative purposes. The operational space was utilized for truck repair and parts storage. The exterior space was utilized for truck parking.

2.3 Previous Investigation

On September 2, 2008, six soil probes, identified as SP-1, SP-2, SP-3, SP-4, SP-5, and SP-6 were installed on the Site by Impact Environmental. The headspace analysis of the samples secured from the soil samples collected from these probes detected concentrations of hydrocarbons above ambient levels. Sample characterization identified evidence of petroleum constituents in samples from the Site near and/or beneath the soil-groundwater interface.

The laboratory analysis of the samples selected from soil probes SP-2, SP-3, SP-5 and SP-6 failed to detect any concentrations of target volatile organic analytes above minimum detection limits. The laboratory analysis of the samples selected from soil probes SP-1 and SP-4 detected concentrations of target volatile organic analytes; however, the concentrations were significantly below the applicable guidance criteria.[1]

The laboratory analysis performed on the subsurface soil samples secured from probes SP-1, SP-2, SP-3, SP-4, SP-5 and SP-6 detected concentrations of semi-volatile organic analytes. The concentrations of

[1] NYSDEC TAGM #4046, Recommended Soil Cleanup Objectives

semi-volatile organic analytes detected from the samples SP-2 and SP-5 were below the applicable guidance criteria.[2]

The monitoring wells were gauged for the presence and thickness of free phase product and depth to water with an oil-water interface meter. Measurable free phase product was detected at each monitoring well with a range of thicknesses from 0.80 to 1.4 feet. It was noted that the thickness of the free phase product have been exaggerated due to the small diameter of the wells (1-inch, refer to Section 3.4 for details).

Groundwater samples were collected from each monitoring well beneath the free phase product using a dedicated bailer. The laboratory analysis performed on the groundwater samples at groundwater monitoring wells GW-1, GW-4 and GW-6 detected concentrations of target volatile analytes marginally above applicable guidance criteria[3].

The soil at the sampling points at the Site exhibits olfactory evidence of petroleum contamination. However, the laboratory analysis of the soil samples indicated non-detectable and/or low level concentrations of volatile organic compounds, which were below applicable guidance criteria. The speciation of the analytes indicates that the petroleum related compounds detected are aged and degraded. No significant sources of petroleum contamination were identified in the unsaturated soils at the Site that would appear to be the result of the underlying free phase product detected on the groundwater.

The previous sampling locations can be referenced with **Plate 2**.

[3] NYSDEC Technical Operational Guidance Series (TOGS) 1.1.1, Ambient Water Quality Standards and Limitations

3 Survey, Sampling and Analysis Plan

A sampling and analysis program was developed in accordance with the requirements of the NYSDEC. The plan included: 1) an investigation to sample subsurface soil and groundwater; 2) an investigation to determine the site-specific groundwater flow direction; and 3) slug tests to determine hydraulic conductivities throughout the Site. All sampling locations can be referenced with **Plate 2**. The result of the groundwater elevation survey can be referenced with **Plate 3**.

3.1 Subsurface Soil Sampling

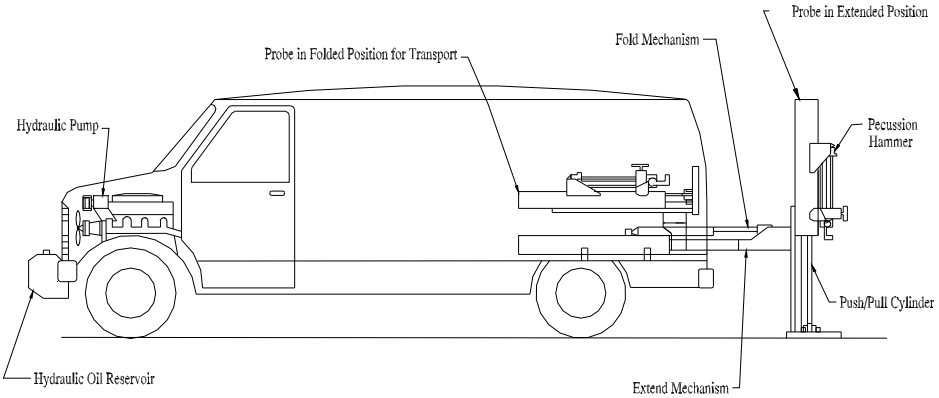
From March 31 to April 2, 2009, Impact Environmental installed 6 soil probes, identified as MW-SP-1 through MW-SP-6, on the Site as part of this investigation.

The locations of installed soil probes were consistent with the approved Investigation Work Plan. Subsurface soil samples were secured from grade to 20 feet below existing grade (BEG) or until significant clay layer was encountered. Soil probe MW-SP-2 was only installed to 15 ft due to multiple refusals.

3.1.1 Subsurface Probe Installation

Subsurface probes were sited using a Geoprobe hydraulically powered probing tool (see **Figure 1:** Geoprobe Operating System). Mechanized, vehicle mounted probe systems apply both static force and hydraulically powered percussion hammers for tool placement (static down forces up to 18,000 pounds combined with percussion hammers of eight horsepower continuous output). Recovery of large sample volumes was facilitated with a probe-driven sampler. The probe-driven sampler consisted of a hollow probe that opened via a remote control mechanism at the selected sampling depth in the soil profile to allow soil to enter as it was advanced. Discrete media samples were secured at the desired depths and were contained within a non-reactive transparent plastic sleeve that lined the hollow probe. The plastic sleeves were removed for subsequent inspection and sample aliquot acquisition.

Figure 1: Geoprobe Operating System

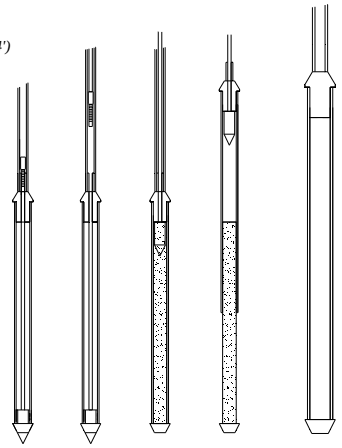


Basics

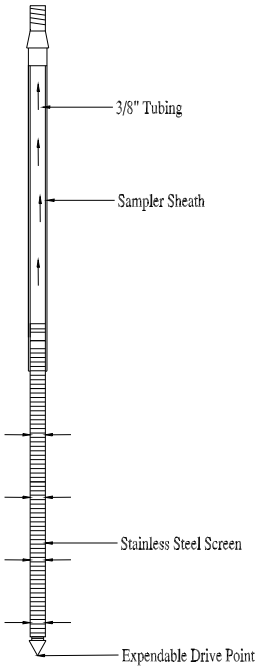
- Hydraulic powered probe unit isoperated from a engine driven pump.
- Remote vehicle ignition allows operator to start engine from probe unit.
- Belt driven hydraulic pump supplies 10 gpm @ 2000 rpm, 3000 psi operating pressure
- Probe unit folds for transport
- Unit utilizes static weight of vehicle and pecussion hammer to advance probing tools.
- Hydraulic hammer delivers pecussion rate of 30 Hz.
- Probes have greater than 18,000 lbs of down force and 25,000 lbs of retraction force.
- Drives multiple diameter probes (1", 1.25" and 2.25") to depths over 100 feet.

Soil Probing Tool
The tools are advanced and a sample is acquired in a non-reactive plastic sheathing. The system offers two sizes of sample retrieval:

Large bore - 1.5" x 2'
Macro - 2.25" x (2', 3' & 4')



Groundwater SP-15 Sampler
The tool allows a stainless steel, 4' screen to be delivered to the underlying groundwater. At the desired depth, the screen is retracted and samples are obtained via a check valve assembly.



3.2 Field Headspace Analysis

Headspace analysis was performed on each subsurface soil sample to provide precursory data regarding contamination. Results of the analysis were used to adjust the sample and analysis program to yield the most accurate and representative results. The results of the field analysis are presented in **Appendix A**.

3.2.1 Headspace Analysis Procedure

Headspace analysis was performed on each of the acquired samples utilizing a portable photo ionization detection meter to measure what, if any, hydrocarbon concentrations were present in isolated portions of the secured samples. Headspace analysis was conducted by partially filling a wide-mouth glass container with sample aliquot and sealing the top with aluminum foil, thereby creating a void. This void is referred to as the sample headspace.

To facilitate the detection of any hydrocarbons contained within the head space, the container was agitated for a period of thirty (30) seconds. The probe of the vapor analyzer was then injected through the foil into the headspace to measure the hydrocarbon concentrations present. A Photovac Micro-Tip, photo ionization detection meter (PID) was the organic vapor analyzer selected for the head space analysis. A PID utilizes the principle of photo ionization for detection and measurement of hydrocarbon compounds. A PID does not respond to all compounds similarly; rather, each compound has its own response factor relative to its calibration. For this investigation, the PID was calibrated to isobutylene. Hydrocarbon relative response factors for a PID calibrated to isobutylene are published by the manufacturer.

3.3 Sample Characterization

A visual inspection of all samples recovered during the installation of each of the soil probe was conducted to identify any gross signs of chemical contamination and to classify the sample media. Color classifications were made in accordance with the Munsell Classification System. Gradation classifications were made in accordance with the Unified Soil Classification System.

In general, on the eastern portion of the Site the subsurface soil were found to consist of brown coarse to medium sand from grade to approximately 12 feet BEG. A clay layer, at lease 3 ft in thickness, was encountered starting at approximately 12 ft BEG. On the western portion of the Site, the subsurface soil

were found to consist of dark brown coarse to fine sand mixed with urban fill material, including concrete, rock, slag and cinderblock debris. No clay layer was encountered within 20 ft BEG.

The groundwater was encountered approximately 5-7 ft below grade. At soil probe SP-1, the highest PID reading (144.0 ppm) was detected at 15-16 ft BEG within saturated fill material. Strong petroleum odor was noted. At soil probe SP-2, the highest PID reading (50.4) was detected at 15 ft BEG within saturated fill material. Strong petroleum odor was noted. At soil probe SP-3, the highest PID reading (665.0 ppm) was detected at 4 ft BEG within a layer of coarse to medium sand. Black stains and strong petroleum odor were noted. At soil probe SP-4, the highest PID reading (45.9 ppm) was detected at 4 ft BEG withih coarse to fine sand. At soil probe SP-5, the highest PID reading (54.1 ppm) was detected at 15 ft BEG within saturated fill material. Strong petroleum odor and oil sheen were noted. At SP-6, the highest PID reading (128.0 ppm) was detected at 12 ft BEG within a layer of coarse sand, on top of the clay. Strong petroleum odor and black stains were noted.

The soil probe logs presented in **Appendix A** provide a classification of each sample for color and gradation.

3.4 Groundwater Sampling

From March 31 to April 7, 2009, Impact Environmental installed six 4-inch diameter groundwater monitoring wells, identified as MW-1 through MW-6, on the Site as part of this investigation. The locations of the installed groundwater monitoring wells were consistent with the approved Investigation Work Plan.

The monitoring wells were installed from grade to 20 ft BEG or wherever a clay layer exists. Note that MW-2 was only installed to 12 ft BEG due to the presence of significant fill material.

On April 10, 2009, upon completion of well installation, Impact Environmental developed the six 4-inch diameter monitoring wells utilizing well pump and 3-inch bailers.

On April 23, 2009, two week after the installation of the wells, the monitoring wells were gauged for the presence and thickness of free phase product and depth to water with an oil-water interface meter. No measurable free phase product was observed in any of the wells. This observation contradicts the previous observation made through 1-inch diameter wells. On June 5, 2009, Impact Environmental re-gauged the 4-inch monitoring wells on the Site, and again no measurable free phase product was

observed in any of the wells. On June 12, 2006, Impact Environmental re-gauged all the six 1-inch wells, six 4-inch wells and one pre-existing 4-inch (identified as MW-7H on the **Plate 2**), with oil-water interface meter and disposable bailers. Approximately 0.01 ft of free phase product was observed in MW-7H. No measurable free phase product was observed in any other wells. Note that MW-7H is a pre-existing well, probably associated with previous spill investigation on the Site. At this time, the construction details of MW-7H are unknown. MW-7H was not developed prior to gauging.

The results of the field measurements gauging and surveying the monitoring wells are presented in **Table 1**. The monitoring wells (MW-1 through MW-6) were developed and sampled as part of this investigation. One groundwater sample was secured from each of these monitoring wells for laboratory analysis.

3.4.1 Monitoring Well Installation

Six 4-inch diameter monitoring wells (MW-1 through MW-6) were installed to a depth of approximately 15 to 20 feet BEG on the Site (with the exception of MW-2). The wells were installed using a hollow stem auger drilling technique with Geoprobe® 6600 unit. Each well was constructed of fifteen feet of screened interval (0.020 slot size, schedule 40, PVC), 5 ft above the groundwater interface and 10 ft below soil-groundwater interface. The annular space between the boring and the screened casing was filled with a filtration media which extended 2 ft above the top of the screen. The annular space 1 ft above the filtration media was sealed with bentonite. The remainder of the bore hole was filled with grout. The monitoring well was finished with a locking monitoring well cover. Detailed well logs are referenced with **Appendix B** of this report.

3.4.2 Monitoring Well Development and Sampling Procedure

The development and sampling procedures conformed to NYSDEC protocols. A field log protocol was conducted to record sampling data including; date, time, location, sample identification code, depth to water, total depth of the well, method of well development, and sampling technique. The monitoring wells were developed by purging a minimum of three (3) static well volumes utilizing a mini pump. A static well volume is defined as:

$$\text{Static well volume} = \text{height of water column} \times (\text{well radius})^2 \times \text{pi} \times 7.48$$

where 7.48 is the conversion factor for cubic feet to gallons

Field measurements were secured from each monitoring well during the development process to provide data regarding physical groundwater characteristics. The development water was field analyzed for pH, specific conductivity and temperature. Results of the field measurements were utilized to establish steady state conditions within the groundwater aquifer. Following development, one water sample was acquired from each of the monitoring wells utilizing a dedicated disposable bailer to prevent cross-contamination. All of the samples were transferred with minimal disturbance into the appropriate vessels.

3.5 Laboratory Sample Location and Frequency

The samples secured from soil probes SP-1 through SP-6 were subjected to headspace analysis. The headspace analysis detected concentrations of hydrocarbons within all of the representative samples. Accordingly, one sample that exhibited the highest headspace analysis result from each probe was selected for laboratory analysis. In addition, one sample from the soil-groundwater interface from each probe was selected for laboratory analysis.

The selected samples were labeled for identification purposes as MW-SP-1 (10'), MW-SP-2 (17'), MW-SP-3 (5'), MW-SP-4 (10'), MW-SP-5 (12'), MW-SP-6 (12'), MW-SP-1 (5'), MW-SP-2 (5'), MW-SP-5 (8'), and MW-SP-6 (7'), respectively.

The groundwater samples secured from probes MW1 through MW-6 was labeled for identification purposes as MW-1 through MW-6, respectively.

The soil and groundwater samples selected for laboratory analysis were containerized in the appropriate vessels, preserved at 4°C in a cooler and transported under proper chain-of-custody procedures to a NYS-DOH certified commercial laboratory for analysis.

3.6 Groundwater Elevation Survey

On April 23, 2009, a groundwater elevation survey was performed on the Site to determine groundwater flow direction. The elevation of groundwater was gauged at each monitoring well and recorded. The elevations were used to graphically define the planimetric surface of the water table. The elevations of the top of the casings were represented with respect to each other and based on a benchmark elevation

or approximate elevation above mean sea level. The groundwater elevations were based as a function of the depth to water and these elevations.

Based on the groundwater elevation survey, the groundwater flow direction on the site is to the northwest. This is consistent with the regional groundwater flow direction. A detailed groundwater potentiometric map is referenced in **Plate 3**.

3.7 Hydraulic Conductivity Investigation

On April 23, 2009, slug tests were performed at MW-1 through MW-6 to calculate hydraulic conductivity throughout the Site.

Each slug test was performed using an electronic data-logger and pressure transducer. Post operation data processing was conducted utilizing AquifterTest® (HVORSLEV's method for slug test evaluation). A computer printout of the data and the evaluation results can be referenced with **Appendix C** of this report.

Based on the slug tests results, the hydraulic conductivity ranges from 10.4×10^{-3} ft/s to 8.50×10^{-6} ft/s, with higher results on the western portion where subsurface soil is characterized by porous fill material; while lower results on the eastern portion where subsurface soil is characterized by medium to fine sand and clay.

4 Laboratory Analysis

4.1 Analytical Test Methods

The samples were transported to a New York State Certified Commercial Laboratory for analysis. Selection of the analytical test methods was based on the New York State Department of Environmental Conservation Technical and Administrative Guidance Memorandum (TAGM) #4046, Determination of Soil Cleanup Objectives; and the New York State Department of Environmental Conservation Technical Operational Guidance Series (TOGS) 1.1.1, Ambient Water Quality Standards and Limitations.

The laboratory analysis performed on the soil samples MW-SP-1 (5'), MW-SP-2 (5'), MW-SP-5 (8'), and MW-SP-6 (7'), consisted of United States Environmental Protection Agency (USEPA) Test Method8260 for target volatile organic analytes; USEPA Test Method 8270 for target semi-volatile organic analytes; and total petroleum hydrocarbon (TPH).

The laboratory analysis performed on the soil samples MW-SP-1 (10'), MW-SP-2 (17'), MW-SP-3 (5'), MW-SP-4 (10'), MW-SP-5 (12') and MW-SP-6 (12') consisted of USEPA Test Method8260 for target volatile organic analytes; USEPA Test Method 8270 for target semi-volatile organic analytes; chemical oxygen demand (COD), biological oxygen demand (BOD), and TPH.

The laboratory analysis performed on the groundwater sample MW-1 through MW-6 consisted of USEPA Test Method8260 for target volatile organic analytes; USEPA Test Method 8270 for target base-neutral semi-volatile organic analytes; COD, BOD, TPH, and fingerprint analysis.

4.2 Analytical Results

Groundwater Interface Soil Sample Analytical Results

The laboratory analysis performed on the subsurface soil samples MW-SP-1 (5'), MW-SP-2 (5'), MW-SP-5 (8') failed to detect any concentrations of target volatile organic analytes. However, the laboratory analysis performed on the subsurface soil sample MW-SP-6 (7') detected concentration of one target volatile organic analyte (n-butyl benzene).

The laboratory analysis performed on the subsurface soil samples MW-SP-1 (5'), MW-SP-5 (8') and MW-SP-6 (7') failed to detect any concentrations of target semi-volatile organic analytes. However, the laboratory analysis performed on the subsurface soil sample MW-SP-2 (5') detected concentration of one target semi-volatile organic analyte (chrysene).

Saturated Soil Sample Analytical Results

The laboratory analysis performed on the subsurface soil samples MW-SP-1 (10'), MW-SP-2 (17') and MW-SP-5 (12') failed to detect any concentrations of target volatile organic analytes. However, the laboratory analysis performed on the subsurface soil samples MW-SP-3 (5'), MW-SP-4 (10') and MW-SP-6 (12') detected concentrations of several target volatile organic analytes.

The laboratory analysis performed on the subsurface soil samples MW-SP-1 (10'), MW-SP-2 (17') and MW-SP-6 (12') failed to detect any concentrations of target semi-volatile organic analytes. However, the laboratory analysis performed on the subsurface soil samples MW-SP-3 (5'), MW-SP-4 (10') and MW-SP-5 (12') detected concentrations of several target semi-volatile organic analytes.

Groundwater Sample Analytical Results

The laboratory analysis performed on the groundwater samples MW1, MW-5 and MW-6 failed to detect any concentrations of target volatile organic analytes. However, the laboratory analysis performed on the groundwater samples MW-2, MW-3 and MW-4 detected concentrations of several target volatile organic analytes.

The laboratory analysis performed on all the groundwater samples failed to detect any concentration of target semi-volatile organic analytes.

The fingerprint analysis was performed on the groundwater samples MW-1 through MW-6. The chromatograms of the groundwater samples MW-1 through MW-6 were most consistent with a combination of gasoline and #6 fuel oil.

Geochemical analysis was performed on the soil and groundwater samples. TPH concentrations ranged from 32 ppm to 65 ppm in groundwater samples, from 270 ppm to 1800 ppm in saturated soil samples, and from 20 ppm to 500 ppm in interface soil samples. COD concentrations ranged from 320 ppm to 2600 ppm in groundwater samples, and from 20 ppm to 78 ppm in saturated soil samples. BOD concentrations was <600 ppm in groundwater samples, and ranged from 10 ppm to 26 ppm in saturated soil samples.

Table 2 and **Table 3** present a summary of the detected concentrations versus the relevant guidance values that apply in New York State. **Table 4** presents the groundwater fingerprint analysis results. **Table 5** presents the geochemical analysis results.

The original laboratory analysis report as prepared by JMS Environmental Services, Inc. is presented in **Appendix E** of this document.

5 Evaluation of Results

From March 31 to April 23, 2009, Impact Environmental conducted a spill investigation on the Site. The investigation consisted of sampling and analysis of subsurface soil and groundwater, the installation of large diameter groundwater monitoring wells, a groundwater elevation survey and a hydraulic conductivity investigation.

A total of 6 soil probes, identified as MW-SP-1 through MW-SP-6, were installed on the Site as part of this investigation. Subsurface soil samples were secured from grade to 20 feet below existing grade (BEG) or until significant clay layer was encountered. Soil probe MW-SP-2 was only installed to 15 ft due to multiple refusals.

On the eastern portion of the Site, subsurface soil was found to consist of brown coarse to medium sand from grade to approximately 12 feet BEG. A clay layer, at lease 3 ft in thickness, was encountered starting at approximately 12 ft BEG. On the western portion of the Site, subsurface soil was found to consist of dark brown coarse to fine sand mixed with urban fill material, including concrete, rock, slag and cinderblock debris. No clay layer was encountered within 20 ft BEG.

PID readings were detected throughout the investigated areas in saturated zone. Soil samples with the highest PID readings and the soil samples from the soil-groundwater interface were collected for laboratory analysis.

Six 4-inch diameter groundwater monitoring wells, identified as MW-1 through MW-6, were installed on the Site as part of this investigation. The locations of the installed groundwater monitoring wells were consistent with the approved Investigation Work Plan. The wells were gauged and sampled two weeks after the installation. No measurable free-phase product was observed in any of the wells. A second gauging event confirmed the absence of measurable free-phase product in all the wells. A third gauging event incorporated all the existing wells on the Site. Approximately 0.01 ft of free-phase product was observed in MW-7H, which is an old well probably associated with previous spill investigation. No measurable free-phase product was observed in any other wells.

Groundwater flow direction on the site was to the northwest. This is consistent with the regional groundwater flow direction. Slug test resulted in hydraulic conductivity ranging from 10.4×10^{-3} ft/s to 8.50×10^{-6} ft/s.

The laboratory analysis performed on the interface soil sample MW-SP-6 (7') detected concentration of one target volatile organic analyte (n-butyl benzene). However, the detected concentration was below the applicable guidance criteria.[4]

The laboratory analysis performed on the interface soil sample MW-SP-2 (5') detected concentration of one target semi-volatile organic analyte (chrysene) above the applicable guidance criteria.[5]

The laboratory analysis performed on the saturated samples MW-SP-3 (5'), MW-SP-4 (10') and MW-SP-6 (12') detected concentrations of several target volatile organic analytes. The detected concentrations of isopropylbenzene and n-propylbenzene of MW-SP-4 (10') were above the applicable guidance criteria.[6]

The laboratory analysis performed on the saturated soil samples MW-SP-3 (5'), MW-SP-4 (10') and MW-SP-5 (12') detected concentrations of several target semi-volatile organic analytes. The detected concentrations of chrysene, benzo-a-anthracene and benzo-a-pyrene were above the applicable guidance criteria.[7]

The laboratory analysis performed on the groundwater samples MW-2, MW-3 and MW-4 detected concentrations of several target volatile organic analytes. Several detected concentrations, mainly gasoline related compounds, were above the applicable guidance criteria.[8]

The laboratory analysis performed on all the groundwater samples failed to detect any concentration of target semi-volatile organic analytes.

The fingerprint analysis was performed on the groundwater samples MW-1 through MW-6. The chromatograms of the groundwater samples MW-1 through MW-6 were most consistent with a combination of gasoline and #6 fuel oil. This observation is consistent with the previous land use of the Site as an oil terminal, with bulk storage of gasoline and heavy fuel oil (#5 or #6 fuel oil).

6 Recommendations

Impact Environmental has performed a Subsurface Investigation on the Site in accordance with good commercial and customary practice and generally accepted protocols within the consulting industry. The investigation consisted of the sampling and analysis of subsurface soil and groundwater to define the extent of contamination associated with NYSDEC Spill # 0807459. The scope of this investigation is based upon the Investigation Work Plan, dated November 14, 2008 prepared by Impact Environmental and approved by the NYSDEC.

A total of six soil probes were installed under the scope of this investigation. Groundwater was encountered approximately 5 to 7 ft BEG. A clay layer was detected on eastern portion of the Site approximately 12 ft BEG. Highest PID readings were detected in saturated zone and on top of the clay layer, indicating that the clay layer prevents the contamination from downward migration.

Gasoline related analytes were detected marginally above NYSDEC guidance criteria in the saturated zone on the eastern portion of the Site (MW-SP-4). #5 or #6 fuel oil related analytes were detected marginally above NYSDEC guidance criteria at soil-groundwater interface on the central portion of the Site (MW-SP-2 and MW-SP-3) and in saturated zone on the western portion of the Site (MW-SP-5). Accordingly, it is suspected that potential historical sources may exist in the vicinity of MW-2 and MW-3. However, the relatively low levels of concentrations do not warrant soil excavation as necessary remedy.

A total of six 4-inch diameter monitoring wells were installed and sampled under the scope of this investigation to define the extent of dissolved phase product on the Site. Three separate gauging events were performed. No measurable free-phase product was detected in either the newly installed 4-inch wells or the previous installed 1-inch wells. Approximately 0.01 ft of free-phase product was observed in an old well (MW-7H) on the eastern portion of the Site. Said well was not developed prior to gauging and its installation date and construction details are unknown. The results of the groundwater analysis from the 4-inch wells detected concentrations of gasoline related analytes marginally above NYSDEC ambient water quality standards in MW-2, MW-3 and MW-4.

The fingerprint analysis was performed on the groundwater samples MW-1 through MW-6. The chromatograms of the groundwater samples MW-1 through MW-6 were most consistent with a combination of gasoline and #6 fuel oil. This observation is consistent with the previous land use of the Site as an oil terminal, with bulk storage of gasoline and heavy fuel oil (#5 or #6 fuel oil).

Based upon the results of this investigation, Impact Environmental concludes that historical petroleum operations on the Site have resulted in the leaking of fuel oil and gasoline into the subsurface soil and groundwater. As the result, subsurface soil and groundwater quality has been impacted.

Strong petrochemical odor, oil sheen and high PID readings were detected throughout the Site. However, the laboratory analysis of the soil and groundwater samples failed to detect any significant target VOC or SVOC levels. This is consistent with the results of the previous investigation conducted by Impact Environmental in 2008.

Therefore, it is concluded that the observed subsurface petroleum product is aged and degraded. It probably has accumulated during the decades of historical petroleum product storage on the Site. Gasoline and fuel oil have been mixed (potentially due to tidal influence) and created a commingled plume. Over time, the plume has been degraded due to natural attenuation. The majority of the volatile organic and semi-volatile organic compounds have been removed from the subsurface system, either by physical advection or biochemical reaction. The residual petroleum product is mainly degraded. It still has a strong petroleum odor; however, it does not exhibit high levels of VOCs and SVOCs.

Currently, relatively low concentrations of target VOCs and SVOC are present in subsurface soil and groundwater at levels marginally above NYSDEC guidance criteria. However, based on the land use, the geology and the hydrology of the Site, it is unlikely for the residual degraded petroleum product to impose a significant risk to human health and the environment. Since no significant source was found, it is unlikely that any soil excavation will be necessary.

Accordingly, Impact Environmental has come to the following recommendations regarding NYSDEC Spill Case 0807459:

(1) A groundwater Monitored Natural Attenuation (MNA) plan should be designed and submitted for review by the NYSDEC. Said MNA should be operated for at least 6 quarters to monitor the fate-and-transport of the residual contaminants.

(2) In case future quarterly sampling events encounter free phase product, enhanced fluid recovery activities should be performed via the 4-inch diameter wells.

(3) If the quarterly monitoring program shows steady or diminishing levels of target contaminants, then at the conclusion of the MNA program, an exposure assessment based on current and

potential site uses, should be conducted, in support of spill closure, to quantitatively evaluate the human exposure risk associated with the degraded residual contamination on the Site.

DISCLAIMER FOR SUBSURFACE INVESTIGATION

The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services or the time and budgetary constraints imposed by the Client.

In preparing this report, Impact Environmental may have relied on certain information provided by state and local officials and other parties referenced therein, and on information contained in the files of state and/or local agencies available to Impact Environmental at the time of the Site assessment. Although there may have been some degree of overlap in the information provided by these various sources, Impact Environmental did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this Site assessment.

Observations were made of the Site and of structures on the Site as indicated within the report. Where access to portions of the Site or to structures on the Site was unavailable or limited, Impact Environmental renders no opinion as to the presence of non-hazardous or hazardous materials, or to the presence of indirect evidence relating to non-hazardous or hazardous materials, in that portion of the Site or structure. In addition, Impact Environmental renders no opinion as to the presence of hazardous materials, or the presence of indirect evidence relating to hazardous materials, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

Impact Environmental did not perform testing or analyses to determine the presence or concentration of asbestos at the Site or in the environment of the Site under the scope of the services performed.

The conclusions and recommendations contained in this report are based in part, where noted, upon the data obtained from a limited number of soil samples obtained from widely spaced subsurface explorations. The nature and extent of variations between these explorations may not become evident until further exploration. If variations or other latent conditions then appear evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

Any water level readings made in test pits, borings, and/or observation wells were made at the times and under the conditions stated in the report. However, it must be noted that fluctuations in the level of groundwater may occur due to variations in rainfall and other factors different from those prevailing at the time measurements were made.

Except as noted within the text of the report, no qualitative laboratory testing was performed as part of the Site assessment. Where such analyses have been conducted by an outside laboratory, Impact Environmental has relied upon the data provided, and has not conducted an independent evaluation of the reliability of the data.

The conclusions and recommendations contained in this report are based in part, where noted, upon various types of chemical data and are contingent upon their validity. The data have been reviewed and interpretations were made in the report. As indicated within the report, some of the data may be preliminary "screening" level data, and should be confirmed with quantitative analyses if more specific information is necessary. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, the data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

Chemical analyses have been performed for specific constituents during the course of this Site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study may be present in soil and/or groundwater at the Site.

Soil Probe Logs

Impact Environmental Soil Boring Log		Probe Code:	MW-SP-1
Site Location:	28-90 Review Avenue	**Installer:**	EC
Job Number:	1649.1-1-04-1008	**Installation Method:**	Geoprobe
Client:	AA Truck Renting, Inc.	**Installation Date:**	4/2/2009
Location:		**Geologist:**	WF

Depth BEG (ft.)	Soil Type	Soil Color	PID Reading	Comments
0'-1'	asphalt	gray	2.0	
1'-2'	M-sand and gravel	brown	1.8	petroleum odor
2'-3"	concrete	whilte, gray	6.8	petroleum odor
3'-4'	M-F sand	brown	1.6	petroleum odor
4'-5'	fill material, slag, pebble, debris of cinder block	black	5.9	petroleum odor
5'-10'	fill material, slag	black, dark brown	45.2	strong petroleum odor, little recovery
15'-16'	fill material, slag	balck, dark brown	144.0	strong petroleum odor
16'-18'	fill material, slag	black, dark brown	41.0	petroleum odor
18'-20'	fill material, slag	black, dark brown	28.1	petroleum odor

Impact Environmental Soil Boring Log		Probe Code:	MW-SP-2
Site Location:	28-90 Review Avenue	**Installer:**	EC
Job Number:	1649.1-1-04-1008	**Installation Method:**	Geoprobe
Client:	AA Truck Renting, Inc.	**Installation Date:**	4/2/2009
Location:		**Geologist:**	WF

Depth BEG (ft.)	Soil Type	Soil Color	PID Reading	Comments
0'-2'	concrete	gray	2.7	
2'-2.5'	M-F sand	brown	1.7	petroleum odor
2.5'-5'	fill material, C-sand, slag, brick	dark brown, black	5.0	petroleum odor
5'-10'	-	-	-	no recovery
10'-15'	fill material, C-sand, gravel	black, gray	50.4	petroleum odor

Impact Environmental Soil Boring Log		Probe Code:	MW-SP-3
Site Location:	28-90 Review Avenue	**Installer:**	EC
Job Number:	1649.1-1-04-1008	**Installation Method:**	Geoprobe
Client:	AA Truck Renting, Inc.	**Installation Date:**	4/2/2009
Location:		**Geologist:**	WF

Depth BEG (ft.)	Soil Type	Soil Color	PID Reading	Comments
0'-2'	asphalt	gray	27.1	
2'-4'	C-M sand, gravel	black	665.0	black stain, original brown
4'-5'	M-F sand, silt	dark brown, black	645.0	black stain at 5'
5'-10'	-	-	-	no recovery, possibly due to presence of silt
10'-13'	C-M sand, gravel	black	21.5	petroleum odor
13'-15'	clay with organic debris	brown	9.5	petroleum odor

Impact Environmental Soil Boring Log		Probe Code:	MW-SP-4
Site Location:	28-90 Review Avenue	**Installer:**	EC
Job Number:	1649.1-1-04-1008	**Installation Method:**	Geoprobe

APPENDIX D:

Quality Assurance and Quality Control Procedures (QA/QC)

Quality Assurance and Quality Control Procedures (QA/QC)

The following sampling QA/QC protocol is in accordance with the United States Environmental Protection Agency's (USEPA) accepted sampling procedures for hazardous waste streams [Municipal Research Laboratory, 1980, Sampling and Analysis Procedures for Hazardous Material Waste Streams, Office of Emergency and Remedial Response, Cincinnati, Ohio. EPA-600/280-018] and American Society of Testing and Material's (ASTM's) Sampling Procedures.

A. Sampling Personnel

The activities associated with the survey, sampling and analysis plan were performed by or under the auspices of a USEPA Office of Emergency and Remedial Response, Certified Sampler for Hazardous Materials. The sample staff (samplers) possessed a minimum of a B.A. Degree in the Earth, Space or Biological Sciences or a B.S. Degree in Engineering. Samplers had a minimum of one (1) year experience in environmental/geological field work. Additionally, all samplers had received mandatory forty-hour Occupational Safety and Health Administration (OSHA) training on working with potentially hazardous materials and appropriate Hazard Communication Program and "Right-To-Know" training.

B. Sampling Equipment

Separate QA/QC measures were implemented for each of the instruments used in the performance of the SAP.

B.1 Geoprobe

Prior to arrival on the Site and between sample locations, the probes were decontaminated by washing them with a detergent (Alconox) and potable water solution and rinsing them with distilled water.

B.2 Photo Ionization Detector

Calibration of the PID was conducted prior to sampling using a span gas of known concentration. The PID was a Photovac Micro-Tip, photo ionization detection meter.

B.3 Sample Vessels

All sample vessels were "level A" certified decontaminated containers supplied by a New York State Certified Commercial Laboratory. Samples analyzed for hydrocarbons were placed in containers with

Teflon lined caps. All samples were preserved by cooling them to a temperature of approximately four degrees Celsius.

C. Sample Documentation

A sample represents physical evidence. An essential part of liability reduction is the proper control of gathered evidence. To establish proper control, the following sample identification and chain-of custody procedures were followed.

C.1 Sample Identification

Sample identification was executed by use of a sample tag, log book and chain-of-custody form. Said documentation provided the following information: 1) the project code; 2) the sample laboratory number; 3) the sample preservation; 4) instrument used for source sample grabs; 5) the composite medium used for source sample grabs; 6) the date the sample was secured from the source media; 7) the time the sample was secured from the source media; and 8) the person who secured the sample from the source media.

C.2 Chain-of-Custody Procedures

Due to the evidential nature of samples, possession was traceable from the time the samples were collected until they were received by the testing laboratory. A sample was considered under custody if it: was in a person's possession; it was in a person's view, after being in possession; if it was in a person's possession and they locked it up; or, it was in a designated secure area. When transferring custody, the individuals relinquishing and receiving the samples signed, dated and noted the time on the Chain-of-Custody Form.

C. 3 Laboratory-Custody Procedures

A designated sample custodian accepted custody of the shipped samples and verified that the information on the sample tags matched that on the Chain-of-Custody Records. Pertinent information as to shipment, pick-up, courier, etc., were entered in the "remarks" section. The custodian entered the sample tag data into a bound logbook.

The laboratory custodian used the sample tag number, or assigned a unique laboratory number to each sample tag, and assured that all samples were transferred to the proper analyst or stored in the

appropriate source area. The laboratory custodian distributed samples to the appropriate analysts. Laboratory personnel were responsible for the care and custody of samples, from the time they were received, until the sample was exhausted or returned to the sample custodian. All identifying data sheets and laboratory records were retained as part of the permanent documentation. Samples received by the laboratory were retained until after analysis and quality assurance checks were completed.
