**RE: Underground Storage Tank Closure Report  
161-05 – 161-07 29<sup>th</sup> Avenue, Flushing, New York  
NYSDEC Spill No. 1911712**

Dear Mr. Patel,

Please find the attached Underground Storage Tank Closure Report for the property located at 161-05 – 161-07 29<sup>th</sup> Avenue, Flushing, New York.

One underground storage tank (UST) was removed from the site on June 29, 2020. Authorization to commence with tank removal activities was provided by NYSDEC (email, dated June 24, 2020).

During the removal, the tank was found to be a 1,500-gallon capacity UST. Several holes were identified on the bottom and sides of the tank. Further, evidence of discharge, i.e., visual/olfactory signs of petroleum impact and elevated PID readings for VOCs, was observed within the excavation. Soil showing evidence of impact was removed from the excavation and stockpiled. Excavation activities continued until further excavation was no longer feasible due to site conditions. A total of 102.62 tons of petroleum impacted material was disposed at Clean Earth of Carteret (Carteret, New Jersey).

Twelve endpoint samples were collected, and laboratory analyzed. Endpoint sampling analytical results report concentrations below applicable standards. Based on these findings, remedial activities were successful in that petroleum contaminated soils associated with the removed UST were effectively removed. Any residual petroleum impacted soil remaining is at depth and not representative of a significant threat to human health and the environment.

After your review, Castleton requests closure of NYSDEC Spill Number 1911712 relative to the former UST.

Please call with any questions or comments.

Very truly yours,  
**Castleton Environmental Inc.**

## 1.0 INTRODUCTION

On behalf of Dominick A. DeRiso of Dorsey and DeRiso, Castleton Environmental Geologic Services DPC (Castleton) has prepared this Underground Storage Tank Closure Report for the property located at 161-05 – 161-07 29<sup>th</sup> Avenue, Flushing, New York (the site).

Tank closure efforts were based on the findings of the Phase II testing work performed by Merritt Environmental Consulting Corp (MECC) in their Focused Subsurface Site Investigation Report (FSSI), dated January 2020 which identified petroleum impacts to subsurface soil and groundwater in the vicinity of a previously abandoned fuel oil UST of unknown capacity. MECC recommended reporting of the FSSI findings to the New York State Department of Environmental Conservation (NYSDEC). On March 24, 2020, Castleton notified the NYSDEC Spills Hotline of the FSSI findings associated with the abandoned fuel oil UST and Spill Number 1911712 was issued for the property.

In addition to petroleum impacts from the abandoned UST, the MECC FSSI also identified chlorinated volatile organic compounds (CVOCs) in water samples collected from two basement sump pits. The CVOC issue is being addressed separately by NYSDEC's Division of Environmental Remediation under the Brownfield Cleanup Program (BCP). Authorization to commence with tank removal activities in advance of the site's acceptance into the BCP was provided by NYSDEC (email dated June 24, 2020).

During the removal on June 29, 2020, the tank was removed and found to be a 1,500-gallon capacity UST. The tank was previously closed and filled with sand. Evidence of discharge, i.e., visual/olfactory signs of petroleum impact and elevated photoionization detector (PID) readings for volatile organic compounds (VOCs), was observed within the excavation.

The following report details the tank removal, soil removal, and endpoint sampling to support closure of Spill Number 1911712. Further, the report documents the proper registration and closure of the tank.

## 2.0 SITE BACKGROUND

The site is located at 161-05 – 161-07 29<sup>th</sup> Avenue, Flushing, New York (Figure 1). According to the MECC FSSI, the site is associated with a series of six (6) attached two-story mixed-use residential/commercial buildings constructed in 1931. Each of the six (6) buildings have their own address and block and lot number. The two-story buildings contain commercial and retail operations on the ground floors and residential apartments on the second floors. A shared yard is present at the rear (north side) of the buildings. Each of the buildings contain discrete full basements. The size of the entire site is approximately 13,100 square feet inclusive of the building footprints and rear yard (Figure 2). The aggregate footprint of the buildings is approximately 7,300 square feet.

On December 12, 2019, an FSSI was completed by MECC including the performance of a ground penetrating radar (GPR) survey to confirm the location of the abandoned UST and the advancement of soil borings adjacent to the UST.

The GPR survey was completed within the rear yard of the site. The results of the survey confirmed the location of the abandoned fuel oil UST. Based on the reported dimensions of the subsurface anomaly, the UST had an estimated capacity of 2,000-gallons.

A total of two (2) soil borings (B1, B2) were installed adjacent to the UST. A third soil boring (B3) was installed within the rear yard, approximately 30 feet north of the rear entrance of 161-03 29<sup>th</sup> Avenue (former dry cleaner tenant space), at some distance from the UST. Each boring was advanced to approximately 15 feet below ground surface (bgs). Depth to water was encountered at approximately 5 to 7 feet bgs within the soil borings. Review of local maps prepared by the United States Geological Survey (USGS) indicates that the site is located approximately 70 feet above mean sea level; depth to groundwater in the area of the subject property is approximately 40 feet below land surface. Therefore, it appears that the encountered shallower water-bearing zones represented perched groundwater conditions.

Upon completion of soil borings B1, B2, and B3, temporary well points were installed at each location for the collection of groundwater samples.

Elevated PID readings, olfactory, and/or visual evidence of petroleum contamination was observed in soil and groundwater at both soil borings B1 and B2. No free-phase product was observed on water extracted from B1 and B2, however, a heavy petroleum sheen and strong petroleum odors were identified. There was no field evidence of soil or groundwater contamination identified at soil boring B3. Analytical results of groundwater samples (B1GW, B2GW) revealed concentrations of VOCs and SVOCs that exceeded applicable regulatory limits. No soil samples were submitted for laboratory analysis.

Based on these findings, MECC recommended that the UST be removed along with petroleum contaminated soils that may be a continuing source of a release to local groundwater. MECC further recommended that the condition be reported to regulators as required by New York State law.

A copy of the MECC report is included as Appendix A.

### 3.0 TANK REMOVAL

Authorization to commence with tank removal activities was provided by NYSDEC (email dated June 24, 2020).

Tank removal activities were conducted by PAL Environmental Services, Inc on June 29, 30, and July 1, 2020. Work permits (permit numbers 440596222-01-EW-OT and 440596259-01-EQ-OT) were obtained from New York City Department of Buildings (NYC DOB) by PAL Environmental Services for the removal of the tank prior to commencement of work activities. The tank was removed from the ground on June 29, 2020; petroleum contaminated soil was removed from the excavation and endpoint sampling was conducted on June 30, 2020; and site restoration was completed on July 1, 2020.

The NYC DOB work permits are provided in Appendix B.

After removal of the overburden material, the tank was opened and observed to contain petroleum impacted sand and a minimal amount of oil/water mixture. The top of the tank was located at approximately 2.5 feet below grade. Removal activities began by removing pumpable tank contents into 55-gallon drums staged on-site (total of 3 drums). The petroleum impacted sand was stockpiled and covered with poly sheeting. The tank and associated piping were then removed from the ground. Three drums of oil/water mixture and a total of approximately 8.0 cubic yards of petroleum impacted sand were removed from inside the tank.

A photolog of tank removal activities is included as Appendix C.

After the storage tank was cleaned, it was removed from the ground and made accessible for inspection. The tank was measured at 16.0 feet long X 4.0 feet in diameter and found to be a 1,500-gallon capacity UST. Several holes were identified on the bottom and sides of the tank. Further, evidence of discharge, i.e., visual/olfactory signs of petroleum impact and elevated PID readings for VOCs, was observed within the excavation.

Soil showing evidence of impact was removed from the excavation and stockpiled and covered with poly sheeting. Excavation activities continued until further excavation was no longer feasible due to site conditions. Final excavation depth measured between 10.0 feet and 13.0 feet below grade. Groundwater was not encountered in the excavation at the time of the work. A total of approximately 50 cubic yards of petroleum impacted soil was removed from the excavation and commingled with the petroleum impacted sand removed from inside the tank.

The excavation was backfilled to grade with imported fill. The fill was provided by Allocco Recycling (540 Kingsland Avenue, Brooklyn, NY 11222). Visual/olfactory observations were conducted of the imported fill prior to backfilling activities. There was no evidence of staining, discoloration, and/or unusual odors. Receipts from the source facility are included as Appendix D.

### **3.1 Waste Characterization and Disposal**

Waste characterization sampling was performed on the stockpiled petroleum impacted soil per the requirements of Clean Earth of Carteret (Carteret, New Jersey). The Waste Characterization Analytical Report and Acceptance Letter are provided in Appendix E.

The petroleum impacted material (total of 102.62 tons) was properly disposed of by PAL Environmental Services, Inc at Clean Earth of Carteret (Carteret, New Jersey). Waste Characterization Analytical Report and Acceptance Letter are provided in Appendix E. The soil disposal manifests are included in Appendix F.

The oil/water mixture generated during the tank removal was properly disposed of by PAL Environmental Services, Inc at Clean Waters of New York (Staten Island, NY). Disposal documentation is included as Appendix F.

The former UST and piping were properly disposed of by PAL Environmental Services, Inc. at Two Brothers Scrap Metal (12 Sarah Drive, Farmingdale, NY 11735). A receipt from the scrap facility is included in Appendix G.

### **3.2 UST Registration**

The tank was registered with NYSDEC Petroleum Bulk Storage (PBS) Program (PBS Number: 2-613172). The facility has the status of unregulated/closed since the tank was removed. No further action is required regarding registration activities. The PBS registration is included as Appendix H.

The New York City Fire Department (NYCFD) Bureau of Fire Prevention was notified of the permanent removal of the UST. A copy of the affidavit submitted to the NYCFD is included as Appendix I.

## 4.0 ENDPOINT SAMPLING AND ANALYTICAL RESULTS

### 4.1 Endpoint Sampling

On June 30, 2020, twelve endpoint samples, EP01 through EP12 were collected from the tank excavation. The samples were biased upon field observations toward the locations of greatest contamination. Sampling was performed in accordance with NYSDEC DER-10. The following table summarizes the location of each sample:

Endpoint Samples	Depth (fbg)	PID (ppm)	Location
EP01	12-13	645	Bottom – East
EP02	9-10	225	Sidewall – East
EP03	9-10	1205	Sidewall – East
EP04	12-13	370	Bottom – East/Middle
EP05	12-13	574	Bottom – West/Middle
EP06	10-11	860	Bottom – West
EP07	9-10	940	Sidewall – North
EP08	9-10	686	Sidewall – North
EP09	9-10	981	Sidewall – South
EP10	9-10	702	Sidewall – South
EP11	9-10	3050	Sidewall – West
EP12	9-10	3519	Sidewall – West

Sample locations are included on Figure 3.

Soil samples were collected in laboratory supplied glassware and submitted under chain of custody to York Analytical Laboratories of Stratford, CT, a New York State Department of Health (NYSDOH) Environmental Laboratory Approved Program (ELAP) certified laboratory. Soil samples were analyzed for:

- VOCs by United States Environmental Protection Agency (USEPA) Method 8260.
- New York State Department of Environmental Conservation (NYSDEC) Commissioner's Protocol (CP)-51 SVOCs by USEPA Method 8270 for fuel oil contaminated soil.

### 4.2 Soil Analytical Results

Soil quality analytical results were compared to NYSDEC Part 375 Soil Cleanup Objectives (SCOs)/CP-51 Soil Cleanup Levels.

Soil analytical results reported concentrations of VOCs and SVOCs as non-detect or below applicable standards in all soil samples analyzed. The reporting limit of several VOCs exceeded their respective SCOS/CP-51 SCL; however, each of these results were reported as non-detect.

A summary of the analytical results is presented as Table 1. The laboratory report is included as Appendix J.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

Castleton has prepared this Underground Storage Tank Closure Report for the property located at 161-05 – 161-07 29<sup>th</sup> Avenue, Flushing, New York.

One underground storage tank (UST) was removed from the site on June 29, 2020. Authorization to commence with tank removal activities was provided by NYSDEC (email, dated June 24, 2020). Prior to tank removal activities, the size of the abandoned fuel oil UST was unknown.

During the removal, the tank was found to be a 1,500-gallon capacity UST. Several holes were identified on the bottom and sides of the tank. Further, evidence of discharge, i.e., visual/olfactory signs of petroleum impact and elevated PID readings for VOCs, was observed within the excavation. Soil showing evidence of impact was removed from the excavation and stockpiled and covered with poly sheeting. Excavation activities continued until further excavation was no longer feasible due to site conditions. A total of 102.62 tons of petroleum impacted material was disposed of by PAL Environmental Services, Inc at Clean Earth of Carteret (Carteret, New Jersey). The soil disposal manifests are included in Appendix D.

Twelve endpoint samples were collected, and laboratory analyzed. The samples were biased upon field observations toward the locations of greatest contamination. Endpoint sampling analytical results report concentrations below applicable standards. Based on these findings, remedial activities were successful in that petroleum contaminated soils associated with the removed UST were effectively removed. Any residual petroleum impacted soil remaining is at depth and not representative of a significant threat to human health and the environment.

Based on the findings above and the tank removal work completed, Castleton requests closure of Spill Number 1911712 relative to the former UST.

RE: Focused Subsurface Site Investigation (FSSI)  
161-01/11 29th Avenue  
Flushing, New York

Dear Ms. Gentile:

Merritt Environmental Consulting Corp. ("MECC") has completed a Focused Subsurface Site Investigation (the "FSSI") at the 161-01 to 161-11 29<sup>th</sup> Avenue property (the "Site"). The Site contains a series of six attached two-story mixed-use residential/commercial buildings constructed in 1931. No dry cleaning currently takes place at the Site. The principal intent of this study was to determine if soil or groundwater quality was adversely affected by potential releases of perchloroethylene (PCE) by historical Site dry cleaning operations. In addition, one closed in-place underground #2 heating oil storage tank (UST) is present at the Site; the scope of this study also included the UST. Three exterior soil borings were installed at the Site and converted to temporary well points for groundwater sampling. Groundwater samples were also collected from two sump pits in the basement of the former dry cleaner tenant space.

This study identified elevated concentrations of PCE in groundwater, along with other chlorinated volatile organic compounds (VOCs) that are PCE degradation products. The highest total chlorinated VOC content reported in the five collected groundwater samples is 140.2 micrograms per liter (ug/l) as identified in a sample collected from one of the two groundwater sump pits. Specifically, PCE was detected at 92 ug/l in this sump sample (the regulatory limit for PCE in ground water is 5 ug/l). Lesser total chlorinated VOC levels were detected in two additional collected groundwater samples: 90 ug/l in the sample collected from the second basement sump; and 5.7 ug/l in a groundwater sample collected from the building exterior. While the horizontal extent of groundwater impacted by chlorinated VOCs currently appears to be limited, the detected concentrations are great enough to warrant a recommendation for regulatory reporting and additional investigation to better understand the horizontal and vertical extent of the impacted media, and to determine if a volatile organic vapor intrusion condition exists within the Site building.

Further, evidence of a petroleum release from the UST was identified in groundwater. Petroleum-related VOCs and semi-volatile organic compounds (SVOCs) are reported in two groundwater samples collected from adjacent to the UST at concentrations that exceed applicable regulatory limits. Regulatory reporting is required in the State of New York when a petroleum release is discovered. MECC recommends that the UST be removed along with any petroleum-contaminated soil that may be a continuing source of a release to local groundwater. Depth to the local water table was measured to be as shallow as five feet bgs at the Site.

## Background

The Site is located at the northeast corner of the intersection of 29<sup>th</sup> Avenue and 161<sup>st</sup> Street in an urban setting. The large majority of properties surrounding the Site are used for residential purposes. The Site contains six attached two-story buildings housing commercial and retail operations on the ground floors and residential apartments on the second floors. A shared rear yard is present at the rear (north sides) of the Site buildings. Each of the Site building sections contains discrete full basements. The size of the Site is approximately 13,100 square feet inclusive of the building footprints and rear yard. The aggregate footprint of the Site buildings is approximately 7,300 square feet. Site building construction consists of wood-frame floor and roof decks with brick and mortar exterior walls. The Site appears to have always been connected to the local sewer and drinking water supply systems.

A recently completed phase I environmental site assessment (ESA) indicates that a dry cleaner historically occupied the commercial space at the 161-03 29<sup>th</sup> Avenue portion of the Site (currently occupied by a small drug store). According to sources of historical information gathered by the ESA, a dry cleaner occupied this Site tenant space between 1973 and 2014 and was known as “Rose Garden Cleaners.” Further, regulatory agency databases reviewed by the ESA shows that spent PCE was generated in this tenant space in 2007.

## Topography and Geology

The elevation of the Site is approximately 70 feet above mean sea level. Local surface topography has little relief with a slight downward slope to the north-northeast. MECC’s review of the attached USGS topographic map confirms an apparent slight downward slope to the northeast. Subsurface sediment encountered at the Site consists of clay with varying amounts of sand interspersed by water-bearing zones consisting of fine to coarse sand. This unconsolidated sediment likely represents a glaciofluvial depositional environment. Two of these water-bearing zones were encountered to a depth of 15 feet bgs. United States Geological Survey (USGS) interactive maps of Long Island list the depth to the unconfined aquifer in the Site area at approximately 40 feet bgs. Therefore, MECC believes that the encountered shallower water-bearing zones represent perched groundwater conditions. The lateral extent of these water-bearing zones is unknown but it appears that they extend beyond Site borders (evidence of water intrusion was observed within the Site building basements). Based on contaminant concentration gradients identified by this FSSI, it appears that local groundwater flow is likely to the north-northeast. Depth to water at the Site ranged from five feet to seven feet bgs.

## Scope of Work Completed

All field activities were conducted on December 12, 2019. A qualified contractor was retained to first conduct a ground-penetrating radar (GPR) survey of the rear yard at the Site. The GPR survey confirmed the location of the closed in-place heating oil UST. Please refer to the attached Site Sketch for the locations of the historical UST location. Based on the reported dimensions of the subsurface anomaly, MECC believes that the volume of the UST may as great as 2,000 gallons.

The principal intent of this study was to determine if possible historical Site dry cleaning had adversely affected the environmental integrity of the Site. In addition, this FSSI was conducted to establish if the historical #2 heating UST released petroleum to the environment at actionable or reportable concentrations. A qualified contractor was retained to install a total of three exterior soil borings using a track-mount hydraulic direct-push drill rig (Soil Boring Nos. B1 through B3). B1 and B2 were installed directly adjacent to the UST and B3 was placed approximately 30 feet north of the rear entrance of the 161-03 29<sup>th</sup> Avenue Site address.

MECC originally proposed to install two soil borings into the basement floor of the 163-03 29<sup>th</sup> Avenue Site building for soil sample collection and laboratory analysis. However, two groundwater sump pits were observed in this basement. MECC therefore adjusted the scope of this project to collect a sample of the standing water

within each of these sumps. Since an unexpectedly shallow water-bearing deposit was encountered at the Site, this study was centered on establishing groundwater quality; no soil samples were submitted to the laboratory for analysis.

Mr. Frank Galdun, Qualified Environmental Professional (QEP) with MECC, conducted all field sampling activities and directed the drilling contractor.

All driller sampling tubes and rods were subjected to a water/alconox wash between soil boring locations to reduce the potential for cross contamination. All penetrations made by the drilling activities were filled and then patched with like surfacing material.

### **Soil Quality Field Screening Results**

Soil samples were continuously subjected to field screening techniques as B1 through B3 were drilled. The field screening techniques consisted of using a portable photoionization detector (PID) for measuring volatile organic vapors and assessing each soil sample for physical evidence of contamination. Field screening activities were conducted to boring termination at 15 feet bgs. PID readings in soil ranged from undetect to up to 100 parts per million (ppm) in B1 in clay and sand below the first water-bearing deposit at five feet to seven feet bgs. In addition, physical evidence of petroleum contamination was observed in soil and groundwater at both B1 and B2. No free-phase product was observed on water extracted from B1 and B2, although a heavy petroleum sheen and strong petroleum odors were identified. B3 was installed north of the dry cleaner tenant space, at some distance from the UST. No field evidence of soil or groundwater contamination as identified in this boring.

### **Soil/Groundwater Sampling and Laboratory Analysis**

Continuous soil sampling was accomplished by inserting a five-foot plastic sleeve into a casing at the end of the drill rods then driven into the subsurface. The sleeves were removed from the casings as they were extracted from the soil borings. Soil quality evaluation and soil sampling was conducted by cutting the sleeves longitudinally, exposing the collected soil.

Each of three exterior direct-push borings were converted to temporary well points by installing a ten-foot length of one-inch diameter PVC well screen to a depth of 15 feet bgs for groundwater sample collection. Unscreened riser extended to ground surface at each well point. Dedicated disposable one-quarter inch diameter flexible tubing fitted with a foot valve was then used to collect the groundwater samples. Groundwater was purged until apparent turbidity was visibly reduced and one groundwater sample was collected from the each well point for laboratory analysis. In addition, MECC collected one sample each from the standing water within the two sump pits in the basement of 161-03 29<sup>th</sup> Avenue for laboratory analysis.

The groundwater samples collected from the exterior temporary well points are identified on the attached laboratory report as B1GW through B3GW. The two water samples collected from the interior sumps are identified as Sump1 and Sump2. All samples (five groundwater) were analyzed at Veritech, a New York State Department of Health-Certified environmental laboratory (NYSDOH Cert. No. 10982). All samples were analyzed under EPA Method 8260 – VOCs. In addition, the two groundwater samples collected at B1 and B2 were further analyzed under EPA Method 8270 – SVOCs.

All appropriate chain of custody documentation shall be completed before sample shipment to the laboratory. All samples were collected in laboratory-supplied containers and shipped on ice to the laboratory within one day of completion of field activities.

VOCs were detected in the groundwater samples and the following table summarizes the laboratory report:

TABLE 1: VOC RESULTS FOR GROUNDWATER SAMPLES (detected compounds only)						
Compound	B1GW	B2GW	B3GW	Sump1	Sump2	Standards
Acetone	23	ND	ND	ND	<b>140</b>	50
Ethylbenzene	2.6	ND	ND	ND	ND	5
Isopropylbenzene	<b>18</b>	<b>14</b>	ND	ND	ND	5
Methyl-tert-butyl ether (MTBE)	3.6	2.0	ND	ND	ND	10
Naphthalene	<b>300</b>	<b>79</b>	ND	ND	ND	10
n-Propylbenzene	<b>26</b>	<b>22</b>	ND	ND	ND	5

sec-Butylbenzene	<b>16</b>	<b>13</b>	ND	ND	ND	5
tert-Butylbenzene	2.0	1.1	ND	ND	ND	5
cis-1,2-Dichloroethene	ND	ND	4.6	<b>8.2</b>	<b>13</b>	5
Trichloroethene	ND	ND	1.1	<b>40</b>	<b>12</b>	5
Perchloroethylene	ND	ND	ND	<b>92</b>	<b>65</b>	5
Total VOCs	391.2	137.3	5.7	140.2	230	

#### NOTES

All results are expressed in micrograms per liter (ug/l), which can also be expressed as parts per billion (ppb).

Any result in bold exceeds New York State Department of Health Maximum Contaminant Level for drinking water, and the guidance values or standard listed in the NYSDEC Division of Water Technical and Operational Guidance Series (1.1.1) or "TOGS" Water Quality Standards and Guidance Values.

ND: Parameter non-detected, below method detection limits.

Acetone was detected in two samples. However, this substance is commonly introduced into sample media during analytical procedures and is not considered by MECC as a representative of actual groundwater quality. Further, acetone is not a degradation product of PCE, nor is it a constituent of petroleum fuels.

Laboratory analysis of the groundwater samples identifies PCE at elevated concentrations in both of the interior sump samples. Trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE) were also detected in both sump samples at concentrations exceeding the applicable regulatory limit (TCE and cis-1,2-DCE are PCE degradation products).

Aside from acetone, all detected VOCs in B1GW and B2GW are constituents of petroleum-related fuels. Naphthalene, which was detected in both B1GW and B2GW, is a common constituent of heavier petroleum fuels such as heating oil.

SVOCs were detected in B1GW and B2GW and Table 2 on the following page summarizes the laboratory data:

TABLE 2: SVOC RESULTS B1GW AND B2GW (detected compounds only)			
Compound	B1GW	B2GW	Standards
Acenaphthene	<b>89</b>	15	20
Anthracene	18	ND	50
Fluorene	<b>93</b>	21	50
Naphthalene	<b>290</b>	43	10
Phenanthrene	<b>190</b>	33	50
Pyrene	11	2.7	50
Total SVOCs	691	114.7	

#### NOTES

All results are expressed in micrograms per liter (ug/l), which can also be expressed as parts per billion (ppb).

Any result in bold exceeds New York State Department of Health Maximum Contaminant Level for drinking water, and the guidance values or standard listed in the NYSDEC Division of Water Technical and Operational Guidance Series (1.1.1) or "TOGS" Water Quality Standards and Guidance Values.

ND: Parameter non-detected, below method detection limits.

As shown, several individual SVOC concentrations exceed applicable regulatory limits, confirming MECC's field observations of groundwater quality.

#### Conclusions/Recommendations

Based on the data gathered by this study, MECC believes that the lateral extent of chlorinated VOC contamination caused by the former dry cleaner is limited and moderate in severity. However, the contaminant concentrations are great enough to warrant a recommendation to notify regulators and to conduct further investigation to better establish the horizontal and vertical extent of groundwater impact, and to determine if a vapor intrusion condition exists inside the building.

Laboratory analysis of the two groundwater samples collected from B1 and B2 show that an actionable petroleum release has occurred at the Site heating oil UST. Although MECC concludes that the extent and severity of this release is likely limited to the immediate vicinity of the UST, this finding requires regulatory reporting and corrective action. It is recommended that the UST be removed along with any soil containing petroleum contamination which is the presumed source of the discovered groundwater contamination.

### Limitations of the FSSI

The scope of the FSSI is intended to aid in evaluating whether additional investigation would be prudent. The tasks that comprise this FSSI are not exhaustive or definitive. MECC has made no independent investigation of the accuracy of these secondary sources and has assumed them to be accurate and complete. MECC does not warrant the accuracy or completeness of information provided by secondary sources (MECC has no reason to believe that the secondary sources provided or acquired during this study contain intentionally false or misleading information). MECC does not warrant that all contamination that may exist under the Site has been discovered, that the Site is suitable for any particular purpose or that the Site is clean or free of liability.

If you have any questions concerning this document, please feel free to call our office.

Sincerely,  
MERRITT ENVIRONMENTAL CONSULTING CORP.

## APPENDIX E

July 27, 2020

John Procida  
16103-11 29th Avenue LLC  
294 Vista Drive  
Jericho, NY 11753

Approval #: 203071282

RE: 16103-11 29th Avenue LLC| 161-01-161-11 29th Avenue  
161-01-161-11 29th Avenue Flushing, NY 11358

Dear Mr. Procida,

Clean Earth of Carteret, LLC. (CEC) is pleased to provide you with this acceptance letter for the soil material being generated from the site referenced above. We reviewed the Material Profile Sheet, soil sample procedure, and analytical results performed by York Analytical Laboratories Inc. (Lab Id #: 20G0066) for the above referenced site. Based upon the review of the data and, the profile provided, CEC can accept non-hazardous soil material being generated from the site.

This letter serves as approval of ~ 70 tons of non-hazardous material with soil material represented by composite sample IDs: 'WC01' and all related grab samples to be generated from Underground Storage Tank removal activities at the site.

Currently CEC has enough analysis on hand to cover estimated quantity of material. In the event the volume exceeds approved tonnages, the facility is permitted to analyze missing parameters by collecting soil samples from incoming loads. TPH analysis (every 600 Tons) will be required to comply with CEC's Class B permit. In the essence of saving time, CEC will collect the additional TPH samples as required upon arrival at the facility to meet the CEC analytical requirements. CEC will amend the invoice accordingly.

Please provide the approval number when scheduling and include the approval number and grid location ID on all manifests when shipping soils generated from this site. CEC can only accept non-Hazardous soil material. Any soils with free petroleum product or liquids, sludge's, or hazardous waste cannot be accepted. The generator will be notified of any non-conforming material. Processing of the soil will be performed under NJDEP Recycling Center Permit No. CBG190002.

If you should have any questions or require any additional information, please contact me at (732) 541-8909 Ext 1966.

Sincerely,

Lawrenzo Yengwia  
Clean Earth of Carteret, LLC.

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on July 01, 2020 with a temperature of 4.1 C. The project was identified as your project: **PRMC2001**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

<b><u>York Sample ID</u></b>	<b><u>Client Sample ID</u></b>	<b><u>Matrix</u></b>	<b><u>Date Collected</u></b>	<b><u>Date Received</u></b>

## **General Notes for York Project (SDG) No.: 20G0066**

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

**Approved By:**

**Date:** 07/09/2020

20G0066-01	WC01	40mL Vial with Stir Bar-Cool 4° C

## Sample and Data Qualifiers Relating to This Work Order

S-08	The recovery of this surrogate was outside of QC limits.
Rep-04	The sample was diluted due to the presence of high levels of non-target analytes resulting in elevated reporting limits.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
PF-01	No Free Liquid
M-ICV1	The recovery for this element in the Initial Calibration Verification (ICV) exceeded 110% of the expected value. Positive detections may be biased high.
M-CRL	The RL check for this element recovered outside of control limits.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
IGN-01	Non-Ignit.
EXT-Temp	Extraction temperature slightly exceeded acceptance range.
EXT-COMP	Completed
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

### Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Re: 161-01 through 161-11 29<sup>th</sup> Avenue Queens; permanent removal of one 2,000 gallon underground #2 fuel oil tank.

## AFFIDAVIT

In accordance with R 3404-01 (d), the permanent removal of one 2,000 gallon underground #2 fuel oil at 161-01 through 161-11 29<sup>th</sup> Avenue Queens has been completed.

- 1) The contents of the tank were completely removed.
- 2) The tank was thoroughly cleaned and purged of combustible vapors
- 3) All pipes were removed
- 4) The fill box was removed
- 5) The tank was removed from the premises
- 6) This work was completed on 01, July 2020

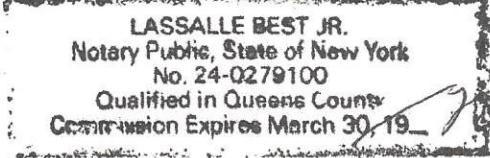

Sincerely

A handwritten signature in black ink, appearing to read "Mark Salamack".

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on July 01, 2020 with a temperature of 4.1 C. The project was identified as your project: **PRMC2001**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

## **General Notes for York Project (SDG) No.: 20G0055**

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

**Approved By:**

**Date:** 07/09/2020

Benjamin Gulizia  
Laboratory Director

## Sample and Data Qualifiers Relating to This Work Order

- S-08 The recovery of this surrogate was outside of QC limits.
- S-03 The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect. This effect was confirmed by reanalysis.
- QL-02 This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
- J Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
- CCV-E The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
- B Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

### Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias ) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.
