1.0 INTRODUCTION

This Remedial Investigation Report (RIR) was prepared on behalf of 38-18 33rd Street LLC and 32-20 38th Avenue LLC (the Applicant) for the Former Refron Inc. Gas Reclamation Site, located at 38-18 33rd Street and 32-20 38th Avenue in the Long Island City section of Queens County, New York (the Site). The Applicant is enrolled in the New York State Brownfield Cleanup Program (BCP). A Brownfield Cleanup Agreement (BCA) was executed by the New York State Department of Environmental Conservation (NYSDEC) on March 11, 2025 (Site No. C241285), with the Applicant classified as a Volunteer. A BCA Amendment was then submitted to the NYSDEC on January 22, 2026, to add a tax parcel (Tax Block: 381, Lot 12) at 32-10 38th Avenue to the BCP Site, and the Amendment was approved on March 20, 2026.

The remedial investigation (RI) described in this document is consistent with the Remedial Investigation Work Plan (RIWP) dated March 2025 and approved by NYSDEC in a letter dated April 10, 2025. The purpose of the RI was to collect data of sufficient quality and quantity to characterize the nature and extent of contamination associated with historic operations and identify the source area for chlorinated solvent contamination at the Site, to complete a qualitative exposure assessment for occupants of the Site and the surrounding community, and to evaluate alternatives to remediate the contamination.

This Remedial Investigation Report (RIR) provides the data and findings of the RI conducted at the Site between May 2, 2025 and June 9, 2025, as well as the investigations conducted on Lot 12 between November 13, 2025 and February 4, 2026. The RI was conducted in accordance with the NYSDEC Division of Environmental Remediation (DER) Program Policy: Technical Guidance for Site Investigation and Remediation (DER-10), Green Remediation (DER-31), and the New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, with revisions (October 2006).

2.0 SITE BACKGROUND

2.1 Site Location and Current Usage

The Site, addressed as 32-10 38th Avenue, 38-18 33rd Street, and 32-20 38th Avenue, is located on the southwest corner of the 38th Avenue and 33rd Street intersection in Queens County, New York between 32nd Street to the west and 33rd Street to the east. The Site consists of three adjacent tax lots totaling approximately 32,031 square feet. The legal description of the Site is New York City Department of Finance Tax Block 381, Lots 5, 12, and 16. Lot 5 is alternately addressed as 38-11 through 38-19 32nd Street, 38-12 through 38-20 33rd Street, and 32-12 through 32-18 38th Avenue. Lot 16 is alternately addressed as 38-02 through 38-10 33rd Street. A Site location map is provided in Figure 1.

Lot 5 of the Site consists of a 26,853 square feet parcel that is currently undeveloped. It was most recently improved with a 30,000-square-foot two-story industrial and manufacturing building with a partial cellar in the northern portion. A concrete paved parking lot is located to the north of the former two-story building and contains a stormwater drain by the metal roll-up door entrance. Two floor drains are present in the former utility room. The partial cellar and ground floor slab remains in place after the partial demolition. Small utility manhole covers for municipal gas, sewer, and electric utilities are located along the sidewalk on 33rd Street.

Lot 12 of the Site consists of a 2,284 square foot parcel that is currently improved with a 2-story residential building with a cellar in the northern portion of the parcel and a one-story extension in the southeast portion. The cellar is utilized as storage and boiler room. In addition to the building, a concrete paved yard is located in the southwest portion.

Lot 16 of the Site consists of a 2,895-square-foot parcel that is currently undeveloped. It was most recently improved with a 5,800-square-foot two-story industrial manufacturing building with a partial cellar. The former building on Lot 16 occupied the entirety of the tax parcel with no open spaces. A floor drain is present in the building's boiler room. The partial cellar and ground floor slab remains in place after the partial demolition.

Since January 2024, Lots 5 and 16 have been vacant and not accessed on a regular basis. The buildings were most recently used for warehouse space and temporary parking. Buildings on Lots 5 and 16 underwent demolition between December 2025 and January 2026. The entrance to Lots 5 and 16 is controlled by a NYCDOB-approved construction fence and locked gates. A site plan and surrounding land use is provided in Figure 2. Locations of the drains and utility lines at the Site are provided in Figure 3.

The Site is located within a mixed residential, commercial, industrial, and manufacturing neighborhood of Queens County. The Site is zoned M1-3/R7X, M1-2/R6A, and Special Long Island City (LIC) Mixed Use District, denoting it as a light industrial, mixed residential/commercial, and special LIC Mixed Use district. This zoning allows for light

industrial uses in areas that are adjacent to residential or commercial districts, and promotes the development and expansion, at varying densities, of the longstanding mix of residential, commercial, industrial, and cultural uses found in the four LIC subdistricts.

2.3 Geology and Hydrogeology

According to a Site survey conducted by Perfect Point in May 2025, the surface elevation of the Site ranges from approximately 25 feet in the southwestern portion to 37 feet in the central east portion (in reference to North American Vertical Datum 1988). The contour lines in the subject property area indicate the area is sloping gently toward the southeast.

Based on the findings of the RI, a historic urban fill layer extending to approximately 5 feet below the existing Site buildings and a historic urban fill layer extending to approximately 3 feet below the grade surface of Site roadways and open areas were identified beneath the Site. The fill material predominantly consists of fine-grained sand with varying amounts of gravel, concrete, asphalt, glass, fine to coarse-grained sand, weathered rock, and silt. According to the United States Geologic Survey (USGS), the Site is located within the Atlantic Coastal Plain physiographic province, which represents the end or terminal moraines of a glacier and the associated outwash aprons along the moraine. Bedrock was not encountered during the RI, according to the USGS the inferred depth to bedrock at the Site is approximately 95 feet bgs.

The depth to water readings were obtained by utilizing an interface probe during the RI. The average depth of groundwater was observed between approximately 14.5 to 15.5

feet below grade surface (bgs) during the RI or el. 14.68 and 17.36 North American Vertical Datum 1988 (NAVD88) during the RI.

Groundwater flow direction may be impacted by several factors, including surface topography, hydrology, hydrogeology, characteristics of soil, and nearby wells. According to the interpretation of topographic and groundwater contour maps, the inferred groundwater flow direction beneath the Site generally flows from the northwest to the southeast portions of the Site, and in the greater surrounding area of the Site, it flows southwest towards Newtown Creek, located approximately 0.80 miles to the southwest of the Site.

2.4 Redevelopment Plans

The proposed redevelopment includes the completion of the demolition of the current Site buildings and construction of three new mixed-use buildings with commercial use on the ground floor and residential uses on the floors above. The new buildings are planned to include approximately 20% affordable housing units. Two of the buildings were partially demolished between December 2025 and January 2026.

3.0 SITE HISTORY

3.1 Past Uses and Ownership

Based on the available records, Lot 5 of the Site was developed as early as 1898 with three one-story dwellings. In 1949, it was redeveloped with the current warehouse in the southern portion, which was utilized for pipe cutting on the first floor and office use on the second floor. The northern portion was then developed with three one-story storage buildings. As of 1970, the warehouse on Lot 5 was identified as a plumbing supply warehouse. Sometime between 1980 and 1985, Lot 5 was configured as the most recent layout prior to demolition. As of January 2026, the building on Lot 5 has been demolished.

Lot 12 was developed as early as 1898 with a one-story dwelling with a basement. It was further developed to its current footprint in 1985 with an interconnected multi-story residential structure. The structure remained unchanged through the present day. Currently, the building is used as a multi-story residential building with a concrete-paved rear yard.

Lot 16 was undeveloped as early as 1898. It was developed to its current footprint in 1947 with a two-story structure identified as a Chemical Lab. Former Site uses were identified as a chemical laboratory from 1947 through at least 1950, manufacturing from 1970 to at least 2006, and has a history of operating as a chain manufacturing business, plumbing and heating supplies business, a refrigerant supply business, and an equipment supply business. Potential releases from these former uses could have impacted the subsurface conditions beneath the Site. As of January 2026, the building on Lot 16 has been demolished.

According to the New York City Department of Finance's Automated City Register Information System (ACRIS), the ownership of Lot 5 is vested in 38-18 33rd Street LLC since June 24, 2025, the ownership of Lot 12 is vested in 38-18 33rd Street LLC since March 12, 2026, and the ownership of Lot 16 is vested in 32-20 38th Avenue LLC since June 24, 2025.

3.2 Previous Investigations

The following prior investigations were conducted at the Site:

Phase I Environmental Site Assessment at 32-20 38th Avenue, Queens, New York, by H2M Architects + Engineers, January 2023

- H2M architects + engineers (H2M) prepared this report for Lot 16 on behalf of Venta Industries, LLC, in accordance with ASTM Standard E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment (ESA) Process.
- The following Recognized Environmental Conditions (RECs) were identified during the Phase I:

  - Presence of possibly impacted soil vapor beneath the Site and the potential soil vapor intrusion due to the reported petroleum-related releases, dry cleaning, and auto repair operations in the vicinity of the property.
  - Listing of the property on the NYC E-Designation database. Future development activities at the subject property will require formal environmental investigations, including soil vapor and soil and groundwater sampling, and approvals obtained through the New York City Mayor's Office of Environmental Remediation.
- The following Business Environmental Risks (BERs) were identified during the Phase I ESA:
  - The building's historical uses as a chemical laboratory, a jewelry manufacturing company, and a storage and reclamation of refrigerant gases.
  - The building's floor drains are also reportedly capped due to stormwater runoff causing floods. H2M considered this a BER due to the unknown conditions of the bottom sediments within the floor drains.

Phase I Environmental Site Assessment at 38-18 33rd Street, Queens, New York by H2M Architects + Engineers, January 2023

- H2M prepared this report for Lot 5 on behalf of Vecta Industries, LLC, in accordance with ASTM Standard E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.
- The following RECs were identified during the Phase I:
  - Presence of possibly impacted soil vapor beneath the Site and the potential soil vapor intrusion due to the reported petroleum-related releases, dry cleaning, and auto repair operations in the vicinity of the property.
  - Listing of the property on the NYC E-Designation database. Future development activities at the subject property will require formal environmental investigations, including soil vapor and soil and groundwater sampling, and approvals obtained through the New York City Mayor's Office of Environmental Remediation.
- The following Historical Recognized Environmental Condition (HREC) was identified during the Phase I ESA:
  - Former spill on the property that occurred on March 20, 2019. According to the report, 25 gallons of diesel fuel were released due to a ruptured tank, and a large amount of absorbent was spread out to cover the fuel staining on the street. DEP's Division of Emergency Response and Technical Assessment (DERTA) verified that no underground structures were impacted by the fuel spill, and any remaining fuel was returned to the vehicle's gas tank. All materials regarding the fuel spill were removed from the location, and the

New York City Department of Sanitation (DOS) was contacted for additional clean-up.

- The following BERs were identified during the Phase I ESA:
  - The building's historical uses as storage and reclamation of refrigerant gases.
  - The subject building currently operates with a fuel oil aboveground storage tank in the basement to supply fuel for a backup generator. During the visual inspection of this system, no evidence of leaking or damage was noted. Therefore, the presence of an active fuel oil AST is considered a BER.
  - The building's floor drains are also reportedly capped due to stormwater runoff causing floods. H2M considers this a BER due to the unknown conditions of the bottom sediments within the floor drains.
- The following De Minimis Condition was identified during the Phase I ESA:
  - During the visual site inspection, pools of water were observed on the floor in both boiler rooms. Water was leaking overhead from the pipes in the boiler room located in the basement. No sheens or unusual odors indicative of a fuel oil release were observed.

Phase II Investigation Report at 38-18 33rd Street and 32-20 38th Avenue, Queens, New York by Vektor Consultants, September 2024

- Based on the review of available Phase I ESA Reports summarized above, Vektor recommended a limited Phase II Environmental Site Assessment (Phase II) to evaluate if the former industrial operations have adversely impacted the subsurface conditions beneath the Site prior to the acquisition of the Subject Property.
- A limited Phase II investigation consisting of performance of a geophysical survey, installation and sampling of eight soil borings, installation and sampling of two temporary groundwater monitoring wells, and the installation and sampling of five soil vapor points was conducted at the Site from July 18, 2024 to July 19, 2024. A supplemental investigation consisting of the installation and sampling of three monitoring wells and the installation and sampling of twelve soil vapor points was conducted at the Site from August 7, 2024 to August 8, 2024.
- The subsurface materials were generally described from surface grade to 17 feet below grade as light brown fine-grained sand with varying amounts of fine gravel, concrete, asphalt, glass, fine to medium-grained sand, weathered rock, and silt. From 17 to 25 feet below grade, brown fine sand with varying amounts of fine gravel, silt, and clay is described.
- The geophysical survey did not identify any anomalies or areas of concern indicative of underground storage tanks.
- Eight soil borings were installed, and eight soil samples were collected to be analyzed at the New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory for the presence of Part

375 Target Compound List (TCL) volatile organic compounds (VOCs) by United States Environmental Protection Agency (EPA) Method 8260, TCL semi-volatile organic compounds (SVOCs) by EPA Method 8270, and Target Analyte List (TAL) Metals by EPA Method 6000/7000.

- No photoionization detector (PID) readings were detected in the soil samples, except for one soil boring, SB-2, at the 2-4 feet interval and 22-23 feet interval, which were detected at 19.1 and 0.5 parts per million (ppm), respectively.
- Although VOCs, tetrachloroethylene and trichlorofluoromethane were detected above their method detection limits (MDLs), they were below) their respective UUSCOs. No VOCs were detected in the soil samples above their respective NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives (SCOs).
- Although SVOCs, mainly consisting of PAHs, were detected in soil samples, no SVOCs were detected above their respective NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives (SCOs).
- One heavy metal, arsenic, was detected in one soil sample at a concentration above its respective Part 375 Restricted Residential Use SCOs.

- Groundwater was encountered at a range of approximately 13.8 to 15.2 feet below grade.
- During the initial investigation in July 2024, two temporary monitoring wells were installed, and two groundwater samples were collected to be analyzed for the presence of TCL VOCs via USEPA Method 8260, TCL SVOCs via USEPA Method 8270, and Target Analyte Metals by EPA Methods 6000/7000. During the supplemental investigation in August 2024, three permanent groundwater monitoring wells were installed, and three groundwater samples were collected to be analyzed for TCL VOCs via USEPA Method 8260.
  - No SVOCs above their respective NYSDEC Class GA Ambient Water Quality Standards (AWQS) were identified in groundwater samples.
  - Chlorinated VOC impacts (PCE, TCE, and trans-1,2-dichloroethylene) were identified in the groundwater, specifically in the western portion of the Site.
- During the initial investigation in July 2024, five soil vapor points were installed to depths between 2.5 feet and 10 feet, and five soil vapor samples were collected. During the supplemental investigation in August 2024, twelve soil vapor points were installed to depths between 10 and 13 feet, and twelve soil vapor samples were collected.
  - Results showed low concentrations of petroleum-related VOCs and elevated concentrations of CVOCs in all soil vapor samples. Furthermore, Freon was detected at elevated concentrations in almost all soil vapor samples. Although Freon does not have a regulatory standard, it was utilized during

the historical operations at the Subject Property, and therefore, the results suggest a release from former uses of the properties.

- Analytical Services Protocols (ASP) Category B laboratory reports for the soil, groundwater, soil vapor samples were provided by York Analytical Laboratories and reviewed by Alpha Geoscience, third-party data validator. Data qualifiers were updated following completion of the DUSRs. The DUSR is included in Appendix F.
- The data were determined to be mostly usable. Completeness, defined as the percentage of analytical results that are judged to be usable, is 99.9% for soil, groundwater, and soil vapor. All data are considered usable and acceptable as qualified, as identified in the DUSR.

Soil:

The data are mostly usable and acceptable.

The following were rejected:

- "not detected" semi-volatile results for 15 acid extractable compounds for sample SB-2 (16'-18')

Groundwater:

The data are mostly usable and acceptable.

The following data were rejected:

- "not detected" volatile results for bromomethane for MW-1, MW-2, and MW-3.
- "not detected" volatile result via EPA method 8260 of 1,4-dioxane for sample TB-1.
- "not detected" semi-volatile results for benzoic acid for GW-1 and GW-2.
- "not detected" volatile results for 4-nitrophenol for samples GW-1 and GW-2.

Please note that although the data for 1,4-dioxane was rejected only under the VOCs list when analyzed via EPA Method 8260. Reporting limits (RLs) via EPA Method 8260 are higher and QC recoveries are always poor and therefore, qualified/rejected data for this one compound via EPA Method 8260 is common. RLs for 8270SIM are lower and as a result, have much better QC recoveries.

Soil Vapor:

The data are mostly acceptable, and no soil vapor data were rejected.

All data that are considered usable with estimated (J, J+, or UJ) data associated with a higher level of quantitative uncertainty. All data that are not qualified rejected (R) are considered usable with estimated (J+, J, J-, UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the data

validation reviews. Validated data, provided in ASP Category B Packages are submitted to the NYSDEC EQUIS database in an Electronic Data Deliverable (EDD) format.

- Based on the results of the Phase II Environmental Site Assessment, impacts to groundwater and soil vapor beneath the Site are identified. Vektor recommended reporting the results to the NYSDEC and remediating the Site under one of their available programs.

Phase I Environmental Site Assessment at 38-18 33rd Street and 32-20 38th Avenue, Queens, New York by Vektor Consultants, September 2024

- Vektor prepared this report for 38-18 33rd Street LLC and 38-18 33rd Street LLC in accordance with ASTM Standard E1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.
- The following RECs were identified during the Phase I:
    - Based on the available records, historical uses of the Lots 5 and 16 include a chain manufacturing business, a refrigerant supply business, and a chemical laboratory. These facilities typically utilize hazardous substances or petroleum products as part of their operations, and potential historic releases from these facilities could have affected the subsurface conditions. The EDR database also indicates that the Subject Property has a history of generating sodium cyanide, ignitable, corrosive material, and halogenated solvents as waste. Therefore, the historical uses of the Site were considered REC.
    - Based on the available records, the properties in the vicinity of the Subject Property were utilized as dry cleaners and auto repair operations. Therefore, the presence of possibly impacted soil vapor beneath the Site and the potential soil vapor intrusion) cannot be ruled out and is considered a REC.
    - A Phase II Environmental Site Assessment conducted at the Subject Property in July and August 2024 identified the presence of CVOCs in groundwater beneath the Site at concentrations exceeding regulatory standards as well as the presence of elevated concentrations of CVOCs and Freon, likely associated with historical operations, in soil vapor across the Subject Property. The presence of contaminants exceeding regulatory standards and guidance limits was considered a REC.
- This Phase I ESA revealed the following HRECs in connection with Lots 5 and 16 of the Site:
    - Landstar Inway on Lot 5 is listed on the Spills database under Spill #1812448 due to an equipment failure that occurred on March 20, 2019. According to the regulatory database report, the spill incident was reported to the NYSDEC on March 20, 2019, when a saddle tank was punctured, and approximately 20 gallons of diesel fuel spilled onto the asphalt. First

Environmental was reported to clean up the spill on March 28, 2019. No drains or soils were impacted. The NYSDEC closed the case on March 28, 2019, as no further action was required. Based on the regulatory status and the de minimis amount of oil spilled, this listing was considered an HREC.

- The Phase I ESA revealed the following environmental issues in connection with the Site:

    - Tax Block 381, Lots 5 and 16, is listed on the E-designation database under E-number E-218 for hazardous materials regarding Phase I and Phase II testing protocol as a result of rezoning of the general surrounding area [Dutch Kills Rezoning and Related Actions (CEQR # 08DCP021Q)]. An E-Designation is a New York City zoning map designation that indicates the presence of an environmental requirement pertaining to potential hazardous materials contamination. Any future redevelopment and/or alteration work must also be coordinated with the NYCOER in order to obtain construction permits from the NYCDOB.

      Based on the age of the building, building materials may contain asbestos-containing materials (ACM) and lead-based paint (LBP). Readily visible suspect ACMs and painted surfaces were observed to be in good condition. Should these materials be replaced, a pre-demolition survey would need to be conducted prior to any renovation or demolition activities.

- Vektor recommended the following:

    - Based on the results of the Phase II Environmental Site Assessment, impacts to groundwater and soil vapor beneath the Site were identified. The results must be reported to the NYSDEC, and the Subject Property must be remediated in order to protect the public health and the environment.
    - Any future redevelopment and/or alteration work must be coordinated with the NYCOER in order to obtain construction permits from the NYCDOB due to the presence of E-Designation for hazardous materials on the Subject Property.
    - An Operations and Maintenance (O&M) Plan should be prepared and implemented in order to safely manage the suspect ACMs and LBP at the Subject Property. If redevelopment or renovation of the Subject Property is planned, suspect ACMs and LBP should be surveyed and abated in accordance with federal and NYC regulations.

Although January 2023 Phase I ESAs conducted at the Site stated all floor drains were capped, two floor drains were observed in the utility room of the building on Lot 5, and a floor drain was observed in the boiler room of Lot 16. The locations of the floor drains are

provided in Figure 2 in the Phase I ESA. No other differences were identified from the Phase I ESA findings.

4.1 Geophysical Investigation

Prior to intrusive sampling, a geophysical survey was conducted by Coastal Environmental Solutions (Coastal) Medford, New York, on May 2, 2025, for Lots 5 and 16. The purpose of the geophysical surveys was to identify anomalies indicative of potential USTs, locate buried utilities, and clear boring locations prior to intrusive drilling. Coastal utilized Geophysical Survey Systems Inc. SIR-3000 cart-mounted Ground Penetrating Radar (GPR) unit with a 400 Mhz antenna, a radio-detection RD7000 precision utility locator and a Fisher M-Scope TW-6 pipe and cable locator.

The findings of the geophysical investigation are provided in the geophysical investigation report. A copy of the geophysical report is provided in Appendix B.

4.2 Soil Investigation

4.2.1 Soil Investigation (Lots 5 and 16)

Coastal was retained to install a total of nineteen soil borings across the Site between May 2, 2025, and May 27, 2025. Soil borings (25SB-1 through 25SB-17) were installed to approximate depths ranging between 12 and 15 feet below grade, utilizing a direct-push probe Geoprobe® 6011DT drill rig. Soil boring location 25SB-11 was installed in the cellar to approximately 1.5 feet (approximately 15 feet below grade) below cellar grade. Additionally, two soil borings (25SB-2-N and 25SB-2-S) were installed to 15 feet below grade to delineate the horizontal and vertical extent of contamination observed in soil vapor point location 25SV-2. Figure 4 shows the location of soil borings installed during the RI. Soil boring logs are provided in Appendix C. Figures 9 and 10 shows the geologic cross-sections of soil borings installed during the RI.

Soil samples were collected continuously into 5-foot-long sample barrels lined with dedicated acetate sleeves. Continuous soil samples were collected from each boring and field screened for presence of VOCs with a Photo Ionization Detector (PID) and visually inspected for evidence of contamination. No elevated PID readings or olfactory odors were identified during the RI. The highest PID reading was 337 parts per million (ppm) in 25SB-2.

Three samples were collected from each soil boring with the exception of soil boring locations 25SB-11 (one sample collected) and 25SV-2-S (five samples collected). A total of fifty-seven soil samples, four duplicate samples, and four matrix spike/matrix spike duplicate (MS/MSD) samples were collected for chemical analysis during the RI. At the RI boring locations, one soil sample was collected from the fill layer at 0 to 2 feet bgs, one sample below the historic fill layer, and one sample immediately above the groundwater table. It should be noted that only one sample was collected from soil boring location 25SB-11 from the fill layer at 0 to 1.5 feet below cellar grade, right above the groundwater interface. Samples from the delineation borings 25SV-2-N and 25SV-2-S were biased towards the depths of observed contamination at the location of soil vapor point 25SV-2.

All soil samples were collected using a dedicated, disposable sampling scoop to prevent cross-contamination. VOC samples were collected via a dedicated one-time use 5g Terra-core sampler tool provided by the laboratory for each sample. Soil samples were immediately containerized in pre-cleaned, laboratory-supplied glassware, stored in a chilled cooler (4 °C), and submitted to York Analytical Laboratories (York) of Stratford, CT, under proper chain of custody procedures.

4.3 Groundwater Investigation

4.3.1 Groundwater Investigation (Lots 5 and 16)

Six permanent groundwater monitoring wells designated as MW-1I, MW-1D, and MW-4 through MW-7 were installed across the Site between May 2 and May 27, 2025. The groundwater monitoring wells were sampled initially on May 5, 2025, and subsequently on June 4, 2025 for monitoring well locations that were newly installed or had low groundwater recharge. Four monitoring wells were installed via a direct push Geoprobe® 6011DT drill rig to approximate depths between 15 and 20 feet bgs. Two monitoring wells (MW-1I and MW-1D) were installed with a direct-push probe Geoprobe® 7822 drill rig to approximate depths of 25 and 35 feet bgs. The monitoring wells were constructed of polyvinyl chloride (PVC) and had a 10-foot well screen set at various terminal depths. Three one-inch (MW-1, MW-2, and MW-3) and six two-inch diameter wells were installed during the Remedial Investigation as follows:

Installed Monitoring Well Construction Information

** One-inch diameter wells were installed during the Phase II ESA prior to acceptance into the BCP.

Figure 4 shows the location of groundwater monitoring wells installed during the RI. Monitoring well construction logs are provided in Appendix D.

All monitoring wells were developed followed by installation using a submersible pump until the water was clear and turbidity was less than 50 Nephelometric Turbidity Units (NTUs). Monitoring wells were gauged and surveyed by Montrose Surveying Co. LLP. Groundwater elevations ranged from el. 14.68 feet North American Vertical Datum 1988 (NAVD88) in MW-5 to el. 17.36 feet (NAVD88) in MW-6.

One groundwater sample (total of nine) was collected from each monitoring well, plus one duplicate groundwater sample from MW-3 and one MS/MSD sample from MW-1, utilizing USEPA low-flow groundwater sampling techniques one week after well

development. The groundwater monitoring wells were purged approximately three well volumes prior to sampling utilizing a peristaltic pump. Groundwater field parameters, including pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, temperature, and turbidity were measured during purging, except for monitoring wells MW-2, MW-5 and MW-6, where low groundwater recharge was observed during sampling. The tubing was changed between each monitoring well to prevent cross-contamination, and the low-flow sampling equipment was cleaned with Alconox and distilled water. Samples were collected with a peristaltic pump with dedicated high density polyethylene tubing. Groundwater samples were placed into laboratory-supplied glassware and stored in a chilled cooler (4^{o}C), and submitted to York of Stratford, CT, under proper chain of custody procedures.

Groundwater samples plus the duplicate and MS/MSD groundwater samples collected at groundwater interface were submitted to York Analytical Laboratories, an ELAP certified laboratory, for analysis for TCL VOCs by EPA Method 8260, TCL SVOCs by EPA Method 8270, pesticides by EPA Method 8081, PCBS by EPA Method 8082, and TAL metals (total and dissolved) via EPA Method 6010, 40 per- and polyfluoroalkyl substances (PFAS) compounds via EPA Method 1633, and 1,4-dioxane via 8270 SIM.

All groundwater monitoring wells were surveyed to a common datum on May 13, 2025. The monitoring wells gauged during the survey on May 13, 2025. A groundwater contour map showing groundwater flow direction is provided on Figure 5. Groundwater sampling logs are provided in Appendix E.

4.2.2 Groundwater Investigation (Lot 12)

One permanent groundwater monitoring well designated as 26MW-1 was installed at the Site on February 4, 2026. The groundwater monitoring well was sampled on February 11, 2026. The monitoring well was installed via a direct push Geoprobe® 6011DT drill rig to an approximate depth of 27 feet bgs. The monitoring well is constructed of polyvinyl chloride (PVC) and had a 10-foot well screen set at various terminal depths. One one-inch diameter well was installed during the Remedial Investigation as follows:

Monitoring Well ID	Well Diameter	Installed Depth *	Depth of Groundwater*	Bottom of Screen *	Top of Screen *	Total Screen Depth *
26MW-1	1-Inch**	27	20	27	17	10

* All measurements above are from grade level.

** A one-inch diameter well was installed due to limitations of the drill rig and site logistics.

Figure 4 shows the location of groundwater monitoring wells installed during the RI. Monitoring well construction logs are provided in Appendix D.

The monitoring well was developed, followed by installation using a bailer until the water was clear and turbidity was less than 50 Nephelometric Turbidity Units (NTUs).

One groundwater sample was collected from the monitoring well. Due to poor recharge rates of the monitoring well, QA/QC samples could not be collected. The groundwater monitoring well was purged with a bailer approximately three well volumes prior to sampling. Groundwater field parameters, including pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, temperature, and turbidity were not measured during purging, as low groundwater recharge was observed during sampling, and samples were collected with a bailer. Groundwater samples were placed into laboratory-supplied glassware and stored in a chilled cooler (4^{o}C), and submitted to York of Stratford, CT, under proper chain of custody procedures.

Groundwater samples collected at the groundwater interface were submitted to York Analytical Laboratories, an ELAP-certified laboratory, for analysis for TCL VOCs by EPA Method 8260, TCL SVOCs by EPA Method, and TAL metals (total and dissolved) via EPA Method 6010.

4.4 Soil Vapor Investigation

4.4.1 Soil Vapor Investigation (Lots 5 and 16)

Five soil vapor probes (designated as 25SV-1, 25SV-2, 25SV-3, 25SV-4, and 25SV-5) were installed via a Geoprobe® 6011DT direct push-probe drill rig at approximately 12 feet bgs across the Site with the exception of soil vapor probe location 25SV-3, which was installed at 6 feet bgs as groundwater was encountered at 8 feet bgs at this location. One duplicate soil vapor sample was collected at soil vapor probe location 25SV-DUP-1 and an outdoor ambient) air sample, 25OA-1, was also collected adjacent to the southeastern perimeter of the Site.

The construction of the vapor points followed the design of the NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in the State of New York" dated October 2006 with updates. For the installation of the soil vapor points were connected to ¼-inch outer diameter inert polyethylene, Teflon-lined, tubing which extended above ground surface to allow for purging and sampling. Prior to testing, the integrity of the seal was tested by placing a plastic shroud over the vapor points to isolate them from ambient air. Then, a helium tracer gas was applied into the shroud and was screened utilizing a helium detector for presence of helium. No helium was detected in any of the vapor points; therefore, the sampling points were confirmed to be sealed properly prior to sampling.

After purging approximately three volumes of air from each vapor point at a flow rate less than 200 milliliters per minute, representative samples were collected for laboratory analysis utilizing 6-liter SUMMA canisters fitted with 8-hour flow controllers during the sampling events on May 7, 2025. One outdoor ambient air sample was collected at breathing height as a background sample. The outdoor air sample was collected over an 8-

hour sampling period concurrently with the soil vapor samples. Flow controllers were set to not to exceed 0.2 liters per minute, as established by the NYSDOH Guidance document. Upon completion of the vapor sampling, all canisters were labeled properly with the sample ID numbers, and vacuum pressure readings in the canisters before and after the sample collection. The vapor samples were submitted to York of Stratford, CT, under proper chain of custody procedures. Soil vapor samples were analyzed for VOCs via USEPA Method TO-15.

Soil vapor and outdoor ambient air sampling locations from the sampling event are shown in Figure 4. Soil vapor sampling logs are included in Table 2.

4.4.2 Soil Vapor Investigation (Lot 12)

Two soil vapor probes (designated as 26SV-2 and 26SV-3) were installed via a Geoprobe® 420M direct push-probe drill rig at approximately 5 feet bgs on the eastern perimeter of the Site, 26SS-1 was installed utilizing a portable hammer drill. One duplicate soil vapor sample was collected at soil vapor probe location DUP (collected alongside 26SV-3) and an outdoor ambient) air sample, 26OA-1, was also collected adjacent to the northeastern perimeter of the Site.

The construction of the vapor points followed the design of the NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in the State of New York" dated October 2006 with updates. For the installation of the soil vapor points were connected to ¼-inch outer diameter inert polyethylene, Teflon-lined, tubing which extended above ground surface to allow for purging and sampling. Prior to testing, the integrity of the seal was tested by placing a plastic shroud over the vapor points to isolate them from ambient air. Then, a helium tracer gas was applied into the shroud and was screened utilizing a helium detector for presence of helium. No helium was detected in any of the vapor points; therefore, the sampling points were confirmed to be sealed properly prior to sampling.

After purging approximately three volumes of air from each vapor point at a flow rate less than 200 milliliters per minute, representative samples were collected for laboratory analysis utilizing 6-liter SUMMA canisters fitted with 8-hour flow controllers during the sampling events on February 11, 2025. One outdoor ambient air sample was collected at breathing height as a background sample. The outdoor air sample was collected over an 8-hour sampling period concurrently with the soil vapor samples. Flow controllers were set to not to exceed 0.2 liters per minute, as established by the NYSDOH Guidance document. Upon completion of the vapor sampling, all canisters were labeled properly with the sample ID numbers, and vacuum pressure readings in the canisters before and after the sample collection. The vapor samples were submitted to York of Stratford, CT, under proper chain of custody procedures. Soil vapor samples were analyzed for VOCs via USEPA Method TO-15.

Soil vapor and outdoor ambient air sampling locations from the sampling event are shown in Figure 4. Soil vapor sampling logs are included in Table 2.

Field duplicates were collected to assess the accuracy of the analytical methods relative to the sample matrix. The duplicates were collected from the same sample media as the primary sample by splitting the volume of homogenized sample collected in the field into two sample containers. Duplicate soil, groundwater, and soil vapor samples were collected at the rate of one per 20 samples and submitted to the laboratory. MS/MSD samples were collected at the rate of one per 20 samples and submitted to the laboratory.

Trip blank samples were collected to assess the potential for contamination of the sample containers and samples during the trip from the laboratory to the field, and back to the laboratory for analysis. Trip blanks contain approximately 40 milliliters of acidic water (doped with hydrochloric acid) that is sealed by the laboratory when the empty sample containers are shipped to the field and unsealed and analyzed by the laboratory when the sample shipment is received from the field. Trip blanks accompanied samples each time they were transported to the laboratory and were analyzed for VOCs.

Field blank samples were collected to determine the effectiveness of the decontamination procedures for the groundwater sampling equipment train and the cleanliness of unused nitrile gloves and acetate liners used to collect soil samples. Field blank samples consisted of deionized, distilled water provided by the laboratory that has passed through the sampling.

4.6 Reporting

Daily reports were provided to NYSDEC including a summary of Site activities, investigation progress updates, and photographs of fieldwork. Copies of the submitted daily reports are included in Appendix F.

4.7 Community Air Monitoring Program

Air monitoring was conducted to characterize any personnel exposures and fugitive emissions generated from the performance of the investigation activities. Air monitoring was performed in accordance with the Community Air Monitoring Program (CAMP)/Health and Safety Plan (HASP) prepared for this investigation.

Calibrated air monitoring instruments were used to monitor for potential releases of volatile organic vapors and soil particulates from the Site. Upwind and downwind air monitoring stations were established relative to each drilling location. A portable data logging Photo Ionization Detector and particulate meter were utilized during all invasive activities. The air monitoring instruments were calibrated on a daily basis prior to the start of field work. No elevated PID or dust readings were identified during the RI. Copies of the air monitoring field forms are included in the daily reports in Appendix F.

4.8 Data Validation

Laboratory reports included ASP Category B deliverables for use in the preparation of a data usability report (DUSR). All analyses were reported using NYSDEC ASP Category B deliverables. Laboratory data for all media (soil, groundwater, soil vapor) during the RI was reviewed by Alpha Geoscience, a third-party validator. The DUSRs are applicable to all samples collected during the RI. Refer to Section 5.7 for further details.

4.9 Investigation Derived Waste

Investigation-derived wastes (IDW) generated during the RI were containerized as necessary. Since no evidence of contamination was observed in soil samples, the soil boring locations were backfilled with soil cuttings. Aqueous waste from monitoring well development and purging and decontamination water were placed into DOT-approved 55-gallon steel drums with sealed tops. The drums will be transported off-site by a licensed waste hauler and disposed of at a permitted facility.

5.0 REMEDIAL INVESTIGATION RESULTS

All media including soil, groundwater, and soil vapor have been sampled and evaluated in this RIR. Discrete (grab) samples have been used for delineating the nature and extent of contamination and to determine the impact of contaminants on public health and the environment.

Soil results are compared to the 6 NYCRR Part 375 Unrestricted Use, Restricted Residential Use SCOs, and Protection of Groundwater SCOs as applicable.

Groundwater results are compared to the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS 1.1.1) AWQS and Guidance Values published in "Sampling, Analysis and Assessment of PFAS under NYSDEC's Part 375 Remedial Programs".

Soil vapor and air results were reviewed in conjunction with groundwater and soil data. Concentrations of VOCs in samples were evaluated by comparison to the Air Guidance Values (AGVs) presented in the NYSDOH 2006 guidance document with updates. The risk of vapor intrusion was evaluated by comparison to the NYSDOH Decision Matrices A through F.

5.1 Fish and Wildlife Remedial Impact Analysis

The Site provides no wildlife habitat or food value. There are no natural waterways, wetlands, resources, or critical habitats of endangered species present on or adjacent to the Site. Therefore, a fish and wildlife remedial impact analysis is not required.

5.2 Geological and Hydrogeological Conditions

5.2.1 Stratigraphy

The stratigraphy of the Site, from the surface down, consists of a historic urban fill layer extending to approximately 5 feet below the majority of Site and consisting primarily of brown and dark brown fine to medium sand with varying amounts of gravel, concrete, asphalt, glass, and silt, and native soils from 5 to 15 feet consisted of primarily brown sand/silt mixtures, with traces of gravel and some weathered rock. However, no competent bedrock was encountered in any soil boring during the RI. According to the USGS the inferred depth to bedrock at the Site is approximately 95 feet bgs.

5.2.2 Hydrogeology

Groundwater head measurements were collected utilizing a Solinst® 122 Oil/Water Interface probe. The interface probe can measure depths to water to 0.01 inch. No free product was observed within any of the monitoring wells. Ground elevation ranges between approximately 25 feet (NAVD88) in the northern portion to 37 feet (NAVD88) in the central east portion of the Site. The depth to water readings were obtained by utilizing an interface probe during the RI. Average depth to groundwater was observed between

approximately 14.5 to 20 feet or el. 14.68 and 17.36 North American Vertical Datum 1988 (NAVD88) during the RI. Based on the findings of the RI synoptic groundwater gauging event, groundwater beneath the Site generally flows from northwest to southeast.

A table of water level data for all monitor wells is included in Table 1. A map of groundwater level elevations with groundwater contours and inferred flow lines is shown in Figure 5.

5.3 Geophysical Investigation Findings

Coastal did not identify any anomalies or areas of concern indicative of potential USTs during either of the geophysical surveys during the RI. Approximate locations of floor drains and utility lines at the Site are provided in Figure 3.

The geophysical investigation report is provided in Appendix B.

5.4 Soil Results

Figure 4 provides the soil boring locations installed during investigations. Figure 6 provides a summary of soil exceedances identified during the RI by including SVOCs, pesticides, and metals. Data on soil sample collection for chemical analyses, including dates of collection and sample depths, are reported in Tables 3 through 8. Laboratory analytical deliverables for soil samples are provided in Appendix G.

5.4.1 Soil Chemistry

A total of sixty-six soil samples plus five soil duplicate (DUP) samples and five sets MS/MSD samples, were collected from 22 soil borings 25SB-1 through 25SB-17, 25SV-2N, 25SV-2S, 26SB-1, 26SB-2, and 26SB-4 during the RI between May 2, 2025 through May 27, 2025 and February 4, 2026. These soil samples were analyzed for TCL VOCs, TCL SVOCs, pesticides, PCBs, TAL metals including chromium, hexavalent and chromium trivalent, 1,4-dioxane, and 40 PFAS compounds.

Soil results were compared to the NYSDEC Part 375 Unrestricted Use SCOs (UUSCOs) and Restricted Residential Use SCOs (RRSCOs). Emerging contaminant results were compared to the guidance values as established in the NYSDEC Guidance Document for Part 375 Remedial Programs. The qualifiers mentioned below are from the laboratory analytical reports and will be updated upon receipt of the DUSRs.

Summary of Groundwater Analytical Results

- Five VOCs, including chloroform, tetrachloroethylene (PCE), toluene, trichloroethylene (TCE), and trichlorofluoromethane, were detected above its respective AWQS in five groundwater samples. Although not exceeding regulatory SCOs, VOCs, PCE and TCE were also detected in soil samples at trace concentrations. Therefore, the presence of VOCs and CVOCs compounds in groundwater could be attributed to an on-site source.
- One SVOC, acenaphthylene, was detected at a concentration of 0.288 µg/L and does not have a respective AWQS. No other SVOCs were detected above laboratory reporting limits.
- One pesticide, dieldrin, was detected at a concentration of 0.149 µg/L above its respective AWQS of 0.004 µg/L in groundwater sample MW-7.
- No PCBs were detected in any of the groundwater samples above laboratory reporting limits.
- Ten naturally occurring metals, including arsenic, barium, cadmium, copper, magnesium, manganese, nickel, selenium, sodium, and zinc, were detected in both the total and dissolved groundwater samples across the Site above their respective AWQS. It should be noted that naturally occurring metal contaminants in groundwater are not site-specific contaminants of concern and will not be addressed by a remedy.
- Two non-naturally occurring metals chromium and lead was detected in total and dissolved groundwater samples in monitoring well MW-2 in the central portion of the Site and 26MW-1 in the northern portion of the Site.
- Two PFAS compounds, PFOS and PFOA, were detected above the regulatory limits, PFOS in one sample and PFOA in nine groundwater samples. PFAS samples were not detected in any of the soil samples above laboratory reporting limits. Therefore, the presence of PFAS compounds in groundwater is likely due to an off-site source.
- It should be noted that the groundwater sample 26MW-1, was turbid at the time of sampling.

5.6 Soil Vapor Results

Figure 4 provides the soil vapor and ambient air sampling locations. Figure 8 provides a summary of findings with detected concentrations. A summary table of data for chemical analyses performed on soil vapor samples is included in Table 15. Laboratory data deliverables for all samples evaluated in the RIR are provided in Appendix I.

5.6.1 Soil Vapor Results

Results further showed concentrations of CVOCs in all soil vapor samples. The highest concentrations of CVOCs detected were of PCE at 25SV-2 (5,900 µg/m^3) and TCE at 25SV-2 (4,200 µg/m^3), located in the central portion of the Site.

- 1,1-Dichloroethane was not detected in any soil vapor samples or the outdoor ambient air sample.
- Carbon tetrachloride was detected in all soil vapor samples and duplicate sample, ranging from 0.27 µg/m^3 in 26SS-1/26SV-3 to 8.3 µg/m^3 in 25SV-2. Carbon tetrachloride was also detected in both outdoor ambient air samples at concentrations ranging from 0.14 µg/m^3 (260A-1) to 0.51 µg/m^3 (25-0A-1).

- Methylene chloride and vinyl chloride were not detected in any of the soil vapor samples or the outdoor ambient air sample.
- PCE was detected in eight soil vapor samples and the two duplicate soil vapor samples, ranging from 1.6 µg/m^3 in 25SV-5 to 7,300 µg/m^3 in 25SV-DUP-1 (collected from the 25SV-2 location). PCE was not detected in the outdoor ambient 25OA-1 sample; however, PCE was detected at 0.88 µg/m^3 in the outdoor ambient 26OA-1 sample.
- TCE was detected in six soil vapor samples and the two duplicate soil vapor samples, ranging from 3.9 µg/m^3 in 26SV-3 to 4,200 µg/m^3 in 25SV-2. TCE was not detected in the outdoor ambient air samples.
- Trichlorofluoromethane (Freon 11) was detected in four soil vapor samples and the duplicate soil vapor sample, ranging from 2.1 µg/m^3 in 26SV-2 to 3,300 µg/m^3 in 25SV-2. Trichlorofluoromethane (Freon 11) was detected at 1.2 µg/m^3 in the outdoor ambient 26OA-1 sample.

Outdoor Air

The total concentrations of BTEX ranged in the background ambient air samples from 5.3 ug/m^3 in 26OA-1 to 6.3 ug/m^3 in 25OA-1. Results further showed detected concentrations

of chlorinated VOCs (CVOCs) in both background ambient air samples 25OA-1 and 26OA-1. Carbon tetrachloride was detected at 0.51 µg/m^3 in 25OA-1 and 0.14 µg/m^3 in 26OA-1, and tetrachloroethylene was detected at 0.88 µg/m^3 in 26OA-1. 1,1,1-Trichloroethane, 1,1-dichloroethane, cis-1,2-dichloroethylene, methylene chloride, PCE, and vinyl chloride were not detected in the outdoor ambient air samples.

Summary of Soil Vapor Analytical Results

Results showed low concentrations of petroleum-related VOCs and elevated concentrations of CVOCs in soil vapor samples. BTEX was identified between 4.37 µg/m^3 in 26SV-3 to 24 µg/m^3 in 25SV-4. The highest concentrations of CVOCs detected were of PCE at 25SV-2 (5,900 µg/m^3) and 7,300 µg/m^3 in 25SV-DUP-1 (collected from the 25SV-2 location), and TCE at 25SV-2 (4,200 µg/m^3), which is located in the central portion of the Site.

5.8 Green Remediation and Sustainability

Green and Sustainable Remediation (GSR) principles were incorporated into both the Remedial Investigation and will be carried forward into the evaluation aand implementation of remedial alternatives in accordance with NYSDEC DER-31 guidance. The RI was completed using methods intended to minimize environmental footprint, reduce waste, and improve the overall sustainability of investigation activities.

5.8.1 GSR Objectives

The primary objectives of incorporating GSR into the remedial program include:

- Minimizing greenhouse gas (GHG) emissions and criteria air pollutants
- Reducing energy consumption and promoting use of renewable energy where feasible
- Conserving water resources during remedial implementation
- Minimizing generation of investigation-derived and remediation-derived waste
- Reducing impacts to the surrounding community, including noise, traffic, and air emissions

5.8.2 RI Phase Sustainability Measures

GSR measures implemented during the RI included:

- Consolidation of field activities to reduce mobilizations and associated fuel use
- Use of properly maintained, low-emission drilling equipment and enforcing anti-idling requirements.
- Use of direct-push drilling methods to minimize soil disturbance and waste generation
- Implementation of low-flow groundwater sampling techniques to minimize purge water generation

- Use of properly maintained low-emission equipment and adherence to anti-idling requirements
- Segregation and appropriate recycling/disposal of IDW streams
- Implementing the Community Air Monitoring Plan (CAMP) to protect nearby receptors and reduce air impacts.

Climate resiliency considerations included:

- Screening for potential flood, extreme precipitation, and heat-related vulnerabilities based on current NYSDEC climate-resiliency criteria.
- Scheduling intrusive work to avoid storm events and securing boring locations to prevent infiltration.
- Evaluating potential impacts of future climate conditions (e.g., increased rainfall, stormwater intrusion) on any future remedial components.

5.8.3 Environmental Footprint Analysis

As part of the remedial program and in accordance with DER-31 Green Remediation, to evaluate the remedy with respect to green and sustainable remediation principles, an environmental footprint analysis was completed. The environmental footprint analysis was completed using an accepted environmental footprint analysis calculator, SEFA (Spreadsheets for Environmental Footprint Analysis, USEPA). SEFA sheets are provided in Appendix J. Water consumption, greenhouse gas emissions, renewable and non-renewable energy use, waste reduction, and material use were estimated, and goals for the project related to these green and sustainable remediation metrics. The following footprint was calculated at the Site between May 2, 2025, through February 11, 2026.

- It was estimated that approximately 12,925 pounds of greenhouse gas emissions (GHG) emissions (carbon dioxide equivalents of global warming potential), 134 pounds of NOx emissions, 229 pounds of SOx emissions, 36 pounds of particulate matter (PM) emissions, and 25 pounds of hazardous air pollutants (HAPs) were emitted during the Remedial Investigation at the Site.

6.0 CONCEPTUAL SITE MODEL

The Conceptual Site Model (CSM) integrates Site history, subsurface conditions, and analytical results to characterize the nature and extent of contamination identified beneath the Site. Investigation results were compared to the following applicable standards and guidance values, and four areas of concern were identified:

- NYSDEC Part 375 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs
- NYSDEC TOGS 1.1.1 AWQS and NYSDEC Guidance Values

6.1 Site Contaminants

The following contaminants of concern were identified at the Site:

- PAHs and Metal Impacts in Soil
- CVOCs in Soil, Groundwater, and Soil Vapor
- Metals in Groundwater
- PFAS compounds in Groundwater

6.1.1 SVOCs (PAHs) and Metal Impacts in Soil

Contaminants associated with urban fill from unknown sources were identified across the Site. A historic urban fill layer extending down to approximately 5 feet below the majority of the Site. The fill material predominantly consists of primarily brown and dark brown fine to medium sand with varying amounts of gravel, concrete, asphalt, glass, and silt. Based on the investigation results, these fill layers have detections of SVOCs, specifically polycyclic aromatic hydrocarbons (PAHs), and metals. Eleven SVOCs, including polycyclic aromatic hydrocarbons (PAHs), benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, dibenzofuran, indeno(1,2,3-cd)pyrene, naphthalene, and phenanthrene were detected at concentrations exceeding their respective UUSCOs. The RRSCO for two of these SVOCs [benzo(a)pyrene and dibenzo(a,h)anthracene] are the same as the UUSCOs and therefore, also exceeded their respective RRSCOs. Benzo(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene, and phenanthrene have differing UUSCOs and RRSCOs but were detected at concentrations above both UUSCOs and RRSCOs. Only dibenzofuran and naphthalene were detected at concentrations exceeding its respective UUSCO but below its RRSCO.

Four metals (copper, lead, zinc, and mercury) were detected at concentrations exceeding their respective UUSCOs in twelve soil samples and one soil duplicate sample. Of these, two metals, lead and mercury also exceeded their respective RRSCOs in two shallow soil samples. Mercury also exceeded its respective RRSCO in one intermediate soil sample.

The SVOC and metal exceedances in soil were identified in generally shallow depths, specifically the 0-to-2-foot interval and 3-to-5-foot interval, and can be attributed to the presence of historic fill at the Site.

6.1.2 CVOCs in Soil, Groundwater and Soil Vapor

Four VOCs, including tetrachloroethylene (PCE), toluene, trichloroethylene (TCE), and trichlorofluoromethane, were detected above their respective AWQS in five groundwater samples. The petroleum-related VOC toluene was detected in two groundwater samples in the western and central portions of the Site, slightly above its AWQS of 5 ug/L (6.27 ug/L in MW-1I and 15 ug/L in MW-4). The three CVOCs, PCE, TCE, and trichlorofluoromethane (Freon 11) were detected at concentrations ranging from 10.1 µg/L to 82 µg/L above the AWQS of 5 ug/L for all three CVOCs. PCE exceedances were detected in four monitoring wells, MW-1, MW-1I, MW-4, and MW-7, located in the southwestern and south-central portion of the Site, with concentrations 10.1 µg/L to 42 µg/L. TCE exceedances were detected in three monitoring wells, MW-1, MW-4, and MW-7, with concentrations 11 µg/L to 79 µg/L. Both PCE and TCE exceedances were identified in monitoring wells located in the southwestern and south-central portions of the Site. Trichlorofluoromethane only exceeded AWQS in one monitoring well, MW-5, at a concentration of 82 µg/L in the southeastern portion of the Site.

Soil vapor results showed concentrations of CVOCs in all soil vapor samples. The highest concentrations of CVOCs detected were of PCE at 25SV-2 (5,900 µg/m^3) and TCE at 25SV-2 (4,200 µg/m^3), located in the central portion of the Site. PCE was detected in eight soil vapor samples and the two duplicate soil vapor samples, ranging from 1.6 µg/m^3 in 25SV-5 to 7,300 µg/m^3 in 25SV-DUP-1 (collected from the 25SV-2 location). PCE was not detected in the outdoor ambient 25OA-1 sample; however, PCE was detected at 0.88 µg/m^3 in the outdoor ambient 26OA-1 sample. TCE was detected in six soil vapor samples and the two duplicate soil vapor samples, ranging from 3.9 µg/m^3 in 26SV-3 to 4,200 µg/m^3 in 25SV-2. TCE was not detected in the outdoor ambient air samples. Trichlorofluoromethane (Freon 11) was detected in four soil vapor samples and the duplicate soil vapor sample, ranging from 2.1 µg/m^3 in 26SV-2 to 3,300 µg/m^3 in 25SV-2. Trichlorofluoromethane (Freon 11) was detected at 1.2 µg/m^3 in the outdoor ambient 26OA-1 sample.

The highest CVOC concentrations in both groundwater and soil vapor are in proximity to one another in the south and central portions of the Site. Since concentrations of CVOCs were also detected in the soil, the presence of CVOCs in groundwater and soil vapor is indicative of an on-site source.

6.1.3 Metals in Groundwater

A total of thirteen metals, including arsenic, barium, cadmium, chromium (total and hexavalent), copper, lead, magnesium, manganese, nickel, selenium, sodium, and zinc, were detected at concentrations exceeding their respective AWQS in both the total and dissolved

metals analysis. Of these metals, arsenic, barium, cadmium, copper, magnesium, manganese, nickel, selenium, sodium, and zinc. Only two non-naturally occurring metals, chromium (total and hexavalent) and lead, were detected in total and dissolved groundwater samples in monitoring well MW-2 in the central portion of the Site and 26MW-1 in the northern portion of the Site. During the RI, MW-2 and 26MW-1 were observed to have low groundwater recharge, and the well could not be properly sampled using low flow techniques to have the groundwater quality parameters stabilize prior to collecting a sample due to low volume. This slight exceedance can be attributed to excessive entrained sediment due to the need to collect a groundwater sample from this monitoring well location without having the turbidity drop to stabilized levels and is not likely attributable to an on-site source.

6.1.4 PFAS Compounds in Groundwater

A total of two PFAS compounds, including Perfluorooctanesulfonic acid (PFOS) and Perfluorooctanoic acid (PFOA), were detected at concentrations exceeding their respective NYSDEC Part 375 PFAS Remedial Program guidance values. PFOS was detected at a concentration of 10.7 ng/L, slightly exceeding its NYSDEC Part 375 Remedial Program guidance value of 10 ng/L in one groundwater sample collected at monitoring well MW-4 located in the south-central portion of the Site. PFOA was detected in all groundwater samples except for the groundwater sample collected from monitoring well MW-6. The highest concentration of PFOA was detected at 170 ng/L in MW-3, located in the northeastern portion of the Site. However, no PFAS compounds were detected in soil. Based on this, the presence of PFAS Compounds in groundwater is likely attributed to an off-site source.

7.0 QUALITATIVE EXPOSURE ASSESSMENT

The objective of the qualitative exposure assessment is to identify potential receptors and pathways for human exposure to the contaminants of concern (COC) that are present at, or migrating from, the Site. Human health exposure risk was evaluated in accordance with Appendix 3B NYSDOH Qualitative Human Health Exposure Assessment and Section 3.3(c)4 of the NYSDEC DER-10. The five elements of an exposure pathway are the (1) source of contamination; (2) environmental media and transport mechanisms; (3) point of exposure; (4) route of exposure; (5) receptor population based on past, present or future events. The potentially exposed receptors and how any unacceptable exposures may be eliminated are determined from an assessment of the primary use of the area, actual and potential use of ground and surface waters that are impacted or threatened, and how any potential routes of exposure may be eliminated.

7.1 Contaminant Sources

Based on the results of the RI, on-site contaminants to be evaluated for human health exposure risk include contaminants of concern at the Site include PAHs and metals in soil, chlorinated solvents in soil, groundwater and soil vapor, metals and PFAS Compounds in groundwater.

The PAHs and metals detections in soil samples are generally consistent with historic fill material observed throughout NYC and not likely attributed to historic uses or a source at the Site.

Low concentrations of CVOCs were identified in soil samples at the Site. The groundwater and soil vapor in the southern and central portions of the Site are impacted with chlorinated solvents, specifically PCE, TCE, and trichlorofluoromethane (Freon 11), which were detected at elevated concentrations. However, across the entire Site, no VOCs were detected above Unrestricted Use SCOs, and only trace detections above laboratory reporting limits of the CVOCs found in groundwater and soil vapor were detected in soil. The Site has historical records of halogenated solvent waste generation. Although concentrations of CVOCs did not exceed regulatory SCOs, CVOCs were also detected in the soil, indicating that the presence of CVOCs in groundwater and soil vapor is indicative of an on-site source.

Although elevated metals were detected in groundwater, ten out of thirteen of the metals exceeding their AWQS were arsenic, barium, cadmium, copper, magnesium, manganese, nickel, selenium, sodium, and zinc, which are known to be naturally occurring metals. The three non-naturally occurring metals exceeding its AWQS was chromium (total and hexavalent) and lead at the location of monitoring well MW-2 and 26MW-1, which were observed to have low groundwater recharge. Groundwater samples were collected from this well without letting the groundwater quality parameters stabilize via low flow sampling techniques and the exceedances are likely attributable to entrained sediment due

to high turbidity at the time of sampling. Chromium and lead were not detected above its AWQS in any other well and these exceedances are unlikely to be attributed to an on-Site source. The groundwater across the Site is impacted with PFAS Compounds, specifically PFOS and PFOA were detected at elevated concentrations. PFOS was detected at a concentration of 10.7 ng/L, slightly exceeding its NYSDEC Part 375 Remedial Program guidance value of 10 ng/L in one groundwater sample collected at monitoring well MW-4 located in the south-central portion of the Site. PFOA was detected in all groundwater samples except for the groundwater sample collected from monitoring well MW-6. However, no PFAS compounds were detected in soil. Based on this, the presence of PFAS Compounds in groundwater is likely attributed to an off-site source.

7.2 Current Conditions

The Site is located in a densely developed part of Long Island City, New York. The Site is currently vacant. The ground surfaces are currently covered by the former buildings' concrete slabs and an asphalt-paved parking lot. Cracks, drains, or damage to concrete slabs and asphalt can act as preferential pathways for contaminated soil vapor. Therefore, human exposure to contaminated soil through dermal absorption, inhalation, and ingestion is limited but not unlikely.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

Although the Site is covered with the current buildings' concrete slabs and asphalt pavement, cracks, drains, or damage to concrete slabs and asphalt were observed and can act as preferential pathways for contaminated soil vapor.

7.3 Exposure Route

An exposure route is the mechanism by which a receptor comes into contact with a chemical. Three potential primary routes exist by which chemicals can enter the body:

- Ingestion of water, fill, and/or soil;
- Inhalation of vapors and/or particulates; and
- Dermal contact with water, fill, soil, and/or building materials.

7.4 Potential Sensitive Receptors

On-Site Receptors: The site is currently vacant and capped with the existing buildings' concrete slab and an asphalt-paved parking lot. The Site is secured with locked roll-up metal doors and typical doorways for both Site buildings, and the entrance to the parking lot is controlled by a locked gate. Onsite receptors are limited to workers, trespassers, site representatives and visitors granted access to the property. Under proposed future conditions, potential on-site receptors include workers, residents, and visitors.

Off-Site Receptors: Potential off-site receptors within a 500-foot radius of the Site include adult and child residents; commercial and construction workers; pedestrians; and trespassers based on the following land uses within 500 feet of the Site:

1. Commercial Businesses – existing and future
2. Residential Buildings – existing and future
3. Building Construction/ Renovation – existing and future
4. Pedestrians, Trespassers, Cyclists – existing and future
5. Schools – existing and future

Community Air Monitoring Program (CAMP) will be implemented at the Site during intrusive activities to monitor air quality the public.

7.5 Potential Exposure Pathways

On-Site: Although the Site is covered with the former buildings' concrete slabs and asphalt pavement, cracks, drains, or damage to concrete slabs and asphalt were observed, and can act as preferential pathways for contaminated soil vapor. Human exposure to contaminated soil through dermal absorption, inhalation, and ingestion is likely due to the condition of the current site cover.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

Although the Site is covered with the former buildings' concrete slabs and asphalt pavement, cracks, drains, or damage to concrete slabs and asphalt were observed, and can act as preferential pathways for contaminated soil vapor. Once construction activities begin, a potential exposure pathway may exist for construction workers and inspectors to come into direct contact with soil. Any future site remediation activities would be conducted under a HASP, which would control and limit human exposure to on-site contaminants.

Off-Site: There is an existing potential exposure pathway from soil gas emanating from on-site CVOCs entering neighboring properties as a result of any floor or wall openings/cracks, although these CVOCs are likely attributed to an off-site soil vapor source. Although it is unlikely, the indoor air quality at the adjoining properties may be susceptible to contamination from subsurface vapor intrusion attributable to CVOCs in the area. The potential receptors from such a migration pathway into the building would be to: off-site construction and commercial workers, adult and child residents, and visitors. The primary route of exposure would be inhalation.

During the redevelopment (excavation activities), the potential exists for off-site vapor intrusion risk to off-site receptors. In the absence of a CAMP and HASP, during ground intrusive activities, off-site receptors could be exposed to particulates and vapors. The

implementation of a CAMP and HASP during intrusive work will monitor and limit off-site receptor's exposure to particulates and vapors.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

Once the redevelopment is completed, it is unlikely for a new foundation with the addition of a vapor barrier engineering control that would allow for vapor migration into the building. Based on the findings, the evaluation during the remedy will include a provision for implementing actions recommended to address exposures related to soil vapor intrusion.

7.6 Exposure Assessment Conclusions and Recommendations

Based upon this analysis, exposure to contaminants in soil and groundwater is not expected, but not unlikely under current conditions, as the site is capped with former buildings' concrete slabs and asphalt pavement with some cracks, and groundwater in this area of New York City is not used as a potable water source. There is an existing potential exposure pathway from soil gas emanating from CVOCs entering neighboring properties as a result of any possible floor or wall openings/cracks. Although it is unlikely, the indoor air quality at the adjoining properties may be susceptible to contamination from subsurface vapor intrusion attributable to CVOCs in the area. Once remediation/construction activities start, any potential exposure pathway will be monitored and controlled by implementation of a CAMP and HASP.

During redevelopment (excavation activities), the potential exists for off-site vapor intrusion risk to off-site receptors through inhalation. In the absence of a CAMP and HASP, during ground intrusive activities, off-site receptors could be exposed to particulates and vapors. Monitoring and control measures have been and will continue to be used during any investigation and any future planned remediation to prevent completion of this pathway. Under future conditions, the Site will be remediated, and engineering and institutional controls will be implemented, if necessary, to prevent completion of this pathway.

8.0 DEVIATIONS

No significant deviations from the NYSDEC- and NYSDOH-approved RIWP occurred during the investigations, except for the following:

- Additional borings (25SB-16, 25SB-17, 25SV-2N, and 25SV-2S) were installed during a second mobilization to complete the installation of monitoring wells on May 27, 2025, upon discussion with the NYSDEC on May 22, 2025. Two of these borings (25SV-2N and 25SV-2S) were installed in the immediate vicinity of 25SV-2, where the highest CVOCs were detected, and the remaining two borings (25SB-16 and 25SB-17) were installed in the western portion, where there was a data gap during the investigations.
- The RIWP did not include Lot 12 sampling as this parcel was acquired after the completion of RI.

9.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the RI, the following conclusions were made:

- The stratigraphy of the Site, from the surface down, consists of a historic urban fill layer extending to approximately 5 feet below the majority of Site and consisted of primarily of brown and dark brown fine to medium sand, with little silt with gravel, soil from 5 to 15 feet consisted of primarily brown sand/silt mixtures, with traces of gravel.
- The topography of the Site is relatively level at the Site, ranging from approximately 25 feet (NAVD88) in the southeastern portion to 37 feet (NAVD88) in the central east portion. The average depth to groundwater was determined was observed between approximately 14.5 to 20 feet or el. 14.68 and 17.36 North American Vertical Datum 1988 (NAVD88) during the RI.
- Geophysical surveys did not identify any areas of concern indicative of anomalies consistent with USTs.
- Although VOCs were detected in the soil samples, no VOCs were detected above their respective UUSCOs or PGWSCOs, as applicable.
- No PCBs were detected above Unrestricted Use SCOs in the soil samples.
- Eleven SVOCs, including polycyclic aromatic hydrocarbons (PAHs), benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, dibenzofuran, indeno(1,2,3-cd)pyrene, naphthalene, and phenanthrene were detected at concentrations exceeding their respective UUSCOs. Nine out of eleven of these SVOCs were detected at concentrations above their respective RRSCOs with the exception of dibenzofuran and naphthalene, which were the only SVOCs deted above their UUSCOs and below its RRSCO. The exceedances were identified in the samples collected from shallow depths consisting of historical fill material at four soil boring locations in the 0-to-2-foot interval.
- One pesticide, 4,4'-DDT, was detected at a concentration slightly exceeding its respective UUSCO but below its RRSCO in one shallow soil sample 25SB-10 (0-2').
- One or more of up to four metals, including copper, lead, zinc, and mercury, were detected at concentrations exceeding their respective UUSCOs in twelve soil samples and one soil duplicate sample. Of the four metals detected, two metals lead and mercury, were detected at concentrations exceeding their respective RRSCOs in two shallow (0-to-2-foot interval) soil samples, 25SB-10 (0-2') and 25SB-12 (0-2'). Mercury was also detected in one intermediate (3-to-5-foot interval) soil sample 25SB-12 (3-5).

- No PFAS or 1,4-dioxane compounds were detected in any of the soil samples.
- Five VOCs, specifically chloroform, tetrachloroethylene (PCE), toluene, trichloroethylene (TCE), and trichlorofluoromethane, were detected above their respective AWQS in the groundwater samples. The Site has historical records of halogenated solvent waste generation. Although concentrations of CVOCs did not exceed regulatory SCOs in soil samples, they were detected in the soil, indicating that the presence of CVOCs in groundwater is indicative of an on-site source.
- No SVOCs were detected above their AWQS in any groundwater samples.
- One pesticide, dieldrin, was detected at a concentration of 0.149 µg/L above its respective AWQS of 0.004 µg/L in groundwater sample MW-7.
- No PCBs were detected above their AWQS in any groundwater samples.
- Non-naturally occurring metals chromium (max. of 3,140 µg/L in 26MW-1) was detected in the total analyses at a total concentration of 3,140 µg/L in monitoring well 26MW-1, and total and dissolved analyses at a dissolved concentration of 63.1 µg/L in monitoring well MW-2, both detections are above its AWQS of 50 µg/L; lead (max. of 1,040 µg/L in 26MW-1) was detected in the total analyses at a concentration of 1,040 µg/L in monitoring well 26MW-1, above its AWQS of 25 µg/L. Magnesium, selenium and sodium were also detected in both the total and dissolved analyses above their respective AWQS but are known to be naturally occurring metals. Arsenic, barium, cadmium, copper, nickel, selenium, and zinc, were detected at concentrations exceeding their respective AWQS in the total metals analysis in the one 26MW-1 groundwater sample. The exceedances are likely attributable to entrained sediment due to low groundwater recharge observed at this monitoring well at the time of sampling.
- Two PFAS compounds, PFOS and PFOA, were detected above the regulatory limits, PFOS in one sample and PFOA in nine groundwater samples.
- Elevated concentrations of chlorinated VOCs (CVOCs) were present in soil vapor samples. The highest concentrations of CVOCs detected were of PCE at 25SV-2 (5,900 µg/m3) and TCE at 25SV-2 (4,200 µg/m3), located in the southern and central portions of the Site. Although concentrations of CVOCs did not exceed regulatory SCOs in soil samples, they were detected in the soil and groundwater, indicating that the presence of CVOCs in soil vapor is indicative of an on-site source.

Based on the results of the RI, remedial action will be necessary. Applicable strategies and technologies may include, but are not limited to, historic fill removal in accordance with all applicable laws and regulations, and installation of engineering controls.

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
~=this indicates that no regulatory limit has been established for this analyte
NT=this indicates the analyte was not a target for this sample
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
~=this indicates that no regulatory limit has been established for this analyte
NT=this indicates the analyte was not a target for this sample
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectives

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectiv

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectiv

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectiv

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Unrestricted Use Soil Cleanup Objectives
Bold and highlighted values are detected at concentrations above NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectiv

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

NOTES:
Any Regulatory Exceedences are color coded by Regulation

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be present in the sample. Supporting data or information is necessary to confirm the result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable
ppm= parts per million

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
U= Analyte not detected at or above the level indicated
J= Analyte detected at or above the method detection limit but below the reporting limit - data is estimated
J-= Analyte is present. Reported value may be biased low and associated with
a higher level of uncertainty than is normally expected with the analytical method.
a higher level of uncertainty than is normally expected with the analytical method.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be
present in the sample. Supporting data or information is necessary to confirm the
result.
~=this indicates that no regulatory limit has been established for this analyte
N/A= Not Applicable

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte
J-= Analyte is present. Reported value may be biased low and associated with a higher level of uncertainty than is normally expected with the analytical method.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be present in the sample. Supporting data or information is necessary to confirm the result.
UJ= Not detected, quantitation limit may be inaccurate or imprecise.

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold and highlighted values are detected at concentrations above NYSDEC TOGS Standards and

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Lin
U=analyte not detected at or above the level indicated
NT=this indicates the analyte was not a target for this sample
~=this indicates that no regulatory limit has been established for this analyte
UJ= Not detected, quantitation limit may be inaccurate or imprecise.

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
J+= Analyte is present. Reported value may be biased high andassociated with
a higher level of uncertainty than is normally expected with the analytical method.
U=analyte not detected at or above the level indicated
NT=this indicates the analyte was not a target for this sample
~=this indicates that no regulatory limit has been established for this analyte
UJ= Not detected, quantitation limit may be inaccurate or imprecise.

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
NT=this indicates the analyte was not a target for this sample
~=this indicates that no regulatory limit has been established for this analyte
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be present in the sample. Supporting data or information is necessary to confirm the result.

NOTES:
Any Regulatory Exceedences are color coded by Regulation

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte
UJ= Not detected, quantitation limit may be inaccurate or imprecise.
R= Unreliable result; data is rejected or unusable. Analyte may or may not be present in the sample. Supporting data or information is necessary to confirm the result.

1.0 INTRODUCTION

On 5/2/2025, Coastal Environmental Solutions, Inc (Coastal) personnel performed a limited Geophysical Investigation at 32-20 38th Avenue, Long Island City, NY. The areas of interest included the parking lot/loading dock area along 38th Ave as well as the interior of the buildings indicated as the former "Aspen Refrigerants" buildings as directed by the client. Surface conditions consisted of concrete.

2.0 SCOPE OF WORK

1. Locate and mark detectable underground utilities and other subsurface features in client-indicated investigation areas to clear proposed soil boring locations.

3.0 EQUIPMENT

ImpulseRadar PinPointR Ultra-Wide Band (UWB) Penetrating Radar System

Ground Penetrating RADAR (GPR) is a non-destructive geophysical method that produces a continuous cross-sectional profile of subsurface features in real time. GPR operates by transmitting both high and low frequency electromagnetic wave pulses down into the ground through a transmitter in the antenna. The transmitted electromagnetic waves reflect off materials with contrasting dielectric properties from surrounding medium such as underground storage tanks, utilities, distinct contacts between different earth materials, and other various subsurface objects. The antenna receiver collects the reflected electromagnetic waves which are then interpreted by the operator.

The ImpulseRadar PinPointR UWB GPR utilizes a dual band 400/800 MHz HS antenna mounted to a stroller frame which rolls over the surface. The total depth of penetration achieved with the antenna can be up to 10 feet but widely varies based on site-specific subsurface conditions. Conductive materials in the soil attenuate the GPR signal causing a decrease in effective depth of penetration and clarity.

Vivax-Metrotech vLoc3-Pro Receiver/Transmitter

The vLoc3-Pro Receiver is a hand-operated antenna capable of detecting electromagnetic (EM) fields emitted from a source. The EM antenna can detect pipes and cables in the ground at depths of up to 20 feet using active or passive tracing techniques. Passive tracing is the act of locating an underground utility through the detection of electrical or radio signals travelling along conductive utilities. Active tracing is used in conjunction with the Transmitter that is directly connected to the target utility or to a conductive rodder within a non-conductive line. A signal is sent through the utility at a specific frequency that can be detected by the Receiver. The detectability of a target utility depends on many factors including access to the target utility, grounding, depth of utility, conductivity, and other site-specific factors.

TW-6 Pipe and Cable Locator

The TW-6 Pipe and Cable locator is a handheld magnetometer which utilizes a transmitter-receiver pair attached to opposite ends of a handle and carried approximately 1-2ft from the surface. The magnetometer induces an electromagnetic (EM) field into the ground that is generated by the

transmitter. Once the induced EM field passes through a buried metallic object, it generates a secondary EM field which is detected by the receiver, generating an audible tone. Based on the calibration of the magnetometer, the audible tone reflects the strongest response as the highest pitched sound, trailing off on all sides of the peak. This piece of technology can be used to detect subsurface features such as metallic USTs, large diameter conductive pipes, and buried manholes, especially in areas in which traditional GPR methods cannot be utilized, such as overgrown or uneven surfaces.

4.0 METHODOLOGY

1. A subsurface investigation was performed in close proximity to the client proposed soil boring locations. Active and passive detection methods were utilized with the VLoc3-Pro receiver/transmitter. Coastal personnel directly connected to all accessible and traceable pipes, conduits, valve covers, and any other surface feature throughout the site. A passive scan was performed throughout the site to detect any potential underground utilities that could not be located with active scan.
2. (If applicable) The TW-6 was utilized to sweep accessible areas around suspected UST locations in 3-to-5-foot spacings for readings that may represent a buried metallic anomaly. Upon detection of a reading, the approximate size and shape of the anomalous area was marked on the surface to be investigated further with GPR.
3. GPR was utilized to further characterize the approximate dimensions, depth, and shape of the anomalies located with the TW-6. The remainder of the areas around the suspected locations were scanned with GPR in 3-to-5-foot spacing to locate any anomalous features not previously detected such as non-conductive piping and former excavations.
4. All findings were marked on the surface utilizing the American Public Works Association (APWA) recommended color code, seen below:

WHITE	Proposed Excavation/Limits of Investigation
PINK	Temporary Survey Markings (Approximate UST Locations, Soil Boring Locations)
RED	Electric Power Lines, Cables, Conduit and Lighting Cables
YELLOW	Gas, Oil, Steam, Petroleum or Gaseous Materials
ORANGE	Communication, Alarm or Signal Lines, Cables or Conduit
BLUE	Water (Domestic and Fire Lines)
PURPLE	Irrigation, Slurry Lines, Reclaimed Water
GREEN	Sewers and Drain Lines

5.0 SUMMARY OF FINDINGS

Geophysical Investigation

Coastal personnel conducted a limited Geophysical Investigation within all areas of concern as indicated by the client. Coastal visually identified all surface features related to utilities during our initial investigation of the property. Within the sidewalk on the north and east sides of the property, all main utilities were identified connecting to the buildings including electric, communications, natural gas, water, and sanitary.

Within the site, the concrete loading dock on the north side facing 38th Avenue was determined to contain multiple storm drain features. One trench drain adjacent to the loading dock was traced to lead inside the building before connecting to the roof drain system. A drainage grate was also located in the parking lot, though no connected piping was detected with GPR. The structure was filled with debris and soil and was thought to possibly be abandoned.

Inside the building, a series of roof drains led down three columns and into the shallow subsurface below. The cast iron drainpipes were determined to be connected to each other and combined to one structure along the eastern side of the building at the location of an additional double-wide loading dock. The structure appeared to be at the location of a manhole approximately 3 feet below the slab covered with fill and concrete up to the surface. One additional line leading from a sump pit within the basement connected to these lines and was marked as such on the surface. No other drains were detected leading off of the site.

Limitations

The effective depth of GPR penetration was limited to approximately 3.5 feet below the concrete grade surfaces. The limiting factor was due to soil conductivity attenuating the GPR signal. The GPR and TW-6 were unable to be utilized within close proximity to parked vehicles and exterior walls. TW-6 was also unable to be utilized over metal-reinforced concrete.

Disclaimer

The subsurface investigation was performed by Coastal after considering the limits of the scope of work and the time constraint for the investigation. The investigation that is described in this report was undertaken in accordance with current accepted standards and practices of the geophysical survey industry. The results and interpretations that are presented are based on professional judgment and are as accurate as can reasonably be achieved. However, no geophysical equipment can accurately depict all subsurface features due to the geology and environmental conditions of the subsurface. Any intrusive work in proximity to identified anomalies should be carefully considered and cross-referenced with all available site-specific documentation. Coastal is not liable for the use, interpretation, or application of the data and information in this report.

PHOTOS & GPR SCREENSHOTS

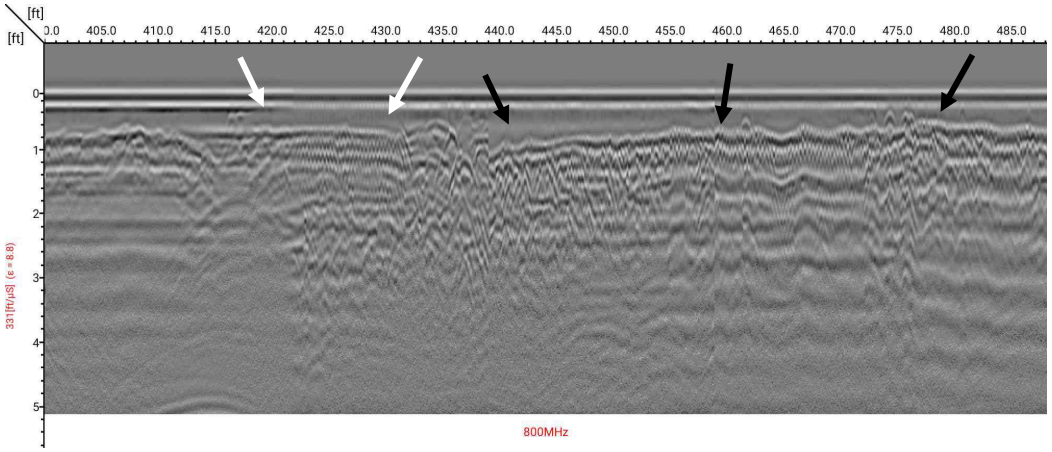

Photo 1 and GPR Screenshot 1 – Photo of the interior of the building at the location of the basement wall intersecting with the remaining slab. At this location, a sump pump line connected to the roof drain lines leading off site. The GPR screenshot shows the change in data between the concrete over the basement (white arrows) versus the slab-on-grade of the rest of the site (black arrows).

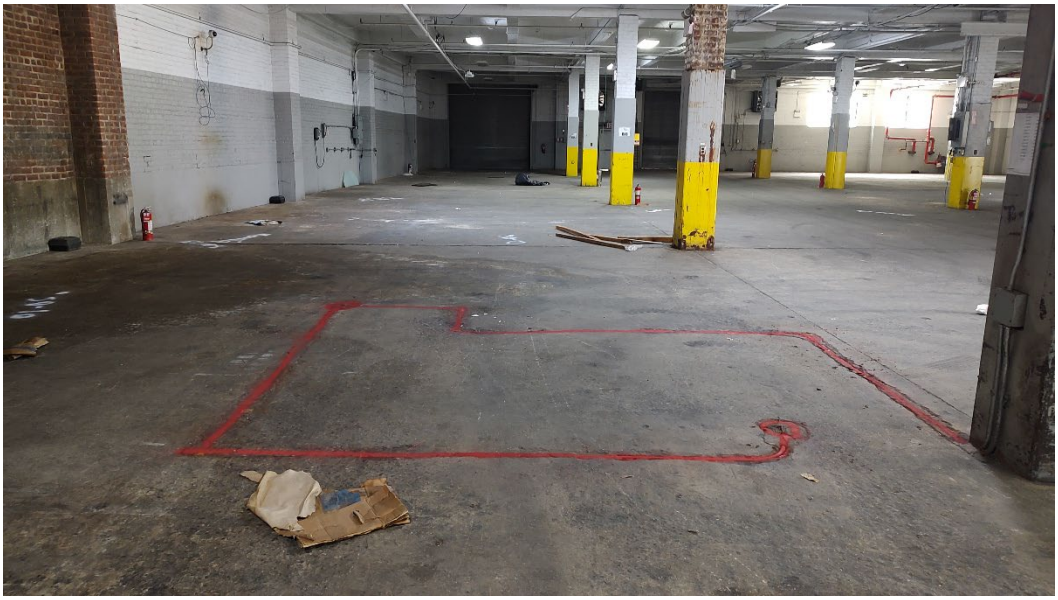
Photo 2 – Views of the roof drain lines leading down three of the columns into the subsurface. All detected drain lines were marked on the surface with green paint, while all proposed boring locations were marked in white.

Photo 3 – View from the eastern loading dock facing the remainder of the building. The green marking indicating the drain lines lead to what appeared to be a buried manhole approximately 3 feet below the lower concrete surface. The line pinned to the yellow wall was determined to be connected to the fire sprinkler system of the building.

Photos 4 & 5 – Additional views of the interior of the building showing proposed boring locations (white), detected drain lines (green) and detected electrical conduits (red).



Photos 6 & 7 – View of the interior of the adjacent property containing multiple proposed borings within the space utilized as storage.

Project Name:	Former Refron Inc. Gas Reclamation Site	**Date:**	5/2/2025

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Coastal Environmental Solutions

Work Activities Performed:

- Vektor inspected the Site with Coastal Environmental Solutions (Coastal), the geophysical surveyor/drilling contractor, to target areas of sample locations, and other potential indicators of underground anomalies and subsurface impacts.
- Coastal performed a geophysical survey to investigate for subsurface structures and to clear boring locations and utilities throughout the site.
    - Coastal precleared all soil boring, groundwater monitoring well, and soil vapor locations. The precleared locations were marked with spray paint on the concrete slab to ensure that utilities were not encountered during boring and well installation.
- Coastal utilized a Geoprobe® Model 6011DT direct-push drill rig to advance 3 soil borings: 25SB-2, 25SB-4, and 25SB-10 to groundwater. Soil samples were collected using 5-foot-long acetate liners which were opened up and inspected, logged and sampled by Vektor immediately after opening each of the 5 ft liners. Soil sampling was conducted by Vektor as described below.
- Vektor inspected the soil recovered from each of the 3 soil borings for visual and olfactory evidence of subsurface impacts. On-site geologist logged soils from grade to bedrock at each boring location describing the physical characteristics of the soil in a dedicated field book. A photoionization detector (PID) was used to field screen the soils. Soil from 0 to 5 feet across the subject property consisted primarily of brown and dark brown fine to medium sand, with little silt with gravel, soil from 5 to 15 feet consisted of primarily brown to light brown sand/silt mixtures, with traces of gravel, no odors or PID detections were noted in soil borings 25SB-4 and 25SB-10. Soil boring 25SB-2 consisted of a PID detection of 337 ppm in the 0-5 foot interval. PID readings for the 5-7.5 foot interval was peaked at 4.7 ppm, and PID readings for the 7.5-10 foot interval peaked at 1.1 ppm. No other PID detections were noted for the rest of soil boring 25SB-2. Fill material consisting of brown silt/sand mixtures with brick and concrete was identified at boring locations 25SB-2 from 0 to 5 ft below grade surface (bgs), 25SB-4 from 0 to 3 ft bgs, and 25SB-10 from 0 to 2 ft bgs. Groundwater was identified at boring locations 25SB-2 at 14.5 feet bgs, 25SB-4 at 13 feet bgs, and 25SB-10 at 13 feet bgs.
- Coastal used the same drill rig to install 2 soil vapor points, 25SV-4, and 25SV-5, to a depth of 12 feet bgs. Sample points were constructed of a dedicated stainless-steel screen fitted with ¼-inch outer diameter inert polyethylene, teflon lined, tubing was extended above ground surface to allow for purging and sampling. The points were backfilled using glass beads followed by environmental grade silica sand and topped with a bentonite layer to seal the tubing in the hole.
- Coastal used the same drill rig to install one monitoring well, MW-6. The 2-inch PVC well was installed to depth of approximately 20’ bgs with the screen set 10 feet above the well bottom. Morrie No. 1 sand was used to fill the annular gap around the screen and above the top of the screened interval. A bentonite seal was installed above the sand, and the remainder of the borehole was backfilled to grade with clean sand
- Soil samples were collected from the shallower (0-2’) interval, the intermediate interval just below the fill layer (5-7’), and the deeper (12.5-14.5’) interval just above groundwater at 25SB-2. Soil samples were collected from the shallower (0-2’) interval, the intermediate interval just below the fill layer (3-5’), and the deeper (11-13’) interval just above groundwater at 25SB-4. Soil samples were collected from the shallower (0-2’) interval, the intermediate interval just below the fill layer (2-4’), and the

deeper (11-13') interval just above groundwater at 25SB-10.

- A total of 9 soil samples were collected from the 3 soil boring locations plus a soil duplicate (DUP-1(0-2')), matrix spike (MS-1), matrix spike duplicate (MSD-1), Field Blank (FB-1), and trip blank (TB-1). The trip blank was submitted to the laboratory for VOCs analysis. The field blank and soil samples collected from 25SB-2, 25SB-4, and 25SB-10 were submitted for TCL VOCs, TCL SVOCs, Pests/PCBs, TAL Metals, trivalent chromium, hexavalent chromium, 1,4-Dioxane, and PFAS analysis.

Samples Collected

- The following intervals were sampled as per the Remedial Investigation Work Plan.

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work performed by Coastal. The upwind CAMP station spent most of the time in the southern portion of the Site and the downwind CAMP station spent most of the time in the northern portion of the Site as the wind was consistently coming from the south.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.024 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.05 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530100933, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-601298
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530141307, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-923366
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Project Name:	Former Refron Inc. Gas Reclamation Site	**Date:**	5/5/2025

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Coastal Environmental Solutions NYSDEC

Work Activities Performed:

- Coastal utilized a Geoprobe® Model 6011DT direct-push drill rig to advance 5 soil borings: 25SB-5, 25SB-6, 25SB-9, 25SB-12, and 25SB-13 to groundwater. Soil samples were collected using 5-foot-long acetate liners which were opened up and inspected, logged and sampled by Vektor immediately after opening each of the 5 ft liners. Soil sampling was conducted by Vektor as described below.

- Vektor inspected the soil recovered from each of the 5 soil borings for visual and olfactory evidence of subsurface impacts. On-site geologist logged soils from grade to bedrock at each boring location describing the physical characteristics of the soil in a dedicated field book. A photoionization detector (PID) was used to field screen the soils. Soil from 0 to 5 feet across the subject property consisted primarily of brown and dark brown fine to medium sand, with little silt with gravel, soil from 5 to 15 feet consisted of primarily brown sand/silt mixtures, with traces of gravel, no odors or PID detections were noted in soil borings. Fill material consisting of brown silt/sand mixtures with brick and concrete was identified at boring locations 25SB-5 from 0 to 3 ft below grade surface (bgs), 25SB-6 from 0 to 3 ft bgs, 25SB-9 from 0 to 2 ft bgs, 25SB-12 from 0 to 3 ft bgs, and 25SB-13 from 0 to 3 ft bgs. Groundwater was identified at boring locations 25SB-5 at 13 feet bgs, 25SB-6 at 13.5 feet bgs, 25SB-9 at 14 feet bgs, 25SB-12 at 13 feet bgs, and 25SB-13 at 15 feet bgs.

- Coastal used the same drill rig to install 2 soil vapor points, 25SV-1 and 25SV-52, to a depth of 12 feet bgs. Sample points were constructed of a dedicated stainless-steel screen fitted with ¼-inch outer diameter inert polyethylene, teflon lined, tubing was extended above ground surface to allow for purging and sampling. The points were backfilled using glass beads followed by environmental grade silica sand and topped with a bentonite layer to seal the tubing in the hole.

- Coastal used the same drill rig to install two monitoring wells, MW-4 and MW-7. The 2-inch PVC wells were installed to depth of approximately 19.5' bgs with the screen set 10 feet above the well bottom. Morrie No. 1 sand was used to fill the annular gap around the screen and above the top of the screened interval. A bentonite seal was installed above the sand, and the remainder of the borehole was backfilled to grade with clean sand

- Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (11-13') interval just above groundwater at 25SB-5. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (11.5-13.5') interval just above groundwater at 25SB-6. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (2-4'), and the deeper (12-14') interval just above groundwater at 25SB-9. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (11-13') interval just above groundwater at 25SB-12. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (13-15') interval just above groundwater at 25SB-13.

- A total of 15 soil samples were collected from the 35 soil boring locations plus a soil duplicate (DUP-2(11-13')), Field Blank (FB-2), and trip blank (TB-2). The trip blank was submitted to the laboratory for VOCs analysis. The field blank and soil samples collected from 25SB-5, 25SB-6, 25SB-9, 25SB-12, and 25SB-13 were submitted for TCL VOCs, TCL SVOCs, Pests/PCBs, TAL Metals, trivalent chromium, hexavalent chromium, 1,4-Dioxane, and PFAS analysis.

Samples Collected

- The following intervals were sampled as per the Remedial Investigation Work Plan.

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work performed by Coastal. The upwind CAMP station spent most of the time in the eastern portion of the Site and the downwind CAMP station spent most of the time in the northwestern portion of the Site as the wind was consistently coming from the east.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.017 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.051 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530173315 AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-904064
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530141708, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-925813

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Coastal Environmental Solutions NYSDEC

Work Activities Performed:

- Coastal utilized a Geoprobe® Model 6011DT direct-push drill rig to advance 7 soil borings: 25SB-1, 25SB-3, 25SB-7, 25SB-8, 25SB-11, 25SB-14, and 25SB-15 to groundwater. Soil samples were collected using 5-foot-long acetate liners which were opened up and inspected, logged and sampled by Vektor immediately after opening each of the 5 ft liners. Soil sampling was conducted by Vektor as described below.

- Vektor inspected the soil recovered from each of the 7 soil borings for visual and olfactory evidence of subsurface impacts. On-site geologist logged soils from grade to bedrock at each boring location describing the physical characteristics of the soil in a dedicated field book. A photoionization detector (PID) was used to field screen the soils. Soil from 0 to 5 feet across the subject property consisted primarily of brown and dark brown fine to medium sand, with little silt with gravel, soil from 5 to 12 feet consisted of primarily brown sand/silt mixtures, with traces of gravel, soil from 12 to 15 feet consisted of primarily brown sand/silt mixtures, with traces of gravel and clay, no odors or PID detections were noted in soil borings. Fill material consisting of brown silt/sand mixtures with brick and concrete was identified at boring locations 25SB-1 from 0 to 2 ft below grade surface (bgs), 25SB-3 from 0 to 4 ft bgs, 25SB-7 from 0 to 3 ft bgs, 25SB-8 from 0 to 3 ft bgs, 25SB-14 from 0 to 4 ft bgs, and 25SB-15 from 0 to 4 ft bgs. No fill material was observed at 25SB-11. Groundwater was identified at boring locations 25SB-1 at 13 feet bgs, 25SB-3 at 13 feet bgs, 25SB-7 at 8 feet bgs, 25SB-8 at 14.5 feet bgs, 25SB-11 at 1.5 feet bgs, 25SB-14 at 12 feet bgs, and 25SB-15 at 12 feet bgs. Please note that boring 25SB-11 was collected in the basement of the warehouse which is approximately 15 feet below sidewalk grade.

- Coastal used the same drill rig to install soil vapor point, 25SV-3, to a depth of 6 feet bgs as groundwater was observed at 8 to 9 feet bgs. Sample points were constructed of a dedicated stainless-steel screen fitted with ¼-inch outer diameter inert polyethylene, teflon lined, tubing was extended above ground surface to allow for purging and sampling. The points were backfilled using glass beads followed by environmental grade silica sand and topped with a bentonite layer to seal the tubing in the hole.

- Coastal used the same drill rig to install one monitoring well, MW-5. The 2-inch PVC wells were installed to depth of approximately 15 feet bgs with the screen set 10 feet above the well bottom as groundwater was observed from 8 to 9 feet bgs. Morrie No. 1 sand was used to fill the annular gap around the screen and above the top of the screened interval. A bentonite seal was installed above the sand, and the remainder of the borehole was backfilled to grade with clean sand

- Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (2-4'), and the deeper (11-13') interval just above groundwater at 25SB-1. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (4-6'), and the deeper (11-13') interval just above groundwater at 25SB-3. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (6-8') interval just above groundwater at 25SB-7. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (3-5'), and the deeper (12.5-14.5') interval just above groundwater at 25SB-8. One soil sample was collected from the shallower/deeper (0-1.5') interval at 25SB-11. 25SB-11 was installed in the basement of Lot 5 which is approximately 15 feet below sidewalk grade, groundwater was encountered at 1.5 feet bgs, no fill material was observed. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the

fill layer (4-6'), and the deeper (10-12') interval just above groundwater at 25SB-14. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (4-6'), and the deeper (10-12') interval just above groundwater at 25SB-15.

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work performed by Coastal. The upwind CAMP station spent most of the time in the eastern portion of the Site and the downwind CAMP station spent most of the time in the northwestern portion of the Site as the wind was consistently coming from the east.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.014 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.067 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530100933, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-601298
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530141307, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-923366
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Problems Encountered

Attempts were made to drill groundwater monitoring wells MW-1I and MW-1D. However, refusal was encountered at 19 feet bgs at both locations. Coordination with the client and driller will be made to bring another drill rig to site at a later date.

Project Name:	Former Refron Inc. Gas Reclamation Site	**Date:**	5/7/2025

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Coastal Environmental Solutions

Work Activities Performed:

- Vektor connected 6-liter summa canisters to the Teflon tubing and opened the 8-hour flow controllers to begin the soil vapor sampling. Additionally, an outdoor air sample was deployed upwind in the southeastern perimeter of the Site along 33rd Street. The start times and initial canister pressures were recorded on the chain of custody. The final locations of soil vapor and outdoor air samples are shown in a figure attached to this report.

- Prior to testing, Vektor utilized a tracer gas was used in accordance with NYSDOH protocols to serve as a quality assurance/quality control (QA/QC) technique to verify the integrity of the soil vapor point seal. The integrity of vapor points was tested by placing a plastic shroud over the vapor points to isolate them from ambient air. Then a helium tracer gas was applied into the shroud and screened utilizing a helium detector for presence of helium. No helium was detected in any of the vapor points. After purging approximately three volumes of air from each vapor point at a flow rate less than 200 milliliters per minute, representative samples were collected for laboratory analysis utilizing 6-liter SUMMA canisters fitted with 8-hour flow controllers set not to exceed 0.2 liters per minute, as established by the NYSDOH Guidance document. Upon completion of the vapor sampling, all canisters were labeled properly with the sample ID numbers, and vacuum pressure readings in the canisters before and after the sample collection. The vapor samples were then submitted to a NYSDOH ELAP-certified laboratory under proper chain of custody procedures to be analyzed for VOCs by EPA Method TO-15.

- Monitoring wells MW-4, MW-5, MW-6, and MW-7 were developed utilizing a 2-inch whale pump. Approximately 2-3 gallons were purged from each well for a total of 8-10 gallons. The purged water was appropriately containerized in 55-gallon drums, properly labeled and stored onsite.

Samples Collected

- Soil Vapor samples (25SV-1 through 25SV-5), plus one duplicate sample (25SV-DUP-1) and one outdoor/ambient sample (OA-1) were collected after an 8-hour period, when vacuum readings were between 5 and -10“ inHg. Sample times, final vacuum readings and equipment information were recorded on the chain of custody. The soil vapor and ambient air samples were submitted to York to be analyzed for VOCs via EPA method TO-15.

Work Activities Performed:

- Vektor gauged all the monitoring wells prior to sampling. In addition to Depth to Water measurements, Vektor measured the depth to bottom (DTB), and the distance between the top or well casings and the building's slab-on-grade foundation.
- Vektor purged each monitoring well and monitored water quality using a Horiba to confirm that water quality parameters stabilized prior to sampling. Between 1 to 2-gallons of water were purged from the two monitoring wells across the Site prior to sampling. Purge water was initially turbid and brown/cloudy but soon cleared during purging.
- Vektor used a peristaltic pump for groundwater sampling. Vektor purged and sampled all wells at a low-flow rate. Approximately 3-gallons of groundwater was collectively purged prior the two onsite monitoring wells prior to sampling. Purged water was appropriately containerized in 55-gallon drums, properly labeled and stored onsite.

Samples Collected

- Groundwater samples collected from monitoring wells: MW-1, MW-7, plus a matrix spike (MS-1), matrix spike duplicate (MSD-1) were collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals plus hexavalent chromium and trivalent chromium, 1,4-dioxane, and per- and polyfluoroalkyl substances (PFAs).
- One trip blank was placed in a cooler full of groundwater samples. The trip blank (TB-1) was provided by the laboratory with a seal around the cap. Vektor submitted the trip blank sample to York to be analyzed for TCL VOCs.

TEMP.	< 32		32-50		50-70	X	70-85		>85	

Project Name:	Former Refron Inc. Gas Reclamation Site	**Date:**	5/27/2025

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants

Work Activities Performed:

- Coastal utilized a Geoprobe® Model 7822DT air rotary drill rig to advance 4 soil borings: 25SB-16, 25SB-17, 25SV-2-N, and 25SV-2-S to groundwater. Soil samples were collected using 5-foot-long acetate liners which were opened up and inspected, logged and sampled by Vektor immediately after opening each of the 5 ft liners. Soil sampling was conducted by Vektor as described below.

- Vektor inspected the soil recovered from each of the 4 soil borings for visual and olfactory evidence of subsurface impacts. On-site geologist logged soils from grade to groundwater at each boring location describing the physical characteristics of the soil in a dedicated field book. A photoionization detector (PID) was used to field screen the soils. Soil from 0 to 5 feet across the subject property consisted primarily of brown and dark brown fine to medium sand, with little silt with gravel, soil from 5 to 15 feet consisted of primarily brown sand/silt mixtures, with traces of gravel, no odors or PID detections were noted in soil borings. Fill material consisting of brown silt/sand mixtures with brick and concrete was identified at boring locations 25SB-16 from 0 to 2 ft below grade surface (bgs), 25SB-17 from 0 to 2 ft bgs, 25SV-2-S from 0 to 2 ft bgs, and 25SV-2-N from 0 to 2 ft bgs,. Groundwater was identified at boring locations 25SB-16 at 13 feet bgs, 25SB-17 at 14 feet bgs, 25SV-2-S at 14 feet bgs, and 25SV-2-N at 14 feet bgs.

- Coastal used the same drill rig to install two monitoring wells, MW-1I and MW-1D. The 2-inch PVC wells were installed to depth of approximately 25' bgs (MW-1I) and 35' bgs (MW-1D) with the screen set 10 feet above the well bottom. Morrie No. 1 sand was used to fill the annular gap around the screen and above the top of the screened interval. A bentonite seal was installed above the sand, and the remainder of the borehole was backfilled to grade with clean sand

- Monitoring wells MW-1I and MW-1D were developed utilizing a 2-inch whale pump. Approximately 5-gallons were purged from well MW-1I and approximately 10-gallons were purged from well MW-1D, for a total of 15 gallons. The purged water was appropriately containerized in 55-gallon drums, properly labeled and stored onsite.

- Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (2-4'), and the deeper (11-13') interval just above groundwater at 25SB-16. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (2-4'), and the deeper (11-13') interval just above groundwater at 25SB-17. Soil samples were collected from the shallower (0-2') interval, the intermediate interval just below the fill layer (2-4'), and the deeper (12-14') interval just above groundwater at 25SV-2-S. Additional soil samples were collected at soil boring 25SV-2-S at (10-12') and (14-15'), and at soil boring 25SV-2-N at (10-12'), (12-14') and (14-15'). Soil borings 25SV-2-N and 25SV-2-S were installed approximately 5 feet north and south of soil vapor point 25SV-2

- A total of 14 soil samples were collected from the 4 soil boring locations plus a soil duplicate (DUP-4(0-2')), matrix spike (MS-4), matrix spike duplicate (MSD-4) Field Blank (FB-4), and trip blank (TB-4). The trip blank field blank and soil samples collected from 25SB-16, 25SB-17, 25SV-2-N, and 25SV-2-S were submitted for TCL VOCs analysis.

Prepared By: David Klein

WEATHER	Snow		Rain		Overcast		Partly Cloudy		Bright Sun	X
TEMP.	< 32		32-50		50-70		70-85	X	>85	

Project Name:	Former Refron Inc. Gas Reclamation Site	**Date:**	6/4/2025

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants

Work Activities Performed:

- Vektor gauged all the monitoring wells prior to sampling. In addition to Depth to Water measurements, Vektor measured the depth to bottom (DTB), and the distance between the top or well casings and the building's slab-on-grade foundation.
- Vektor purged sampled monitoring well MW-1D and monitored water quality using a Horiba to confirm that water quality parameters stabilized prior to sampling. Between 3 to 5-gallons of water were purged from the one monitoring well at the Site prior to sampling. Purge water was initially turbid and brown/cloudy but soon cleared during purging.
- Vektor used a peristaltic pump for groundwater sampling. Vektor purged and sampled all wells at a low-flow rate. Approximately 3-5-gallons of groundwater was collectively purged prior the one onsite monitoring well prior to sampling. Purged water was appropriately containerized in 55-gallon drums, properly labeled and stored onsite.

Samples Collected

- The groundwater sample collected from monitoring well MW-1D was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals (total and dissolved) plus hexavalent chromium and trivalent chromium, 1,4-dioxane, and per- and polyfluoroalkyl substances (PFAS).
- The groundwater sample collected from monitoring well MW-4 was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals (total and dissolved) plus hexavalent chromium and trivalent chromium, 1,4-dioxane, and per- and polyfluoroalkyl substances (PFAS).
- The groundwater sample collected from monitoring well MW-2 was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals (total and dissolved) plus hexavalent chromium and trivalent chromium, and 1,4-dioxane.
- One trip blank was placed in a cooler full of groundwater samples. The trip blank (TB-4) was provided by the laboratory with a seal around the cap. Vektor submitted the trip blank sample to York to be analyzed for TCL VOCs.
- One field blank (FB-4) was collected and submitted to York to be analyzed for per- and polyfluoroalkyl substances (PFAs). Vektor collected the rinsate blank by running DI water through the decontaminated water quality meter and peristaltic pump and then collecting the water in laboratory supplied glassware.

Community Air Monitoring Program (CAMP)

- No CAMP was performed as no intrusive activities occurred onsite

Problems Encountered

- Prior to this round of sampling, Wells MW-2 and MW-4 did not recharge during sampling. TCL SVOCs, PCBS, Pesticides, TAL/TCL metals, hexavalent chromium and trivalent chromium, and 1,4-dioxane were collected only for MW-2. TCL SVOCs, PCBS, Pesticides, TAL/TCL metals, hexavalent chromium and trivalent chromium, 1,4-dioxane, and PFAS were collected only for MW-4.

Planned Activities for the Next Day

- Groundwater sampling is planned for tomorrow.

- Vektor gauged all the monitoring wells prior to sampling. In addition to Depth to Water measurements, Vektor measured the depth to bottom (DTB), and the distance between the top or well casings and the building's slab-on-grade foundation.
- Vektor purged each sampled monitoring well and monitored water quality using a Horiba to confirm that water quality parameters stabilized prior to sampling. Between 2 to 3-gallons of water were purged from the two monitoring wells across the Site prior to sampling. Purge water was initially turbid and brown/cloudy but soon cleared during purging.
- Vektor used a peristaltic pump for groundwater sampling. Vektor purged and sampled all wells at a low-flow rate. Approximately 4-6-gallons of groundwater was collectively purged prior the two onsite monitoring wells prior to sampling. Purged water was appropriately containerized in 55-gallon drums, properly labeled and stored onsite.

Samples Collected

- The groundwater sample collected from monitoring well MW-1I was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals (total and dissolved) plus hexavalent chromium and trivalent chromium, 1,4-dioxane, and per- and polyfluoroalkyl substances (PFAS).
- The groundwater sample collected from monitoring well MW-6 was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL volatile organic compounds (VOCs), and TCL semi-volatile organic compounds (SVOCs).
- The groundwater sample collected from monitoring well MW-5 was collected and submitted to York Analytical Laboratories, Inc. (York) to be analyzed for TCL semi-volatile organic compounds (SVOCs), polycyclic biphenyls (PCBs), pesticides, target analyte list (TAL)/TCL metals (total and dissolved) plus hexavalent chromium and trivalent chromium, and 1,4-dioxane.

- No CAMP was performed as no intrusive activities occurred onsite

Problems Encountered

- Prior to this round of sampling, Well MW-5 did not recharge during sampling. TCL SVOCs, PCBS, Pesticides, TAL/TCL metals, hexavalent chromium and trivalent chromium, and 1,4-dioxane were collected only for MW-5.
- Well MW-6 did not recharge during sampling. TCL VOCs and TCL SVOCs were collected only, the remaining constituents will have to be collected next mobilization.

Sample and Data Qualifiers Relating to This Work Order

PF-LCS-L	The LCS recovery for this PFAS compound was below control limits.
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CCVH	The value reported is estimated due to its behavior during continuing calibration verification (>20% difference for average RF or >20% drift for linear or quadratic fit.) This value may be biased high.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
M-BS	The recovery for this element in the batch blank spike recovered slightly outside of control limits
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) was outside the 90-110% recovery criteria.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.
PF-CCV-L	The CCV recovery for this PFAS compound was below control limits.
S-HI	Surrogate recovery is above acceptance limits. No target compound is detected in sample.
PFSu-H	The isotopically labeled surrogate recovered above lab control limits due to a matrix effect. Isotope Dilution was applied.
PFSu-L	The isotopically labeled surrogate recovered below lab control limits due to a matrix effect. Isotope Dilution was applied.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QR-02	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
S-08	The recovery of this surrogate was outside of QC limits.
S-Alk	The surrogate recoveries for the acid surrogates in the sample recovered below control limits due to a highly alkaline matrix present in the sample. This is common when concrete or mixtures containing concrete or limestone are encountered.
S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
PCB-Tot	It is noted that other PCB species were detected in the sample other than those reported and may include PCB 1262 and PCB 1268.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.

MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.
