RE: PHASE II ENVIRONMENTAL SITE ASSESSMENT
10-14 Tucker Road
Poughkeepsie, Dutchess County, New York

NYSDEC Spill No. 16-10111

To all:

Attached please find the Phase II Environmental Site Assessment (ESA) as generated for the above referenced site. As required, a copy of this report will be forwarded to the New York State Department of Environmental Conservation (NYSDEC) for their review and comment. The necessity for further action is at the discretion of the NYSDEC. If you should have any questions or require additional information please feel free to contact me at (845) 658-3484. DT Consulting Services, Inc. (DTCS) thanks you for the opportunity to work with you on this project.

Sincerely,
DT CONSULTING SERVICES, INC.

Deborah J. Thompson

1.0 INTRODUCTION/SITE INFORMATION

DT Consulting Services, Inc. (DTCS) has been contracted by Tompkins Mahopac Bank to perform a Phase II Environmental Site Assessment (ESA) on the property located at 10 – 14 Tucker Drive, Poughkeepsie, Dutchess County, New York (heretofore referenced as the Site or Subject Property). A Site location map and Site (base) plan (Figures 1 & 2) are included for your reference.

The irregularly shaped 5.99-acre property is improved with a multi-tenanted commercial building. According to documentation reviewed, the part one and two-story masonry block structure has a gross floor area of approximately 55,423-ft². The building appears to have been constructed in 1984. The subject structure is currently occupied by Arlington Central School District (bus inspection/service), Valley Moving and Storage (offices and storage warehouse), a repair facility (no access granted) and a vacant bank. The Site is situated within a moderately developed commercial and industrial area. Reportedly, the local municipality provides potable water and sanitary sewer service to the Subject Property and surrounding parcels.

The surrounding property uses include Clear Channel Radio (20 Tucker Drive) to the north, Hudson Valley Federal Credit Union (4 Tucker Drive) to the south, undeveloped, wooded land and the Casper Creek is located east, while McCollister's Transportation Group (7 Tucker Drive) exists to the west of the Site. The Site topography is generally level and at grade with surrounding roadways.

2.0 BACKGROUND

LCS, Inc. (LCS) of Buffalo, New York performed a Phase I Environmental Assessment on the Subject Property dated July 9, 2015. Based on the findings of LCS's Phase I ESA, the following issues of potential environmental concern

DT CONSULTING SERVICES, INC.

and/or recognized environmental conditions (RECs) associated with the Subject Property were identified:

- Potential residual subsurface soil/groundwater contamination issues associated with historic commercial Site use for bus services and fueling operations;
- The subject property was listed as an ICIS Site (involving an enforcement action/compliance activity); no details were provided;
- Disturbed land was noted on-Site in at least 1970 and 1980 (possibly associated with a landfill); and
- Adjacent property regulatory listings of potential concern.

The performance of a Phase II ESA has been recommended due to the identified RECs. The purpose of the investigation is to provide information on current subsurface conditions at the facility to determine if impacted materials are present (to the extent possible) due to historic Site use. To complete a Phase II ESA, DTCS recommended that tasks associated with this effort should include performance of a Geophysical Survey (e.g., ground-penetrating radar) and a follow-up Subsurface Sampling Investigation. DTCS was subsequently retained by Tompkins Mahopac Bank to perform a Phase II ESA to provide information on subsurface conditions at the facility prior to the potential sale of the Subject Property.

3.0 PHASE II ESA FIELD ACTIVITIES

The investigation was concentrated in locations as outlined above so as to quantify subsurface conditions within the area(s) of study. To complete this task, DTCS's Scope of Work included:

DT CONSULTING SERVICES, INC.

- Contacting Dig Safely New York 811 (UFPO) to obtain subsurface utility mark-outs prior to performing the field sampling investigation;
- Performance of a Geophysical Survey utilizing a magnetometer, void detector and ground penetrating radar (GPR) equipment. The purpose of this survey was to identify buried anomalies of potential concern (e.g., out-of-service tanks, buried drums), and to “clear” proposed soil sampling locations (i.e., identify underground utility infrastructure to ensure services were not impacted/damaged during the installation of soil borings);
- Provide quantitative data on targeted volatile organic compounds (VOCs), and semi-volatile organic compounds (SVOCs) if detected within subsurface materials at the facility; and
- Prepare a Phase II ESA report summarizing the findings of the field investigations and/or to address any identified subsurface contamination.

The identified six soil boring locations (SB-1 to SB-6) documented for the Site can be reviewed in Figure 2, attached.

3.1 Geophysical Survey/Private Underground Utility Mark-out

On January 23, 2017 DTCS and Underground Survey Corporation (USC) of Washingtonville, New York performed the Geophysical Survey utilizing a Noggin Ground Penetrating Radar (GPR) Cart system unit, ferromagnetic metal detectors and electro-magnetic/Radio Frequency Pipe/Cable Locators.

DTCS/USC conducted the Geophysical Investigation by scanning accessible portions of the property; concentrating in the areas surrounding the suspect landfill activities and former petroleum bulk storage (PBS) area. Upon

DT CONSULTING SERVICES, INC.

completing the investigation of known Site artifacts, DTCS/USC cleared the six proposed boring locations in preparation of performing the subsurface investigation.

Findings

1. Suspect Landfill Area – Eastern Side of Site Structure

A paved area ranging from approximately 110-275' in width by 590' in length is found along the eastern side of the building and is accessed via Tucker Road. As documented in LCS July 2015 Phase I ESA, the Subject Property is suspected to have been associated with a landfill as disturbed land was noted in at least 1970 and 1980 aerial photographs. In addition, LCS noted that an on-Site spill listing states the Subject Property was formerly utilized as a landfill. While performing the Geophysical Investigation, this area was scanned with GPR and other locating equipment for the presence of subsurface anomalies. As detected with GPR, certain portions of the eastern parking area were found to contain a form of subsurface void at a depth of approximately three feet below grade surface (bgs). DTCS theorizes that the void could have been created by decaying organic material which had been previously been covered by three feet of fill material. In addition, several underground utilities were mapped in this section of the Site, (mainly drainage conduits) on the day of the survey. DTCS cleared three soil boring locations within this paved area.

2. Historical Petroleum Bulk Storage – Northern Side of Site Structure

According to documents reviewed, PBS including one, 10,000-gallon baffled diesel/gasoline aboveground storage tank (AST) several 275 – 300 gallon ASTs for motor oil and washer fluid as well as two, 1,000-gallon ASTs (fuel type not noted) have been utilized on-Site. As of the date of this report, all ASTs with the exception of those utilized by Arlington Central School Bus Garage appear to

DT CONSULTING SERVICES, INC.

have been removed. Those ASTs located within the Bus Garage are monitored and maintained by the School District. While performing the Geophysical Investigation, this area surrounding the 10k baffled AST was scanned with GPR and other locating equipment for the presence of subsurface anomalies. Other than abandoned subsurface conduits, none were detected on the day of the survey. DTCS cleared two soil boring locations within this suspect area.

3. Utility Clearance – Western and Northwestern Side of the Site Structure

To obtain quantitative data on subsurface conditions throughout the Site, DTCS and USC scanned and cleared two soil boring locations within the western and northwestern quadrants of the Site. At the completion of on-Site Geophysical activities, DTCS documented that most all of the utilities employed on-Site enter the building along the western corridor.

3.2 Soil Sampling Procedures

DTCS mobilized to the site with Core Down Drilling (drilling services contractor) of Pawling, New York on January 26, 2017 to perform the subsurface investigation. Employing a Geoprobe trac-mounted drill rig, soil samples were collected from six borehole locations continuously from grade to a maximum depth of twelve feet bgs (see Figure 2 for sampling locations). Each sample was obtained by advancing a forty-eight inch long, two inch outer diameter, stainless hollow spoon sampler equipped with a disposable acetate liner into undisturbed soils. To prevent the potential for cross-contamination, all sampling equipment was decontaminated between each soil boring location.

An on-site DTCS Geologist performed screening and classification immediately following collection of subsurface materials. The screening was conducted using a MiniRae Photoionization Detector or PID. As most petroleum products contain

DT CONSULTING SERVICES, INC.

volatile organic compounds, PID screening can indicate the presence of volatile organics in a soil sample. Additionally, soil samples were screened by visual and olfactory means for staining and/or unusual odors.

3.3 Subsurface Soil Characterization

As detected during this investigation, the lithology of overburden materials encountered at the facility can be characterized as asphalt and gravel, underlain by sandy loam/mixed fill and silty clay. Note that several of the soil boring locations revealed the similar subsurface void as detected during the Geophysical Investigation (Soil Boring SB-2 and SB-3); hence sampling rods were not able to recover soils for testing. Refer to Attachment A for soil boring logs which detail subsurface materials encountered during this investigation.

Saturated soils (typically an indicator of groundwater) were documented within soil borings SB-2 and SB-3. As such, a temporary well, which included ten feet of one-inch 0.10-slot well screen and five feet of solid riser casing was set in each borehole for the purpose of groundwater collection and analysis. Prior to groundwater sampling, fluid levels in the monitoring wells were gauged using a sonic interface probe to determine the depth of free phase product (DTP) if any, depth to water (DTW) and depth to bottom (DTB) of each well. These measurements were recorded in a field log along with details of the sampling procedures. A summary of collected monitoring data is as follows:

MW ID	DTP (ft.)	DTW (ft.)	DTB (ft.)	Color	Appearance	Odor	Sheen
SB-2 GW	--	12.00	15.50	Grey	Cloudy/Clear	Strong	Yes
I SB-3 GW	--	12.80	14.40	Grey	Cloudy	None	None

DT CONSULTING SERVICES, INC.

While performing this field survey, all soil cores were screened with a PID for VOCs upon removal from the subsurface. This screening was performed by placing the selected soil sample in a Ziploc® style freezer bag, sealing the bag, and after a short pause, yielding stabilized readings with a PID calibrated to 100 parts-per-million (ppm) isobutylene standard. The only headspace screening which yielded a detectable response included the 4-8' bgs soil core of soil boring SB-4 at a concentration of 4 ppm. The remaining samples all screened non-detect with the PID.

Pursuant to 6 NYCRR Part 613-2.4, DTCS reported the observation of contaminated materials to the NYSDEC immediately upon their detection, and thus Spill No. 16-10111 was generated for the Site.

3.4 Subsurface Sampling and Laboratory Analysis

During investigative procedures, soil samples were collected from the bottom two feet of each borehole as obvious subsurface impacts were not encountered. As stated previously, on account of the subsurface void, groundwater samples were collected for analysis from soil borings SB-2 & SB-3. All subsurface materials submitted for laboratory testing was identified as follows (note that soil collection depths within each borehole are documented in Attachment A):

York Laboratory Number: 17A0928

Sample No. 001 = Soil Boring SB-1

Sample No. 002 = Soil Boring SB-2-GW

Sample No. 003 = Soil Boring SB-3-GW

Sample No. 004 = Soil Boring SB-4

Sample No. 005 = Soil Boring SB-5

Sample No. 006 = Soil Boring SB-6

DT CONSULTING SERVICES, INC.

All soil and groundwater samples collected during the investigation were analyzed for the full list of VOCs and the NYSDEC CP-51 targeted compound list for SVOCs via EPA test methods 8260 and 8270 B/N respectively. The complete laboratory package may be found in Attachment B for your review.

3.5 Soil Gas Sampling

To compile more complete assessment of the subsurface environment, three soil gas samples were collected during the Phase II ESA field study (see Figure 2 for locations). Based upon the suspect historical Site use as a landfill, two soil gas vapor probes were installed within the asphalt parking area and one probe was placed beneath the concrete slab of the Site structure for analysis. Soil vapor cores were extended to approximately two feet above the groundwater table during this investigation. Final core depths are as follows:

Soil Gas Sampling Number	Location/Depth
Soil Gas SG-1	Eastern Parking Area/10' bgs
Soil Gas SG-2	Eastern Sub-slab/8' bgs
Soil Gas SG-3	Southeastern Parking Area/7' bgs

The vapor implants were installed with the employment of the Geoprobe drill rig and/or hand tooling. To accomplish this task, a temporary sampling point was installed consisting of a two inch diameter core. Following the installation of the temporary soil gas implant, the borehole was filled with filter sand and sealed off above ground surface using bentonite slurry to prevent surface air infiltration. Following the recording of initial canister pressure, the sampling zone was purged of a minimum of three volumes of vapors through dedicated tubing to ensure representative sampling of subsurface conditions. Soil vapor sampling was collected for analysis employing a six liter SUMMA canister equipped with a laboratory-calibrated flow control device to facilitate the collection of the samples for a 2-hour sample duration time. During both purging and sampling, the flow

DT CONSULTING SERVICES, INC.

rate was restricted to less than (<) 0.2 liters per minute and connected directly to the dedicated tubing. Following sampling, the pressure of the SUMMA canister was recorded and the temporary well point backfilled with cement slurry.

A sample log sheet was maintained summarizing sample identification, date and time of sample collection, sampling depth, identity of samplers, sampling methods and devices, soil vapor purge volumes, volume of the soil vapor extracted, vacuum of canisters before and after the samples are collected, and chain of custody protocols.

3.6 Soil Gas Laboratory Analysis

Samples collected in Summa canisters were certified clean by the laboratory and analyzed by using USEPA Method TO-15 and methane. Each soil vapor sample submitted for laboratory testing was identified as follows:

York Laboratory Number: 17A0930

Sample No. 001 = Soil Gas SG-1

Sample No. 002 = Soil Gas SG-2

Sample No. 003 = Soil Gas SG-3

The complete laboratory package may be found in Attachment B for your review.

4.0 AMBIENT INDOOR AIR QUALITY SAMPLING

Upon receipt of soil, soil gas and groundwater analysis from the initial Phase II ESA field investigation, DTCS identified exceedances in soil gas and groundwater sample concentrations when compared to state guidelines. DTCS subsequently met with the Department to discuss the findings of the Phase II field work performed to date, and additional sampling requirements as deemed necessary.

DT CONSULTING SERVICES, INC.

At the conclusion of the review process with the Department, DTCS was to execute an indoor air monitoring program to determine the quality of ambient air on-Site. The results of this survey will ultimately dictate the need for further study and or remedial action. DTCS was retained by the current property owner, Cryo Weld Corporation (Cryo Weld) of Poughkeepsie, New York to perform the air monitoring procedures.

Prior to the execution of this monitoring program, a pre-sampling inspection was performed prior to the collection of air samples to identify any condition that may affect or interfere with the proposed testing. For the indoor air test, a total of eight, one six-liter Summa canisters with flow controllers were placed within accessible areas of the Site structure. Once positioned, the initial pressure was recorded and the canister valve opened for an 8-hour period to facilitate the collection of samples at a flow rate less than (<) 0.2 liters per minute. During the monitoring period, human activity or artificial air movement was limited to the extent possible. A sample log sheet was maintained summarizing sample identification, date and time of sample collection, sampling depth, identity of samplers, sampling methods and devices, vacuum of canisters before and after the samples are collected, and chain of custody protocols.

4.1 Indoor Air Laboratory Analysis

Samples collected in Summa canisters were certified clean by the laboratory and analyzed by using USEPA Method TO-15 and methane. Note that due to an error on the chain of custody, DTCS returned to the Site on March 17, 2017 and repeated the air sampling program so that the samples could be analyzed for methane. Each soil vapor sample submitted for laboratory testing was identified as follows:

York Laboratory Number: 17C0136/17C0648

Sample No. 001 = Indoor Ambient Air IA-1

DT CONSULTING SERVICES, INC.

Sample No. 002 = Indoor Ambient Air IA -2

Sample No. 003 = Indoor Ambient Air IA -3

Sample No. 004 = Indoor Ambient Air IA -4

Sample No. 005 = Indoor Ambient Air IA -5

Sample No. 006 = Indoor Ambient Air IA -6

Sample No. 007 = Indoor Ambient Air IA -7

Sample No. 008 = Indoor Ambient Air IA -8

The complete laboratory package may be found in Attachment C for your review.

5.0 FINDINGS

Based upon the results of the investigation, DTCS presents the following findings concerning subsurface and indoor air quality:

5.1 Subsurface Soil Quality

To provide data on current subsurface conditions, a total of six soil borings were advanced on the 10-14 Tucker Drive, Poughkeepsie, New York property. Based upon analytical testing, DTCS concludes that all targeted soil parameters were returned with minimal to non-detectable concentrations for VOCs and SVOCs. Attached as Table 1 is a soil quality chart of laboratory documented compounds in comparison to their respective soil cleanup objectives (SCOs). All reported parameters were below their respective regulatory standard as defined in NYSDEC Part 375-6.8(a) Unrestricted Use SCOs, December 14, 2006.

5.2 Groundwater Quality

On account of the subsurface void encountered within Soil Borings SB-2 and SB-3 and the detected presence of saturated materials, groundwater was collected from each of these two soil boring locations as an alternate to soil sampling.

DT CONSULTING SERVICES, INC.

Analysis of two temporary site wells installed during this investigation revealed concentrations of laboratory detectable dissolved phase VOCs and SVOCs. Attached as Table 2 is a chart of Site temporary monitoring well analytical reporting in comparison to the NYSDEC groundwater quality guidance values as described in Technical & Operations Guidance Series (TOGS) 1.1.1, June 1998. When compared to guidance, eight VOCs and one SVOC were found to exceed their respective regulatory standard.

5.3 Soil Vapor/Gas Quality

The results of soil vapor sampling indicate that twenty-seven VOCs are present within the three soil gas samples collected on-Site. A summary table of data for all chemical analytical work is included in Table 3. The major on-site vapor concentrations range from 0.38 microgram per cubic meter ($\mu\text{g}/\text{m}^3$) to 260 $\mu\text{g}/\text{m}^3$ in soil gas samples SG-1 - SG-3. The on-Site vapors in these samples are consistent with petroleum based products and solvents typically found in dry cleaning chemicals and metal degreasing operations. Note that analysis for methane, ranged from 250,000 parts per million by volume (ppmv) to 620,000 ppmv across the Site. The origin of the methane on-Site is theorized to originate from a natural byproduct of the decomposition of organic material. Studies have shown that landfill gas is composed of roughly 50 percent methane, 50 percent carbon dioxide (CO_2) and a small amount of non-methane organic compounds. As such, the identification of the Subject Property as a suspected landfill based upon 1970 and 1980 aerial photographs appears accurate.

5.4 Ambient Indoor Air Quality

Based upon the findings of the initial Phase II ESA field work, the NYSDEC requested an indoor air sampling program to be performed on-Site to quantify indoor air quality. To accommodate this request, DTCS placed eight six-liter Summa canisters with flow controllers within accessible areas of the Site

DT CONSULTING SERVICES, INC.

structure. The results of soil vapor sampling indicate that twenty-five VOCs are present within samples collected on-Site. A summary table of data for all chemical analytical work is included in Table 4. The major on-Site indoor air concentrations range from 5.2 microgram per cubic meter ($\mu\text{g}/\text{m}^3$) to 340 $\mu\text{g}/\text{m}^3$ in indoor air samples denoted as IA-1 – IA-8. Similar to those compounds detected within soil gas laboratory reporting, targeted parameters which were found to exceed regulatory standards were consistent with chlorinated solvents typically found in dry cleaning and degreasing agents. Two compounds, namely Tetrachloroethylene and Trichloroethylene were found to exceed their respective standard as outlined in the NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006 while analyzing indoor air (see Table 4). Note that analysis for methane, ranged from non-detect to 24 ppmv within the interior ambient air on-Site.

6.0 CONCLUSIONS/RECOMMENDATIONS

After completing the review of all available documentation as generated for the subject parcel, coupled with completed follow-up field activities, DTCS concludes the following:

- Prior to the construction of the Site structure, the Subject Property is suspected to have been utilized as a landfill. Said land use appears to have impacted the subsurface and indoor air quality with petroleum hydrocarbons, chlorinated solvents and methane based upon recent field testing. However, the use and storage of materials for vehicle (i.e., school bus) repair within that portion of the building utilized by Arlington Central Schools, likely spiked laboratory analysis within interior indoor air IQ-8 due to the nature of operations.

DT CONSULTING SERVICES, INC.

- In an effort to relieve the accumulation of soil vapor beneath the slab foundation, DTCS has recently been notified that the original property owner installed a series of extraction trenches while constructing the Site structure. Reportedly, the piping system consists of individual trenches with 4" slotted PVC laid in sand and gravel. Each trench is reportedly equipped with an internal fan which rests inside the 4" piping along the exterior of the Site Structure.

On March 31, 2017 a Cryo Weld employee utilized a video camera to obtain data on the construction of the sub-slab piping system. According to documents reviewed, there are a total of seven 50-foot trenches beneath the +/-55,423-ft² structure (see Figure 3 for provided schematic).

Based upon field and laboratory analysis performed to date, the historical Site use appears to have impacted soil vapor and induced the advective transport of vapor-phase contaminants towards and into the Site structure. The concentrations of select compounds detected within sub-slab and indoor air exceed the NYS DOH Final Guidance on Soil Vapor Intrusion. Although a sub-slab depressurization system (SSDS) had been installed during building construction, based on findings of this investigation, this system does not appear to be functioning efficiently enough to properly diffuse the migration and accumulation of soil vapor beneath the Site.

With approval from the Department, diagnostic tests are recommended to investigate and evaluate the development of an effective negative pressure field via the induced movement of soil gases beneath the slab. Results of the SSDS diagnostic survey would then be utilized to properly design an SSDS to remediate accumulated soil vapor to prevent vapor intrusion into the Site structure.

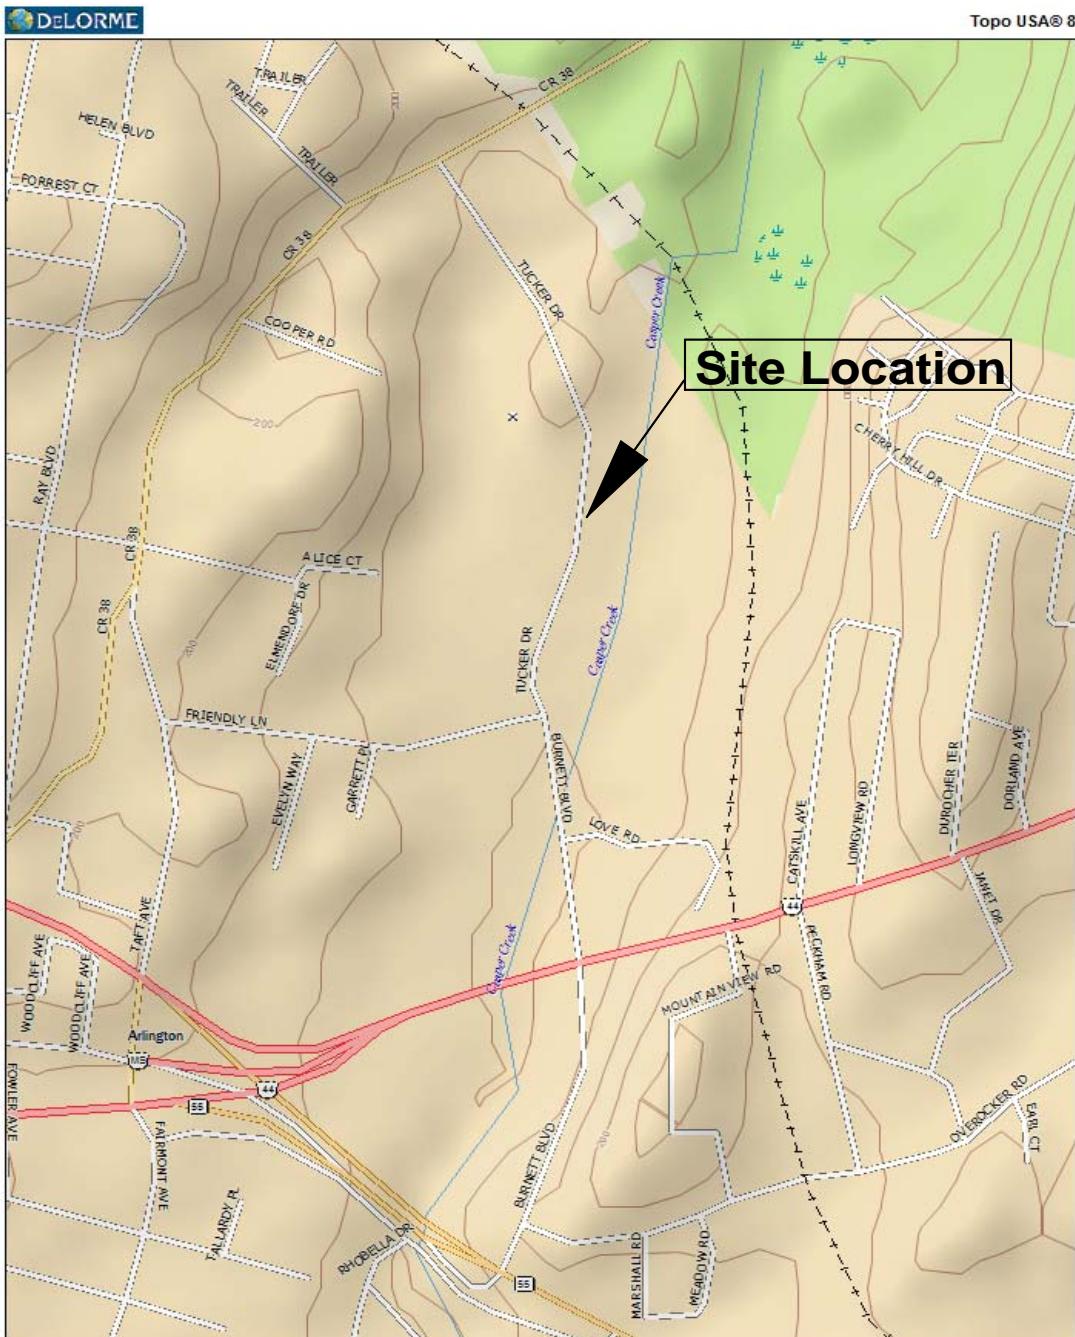

DT CONSULTING SERVICES, INC.

7.0 LIMITATIONS

DTCS has prepared this report using reasonable efforts in each phase of its work to determine the extent of subsurface contamination (if any) within the locations of potential environmental concern. This report is not definitive, and should not be assumed to be a complete or specific definition of all conditions above or below grade. The conclusions/recommendations set forth herein are applicable only to the facts and conditions described at the time of this report.

Pyrene	100,000	ND		65J	200	ND

Notes:

1. Soil results are recorded in micrograms-per-kilogram ($\mu\text{g}/\text{Kg}$) or ppb.
2. ND = Undetected. J = Detected below reporting limit but greater than or equal to MDL; therefore, the result is an estimated concentration. NS = No standard.
3. The presented soil quality guidance values were adopted from the NYSDEC Part 375-6.8(a) Unrestricted Use SCOs, December 14, 2006.
4. Analytical measurements exceeding guidance values are in bold type and underlined as such 100.

Technical Report

prepared for:

DT Consulting Services
1291 Old Post Road
Ulster Park NY, 12487
Attention: Deborah Thompson

Report Date: 02/03/2017
Client Project ID: 10-14 Tucker Rd. Poughkeepsie, NY
York Project (SDG) No.: 17A0928

CT Cert. No. PH-0723

New Jersey Cert. No. CT005 and NY037

New York Cert. Nos. 10854 and 12058

PA Cert. No. 68-04440

Report Date: 02/03/2017
Client Project ID: 10-14 Tucker Rd. Poughkeepsie, NY
York Project (SDG) No.: 17A0928

DT Consulting Services
1291 Old Post Road
Ulster Park NY, 12487
Attention: Deborah Thompson

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on January 27, 2017 and listed below. The project was identified as your project: **10-14 Tucker Rd. Poughkeepsie, NY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 17A0928

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
9. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Notes and Definitions

VOA-CONT NON-COMPLIANT-	the container(s) provided by the client for soil volatiles do not meet the requirements of EPA SW846-5035A. Results reported below 200 ug/kg may be biased low due to samples not being collected according to EPA SW846 5035A requirements.
SCAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%).
QR-04	The RPD exceeded control limits for the LCS/LCSD QC.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
Cal-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on January 27, 2017 and listed below. The project was identified as your project: **10-14 Tucker Dr Poughkeepsie NY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

<u>York Sample ID</u>	<u>Client Sample ID</u>	<u>Matrix</u>	<u>Date Collected</u>	<u>Date Received</u>

General Notes for York Project (SDG) No.: 17A0930

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
9. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Notes and Definitions

- QR-01 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
- QL-02 This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- CCV-A The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>30% Difference for average Rf). This applies to detected analytes only.

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on March 03, 2017 and listed below. The project was identified as your project: **10-14 Tucker Dr. Poughkeepsie, NY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 17C0136

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
9. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Surrogate Recoveries		Result	Acceptance Range								
460-00-4	Surrogate: p-Bromofluorobenzene	101 %	72-118								

Notes and Definitions

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on March 17, 2017 and listed below. The project was identified as your project: **10-14 Tucker Drive Poughkeepsie, NY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 17C0648

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
9. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Notes and Definitions

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Field Chain-of-Custody Record - AIR

NOTE: York's Std. Terms & Conditions are listed on the back side of this document.
This document serves as your written authorization to York to proceed with the analyses requested and your signature binds you to York's Std. Terms & Conditions unless superseded by written contract.
