New Paltz, New York 12561

RE: Remedial Investigation Report - REVISED
Willow Brook Rentals LLC
10-14 Tucker Drive
Poughkeepsie, Dutchess County, New York
Site No.: C314132

Dear Mr. Richard:

DT Consulting Services, Inc. (DTCS) and Bellucci Engineering, PLLC (BE) are pleased to present this *Remedial Investigation Report - Revised* for the above referenced property. This report documents the Site characterization conducted at the Site as outlined in the November 14, 2022, *Remedial Investigative Work Plan (RIWP) and the Supplemental Remedial Investigative Work Plan (SRIWP) dated February 16, 2024*. If you should have any questions or require additional information, please contact our office.

Respectfully submitted,

Daniel Bellucci, P.E.
Bellucci Engineering, PLLC

Deborah Thompson, Senior Geologist
DT Consulting Services, Inc.

1.0 INTRODUCTION AND BACKGROUND

The Subject Property is located at 10-14 Tucker Drive in the Town of Poughkeepsie, Dutchess County, New York (heretofore referenced as the Site or Subject Property). Refer to Figures 1 & 2 for a Site Location and Site Base maps, respectively. A portion of the Site has been accepted into the BCP Program (BCP Site # C314132); see Figure 2 for reference. Prior investigation activities have been conducted on the Site and the results of those investigations were submitted to the Department along with the BCP Application. A Revised Remedial Investigation Work Plan (RIWP), dated November 14, 2022, was approved by the New York State Department of Environmental Conservation (NYSDEC or "Department") on November 28, 2022. The expressed purpose of this RI work is to provide current soil vapor conditions beneath the Site structure and along the periphery of the BCP boundaries, to document the composition and characteristics of surface and subsurface soils, to document local groundwater quality conditions and direction of groundwater flow, and to provide guidance on the selection and implementation of a Remedial Action program for the Site.

2.0 SITE INFORMATION

The Site includes an irregularly shaped 5.826 lot which is referenced under Section 6262, Block 3, Lot 162080 by the Town of Poughkeepsie. The portion of the Site accepted into the BCP includes an approximate 2.52-acre portion of the Site (as referenced on Figure 2). The Subject parcel is improved with a +/- 55,423 ft^2 two-story commercial warehouse/office building, asphalt parking areas and landscaped spaces. Approximately 50% of the building is warehouse storage space and the remaining 50% is occupied by various commercial enterprises. According to Town of Poughkeepsie Assessor records, the building was constructed in 1984. The Site is suspected to have been associated with a landfill as disturbed land was noted in at least 1970 and 1980 aerial photographs. Additionally, portions of the building have historically been utilized for bus repair and fueling operations. According to documents reviewed and based upon prior site inspections, petroleum bulk storage (PBS) tanks including one, 10,000-gallon baffled diesel/gasoline aboveground storage tank (AST), several 275 – 300 gallon ASTs for motor oil and washer fluid as well as two, 1,000-gallon ASTs (fuel type not noted) have been utilized at the Site. There is no evidence of any underground storage tanks (USTs) existing at the Site and as of the date of this report, all ASTs appear to have been removed.

Historically, a total of three spills have been reported to the New York State Department of Environmental Conservation (NYSDEC) for the Site. Spill #08-08935 was reported on November 7, 2008, based on the release of 5-gallons of diesel fuel to soil. According to the database, the spill was associated with the bus maintenance garage, and the cause of the release was unknown. The spill was closed by NYSDEC on November 7, 2008. Spill #09-07487 was reported on October 3, 2009, based on the release of 10-gallons of No. 2 fuel oil. The source of the spill was reported to be a commercial vehicle. The spill was closed by NYSDEC on October 5, 2009. Spill # 09-04392 was reported on July 15, 2009, based on the release of an unknown quantity of diesel to soil. The source of the spill is unknown. The spill was closed by NYSDEC on December 31, 2009. In March 2017, DT Consulting Services, Inc. (DTCS) performed a Phase II Environmental Site Assessment on the Subject Property for then owner, 10 Tucker Drive, LLC. As a result of the investigation, Spill #16-10111 was generated for the Site based upon subsurface impacts to soil, groundwater and soil vapor (along with advective transport of vapor phase contaminants towards and into the Site structure – vapor intrusion). The spill remains open at this time.

The Site is bounded by commercial properties to the north, south and west, and wetlands to the east. Roadways adjoining the site include Tucker Drive to the west. Topography is generally level across most of the Site, with a slight decline to the east. A property location map and a Site Base map are presented as Figures 1 and 2, respectively. Potable water and wastewater disposal are reportedly provided by the Town of Poughkeepsie. No groundwater supply wells were observed by representatives of this office during site inspections and no groundwater supply wells are known to be present or used on adjoining or nearby properties.

ASTM Phase I and Phase II Environmental Site Assessments were conducted at the Site in July 2015 and March 2017, respectively. As a result of such prior investigation activities, the following areas of potential environmental concern and/or "recognized environmental conditions" (RECs) were identified and are associated with the Subject Property:

- Groundwater contamination issues associated with the historic landfill operated by the Town of Poughkeepsie under and near the Site (hereinafter Town landfill) and/or former bus repair/ fueling operations at the Site.[1]

- Soil vapor impacts, including petroleum and chlorinated VOCs associated with the historic Town landfill and/or former bus repair/ fueling operations, along with methane associated with the historic Town landfill;

- Indoor air impacts, including chlorinated VOCs (namely tetrachloroethylene and trichloroethylene), methane and benzene associated with the historic Town landfill and/or former bus repair/ fueling operations;

This report summarizes the remedial investigation field study conducted at the Site between December 27 and 29, 2022 and on February 9, 2023. The purpose of the Remedial Investigation (RI) on the Subject Property was to assess Site-wide soil and groundwater, evaluate potential off-Site soil vapor impacts, evaluate the extent of vapor impacts beneath the building, and to collect sufficient data to determine whether mitigation of the Site structure is warranted or if alterations to the existing mitigation system are necessary.

[1] Durham School Services operated a trucking/transportation company (mainly student transportation for the local school district) out of the facility until its departure in 2017. The bus repair/fueling operations noted as a REC for the Subject Property included the aboveground bulk storage of petroleum products (i.e., gasoline, diesel, motor oil and waste oil) which were utilized to operate and maintain the buses and transport vehicles. According to the NYSDEC database, bulk storage Site No. 3-602053 (which was historically assigned to the Site) is presently unregulated/closed.

3.0 ADDITIONAL SITE CHARACTERIZATION

3.1 SOIL BORINGS

A total of seven exterior soil borings were advanced throughout the property and along the property boundaries. See Figure 3 for the soil boring locations. Soil boring locations for prior 2017 investigations are also noted in Figure 3.

On December 28th, 2022, DTCS/BE oversaw advancement of the investigative borings on the Site. The on-Site geologist/engineer screened the soil samples for environmental impacts and collected samples for laboratory analysis. All fieldwork associated with the soil sampling program complied with the safety guidelines as outlined in the Site-Specific Health and Safety Plan (HASP) and Community Air Monitoring Program (CAMP), provided in the RIWP. The investigative borings were advanced to depths ranging from 20 to 25 feet below ground surface (bgs) using direct push Geoprobe® 7822DT drill rig advancing a five-foot macro core sample rod. The drill rods were periodically screened for % LEL. LEL readings greater than 0% were not observed during the advancement of the soil borings. Soil was collected continuously to the boring termination depth using disposable acetate sleeves. Generally, soil borings were extended to depths of 20-25 feet bgs. These depths were sufficient to identify the native soil horizon located beneath the landfill layer at depths between 9 and 10 feet bgs in the boring locations. Each sample was screened for organic vapors with a photo-ionization detector (PID) and evaluated for visual and olfactory indications of environmental impacts. Soil descriptions and PID readings were recorded in boring logs included as Appendix A.

A minimum of three soil samples (one shallow, one middle and one deep) were collected from each soil boring. An additional shallow surface sample (0-6") was collected at SB-5 which was advanced in a landscaped area with no asphalt or concrete cap. The table below summarizes the soil sample designation and collection depths.

Soil Sample Designation	Soil Sample Depth (Feet bgs)	Soil Sample Designation	Soil Sample Depth (Feet bgs)
SB-1A	1-2	SB-5A	0-6"
SB-1B	10-12	SB-5B	1-2
SB-1C	18-20	SB-5C	16-18
SB-2A	1-2	SB-5D	23-25
SB-2B	10-12	SB-6A	2-4
SB-2C	18-20	SB-6B	10-12
SB-3A	3-5	SB-6C	23-25
SB-3B	14-16	SB-7A	2-4
SB-3C	18-20	SB-7B	9.5-11.5
SB-4A	3-5	[1]SB-7C	18-20
SB-4B	14-16		
SB-4C	18-20		

[1] *Duplicate sample collected for SB-7C*

Generally, PID readings greater than 0.0 parts per million (ppm) were not observed in the samples screened. Slightly elevated PID readings were recorded in the landfill horizon of soil borings SB-2 and SB-3 ranging from 1.0 to 2.5 ppm. No olfactory evidence of contamination was documented in any of the soil samples collected, including those with slightly elevated PID headspace readings. Each soil boring was advanced to a sufficient depth (20 or 25 feet bgs) to completely delineate the vertical extent of the landfill layer. Refer to soil boring logs in Appendix A for additional details. All investigation-derived waste (IDW) was contained in DOT-approved 55-gallon steel drums for appropriate characterization and disposal by DTCS/BE.

Particulate and VOC monitoring was conducted continuously during ground intrusive work associated with the installation of each soil boring as per the NYSDEC/NYSDOH approved CAMP. No exceedances of the thresholds for VOCs and/or particulate set forth in the CAMP were observed. Field data sheets associated with the CAMP are included in Appendix B.

Each sample was collected for laboratory analysis of VOCs, Semi-volatile organic compounds (SVOCs), Target Analyte List (TAL) Metals, Pesticides, Polychlorinated Biphenyls (PCBs), and Per- And Polyfluoroalkyl Substances or PFAs, Cyanide, and 1, 4-Dioxane via USEPA test methods 8260, 8270, 3050B/7473, 8081, 8082, and 1633, respectively. Field quality control measures including duplicate, trip and field blanks were also collected and submitted to the laboratory for analysis.

3.1.1 Soil Sampling Results

A total of twenty-three soil samples were collected from seven soil boring locations (including one duplicate sample). The soil sample results are summarized in Table 1 and are compared with NYSDEC 6 NYCRR Part 375-8.8(a) Unrestricted Use and NYCRR Part 375-8.8(b) Commercial Use Soil Clean Up Objectives or SCOs. Spider maps showing exceedances of Unrestricted and Commercial Use SCOs recorded during this RI are included as Figures 4, 5, 6 and 7. A spider map showing exceedances of April 2023 guidance document titled, “Sampling, Analysis, and Assessment of PFAS” is included as Figure 8. The complete laboratory analytical reports have been placed in Appendix C for reference.

VOCs

Acetone, a common laboratory derived contaminant, was detected in two soil samples (denoted as SB-4 & SB-5) in January 2017 at concentrations of 0.060 and 0.0630 mg/kg. The concentrations exceed the Unrestricted Use SCO (0.05 mg/kg) but are well below the Commercial Use SCO (500 mg/kg). Additional VOCs detected in January 2017 did not exceed Unrestricted or Commercial Use SCOs.

Total xylenes were detected in one soil sample (denoted as SB-5C) collected during the December 2022 RIR investigation at a concentration of 0.270 mg/kg. The concentration narrowly exceeds

the Unrestricted Use SCO (0.26 mg/kg) but is well below the Commercial Use SCO (500 mg/kg). Additional VOCs detected in in the December 2022 RIR investigation did not exceed Unrestricted or Commercial Use SCOs.

SVOCs

Several SVOCs were detected in the soil samples collected above laboratory detection limits. The detected concentrations were below both Unrestricted and Commercial Use SCOs. The detected concentrations were primarily in the shallow samples collected.

Pesticides

4,4-DDD was detected in two soil samples (denoted as SB-6B and SB-7B) collected during the December 2022 RIR investigation at concentrations of 0.0101 and 0.0136 mg/kg, respectively. The concentrations exceed the Unrestricted Use SCO (0.0033 mg/kg) but are well below the Commercial Use SCO (92 mg/kg). 4,4-DDE was detected in one soil sample (denoted as SB-7B) at a concentration of 0.00704 mg/kg. The concentration exceeds the Unrestricted Use SCO (0.0033 mg/kg) but is well below the Commercial Use SCO (62 mg/kg). 4,4-DDT was detected in one soil sample (denoted as SB-6B) at a concentration of 0.0232 mg/kg. The concentration exceeds the Unrestricted Use SCO (0.0033 mg/kg) but is well below the Commercial Use SCO (47 mg/kg). Dieldrin was detected in one soil sample (denoted as SB-7B) at a concentration of 0.00521 mg/kg. The concentration exceeds the Unrestricted Use SCO (0.005 mg/kg) but is well below the Commercial Use SCO (1.4 mg/kg). Additional pesticides detected in the December 2022 RIR investigation did not exceed Unrestricted or Commercial Use SCOs.

Metals

Cadmium was detected in one shallow soil sample (denoted as SB-2A) at a concentration of 12 mg/kg. The concentration exceeds both the Unrestricted Use SCO (2.5 mg/kg) and the Commercial Use SCO (9.3 mg/kg). Cadmium did not exceed Unrestricted or Commercial Use SCOs in the remaining soil samples collected from the Site, or samples collected at deeper intervals from SB-2. Copper was detected in three soil samples (denoted as SB-2A, SB-3A and SB-4B) at concentrations of 121, 71.7 and 78 mg/kg, respectively. The concentrations exceed the Unrestricted Use SCO (50 mg/kg) but are below the Commercial Use SCO (270 mg/kg). Lead was detected in two soil samples (denoted as SB-3A and SB-5B) at concentrations of 121, 71.7 and 78 mg/kg, respectively. The concentrations exceed the Unrestricted Use SCO (50 mg/kg) but are below the Commercial Use SCO (270 mg/kg). Nickel was detected in eighteen of the twenty-three soil samples (denoted as SB-1B, SB-1C, SB-2B, S-2C, SB-3A, SB-3B, SB-3C, SB-4B, SB-4C, SB-5C, SB-5D, SB-6A, SB-6B, SB-6C, SB-7A, SB-7B, SB-7C and SB-7C Dup) at concentrations ranging from 31.3 to 50.8 mg/kg. The concentrations exceed the Unrestricted Use SCO (30 mg/kg) but are below the Commercial Use SCO (310 mg/kg). Zinc was detected in seven of the twenty-three soil samples (denoted as SB-2A, SB-3A, SB-4B, AB-5A, SB-6C, SB-7B and SB-7C Dup) at concentrations ranging from 113 to 138 mg/kg. The concentrations exceed the Unrestricted Use SCO (109 mg/kg) but are well below the Commercial Use SCO (10,000 mg/kg). Mercury was detected in one soil sample (denoted as SB-5B) at a concentration of 0.192 mg/kg.

The concentration exceeds the Unrestricted Use SCO (0.18 mg/kg) but is below the Commercial Use SCO (2.8 mg/kg).

Additional TAL metals were reported in shallow and deep soils across the Site but were found below both Unrestricted and Commercial Use SCOs once compared to the regulatory standards.

Lead was the only soil contaminant which was detected in groundwater above its Ambient Water Quality Standard (AWQS). The groundwater monitoring well where lead was detected above the AWQS was MW-4, where lead was not detected in soil above the Unrestricted Use SCO. Groundwater samples collected from the monitoring wells in the two locations where lead in soil exceeds the Unrestricted Use SCO (SB-3 and SB-5) did not contain concentrations of lead above the AWQS. Additionally, the detected concentrations of lead in soil are all below the Protection of Groundwater (POG) SCO of 450 mg/kg.

PCBs

Total PCBs were detected in three soil samples (denoted as SB-2A, SB-3B and SB-7B) at concentrations of 0.381, 0.212 and 0.261 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO (0.1 mg/kg) but are below the Commercial Use SCO (1 mg/kg). Additional low-level PCBs were detected at SB-6, below both Unrestricted and Commercial Use SCOs.

PFAS

Perfluorooctanesulfonic acid (PFOS) was detected in two soil samples (denoted as SB-4B and SB-5A) at concentrations of 1.61 and 1.26 micrograms per kilogram (µg/kg), respectively. The concentrations exceed the Unrestricted Use Guidance Value[2] (0.88 µg/kg) but are well below the Commercial Use Guidance Value (440 µg/kg). Additional PFAS detected in soil did not exceed Part 375 published Guidance Values.

3.2 GROUNDWATER MONITORING

Following completion of the soil sampling, each of the seven soil borings were converted into a permanent 1-inch PVC groundwater monitoring well. The wells were constructed of 10 feet of 0.01 slot schedule 40 PVC well screen and completed to grade with solid schedule PVC riser pipe. The annulus around the well screen was backfilled with No. 2 filter sand and sealed with a 1-foot bentonite layer. Each well was then finished at grade surface with steel flush-mount road boxes set in approximate 2'x 2' concrete pad. Details regarding the well installations are included in the boring / well completion logs (Appendix A). Following installation, each well was developed by rapidly pumping the wells to remove entrained silt and sediment from the sand pack and well screen and ensure connectivity with the surrounding shallow groundwater table. A minimum of three to five well volumes were removed from each well during development. Groundwater samples were collected from each of the newly installed monitoring wells (MW-1 through MW-

[2] *NYSDEC Part 375 Remedial Soil Guidance PFAS Commercial-October 2020*

7; See Figure 3). It should be noted that only a VOC sample could be collected from MW-2 based on the lack of sufficient recharge following the development of the well. Prior to sampling, water level measurements were recorded to the nearest 0.01-foot prior sampling and a minimum of 3 well volumes were purged from each where sufficient recharge would allow. Groundwater purge logs are included in Appendix A. The table below includes groundwater sampling/ gauging data and observations.

Well ID	Depth to Water (TOC[1])	Total Depth (TOC[1])	Purge Volume (gal)	Tubing Sample Depth (Feet bgs)	Odor (Y/N)	Sheen (Y/N)
MW-1[2]	4.58	15	1.5	14	N	N
MW-2	8.30	15	1[3]	14	N	N
MW-3	9.50	15	1.5	14	N	N
MW-4	7.59	15	1.5	14	N	N
MW-5	6.41	15	1.5	14	N	N
MW-6	7.50	15	2	14	N	N
MW-7	4.64	15	3.5	14	N	N

TOC[1] – Depth to water and total depths measured to top of PVC casing.
[2] Duplicate sample collected for MW-1
[3] Insufficient recharge in MW-2 for additional purging

The sampling was conducted in accordance with field sampling procedures outlined in Section 6.0 of the November 14, 2022, *Revised Remedial Investigative Work Plan*. While conducting groundwater well development and sampling procedures, all IDW was placed in DOT-approved 55-gallon steel drums for appropriate characterization and disposal by DTCS/BE. Each sample was analyzed for VOCs, SVOCs, TAL Metals, Pesticides, PCBs, PFAs, Cyanide, and 1, 4-Dioxane via USEPA test methods 8260, 8270, 3050B/7473, 8081, 8082, and 1633 respectively. As noted above, samples for SVOCs, TAL Metals, Pesticides, PCBs, PFAs, Cyanide, and 1, 4-Dioxane analysis were not obtained from MW-2 based on the lack of sufficient recharge. Field quality control measures including trip and field blanks, along with a duplicate sample from MW-1, were collected and submitted to the laboratory for chemical analysis. The complete laboratory analytical reports have been placed in Appendix C for reference.

3.2.1 Groundwater Sampling Results

The groundwater sample results are summarized in Table 2 and compared with the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1, Ambient Water Quality Standards and Guidance Values (AWQS) and the April 2023 Guidance for Sampling, Analysis and Assessment of Per- and Polyfluoroalkyl Substances (PFAS). Spider maps showing VOC, SVOC, and TAL Metal exceedances above AWQS are included as Figures 9, 10 and 11. A spider map showing exceedances of PFAS above regulatory guidance is included as Figure 12. The complete laboratory analytical reports are included in Appendix C.

VOCs

1,4-Dichlorobenzene was detected in MW-3 at a concentration of 7.31 micrograms per liter (µg/L) above the AWQS (3 µg/L). Benzene was detected in MW-2 at a concentration of 7.13 µg/L above the AWQS (1 µg/L). Chlorobenzene was detected in MW-2, MW-3 and MW-4 at concentrations of 83.9, 92.6 and 35.9 µg/L, respectively. These detections are above the AWQS (5 µg/L). Additional low-level VOCs were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

SVOCs

Benzo(a)anthracene was detected in MW-1 Dup and MW-3 at concentrations of 0.0513 and 0.0615 µg/L, respectively. These detections are above the AWQS (0.002 µg/L). Bis(2-ethylhexyl)phthalate was detected in MW-7 at a concentration of 7.98 µg/L above the AWQS (5 µg/L). Additional low-level SVOCs were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

Pesticides

Pesticides were not detected in the groundwater samples collected from the Site.

Metals

Lead was detected in MW-4 at a concentration of 42.8 µg/L above the AWQS (25 µg/L). Magnesium was detected in MW-3 and MW-7 at concentrations of 45,300 and 40,600 µg/L, respectively. These detections are above the AWQS (35,000 µg/L). Manganese was detected in each well at concentrations ranging from 448 to 3,340 µg/L. These detections are above the AWQS (300 µg/L). Sodium was detected in each well at concentrations ranging from 42,500 to 418,000 µg/L. These detections are above the AWQS (20,000 µg/L). Additional low-level metals were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

PCBs

PCBs were not detected in the groundwater samples collected from the Site.

PFAS

PFOS was detected in MW-1 & MW-1 Dup, MW-3, MW-4, MW-5 and MW-6 at concentrations of 14.2, 15.4, 160, 75.5, 7.63 and 6.61 nanograms per liter (ng/L), respectively. The concentrations of PFOS in these wells exceed the NYSDEC April 2023 groundwater guidance which sets the human health criteria at 2.7 ng/L. Perfluorooctanoic acid (PFOA) was detected in MW-1, MW-3 and MW-4 at concentrations of 7.27, 42.5 and 16.1 ng/L, respectively. The concentrations of PFOAs in these wells exceed the 6.7 ng/L groundwater quality standard when compared to the NYSDEC April 2023 human health criteria for PFOAs. Additional low-level PFAS were detected above laboratory detection limits in Site groundwater but below their respective water quality guidance values.

3.2.2 Relative Groundwater Elevation Survey

Each of the seven Site wells were gauged using an electronic interface probe during the December 2022 RI field work. The depth to water readings, as measured to the top of PVC well casing, were used in conjunction with elevation survey data collected from each well. An arbitrary datum of 100.00 feet bgs was applied to a benchmark, and corresponding relative elevations for depth to water were established for each monitoring well. The table below depicts groundwater elevations as recorded during the January 5, 2023, monitoring event.

Well ID	Depth to Water (TOC[1])	Relative Elevation (Feet bgs)
MW-1	4.59	92.77
MW-2	8.30	91.70
MW-3	9.50	91.26
MW-4	7.59	90.86
MW-5	6.41	88.75
MW-6	7.50	93.24
MW-7	4.64	93.37

TOC[1] – Depth to water and total depth recordings were measured from top of PVC casing and recorded in ft. bgs.

The relative groundwater elevations along with contour lines are included as Figure 19 – Groundwater Contour Map for January 5, 2023. Based upon the assumption that groundwater flows perpendicular to lines of equal elevation in an isotropic, homogenous system, groundwater on-Site generally flows in a southeasterly direction across the northern portion of the Site, and a southerly direction across the southern portion of the Site. Wetlands are located to the east and southeast of the Site and are the presumed receiving body for Site groundwater. In addition to the adjacent wetlands, the Casperkill Creek is also a presumed receiving water body downgradient of the BCP Site.

3.3 EXTERIOR SOIL GAS POINT INSTALLATION

A total of seven temporary exterior soil gas sampling points, designated SV-1R, SV-2, SV-3, SV-4, SV-5, SV-6 and SV-7 were installed along the BCP Site Boundary (see Figure 3). The summa canister connected to SV-1 did not properly collect the sample over the allotted sample duration (8 hours) during the initial December 28, 2022, sampling event. Accordingly, a new sample (designated SV-1R) was collected from the location of SV-1 on January 5, 2023.

The soil gas points were installed by advancing 1.25-inch solid stem direct-push sample rods to depths of 5-feet bgs. A dedicated soil vapor implant was installed at the base of the borehole and connected to the surface with dedicated high density polyethylene tubing. The annulus around the vapor implant was filled with No. 2 filter sand to approximately 3-feet bgs. The remaining borehole space was sealed with hydrated bentonite to the surface. Following installation, a Mini Rae photoionization detector (which registers airflow below 0.2 liters per minute) was attached to the high-density polyethylene tubing and a minimum of three sample volumes was purged from each

point. The maximum VOC readings recorded for each soil gas point during purging are presented in the table below.

Soil Gas Point	PID Reading in PPM (max)
SV-1R	0.0
SV-2	0.0
SV-3	9.8
SV-4	0.0
SV-5	0.0
SV-6	0.4
SV-7	15.8

The soil gas samples were collected for analysis in batch clean SUMMA canisters equipped with a laboratory calibrated flow control device to facilitate the collection of the samples for an 8-hour sample duration. As a quality assurance/quality control measure, an inert tracer gas (helium) test was completed before and after sampling to document that the soil vapor sampling points were properly sealed preventing subsurface infiltration of ambient air into the sample chain.

Following sampling, the pressure of the SUMMA canister was recorded, and each soil gas point was removed from the ground, plugged with bentonite chips, and sealed at the surface with asphalt. The soil vapor samples were analyzed for VOCs (USEPA Method TO-15) by a NYSDOH-approved laboratory. The complete laboratory analytical reports have been placed in Appendix C for reference.

3.3.1 Exterior Soil Gas Sampling Results

The exterior soil gas results are summarized in Table 3. A spider map showing VOC detections in exterior soil gas is included as Figure 13. Elevated methane was detected in each of the exterior soil vapor points at concentrations ranging from 43 to 1,700,000 ppmv. Methane was not detected in the ambient outdoor air sample. Elevated petroleum VOCs were detected in SV-2, including benzene (3,200 µg/m^3), chlorobenzene (2,500 µg/m^3) cyclohexane (6,700 µg/m^3), n-heptane (3,100 µg/m^3) and n-hexane (4,500 µg/m^3). Peak concentrations of trichloroethylene (TCE) (27 µg/m^3) and vinyl chloride (78 µg/m^3) were also detected at SV-2. Tetrachloroethylene (PCE) was detected in the exterior soil vapor samples at low levels ranging from 0.56 to 30 µg/m^3. Additional low-level exterior soil vapor contamination, typical of well-developed urban settings, has been identified at the Site.

3.4 SUB-SLAB SOIL GAS AND AIR SAMPLING

A total of eleven permanent interior sub-slab soil gas monitoring points (SG-1 through SG-11) were installed at the Site during the RI (see Figure 3). Concrete thickness ranged from 8 to 10-inches in each location. Co-located indoor air samples were also gathered from locations proximal

to each soil gas point. To quantify potential background VOC concentrations, one outdoor ambient air sample was collected from an upwind location. The outdoor ambient air sample data is included in Table 3.

Prior to sampling, a minimum of three sample volumes were purged from each point using a PID as described above. Each sample location was also screened for % LEL. The maximum VOC readings and % LEL recorded for each soil gas point during purging are presented in the table below.

Soil Gas Point	PID Reading in PPM (max)	% LEL
SG-1	0.6	0
SG-2	0.1	0
SG-3	0.0	0
SG-4	1.6	0
SG-5	0.8	0
SG-6	3.0	0
SG-7	0.2	0
SG-8	0.6	0
SG-9	3.0	0
SG-10	0.0	0
SG-11	1.8	0

The soil gas and ambient air samples were collected for analysis in batch clean SUMMA canisters equipped with a laboratory calibrated flow control device to facilitate the collection of the samples for an 8-hour sample duration. As a quality assurance/quality control measure, an inert tracer gas (helium) test was completed before and after sampling to document that the soil vapor sampling points were properly sealed preventing subsurface infiltration of ambient air into the sample chain.

The soil vapor and indoor/ outdoor air samples were analyzed for VOCs (USEPA Method TO-15) by a NYSDOH-approved laboratory. The complete laboratory analytical reports have been placed in Appendix C for reference.

3.4.1 Sub-slab Soil Gas and Indoor Air Sampling Results

The sub-slab soil gas sample results (January 2017 and December 2022) are summarized in Table 4. The indoor and outdoor air sample results (March 2017 and December 2022) are summarized in Table 5. Spider maps showing VOC detections in interior soil gas and indoor air are included as Figures 14 and 15.

As documented in the RIWP, several VOCs were detected in sub-slab soil gas sample SG-2 collected in January 2017. Of note, elevated TCE (31 µg/m^3) and methane (250,000 ppmv) were detected in the eastern portion of the building.

December 2022 sub-slab soil vapor samples were collected throughout the building to provide current building-wide soil gas concentrations. The existing SSDS was shut off on December 27, 2022, 1-day prior to sample collection. The SSDS remained off for the duration of the sub-slab soil gas and indoor air sampling events. Low-level VOC (both petroleum and chlorinated VOCs) were detected in sub-slab soil gas throughout the Site. Methane concentrations ranged from non-detect to 107,000,000 ppmv. Elevated levels of acetone (peak concentration 1,500 µg/m^3) and tetrahydrofuran (peak concentration 2,400 µg/m^3) were detected in SG-9 and SG-10 collected from the SSI Aeration tenant space. This tenant was observed to regularly use PVC glue and primers for its onsite pipe assembly operations. Acetone and tetrahydrofuran are primary chemical components of PVC glues and primers, and the soil gas detections are likely attributable to elevated indoor concentrations noted in the indoor air sample results discussion below. Additional low-level sub-slab soil gas contamination, typical of well-developed urban settings, has been identified at the Site. Although reported, said laboratory reported parameters are not likely to be indicative of grossly contaminated on-Site subsurface medium, or be a source of significant off-Site migration.

Elevated PCE (peak concentration 120 µg/m^3) and TCE (peak concentration 220 µg/m^3) were detected in indoor air samples collected in March 2017. The concentrations of PCE (peak concentration 0.990 µg/m^3) and TCE (peak concentration 0.550 µg/m^3) were significantly lower during the December 2022 sampling event. TCE was not detected in eight of the eleven air samples collected. Elevated levels of 2-butaanone (peak concentration 2,900 µg/m^3), acetone (peak concentration 4,700 µg/m^3), and tetrahydrofuran (peak concentration 7,500 µg/m^3) were detected in IA-9 and IA-10 collected from the SSI Aeration tenant space. As noted above, these VOCs are primary chemical components in PVC glue and primers, which are commonly used within the SSI Aeration tenant space from which IA-9 and IA-10 were collected. Methane concentrations ranged from non-detect to 6,110 ppmv in December 2022/ January 2023 samples. The highest methane concentrations in soil gas and indoor air were located in the eastern portion of the building (SG-11/ IA-11). The methane concentration at IA-11 is equal to 0.6% and is below the LEL action level of 10%. This portion of the building does not have an active sub-slab depressurization system. Methane in indoor air in other portions of the building was much lower with a peak concentration of 50 ppmv or 0%.

A comparison of the sub-slab soil gas and indoor air data (December 2022) with the New York State Department of Health May 2017 Decision Matrices is provided in Table 6. The DOH Matrices include select cVOC compounds, including 1,1-DCE, cis-1,2-DCE, carbon tetrachloride, TCE (Matrix A), PCE, 1,1,1-TCA, methylene chloride (Matrix B) and vinyl chloride (Matrix C). A comparison of the data does not yield a "Mitigate" result in any of the sampled locations. A result of "Monitor" for TCE at SG-8/ IA-8 and vinyl chloride at SG-11/ IA-11 was produced based on the NYSDOH matrix comparison. Both of these sample locations are slab-on-grade potions of the building which do not have a sub-grade piping network and active depressurization. Although the NYSDOH matrix comparison does not indicate mitigation is required, the elevated methane concentration at SG-11/ IA-11 should be addressed by active depressurization.

.

3.5 CAMP FIELD DATA

CAMP field data sheets are included in Appendix B. PM10 and PID readings were recorded approximately every 15-mintues during RIR field activities in accordance with the CAMP.

PID readings greater than background levels were not recorded during the field activities and thus did not exceed the Action Level specified within the CAMP (5 ppm).

PM10 readings significantly above background levels were not recorded during any of the December 2022 or February 2023 RI field activities and thus did not exceed the Action Level specified within the CAMP (100 µg/m^3).

3.6 Site Geology/Hydrogeology/Landfill Mass

Geologic mapping of the area reveals the underlying bedrock as belonging to the Trenton Group, consisting of the Taconic Melange. Taconic Melange is a chaotic mixture of Early Cambrian through Middle Ordovician pebble to block-size clasts in a politic matrix of Middle Ordovician age. The thickness ranges up to 8,000 feet. Based upon surficial geologic characterization performed on-Site, the Subject Property is underlain with varying thicknesses of mixed fill (~ 5ft. - upwards of 10-ft.), underlain by a len(s) of municipal waste and silty clay. See Attachment A for detailed descriptions of the surficial geology encountered during this RI.

The BCP Site is situated regionally in the Lower Hudson Major Drainage Basin and locally within the Hudson - Wappinger Sub-Basin. The Subject Property does not have any open water bodies or surficial water bodies located on-Site. Of note, the nearest water body is denoted as Casper Creek and is located to the east of the Site. A site-specific hydrogeological study was performed during this RI to assist in determining groundwater quality and flow direction. The relative groundwater elevations along with contour lines are included as Figure 19 – Groundwater Contour Map for January 5, 2023. Based upon the assumption that groundwater flows perpendicular to lines of equal elevation in an isotropic, homogenous system, groundwater on-Site generally flows in a southeasterly direction across the northern portion of the Site, and a southerly direction across the southern portion of the Site. Wetlands are located to the east and southeast of the Site and are the presumed receiving body for Site groundwater. In addition to the adjacent wetlands, the Casperkill Creek is also a presumed receiving water body downgradient of the BCP Site.

As stated in Section 2 of this RIR, the Site is suspected to have been associated with a landfill as disturbed land was noted in at least 1970 and 1980 aerial photographs. Additional data as collected during historical environmental surveys of the Site has the property documented as being utilized by the Town of Poughkeepsie as a municipal landfill. Soil borings advanced during this RI revealed the presence of waste debris (i.e., paper, wood and plastics) at depths beginning at five feet below grade and at a maximum depth of eighteen feet below grade. The average thickness of the debris layer was approximately four feet, with a maximum thickness of nine feet of municipal

waste (See Figure 16 for reference). Subsurface soils encountered beneath the debris layers were classified as silty clay. Note that municipal solid waste landfill debris was documented within each of the seven soil borings advanced during the RI and is likely to extend outside the investigative area. Please see attached soil boring logs placed in Appendix A for further details.

4.0 PHASE I – EXISTING SSDS PILOT TEST FIELD ACTIVITIES

The purpose of the pilot test was to evaluate the effectiveness of the existing SSDS fans and piping network. Field activities were conducted on December 29, 2022, January 5, 2023, and February 9, 2023 (Phase I - Existing SSDS). Tables 7, 8, 9, 10 and 11 include the tabulated data collected during the pilot test. Figure 3 depicts the locations where the existing SSDS sub-grade piping network daylights outside the building, along with the locations of soil gas/vacuum monitoring points utilized during the pilot test program. Figure 17 shows the estimated radius of influence generated during the Phase I testing conducted at the Site.

Expansion joints are present throughout the raised portions of the building to allow for movement of the building slab as the sub-grade settles over time. Despite the large undulations in the building slab as result of the decay and settling of the sub-grade landfill materials, significant sub-slab vacuum loss was not observed at these expansion joint locations during testing, confirming the competency of the slab beneath the surface expansion joints. A vapor barrier was likely installed beneath the slab which may contribute to the lack of air loss despite the undulations in the slab from settling.

Additional monitoring of the expansion joints will be conducted during system startup of the SSDS to be modified in this portion of the building. Should additional testing indicate air loss, efforts to seal these joints will be made and will be outlined in a SSDS Design Document.

4.1 PHASE I - EXISTING SSDS TESTING

An SSDS piping network and powered fans were installed as part of building construction in 1984. The SSDS was installed as a precautionary measure to prevent the accumulation of methane gas from beneath the slab and within the building, as a result of the known sub-grade landfill materials. During Phase I of pilot testing, a total of seven 4-inch PVC horizontal SSDS pipes were observed along the eastern portion of the building. According to information provided by the Site owner, these SSDS pipes run beneath the existing slab horizontally in a gas permeable layer from the western portion of the building and daylighting through the concrete wall along the eastern portion of the building. Five of the seven pipes have powered fans. Figures 3 and 17 depict the approximate location of the sub-grade SSDS pipes as provided by the Site owner. The table below contains the information gathered on the existing SSDS.

SSDS Designation	Existing Fan Type	Pipe Diameter/ Materials
SSD-1	RP145C	4” PVC drainpipe
SSD-2	RP145C	4” PVC drainpipe
SSD-3	RP145C	4” PVC drainpipe
SSD-4	Suncourt 08206C	4” Sch. 40 PVC pipe
SSD-5	No SSDS Fan	4” Sch. 40 PVC pipe
SSD-6	Suncourt 08206C	4” PVC drainpipe
SSD-7	No SSDS Fan	4” PVC drainpipe

4.2 PHASE I - PILOT/ DIAGNOSTIC TESTING

After completion of indoor air and sub-slab soil gas sampling on December 28, 2022, the SSDS fans were turned back on. The sub-sab soil gas points (SG-1 through SG-11) installed in the slab (See Section 3.3) were utilized for vacuum monitoring purposes. Sample ports were installed on each SSDS riser pipe prior to the fan. On December 29, 2022, testing was performed using the existing SSDS fans noted in the table above in Section 4.1. Additional follow up testing of SSD-4, SSD-5 and SSD-6 was performed on February 9, 2023, using a RadonAway® GP-501 high air flow SSDS fan. This round of testing was performed based on the absence of a fan for SSD-5 and SSD-7 and the lack of air flow produced by the existing Suncourt 08206C (10 – 20 cubic feet per minute (cfm)) fans serving SSD-4 and SSD-6.

During each test, vacuum monitoring points SG-1 through SG-10 were utilized as observation points. SG-11 was not installed at the time of Phase I testing.

4.2.1 Equipment and Monitoring

During the pilot tests, a number of parameters were monitored and recorded to evaluate performance-related measurements. Velocity, recorded in feet per minute (FPM) and temperature documented in Degrees Fahrenheit were measured using a Dwyer® Air Velocity Meter. The velocity was converted to a flow rate in cubic feet per minute (CFM) using the inner diameter of a 4-inch schedule 40 PVC pipe, as appropriate. The velocity/flow readings were collected from an appropriately sized sample port, centered on the PVC pipe; a minimum of 2-feet from any bend/elbow or intake. Extracted vapor vacuum readings were collected in inches of water (in-H_2O) using a Dwyer Magnehelic® differential pressure gage and converted to inches of mercury (in-Hg). Sub-slab vacuum readings were also collected in in-H_2O using an Infiltec® DM1 micromanometer.

In summary, the following performance indicators shown in the table below were monitored during the pilot test.

Monitored Parameter	Unit of Measure	Monitoring Location
Velocity/ Flow rate	Feet per minute (fpm) [converted to cubic feet per minute (cfm)]	SSDS Risers
Temperature	Degrees Fahrenheit (˚F)	SSDS Risers
Vacuum	Inches of Water (in-H_2O) [converted to inches of mercury (in-Hg)]	SSDS Risers & Vacuum Monitoring Points
Total VOCs	Parts Per Million (ppm)	SSDS Risers

4.3 PHASE I -ANALYTICAL TESTING

Analytical testing was performed to establish projected effluent concentrations and mass removal. One effluent sample was collected from each of the SSDS Risers, with the exception of SSD-5, which did not have a powered fan during the initial testing round. The grab samples were collected in batch cleaned 6-liter laboratory supplied summa canisters. The extracted vapor samples were submitted to York Analytical Laboratories, Inc. for VOC analysis using EPA Method TO-15. A copy of the technical reports has been placed in Appendix C for your reference.

4.4 PHASE I - CAMP FIELD DATA

CAMP field data sheets are included in Appendix B. PM10 and PID readings were recorded approximately every 15-mintues during RIR field activities in accordance with the CAMP.

PID readings greater than background levels were not recorded during the field activities and thus did not exceed the Action Level specified within the CAMP (5 ppm).

PM10 readings significantly above background levels were not recorded during any of the December 2022 or February 2023 RI field activities and thus did not exceed the Action Level specified within the CAMP (100 µg/m^3).

5.0 PHASE II –SSDS PILOT TEST FIELD ACTIVITIES

Field activities associated with Phase II of the SSDS pilot testing were conducted February 9, 2023, This testing phase included slab on grade portions of the building where an active SSDS fan and sub-grade piping were not installed during building construction. Tables 7, 8, 9, 10 and 11 include the tabulated data collected during the pilot test. Figures 3 and 18 depict the locations of the extraction wells and soil gas/vacuum monitoring points utilized during the pilot test program. Figure 18 shows the estimated radius of influence generated during Phase II testing conducted at the Site. A description of the SSDS extraction well installation, vacuum monitoring point installation and other Phase II pilot/diagnostic test work is presented in the following sections.

Minimal cracking of the slab on grade portions of the building was observed during pilot testing. Expansion joints are present in these portions of the building to allow for movement of the building slab as the sub-grade settles over time. Notable sub-slab vacuum loss was not observed at these expansion joint locations during pilot testing, confirming the competency of the slab beneath the surface expansion joints. Additional monitoring of the expansion joints will be conducted during system startup of the SSDS to be installed in this portion of the building. Should additional testing indicate air loss, efforts to seal these joints will be made and will be outlined in a SSDS Design Document. No sealing was conducted during pilot testing.

5.1 PHASE II - EXTRACTION WELL AND VACUUM MONITORING POINT INSTALLATION

A total of two extraction wells were placed in the garage areas in the eastern portion of the building. The wells were installed by wet core drilling a 4 and 5/8-inch diameter core through the existing concrete slab. The slab thickness was measured at 6 -inches. Soils were removed from each extraction well to the extent feasible and the cavity was backfilled with 1 to 1.5-inch diameter gravel. The table below summarizes the extraction well designations, slab thickness, sub-grade material description, approximate soil volume removed and the corresponding tenant spaces.

Extraction Well Designation	Slab Thickness (inches)	Soil/ Sub-grade Description	Approximate Volume of Soil Removed (Gallons)	Location
EX-1	6	Dense sand and gravel ravel	5	Former bus repair garage
EX-2	6	Dense sand and gravel	5	Current Northeast HVAC contractor space

The SSDS extraction wells were constructed with a 4-inch PVC coupler sealed in the cored hole and connected to 3-inch schedule 40 PVC riser pipe. The space between the cored slab and PVC

coupler was sealed with RadonAway® Pro Hybrid sealant. Note that all investigative/ well installation derived waste was properly containerized in DOT-approved 55-gallon steel drums for characterization and off-Site disposal.

A total of ten temporary vapor points (TVP-1 through TVP-10) were installed within the eastern portion of the building (See Figure 18). These temporary vapor points, along with permanent points SG-8 and SG-11 were used during pilot testing in these sections of the building. All extraction well and temporary/ permanent vacuum monitoring point locations are depicted in Figure 18.

All extraction wells and vacuum monitoring point locations were selected in consultation with building ownership.

5.2 PHASE II - PILOT/ DIAGNOSTIC TESTING

Phase II pilot/diagnostic testing was conducted on February 9, 2023. A total of two tests were conducted by extracting vapor from each of the two extraction wells. An Obar® GBR 76SOE medium air flow fan SSDS fan was used for both tests.

During each test, vacuum monitoring points SG-8 and SG-11 and TSG 1 through TSG-10 were utilized as observation points. Extracted sub-slab vapors were routed through a 30-gallon granular activated carbon (GAC) drum for VOC removal. The treated discharge was subsequently channeled (via temporary piping) to the exterior of the building; a minimum 10-feet away from building intakes/openings and neighboring structures.

5.2.1 Equipment and Monitoring

During the pilot tests, a number of parameters were monitored and recorded to evaluate performance-related measurements. Velocity, recorded in feet per minute (FPM) and temperature documented in Degrees Fahrenheit were measured using a Dwyer® Air Velocity Meter. The velocity was converted to a flow rate in cubic feet per minute (CFM) using the inner diameter of a 3-inch schedule 40 PVC pipe, as appropriate. The velocity/flow readings were collected from an appropriately sized sample port, centered on the PVC pipe; a minimum of 2-feet from any bend/elbow or intake. Extracted vapor vacuum readings were collected in inches of water (in-H_2O) using a Dwyer Magnehelic® differential pressure gage and converted to inches of mercury (in-Hg). Sub-slab vacuum readings were also collected in in-H_2O using an Infiltec® DM1 micromanometer. In summary, the following performance indicators shown in the table below were monitored during the pilot test.

Monitored Parameter	Unit of Measure	Monitoring Location

Velocity/ Flow rate	Feet per minute (fpm) [converted to cubic feet per minute (cfm)]	Extraction Wells
Temperature	Degrees Fahrenheit (˚F)	Extraction Wells
Vacuum	Inches of Water (in-H_2O) [converted to inches of mercury (in-Hg)]	Extraction Wells & Vacuum Monitoring Points
Total VOCs	Parts Per Million (ppm)	Extraction Wells (pre and post carbon)

5.3 PHASE II - ANALYTICAL TESTING

Analytical testing was performed to establish projected effluent concentrations and mass removal. One effluent sample was collected from EX-1. The grab sample was collected in batch cleaned 6-liter laboratory supplied summa canister. The sample was collected at the end of the approximate 30-minute diagnostic test prior to effluent polishing with the GAC drum. The extracted vapor sample was collected as a grab sample from the effluent (i.e. no summa canister regulator). No sample was collected from EX-2 as a canister was unavailable. Accordingly, lab data for EX-1, located closest to EX-2, was used for estimated mass removal calculations at EX-2. The extracted vapor sample was submitted to York Analytical Laboratories, Inc. for VOC analysis using EPA Method TO-15. A copy of the technical report has been placed in Appendix C for your reference.

Lab samples were collected in canisters equipped with 30-minute regulators. A sample duration of 60-minutes was used to calculate mass removal in pounds per hour in accordance with the AERSCREEN model input requirements (See Table 10 and Section 6.7 for additional details).

5.4 PHASE II - CAMP FIELD DATA

CAMP field data sheets are included in Appendix B. PM10 and PID readings were recorded approximately every 15-mintues during RIR field activities in accordance with the CAMP.

PID readings greater than background levels were not recorded during the field activities and thus did not exceed the Action Level specified within the CAMP (5 ppm).

PM10 readings significantly above background levels were not recorded during any of the December 2022 or February 2023 RI field activities and thus did not exceed the Action Level specified within the CAMP (100 µg/m^3).

During Pilot Testing, extraction wells not being tested were sealed with an airtight expansion plug.

6.0 PILOT/ DIAGNOSTIC TEST RESULTS

The findings of both phases of the pilot/diagnostic testing are presented in the following sub-sections. Each test was run for approximately 30-minutes.

Post-carbon treatment effluent readings were collected from the end of the exhaust pipe during Phase II testing, outside of the building. These diagnostic results are summarized in Table 8.

6.1 EXTRACTION WELL AIR FLOW

6.1.1 Phase I Testing

The system removed soil vapor from the original SSDS sub-slab piping network at average flow rates ranging from 82.8 to 137.2 CFM using existing Fantech® RP145C fans and the RadonAway GP-501 test fan. Very low air flow readings were observed with the two existing Suncourt 08206C fans (SSD-4 & SSD-6) ranging from 10.4 to 26.1 CFM.

The air flow rates observed utilized the Fantech® RP145C and the RadonAway GP-501 test fan are indicative of piping network set a gas permeable stone layer. These subsurface parameters require blowers capable of high air flow and low vacuum for proper pressure field extension.

6.1.2 Phase II Testing

Air flow rates of 18.8 and 23.8 CFM were observed at EX-1 and EX-2, respectively. These CFM were generated using a GBR 76SOE test fan set at 100% output. The low air flow rates observed are indicative of a dense, low porosity sub-grade. These subsurface parameters require blowers capable of generating high vacuum for proper pressure field extension.

6.2 EXTRACTION WELL VACUUM

6.2.1 Phase I Testing

Average vacuum readings ranging from 1.0 to 1.5 in-H_2O using existing Fantech® RP145C fans and the RadonAway GP-501 test fan. Vacuum readings of 0.5 in-H_2O were observed using the existing Suncourt 08206C fans (SSD-4 & SSD-6).

6.2.2 Phase II Testing

Vacuum readings of 15 and 16 in-H_2O were observed at EX-1 and EX-2, respectively. These vacuum readings were generated using a GBR 76SOE test fan set at 100% output. The high vacuum readings are at the upper threshold of a GBR 76SOE fan, and are indicative of a dense, low porosity sub-grade. These subsurface parameters require blowers capable of generating high vacuum for proper pressure field extension.

6.3 EXTRACTION WELL TEMPERATURE

6.3.1 Phase I Testing

Average temperature readings ranged from 46.9 to 54.4 degrees Fahrenheit.

6.3.2 Phase II Testing

Average temperature readings of 58.0- and 50.1-degrees Fahrenheit were observed at EX-1 and EX-2, respectively.

The temperature readings were incorporated into the mass removal calculations included in Table 9.

6.4 EFFLUENT PID READINGS

6.4.1 Phase I Testing

PID readings were collected from the effluent using a PID calibrated with an isobutylene standard gas. Carbon treatment was not used as the existing SSDS pipes discharge close to the roofline. PID readings greater than 0.0 ppm were not recorded at SSD-1, SSD-2 and SSD-3. Low-level average VOC readings ranging from 0.3 to 4.5 ppm were recorded in effluent of SSD-4, SSD-5, SSD-6 and SSD-7. The highest concentration was detected in SSD-5 which is located in the southern portion of the building.

6.4.2 Phase II Testing

PID readings were collected both pre- and post-carbon treatment during each test using a PID calibrated with an isobutylene standard gas. Average VOC readings pre-carbon of 0.1 and 0.0 ppm was observed at EX-1 and EX-2, respectively. Average VOC readings post-carbon was 0.0 ppm at both wells.

6.5 SUB-SLAB VACUUM RESPONSE

Vacuum response data for the vacuum monitoring points is summarized in Table 9. The vacuum response for each is depicted on Figures 17 and 18 – SSDS Radius of Influence Maps. Updated U.S. EPA guidance for vapor intrusion assessment and mitigation was released on June 15, 2015. The U.S. EPA has not issued a definite value for SSDS design; however, achieving a pressure differential of -0.004 in-H_2O across the slab is generally considered sufficient to mitigate vapor intrusion based on available industry guidance as provided in ASTM E1465-08a “Standard Practice for Radon Control Options” and ASTM E2121-13 “Standard Practice for Installing Radon Mitigation Systems in Existing Low-Rise Residential Buildings”.

During each test, certain vacuum monitoring points were selected based on their proximity to the anticipated radius of influence for each extraction well. Testing was not conducted at vacuum

monitoring points located far from the extraction well/ SSDS sub-grade piping network and/or where vacuum points proximal to the test well did not yield measurable vacuum.

6.5.1 Phase I Testing

Updated U.S. EPA guidance for vapor intrusion assessment and mitigation was released on June 15, 2015. The U.S. EPA has not issued a definite value for SSDS design; however, achieving a pressure differential of -0.004 is generally considered as acceptable vacuum for vapor mitigation systems.

Test #1
The first test was conducted utilizing the existing SSDS extraction wells with the current SSDS fans. This included SSD-1, SSD-2, SSD-3, SSD-4 and SSD-6. Average vacuum readings greater than -0.004 in-H_2O were recorded in SG-1 through SG-4, located in the northern and central portions of the building. The measured average vacuum in these locations ranged from -0.058 to -0.123 in-H_2O. Marginal/ low-level vacuum was observed at SG-5 and SG-6, and no vacuum was observed at SG-7 through SG-10. Vacuum was demonstrated at vacuum monitoring points located proximal to SSDS pipes using modern high air flow Fantech® RP-145C fans (SSD-1, SSD-2 and SSD-3). Vacuum monitoring points located proximal to SSDS pipes using the low air flow Suncourt 08206C fans (SSD-4 & SSD-6) did not demonstrate proper sub-slab vacuum.

Test #2
A test was performed on SSD-4 using a modern high air flow RadonAway GP-501 fan. To perform the test, the existing Suncourt 08206C fan was removed and the GP-501 fan temporarily installed in its place. Resulting average vacuum readings greater than -0.004 in-H_2O were recorded at SG-4 and SG-5, located in the northern and central portions of the building. The measured average vacuum in these locations ranged from -0.005 to -0.023 in-H_2O. Marginal/ low-level vacuum was observed at SG-6, and no vacuum was observed at SG-7.

Test #3
A test was performed on SSD-5 using a modern high air flow RadonAway GP-501 fan. No fan was previously present for SSD-5. Resulting average vacuum readings greater -0.004 in-H_2O were recorded at SG-5 and SG-6, located in the central portions of the building. The measured average vacuum in these locations ranged from -0.045 to -0.058 in-H_2O. No vacuum was observed at SG-7.

Test #4
A test was performed on SSD-6 using a modern high air flow RadonAway GP-501 fan. To perform the test, the existing Suncourt 08206C fan was removed and the GP-501 fan temporarily installed in its place. Resulting average vacuum readings greater -0.004 in-H_2O were recorded at SG-7 and SG-9, located in the central/ southern portions of the building. The measured average vacuum in these locations ranged from -0.017 to -0.025 in-H_2O. Marginal/ low-level vacuum was observed at SG-10.

Test #6
A test was performed on SSD-7 using a modern high air flow RadonAway GP-501 fan. No fan was previously present for SSD-7. Resulting average vacuum readings greater than -0.004 in-H_2O were recorded at SG-9 and SG-10 located in the southern portion of the building. The measured average vacuum in these locations ranged from -0.011 to -0.058 in-H_2O.

6.5.2 Phase II Testing

Test #7
A test was performed on EX-1 using a modern medium air flow and medium vacuum GBR® 76 SOE fan. Resulting average vacuum readings greater -0.004 in-H_2O were recorded at SG-11, TVP-1, TVP-2, TVP-3 and TVP-4. The measured average vacuum in these locations ranged from -0.007 to -0.395 in-H_2O. No vacuum was observed at TVP-5 and TVP-6, indicating the need for a second extraction well in the southern portion of this space.

Test #8
A test was performed on EX-2 using a modern medium air flow and medium vacuum GBR® 76 SOE fan. Resulting average vacuum readings greater -0.004 in-H_2O were recorded at SG-8, TVP-7 and TVP-10. The measured average vacuum in these locations ranged from -0.007 to -0.395 in-H_2O. Marginal/ low-level vacuum was observed at TVP-8. No vacuum was observed at TVP-9 and TVP-8, indicating the need for a second extraction well in the northern portion of this space.

6.6 EXTRACTION WELL LABORATORY TESTING RESULTS

6.6.1 Phase I Testing

Effluent samples were collected from SSD-1, SSD-2, SSD-3, SSD-4, SSD-6 and SSD-7. A sample was not collected from SSD-5 based on the absence of a powered fan at the time of testing. Low-level VOCs were present in the extracted effluent samples. Of note, elevated 2-butanone (980 µg/m^3), acetone (2,000 µg/m^3), and tetrahydrofuran (4,800 µg/m^3) were reported in SSD-7. This sub-grade pipe network underlies SSI Aeration, which regularly utilizes PVC primer and glues what are known to contain these compounds. Methane concentrations in the extracted effluent ranged from 33 to 10,100 pump. Additional elevated VOCs were not reported in the extracted effluent samples.

6.6.2 Phase II Testing

An effluent sample was collected from EX-1. Low-level VOCs were present in the extracted effluent sample including PCE (29 µg/m^3), TCE (12 µg/m^3) and (1.5µg/m^3). Methane was detected at EX-1 at a concentration of 10,100 ppmv. Additional elevated VOCs were not reported in the extracted effluent sample.

The complete analytical reports including the chain of custody are included in Appendix C.

6.7 MASS REMOVAL

Table 10 presents the data and calculations used to determine the approximate mass of cVOCs removed from the vapor phase during each test. Although each testing period lasted approximately 30 minutes, the removal calculations were made assuming a 60-minute sample duration period[3]. This allows for direct use of the estimated mass removal in pounds per hour in the AERSCREEN evaluation (See *Section 6.8*). The mass removed from soil vapor was calculated using the laboratory analytical data, average vacuum, flow and temperature readings collected during pilot testing procedures. The mass removed during the analytical test was calculated using the following equation:

Volume of extracted gas was corrected for pressure and temperature using the following equation:

$$V=nRT/p$$

Where: V = volume of the gas
P = pressure of the gas
n = 1 lb-mole
R = ideal gas constant = 0.7302
T = absolute temperature (°F + 460)

The corrected volume of gas was used to calculate the mass removal using the following equation:

Mass Removed = [(1 / Volume of gas corrected) x (time elapsed) x (Flow) x (Concentration cVOC) x (molecular weight cVOC)] / 1x10^6

Empirically:

lbs = [(1 / V (ft^3 / lb-mole)) x (minutes) x (ft^3 / minute) x (cVOC$_{ppm}$) x (165.83^{PCE} g / mole)] / 1 x10^6

where:

lbs = pounds
ppm = parts per million
time elapsed = minutes
molecular weight PCE = 165.83 g/mole
molecular weight TCE = 131.39 g/mole
molecular weight acetone = 84.93 g/mole

[3] Lab samples were collected in canisters equipped with 30-minute regulators. A sample duration of 60-minutes was used to calculate mass removal in pounds per hour in accordance with the AERSCREEN model input requirements.

molecular weight 2-butanone (MEK) = 72.11 g/mole
molecular weight tetrahydrofuran = 72.11 g/mole
molecular weight toluene = 92.14 g/mole

The results of the mass removal calculations using the laboratory analytical data indicated a total of approximately $4.48x10^{-3}$ pounds of total mass (PCE, TCE, acetone, 2-butanone (MEK), tetrahydrofuran and toluene) and 2.32 pounds of methane were cumulatively removed during the pilot testing. The projected average removal rate for PCE, TCE, acetone, 2-butanone (MEK), tetrahydrofuran and toluene were calculated as $1.32x10^{-2}$ pounds per day if influent concentrations were to remain consistent with reported concentrations as measured during pilot testing. The projected average removal rate for methane was calculated as 55.6 pounds per day if influent concentrations were to remain consistent with reported concentrations as measured during pilot testing.

6.8 AERSCREEN EVALUATION

The samples collected during pilot testing from the SSDS piping/ extraction wells were analyzed for VOCs to evaluate the toxicity and impacts on the receptors downwind using a dispersion model (AERSCREEN). AERSCREEN is a screening model based on the U.S. EPA AERMOD air quality dispersion model to predict ambient air concentrations attributed to a single source. The input parameters including total VOC concentrations, effluent loading rates, stack height, flow rates, temperature, velocity and the distance to the receptor (Estimated at 10 feet) were compared to the NYSDEC DAR Air Guidance (DAR-1) Guidelines for the Control of Toxic Ambient Air Contaminants, AERSCREEN computer program (Table 11). The average flow for each extraction well during pilot testing was used in the AERSCREEN model. The generated concentrations were compared with Short-term Guideline Concentrations (SGCs) and Average-Annual Guidance Criteria (AGCs). A scenario was run for combined effluent assuming use of each of the seven existing SSDS pipe networks, with the addition of new extraction wells EX-1 and EX-2. The model's predicted results for acetone (0.78932 $\mu g/m^3$), 2-butanone / MEK (0.39433 $\mu g/m^3$), tetrahydrofuran (0.18929 $\mu g/m^3$), toluene (1.0292 $\mu g/m^3$), PCE (0.00514 $\mu g/m^3$), TCE (0.00159 $\mu g/m^3$), do not exceed the concentration values for contaminants of concern listed within the SGC and AGC values. There are no AGC and SGC values for methane. The model's predicted results are compared to the AGC and SGCG values in Table 11. The pilot testing laboratory analytical data utilized in the AERSCREEN Model is included in Appendix C**.** The raw data inputs for the AERSCREEN model are included in Appendix G.

Accordingly, the results of pilot testing and the AERCREEN model indicate that the levels to be discharged from the Site are acceptable for direct discharge to the atmosphere without vapor control during the full-scale SSD system operation.

7.0 REMEDIAL INVESTIGATION AND SSDS PILOT TEST FINDINGS

The objective of the Remedial Investigation was to provide current soil vapor conditions beneath the Site structure and along the periphery of the property boundaries, to document the composition and characteristics of surface and subsurface soils, to document local groundwater quality conditions and direction of groundwater flow, and to provide guidance on the selection and implementation of a Remedial Action program for the Site.

7.1 SOIL

VOCs (acetone and total xylenes), pesticides (4,4, DDD, 4,4-DDE, 4,4-DDT and dieldrin) TAL Metals (copper, lead, nickel, zinc and mercury) and total PCBs were detected in several soil samples above Unrestricted Use but below Commercial Use SCOs. PFOS were detected in two soil samples above Unrestricted but below Commercial Guidance. With the exception of nickel and zinc, each Unrestricted Use exceedances were only detected in soil samples within the documented landfill soil horizon. SVOCs were not detected in excess of Unrestricted or Commercial Use SCOs in the soil samples collected from the Site.

Cadmium was detected at SB-2A at a depth of 1-2 feet bgs above the Unrestricted and Commercial Use SCOs. The concentration of cadmium at SB-2A also exceeds the POG SCO (7.5 mg/kg, respectively). Cadmium was not detected in the soil samples collected from SB-2 (SB-2B) at a depth of 10- 12 feet bgs. SB-2 is located in the parking lot and is covered with an asphalt paved surface.

7.2 GROUNDWATER

1,4-Dichlorobenzene was detected in MW-3 at a concentration of 7.31 (µg/L) above the AWQS (3 µg/L). Benzene was detected in MW-2 at a concentration of 7.13 µg/L above the AWQS (1 µg/L). Chlorobenzene was detected in MW-2, MW-3 and MW-4 at concentrations of 83.9, 92.6 and 35.9 µg/L, respectively. These detections are above the AWQS (5 µg/L). Additional low-level VOCs were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

Benzo(a)anthracene was detected in MW-1 Dup and MW-3 at concentrations of 0.0513 and 0.0615 µg/L, respectively. These detections are above the AWQS (0.002 µg/L). Bis(2-ethylhexyl)phthalate was detected in MW-7 at a concentration of 7.98 µg/L above the AWQS (5 µg/L). Additional low-level SVOCs were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

Lead was detected in MW-4 at a concentration of 42.8 µg/L above the AWQS (25 µg/L). Magnesium was detected in MW-3 and MW-7 at concentrations of 45,300 and 40,600 µg/L, respectively. These detections are above the AWQS (35,000 µg/L). Manganese was detected in each well at concentrations ranging from 448 to 3,340 µg/L. These detections are above the AWQS (300 µg/L). Sodium was detected in each well at concentrations ranging from 42,500 to 418,000

µg/L. These detections are above the AWQS (20,000 µg/L). Additional low-level metals were detected above laboratory detection limits in Site groundwater but below their respective AWQS. Note that a groundwater sample could not be collected from MW-2 for metals analysis based on the lack of recharge during the RI field work.

The absence of significant metals impacts to Site soils, with the exception of cadmium at SB-2; suggest groundwater impacts are likely to be due to local groundwater quality and area-wide impacts associated with the historic landfill on the Site and surrounding properties.

PFOS was detected in MW-1 & MW-1 Dup, MW-3 and MW-4 at concentrations of 14.2, 15.4, 160 and 75.5 ng/L, respectively. The concentrations of PFOS in these wells exceed the April 2023 PFAS Remedial Program Guidance for Sampling, Analysis, and Assessment of PFOS (10 ng/L). PFOA (one of the most widely used PFAS compounds) was detected in MW-3 and MW-4 at concentrations of 42.5 and 16.1 nanograms per liter (ng/L), respectively. The concentrations of PFOAs in these wells exceed the October 2020 PFAS Remedial Program Guidance and April 2023 Sampling, Analysis, and Assessment of PFAS - 10 ng/L). Additional low-level PFAS were detected above laboratory detection limits in Site groundwater but below their respective October 2020 PFAS Remedial Program Guidance and April 2023 Sampling, Analysis, and Assessment of PFAS. As PFAS owe their properties to the carbon-fluorine bond, which is one of the shortest and strongest known, they are highly resistant to breakdown in the environment; thus, have been nicknamed the "forever chemicals." The source of PFAS in groundwater samples collected during the RI is likely a result of the historical use of the Subject Property by the Town of Poughkeepsie as a municipal waste landfill in the 1970s and 1980s. These emerging contaminants were first discovered in the late 1930s and since the 1950s many products commonly used by consumers and industry have been manufactured with or from PFAS. Some uses of PFAS include (but are not limited to) building and construction, cable and wiring, industrial surfactants, paper products and packaging, textiles, leather and apparel (including carpet and furniture). Note that some of these items were detected during the RI and thus further support the origin of PFAS is likely a result of the municipal landfill which operated on-Site by the Town of Poughkeepsie.

Pesticides and PCBs were not detected in groundwater samples collected from the Site.

7.3 EXTERIOR SOIL GAS

Elevated methane was detected in each of the exterior soil vapor points at concentrations ranging from 43 to 1,700,000 ppmv. Methane was not detected in the ambient outdoor air sample. Elevated petroleum VOCs were detected in SV-2, including benzene (3,200 µg/m^3), chlorobenzene (2,500 µg/m^3) cyclohexane (6,700 µg/m^3), n-heptane (3,100 µg/m^3) and n-hexane (4,500 µg/m^3). Peak concentrations of TCE (27 µg/m^3) and vinyl chloride (78 µg/m^3) were also detected at SV-2. PCE was detected in the exterior soil vapor samples at low levels ranging from 0.56 to 30 µg/m^3.

Additional low-level exterior soil vapor contamination, typical of well-developed urban settings, has been identified at the Site. These detected concentrations, however, are not likely to be

indicative of grossly contaminated on-Site soil or groundwater or be a source of significant offsite migration. Petroleum VOCs noted above at SV-2, are likely associated with off-gassing from petroleum VOCs in groundwater along the eastern portion of the Site. A significant source of petroleum VOCs was not identified in Site soil.

7.4 INTERIOR SUB-SLAB SOIL GAS AND INDOOR AIR

As documented in the RIWP, several VOCs were detected in sub-slab soil gas sample SG-2 collected in January 2017. Of note, elevated TCE (31 µg/m^3) and methane (250,000 ppmv) were detected in the eastern portion of the building.

December 2022 sub-slab soil vapor samples were collected throughout the building to provide current building-wide soil gas concentrations. The existing SSDS was shut off on December 27, 2022, 1-day prior to sample collection. Low-level VOC (both petroleum and chlorinated VOCs) were detected in sub-slab soil gas throughout the Site. Methane concentrations ranged from non-detect to 107,000,000ppm. Elevated levels of acetone (peak concentration 1,500 µg/m^3) and tetrahydrofuran (peak concentration 2,400 µg/m^3) were detected in SG-9 and SG-10 collected from the SSI Aeration tenant space. This tenant was observed to regularly use PVC glue and primers for its onsite pipe assembly operations. Acetone and tetrahydrofuran are primary chemical components of PVC glues and primers, and the soil gas detections are likely attributable to elevated indoor concentrations noted in the indoor air sample results discussion below. Additional low-level sub-slab soil gas contamination, typical of well-developed urban settings, has been identified at the Site. Although reported, said laboratory reported parameters are not likely to be indicative of grossly contaminated on-Site subsurface media, or be a source of significant off-Site migration.

Elevated PCE (peak concentration 120 µg/m^3) and TCE (peak concentration 220 µg/m^3) were detected in indoor air samples collected in March 2017. The concentrations of PCE (peak concentration 0.990 µg/m^3) and TCE (peak concentration 0.550 µg/m^3) were significantly lower during the December 2022 sampling event. TCE was not detected in eight of the eleven air samples collected. Elevated levels of 2-butanone/ MEK (peak concentration 2,900 µg/m^3), acetone (peak concentration 4,700 µg/m^3), and tetrahydrofuran (peak concentration 7,500 µg/m^3) were detected in IA-9 and IA-10 collected from the SSI Aeration tenant space. As noted above, these VOCs are primary chemical components in PVC glue and primers, which are commonly used within the SSI Aeration tenant space, from where IA-9 and IA-10 were collected. Methane concentrations ranged from non-detect to 6,110 ppmv. The highest methane concentrations in soil gas and indoor air were located in the eastern portion of the building (SG-11/ IA-11). This portion of the building does not have an active sub-slab depressurization system.

A comparison of the sub-slab soil gas and indoor air data (December 2022) with the New York State Department of Health May 2017 Decision Matrices did not yield a "Mitigate" result in any of the sampled locations. A result of "Monitor" for TCE at SG-8/ IA-8 and vinyl chloride at SG-11/ IA-11 was produced based on the NYSDOH matrix comparison. Both of these sample locations are slab-on-grade potions of the building which do not have a sub-grade piping network

and/or active depressurization. Although the NYSDOH matrix comparison does not indicate mitigation is required, the elevated methane concentrations should be addressed by active depressurization. Note that each tenant was provided a copy of the ambient indoor air sampling results and associated fact sheets soon after the receipt of the RI laboratory analysis.

The results of the indoor air sampling were summarized in Tenant Letters dated May 22, 2023. These were disturbed by building management to the tenants on May 24, 2023. Copies of the Tenant Letters are included in Appendix H.

7.5 INDOOR AIR QUALITY SURVEY

In general, the Site tenants do not use chemicals which would be considered a likely source of cVOCs in soil vapor or indoor air. Typical chemicals observed during Site investigative activities include various janitorial supplies, paints, PVC glue and primer, and hydraulic oils / lubricants (used for the on-Site forklift). An indoor air survey of tenant spaces sampled during the RI was conducted. No obvious sources of products which may contain cVOCs were observed. Frequent use of PVC primers and glues within the SSI Aeration space (southern portion of building) are the source of acetone, 2-butanone/ MEK and tetrahydrofuran. A copy of the Indoor Air Quality Survey is included as Appendix D.

7.6 SSDS PILOT TESTING

The existing SSDS is effectively depressurizing the sub slab space beneath the northern and central portions of the building. The southern portion and select slab on grade (eastern) portions of the building are not being depressurized by the current system.

7.7 ELECTRONIC DATA DELIVERABLES

This final RIR will be provided to NYSDEC and DOH in the Department's most current electronic data deliverable (EDD) format. Copies of the EDD acceptable emails will be included in Appendix E.

7.8 DATA USABILITY SUMMARY REPORT

As part of this Remedial Investigation, a Data Usability Summary Report or DUSR is required to summarize the soil, groundwater, soil vapor and indoor air sampling analytical results for the Site. The primary objective of the DUSR is to determine whether the analytical data meets Site specific objectives for data quality and data use.

DUSR(s) were prepared following the guidelines provided in DER-10 *Technical Guidance for Site Investigation and Remediation*, May 2010, Guidance for the Development of Data Usability Summary Reports. A copy of the DUSR has been placed in Appendix F for your reference. The table below includes a narrative summary of the DUSR validity, qualifiers present, and the results rejected:

Laboratory Report #	Sample IDs	DUSR Summary
24D0867	MW-8, MW-9, MW-10, Trip Blank, Field Blank	The data associated with this Sample Delivery Group (SDG) 24D0867, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality.** However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR). Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an "R" should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.
24C1134	SED-1 – SED-6 SWS-1 – SW_3 SB12B, SB13A, SB 13B, SB-14, SB-14 (Dup), SB-15, Field Blank, Rinsate	The data associated with this Sample Delivery Group (SDG) 24C1134, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided. in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).** Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an "R" should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.
24C1132	SB8A, SB8B, SB9A, SB9B, SB9C, SB10A,	The data associated with this Sample Delivery Group (SDG) 24C1132, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State

	SB10B, SB11A, SB11B, SB12A, Trip Blank	Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).** Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an "R" should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error
22L1390	SV-2, SV-3, SV-4, SV-5, SV-6, SV-7, AO	The data associated with this Sample Delivery Group (SDG) 22L1390, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).** Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.
22L1391	SG-1, IA -1, SG-2, IA -2, SG-3, IA -3, SG-4, IA-4, SG-5, IA-5, SG-6, IA-6, SG-7, IA-7, SG-8, IA-8, SG-9, IA-9, SG-10, IA-10	The data associated with this Sample Delivery Group (SDG) 22L1391, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the**

		analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR). Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an "R" should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.
22L1392	SB-1A, SB-1B, SB-2A, SB-2B, SB-2C, SB-3A, Sb-3B, SB-3C, SB-4A, SB-4B, SB-4C, SB-5A, SB-5B,SB-5C, SB-5D, SB-6A, SB-6B, SB-6C, SB-7A, SB-7B, SB-7C, SB-7C Dup, Rinsate, Field Blank, Trip Blank	The data associated with this Sample Delivery Group (SDG) 22L1392, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that has been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).** Two facts should be noted by all data users. First, the "R" qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an "R" should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.
23A0328	SG-11, IA-11, SSD-1, SSD-2, SSD-3, SSD-6, SV-1R	The data associated with this Sample Delivery Group (SDG) 23A0328, analyzed by York Analytical Laboratories, Stratford, CT have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data. **All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, "R". Results qualified as estimated "J", or as non-detects, "U", are considered usable for the purpose of evaluating water and/or soil quality. 8.0 SUPPLEMENTAL REMEDIAL INVESTIGATION

The purpose of the Supplemental Remedial Investigation (SRI) was to further define the nature and extent of landfill materials as it relates to the adjacent wetlands on the northeastern and eastern property boundaries. Additionally, the goal of the SRI was to (a) fill data gaps from the December 2022 RI, (b) to determine if a source of VOC impacted soil is present proximal to SB-2/ MW-2, (c) to further define the horizontal/vertical extent of the landfill mass within the Subject Property boundary, (d) to document groundwater impacts beyond the BCP border, but within the tax parcel's metes and bounds, and (e) to ensure all exposed soils at the Site are adequately characterized to verify that they conform with commercial Site-use clean up requirements (Track 4). All work proposed in the SRI was performed by DTCS/BE under a NYSDEC/NYSDOH approved SRI Work Plan between March 18 and April 11, 2024.

8.1 SOIL BORINGS

A total of eight exterior soil borings (denoted as SB-8 – SB-15) were advanced both outside of the BCP Site Boundary (but within the tax parcel) and within exposed areas inside the BCP Site Boundary to further characterize soil conditions on the Subject Property. See Figure 3 for the soil boring locations.

On March 18, 2024, DTCS/BE oversaw advancement of the investigative borings associated with this SRI. The on-Site geologist/engineer screened the soil samples for environmental impacts and collected samples for laboratory analysis. All fieldwork associated with the soil sampling program complied with the safety guidelines outlined in the Site-Specific HASP and CAMP. The investigative borings were advanced to depths ranging from 20 to 25 feet bgs using direct push Geoprobe® 7822DT drill rig advancing a five-foot macro core sample rod. The open borehole was periodically screened for % LEL during the advancement of each soil boring. LEL readings greater than 0% were not observed in any sampling location. Soil was collected continuously to the boring termination depth using disposable acetate sleeves. Each sample was screened for organic vapors with a PID and evaluated for visual and olfactory indications of environmental impacts. Soil descriptions and PID readings were recorded in boring logs included as Appendix A.

A minimum of two (2) soil samples (one shallow and one deep) were collected from each soil boring. Note that the deep soil sample collected in each boring location was gathered at the base of the landfill layer (if detected) or at the groundwater interface. Additional shallow surface samples were collected at SB-9 and SB-13 as these monitoring areas had no asphalt or concrete cover. The table below summarizes the soil sample designation and collection depths.

Soil Sample Designation	Soil Sample Depth (Feet bgs)
SB-8A	0-2

SB-8B	10-12
SB-9A	0-1
SB-9B	1-2
SB-9C	10-12
SB-10A	0-2
SB-10B	3-5
SB-11A	0-2
SB-11B	18-20
SB-12A	0-2
SB-12B	14-16
SB-13A	0-2
SB-13B	0-6"
SB-14	0-1
SB-14 dup[1]	0-1
SB-15	0-2

[1] *Duplicate sample collected for SB-14*

Generally, PID readings greater than 0.0 ppm were not observed in the samples screened. Slightly elevated PID readings were recorded in the landfill horizon of soil boring SB-13 ranging from 0.8 to 4 ppm at a depth of 12 – 15 feet bgs. No olfactory evidence of contamination was documented in any of the soil samples collected, including those with slightly elevated PID headspace readings. Each soil boring was advanced to a sufficient depth (15 - 25 feet bgs) to completely delineate the vertical extent of the landfill layer and confirm the lack of field evidence of contamination. Refer to soil boring logs in Appendix A for additional details. All IDW was contained in DOT-approved 55-gallon steel drums for appropriate characterization and disposal by DTCS/BE.

Particulate and VOC monitoring was conducted continuously during ground intrusive work associated with the installation of each soil boring as per the NYSDEC/NYSDOH approved CAMP. No exceedances of the thresholds for VOCs and/or particulate set forth in the CAMP were observed. Field data sheets associated with the CAMP are included in Appendix B.

Each designated soil sample as referenced above was submitted to the laboratory for analysis. Soil samples collected from SB-8, SB-9 and SB-10 were analyzed for VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), TAL metals (USEPA Various Methods), pesticides (USEPA Method 8081), PCBs (USEPA Method 8082), PFAs (USEPA Method 1633), cyanide (USEPA Method 9014/9010C) and 1,4-dioxane (USEPA Method 8270 SIM). Note that those soil samples collected from SB-11, SB-12 and SB-13 were analyzed for VOCs (USEPA Method 8260) and SVOCs (USEPA Method 8270) only. Field quality control measures including duplicate, trip and field blanks were also collected and submitted to the laboratory for analysis.

8.1.1 Soil Sampling Results

A total of sixteen soil samples were collected from eight soil boring locations (including one duplicate sample). The soil sample results are summarized in Table 1 and are compared with NYSDEC 6 NYCRR Part 375-8.8(a) Unrestricted Use and NYCRR Part 375-8.8(b) Commercial

Use Soil Clean Up Objectives or SCOs. Spider maps showing exceedances of Unrestricted Use SCOs recorded during this SRI are included as Figures 4, 5, 6 and 7. A spider map showing exceedances of April 2023 guidance document titled, "Sampling, Analysis, and Assessment of PFAS" is included as Figure 8. The complete laboratory analytical reports have been placed in Appendix C for reference.

VOCs

VOCs (acetone, total xylenes, ethyl benzene, and toluene) were detected in several soil samples above Unrestricted Use but below Commercial Use SCOs during the performance of the SRI. Most all laboratory reportable VOCs were encountered within the documented landfill soil horizon.

SVOCs

Several SVOCs were detected in the soil samples collected above laboratory detection limits. The detected concentrations were below both Unrestricted and Commercial Use SCOs. The detected concentrations were primarily in the shallow samples collected.

Pesticides

Pesticides were not detected in any of the soils collected for analysis during the March 2024 SRI.

Metals

Copper was reported in all of the soil samples collected during the SRI. Only one shallow soil sample (denoted as SB-9A) had a reported concentration of 50.5 mg/kg which exceeded the Unrestricted Use SCO (50 mg/kg) but was below the Commercial Use SCO (270 mg/kg). Nickel was detected in all soil samples at concentrations ranging from 15.3 to 36.6 mg/kg. The reported concentration in SB-10B (36.6 mg/kg) was found to exceed the Unrestricted Use SCO (30 mg/kg) but was below the Commercial Use SCO (310 mg/kg). All remaining samples were below Unrestricted SCOs for nickel. Selenium was reported by the laboratory (above laboratory detection limits) within samples collected from SB-8B, SB-9A, SB-9C, SB-10A, SB-10B, SB-14 and SB-14 Dup at concentrations ranging from 2.22 – 5.9 mg/kg. The reported concentration in SB-8B, 10B and SB-14 Dup (3.92, 5.41 and 5.90 mg/kg, respectively) were found to exceed the Unrestricted Use SCO (3.9 mg/kg) but were well below the Commercial Use SCO (1,500 mg/kg). All remaining samples were below Unrestricted SCOs for selenium. Similar to other TAL metals as documented above, Zinc was reported in all soil samples collected during the SRI. Note however that SB-14 and SB-14 Dup were the only two samples with contaminant concentrations (115 and 113 mg/kg, respectively) which exceeded the Unrestricted Use SCO (109 mg/kg) but were well below the Commercial Use SCO (10,000 mg/kg).

Additional TAL metals were reported in shallow and deep soils across the Site but were found below both Unrestricted and Commercial Use SCOs once compared to the regulatory standards.

PCBs

Total PCBs were detected in one soil sample (denoted as SB-9C) at a concentration of 0.104 mg/kg. This concentration exceeds the Unrestricted Use SCO (0.1 mg/kg) but is below the

Commercial Use SCO (1 mg/kg). The remaining soil samples analyzed for PCBs were returned with non-detect sample concentrations by the laboratory.

PFOS/PFOA

PFOS and PFOA compounds were detected in most soil samples collected during this SRI, but only one sample (SB-15 with a recorded concentration of 1.540 µg/kg for PFOS) exceeded the Unrestricted Use Guidance Value (0.88 µg/kg) but was well below the Commercial Use Guidance Value (440 µg/kg). All additional PFOS/PFAS soil detections did not exceed Part 375 Unrestricted SCOs when compared to remedial guidance values.

8.2 GROUNDWATER MONITORING

Following completion of the soil sampling, each of the soil borings denoted as SB-8 – SB-10 were converted into a permanent 2-inch PVC groundwater monitoring well. The wells were constructed of 10 feet of 0.01 slot schedule 40 PVC well screen and completed to grade with solid schedule PVC riser pipe. The annulus around the well screen was backfilled with No. 2 filter sand and sealed with a 1-foot bentonite layer. Each well was then finished at grade surface with steel flush-mount road boxes set in approximate 2'x 2' concrete pad. Details regarding the well installations are included in the boring / well completion logs (Appendix A). Following installation, each well was developed by rapidly pumping the wells to remove entrained silt and sediment from the sand pack and well screen and ensure connectivity with the surrounding shallow groundwater table. A minimum of three to five well volumes were removed from each well during development. Groundwater samples were collected from each of the newly installed monitoring wells (MW-8 through MW-10; See Figure 3) on April 11, 2024. Prior to sampling, water level measurements were recorded to the nearest 0.01-foot prior sampling and a minimum of 3 well volumes were purged from each where sufficient recharge would allow. Groundwater purge logs are included in Appendix A. The table below includes groundwater sampling/gauging data and observations obtained during the April 11, 2024, monitoring event.

Well ID	Depth to Water (TOC[1])	Total Depth (TOC[1])	Purge Volume (gal)	Tubing Sample Depth (Feet bgs)	Odor (Y/N)	Sheen (Y/N)
MW-8	8.54	18.40	3	17	N	N
MW-9	8.68	18.00	3	17	N	N
MW-10	9.15	18.10	3	17	N	N

TOC[1] – Depth to water and total depths measured to top of PVC casing.

While conducting groundwater well development and sampling procedures, all IDW was placed in DOT-approved 55-gallon steel drums for appropriate characterization and disposal by DTCS/BE. Each sample was analyzed for VOCs, SVOCs, TAL Metals, Pesticides, PCBs, PFAs, Cyanide, and 1, 4-Dioxane via USEPA test methods 8260, 8270, 3050B/7473, 8081, 8082, and 1633 respectively. Field quality control measures including trip blanks and field blanks for PFA

testing were collected and submitted to the laboratory for chemical analysis. The complete laboratory analytical reports have been placed in Appendix C for reference.

8.2.1 Groundwater Sampling Results

The groundwater sample results are summarized in Table 2 and compared with the NYSDEC TOGS 1.1.1, AWQS and the April 2023 Guidance for Sampling, Analysis and Assessment of PFAS. Spider maps showing VOC, SVOC, TAL Metal and PCB exceedances above AWQS are included as Figures 9, 10, 11 and 27, respectively. A spider map showing exceedances of PFAS above Guidance is included as Figure 12.

VOCs

A total of eleven VOCs were detected during the SRI groundwater sampling event that exceeded TOGS 1.1.1 AWQS. Specifically, 1,2,4-Trimtheylbenzene, 1,3,5-Trimethylbenzene, 1,4-Dichlorobenzene, Benzene, Chlorobenzene, Ethyl benzene, Isopropylbenzene, n-Propulbenzene, o-Xylene, Toluene and Total Xylenes were found to exceed their respective groundwater quality standard when reported concentrations were compared to guidance (see Table 2 for analytical summary). Note that additional low-level VOCs were detected above laboratory detection limits during the April 11, 2024, monitoring event, but were below their respective AWQS.

SVOCs

1,4-Dioxane was reported at a concentration of 1.78 µg/L, which exceeds its respective AWQS groundwater quality standard of 0.35 µg/L. Additional low-level SVOCs were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

Pesticides

Pesticides were not detected in the groundwater samples collected from the Site.

Metals

Magnesium was detected in MW-9 at a concentration of 36,100 µg/L. This detection is above the AWQS of 35,000 µg/L set for this compound. Manganese was detected in each well (MW-8 – MW-10) at concentrations ranging from 933 to 1,360 µg/L. These detections are above the AWQS (300 µg/L). Sodium was detected in each well at concentrations ranging from 101,000 to 223,000 µg/L. These detections are above the AWQS (20,000 µg/L). Additional low-level metals were detected above laboratory detection limits in Site groundwater but below their respective AWQS.

PCBs

Aroclor 1232 was reported by the laboratory within groundwater monitoring wells MW-8 – MW-10 at concentrations of 0.116, 0.121 and 0.556 µg/L which is above the total PCB AWQS guidance

of 0.09 µg/L. Other targeted PCB parameters were not detected in the groundwater samples collected from the Site.

PFAS

PFOS were detected in MW-8, MW-9 andMW-10 at concentrations of 69.7, 68.1, 48.1 ng/L, respectively. The concentrations of PFOS reported within these wells exceed the NYSDEC April 2023 guidance which sets the MCL at 2.7 ng/L. PFOA was also reported in each of the three wells sampled during the April 11, 2024, monitoring event at concentrations of 20.3, 44.3, and 29.7 ng/L, respectively. The concentrations of PFOAs in these wells exceed the 6.7 ng/L MCL when compared to the NYSDEC April 2023 remedial guidance. Additional low-level PFAS were detected above laboratory detection limits in Site groundwater but below their respective water quality guidance values.

8.2.2 Relative Groundwater Elevation Survey

Each of the three newly installed Site wells were gauged using an electronic interface probe during the April 2024 SRI field work. The depth to water readings, as measured to the top of PVC well casing, were used in conjunction with elevation survey data collected from each well. An arbitrary datum of 100.00 feet bgs was applied to a benchmark, and corresponding relative elevations for depth to water were established for each monitoring well.

Well ID	Depth to Water (TOC[1])
MW-8	8.54
MW-9	8.68
MW-10	9.15

TOC[1] – Depth to water and total depths measure to top of PVC casing.

Historical groundwater elevation data gathered during the initial RI in January 2023 has shown that groundwater on-Site generally flows in a southeasterly direction across the northern portion of the Site, and a southerly direction across the southern portion of the Site. Wetlands are located to the east and southeast of the Site and are the presumed receiving body for Site groundwater. In addition to the adjacent wetlands, the Casperkill Creek is also a presumed receiving water body downgradient of the BCP Site.

8.3 SEDIMENT AND SURFACE WATER SAMPLING

To further characterize environmental conditions on the Subject Property which could have the potential to impact the adjacent/off-Site sensitive receptor known as the Casper Creek and surrounding wetlands, a total of six sediment and three co-located surface water samples were collected and analyzed during this SRI. All fieldwork associated with the soil sampling program complied with the safety guidelines outlined in the Site-Specific HASP and CAMP.

8.3.1 Sediment Sampling

On March 18, 2024, DTCS/BE collected a total of six sediment samples within the wetland boundary utilizing hand tooling (see Figure 24 for locations). The sediment samples were collected at the perimeter of the standing water associated with the wetlands/Casper Creek beginning downstream and continued in an upstream direction. Each of the six samples (denoted as SED-1 – SED-6) were obtained from the top of the sediment layer to approximately 6-inches into the sediment and can be described as silt, with traces of sand and gravel. Each sample was screened for organic vapors with a field calibrated PID equipped with a 10.2 electron volt lamp and evaluated for visual/olfactory indications of environmental impacts. No positive PID readings or evidence of environmental impacts were documented in any of the sediment sampling locations.

Upon retrieval and documenting sediment characteristics, each sample was placed in laboratory supplied glassware (once any excess water was allowed to drain), labeled, and readied for transport to the laboratory for analysis. All sampling tubes and tools used to collect the soil samples were decontaminated between each sampling location using a detergent wash and potable water rinse.

Each sample was submitted to a NYSDOH-approved laboratory for analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), TAL metals (USEPA Various Methods), pesticides (USEPA Method 8081), PCBs (USEPA Method 8082), PFAs (USEPA Method 1633), cyanide (USEPA Method 9014/9010C), 1,4-dioxane (USEPA Method 8270 SIM) and organic carbon. All analyses were performed utilizing NYSDEC ASP methodology with Category B deliverables.

8.3.2 SURFACE WATER SAMPLING

A total of three co-located surface water samples (denoted as SWS-1, SWS-2 and SWS-3) were collected from the adjacent wetlands water body in the locations of the sediment samples denoted as SED-1, SED-3 and SED-5 (See Figure 24 for locations). Surface water samples were collected prior to sediment sampling, so as not to disturb the steady state conditions present in the water body and commenced downstream and continued in an upstream direction to avoid disturbing the sediments during sampling.

All surface water samples were collected in a manner consistent with NYSDEC sample collection protocols. Specifically, the employment of a sampling pole with a dedicated laboratory provided sample jar, enabled collection of grab surface water samples during the SRI, while minimizing the potential for disturbance of the underlying sediments. Following collection, each sample will be poured into appropriately labeled containers provided by the laboratory. All samples will be maintained at appropriate cold temperatures and were subsequently submitted to a NYSDOH-approved laboratory for analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), TAL metals (USEPA Various Methods), pesticides (USEPA Method 8081), PCBs (USEPA Method 8082), PFAs (USEPA Method 1633), cyanide (USEPA Method 9014/9010C), 1,4-dioxane (USEPA Method 8270 SIM) and organic carbon. Field quality control measures including trip

and field blanks will be collected and submitted to the chemical laboratory for analysis. All analyses were performed utilizing NYSDEC ASP methodology with Category B deliverables.

8.3.3 SEDIMENT SAMPLING RESULTS

A total of six sediment samples were collected from within the wetland boundary located on the Subject Property. The analytical findings are summarized in Table 12 and are compared with NYSDEC Freshwater Sediment Guidance Values or SGVs (Tables 5, 7 and 8). The complete laboratory analytical reports have been placed in Appendix C for reference. A TAL Metals and SVOC exceedance sediment spider map is included as Figure 25

VOCs
A total of six VOCs (1,4-Dichlorobenzene, 2-Butanone, 4-Methyl-2-pentanone, Chlorobenzene, Ethanol, and Methyl acetate) were detected above laboratory detection limits during analysis of sediment samples collected. Note however that none of the reported parameters were found to exceed published guidance values. All other targeted VOCs were returned with non-detectable concentrations by the laboratory.

SVOCs
Several SVOCs were detected in the sediment samples collected above laboratory detection limits. Benzo(a)pyrene was detected in three of the six sediment samples above the Table 8 Guidance Value for Bioaccumulation-Human Health (0.0044-0.018 mg/kg). The concentrations of benzo(a)pyrene ranged from 0.136 to 1.050 mg/kg in the three samples which exceed the Guidance Value. All other reported concentrations were below freshwater sediment guidance values.

Pesticides
Pesticides were not detected in any of the sediment samples collected for analysis during the March 2024 SRI.

Metals
Sediment samples collected along the perimeter of standing water reported TAL metals in each of the six samples collected during analysis. Five metals including arsenic, copper, lead, nickel and zinc were the only compounds to exceed Class A guidance. Those metals which exceeded the Class A Guidance Values, were within the range for Class B freshwater sediment guidance values. None of the detected metals were within the Class C guidance values.

PCBs
PCBs were not detected in any of the sediment samples collected for analysis during this SRI.

PFAS
PFA parameters as outlined in EPA test method 1633 were detected in each of the six sediment samples collected during this SRI. A total of eight PFA compounds were detected, including (N-

EtFOSAA, Perfluorodecanoic acid (PFDA), Perfluorododecanoic acid (PFDoA), Perfluoroheptanoic acid (PFHpA), Perfluorohexanoic acid (PFHxA), Perfluorooctanesulfonic acid (PFOS), Perfluorooctanoic acid (PFOA), Perfluorotetradecanoic acid (PFTA), and Perfluoroundecanoic acid (PFUnA)). There are currently no Freshwater Sediment Guidance Values for PFAS. All additional PFOS/PFAS parameters were returned with non-detectable concentrations by the laboratory.

8.3.4 SURFACE WATER SAMPLING RESULTS

A total of three surface water samples were collected from the adjacent wetlands water body in the locations of the sediment samples denoted as SED-1, SED-3 and SED-5 on March 18, 2024. The analytical findings are summarized in Table 13 and are compared to TOGS 1.1.1 AWQS and the April 2023 Guidance for Sampling, Analysis and Assessment of PFAS. The complete laboratory analytical reports have been placed in Appendix C for reference. A TAL Metals exceedance surface water spider map is included as Figure 26.

VOCs

All targeted VOCs were returned with non-detect dissolved phase contaminant concentrations with the exception of naphthalene in each sample (0.27 to 0.56 µg/L) and chlorobenzene (0.550 µg/L) in SWS-2. The concentrations are well below the TOGS 1.1.1 guidance of 5 µg/L for chlorobenzene and 10 µg/L for naphthalene.

SVOCs

Four SVOCs were detected in the surface water samples collected above laboratory detection limits. Specifically, 1,4-Dioxane was reported in SWS-2 at a concentration of 0.304 µg/L, Bis(2-ethylhexyl)phthalate was found above laboratory detection limits in SWS-1 (0.576 µg/L) and SWS-3 (1.210 µg/L), Naphthalene was reported in SWS-3 at a concentration of 0.137 µg/L and Pyrene was documented at 0.0808 µg/L within SWS-1. The AWQS for these compounds are 0.35µg/L, 5 µg/L, 10 µg/L, and 50 µg/L, respectively. As such, each parameter was found below standards when compared to regulatory guidance. All other SVOCs were returned with non-detectable concentrations by the laboratory.

Pesticides

Pesticides were not detected in any of the surface water sediment samples collected for analysis during the March 2024 SRI.

Metals

Surface water samples collected along the perimeter of standing water reported eight TAL metals in each of the three samples collected during analysis. Only one metal, sodium, was found above its respective AWQS. Specifically, sodium was recorded at concentrations of 61,000, 23,900 and

23,300 µg/L within surface water samples SWS-1 – SWS-3. Note that the guidance for sodium is 20,000 µg/L. The remaining TAL Metals were returned with non-detectable contaminant concentrations by the laboratory.

PCBs

PCBs were not detected in any of the surface water samples collected for analysis during this SRI.

PFAS

PFA parameters as outlined in EPA test method 1633 were detected in each of the three surface water samples collected during this SRI. Each of the eight PFA compounds detected (1H,1H,2H,2H-Perfluorooctanesulfonic acid (6:2 FTS), N-EtFOSE, N-MeFOSA, Perfluorobutanesulfonic acid (PFBS), Perfluorododecanesulfonic acid (PFDoS), PFHpA, Perfluorohexanesulfonic acid (PFHxS), PFHxA, PFOS, PFOA and, Perfluoropentanoic acid (PFPeA) were below AWQS when compared to applicable guidance (where available). All additional PFOS/PFAS parameters were returned with non-detectable concentrations by the laboratory.

9.0 ENVIRONMENTAL AND PUBLIC HEALTH

A Qualitative Human Health Exposure Assessment (QHHEA) for the Site has been prepared in accordance with the requirements of DER-10/Technical Guidance for Site Investigation and Remediation, Appendix 3B, May 2010, and is presented in the following subsections. The QHHEA characterizes the exposure setting, identifies potentially complete exposure pathways, and qualitatively evaluates potential fate and transport of constituents from one medium to another (i.e., soil-to-air or soil-to-groundwater).

9.1 SITE SETTING

The Site is located at 10-14 Tucker Drive, Poughkeepsie, Dutchess County, New York. The Site includes an irregularly shaped 5.826 lot which is referenced under Section 6262, Block 3, Lot 162080 by the Town of Poughkeepsie. The portion of the Site accepted into the BCP includes an approximate 2.52-acre portion of the parcel (as referenced on Figure 2). The Subject facility is improved with a +/- 55,423 ft^2 two-story commercial warehouse/office building, asphalt parking areas and landscaped spaces. Approximately 50% of the building is warehouse storage space and the remaining 50% is occupied by various commercial enterprises. According to Town of Poughkeepsie Assessor records, the building was constructed in 1984. The Site is suspected to have been associated with a landfill as disturbed land was noted in at least 1970 and 1980 aerial photographs. Additionally, portions of the building have historically been utilized for bus repair and fueling operations. According to documents reviewed and based upon prior site inspections, PBS tanks including one, 10,000-gallon baffled diesel/gasoline AST, several 275 – 300-gallon ASTs for motor oil and washer fluid as well as two, 1,000-gallon ASTs (fuel type not noted) have been utilized at the Site. There is no evidence of any USTs existing at the Site and as of the date of this report, all ASTs appear to have been removed.

Groundwater beneath the Site is not used as potable drinking water. Additionally, potable water for the Site and surrounding area is reportedly supplied by municipal water. General Site use, a description of previous investigations, and the results of subsurface investigations can be found in Sections 1.0 through 7.0.

9.2 EXPOSURE ASSESSMENT

An exposure pathway is the way that humans or the environment come into contact with chemicals of potential concern (COPC). An exposure pathway is considered complete when the following five conditions are met:

1. Source (i.e., metals, semi-volatile organic compounds, PCBs, etc.);

2. Release and transport mechanism from source to environmental media (i.e., into the subsurface or volatilization to the air of an overlying building);

3. Point of human exposure (i.e., an occupied building or surface soil);

4. A route of exposure (ingestion, dermal contact, or inhalation); and

5. A receptor population (i.e., on-site workers or residents).

An exposure assessment will identify these pathways and includes a review of the potential sources of COPC and their release mechanisms, and identification of potential human receptors.

9.3 EXPOSURE CONCEPTUAL SITE MODEL

A conceptual site model has been developed based on the findings of the Site subsurface investigations described above and from the anticipated future use of the Site.

9.3.1 Potential Sources of Constituent of Potential Concern

Potential constituents of concern identified in Site soils above Unrestricted Use SCOs include:

- Metals: cadmium, copper, lead, nickel, zinc, and mercury
- VOCs: acetone, and xylenes
- PCBs
- Pesticides: 4,4-DDE, 4,4-DDT, 4,4-DDD, and dieldrin
- PFOAS

Potential contaminants of concern identified in Site soils above the Restricted Commercial Use SCOs, applicable to the proposed Track 4 Cleanup include:

- Metals: cadmium

Potential constituent of concern identified in groundwater above AWQS:

- Metals (unfiltered): lead, magnesium, manganese, and sodium
- VOCs: 1,4-Dichlorobenzene, benzene, and chlorobenzene

- PFOS/PFOA
- SVOCs (filtered): benzo(a)anthracene, and bis(2-ethylhexyl)phthalate

Potential contaminants of concern identified in soil gas above the New York State Department of Health (NYSDOH) Air Guidance Value and the NYSDOH Soil Vapor Intrusion Matrix A include:

- VOCs: TCE, PCE, and vinyl chloride

Other potential contaminants of concern identified in soil gas include:

- Methane

As a precaution, it is anticipated that the remedy will include a modification to the current mitigation system utilized on-Site.

9.3.2 Potential Release Mechanisms

Analysis of soil shows the Site-specific COPCs for soils are metals. Analysis of groundwater indicates low levels of metals, VOCs PFOS/PFOAS and SVOCs in groundwater on Site. Analysis of soil gas indicates the presence of TCE, PCE and methane in select soil gas locations on Site.

The possible explanations as to the occurrence of the above referenced compounds is the documented use of the Site as a municipal landfill by the Town of Poughkeepsie. As evidenced by changes in soil composition at varying depths, fill was imported to the Site during landfill operations to cover the debris imported. A combined effect of decomposing municipal waste and off-Site fill materials (common source of PAHs) is likely the source of Site-specific COPCs in soil, groundwater and soil gas.

9.3.3 Potential Human Receptors and Exposure Pathways

Ingestion and dermal contact are the possible routes of exposure to potential receptors with respect to impacted soils and groundwater on Site. Inhalation of dust is another possible route of exposure to potential receptors with respect to impacted soils. Under current and reasonably foreseeable uses, the potentially exposed populations include construction workers, utility workers, Site employees and visitors. The potential points of exposure include contact with soil and groundwater. As discussed below, the only complete exposure pathway is to construction and utility workers. At present, all impacted areas (with the exception of SB-5/MW-5) are covered by asphalt, concrete or the Site structure thus limiting exposure. As soils within the shallow soil horizon of SB-5/MW-5 (or grassy area within a parking island in the western quadrant of the Site) met RCSCOs; the exposure pathway is also limited. Groundwater beneath the Site is not, and is not expected to be, used as a water supply for commercial use or as potable drinking water to

residents or businesses. The potable water for the Site and surrounding area is supplied by municipal water.

The exposure pathway from groundwater and soil gas to indoor air appears limited at this time based upon Site characterization performed to date. An evaluation of sub-slab soil gas and ambient air (i.e., Soil Vapor Intrusion or SVI) has been completed and resulting detections do not warrant mitigation once compared to NYSDOH May 2017 Decision Matrices in any of the sampled locations. A result of "Monitor" for TCE at SG-8/ IA-8 and vinyl chloride at SG-11/ IA-11 was produced based on the NYSDOH matrix comparison. Both of these sample locations are slab-on-grade potions of the building which do not have a sub-grade piping network and/or active depressurization. Although the NYSDOH matrix comparison does not indicate mitigation is required, the elevated methane concentrations are expected to be remedied by the installation of an active depressurization system.

Based on the current use and the anticipated future use of the Site, the following potential human receptors have been identified: (i) Site employees and (ii) construction workers.

9.3.3.1 SITE EMPLOYEES

Future Site employees will not be exposed to soil or groundwater. As stated above, the majority of Site soils are covered by impervious surfaces and groundwater is not utilized; therefore, there are no exposure pathways via ingestion, inhalation or dermal contact. For the limited portion of the Site where surface soils do not a have a cover, said soils met RCSCOs (i.e. the small grassy strip within a parking lot island in the western portion of the Site) thus restricting exposure pathways. Future Site employees will not be exposed to soil gas as mitigation of soil vapor is anticipated to be remedied by an active depressurization system.

9.3.3.2 CURRENT OR FUTURE ON-SITE CONSTRUCTION AND UTILITY WORKERS.

Current or future on-Site and construction workers involved with disturbance of subsurface soils or groundwater may be exposed to COPCs through incidental ingestion and dermal contact during subsurface disturbance or excavation. Therefore, this receptor population has the potential for a complete exposure pathway. The final remedy will include the generation of a Site Management Plan which outlines practices to be used to minimize exposure when disturbing impacted soils and groundwater.

9.4 POTENTIAL ECOLOGICAL IMPACTS

Based upon the investigations conducted at the Site and knowledge of historical landfill activities surrounding the Subject Property, it does not appear that a Fish and Wildlife Impact Analysis (FWIA) is necessary. The Site is in an urban area consisting mainly of commercial areas. The majority of soil on Site is covered thereby reducing the potential for ecological impact. While

rainwater percolating through soil can allow for migration of contaminants to groundwater, the limited perched water identified at the Site suggests the extensive existing site pavement and generally clayey soils limit contaminant migration into deeper groundwater. Groundwater analyzed during Site characterization activities did display some targeted compound concentrations above AWQS. According to available documentation, the extent of the municipal waste landfill extends well beyond the BCP boundaries and parcel boundaries in every cardinal direction. Therefore, there is an obvious cumulative effect of potential off-Site related COPCs to migrate.

9.5 QHHEA CONCLUSIONS

A summary of the QHHEA is provided in the table below. The QHHEA identified soil gas as the primary impacted media and the use of the Site as a municipal landfill by the Town of Poughkeepsie as the primary potential source of COPCs. Site employees are not a likely receptor population for dermal, or ingestion pathways. Construction or utility workers conducting intrusive subsurface activates could be exposed to COPCs in Site soils and groundwater. The Site Management Plan will outline soil and groundwater handling practices to minimize exposure. Vapor mitigation will be remedied by an active depressurization system which will eliminate the potential for SVI.

Environmental Media & Exposure Route	Human Exposure Assessment
Direct Contact with Surface Soils (and incidental ingestion)	• People are not coming into contact because contaminated surface soils are being removed and/or covered with building slab, pavement, concrete or clean soils. • Site employee contact will be eliminated through operational restrictions.
Direct Contact with Subsurface Soils and Groundwater (and incidental ingestion)	• People come into contact if they complete ground intrusive work at the Site. This exposure is, therefore, limited to construction and utility workers as will be outlined in the Site Management Plan.
Ingestion of Groundwater	• Groundwater is not being used for drinking water; the area is served by the public water supply. • There are no known domestic water supply wells on-site or downgradient of the Site.
Inhalation of Air	• Potential soil gas impacts will be remedied via a mitigation system.

10.0 RI SUMMARY OF FINDINGS

Based on the RI data collected, remediation or additional investigation of Site soil, groundwater and exterior soil gas are not warranted. Limited impacts identified in these media are associated with the historic filling of the Site prior to the construction of the existing structure. Similar impacts are well documented in the surrounding area. Petroleum impacts to groundwater and soil vapor along the eastern portion of the Site are likely associated with closed Spills reported for the Site and/or former bus repair operations. No potential ongoing source (i.e., bulk petroleum storage, bus repair operations) of petroleum is known to exist at the Site. There are no potable wells in the vicinity of the Site and the majority of the Site is capped with asphalt and/or concrete slab associated with the building structure. Shallow soil samples collected from vegetated areas (non-capped) areas of the Site did not exhibit impacts in excess of Unrestricted Use SCOs (Note PFOS were detected in a shallow 0 to 6" sample (SB-5) in a vegetated area above the Unrestricted Guidance value).

Based upon the findings of this RI and subsequent pilot testing of the current mitigation system, modification of the existing SSDS in the central and southern portions of the building is necessary to effectively mitigate vapor intrusion and methane accumulation beneath the slab (see Figure 20 for an overview of the piping schematic for the current mitigation system). Such modifications include removal of old low air flow Suncourt fans, to be replaced with modern high airflow SSDS fans. Additionally, existing SSDS subgrade piping not connected to powered fans is recommended to be connected to modern high air flow SSDS fans. The eastern slab-on-grade garage areas are recommended for a complete SSDS installation including permanent extraction well(s) and connected to mitigation fan(s) Specific details regarding SSDS installation/ modifications will be presented in a Remedial Design (SSDS Design Document). A permanent methane monitoring system for the building will be specified in the Design Document for continuous monitoring of methane concentrations in indoor air.

Casper Creek flows along the eastern property boundary and is the presumed receiving body for Site-wide groundwater which generally flows from the BCP Site to the southeast (northern portion of Site) and south (southern portion of Site). Casper Creek is considered a Class C water body and is part of a network of streams and tributaries which ultimately drain to the Lower Hudson River. Class C water bodies are not used as a drinking water resource. These waters shall be suitable for fish, shellfish and wildlife propagation and survival. The water quality shall be suitable for primary and secondary contact recreation, although other factors may limit the use for these purposes. The sediment samples collected from the site boundary meet the Class B Freshwater Guidance Values. Benzo(a) pyrene exceeds the Table 8- Bio-accumulation Guidance Values for Human Health, however, human consumption of fish and shellfish from a Class C water body is not permitted. One metal (sodium) was detected in the surface water samples collected from Casper Creek above AWQS. Sodium exceeded AWQS in on-site monitoring wells. All other metals and analyte groups (VOCs, SVOCs, pesticides, PCBs and PFAS) did not exceed AWQS in surface water.

A Remedial Action Work Plan will be prepared summarizing the RI findings and outlining the remedial strategy for the Site. A Track 4 cleanup with the use of Engineering and Institutional Controls (ECs/ ICs) to manage residual impacted Site media is appropriate based on the RI findings. A Site Management Plan will be required for long-term management of residual contamination, including plans for operation, maintenance, monitoring, inspection and certification of ECs/ ICs, and reporting at a specified frequency.

11.0 SCHEDULE

Milestone	Anticipated Date
Revised RIR Submission	July 11, 2024
NYSDEC and NYSDOH Revised RIR Approval	August 23, 2024
SSDS Design Document Submission	August 5, 2024
Remedial Action Work Plan Submission	August 19, 2024
NYSDEC and NYSDOH SSDS Design Document Approval	September 16, 2024
Installation/ Modification of SSDS/ System Startup and Testing	October – November 2024
Remedial Action Field Work	November 2024
Final Engineering Report and Site Management Plan	December 2024
Certificate of Completion	December 2024

NOTES:

ANALYTE DETECTED

ANALYTE DETECTED ABOVE UU SCO

ANALYTE DETECTED ABOVE CU SCO

U=analyte not detected at or above the level indicated

D=result is from an analysis that required a dilution

J= Analyte detected at or above the MDL (Method Detection Limit)
but below the RL (Reporting Limt) - Data is estimated

NOTES:

ANALYTE DETECTED

ANALYTE DETECTED ABOVE UU SCO

ANALYTE DETECTED ABOVE CU SCO

U=analyte not detected at or above the level indicated

D=result is from an analysis that required a dilution

J= Analyte detected at or above the MDL (Method Detection Limit) but below the RL (Reporting Limt) - Data is estimated

NOTES:

ANALYTE DETECTED

ANALYTE DETECTED ABOVE UU SCO

ANALYTE DETECTED ABOVE CU SCO

U=analyte not detected at or above the level indicated

D=result is from an analysis that required a dilution

J= Analyte detected at or above the MDL (Method Detection Limit) but below the RL (Reporting Limt) - Data is estimated

NOTES:

ANALYTE DETECTED

ANALYTE DETECTED ABOVE UU SCO

ANALYTE DETECTED ABOVE CU SCO

U=analyte not detected at or above the level indicated

D=result is from an analysis that required a dilution

J= Analyte detected at or above the MDL (Method Detection Limit) but below the RL (Reporting Limt) - Data is estimated

NOTES:

ANALYTE DETECTED

ANALYTE DETECTED ABOVE UU SCO

ANALYTE DETECTED ABOVE CU SCO

U=analyte not detected at or above the level indicated

D=result is from an analysis that required a dilution

J= Analyte detected at or above the MDL (Method Detection Limit) but below the RL (Reporting Limt) - Data is estimated

Notes:

Concentration Detected

Concentration Above AWQS

ITALICS indicate laboratory detection limit above AWQS

Q is the Qualifier Column with definitions as follows:

J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated

U=analyte not detected at or above the level indicated

B=analyte found in the analysis batch blank

NT- Not tested. SVOC, pesticide, metals and PCB samples could not be collected from MW-2 based on lack of recharge

Notes:

Concentration Detected

Concentration Above AWQS

ITALICS indicate laboratory detection limit above AWQS

Q is the Qualifier Column with definitions as follows:

J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated

U=analyte not detected at or above the level indicated

B=analyte found in the analysis batch blank

D=result is from an analysis that required a dilution

NT- Not tested. SVOC, pesticide, metals and PCB samples could not be collected from MW-2 based on lack of recharge

Table 2 - SVOC Groundwater Data

Notes:

ANALYTE DETECTED

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

B=analyte found in the analysis batch blank

U=analyte not detected at or above the level indicated

SSSV= Sub-slab soil vapor

$\mu g/m^3$ - micrograms per cubic meter

ppmv - parts per million by volume

% Methane expressed in % by volume by: ppm/10,000

Notes:

ANALYTE DETECTED

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

B=analyte found in the analysis batch blank

U=analyte not detected at or above the level indicated

µg/m^3 - micrograms per cubic meter

ppmv - parts per million by volume

% Methane expressed in % by volume by: ppm/10,000

Notes:

ANALYTE DETECTED

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

B=analyte found in the analysis batch blank

U=analyte not detected at or above the level indicated

µg/m^3 - micrograms per cubic meter

ppmv - parts per million by volume

% Methane expressed in % by volume by: ppm/10,000

Notes:

in-H_2O = Inches of water

Vacuum monitoring point measurements taken with Infiltec DMI Micro Manometer with a detection limit of 0.001 inches of water

NT - Not tested. Only selected points were tested during each pilot test based on anticpated ROI and the building layout.

NT[1] -SG-11 not yet installed during 12/29/2022 testing event

NT[2] -Certain vacuum points shown to have vacuum during Test #1 not tested

Average vacuum greater than target value of -0.004 in-H_2O

Average vacuum less than target value of -0.004 in-H_2O but greater than 0.000 in-H_20

lbs = pounds

1-in-Hg = 0.033421 atm

SSD-5[1] No sample collected from SSD-5. Lab data for SSD-4, located closesd to SSD-5, was used for estimated mass removal calculations

EX-2[2] No sample collected from EX-2. Lab data for EX-1, located closesd to EX-2, was used for estimated mass removal calculations

Extrapolated[3] Sample Duration (minutes) -Lab samples were collected in canisters equipped with 30-minute regulators. A sample duration of 60-minutes was used to calculate mass removal in pounds per hour in accordance with the AERSCREEN model input requirements.

TABLE 11
AERSCREEN Model Input and Output Data
10-14 Tucker Drive, Poughkeepsie NY
BCP Site #: C314132

Compound	Projected Total System Flow (CFM)	Average Temp. (°F)	Pilot Test Mass Removed (lbs/Hr)	Maximum 1-Hour Concentration (AERSCREEN Model Output)	AGC	SGC	Exceeds AGC/ SGC
Acetone	780	51.7	9.51E-04	0.78932	30,000	180,000	No
2-Butanone/ MEK	780	51.7	4.75E-04	0.39433	5,000	13,000	No
Tetrahydrofuran	780	51.7	2.28E-03	0.18929	350	30,000	No
Toluene	780	51.7	1.24E-03	1.0292	5,000	37,000	No
PCE	780	51.7	6.20E-06	0.00514	3.8	300	No
TCE	780	51.7	1.92E-06	0.00159	0.21	20	No

Notes

Projected flow rates based on pilot testing data.

Temperature readings are an average of pilot testing extracted vapor temperatures

Mass removed is based on laboratory analytical data.

AGC - Annual Guideline Concentration

SGC - Short-trem Guideline Concentration

NYSDEC DAR-1 *Guidelines for the Evaluation and Control of Ambient Air Contaminants Under 6NYCRR Part 212* does not provide AGC/ SGC guidelines for methane emissions

Notes:

Concentration Detected

Concentration Above AWQS

ITALICS indicate laboratory detection limit above AWQS

Q is the Qualifier Column with definitions as follows:

J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated

U=analyte not detected at or above the level indicated

B=analyte found in the analysis batch blank

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on March 19, 2024 and listed below. The project was identified as your project: **C314132 Willow Brook Rentals LLC**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 24C1132

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854, NJ Cert No. CT005, PA Cert No. 68-04440, CT Cert No. PH-0723; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058, NJ Cert No. NY037, CT Cert No. PH-0721, NH Cert No. 2097, EPA Cert No. NY01600.

Sample and Data Qualifiers Relating to This Work Order

S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
S-08	The recovery of this surrogate was outside of QC limits.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
PFSu-L	The isotopically labeled surrogate recovered below lab control limits due to a matrix effect. Isotope Dilution was applied.
PFSu-H	The isotopically labeled surrogate recovered above lab control limits due to a matrix effect. Isotope Dilution was applied.
PF-CCV-L	The CCV recovery for this PFAS compound was below control limits.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) was outside the 90-110% recovery criteria.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon current NELAC/TNI Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on December 29, 2022 and listed below. The project was identified as your project: **C314132 Willow Brook Rentals LLC**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22L1392

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By: **Date:** 01/12/2023
