Re: Indoor Air Sampling Summary Report
50 Raymond Avenue, Poughkeepsie, NY
Gladmore Cleaners Site – NYSDEC Spill No. 2402735
LaBella Project No. 2243037

Dear Ms. Mossey,

LaBella Associates, D.P.C. (“LaBella”) has prepared this report to summarize the results of an indoor air assessment that was performed at 50 Raymond Avenue, Town of Poughkeepsie, Dutchess County, New York, hereinafter referred to as the “Site.”

PROJECT BACKGROUND

LaBella was retained to provide environmental consulting services at the Site following receipt of results from a sub-slab vapor sampling event performed by a consultant for an outside party. In June 2024, Gallagher Bassett Technical Services (GBTS) collected samples from four (4) locations within the first-floor slab-on-grade portion of the Site building. Analytical results from each of the sub-slab vapor locations indicated elevated concentrations of tetrachloroethene (PCE) and trichloroethene (TCE). The PCE concentrations ranged from 10 to 5,200 µg/m³ and TCE concentrations ranged from 6.8 to 11,000 µg/m³, which are concentrations that warrant mitigation. On behalf of the owner, LaBella notified the New York State Department of Environmental Conservation (NYSDEC) of the findings on June 25, 2024, and Spill No. 2402735 was assigned to the Site. NYSDEC requested indoor air sampling be conducted to evaluate air quality within the structure, recognizing that this sampling would be performed outside of the heating season, which is when indoor air sampling should be conducted to be consistent with NYS Department of Health (NYSDOH) guidance. Steps were immediately taken to initiate that effort and this letter-report summarizes the results of the investigation.

The Site consists of a two-story brick building with a small partial basement in the northwestern building footprint and finished attic. Based on available information, it appears the original two-story residence was expanded prior to 1950 for commercial use, with additions on both the first and second floor. The building is currently comprised of three (3) first/ground floor tenant spaces (Gladmore Cleaners, New Nelly Restaurant, and Twisted Soul Desserts), two vacant commercial units on the second floor, and a vacant unit in the finished attic on the third level.

SCOPE OF WORK

Indoor air quality (IAQ) sampling was performed between July 2 and 3, 2024 in accordance with LaBella’s *“Environmental Consulting Services and Indoor Air Sampling”* proposal dated June 26, 2024. The day before conducting the sampling, LaBella received floor plans that identified a

basement; this additional information warranted an adjustment to our sampling approach. LaBella reallocated a sample canister that was planned for use as a duplicate to be used to collect a basement air sample.

LaBella initially performed a walkthrough of the site to identify sample locations and potential interferences. Prior to sample collection, LaBella staff completed an inventory and monitored indoor air with a photoionization detector (PID) that presents readings in parts per billion (ppb). Results were recorded on the New York State Department of Health (NYSDOH) "Indoor Air Quality Questionnaire and Building Inventory" form, that is included as **Attachment 1**.

The highest PID readings (400 to 500 ppb) were detected in the general area of a 55-gallon drum of "Intense" brand alternative dry-cleaning solvent and related one-gallon soaps and detergents, and readings of 10 to 20 ppb were detected in the general area of 100-lb containers of "Nutra-Sour" powdered laundry sour and Tiger Comb Bleach products. LaBella reviewed the Safety Data Sheet (SDS) of the "Intense" brand solvent that confirmed the absence of PCE and its daughter products.

Observations made during the walkthrough and inventory were taken into consideration when selecting final sample locations. Locations avoided areas where the presence or use of oils and chemicals could potentially interfere with sample analysis and the laboratory's ability to achieve sufficiently low reporting limits.

LaBella staff collected a total of six (6) samples in 6-liter SUMMA®-type canisters equipped with 24-hour flow regulators, including five (5) indoor air (IA) samples and one (1) outdoor ambient (OA) air sample. Sample information is presented in the table below. Using Teflon-lined tubing, samples were collected three to five (3-5) feet above the floor surface to represent the breathing zone. Sample locations were spaced throughout the Site building to evaluate conditions in different tenant spaces, as described in the following table. No sample was collected in the finished attic space.

Sample ID	Sample Type	Tenant Space	Building Level
50Ray-B	Indoor Air	Beneath New Nelly Restaurant	Basement
50Ray-A	Indoor Air	Gladmore Cleaners (Break Room)	First Floor
50Ray-C	Indoor Air	Twisted Soul Desserts	First Floor
50Ray-D	Indoor Air	New Nelly's Restaurant	First Floor
50Ray-E	Indoor Air	Former Tattoo Voodoo space	Second Floor (southern unit)
50Ray-F	Outdoor Air	N/A	Outdoor Air

To reduce the potential for sample interference over the 24-hour period, the OA canister was placed in the northern second-story unit near a north-facing window. LaBella extended Teflon tubing out the window down to a collection height of approximately six feet above the ground surface outside the Site building.

The six (6) samples were collected concurrently, and the flow valves were closed approximately 24 hours after initiating sample collection. Samples were submitted for analysis of Volatile Organic Compounds (VOCs) by EPA Method TO-15 under standard chain-of-custody procedures to York Analytical Laboratories, Inc. of Stratford, CT. Canisters were picked up at LaBella's Poughkeepsie office by laboratory courier and a rush (3-5 day) turnaround time was requested on the analysis. York Analytical Laboratories, Inc. is certified by the National Environmental Laboratory Accreditation Conference (NELAC) and holds certification in New York, New Jersey, Connecticut, and Pennsylvania.

LABORATORY ANALYTICAL RESULTS

The IAQ results, along with June 2024 sub-slab vapor results, were compared to the NYSDOH Decision Matrices as per their Guidance for Evaluating Soil Vapor Intrusion in the State of New York (October 2006, with amendments). The attached tables include a summary of the analytical results for the July IAQ sampling event, as well as the June 2024 sub-slab sampling event. Data is presented in **Table 1** (Decision Matrix Compounds only) and **Table 2** (Non-Matrix VOCs). Sample locations and a summary of PCE and TCE results are depicted on **Figure 1**, overlaid on a Site Plan provided to LaBella.

The analytical results for the July 2024 IAQ sampling reported VOCs above laboratory detection limits. The basement air sample (50Ray-B) exhibited PCE at 4.0 µg/m³ and TCE at 0.97 µg/m³. First floor IA concentrations of PCE ranged from 1.4 to 3.5 µg/m³ and TCE ranged from 0.17 to 1.2 µg/m³. PCE was reported at 0.69 µg/m³ on the second floor and TCE was not detected above method detection limits. Indoor air concentrations of PCE and TCE were less than their respective NYSDOH Air Guideline Values (AGVs), of 30 µg/m³ and TCE of 2 µg/m³, which were established to be protective of public health.

GBTS sample SV-01, closest to Raymond Avenue, also exhibited Benzene at elevated concentrations (950 µg/m³) where mitigation would be recommended; however, indoor air concentrations for Benzene were at or below background concentrations in outdoor air.

IAQ results reported the presence of 18 other compounds in indoor air that do not have associated NYSDOH guidance values. In general, these concentrations were relatively low and consistent with commercial conditions and/or outdoor air (background) concentrations. Of these compounds, acetone was the most elevated, with indoor air concentrations ranging from 14 to 310 µg/m³. The laboratory report identified acetone in the outdoor air sample (50Ray-F) at 9,300 µg/m³. Elevated acetone was also reported by Gallagher Bassett in sub-slab vapor sample SV-01 at 1,600 µg/m³. The source of the acetone cannot be confirmed; however, acetone is not listed in the ingredients section of the Safety Data Sheet for the Intense Solvent.

The full laboratory report is provided as **Attachment 2**.

DISCUSSION AND RECOMMENDATIONS

LaBella prepared a comparison of existing GBTS and LaBella data to NYSDOH guidance matrixes and the comparison indicates the following:

- Although indoor air concentrations of PCE and TCE were less than NYSDOH AGVs, sub-slab vapor results alone identified PCE and TCE at concentrations above “Mitigate” thresholds at the Site building. NYSDOH recommends mitigation for sites where TCE concentrations in sub-slab vapor are greater than 60 µg/m³ and PCE concentrations are greater than 1,000 µg/m³. Additionally, elevated concentrations of 1,1-Dichloroethylene (1,1-DCE) trigger a Mitigate recommendation.
- The concentrations in GBTS sample SV-01, closest to Raymond Avenue, identified Benzene at a concentration also warranting mitigation; however, this compound was not reported in indoor air above background levels. Spill #0209962 was reported at the site in 2003 for a release of 150 gallons of #2 fuel oil from a storage tank, which was subsequently closed. It is possible that petroleum VOCs are related to that spill.

Based on a review of the results, LaBella offers the following recommendations:

Since sub-slab vapor data identified concentrations of PCE and TCE above mitigation guidance values, LaBella recommends design and installation of a sub-slab depressurization system (SSDS) to eliminate the potential for soil vapor intrusion into the building and satisfy NYSDOH requirements.

- The extent of subsurface impacts related to historical release of dry-cleaning solvents is unknown; therefore, LaBella recommends submitting this report to NYSDEC and scheduling further discussion regarding appropriate next steps for Spill 2402735.

If you have any questions regarding this transmittal, please do not hesitate to contact me at (838) 946-5170.

Respectfully submitted,
LABELLA ASSOCIATES, D.P.C.

(1) New York State Department of Health (NYSDOH), Guidance for Evaluating Soil Vapor Intrusion in the State of New York , October 2006 and subsequent updates. [Note: This Guidance uses a combination of indoor air and sub-slab soil vapor when comparing to the matrices. In addition, for compounds not listed in the matrices an overall site approach is employed which utilizes the USEPA BASE Database (see 2. below) as typical background for commercial buildings and also uses the outdoor air sample, refer to Guidance document for details.]

(2) USEPA Building Assessment and Survey Evaluation (BASE) Database (90th Percentile). As recommended in Section 3.2.4 of the NYSDOH Guidance (Refer to Footnote "1") this database is referenced for the indoor air sampling results. This database is also referenced to provide initial benchmarks for comparison to the air sampling data and does not represent regulatory standards or compliance values.

(3) Values obtained from NYSDOH, Guidance for Evaluating Soil Vapor Intrusion in the State of New York, updated February 2024. Recommended action depends on comparison of both sub-slab and indoor air results to matrices.

NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York, May 2017/February 2024 Decision Matrices Notes:

MONITOR:

NYSDOH recommends monitoring (sampling on a recurring basis), including but not necessarily limited to sub-slab vapor, basement air and outdoor air sampling, to determine whether concentrations in the indoor air or sub-slab vapor have changed and/or to evaluate temporal influences. Monitoring might also be recommended to determine whether existing building conditions (e.g., positive pressure heating, ventilation and air-conditioning systems) are maintaining the desired mitigation endpoint and to determine whether changes are needed. The type and frequency of monitoring is determined based on site-, building-, and analyte-specific information, taking into account applicable environmental data and building operating conditions. Monitoring is an interim measure required to evaluate exposures related to soil vapor intrusion until contaminated environmental media are remediated.

MITIGATE:

NYSDOH recommends mitigation to minimize current or potential exposures associated with soil vapor intrusion. The most common mitigation methods are sealing preferential pathways in conjunction with installing a sub-slab depressurization system and changing the pressurization of the building in conjunction with monitoring. The type, or combination of types, of mitigation is determined on a building-specific basis, taking into account building construction and operating conditions. Mitigation is considered a temporary measure implemented to address exposures related to soil vapor intrusion until contaminated environmental media are remediated.

--Note that results in unshaded cells are designated "No Further Action" recommended to address human exposure for that compound in that location; however, results from other locations in the same building may yield other recommendations.

LOWEST BUILDING LEVEL LAYOUT SKETCH

Please click the box with the blue border below to upload a sketch of the lowest building level.
The sketch should be in a standard image format (.jpg, .png, .tiff)

[Clear Image](#)

Design Sketch

Design Sketch Guidelines and Recommended Symbology

- Identify and label the locations of all sub-slab, indoor air, and outdoor air samples on the layout sketch.
- Measure the distance of all sample locations from identifiable features, and include on the layout sketch.
- Identify room use (bedroom, living room, den, kitchen, etc.) on the layout sketch.
- Identify the locations of the following features on the layout sketch, using the appropriate symbols:

B or F	Boiler or Furnace
HW	Hot Water Heater
FP	Fireplaces
WS	Wood Stoves
W/D	Washer / Dryer
S	Sumps
@	Floor Drains

○	Other floor or wall penetrations (label appropriately)
xxxxxx	Perimeter Drains (draw inside or outside outer walls as appropriate)
#####	Areas of broken-up concrete
● SS-1	Location & label of sub-slab samples
● IA-1	Location & label of indoor air samples
● OA-1	Location & label of outdoor air samples
● PFET-1	Location and label of any pressure field test holes.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on July 03, 2024 and listed below. The project was identified as your project: **2243037 Gladmore Cleaners**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 24G0188

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854, NJ Cert No. CT005, PA Cert No. 68-04440, CT Cert No. PH-0723; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058, NJ Cert No. NY037, CT Cert No. PH-0721, NH Cert No. 2097, EPA Cert No. NY01600.

Vinyl Chloride	9.57	"	10.0		95.7	70-130					

Sample and Data Qualifiers Relating to This Work Order

- TO-VAC The final vacuum in the canister was less than -2" Hg. The optimum pressure range for constant flow rate is full vacuum to -2" Hg. Bias is not suspected provided there was constant flow to the can to 75% full.
- TO-LCS-L The result reported for this compound may be biased low due to its behavior in the analysis batch LCS where it recovered less 70% of the expected value.
- ICVE The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- CAL-E The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
- B Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

- * Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
- ND NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
- RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
- LOQ LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
- LOD LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
- MDL METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
- Reported to This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
- NR Not reported
- RPD Relative Percent Difference
- Wet The data has been reported on an as-received (wet weight) basis
- Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
- High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
- Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Revision Description: This report has been revised to correct VOA results.
