EXECUTIVE SUMMARY

The Centre Avenue Development South Site (herein referred to as the "Site") was accepted into the New York Brownfield Cleanup Program (BCP) by New York Department of Environmental Conservation (NYSDEC) on June 28, 2019, and is known as BCP Site No. C360182. The Site is approximately 0.46 acres in size and is bounded by Centre Avenue to the north, Huguenot Street to the east, multi-story residential and commercial buildings to the south, and Relyea Place to the west.

This Remedial Investigation Report (RIR) summarizes the results of prior investigations and the Remedial Investigation (RI) performed on the Site. The RI was conducted in general accordance with the Remedial Investigation Work Plan/Interim Remedial Measures Work Plan (RIWP/IRMWP) for the Site, which was last revised August 22, 2019, and subsequently approved by the NYSDEC in August 27, 2019, and the NYSDEC's Technical Guidance for Site Investigation and Remediation (DER-10).

The RI consisted of collecting thirty-six (36) soil samples, nine (9) groundwater samples, and nine (9) soil vapor samples. The RECs identified in previous Phase I reports included a former automobile repair shop (1951) and former electroplating and metal finishing operation (1971-2018). Samples were collected to investigate and delineate previously identified contamination from prior subsurface investigations including VOCs, SVOCs, and metals in soil, and VOCs in groundwater and soil vapor. Soil and groundwater samples were analyzed for a combination of full target compound list (TCL) and target analyte list (TAL) analytes – which include volatile organic compounds (USEPA Method 8260), metals (USEPA Methods 6010/7471), semi-volatile organic compounds (USEPA Method 8270), PCBs and pesticides (USEPA Methods 8081/8082), and PFAS (USEPA Method 537), and 1,4-dioxane (USEPA Method 8270). Soil vapor samples were analyzed for VOCs (USEPA Method TO-15). Duplicates samples were collected in general accordance with frequencies specified in DER-10, and trip blanks accompanied all groundwater samples analyzed for volatile organic compounds (VOCs).

Based on the field investigation, the overall depth of impacted soils extend to 12 feet (ft) below ground surface (bgs). Soil impacts were identified throughout the soil column and delineated extending down to the weathered bedrock, which in certain areas was very shallow (3 ft bgs), and in other areas relatively shallow (12 ft bgs) across the Site. Polycyclic aromatic hydrocarbon (PAH) impacts exceeding both Unrestricted Use Soil Cleanup Objectives (USCO)

and Restricted Residential Soil Cleanup Objectives (RRSCOs) were identified between 3 and 8 ft bgs across the Site. Metals-contaminated soils exceeding the RRSCOs were identified in soils 1 to 11 ft bgs. Metals contaminated soils exceeding the USCOs extends down to 12 ft bgs in one sample. Pesticides impacted soils exceeding USCOs were identified in soils between 2 and 8 ft bgs at the Site. One VOC (trichloroethene) was identified in three (3) soil samples exceeding the USCO at depths between 1 and 8 ft bgs. PFOS, PFOA, and other PFAS compounds were detected sporadically in soils throughout the Site.

The Site's groundwater, which was present between 7 to 23 feet bgs, is heavily impacted with chlorinated VOCs, and also contains PAHs and metals above NYSDEC Technical Operational Guidance Series (TOGS) 1.1.1 GA Ambient Water Quality Standards (AQWS) groundwater standards primarily as a result of the historical electroplating and metal finishing operations. Groundwater was also found to contain PFAS compounds exceeding the NYSDEC Groundwater Action Level Trigger (January 2020). Contaminated groundwater was found in the weathered rock throughout the Site, which results in impacts to the fractured bedrock beneath the soil and weathered rock layer. A supplemental RI (SRI-1) was conducted in August and September 2020 to further map bedrock fractures with geophysics and to investigate contamination in the deeper fractured bedrock zones. Chlorinated VOCs (CVOCs) as well as PFOS, PFOA, and toluene were identified within shallow and deeper bedrock fractures at overall significantly lower concentrations than during the RIR as a result of dewatering conducted during the IRM. The SRI-1 report is attached as Appendix J to this RIR. A second supplemental RI (SRI-2) was conducted in January and February 2021 to vertically delineate impacts in the fractured bedrock and to determine the magnitude of impacts to nearby offsite groundwater. Results of the SRI-2 indicate that the vertical trend has shown significant decrease in groundwater CVOC concentrations with depth. The horizontal trend noted in the SRI-2 has also shown significant decrease in the CVOC concentrations downgradient (westward) in the off-site wells that were installed. The SRI-2 results indicated that there is no deeper CVOC source and that the detected CVOCs in deeper bedrock are a result of the identified source at elevation 60-45 ft-amsl. These trends indicate that the plume has been delineated vertically and horizontally. The SRI-2 report is attached as Appendix K to this RIR.

The Site soil vapor also contains CVOCs exceeding NYSDOH (New York State Department of Health) soil vapor intrusion criteria.

LNAPL (Light Non-Aqueous Phase Liquid) was identified in geotechnical boring SB-101 (located in the northwest corner of the parking lot) during the geotechnical investigation. The

LNAPL was identified at approximately 18.5 ft bgs, approximately five (5) feet below the observed weathered rock depth (13.5 feet) in this boring.

1.0 INTRODUCTION

The NYSDEC has entered into a BC Agreement (BCA) for the property located at 339 Huguenot Street and 33-35 Centre Avenue, New Rochelle, New York, which has been named the Centre Avenue Development – South Site (BCP Site. # C360182) ("Site") with BCP Volunteers Huguenot Partners LLC on June 28, 2019. A Site Location map is presented as **Figure 1 in Appendix A.** This document consists of a remedial investigation report (RIR). This RIR is a summary of the investigative work that was performed in accordance with the Remedial Investigation Workplan/Interim Remedial Work Plan (RIWP/IRMWP) prepared by SESI and dated August 22, 2019. The RIWP was approved by the NYSDEC on August 27, 2019. The report also includes a summary of the previous investigations that were conducted prior to the BCA.

The RI was completed in accordance with the NYSDEC DER-10, to provide a systematic assessment of environmental conditions on the Site. The RI defines the nature and extent of contamination on-Site, identifying contaminant source areas, and producing data of sufficient quantity and quality to complete an on-site exposure assessment and a qualitative off-site exposure assessment for purposes of designing the remedial action for the Site.

2.0 BACKGROUND

2.1 Site Description and Proposed development

The 0.46-acre rectangular-shaped site is located in an urban area in the Downtown District of the City of New Rochelle, New York and is identified as Section 2, Block 437, Lot 42 (formerly Lots 1, 3 and 42) on the Westchester County Tax Map. The original Lots 1 and 3 were identified by address 339 Huguenot Street and Lot 42 was identified by 33-35 Centre Avenue. A lot merger was approved by the City to consolidate the three lot into one before the site was entered into the BCP. The site is located on the northern part of the City block bordered by Centre Avenue to the north, Huguenot Street to the east, Columbus Avenue to the south, and Relyea Place to the west. The site is bordered to the south by multi-story residential and commercial buildings.

The Site was most recently developed by a one-story industrial building on the western half of the Site (Lot 42) and parking lot on the eastern half (Lots 1 and 3). Based on review of Sanborn fire insurance maps, former Lots 1 and 3 were developed with dwellings between 1887 and 1951 and with a parking lot between 1990 and 2003. Former Lot 42 is shown as undeveloped land prior to 1931, as a garage in 1931, and subsequently developed with residential, commercial and industrial buildings. Lot 42 was occupied by an electroplating and metal-finishing business between 1971 and 2018. The Site was historically listed as a Large Quantity Generator (LQG) and as a Small Quantity Generator (SGQ) for the generation of characteristic hazardous waste D001 (ignitable waste), D002 (corrosive waste), D005 (barium), D007 (chromium), D008 (lead), D039 (tetrachloroethene [PCE]), and U226 (1,1,1-trichloroethane [1,1,1-TCA]) between 1984 and 2004. All the buildings have been demolished down to their foundations. **Figure 2** presents a Site Plan.

The proposed brownfield project includes demolition of the existing building, installation of support of excavation and remediation of the Site and then construction of a commercial/residential development on the Site and an associated 5-story parking garage.

2.2 Description of Surrounding properties

The surrounding properties consist of multiple commercial properties including:

Direction	Adjacent Property
North	Food Market, flower shop, parking lot
South	Art Gallery, residential apartment building
East	Mixed use commercial/residential
West	Former Industrial Overall Services

2.3 Previous Environmental Investigations

The following environmental reports are attached in **Appendix B** and summarized below:

- Phase I Environmental Site Assessment (ESA), prepared by Nelson, Pope & Voorhis, LLC (NP&V), dated April 21, 2017;
- Limited Phase II ESA, prepared by NP&V, dated June 1, 2017;
- Augmented Phase I ESA, prepared by WCD Group, LLC (WCD), dated October 27, 2017;
- Environmental Fieldwork Report, prepared by WCD, dated October 27, 2017;
- Phase II ESA, prepared by WCD, dated January 24, 2018, and
- Summary Report of Environmental Investigation by WCD, January 25, 2018.

2.3.1 Phase I Environmental Site Assessments by NP&V (April 2017)

The report was prepared for a larger area that included a portion of the site (former Lots 1 and 3). The Phase I ESA identified the following two recognized environmental conditions (RECs) associated with the site:

- The site was previously occupied by an apartment building. Potential subsurface structures associated with the apartment building may still be present at the site.
- Results of a Tier 1 Vapor Encroachment Condition (VEC) Assessment identified several sites within established critical distances with documented releases or activities which could results in releases of petroleum products of toxic chemicals.

Although outside of the subject property covered in the Phase I ESA, findings related to former original Lot 42 included:

- This parcel was registered as a Conditionally Exempt Small Quantity Generator (CESQG) (Facility ID No. NYD002015402 [Eric S. Turner & Company, Inc.]). The site was historically

listed as a Large Quantity Generator (LQG) and as a Small Quantity Generator (SGQ) for the generation of characteristic hazardous waste D001 (ignitable waste), D002 (corrosive waste), D005 (barium), D007 (chromium), D008 (lead), D039 (PCE), and U226 (1,1,1-trichloroethane [1,1,1-TCA]) between 1984 and 2004.

- This parcel was also identified as a New York State Department of Environmental Conservation (NYSDEC) Air Discharge Facility (Facility ID No. 3611900260 [Eric S. Turner & Company, Inc.]) for potential uncontrolled emissions less than 100 tons of total hazardous air pollutants per year.

2.3.2 Limited Phase II ESA, prepared by NP&V, (June 2017)

A Limited Phase II ESA was prepared to evaluate potential impacts related to the RECs identified in the NP&V Phase I. The Phase II ESA was performed over a larger area that included a portion of the site (former Lots 1 and 3). The scope of the Phase II ESA within the site is described below.

- A ground penetrating radar survey was performed; anomalies indicative of subsurface structures were not identified.
- A soil vapor point was installed and one soil vapor sample and one outdoor ambient air sample were collected. The total volatile organic compound (VOC) concentration in the soil vapor sample (SV-4) was 6,279 micrograms per cubic meter ($\mu g/m^3$). The total VOC concentration in the outdoor ambient air sample (OA-2) was 184.2 $\mu g/m^3$.

The report indicates records were obtained from the City of New Rochelle regarding the closure and removal of fuel oil storage tanks previously installed in the cellar of a former building.

2.3.3 Augmented Phase I ESA by WCD (October 2017)

A Phase I ESA was prepared for original former Lot 42. The Phase I ESA identified the following RECs associated with the site:

- The former uses of this parcel include an automobile repair shop (1951) and an electroplating and metal-finishing business (1971 – 2018).
- A 550-gallon fuel oil underground storage tank (UST) previously serviced this parcel according to an interview with the property owner. The UST was reportedly closed in 2007.
- The west-adjacent property is an Inactive Hazardous Waste Disposal Site (IHWDS) in the State Superfund Program (NYSDEC Site No. 360109). This property is being investigated and remediated due to historical releases of chlorinated solvents.

2.3.4 Environmental Fieldwork Report by WCD (October 2017)

An Environmental Fieldwork Report was prepared to document activities and results related to soil vapor sampling in Lot 42. The scope of the work included:

- Installation of three soil vapor points and collection of soil vapor samples.

Laboratory analytical results are summarized below:

- The total VOC concentration in the soil vapor samples ranged from 9,423 µg/m^3 in SV-02 to 287,781 µg/m^3 in SV-01.
- Concentrations were compared to the New York State Department of Health (NYSDOH) October 2006 Guidance for Evaluating Soil Vapor Intrusion in the State of New York Decision Matrices for Sub-Slab Vapor and Indoor Air and subsequent updates (2017). Five VOCs (1,1,1-TCA, 1,1-dichloroethene [1,1- DCE], cis-1,2-dichloroethene [cis-1,2-DCE], PCE and trichloroethene [TCE]) triggered a recommendation for mitigation.

2.3.5 Phase II ESA Report by WCD (January 2018)

A Phase II ESA was performed in Lot 42 to evaluate soil and groundwater at the site.

The scope of the Phase II ESA included:

- Advancement of six soil borings; screening of soil for indications of contamination with a photoionization detector (PID); and collection of soil samples
- Installation of three temporary groundwater monitoring wells and collection of groundwater samples

Field observations and laboratory analytical results are summarized below:

- Historic fill was observed in three of the six borings and boring refusal was encountered at a depth of up to 12.5 ft bgs. Chemical impacts as evidenced by odors and PID readings up to 172 parts per million (ppm) were observed in five of the six borings. Odor was also observed during sampling of groundwater monitoring well TGW-03. Geotechnical boring results show that this is highly fractured rock which may have allowed water to migrate lower than rock depths encountered.
- Soil samples were analyzed for VOCs, PAH semi-volatile organic compounds (SVOC), and metals. Analytical results were compared to NYSDEC Title 6 of the Official Compilation of New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted Use (UR) and Restricted Use – Restricted Residential (RR) Soil Cleanup Objectives (SCO). Two VOCs (TCE and 1,4-dioxane) and five metals (barium, chromium, copper, nickel and zinc) were detected at concentrations exceeding USCOs and/or RRSCOs in 10 soil samples.
- Groundwater samples were analyzed for VOCs. Analytical results were compared to the NYSDEC 6 NYCRR Part 703.5 and the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values for Class

GA Water (AWQS). Five VOCs (1,1,1-TCA, 1,1-dichloroethane, 1,1-DCE, PCE, and TCE) were detected at concentrations exceeding NYSDEC AWQS in all three groundwater samples. A maximum TCE concentration of 15,000 micrograms per liter (µg/L) was detected in the sample collected from monitoring well TGW-03.

2.3.6 Summary Report of Environmental Investigation by WCD (January 2018)

An environmental investigation summary report was prepared for the investigation of original Lots 1 and 3 to evaluate soil at these parcels. The scope of the environmental investigation included:

- Advancement of three soil borings; screening of soil for indications of contamination by visual and olfactory means and with a PID readings; and collection of soil samples for laboratory analysis.

Field observations and laboratory analytical results are summarized below:

- Historic fill was observed from grade surface to rock. Boring refusal was encountered at depths ranging from 6.5 to 7.5 feet bgs. Chemical impacts as evidenced by odors and PID readings of up to 17.5 ppm were observed in soil boring ESB-02; petroleum impacts as evidenced by odors and PID readings of up to 81.5 ppm were observed in soil boring ESB-01.

Soil samples were analyzed for VOCs, PAHs, and metals. Analytical results were compared to NYSDEC Title 6 of the Official Compilation of New York Codes, Rules, and Regulations (NYCRR) Part USCOs and RRSCOs. Two VOCs (TCE and 1,4-dioxane) and five metals (barium, chromium, copper, nickel and zinc) were detected at concentrations exceeding USCOs and/or RRSCOs in 10 soil samples.

2.4 SUMMARY OF ENVIRONMENTAL CONDITIONS

Based on the investigations conducted prior to this RI, the primary contaminants of concern (COCs) were chlorinated VOCs, SVOCs, metals and pesticides.

Soil

- A total of 20 soil samples were collected during previous investigations. Soil sample analytical results were compared to USCOs and RRSCOs. Analytes detected with concentrations above USCOs and RRSCOs are listed below, with those above the RRSCOs shown in bold.
  - VOCs – 1,4-dioxane and TCE;
  - SVOCs – benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene
  - Metals – **barium**, **chromium**, copper, **nickel**, and zinc.

Groundwater

- A total of 15 groundwater samples were collected during previous investigations. Groundwater sample analytical results were compared to the NYSDEC Standards. Analytes detected with concentrations above NYSDEC Standards are listed below.
    - VOCs – 1,1,1-TCA, 1,1-dichloroethane, 1,1-DCE, PCE, and TCE.

Soil Vapor

- A total of four soil vapor samples and one outdoor ambient air sample were collected during previous investigations. Soil vapor sample analytical results were compared to the minimum soil vapor concentrations recommending mitigation as set forth in the NYSDOH October 2006 Guidance for Evaluating Soil Vapor Intrusion in New York State Decision Matrices for Sub-slab Vapor and Indoor Air and subsequent updates (2017). Relevant findings are listed below.
    - Total VOC concentrations ranged from 6,279 to 278,781 µg/m^3;
    - 1,1,1-TCA, 1,1-DCE, cis-1,2-DCE, PCE and TCE were detected with concentrations above minimum concentrations recommending mitigation

3.0 SITE SETTING

3.1 TOPOGRAPHY

The Site encompasses an area of about 20,000 square feet (0.46 acres). Sidewalk elevations (el) generally increase from southwest to northeast and range from about el 87.3 to 97.2 feet referenced to the North American Vertical Datum of 1988 (NAVD88).

3.2 SURFACE WATER AND DRAINAGE

There are no surface water bodies or streams on or directly adjacent to the Site. SESI did not observe any areas suspected to be wetlands on the Site. Storm water drainage patterns are generally consistent with the surrounding topography and primarily flow to the southwest down Relyea Place.

3.3 GEOLOGY

According to the 1970 Geologic Map of New York – Lower Hudson Sheet published by the University of the State of New York, the bedrock underlying the site is of the Hartland Formation, and is comprised primarily of basal amphibolite gneiss overlain by politic schists. Gneiss and schist were the primary bedrock types encountered during SESI's geotechnical investigation in September 2019 and during the Supplemental RI in August 2020. Refusal/decomposed rock was encountered during this RI at depths up to 12 ft bgs. Fill material was encountered in most borings beneath the concrete/asphalt subbase extending to varying depths up to 8 ft bgs. The fill material is underlain by fine to silty sand followed by a layer of weathered (decomposed) rock of varying thickness overlying the bedrock. Rock coring and geophysical logging was performed at 10 locations across the Site during the Supplemental RI – 1 (SRI-1), including measurements of temperature, fluid conductivity, heat pulse flow, natural gamma, caliper, electrical resistivity, acoustical televiewer, and optical televiewer. The geophysical logging results indicated that two distinct water-bearing fracture sets/zones exist beneath the Site, separated by zones of more competent bedrock, which vary in thickness from at least 10 feet to more than 25 feet. The competent bedrock zones contain low and high-angle discontinuous hairline fractures that may be potentially transmissive to varying degrees. Additional information regarding the bedrock is included in the Supplemental RIR, attached to this report as **Appendix J**.

3.4 HYDROGEOLOGY

On-site monitoring wells were gauged by SESI on December 19, 2019. Groundwater was encountered at depths of approximately 7 ft bgs at the eastern end of the Site to 23 ft bgs in the southwest corner of the Site in bedrock monitoring wells installed by SESI. The groundwater gradient in bedrock was determined to be in a southwesterly direction across the Site, as shown on the groundwater contour map (**Figure 3**). No groundwater was encountered in the overburden soils.

4.0 REMEDIAL INVESTIGATION ACTIVITIES

The RI was conducted in accordance with the NYSDEC DER-10, and in accordance with the NYSDEC-approved RIWP/IRMWP (August 27, 2019). The objective of the RI was to complete the investigation of soil, soil vapor, and groundwater on the Site and to delineate the nature and extent of the contamination on Site.

4.1 RI SAMPLING SUMMARY

Field activities were completed for the RI from September to December 2019. Nineteen (19) soil probes, nine (9) permanent groundwater monitoring wells and nine (9) soil vapor points were installed and sampled as part of the RIR. **Table 4.1 in Appendix C** includes a summary of all RI samples collected and their analyses. **Figures 4, 5, and 6 in Appendix A** present the RI sample locations for soil, groundwater, and soil vapor respectively. Field activities for the SRI-1 were completed in August and September 2020 and included the installation of sixteen (16) additional monitoring wells. **Table J1** in the SRI-1 (Appendix J) includes the construction details of the additional wells, and **Figures SRI1-A** and **SRI1-B** in Appendix J present the additional well locations. Field activities for SRI-2 were completed in January and February 2021 and included the installation of seven (7) additional monitoring wells. **Figure SRI2-A** and **Table K-1** in **Appendix K** presents the additional well locations and well construction details, respectively.

The soil and groundwater samples that were collected during the RI were analyzed for TCL/TAL +30 including metals (USEPA Methods 6010/7471), SVOCs (USEPA Method 8270), VOCs (USEPA Method 8260), PCBs, pesticides (USEPA Methods 8081/8082), PFAS (USEPA EPA Modified Method 537), and 1,4 dioxane (USEPA Method 8270). SRI-1 and SRI-2 groundwater samples were collected for VOCs, TAL metals, PFAS, and 1,4-dioxane. Field Blanks were collected each day groundwater sampling was conducted, and trip blanks accompanied all groundwater samples analyzed for VOCs. The soil vapor samples were analyzed for VOCs in accordance with EPA Method TO-15.

4.2 INVESTIGATION METHODOLOGY

All the field work was completed under the on-Site observation of a SESI field engineer and the environmental professional engineer (PE). The field work involved advancing borings, installing soil vapor probes, and installing permanent monitoring wells. Disposable field equipment was utilized to collect soil and groundwater samples. SESI observed the work completed by the following subcontractors:

- All Star Drilling - advanced soil borings, installed monitoring wells, and installed soil vapor points utilizing direct-push, hollow-stem auger, and air rotary drilling techniques during the RI.
- AARCO Environmental Services – advanced boreholes in bedrock, installed monitoring wells during SRI-1 and SRI-2.
- Alpha Analytical, Massachusetts (NY ELAP Certification 11148) – Analyzed soil and groundwater samples as per requested analytical methods.
- Alpha Analytical, Massachusetts (NY ELAP Certification 11148) – Analyzed soil vapor samples as per requested analytical methods.
- Earth Data Northeast (EDN) has conducted borehole geophysics during the RI and SRI-1 field efforts.

4.3 SOIL BORINGS AND SAMPLING

A total of thirty-six (36) soil samples were collected from nineteen (19) soil borings (B-1 through B-19) during the RI. The borings were advanced utilizing direct-push drilling techniques. Borings generally covered all areas of the Site, with a few boring locations (B-1, B-2, B-6) modified slightly due to interior building structures and basements that were still present at the time of sampling. Borings were advanced to refusal/assumed bedrock depth, which ranged from 3 to 12 ft bgs. Soil samples were collected utilizing macro-core samplers. Samples for laboratory chemical analyses were collected based on field screening, which includes visual and olfactory observations and screening with PID. The boring logs are provided in **Appendix D.**

In addition to the remedial investigation grab samples, composite samples were collected for waste characterization purposes. The waste characterization samples were collected at an approximate frequency of 1 composite per 750 cubic yards (CY) of soils based on site grid cells of 50 foot-wide by 50 foot-long and 10 foot deep. The waste characterization sample results and site grid are included in **Appendix F**.

4.4 MONITORING WELL INSTALLATIONS

During the RI, eight (8) permanent groundwater monitoring wells were installed and sampled and one (1) existing on-site monitoring well was sampled to investigate groundwater

across the Site, and to delineate groundwater contamination previously identified underlying the former electroplating operation. Monitoring well installation activities were conducted on October 1-2, 2019 (MW-1 and MW-2), and from November 25 – December 6, 2019 (MWs 5S, 5D, 7D, 8D, 9D, 10).

Additional monitoring wells were installed during SRI-1 and SRI-2, the details of which are presented in **Appendix J** and **Appendix K**, respectively.

Well screen depths within the bedrock varied based on the depths of fractures identified during geophysical logging of the boreholes for wells MW-5D, MW-8D, and MW-9D. The first borehole geophysical logging during the RI was conducted on December 11, 2019 by Earth Data Northeast, and consisted of temperature, conductivity, natural gamma, and acoustic televiewer sensors. The log for borehole 5D indicates significant fractures at depths of 12 ft bg, 17 ft bg, and 23 ft bg. Two nested wells were therefore installed at this location, including well MW-5S screened from 9.5-14.5 ft bg, and well MW-5D screened from 20-30 ft bg. The log for borehole 8D indicates a large fracture from 36-38 ft bg, therefore well MW-8D was screened from 33-43 ft bg. The log for borehole 9D indicated a fracture at 24 ft bg, and no other discernable fractures down to its completion depth of 43 ft bg. Well MW-9D was therefore screened for the entire length of open borehole from 23-43 ft bg. Well screen depths for MW-7D and MW-10 were adjusted from 25-35 ft bgs (as proposed in the RIWP) to 15-25 ft bgs based on extensive shallow fractures identified during drilling of these boreholes and more competent bedrock encountered below 25 ft bg during SESI's geotechnical investigation, which eliminated the need to screen these wells at a deeper interval. Wells MW-1 and MW-2 were screened across the top 10 feet of bedrock (7.5-17.5 ft bg) in order to capture groundwater present in shallow bedrock. Well MW-3 was previously installed by others and was measured to have a total depth of 18 feet below site grade. As no construction log was identified for this well, the screened interval is not known. Construction details for the wells installed during SRI-1 are included in Appendix J, and details for the wells installed during SRI-2 are included in Appendix K.

All new wells were constructed utilizing 2-inch PVC pipe with a 10-foot, 10 (0.010 inches) slot screen. The PVC screen was surrounded by #2 filter sand in each well. The filter sand extends at least about 1 foot above the screen. Bentonite about 1 foot thick was then placed on top of the filter sand and the remaining annular space around the PVC riser was grouted with cement/bentonite mix. The wells were subsequently completed with protective steel manholes as flush mount.

The monitoring wells were developed until the purge water being pumped was free of

sediment. The development water was collected in drums for disposal off-site. **Appendix D** includes the RI monitoring well construction logs, and **Appendix E** includes the borehole geophysical logging results.

Groundwater sampling was conducted on December 19-20, 2019. Groundwater samples were analyzed for TCL/TAL +30, PFAS, and 1-4 dioxane. The depth of the wells ranged from 14.5 to 43 ft bgs. All wells were installed within the bedrock. The depth of water table was determined to vary from 7 to 23 ft bgs across the Site this variation is due to the change in the Site topographic elevations. Details regarding the construction and sampling of the additional wells installed as part of the SRI-1 and SRI-2 are included in Appendix J and Appendix K, respectively.

4.5 GROUNDWATER SAMPLING

On December 19-20, 2019, the monitoring wells were sampled in accordance with USEPA low flow sampling procedures. The purge water was piped to a "flow cell," where groundwater geochemical parameters such as pH, redox potential, specific conductance, dissolved oxygen, salinity and turbidity were measured at three (3) minute intervals. Drawdown during the well sampling was also measured. Field parameters including pH, dissolved oxygen, turbidity, specific conductance and oxidation/reduction potential (ORP) were measured. "Redi-flow" purging techniques were implemented to achieve stabilization. Groundwater samples were collected once the geochemical parameters stabilized for three consecutive readings. **Appendix G** includes the purge data for the groundwater monitoring wells.

The wells installed as part of SRI-1 and SRI-2 were sampled in general accordance with the procedures described above. Purge data for these additional wells are included in Appendix J and Appendix K, respectively.

A groundwater contour map was developed using well gauging and surveying data (**Figure 3, Appendix A**). The map depicts groundwater flow in bedrock to the southwest across the Site. This follows the regional topography. The Well gauging and Survey data is presented on **Table 4.2 in Appendix C.**

4.6 SOIL GAS INVESTIGATION

SESI collected nine (9) soil vapor samples (SV-1 through SV-5, SV-7 through SV-10) were collected across the Site. Location SV-6 could not be completed due to the presence of shallow

water (probable perched rainwater) in the hole. The soil vapor points were collected at a depth of 5 ft bgs across the Site. Soil gas samples were collected in accordance with the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York.

Semi-permanent soil vapor probes were installed with an adequate surface seal to prevent outdoor air infiltration at each sampling location. Soil gas implants were installed using a direct push Geoprobe® to attain the depths as noted in Table 4.1. Porous, inert backfill packer sand was used to create a sampling column of 2 feet in length. The implants were fitted with inert Teflon® tubing to the surface. Soil vapor probes were sealed above the sampling zone with a bentonite slurry for a minimum distance of 3 feet. The remainder of the borehole was backfilled with clean material.

Prior to sampling, the soil vapor points were purged three times the volume of the sample probe and tube. Flow rates for both purging and collecting were maintained below 0.2 liters per minute to minimize outdoor air infiltration during sampling. Soil vapor samples were collected over 30-minute runtimes in certified 1-L Summa ® canisters provided by the laboratory. Helium tracer testing was performed on each probe using a box and helium gas detector per the NYSDOH Guidance to ensure no ambient air was penetrating the bentonite seal. In addition, one (1) ambient air sample (AA-1) was also collected during the soil vapor sampling as a control, with a 1-hour runtime. All the samples were sent to Alpha Analytical (an ELAP-accredited laboratory) for EPA TO-15 analysis.

5.0 REMEDIAL INVESTIGATION RESULTS

For purposes of evaluating the remedial alternatives associated with the proposed Site redevelopment, the analytical results of the soil samples were compared to the NYSDEC USCOs and RRSCOs as presented in **Table 5.9 in Appendix C**. The constituent concentrations in groundwater were compared to the applicable NYSDEC TOGS Class GA AWQS as presented in **Table 5.10 in Appendix C**. The soil vapor data is presented in Table **5.11 in Appendix C**, and were compared to the NYS DOH Soil Vapor Intrusion Guidance matrices. Sampling locations and concentrations maps for soil, groundwater, and soil vapor are identified in **Figures 4, 5, and 6 in Appendix A**. The laboratory data packages for soil, soil vapor and groundwater results are included as **Appendix H**. The Data Usability Summary Reports (DUSRs) are included in **Appendix I** of this report. All data generated has been or will be submitted in an electronic data deliverable (EDD) that complies with the DEC's Electronic Data Warehouse Standards (EDWS). Laboratory data packages for groundwater samples from the SRI-1 is included in **Appendix J**, and those from the SRI-2 are included in **Appendix K**.

5.1 SOIL INVESTIGATION RESULTS

VOCs

One volatile organic compound (VOC), trichloroethene (TCE), was detected in 3 samples exceeding USCOs, as shown in the summary table below. Acetone, a common laboratory contaminant, was also detected in excess of USCOs in most soil samples. The presence of this compound is not considered to be site-related.

Table 5.1 - Summary of VOC Exceedances in Soil

Analyte	Part 375-6.8(a) URSCO	Part 375-6.8(b) RRSCO	B-7 (1-2)	B-16 (3-4)	B-16 (7-8)
Trichloroethene	0.47	21	0.92	1.5	0.55

Indicates compound Exceeds NYSDEC USCO
All concentrations in mg/kg
Sample depth range indicated in feet below grade in parentheses

PCBs and Cyanide

One soil sample, B-17 (1.5-2.5), contained PCBs at a concentration of 0.11 mg/kg, slightly exceeding the USCO of 0.1 mg/kg. Cyanide was also detected in the sample at 74 mg/kg,

exceeding the USCO/RRSCO of 27 mg/kg. PCBs and cyanide were not detected exceeding any SCOs in any other soil samples.

PAHs

Polyaromatic hydrocarbons (PAHs) including benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, pyrene, fluoranthene, and indeno(1,2,3-cd)pyrene were identified in five (5) soil samples from five (5) soil borings [B-10(7-8), B-4(4-5), B-9(3-4), B-13(6-7), and B-8(4-5)] at concentrations that exceeded the USCO and RRSCO. The logs of these borings indicated the presence of historic fill which consists of concrete, ash, and brick down to as deep as 8 ft bgs. The soil samples with PAHs exceeding the USCOs is presented in the summary table below.

Table 5.2 - Summary of PAH Exceedances in Soil

Metals

Metals including barium, copper, lead, mercury, nickel, and zinc were identified in twenty-five (25) of 36 at concentrations exceeding their USCO and/or RRSCO. The depth of metals impacts ranged from 1 to 12 feet across the Site exceeding their USCOs. The soil samples with metals exceeding the USCOs and RRSCOs are presented in the summary table below.

Table 5.3 - Summary of Metals Exceedances in Soil

Pesticides

Several pesticides, including dieldrin, 4,4'-DDE, 4,4'-DDD, 4,4'-DDT, and cis-chlordane were identified in eleven (11) samples exceeding USCOs. Depth of pesticide impacts ranged from 2 to 8 feet across the Site. Soil samples with pesticides exceeding USCOs are summarized in the table below.

Table 5.4 - Summary of Pesticide Exceedances in Soil

Analyte	Part 375-6.8(a) URSCO	Part 375-6.8(b) RRSCO	B-10 (2-3)	B-10 (7-8)	B-15 (3-4)	B-15 (6-7)	B-4 (4-5)

Emerging Contaminants

Emerging contaminants including Perfluorooctanesulfonic acid (PFOS), Perfluorohexanoic acid (PFHxA), Perfluorooctanoic acid (PFOA), Perfluorooctanesulfonamide (FOSA), and N-Ethyl Perfluorooctanesulfonamidoacetic Acid (NEtFOSAA) were detected sporadically in soils across the Site. Soil standards have not yet been promulgated for these compounds. PFOS was detected at concentrations ranging from 0.18 ug/kg to 10.6 ug/kg, PFOA was detected at concentrations ranging from 0.057 ug/kg to 0.324 ug/kg, FOSA was detected at concentrations ranging from 0.105 ug/kg to 5 ug/kg, PFHxA was detected at concentrations ranging from 0.054 ug/kg to 0.087 ug/kg, and NEtFOSAA was detected at concentrations ranging from 0.343 ug/kg to 7.07 ug/kg. A summary of PFAS soil sampling detections are presented in

Table 5.9E in Appendix C. Another emerging contaminant, 1,4-dioxane, was analyzed via EPA Method 8270 SIM, but did not exceed the USCO in any samples (see Table 5.9B).

The following conclusions can be made based on the above soil results:

- Soil impacts were identified throughout the soil column and delineated extending down to the weathered bedrock.
- PAH impacts exceeding both USCOs and RRSCOs were identified between 3 and 8 ft bgs across the Site.
- Metals contaminated soils exceeding the RRSCOs were identified in soils from 1 to 11 ft bg. Metals contaminated soils exceeding the USCOs extends down to 12 ft bgs in one sample.
- Pesticides impacted soils exceeding USCOs were identified in soils between 2 and 8 ft bgs at the Site.
- One VOC (TCE) was identified in three (3) soil samples exceeding the USCO at depths between 1 and 8 ft bgs.
- PFOS and PFOA were identified in soil samples throughout the Site, and several other PFAS compounds were sporadically detected in soil samples as well.

5.2 GROUNDWATER

Nine (9) permanent groundwater monitoring wells were sampled on December 19 and 20, 2019. Groundwater samples were analyzed for TCL/TAL+30, PFAS, and 1,4-dioxane.

VOCs

VOCs were detected at concentrations in excess of the AWQS in six of the nine wells sampled, including all wells on the western half of the Site. These include several chlorinated VOCs (cVOCs) such as 1,1,1-trichloroethane (1,1,1-TCA), 1,1-dichloroethene (1,1-DCE), cis-1,2 and trans 1,2-dichloroethene, trichloroethene (TCE), vinyl chloride, tetrachloroethene (PCE), and 1,1-dichloroethane, as well as toluene, a petroleum-related constituent. The highest cVOC concentrations were detected in the two deepest wells, MW-8D and MW-9, which contained large bedrock fractures at 36-38 ft bg and 24 ft bg, respectively. MW-8D and MW-9 are located within the footprint of the pre-exiting electroplating vats. The 1,1,1-TCA concentrations in MW-8D and MW-9 (23,000 ug/L and 1,000,000 ug/L, respectively) exceed 1% of the aqueous solubility for 1,1,1-TCA (13,340 ug/L at 25°C) indicating the probable presence of this compound as free phase

dense non-aqueous phase liquid (DNAPL) in the area of these wells. The concentration of 1,1-DCE in MW-9 (28,000 ug/L) also exceeds 1% of the aqueous solubility for 1,1-DCE (22,500 ug/L at 25°C) indicating that this constituent may also be present as free phase DNAPL in the area of this well. The VOC groundwater sampling results exceeding AWQS are presented in the table below.

Table 5.5 - Summary of VOCs Exceeding NYSDEC AWQS

	NY-AWQS	NY-TOGS-GA	MW-5S	MW-5D	MW-7D	MW-8D	MW-9	MW-10

SVOCs

Several SVOC were detected in three wells at concentrations exceeding their AWQS, including benzo(a)anthracene, benzo(a)pyrene), benzo(k)fluoranthene, benzo(b)fluoranthene, chrysene, and phenol. The SVOC groundwater sampling results exceeding AWQS are presented in the table below.

Table 5.6 - Summary of SVOCs Exceeding NYSDEC AWQS

Metals

Several metals including sodium, chromium, iron, magnesium, manganese, and nickel were detected at levels that exceeded the TOGS Class GA AWQS or TOGS maximum groundwater effluent limitations in at least one of the monitoring wells sampled. The metals groundwater sampling results exceeding AWQS are presented in the table below.

Table 5.7 - Summary of Metals Exceeding NYSDEC AWQS

Notes:
All concentrations in ug/L
Indicates compound Exceeds NYSDEC AWQS

PCBs/Pesticides

One pesticide, dieldrin, was detected in one well (MW-1) at a concentration of 0.005 ug/L, slightly exceeding the AWQS of 0.004 ug/L. No PCBs were detected in any of the groundwater samples in excess of AWQS.

Emerging Contaminants

Two PFAS compounds, perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) were detected in all wells exceeding the NYSDEC action level triggers noted in the NYSDEC Sampling, Analysis, and Assessment of PFAS (January 2021). Total PFAS compound levels were also found to be in excess of the action level trigger in six (6) of the wells. The highest concentrations were identified in the western portion of the Site (MW-5S, MW-5D, MW-7D, MW-8D, MW-9, MW-10), significantly higher than on the eastern half (MW-1, MW-2, MW-3), as illustrated in the table below. The PFOS concentrations in samples MW-5S, MW-5D, MW-9, and MW-10 exceeded the calibration range of the lab instrumentation, and diluted runs were completed for these samples. The table below shows the diluted run PFOS results for these samples.

Table 5.7A – Summary of PFAS Compounds in Groundwater Exceeding Action Levels

Well ID			MW-1	MW-2	MW-3	MW-7D	MW-5S

NYS PFAS: NYSDEC Guidelines for Sampling and Analysis of PFAS Groundwater Action Level Trigger (January 2020)
Highlight - Exceeds Action Level Trigger

The following conclusions can be made based on the RIR groundwater results:

- The water bearing zones and the fractures within the rock strata were delineated vertically using borehole geophysics combined with the geotechnical investigation. It was determined that the water bearing zone depth generally ranges from 12-24 ft bgs. Below this zone, the rock was found to be generally solid with identified micro fractures, except for one water-bearing fracture between 36-38 ft bgs in borehole MW-8D. Additional bedrock characterization was conducted during the SRI-1 (Appendix J).
- Dissolved CVOC exceedances are present on the western half of the Site underneath the former electroplating operation. The highest CVOC concentrations are present in the southwestern-most corner of the Site in wells MW-8D, MW-9, and MW-10 and are indicative of possible free phase DNAPL.
- Dissolved toluene (a petroleum hydrocarbon) exceedances are also present on the western half of the Site in four (4) wells, including a maximum concentration of 7,200 ug/L in MW-9D, also underlying the former electroplating operation and co-located with the highest cVOC concentrations.
- The 1,1,1-TCA concentration in MW-9 is at least two (2) orders of magnitude higher than the second highest concentration detected (MW-8D), and five (5) orders of magnitude

higher than the concentrations in MW-5S/MW-5D, located just 45 feet to the east. Similarly, concentrations of toluene and 1,1-DCE in MW-9 are 1-3 orders of magnitude higher than all other wells in which the compounds were detected.

- TCE concentrations are highest in MW-10, indicating an increasing trend in the downgradient direction. Three common TCE breakdown products (cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride) were detected above TOGS AWQS in the MW-5S/MW-5D cluster well location.
- PCE was detected exceeding TOGS AWQS in MW-10, and detected below TOGS AWQS in MW-5S and MW-5D.
- Dissolved SVOCs were identified in three wells including MW-3 on the eastern portion of the Site, and wells MW-9 and MW-10 on the western portion.
- PFOA and PFOS were detected in excess of their respective NYSDEC action levels in all wells, and total PFAS was in excess of the action level in six of the wells on the western half of the Site. The highest concentrations were detected on the western half of the Site.
- On the East side of the side the highest PFAS levels were detected in MW-3 (357 ng/l), which is the most upgradient well of the Site. The PFAS levels were lower in MW-2 (296 ng/l), which is downgradient of MW-3, and lowest in MW-1 (110 ng/l) in the northeast corner. Concentrations in all three wells were significantly lower than those on the western half where concentrations as high as 4,830 ng/l were detected. In addition, the original grade of the eastern half of the Site was significantly higher than the western side and therefore upgradient.
- Several metals exceeded their AWQS sporadically across the Site. The majority of the detected metals (sodium, magnesium, manganese, and iron) are secondary contaminants and their exceedances may be the result of background/naturally occurring levels. Chromium and nickel were detected in the western portion of the Site only and may be related to historic electroplating operations.
- One pesticide, dieldrin, was detected in one well (MW-1) slightly exceeding the AWQS. No PCBs were detected in excess of the AWQS.
- The weathered rock below the soils was found impacted with petroleum LNAPL in one isolated location as described in Section 5.4 below. In addition, it was determined that this layer was impacted with contaminated groundwater because the layer is within the

seasonal groundwater table variation.

The following additional conclusions can be made based on the SRI-1 groundwater results included in Appendix J:

East Side of the Site:

- Analytical data from monitoring wells installed on the eastern side of the site indicates elevated levels of PFAS and a concentration of xylene in monitoring well MW-202 above AWQS. However, the groundwater in New Rochelle is not used as a drinking water source and these exceedances are limited in their area.

West Side of the Site:

- The supplemental investigation confirmed the findings of the RIR conducted in December 2019 and reported in February 2020. The Site geology is formed of competent rock with water bearing fractures and potentially transmissive micro-fractures. The fractures were identified at different elevation depending on the location on the Site.
- The same contaminants of concern (COCs) including the CVOCs, toluene, PFOS/PFOA, and 1,4 dioxane were identified in both the RI and the SRI. There was significant drop in the CVOC, PFOS, PFOA, and toluene concentrations from the RI compared to the SRI-1 data as result of the dewatering conducted during the IRM.
- The source area was further delineated as a result of the SRI-1 as shown in Figures SRI1-A and SRI1-B.

The following additional conclusions can be made based on the SRI-2 groundwater results included in Appendix K:

West Side of the Site:

- The vertical trend has shown significant decrease of the groundwater CVOC concentrations with depth. The horizontal trend has also shown significant decrease in the CVOC concentrations downgradient (westward and southward) in the wells installed at the western and southern property borders. These trends indicate that the plume has been delineated vertically and horizontally.
- Based on the vertical trend that is decreasing with depth, no source area was identified in the deep rock aquifer. The extent of the CVOC source appears to be limited to the area around wells MW-207, MW-208 and MW-209 installed during the initial remedial

investigation (RI) at elevation 28-48 ft-amsl.

5.3 SOIL GAS RESULTS

The cVOC 1,1-Dichloroethene was identified at two locations and TCE was identified at 3 location exceeding their respective lower threshold values when compared to the applicable NYSDOH 2017 Matrix A. The cVOC 1,1,1-TCA was identified at one location exceeding its respective lower threshold value when compared to the applicable NYSDOH 2017 Matrix B. Soil vapor exceedances are presented in the table below.

Table 5.8 - Summary Soil Vapor VOCs results

	Units	NYSDOH Standards		SV-1	SV-2	SV-5
		NY-SSC-A	NY-SSC-B			
1,1-Dichloroethene	ug/m3	6		16	U	1110
Trichloroethene	ug/m3	6		53.5	11.4	184
1,1,1-Trichloroethane	ug/m3		100	81.8	17.4	15100

Notes:
Indicates compound Exceeds NYSDOH Matrices threshold (May 2017)

Conclusions of the soil vapor results include the following:

- 1,1-Dichloroethene exceeded the NYSDOH Matrix A screening values in SV-1 and SV-5, which are located in the western portion of the Site. The compound was also detected in groundwater in this area of the Site.
- TCE exceeded the NYSDOH Matrix A screening value in three locations at the Site. The two highest concentrations (SV-1 and SV-5) are located in the western portion of the Site. The remaining location, SV-2, is located just outside the former building footprint in the center of the Site. TCE was also detected in groundwater at elevated concentrations beneath the western half of the Site.
- An elevated concentration of 1,1,1-TCA well above the NYSDOH Matrix B screening value was detected in SV-5, corresponding to the location of the most elevated concentration detected in groundwater (MW-9).

5.4 LNAPL DISCOVERY AND DELINEATION

LNAPL (Light Non-Aqueous Phase Liquid) was identified in geotechnical boring SB-101 (located in the northwest corner of the parking lot) during the geotechnical investigation. The LNAPL was identified at approximately 18.5 ft bgs, approximately five (5) feet below the observed weathered rock depth (13.5 feet) in the boring. A sample of the LNAPL was collected on March 27, 2020 for fingerprint analysis. The fingerprint analysis did not produce a match, and no VOCs were detected in the sample, indicating that the NAPL is highly weathered since it has no more detectable volatiles. Fingerprint analysis results were submitted to NYSDEC on April 8, 2020, and are included in **Appendix L**. In order to confirm the presence of LNAPL, a monitoring well (FP-1) was installed immediately next to SB-101. No LNAPL was detected in the well, although an elevated PID reading (97 ppm) was noted in the well. Three (3) temporary wells (TW-1, TW-2, TW-3) were installed 10 feet to the west, south, and east of FP-1, respectively, to delineate the LNAPL. No LNAPL was measured in the temporary wells, and no PID readings were noted. LNAPL at the Site is considered to be delineated at this time. The LNAPL and delineation well locations are shown on **Figure 7**.

6.0 REMEDIAL INVESTIGATION FINDINGS AND SUMMARY

6.1 CONCEPTUAL SITE MODEL

Soil impacts were identified throughout the soil column and delineated extending down to the weathered rock, which in certain areas was very shallow (3 ft bgs), and in other areas relatively shallow (12 ft bgs) across the Site. PAH impacts exceeding both USCOs and RRSCOs were identified between 3 and 8 ft bgs across the Site. Metals contaminated soils exceeding the RRSCOs were identified in soils from 1 to 11 ft bg. Metals contaminated soils exceeding the USCOs extends down to 12 ft bgs in one sample. Pesticides impacted soils exceeding USCOs were identified in soils between 2 and 8 ft bgs at the Site. One VOC (TCE) was identified in three (3) soil samples exceeding the USCO at depths between 1 and 8 ft bgs.

The applicable standards criteria and guidance (SCGs) for the Site groundwater are the NYSDEC TOGS 1.1.1 AWQS. The Site's groundwater has been significantly impacted with chlorinated VOCs, toluene (a petroleum hydrocarbon), as well as chromium and nickel underneath the western half of the Site due to historical site operations. Chlorinated VOCs 1,1,1-TCA and 1,1-DCE were present in two wells on the western portion of the Site at concentrations indicative of DNAPL. Chlorinated VOCs were also found to be present in deeper bedrock fractures

during the Supplemental RI at significantly lower overall concentrations due to construction dewatering/aquifer pumping that occurred during the IRM. Results of SRI-2 indicate that the vertical trend has shown significant decrease in groundwater CVOC concentrations with depth. The horizontal trend noted in SRI-2 has also shown significant decrease in the CVOC concentrations downgradient (westward) in the off-site wells that were installed near the property boundary. These trends indicate that the plume has been delineated vertically and horizontally. Groundwater is also impacted to a lesser extent by PAH compounds and secondary metals above NYSDEC TOGS AQWS groundwater standards that could be attributed either to potential leaching from historic fill or background/naturally occurring conditions.

The Site groundwater flow direction is to the southwest. No groundwater was identified within the soil column and all groundwater beneath the Site was identified within the bedrock. Water-bearing fractures in the bedrock were generally identified between 12 and 24 ft bgs, with generally fewer fractures and more competent bedrock present beneath this depth based on borehole geophysical logging conducted during the RI and the results of SESI's geotechnical investigation completed in September 2019. Additional borehole geophysical logging conducted during the Supplemental RI indicated that the deeper Site geology is formed of competent rock with water bearing fractures. The fractures were identified at different elevations depending on the location on the Site.

The pathway of the contaminated groundwater to human receptors is limited to the ingestion of the groundwater or direct exposure through excavation work. However, groundwater in this area of New Rochelle is not used for drinking. In addition, the impacted Site groundwater is not likely to have an ecological pathway.

Finally, the cVOCs detected in soil vapor can result in soil vapor intrusion into the future on-Site buildings. A sub-slab depressurization system with the foundation sealed by a soil vapor barrier are recommended to be installed beneath the future on-Site buildings to mitigate the potential for vapor intrusion.

6.2 HUMAN HEALTH EXPOSURE ASSESSMENT

There are potential exposure pathways related to the contamination if left unaddressed:

The pathway of the contaminated groundwater to human receptors is limited to the direct ingestion of the groundwater or direct exposure through excavation work. Groundwater was found to contain CVOC at levels that exceed the AWQS. However, groundwater in this area in

New Rochelle is not used for drinking water and once the site is redeveloped, excavation to the depths at which groundwater is present (between 16-18 ft bgs) is unlikely. After source zone treatment occurs, the groundwater will naturally attenuate with time and is not anticipated to be a pathway for human heath exposure in the future post remediation and mitigation.

PAHs, metals, and pesticides exceedances of the RRSCOs in the Site soil that consist of contaminated fill from 0 to approximately 12 ft bgs pose a direct exposure risk to human health. The exposure pathway to humans can be through direct dermal contact with the contaminated soils or incidental ingestion. However, the soil source will be removed through Site remediation activities, which call for the source removal excavation of all on-Site soils above the bedrock.

The cVOC levels in the Site soil vapors were found to exceed the NYSDOH Matrix A and B threshold values. The exposure route for soil vapor through the inhalation of the contaminated soil vapor that may intrude into the enclosed spaces of any planned Site development will be mitigated by a sub-slab depressurization system after the foundation is sealed with a vapor barrier to prevent intrusion via any potential cracks in the foundation in the future as the groundwater is attenuating.

6.3 FISH AND WILDLIFE RESOURCES IMPACT ANALYSIS

The Site was evaluated based on the criteria listed in DER-10 Section 3.10.1(b), and based on the fact that the Site is an urban site which is not proximate to a surface water body, wetland or other ecologically significant area, and that there is no habitat of an endangered, threatened or special concern species present, an FWRIA is not needed.

6.4 DATA USABILITY SUMMARY REPORT

To validate laboratory analytical data, Data Usability Summary Reports (DUSR) for each laboratory analytical data package have been prepared. To ensure that the field sampling and laboratory analytical practices were acceptable, the data associated with all the samples were validated by a third party (in accordance with requirements of DER-10). The validation approach and results are presented in the DUSRs and are included in this RIR. The DUSR results are presented in **Appendix I**.

The DUSR includes data sets from this phase of the remedial investigation. The DUSR was carried out as specified in DER-10 to evaluate the quality control measures that were implemented during the field and laboratory analytical programs, with the objective of determining whether the reported analytical data are representative and usable for decision making. The

DUSR evaluated whether the data are technically defensible (i.e. were all analytical data requirements met and documented?). Data usability analysis reviews the Site data to determine whether they are adequate to draw conclusions regarding the nature and extent of contamination.

The items that were reviewed as part of the DUSR include the following:

- Completeness (number of samples collected and analyzed compared to plans)
- Chains of custody are complete and accurate
- Holding times
- Instrument calibration
- Relative percent difference between field duplicates
- Reasonableness of data (e.g. relationships between total and soluble analytes)
- Blank contamination

The DUSRs for the soil, groundwater and soil vapor samples analyzed by Alpha Analytical showed that the overall performances of the analyses are acceptable and did fulfill the requirements of the analytical methods. The DUSR from the SRI-2 is currently pending. The samples were analyzed within the USEPA SW-846 holding times. None of the analytical data changed based on the DUSR. All results are usable as reported or usable with minor modification due to sample matrix or laboratory quality control outliers, with a few exceptions which are explained below:

Groundwater

- Samples MW-5S, MW-5D, MW-9, MW-10, and DUP were diluted or re-analyzed for perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For perfluorooctanesulfonic acid results in samples MW-5S, MW-5D, MW-9, MW-10, and DUP, the diluted or re-analyzed results should be considered the most usable. The initial MW-5S, MW-5D, MW-9, MW-10, and DUP results should not be considered usable for perfluorooctanesulfonic acid. Results presented in this report (Table 5.7A) are of the diluted analysis for these samples.

- The SVOC nondetect results for benzoic acid in samples MW-1, MW-2, MW-3, MW-7D, and FB were rejected (R) due to severely low for LCS/LCSD percent recoveries. The results are not usable for project objectives, which may have a major impact on the data usability. However, benzoic acid is not a COC at the Site.

- Sample MW -206DL was diluted for 1,1,1-trichloroethane due to original analysis

exceeding the calibration range. For the 1,1,1-trichloroethane result in sample MW-206DL, the diluted result should be considered the most usable. The MW-206 result should not be considered usable for 1,1,1-trichloroethane.

- Sample MW-209S (62.5-67.5)DL was diluted for perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For the perfluorooctanesulfonic acid result in sample MW-209S (62.5-67.5)DL, the diluted results should be considered the most usable. The MW-209S (62.5-67 .5) result should not be considered usable for perfluorooctanesulfonic acid.

- Sample MW-207D was diluted for perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For the perfluorooctanesulfonic acid result in sample MW-207DDL, the diluted result should be considered the most usable. The MW-207D result shouldnot be considered usable for perfluorooctanesulfonic acid.

- Samples MW-210D and MW-210I were diluted for 1,1,1-trichloroethane and perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For the 1,1,1-trichloroethane and perfluorooctanesulfonic acid results in samples MW-210DDL and MW-210IDL, the diluted results should be considered the most usable. The MW-210D and MW-210I results should not be considered usable for 1,1, !-trichloroethane and perfluorooctanesulfonic acid.

- Sample MW-210S was diluted for trichloroethene and perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For the trichloroethene and perfluorooctanesulfonic acid results in sample MW-210SDL, the diluted results should be considered the most usable. The MW-210S results should not be considered usable for trichloroethene and perfluorooctanesulfonic acid.

- Sample MW -208D was diluted for perfluorooctanesulfonic acid due to original analysis exceeding the calibration range. For the perfluorooctanesulfonic acid result in sample MW- 208DDL, the diluted result should be considered the most usable. The MW-208D result should not be considered usable for perfluorooctanesulfonic acid.

Soil Vapor

- Sample SV-5 was diluted for 1,1,1-trichloroethane due to original analysis exceeding the calibration range. For the 1,1,1-trichloroethane result in sample SV-5, the diluted result should be considered the most usable.

Soil

- Samples B-16 (7-8), B-15 (3-4), and B-15 (6-7) were re-analyzed for VOC at medium level since the acetone results were over the calibration range in the low-level analysis. All the acetone results were non-detect in the re-analysis. For all VOC results in samples B-16 (7-8), B-15 (3-4), and B-15 (6-7), the original results should be considered the most usable. The VOC results should not be considered usable for samples B-16 (7-8)RE, B-15 (3-4)RE, and B-15 (6-7)RE.

- The PFAS non-detect results for perfluorotridecanoic acid in samples B-2 (3-4) and B-1 (5-6) were rejected (R) due to severely low labeled compound percent recoveries. The results are not usable for project objectives. However, perfluorotridecanoic acid is not a COC at the Site.

- Samples B-4 (7-8), B-9 (3-4), B-8 (4-5), B-8 (5-6), B-3 (4-5), B-3 (6-7), and DUP were re-analyzed for VOC at medium level since the acetone results were over the calibration range in the low-level analysis. All the acetone results were non-detect in the re-analysis. For all VOC results in samples B-4 (7-8), B-9 (3-4), B-8 (4-5), B-8 (56), B-3 (4-5), B-3 (6-7), and DUP, the original results should be considered the most usable. The VOC results should not be considered usable for samples B-4 (7-8)RE, B-9 (3-4)RE, B-8 (4-5)RE, B-8 (5-6)RE, B-3 (4-5)RE, B-3 (6-7)RE, and DUPRE. Acetone is not a COC at the Site.

- Sample B-8 (4-5) was re-analyzed at a dilution in the SVOC analysis because the fluoranthene, phenanthrene, and pyrene results were over the calibration range in the initial analysis. For fluoranthene, phenanthrene, and pyrene results in sample B-8 (4-5), the dilution should be considered the most usable.

- Sample B-4 (4-5) was re-analyzed at a dilution in the pesticides analysis because the 4,4'-DDD result was over the calibration range in the initial analysis. For the 4,4' -DDD result in sample B4 (4-5), the dilution should be considered the most usable.

- Sample B-9 (3-4) was re-analyzed at a dilution in the pesticides analysis because the trans-chlordane and cis-chlordane results were over the calibration range in the initial analysis. For the trans-chlordane and cis-chlordane results in sample B-9 (3-4), the dilution should be considered the most usable.

- Sample B-13 (6-7) was re-analyzed at a dilution in the pesticides analysis because the 4,4'-DDT result was over the calibration range in the initial analysis. For the 4,4' -DDT result

in sample B13 (6-7), the dilution should be considered the most usable.

- Sample B-12 (8'-9') was diluted for trichloroethene due to original analysis exceeding the calibration range. For trichloroethene results in sample B-12 (8'-9'), the diluted results should be considered the most usable. For all results in sample B-12 (8'-9') except trichloroethene, the original results should be considered the most usable.

6.5 RECOMMENDATIONS

6.5.1 Summary of RI Results

The RI resolved the missing data gaps building on prior investigations and completed the nature and extent delineation in all on-site media of contamination at the Site to the extent required to determine a remedial action for the Site. Track 1 through 4 cleanup remedies will be evaluated in the Remedial Action Work Plan (RAWP).

Based on the field investigation, the overall depth of impacted soils ranged from 1 to 12 ft bgs including PAHs and metals exceeding RRSCOs. The Site's groundwater, located in the weathered/decomposed and fractured bedrock layers, is heavily impacted with chlorinated VOCs (cVOCs), and contains PAHs and metals above NYSDEC AQWS, as well as PFAS compounds and 1,4-dioxane above current Maximum Contaminant Levels. The Site soil vapor also contains cVOCs exceeding NYSDOH soil vapor intrusion criteria.

In order to render the Site usable for future development, the RAWP will address the remedial alternatives to limit the exposure to the impacted soils and mitigate the impact to groundwater from on-site sources. It will also include measures to mitigate exposures to any VOC vapor intrusion into the proposed development.

6.5.2 Data Limitations and Recommendations for Future Work

The RI results provide sufficient data to develop a feasible, conceptual remedy for the impacted groundwater, soils, and soil vapor.

6.5.3 Recommended Remedial Action Objectives

The RI has determined that remedial action needs to be implemented to remediate the contaminated soil via remedial source removal of all on-Site soils. A remedial action is also

required to address the contaminated groundwater beneath the western half of the Site. In addition, a remedial action is required to address the potential for vapor intrusion from soil vapor contamination. The specific alternatives proposed will be fully evaluated in the RAWP.

7.0 DEVIATIONS FROM THE RIWP

- Proposed installation of 11 overburden monitoring wells was not conducted due to the lack of any groundwater identified in overburden soils across the Site. Eight (8) bedrock monitoring wells were installed.
- One soil vapor point, SV-6, was not completed due to the presence of shallow groundwater in the boring.
- Two soil vapor points, SV-2 and SV-9, were relocated to the eastern edge of the former building footprint due to refusal at the original locations.
- Well screen depths for monitoring wells MW-7D and MW-10D were adjusted from 25-35 ft bgs to 15-25 ft bgs due to shallow bedrock fractures identified during drilling at these well locations, and more competent bedrock below 25 feet, which eliminated the need to screen the wells at a deeper interval. SESI informed the NYSDEC project manager of this deviation via email on December 5, 2019.
- Well MW-5S was installed to capture groundwater within a shallow bedrock fracture identified at this location.

EXECUTIVE SUMMARY

WCD Group, LLC (WCD) performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Practice E 1527-13 of the property located at 33-35 Centre Avenue, City of New Rochelle, Westchester County, New York. A supplemental environmental investigation was additionally conducted to investigate specific environmental concerns identified during the Phase I review.

The goal of a Phase I ESA is to identify Recognized Environmental Conditions (RECs) in connection with a property. In addition to RECs, WCD has attempted to identify conditions that do not meet the threshold to be considered a REC but nonetheless represent a significant existing and/or likely environmental liability, and de minimis conditions that generally do not present a significant threat and would not be the subject of an enforcement action if brought to the attention of regulatory authorities.

WCD's findings, conclusions and recommendations are presented in Section 4.0 of this Report and are summarized below.

Subject Property Description and History

The subject property is a 0.23-acre commercial parcel located in an urban setting. Historical records document residential use of the subject property prior to 1911 and ongoing commercial use since 1925, when the current on-site building was constructed. Early commercial uses have included automotive repair, and the site has since been used for electroplating operations beginning in the early 1970s. These commercial uses are likely to have resulted in releases of petroleum, chlorinated solvents and/or metals to the subsurface at the subject property. Soil vapor sampling conducted in conjunction with this ESA documented very high levels of the industrial chlorinated solvents TCE and TCA (as well as relatively high levels of PCE and TCE/TCA breakdown products), consistent with a potential on-site contaminant source area (grossly contaminated soil and/or groundwater) beneath the building. Chemical staining and residue are present on floors in the vicinity of the electroplating area, suggesting a high potential for subsurface metal contamination. Although no significant petroleum contamination was documented in soil vapor, existing data is not sufficient to rule out a significant release at or near a former fuel-oil underground storage tank (UST) in the adjoining sidewalk to the west. No further investigation of historical records is recommended.

Identified Areas of Environmental Concern

Category	Specific Environmental Concerns	Recommendations
RECs	Former and current commercial uses of the subject property, including automotive repair and electroplating operations; potential impacts from former fuel-oil UST	Perform comprehensive Phase II subsurface investigation, including sub-slab soil and groundwater testing
	Potential impacts from solvent releases at the western adjoining property, an active NYSDEC IHWD Site	Any impacts to the subject property from the IHWDS may be evaluated during the on-site subsurface investigation recommended, above
HRECs	None Identified	NA

Category	Specific Environmental Concerns	Recommendations
General Environmental Concerns	Electroplating baths (some with standing liquids) are not located within secondary containment, and chemical staining and residue are present on tank exteriors as well as on the floors. These conditions may have resulted in contamination of building structural materials	Remove all interior equipment, as regulated waste and test remaining building materials for metal contamination, prior to building reuse and/or demolition
	Potential future releases from fuel-oil aboveground storage tanks (ASTs)	Proper maintenance and periodic inspections
	Potential demolition debris in subsurface	Properly manage any materials encountered during site development/use
De Minimis Conditions	Chemicals and waste materials related to electroplating activities, other chemicals, petroleum products and paints are stored on site; releases from these containers could potentially impact the property	Properly store containers; maintain appropriate absorbent materials; dispose of as regulated waste
	Asbestos-containing materials (ACM) and lead-based paint (LBP)	Test suspect materials as needed; handle materials in accordance with regulations
	On-site debris and deteriorating building materials	Dispose off-site; properly manage any materials encountered during site development/use
	Electrical equipment potentially containing PCBs is located in the electroplating area of the building	If this equipment is to remain on-site, it should be tested for PCBs, or, in the absence of analytical data, be treated as though it contained PCBs

1.0 INTRODUCTION

1.1 Purpose of the Investigation

This Augmented Phase I Environmental Site Assessment (Report) identifies recognized environmental conditions (RECs) and/or other significant environmental liabilities resulting from or associated with the storage, use, transport or disposal of hazardous or regulated materials on the property located at 33-35 Centre Avenue, City of New Rochelle, Westchester County, New York (property descriptions are presented in Sections 2.1 and 3.3.2).

1.2 Methodology

This Report has been prepared in conformance with the attached Scope of Services and with guidelines set forth by the American Society for Testing and Materials (ASTM) Method E1527-13 (no exceptions to or deletions from this practice have occurred). All work was performed under the direct supervision and responsible charge of a qualified environmental professional, following the requirements for "all appropriate inquiry" as defined in 40 CFR Part 312.

WCD Group, LLC (WCD) performed the following work:

1. Investigation of the subject property's history and characteristics through the analysis of available physical settings maps, historical documents, local municipal records, and information provided by subject property representatives and/or other knowledgeable individuals.
2. Review of Federal, State, and/or Tribal regulatory-agency computer databases and printed records for documentation of potential environmental liabilities relevant to the property, consistent with (or exceeding) applicable ASTM requirements.
3. Inspection of the property by Scott Spitzer and Victoria Panico of WCD on October 4, 2017. Vernon and Kenneth Turner, the property owners, and Gavin Steinberg, representing LJI Management Corporation (the User), were present during portions of the site inspection.
4. Investigation of soil vapor by Scott Spitzer and Victoria Panico of WCD on October 4, 2017.

1.3 Limitations

This Report is an evaluation of the property described in Section 2.1 below and is not valid for any other property or location. It is a representation of the property analyzed as of the dates that services were provided. This Report cannot be held accountable for activities or events resulting in environmental liability after the respective dates of the site inspection or historical and regulatory research.

This Report is based in part on certain information provided in writing or verbally by federal, state, and local officials (including public records) and other parties referenced herein. The accuracy or completeness of this information was not independently verified. Unless specifically noted, the findings and conclusions contained herein must be considered not as scientific certainties, but as probabilities based on professional judgment. Any limitations specific to the site inspection are detailed in Section 3.3.

1.4 Definitions

Definitions of some common terms found in ASTM Standard 1527-13 are provided below.

Key Site Manager

The person identified by the owner or operator of a property as having good knowledge of the uses and physical characteristics of the property.

Practically Reviewable / Reasonably Ascertainable

Information that is provided by a source that yields information relevant to the property without the need for extraordinary analysis of irrelevant data is Practically Reviewable. Records must be for a limited geographic area. Records arranged chronologically, lacking adequate address information to be located geographically, in large databases that are not sorted by zip code, or are so numerous to be unmanageable are not generally practically reviewable. Information that is (1) publicly available, (2) obtainable from its source within reasonable time and cost constraints, and (3) practically reviewable is Reasonably Ascertainable.

Recognized Environmental Condition (REC)

The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. A material threat is a physically observable or obvious threat which is reasonably likely to lead to a release that is threatening and might result in impact to public health or the environment. The term includes hazardous substances or petroleum products even under conditions in compliance with laws.

De minimis conditions (i.e. conditions that generally do not present a threat to human health or the environment and would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies) are not RECs.

Controlled Recognized Environmental Condition (CREC)

A REC resulting from a past release that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (legal or physical restrictions or limitations on the use of, or access to, a site or facility to reduce or eliminate potential exposure to remaining contaminants, or to prevent activities that could interfere with the effectiveness of a response action).

Historical Recognized Environmental Condition (HREC)

A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

2.0 SITE LOCATION AND PHYSICAL SETTING

The subject property as defined in this Report consists of the property located at 33-35 Centre Avenue, City of New Rochelle, Westchester County, New York (identified as City of Rochelle tax lot parcel: Section 2, Block 437, Lot 42). A Site Location Map is provided on Page 7, a Selected Site Features Map illustrating the layout of the property and fieldwork locations (see Section 3.3.4) is provided on Page 8 and photographs are provided in Appendix A. Sources of information documenting physical-setting conditions are cited in Section 5.0 and site-specific topographic, geological, hydrological, wetlands and/or other maps are provided in Appendix B.

2.1 Description of Subject Property

The subject property is a square, 0.23-acre parcel located on the southeast corner of Centre Avenue and Relyea Place. A one-story commercial building (with a partial basement) occupies the entire property. Comprehensive observations from a physical inspection of the property are provided in Section 3.3.

2.2 Description of Adjoining and Surrounding Area Properties

The property is in an urban area comprised primarily of single and multi-family residential and commercial properties. Current uses of adjoining and surrounding area properties are summarized below:

Direction	Adjoining Use(s)	Vicinity Use(s)
North	• Food market • Rancho Grande • Parking lot	• Commercial • Multi-family residential
East	• Parking lot	• Mixed-use (commercial and residential)
South	• Museum Editions Ltd (art gallery)	• Commercial and residential
West	• Former Industrial Overall Services • Former Apparel Plus (textile rental)	• Commercial; Metro-North Railroad

2.3 Physical Setting

2.3.1 Topography

Local area topography is somewhat hilly. Surface relief in the immediate vicinity of the subject property is varied, with overall downward slopes to the southwest, towards New Rochelle Harbor.

The USGS Topographic map providing coverage for the subject property indicate approximate on-site surface elevations ranging from 90 to 95 feet above mean sea level (the property slopes downward from east to west). No on-site structures are depicted on the map (the property is located in a developed area where only selected landmark buildings are depicted). The map did not indicate the presence of any soil/gravel mining operations or unusual topographic patterns indicative of landfilling activities on the property. Observations made during the site inspection are in general agreement with conditions depicted on the map. Survey information from previous investigations at the adjoining property to the west (see Section 3.2.2) indicate a sidewalk elevation of approximately 91.5 feet near the northeastern corner of the on-site building.

2.3.2 Local Geology and Hydrogeology

Soils in the vicinity of the subject property are likely to be derived from glacial till deposits, which overlie metamorphic bedrock. Soil survey maps indicate that Urban Land soils are likely to be located on the property. The Urban Land designation identifies areas where at least 80% of the surface is covered by buildings, parking areas or other impervious structures, and specific soil and bedrock characteristics are generally not well known. The presence of an on-site structure suggests that soils located on the property may have been altered by cutting, regrading and/or filling activities.

Information from previous investigations at the adjoining property to the west (see Section 3.2.2), which included the extension of soil borings and installation of monitoring wells in close proximity to the subject property, described subsurface soils as fine to coarse sand with varying amounts of silt (fill materials were noted), overlying highly weathered bedrock (gneiss or schist, at depths ranging from approximately 15 to 20 feet near the subject property). Groundwater depths ranged from approximately 5 to 6 feet in an overburden monitoring well located in the parking lot east of the subject property, and from approximately 7.5 to 9 feet in a bedrock monitoring well located in the Centre Avenue sidewalk near Relyea Place. Both overburden and shallow groundwater were shown to flow southwest, following a topographic valley and bedrock trough towards Burling Brook (ultimately discharging to New Rochelle Harbor, located approximately 0.7-miles from the property). Reported data indicated that a confining layer for vertical groundwater movement between the overburden and bedrock is not likely to be present.

WCD has not reviewed any other reports or other information documenting site-specific subsurface conditions.

2.3.3 Surface Hydrology and Wetlands

No waterbodies or wet areas were observed on the subject property or in the immediate vicinity during the site inspection.

Regulated Wetlands

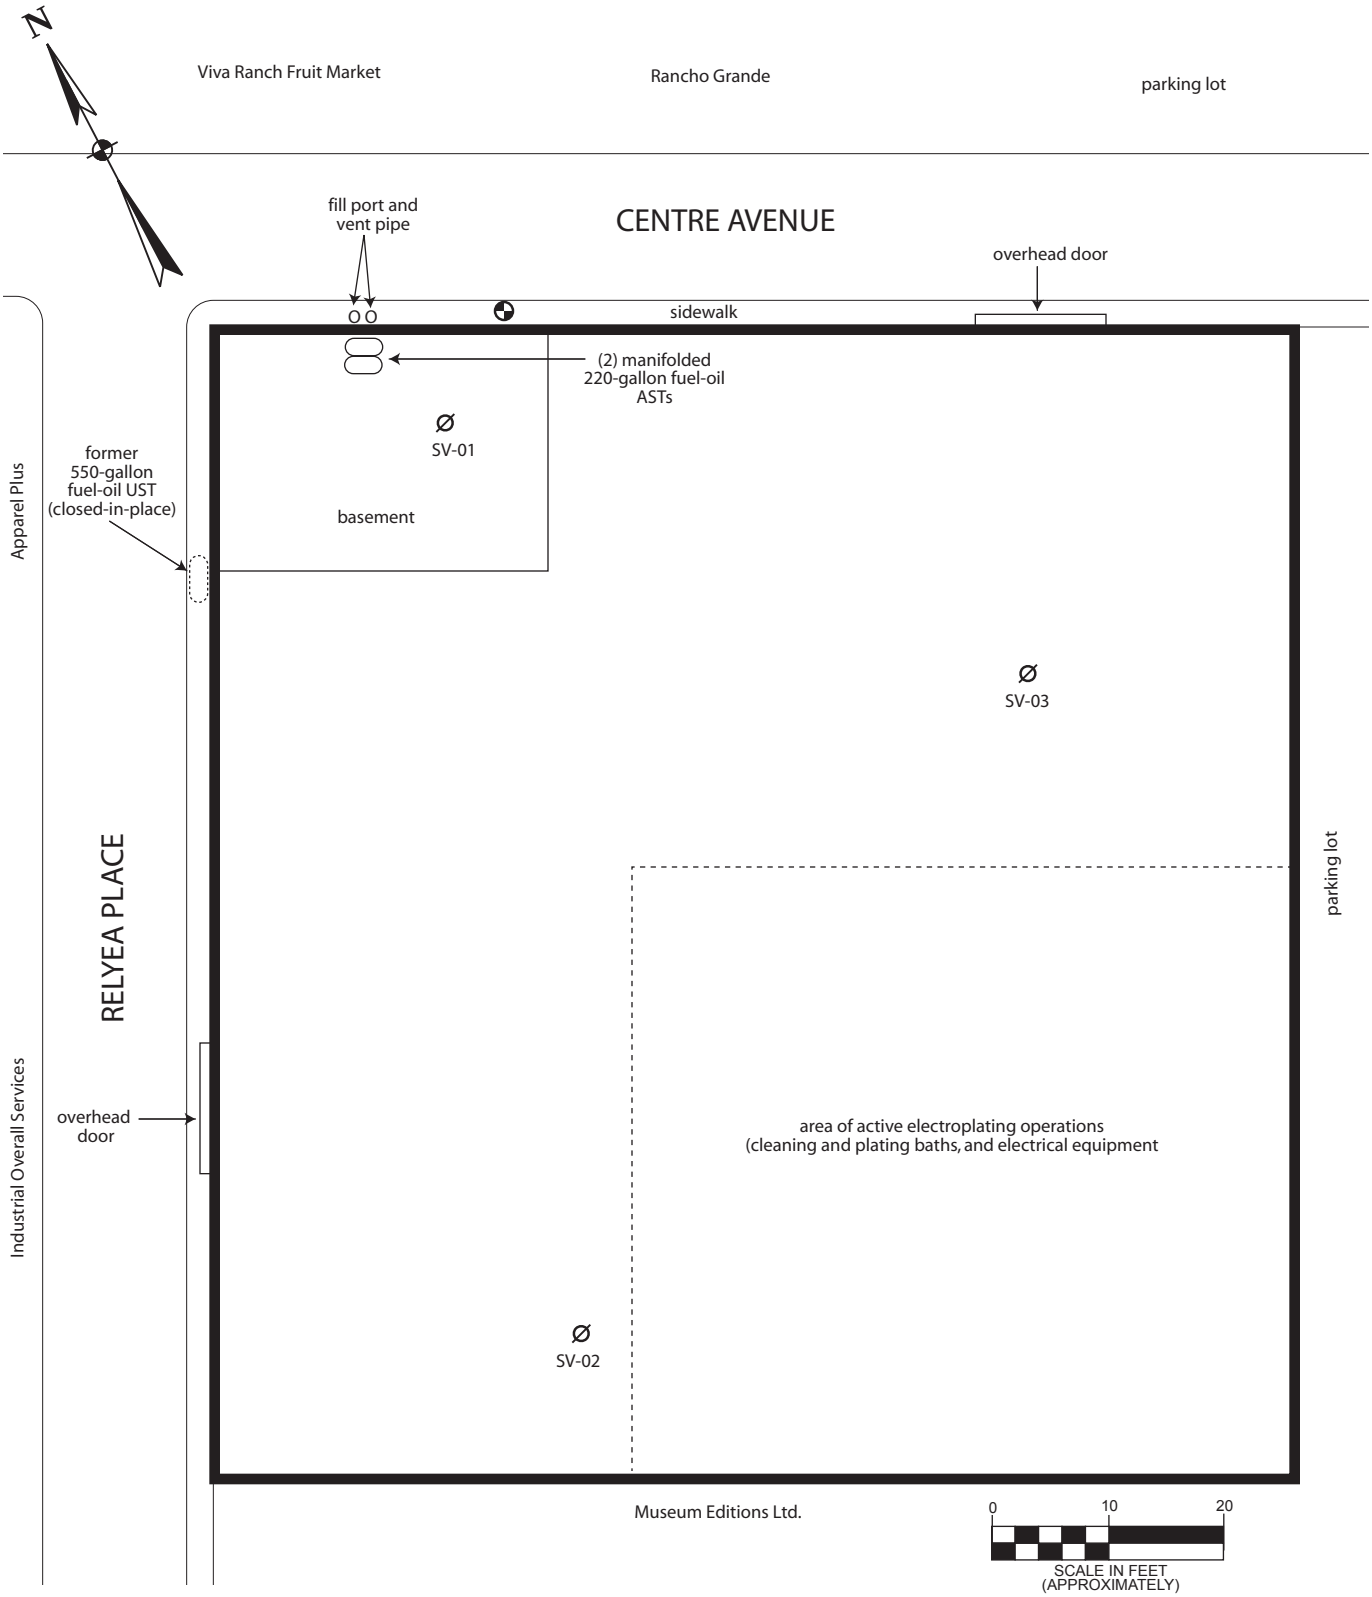
Federal and state mapping data do not identify any classified surface waterbodies, wet areas, or regulated wetlands on or in the immediate vicinity of the property.

2.3.4 Sensitive Environmental Receptors

Sensitive Environmental Receptors (SERs) are valued physical, biological and/or man-made features that may be adversely impacted by environmental contamination, and where a discharge or release could pose a greater threat than a discharge or release to other less valued areas. SERs include (but are not limited to) potable supply wells, wetlands, and protected wildlife habitat.

The review of maps and observations made during the site inspection indicate that no SERs are located on or in the immediate vicinity of the subject property.

Site Location Map 33-35 Centre Avenue City of New Rochelle Westchester County, New York	N	File No: LN17112.10 October 2017 Page 7



All feature locations are approximate. This map is intended as a schematic to be used in conjunction with the associated report, and it should not be relied upon as a survey for planning or other activities.

Scale as shown

3.0 INVESTIGATION

3.1 Site History

The history of the subject property was researched by attempting to interview knowledgeable individuals and reviewing both standard ASTM historical sources (including local agency records and historical maps, aerial photographs and/or city directories) and additional sources (if such sources were judged to be reasonably ascertainable and sufficiently useful, accurate, and complete considering the objective of the records review).

3.1.1 User-Reported Information

ASTM Practice E 1527-13, Section 6, requires that the User (the party seeking to complete the environmental site assessment [ESA] of the property) provide specific information to the Environmental Professional to meet the requirements for "all appropriate inquiry". Representatives of the User (the LJI Management Corporation) have not responded to a questionnaire provided by WCD, which requested information regarding the subject property as specified in Section 6.

WCD assumes that the LJI Management Corporation requested performance of the Phase I ESA to qualify for one or more Landowner Liability Protections (LLPs) to CERCLA liability and to document potential environmental liabilities on the subject property.

3.1.2 Interviews

Kenneth Turner (the property owner) was identified as a Key Site Manager for the subject property and was interviewed regarding specific site conditions and recent uses, as well as the topics detailed in the User Questionnaire (see Section 3.1.1, above). Mr. Turner had no specialized knowledge or experience, actual knowledge, or knowledge of commonly known or reasonably ascertainable information regarding potential environmental conditions and/or liabilities in connection with the property.

Pertinent information from interviews is provided in relevant report sections, where appropriate.

3.1.3 Ownership Records

Property ownership information, based on City of New Rochelle Assessor's Office and Building Department records, is summarized below. "Date of Ownership" indicates a time the property was owned by the specified entity.

Owner	Date of Ownership
Centre Avenue Association, LLC (Vernon Turner, Current Owner)	10/31/2016
Turner Walter & Kenneth	NA
Eric S. Turner	1971

3.1.4 Standard ASTM Historical Sources

A summary of environmentally significant information obtained from a review of standard historical sources is provided below. [Note: Any property outlines, as drawn by WCD on maps and/or photographs, are approximations.]

Sanborn Fire Insurance Maps

WCD reviewed historical Sanborn Fire Insurance Company Maps dated 1887, 1892, 1896, 1903, 1911, 1931, 1942, 1951, 1990-1996, and 2003 (relevant copies of these maps are provided in Appendix C).

1887-1911: Municipal water is depicted as being available to the property. No petroleum or chemical bulk storage tanks are noted at the subject property or adjoining properties. The eastern portion of the subject property contains a portion of a dwelling that extends westward from the eastern adjoining property, but is vacant by 1911. The northern and eastern adjoining properties contain dwellings. Railroad tracks are present nearby to the northwest. The surrounding area is moderately developed with likely residential and commercial structures.

1931-1951: The subject property is now developed with the current on-site building, which is labeled as a garage in 1931, "Bishop, McCormick and Bishop Dodge" in 1942 (likely a vehicle modification facility), and automotive repair in 1951. The western adjoining property (now shown as a single large site) contains a parking garage, with four gasoline tanks located near the subject property at the intersection of Centre Avenue and Relyea Place. The central northern adjoining property now contains a new, large building used as an auditorium in 1931 and a cartoon studio in 1951, and the adjoining property to the northwest contains a new, small battery-repair facility in 1951. The surrounding area shows an overall increase in development, mainly for commercial purposes, including new filling stations to the north.

1990-2003: The structure on the subject property is now labeled as a generic manufacturing facility, and buildings at the adjoining properties to the west and south are labeled as generic commercial structures (appliance repair is noted to the south in 1990). The adjoining property to the east (1990) and northeast (1993) are now vacant (or labeled as parking lots). The large building to the north is used as a film studio in the 1990s and then as a likely grocery store in 2003. The adjoining property to the northwest is used as an automotive repair facility. Additional filling stations are noted in the surrounding area.

City Directories

WCD reviewed historical city directories dated 1975, 1985, 1992, 1995, 1999, 2003, 2008, and 2013 for the subject property and for several adjoining properties (data sources are provided in Appendix D). The on-site building has been occupied by Eric S. Turner & Company (current occupant) since 1975. The adjoining property to the north was occupied by an automotive repair facility in 1975.

3.1.5 Municipal and Regulatory Agency Records

Assessor's Office Records

City of New Rochelle Assessor's Office property card records for the subject property were reviewed on October 3, 2017. According to notations made on the property card, the structure located on the subject property was built in 1925 for use as a garage and "dairy storage", and is heated with oil. No other information pertinent to the environmental integrity of the subject property was present in these records. Readily available property ownership information is summarized in Section 3.1.3.

Building Department Records

City of New Rochelle Bureau of Buildings records for the subject property were reviewed on October 9, 2017. Included in the records was a building permit (September 21, 1972) to alter the existing structure for plating and metal finishing operations.

Local Agency Interviews

Health Department

A request was made on October 2, 2017 to search available Westchester County Health Department records for information regarding the subject property. No response from this agency has been received as of the date of this Report.

NYSDEC

A request was made on September 29, 2017 to search available NYSDEC records for information regarding the subject property. According to the NYSDEC, that agency does not maintain files identified with the subject property address. NYSDEC personnel provided copies of relevant documents for environmental investigations conducted at the adjoining property to the west (see Section 3.2.2, State Sites).

3.1.6 Previous Environmental Reports

WCD did not review any previous environmental reports documenting investigations at the subject property; a review of documents pertaining to the adjoining property to the west, however, provided information relevant to conditions at the subject property (see Section 3.2.2, State Sites).

3.2 Review of Federal and State Agency Records

Federal and state computer databases and printed records were reviewed for documentation of environmental conditions and/or liabilities relevant to the property.

3.2.1 Methodology

The following ASTM Standard Environmental Record Sources (as available for the subject property's locality) were reviewed (search distances are consistent with, or exceed, ASTM requirements).

Federal National Priority List (1.0 mile) and delisted National Priority List sites (0.5 mile)
Federal SEMS (formerly CERCLIS) list and SEMS NFRAP site list (0.5 mile)
Federal RCRA CORRACTS facilities list (1.0 mile)
Federal RCRA non-CORRACTS TSD facilities list (0.5 mile)
Federal RCRA generators list (subject/adjoining properties)
Federal ERNS list (subject property)
Federal, State, and Tribal Institutional Control / Engineering Control registries (subject property)
State- and Tribal-equivalent NPL (1.0 mile)
State- and Tribal-equivalent SEMS (0.5 mile)
State and Tribal Brownfield and voluntary cleanup sites (0.5 mile)
State and Tribal leaking storage tank lists (0.125 mile)*
State (including locally administered) and Tribal registered storage tank lists (subject/adjoining properties)
State and Tribal landfill and/or solid waste disposal site lists (0.5 mile)

* *The search distance for this ASTM database has been reduced due to the high level of development of the area in which the subject property is located.*

Additional Environmental Record Sources (as available for the subject property's locality) were reviewed to enhance and supplement the review of standard sources, including: state spill file records and MOSF lists, federal and state radon data (by local municipality as available) and wastewater discharge permits, and federal Toxic Release Information System (TRIS) and Facility Index System (FINDS) databases.

A copy of relevant portions of a database search conducted by Environmental Data Resources, Inc. (EDR) for WCD is provided is provided in Appendix E. Not all sites contained in the attached database search may be referenced below; some sites may have been excluded based on either ASTM requirements, WCD's scope of services or professional opinion, and/or information obtained during the review of historical records and the site inspection. Some information may have been deemed to not be practically reviewable (e.g., records lack adequate address information). Sites or additional information not included in the database search may also be referenced based on WCD's knowledge of the subject property area.

WCD's opinion is presented for any sites identified within the specified approximate minimum search distances as to any possible impacts that might result in RECs in connection with the subject property, arising from the migration of contaminated soil, soil vapor and/or groundwater. Evaluation of potential impacts to the subject property is based on: distance and direction to the identified site; type of regulated materials and other relevant information found in available records; presence of intervening roadways and/or other physical conduits; local physical setting (topography, soil conditions, geology, hydrology, etc.); and other information known to WCD.

3.2.2 Findings of Regulatory Records Review

Federal Hazardous Waste-Contaminated Sites

The subject property is not identified on the United States Environmental Protection Agency's (USEPA): National Priority List (NPL) of uncontrolled or abandoned hazardous waste sites identified for priority remedial actions; Superfund Emergency Management System (SEMS, formerly known as CERCLIS) list of sites that are proposed to the NPL or that are in the screening and assessment phase for possible proposal to the NPL; SEMS-Archive list (formerly known as CERCLIS NFRAP), which are former SEMS sites that were delisted because no significant hazardous waste contamination was found, or because the site has been remediated; or Federal Brownfields list of sites with known or potential contaminants receiving federal cleanup funding. The subject property is not identified on readily available USEPA Institutional Control/Engineering Control registries.

No NPL sites are located within one mile of the property and no SEMS sites or delisted NPL sites are located within a half mile of the property.

State Sites

Inactive Hazardous Waste Disposal Sites

NYSDEC maintains a Registry of Inactive Hazardous Waste Disposal Sites (IHWDS), a state equivalent to the federal NPL, which are commonly referred to as "Registry" or "Superfund" sites. Sites are placed on the Registry if there is evidence that hazardous waste was disposed and NYSDEC and NYSDOH determine that a significant threat to public health is present. When a site has been remediated, it is reclassified or removed from the Registry (delisted) to indicate that the significant threat(s) has been addressed. Non-Registry sites may (but usually do not) also present significant threats.

The subject property is not identified as a NYSDEC IHWD site, and has not been listed as a site under investigation for inclusion in the IHWDS Registry (a state equivalent to the federal SEMS List).

The following relevant sites have been identified:

Site Name	Site ID	Distance/Direction	Classification Code
Industrial Overall Service Corp.	360109	Western adjoining property	2 – significant threat, action required
Bakers Pride Oven Co, Inc.	360087	0.19 mile, SW	N – no further action at this time
Consolidated Edison – Echo Ave. Site	360016	0.60 mile, NE	P – potential site, further investigation needed

WCD reviewed a Remedial Investigation Report and Supplemental Remedial Investigation Report (issued in November 2016; collectively referenced as the "RIR") prepared for the Industrial Overall Services site, a former dry cleaning facility. Releases of tetrachloroethylene (PCE), a chlorinated volatile organic compound (cVOC), at the IHWD site (as well as at the adjoining Metro North Railroad property) have resulted in significant soil, soil vapor and groundwater contamination (groundwater impacts extend as far as 1,900 feet to downgradient locations to the southwest). Compounds found in contaminated media include the cVOCs trichloroethylene (TCE) and other breakdown products of PCE. The cVOC 1,1,1-trichloroethane (TCA), an industrial solvent generally used for degreasing operations unrelated to dry cleaning, was identified at high concentrations in monitoring wells located on Relyea Place (between the IHWD site and the subject property). Low levels of PCE and TCE (below NYSDEC groundwater standards) were detected in several monitoring wells located in the Centre Avenue sidewalk north of the subject property.

Figures presented in the RIR provide "interpreted" groundwater contours of cVOC contamination, indicating potential impacts from PCE, TCE and TCA beneath the building on the subject property. The RIR indicates that TCA contamination may have resulted from historical uses pre-dating the dry cleaning operations at the IHWD site, but states that the source of TCA in groundwater appears to be the result of an upgradient, off-site source.

Excerpts from the RIR are provided in Appendix F.

Based on WCD's review of reported information, the remaining two identified sites are not likely to significantly impact the subject property.

Voluntary Cleanup, Brownfields Cleanup, and Environmental Restoration Programs

Significantly contaminated properties that are not Registry sites may be listed in NYSDEC database records based on participation in the Voluntary Cleanup (VCP), Brownfields Cleanup (BCP) or Environmental Restoration (ERP) NYSDEC environmental remediation programs.

The subject property has not been identified as a NYSDEC remedial program site.

The following relevant sites have been identified:

Site Name (Program)	Site ID	Distance/Direction	Classification Code
The Huguenot (BCP)	C360157	0.08 mile, S	A – active site, work is ongoing
Off-Site Flamingo Cleaners (BCP)	C360078A	0.30 mile, E	A – active site, work is ongoing
Flamingo Cleaners (BCP)	C360078	0.30 mile, E	C – completed, may need maintenance
Schmuckler's Dry Cleaners (BCP)	C360088	0.41 mile, N	A – active site, work is ongoing

Based on WCD's review of reported information, these sites are not likely to significantly impact the subject property (although located nearby, any groundwater contamination at the Huguenot site is likely to be downgradient of the subject property).

New York Institutional and Engineering Controls

The subject property is not identified in NYSDEC Institutional and Engineering Control databases.

Federal Hazardous Waste Handlers

The SEMS database details facilities that report treatment, storage or disposal of hazardous waste (TSD facilities) or generation or transportation of hazardous waste. Facilities that have been notified by the USEPA to take corrective action regarding their handling of hazardous waste are classified as CORRACTS facilities.

CORRACTS and/or TSD Facilities

The subject property is not registered with the USEPA as a CORRACTS and/or TSD facility for hazardous waste or materials. No TSD facilities are located within one mile of the property.

The following relevant site has been identified:

Site Name	Site ID	Distance/Direction	Database
Rush MFG Corp.	NYD075436394	0.16 mile, SW	CORRACTS

Based on WCD's review of reported information, this site is not likely to significantly impact the subject property.

Generators or Transporters (Non-CORRACTS)

The subject property is identified in USEPA records as a conditionally exempt small quantity generator (CESQG) in 2007, a small quantity generator (SQG) in 2006 and a large quantity generator (LQG) in 2005 and 1994 (EPA ID NYD002015402). State manifest records indicate that non-listed corrosive waste was transported off-site in 2004. No violations have been recorded for the subject property. According to Mr. Turner, the current on-site electroplating operation does generate hazardous wastes.

Two Con Edison utility manholes are identified in database records at addresses of adjoining properties. Based on WCD's review of reported information, these sites are not likely to impact the subject property.

Landfills and Solid Waste Disposal Facilities

The NYSDEC's Facility Register does not list the subject property as an active or inactive landfill or solid waste disposal facility.

The following relevant sites have been identified:

Site Name	Status	Distance/Direction	Classification
New Rochelle Leaf TS	Active	0.37 mile, SW	Transfer station
Queen City Recycling Center	Active	0.37 mile, SW	C & D processing

Based on WCD's review of reported information, these sites are not likely to impact the subject property.

Chemical Bulk Storage (CBS)

A review of NYSDEC records indicates that the subject property and adjoining properties are not registered as CBS facilities. The on-site building contains numerous open-topped "baths" utilized in electroplating operations, some of which were observed to contain standing liquids; determination as to compliance with NYSDEC CBS regulations (i.e. specific requirements for chemical composition, maximum storage time, use

of containers as "process equipment", etc.) is beyond the scope of this Report. Evidence of CBS was not observed at any adjoining properties.

Petroleum Bulk Storage (PBS)

The Westchester County Department of Health (WCDOH) is a designated administrator of the NYSDEC PBS program and maintains the current database of County PBS facilities. PBS database searches conducted by EDR include the WCDOH database and older PBS records maintained by the NYSDEC prior to WCDOH administration of the program.

Subject Property

The subject property is not identified in database records as either a regulated or unregulated PBS facility. Observations made during the site inspection indicated the presence of two, manifolded 220-gallon fuel-oil aboveground storage tanks (ASTs) located at the northern interior wall of the basement (see Section 3.3.3 Petroleum Storage). According to Mr. Turner, a former 550-gallon fuel-oil underground storage tank (UST) servicing the subject property was previously located in the western sidewalk at Relyea Place. The tank was closed in place circa 2007.

No NYSDEC spill events are reported for the subject property.

County PBS Regulations

WCDOH petroleum bulk storage regulations (Article XXV of the Westchester County Sanitary Code) apply to facilities with a combined storage capacity greater than 1,100 gallons, properties with USTs greater than 110 gallons and/or properties with waste-oil USTs and/or ASTs (a property is not a facility if tanks are not interconnected, are used to store oil for on-premises consumption and no single tank has a capacity greater than 1,100 gallons. Based on the known capacity and use of the on-site tanks, the property is not subject to these PBS regulations.

Adjoining Properties

No adjoining properties are identified in database records as regulated or unregulated PBS facilities.

Major Oil Storage Facilities

The subject property is not listed with the NYSDEC as a major oil storage facility (MOSF). No MOSFs are located within a half mile of the property.

Federal Chemical and Petroleum Spills

The USEPA Emergency Response Notification System (ERNS) database details initial reports of releases of oil and hazardous substances as reported to federal authorities. There are currently no chemical or petroleum spills on record for the subject property.

State Chemical and Petroleum Spill and Leaking Underground Storage Tank Events

NYSDEC database records were reviewed to determine possible impacts from leaking tanks and other reported releases within an eighth mile of the subject property. No spill events are known to have occurred at the subject property.

Two closed spill events were reported at adjoining properties:

Spill File ID and Status	Location	Material Spilled	Spill Date (Closure Date)
1310684 – closed	Western adjoining property	PCE, Quantity unknown	January 13, 2014 (March 30, 2017)
1309988 – closed	Western adjoining property	Motor oil, 2 gallons	January 14, 2014 (January 14, 2014)

Spill number 1310684 was reported after an unknown amount of PCE was dumped into the soil (see State Sites, above). Spill number 1309988 was reported after oil was observed leaking into a sewer drain. Cleanup was conducted and the spill was subsequently closed later that day.

An open spill event is reported at 381 Huguenot Street, located approximately 450 feet to the south. Given the likely downgradient location and distance, this spill is not likely to have impacted the subject property.

No other relevant spill events were identified in database records.

Air Discharges

No NYSDEC permits for air discharges from the subject property are known to exist. No operations likely to require a NYSDEC air discharge permit were noted on the subject property.

Wastewater Discharges

No USEPA National or NYSDEC State Pollutant Discharge Elimination System (NPDES or SPDES) permit was identified for the subject property. No operations likely to require a NPDES or SPDES permit were noted on the subject property. According to municipal records, the subject property is connected to the municipal wastewater system. No adjoining properties are registered as NPDES or SPDES facilities.

Radon

Information on radon levels was obtained from New York State Department of Health (NYSDOH) documents. No regulatory standards for radon levels currently exist in New York State. The USEPA has established a guidance value (the level where mitigation measures may be appropriate) for radon concentrations of 4.0 or greater picoCuries/liter (pCi/l). Other regulatory authorities (e.g., OSHA) have established guidance levels that are directly related to specific site activities (a determination as to applicable radon guidance levels is beyond the scope of this report). Available radon information for the subject property's vicinity is summarized below (all radon levels provided in picoCuries/liter [pCi/l]).

NYSDOH Radon Information	Westchester County	City of New Rochelle
Number of Homes Tested	2,535	134
Average Radon Level	1.74	1.29
Percent of Homes >4.0 pCi/l	17.3	9.0

These average radon levels are below the USEPA's guidance value of 4.0 pCi/l and less than 20% of the homes tested in the subject property's vicinity had levels above this guidance value. These data support the conclusion that elevated radon levels are not likely to be present on the subject property. Mr. Turner had no information regarding radon testing at the subject property.

3.3 Site Inspection

3.3.1 Protocol

The site inspection was conducted on October 4, 2017 to address any potential concerns raised during the investigation of the site's history (Section 3.1) and the regulatory agency records review (Section 3.2), and to identify any additional indications of contamination from the use, storage, or disposal of hazardous or regulated materials. To the extent possible, site structures, vegetation, topography, surface waters, and other relevant site features were examined for any obvious evidence of existing or previous contamination or unusual patterns (e.g., vegetative stress, soil staining, surface water sheen, or the physical presence of contaminants), which would indicate that the environmental integrity had been or could be impacted.

Section 3.3.2 describes the physical characteristics of the subject property. Section 3.3.3 is divided into topics on specific environmental conditions or concerns, actual or potential, noted on the subject property during the site inspection. Section 3.3.4 describes the physical characteristics of adjoining properties as they concern the potential or actual environmental condition of the subject property.

A Selected Site Features Map illustrating the general layout of the subject property and the locations of specific areas of concern (if any) is provided on Page 8, and photographs of the subject property are provided in Appendix A.

3.3.2 Physical Characteristics of the Subject Property

3.3.2.1 Property

The subject property is a square, 0.23-acre parcel, which has 100 feet of frontage on the southern side of Centre Avenue and a maximum depth of 100 feet. A one-story commercial building occupies the property (see below). The exterior walls of the on-site building define the property lines.

3.3.2.2 Structures

The on-site building is a one-story masonry structure with a concrete slab-on grade foundation (except at the northwestern corner where a partial basement is located) and wood-frame roof. Exterior siding is brick and the roof is likely to be covered by asphaltic materials (note: the roof was not accessible during the site inspection). City of New Rochelle Assessor's Office records indicate that the building dates from 1925. Several, small wood-framed spaces (e.g., office, bathroom) with wallboard systems are present at the western portion of the building. Interior surfaces are generally unfinished (degraded metal coverings were observed at portions of the ceiling).

The building, occupied by Eric S. Turner and Company, Inc. since 1971, is used for electroplating and metal finishing operations. Active and inactive electroplating gear, including multiple cleaning and plating baths, as well as related equipment, stored supplies and waste containers, are present throughout the structure.

Potable Water Supply

According to available information, potable water is obtained from the municipal water system. No water supply wells were noted on the subject property during the site inspection and no on-site uses of groundwater are known to exist for the subject property.

Sewage Disposal System

According to available information, the on-site structure is serviced by the municipal sewer system.

Heating/Cooling

The on-site structure is heated with hot water generated by an oil-fired boiler in the basement. An electric water heater is located near the boiler. A window-mounted air conditioning unit cools an office located at the northwestern corner of the structure; the remainder of the on-site structure is not cooled. According to Mr. Turner, process water for electroplating operations is heated by a separate gas-fired boiler located in the first floor mechanical room at the southwest corner of the building.

3.3.3 Specific On-Site Environmental Conditions

Debris Areas

On-site debris is generally restricted to the presence of empty drums, and metal fragments (from cleaning electrodes) and metal salts and/or metal oxides (from sides of plating tanks) that are scattered on the floor in multiple interior areas.

Petroleum Storage

Two, manifolded 220-gallon fuel-oil ASTs are located at the northern interior wall of the basement. These tanks appeared to be sound and were noted to be free of signs of corrosion, staining or leakage. The fill port and vent pipe servicing the ASTs are located near the northwestern exterior wall of the building. No staining was noted on or near the fill ports and vent pipe.

According to Mr. Turner, a former 550-gallon fuel-oil UST servicing the subject property was previously located in the western sidewalk at Relyea Place. The tank was closed in place (filled with sand or cement) circa 2007, reportedly with the approval of the Bureau of Buildings. A patch in the sidewalk and evidence of the former vent pipe were noted during the site inspection.

Several small containers of petroleum products (lubricants, etc.) are located in various locations throughout the building. No staining or other evidence of a release from these containers was observed. No other small quantities of petroleum products, aboveground storage tanks or indications of underground petroleum storage tanks (e.g., fill ports or vent pipes) were observed on the subject property.

Chemical Storage

Multiple containers of metal salts/solutions, additives and various cleaners used in the electroplating process, and small containers of paints, paint remover and similar items are stored within the building, as are various waste containers holding spent materials (at least one drum was observed to be labeled as hazardous waste [D002 - corrosive materials]). No significant staining or other evidence of a release from these containers was observed during the site inspection.

Multiple open topped plating baths are present at the southern portion of the building. Some of these containers have standing liquids, including cleaning solutions and plating solutions. Metal salts and/or metal oxides have accumulated at exterior portions of some tanks and were observed to have fallen (or been disposed of) on floor areas in the vicinity of the baths.

An empty 55-gallon drum formerly containing TCE was observed at the northeastern portion of the building. According to Mr. Turner, TCE and potentially other chlorinated solvents were used on-site in the 1970s, and the empty drum is solely used to store trash and similar items.

Asbestos-Containing Materials

Asbestos-containing materials (ACM) are those materials containing over 1% of any type of asbestos. Asbestos has been incorporated into a wide variety of building products based on its thermal and resilient qualities, including insulation, texture-finished ceiling and wall materials, sprayed- or troweled-on structural coverings, floor and ceiling tiles, dry-wall/sheet rock, joint compound and siding and roofing materials. Although ACM are no longer used as extensively as they were prior to the 1970s (when the federal government began regulating and/or prohibiting the use of ACM in specific applications), asbestos may still be found in common building products used today. The presence or absence of asbestos within a material can only be determined through the physical analysis of material samples. Mr. Turner had no information regarding testing or surveys for asbestos being conducted at the subject property. The date of construction of the on-site building (1925) indicates that ACM is likely to have been used during initial construction and/or subsequent maintenance work.

Lead-Based Paint

Lead-based paint (LBP) is paint containing at least 0.5% lead by weight. The presence of LBP presents a risk of both environmental contamination and potential health impacts from inhalation and/or ingestion of paint dust or chips (lead in paint has been regulated since 1978). The presence or absence of lead in painted surfaces can only be determined through the physical analysis of material samples. Mr. Turner had no information regarding surveys for LBP being conducted at the subject property. The date of construction of the on-site building (1925) indicates that LBP is likely to have been used during initial construction and/or subsequent maintenance work. All painted surfaces (exterior and interior walls) observed during the site inspection were in poor condition.

Wastewater Discharges

The term “wastewater” indicates water that: (1) is or has been used in an industrial or manufacturing process; (2) or is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant; (3) or conveys or has conveyed sewage (water originating on or passing through or adjacent to a site, such as stormwater flows, is not generally considered to be wastewater). Wastewater generated from the cooling of metal lathes is discharged into interior pipes drains that lead to the municipal sewer system (see below). No other evidence of wastewater discharges into drains, ditches, or streams on or adjacent to the property was observed during the site inspection.

Interior Floor Drains/Sumps/Conduits

A floor drain covered by a piece of wood is located at the northeastern portion of the building. Visible staining (but no obvious odors of other field indications of contamination) was noted at the drain. According to available information, all floor drains inside the buildings lead to the municipal sewage system. No other floor drains, sumps, or conduits to the subsurface were noted inside the structure.

Stormwater Management and Exterior Drains/Sumps/Conduits

No exterior stormwater catch basins, drains, sumps, or other potential significant conduits to the subsurface, or indications of liquid discharges into drains, ditches, or streams on or adjacent to the property, were observed on the subject property.

Staining/Corrosion/Leaks

Chemical staining (including the presence of overt accumulations of crystals) is present at floor areas throughout the southern portion of the building, in the vicinity of the electroplating operations, and minor petroleum staining was observed on equipment and floors at the northeastern portion. Concrete floors in these areas were noted to be in somewhat poor condition.

Topographic Irregularities

No overt topographic irregularities (e.g., sinkholes or berms) indicative of the presence of non-natural materials (including debris) in the subsurface were observed on the subject property.

Vegetative Features

No overt areas of stressed or dying vegetation indicative of the presence of contaminants in surface or subsurface soils were observed on the subject property.

Pits, Ponds, or Lagoons

No pits, ponds, or lagoons exhibiting evidence (e.g., discolored water, distressed vegetation, obvious wastewater discharge) of holding liquids or sludge containing hazardous substances or petroleum products were observed on the subject property.

Surface Waters

No surface water bodies are located on the subject property.

Odors

No unusual odors indicative of the presence of contamination were noted during the site inspection.

PCBs

Electrical equipment (rectifiers) used in the plating process, located in the southern portion of the building, may potentially contain PCBs. No other equipment likely to contain PCBs was noted on the subject property.

3.3.4 Environmental Concerns at Adjoining and Nearby Properties

Adjoining and nearby properties were observed from the subject property and from public thoroughfares to identify any recognized environmental conditions or other potential environmental concerns. No conditions likely to significantly impact the subject property were observed during the site inspection.

3.4 On-Site Environmental Investigations

Environmental sampling for soil vapor was conducted in conjunction with the Phase I ESA (complete documentation of fieldwork, including results, is provided in Appendix G). WCD installed three temporary soil vapor implants (SV-01, SV-02 and SV-03; see the Selected Site Features Map) and collected soil vapor samples to document the presence or absence of contamination by volatile organic compounds (VOCs).

Laboratory analyses document extensive sub-slab contamination by chlorinated compounds, primarily at the northern half of the on-site structure. Identified VOCs include very high levels of the industrial solvents TCE and TCA, reported at peak concentrations of 240,000 µg/m^3 and 40,000 µg/m^3, respectively, as well as relatively high levels of PCE (peak concentration 5,900 µg/m^3) and TCE/TCA breakdown products (the presence of breakdown products suggests that contamination is related to historical releases). These data may indicate the presence of an on-site contaminant source (grossly contaminated soil and/or groundwater) beneath the building.

Current findings support the conclusion that no significant petroleum contamination is present in the vicinity of the sampling locations (the location of SV-01, however, may be too far from the former UST location to provide meaningful screening data).

4.0 FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

WCD Group, LLC (WCD) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Practice E 1527-13 to identify recognized environmental conditions (RECs), historical RECs (HRECs) and/or other significant environmental liabilities resulting from or associated with the storage, use, transport, or disposal of hazardous or regulated materials at the property located at 33-35 Centre Avenue, City of New Rochelle, Westchester County, New York. Any exceptions to, or deletions from, this practice are described in Section 1.2 of this report.

Summary information regarding RECs is presented in Section 4.1. WCD's findings, conclusions and recommendations regarding RECs, other potential environmental liabilities associated with the property, and de minimis conditions are presented in Sections 4.2 through 4.5.

4.1 Recognized Environmental Conditions

Significant Data Gaps

The Environmental Professionals preparing this report have not identified any significant data gaps that affect their ability to identify RECs.

Overview of Identified RECs

This assessment has revealed evidence of the following RECs in connection with the property:

- Former and current commercial uses of the subject property, including automotive repair and electroplating operations ─ Section 4.2
- Potential impacts from former fuel-oil underground storage tank (UST) ─ Section 4.2
- Potential impacts from historical solvent releases at the western adjoining property ─ Section 4.3

Historical RECs

This assessment has revealed no evidence of Historical RECs in connection with the property.

4.2 Site History

Historical records document residential use of the subject property prior to 1911 and ongoing commercial use since 1925, when the current on-site building was constructed. Early commercial uses have included automotive repair, and the site has since been used for electroplating operations beginning in the early 1970s. These commercial uses are likely to have resulted in releases of petroleum, chlorinated solvents and/or metals to the subsurface at the subject property. Soil vapor sampling conducted in conjunction with this ESA documented very high levels of the industrial chlorinated solvents TCE and TCA (as well as relatively high levels of PCE and TCE/TCA breakdown products), consistent with a potential on-site contaminant source area (grossly contaminated soil and/or groundwater) beneath the building. Chemical staining and residue are present on floors in the vicinity of the electroplating area, suggesting a high potential for subsurface metal contamination. Although no significant petroleum contamination was documented in soil vapor, existing data are not sufficient to rule out a significant release at or near a former fuel-oil UST in the adjoining sidewalk to the west.

No further investigation of historical records is recommended. A comprehensive subsurface investigation is recommended to document existing conditions at the subject property. It is further recommended that future work be conducted with the active involvement of the NYSDEC including the timely release of this information to the NYSDEC.

The potential exists that debris from the demolition of former on-site structures may be present in the subsurface (such debris could contain lead, asbestos, or other regulated materials).

Future development activities at the property should be conducted with an awareness of the potential presence of subsurface debris and provision should be made for the proper management of any materials that warrant special handling.

4.3 Review of Regulatory Records

The subject property is a current and former generator of hazardous wastes (the property was not otherwise identified during the review of regulatory agency records). The adjoining property to the west is an Inactive Hazardous Waste Disposal Site (IHWDS; NYSDEC Site No. 360109), currently undergoing active investigation and remediation due to historical releases of chlorinated solvents. Although existing data show that contamination conditions at the IHWDS are generally located downgradient of the subject property, investigators have suggested that groundwater contamination from this site may be impacting the western portions of the subject property. Investigative reports have also stated an opinion that documented TCA contamination in wells located at and near the western side of Relyea Place is likely related to an upgradient release site (potentially the subject property, based on available data). No other relevant sites were identified during the review of regulatory records.

Any impacts to the subject property from the IHWDS may be evaluated during the on-site subsurface investigation recommended in Section 4.2. No further investigation of regulatory records is recommended.

4.4. Current Site Conditions and General Environmental Concerns

Electroplating baths (some of which hold standing liquids) are not located within secondary containment, and chemical staining and residue is present on tank exteriors as well as on the floors. These conditions may have resulted in contamination of building structural materials.

It is recommended that all interior equipment be removed, and remaining building materials be tested for metal contamination, prior to building reuse and/or demolition.

Two, manifolded 220-gallon fuel-oil aboveground storage tanks (ASTs) are located at the northern interior wall of the basement. These tanks appeared to be in sound condition and no evidence of a release or an impending threat of a release was observed during the site inspection. Future releases from these tanks, however, could impact the subject property.

It is recommended that all PBS tanks be periodically inspected and managed in accordance with applicable state and local regulations.

4.5 De Minimis Conditions

An environmental condition is considered "de minimis" when that condition generally does not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. Conditions determined to be de minimis are not recognized environmental conditions.

Chemicals and waste materials related to electroplating activities, other chemicals, petroleum products and paints are stored on site; releases from these containers could potentially impact the property.

It is recommended that all waste products, chemicals, petroleum products and paints be properly stored within adequate secondary containment areas and that appropriate absorbent materials be maintained in all areas where releases could potentially occur. All waste materials should be disposed off-site in accordance with applicable USEPA regulations.

Limited visual observations by WCD and the likely dates of building construction suggest that asbestos-containing materials (ACM) and lead-based paint (LBP) may be present. No surveys for ACM or LBP are known to have been conducted.

No further investigation is recommended. Any suspect material encountered during maintenance, renovation, or demolition activities should be tested for asbestos or lead, or, in the absence of analytical data, be treated as though it contained asbestos or lead. All maintenance, renovation, or demolition activities should be conducted in accordance with applicable regulations.

Electrical equipment potentially containing PCBs is located in the electroplating area of the building.

If this equipment is to remain on-site, it should be tested for PCBs, or, in the absence of analytical data, be treated as though it contained PCBs. All maintenance, renovation, or demolition activities should be conducted in accordance with applicable regulations.

6.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

The following statements are required by 40 CFR 312.21(d) of the environmental professional(s) responsible for conducting and preparing the Phase I Environmental Site Assessment report.

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

and

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Paul H. Ciminello

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

33-35 CENTRE AVENUE
NEW ROCHELLE, NY 10801

COORDINATES

Latitude (North):	40.9082270 - 40° 54' 29.61''
Longitude (West):	73.7855270 - 73° 47' 7.89''
Universal Tranverse Mercator:	Zone 18
UTM X (Meters):	602284.4
UTM Y (Meters):	4529067.5
Elevation:	91 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1

CORRACTS site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
RUSH MFG CORP	***10-12 PINE CT***	***SW 1/8 - 1/4 (0.159 mi.)***	***O128***	***195***

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 4 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 3 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state

funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 05/16/2017 has revealed that there are 3 NY SHWS sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 06/30/2017 has revealed that there are 2 NY SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 05/16/2017 has revealed that there are 12 NY LTANKS sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/12/2016 has revealed that there are 41 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the

environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
CON EDISON-CEDAR ST	ONE RAMADA PLAZA	NE 1/2 - 1 (0.566 mi.)	167	282

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 14 EDR Hist Auto sites within approximately 0.25 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 16 EDR Hist Cleaner sites within approximately 0.25 miles of the target property.

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

NY RGA HWS: The EDR Recovered Government Archive State Hazardous Waste database provides a list of SHWS incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the Department of Environmental Conservation in New York.

A review of the NY RGA HWS list, as provided by EDR, has revealed that there is 1 NY RGA HWS site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
INDUSTRIAL OVERALL S	10 BARTELS PLACE	W 0 - 1/8 (0.034 mi.)	A30	54

NY RGA LF: The EDR Recovered Government Archive Landfill database provides a list of landfills derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the Department of Environmental Conservation in New York.

A review of the NY RGA LF list, as provided by EDR, has revealed that there are 2 NY RGA LF sites within approximately 0.5 miles of the target property.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

DEC Memo:	"2-10-14 Spoke with Carlos. He said incident occurred 1/13/14. Soil was from sump inside. Carlos says Todd has soil sample results showing around 7000 ppm. jc 2/24/2014 -- WCDOH on site last Friday. Dumped sludge has been placed into a 5 yd dumpster. Not meant for Haz Waste, but containerized. List of acceptable contractors for proper disposal provided to owner on 2/21/14 by DOH. NOV issued by DOH on 2/21 for PBS violations, sediment dumping, drums leaking, asbestos, TCR for 5K Gasoline UST, TT for heating oil tank. ELM 4/25/2014 -- On site 4/24 to meet with Mr. O'Brien and his 2 contractors (HydroEnviro for investigation/remediation) and Advanced Enviro (transfer of dumpster wastes into proper shipping containers. Mr. O'Brien then made contact with Metro North for permission to work on MNR property (sludge investigation). Screened soil samples from 2 holes dug by pick axe. Down to 10 inches, pid readings were 8 to 12 (slightly higher with depth, but not much found). Similar pid screening from dumpster hit 1,900 ppm. Work plan to be developed by HydroEnvir for investigation (3 borings to water table, one extended for groundwater sample). They will also complete 2 other borings where a former Gasoline UST was removed without site assessment over 10 years ago.

PERC - APPAREL PLUS (Continued) **S116156593**

Today sending State contractors RI of the area to all at the site visit. ELM 7/21/2014 -- MEQ emailed spill closure report including 3 geoprobe soil borings and one water sample. PERC hits were less than 10 ppb, roughly at or less than the previously known levels of contamination from RI for Superfund project. Groundwater was clean. ELM 3/30/2017 -- Carlos drove by this week and the soil pile has been removed. The entire site clean-up being accomplished under Haz Waste. 360109 ELM"

Remarks: "Caller advised unknown amount of product dumped onto soil. Caller advised workers took out 2 wheel barrows and dumped in the back. Caller advising samples were taken and result just came back. Further clean up is pending."

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Registry ID: 110058881152

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: Location: The Industrial Overall Service Corporation site is located at 10 Bartels Place in the City of New Rochelle, Westchester County, NY. The site is located east of I-95 and west of US-1 (Huguenot Street) and it is bounded by Reylea Place, Bartels Place, Centre Avenue and the Metro North railroad property and tracks. Site Features: The site is 0.42 acres in size and resides on a slightly sloping irregularly shaped parcel. The main site feature includes a six-sided building which occupies the majority of the property and a small parking area located to the south and southwest of the

INDUSTRIAL OVERALL SERVICE CORP. (Continued) **S110043643**

building. The surrounding area is urban with a mix of commercial and residential establishments mixed in between the commercial businesses. Current Zoning/ Uses: This property is zoned for commercial use. The building is the location of two active businesses, Workingman s Closet and Apparel +Plus. The Workingman s Closet business uses the business address of 27 Centre Street. Historic Uses: Industrial Overall Services has been operating at the current location as a uniform and industrial clothing laundering facility, historically cleaning heavily soiled clothing from auto body and gasoline dispensing businesses since 1939. Based on a Sanborn Fire Insurance Map form 1931, the site previously operated as an automobile garage. In 1980, Workingman s Closet which sells new and reclaimed work clothes, was opened, and a dry cleaning facility operated there for a short time in the same decade. Today, Workingman s Closet launders linens and uniforms for restaurants and other businesses, and Apparel +Plus is a retail uniform business. Laundry operations on the site have used various cleaning products in the past. A remedial investigation conducted at the site has measured high concentrations of the dry cleaning chemical tetrachloroethylene (PCE) and its degradation products which is migrating from two sources: the subsurface lint trap located within the site building, and a debris and waste disposal area on the ground surface on site and on the adjacent Metro North Railroad property. Contamination migrating from these sources has impacted groundwater in the bedrock and overburden aquifers and has developed a plume extending downgradient (southwest) from the site over 1900 feet, as well as the bedrock itself. Site Geology and Hydrology: Groundwater is found in the overburden and in the bedrock. Groundwater is generally found 10 to 15 feet below ground surface and flows in a southwesterly direction. Overburden in the vicinity ranges in thickness from 2.2 feet to 32 feet, and consists of fill material (1-5 feet in thickness) and varied amounts of fine to coarse sand with varying amounts of silt. Deeper overburden is described as having till-like characteristics (higher density, well consolidated, and lower moisture content). Bedrock in the vicinity is a highly weathered gneissic/schistosic rock which is undulating in nature and is generally more transmissive than the till-like overburden material directly above.

Env Problem: Nature and Extent of Contamination: The primary contaminants of concern at the site include tetrachloroethylene (PCE) and its associated breakdown products. PCE was detected in groundwater at the site and downgradient off-site. On-site PCE in groundwater was noted at greater than 5,300 parts per billion (ppb) in site. The levels of PCE appear to diminish from the 1,000's of ppb of PCE to non detectable approximately 1000 feet to the southwest of the site. However, a high (PCE) concentration of 200 ppm was documented by within the adjoining Metro North railway property. Trichloroethylene (TCE) and TCA, were also detected in the groundwater both downgradient and on the site. Special Resources Impacted/Threatened: The site is located in an urban area of the City of New Rochelle. No significant environmental resources have been identified near the site. Significant Threat: The site presents a significant threat to the environment and a potential threat to human health due to the ongoing release of contamination from the site and from adjoining Metro North property into groundwater and soil vapor.

Health Problem: Direct contact with contaminants in groundwater is unlikely because the area is served by an uncontaminated public water supply. While

INDUSTRIAL OVERALL SERVICE CORP. (Continued) **S110043643**

the majority of the site is covered with buildings and pavement, trespassers or employees may come in direct contact with some contaminated surficial soils on site and on the adjacent Metro North Railroad property. Volatile organic compounds in the groundwater or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion (SVI). Inhalation of site contaminants in indoor air due to soil vapor intrusion is unknown because the on-site building is an active laundry facility. However, an evaluation to determine the potential for soil vapor intrusion to occur, will be needed should the current site use of the building or chemical use change in the future. Sub-slab depressurization systems have been installed in two off-site buildings to prevent the inhalation of site-related contamination. In addition, air monitoring is on-going at four additional off-site buildings to verify further actions are not needed. Sampling indicates soil vapor intrusion may be a concern for additional off-site buildings.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

GREEN HEAVEN CLEANERS (Continued) **1000338662**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

FINDS:

Registry ID: 110004439705

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was GHIOSAY 11-18-03 P&D Transport trailer carrying 5000 gallons of a hot tar product developed several leaks from seams and holes beneath the trailer. The driver, John Culbreath, pulled the vehicle to the shoulder of I-95 NB at mm 5.4 in New Rochelle. The trailer drained hot tar to the road shoulder where it flowed downhill until it cooled and solidified. Approximatley 200 feet of shoulder where affected before the trailer could be offloaded. DEC called out Castlton Environmental contractors when a company Rep stated that he/she would not sent a second truck to offload the damaged trailer. Castlton contacted Mystic Bulk Carriers and requested their assistance. Mystic provided a heated truck, suitable to offload the cargo and return it to Ownes Corning in Kearny where the load was originally picked up. The P&D damaged trailer was towed off the road to a spot near the

P&D TRANSPORT - HOT TAR (Continued) **S106126552**

I-95 toll plaza. Castlton performed the removal of the solidified tar several days later as they were delayed by heavy rain which created hazardous working conditions on busily traveled I-95. As of 11-18-03, Portland Asphalt indicated that they would pay Caslton directly for the cost of the cleanup. "

Remarks: "material goes into a manhole which leads to a water way. poss hutchinson river. spill not controlled yet. caller req call back from rep"

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Town:	New Rochelle (c)
Record Added Date:	03/29/2017
Record Updated Date:	05/01/2017
Update By:	GWHEITZM
Site Description:	LOCATION: The Site is located at 381-393 Huguenot Street, in an urban area in New Rochelle, New York. The Site is bound to the north by a vacant store (first floor) with residential above; to the south by a three-story residential apartment building and a one-story residential building; to the east by Huguenot Street and beyond by a Gulf labeled gasoline filling station; and to the west by an office building/warehouse. SITE FEATURES: The Subject Property consists of these (3) irregular shaped parcels totaling approximately 0.39 acres. The property currently maintains two structures. Lot 7 currently maintains an irregular shaped one-story building (with partial basement), with an approximate footprint of 3,400-square feet. This building is currently utilized for office and storage space associated with a U-Haul business, a real-estate firm, and a janitorial supply business. The first floor of the buildings maintained on Lots 3A and 4 house a church ministry, with the second floors occupied by one residential unit in each. The basement on Lot 4 is occupied by a hydraulic repair business. CURRENT ZONING AND LAND USE: The Site is currently utilized for mixed commercial and residential uses. The surrounding parcels are currently utilized for mixed commercial and residential uses. The Site is located within the City of New Rochelle s recently designated Downtown Overlay Zone (DOZ). The DOZ is part of a new zoning plan adopted in 2015 to re-establish the downtown as a center of vibrancy within a mixed-use, transit oriented setting. The characteristics of the Site allow a building of up to six stories, with the provision by the developer of a community benefit. Past Use of the Site: The northern portion of the Site (Lots 3A and 4 at 381 and 383 Huguenot Street) has been utilized for dry cleaning services circa 1931, and for manufacturing since the 1970s to 2010s. The potential source of contamination in this area includes former dry cleaning operations and the former fuel oil USTs. The central portion of the Site (385 & 387 Huguenot)has maintained a residential dwelling circa 1931, and as truck and trailer parking since 1990s. The potential source of contamination in this area includes a former fuel oil UST, which was removed prior to 1997. The southern portion of the Site (Lots 5 and 7 at 391 and 393 Huguenot)has maintained a gasoline filling station from 1930s to

THE HUGUENOT (Continued) **S120706214**

	1950s, and then as car wash and warehouse from 1970s to 2010s. The potential source of contamination in this area includes former gasoline USTs and car wash operation. In addition, urban fill material was detected throughout the site. Site Geology and Hydrogeology: Per the United State Department of Agriculture (USDA) Natural Resources Conservation Service, the soil at the Subject Property is classified as Uh-Urban. Actual soil conditions observed during the Phase II ESA and the SSI field activities revealed that the subsurface soil consists of dark to brown medium to coarse sand from grade to 10 feet below. Groundwater was encountered at approximately 6 to 8 feet below grade. Site-specific groundwater flow direction is towards northwest.
Env Problem:	Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available.
Health Problem:	Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Caller id from Duke Energy (?) 713-627-5505, consultant for a bank, requesting contact information for the DEC case manager. jod 05/16/16 The following email was received: Dear Mr. Ghiosay, This is Wenqing Fang with Cider Environmental. We represent the owner of 381 Huguenot Street, New Rochelle, NY. The property has an active NYSDEC Spill case (No. 9604099), and is slated for redevelopment. It is our intention to work with the DEC to achieve closure during the site redevelopment. The first step is to develop a Remedial Action Work Plan (RAWP) with DEC approval within 3 months. We recently performed Phase I/II ESA at the site. The Phase I/II reports and the proposed site redevelopment plan are available upon request. Looking forward to working with you on this project. Regards, Wenqing _____ Wenqing Fang, P.E. - Principal - Cider Environmental, LLC. 6268 Jericho Turnpike, Suite

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo: "5/7/09 At a construction site, contaminated soils were encountered, which was confirmed by soil tests done by Northeast. They will be doing the site remediation and will submit a cleanup report. dw 06/12/09 Northeast Environmental provided oversight activity when petroleum impacted soil was discovered and need to be removed. Remediation consisted of the removal of 425.66 tons of petroleum contaminated soil. Post excavation TAGM soil sample results were all below DEC guidance values. NFA required. TG"
Remarks: "1231 The caller advised dispatch North East Environmental will conduct the clean up. The caller requested a call back. No water ways affected."

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

FINDS:

Registry ID: 110004370369

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource

ROTH CLEANERS (Continued) **1000237840**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Region: 3
Acres: 3.75
HW Code: 360087
Record Add: 11/08/2005
Record Upd: 07/21/2009
Updated By: RXKEATIN
Site Description: The Baker?s Pride site is located at 30 Pine Street in the City of New Rochelle, Westchester County, NY. The surrounding area is urban with commercial and residential establishments mixed in between the commercial businesses. The Baker?s Pride site is an approximately 3.75 acre flat to severely sloping irregularly shaped parcel. The Baker?s Pride building occupies approximately 111,450 sf of building space and occupies the majority of the property. Baker?s Pride owns the Bakers Pride Oven Company Inc and is engaged in the production of restaurant/commercial grade ovens and broilers. The site is bordered by Metro North railroad tracks to the west and northwest, a mix of commercial and residential properties to the northeast, east, and south. Interstate (I-95) is located to the west of the Metro North railroad tracks. In 2005, a Phase II Environmental Assessment report was completed by Enercon as part of closure proceedings for a 3,000 gallon fuel oil UST that was closed in place and a 10,000 gallon fuel oil UST that was removed. Monitoring wells installed as part of this assessment revealed the presence of PCE in groundwater at levels up to 1,430 ppb. (The State groundwater standard for PCE is 5 ppb.) Also, this report noted chemical storage for cutting oils, lubricants, solvents and paints. No products were indicated that contained PCE. In 2007 a follow up report was conducted which revealed PCE in groundwater at levels up to 1,700 ppb. The site was added as a potential inactive hazardous waste disposal site ("P site") in 2007. A State funded site characterization was initiated in 2008 to determine the source of the PCE groundwater plume. A total of 9 monitoring wells were installed in the fall of 2008. Groundwater contaminated with PCE showed higher levels of PCE in wells upgradient from the Baker?s Pride facility. The PCE concentrations were as high as 3,700 ppb in MW-13 which is located about 300 feet upgradient from the Baker?s Pride facility. This prompted the State to do a second round of groundwater sampling further upgradient of MW-13. Two additional wells (MW-24 and MW-25) were installed about 150 feet upgradient of MW-13 in the winter of 2009. MW-24 revealed PCE at 5,300 ppb. The second round of sampling further defined a groundwater plume with a source area upgradient from the Bakers Pride site. Since the site information for Baker?s Pride indicates that the plume of PCE is coming from an off-site source, the Baker?s Pride site (360087) will not be listed in the Registry of Inactive Hazardous Waste Disposal sites. A separate site was added to the Registry to address the source of the PCE plume (See

BAKERS PRIDE OVEN CO INC (Continued) **1004571492**

site #360109.)

Env Problem:	Based upon investigations to date, the primary contaminants of concern at the site include tetrachloroetylene (PCE) and its associated breakdown products. PCE was detected in upgradient groundwater as well as on-site and also in indoor air in residences upgradient of the site. PCE was detected on-site in groundwater from non-detect up to 3,200 parts per billion (ppb) at MW-1) above the respective groundwater standard of 5 ppb. Upgradient off-site levels of PCE were as high as 5,300 ppb. Indoor air was impacted in two residences with the highest level being 530 micrograms per cubic meter (ug/m3) at a property on Bartels Place. Since the highest levels of PCE were identified in the groundwater upgradient of the site this suggests an off-site source that is impacting the Baker?s Pride site. The source of this contamination is the Industrial Overall Service Corp. Class 2 site (#360109)

Environmental Interest/Information System

BAKERS PRIDE OVEN CO INC (Continued) **1004571492**

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Update By: DACROSBY
Site Description: Location: The Flamingo Cleaners site is located in an urban area of New Rochelle, Westchester County, at the southeastern corner of the intersection of Clinton Place and North Avenue. Site Features: The site is a one-story commercial building with a full basement. The building is divided into four tenant spaces which include a bar/lounge, beauty salon, and two vacant spaces that previously housed a travel agency and a dry-cleaner. Current Zoning/use(s): The site consists of four retail spaces, two of which are currently occupied. The site is zoned for commercial use. The surrounding land uses include parking lots, commercial establishments, a residential apartment complex, a medical center, and a church. The dry cleaning operation is no longer active and the space is currently vacant. Past Uses of the Site: The existing building was constructed in 1941 and used for retail. Flamingo Cleaners began dry cleaning operations in 1958, and ran until 2005 when all dry-cleaning equipment was removed. Site contamination is a result of the former dry cleaner operations from improper management, disposal, and leaks of tetrachloroethylene (PCE). Prior completed investigations include a Phase I Investigation in October of 2003 and a Phase II Investigation completed in March of 2004. The Volunteer entered into a Brownfield Cleanup Agreement in April 2005. A Decision Document was issued in March 2012 for a remedy involving source soil removal and in situ chemical oxidation treatment of groundwater. Based on the extent of the site contamination, a referral to State Superfund for an off-site investigation was completed in December 2007. The groundwater plume was found to be isolated to immediately behind the building and little to no off-site impacts were noted in groundwater, soils, nor in soil vapor. Site Geology/hydrogeology: The site is underlain by glacial till which sits atop highly weathered bedrock. Bedrock ranges from 5 - 22 feet below ground surface. The water table is between 5 - 11 feet below ground surface. Groundwater flow direction dominantly to the south-southeast toward Long Island Sound, however, site specific groundwater flow direction is radial, and seasonally affected.

FLAMINGO CLEANERS (Continued) **1000299848**

Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were volatile organic compounds (VOCs), primarily tetrachloroethylene (PCE or perc) which was present in soils, groundwater, and indoor air. PCE breakdown products Trichloroethene (TCE) and 1,2-dichloroethene (1,2-DCE), vinyl chloride, as well as 1,1,1 trichloroethane (1,1,1 TCA), were also present at the site. Remedial actions have removed source soils, treated groundwater, and have prevented contaminants from entering the indoor air. Residual contamination in the soil, groundwater, and indoor air is being managed under a Site Management Plan.
Health Problem:	Measures are in place to control the potential for coming in contact with subsurface soil and ground water contamination remaining on the site. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in groundwater and/or soil may move into the soil vapor (air space within the soil), which in turn may move into overlying building and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system (system that ventilate/remove the air beneath the building) has been installed in the on-site building to prevent the indoor air quality from being affected by the contamination in the soil vapor beneath the building. Sampling indicates soil vapor intrusion is not a concern for off-site buildings.

Site Description:	Location: This site is the off-site component of the former Flamingo Dry Cleaners site (C360078). The site is located in an urban area of New Rochelle, Westchester County, at the southeastern corner of the intersection of Clinton Place and North Avenue. Site Features: The site itself is a one-story commercial building which includes four stores including the vacant dry cleaners. This off-site component is comprised of immediately-surrounding areas. Current Zoning/Uses: Surrounding land uses include parking lots, commercial establishments, a residential apartment complex, a college, a medical facility, and a church. Historical Uses: The on-site building was constructed in 1941 and used for retail. Flamingo Cleaners began operations in 1958 and ran until 2005 when all dry-cleaning equipment was removed. On-site contamination is a result of the former dry cleaner operations from improper management, disposal, and leaks of tetrachloroethylene (PCE). A referral for off-site work was completed in December 2007 and a SSF RI/FS Work assignment was approved in March 2009. The RI field work was conducted in the summer of 2009 and fall of 2009. Additional round of gw analyses occurred in spring 2010. The on-going off-site investigation thus far indicates that PCE is not present in environmental media above standards in the area

OFF-SITE FLAMINGO CLEANERS (Continued) **S110043637**

	surrounding the site. Site Geology/Hydrogeology: The area surrounding the site is underlain by glacial till which sit atop highly weathered bedrock. Area bedrock ranges from 5-25 feet below ground surface. The water table ranges from 5-11 feet below ground surface. Groundwater flow direction is dominantly to the south-southwest toward Long Island Sound, but site specific groundwater flow direction is radial and seasonally affected.
Env Problem:	Nature and Extent of Contamination: Based on investigations to date, the primary contaminant of concern at the site is tetracholoroethylene (PCE), a dry cleaning solvent. On-site, PCE has been detected in soils, soil vapor, indoor air, and groundwater. The off-site investigation to date indicates that there are no off-site impacts. Special Resources Impacted/Threatened: The site is located in an urban area of the City of New Rochelle. There are no special resources identified near the site.

Site Description:	Location: The Schmuckler s Dry Cleaners site is located in an urban area located at 258-364 North Avenue in New Rochelle, Westchester County. The site is 0.21 acres, most of which is covered by a two-story row building with a full basement. Site Features: In addition to the former dry cleaners, historically located on the first floor, the site also includes an enclosed backyard area to the immediate west of the building. The backyard is mostly covered by lawn, but also includes elevated planting beds, and a paved walkway. Current Zoning/Use(s): The site is commercially zoned, and currently has five commercial tenants occupying both the first and second floors. Properties along North Avenue are predominantly zoned for commercial or mixed use, some maintaining residential apartments above. Commerical uses dominate areas within one block east and west of North Avenue with the exception of a multi-unit residential building immediately to the west of the site. Drinking water on-site is provided from a municipal source. Past Uses of the Site: The building on-site was built in 1891, and operated by Schmuckler s Cleaners from 1914 to 2006 on the first floor and basement of the building. Additions were added to the building in 1937, and two in 1987. The site was acquired by the Volunteer, HNJ Realty, LLC, in August 2005, and entered into a BCA in June 2006. An interim remedial measure (IRM) was conducted starting in late 2008 to install a combined soil vapor extraction system/sub-slab depressurization system (SVE/SSDS) in the former dry cleaner to mitigate PCE in indoor air. The IRM was deemed complete in December 2013, but the SVE/SSDS continues to operate. A second IRM work plan was approved in May 2015 to conduct a pilot study of an enhanced biological in situ treatment to remediate contaminants under the on-site building slab. Site Geology and Hydrogeology: The site is underlain by fill which is underlain by poorly sorted glacial material (silty-clay with sand and gravel). The highly weathered bedrock surface is between 9 and 13 feet below ground surface at site. Groundwater was encountered between 9 to 12 feet below site. Bedrock groundwater flows to the southeast. Only two overburden wells onsite have produced water, therefore a groundwater flow direction in overburden cannot be determined. It is assumed that it flows in the same basic southeast direction as the bedrock groundwater.
Env Problem:	Based on the investigations conducted to date, the primary contaminants of concern at the site are chlorinated volatile organic compounds (VOCs), primarily tetrachloroethylene (PCE) and its breakdown compounds, in soils, groundwater, sub-slab vapor, and soil gas; petroleum-related VOCs in soils, groundwater, sub-slab vapor, and soil gas; and semi-volatile organic compounds (SVOCs) in

SCHMUCKLER'S DRY CLEANERS (Continued) **S107787044**

groundwater. Soils: Tetrachloroethylene (PCE), trichloroethene (TCE), and multiple petroleum related VOCs were detected in onsite soils underneath the building slab. The highest concentration of PCE at 210 parts per million (ppm), exceeding restricted commercial soil cleanup objectives (SCOs), was located underneath the former dry cleaning equipment room. Other contaminants detected in soils only exceeded the Protection of Groundwater SCOs. These exceedences were largely in soils located downgradient of the dry cleaning equipment room and consisted of: TCE at 1.3 ppm, cis-1,2 dichloroethene (cis-1,2-DCE) at 3 ppm, n-propylbenzene at 16 ppm, m+p xylenes at 15 ppm, ethylbenzene at 6.6 ppm, 1,3,5-trimethylbenzene at 63 ppm, and 1,2,4-trimethylbenzene at 99 ppm. Groundwater: Petroleum-based floating product (LNAPL, or light non-aqueous phase liquid) was observed in groundwater under much of the on-site building slab, a maximum of 6 inches thick under the former dry cleaning equipment room. Also observed were very high concentrations of select VOCs also under the former drycleaning equipment room. The maximum detected PCE was 830,000 parts per billion (ppb), and TCE at 58,000 ppb, indicating the presence of these compounds as free product DNAPLs (dense non-aqueous phase liquid) in groundwater. 25 individual VOCs were also detected in site groundwater samples exceeding NYS Class GA groundwater standards. These include the above-mentioned PCE, TCE, as well as other maximum detected concentrations of PCE breakdown products: cis-1,2-DCE at 8,700 ppb, and vinyl chloride at 28 ppb. BTEX was detected, with benzene at 62 ppb, toluene at 130 ppb, ethylbenzene at 150 ppb, m+p xylene at 520 ppb, and o-xylene at 290 ppb. Other significant concentrations of VOCs detected in groundwater include 1,3,5-trimethylbenzene at 890 ppb, and 1,2,4-trimethylbenzene at 840 ppb. Eight SVOCs were detected over groundwater standards in groundwater under the building slab, including napthalene at a concentration of 1300 ppb, phenanthrene at 2400 ppb, acenapthene at 710 ppb, and antracene at 280 ppb. Bedrock wells were installed off-site in the downgradient, sidegradient, and upgradient directions. Petroleum-based VOCs and SVOCs were detected in the bedrock aquifer at concentrations above groundwater standards. For VOCs, total maximum BTEX concentration of 722 ppb was detected in a downgradient bedrock well. 11 individual SVOC contaminants were detected over groundwater standards in the same downgradient off-site bedrock well, including naphthalene at 4100 ppb, phenanthrene at 2800 ppb, acenapthene at 710 ppb, and antracene at 300 ppb. The extent of groundwater contamination is concentrated underneath the on-site building slab, with petroleum-based VOC and SVOC contaminants and LNAPL extending off-site in the bedrock downgradient or southeast direction. Soil Gas/Soil Vapor: The high concentrations of PCE (787,000 ug/m3), TCE (15,200 ug/m3), cis-1,2-DCE (46,000 ug/m3), and Vinyl Chloride (34 ug/m3) in soil vapor under the slab of the on-site building required the installation and continuing operation of a combined soil vapor extraction and sub-slab mitigation system during a 2008-2013 Interim Remedial Measure (IRM) action. PCE (at 91 ug/m3) and TCE (13.4 ug/m3) were also detected in soil gas outside of the building near the location of a former drywell. Benzene (37 ug/m3), toluene (126 ug/m3), ethylbenzene (85 ug/m3), xylene (555 ug/m3), 1,3,5-trimethylbenzene (3 ug/m3), and 1,2,4-trimethylbenzene (14 ug/m3) were also detected in subslab vapor and soil gas. Special Resources Impacted/Threatened: The site is located in an urban area of the City of New Rochelle. There are no special resources identified near the site.

SCHMUCKLER'S DRY CLEANERS (Continued) **S107787044**

Health Problem:	While direct contact with contaminants in the soil is unlikely because most contaminated soils are found beneath the on-site building, persons who dig below the ground surface adjacent to the building may come into contact with contaminants in subsurface soil. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. A sub-slab depressurization system was installed in the on-site building to prevent vapors beneath the slab from entering the building. Sampling indicates soil vapor intrusion is not a concern in one adjacent off-site building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for other nearby off-site buildings.

Site Description:	Location The Site is located at 78 Echo Avenue in New Rochelle, Westchester County, New York. This 3 acre site is bordered to the north by Echo Bay, an estuary of the Long Island Sound. It is bordered to the east and south by residential properties, to the southwest by Echo Bay Avenue, and to the west by a landscaping company (formerly a fuel oil terminal). Site Features All the former structures and underground utility services have been removed, and the whole site has been levelled, top-soiled and grassed. Current Use The site is currently vacant Past Use of the Site Con Edison used the site as an electrical distribution substation until 1981. PCBs transformers were stored and used at the site. Leaks and spills of PCBs may have occurred in the handling or servicing of these transformers. The soil on site and the sediment in the Bay were contaminated with PCBs.
Env Problem:	Prior to remediation the contaminant of concern was PCBs. Remediation of the site is complete. The cleanup of PCBs and other incidentally detected contaminants has mitigated the threat to the environment, and in particular to the natural habitat in the bay.
Health Problem:	As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/30/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory
The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Elevation:	91 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5940557 MOUNT VERNON, NY
Version Date:	2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

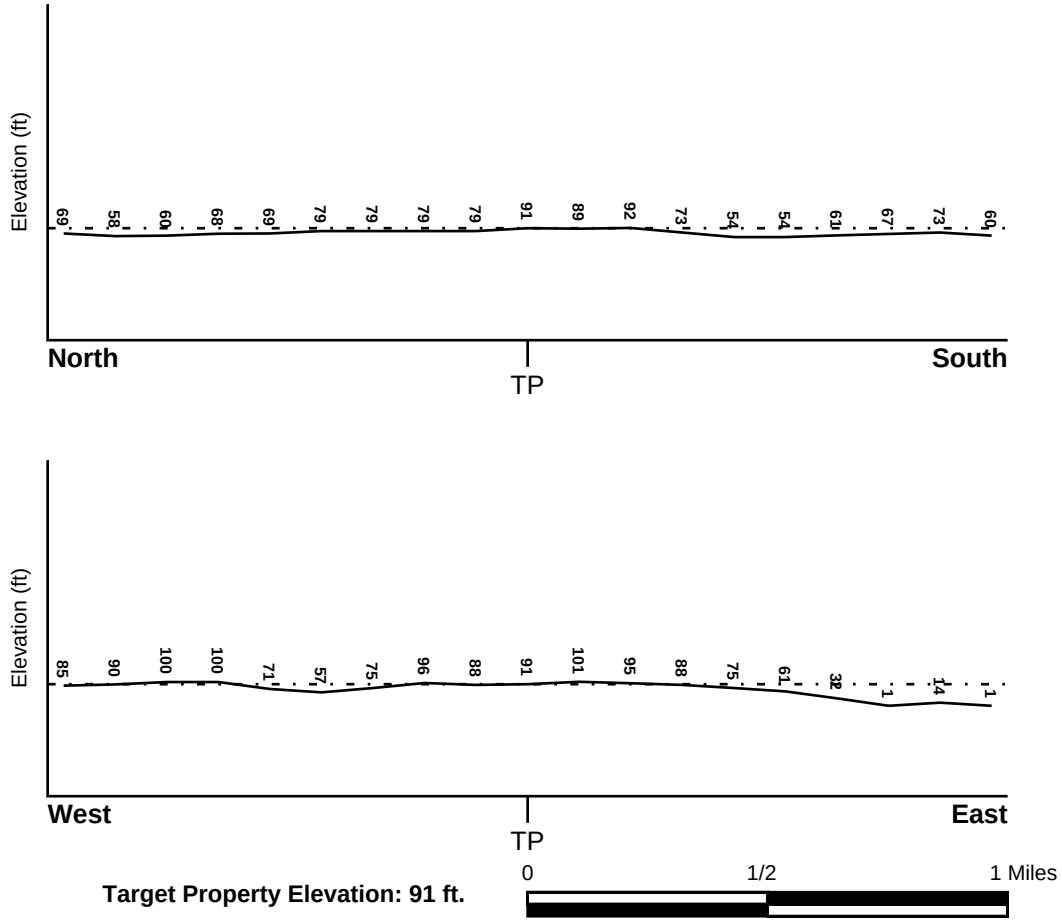
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 91 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type

36119C0344F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOUNT VERNON	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 61 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

REMEDIAL INVESTIGATION REPORT
INDUSTRIAL OVERALL SERVICES
SITE # 360109

WORK ASSIGNMENT NO. D007619-07

Prepared for:

New York State Department of Environmental Conservation
Albany, New York

Prepared by:
MACTEC Engineering and Consulting, P.C.
Portland, Maine

MACTEC: 3612112221

NOVEMBER 2016

EXECUTIVE SUMMARY

The Industrial Overall Services Site (NYSDEC Site No. 360109) is located at 10 Bartels Place in New Rochelle, Westchester County, New York. It is 0.42 acres in size and resides on a slightly sloping irregular shaped parcel. The main Site feature includes a six-sided building which occupies the majority of the property and a small parking area located to the south and southwest of the building. The surrounding area is urban with a mix of commercial and residential structures.

The Site began operations in 1950 as a uniform and industrial clothing cleaning facility for heavily soiled clothing from auto body and gasoline dispensing businesses. In 1980, Workingman's Closet, a direct factory sales division of Industrial Overall which sells new and reclaimed work clothes, was opened. The Site reportedly operated as a dry cleaning laundering facility for a short time during the 1980's. Current operations at the Site include laundering linens and uniforms for restaurant and other businesses and retail uniform sales.

A Remedial Investigation (RI) was completed at the Site between March 2012 and April 2015 to evaluate the nature and extent of contamination in soil, groundwater, soil vapor, and pore water both on and off-site. Results of this investigation indicate:

- Two sources of contamination (primarily tetrachloroethylene [PCE]) were identified at the Site 1) the lint trap and 2) the debris disposal areas;
- PCE concentrations in soil on the Site and Metro North Railroad property adjacent to the Site exceed the NYS SCGs;
- Concentrations of PCE in overburden and bedrock groundwater exceed the NYS groundwater criteria (5 µg/L) on the Site, and extend approximately 1,900 feet downgradient of the Site;
- PCE in residential sub-slab soil vapor and indoor air exceeded the NYSDOH recommended guidance values at two residential structures and mitigation measures have been implemented;
- Four additional residential structures require ongoing monitoring based on the NYSDOH SVI matrix; and
- The sanitary sewer line was identified as preferential pathway for contaminated vapor to enter into nearby structures.

A Qualitative Exposure Assessment indicated ecological receptors are not present; however; complete exposure pathways exist for:

- Direct exposure to contaminated media on-site (soil, soil vapor, groundwater, and sludge), and
- Soil vapor intrusion into nearby structures.

During the RI, an IRM was implemented to mitigate direct exposure to contaminated soil on an adjacent residential property. The IRM Construction Completion Report was approved by NYSDEC on August 14, 2015.

Based on the findings of the RI, MACTEC recommends preparing a Focused Feasibility Study Report to evaluate alternatives for remediating soil and source areas onsite, as well as contaminated groundwater migrating off-Site. Prior to implementing a remedial action, a pre-design investigation should be conducted to address the following data gaps:

- Delineate the extent of contamination on the MNR property
- Evaluate the potential for Dense Non-Aqueous Phase Liquid and/or soil contamination to exist along the sanitary sewer line
- Delineate the extent of contamination in the bedrock south of the Site
- Delineate the extent of contamination downgradient of the Site
- Evaluate the potential upgradient source(s) of 1,1,1-trichloroethane that is contributing to groundwater contamination at the Site.

4.2 GROUNDWATER SAMPLE RESULTS

Groundwater samples were collected from 53 monitoring wells at, and hydraulically downgradient from the Site. In addition, 30 groundwater grab samples were collected during the RI. Groundwater sampling locations are shown on Figure 2.1 and Figure 2.2. Groundwater results are presented in the following tables and figures:

4.2.1 Site Groundwater Sample Results

Seventy-seven groundwater samples were collected from 41 locations on Site for VOC analysis. Seven additional samples were collected for RCRA 8 metals analysis and one for TPH. A review of the Site groundwater results indicate the following findings:

- PCE was detected in 73 samples from 40 locations at concentrations exceeding the GA Standard (5 µg/l);
    - The highest concentration of PCE detected in Site groundwater was interpreted to be co-located with a source area (SP-003) beneath the lint trap at a concentration of 170,000 µg/l;
- TCE concentrations were detected in 65 samples from 34 locations exceeding the GA Standard (5 µg/l);
    - The highest concentration of TCE detected in Site groundwater was also interpreted to be co-located with a source area (SP-003) beneath the lint trap at a concentration of 40,000 µg/l; and,
- Metals were not detected at concentrations exceeding the GA Standard.

In general contaminant concentrations increase with depth in overburden and bedrock groundwater, which is consistent with a subsurface discharge of contamination in the lint trap source area (Table 4.18). The bottom of the lint trap is located near the groundwater table approximately (11 feet bgs). Results from the vicinity of the lint trap indicate that contaminants were released from sludge within the trap and migrated vertically into the highly weathered bedrock unit and then spread laterally within that layer as well as into the deeper weathered bedrock aquifer.

4.2.2 Metro North Railroad Groundwater Sample Results

Twenty-two groundwater samples were collected from 13 locations on the MNR property for VOC analysis. Four of these locations were also sampled for RCRA 8 metals analysis. A review of the MNR groundwater results indicate the following findings:

- PCE was detected in 18 samples from 12 locations at concentrations exceeding the GA Standard;
- TCE was detected in eight samples from five locations at concentrations exceeding the GA Standard; and,
- No metals were detected at concentrations exceeding the GA Standard.

4.2.3 Downgradient Groundwater Sample Results

Fifty three samples were collected from 23 locations downgradient of the Site for VOC analysis. Three of these locations were also sampled for RCRA 8 metals analysis. A review of the downgradient groundwater results indicate the following findings:

- PCE was detected in 17 samples (six locations) at concentrations exceeding the GA Standard;
- TCE and cis-1,2-DCE were both detected in 23 samples (nine locations) at concentrations exceeding the GA Standard;
- VC was detected in three samples (two locations) at concentrations exceeding the GA Standard; and,
- Chromium was detected at one location (MW-13 at 791 µg/l) at a concentration exceeding the GA Standard.

Figures 4.2 to 4.7 present groundwater contour plumes for PCE, TCE and 1,1,1-trichloroethane (1,1,1-TCA) from the most recent sample data set from each location.

Groundwater from MW-5, located south of the Bakers Pride building, contains a light non-aqueous phase liquid which was measured in January 2013 using an oil-water-interface probe and estimated to be 0.6 feet thick on top of the groundwater surface. Laboratory analysis of the floating product identified it as #2 fuel oil with a concentration of 13,000 mg/kg. TPH in groundwater in MW-5 was non-detected above the reporting limit.

4.2.4 Background Sample Results

To evaluate if there is an upgradient source from the Site that could be contributing to the contamination plume originating from the Site, upgradient groundwater samples were collected for VOC analysis. VOCs were either not detected or were detected at low concentrations (compared concentrations detected onsite) in groundwater upgradient from the Site (MW-26, MW-26B, MW-27B and PZ-29), indicating that the contamination on Site is not likely from an upgradient source.

4.2.5 Other Water Sample Results

To evaluate the exposure pathway for direct contact with groundwater via sump water, and inhalation of vapors that may migrate from groundwater to air within overlying structure, groundwater was collected from within two residential structures adjacent to the Site (CL-006 and CL-009) and adjacent to each structure (CL-004) and analyzed for VOCs. Residential sump water sampling results are summarized in Table 4.9 and locations are shown on Figure 2.1. PCE was detected in groundwater collected CL-004 at a 2.1 µg/L. TCE and 1,1,1-TCA were not detected in the residential sump water samples.

Three additional water samples were collected from catch basin (CB-001) adjacent to and upgradient of the Site building and from, from within the Site building, standing water (SW-001) from the vault and downgradient from the Site, water (SW-002) from a residential sump pit west of the Site. These water VOC sampling results are shown in Table 4.11 and the locations are shown on Figure 2.1. A review of the sample results indicate the following findings:

- PCE, TCE and ,1,1-TCA were not detected in water collected from CB-001;
- TCE and 1,1,1-TCA were detected in water collected from the vault in the Site building (SW-001) at a concentrations of 75 µg/L and 24 µg/L, respectively; and,
- PCE was detected in water collected downgradient from the Site building (SW-002) at a concentration of 69 µg/L.

Three pore water, samples were collected from a potential surface water discharge location (Burling Brook) located approximately one-mile south of the Site (Figure 2.2). Pore water sample results are summarized in Table 4.10. Site related VOCs were not detected at concentrations above the reporting limits.

4.2.6 Monitoring Well Groundwater MNA Results

Samples from five overburden and two bedrock monitoring wells were submitted for analysis of monitored natural attenuation (MNA) parameters July 2012. Groundwater results were used to evaluate the likelihood that anaerobic biological degradation of chlorinated VOCs is occurring within groundwater at, and downgradient of the Site; therefore, sample results were not compared to SCGs. A subset of MNA parameters were collected from MW-26 and MW-26B to evaluate background

overburden and bedrock groundwater conditions. An evaluation of MNA results is discussed in Section 5. MNA groundwater results are presented in Table 4.7.

4.2.7 Extent of Groundwater Contamination

Figures 4.2 to 4.9 present the extent of PCE, TCE and 1,1,1,-TCA contamination in groundwater. As shown on these figures, Site related contamination was detected in groundwater over 1,900 feet downgradient of the Site.

4.3 SOIL VAPOR INTRUSION SAMPLING

The two primary Site related chlorinated solvents detected in shallow groundwater emanating from the Site are PCE and TCE. SVI sampling was conducted to evaluate if the VOCs detected at the Site and in groundwater downgradient from the Site are migrating into overlying residential structures via vapor intrusion. Therefore, SVI samples were collected from 11 residential structures and five commercial/industrial structures in the vicinity of the Site during the heating seasons between 2012 through 2015. Analytical results for the SVI sampling events are presented in Table 4.29.

Sample results have been submitted to the NYSDEC and NYSDOH in five Confidential SVI Letter Reports (MACTEC, 2012c; MACTEC 2013d; MACTEC 2013d MACTEC, 2014d; MACTEC 2015c; MACTEC, 2015d). Based on the SVI sample results, mitigation measures have been implemented at two structures and continued monitoring was deemed warranted by the NYSDOH at an additional four structures.

In addition to the SVI sampling, three soil vapor samples from exterior locations were collected at the down gradient edge of the groundwater plume to evaluate the potential for SVI in structures located in this area. Exterior soil vapor grab sampling results are shown on Table 4.30. PCE was detected in all three samples, with the highest concentration at 110 micrograms per cubic centimeter (ug/cm^3). Based on this concentration and considering contaminants generally attenuate when migrating through building foundations, it is unlikely concentrations in indoor air in nearby structures would exceed the PCE standard of 30 ug/cm^3.

5.0 CONTAMINANT FATE AND TRANSPORT

This section presents an assessment of contaminant movement and disposition within the environment.

5.1 CONCEPTUAL SITE MODEL UPDATE

A CSM for the Site was first presented in the Field Activities Plan (MACTEC, 2012a). The update presented in this RI has been modified based on the data that was collected during field activities conducted between 2012 and April 2015.

Based on detected concentrations, PCE may be present at the Site as a DNAPL (detected in the vicinity of the lint trap in soil at 21,000 mg/kg and in groundwater at 170,000 µg/l). PCE and its breakdown products have migrated from waste disposal areas (lint trap and debris piles) into soil and overburden groundwater, and then into the bedrock groundwater. Site related contaminants have been detected at concentrations above applicable SCGs in overburden and bedrock groundwater at and downgradient of the Site.

5.1.1 Contaminants of Concern (COC)

The primary Site-related COCs are PCE and its breakdown products (TCE, cis-1,2-dichloroethene [DCE], VC). PCE has historically been used at the Site for dry cleaning operations, its use was purportedly discontinued in the 1980's. 1,1,1-TCA and its breakdown product 1,1-dichloroethane [DCA] have also been detected on Site. 1,1,1-TCA was not believed to have been used in dry cleaning operations at the Site but may have been used when the Site was an active automobile garage. 1,1,1-TCA is commonly used as a solvent for removing grease from machined metal products. Concentrations of 1,1,1-TCA detected in soils do not exceed the Protection of Groundwater SCO; however, concentrations detected in groundwater exceed the GA Standard.

5.1.2 Source Areas and Points of Entry

The presence and distribution of PCE and TCE suggest two source areas are present at the Site; 1) the lint trap (SP-003) located inside the Industrial Overall Services Site building; and 2) debris areas located

west and northwest of the Site. The debris areas are historical disposal areas where waste material from the Site were disposed on the ground surface.

5.1.2.1 Lint Trap Source Area

The lint trap (SP-003) is a four foot by six foot by 9.5 foot deep subsurface structure located inside the Site building which is part of the sanitary sewer system. The purpose of this structure is to collect solid materials from process wastewater prior to discharge to the Westchester County sewer system. The integrity of the walls and bottom the lint trap were evaluated at the time the sludge was removed. The walls of the lint trap were constructed of brick and mortar and found to be in moderate condition with little to no cracks. The bottom of the lint trap was constructed of stones, bricks and cinders with some aggregate mortar, estimated to be 0.2-feet in thickness. The overall condition of the bottom of the lint trap was considered to be in poor condition. A direct push investigation beneath the lint trap identified soils containing what appeared (based on visual observations) to be free-phase product (DNAPL).

Water processed through the lint trap includes, at a minimum, sanitary wastewater, laundering wash water and precipitation collected through roof drains from the Site building. The floor drain (SP-001) adjacent to the former location of the dry cleaning unit (Figure 1.2), drains into the lint trap. Samples collected from the lint trap in 2013 contained PCE source materials. This material was likely disposed from the dry cleaning process into floor drains beneath the Site building that discharged to the lint trap. The lint trap represents a direct entry point for source material to soils, groundwater and shallow, highly weathered bedrock.

5.1.2.2 Debris Pile Waste Disposal Source Area

Debris disposed on the ground surface west and northwest of the Site represents a second source of VOC contamination. Laundry related waste materials including lint have been observed in the debris pile areas. In 2014, sludge which appeared to have been recently disposed on the ground surface, was observed in the debris areas. Based on discussions with Site workers the sludge was determined to have originated from the lint trap within the Site Building (NYS Spill Number 1310684). The sludge contained laundry related wastes including cloth and lint material similar to the materials historically disposed in this area.

PCE contamination is present in surface soil along the MNR tracks exceeding the Protection of Groundwater SCO in 28 of 30 locations, and was detected as high as 190 mg/kg in a 0-0.2 inch sample (SS-300). Migration of contaminants through precipitation (both infiltration and erosion of soil with overland flow) likely mobilized the surficial contamination in the debris piles. PCE is present in soils above the water table (approximately seven feet bgs) at a concentrations as high as 500 mg/kg (SS-301). The vertical and lateral extent of contaminated soils on the MNR property has not been delineated, due to MNR access limitations.

5.1.3 Source Area Mitrgation

Contaminants from source areas at the Site have and are migrating through various mechanisms including: spillage, disposal, migration with precipitation and through groundwater flow.

Contaminants were generated through dry cleaning processes in the Site building. Some of the materials generated in these processes were disposed in the debris areas west and northwest of the Site. Soil samples from the parking lot areas onsite have sporadic PCE contamination in relatively shallow soils exceeding the Protection of Groundwater, Residential and Industrial SCOs which is likely due to incidental spillage when transporting waste from the Site building to the debris areas.

Migration of contaminants through precipitation (both infiltration and erosion of soil with overland flow) likely mobilized the surficial contamination in the debris piles. Contaminants detected on the Residential Use Area likely migrated via overland flow with precipitation. Contamination in groundwater in this area appears to have been caused by contaminant migration through infiltrating precipitation within the source area.

Two PCE hotspots (i.e. concentrations greater than 30 mg/L) were identified in groundwater associated with the Site:

- Overburden and bedrock groundwater associated with the lint trap - (170,000 µg/l at SP-003), and hydraulically downgradient in highly weathered bedrock (140,000 µg/l at PZ-36) and in deeper weathered bedrock (18,000 µg/l at BR-102); and,
- Overburden and bedrock groundwater associated with the debris piles - (38,000 µg/l at MW-30B) and highly weathered bedrock (36,000 ug/L at MW-30B).

Based on soil and groundwater results in the vicinity of the lint trap discharge of high concentrations of PCE, likely as a DNAPL (e.g., greater than its solubility concentration of PCE [150,000 µg/l]), appears to have migrated vertically via gravity into the underlying soils and then into the highly weathered bedrock. Once in the highly weathered bedrock the contamination appears to have migrated horizontally in this highly transmissive layer (i.e. 300 feet/year) as well as vertically into the fractures of the weathered bedrock below. Once in the fracture system within the bedrock aquifer, the DNAPL appears to have continued to drain vertically until the DNAPL movement was halted by matrix diffusion and dilution. Concentrations of TCE generally mimicked the distribution of PCE detected in Site groundwater. The vertical extent of groundwater contamination at the Site and the horizontal extent of groundwater contamination to the south have not been delineated.

Low concentrations of Site-related COCs were detected in groundwater upgradient from the Site (PCE at 2.1 µg/l and TCE at 56 µg/l), suggesting there may be another source contributing in part to groundwater contamination at the Site.

A source of the 1,1,1-TCA detected in groundwater on and downgradient of the Site has not been identified. Distribution of 1,1,1-TCA in groundwater near the Site suggests a source may be present onsite upgradient of the lint trap or perhaps from an upgradient off-site source. It is possible that 1,1,1-TCA was used onsite as degreasers during the period when the building was used to service automobiles. A groundwater sample collected from beneath the Site building (PZ-33) and upgradient from either source area near a reported location of a former hydraulic car lift, contained the highest concentration of 1,1,1-TCA detected on the Site (730 µg/L). Soil collected from the same boring contained 1,1,1-TCA at a concentration of 0.083 mg/kg which is less than the protection of groundwater SCO. Additional sampling is needed to evaluate a potential upgradient contaminant sources along Relyea Place.

5.2 CONTAMINANT PERSISTANCE

Both PCE and 1,1,1-TCA tend to be recalcitrant (i.e., persistent) in the environment. These contaminants can persist in the environment decades after their use is discontinued. Both compounds degrade through reductive dechlorination. The presence of daughter products in groundwater and soil at and downgradient if the Site for both of these compounds suggests that conditions may be suitable for their natural degradation. However, the concentration of the core of the plume remains high, suggesting an on-going source. The on-going source is most likely resulting from soil contamination in the source

areas as well as bedrock matrix diffusion associated with the presumed occurrence of DNAPL in the vicinity of the lint trap.

COCs (i.e., VOCs) detected at concentrations greater than their associated NYS SCGs values for soil and groundwater include, but are not limited to, PCE, TCE, cis-1,2-DCE and VC and 1,1,1-TCA, 1,1,2-TCA, 1,1-DCA and 1,2-DCA. These contaminants are classified as halogenated hydrocarbons and are present in groundwater at and downgradient of the Site property.

The processes that likely control the fate of these VOCs at the Site include volatilization, dissolution, and biodegradation. These processes are briefly discussed below.

Volatilization. The fate of VOCs in surface soils and shallow groundwater is likely volatilization, as VOCs partition rapidly to the atmosphere, and neither biodegradation nor hydrolysis (a photolytic decomposition due to exposure to sunlight) occurs at a rapid rate (Agency for Toxic Substances and Disease Registry, 1997).

Dissolution. Dissolution of VOCs from Site sources to groundwater is a significant transport mechanism for VOCs at the Site. Factors affecting dissolution of VOCs likely are: (1) water table elevation in comparison to source areas; (2) flow rate (residence time) of the groundwater in the contaminated material; (3) solubility of the compound; (4) amount of recharge through VOCs in the unsaturated zone; and (5) the degree of partitioning to soils and sediments.

Biodegradation. Biodegradation reactions can reduce the total mass of VOCs in groundwater. Naturally occurring bacteria in soil are capable of degrading VOCs. The microorganisms require oxygen to aerobically biodegrade VOCs and the concentration of dissolved oxygen is an indicator of the potential for aerobic biologic activity in groundwater. Aerobic biodegradation is particularly effective for aromatic hydrocarbons, such as benzene and toluene, and may be effective in mineralizing TCE daughter products such as 1,2-DCE and VC.

Chlorinated VOCs undergo biodegradation through three different pathways: (1) use as an electron acceptor (reductive dechlorination); (2) use as an electron donor (primary substrate); (3) co-metabolism. Co-metabolism is the process by which a contaminant is fortuitously degraded by an enzyme or cofactor produced during microbial metabolism of another compound.

The most important process for the biodegradation of chlorinated solvents is reductive dechlorination. The chlorinated VOC is utilized as an electron acceptor, and a chlorine atom is removed and replaced with a hydrogen atom. Because chlorinated VOCs are utilized as electron acceptors during reductive dechlorination, an appropriate carbon source is required for microbial growth to occur.

Under aerobic conditions, parent compounds such as PCE are relatively stable and persistent in the environment. Under suitable anaerobic conditions, however, PCE may undergo biologic transformation as the dominant fate process. It has been shown that biodegradation of PCE in groundwater increases with the organic content of the saturated soil.

The complete anaerobic biologic transformation pathway for PCE is:
PCE→TCE→1, 2-DCE→VC→ethene→carbon dioxide and water.

The complete anaerobic biological transformation pathway for 1,1,1-TCA is:
1, 1, 1- TCA→1,1-DCA→chloroethane→carbon dioxide and water

In the presence of fuel hydrocarbons, co-metabolism of chlorinated VOCs can occur, which is apparently taking place in groundwater near MW-5. Fuel-related VOCs (petroleum hydrocarbons) were detected in overburden groundwater at MW-5 and based on the absence of PCE downgradient of MW-5 the fuel is apparently facilitating reductive dechlorination (Figures 4.2 to 4.5). Chlorinated VOCs are indirectly transformed by bacteria as they use the fuel hydrocarbons to meet their energy requirements. In anaerobic environments, many chlorinated organic compounds can only be degraded via cometabolism.

Persistence of VOCs in Site Media.

As previously discussed chlorinated VOCs are fairly persistent in the environment. Dry cleaning operations and the use of PCE reportedly for a short period of time in the 1980's; therefore the high concentration of PCE in the bedrock aquifer has likely been present since at least that time-frame. The residual contamination is likely present in the bedrock matrix. The high concentrations of PCE that have been detected in the bedrock aquifer will likely persist. The contaminant which is likely entrained in the bedrock matrix will slowly diffuse into the aquifer due chemical disequilibrium. Based on the samples collected to date, it is unlikely that the PCE still exists as a separate phase within the aquifer matrix. It is more likely that what was once DNAPL is now entrained in the organic carbon within the overburden

and within the bedrock matrix thereby providing an on-going source of groundwater contamination through the mechanism of diffusion.

5.3 MONITORED NATURAL ATTENUATION

Natural attenuation refers to the presence of microorganisms which are capable of degrading chlorinated solvents. Anaerobic conditions occur under reducing conditions and with little to no dissolved oxygen. Aerobic conditions occur under oxygenated conditions or with high levels of dissolved oxygen.

MNA parameters for groundwater were collected in July 2012 from select monitoring wells from the vicinity of the Site. MNA analytical results are presented in Table 4.3. BIOCHLOR Model (BIOCHLOR) Natural Attenuation Screening forms are included in Appendix I.

BIOCHLOR uses the MNA data to evaluate the likelihood that biodegradation of the chlorinated solvents may be occurring in the aquifer, via reductive dechlorination. Evaluation results are presented as a numerical value in Table 4.3, which represents whether there is *inadequate evidence*, *limited evidence, adequate evidence,* or *strong evidence* that anaerobic biodegradation of chlorinated organics is occurring in the aquifer.

Based on an evaluation of the MNA data for the overburden aquifer, conditions ranged between *limited to adequate evidence for anaerobic biodegradation* in groundwater at the Site (MW-25 and MW-24, respectively). The BIOCHLOR model also indicated that there is *adequate evidence for anaerobic biodegradation* in the overburden aquifer downgradient of the Site (MW-1), suggesting that reductive dechlorination may be occurring. VOC analytical groundwater data collected from 2012 and 2013 supports the BIOCHLOR model, based concentrations of TCE detected in overburden groundwater, as shown on Figure 4.4.

Based on an evaluation of the MNA data for the weathered bedrock aquifer, there is *limited evidence for anaerobic biodegradation* in groundwater at the Site (MW-24B). VOC analytical groundwater data collected in 2012 support BIOCHLOR model, based on the high concentrations of PCE detected (1,400 µg/L) in bedrock groundwater approximately 600 feet downgradient from the Site (Figure 4.3).

5.4 CONTAMINANT MIGRATION

Mapping of the potentiometric surface in the overburden and bedrock was completed and is shown on Figure 3.5 and Figure 3.6. These figures indicate that groundwater is following a subtle topographic valley that was once occupied by a stream. The stream is now contained in a culvert, estimated to be five feet in diameter, and re-appears as Burling Brook, about one mile downgradient of the Site. The overburden groundwater contours southwest of MW-5 suggests that the culvert system may be moving a substantial amount of groundwater (Figure 3.5). The vertical hydraulic gradient between the overburden and bedrock aquifers changes across the area investigated from downward upgradient of the Site to variable at the Site and changing to upward downgradient of the Bakers Pride site.

The downgradient extent of PCE and/or its breakdown products in the overburden and bedrock have been identified. Pore water samples collected at Burling Brook do not indicate the presence of Site-related contaminants. The furthest downgradient detection of Site-related contaminants was at the well pair PZ-14 and MW-28B. Both wells contained low-levels (less than 10 ug/L) of PCE, TCE and cis-1,2-DCE. These wells are approximately 1,900 feet downgradient of the source area. MW-26 cliff, located another 500 feet downgradient, was non-detect Site related COCs (Figures 4.2 to 4.5).

Upgradient nested wells (i.e., overburden/bedrock) indicate a low concentration of TCE (4.4 µg/l) in the bedrock well (MW-26B). Chlorinated solvents were not detected in the upgradient overburden well (MW-26). The vertical hydraulic gradient between the overburden and bedrock is downward at the MW-26/26B well pair. The presence of low-level TCE contamination is potentially the result of an upgradient source that has contaminated the bedrock aquifer; the presence of TCE in MW-26B does not appear to be related to the Site.

Surface soil samples collected in a drainage pathway on an adjacent Residential Use Property showed PCE at a concentration of 46 mg/kg at less than a foot in depth. This contamination was likely the result of soil migration through transportation from the debris disposal areas located on the Site and MNR properties. The presence of PCE at this concentration in surface soil presented a potential for direct contact to residents of the property, and indicate that discharge of PCE to the environment may still be on-going. An IRM was conducted in 2014 to remove the soil exceeding the Residential SCO and re-grade the Site to prevent future transport of contaminants via surface run-off from the debris areas onto the Residential Use Property.

Subsurface soil samples collected in borings located downgradient of the Site building showed low concentrations of PCE, ranging from non-detect to 0.65 mg/kg. This contamination is likely the result of contaminated groundwater migration and not indicative of an additional PCE source area.

6.0 QUALITATIVE EXPOSURE ASSESSMENT

6.1 INTRODUCTION

This section provides a Qualitative Exposure Assessment (QEA) for soil, groundwater and soil vapor at the Site. The QEA was performed in accordance with NYSDEC DER-10 Technical Guidance (NYSDEC, 2010), which indicates that the assessment should evaluate the mechanisms or exposure pathways by which humans and the environment may be potentially exposed to contamination associated with the Site. This section also evaluates the significance of exposure that may occur through the potential exposure pathways. This exposure assessment involves five elements:

1. Description of the contaminant source and the contaminated environmental medium (discussed in detail in Section 5.0);
2. An explanation of the contaminant release and transport mechanisms to the exposed population (discussed in detail in Section 5.0);
3. Identification of potential exposure points to which the populations may come in contact with contaminated medium (discussed in detail in Section 5.0);
4. Description of the routes of exposure (i.e., ingestion, inhalation, etc.); and
5. Characterization of the receptor population who may be exposed to contaminants at the identified points of exposure (takes into consideration the populations that may be potentially exposed to Site-related contamination under the current and future land uses).

In addition, this section includes a discussion of contaminant concentrations at potential exposure points compared to regulatory SCGs.

6.2 RECEPTORS, EXPOSURE PATHWAYS, AND EXPOSURE POINTS

The current and anticipated future use of the Site property is commercial/industrial. The properties bordering the Site include both residential and commercial uses.

The Site related contaminants of concern are VOCs. These contaminants either were spilled, leaked, disposed in the sanitary sewer (lint trap) or were disposed of to the ground surface resulting in contamination of soil, groundwater, and soil vapor. Two potentially completed exposure pathways were identified emanating from the Site;

- Inhalation of contaminated VOC vapors through vapor intrusion into the indoor air of nearby structures
    - volatile chemicals may partition from groundwater or a subsurface source and migrate via vapor intrusion into the indoor air of overlying structures; and,
    - migration of volatile chemicals through a preferential pathway (e.g. subsurface utility corridors and connecting utility lines);
- Direct contact by humans with contaminated surficial soil on, and adjacent to the Site.
    - Contaminated surficial soil on the adjacent residential property was addressed in the form of a soil removal program, as part of an IRM.

Ecological receptors were not identify based on the fact that the Site is largely occupied by the Site building and asphalt parking areas prohibiting ecological habitat. The significance of exposure pathways associated with soil, groundwater and soil vapor/indoor air media is evaluated in this subsection through comparison of analytical data to standard and guidance concentrations published by the NYS and NYSDOH and/or background concentrations.

6.2.1 Soil

VOCs, predominately PCE and TCE, were detected in surficial soils on MNR property, creating a direct exposure risk under commercial uses. These areas are currently gravel (railroad ballast) and unconsolidated sands, and commercial or industrial workers may have the potential to come in contact with the contaminated soil. The potential for contaminant migration from surface soil near the railroad tracks, on to the adjacent residential use property via precipitation, remains as a future potential exposure risk.

If sub-surface work were to occur in the vicinity of the identified contaminated soil direct contact to contaminated soil could occur. Due to the presence of underground utilities (sanitary sewer, storm sewer, water supply line and natural gas) in this vicinity of the lint trap there is a potential that subgrade utility work may be conducted in this area.

6.2.2 Groundwater

Groundwater at and in the vicinity of the Site is not used as drinking water and therefore there is not a potential for direct exposures from drinking contaminated groundwater under the current or anticipated

future land uses. However, a comparison of groundwater analytical data to NYS drinking water standards and guidance values was performed. VOCs (primarily PCE, TCE, cis-1,2-DCE, and 1,1,1-TCA) were detected in groundwater at, and downgradient from the Site at concentrations exceeding NYS class GA drinking water standards. Direct contact with contaminated groundwater is possible if excavations are conducted within the area of the overburden groundwater plume (depth to groundwater at the Site varies from between approximately five and seven feet bgs). Minimal direct exposure to contaminated groundwater could also occur if work was conducted on basement sumps that potentially contain relatively low concentrations of VOCs in groundwater (PCE detected at a concentration of 2.1 µg/l in CL-004).

A deep irrigation well (250 feet bgs) was identified at a golf course located approximately one-mile downgradient from the Site; however, groundwater characteristics at that location well are unknown. The irrigation well is currently not in service; therefore, exposure to contaminated groundwater (if present) via inhalation from irrigation is not currently considered to be a completed pathway.

6.2.3 Surface Water

Surface water was not evaluated during the RI; however, three pore water samples were collected at the presumed groundwater discharge location in Burling Brook approximately one-mile south of the Site. VOCs were not detected in pore water; therefore, direct contact with contaminated shallow groundwater potentially discharging to surface water is not anticipated to be a complete exposure pathway for the Site.

6.2.4 Soil Vapor

Comparing concentrations of chlorinated VOCs detected in soil vapor and indoor air from residential dwellings near the Site to the NYSDOH decision matrix resulted in implementing vapor control measures in two residential structures (Structure 1 and Structure 10). A SSDS was installed at Structure 10. The sanitary sewer cleanout was permanently sealed in Structure 1 because vapor contamination detected in Structure 1 was determined to be entering via a preferential pathway, or from an open sanitary sewer line in the basement of the dwelling (described below). The continued monitoring is recommended by the NYSDOH for both dwellings containing vapor control measures.

Based on the VOC concentrations detected, the NYSDOH decision matrix recommended the continued monitoring for an additional four residential structures. No further action was deemed necessary at the remaining five residential dwellings.

PCE and TCE was detected in soil vapor (concentrations ranging from 3.6 µg/m^3 to 110 µg/m^3 and non-detect to 3.8 µg/m^3, respectively) beneath five commercial structures near the Site, suggesting the potential for vapor intrusion. Soil vapor intrusion at commercial structures near the Site was not fully evaluated (i.e. indoor air samples were not collected); therefore, a completed exposure pathway was not evaluated.

SVI sampling events and results are discussed in further detail in standalone confidential reports (MACTEC, 2012c; MACTEC 2013e; MACTEC, 2013d; MACTEC, 2014d; MACTEC, 2015c; and, MACTEC, 2015d).

Groundwater and soil vapor grab sample results downgradient from the Site (near the former Bakers Pride site on Pine Street) suggest there may be a potential for vapor intrusion; however, residential locations in this area were not sampled and the exposure pathway could therefore not be evaluated.

6.2.5 Sanitary Sewer Line Vapor Intrusion

One identified source area at the Site (lint trap) is directly connected to the Westchester County sanitary sewer line. Vapor sample results from samples collected from two residential sanitary sewer cleanouts hydraulically downgradient from the Site, suggest that the sanitary sewer line may be acting as a transport mechanism for contaminated vapor to enter residential dwellings. An evaluation of the extent of contamination along the sanitary sewer line has not been conducted. Direct inhalation of contaminated vapors in the sanitary sewer near the Site is a complete pathway for WCDEF employees entering the subgrade sewer system for routine maintenance or cleaning.

7.0 SUMMARY AND CONCLUSIONS

7.1 SUMMARY

The Site is located at 10 Bartels Place in New Rochelle, Westchester County, New York (Figure 1.1). It is 0.42 acres in size and resides on a slightly sloping irregular shaped parcel. The main Site feature includes a six-sided building which occupies the majority of the property and a small parking area located to the south and southwest of the building. The surrounding area is urban with a mix of commercial and residential structures.

The Site began operations in 1950 as a uniform and industrial clothing cleaning facility for heavily soiled clothing from auto body and gasoline dispensing businesses. In 1980, Workingman's Closet, a direct factory sales division of Industrial Overall which sells new and reclaimed work clothes, was opened. The Site reportedly operated as a dry cleaning laundering facility for a short time during the 1980's. Current operations at the Site include, laundering linens and uniforms for restaurant and other businesses and retail uniform sales.

RI field investigations were completed at the Site between March 2012 and April 2015, and consisted of:

- Soil sampling (surface and subsurface), both on the Site and off-site;
- Monitoring well installation;
- Groundwater sampling and groundwater elevation measurements from monitoring wells;
- Bedrock Sampling and downhole geophysics;
- SVI sampling from 15 structures located in the vicinity of the Site;
- Pore water sampling at Burling Brook, the presumed groundwater discharge; and,
- An IRM for removal of soil on the Residential Use property exceeding the Residential SCOs was conducted.

7.2 CONCLUSIONS

Results of this investigations show:

- Two sources of contamination currently exist at the Site 1) the lint trap and 2) the debris disposal areas;
- The QEA indicated ecological receptors are not present; however; completed exposure pathways exist for:
    - Direct exposure to soil exceeding the residential, commercial and industrial SCOs;
    - If sub-surface work were to occur in the vicinity of the identified contaminated soil, groundwater or soil vapor, direct exposure could occur; and,
    - Soil vapor intrusion into nearby structures.
- PCE concentrations in soil on the Site and MNR property adjacent to the Site exceed the NYS SCGs;
- VOC concentrations of PCE in overburden and bedrock groundwater exceed the NYS groundwater criteria (5 µg/L) on the Site, and extend approximately 1,900 feet downgradient of the Site;
- PCE in residential sub-slab soil vapor and indoor air exceeded the NYSDOH recommended guidance values at two residential structures and mitigation measures have been implemented;
- Four additional residential structures require ongoing monitoring based on the NYSDOH SVI matrix; and,
- The sanitary sewer line was identified as preferential pathway for contaminated vapor to enter into nearby structures.

7.3 RI DATA GAPS

A review of the data generated during the RI identified the following data gaps:

- The extent of bedrock groundwater contamination on Site to the south has not been fully delineated;
- The extent (both horizontally and vertically) of bedrock groundwater contamination above NYS Class GA groundwater standards downgradient of the Site has not been fully delineated;
- Potential source of 1,1,1-TCA contamination detected in groundwater has not been fully characterized;
- The extent of soil contamination associated with the debris pile on the MNR property has not been fully delineated;

- Potential contamination originating at the lint trap and migrating along the sanitary sewer has not been evaluated ;

7.4 RECOMMENDATIONS

Based on the findings of the RI MACTEC recommends preparing a Focused Feasibility Study Report to evaluate alternatives for remediating soil and source areas onsite as well as contaminated groundwater in the vicinity of the Site. Prior to implementing a remedy a pre-design investigation should be conducted to address the data gaps related to the extent of contamination on the MNR property and to determine if DNAPL or soil contamination exists along the sanitary sewer line.

In addition, MACTEC recommends that the pre-design investigation should also address the following data gaps:

- Delineate the extent of contamination in the bedrock south of the Site
- Delineate the extent of contamination downgradient of the Site
- Evaluate the potential upgradient source(s) of 1,1,1-trichloroethane that is contributing to groundwater contamination at the Site.

NOVEMBER 2016

EXECUTIVE SUMMARY

The Industrial Overall Service Corporation (Industrial Overall) Site (New York State Department of Environmental Conservation Site No. 360109) (Site) is located at 10 Bartels Place in New Rochelle, Westchester County, New York. It is 0.42 acres in size and resides on a slightly sloping irregular shaped parcel. The main Site feature includes a six-sided building which occupies the majority of the property and a small parking area located to the south and southwest of the building. The surrounding area is urban with a mix of commercial and residential structures.

The Site began operations in 1950 as a uniform and industrial clothing cleaning facility for heavily soiled clothing from auto body and gasoline dispensing businesses. In 1980, Workingman's Closet, a direct factory sales division of Industrial Overall which sells new and reclaimed work clothes, was opened. The Site owner indicated that the Site operated as a dry cleaning laundering facility in the past. The exact period of operation is unknown but has been reported as between the 1960's and the 1980's. Current operations at the Site include laundering linens and uniforms for restaurant and other businesses and retail uniform sales.

MACTEC Engineering and Consulting, P.C. conducted a Supplemental Remedial Investigation (RI) to evaluate the following areas where data gaps were identified in the RI Report:

- MetroNorth Railroad (MNR) – the area of contamination adjacent to the tracks southwest of the Site had not been delineated in soil or groundwater;
- Sewer Line –both inside the pipe and in bedding material surrounding the pipe was identified as a potential soil vapor migration pathway; and
- 1,1,1- Trichloroethane (TCA) groundwater contamination – the source of 1,1,1-TCA detected in groundwater which appears to be originating upgradient of the lint trap had not been identified.

Subsequent to submittal of the Draft RI an additional data gap was identified:

- Site building – at a potential location of the former dry cleaning machine which was identified by the Site Owner;

Results of this investigation indicates:

- The former dry-cleaning machine location, newly identified by the Site owner, is not an additional source of contamination to soil and shallow groundwater in this area of the Site;

- The source of 1,1,1-TCA in groundwater appears to be the result of an upgradient source;
- The observed contaminants on the MNR property generally correspond with the surface disposal areas (western debris pile, northwestern debris pile and along the MNR tracks),and the extent of the soil contamination has be vertically and laterally delineated;
- No soil contamination was observed in the sanitary sewer bedding materials in the vicinity of the lint trap source area;
- The sanitary sewer line is not acting as a preferential pathway for contaminants originating at the lint trap to migrate and enter into nearby structures as soil vapor; and
- Vapors were detected in storm drains downgradient of the Site which may be a result of volatilization from groundwater entering the storm system.

The Qualitative Exposure Assessment indicated ecological receptors are not present; however; a potential completed exposure pathways exist for:

- Direct exposure to workers conducting sub-surface activities in the vicinity of the identified contaminated soil, groundwater or soil vapor.

Based on the results of the Supplemental RI the following data gap was identified:

- The source of and migration pathway for contaminated vapors entering a residential structure through the sanitary sewer line should be further investigated.

Groundwater sampling locations are shown on Figure 2.1A. Groundwater results are presented in the following tables and figures:

Table No.	Title
4.7	Site and Railroad Property Groundwater VOC Results

Figure No.	Title
4.2	RI & SRI PCE Concentrations in Overburden Groundwater
4.3	RI & SRI PCE Concentrations in Bedrock Groundwater
4.4	RI & SRI 1,1,1-TCA Concentrations in Overburden Groundwater
4.5	RI & SRI 1,1,1-TCA Concentrations in Bedrock Groundwater

4.2.1 Site Groundwater Sample Results

Seven groundwater samples were collected from seven locations on Site for VOC analysis. One additional background sample was collected upgradient of the Site for VOC analysis for comparison to the onsite results. A review of the Site groundwater results indicate the following findings:

- PCE was detected in seven samples at concentrations exceeding the GA Standard (5 µg/l);
    - The highest concentration of PCE detected in Site groundwater was interpreted to be located adjacent to the potential source area beneath the lint trap at a concentration of 17,000 µg/l (PZ-34);
- TCE concentrations were detected in six samples exceeding the GA Standard (5 µg/l);
    - The highest concentration of TCE detected in Site groundwater was interpreted to be located adjacent to the potential source area beneath the lint trap at a concentration of 13,000 µg/l (PZ-34);
- 1,1,1-TCA concentrations were detected in four samples exceeding the GA standard (5 µg/l);
    - The highest concentration of 1,1,1-TCA was detected in the upgradient background sample (MW-505) at a concentration of 910 µg/l and generally decreased hydraulically downgradient across the Site.

In general contaminant concentrations observed on Site during the SRI did not deviate significantly from the relative locations and concentrations observed during the RI. The impacts of contaminants in bedrock in the vicinity of the former dry cleaning unit could not be assessed due to field limitations on the bedrock well installation. The 1,1,1-TCA concentration observed in the upgradient sample at MW-505 further indicates that an upgradient source is contributing to the concentrations observed on Site.

5.0 CONTAMINANT FATE AND TRANSPORT

This section presents an assessment of contaminant movement and disposition within the environment.

5.1 CONCEPTUAL SITE MODEL UPDATE

A CSM for the Site was first presented in the FAP (MACTEC, 2012) and updated with the RI. No significant revisions were required to the CSM presented in the RI based on the SRI data.

Based on detected concentrations, PCE may be present at the Site as a DNAPL (detected in the vicinity of the lint trap in soil at 21,000 mg/kg and in groundwater at 170,000 µg/l). PCE and its breakdown products have migrated from waste disposal areas (lint trap and debris piles) into soil and overburden groundwater, and then into the bedrock groundwater. Site related contaminants have been detected at concentrations above applicable SCGs in overburden and bedrock groundwater at and downgradient of the Site. Further discussion can be found in Section 5 of the RI Report. The following sections provide relevant updated information for the CSM.

5.1.1 Contaminants of Concern

The primary Site-related COCs are PCE and its breakdown products (TCE, cis-1,2- DCE, VC). PCE has historically been used at the Site for dry cleaning operations, its use was purportedly discontinued in the 1980's. 1,1,1-TCA and its breakdown product 1,1-dichloroethane have also been detected on Site; however based on data collected in the SRI the source of 1,1,1-TCA appears to be the result of an upgradient source.

During the RI, 1,1,1-TCA was primarily detected in groundwater upgradient from identified Site-related COC source areas along the southern and eastern edge of the Site. 1,1,1-TCA was not detected in samples collected during the RI from upgradient wells (MW-26 and MW-26B) on Centre Avenue. SRI sample results indicated that 1,1,1-TCA concentrations were highest (910 µg/l) at monitoring well MW-505 located in the sidewalk on Relyea Place and generally decreased hydraulically downgradient across the Site (570 µg/l to not-detected). This location is immediately upgradient of the Site and downgradient of current and former industrial facilities located on Relyea Place. The decreasing concentration of

1,1,1-TCA from off-site hydraulically upgradient to across the Site and the lack of an identified 1,1,1-TCA source area in the RI report suggest an upgradient source for 1,1,1-TCA detections on the Site.

5.1.2 Source Areas and Points of Entry

Site Building

Low level site related contaminants were detected in the vicinity of the former dry-cleaning machine, recently identified by the Site Owner. However, soil and groundwater results do not suggest that there is an additional source of contamination in this area.

MNR Property

PCE contamination is present in surface soil along the MNR tracks exceeding the Protection of Groundwater SCO in 5 of 9 locations, and was detected as high as 14 mg/kg. Migration of contaminants through precipitation (both infiltration and erosion of soil with overland flow) likely mobilized the surficial contamination in the debris piles. PCE is present in subsurface soils above the water table (approximately seven ft bgs) at a concentrations as high as 2.6 mg/kg (SS-301). Based upon the SRI results the vertical and lateral extent of contaminated soils on the MNR property has been delineated.

In general the contaminant concentrations observed in groundwater on the MNR are consistent with the RI results. PCE was detected above GA standard in both groundwater samples at a concentration as high as 500 µg/l. The observed contaminants on the MNR property generally correspond with the surface disposal areas (western debris pile, northwestern debris pile and along the MNR tracks (Figure 4.1)).

Sanitary Sewer Bedding Material

PCE contamination was not observed exceeding the Protection of Groundwater SCO in the two soil samples collected adjacent to the sanitary sewer bedding materials in the vicinity of the lint trap. These samples were collected at a depth of 2 to 3 ft bgs which are consistent with the depth of the bottom of the pipe at 2 ft bgs in this area. Deeper samples in the same borings did detect PCE above SCOs, however these results are likely related to the downward migration of contaminants from the lint trap rather than from the sanitary sewer bedding materials.

7.0 SUMMARY AND CONCLUSIONS

7.1 SUMMARY

The Site is located at 10 Bartels Place in New Rochelle, Westchester County, New York (Figure 1.1). It is 0.42 acres in size and resides on a slightly sloping irregular shaped parcel. The main Site feature includes a six-sided building which occupies the majority of the property and a small parking area located to the south and southwest of the building. The surrounding area is urban with a mix of commercial and residential structures.

The Site began operations in 1950 as a uniform and industrial clothing cleaning facility for heavily soiled clothing from auto body and gasoline dispensing businesses. In 1980, Workingman's Closet, a direct factory sales division of Industrial Overall which sells new and reclaimed work clothes, was opened. The Site reportedly operated as a dry cleaning laundering facility for a short time during the 1980's. Current operations at the Site include, laundering linens and uniforms for restaurant and other businesses and retail uniform sales.

The SRI field investigation was completed at the Site in October 2015, and consisted of:

- Soil sampling (surface and subsurface), both on the Site and on the MNR property;
- Monitoring well installation;
- Groundwater sampling and groundwater elevation measurements from monitoring wells;
- Indoor air sampling from two residential structures located in the vicinity of the Site; and,
- Soil vapor sampling along and inside the sanitary sewer in the vicinity and downgradient of Site.

7.2 CONCLUSIONS

Results of this investigation indicates:

- The former dry-cleaning machine location, newly identified by the Site owner, is not an additional source of contamination to soil and shallow groundwater in this area of the Site;
- The source of 1,1,1-TCA in groundwater appears to be the result of an upgradient source;

A1.0 INTRODUCTION

A1.1 Purpose

This Environmental Fieldwork Report, an Appendix to the Phase I Environmental Site Assessment dated October 27, 2017 (Phase I ESA), documents activities performed and/or supervised by WCD Group, LLC (WCD) at the property located at 33-35 Centre Avenue, City of New Rochelle, Westchester County, New York. Sub-slab soil vapor sampling was performed in conjunction with preparation of the Phase I ESA to screen for potential impacts from on-site historical and current commercial operations, and from known off-site solvent contamination at the adjoining property to the west (see Phase I ESA Section 3.2).

This document describes all fieldwork methodologies for the work conducted by WCD and includes discussions of the resulting analytical data; conclusions and recommendations regarding this fieldwork are presented in the Phase I ESA report.

A1.2 Limitations

This written analysis summarizes the site characterization activities conducted on a specified portion (the "Site") of the above-referenced property and is not relevant to other portions of this property or any other property. It is a representation of those portions of the property analyzed as of the respective dates of fieldwork. Environmental services were performed in accordance with generally accepted practices and established New York State Department of Environmental Conservation (NYSDEC) protocols. This Appendix is an integral portion of the Phase I ESA report and is not intended to be used as a stand-alone document.

A2.0 SUBSURFACE INVESTIGATION

A2.1 Summary of Services

WCD installed three temporary soil vapor implants (SV-01, SV-02 and SV-03) and collected soil vapor samples to document the presence or absence of contamination. A map indicating relevant Site information and fieldwork locations is provided as Attachment A.

A2.2 Fieldwork Activities

GENERAL PROTOCOLS

All encountered material was screened with a properly calibrated MiniRAE Lite (Model PGM 7300) photo-ionization detector (PID) for the presence of any volatile organic vapors where appropriate. WCD described all encountered media in field log books, including specific characteristics, the presence of foreign materials, and field and instrument indications of contamination (e.g., staining, odors, PID readings).

WCD collected samples in general conformance with NYSDEC and New York State Department of Health (NYSDOH) sample collection and decontamination protocols. All field personnel wore

dedicated, disposable gloves during fieldwork activities, and any non-dedicated sampling instruments were decontaminated prior to media collection.

All samples were placed in laboratory-supplied containers and properly maintained while in WCD's custody. Samples were transported the following day (October 5, 2017) via courier to York Analytical Laboratories, Inc., a New York State Department of Health-certified laboratory (ELAP Certification Number 10854) for chemical analyses. Appropriate chain-of-custody procedures were followed.

COLLECTION OF SOIL VAPOR

Soil vapor samples were collected from beneath the concrete slab at the eastern-central portion of the basement (SV-01), and the southwestern (SV-02) and northeastern (SV-03) portions of the building (located to the west and north of the cleaning/plating baths, respectively).

The slab was breached utilizing a concrete drill and the holes were extended to a depth of 12 to 16 inches below the top of the slab. The end of the sample tubing (0.188-inch inner diameter Teflon) was attached to an "air stone" filter and inserted through the borehole. Clean sand was poured into the void surrounding the air stone. The holes were backfilled leaving approximately two inches of depth between the top of the sand and the slab surface. The remaining space at the top of each hole was sealed off with a non-VOC containing clay to prevent surface air from entering the system. A properly calibrated PID was used to measure volatile organics before purging. No significant PID readings were recorded at any borehole. A vacuum pump was utilized to purge the standing air from the tubing. At least three borehole and tubing volumes were purged prior to collection at a rate of 0.2 liters per minute. Following purging, the vapor samples were collected over a two-hour period using 6-liter stainless steel, laboratory supplied Summa canisters with two-hour calibrated flow controllers.

A2.3 Laboratory Analysis

STANDARDS, CRITERIA AND/OR GUIDANCE

The State of New York does not have any standards, criteria or guidance values (SCG) for volatile chemicals in subsurface vapors; the NYSDOH does, however, utilize several decision matrices for evaluating potential soil vapor intrusion for a limited number of compounds under specific circumstances (see NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York [October 2006]). Potentially applicable matrix values and/or relatively high concentrations of VOCs are identified in the report text and in data summary tables, as warranted.

SAMPLE SUBMISSION

All soil vapor samples were analyzed for volatile organic compounds (VOCs) using USEPA Method TO-15.

LABORATORY RESULTS AND DISCUSSION

A summary of the results of the laboratory analyses is presented below. Soil vapor results are referenced as micrograms per cubic meter ($\mu g/m^3$). A complete data summary table and the laboratory report are provided as Attachments B and C, respectively.

Significant contamination by chlorinated VOCs (cVOCs), primarily by industrial solvents such as trichloroethylene (TCE) and trichloroethene (TCA), was documented in sub-slab soil vapor. Significant detections included:

cVOC	SV-01	SV-02	SV-03
TCE	240,000	1,100	110,000
1,1,1-TCA	40,000	1,900	20,000
Tetrachloroethene (PCE)	1,500	5,900	4,600
1,1-Dichloroethene	4,500	340	1,300
1,1-Dichloroethane	730	36	150
trans-1,2-Dichloroethene	550	5.8	46
cis-1,2-Dichloroethene	160	5.8	89
1,2-Dichloroethane	74	7.7	17

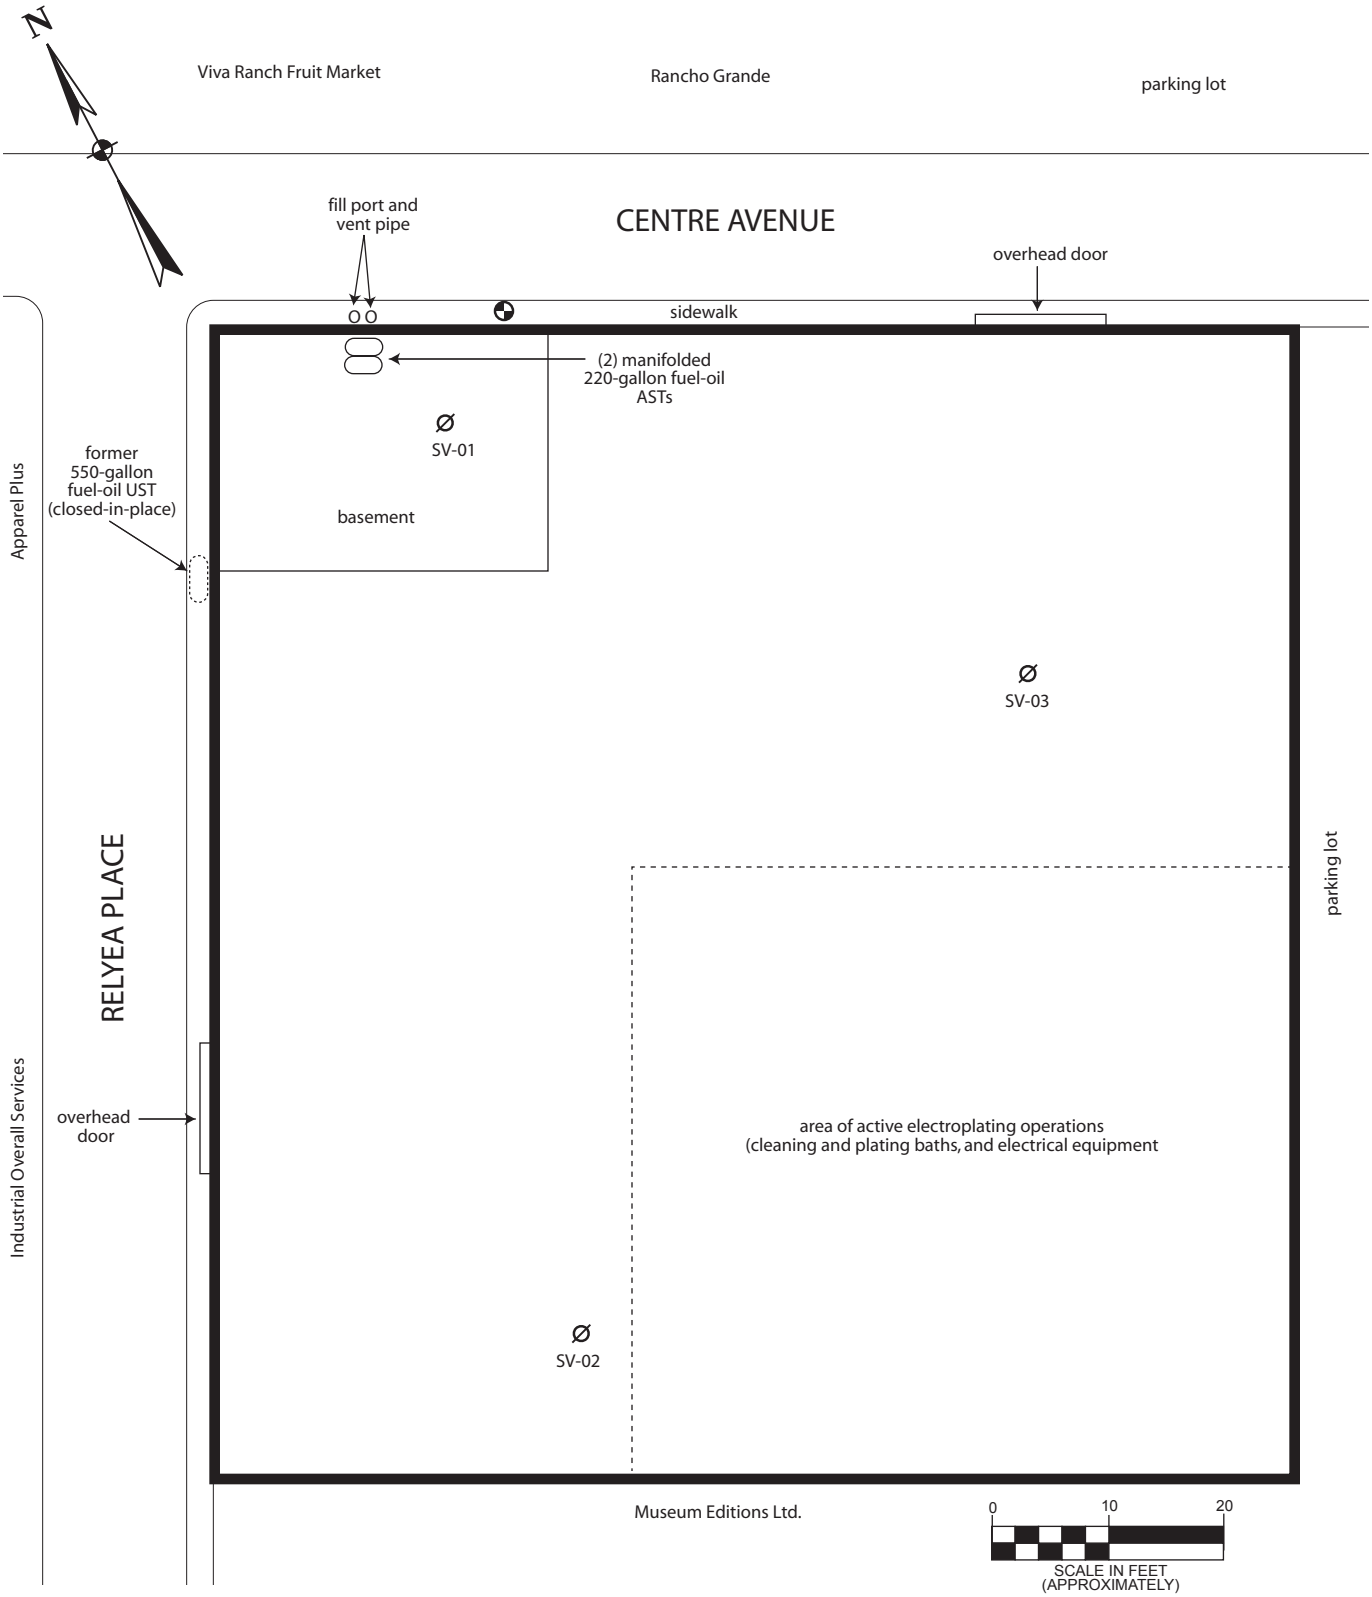
Several VOCs associated with petroleum, and other solvents, were detected in soil vapor samples at low concentrations, consistent with the urban location of the subject property.

A3.0 SUMMARY OF FINDINGS

Laboratory findings document significant concentrations of c-VOCs in vapor. These data may be from an on-site source and may indicate the presence of on-site soil and/or groundwater contamination. The presence of high concentrations of dichloroethanes and dichloroethenes (breakdown products of TCA and PCE/TCE) suggests that source materials are related to historical releases. Current data support the conclusion that no significant petroleum contamination is present near or below the building in the vicinity of the sampling locations.

ATTACHMENT A

Fieldwork Map



All feature locations are approximate. This map is intended as a schematic to be used in conjunction with the associated report, and it should not be relied upon as a survey for planning or other activities.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on October 05, 2017 and listed below. The project was identified as your project: **LN17122.10**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 17J0156

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
CCV-A	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>30% Difference for average Rf). This applies to dectected analytes only.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Field Chain-of-Custody Record - AIR

YORK ANALYTICAL LABORATORIES INC

NOTE: York's Std. Terms & Conditions are listed on the back side of this document.
This document serves as your written authorization to York to proceed with the analyses requested and your signature binds you to York's Std. Terms & Conditions unless superseded by written contract.

APPENDIX H

Scope of Services

Phase I Environmental Site Assessment
Scope of Services

Task 1.0 Description of Subject Property and Surrounding Area Physical Settings

1.1 Description of property location, topography, geology, hydrogeology, surface hydrology and wetlands
1.2 Identification of adjoining and surrounding area properties

Task 2.0 Historic Investigation (Review of Applicable, Reasonably Ascertainable Sources)

2.1 Review of historic maps and plans (to the earliest date of available maps)
2.2 Review of aerial photographs
2.3 Review of local records (e.g., building department), including cursory ownership information and City Directories, if applicable.
2.4 Interviews with User, Key Site Manager, and other knowledgeable individuals
2.5 Review of User or property owner provided documents and/or analytical results

Task 3.0 Federal and State Regulatory Agency Records Review

3.1 Review of ASTM-required federal, state, and/or tribal databases at required search distances and analysis of the relationship of each Site (e.g., upgradient, downgradient) to the Subject Property;
- Federal NPL (1.0 mile) and delisted NPL sites (0.5 mile)
- Federal CERCLIS list and CERCLIS NFRAP site list (0.5 mile)
- Federal RCRA CORRACTS facilities list (1.0 mile)
- Federal RCRA non-CORRACTS TSD facilities list (0.5 mile)
- Federal RCRA generators list (subject/adjoining properties)
- Federal ERNS list (subject property)
- Federal, state, and tribal institutional control/engineering control registries (subject property)
- State- and tribal-equivalent NPL (1.0 mile)
- State- and tribal-equivalent CERCLIS (0.5 mile)
- State and tribal Brownfield and voluntary cleanup sites (0.5 mile)
- State and tribal leaking storage tank lists (0.5 mile)
- State (including locally administered) and tribal registered storage tank lists (subject/adjoining)
- State and tribal landfill and/or solid waste disposal site lists (0.5 mile)
- NYC E-Designation List

3.2 Review of additional federal and state environmental databases:
- State spill file records (0.5 mile)
- State MOSF list (0.5 mile)
- State radon data (by local municipality as available)
- Federal and state wastewater discharge permits (subject/adjoining properties)

3.3 Interviews (as applicable) with government representative regarding regulatory compliance

Task 4.0 Physical Inspection

4.1 Inspection of property and structures for potential contamination and contaminant sources, including:
- Hazardous/medical/radioactive waste storage and disposal areas
- Petroleum and/or chemical storage (including tanks and associated piping)
- Spatial extent and current condition of suspect asbestos-containing materials (ACM), suspect lead-based paint (LBP) and mold
- Site conditions that may indicate the potential for radon and lead in drinking water
- If ACM or LBP is identified as presumed or suspect, provide estimates of the quantity of such material and costs for abasement to the extent feasible.
- Wastewater and stormwater discharge systems
- Equipment potentially containing polychlorinated biphenyls (PCBs)

4.2 Inspection of property for the following:
- Presence of contamination (e.g., debris, soil staining)
- Evidence of prior structures and uses
- Unusual or man-made topographical formations (e.g., berms, sinkholes)
- On-site surface water quality
- Evidence and location of wells
- Vegetative stress

4.3 Identification of overt on-site sensitive environmental receptors (e.g., wetlands)
4.4 Limited inspection of adjoining and nearby properties for:
- Potential off-site sources of contamination
- Sensitive environmental receptors

4.5 If appropriate, interviews with owners/tenants/operators and other available knowledgeable individuals present during physical inspection

Task 5.0 Preparation of Written Summary Report

5.1 Summary of findings of Tasks 1.0 through 4.0
5.2 Identification of any Recognized Environmental Conditions and/or other potential concerns
5.3 Conclusions and Recommendations, including any specific additional investigatory or remedial work
5.4 Production and transmission of the final Phase I ESA to Client in PDF format, and hard copy if requested.

APPENDIX I

Qualifications of Environmental Professionals

Paul H. Ciminello, QEP
EXECUTIVE VICE PRESIDENT
PCIMINELLO@WCDGROUP.COM

EDUCATION

Master of Environmental Management, 1986
School of the Environment, Duke University, Durham, North Carolina

Master of Arts in Public Policy Sciences, 1986
Institute of Policy Sciences and Public Affairs, Duke University, Durham, North Carolina

Bachelor of Arts, 1980
Tufts University, Medford, Massachusetts

CERTIFICATIONS AND TRAINING

Qualified Environmental Professional (QEP), Institute of Professional Environmental Practice (Cert. Number 08130024)
In compliance with OSHA Hazardous Materials Safety (29 CFR 1910) requirements (updated 2012)
Certified Air Quality Specialist, Environmental Assessment Association, 2007
Certified Environmental Manager, Environmental Assessment Association, 2006
NJ Dept. of Environmental Protection Licensed Subsurface Evaluator (License Number: 0014686)
NYS Dept. of Labor Certified Asbestos Building Inspector (Cert. Number: AH92-14884)
NYS Department of State, Division of Licensing Services, Real Estate Instructor

PROFESSIONAL EXPERIENCE

Executive Vice President, WCD Group, LLC — *2017 to present*
President, Ecosystems Strategies, Inc., Poughkeepsie, New York — *1992 to 2016*

Coordinates corporate strategic planning, financial management and marketing activities. Oversees corporate work on state and federal superfund sites and manages education/training services. Responsible for technical services in areas of pollution prevention, contaminant delineation and site remediation. Twenty-five years experience in the investigation and remediation of organic and inorganic contamination at commercial and residential properties. Major recent projects of relevance include:

- Irvington Waterfront Park (Irvington, NY): Project Manager for site investigation and remedial design of abandoned industrial riverfront properties. Documented soil and groundwater contamination and designed remediation including soil removal and site capping. Project completed in 2000; project awarded the 2000 Gold Medal Award by Consulting Engineers Council of New York State.

- Greyston Bakery Site (Yonkers, NY): Project Manager for site investigation and remedial design of former manufactured gas plant site for future use as a bakery. Documented soil, groundwater and soil gas contamination. Remedial systems included installations of a DNAPL collection system, a barrier layer, a subslab depressurization system under the building, and groundwater monitoring. Project completed in 2004.

- 400 Block Redevelopment (Poughkeepsie, NY): Project Manager for site investigation and remedial design of multi-use industrial development property (boiler repair, clothing manufacturer, auto repair) for future retail/residential use. Documented soil (petroleum, PCBs, metals) and groundwater (petroleum) contamination. Remedial systems include: soil (and tank) removal, installation of a barrier, and groundwater monitoring. Project completed in 2006.

- Prospect Court Housing Site (Bronx, NY): Project Manager for site investigation and remediation of a former gas station/auto repair facility. Documented contamination included both dissolved and free-phase petroleum hydrocarbons, dissolved halogenated solvents, and metals contamination in soil. Remedial systems consisted of In-Situ Chemical Oxidation, soil excavation, vapor interception systems, and on-going groundwater monitoring. Project secured Certificate of Completion from the NYSDEC in December 2012 and received the "Brownfield Innovation Award" from the New York City Brownfield Partnership in 2013.

- Parkview Commons Site (Bronx, NY): Project Manager for site investigation and remedial design of former gas station/auto repair facility for future use as a residential/commercial building. Certificate of Completion was secured from the NYSDEC in 2007.

Senior Hazardous Waste Specialist, U.S. Hydrogeologic, Inc., Poughkeepsie, New York 1986 to 1992

Supervisor for corporate hazardous and solid waste investigatory and remedial services. Major projects included:

- Coordination of subsurface investigations at a New York State Superfund site (former industrial facility); project manager in charge of site reclassification (delisted as of January, 1991).
- Coordination of petroleum storage tank management plan for Dutchess County (NY) Department of Public Works, including an assessment of regulatory compliance, product utilization and physical conditions of more than 100 tanks at over 20 facilities.

Adjunct Professor, (various institutions) *1991 to Present*

Dutchess Community College, Poughkeepsie, New York (1991-1996)
Marist College, Poughkeepsie, New York (1999-present)
Vassar College, Poughkeepsie, New York (2007, 2013)

Courses: Macroeconomics, Environmental Economics (DCC)
Introduction to Environmental Issues (Marist)
Environmental Geology Seminar in Environmental Investigation and Remediation (Vassar)

Policy Intern, Southern Growth Policies Board, North Carolina *1985*

Prepared several in-depth and short analyses of environmental and economic issues, with specific concern for their impact on Southern state policies. Analyses included: hazardous waste facility setting policies and environmental impacts of "high tech" industries on host communities.

Research Assistant, University of Oregon, Eugene, Oregon *1983*

Analyzed (with Dr. John Baldwin, Chairman of the Department of Planning, Public Policy and Management, U. of Oregon) the "Oregon Riparian Tax Incentive Program". Designed survey, conducted interviews and analyzed data. Summary paper with programmatic recommendations, was presented at the Annual Conference of the National Association of Environmental Educators.

PRESENTATIONS

- "Environmental Risks in Lending", Training for Hudson Valley Federal Credit Union, February 2014
- "Environmental Risks in Lending" Training Session for Pawling Savings Bank employees, December 18 and 19, 1989; and July 1, 1993.
- "Identifying Environmental Concerns in Appraisals", Workshops for Lakewood Appraisal Corporation, October, and November, 1989 and April, 1990.
- "State and Local Groundwater Protection Strategies", Annual meeting of the New York State Association of Towns, February, 1990.
- "Environmental Audits on Orchards and Agricultural Properties", Resource Education Institute, Inc., Real Estate Site Assessment and Environmental Audits Conference, December 4, 1990.
- "Environmental Audits on Orchards and Agricultural Properties", National Water Well Association Annual Conference, July 29-31, 1991.

- "Principles of Environmental Economics for Ground Water Professionals", National Groundwater Association Outdoor Action Conference, May 27, 1993.
- "Impact of Environmental Liabilities on Real Estate Transactions", a NYS Department of Education approved course for licensed real estate professionals, March 1995; April 1995; May 1995; October 1995.
- "Brownfields Redevelopment in New York: A Discussion of Two Case Studies", New England Environmental Conference 1996, March, 1996.
- "Quantifying Environmental Liabilities", a NYS Department of Education approved course for licensed real estate professionals, March 1997.
- "Environmental Assessments in Urban Settings", Vassar College, Fall 1999 and Fall 2000.
- "Navigating Property Contaminant Problems", Land Trust Alliance Rally 2001, Oct 2001.

ADDITIONAL INFORMATION

Member, Dutchess County (NY) Youth Board (1987-1992); Chairman, 1992
Member, City of Poughkeepsie (NY) School District Ad Hoc Committee on Teen Parents and Pregnancy Prevention (1991)
Member, City of Poughkeepsie School District Budget Advisory Committee (1994 to 2000)
Member, City of Poughkeepsie PTA and Middle School Building Level Team

Scott Spitzer
Director of Environmental Investigations
sspitzer@wcdgroup.com

PROFESSIONAL EXPERIENCE

Director of Environmental Investigations, WCD Group, LLC, Poughkeepsie, NY *2017 - Present*
Director of Environmental Investigations, Ecosystems Strategies, Poughkeepsie, NY *2013 - 2017*

Management and quality review of environmental site assessments, technical environmental investigations, and remedial projects including Brownfield sites. Conducts research to obtain field and regulatory information about the environmental status of a designated area. Reviews all documents prepared by WCD Poughkeepsie Office to ensure consistency and technical accuracy. Responsibilities associated with the preparation of site assessments include: investigating site histories, conducting facility inspections, reviewing regulatory agency records, documenting facility compliance with relevant State and Federal regulations, and preparing reports. Management of complex technical environmental investigations (including sites currently on the NYSDEC Registry of Inactive Hazardous Waste Sites), including coordinating subcontractors, overseeing fieldwork, designing and implementing sampling plans, preparing technical reports, and interfacing with regulatory agency personnel.

Senior Project Manager, Long-Form Reports, The 451 Group, Inc., New York, NY *2008-2011*

- Managed the production of over 150 technical white papers.

Senior Project Manager, Ecosystems Strategies, Inc., Poughkeepsie, NY *2001 - 2008*

- Conducted Environmental Site Investigations and prepared final site assessment reports. Over 300 Investigations and Final Reports completed as lead manager.
- Investigated site histories.
- Conducted facility inspections.
- Reviewed regulatory agency records.
- Documented facility compliance with relevant State and Federal regulations.
- Conducted Phase II Technical Environmental Investigations and prepared technical reports.
- Researched field and regulatory information.
- Managed tank removals.
- Coordinated subcontractors.
- Oversaw fieldwork and handled collection of material, soil and water samples.

Select Projects

Scenic Hudson Land Trust, Inc., Beacon Waterfront Project, Beacon, NY

ESI conducted soil and groundwater investigations on a former MOSF and adjacent scrap yard. Projects involved soil remediation of both petroleum and PCB-contaminated soils and long-term groundwater monitoring. Both projects were classified as Voluntary Clean-Up projects by the NYSDEC and closure status was attained.

Sakmann Restaurant Corporation Site, Fort Montgomery, NY

Conducted Phase I Environmental Site Assessment and Phase II Subsurface Investigations for former filling station and automotive repair garage contaminated by solvent and waste-oil discharges to an on-site drywell.

Designed and implemented a sampling plan for soils impacted by chlorinated hydrocarbons, petroleum, and metals. Created Workplan (in coordination with the NYSDEC Voluntary Cleanup Program) for remediation of on-site contamination and long-term sampling of on-site groundwater monitoring wells.

Staten Island Marina Site, Staten Island, NY

Conducted Phase I Environmental Site Assessment and Phase II Subsurface Investigation for an active marine facility engaged in boat painting and engine maintenance activities. Coordinated the delineation of metals contamination over a three-acre area and analyzed potential impacts from on-site fill materials. Submitted remedial and budgetary analysis in support of regulatory agency approval for conversion of boatyard into a public park.

Octagon House Development Site, Roosevelt Island, NY

Conducted Phase I Environmental Site Assessment and Phase II Subsurface Investigations at the former site of a large, urban hospital. Interpreted the results of geotechnical studies, extended test pits, and conducted extensive soil sampling, to document subsurface soil conditions in support of client's application to the U.S. Housing and Urban Development Agency (HUD). Created Workplan (in coordination with the NYCDEP Office of Environmental Planning and Assessment) for site-wide remediation of contaminated soils and secured NYCDEP approval for site remediation as required by HUD.

Camp Glen Gray Boy Scout Facility, Mahwah, NJ

Conducted Phase I Environmental Site Assessment and Phase II Subsurface Investigations at an approximately 800-acre campground containing numerous structures. Documented subsurface soil conditions at the locations of aboveground and underground storage tanks, and delineated lead contamination at a former firing range. Assisted in design and implementation of remediation plans for removal of petroleum and lead contaminated soils, and obtained NJDEP approvals.

EDUCATION

SUNY at Stony Brook, Bachelor of Science - Biology, SUNY at Stony Brook *May 1992*
SUNY at Purchase, extensive studies in Environmental Science

1.0 INTRODUCTION

1.1 Purpose

This Phase II Environmental Site Assessment (Report) documents environmental fieldwork performed by WCD Group, LLC (WCD) at the property located at 33-35 Centre Avenue, New Rochelle, Westchester County, New York (Site). Fieldwork was performed to further investigate known and suspect contamination documented in previous investigations (see Section 1.4, below). The specific purpose of this Report is to summarize the work performed by WCD and WCD's subcontractors, and to suggest, if appropriate, further investigative and/or remedial options regarding identified on-site conditions.

This Report describes all fieldwork methodologies for the work conducted by WCD, includes discussions of the resulting analytical data from collected samples and provides conclusions and recommendations drawn from the fieldwork and analytical data.

1.2 Limitations

This written analysis summarizes the site characterization activities conducted on a specified portion of the above-referenced property and is not relevant to other portions of this property or any other property. It is a representation of those portions of the property analyzed as of the respective dates of fieldwork. This Report cannot be held accountable for activities or events resulting in contamination after the dates of fieldwork.

Services summarized in this Report were performed in accordance with generally accepted practices and established New York State Department of Environmental Conservation (NYSDEC) protocols. Unless specifically noted, the findings and conclusions contained herein must be considered not as scientific certainties, but as probabilities based on professional judgement.

1.3 Site Location and Description

The Site contains a one-story commercial building, currently used for electroplating operations. A Fieldwork Map indicating specific Site characteristics is provided in Appendix A.

1.4 Previous Environmental Reports

A Phase I Environmental Site Assessment (Phase I ESA) performed on the property by WCD in October 2017 identified significant commercial uses of the Site, including historical automotive repair, and current and historical electroplating operations (beginning in the early 1970s). These commercial uses were noted to have likely resulted in releases of petroleum, chlorinated solvents and/or metals to the subsurface.

Concurrent soil vapor sampling documented very high levels of the industrial chlorinated solvents trichloroethene (TCE, a compound likely to have been historically used at the subject

property) and trichloroethane (TCA), as well as relatively high levels of tetrachloroethene (PCE) and TCE/TCA breakdown products, consistent with a potential on-site contaminant source area (grossly contaminated soil and/or groundwater) beneath the building. Chemical staining and residue were observed on floors in the vicinity of the electroplating area, suggesting a high potential for subsurface metal contamination.

The Phase I ESA also identified an Inactive Hazardous Waste Disposal (IHWD) Site at the western adjoining property (Industrial Overall Services, a former dry cleaning facility), currently undergoing active investigation due to contamination from chlorinated volatile organic compounds (cVOCs). WCD reviewed a Remedial Investigation Report and Supplemental Remedial Investigation Report (collectively the "RIR"; issued in November 2016), which indicated that releases of PCE at the IHWD site (as well as at the adjoining Metro North Railroad property) had resulted in significant soil, soil vapor and groundwater contamination (groundwater impacts extend as far as 1,900 feet to downgradient locations to the southwest). Compounds found in contaminated media include TCE and other breakdown products of PCE. TCA, an industrial solvent generally used for degreasing operations unrelated to dry cleaning, was identified at high concentrations in monitoring wells located on Relyea Place (between the IHWD site and the subject property). Low levels of PCE and TCE (below NYSDEC groundwater standards) were detected in several monitoring wells located in the Centre Avenue sidewalk north of the subject property.

Figures presented in the RIR provide "interpreted" groundwater contours of cVOC contamination, indicating potential impacts from PCE, TCE and TCA beneath the building on the subject property. The RIR indicates that TCA contamination may have resulted from historical uses pre-dating the dry cleaning operations at the IHWD site, but states that the source of TCA in groundwater appears to be the result of an upgradient, off-site source.

2.0 SUBSURFACE INVESTIGATION

2.1 Summary of Services

WCD coordinated and supervised the extension of six soil borings at the Site and conversion of three borings to temporary groundwater monitoring wells, and collected soil and groundwater samples to document the presence or absence of contamination. This Report is divided into individual sections that document fieldwork methodology (Section 2.2) and laboratory results (Section 2.3), and present WCD's conclusions and recommendations (Section 3.0). A map indicating all fieldwork locations and selected Site features is provided in Appendix A.

2.2 Fieldwork Activities

2.2.1 Site Preparation Services

WCD requested a complete utility markout (as required by New York State Department of Labor regulations) and on-site personnel reviewed the markout and underground utility locations prior to the initiation of fieldwork.

2.2.2 Fieldwork Methodology

General Protocols

All encountered material was screened with a properly calibrated MiniRAE 3000 (Model PGM 7320) photo-ionization detector (PID) for the presence of any volatile organic vapors where appropriate. WCD described all encountered media in field log books, including specific characteristics, the presence of foreign materials, and field and instrument indications of contamination (e.g., staining, odors, PID readings). Soil boring logs are provided in Appendix B.

WCD collected samples in general conformance with NYSDEC and NYSDOH fieldwork protocols. All field personnel wore dedicated, disposable gloves during relevant fieldwork activities, and any non-dedicated sampling instruments were decontaminated prior to media collection.

All samples were collected into appropriately-sized containers provided by the laboratory (with preservatives as required for the specific analysis), and were maintained at proper temperatures (using ice-packs and coolers as needed) while in WCD's custody. Samples were transported the following day via courier to York Analytical Laboratories, Inc., a New York State Department of Health-certified laboratory (ELAP Certification Number 10854), for chemical analyses. Appropriate chain-of-custody procedures were followed.

Extension of Soil Borings

Six soil borings were extended on December 27, 2017. Borings were extended inside the building near formerly installed soil vapor implants. Boring SB-01 was located in the partial basement (SB-01), approximately 8-10 feet below the starting grade of the remaining five boring

locations. Borings SB-02 and SB-03 were located at the southwestern portion of the building and borings SB-04 and SB-05 were located at the northeastern portion.

Borings SB-02 through SB-06 were extended by personnel from Core Down Drilling using a track-mounted Geoprobe direct-push corer equipped with disposable acetate sleeves (used to prevent the cross contamination of soil samples). Soil was recovered at each mechanized boring location at intervals of 4 feet until refusal was reached (maximum refusal depth at the mechanized locations was 12.5 feet bsg). Boring SB-01 was extended using a hand-held Geoprobe direct-push corer (also equipped with disposable acetate sleeves). Soil was recovered at the manual boring location at intervals of 2 feet until refusal was reached.

Subsurface soils encountered beneath the on-site building during the extension of the soil borings generally consisted of less than 1 foot of likely fill materials, consisting of variable color, variable texture sands, silts, and clays with some gravel and minimal debris (metal, rock, asphalt, brick), overlying brown sands with some rock fragments.

Field evidence of contamination (elevated PID readings and mild to moderate chemical odors) was noted at all borings except SB-01. Contamination was noted at borings SB-02 and SB-03 between approximately 9-13' bsg and at SB-04 through SB-06 between approximately 1-5' bsg.

Saturated soils were encountered during the extension of borings SB-01 and SB-03 at or near the surface (beneath the building slab) and at SB-02 at approximately 12' bsg.

Soil samples were collected directly from the acetate sleeves utilizing clean, disposable equipment. Soil collection for VOC analysis was conducted according to USEPA Method 5035 fieldwork protocols, utilizing laboratory sampling kits.

Temporary Monitoring Well Installation, Development and Sampling

Soil borings SB-01 through SB-03 were completed as temporary monitoring wells TGW-01 through TGW-03, respectively. Each well was constructed of one-inch PVC casing and 0.01-inch slotted PVC well screening. TGW-01 was installed to 3.5' bsg and TGW-02 and TGW-03 were installed to 12.5' and 12' bsg (well screen from 7.5-12.5' and from 7'-12', respectively).

The wells were allowed to stabilize for at least 30 minutes following installation. The approximate volumes of groundwater in the wells were calculated (based on well depths and depth to water measurements) and at least one purge volume of water (three times the static well volume) was removed before groundwater samples were collected, using dedicated bailers for each well. No groundwater samples were filtered prior to submission to the laboratory.

A moderate "sweet" odor was noted at TGW-03 (no other field evidence of contamination was observed).

2.3 Laboratory Analysis

2.3.1 Standards, Criteria and/or Guidance

Soil

Laboratory results for organic compounds and metals detected in soils are compared to NYSDEC Remedial Program Soil Cleanup Objectives (SCOs) for Unrestricted Use (UU) and Restricted-Residential Use (RRU) as provided in 6 NYCRR Subpart 375, Tables 375-6.8(a) and 375-6.8(b), and (as needed) Soil Cleanup Levels (for gasoline and fuel oil contaminated Soils) presented in NYSDEC CP-51 (Soil Cleanup Guidance, October 2010) Tables 2 through 3.

Groundwater

Laboratory results for all compounds detected in water are compared to NYSDEC Division of Water Ambient Water Quality Standards and Guidance Values (AWQS), provided in Technical and Operational Guidance Series 1.1.1.

2.3.2 Sample Submission

Submission of samples for laboratory analysis was based on observations made by WCD personnel during the extension of the soil borings, including the presence or absence of elevated PID readings, unusual odors, discoloration, or, any other unusual patterns.

Sample Type	Sample ID(s)	Laboratory Analysis
Soil	SB-01 (3.5'), SB-02 (12'), SB-03 (5'), SB-03 (12'), SB-04 (3'), SB-05 (5'), SB-06 (4')	VOCs
	SB-01 (2.5'-3.5'), SB-02 (11'-12.5'), SB-03 (4'-6'), SB-03 (10'-12'), SB-04 (3'-3.5'), SB-05 (4'-5'), SB-06 (4'-5')	Polycyclic aromatic hydrocarbons (PAHs), TAL metals
Groundwater	TGW-01, TGW-02, TGW-03	VOCs
USEPA methodologies: VOCs (8260), PAHs (8270), metals (6010/7473)		

2.3.3 Laboratory Results

A summary of the results of the laboratory analyses is presented below. Results are referenced as parts per million (ppm, equivalent to milligrams per kilogram) for soil and parts per billion (ppb, nominally equivalent to micrograms per liter) for groundwater. Data summary tables and the laboratory report are provided as Appendices C and D, respectively.

SOIL

VOCs

An elevated concentration of 1,4-dioxane (16 ppm, RRU SCO 13 ppm, UU SCO 0.1 ppm) was detected at SB-05 5'. 1,4-dioxin was detected at the UU SCO at SB-06 4' and at a low-level (0.079 ppm) at SB-03 12'. [Note: 1,4-Dioxane has historically been used as a stabilizer and corrosion inhibitor for chlorinated solvents, particularly 1,1,1-TCA.]

Elevated concentrations of TCE (UU SCO 0.47 ppm) were detected at SB-03 12' (1.0 ppm) and SB-06 4' (0.56 ppm). Trace- to low-level concentrations of TCE were also detected at SB-01 3.5', SB-02 12', SB-04 3' and SB-05 5'.

Trace- to low-level concentrations of TCA and several other solvents were detected in multiple soil samples.

PAHs

Trace- to low-level concentrations of several PAHs were detected at SB-01 2.5-3.5' and SB-03 10-12'. No other PAHs were detected.

TAL Metals

Elevated metals were detected in all samples. Notable peak concentrations included chromium (RRU SCO 180 ppm) at SB-02 11'-12.5' (269 ppm) and nickel (RRU SCO 310 ppm) at SB-02 11'-12.5' (2,770 ppm).

GROUNDWATER

VOCs

Significantly elevated concentrations of cVOCs and related breakdown products were detected in the groundwater samples (AWQS 5 ppb for all noted VOCs), including TCE (peak 15,000 ppb at TGW-03), TCA (peak 930 ppb at TGW-03), 1,1-dichloroethane (DCA; peak 29 ppb at TGW-02), 1,1-dichloroethylene (1,1-DCE, peak 87 ppb at TGW-03) and PCE (peak 22 ppb at TGW-03). Low-level concentrations of several other VOCs were detected in the samples.

3.0 CONCLUSIONS AND RECOMMENDATIONS

This office has completed the services summarized in Section 2.0 on specified portions of the property, located at 33-35 Centre Avenue, New Rochelle, Westchester County, New York. Services included the extension of six soil borings, installation of three temporary groundwater monitoring wells, and the collection of soil and groundwater samples to further investigate known and suspect contamination from on-site operations (electroplating) and historical commercial uses, and possible impacts from an off-site former dry cleaning facility.

Based on the services provided and data generated, the following conclusions and recommendations (in **bold**) have been made.

Groundwater at the western portion of the Site is significantly impacted by chlorinated VOCs (cVOCs), including trichloroethene (TCE, a compound likely to have been historically used at the subject property) and 1,1,1-trichloroethane (TCA), and their breakdown products. Low levels of TCE and TCA were detected in on-site soils above and at the groundwater interface, and 1,4-dioxane, a stabilizer/corrosion inhibitor commonly added to TCA and other cVOCs, was detected at elevated concentrations in several samples. These findings are consistent with previous site investigation data that document very high levels of TCE and TCA in sub-slab soil vapor, and support the conclusion that releases of cVOCs have occurred at the subject property. The presence of elevated levels of metals in Site soils, notably chromium and nickel, is likely to be related to releases from on-site electroplating operations.

It is recommended that additional investigation be conducted to fully document and delineate on-site contamination. Consideration should be given enrolling the site in the New York State Brownfield Cleanup Program.

Laboratory Report

Technical Report

prepared for:

WCD Group
23 Route 31 North, Suite B26
Pennington NJ, 08534
Attention: Claire Siegrist

Report Date: 01/24/2018
Client Project ID: LN171112
York Project (SDG) No.: 17L1081

Revision No. 3.0

Report Date: 01/24/2018
Client Project ID: LN171112
York Project (SDG) No.: 17L1081

WCD Group
23 Route 31 North, Suite B26
Pennington NJ, 08534
Attention: Claire Siegrist

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on December 28, 2017 and listed below. The project was identified as your project: **LN171112**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 17L1081

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

17L1081-23	TGW-03	40mL Clear Vial (pre-pres.) HCl; Cool to 4° C

Sample and Data Qualifiers Relating to This Work Order

SCAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%).
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
HT-01R	This flag indicates that the sample was initially analyzed within recommended hold time and that a re-run was performed outside of the hold time.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Revision Description: This report has been revised per client's request.

*T There are no TICs reported for the sample
* : LCS or LCSD is outside acceptance limits.
SCOs: Soil Cleanup Objectives
J : Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U : Indicates the analyte was analyzed for but not detected.
Exceeds Unrestricted Criteria
Reporting limit exceeds one or more standards

*T There are no TICs reported for the sample
* : LCS or LCSD is outside acceptance limits.
SCOs: Soil Cleanup Objectives
J : Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U : Indicates the analyte was analyzed for but not detected.
Exceeds Unrestricted Criteria
Reporting limit exceeds one or more standards

*T There are no TICs reported for the sample
* : LCS or LCSD is outside acceptance limits.
SCOs: Soil Cleanup Objectives
J : Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U : Indicates the analyte was analyzed for but not detected.
Exceeds Unrestricted Criteria
Reporting limit exceeds one or more standards

*T There are no TICs reported for the sample
* : LCS or LCSD is outside acceptance limits.
SCOs: Soil Cleanup Objectives
J : Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U : Indicates the analyte was analyzed for but not detected.

Exceeds Restricted Residential Standard
Exceeds Unrestricted Standard
Reporting limit exceeds one or more standards

*T There are no TICs reported for the sample
* : LCS or LCSD is outside acceptance limits.
SCOs: Soil Cleanup Objectives
J : Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U : Indicates the analyte was analyzed for but not detected.
Exceeds Restricted Residential Standard
Exceeds Unrestricted Standard
Reporting limit exceeds one or more standards

I - The lower value for the two columns has been reported due to obvious interference.
J - Presumptive evidence of compound.
U - Not detected at the reported detection limit for the sample.
P - The RPD between the results for the two columns exceeds the method-specified criteria.
NY-AWQS: New York TOGS 111 Ambient Water Quality Standards

U - Not detected at the reported detection limit for the sample.
E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
Exceeds NY Soil Vapor Standards:
NY-SSC-A: New York DOH Matrix A Sub-slab Vapor Concentrations Criteria per Guidance for Evaluating Soil Vapor Intrusion, updated May 2017.
NY-SSC-B: New York DOH Matrix B Sub-slab Vapor Concentrations Criteria per Guidance for Evaluating Soil Vapor Intrusion, updated May 2017.
NY-SSC-C: New York DOH Matrix C Sub-slab Vapor Concentrations Criteria per Guidance for Evaluating Soil Vapor Intrusion, updated May 2017.
EPA-VISL-CTSSGC-5: EPA VISL Default Commercial Target Sub-Slab & Exterior Soil Gas Concentrations (TCR = 1E-05; THQ = 1) Criteria per VISL Calculator, Updated May 2019.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Total Metals

L1941307-01, -04, -06, -08, -10 and -12: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by matrix interferences encountered during analysis.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	Not Specified	**Lab Number:**	L1941307
Project Number:	10567	**Report Date:**	09/17/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Project Name:	33 CENTRE AVE	**Lab Number:**	L1941584
Project Number:	10567 PHASE3.1	**Report Date:**	10/18/19

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name: 33 CENTRE AVE
Project Number: 10567 PHASE3.1
Lab Number: L1941584
Report Date: 10/18/19

Case Narrative (continued)

Report Submission

October 18, 2019: This final report includes the results of all requested analyses.

October 02, 2019: This is a preliminary report.

September 18, 2019: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L1941584-17: A sample identified as "DUP" was received but not listed on the Chain of Custody. At the client's request, this sample was analyzed.

Volatile Organics

L1941584-02, -05, -07, and -13 through -17 were analyzed as a High Level Methanol in order to quantitate the sample within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial Low Level analysis. The results of both analyses are reported. Differences were noted between the results of the analyses which have been attributed to vial discrepancies. Further re-analysis could not be performed due to the existing vials being compromised.

Semivolatile Organics

L1941584-04: The sample has elevated detection limits due to the dilution required by the sample matrix.

L1941584-04: The surrogate recoveries are below the acceptance criteria for 2-fluorophenol (0%), phenol-d6 (0%), nitrobenzene-d5 (0%), 2-fluorobiphenyl (0%), 2,4,6-tribromophenol (0%), and 4-terphenyl-d14 (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

Perfluorinated Alkyl Acids by Isotope Dilution

Project Name: 33 CENTRE AVE **Lab Number:** L1941584
Project Number: 10567 PHASE3.1 **Report Date:** 10/18/19

Case Narrative (continued)

The WG1288952-3 LCSD recovery, associated with L1941584-04, -05, -07 through -10, and -17, is above the acceptance criteria for perfluorooctanesulfonamide (fosa) (218%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported. The LCS/LCSD RPD is above the acceptance criteria for perfluorooctanesulfonamide (fosa) (51%).
WG1290269-3: The continuing calibration standard had the response for 8:2 FTS outside the acceptance criteria for the method. This value represents less than 10% of all compounds; therefore, the calibration was accepted.

Pesticides
L1941584-15: The surrogate recoveries are outside the acceptance criteria for decachlorobiphenyl (399%/12800%); however, the sample was not re-extracted due to coelution with obvious interferences.

Total Metals
L1941584-01 through -17: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by matrix interferences encountered during analysis.
The WG1284789-3 MS recoveries for aluminum (336%), calcium (0%), iron (0%), and magnesium (0%), performed on L1941584-01, do not apply because the sample concentrations are greater than four times the spike amounts added.
The WG1284789-3 MS recoveries, performed on L1941584-01, are outside the acceptance criteria for barium (57%), chromium (74%), potassium (126%), and zinc (25%). A post digestion spike was performed and was within acceptance criteria.
The WG1284870-3 MS recovery, performed on L1941584-01, is outside the acceptance criteria for mercury (63%). A post digestion spike was performed and was within acceptance criteria.
The WG1284789-4 Laboratory Duplicate RPDs for barium (40%), calcium (70%), magnesium (67%), potassium (21%), and zinc (28%), performed on L1941584-01, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.
The WG1284870-4 Laboratory Duplicate RPD for mercury (22%), performed on L1941584-01, is outside the

Project Name: 33 CENTRE AVE **Lab Number:** L1941584
Project Number: 10567 PHASE3.1 **Report Date:** 10/18/19

Case Narrative (continued)

acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Cyanide, Total
The WG1283363-2/-3 LCS/LCSD recoveries (52%/60%), associated with L1941584-01 through -10, are outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.
The WG1283364-2/-3 LCS/LCSD recoveries (51%/61%), associated with L1941584-11 through -16, are outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.
The WG1284337-2/-3 LCS/LCSD recoveries (54%/72%), associated with L1941584-17, are outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported. The LCS/LCSD RPD (44%) is above the acceptance criteria.
WG1283364: A Matrix Spike and Matrix Spike Duplicate were prepared with the sample batch, however, the native sample was not available for reporting; therefore, the Matrix Spike and Matrix Spike Duplicate results could not be reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.
