Soil Sampling.....	3
Soil-Grout Mixtures	4
Summary Conclusions	7

Project Background & Objectives

- Site Location – Former Excelsior Bag Site in Yonkers, NY
- The goal is to gather the test results, accurately convey them, and determine the most efficient grout mixture for this job site.
- Select commercially available reagents (e.g., Portland cement, blast furnace slag) that are suitable for use in the ISS project and available at the project site in the quantities required for the full-scale work.
- Improve physical properties of the soils in situ to achieve a targeted unconfined compressive strength (UCS) of greater than 50 pounds per square inch (psi) with a factor of safety of at least 2.
- Reduce hydraulic conductivity of the treated soils below 1×10^{-6} centimeters per second (cm/sec) with a factor of safety of approximately $\frac{1}{2}$ order of magnitude.
- The above safety factors are intended to account for heterogeneities in the field, as well as an abnormally high number of subsurface obstructions and debris, which could adversely affect achieving the UCS and hydraulic conductivity criteria during field implementation.
- All laboratory testing was conducted by Geotechnics.

Materials

The materials used in the ISS bench scale treatability study are summarized on Table 1.

Table 1. Phase I Material Type and Source

Material	ID	Source	Depth
Soil	Comp 1 (TS-1)	WC-02 – between cell G16 & H16	40.0 feet
Soil	Comp 2 (TS-2)	WC-05 – between cell A12 & B12	31.5 feet
Soil	Comp 3 (TS-3)	WC-09 – inside cell H4	30.0 feet
Water	Municipal Water	New Kensington Municipal Water	N/A
Slag	Slag	Holcim	N/A
Cement Type 1L	Type 1L PC	Titan/Holcim	N/A

Soil Sampling

A drilling program was completed on site to collect soil samples for use in the mix design study. In total, 3 boreholes were drilled with samples being collected from each location. Each boring location was sampled from the top of the ISS treatment elevation to the bottom. Each location had a composite of soils collected from each 5-foot run. The soils were shipped to Geo-Solutions' office located in New Kensington, PA for the mix design study to be completed. A total of 6, five-gallon buckets of soil were sent to GSI (2 from each location).

Soil Index Testing

After the samples were received each soil source was homogenized and a grab sample of each was sent to Geotechnics located in East Pittsburgh, PA for soil index testing. The results of the soil index testing are

summarized on Table 2. Laboratory data reports to support the information presented on Table 2 are attached to this letter.

Table 2. Soil Index Test Results

Borehole	Depth	Fines	Moisture Content	Organic Content	pH
TS-1	0-40'	14.7%	39.1%	4.5%	7.97
TS-2	0-31.5'	14.2%	18.8%	1.6%	8.56
TS-3	0-30'	23.0%	44.1%	7.8%	8.81

Soil-Grout Mixtures

Using the results of the soil index testing and experience, GSI selected and created mixtures of the site composite and reagents. The soil-grout mixtures were created using methods that mimic an ISS field mixing process. The general procedure is described below:

1. Run soil composite through a 12.7mm (0.5 inch) sieve to remove large pieces of gravel or clods of soil that would have an unrepresentatively large impact on the behavior of the relatively small, 51 mm (2 inch) and 76 mm (3 inch), diameter laboratory samples.
2. Weigh appropriate amount of soil composite, generally between 1,000 and 5,000 g.
3. Mix grout consisting of predetermined amounts of water and reagents.
4. Add grout to soil composite until workable condition is achieved.
5. Mix until visually homogeneous.
6. Place mix into 2x4" and 3x6" testing cylinders in a manner that limits air entrapment.
7. Store samples in a temperature-controlled environment and allow samples to cure for at least 3 days before transporting to the laboratory,

After samples had taken their initial set, specimens of each mixture were taken to a geotechnical laboratory for hydraulic conductivity and UCS testing. The results of this testing are summarized on Tables 3 and 4. Laboratory data sheets to support Tables 3 and 4 are included in an attachment to this letter.

Table 3. Grout & Soil Mixtures

Mix ID	Water/ Cement ratio	Weights		Reagents in % to Weight of Soil

Reagent percentages based on reagent weight to soil weight (wet)

Summary Conclusions

The following conclusions were made from this completed bench scale study:

- All mixtures in the treatability study achieved the target UCS criteria of 50 psi at 28 days.
 - Soil Composites 1 (TS-1) & 3 (TS-3) at the 8% reagent addition did not achieve the preferred factor of safety of 2 at 28 days.
- Soil Composites 1 (TS-1) & 3 (TS-3) at the 8% reagent addition rate did not achieve the target hydraulic conductivity at 28 days. Therefore, the 8% mix is eliminated from further discussion.
- Samples containing soils from composite 2 (TS-2) greatly outperformed the other soils in both UCS and hydraulic conductivity. It is likely that the contaminant levels in soil composite 2 (TS-2) were lower than the other two composites. Therefore, sample results from soil composites 1 (TS-1) & 3 (TS-3) should govern.
- GSI recommends using the highest addition rate of 15% for full scale mixing.
 - On average (see below table) the 15% mix outperformed the 12% on UCS and Permeability.
 - The 15% mix achieves the minimum of 2x UCS and ½ order of magnitude lower permeability target. The 12% mix failed the UCS criteria when accounting for a 2x factor of safety.
 - Due to the contaminant variability and varying soil composition (bricks, cobbles, boulders, debris, etc.) across the project site, GSI recommends the 15% mix design for this work.
 - The use of the higher addition rate mix will help mitigate the need for rework and allow for early (less cure time) sampling/testing of material. This includes early coring for post-installation visual observation.
 - The additional drilling fluid required for the 15% mix will allow for additional grout distribution throughout the soil mixed columns and for additional fluid for drilling through debris/obstructions.
 - The 15% mix is optimized from the 20% mix that was used during the ISS work at the adjacent properties.
- GSI recommends testing the 15% mix during the demonstration (pilot) study to further evaluate its efficacy in the field.

TS-1 & TS-3 Average Results					
Add. Rate	UCS (psi)			Permeability (cm/sec)	
	7 Day	14 Day	28 Day	14 Day	28 Day
8%	25.50	42.07	81.83	1.8E-06	1.4E-06
12%	50.77	82.48	99.00	7.1E-07	4.0E-07
15%	62.44	101.98	148.04	1.1E-08	1.4E-07

Laboratory Test Results
Yonkers, NY 23-075

Please find attached the laboratory test results for the above referenced project. The tests were outlined on the Project Verification Form that was transmitted to your firm prior to the testing. The testing was performed in general accordance with the methods listed on the enclosed data sheets. The test results are believed to be representative of the samples that were submitted for testing and are indicative only of the specimens that were evaluated. We have no direct knowledge of the origin of the samples and imply no position with regard to the nature of the test results, i.e. pass/fail and no claims as to the suitability of the material for its intended use.

The test data and all associated project information provided shall be held in strict confidence and disclosed to other parties only with authorization by our Client. The test data submitted herein is considered integral with this report and is not to be reproduced except in whole and only with the authorization of the Client and Geotechnics. The remaining sample materials for this project will be retained for a minimum of 90 days as directed by the Geotechnics' Quality Program.

We are pleased to provide these testing services. Should you have any questions or if we may be of further assistance, please contact our office.

Respectfully submitted,
Geotechnics, Inc.

Nathan Melaro
Director of Operations

***We understand that you have a choice in your laboratory services
and we thank you for choosing Geotechnics.***

Laboratory Test Results
Yonkers, NY 23-075

Please find attached the laboratory test results for the above referenced project. The tests were outlined on the Project Verification Form that was transmitted to your firm prior to the testing. The testing was performed in general accordance with the methods listed on the enclosed data sheets. The test results are believed to be representative of the samples that were submitted for testing and are indicative only of the specimens that were evaluated. We have no direct knowledge of the origin of the samples and imply no position with regard to the nature of the test results, i.e. pass/fail and no claims as to the suitability of the material for its intended use.

The test data and all associated project information provided shall be held in strict confidence and disclosed to other parties only with authorization by our Client. The test data submitted herein is considered integral with this report and is not to be reproduced except in whole and only with the authorization of the Client and Geotechnics. The remaining sample materials for this project will be retained for a minimum of 90 days as directed by the Geotechnics' Quality Program.

We are pleased to provide these testing services. Should you have any questions or if we may be of further assistance, please contact our office.

Respectfully submitted,
Geotechnics, Inc.

Nathan Melaro
Director of Operations

***We understand that you have a choice in your laboratory services
