EXECUTIVE SUMMARY

The New York State Department of Environmental Conservation (NYSDEC) entered into a Brownfield Cleanup Agreement (BCA) Site No. C360200 on July 7, 2020 for the property located at 247 North Avenue in New Rochelle, Westchester County, New York (the "Site"). The Site consists of a 0.57-acre property containing a partially occupied one (1) story building with a basement and an asphalt-paved parking lot. The Site is bound to the west by North Avenue followed by retail buildings, to the north by a commercial building and a new residential apartment building, to the east by LeCount Place followed by a multi-story parking and residential structure and hotel, and to the south by a one (1)-story commercial building occupied by the Creative Learning Center, and a four (4)-story residential building with ground-floor retail.

This Remedial Investigation Report (RIR) summarizes the results of prior investigations and the Remedial Investigation (RI) performed on the Site. The RI was conducted in general accordance with the Remedial Investigation-Interim Remedial Measures Work Plan (RI-IRMWP) for the Site, which was last revised in May 2021, and subsequently approved by the NYSDEC on June 11, 2021.

The RI consisted of collecting 37 soil samples, four (4) groundwater samples, and six (6) soil vapor samples. Soil samples were collected in a grid pattern approximately every 50 feet in order to systematically investigate soil contamination across the Site. The samples were analyzed for a combination of full target compound list (TCL) and target analyte list (TAL) analytes – which include volatile organic compounds (VOCs) (USEPA Method 8260), metals (USEPA Methods 6010/7471), semi-volatile organic compounds (SVOCs) (USEPA Method 8270), polychlorinated biphenyls (PCBs) and pesticides (USEPA Methods 8081/8082), per and polyfluoroalkyl substances (PFAS) (USEPA Method 573), and 1,4 dioxane (USEPA Method 8270). Duplicates and field blanks were collected for quality assurance/quality control (QA/QC) purposes.

The overall maximum depth of impacted soils was seven (7) ft-bgs within the northern and southeast portions of the Site. Soil samples collected beneath the building slab during this RI did not exhibit exceedances above applicable soil cleanup objectives; however, soil impacts were observed via field screening methods (i.e., visual, olfactory, and/or photoionization detector [PID]) and delineated in the field. Contaminants of concern in soil consist of polycyclic aromatic hydrocarbons (PAHs) (i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene,

benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and/or indeno(1,2,3-cd)pyrene) and metals (i.e., copper, lead, mercury, nickel, and/or zinc), which were identified exceeding both the Unrestricted Use Soil Cleanup Objectives (USCOs) and the Restricted Residential Soil Cleanup Objectives (RRSCOs) in soils down to seven (7) ft-bgs. Groundwater is impacted under the entire Site as described below.

The contaminants of concern identified in the Site's groundwater include metals (i.e., antimony, iron, magnesium, manganese and sodium) above NYSDEC Technical and Operations Guidance Series (TOGS) Ambient Water Quality Standards (AQWS) across the entire Site. Site groundwater is also impacted by perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) exceeding the NYSDEC guidance value in the six (6) groundwater monitoring wells, which may be indicative of regional background contamination of PFOS/PFOA that has also been identified at nearby BCP sites (33 Centre Avenue, 14 LeCount Place, 329 Huguenot Street). No VOCs, SVOCs, pesticides, or PCB compounds were identified in groundwater samples above the NYSDEC TOGS AQWS during this investigation.

Finally, several petroleum hydrocarbon (PHC) VOCs and chlorinated volatile organic compound (CVOCs) were detected in soil vapor and may have the potential to result in soil vapor intrusion into the future on-Site buildings. A vapor intrusion evaluation may be needed for any proposed enclosed areas.

1.0 INTRODUCTION

The NYSDEC entered into a BCA with 247 North Avenue Associates, LLC on July 7, 2020 for the property located at 247 North Avenue in New Rochelle, Westchester County, New York (the "Site", Site No. C360200). A USGS Site Location Map is presented as **Figure 1.1.** This document presents the investigative work that was performed in accordance with the Remedial Investigation-Interim Remedial Measures Workplan, which was last revised in May 2021, and subsequently approved by the NYSDEC on June 11, 2021.

The RIR was completed in accordance with the NYSDEC DER-10, to provide a systematic assessment of environmental conditions on the Site. The RI defines the nature and extent of contamination on-Site, identifying contaminant source areas, and producing data of sufficient quantity and quality to complete an on-Site exposure assessment and a qualitative off-Site exposure assessment for purposes of designing the remedial action for the Site. The results of this investigation will also be utilized to conduct the IRM. The IRM will include removal of soils which exceed USCOs.

2.0 BACKGROUND

2.1 SITE DESCRIPTION AND PROPOSED DEVELOPMENT

The Site is a 0.57-acre property located at 247 North Avenue in New Rochelle, Westchester County, New York. The Site comprises one (1) parcel and is identified on the Westchester County Clerk's map as tax parcel 1-231-0019. The Site is improved with a largely vacant one (1)-story commercial building with a basement, and an associated asphalt parking lot. A small portion of the building facing North Avenue is currently occupied by an employment assistance center. The remainder of the building was formerly occupied by Planned Parenthood.

The Site is located in a dense commercial and residential area in downtown New Rochelle, and is bound to the west by North Avenue followed by retail buildings, to the north by a commercial building and a new residential apartment building, to the east by LeCount Place followed by a multi-story parking and residential structure and hotel, and to the south by a one (1)-story commercial building occupied by the Creative Learning Center, and a four (4)-story residential building with ground-floor retail. **Figure 2.1** presents a Site Plan.

The Site has been developed with various structures since at least 1887 including a coal and wood yard, tenements, laundry, and storage buildings. A garage is depicted on the 1911 Sanborn map, with a potential 120-gallon gasoline aboveground storage tank (AST). The 1931 Sanborn map depicts a miniature golf course on the Site, and the current Site building is first depicted on the 1951 Sanborn map. The building was renovated in the mid-1990s and was occupied by Planned Parenthood from 1996 to 2019, and the employment assistance center has occupied the storefront portion of the building since 2016.

The proposed Site development includes an apartment building with 244 residences, approximately 3,000 square feet of ground floor retail space and a 210-car structured parking garage beneath the building.

2.2 DESCRIPTION OF SURROUNDING PROPERTIES

The surrounding properties consist of multiple commercial and residential properties:

2.3 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

Prior Site investigations have been conducted. A list of the reports prepared as part of these activities is presented below. The documents were attached to the previously-submitted RI-IRMWP. A brief summary of each of the documents is also included.

- Phase II ESA for 247 North Avenue, prepared for 247 North Avenue Associates, LLC, prepared by SESI, November 2019.
- Phase I ESA for 247 North Avenue, prepared for 247 North Avenue Associates LLC, prepared by SESI, February 2020.
- Indoor Air Quality Report, 247 North Avenue, prepared for 247 North Avenue Associates, LLC, prepared by AKRF, Inc. (AKRF), February 2020.
- Supplemental Phase II ESA Sampling for 247 North Avenue, conducted for 247 North Avenue Associates, LLC by SESI in April 2020.

2.3.1 PHASE II ESA REPORT FOR 247 NORTH AVENUE (NOVEMBER 2019)

SESI conducted a Phase II Environmental Site Assessment Report in November 2019 for the subject Site. Field work for the Phase II ESA was completed on October 3 and 4, 2019 and included 11 soil borings advanced to depths ranging from 10-21 feet below ground surface (ft-bgs), and four (4) soil vapor points using a direct push Geoprobe® rig. Eleven soil samples were collected, one (1) from each boring, and four (4) soil vapor samples were collected from each soil vapor point at approximately 10 ft-bgs. The soil samples were collected from various depths based on field screening using a Photo Ionization Detector (PID), visual and olfactory observations.

Soil Results

Laboratory results of the soil samples indicated several exceedances of SVOCs in three (3) of the samples by as much as 48 times the NYSDEC USCOs to depths of up to six (6) ft-bgs. Metals, including lead, mercury, and selenium, exceeded USCOs in four (4) samples to depths of up to six (6) ft-bgs. No pesticides or PCBs were detected, and no VOCs exceeded NYSDEC USCOs in any soil samples.

Soil Vapor Results

Analytical results of the soil vapor samples indicated detectable concentrations of 1,1-dichloroethene, 1,1,1-trichloroethane (1,1,1-TCA), and trichloroethene (TCE). The elevated concentration of 1,1,1-TCA required additional investigation as part of the remedial investigation of the Site.

2.3.2 PHASE I ESA REPORT FOR 247 NORTH AVENUE (FEBRUARY 2020)

SESI conducted a Phase I ESA for the Site in February 2020. As part of this work, two (2) Recognized Environmental Conditions (RECs) were identified at the Site.

- REC 1 – Soil and Soil Vapor Contamination: SESI performed a Phase II ESA in October 2019, which was documented in the November 2019 Phase II Report, and which included the collection of soil and soil vapor samples. Based on the sampling results indicating the presence of SVOCs and metals in soil exceeding applicable soil standards and the presence of VOCs in soil vapor exceeding applicable screening levels at the Site, these findings constituted an REC.
- REC 2 – Potential Former Gasoline Tank: The potential former on-Site presence of a 120-gallon gasoline storage tank on the 1911 Sanborn map represented a REC in connection with the Site based on the presumed tank contents and the age of operation, which predates legislated environmental regulations, and lack of any closure documentation associated with the tank. This finding constituted an REC.

A REC location map is presented as **Figure 2.2**.

2.3.3 INDOOR AIR QUALITY REPORT FOR 247 NORTH AVENUE (FEBRUARY 2020)

An indoor air quality assessment was performed in the current on-Site building by AKRF in February 2020. Six (6) indoor air samples and one (1) outdoor (ambient) air sample were collected as part of the assessment. The indoor air samples were collected in the basement, crawl space, and first floor of the building over an eight (8)-hour sampling period.

Three (3) compounds (isopropanol, ethanol, and chloroform) were detected in the indoor air samples above New York State Department of Health (NYSDOH) background levels. These compounds were not detected in the soil vapor samples from SESI's Phase II ESA described in Section 2.3.1, and AKRF concluded that the compounds were not likely attributable to soil vapor intrusion but were more likely derived from the use of sterilization and disinfection products in the building, or in the case of chloroform, the interaction of bleach with other compounds or with indoor air. No other compounds were detected in the indoor air samples above NYSDOH background levels.

2.3.4 SUPPLEMENTAL PHASE II ESA FOR 247 NORTH AVENUE (APRIL 2020)

SESI conducted a Supplemental Phase II ESA in April 2020 within accessible areas of the basement and crawlspace of the current on-Site building. The purpose of the supplemental Phase II ESA was to collect additional soil and sub-slab soil vapor data to support application to the New York BCP. The field work was conducted on April 18, 2020 and included the advancement of five (5) soil borings to a maximum depth of 5.5 feet beneath the basement slab using a direct push Geoprobe® rig and placement of four (4) sub-slab soil vapor points to a depth of approximately six (6) inches beneath the slab. Two (2) soil samples were collected from each soil boring, one (1) soil vapor sample was collected from each sub-slab soil vapor point, three (3) indoor air samples were collected from within the basement, crawlspace, and first floor tenant space, and one (1) outdoor ambient air sample was collected during the indoor air sampling activities. The soil samples were collected from various depths based on field screening using a PID, visual and olfactory observations and were analyzed for VOCs, SVOCs, pesticides, PCBs, metals, and cyanide.

Analytical results from the soil samples did not indicate any exceedances of their respective USCOs. Analytical results of the soil vapor samples indicated detectable concentrations of several PHC VOCs and CVOCs.

3.0 SITE SETTING

3.1 TOPOGRAPHY

The Site is generally flat with artificial grade. Regional surface topography slopes downward to the southeast. Based on the U.S. Geological Survey – Mount Vernon Quadrangle map, the Site is approximately 95 feet above the North American Datum.

3.2 SURFACE WATER AND DRAINAGE

There are no surface water bodies or streams on or directly adjacent to the Site. SESI did not observe any areas suspected to be wetlands on the Site. Echo Bay is located approximately 2,000 ft to the east. Storm water drainage patterns are generally over paved surfaces into storm drains.

3.3 GEOLOGY

During SESI's 2019 and 2020 Phase II ESA and 2021 RI, uncontrolled fill material consisting of brown sand with varying amount of clay, silt, and gravel was encountered from the surface to depths ranging from two (2) to seven (7) ft-bgs across the Site. The fill material was observed to be underlain by medium-fine sand, silt, and clay with some gravel. Refusal on weathered rock was encountered at depths ranging between 14 to 20 ft-bgs. Bedrock was identified to be Schist.

In 2017, SESI conducted a geotechnical investigation on an adjacent property to the north (251 North Avenue). From the surface grade (down), the stratigraphy at the adjacent property consisted of fill material to a depth of 9-10 ft-bgs, followed by gray-brown coarse to fine sand with some silt and gravel. Refusal on weathered rock was encountered at depths ranging between 14 to 20 ft-bgs. The depth to bedrock was estimated to range from 21 to 35 ft-bgs.

3.4 HYDROGEOLOGY

Groundwater was encountered during this RI at depths ranging from 12.5 to 14.5 ft bsg (below surface grade). Groundwater was determined to flow in an east-southeast direction across the Site. However, local groundwater flow direction can be affected by subsurface openings or obstructions such as basements and utilities, groundwater pumping and other factors.

4.0 REMEDIAL INVESTIGATION ACTIVITIES

The RI was conducted in general accordance with the NYSDEC DER-10 and with the RI-IRMWP for the Site, which was last revised in May 2021, and subsequently approved by the NYSDEC on June 11, 2021. The objective of the RI was to complete the investigation of soil, soil vapor, and groundwater on the Site and to delineate the nature and extent of the contamination on Site. The applicable standards criteria and guidance (SCGs) for the Site soil are the USCOs and RRSCOs, and NYSDEC guidance values for 21 PFAS compounds. There are no currently applicable standards for soil vapor. The applicable SCGs for the Site groundwater are the TOGS AWQS Class GA standards (cf. Section 703.6), the NYS drinking water maximum contaminant levels (MCLs) for PFOA, PFOS, and 1-4-dioxane.

4.1 RI SAMPLING SUMMARY

Field activities were completed from June 29 through August 26, 2021. A total of 17 soil borings, six (6) permanent groundwater monitoring wells, and six (6) soil vapor points were installed and sampled to investigate the presence of contamination across the Site. **Table 1** includes a summary of the samples collected, depths, rationale, and their corresponding analyses. **Figures 4.1, 4.2, and 4.3** present the sample locations for soil, groundwater, and soil vapor, respectively.

The soil samples were analyzed for various compounds, as depicted in the sampling plan (**Table 1**), including TCL/TAL+30 including metals (USEPA Methods 6010/7471), SVOCs (USEPA Method 8270), VOCs (USEPA Method 8270), PCBs, pesticides (USEPA Methods 8081/8082), PFAS (USEPA Method 537), and 1,4 dioxane (USEPA Method 8760). The groundwater samples were all analyzed for TCL/TAL+30, PFAS, and 1,4-dioxane. Field blanks were collected each day sampling was conducted, and trip blanks accompanied all samples analyzed for VOCs. The soil vapor samples were analyzed for VOCs in accordance with EPA method TO-15.

4.2 INVESTIGATION METHODOLOGY

All the field work was completed under the on-Site observation of a SESI field engineer under the supervision of an environmental professional engineer. The field work involved performing a geophysical survey, advancing borings, installing permanent monitoring wells, and placing temporary soil vapor points. Disposable field equipment was utilized to collect soil and groundwater samples. A Community Air Monitoring Plan (CAMP) was implemented during all intrusive field work in accordance with the RI-IRMWP. This included monitoring for VOCs and

dust. There were no exceedances for VOCs or dust during the CAMP monitoring. All CAMP monitoring data is included in **Appendix A**. SESI observed the work completed by the following subcontractors:

- AARCO Drilling – Performed a geophysical survey across the Site to pre-clear boring locations as well as to identify subsurface utilities and/or anomalies. AARCO Advanced 17 soil borings, installed of six (6) monitoring wells, and placed six (6) soil vapor points utilizing direct-push, and/or modular air rotary drilling techniques. A 7822DT Geoprobe® drill rig was used to advance soil borings and install monitoring wells in the exterior portions of Site (i.e., soil borings RI-SB-1 through RI-SB-7, RI-SB-11, RI-SB-12, RI-SB-17, and RI-SB-18 and monitoring wells RI-MW-1, RI-MW-2, RI-MW-3, and RI-MW-6) and a limited access 420M Geoprobe® drill rig was used to advance soil borings in the interior basement of the Site (i.e., soil borings RI-SB-8 through RI-SB-10 and RI-SB-14 through RI-SB-16). A modular air rotary drill rig was used to install bedrock monitoring wells RI-MW-4 and RI-MW-5 in the interior basement.
- SGS Laboratories (SGS) – Analyzed soil, groundwater, and soil vapor/ ambient air samples as per requested analytical methods.

4.3 SOIL BORINGS AND SAMPLING

A total of 37 soil samples were collected from 17 soil borings (RI-SB-1 through RI-SB-12 and RI-SB-14 through RI-SB-18) as shown on **Table 1**. The borings were advanced utilizing direct-push drilling techniques. Borings were advanced to depths of 14 ft-bgs. Soil samples were collected utilizing a macro-core sampler. Samples for laboratory chemical analyses were collected based on field screening, which includes visual and olfactory observations and screening with photo-ionization detector. QA/QC samples consisting of field rinsate blanks and duplicate samples were collected each day or one for every 20 samples. All borings were logged continuously from grade to completion by the SESI field inspector and sampling activities were also conducted by the inspector. The boring logs are provided in **Appendix B.**

In addition to the remedial investigation grab samples, composite samples were collected from select borings for waste characterization purposes. The waste characterization samples were collected at an approximate frequency of one (1) composite per 750 cubic yards (CY) of soils based on a site grid of 50 foot-wide by 50 foot-long and 20-feet deep. The waste classification sampling data and Site grids are included in **Appendix C**.

4.4 MONITORING WELL INSTALLATIONS

Six (6) permanent groundwater monitoring wells were installed to investigate groundwater across the Site, as detailed on **Table 1**. Groundwater samples were analyzed for TCL/TAL +30, PFAS, and 1-4 dioxane. The depth of the wells ranged from 15 to 30 ft bgs. The depth of water table ranged from approximately 12.5 to 14.5 ft below street grade. Monitoring wells RI-MW-1, RI-MW-2, RI-MW-3, and RI-MW-6 were installed in the asphalt-paved portions of the Site. Monitoring wells RI-MW-4 and RI-MW-5 were installed in the basement floor of the Site building, which is approximately 8 ft-bgs. Individual well depth details are provided in **Table 1**. All the wells were constructed utilizing two (2)-inch PVC pipe with 10 feet of 10-slot (0.010 inch) screen. The PVC screen was surrounded by #2 filter sand. The filter sand was extended at least approximately 1 foot above the screen. Bentonite approximately 1 foot thick was then placed on top of the filter sand and the remaining annular space around the PVC riser was grouted with cement/bentonite mix. The wells were subsequently completed with protective steel manholes as flush mount.

The monitoring wells were developed until the purge water being pumped was free of sediment, or the well no longer had groundwater present, whichever was encountered first. The development water was collected in drums for disposal off-site. **Appendix C** includes the monitoring well construction logs.

4.5 GROUNDWATER SAMPLING

Monitoring wells MW-1, MW-2, MW-3, and MW-6 were sampled on July 13, 2021 and monitoring wells MW-4 and MW-5 were sampled on August 26, 2021. The monitoring wells were sampled in accordance with USEPA low flow sampling procedures. The low flow purge water was piped to a “flow cell,” where groundwater geochemical parameters such as pH, redox potential, specific conductance, dissolved oxygen, salinity and turbidity were measured at three (3) minute intervals. Drawdown during the well sampling was also measured. Field parameters including pH, dissolved oxygen, turbidity, specific conductance and oxidation/reduction potential (ORP) were measured. “Redi-flow” purging techniques were implemented to achieve stabilization. Groundwater samples were collected once the geochemical parameters stabilized for three consecutive readings. **Appendix D** includes the purge data for the groundwater monitoring wells. QA/QC samples including field blanks were collected each day or one per 20 samples. Trip blanks were included in each cooler shipment when VOCs were to be analyzed.

A groundwater contour map was developed using well gauging and surveying data (**Figure 4.4**). The map depicts groundwater flow to the east-southeast across the site. The well gauging and survey data is presented on **Table 2** (attached)**.** The monitoring well survey completed by Line & Grade Surveyors D.P.C, dated September 16, 2021, is included as **Appendix E** to this report.

4.6 SOIL GAS INVESTIGATION

4.6.1 SOIL VAPOR SAMPLING

SESI collected six (6) soil vapor samples (RI-SV-1 through RI-SV-6) across the Site. Two (2) of the samples (RI-SV-4 and RI-SV-5) were collected from beneath the sub-slab of the current Site building (at a depth of approximately five [5] feet beneath the slab floor) and four (4) of the samples (RI-SV-1, RI-SV-2, RI-SV-3, and RI-SV-6) were collected beneath the asphalt parking lot at a depth of approximately 5 ft-bgs. Soil vapor samples were collected in accordance with the Guidance for Evaluating Soil Vapor Intrusion in the State of New York.

4.6.2 SAMPLING PROCEDURE

Semi-permanent soil vapor probes were installed with an adequate surface seal to prevent outdoor air infiltration at each sampling location. Soil vapor implants were installed using a direct push Geoprobe® to attain the depths as noted in **Table 1** (attached). Porous, inert backfill packer sand was used to create a sampling column. The implants were fitted with inert Teflon® tubing to the surface. Soil vapor probes were sealed above the sampling zone with a bentonite slurry for a minimum distance of three (3) feet. The remainder of the borehole was backfilled with clean material.

Prior to sampling, the soil vapor points were purged three (3) times the volume of the sample probe and tube. Flow rates for both purging and collecting were maintained below 0.2 liters per minute to minimize outdoor air infiltration during sampling. Samples were collected in certified 1-L Summa ® canisters provided by the laboratory. Helium tracer tests were conducted at each vapor sample location. All the samples were sent to SGS (an ELAP-accredited) laboratory for EPA TO-15 analysis.

5.0 REMEDIAL INVESTIGATION RESULTS

For purposes of evaluating the remedial alternatives associated with the proposed Site redevelopment, the analytical results of the soil samples were compared to the NYSDEC USCOs and RRSCOs, and January 2021 guidance values for 21 PFAS compounds. The constituent concentrations in groundwater were compared to the applicable NYSDEC TOGS Class GA AWQS or MCLs. The laboratory analytical reports for soil, soil vapor and groundwater results are included as **Appendix F**. The Data Usability Summary Report (DUSR) are included in **Appendix G** of this report.

5.1 SOIL RESULTS

Seven (7) PAHs and five (5) metals were detected in excess of their respective USCOs and/or RRSCOs. Exceedances were limited to three (3) locations for PAHs, and nine (9) locations for metals. Exceedances are detailed in **Tables 5.1** and **5.2** below. The soil sample depth intervals in each sample name represent depth below the ground surface of each boring.

PAHs including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and/or indeno(1,2,3-cd)pyrene were identified in three (3) samples from three (3) soil borings (RI-SB-4 (4-4.5), RI-SB-17 (2.5-3), RI-SB-18 (6.5-7) at concentrations that exceed their USCOs and/or RRSCOs. The maximum depth of PAH impacts is 7 ft-bgs based on the soil samples.

No exceedances of VOCs, pesticides, PCBs, or cyanide were identified in any of the soil samples collected above their respective USCOs. PFOA and PFOS were not detected in any samples above their respective NYSDEC guidance values (October 2020).

Sampling locations and concentrations of the USCO and RRSCO exceedances are identified in **Figure 4.1**. All soil analytical data is presented in **Table 3** (attached).

5.1.1 IMPACTED SOIL DELINEATION (RI-SB-9)

Impacted soil was identified during the advancement of boring RI-SB-9, located in the basement of the on-site building. Strong odors were identified beginning at approximately three (3) ft-bgs, and staining was noted between 5-6 ft-bgs with a maximum PID reading of 429 ppm (parts per million) in this interval. Refusal was encountered at six (6) ft-bgs. An additional soil sample was collected from 5.5-6 ft-bgs and analyzed for VOCs. No VOCs were detected in the sample.

SESI notified the NYSDEC project manager to the discovery of impacted soil, and performed a series of delineation borings in the basement on June 30 and July 1, 2021. The NYSDEC project manager, Mr. Gerald Pratt, visited the Site on July 2, 2021 in response to the impacted soil discovery. A total of 12 delineation borings were completed in the vicinity of RI-SB-9 as shown on **Figure 4.1A** to a depth of six (6) ft-bgs. Soil from each delineation boring was field screened for impacts using a PID and visual/olfactory methods. Two (2) of the initial delineation borings located to the east and southeast exhibited similar impacts to RI-SB-9, and three (3) additional borings further to the southeast exhibited soil with moderate odors but no measurable PID readings. The seven (7) additional delineation borings done to the west and further to the east and southeast did not exhibit any impacts, thus completing delineation of the impacted soil area within the basement. In the northerly direction, beyond the basement wall, RI-SB-3 (located in the parking lot approximately 50 feet to the north of RI-SB-9) serves as the delineation boring in this direction as no impacts were noted in this boring.

Based on the presence of impacted soil underneath the building, demolition and removal of the existing Site building and its foundation are required in order to excavate the impacted soils and complete the remediation of the Site. All impacted soil will be addressed during the planned IRM via excavation, segregation and disposal at an appropriate offsite facility in accordance with the approved RI-IRMWP.

5.2 GROUNDWATER RESULTS

Six (6) monitoring wells (MW-1 through MW-6) were sampled for TCL/TAL+30 (including VOCs, SVOCs, PCBs, pesticides, and metals), PFAS, and 1,4-dioxane. There were no VOCs, SVOCs, PCBs, or pesticides detected in exceedance of the NYSDEC AWQS in the groundwater samples. One non-naturally occurring metal (antimony) was detected exceeding the AWQS in one sample (MW-2). There were no additional metals exceedances of the AWQS with the exception of several naturally occurring metals including iron, magnesium, manganese and sodium, as shown in **Table 5.3** below.

5.3 SOIL AND VAPOR AMBIENT AIR RESULTS

Several chlorinated VOCs and PHC VOCs were detected in the sub-slab soil vapor and soil vapor samples collected. Currently, there are no standards specific to soil vapor in New York State; however, a summary of the detected compounds is discussed below.

Several PHC VOCs, including benzene, toluene, ethylbenzene, xylenes (BTEX), ethanol, propylene, and tertiary butyl alcohol (TBA), among others, were detected in soil vapor samples at the Site. The highest concentration of PHC VOCs were detected in soil vapor sample RI-SV-2. Benzene was detected in soil vapor samples at concentrations ranging from 9.9 ug/m^3 in RI-SV-5 to 50.2 ug/m^3 in RI-SV-2. Ethanol was detected in soil vapor samples at concentrations ranging from 61 ug/m^3 in RI-SV-4 to 448 ug/m^3 in RI-SV-2. Propylene was detected in soil vapor samples at concentrations ranging from 1,890 ug/m^3 in RI-SV-6 to 4,810 ug/m^3 in RI-SV-2. Additional PHC VOC detections are summarized in **Table 5.5 below**.

Additionally, several CVOCs and solvents including cis-1,2-Dichloroethylene, TCE, TCA, tetrachloroethene (PCE), chloromethane, and hexane, among others, were detected in soil vapor samples at the Site. Cis-1,2-Dichloroethene was detected in sub-slab soil vapor sample RI-SV-4 at 10 ug/m^3. Chloromethane was detected in soil vapor samples at concentrations ranging from 9.3 ug/m^3 in RI-SV-5 and RI-SV-6 to 19 ug/m^3 in RI-SV-1. Hexane was detected in soil vapor samples at concentrations ranging from 33 ug/m^3 in RI-SV-4 to 497 ug/m^3 in RI-SV-6. TCA was detected in soil vapor samples at concentrations ranging from 8.7 ug/m^3 in RI-SV-2 to 26 ug/m^3 in RI-SV-3. PCE and TCE were detected in sub-slab soil vapor sample RI-SV-5 at concentrations of 24 ug/m^3 and 74.2 ug/m^3, respectively.

Sampling locations and a summary of the detected VOCs for each sample are identified in **Figure 4.3**. Soil vapor VOC detections are summarized in **Table 5.5** below and all soil vapor results are presented in **Table 5** (attached).

5.4 SUMMARY OF RESULTS

Based on the geotechnical investigation conducted by SESI in 2017 on 251 North Avenue, which adjoins the Site to the north, the stratigraphy of the Site, from the surface down, consists of fill

material down to 9-10 ft-bgs, followed by grey-brown coarse to fine sand with some silt and gravel. Refusal on weathered rock was encountered at depths ranging between 14 and 20 ft-bgs. The geotechnical investigation on the adjacent property estimated the range of bedrock depths to be from 21 ft-bgs to 35 ft-bgs. During SESI's 2019 and 2020 Phase II ESA and 2021 RI, uncontrolled fill was encountered from the surface to depths of 7 ft-bgs across the Site, and was underlain by medium-fine sand, silt, and clay with some gravel. Groundwater was observed at approximately 12.5 to 14.5 feet ft-bgs during this RI.

PAHs were identified in three (3) soil samples from three (3) soil borings at concentrations that exceed their RRSCOs. The exceedances extended to a depth of seven (7) feet and were identified at a boring along the northcentral portion of the Site (RI-SB-4) and two (2) borings in the southeast portion of the Site (RI-SB-17 and RI-SB-18). Metals were identified in ten (10) soil samples from eight (8) soil borings at concentrations exceeding their USCO and/or RRSCO. The depth of metals impacts extended to a maximum depth of seven (7) ft-bgs and extend across the outdoor portions of the Site. VOCs, pesticides, and PCBs were not identified in excess of the soil cleanup objectives in any of the samples.

There were no VOCs, SVOCs, PCBs, or pesticides detected in exceedance of the NYSDEC AWQS in the groundwater samples. One non-naturally occurring metal (antimony) was detected exceeding the AWQS in one sample (MW-2). There were no additional metals exceedances of the AWQS with the exception of several naturally occurring metals including iron, magnesium, manganese and sodium. PFOA and PFOS were detected in all wells exceeding the NYSDEC MCL of 10 ng/l. 1,4-dioxane was not detected in any wells exceeding the NYS MCL of 1 ppb.

Several PHC VOCs including benzene, toluene, ethylbenzene, xylenes (BTEX), ethanol, propylene, and TBA, among others, were detected in soil vapor samples across the Site. Additionally, several CVOCs and solvents including cis-1,2-Dichloroethene, TCE, TCA, PCE, chloromethane, and hexane, among others, were detected in soil vapor samples across the Site.

6.0 REMEDIAL INVESTIGATION FINDINGS AND SUMMARY

6.1 CONCEPTUAL SITE MODEL

The overall maximum depth of impacted soils was seven (7) ft-bgs within the northern and southeast portions of the Site. Soil samples collected beneath the building slab during this RI did not exhibit exceedances above applicable soil cleanup objectives; however, soil impacts were observed via field screening methods (i.e., visual, olfactory, and/or photoionization detector [PID]) and delineated in the field. Polycyclic aromatic hydrocarbon (PAH) impacts exceeding both the USCOs and the RRSCOs were identified in soils to a depth of seven (7) ft-bgs. Metals contaminated soils exceeding the USCOs and the RRSCOs were identified in soils down to a depth of seven (7) ft-bgs.

The Site's groundwater has been impacted with metals above NYSDEC TOGS AQWS groundwater standards across the entire Site. However, the metals are likely naturally occurring and not the result of historical land uses, with the possible exception of antimony. Site groundwater is also impacted by PFOA and PFOS exceeding the NYSDEC guidance value in all wells, which may be indicative of regional background contamination of PFOS/PFOA that has also been identified at nearby BCP sites (33 Centre Avenue, 14 LeCount Place, 329 Huguenot Street). No VOCs, SVOCs, pesticides, or PCB compounds were identified above the NYSDEC TOGS AQWS during this investigation.

The Site groundwater flow direction is to the east-southeast. The groundwater table was measured at 12.5 to 14.5 ft bgs during this RIR. Groundwater was encountered approximately seven (7) feet below the basement slab. Basement slabs are located approximately nine (9) ft-bgs. The groundwater depth and flow direction may vary as a result of the time of the year and nearby pumping or dewatering operations.

Finally, the PHC VOCs and CVOCs detected in soil vapor may have the potential to result in soil vapor intrusion into the future on-Site buildings. A vapor intrusion evaluation will be needed for any proposed enclosed areas as these PHC VOCs and CVOCs have the potential to result in soil vapor intrusion into the future on-Site buildings.

6.2 HUMAN HEALTH EXPOSURE ASSESSMENT

This exposure assessment discusses potential migration routes by which chemicals in the environment may be able to reach human receptors in accordance with NYSDEC DER-10 sections 3.14(c)17, 3.3(c)4 and Appendix 3B. This discussion is based on current and hypothetical future Site conditions at the investigation area.

An exposure assessment must evaluate five (5) elements that comprise an exposure pathway. A complete exposure pathway includes the following:

1. A description of the contaminant source. If the original source is unknown, then a description of the contaminated environmental medium at the point of exposure;
2. An explanation of the transport mechanism;
3. An identification of all potential exposure points;
4. A description of the exposure route at the contact point; and
5. A receptor population.

During this investigation, contaminated soil, soil vapor, and groundwater were identified.

SVOCs and metals were identified in the Site's soil at concentrations exceeding the NYSDEC USCOs and/or RRSCOs down to seven (7) ft-bgs.

Metals were identified in the Site's groundwater at concentrations exceeding the NYSDEC TOGS AQWS. In addition, PFOA and PFOS were identified in the Site's groundwater at concentrations exceeding the NYSDEC guidance value.

The Site soil vapor has been impacted by various VOCs including PHC VOCs and CVOCs.

The proposed Site development for the Site includes an apartment building with 244 residences, approximately 3,000 square feet of ground floor retail space and a 210-car structured parking garage beneath the building. The planned building construction will occupy the entire Site leaving no unpaved surfaces.

The surrounding properties consist of commercial and residential properties. Additionally, one (1) sensitive receptor (i.e., preschool) is identified within close proximity to the Site (located south-adjacent to the Site).

<u>Groundwater</u>

The pathway of the contaminated groundwater to human receptors is limited to the direct

ingestion of the groundwater or direct exposure during dewatering activities that may be conducted during excavation work. However, groundwater in this area in New Rochelle is not used for drinking water and once the Site is redeveloped, excavation to the depths at which groundwater is present (between 12.5-14.5 ft bgs) is unlikely. Groundwater does not contain VOCs at concentrations that would be a source of harmful vapors to residents or visitors. Naturally occurring metals and PFOS/PFOA may still be present in Site groundwater following site development, but as stated above, exposure to contaminated groundwater following development is unlikely. Therefore, groundwater is not anticipated to be a pathway for human heath exposure. In addition, the impacted Site groundwater is not likely to have an ecological pathway since there are no ecological receptors in the vicinity of the Site.

Surface Water

Surface water is not present on the Site. Thus, this exposure pathway may be eliminated from further evaluation.

Soils

Potential routes of exposure to subsurface and surface soils include dermal contact, ingestion and inhalation of soil particulates. This exposure pathway will be addressed as part of the soil excavation IRM.

Soil Vapor

Finally, the PHC VOCs and CVOCs detected in soil vapor have no applicable State standards, and the indoor air results to date did not pose a significant risk to the current building tenant. The future exposure route for soil vapor may be through the inhalation of the contaminated soil vapor that may intrude into the enclosed spaces of any planned Site development. This exposure pathway will be addressed in the RAWP through the implementation of precautionary soil vapor controls such as a sealing layer vapor barrier. In addition, the proposed sub-grade parking garage will provide a ventilated space.

The off-Site exposure potential of Site contaminant sources includes groundwater, soil vapor, and soil dust. Because groundwater is not used in New Rochelle for drinking water, a potential exposure pathway does not exist for this source. An on-Site source of soil vapor has not been determined during this RI, therefore off-Site exposure to soil vapor contamination from the Site is not a concern at this time. The future potential exposure of soil gas will be addressed in the RAWP through the installation of a vapor barrier, as well as the proposed sub-grade ventilated

parking. Off-site exposure to soil dust will be addressed in the RAWP through the implementation of a Community Air Mentoring Plan (CAMP) until the installation of the building foundation is completed across the Site.

The following summary table provides an overview of the current and potential exposures for the Site:

Table 6.1 – Potential Exposures

Environmental Media & Exposure Route	Human Exposure Route
Direct Contact with Surface Soils	This exposure pathway will be addressed as part of the soil excavation IRM.
Inhalation of Soil Dust	
Direct Contact with Soil Dust	
Direct Contact with Subsurface Soils	
Ingestion of Groundwater	Groundwater is not used for dinking. New Rochelle is serviced by public water supply.
Direct Contact with Groundwater	This exposure pathway will be addressed as part of the RAWP (i.e., installation of a building slab and waterproofing membrane).
Inhalation of Contaminated Soil Vapor	This exposure pathway will be addressed in the RAWP (i.e., installation of a vapor barrier and sub-grade parking ventilation).

6.3 FISH AND WILDLIFE IMPACT ANALYSIS

The Site does not contain any ecologically sensitive resources and hence the contaminated soils are not expected to have any impacts on any ecological resources.

6.4 DATA USABILITY SUMMARY REPORT

To validate laboratory analytical data, Data Usability Summary Reports (DUSR) for each laboratory analytical data package have been prepared. To ensure that the field sampling and laboratory analytical practices were acceptable, the data associated with all the samples were validated by a third party (in accordance with requirements of DER-10). The validation approach and results are presented in the DUSRs and are included in this RIR. The DUSR results are presented in **Appendix G** of this report.

The DUSR includes data sets from this phase of the remedial investigation. The DUSR was carried out as specified in DER-10 to evaluate the quality control measures that were implemented during the field and laboratory analytical programs, with the objective of determining whether the reported analytical data are representative and usable for decision making. The DUSR evaluated whether the data are technically defensible (i.e. were all analytical data

requirements met and documented?). Data usability analysis reviews the Site data to determine whether they are adequate to draw conclusions regarding the nature and extent of contamination.

The items that were reviewed as part of the DUSR include the following:

- Completeness (number of samples collected and analyzed compared to plans)
- Chains of custody are complete and accurate
- Holding times
- Instrument calibration
- Relative percent difference between field duplicates
- Reasonableness of data (e.g. relationships between total and soluble analytes)
- Blank contamination

The DUSRs for the soil, groundwater and soil vapor samples analyzed by SGS showed that the overall performances of the analyses are acceptable and did fulfill the requirements of the analytical methods. The samples were analyzed within the USEPA SW-846 holding times. The data packages were identified to be complete as defined under the requirements for the NYSDEC ASP category B laboratory deliverables. None of the relevant analytical data changed based on the DUSR. All results are usable as reported or usable with minor modification due to sample matrix or laboratory quality control outliers, with a few exceptions identified with lab package JD27540, which are listed below.

- The SVOC nondetect result for 2,4-dinitrophenol in sample RI-SB-1 (1.5-2.0) was rejected (R) due to low MS/MSD recoveries. The result is not usable for project objectives, which may have a major impact on the data usability. However, this compound is not a COC for this Site.
- The SVOC nondetect result for 2,4-dinitrophenol in samples RI-SB-1 (1.5-2.0), RI-SB-1 (5.0- 5.5), RI-SB-1 (11-11.5), RI-SB-2 (3-3.5), RI-SB-2 (6-6.5), RI-SB-3 (1-1.5), RI-SB-3 (7-7.5), RISB- 3 (12-12.5), RI-SB-4 (4-4.5), RI-SB-4 (8-8.5), RI-SB-5 (3.5-4.0), RI-SB-5 (7.5-8.0), RI-SB-6 (3.5-4.0), RI-SB-6 (5.5-6.0), RI-SB-12 (3.5-4.0), RI-SB-12 (6.5-7.0), RI-SB-11 (1.5-2.0), and RI-SB-11 (6-6.5) was rejected (R) due to low LCS recovery. The result is not usable for project objectives, which may have a major impact on the data usability. However, this compound is not a COC for this Site.

6.5 RECOMMENDATIONS

6.5.1 CLEANUP ALTERNATIVES

The data obtained as part of the RI activities provided information to complete the Site characterization initiated during the prior investigations and completed the nature and extent delineation in all on-Site media of contamination at the Site to the extent required to determine a remedial action for the Site. Track 1 through 4 cleanup remedies will be evaluated in the RAWP.

In order to render the Site usable for future development, the soils will be removed as an interim remedial measure (IRM), and the RAWP will address the remedial alternatives to eliminate exposure from impacted groundwater from on-Site sources, if any. It will also address alternatives to mitigate exposures to any VOC vapor intrusion into the proposed development.

6.5.2 DATA LIMITATIONS AND RECOMMENDATIONS FOR FUTURE WORK

The RI results provide sufficient data to develop a feasible, conceptual remedy for the impacted groundwater, soil vapor, and soils.

6.5.3 RECOMMENDED REMEDIAL ACTION OBJECTIVES

The RI has determined that remedial action needs to be implemented to remediate the contaminated soil and groundwater and mitigate potential vapor intrusion risks. The specific alternatives proposed will be fully evaluated in the RAWP. As stated above, removal of the contaminated soils has been proposed to be conducted as an IRM.

7.0 DEVIATIONS FROM THE RIWP

The RIWP proposed that 18 soil borings would be advanced across the Site; however, due to tenant operations in the southern corner of the Site building rendering that portion of the building inaccessible, SESI was unable to advance one (1) proposed soil boring (RI-SB-13).

Footnotes:

[a] Associated CCV outside of control limits high, sample was ND. This compound in blank spike is outside in house QC limits bias high.

[b] Associated CCV outside of control limits high, sample was ND.

[c] Associated CCV outside of control limits low. Low-level verification was analyzed to demonstrate system suitability to detect affected analytes. Sample was ND.

[d] More than 40 % RPD for detected concentrations between the two GC columns.

[e] Elevated detection limit due to dilution required for high interfering element.
