1 INTRODUCTION

Impact Environmental Engineering and Geology, PLLC (IEEG) prepared this Remedial Investigation Report (RIR) on behalf of SNL Yonkers, LLC (the "Volunteer") for the property located at 46-70 McLean Avenue, Yonkers (Block 203, Lot 51.61) Yonkers, New York (the "Site"). A Site Location Map is provided as **Figure 1**. The Volunteer was accepted into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) pursuant to a NYSDEC Brownfield Cleanup Agreement (BCA), dated May 11, 2021 (BCP Site No. C360211).

1.1 Purpose and Scope

This RIR presents environmental data and findings from the May 2022 Remedial Investigation (RI) performed by IEEG under the auspices of New York State Department of Environmental Conservation (NYSDEC) and in substantial accordance with the Remedial Investigation Work Plan (RIWP) approved by NYSDEC on August 26th, 2021. The objective of the investigation was to determine, to the extent possible, the nature and extent of contamination in soil, soil vapor, and groundwater. Information presented in this RIR will be used to evaluate appropriate remedial action alternatives.

The combined scope of work implemented during the referenced investigations included the following: 1) performance of a geophysical investigation of the sample collection locations and to define the extent of an underground storage tank (UST); 2) installation of nine (9) soil vapor sampling points and collection of nine (9) soil vapor samples, along with four (4) indoor air samples, and two (2) ambient outdoor air samples for laboratory analysis; 3) the advancement of 21 remedial investigation soil borings to a maximum depth of 10-feet below grade surface (bgs) for collection of soil samples for field screening and laboratory analyses; 4) installation of three (3) permanent groundwater monitoring wells for collection of representative groundwater samples for laboratory analysis, and 5) the collection of representative groundwater samples from five (5) existing monitoring wells for laboratory analysis.

The investigative protocols used for this assessment were based, in part, upon the following documents: 1) NYSDEC, Division of Environmental Remediation (DER), DER-10 Technical Guidance For Site Investigation and Remediation, dated May 3, 2010; 2) the New York Codes, Rules and Regulations (NYCRR) Part 375 Environmental Remediation Programs Effective December14, 2006; 3) the NYSDEC Commissioners Policy CP-51 Soil Cleanup Guidance issued October 21, 2010; 4) the NYSDEC Technical Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Limitations; and 5) the New York State Department of

Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006, and the subsequent updates.

Presented herein are the results of the investigations conducted by IEEG on the Site.

2 SITE CHARACTERISTICS

2.1 Site Description

The Site consists of a single parcel of land approximately 0.87-acres in size which is located about 0.55 miles west of the Saw Mill River Parkway North (refer to **Plate 1**), and situated on the northwest corner of McLean Avenue and Van Cortlandt Park Avenue. The Site consists of a single parcel of land assigned City of Yonkers Tax Map Designation: Section 1, Block 203, and Lot 51.61 (formerly Lots 51, 57, 59, and 61), and is in an area composed of commercial and residential development along collector and local roadways, respectively, along with two adjacent Public Parks (Sutherland Park to the north and Pelton Park to the east) within a historically commercial and residential area (refer to **Plate 2**). The Site has a CM zoning designation for Commercial, Storage, and Light Manufacturing uses.

2.1.1 Site Conditions

Currently, the Site is unoccupied and contains a single two-story building with a partial sub-grade boiler room located in the northeast section of the building. The portion of the building that fronts along McLean Avenue is composed of six (6) commercial units: 46 McLean Avenue (formerly occupied by JS Garage); 48 McLean Avenue (formerly occupied by Simax Transmissions); 50 McLean Avenue (formerly occupied by Claudio Transmissions); 60 Mclean Avenue Suite 1 (formerly occupied by Victor and Rene); 60 McLean Avenue Suite 2 (formerly occupied by VP Tires); and 70 McLean Avenue (formerly occupied by Pizza Barn). The second story of the building that extends into northern segment of the Site is accessible via ramp or stairwell from McLean Avenue and is addressed 60 McLean Avenue Suite 200. This area was predominantly inactive storage space for former occupant, including dolls and stuffed toys, frames, leather goods, office supplies, antiquated printing machines or vacant space. A small portion of the 2nd floor was, until recently, still operable and utilized for heating sealing to customize jerseys, sweatshirts and performance wear. The building encompasses the entire Lot and has a footprint approximately 37,897 square feet (SF). (See **Figure 2** for Existing Site Plan).

The building currently receives electrical service from Con Edison, potable water from the City of Yonkers Water Bureau, while sanitary waste is reportedly handled by the City of Yonkers Sewer Department. The property does not reportedly receive natural gas service. Storm water runoff for the Site is handled via the municipal storm water drainage system located along both McLean Avenue and Van Cortland Park Avenue.

2.1.2 Description of Surrounding Properties

The surrounding land parcels have a combination of residential, commercial, and municipal uses. Commercial uses are predominantly along collector roadways. The Site is bordered to the north by Sutherland Park, to the east by Van Cortland Park Avenue followed by Pelton Park, to the south by McLean Avenue followed by an active gasoline station and auto repair shop (Global Automotive), a food distribution center and several single-family residential dwellings, and to the west by McLean Avenue and several commercial properties (including Advance Auto Parts, Chase Bank, Hollywood Florist, and Malecon Restaurant).

While the property will be redeveloped into a self-storage facility, the redevelopment will retain the exterior façade of the current commercial building to maintain the current aesthetic of the neighborhood.

Based on a review of available databases, IEEG has identified the following sensitive receptors, such as hospitals, day care facilities, or schools, in the vicinity of the Site. No sensitive receptors were identified within a 500-foot radius of the Site:

Private Water Wells

In addition, a search of publicly available information was conducted to determine the presence, if any, of private groundwater drinking wells in the vicinity of the Site. Utilizing the USEPA Private Domestic Well Map, the nearest property actively using private wells was located approximately 2,140-feet northwest of the Subject Property (see **Figure 3**). Based on the distance and hydraulically down gradient location of this property, it is not expected to be impacted by any soil, groundwater, or soil vapor contamination detected at the Subject Property.

2.2 Physical Setting of the Site

2.2.1 Topography

The Site is located within the Atlantic Coastal Plain Physiographic Provence. The elevation of the Site, as presented on the United States Geologic Survey (USGS), Yonkers Quadrangle Map, is approximately 80 feet above mean sea level (amsl) on the southern portion of the Site and 90 feet amsl on the northern portion of the Site. The **Site Topographic Map** is included as **Plate 3** and indicates the Site area has an approximately 10-foot elevation change from the north to south portions of the property. The nearest major surface water body to the Site is Hudson River, located approximately 0.82 miles (or 4,350 feet) to the west.

Westchester County is divided into 26 general soil units, or groups of soils geographically associated in a characteristic repeating pattern, according to the Soil Survey of Westchester County, New York (U.S. Department of Agriculture, U.S. Soil Conservation Service). The general soil component of the Site, as defined by this publication, is Urban Land. This soil type consists of urbanized areas where the majority of the surface

is covered with buildings, roads, driveways, parking lots, and other manmade structures. Further classification of the soils in these areas is impractical.

2.2.2 Regional and Site Geology and Hydrogeology

Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeological network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks.

Westchester County is underlain by multiple aquifers, the Galpermin aquifer which is located under the Site is an unconfined aquifer and not a primary source of water. Potable water is drawn from surface water reservoir systems that are sourced from New York state. Based upon the topographic map (USGS – Yonkers Quadrangle) and proximity to the Hudson River, regional groundwater flow direction is presumed to be west to southwest. It should be noted that there may be localized variations in subsurface hydrology created by sewers, wells and other anthropogenic structures. Hydrologic conditions in the vicinity of the Site may be subject to variations in seasonal precipitation and geological conditions not evident during review of publicly available records.

Based on corporate records, obtained by IEC, a Phase II and Supplemental Phase II Environmental Site Assessment (ESA) conducted in April and July 2020 at the Site identified bedrock directly beneath the building slab on the western portion of the Site. Furthermore, sub-grade materials in areas where bedrock was not present, consisted of fine to medium grained brown sand, with no signs of non-native fill material identified. During the Supplemental Phase II ESA, six (6) groundwater monitoring wells were installed on the southeast portion of the Site, and groundwater was encountered between 9.7 and 10.06 feet bgs. Finally, a survey of the installed monitoring wells was performed by Control Point on May 24, 2022 and it was determined that localized groundwater flow is towards the southwest.

During the RI, three (3) groundwater monitoring wells were installed at predetermined locations across the site and depth to groundwater was measured, an additional five wells previously installed by others, were also gauged for depth to groundwater readings. Groundwater ranged from approximately 1.29 feet below the site (MW-5A), perched on top of bedrock, to 10.57 feet in MW-9A on the southeastern portion of the site.

3 SITE BACKGROUND

The following sections describe the historical Site use, the proposed Site redevelopment plan, the findings from previous environmental investigations completed by others for the Site and a summary of the identified areas of concern (AOCs).

3.1 Historical Site Use

Through review of historical records, New York City records, NYC databases and environmental databases for the Site, the following is a summary of the information identified:

- Sanborn Historical Fire Insurance Maps which indicate the Site was developed with a two-story warehouse type building as early as **1942**, at which point the property was reportedly occupied by "Park Hill Garage". Prior Sanborn Maps from 1898 and 1917 show the Site as undeveloped

3.2 Proposed Site Redevelopment Plan

The development project consists of a commercial storage facility that will incorporate the existing façade of the current building. The proposed development will be approximately 88,830 gross-square-foot (GSF) and 46 feet 3-inches in height (3 stories) and upon completion will include 11 interior parking spaces, storage units and office space. The building will be constructed slab on grade, with final excavation depth ranging from 4-feet bgs beneath the building slab, and 6-feet bgs in areas of footings. The water table is expected at

between approximately 1.29 and 10.57-feet bgs and may impact the development. Development is slated to take 27 months to complete. Plans for the Site redevelopment are provided in **Appendix A.**

3.3 Previous Investigations

Structural Engineering Technologies, P.C. (SET) Phase I ESA, October 2, 2018

Below is a summary of the findings of the SET Phase I ESA:

- The historic use of the Property as a printing company from 1951 to at least 1956, as Willow Laundry Company in 2010 and as various auto repair facilities from 1987 to the present time. Since the use and storage of hazardous chemicals and petroleum products used by these facilities is unknown their historic presence should be considered a REC.
- The presence of a Potential Vapor Encroachment Condition from the adjacent property to the south – The Unnamed Gasoline Station. This unnamed gasoline station is associated with four closed NYSDEC Spills. One of the spills is reported to have impacted the groundwater and the three other spills are reported to have impacted the soil. Since the unnamed gasoline station is located within 200 feet of the Property there is a potential for the closed NYSDEC spills to impact upon the soil vapor quality beneath the Property. Therefore, the presence of the adjacent gasoline station should be considered a potential vapor encroachment condition (PVEC).
- The presence of an active UST in the eastern portion of the Site. The UST may be impacting upon the environmental quality of the Property and its presence should therefore be considered a REC.
- The listing of closed NYSDEC Spill # 93-10281 for the Property. The spill is related to the release of petroleum during a fuel oil delivery to the underground fuel oil storage tank. The database indicates the spill was cleaned up immediately. The presence of a closed NYSDEC associated with the Property should be considered a HREC and no further action is required regarding this spill.

Structural Engineering Technologies, P.C. (SET) Phase II ESA, April 22, 2020

Below is a summary of the SET Phase II ESA:

- A Ground Penetrating Radar (GPR) survey was performed in accessible areas of the Site. One anomaly indicative of the 5,000-gallon fuel oil UST was identified in the parking garage ramp at 60 McLean Avenue. The tank is buried in the parking garage ramp and is not located in the basement.
- Eight (8) soil probes (designated SP-1 through SP-7 and SP-9) were installed by PG Environmental, Corp with a Geoprobe. The soil probes were installed to investigate the historic use of the site as a suspect laundry and printing facility, the current and historic use of the site as an auto repair facility and the presence of the 5,000-gallon UST.

- Soil probe SP-1 was installed at 46 McLean Avenue, soil probe SP-2 and SP-3 were installed at 48 McLean Avenue, soil probe SP-4 was installed at 50 McLean Avenue, soil probe SP-5 was installed at 60 McClean Avenue at the Tire Shop, soil probe SP-6 was installed at 60 McLean Avenue at the southern side of the parking garage ramp, soil probe SP-7 was installed to the south of the 5,000-gallon UST and soil probe SP-9 was installed in the basement directly to the north of the 5,000-gallon UST.
- The soil probes were installed until the groundwater table or refusal was encountered. Refusal was encountered at less than 1 foot below grade at SP-2, SP-3, and SP-4. Several attempts were made to install the probes in nearby locations; however, after three failed attempts at each location, it was determined that bedrock was present directly beneath the slab in the western portion of the site and soil probes could not be installed within the eastern portion of 46 McLean Avenue, throughout 48 McLean Avenue and throughout 50 McLean Avenue; therefore, soil samples were not collected from these areas.
- Soil probes SP-1, SP-5 and SP-6 were installed until groundwater was encountered at 15 feet below grade. Soil probes SP-7 and SP-9 were installed to 5 feet below grade. Refusal was encountered at 5 feet below grade in SP-7 and SP-9 was intended to investigate the area to the north of the UST. Since SP-9 was present in the basement below the UST depth it was only installed to 5 feet. A total of five (5) soil samples were submitted for laboratory analysis.
- The groundwater investigation consisted of the installation and sampling of two temporary monitoring wells designated MW-5 and MW-7. Groundwater was encountered at 10 feet below grade in MW-5 and MW-8. Monitoring well MW-5 was installed at 60 McLean Avenue in the tire shop. Monitoring well MW-8 was installed at 60 McLean Avenue in the southern portion of the parking garage ramp. Two (2) groundwater samples were submitted for laboratory analysis.
- A total of six sub slab probes (designated SV-1 to SV-6) were installed during the investigation with a Geoprobe. It should be noted that the SET report incorrectly states that SV-7 was one of the collected samples. Following a review of the Sample Location Plan, Tabulated Soil Vapor results, and raw analytical data report, IEC concluded that SV-7 was not one of the collected samples. The sub-slab probes were installed beneath the foundation slab. Sub-Slab SV-1 was installed at 46 McLean Avenue, Sub-Slab Vapor Probes SV-2 and SV-3 were installed at 48 McLean Avenue, Sub-Slab Vapor Probe SV-4 was installed at 50 McLean Avenue, Sub-Slab Vapor Probe SV-5 was installed at 60 McLean Avenue and Sub-Slab Vapor Probe SV-6 was installed at the southern portion of the parking

garage ramp. Additionally, two indoor air samples (designated IA-1 and IA-2) and one outdoor air sample (designated OA-1) were collected during the investigation.

- Volatile organic compounds (VOCs) were detected in SP-9, 2.5 to 5 feet at concentrations exceeding their respective UUSCO. Acetone was detected in SP-1 (7.5 to 10 feet), SP-5 (5 to 7.5 feet), SP-6 (7.5 to 10 feet) and SP-7 (2.5 to 5 feet) at concentrations exceeding its respective method detection limit (MDL) but less than its UUSCO (and Protection of Groundwater standard (PGW)) of 0.05 mg/kg. No other VOCs were detected in SP-1 (7.5 to 10 feet), SP-5 (5 to 7.5 feet), and SP-7 (2.5 to 5 feet) at concentrations exceeding their respective MDL.
- Several VOCS including, 1,2,4-Trimethylbenzene (0.0900 mg/kg), 1,3,5-Trimethylbenzene (0.0320 mg/kg), Ethyl Benzene (0.00980 mg/kg), Isopropylbenzene (0.00670 mg/kg), Methylcyclohexane (0.00930 mg/kg), n-Butylbenzene (0.0130 mg/kg), n-Propyl benzene (0.0120 mg/kg), o-Xylene (0.0120 mg/kg), m & p xylene (0.0310 mg/kg), p-isopropyltoluene (0.0150 mg/kg), sec-Butylbenzene (0.00750 mg/kg) were detected in SP-6, 7.5 to 10 feet. The remaining VOCs in SP-6, 7.5 to 10 feet were detected at concentrations less than their respective MDL.
- No semi-volatile organic compounds (SVOCs) were detected in the soil at concentrations exceeding their respective MDL.
- The VOC, acetone, was detected in MW-5 at a concentration exceeding its respective MDL. The remaining VOCs in MW-5 were detected at a concentration less than their MDL.
- Eleven (11) VOCs were detected in MW-8 at a concentration their respective GQS. These VOCs include the following compounds: 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, ethyl benzene, isopropyltoluene, n-butylbenzene, n-propylbenzene, o-xylene, p/m-xylene, p-isopropyltoluene, sec-butylbenzene, toluene, and total xylenes.
- The compound, Carbon Tetrachloride, was detected in SV-1 (1.2 $\mu g/m^3$), SV-3 (10 $\mu g/m^3$), SV-4 (0.720 $\mu g/m^3$), SV-5 (0.390 $\mu g/m^3$) and in the indoor air IA-1 (1 $\mu g/m^3$) and the outdoor air, OA-1 (0.490 $\mu g/m^3$). According to the NYSDOH Decision Matrix A and based upon the concentrations detected mitigation is recommended for Carbon Tetrachloride.
- The compound, trichloroethene (TCE), was detected in SV-4 at a concentration of 2.5 $\mu g/m^3$. Trichloroethene was not detected in any other sub-slab probe, the indoor air samples, or the outdoor air sample. According to the NYSDOH Decision Matrix A and based upon the concentrations detected no further action is required for trichloroethene.

- The compound, methylene chloride, was detected in SV-4 (5.6 µg/m^3). Methylene chloride was not detected in any other sub-slab probe, the indoor air samples, or the outdoor air sample. According to the NYSDOH Decision Matrix B and based upon the concentrations detected no further action is required for methylene chloride.
- The compound, tetrachloroethene (PCE), was detected sub-slab samples SV-1 (30 µg/m^3), SV-2 (210 µg/m^3), SV-3 (220 µg/m^3), SV-4 (110 µg/m^3), SV-5 (3.6 µg/m^3) and the indoor air sample, IA-1 (4 µg/m^3), and the outdoor air sample, OA-1 (0.890 µg/m^3). Tetrachloroethene was not detected in SV-6 or IA-2. According to NYSDOH Decision Matrix B and based upon the concentrations detected, the levels of PCE should be monitored over time.
- The compound, Vinyl Chloride, was detected in the sub-slab sample SV-5 at a concentration of 0.270 µg/m^3. Vinyl Chloride was not detected in any other sub-slab probe, the indoor air samples or the outdoor air sample. According to NYSDOH Decision Matrix C and based upon the concentrations detected, the levels of Vinyl Chloride require no further action at this time.
- The compounds 1,1,1-Trichloroethane, cis 1-2-dichloroethene, 1,1-Dichoroethylene, were not detected in the sub slab vapor samples or indoor air sample.
- An evaluation of the analytical results indicated elevated levels of VOCs were detected in SV-6. These VOCs include Cyclohexane (190,000 µg/m^3), Ethyl Benzene (13,000 µg/m^3), n-Heptane (300,000 µg/m^3), n-Hexane (280,000 µg/m^3), o-Xylene (4,300 µg/m^3), m & p xylene (22,000 µg/m^3) and Toluene (4,500 µg/m^3).
- The results of the Phase II ESA indicate that the historic use of the site and the presence of an active 5,000-gallon UST do not appear to have impacted upon the environmental quality of the Property. This is evidenced by the soil screening and soil analytical results of SP-1, SP-5, SP-7 and SP-9 and the groundwater analytical results from MW-5. No VOCs or SVOCs were detected in the soil or the groundwater at concentrations exceeding regulatory standards from beneath the auto repair shops or around the 5,000-gallon UST. Additionally, the sub-slab vapor data collected from beneath the auto repair facilities shows only low-level exceedances in the soil vapor. These concentrations may be related to the current use of the Property as auto repair facilities.
- The results of the Phase II ESA indicated that the presence of an unnamed gasoline station adjacent to the Property, is most likely impacting upon the vapor quality and groundwater quality of the Property. This is evidenced by the presence of gasoline and solvent related VOCs in the groundwater beneath the bottom of the parking garage ramp (MW-8) in the eastern portion of the property at

concentrations exceeding the Groundwater Quality Standard. The gas station is located in the presumed downgradient direction; however, its gasoline tanks are within a 50 feet radius of influence of MW-8 and based upon the distance and the presence of historic spills documented to have impacted upon the groundwater the unnamed gasoline station is most likely the source of the VOCs identified in the groundwater.

- No evidence of a petroleum release was identified in the soil around MW-8 as evidenced by the soil screening results of SP-6. No olfactory/visual evidence of petroleum and no elevated levels of organic vapors were identified from zero to 10 feet below grade. However, olfactory evidence of petroleum was identified in the saturated soil from 10 to 15 feet below grade. Additionally, while the soil collected from SP-6 at 7.5 to 10 feet below grade had levels of VOCs exceeding the MDL but less than the UUSCO, these concentrations can be attributed to fluctuations in the groundwater table.
- Based on the results of the Phase II ESA, SET made the following recommendations:
    - During future construction activities it is recommended the active 5,000-gallon UST be removed in accordance with local, state and federal guidelines.
    - A soil vapor mitigation system should be designed and installed within the new building to prevent vapors from the adjacent gasoline station from impacting the indoor air.
    - The NYSDEC should be notified of a release from the adjacent property, 67 McLean Avenue. A copy of this report should then be provided to the NYSDEC for their review and comment.
    - Soil excavated during construction activities should be disposed of in accordance with local, state and federal regulations.

<u>Structural Engineering Technologies, P.C. (SET) Supplementary Phase II ESA (Phase IIb), July 6, 2020</u>

Below is a summary of the SET Supplemental Phase II ESA:

- Six (6) soil probes (designated SP-10 through SP-15) were installed by PG Environmental, Corp with a Geoprobe. The soil probes were installed to further delineate levels of VOCS and SVOCs previously detected.
- Soil probe SP-10 was installed at 48 Mclean Avenue in the previous location of SP-2/SV-2. Soil probe SP-11 was installed at the parking of the parking garage ramp at 60 Mclean Avenue in a similar location of SP-6/SV-6. Soil probe SP-12 is located on the sidewalk to the south of the parking garage ramp along Mclean Avenue. Soil Probe SP-13 was installed to the west of SP-12 and soil probe SP-14 was installed to the east of SP-12. Soil probe SP-15 was installed in VP-Discount Tire (60 Mclean Avenue) in a similar location as SP-5/MW-5/SV-5.

- Refusal was encountered at 5 feet in SP-10A and SP-15A. Several attempts were made to install the probes in nearby locations; however, after three failed attempts at each location, it was determined that the probe could not be installed any deeper. Soil probes SP-11 through SP-14 were installed until 15 feet below grade. Groundwater was encountered at approximately 10 feet below grade.
- A total of 10 soil samples were submitted for laboratory analysis.
- During the investigation five (5) permanent monitoring wells designated WP-10A, WP-11, WP-12, WP-13, and WP-14 were installed. WP-10A was installed in the western portion of the site within 48 Mclean Avenue. Monitoring Wells WP-12, WP-13 and WP-14 were installed on the sidewalk along Mclean Avenue. Monitoring Well WP-15 was installed in the Tire Shop at 60 Mclean Avenue and Monitoring Well MW-11 was installed at the bottom of the parking garage ramp.
- Land survey was used to identify the location of the monitoring wells. The elevations of all installed monitoring wells were surveyed relative to a permanent surface benchmark. The results of the survey indicate groundwater is flowing towards the southwest.
- A total of five (5) groundwater samples were submitted for laboratory analysis.
- No SVOCs were detected in the soil at concentrations exceeding their respective UUSCO.
- Several VOCs were detected in WP-11, WP-12, WP-13, and WP-14 at concentrations exceeding their respective GQS. The VOC, 1,2,4-Trimethylbenzene was detected in at concentrations ranging from 130 µg/L in WP-13 to 700 µg/L in WP-11, which exceeds the GQS of 5 µg/L. The VOC, 1,3,5-Trimethylbenzene range from 40 µg/L in WP-13 to 230 µg/L in WP-11. The VOC Benzene was detected in WP-11 at a concentration of 3.2 µg/L which exceeds the GQS of 1 µg/L. The VOC, Ethyl Benzene was detected at concentrations ranging from 0.740 µg/L in WP-10A to 340 µg/L WP-11. The GQS for Ethyl Benzene is 5 µg/L. Isopropyl benzene was detected at concentrations ranging from 21 µg/L in WP-13 to 85 µg/L in WP-11. The GQS for Isopropyl benzene is 5 µg/L. The VOC, o-Xylene was detected at a concentration ranging from 12 µg/L in WP-14 to 340 µg/L in WP-11 and the VOC p-& m-Xylene was detected at concentrations ranging from 3.2 in WP-10A to 1,000 in WP-11. The GQS for o-Xylene and p-m-Xylene is 5 µg/L. The VOC, p-Isopropyl toluene was detected at concentrations ranging from 19 µg/L in WP-12 to 35 µg/L in WP-11. The GQS for p-Isopropyl toluene is 5 µg/L. The VOC sec-Butylbenzene was detected at concentrations ranging from 11 µg/L in WP-12 to 18 µg/L in WP-11. The GQS from sec-Butylbenzene is 5 µg/L. Toluene was detected at concentrations ranging from 3 µg/L in WP-10A to 52 µg/L in WP-11. The GQS for Toluene is 5 µg/L.

- The SVOC, Naphthalene, was detected in WP-12 (48 µg/L) and WP-14 (67.6 µg/L) at concentrations exceeding their respective GQS of 10 µg/L. No other SVOCs were detected at concentrations exceeding their respective GQS.
- Based upon the nature of the contaminants, the documented NYSDEC Spill incidents at the suspect gasoline station and the potential radius of influence of these gasoline releases, the suspect gasoline station at 67 Mclean Avenue still appears to be the source of the gasoline contamination on-site. This is evidenced by the fact that no levels of VOCs were identified in the unsaturated soil during the Phase II performed in April 2020 or this current Phase II(B). Additionally, based upon the chemical inventory performed in June 2020, there does not appear to be a source of VOCs on the Property. Furthermore, the suspect gasoline station located at 67 Mclean Avenue is associated with four closed NYSDEC Spills. One of the spills is reported to have impacted the groundwater and the three other spills are reported to have impacted the soil. There is no record of a cleanup being performed at 67 Mclean Avenue.

Structural Engineering Technologies, P.C. (SET) Fourth Round Groundwater Testing, November 5, 2020

Below is a summary of the SET 4th Quarter Groundwater sampling event for 2020:

4 FIELD INVESTIGATION

The RI was performed at the Site in May 2022. The purpose of the RI was to further delineate the nature and extent of impacts detected in the Phase II and Phase IIb Site Investigations completed by SET between April and July 2020, in accordance with DER-10-3.1, to formulate a conceptual site model and an effective strategy for site remediation. A description of the 2020 field investigations performed by SET at the Site are summarized in Section 3.3 and previous laboratory reports are included in **Appendix I**.

The following scope of work was performed in the May 2022 RI to supplement the data and findings of previous investigations:

- Installation of nine (9) soil vapor points throughout the property for the collection of nine (9) soil vapor samples to further define the extent of cVOCs and petroleum compounds across the Site to assess the potential for off-site migration in relation to downgradient receptors.

- Collection of four (4) indoor air and two (2) ambient outdoor air samples for laboratory analysis.

- Advancement 21 remedial investigation soil borings to a maximum depth of approximately 10-feet below grade surface (bgs), or refusal in cases where bedrock was encountered, for collection of soil samples for field screening and laboratory analyses.

- Installation and sampling of three (3) permanent groundwater monitoring wells for collection of representative groundwater samples for laboratory analysis.

- Collection of representative groundwater samples from five (5) existing permanent groundwater wells previously installed by others it the southeastern portion of the site.

All samples collected during the RI were transported under chain of custody procedures to Alpha Analytical (Alpha) located in Westborough, Massachusetts, an Environmental Laboratory Approval Program (ELAP)-Certified laboratory.

Quality Assurance/Quality Control sampling during the RI included collection of one duplicate, one field blank and one matrix spike/matrix spike duplicate (MS/MSD) sample per 20 field samples and one trip blank per cooler for soil and groundwater.

The laboratory reported the results for RI data in Analytical Services Protocol (ASP) Category B deliverable packages. An electronic data deliverable (EDD) in the required NYSDEC format was provided by the laboratory. Analytical data packages are presented in **Appendix I**. A DUSR was prepared by an independent data validator in accordance with Appendix 2B of DER-10 and is provided in **Appendix G**. The field activities completed as part of this RI are described in the following sections.

4.1 Community Air Monitoring

Due to all Remedial Investigation work being conducted within the enclosed building, it was determined that Community Air Monitoring was not required, as the general public would not be exposed to any contaminants associated with the installation of soil borings, groundwater monitoring wells, or soil vapor points. However, on the first day of remedial investigation activity (May 2, 2022), IEEG conducted baseline air monitoring for particulates and VOCs downwind of the activities, which included installation of soil borings within the building. No exceedances of the particulate or VOC thresholds, as outlined in the Remedial Investigation Work Plan, were encountered during the first day of drilling. A maximum particulate concentration of 0.012 mg/m3 was noted at 11:00am, and a maximum PID reading of 0.2 ppm was noted at 9:00am. Due to the benign readings noted during the first day of the Remedial Investigation activities, no further continuous Community Air Monitoring was performed. On site personnel remained cognizant of visible dust during the entire RI, and where applicable instituted dust mitigation practices, such as wetting the Site in the locations of ground intrusive activity to suppress dust migration. See **Appendix K** for the baseline air logs.

4.2 Geophysical Survey

On May 3, 2022, prior to any subsurface disturbance activities, a geophysical survey was performed by Coastal Environmental Solutions (Coastal) The geophysical survey utilized ground-penetrating radar (GPR) to identify the subsurface water, sewer, drainage and gas service lines within the Site boundaries to ensure the selected boring locations were not in an area underlain by subsurface utilities or anomalies that may hinder the advancement of soil vapor points, soil borings, and monitoring wells or may pose a health and safety risk. The locations of the associated piping and the water, sewer, drainage and natural gas lines were marked on

the Site and boring locations were ensured to be clear of any subgrade utilities. One Underground Storage Tank (UST) was identified within the ramp leading to the second floor of the building. Documentation indicates the tank holds a capacity of approximately 5,000 Gallons of No.2 Fuel oil, which is used to heat the building.

4.3 Soil Vapor Investigation

The NYSDEC and the NYSDOH require assessment of soil vapor at contaminated sites to collect data to evaluate health risk associated with potential exposure to VOCs through vapor intrusion into occupied spaces. The soil vapor sampling points were installed by Coastal on May 3, 2022, and the soil vapor samples were collected by IEEG on May 4, 2022. The locations of the soil vapor sampling points are shown on **Figure 3**. The sample locations were chosen to confirm soil vapor conditions under the Site and were based on contaminants of concern identified during the previous Phase II ESA and 2020 Investigation.

In addition to the soil vapor points designated SV-2A through SV-10A (SV-1A was collected but not submitted to the lab for analysis due to the presence of water in the summa canister), installed as part of the IEEG 2022 Remedial investigation at the Site, four (4) indoor air samples and two (2) ambient outdoor air samples were also collected to aid in comparison to NYSDOH Indoor air and Sub-slab soil vapor decision matrices. Prior to conducting the investigation, a NYSDOH Pre-Inspection Checklist was completed and can be found in **Appendix L**.

Ten (10) soil vapor sampling points designated SV-1A through SV-10A, four (4) indoor air sampling points designated IA-1A through IA-4A, and two (2) outdoor air sampling points designated OA-1A and OA-2A were installed during this RI. SV-1A was not able to be analyzed, as discussed above. The sample locations chosen were as follows:

- **SV-1A:** Located in the northwestern portion of the 2nd floor (not analyzed due to presence of groundwater).
- **SV-2A:** Located in the northern central portion of the 2nd floor.
- **SV-3A:** Located in the northeastern portion of the 2nd floor.
- **SV-4A:** Located in the boiler room in the eastern portion of the site.
- **SV-5A:** Located in the southwestern unit (46 McLean Avenue).
- **SV-6A:** Located in the southern central unit (48 Mclean Avenue).

- **SV-7A:** Located in on the southern central unit (50 Mclean Avenue).
- **SV-8A:** Located in the southern central unit (60 Mclean Avenue – Suite 1).
- **SV-9A:** Located in the southern central unit (60 Mclean Avenue – Suite 2).
- **SV-10A:** Located in the eastern pizza shop unit (70 McLean Avenue).
- **IA-1A:** Located in the northern central portion of the 2nd floor.
- **IA-2A:** Located in the southwestern unit (46 McLean Avenue).
- **IA-3A:** Located in the southern central unit (60 Mclean Avenue – Suite 1).
- **IA-4A:** Located in the eastern pizza shop unit (70 McLean Avenue).
- **OA-1A:** Located along the southern exterior wall of unit 60 McLean Avenue.
- **OA-2A:** Located along the eastern exterior wall of the site.
- **SV-DUP-1:** Collected as a duplicated of SV-9A.

4.3.1 Installation of Temporary Soil Vapor Points

The soil vapor points were advanced to a depth of between 3 and 5 fbg, or depth of refusal in instances where bedrock was encountered. The sampling implant, constructed of 3/8-inch diameter 6-inch-long stainless-steel wire wrapped screen, was inserted down the bore hole to an anchor point. The implant was threaded to dedicated polyethylene tubing (0.5-inch diameter) and lowered to near the bottom of the borehole. Approximately 2 feet of a porous, inert backfill material (i.e., washed No. 2 sand) was then used to fill the annulus to create the sampling zone. The soil vapor monitoring points were sealed above the sampling zone with a bentonite slurry for a minimum distance of three (3) feet to prevent outdoor air infiltration and the remainder of the borehole was filled with concrete to the surface. A soil vapor sample point construction detail is presented in **Appendix B**. The soil vapor points were allowed to equilibrate for a minimum of 24 hours prior to sampling. Following the 24-hour equilibrium time, a helium leak test was performed on each soil vapor point. A plastic shroud was sealed to the floor using bentonite and was used to keep the tracer gas in contact with the vapor probe during testing. Helium was introduced to the cavity of the shroud and a helium detector apparatus was used to test the content of the soil vapor probe. No helium infiltration was observed in the nine (9) soil vapor probes installed as part of the RI, and the integrity of the seals were considered verified.

4.3.2 Soil Vapor Sampling Procedures

Prior to sampling, the vapor points were each purged to evacuate potential atmospheric air prior to sample collection to ensure the sample would be representative of subsurface soil vapor conditions. The evacuation process was completed by using a PID attached to the polyethylene tubing of the sampling point. A PID has a flow rate of approximately 0.02 liters per minute. A total of three tube volumes was purged during the evacuation and during the prior helium tracer gas test. A PID reading was also recorded once the evacuation with the PID was completed.

After purging was complete, a laboratory supplied clean 2.7-liter Summa canister with a laboratory pre-calibrated flow controller with a flow rate of 0.02 liters per minute, was attached to the vapor sampling point polyethylene tubing. Sampling of the sub-slab soil vapor then proceeded by fully opening the flow control valve on each sample canister. Immediately after opening the flow control valve on each canister, the initial vacuum (inches of mercury) was recorded in the field log and on the sample tag. The Summa canisters supplied by the analytical laboratory arrived with approximately 29.32 to 30.20 inches of mercury vacuum.

The samples were collected over a period of approximately 2-hours. When approximately 2.7 liters of sample had been collected or the canister pressure dropped to approximately 4 inches of mercury (approx. 2 hours), the samples were stopped by closing the flow controller valves. The final vacuum recorded in the field notebook and on the sample tag.

4.3.3 Soil Vapor Sample Laboratory Analysis

The soil vapor sample identification, date, start time, start vacuum, end time, and end vacuum for each Summa canister sample were recorded on a sample log sheet and the laboratory chain of custody. Nine (9) soil vapor samples, one (1) duplicate soil vapor sample, four (4) indoor air samples, and two (2) ambient outdoor air samples were submitted to Alpha on May 4, 2022, via laboratory courier for laboratory analysis of VOCs via EPA Method TO-15. One soil vapor sample (SV-1A) was not submitted for laboratory analytical analysis due to water infiltration in the summa cannister. All Summa canisters were “Batch Certified” by Alpha Analytical Laboratories, of MA (ELAP #11627).

4.4 Soil Investigation

The RI included 21 borings completed by Coastal during the period from May 23 to 25, 2022, to further investigate the contaminants of concern detected during previous investigations completed by others. The soil boring locations are identified on **Plate 3**.

Where possible, the continuous soil samples were collected at 5-foot intervals to a final depth specific to each boring. Grab soil samples were collected for laboratory analysis. Recovered soil was screened for visual, olfactory, and instrumental evidence of environmental impacts and was visually classified for soil type, grain size, color, texture, and moisture content. Instrument screening for the presence of VOCs was performed with a PID equipped with a 10.6 electron volt (eV) lamp. For this investigation, a MiniRae 3000PID was used and calibrated to isobutylene span gas to yield total VOCs in parts per million by volume (ppm_v) referenced to benzene. Boring logs documenting these observations are provided in **Appendix C**. Soil cuttings were backfilled into the original boring locations that were not converted into monitoring wells and/or containerized into Department of Transportation (DOT)-approved 55-gallon steel drums

The 21 soil borings advanced during the remedial investigation and their respective locations were as follows:

- **SB-1:** Remedial Investigation boring located in the northwestern portion of the Site on the 2nd Floor.
- **SB-2**: Remedial Investigation boring located east of SB-1.
- **SB-3**: Remedial Investigation boring located east of SB-2 in the northern central portion of the Site on the 2nd Floor.

4.4.1 Advancement of Soil Borings

Each borehole location was cleared for utilities by way of GPR prior to commencement of drilling. A hydraulically driven direct push Geoprobe® DT22 Soil Sampling System was utilized to collect continuous soil cores to the boreholes final depth. Dual tube sampling uses two sets of probe rods to collect continuous soil cores. One set of rods is driven into the ground as an outer casing. These 2.25 in outer rods receive the driving force from the hammer and provide a sealed borehole from which soil samples may be recovered minimizing the risk of cross contamination. The second, smaller set of 1.25 inner rods are placed inside the outer casing. The smaller rods hold a non-reactive transparent plastic sample collection sleeve (liner) in place as the outer casing is driven one sampling interval. The small rods are then retracted to retrieve the filled 5-foot liner. The plastic sleeves were removed for subsequent inspection and sample acquisition. The drilling rods were decontaminated between each soil boring location using an Alconox wash followed by a deionized water rinse.

4.4.2 Soil Sampling Rational and Methodology

A total of 27 soil samples were collected during the RI, including Quality Assurance/Quality Control samples, and submitted for laboratory analysis from the 21 soil borings. Due to the presence of bedrock in the majority of soil boring locations, and subsequent limited recovery, soil samples were collected from either the 0–2 foot, 0–3 foot, or 0–4 foot interval, depending on the depth that bedrock was encountered. In the southeastern portion of the site, where shallow bedrock was not encountered, additional soil samples were collected from the 7–9 foot interval and/or biased towards evidence of contamination (PID screening, visual, odors).

Samples for VOC analysis were collected directly from the acetate liner via laboratory supplied Terra Core® soil sample kits. The remaining soil sample volumes from soil cores were separated into two aliquots where one was placed in appropriate laboratory supplied containers for the remaining analyses and the other was placed in a labelled clean zip lock plastic bag for headspace analyses.

4.4.3 Soil Sample Laboratory Analysis

Representative soil samples from the 21 investigatory soil borings for laboratory analysis were collected from the shallow 0-2-foot, 0-3-foot, or 0-4-foot interval, and the 7-9 foot interval (where possible). Sample collection locations and depths were selected in the field based on field observations and field screening. A total of 25 grab soil samples, plus 2 duplicate samples, were collected during the RI, as described below:

27 samples from the 21 RI borings were collected from the respective interval and analyzed for the following:

- Target Compound List (TCL) VOCs plus Tentatively Identified Compounds (TICs) by USEPA methods 8260C/5035
- TCL SVOCs plus TICs by USEPA method 8270D
- TCL Pesticides and herbicides by USEPA methods 8081B and 8151A
- PCBs by USEPA method 8082A
- Target Analytes List (TAL) Metals / Part 375 List metals (including cyanide and hexavalent and trivalent chromium) by USEPA Methods 6010C/7471B/9010C/7196A
- Per- and Polyfluoroalkyl Substances (PFAS) by USEPA Method 537
- 1,4-dioxane by USEPA Method 8270 SIM isotope dilution

A summary of the RI analytical program including appropriate field/equipment blanks and of sample parameter hold times and sample container requirements are provided in Appendix F, the Quality Assurance Project Plan (QAPP) Table 1 and Table 2, within the NYSDEC-approved RIWP. Refer to **Figure 3** for the soil boring locations.

4.5 Groundwater Investigation

A total of four (4) monitoring wells were permanently installed on the Site on May 3, 2022. The four (4) wells (designated MW-4A, MW-5A, MW-7A, and MW-9A) were installed to the following depths:

- In monitoring well MW-4A, refusal was met at 1.5 feet bgs however liquid was observed perched on top of bedrock and a monitoring well was installed with screened Schedule 40 PVC only.
- In monitoring well MW-5A, refusal was met at 3 feet bgs and a monitoring well was installed with screened 20 mil slotted Schedule 40 PVC only.
- Monitoring well MW-7A was completed to 15 feet bgs with 10 feet of screened 20 mil slotted Schedule 40 PVC.
- Monitoring well MW-9A was completed to 15 feet bgs with 10 feet of screened 20 mil slotted Schedule 40 PVC.

These permanent groundwater monitoring wells were installed by advancing the designated soil borings into the groundwater table to the designated interval depths. The monitoring wells were used to evaluate groundwater flow direction and groundwater quality data. The location for the groundwater monitoring wells on Site is presented on **Figure 3**.

4.5.1 Installation of Monitoring Wells

Bedrock was identified at varying depths across the site; however, it was not encountered within the first fifteen feet of soil column in the southeastern portion of the Site. Based on previous environmental and geotechnical investigations. Groundwater flow was expected to flow in a southerly direction. Based on this information, the following monitoring well locations were selected:

- **MW-4A:** located in the northeastern portion of the 48 Mclean Avenue unit.
- **MW-5A:** located in the northeastern portion of the 50 Mclean Avenue unit.
- **MW-7A:** located on the ramp downgradient from the UST.
- **MW-9A:** located in the 70 Mclean Avenue unit east of the ramp and UST.

All the monitoring wells were installed using 2-inch, inner diameter (ID), flush-joint schedule 40 polyvinyl chloride (PVC) casing with a flush-joint schedule 40 PVC, 0.010-inch machine slotted well screen. The specific construction details can be found in **Appendix F**. Each well screen interval and attached riser was placed at the bottom of each borehole interval and a silica sand filter pack (Morie sand size #2) was installed from the base of the well screen to a maximum of 2 feet above the top of the screen. Seals in the boreholes were constructed between sand packs. A two-foot bentonite chip seal was then installed around the casing above the filtration media and allowed to hydrate sufficiently to mitigate the potential for downhole grout

contamination. A grout mixture was placed above the bentonite seal to a point approximately one (1) foot below existing grade. Concrete was used to fill the area surround 6 to 8-inches of the remaining well casing in conjunction with the installation of an eight-inch, steel flush mounted road box with an access cover in a concrete pad. The newly installed monitoring wells were completed with lockable J-plugs.

4.5.2 Monitoring Well Development

Between May 4 and 5, 2022, upon their completion, the newly installed monitoring wells were developed in accordance with NYSDEC protocols. Development of the monitoring wells was accomplished using a Monsoon XL® Sampling Pump with dedicated disposable high-density polyethylene (HDPE) tubing. Field parameters including pH, temperature, turbidity, dissolved oxygen (DO), oxidation- reduction potential (ORP) and specific conductance were measured periodically (e.g., every well volume or as necessary) during development. Field measurements continued until they became relatively stable. Stability is defined as variation between measurements of approximately 10 percent or less with no overall upward or downward trend in the measurements. The well development groundwater was containerized in Steel 55-gallon DOT drums, labeled, and stored on the Site pending characterization, transport, and disposal.

Groundwater Sample Collection

Groundwater sampling was conducted with a Monsoon pump using the low-flow sampling procedures following USEPA guidance "*Low Stress [low flow] Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells*", dated September 19, 2017. During purging, field parameters were measured including water level drawdown, purge rate, pH, specific conductance, temperature, dissolved oxygen, turbidity and oxidation reduction-potential (ORP), every five minutes using a water quality meter (Horiba) and a depth-to-water interface probe that was decontaminated between wells. Samples were not collected until the field parameters have stabilized. Field parameters were considered stable once three sets of measurements were within ±0.1 standard units for pH, ±3% for conductivity and temperature, ±10 millivolts for ORP, and ±10% for turbidity and dissolved oxygen. Purge rates were adjusted to keep the drawdown in the well to less than 0.3 feet, as practical.

Additionally, attempts were made to achieve a stable turbidity reading of less than 10 Nephelometric Turbidity Units (NTU) prior to sampling. Due to turbidity readings not stabilizing at readings of less than 10 NTU for the wells sampled, both filtered and unfiltered samples for metal compounds were collected from the wells. Lab filtered samples were elected to be used.

On May 4 and 5, 2022, nine (9) groundwater samples, including one (1) duplicate sample, were collected from the referenced monitoring wells/sampling points and analyzed for:

- Target Compound List (TCL) VOCs plus Tentatively Identified Compounds (TICs) by USEPA methods 8260C/5035
- TCL SVOCs plus TICs by USEPA method 8270D
- TCL Pesticides and herbicides by USEPA methods 8081B and 8151A
- PCBs by USEPA method 8082A
- Target Analytes List (TAL) Metals / Part 375 List metals (including cyanide and hexavalent and trivalent chromium) by USEPA Methods 6010C/7471B/9010C/7196A
- Per- and Polyfluoroalkyl Substances (PFAS) by USEPA Method 537
- 1,4-dioxane by USEPA Method 8270 SIM isotope dilution

A summary of the RI analytical program including appropriate field/equipment blanks and of sample parameter hold times and sample container requirements are provided in Tables 1 and 2 of the QAPP, located in the NYSDEC-approved RIWP. Refer to **Figure 3** for the groundwater monitoring well locations.

Representative groundwater samples were placed in pre-cleaned laboratory provided sample bottles, placed on ice and cooled to 4ºC in the field, and transported under chain-of-custody command to Alpha for analysis. The laboratory has furnished ASP Category B deliverables package to facilitate groundwater data evaluation and preparation of a DUSR by a third- party validation expert. See **Appendix H** for the DUSR.

4.5.3 Monitoring Well Elevation Survey

Control Point Associates, Inc. (CP) conducted a well elevation survey of the monitoring wells on May 24, 2022. The survey was performed utilizing an automatic engineers' level and stadia rod. Vertical locations of the monitoring wells, including ground surface elevation and well casing elevations were surveyed to the nearest 0.01 foot. Location coordinates (provided in **Table 5**) were taken at the time of the field survey, utilizing the New York State RTK Network (NYSNET), while elevations were based on the North American Vertical Datum of 1988 (NAVD88).

4.6 Field Equipment Decontamination

Handheld sampling equipment, including oil/water interface probes, water quality meters, pumps, down-hole drill casings, and hand augers were decontaminated using an Alconox® -based solution and triple rinsed with distilled water. Down-hole drilling equipment was decontaminated between each boring by rinsing with an Alconox® -based solution. Decontamination wastewater was placed into DOT-approved 55- gallon drums for future off-site disposal.

4.7 Investigation Derived Waste Management

Investigation derived waste (IDW) generated during the RI was properly handled and containerized. Groundwater from monitoring well development and purging, and decontamination water were placed into DOT-approved 55-gallon steel drums with sealed tops. Drill cuttings exhibiting no evidence of chemical, or petroleum impacts were used to backfill soil borings. Three (3) drums of purged groundwater were staged in a secured area on-site (1 drum per lot) pending transport by a licensed waste hauler for disposal at an approved facility.

4.8 Quality Control Sampling

As part of the May 2022 RI, field blanks, trip blanks and duplicate samples were collected for QA/QC purposes in accordance with the QAPP. The QA/QC samples collected/analyzed during the RI are provided in the data summary **Tables 1** through **4.** Matrix-specific QA/QC samples that were collected for the RI are summarized below:

<u>Soil QA/QC Samples</u>

- Two (2) field duplicate samples
- Two (2) field blank samples
- Two (2) trip blank samples

<u>Groundwater QA/QC Samples</u>

- One (1) field duplicate sample
- One (1) field blank sample
- One (1) trip blank sample
- One (1) MS sample
- One (1) MSD sample

Soil Vapor QA/QC Samples

- One (1) field duplicate sample

Field blanks were collected to determine the effectiveness of the decontamination procedures implemented for the equipment used during sample collection to indicate potential cross-contamination (e.g., quality control of decontamination procedures).

Field duplicate samples were collected to assess the precision of the analytical methods relative to the sample matrix. The duplicates were collected from the same material as the primary sample by splitting the volume of homogenized sample collected in the field into two sample containers.

Trip blank samples were collected to assess the potential for contamination of the sample containers and samples during transport from the laboratory, to the field, and back to the laboratory for analysis. Trip blanks contain about 40 milliliters of acidic water (doped with hydrochloric acid) that is prepared and sealed by the laboratory when the empty sample containers are shipped to the field, and then unsealed and analyzed for VOCs by the laboratory when the sample shipment is received from the field.

4.9 Data Validation

The analytical data packages from the RI and prior investigation in 2020 were validated by Ms. Polly Newbold with DDMS, Inc. of St. Paul, Minnesota (DDMS), an independent third-party data validator subcontractor in accordance with USEPA and NYSDEC validation protocols. The validator's credentials are provided in **Appendix G** and the DUSRs are included in **Appendix H**.

5 INVESTIGATION FIELD OBSERVATIONS AND ANALYTICAL RESULTS

The following sections provide information regarding the field observations and laboratory analytical results for the soil vapor, soil and groundwater samples collected during this 2022 Remedial Investigation.

Consistent with an NYSDEC approved RIWP dated December 24, 2020, and revised on June 30, 2021, the 2022 RI scope included twenty (20) soil borings (identified as SB-1 through SB-20) from which 27 samples were collected, three (3) permanent monitoring wells (MW-4A, MW-7A, and MW-9A) and five (5) previously installed monitoring wells (WP-11 through WP-15), from which groundwater samples were collected, nine (9) soil vapor points (SV-2A through SV-10A) from which nine (9) soil vapor samples were collected from, four (4) indoor air samples, and two (2) outdoor air samples.

5.1 Field Observations

The general Site topography was observed to undulate and slope from north to south towards McLean Avenue, and the site is located at an elevation of approximately 84 feet amsl. Bedrock outcrops are located and were observed north and west of the Site.

5.2 Geology and Hydrogeology

Soil borings during the RI were advanced to a minimum depth of approximately 2-feet bgs, and a maximum depth of 15-feet bgs at the Site during the May 2022 investigation.

The geology of the shallow soil down to approximately 3-5 fbg (in areas where bedrock was encountered) consists predominantly of fine to medium grained sand. No evidence of anthropogenic material (brick, wood, or glass) was observed. In the southeastern portion of the Site where bedrock was not encountered, consisted of brown to gray fine sand and silt. The soil boring logs from the RI are provided in **Appendix C**. **Figure 4** provides a bedrock contour map.

CP conducted a well elevation survey of the monitoring wells on May 24, 2022. This data was used in conjunction with the groundwater well gauging data collected on May 5, 2022 (summarized in **Table 4**) to

prepare the sample location plan and groundwater contour map presented in **Figure 5**. Referring to **Table 4** and **Figure 5** and based off NAVD88 elevations (based off GPS observations taken at the time of the field survey, utilizing NYSNET) the elevation of the water table across the Site ranges from 1.29 fbg in MW-5A, located in the central portion of the site (within 50 McLean Avenue), to 10.57 fbg in MW-9A, located on the southeastern side of the Site (70 McLean Avenue), and is a result of the TOC elevation measurements minus the measured depth to water (DTW) readings. Based on the potentiometric surface map contours, groundwater flow direction is generally to the southeast in the eastern portion of the site and southwest in the western portion of the site due to the presence of a shallow bedrock ridge in the central portion of the Site.

5.3 Soil Vapor Analytical Results

A total of 9 soil vapor samples were collected from locations across the Site (see **Appendix E** for Soil Vapor Sampling Logs). Results of the soil vapor samples are summarized in **Table 3**, and VOC detections are shown on **Figure 8**. The Category B laboratory report for the soil vapor analysis is included in **Appendix I**. Results of the soil vapor analysis indicated that the cVOC PCE was detected at varying concentrations throughout the site. However, when compared to Indoor air concentrations and the NYSDOH decision Matrices guidelines the indoor air levels do not warrant action be taken at this time. However, multiple petroleum compounds were detected in soil vapor in the southeastern portion of the Site, and located downgradient from the UST located in the ramp that leads to the 2nd floor of the building.

There are currently no standards for soil vapor established by either the NYSDEC or the NYSDOH. The NYSDOH has established guidance for evaluating soil vapor intrusion in which the results of soil vapor samples are compared to corresponding indoor air quality results. The NYSDOH has established guidance for evaluating soil vapor intrusion in which the results of soil vapor samples are compared to corresponding indoor air quality results. The guidance is presented in Matrix A, Matrix B, and Matrix C from the NYSDOH Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006 (matrices were updated in May 2017). The matrices provide guidance relative to carbon tetrachloride, cis1,2 dichloroethene, 1,1-dichloroethene, TCE, PCE, 1,1,1-trichloroethane, methylene chloride, and vinyl chloride.

The soil vapor results reported from the samples collected during the RI indicate PCE and TCE concentrations are present in subsurface vapors. Additionally, multiple petroleum compounds were found present in soil

vapor. Chlorinated VOCs, specifically carbon tetrachloride and PCE, have been detected in soil vapor beneath the Site at concentrations that return a "No Further Action" decision according to the NYSDOH Final Guidance for Evaluating Soil Vapor Intrusion decision matrices (see **Tables 3.1** through **3.5**).

5.4 Soil Analytical Results

A total of 21 soil borings were advanced during the 2022 RI investigation performed by IEEG to collect representative samples across the Site. The soil laboratory analytical results were compared to NYSDEC Part 375 Unrestricted Use SCOs, the Part 375 PGW SCOs and the Part 375 RR SCOs. Results of the 27 soil samples are summarized in **Table 1** and soil analytical results with exceedances are shown on **Figures 6**. Laboratory analytical data reports are in **Appendix I**.

5.4.1 Soil Investigation

A total of 25 remedial investigation soil samples were collected from the varying depths across the Site to determine the conditions of shallow soils lying above bedrock across the Site. 5.5.2.1 NYSDEC Emerging Contaminants 1,4-Dioxane, and PFAS

Four (4) groundwater samples were analyzed for the emerging contaminants identified as 1,4-Dioxane and the NYSDEC PFAS List. DEC has released DRAFT Guidance Values for PFAS PFOA and 1,4-Dioxane. The guidance values are as follows:

New York State Groundwater Effluent Limitations (Class GA) July 2020

1,4-Dioxane (123-91-1	0.35 ug/L	B
Perfluorooctane Sulfonic Acid (PFOS) (1763-23-1)	2.7 ng/L	B

Ng/L = nanograms per liter

Several NYSDEC PFAS List compounds were detected in groundwater monitoring wells MW-4A, MW-5A, MW-7A and MW-9A as follows:

- **Perfluorooctanoic Acid (PFOA)** was detected at concentrations exceeding the Draft Guidance Value of 6.7 ng/L at 78.8 ng/L, 44.8 ng/L and 21.4 ng/L in MW-4A, MW-7A and MW-9A, respectively.
- **Perfluorooctanesulfonic Acid (PFOS)** was detected at concentrations exceeding the Draft Guidance Value of 2.7 ng/L at 4.99 ng/L, 8.2 ng/L and 8.26 ng/L in MW-4A, MW-7A and MW-9A, respectively.

1,4-Dioxane was detected at concentrations of 0.184 ug/L and 0.064 ug/L in MW-4A and MW-7A and was non-detect in MW-9. These concentrations were below the NYSDEC Draft Guidance Values. A summary of the analytical results for the groundwater monitoring wells are compared to the NYSDEC TOGS in **Table 2.**

5.6 QA/QC Field and Trip Blank Sample Results

During the RI, field blank samples were collected as equipment blanks during soil and groundwater sample collection for QA/QC purposes in accordance with the QAPP. Additionally, trip blanks accompanied the VOC sample collection containers/coolers and were submitted with samples for transported to the Alpha for VOC analysis. A summary of the results for these QA/QC samples is provided in **Tables 1** through **3**. The deionized water used for decontamination of field equipment was obtained in bulk from Alpha and was a type IV deionized water which indicates it was produced through a cartridge filter, carbon filter, dual ion exchange units, UV Sterilizer, and final filtered at 0.2 µS/cm, the source of which was not from distillation. This water was analyzed as sample Field Blank DI-Water and no VOCs/Tics, SVOCs/TICs, PCBs, organochlorine pesticides, metals, PFAS compounds or 1,4-dioxane were detected. The deionized water used for the collection of field blanks was provided by Alpha with sample collection containers.

5.7 Evaluation of Results

The nature and extent of contamination at the Site, based on field observation and the analytical results of the various media samples collected as part of this RI, are discuss in the following sections.

The main contaminant of concern identified at the Site, in soil, are the heavy metals, lead, nickel, zinc, mercury and chromium, two PCB compounds, and two Pesticide compounds. In groundwater, VOCs and SVOCs were found primarily located downgradient of the UST in groundwater monitoring wells MW-7A, MW-9A and WP-11. In soil vapor, PCE and a number of VOC compounds were identified. Two (2) locations were found in exceedance of the NYSDOH minimum guidelines for PCE, however, the indoor air level for that location indicated low levels of PCE in indoor air and yielded a no further action response when compared to the NYSDOH Decision Matrices. The remaining petroleum related VOC compounds identified in soil vapor do not have NYSDOH air guidelines.

5.7.1 Chemicals of Concern Distribution

In summary, in soil, the heavy metal Chromium was found above Protection of Groundwater Standards in two locations, in SB-1 and SB-2, located in the northwestern portion of the Site on the second floor on top of shallow bedrock. Mercury was found above PGW standards in SB-3 and SB-4 on the second floor above shallow bedrock, and in SB-8B, SB-10A and SB-11, in units 48 McLean Avenue and 50 McLean Avenue located on the first floor. Mercury was also found in SB-18 within the ramp in the southeastern portion of the site, downgradient from the UST. Nickel was found exceeding the Restricted Residential SCO in SB-1, and above the Unrestricted SCO in SB-10B, SB-11 and SB-12. Lead and Zinc were found above their respective UUSCOs in SB-1. Lead was also found exceeding the UUSCO in SB-18. Two Pesticides were found exceeding their respective UUSCOs in SB-12. Two PCBs were found exceeding their respective UUSCOs in SB-8B.

It should also be noted that compounds on the NYSDEC PFAS list were detected in groundwater samples collected from across the Site, but not in the onsite soils, indicating the presence of these compounds is the cause of an offsite source. The dissolved metals identified in groundwater above the AWQS were magnesium, manganese, iron and sodium which are likely naturally occurring compounds.

6 QUALATATIVE HUMAN EXPOSURE ASSESSMENT

A qualitative exposure assessment for human health has been prepared to evaluate exposure to the identified contaminants of concern in accordance with the May 2010 NYSDEC Final DER-10 Technical Guidance for Site Investigation and Remediation. The following sections provide the details for both assessments.

6.1 Human Health Exposure Assessment

Human health exposure risk was evaluated for both the current and the proposed future use conditions associated with the Site. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

6.1.1 Current Site Condition

Currently, the Site is unoccupied and is developed with a single two-story building with a partial sub-grade boiler room located in the northeast section of the building. The portion of the building that fronts along McLean Avenue is composed of six (6) commercial units: 46 McLean Avenue (formerly occupied by JS Garage); 48 McLean Avenue (formerly occupied by Simax Transmissions); 50 McLean Avenue (formerly occupied by Claudio Transmissions); 60 Mclean Avenue Suite 1 (formerly occupied by Victor and Rene); 60 McLean Avenue Suite 2 (formerly occupied by VP Tires); and 70 McLean Avenue (formerly occupied by Pizza Barn). The second story of the building that extends into northern segment of the Site is accessible via ramp or stairwell from McLean Avenue and is addressed 60 McLean Avenue Suite 200. This area was predominantly inactive storage space for former occupant inventory, including dolls and stuffed toys, frames, leather goods, office supplies, antiquated printing machines or vacant space. A small portion of the 2nd floor was, until recently, still operable and utilized for heating sealing to customize jerseys, sweatshirts and performance wear. The building encompasses the entire Lot and has a footprint approximately 37,897 square feet (SF).

6.1.2 Proposed Future Use Conditions

The proposed development project consists of a commercial storage facility that will incorporate the existing façade of the current building. The proposed development will be approximately 88,830 gross-square-foot (GSF) and 86.5 feet in height (3 stories) and upon completion will include 11 parking spaces, storage units and office space. The building will be constructed slab on grade, with final excavation depth ranging from 4-feet bgs beneath the building slab, and 6-feet bgs in areas of footings. The water table is expected at between

approximately 13 and 19-feet bgs and is not expected to impact the development. Development is slated to take 27 months to complete. Plans for the Site redevelopment are provided in **Appendix A.**

6.1.3 Exposure Assessment

This exposure assessment discusses potential migration routes by which chemicals in the environment may be able to reach human receptors. This discussion is based on current and hypothetical future conditions at the Site and investigation area. A complete exposure pathway for the COCs identified for the Site includes an evaluation of the following:

- The contaminant source(s) and location of the release(s) to the environment, and the contaminated medium at the potential points of exposure;
- Description of the contaminant release and transport mechanisms to the exposed population;
- Identification of all points of potential human contact with the contaminated medium;
- Possible exposure route (i.e., ingestion, inhalation, dermal absorption); and
- Description of the receptor populations the who may be exposed to contaminants.

An exposure pathway is considered complete when these five elements are documented. A potential exposure pathway exists if one or more of the five elements is unknown. An exposure pathway can be eliminated from further evaluation when one of the five elements has not existed in the past, does not exist in the present and can reasonably be expected to never exist in the future. The following section identifies potential points of human contact with contaminated media and exposure pathways identified for the Site.

6.1.3.1 Soil Exposure

As described above in Section 5.4, soil samples collected during the RI indicated the presence of Metals, PCBs, and pesticides at concentrations above the NYSDEC Part 375 PGW and UU SCOs. An individual could be exposed to these contaminants through direct contact with Site soil during ground intrusive work at the Site. An individual could be exposed to these contaminants through direct contact with Site soil during ground intrusive work at the Site. Direct contact without the use of proper personal protective equipment (PPE) and personal hygiene measures could lead to dermal contact and incidental ingestion of these compounds. Since the Site is currently completely covered by the Site buildings and/or concrete and asphalt, potential contact with Site soil is restricted to slab demolition, remedial and construction contract workers at the Site performing ground intrusive activities. The general public is not currently exposed to direct contact with Site soil, which is currently covered by the historic industrial buildings. A community air monitoring program

(CAMP) will be implemented during intrusive activities to minimize the potential for off-site exposures from soil/dust leaving the Site.

The planned future use of the Site will likely be commercial use. The forthcoming RAWP will discuss plans to limit future exposure and will include the use of an engineered cover system (e.g., building slab, pavement and certified clean soil cover) to minimize the potential for exposure by direct contact with contaminated soil and a Site Management Plan and other institutional and engineering controls as appropriate.

Environmental Media and Exposure Route	Human Exposure Assessment
Direct contact with subsurface Soils	• Remedial or construction workers can come into contact with soil if they perform ground intrusive work at the Site. • During remediation or construction, workers, trespassers, passersby, and utility workers could come into contact with contaminated soil contained in dust through inhalation, incidental ingestion and dermal contact.

6.1.3.2 Groundwater Exposure

Groundwater is not used for drinking or irrigation (the area is connected to the public water supply), therefore, there is no direct contact with or ingestion of groundwater by the general public (on-Site or off-Site). Individuals who perform groundwater sampling or remedial activities may come into contact with contaminated groundwater if proper PPE and personal hygiene measures are not used, which could lead to dermal contact and the potential for incidental ingestion of these compounds.

The planned future use of the Site is commercial use. The future building will be serviced by the public water supply. Based on this and the proposed remedy, the potential for public exposure by direct contact with contaminated groundwater will be reduced or eliminated.

Environmental Media and Exposure Route	Human Exposure Assessment
Ingestion of groundwater	• Contaminated groundwater is not used for drinking water, as the Site is connected to the public water supply.
Direct contract with groundwater (and incidental ingestion)	• Based on the depth to water, contact with contaminated groundwater during construction is low. Remedial workers performing groundwater sampling activities could come into contact through dermal contact and incidental ingestion.

6.1.3.3 Soil Vapor Exposure

As described above in Section 5.3, soil vapor samples collected during the RI indicated the presence of cVOCs, specifically PCE, in soil vapor at the Site. The future Site use will be mixed commercial/residential use, and vapor mitigation will be evaluated in the forthcoming RAWP. Since the Site buildings are not currently occupied and will not be occupied prior to redevelopment, there is no potential for human exposure to soil vapor intrusion on the Site. The buildings will be accessed for demolition and the potential for exposure for this short-term access is low, as there will likely be infiltration of ambient air through the access points, windows, doors, and former ventilation fans in the exterior walls.

The future building will occupy the entire Site, where contaminants were detected in soil vapor samples, results in the potential for soil vapor intrusion. However. the proposed remedy will be designed to mitigate this potential exposure impact.

Environmental Media and Exposure Route	Human Exposure Assessment
Inhalation of air (exposures related to soil vapor intrusion)	• Remedial workers, trespassers, and construction workers may be exposed to contaminated soil vapor inside the building or within open excavations.

6.2 Conceptual Site Model

A Conceptual Site Model (CSM) was developed based on RI findings and previous investigations to produce a simplified framework for understanding of the distribution of contaminants in the various media and the risk posed to potential receptors via potential migration pathways, and potentially complete exposure pathways. Potential sources of contamination have been identified and include historic fill and off-site groundwater sources.

This RIR has included updating of the initial CSM to consider the relationship between contaminant sources and contaminants of concern, environmental media and receptors through consideration of migration and exposure pathways. This conceptual model is based on current Site conditions and surrounding land use as well as the planned future Site and the surrounding land uses. The remedy selected for the Site will address the complete exposure pathways in a RAWP.

Bedrock was encountered at varying shallow depths beneath the majority of the Site, except for the southeastern portion of the Site where bedrock was not encountered to a depth of fifteen (15) feet below grade, and in soil borings SB-6 and SB-7 located in 46 McLean Avenue (the western portion of the Site on the first floor).

Soils situated above bedrock predominantly consisted of fine to medium grained sands. Low levels of chlorinated VOCs in soil vapor, heavy metals in soil and groundwater, and BTEX compounds are present in soil and groundwater media at the Site.

In addition, the emerging contaminants PFAS and PFOA were detected exceeding their respective NYSDEC Draft Guidance Values in groundwater in four (4) groundwater wells sampled (MW-4A, MW-5A, MW-7A and MW-9A). However, neither compound was detected in any soil sample that was analyzed for same.

The site is currently vacant with limited access to authorized workers and the project development team. Under future conditions, human receptors may include construction and remediation workers, authorized guests visiting the site, and the public adjacent to the site, as well as potential future building occupants. An illustrative CSM, **Plate 1**, is a pictorial depiction of environmental hazards associated with contaminated soil, groundwater and soil vapor.

7 FINDINGS AND CONCLUSIONS

The data collected during the RI and described herein is intended to determine, to the extent possible, the nature and extent of contamination in soil, soil vapor, and groundwater and will be used to evaluate appropriate remedial action alternatives for the Site. The conclusions are based on data collected during the initial investigations performed in May 2022 by IEEC. The findings and conclusions are as follows:

- **Field Observations**: The general Site topography was observed to slope from northwest to southeast across the Site and is likely influenced by bedrock. The current on-site building was constructed on top of bedrock, which can be observed in outcroppings directly north and west of the Site.

- **Stratigraphy**: Due to the abundance of bedrock refusals encountered in soil borings, soil recovery was limited, however where soils were present, they generally consisted of fine to medium grained sand, and in the southeastern portion of the property where bedrock was not encountered to a depth of 15 feet, generally consisted of silty sand.
- **Hydrogeology**: Synoptic water-level measurements recorded at onsite wells ranged from 1.29 fbg in MW-5A, located in the central portion of the site (within 50 McLean Avenue), to 10.57 fbg in MW-9A, located on the southeastern side of the Site (70 McLean Avenue). The difference in depth to water elevation is the result of shallow bedrock located across the majority of the site.
- **Soil Vapor Contamination**: In soil vapor, PCE and a number of VOC compounds were identified. One location was found in exceedance of the NYSDOH minimum guidelines for PCE however the indoor air level for that location indicated low levels of PCE in indoor air and yielded a no further action response when compared to the NYSDOH Decision Matrices. The VOC compounds identified in soil vapor do not have NYSDOH air guidelines.
- **Soil:** The heavy metals, lead, nickel, zinc, mercury and chromium, two PCB compounds, and two Pesticide compounds were found in exceedance of Soil Cleanup Objectives. The heavy metal Chromium was found above Protection of Groundwater Standards in two locations, in SB-1 and SB-2, located in the northwestern portion of the Site on the second floor on top of shallow bedrock. Mercury was found above PGW standards in SB-3 and SB-4 on the second floor above shallow bedrock, and in Sb-8B, SB-10A and Sb-11, in units 48 McLean Avenue and 50 McLean Avenue located on the first floor. Mercury was also found in SB-18 within the ramp in the southeastern portion of the site, downgradient from the UST. Nickel was found exceeding the Restricted Residential SCO in Sb-1, and above the Unrestricted SCO in SB-10B, SB-11 and SB-12. Lead and Zinc were found above their respective UUSCOs in SB-1. Lead was also found exceeding the UUSCO in SB-18. Two Pesticides were found exceeding their respective UUSCOs in SB-12. Two PCBs were found exceeding their respective UUSCOs in SB-8B.
- **Groundwater**: No non-aqueous phase liquids or DNAPL was detected in the 9 groundwater monitoring wells at the Site, however a sheen was observed in MW-4A. Volatile organic compounds (VOCs), primarily BTEX compounds and their breakdown compounds were detected at concentrations above the TOGS Class GA SGVs in four (4) groundwater samples collected from MW-4A, MW-7A MW-9A and WP-11. Three of those monitoring wells (MW-7A, MW-9A and WP-

11) are located downgradient from the UST located within the access ramp that leads the second floor of the building. It should be noted that wells located further downgradient, in the sidewalk (WP-12, WP-13 and WP-14) did not contain VOC exceedances therefore an off-site source can likely be ruled out. Other contaminates including some PAHs and Metals were marginally detected above the referenced standard and are typical of regional groundwater conditions in urban areas. Pesticides, PCBs and 1,4-dioxane were not detected in any of the groundwater samples collected during this RI.

- **Perfluorooctanoic Acid (PFOA)** was detected at concentrations exceeding the Draft Guidance Value of 0.0067 ug/L at 0.0788 µg/L, 0.0448 µg/L and 0.0214 ug/L in MW-4A, MW-7A and MW-9A, respectively.
- **Perfluorooctanesulfonic Acid (PFOS)** was detected at concentrations exceeding the Draft Guidance Value of 0.0027 ug/L at 0.00499 µg/L, 0.0082 µg/L and 0.00826 ug/L in MW-4A, MW-7A and MW-9A, respectively.

  Perfluorinated Alkyl Acids (PFAS), specifically PFOA and PFOS, were detected at 0.0214 ug/L to 0.0788 ug/L in three (3) samples collected from the groundwater monitoring wells, which exceeded the NYSDEC standard of 0.0067 µg/L (or 67 pg/L). However, due to there being no exceedances in the soil samples collected, by comparison, these detections of PFOA and PFOS are not determined to be attributable to the Site. In addition, no other individual PFAS (excluding PFOA and PFOS) were detected at concentrations exceeding the NYSDEC Standard of 100 ng/L, and total concentrations of PFAS did not exceed 500 ng/L in all samples collected.

- **Source Area**: The most prevalent COCs identified during previous investigations and this RI are petroleum related VOCs and SVOCs in soil and groundwater located proximal to and hydraulically downgradient from the UST located in the entrance ramp to the second floor of the site building.

The RI determined the degree and extent of on-site contamination from potential on- or off-site sources. Sufficient analytical data was gathered during this RI to establish site-specific soil cleanup levels and develop a remedy for the Site. The remedy will be described and evaluated in a RAWP prepared in accordance with NYSDEC BCP guidelines. The remedy will address the petroleum related compounds associated with the onsite UST.

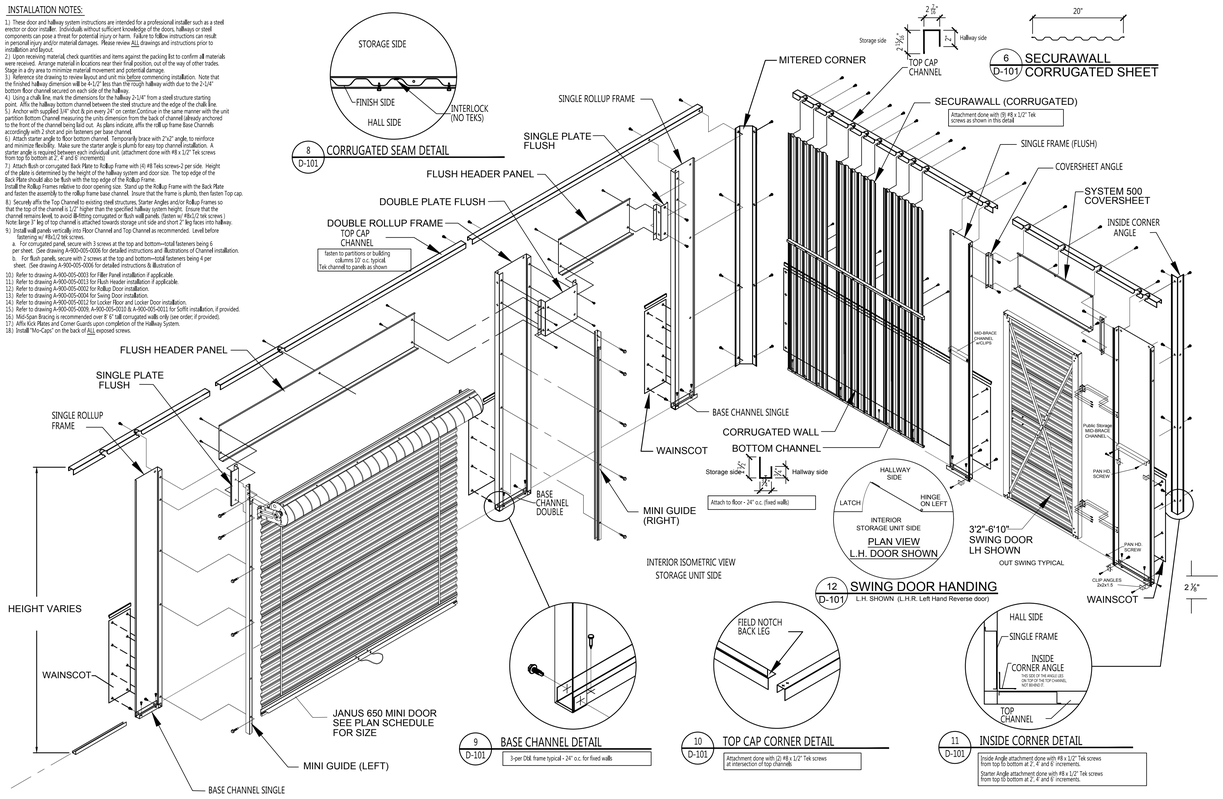
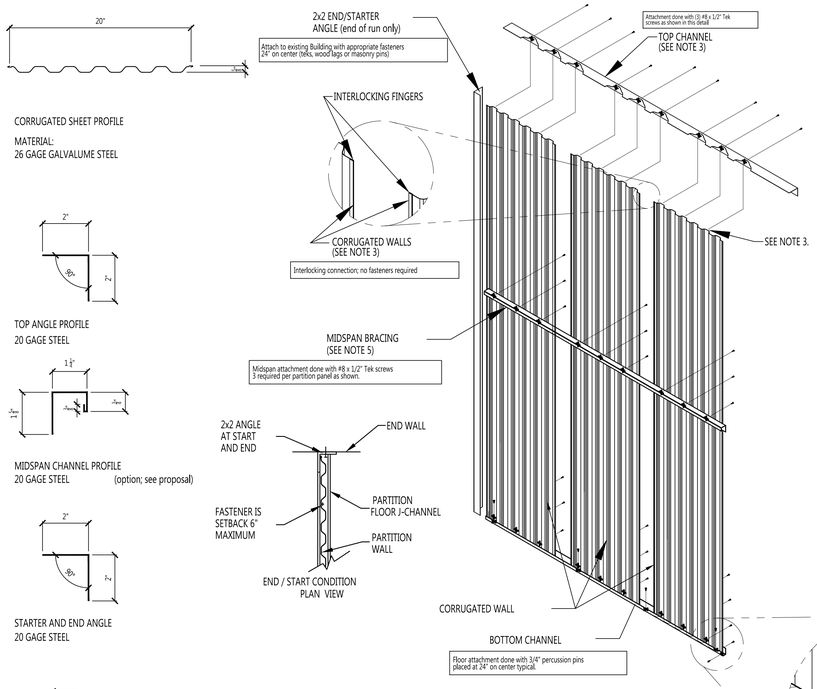
INSTALLATION NOTES:

1.) These door and hallway system instructions are intended for a professional installer such as a steel erector or door installer. Individuals without sufficient knowledge of the doors, hallways or steel components can pose a threat for potential injury or harm. Failure to follow instructions can result in personal injury and/or material damages. Please review ALL drawings and instructions prior to installation and layout.
2.) Upon receiving material, check quantities and items against the packing list to confirm all materials were received. Arrange material in locations near their final position, out of the way of other trades. Stage in a dry area to minimize material movement and potential damage.
3.) Reference site drawing to review layout and unit mix before commencing installation. Note that the finished hallway dimension will be 4-1/2" less than the rough hallway width due to the 2-1/4" bottom floor channel secured on each side of the hallway.
4.) Using a chalk line, mark the dimensions for the hallway 2-1/4" from a steel structure starting point. Affix the hallway bottom channel between the steel structure and the edge of the chalk line.
5.) Anchor with supplied 1/4" shot & pin every 24" on center.Continue in the same manner with the unit partition Bottom Channel measuring the units dimension from the back of channel already anchored to the front of the channel being laid out. As plans indicate, affix the roll up frame Base Channels accordingly with 2 shot and pin fasteners per base channel.
6.) Attach starter angle to floor bottom channel. Temporarily brace with 2"x2" angle, to reinforce and minimize flexibility. Make sure the starter angle is plumb for easy top channel installation. A starter angle is required between each individual unit. (attachment done with #8 x 1/2" Tek screws from top to bottom at 2, 4 and 6 increments)
7.) Attach Bush or corrugated Back Plate to Rollup frame with (4) #8 Teks screws-2 per side. Height of the plate is determined by the height of the hallway system and door size. The top edge of the Back Plate should also be flush with the top edge of the Rollup Frame.
Install the Rollup Frames relative to door opening size. Stand up the Rollup Frame with the Back Plate and fasten the assembly to the rollup frame base channel. Insure that the frame is plumb, then fasten Top cap.
8.) Securely affix the Top Channel to existing steel structures, Starter Angles and/or Rollup Frames so that the top of the channel is 1/2" higher than the specified hallway system height. Ensure that the channel remains level, to avoid ill-fitting corrugated or flush wall panels. (fasten w/ #8x1/2"tek screws.)
Note large 3" leg of top channel is attached towards storage unit side and short 2" leg faces into hallway.
9.) Install wall panels vertically into Floor Channel and Top Channel as recommended. Level before fastening w/ #8x1/2 tek screws.
a. For corrugated panel, secure with 3 screws at the top and bottom--total fasteners being 6 per sheet. .See drawing A-900-005-0006 for detailed instructions and illustrations of Channel installation.
b. For flush panels, secure with 2 screws at the top and bottom--total fasteners being 4 per sheet. .See drawing A-900-005-0006 for detailed instructions & illustration of
10.) Refer to drawing A-900-005-0003 for Filler Panel installation if applicable.
11.) Refer to drawing A-900-005-0013 for Flush Header installation if applicable.
12.) Refer to drawing A-900-005-0002 for Rollup Door installation.
13.) Refer to drawing A-900-005-0004 for Swing Door installation.
14.) Refer to drawing A-900-005-0012 for Locker Door and Locker Door installation.
15.) Refer to drawing A-900-005-0008, A-900-005-0010 & A-900-005-0011 for Soffit installation, if provided.
16.) Mid-Span Bracing is recommended over 8'-6" tall corrugated walls only (see order, if provided).
17.) Affix Kick Plates and Corner Guards upon completion of the Hallway System.
18.) Install "Mo-Caps" on the back of ALL exposed screws.



HALLWAY DOOR SYSTEM



NOTES:

1) FASTEN THE BOTTOM CHANNEL TO THE FLOOR 24" OC USING AIR, BUTANE OR POWDER ACTUATED FASTENERS.

2) CONNECT THE TOP ANGLE TO THE HALLWAY SYSTEM AND 2x2 MESH BRACING ANGLES WITH TEK SCREW FASTENERS.

3) INSERT THE CORRUGATED WALL PANELS INTO THE TOP ANGLE AND BOTTOM CHANNEL. SLIDE INTERLOCKING "FINGERS" OF THE CORRUGATED UNTIL SECURE AND FASTEN THE TOP OF THE CORRUGATED WALL SECTIONS TO THE TOP ANGLE'S OUTER LIP USING TEKS SCREWS (AS SHOWN IN THE REAR VIEW).

4) SECURE THE BOTTOM OF THE CORRUGATED WALL SECTIONS TO THE BOTTOM CHANNEL'S FRONT FACE USING TEKS SCREWS (AS SHOWN IN REAR VIEW).

5) SECURE THE MIDSPAN BRACING CHANNEL ACROSS THE BACK OF THE CORRUGATED WALL SECTIONS USING TEKS SCREWS (AS SHOWN IN REAR VIEW).

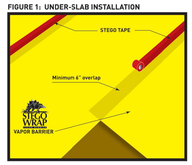
STEGO® WRAP VAPOR BARRIER/RETARDER INSTALLATION INSTRUCTIONS

IMPORTANT: Please read these installation instructions completely, prior to beginning any Stego Wrap installation. The following installation instructions are based on ASTM E1643 - Standard Practice for Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs. If project specifications call for compliance with ASTM E1643, then be sure to review the specific installation sections outlined in the standard along with the techniques referenced in these instructions.

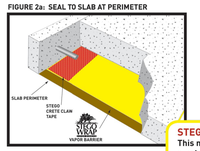
UNDER-SLAB INSTRUCTIONS:

FIGURE 1: UNDER-SLAB INSTALLATION



1. Stego Wrap can be installed over an aggregate, sand, or tamped earth base. It is not necessary to have a cushion layer or sand base, as Stego Wrap is tough enough to withstand rugged construction environments.
2. Unroll Stego Wrap over the area where the slab is to be placed. Stego Wrap should completely cover the concrete placement area. All joints/seams both lateral and butt should be overlapped a minimum of 6" and taped using Stego® Tape.
   NOTE: The area of adhesion should be free from dust, dirt, moisture, and frost to allow maximum adhesion of the pressure-sensitive tape.
3. ASTM E1643 requires sealing the perimeter of the slab. *Extend vapor retarder over footings and seal to foundation wall, grade beam, or slab at an elevation consistent with the top of the slab or terminate at impediments such as waterstops or dowels.* Consult the structural engineer of record before proceeding.

FIGURE 2a: SEAL TO SLAB AT PERIMETER

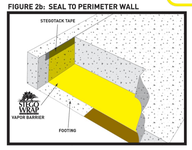


SEAL TO SLAB AT PERIMETER:*
NOTE: Clean the surface of Stego Wrap to ensure that the area of adhesion is free from dust, dirt, moisture, and frost to allow maximum adhesion of the pressure-sensitive adhesive.

a. Install Stego® Crete Claw® Tape on the entire perimeter edge of Stego Wrap.
b. Prior to the placement of concrete, ensure that the top of Stego Crete Claw Tape is free of dirt, debris, or mud to maximize the bond to the concrete.

STEGO LABOR SAVER!
This method not only complies with ASTM E1643, but it also:
• reduces labor compared to other perimeter sealing techniques.
• can be used even without an existing wall or footing, unlike alternatives.

FIGURE 2b: SEAL TO PERIMETER WALL



OR **SEAL TO PERIMETER WALL WITH STEGOTACK® TAPE:***

a. Make sure area of adhesion is free of dust, dirt, debris, moisture, and frost to allow maximum adhesion.
b. Remove release liner on one side and stick to desired surface.
c. When ready to apply Stego Wrap, remove the exposed release liner and press Stego Wrap firmly against StegoTack Tape to secure.

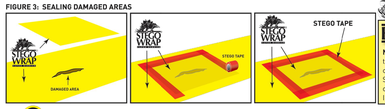
* If ASTM E1643 is specified, consult with project architect and structural engineer to determine which perimeter seal technique should be employed for the project.

Continued...
Note – legal notice on page 2.

P2 of 2

4. In the event that Stego Wrap is damaged during or after installation, repairs must be made. For holes, cut a piece of Stego Wrap to a size and shape that covers any damage by a minimum overlap of 6" in all directions. Clean all adhesion areas of dust, dirt, moisture, and frost. Tape down all edges using Stego Tape **(See Figure 3)**.

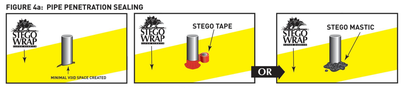
FIGURE 3: SEALING DAMAGED AREAS



BEAST
NOTE: Stego Industries recommends the use of vapor barrier-safe concrete accessories, like Beast® Screed, to help minimize the amount of penetrations in a Stego Wrap Installation.

5. **IMPORTANT: ALL PENETRATIONS MUST BE SEALED.** All pipe, ducting, rebar, wire penetrations and block outs should be sealed using Stego Wrap, Stego Tape and/or Stego Mastic **(See Figure 4a)**. If penetrations are encased in other materials, such as expansive materials like foam, unless otherwise specified, Stego Wrap should be sealed to the underlying penetration directly.

FIGURE 4a: PIPE PENETRATION SEALING



STEGO WRAP PIPE PENETRATION REPAIR DETAIL:
1: Install Stego Wrap around pipe penetrations by slitting/cutting material as needed. Try to minimize the void space created.
2: If Stego Wrap is close to pipe and void space is minimized then seal around pipe penetration with Stego Tape and/or Stego Mastic. **(See Figure 4a)**
3: If detail patch is needed to minimize void space around penetration, then cut a detail patch to a size and shape that creates a 6" overlap on all edges around the void space at the base of the pipe. Stego Pre-Cut Pipe Boots are also available to speed up the installation.
4: Cut an "X" the size of the pipe diameter in the center of the pipe boot and slide tightly over pipe.
5: Tape down all sides of the pipe boot with Stego Tape.
6: Seal around the base of the pipe using Stego Tape and/or Stego Mastic. **(See Figure 4b)**

FIGURE 4b: DETAIL PATCH FOR PIPE PENETRATION SEALING

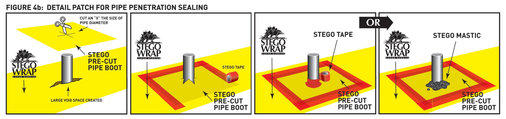


FIGURE 5: MULTIPLE PIPE PENETRATION SEALING

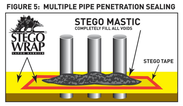

MULTIPLE PIPE PENETRATION SEALING:
Multiple pipe penetrations in close proximity and very small pipes may be sealed using Stego Wrap and Stego Mastic for ease of installation **(See Figure 5)**.

NOTE: Stego Industries, LLC's ("Stego") installation instructions are based on ASTM E1643 - *Standard Practice for Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs.* These instructions are meant to be used as a guide, and do not take into account specific job site situations. Consult local building codes and regulations along with the building owner or owner's representative before proceeding. If you have any questions regarding the above mentioned installation instructions or Stego products, please call us at 877-444-7834 for technical assistance. While Stego employees and representatives may provide technical assistance regarding the utility of a specific installation practice or Stego product, they are not authorized to make final design decisions.

DENISE "DEE" SHEPPERD

Sr. Environmental Chemist

Ms. Shepperd has over 30 years of experience in the environmental industry. Her field experience includes site assessments, investigations, sample collection, auditing field procedures, writing SOPs for the field, and training staff. Her analytical experience includes preparation and analysis for many organics, inorganics, microbiological, and physical parameters, with a broad spectrum of methods and instrumentation. She has worked in sample management, client services, and logistics, as well as laboratory operations and management, maintaining and interpreting data sets within a variety of client and vendor software systems, and has operated mobile laboratories on both commercial and government-operated sites. She has served as QA officer with several independent, as well as a number of large network laboratories, with experience in implementing, maintaining, and improving quality systems. She has audited laboratories for agencies, private industries, and legal investigations. She is familiar with the administration of accreditation programs and the operation of an effective PT program, has written many SOPs and laboratory quality manuals, and has reviewed and revised these documents to assist laboratories and agencies to improve their quality systems. Within the laboratory environment, Ms. Shepperd has been responsible for the evaluation, purchase, installation, repair, and maintenance of analytical instruments, training of analysts, development and implementation of methods, managing projects, scheduling, troubleshooting processes, and performing sample preparation and analysis for a wide variety of organic and inorganic methods.

During her work with a chemistry consulting firm, Ms. Shepperd assisted in many litigation cases, conducting research, interpreting data, writing expert reports and affidavits, and assisting in depositions and testimony. She has served in an interim capacity as a lab manager, QA officer, and analyst during her work both for a private firm, as well as, as an independent consultant. She has performed laboratory data validation both inside the lab, as a part of the laboratory or client-driven quality assurance programs, as an external third-party validator, to support a variety of clients, and for regulatory and litigation applications including both defense and prosecution. Environmental projects for which Dee has performed data validation include site assessment, liability, remediation, decommissioning and closure of chemical and petroleum facilities, real estate transactions, brownfields use, and litigation to determine source, responsibility, and allocation.

Ms. Shepperd has given numerous presentations and trainings in analytical techniques, environmental forensics, quality systems, ethics, data validation, and data defensibility both as a consultant and within the companies for which she has worked. As an investigator and compliance officer, she was instrumental in investigations into improper practices, and in assisting laboratories to recover from allegations or incidences of improper practices. She has assisted in writing, reviewing and editing project specific QAPPs and SAPs as well as other project laboratory and site-specific documents.

Project Experience:

Data Validation Experience

Ms. Shepperd continues to actively perform validation of data, including organics (GC, GCMS, HRMS, LC/MS/MS, inorganics, metals, microbiological, radiological, and specialty chemical analyses), pursuant to the U.S. EPA Contract Laboratory

Program Statement of Work (CLP), U.S. EPA Regional Guidelines, DOD/DOE QSM, ASTM, Standard Methods, U.S. EPA SW-846, and other methodologies. She has a thorough understanding of the U.S. EPA Functional Guidelines for data validation, and various regional and other agency guidelines, and has, herself, performed many of the methods for which she performs data review. She has prepared EDDs in many agency and client-specific formats as well as data usability summary reports for many state, agency, and client-specific programs, including NYSDEC. Her current work includes implementation of Earthsoft's Data Quality Module (DQM) for use in automated assessment of electronic deliverables environmental data, both in-house for ddms' Environmental Chemistry Services (ECS) team, as well as assisting client companies.

Analytical Laboratory Experience
As a laboratory analyst and group leader, performed preparation and analyses for many parameters, including organics, metals, wet chem, and microbiology, set-up and validated instrumentation and methods, validated methods, and trained analysts. Ms. Shepperd has implemented and validated new methods for analysis and adapted existing methods to address new analytes and matrices.

Served as interim analyst, group leader, QA officer, and manager in laboratories, to fill gaps left by loss or reassignment of personnel, re-organization, or re-location of laboratory operations. Served as temporary analyst to develop methods for specific site compounds of concern and assist laboratories to implement and operate methods for analysis of site samples.

As a QA officer for several laboratories, was responsible for all aspects of the quality system, directing document control, staff training, PT programs, internal auditing, field operations, chemical, radiological, toxicity testing, and microbiological laboratories, and attaining, and maintaining accreditation with national and state programs, including NY, as well as private industries.

Laboratory Investigations
Investigated allegations of testing laboratory fraud impacting a national multi-facility power generation utility. Determined the improper practices being performed and assisted the company to prevail in legal proceedings and recover costs and lost capital.

Investigated allegations of fraud brought against independent and large nationally known environmental laboratories. Determined the nature and extent of the issues. Worked with laboratories to implement and improve elements of the quality systems to prevent further problems and to recover and remedy the impact to clients to the extent possible.

Site Investigations
Performed site investigation, followed with designing and implementing sampling and analysis plans, retrieving historical documents and data, review and interpretation, and drafting of affidavits, expert reports, and deposition questions for companies sued for remediation costs, to determine culpability or allocation of costs. Example companies include small private firms and family-run companies, such as an oil recovery operation, auto salvage, restaurants, gas stations, grain supplier, dairy operations, private homes, contractors, truck maintenance operation, commercial uniform and linens service, and large national corporations such as chemical producers, warehouse and distribution, textile manufacture, and oil companies, and municipal operations, such as airports, wastewater treatment

plants, and landfills.

Performed annual audits of laboratories to satisfy requirements for client company approved laboratory list. Performed laboratory audits in support of the quality and defensibility of data for litigation cases involving organic and inorganic contaminants. Performed laboratory audits to determine usability for projects-specific analyses and matrix types.

EXECUTIVE SUMMARY

Validation of the organic analyses data prepared by Alpha Analytical Westborough, Massachusetts for five groundwater samples from the 60 McLean Avenue Site has been completed by de maximis Data Management Solutions, Inc. (ddms). Stage 4 validation was performed on the sample data. The data were reported by the laboratory under SDG No. L2123311. The following samples were reported:

WP-11	WP-12	WP-13	WP-14
WP-15			

Based on professional judgment, results for non-detects should be considered to be "U," not detected, at the analyte-specific reporting limit (RL) to represent the lowest concentration at which the laboratory can detect and accurately quantitate sample concentrations based on the documentation provided. The laboratory reported results as not detected at the method detection limit (MDL). The MDL is an estimated value based on a statistical determination, not a quantitative measurement supported by the data provided and should not be used to report non-detect results. It should also be noted by the data user that the laboratory reported non-detect results, RLs, and MDLS to three significant figures. The level of accuracy portrayed at these concentrations and estimated concentrations is not supported by the data and should not be used.

Below is the Data Usability Summary Report (DUSR) associated with these samples.

Data Usability Summary Report	
1. Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA CLP data deliverables?	Yes
2. Have all holding times been met?	Yes
3. Do all the QC data; blanks, instrument tunings, calibration standards, calibration verifications, surrogate recoveries, spike recoveries, replicate analyses, laboratory controls and sample data fall within the protocol required limits and specifications?	No – See following sections
4. Have all of the data been generated using established and agreed upon analytical protocols?	Yes
5. Does an evaluation of the raw data confirm the results provided in the data summary sheet and the quality control verification forms?	Yes
6. Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?	Yes
7. Have any quality control (QC) exceedances been specifically noted in the DUSR and have the corresponding QC summary sheet from the data package been attached to the DUSR?	Yes – See Attachments A, B, and C

Based on the validation effort, the following data qualifiers were applied:

VOCs

- Results for dichlorodifluoromethane and chloromethane in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (UJ) due to a decrease in sensitivity from the initial calibration.

- Results for tetrachloroethene in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (J+) due to an increase in sensitivity from the initial calibration.

- Results for methyl tert butyl ether, 1,2,3-trichloropropane, dichlorodifluoromethane, 2-hexanone, 2,2-dichloropropane, naphthalene, 1,2,3-trichlorobenzene, 1,4-dioxane, and trans-1,4-dichloro-2-butene in WP-11 were qualified as estimated (J, UJ) due to laboratory control sample (LCS)/LCS duplicate (LCSD) excursions.

SVOCs
8270D Fullscan

- Results for 2-nitroaniline, 2,6-dinitrotoluene, butyl benzyl phthalate, and di-n-octyl phthalate in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (UJ) based on high percent differences (%Ds) between the initial calibration (IC) and the IC verification (ICV) standards.

- Results for all target compounds in WP-13 and WP-15 were qualified as estimated (J-, UJ) based on low recoveries for two or more surrogates in each of the acid and base/neutral extractables fractions.

- Results for benzyl alcohol in WP-11, WP-12, and WP-14 were qualified as estimated (UJ) based on low recovery for one or both of the associated surrogate compounds

- Results for 3,3'-dichlorobenzidine and 4-chloroaniline in WP-11, WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (UJ) based on low recoveries in the LCS and LCSD.

8270D SIM

- Results for hexachloroethane, naphthalene, hexachlorobutadiene, acenaphthylene, 2-methylnaphthalene, 2-chloronaphthalene, and pyrene in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (J, UJ) based on high variability between the ICV and the IC.

- Results for benzo(ghi)perylene and indeno(1,2,3-cd)pyrene in WP-13 were qualified as not detected (U) at the reporting limit, based on presence of these compounds in the laboratory method blank at similar concentrations.

- Results for all target compounds in WP-13 and WP-15 were qualified as estimated (J-, UJ) based on low recoveries for two or more surrogates in the base/neutral extractables fraction.

All other results were determined to be valid as reported by the laboratory.

This report should be considered part of the data package for all future distributions of the data.

INTRODUCTION

Analyses for the requested parameters were performed by the laboratory according to the following analytical methods:

Volatile Organic Compounds (VOCs)	SW846 Method 8260C
Semivolatile Organic Compounds (SVOCs)	SW846 Method 8270D SW846 Method 8270DSIM

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used to denote specific information regarding the analytical results.

ddms' validation was performed in conformance with the USEPA "National Functional Guidelines (NFG) for Organic Data Review" (2020), ddms' Standard Operating Procedures (SOPs) for the methods followed, the requirements of the analytical methods followed, and the specifications of the project-specific Quality Assurance Project Plan (QAPP). Professional judgment was applied as necessary and appropriate.

The data validation process is intended to evaluate data on a technical basis rather than a contract compliance basis for chemical analyses conducted under the CLP. This requires that the data package be presented in accordance with the CLP requirements, so that sufficient supporting documentation is available to facilitate the validation effort. It is assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate quality review prior to submission for validation.

During the validation process, laboratory data are verified against all available supporting documentation. Based on the findings of the evaluation, qualifier codes may be added by the data validator. Validated results are, therefore, either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Final validated results are annotated with the following codes as defined by the NFG:

U The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

NJ The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

UJ The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

All data users should note two facts. First, the "R" qualifier means that the laboratory-reported value is unusable. In other words, due to significant quality control problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Rejected values should not appear on data tables because they cannot be relied upon, even as a last resort. Second, no concentration is guaranteed to be accurate even if all associated quality control is acceptable. Strict quality control conformance serves only to increase confidence in reported results; any analytical result will always contain some error.

The data user is also cautioned that the validation effort is based on the raw data printouts as provided by the laboratory. Software manipulation cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

I. Holding Times, Preservation and Sample Integrity

Copies of the applicable chain of custody (COC) records were included in the data package, documenting a sample collection date of May 5, 2021. The samples were also received at the laboratory on May 5, 2021

The temperature of the cooler upon receipt at the laboratory (4.3°C) was acceptable (QC <6°C). Appropriate sample preservation was noted on the COC records, sample receipt checklists, and VOC run logs. All samples were prepared and analyzed within method holding times.

II. Documentation

The following documentation issues were observed during the validation effort:

- The report narrative states that LCS/LCSD recoveries for benzidine were unacceptably low; however, benzidine was not a reported analyte for these samples.

The remainder of this report discusses the review effort for each of the parameters. The tables below document the quality control (QC) elements reviewed for each analysis parameter. Where a quality indicator was deemed acceptable after thorough review, no further discussion is included in this report. Detailed findings are included for each quality element that impacted the usability of the reported results. Additional information or explanation is included as needed, to provide support for decisions made, based on the validator's best professional judgment.

Where a result was qualified J+ or J- and J, the J qualifier takes precedence. Where a result was qualified biased high and low for differing data quality excursions, the final qualifier is J with an indeterminate bias.

All of the IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable except for acetone (0.042), acrylonitrile (0.047), and 1,4-dioxane (0.001). A review of other laboratory quality control data supports the laboratory's ability to detect and accurately quantify the compounds. No data were qualified on this basis.

An initial calibration verification (ICV) standard was analyzed after the IC; all percent differences (%Ds) were acceptable in the ICV standard.

Data for two continuing calibration standards were reported. All %Ds were acceptable except as summarized below. Where the excursion represented an increase in sensitivity and the analyte was not detected, no data required qualification. Data were qualified as defined in the table below.

A. Calibration

Two initial calibrations were provided in support of the sample results, one performed on 7/12/20 on instrument SV106 and another performed on 3/30/21 on instrument SV124. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after the IC; all percent differences (%Ds) were acceptable (≤20%) in the ICV standard, with the exceptions detailed below:

ICV Date	Compound	%D	Samples Affected	Qualifier Applied
7/13/2020 @ 4:27 am SV106	2-Nitroaniline	27.5	WP-14 WP-15 WP-12 WP-13	UJ
	2,6-Dinitrotoluene	21.5		
	Butyl benzyl phthalate	27.9		
	Di-n-octyl phthalate	21.9		

Results for 2-nitroaniline, 2,6-dinitrotoluene, butyl benzyl phthalate, and di-n-octyl phthalate in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (UJ) based on high %Ds in the ICV.

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%) with the following exception:

CC Date	Compound	%D	Samples Affected	Qualifier Applied
5/11/2021 @ 14:13 SV124	bis(2-Chloroisopropyl) ether	+33.5	WP-11	None

The high %D for bis(2-chloroisopropyl) ether represents an increase in sensitivity from the IC and this compound was not detected in WP-11; therefore, no action was necessary.

B. Surrogates

Six surrogate compounds (2-fluorophenol [2FP], phenol-d_5 [PHL], nitrobenzene-d_5 [NBZ], fluorobiphenyl [FBP], 2,4,6-tribromophenol [TBP], and terphenyl-d_{14} [TPHd14]), were added before extraction to all QC and field samples. Recoveries for the surrogates were acceptable (70-130%) with the exceptions detailed below:

Sample	2FP	PHL	NBZ	FBP	TBP	$TPHd_{14}$	Qualifier Applied
WP-11	a	61	a	a	a	a	J-, UJ
WP-12	59	52	a	a	67	a	
WP-13	39	40	59	58	60	a	
WP-14	55	55	a	a	56	a	
WP-15	49	46	a	66	59	a	

Results for all target compounds in WP-13 and WP-15 were qualified as estimated (J-, UJ) based on low recoveries for two or more surrogates in each of the acid and base/neutral extractables fractions.

Only phenol-d_5 and 2-fluorophenol have bearing on the single acid-extractable target compound (benzyl alcohol) reported in the target list for these samples; therefore, based on professional judgement, recoveries for TBP did not impact sample results.

Results for benzyl alcohol in WP-11, WP-12, and WP-14 were qualified as estimated (UJ) based on low recovery for one or both of the associated surrogate compounds, phenol-d_5 and 2-fluorophenol.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

One LCS/LCSD pair was prepared and analyzed with the extraction batch. Recoveries for all spiked compounds assessed (70-130% R) and agreement between paired results (<20 RPD) were acceptable with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch 1497011-2/3					
3,3'-Dichlorobenzidine	56	56	a	MW-11 MW-12 MW-13 MW-14 MW-15	UJ
bis(2-chloroisopropyl) ether	a	131	a		None
4-Chloroaniline	60	55	a		UJ

Results for 3,3'-dichlorobenzidine and 4-chloroaniline in MW-11, MW-12, MW-13, MW-14, and MW-15 were qualified as estimated (UJ) based on low recoveries in the LCS and LCSD.

There were no detections of bis(2-chloroisopropyl) ether in the field samples; therefore, no action was necessary for this compound.

A. Calibration

Two initial calibrations were provided in support of the samples results, one performed on 2/24/21 and the other on 5/6/21, both on instrument SV119. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after the IC; all percent differences (%Ds) were acceptable (≤20%) in the ICV standard, with the exceptions detailed below:

ICV Date	Compound	%D	Samples Affected	Qualifier Applied
2/24/21 @ 05:28 pm SV119	Hexachloroethane	23.0	WP-12 WP-13 WP-14 WP-15	J, UJ
	Naphthalene	25.3		
	Hexachlorobutadiene	21.6		
	Acenaphthylene	25.0		
	2-Methylnaphthalene	27.2		
	2-Chloronaphthalene	26.0		
	Pyrene	21.8		

Results for hexachloroethane, naphthalene, hexachlorobutadiene, acenaphthylene, 2-methylnaphthalene, 2-chloronaphthalene, and pyrene in WP-12, WP-13, WP-14, and WP-15 were qualified as estimated (J, UJ) based on high variability between the ICV and the IC.

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%).

B. Blanks

One method blank was prepared with the single analytical batch that included all of the site samples. The following compounds were detected in the method blank.

ICV Date	Compound	%D	Samples Affected	Qualifier Applied
WG1497014-1	Benzo(b)fluoranthene	0.02 µg/L	WP-13	U
	Benzo(ghi)perylene	0.02 µg/L		
	Indeno(1,2,3-cd)pyrene	0.01 µg/L		

Results for benzo(ghi)perylene and indeno(1,2,3-cd)pyrene in WP-13 were qualified as not detected, at the reporting limit based on presence of these compounds in the laboratory method blank at similar concentrations. Benzo(b)fluoranthene was not detected in this sample.

C. Surrogates

Six surrogate compounds (2-fluorophenol [2FP], phenol-d_5 [PHL], nitrobenzene-d_5 [NBZ], fluorobiphenyl [FBP], 2,4,6-tribromophenol [TBP], and terphenyl-d_{14} [TPHd14]) were added before extraction to all QC and field samples. Of these, only the three

base/neutral extractable surrogate compounds (NBZ, FBP, and TPHd14) have bearing on the reported target compounds. Recoveries for these surrogates were acceptable (70-130%) with the exceptions detailed below:

Sample	2FP	PHL	NBZ	FBP	TBP	$TPHd_{14}$	Qualifier Applied
WP-13	NA	NA	53	58	NA	a	J-, UJ
WP-15	NA	NA	62	62	NA	a	

Results for all target compounds in WP-13 and WP-15 were qualified as estimated (J-, UJ) based on low recoveries for two surrogates in the base/neutral extractables fraction.

EXECUTIVE SUMMARY

Validation of the organic and inorganic analyses data prepared by Alpha Analytical Westborough, Massachusetts for 24 soil samples, two field blank (FB) samples, and two trip blank (TB) samples from the 60 McLean Avenue Site has been completed by de maximis Data Management Solutions, Inc. (ddms). Stage 4 validation was performed on the samples. The data were reported by the laboratory under SDG No. L2223093. The following samples were reported:

SB-7 (0-2)	SB-7 (7-9)	SB-6 (0-2)	SB-6 (7-9)
SB-9 (0-4)	SB-8b (0-3)	SB-12 (0-4)	SB-10a (0-3)
SB-10b (0-3)	SB-16 (0-4)	SB-17 (2-4)	SB-17 (0-2)
SB-19 (0-2)	SB-19 (7-9)	SB-18 (0-2)	SB-18 (7-9)
SB-11 (0-4)	SB-DUP-2	SB-1 (0-2)	SB-2 (0-2)
FIELD BLANK-1	FIELD BLANK-2	TRIP BLANK 1	SB-3 (0-2)
SB-4 (0-2)	SB-5 (0-2)	TRIP BLANK 2	

Sample SB-DUP-1 (Included in L2223458. See documentation section) was collected and submitted as a field duplicate of field sample SB-19 (7-9), included with this data package. Both samples of the field duplicate pair SB-DUP-2 and SB-1 (0-2) were submitted together with this SDG.

Based on professional judgment, results for non-detects should be considered to be “U,” not detected, at the analyte-specific reporting limit (RL) to represent the lowest concentration at which the laboratory can detect and accurately quantitate sample concentrations based on the documentation provided. The laboratory reported results as not detected at the method detection limit (MDL). The MDL is an estimated value based on a statistical determination, not a quantitative measurement supported by the data provided and should not be used to report non-detect results. It should also be noted by the data user that the laboratory reported non-detect results, RLs, and MDLS to three significant figures. The level of accuracy portrayed at these concentrations and estimated concentrations is not supported by the data and should not be used.

Below is the Data Usability Summary Report (DUSR) associated with these samples.

Data Usability Summary Report	
1. Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA CLP data deliverables?	Yes
2. Have all holding times been met?	Yes

Data Usability Summary Report

4. Have all of the data been generated using established and agreed upon analytical protocols?	Yes
5. Does an evaluation of the raw data confirm the results provided in the data summary sheet and the quality control verification forms?	Yes
6. Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?	Yes
7. Have any quality control (QC) exceedances been specifically noted in the DUSR and have the corresponding QC summary sheet from the data package been attached to the DUSR?	Yes See Attachments A through J

Based on the validation effort, the following data qualifiers were applied:

<u>VOCs</u>

- Results for acetone and 2-butanone in FIELD BLANK-1, FIELD BLANK-2, TRIP BLANK 1, and TRIP BLANK 2 were qualified as estimated (UJ) due to high variability from the IC to the second source standard.

Results of sample analyses are reported by the laboratory as either qualified or unoneualified; various qualifier codes are used to denote specific information regarding the analytical results.

ddms' validation was performed in conformance with the USEPA "National Functional Guidelines (NFG) for Organic Data Review" (2020), the USEPA "National Functional Guidelines for Inorganic Data Review" (2004), ddms' Standard Operating Procedures (SOPs) for the methods followed, the requirements of the analytical methods followed, and the specifications of the project-specific Quality Assurance Project Plan (QAPP). Professional judgment was applied as necessary and appropriate.

The data validation process is intended to evaluate data on a technical basis rather than a contract compliance basis for chemical analyses conducted under the CLP. This requires that the data package be presented in accordance with the CLP requirements, so that sufficient supporting documentation is available to facilitate the validation effort. It is assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate quality review prior to submission for validation.

During the validation process, laboratory data are verified against all available supporting documentation. Based on the findings of the evaluation, qualifier codes may be added by the data validator. Validated results are, therefore, either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Final validated results are annotated with the following codes as defined by the NFG:

U The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

NJ The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.

UJ The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

All data users should note two facts. First, the "R" qualifier means that the laboratory-reported value is unusable. In other words, due to significant quality control problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Rejected values should not appear on data tables because they cannot be relied upon, even as a last resort. Second, no concentration is guaranteed to be accurate even if all associated quality control is acceptable. Strict quality control conformance serves only to increase confidence in reported results; any analytical result will always contain some error.

The data user is also cautioned that the validation effort is based on the raw data printouts as provided by the laboratory. Software manipulation cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

I. Holding Times, Preservation and Sample Integrity

Copies of the applicable chain of custody (COC) records were included in the data package, documenting sample collection dates of May 2 and 3, 2022. The samples were received at the laboratory on May 3, 2022.

The temperatures of the coolers upon receipt at the laboratory (3.4°C to 4.7°C) were acceptable (QC <6°C). Sample SB-19 (0-2) was received in appropriate containers (vials) for the Volatile Organics by EPA Method 5035/8260 Low-Level analysis; however, the initial analysis failed with low internal standards and the second Low-Level vial was disposed of due to laboratory error. With the client's authorization, a sample aliquot was taken from an unpreserved container (jar) and preserved appropriately. All results for SB-19 (0-2) were qualified estimated (J, UJ) on this basis. All other samples were prepared and analyzed within method holding times.

The total solids analysis was performed 2 days after the 7-day holding time for SB-10A (0-3), SB-11 (0-4), and SB-1 (0-2). Results for total solids in SB-10A (0-3), SB-11 (0-4), and SB-1 (0-2) were qualified as estimated (J). The user is cautioned that total solids is used in all dry weight calculation adjustments and affects may have bearing on all associated analysis for those samples.

II. Documentation

The following documentation issues were observed during the validation effort:

- Sample SB-DUP-1 was included on the COC for this data set but was missing from the cooler. It was included in the cooler with SDG L2223458 and was also included on the COC for that SDG.

- Dates and times of collection recorded on the COC records did not match the dates and times of collection listed on the sample containers for SB-18 (0-2), SB-18 (7-9), SB-3 (0-2), and SB-4 (0-2). The client requested that the COC recorded dates and times of collection be used for all of these samples.

- PFAS analyses were not requested on the COC records for SB-DUP-2, FIELD BLANK-1, or SB-5 (0-2), but sample containers for this analysis parameter were received. The PFAS analyses of these samples were performed at the client's request.

- Raw data for a method blank, LCS, and LCSD from PCBs extraction batch WG1638462-1 were included in the data package. This extraction batch is not associated with any of the site samples; therefore, the data were not reviewed as a part of the validation effort.

- Raw data for the 1.0 ng/mL standard of the PFAS initial calibration run on April 27, 2022, on instrument LCMS01 were not included in the data package. Instead, two sets of raw data for the 0.50 ng/mL standard were provided. On request, the

laboratory provided the raw data for the 1.0 ng/mL standard, which were reviewed and verified by the validator. At the discretion of the data user, the laboratory should be requested to revise the data package to include this documentation so that complete and accurate documentation is available for future reference.

- The internal standard used to calculate concentrations of PFTrDA in the calibration standards and laboratory QC samples could not be determined from the information in the data package as received. On request, the laboratory explained that the area used for this calculation is the average of the areas of internal standards M2PFTeDA and MPFDOA. This was confirmed by the validator. At the discretion of the data user, the laboratory should be requested to provide this information in the data package so that complete information is available for future reference.

The remainder of this report discusses the review effort for each of the parameters. The tables below document the quality control (QC) elements reviewed for each analysis parameter. Where a quality indicator was deemed acceptable after thorough review, no further discussion is included in this report. Detailed findings are included for each quality element that impacted the usability of the reported results. Additional information or explanation is included as needed, to provide support for decisions made, based on the validator's best professional judgment.

Where a result was qualified J+ or J- and J, the J qualifier takes precedence. Where a result was qualified biased high and low for differing data quality excursions, the final qualifier is J with an indeterminate bias.

A. Calibration

Data for two ICs were provided, one instrument VOA127 and one on instrument VOA129 supporting the soil sample analyses and one IC on GONZO supporting the aqueous sample analyses. All of the IC relative response factors (RRFs) and percent relative

standard deviations (%RSDs) were acceptable except for 1,4-dioxane (0.003 on instruments VOA127 and VOA 129 and 0.002 on GONZO). A review of other laboratory quality control data supports the laboratory's ability to detect and accurately quantify the compounds. No data were qualified on this basis.

Initial calibration verification (ICV) standards were analyzed after each of the ICs; all percent differences (%Ds) were acceptable in the associated ICV standard with the exception of acetone (24.6%D) and 2-butanone (20.2%D) in the GONZO ICV. Results for acetone and 2-butanone in FIELD BLANK-1, FIELD BLANK-2, TRIP BLANK 1, and TRIP BLANK 2 were qualified as estimated (UJ) due to high variability from the IC to the second source standard.

Four CC standards were analyzed in support of the samples in this data set. All RRFs an %Ds were acceptable with the exceptions summarized below.

Parameter	%D	Samples Affected	Qualifier Applied

Vinyl chloride	+26.7	FIELD BLANK-1 FIELD BLANK-2 TRIP BLANK 1 TRIP BLANK 2	none
Acetone	-21.9		UJ
2-Butanone	-25.0		UJ

The excursions in Batch 1637092 CC all represent an increase in sensitivity. Since none of the compounds were detected in any of the samples in that analytical batch, no data required qualification on this basis. Results were qualified as detailed in the table above.

B. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

Four LCS/LCSD pairs were prepared and analyzed with the field samples. Recoveries for all spiked compounds assessed were acceptable, with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch1637092-3/4					
n-Butylbenzene	136	a	a	SB-2 (0-2) SB-3 (0-2) SB-4 (0-2) SB-5 (0-2)	none

Batch 1638761-3/4					
Acetone	a	64	a	FIELD BLANK-1 FIELD BLANK-2 TRIP BLANK-1 TRIP BLANK-2	UJ

Results for vinyl chloride in SB-19 (0-2) and acetone in FIELD BLANK-1, FIELD BLANK-2, TRIP BLANK-1, and TRIP BLANK-2 were qualified as estimated (UJ) based on low recoveries in the LCSD.

There were no detections of n-butylbenzene in the field samples; therefore, no action was necessary for this compound.

C. Matrix Spike (MS)/MS Duplicate (MSD)

Samples SB-4 (0-2) and SB-5 (0-2) were prepared as MS/MSD pairs. Recoveries and precision between paired recoveries were acceptable (70-130% R and <50% RPD), with the following exceptions:

1,3,5-Trimethylbenzene	a	57	a		
1,2,4-Trimethylbenzene	a	56	a		
1,4-Dioxane	a	a	40		

Results for 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 2-butanone, and n-butylbenzene in SB-4 (0-2) and for all compounds *except acetone and toluene* in SB-5 (0-2) were qualified as estimated (UJ) due to unacceptable MS, MSD, and/or RPD results.

D. Field Duplicates

Based on documentation from the client, SB-DUP-1 (SDG L2223458) was submitted as a field duplicate of SB-19 (7-9).

Compound	SB-19 (7-9)	SB-19 (7-9) RL	SB-DUP-1	SB-DUP-1 RL

SB-DUP-2 was submitted as a field duplicate of SB-1 (0-.2).

Compound	SB-1 (0.2)	SB-1 (0.2) RL	SB-DUP-2	SB-DUP-2RL
1,2,4-Trimethylbenzene	1.0 J	2.7	0.51 J	2.9
1,3,5-Trimethylbenzene	0.32 J	2.7	ND	2.9

Results for 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 2-butanone, acetone, and o-xylene in all samples except SB-1 (0-2) and SB-DUP-2 were qualified as estimated (J, UJ) on this basis.

A. Calibration

Three initial calibrations were provided in support of the samples results, one performed on 1/22/22 on instrument GCMS5, one on 4/20-21/22 on instrument DAKOTA, and one on 5/10-11/22 on instrument SV112. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after each IC; all percent differences (%Ds) were acceptable (≤20%) in the ICV standards, for the target compounds reported for the associated samples.

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%) with the following exceptions:

CC Date	Compound	%D	Samples Affected	Qualifier Applied
5/7/2022 @ 11:12 am DAKOTA	2,4-Dinitrophenol	+36.0	QC samples only	none
5/8/22 @ 9:29 DAKOTA	2,4-Dinitrophenol	+49.9	FIELD BLANK-1 FIELD BLANK-2	none
	4,6-Dinitro-o-creson	+32.4		
5/11/22 @ 11:43 pm SV112	2,4-Dinitrophenol	-20.6	No target compounds for the associated samples	none
	Pentachlorophenol	-25.5		
	Chrysene	-21.1		
	bis(2-Ethylhexyl)phthalate	-24.8		

The high %Ds for 2,4-dinitrophenol and 4,6-dinitro-o-cresol represent increases in sensitivity and these compounds were not detected in FIELDBLANK-1 and FIELDBLANK-2; therefore, no action was necessary. The compounds exhibiting excursions in the 5/11/22 CC listed above were only reported in FIELDBLANK-1 and FIELDBLANK-2, none of the soil samples; therefore, no action was warranted for these excursions.

B. Blanks

Laboratory blanks were prepared and analyzed for each of the extraction batches. Two field blanks were submitted with the field samples. None of the target compounds reported in the field samples were detected in any of the laboratory method blanks.

2-Methylnaphthalene was detected in FIELD BLANK-1 at a concentration of 0.04 J µg/L. This compound was reported only in the two field blanks; therefore, no action was necessary with respect to the field samples.

C. Surrogates

Six surrogate compounds were added before extraction to all QC and field samples. Recoveries for the surrogates were acceptable (70-130%) with the exceptions detailed below:

E. Matrix Spike (MS)/MS Duplicate (MSD)

Two MS/MSD pairs were prepared and analyzed with the field samples. Recoveries for all spiked compounds assessed (validation limits 70-130% R) and agreement between paired results (<50 RPD) was acceptable, with the following exceptions.

F. Field Duplicates

Sample SB-DUP-1 (included in SDG L2223458) was submitted as a field duplicate of SB-19 (7-9) included in this SDG. Sample SB-DUP-2 was submitted as a field duplicate for SB-1 (0-2), both reported with this dataset. None of the reported target analytes were detected in either sample of either of the field duplicate pairs.

V. SVOCs (Method 8270D SIM)

Only the 2 FBs were run for SIM – PAH and dioxane

A. Calibration

One initial calibration, performed on 2/9/22 on instrument SB128, was provided in support of the acid- and base/neutral- extractable semivolatile compound results reported for the two field blanks. Another IC was performed on 5/4/22 on instrument PSH22 for 1,4-dioxane only. Calibration was established using average response factors, linear regression, and isotope dilution (1,4-dioxane only). All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after each of the ICs and all percent differences (%Ds) in these ICVs were acceptable (≤20%).

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%), with one exception:

CC Date	Compound	%D	Samples Affected	Qualifier Applied
5/8/22 @ 07:19 SV128	bis(2-Ethylhexyl)phthalate	+21.9	FIELD BLANK-1 FIELD BLANK-2	J, UJ

The high %D represents an increase in sensitivity for bis(2-ethylhexyl)phthalate, indicating the potential for high bias. This compound was not detected in either of the field blanks; therefore, no action was necessary.

B. Blanks

Two method blanks were prepared with the two field blank samples, one with the analytical batch extracted for acid- and base/neutral extractable compounds and a second for the extraction for 1,4-dioxane, only. The following compounds were detected in the associated method blank:

Blank	Compound	%D	Samples Affected	Qualifier Applied
WG1635276-1	Fluoranthene	0.03 J µg/L	FIELD BLANK-1 FIELD BLANK-2	none
	Naphthalene	0.31 J µg/L		
	Benzo(a)anthracene	0.02 J µg/L		
	Benzo(b)fluoranthene	0.01 J µg/L		
	Phenanthrene	0.02 J µg/L		
	2-Methylnaphthalene	0.07 J µg/L		U

The result for 2-methylnaphthalene in FIELD BLANK-1 was qualified as not detected (U) at the reporting limit, based on the presence of this compound in the associated method blank at a higher concentration. None of the other analytes detected in the method blank were detected in either field blank.

C. Surrogates

Six surrogate compounds (2-fluorophenol [2FP], phenol-d_5 [PHL], nitrobenzene-d_5 [NBZ], fluorobiphenyl [FBP], 2,4,6-tribromophenol [TBP], and terphenyl-d_{14} [TPHd14]) were added before extraction to all QC and field samples. Of these, the three base/neutral extractable surrogate compounds (NBZ, FBP, and TPHd14), the acid-extractable compound 2,4,6-tribromophenol (TBP), and 1,4-dioxane-d_8 (DXd8, applicable to the 1,4-dioxane analyses only) have bearing on the selected target compounds. Recoveries for these surrogates were acceptable (70-130% for acid- and base/neutral extractable surrogates and 30-130% for 1,4-dioxane-d_8) with the exceptions detailed below:

Sample	DXd8	2FP	PHL	NBZ	FBP	TBP	TPHd14	Qualifier Applied
FIELD BLANK-1	a	a	a	a	a	137	a	none
FIELD BLANK-2	a	61	a	a	a	a	a	

Only pentachlorophenol was associated with 2,4,6-tribromophenol and this compound was not detected in FIELD BLANK-1 and 2-fluorophenol is not associated with any of the target compounds reported; therefore, no action was necessary.

D. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

One LCS/LCSD pair was prepared and analyzed with each extraction batch. Recoveries for all spiked compounds assessed (70-130% R) and agreement between paired results (<20 RPD) were acceptable, with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch 1635276-2/3					
Acenaphthylene	69	64	a	FIELD BLANK-1 FIELD BLANK-2	J-, UJ
Pentachlorophenol	a	62	a		

Results for acenaphthylene and pentachlorophenol in FIELD BLANK-1 and FIELD BLANK-2 were qualified as estimated (UJ) based on low recoveries in the LCS and/or LCSD.

A. Calibration

Three initial calibrations were associated with the sample analyses; these were run on September 13, 2021, on instrument PEST10, on January 31, 2022, on instrument PEST18, and on April 22, 2022, on instrument PEST20. Calibration factors (CFs) and %RSDs were correctly calculated and reported. All %RSDs were all less than the maximum acceptance limit of 20%. ICV standards were analyzed after each IC. The %Ds for all target analyte peaks on both columns in the ICV standards were less than the maximum acceptance limit of 20%.

Six CC standards were analyzed with the samples. CFs and %Ds for all analyte 1260 peaks on both columns were correctly calculated and reported. The %D values were less than the maximum acceptance limit of 20%, with the following exceptions:

CC Standard	Analyte	Column	%D	Associated Samples	Qualifier Applied
5/9/22 @ 10:27 PEST10	Tetrachloro-m-xylene	Column 1	21.2	FIELD BLANK-1 FIELD BLANK-2	none
5/9/22 @ 14:17 PEST18	Decachlorobiphenyl	Column 2	23.4	SB-7 (7-9) SB-6 (0-2) SB-9 (0-4) SB-12 (0-4) SB-10a (0-3) SB-10b (0-3) SB-16 (0-4) SB-17 (2-4) SB-17 (0-2) SB-18 (7-9) SB-3 (0-2) SB-DUP-2 SB-1 (0-2) SB-2 (0-2)	none
5/11/22 @ 08:07 PEST20	4,4'-DDD	Column 2	20.1	SB-8b (0-3)	none
5/17/22 @ 08:55 PEST10	Decachlorobiphenyl	Column 2	34.3	SB-5 (0-2)	none

Decachlorobiphenyl and tetrachloro-m-xylene are the surrogate compounds used for these analyses. Since surrogate compound concentrations are calculated using responses from the IC rather than the CC standard, no action was taken based on the high %D for these analytes in the CC standards run on May 9 and 17, 2022, on instrument PEST10 and on May 9, 2022, on instrument PEST18.

For the May 11, 2022, CC standard, the %D for 4,4'-DDD was acceptable on Column 2, and this compound was not detected in the associated site sample. Therefore, based on professional judgment, no action was necessary on this basis.

B. Surrogate Recovery

Tetrachloro-m-xylene (TCX) and decachlorobiphenyl (DCB) were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1	TCX %R Column 2	DCB %R Column 1	DCB %R Column 2	Qualifier

a = acceptable

Results for all target analytes in FIELD BLANK-1, FIELD BLANK-2, SB-7 (0-2), SB-6 (0-2), SB-6 (7-9), SB-12 (0-4), SB-10a (0-3), SB-17 (2-4), SB-17 (0-2), SB-19 (0-2), SB-19 (7-9), SB-18 (7-9), SB-11 (0-4), SB-1 (0-2), and SB-2 (0-2) were qualified as estimated (UJ) due to low surrogate recoveries.

For SB-10b (0-3), three of four surrogate recoveries were acceptable. However, positive results for 4,4'-DDT and cis-chlordane were reported from the primary column, and the recovery of TCX on this column was low. Results for 4,4'-DDT and cis-chlordane in SB-10b (0-3) were qualified as estimated with potential low bias (J-) due to a low surrogate recovery on the column from which these results were reported. Based on professional judgment, since no other target analytes were detected in the sample, and both surrogate recoveries on the secondary column were acceptable, no additional action was taken.

For SB-DUP-2, SB-3 (0-2), and SB-4 (0-2), three of four surrogate recoveries were acceptable, and no target analytes were detected in the samples. Therefore, based on professional judgment, no action was taken.

Sample SB-8b (0-3) was analyzed at a 20-fold dilution; according to the case narrative, the dilution was performed due to the matrix of the sample. As a result, concentrations of the surrogate compounds were diluted out, and no action was taken.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

Four LCS/LCSD pairs were prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Results for all target analytes in FIELD BLANK-1 and FIELD BLANK-2, for delta-BHC, lindane, alpha-BHC, beta-BHC, aldrin, endrin, dieldrin, 4,4'-DDE, 4,4'-DDD, 4,4'-DDT, endosulfan I, endosulfan II, endosulfan sulfate, and cis-chlordane in SB-7 (0-2), SB-7 (7-9), SB-6 (0-2), SB-6 (7-9), SB-9 (0-4), SB-8b (0-3), SB-12 (0-4), SB-10a (0-3), SB-10b (0-3), SB-16 (0-4), SB-17 (2-4), SB-17 (0-2), SB-19 (0-2), SB-19 (7-9), SB-18 (7-9), SB-11 (0-4), SB-DUP-2, SB-1 (0-2), SB-2 (0-2), and SB-3 (0-2), for heptachlor, endosulfan I, endosulfan sulfate, and cis-chlordane in SB-18 (0-2) and SB-4 (0-2), and for cis-chlordane in SB-5 (0-2) were qualified as estimated (J-, UJ) due to low LCS and/or LCSD recoveries.

Results for all target analytes except delta-BHC and endosulfan sulfate in FIELD BLANK-1 and FIELD BLANK-2 were qualified as estimated (UJ) due to LCS/LCSD imprecision.

D. Compound Quantitation

Target analytes concentrations and RLs were correctly calculated and reported. For all detected analytes except cis-chlordane in SB-6 (0-2), the laboratory reported the higher of the two column measurements. Agreement between the two measurements was acceptable (QC <40 RPD), except for cis-chlordane in SB-6 (0-2) (98 RPD). The result for cis-chlordane in SB-6 (0-2) was qualified as estimated (J) due to lack of agreement between the two column measurements.

A. Calibration

Five initial calibrations were associated with the sample analyses; these were run on November 23, 2021, on instrument PEST13, on March 1, 2022, on instrument PEST21, on April 11, 2022, on instrument PEST23, on April 19-20, 2022, on instrument PEST2, and on April 25, 2022, on instrument PEST7. Calibration factors (CFs) and %RSDs were correctly calculated and reported. All %RSDs were all less than the maximum acceptance limit of 20%. ICV standards for Aroclor 1248 and the Aroclor 1016/1260, Aroclor 1242/1268, Aroclor 1232/1262, and Aroclor 1221/1254 mixtures were analyzed after each IC, and %Ds for all selected Aroclor peaks on both columns in the ICV standards were less than the maximum acceptance limit of 20%, with the following exceptions:

ICV Standard	Aroclor	Column	%D	Associated Samples	Qualifier Applied
4/11/22 @ 22:42 PEST23	Aroclor 1260-3	CLP-Pesticide	21.1	Lab QC Samples Only	none
	Aroclor 1260-4		20.3		
	Aroclor 1260-4	CLP-Pesticide II	20.3

	Aroclor 1260-4		20.3		
	Aroclor 1260-4	CLP-Pesticide II	20.2		

The result for Aroclor 1260 in SB-10b (0-3) was qualified as estimated (UJ) due to high %Ds for selected Aroclor 1260 peaks on both columns in the associated ICV standard.

For the April 19, 2022, Aroclor 1232 and Aroclor 1248 ICV standards, %Ds were high on only one column, and the affected Aroclor was not detected in the associated samples. Therefore, based on professional judgment, no action was taken on this basis.

Eleven CC standards were analyzed with the samples. CFs and %Ds for all selected Aroclor 1016 and 1260 peaks on both columns were correctly calculated and reported. The %D values were less than the maximum acceptance limit of 20%, with the following exceptions:

CC Standard	Aroclor	Column	%D	Associated Samples	Qualifier Applied
5/10/22 @ 07:18 PEST21	Decachlorobiphenyl	CLP-Pesticide II	22.3	SB-8b (0-3)	none

	Aroclor 1260-3		21.1		
	Decachlorobiphenyl	CLP-Pesticide II	23.3		
5/19/22 @ 06:42 PEST7	Tetrachloro-m-xylene	CLP-Pesticide II	23.6	SB-10b (0-3)	none
	Aroclor 1016-3		21.2		
	Aroclor 1260-3		20.4		

CC Standard	Aroclor	Column	%D	Associated Samples	Qualifier Applied
	Aroclor 1260-4		21.9		
	Aroclor 1260-5		20.5		

Decachlorobiphenyl and tetrachloro-m-xylene are the surrogate compounds used for these analyses. Since surrogate compound concentrations are calculated using responses from the IC rather than the CC standard, no action was taken based on the high %D for these analytes in the CC standards run on May 10, 2022, on instrument PEST21, and on May 19, 2022, on instrument PEST7.

Since no site sample analyses were associated with the CC standard run on instrument PEST23, no action was necessary based on the high %Ds.

For all other high Aroclor peak %Ds listed above, the %Ds were acceptable on the other column and the Aroclor was not detected in the associated site samples. Therefore, based on professional judgment, no action was necessary on this basis.

B. Blanks

Seven method blanks were prepared and analyzed with the site samples. Two field blanks (FIELD BLANK-1 and FIELD BLANK-2) were submitted with the field samples. The following analytes were detected in these blanks:

Blank ID	Analyte	Concentration (µg/kg)	Associated Samples	Qualifier
Method Blank WG1635783-1	Aroclor 1260	14.4 J	SB-18 (0-2) SB-4 (0-2)	U
Method Blank WG1636093-1	Aroclor 1260	14.6 J	SB-8b (0-3)	none

Results for Aroclor 1260 in SB-18 (0-2) and SB-4 (0-2) were qualified as not detected (U) at the RL due to associated method blank contamination. The concentration of Aroclor 1260 in SB-8b (0-3) was significantly greater than the method blank concentration; therefore, no action was warranted.

C. Surrogate Recovery

Tetrachloro-m-xylene (TCX) and decachlorobiphenyl (DCB) were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1*	TCX %R Column 2**	DCB %R Column 1	DCB %R Column 2	Qualifier

Results for all target Aroclors in SB-7 (7-9), SB-6 (7-9), SB-8b (0-3), SB-12 (0-4), SB-10b (0-3), SB-16 (0-4), SB-17 (2-4), SB-17 (0-2), SB-19 (0-2), SB-18 (7-9), SB-DUP-2, SB-2 (0-2), SB-3 (0-2), SB-4 (0-2), and SB-5 (0-2) were qualified as estimated (J-, UJ) due to low surrogate recoveries on both columns. Based on professional judgment, since TCX recoveries on both columns and DCB recoveries on the CLP-Pesticide column in SB-6 (0-2) and SB-18 (0-2) were acceptable and no target Aroclors were detected in these samples, no action was necessary due to the low DCB recoveries on the CLP-Pesticide II column.

D. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

Seven LCS/LCSD pairs were prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch WG1636668-2/3					
Aroclor 1016	61 / a	49 / 58	a / 23	SB-5 (0-2)	UJ
Aroclor 1260	55 / 48	63 / 56	a / a		
Batch WG1639652-2/3					
Aroclor 1016	68 / 65	a / 58	a / a	SB-10b (0-3)	UJ
Aroclor 1260	55 / 48	63 / 56	a / a		

a = acceptable

Results for all target Aroclors in SB-5 (0-2) and SB-10b (0-3) were qualified as estimated (UJ) due to low LCS/LCSD recoveries and, for SB-5 (0-2), due to LCS/LCSD imprecision. Total PCBs results were also qualified as estimated (UJ).

E. Matrix Spike (MS)/MS Duplicate (MSD)

Samples SB-4 (0-2) and SB-5 (0-2) were prepared as MS/MSD pairs. Recoveries and precision between paired recoveries were acceptable (70-130% R and <50% RPD), with the following exceptions:

Compound	MS %R	MSD %R	RPD	Samples Affected	Qualifier Applied
Parent Sample SB-5 (0-2)					
Aroclor 1016	48 / 42	55 / 44	a / a	SB-5 (0-2)	UJ
Aroclor 1260	44 / 40	46 / 42	a / a		

a = acceptable

Results for all target Aroclors in SB-5 (0-2) were qualified as estimated (UJ) due to low MS/MSD recoveries. Total PCBs results were also qualified as estimated (UJ).

F. Compound Identification and Quantitation

With one exception, target Aroclors were correctly identified where present in the samples based on the presence peaks at appropriate retention times relative to the calibration standards and representative chromatographic patterns. Aroclor 1254 was identified in SB-8b (0-3). While peaks are present at the appropriate retention times on both columns for this Aroclor, the peak pattern representative of this Aroclor is not visible in either sample chromatogram. The result for Aroclor 1254 in SB-8b (0-3) was qualified as presumed present (N) on this basis.

Aroclors 1254 and 1260 were reported in SB-8b (0-3). These two Aroclors share peaks, and the chromatographic patterns overlap. Based on professional judgment, results for Aroclor 1254 and 1260 in SB-8b (0-3) were qualified as estimated (J) due to the potential for contribution from the other Aroclor.

The results for selenium in SB-9 (0-4) and SB-17 (2-4) were qualified as not detected (U) at the reporting limit due to method blank contamination. All other blank contamination (method and continuing calibration) was detected at less that actionable contamination levels and did not warrant qualification.

B. Interference Check Samples (ICSA/ICSAB)

The interference check samples associated with these samples were acceptable for all analytes with exceptions in the ICSA standard. All ICSAB recoveries were within acceptance criteria (85-115%).

ICSA Standard	Analyte	Concentration (mg/L)	Associated Samples	Qualifier

The ICSA standards in both of the analytical runs were detected above the MDL for barium (MDL – 0.00174 mg/L) and lead (MDL – 0.00268 mg/L). Each of these instances exhibited an elevated response with potential for high bias in the associated samples. The barium concentrations in the associated samples were detected above actionable levels and did not warrant qualification. Results for lead in all samples except SB-8b (0-3), SB-16 (0-4), SB-18 (0-2), and SB-11 (0-4) were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. The results for cadmium in SB-3 (0-2), SB-4 (0-2), and SB-5 (0-2) were qualified as estimated and biased high (J+), because the associated ICSA standard was above the MDLs (0.000980 mg/L). The results for cadmium in all samples except SB-3 (0-2), SB-4 (0-2), and SB-5 (0-2) and selenium in SB-3 (0-2), SB-4 (0-2), and SB-5 (0-2) were qualified as estimated and biased low (UJ) because the absolute value of the negative concentrations reported in the associated ICSA standard were above the MDL (0.000980 mg/L and 0.00258 mg/L, respectively). The results of less than ten times the RL for nickel in SB-7 (0-2), SB-8b (0-3), SB-16 (0-4), SB-17 (2-4), SB-17 (0-2), SB-19 (0-2), SB-19 (7-9), SB-18 (0-2), and SB-18 (7-9) were qualified as estimated and biased low (J-) because the absolute value of the negative concentrations reported in the associated ICSA standard were above the MDL (0.00242 mg/L). All other associated samples were either not detected and associated with detected interferences or the samples were above the actionable levels and associated with negative interferences.

C. Laboratory and Field Duplicates

A laboratory duplicate was performed on SB-7 (0-2) in compliance with the analytical method, and all analyte concentrations were within the acceptance limit (<50%). SB-DUP-1 was collected as a field duplicate of SB-3 (0-2). This duplicate pair is split between two SDGs: L2223093 and L2223458. It is identified in both validation reports, and only the samples included in SDG L2223093 will be discussed below. SB-DUP-2 was collected as a field duplicate of SB-5 (0-2). The field duplicate pairs were within acceptance limits with exceptions noted in the table below:

Results for cadmium in all samples except SB-3 (0-2) were qualified as estimated (J, UJ), due to lack of confirmation in the field duplicate pair. Results for barium, chromium, manganese, and nickel in all samples were qualified as estimated (J) due to elevated RPD between the field duplicate pairs.

D. Matrix Spike, Matrix Spike Duplicate and Post Digestion Spike (PDS)

Three MS/MSD/PDS samples were prepared and analyzed with the site samples. Percent recoveries (%Rs) and relative percent differences (RPDs) were acceptable (validation QC 75-125%R, RPDs ≤20 RPD), with the exceptions noted below.

NA - Not Analyzed

Although spike recoveries fell outside of acceptance limits for manganese in SB-5 (0-2) MS, the parent sample concentrations were more than four times the spike concentrations added. There is no expectation of acceptable recoveries at these spike levels, and qualification was not warranted. The results for beryllium, cadmium, chromium, lead, nickel and zinc in SB-7 (0-2) were qualified as estimated (J-, UJ), biased low due to low MS and PDS recoveries. The results for all ICP metals in SB-4 (0-2) were qualified as estimated (J-, UJ), biased low, due to low MS/MSD and PDS recoveries. The results for arsenic, barium, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, and zinc in SB-5 (0-2) were qualified as estimated (J-, UJ), biased low, due to low MS and/or MSD and PDS recoveries. The user is cautioned that matrix effects seen in the above qualified samples, may also be applicable to other site samples.

E. Serial Dilution

Serial dilutions were performed on SB-7 (0-2), SB-4 (0-2), and SB-5 (0-2) at 5-fold dilutions. Most percent differences (%Ds) were acceptable (<20%), with exceptions noted in the table below:

Analyte	SD %D
QC Sample: SB-7 (0-2)	
Barium	62
Chromium	34
Copper	32
Manganese	27
QC Sample: SB-4 (0-2)	
Barium	34
Chromium	36
Copper	29
Manganese	37
QC Sample: SB-5 (0-2)	
Barium	33
Chromium	34
Manganese	35

The results for all barium, chromium and manganese in all samples were qualified as estimated (J), due to elevated percent differences in the serial dilution sample. The results for copper in all samples except to SB-5 (0-2) were qualified as estimated (J) due to elevated percent difference in the serial dilution sample.

F. Analyte Quantitation

Sample SB-1 (0-2) was analyzed at a 5-fold dilution to bring the sample concentrations within the instrument calibration range. All analytes were reported from the dilution. All sample concentrations, RLs, and MDLs were appropriately raised to reflect the dilution factors applied.

A. Calibrations – ICs, ICVs, CCVs

Two initial calibrations were established on 5/24/22 on instrument ICPMSQ. Calibration criteria (R^2 >0.995 for the linear regression) were met for all reported analytes. The calculated percent differences for all non-zero standards were within the 30% limit except for cadmium (-37.5%D), silver (-34.5%D), and beryllium (-40.5) in the lowest calibration standard. Results for cadmium, beryllium and silver in both samples were less than the calibration supported RL of 0.001 mg/L and qualified as estimated (UJ), due to elevated %D in the low-level calibration standard.

A low-level continuing calibration verification (LLCCV) was analyzed at the beginning of the analytical sequence. All recoveries were within the 65-135% limit with exceptions following:

LLCCV ID	Analyte	%D	Associated Samples	Qualifier
LLCCV 5/24/22 @ 08:46:33	Chromium	63	FIELD BLANK-1 FIELD BLANK-2	UJ
	Copper	138		none

Results for chromium in FIELD BLANK-1 and FIELD BLANK-2 were qualified as estimated (UJ) due to the low recovery demonstrated in the LLCCV standard. Results may be biased low, or the limit of detection may be higher than reported. The elevated copper recovery in the LLCCV standard did not warrant qualification in associated non-detected samples.

B. Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. A single preparation blank was prepared and analyzed with the samples. Two field blanks (FIELD BLANK-1 and FIELD BLANK-2) were submitted with the soil samples in this SDG. The

FIELD BLANK-2 was detected for barium (0.00095 mg/L or 0.158 mg/kg). All ICP soil results were compared against the ICP-MS FB detection for barium. Results were greater than the blank action level and did not warrant qualification.

C. Interference Check Samples (ICSA/ICSAB)

The interference check samples associated with these samples were acceptable for all analytes with one exception in the ICSA standard. All ICSAB recoveries were within acceptance criteria (85-115%).

ICSA Standard	Analyte	Concentration (ug/L)	Associated Samples	Qualifier
ICSA1 (R1567696-3 5/24/22 @ 08:51)	Barium	0.250	FIELD BLANK-1	none
			FIELD BLANK-2	J+

The ICSA was detected above the MDL for barium (MDL – 0.000173 mg/L), exhibiting an elevated response with potential for high bias in low level samples. The result for barium in FIELD BLANK-2 was qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. FIELD BLANK-1 was not detected and did not warrant qualification.

D. Analyte Quantitation

Both samples were analyzed, as prepared, without dilution. Sample concentrations, RLs, and MDLs were verified through the raw data and preparatory logs provided in the data package.

A. Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. Two soil preparation blanks and one water preparation blank for mercury were prepared and

analyzed with the samples. Two field blanks (FIELD BLANK-1 and FIELD BLANK-2) were prepared and analyzed in this SDG. Blanks were not detected with exceptions:

Blank ID	Analyte	Concentration (mg/kg)	Associated Samples	Qualifier
CCB (R1565896-4 5/18/22 @ 20:30:09)	Mercury	-0.101	SB-7 (0-2) SB-7 (7-9) SB-6 (0-2) SB-6 (7-9) SB-9 (0-4) SB-12 (0-4) SB-10b (0-3) SB-16 (0-4) SB-17 (2-4) SB-17 (0-2) SB-19 (0-2) SB-8b (0-3) SB-10a (0-3)	J-, UJ

The continuing calibration blanks bracketing the above documented samples demonstrated negative concentrations, indicating a potential for low bias in the associated samples. Results for mercury in the above samples qualified as estimated (J-, UJ) due to negative blank associations.

B. Field Duplicates

SB-DUP-1 was collected as a field duplicate of SB-3 (0-2) This duplicate pair is split between two SDGs: L2223093 and L2223458. It is identified in both validation reports, but only the samples included in SDG L2223093 will be discussed below. SB-DUP-2 was collected as a field duplicate of SB-5 (0-2). Both samples were not detected, and relative percent differences were not calculated. The field duplicate pair was within acceptance limits with exceptions noted in the table below:

Analyte	Original conc. (mg/kg)	Duplicate conc. (mg/kg)	RPD	Associated Sample

N/C – Not Calculated

Results for mercury in SB-7 (0-2), SB-7 (7-9), SB-6 (0-2), SB-6 (7-9), SB-9 (0-4), SB-8b (0-3), SB-12 (0-4), SB-10a (0-3), SB-10b (0-3), SB-16 (0-4), SB-17 (2-4), SB-17 (0-2), SB-19 (0-2), SB-19 (7-9), SB-DUP-1, SB-18 (0-2), SB-18 (7-9), SB-11 (0-4), SB-1 (0-2), SB-2 (0-2), SB-3 (0-2), and SB-4 (0-2) were qualified as estimated (J, UJ) due to lack of confirmation in the field duplicate pair.

C. Matrix Spike, Matrix Spike Duplicate and Post Digestion Spike (PDS)

Three MS/MSD/PDS samples were prepared and analyzed with the site samples [SB-4 (0-2), SB-5 (0-2) and SB-7 (0-2)]. Percent recoveries (%Rs) and relative percent differences (RPDs) were acceptable (validation QC 80-120%R, RPDs ≤20 RPD), with the exceptions noted below.

Analyte	MS %R	MSD %R	MS/MSD RPD
QC Sample: SB-4 (0-2)			
Mercury	a	143	a
QC Sample: SB-5 (0-2)			
Mercury	130	123	a

The result for mercury in SB-4 (0-2) was qualified as estimated and biased high (J+), based on the elevated MSD recovery. SB-5 (0-2) was not detected for mercury and did not warrant qualification. The user is cautioned that matrix effects seen in the above qualified samples, may also be applicable to other site samples.

D. Analyte Quantitation

All samples were analyzed, as prepared, without secondary analytical dilutions. Calculations were verified from the raw data and preparation sheets provided in the data package. All sample concentrations, RLs, and MDLs were appropriately reported.

A. Calibration

Three initial calibrations were associated with the sample analyses; these were run on April 27 and 29, 2022, on instrument LCMS01 and on April 13, 2022, on instrument LCMS02. RRFs and %RSDs were correctly calculated and reported. All %RSDs were all less than the maximum acceptance limit of 20%. Recoveries of the target analytes were within the acceptance limits (50-150% for the low concentration IC standard and 70-130% for all other IC standards), with the following exceptions:

IC Standard	Analyte	%R	Associated Samples	Qualifier Applied
4/13/22 IC – 0.50 ng/mL	branched NEtFOSAA	31.0	SB-10b (0-3) SB-19 (7-9) SB-DUP-2 SB-3 (0-2) SB-5 (0-2)	UJ

	branched NMeFOSAA	41.3		
4/13/22 IC – 2.0 ng/mL	branched NEtFOSAA	46.9		
4/13/22 IC – 5.0 ng/mL	branched NEtFOSAA	56.1		

Results for NEtFOSAA and NMeFOSAA in SB-10b (0-3), SB-19 (7-9), SB-DUP-2, SB-3 (0-2), and SB-5 (0-2) were qualified as estimated (UJ) due to low recoveries in associated IC standards.

ICV standards were analyzed after each IC, and %Rs for the target analytes were within the acceptance limits of 70-130%.

Fifteen CC standards were analyzed with the samples The %Rs for the target analytes were within the acceptance limits (50-150% for the 0.50 ng/mL CC standard and 70-130% for the 10 ng/mL CC standard), with the following exceptions:

CC Standard	Analyte	%R	Associated Samples	Qualifier Applied
5/11/22 @ 14:28 – LCMS02	branched NMeFOSAA	12.5	SB-10b (0-3) SB-19 (7-9) SB-DUP-2 SB-3 (0-2) SB-5 (0-2)	UJ

5/11/22 @ 21:43 – LCMS02	branched NMeFOSAA	47.9		
5/12/22 @ 05:27 – LCMS02	branched NMeFOSAA	39.6	SB-5 (0-2)	
	branched NEtFOSAA	14.0		

Results for NEtFOSAA and NMeFOSAA in SB-10b (0-3), SB-19 (7-9), SB-DUP-2, SB-3 (0-2), and SB-5 (0-2) were qualified as estimated (UJ) due to low recoveries in associated CC standards.

Where a recovery was high and the associated compound was not detected in the sample, no qualification of sample results was warranted, and the recovery is not detailed above.

B. Labeled Analogs

Eighteen labeled analogs (also referred to as extraction standards) were used. Percent recoveries (%Rs) of the labeled analogs were assessed against validation criteria of 40-140%R. Exceedances that impacted sample results are detailed below:

Sample	Labeled Analog	%R	Native Compound	Qualifier Applied
SB-19 (7-9)	D3-NMeFOSAA	17	NMeFOSAA	UJ
	D5-NEtFOSAA	18	NEtFOSAA	
S-DUP-2	D3-NMeFOSAA	38	NMeFOSAA	
	D5-NEtFOSAA	33	NEtFOSAA	
SB-3 (0-2)	M8FOSA	18	FOSA	
SB-5 (0-2)	D3-NMeFOSAA	22	NMeFOSAA	
	D5-NEtFOSAA	27	NEtFOSAA	

Results for NMeFOSSA and NEtFOSAA in SB-19 (7-9), SB-DUP-2, and SB-5 (0-2) and for FOSA in SB-3 (0-2) were qualified as estimated (UJ) due to low labeled analog recoveries.

C. Field Duplicates

Sample SB-DUP-1 was submitted as a field duplicate of SB-19 (7-9). Results for SB-DUP-1 were reported in SDG L2223458. No target analytes were detected in either of these samples.

Sample SB-DUP-2 was submitted as a field duplicate of SB-1 (0-2). Sample SB-1 (0-2) was not analyzed for PFAS.

D. Matrix Spike/Matrix Spike Duplicate

Sample SB-5 (0-2) was prepared as an MS/MSD pair. MS/MSD %Rs were within the acceptance limits of 70-130%, and RPDs were less than the maximum acceptance limit of 50 RPD, except for PFTrDA (136%, 151%). Since the recoveries were high and

PFTrDA was not detected in SB-5 (0-2), no action was necessary due to the high recoveries.

A. Laboratory and Field Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. A single aqueous method blank, multiple soil method blanks, and two field blanks (FIELD BLANK-1; FIELD BLANK-2) were prepared and analyzed with the samples. Blanks were free of contamination and interferences with exception of FIELD BLANK-1 (0.004mg/L). All cyanide soil results were not detected or greater than the contamination level and did not warrant qualification.

B. Laboratory Control Samples

Multiple LCS/LCSD pairs were prepared and analyzed with the site samples. Percent recoveries and relative percent differences were with acceptance limits (85-115%R; 20%RPD) with the following exceptions:

Analyte	LCS %R	LCSD %R	LCS/LCSD RPD	Affected Samples	Qualifiers Applied

The results for hexavalent chromium in the above samples were qualified as estimated (J-, UJ), with low bias, due to low LCS recoveries.

B. Laboratory and Field Duplicates

SB-DUP-2 was submitted as a field duplicate of SB-5 (0-2). A laboratory duplicate was prepared and analyzed with each batch of samples. All results were in agreement with each other, with the exception of the laboratory duplicate performed on SB-5 (0-2) (ND/0.361 mg/kg) and the field duplicate pair (ND/0.427). Both sets of duplicate analysis on SB-5 (0-2) showed low level imprecision. Results for hexavalent chromium in all soil samples except SB-4 (0-2) and SB-7 (0-2) were qualified as estimated (J, UJ) due to low level imprecision in the field and lab duplicates.

XIV. Total Solids

Compound Quantitation	Y

Aside from the holding time exceedance in SB-10a (0-3), SB-11 (0-4), and SB-1 (0-2) that was discussed at the beginning of the report, all results were acceptable as reported.

Case Narrative (continued)

date/time is reported as 03-MAY-22 12:50.
L2223093-27: Sample containers for PFAS were received for the "SB-5 (0-2)" sample, but were not listed on the chain of custody. At the client's request, the analysis was performed.

Volatile Organics
L2223093-13: The sample was received in appropriate containers (vials) for the Volatile Organics by EPA Method 5035/8260 Low-Level analysis; however, the initial analysis failed with low internal standards and the second Low-Level vial was disposed of due to laboratory error. With the client's authorization, a sample aliquot was taken from an unpreserved container (jar) and preserved appropriately. Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

Semivolatile Organics
L2223093-06: The surrogate recoveries were outside the acceptance criteria for 2-fluorophenol (4%) and 2,4,6-tribromophenol (1%); however, re-extraction achieved similar results: 2-fluorophenol (7%) and 2,4,6-tribromophenol (1%). The results of both extractions are reported.
The WG1635274-2/-3 LCS/LCSD recoveries, associated with L2223093-22 and -23, are below the acceptance criteria for 4-chloroaniline (7%/7%); however, it has been identified as a "difficult" analyte. The results of the associated samples are reported.

Semivolatile Organics by SIM
The WG1635276-1 Method Blank, associated with L2223093-22 and -23, has a concentration above the reporting limit for naphthalene. Since the associated sample concentrations are either greater than 10x the blank concentration or non-detect to the RL for this target analyte, no corrective action is required. Any results detected below the reporting limit are qualified with a "B".

Perfluorinated Alkyl Acids by Isotope Dilution

EXECUTIVE SUMMARY

Validation of the organic and inorganic analyses data prepared by Alpha Analytical Westborough, Massachusetts for five soil samples from the 60 McLean Avenue Site has been completed by de maximis Data Management Solutions, Inc. (ddms). Stage 4 validation was performed on the samples. The data were reported by the laboratory under SDG No. L2223458. The following samples were reported:

SB-20 (0-2)	SB-20 (7-9)	SB-14 (0-4)	SB-DUP-1

Although sample SB-20 (13-15) was received and identified by the laboratory as L2223458-03, the following note was included in the data package narrative.

> *L2223458-03: At the client's request, the analyses of Volatile Organics, Semivolatile Organics, Pesticides, PCBs, Total Metals, Hexavalent Chromium and Total Cyanide were not performed.*

Based on professional judgment results for non-detects should be considered to be "U," not detected, at the analyte-specific reporting limit (RL) to represent the lowest concentration at which the laboratory can detect and accurately quantitate sample concentrations based on the documentation provided. The laboratory reported results as not detected at the method detection limit (MDL). The MDL is an estimated value based on a statistical determination, not a quantitative measurement supported by the data provided and should not be used to report non-detect results. It should also be noted by the data user that the laboratory reported non-detect results, RLs, and MDLS to three significant figures. The level of accuracy portrayed at these concentrations and estimated concentrations is not supported by the data and should not be used.

Below is the Data Usability Summary Report (DUSR) associated with these samples.

Data Usability Summary Report	
1. Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA CLP data deliverables?	Yes
2. Have all holding times been met?	Yes
3. Do all the QC data; blanks, instrument tunings, calibration standards, calibration verifications, surrogate recoveries, spike recoveries, replicate analyses, laboratory controls and sample data fall within the protocol required limits and specifications?	No – See following sections
4. Have all of the data been generated using established and agreed upon analytical protocols?	Yes

Data Usability Summary Report	
5. Does an evaluation of the raw data confirm the results provided in the data summary sheet and the quality control verification forms?	Yes
6. Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?	Yes
7. Have any quality control (QC) exceedances been specifically noted in the DUSR and have the corresponding QC summary sheet from the data package been attached to the DUSR?	Yes See Attachments A through H

Based on the validation effort, the following data qualifiers were applied:

VOCs

- The result for acetone in the initial and reanalysis of SB-20 (7-9) were qualified as estimated (J+) and may be biased high, due to an unacceptable surrogate recovery.

- The result for n-butylbenzene in SB-14 (0-4) was qualified as estimated (J+) and may be biased high, due to an unacceptable laboratory control sample recovery.

- Results for 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 2-butanone, acetone, and o-xylene in all samples in this data set were qualified as estimated (J, UJ) due to poor precision between paired field samples.

- The result for acetone in SB-20 (7-9) should be taken from the initial analysis. The concentration in the initial analysis was greater than in the reanalysis and a more conservative approach was taken for determining usability for that data point.

- Results for all compounds in SB-20 (7-9) were qualified estimated J, UJ due to low internal responses.

SVOCs

- Results for all target compounds in SB-DUP-1 were qualified as estimated (UJ) based on low recoveries for the associated surrogate compounds.

- Results for anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene in SB-20 (0-2) and SB-20 (7-9) were qualified as estimated (UJ) based on low recovery for the associated surrogate.

- Results for acenaphthene, hexachlorobenzene, fluoranthene, naphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(ghi)pyrene, chrysene, acenaphthylene, anthracene, fluorene, dibenz(a,h)anthracene, phenanthrene, pyrene, dibenzofuran, and pentachlorophenol in SB-20 (0-2), SB-20 (7-9), and SB-DUP-1 were qualified as estimated (UJ) with potential low bias, based on low recoveries in the associated batch LCS and/or LCSD.

- Results for acenaphthene, fluoranthene, naphthalene, benzo(a)anthracene, chrysene, anthracene, fluorene, phenanthrene, pyrene, dibenzofuran, and pentachlorophenol in SB-14 (0-4) were qualified as estimated (UJ) with potential low bias, based on low recoveries in the associated batch LCS and/or LCSD.

PCBs

- Results for Aroclor 1260 and Total PCBs in SB-20 (0-2), SB-20 (7-9), SB-14 (0-4), and SB-DUP-1 were qualified as not detected (U) at the reporting limit (RL) due to associated method blank contamination.

- Results for all target Aroclors and total Aroclors in SB-20 (0-2), SB-20 (7-9), and SB-14 (0-4) were qualified as estimated (UJ) due to low surrogate recoveries.

- Results for nickel and silver in SB-20 (0-2) were qualified as estimated (J-, UJ) due to low MS and PDS recoveries.

- Result for copper in SB-20 (0-2) was qualified as estimated (J) due to elevated MS recovery.

Trivalent Chromium

- Results for trivalent chromium in all samples were qualified as estimate (J) due to elevated RPD in the field duplicate pair and, for SB-20 (0-2), low MS recovery in the total chromium analysis.

All other results were determined to be valid as reported by the laboratory.

This report should be considered part of the data package for all future distributions of the data.

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used to denote specific information regarding the analytical results.

ddms' validation was performed in conformance with the USEPA "National Functional Guidelines (NFG for Organic Data Review" (1999), the USEPA "National Functional Guidelines for Inorganic Data Review" (2004), ddms' Standard Operating Procedures (SOPs) for the methods followed, the requirements of the analytical methods followed, and the specifications of the project-specific Quality Assurance Project Plan (QAPP). Professional judgment was applied as necessary and appropriate.

The data validation process is intended to evaluate data on a technical basis rather than a contract compliance basis for chemical analyses conducted under the CLP. This requires that the data package be presented in accordance with the CLP requirements, so that sufficient supporting documentation is available to facilitate the validation effort. It is assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate quality review prior to submission for validation.

During the validation process, laboratory data are verified against all available supporting documentation. Based on the findings of the evaluation, qualifier codes may be added

by the data validator. Validated results are, therefore, either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Final validated results are annotated with the following codes as defined by the NFG:

U The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

NJ The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.

UJ The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

All data users should note two facts. First, the "R" qualifier means that the laboratory-reported value is unusable. In other words, due to significant quality control problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Rejected values should not appear on data tables because they cannot be relied upon, even as a last resort. Second, no concentration is guaranteed to be accurate even if all associated quality control is acceptable. Strict quality control conformance serves only to increase confidence in reported results; any analytical result will always contain some error.

The data user is also cautioned that the validation effort is based on the raw data printouts as provided by the laboratory. Software manipulation cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

I. Holding Times, Preservation and Sample Integrity

Copies of the applicable chain of custody (COC) records were included in the data package, documenting sample collection dates of May 3 and 4, 2022. The samples were received at the laboratory on May 4, 2022.

The temperatures of the coolers upon receipt at the laboratory (2.9°C to 5.4°C) were acceptable (QC <6°C). All samples were prepared and analyzed within method holding times.

II. Documentation

The following documentation issues were observed during the validation effort:

- Sample SB-DUP-1 was collected as a field duplicate of SB-19 (7-9). The COC indicated that SB-DUP-1 was collected on May 3, 2022, while SB-19 (7-9) was collected on May 2, 2022. The client was contacted and replied that SB-DUP-1 was mis-labelled as being collected on May 3, 2022, and was actually collected on May 2, 2022. It was mislaid in the field and was submitted on May 4, 2022.

- Sample SB-DUP-1 was included on the COC for SDG L2223093. It was not received by the laboratory in SDG L2223093, but it was included with SDG L2223458 samples as well as on the COC for SDG L2223458. Discussion of any data quality excursions impacting SB-DUP-1 have been included in this data review report.

- Raw data for the 1.0 ng/mL standard of the PFAS initial calibration run on April 27, 2022, on instrument LCMS01 were not included in the data package. Instead, two sets of raw data for the 0.50 ng/mL standard were provided. On request, the laboratory provided the raw data for the 1.0 ng/mL standard, which were reviewed and verified by the validator. At the discretion of the data user, the laboratory should be requested to revise the data package to include this documentation so that complete and accurate documentation is available for future reference.

- The internal standard used to calculate concentrations of PFTrDA in the calibration standards and laboratory QC samples could not be determined from the information in the data package as received. On request, the laboratory explained that the area used for this calculation is the average of the areas of internal standards M2PFTeDA and MPFDOA. This was confirmed by the validator. At the discretion of the data user, the laboratory should be requested to provide this information in the data package so that complete information is available for future reference.

The remainder of this report discusses the review effort for each of the parameters. The tables below document the quality control (QC) elements reviewed for each analysis parameter. Where a quality indicator was deemed acceptable after thorough review, no

further discussion is included in this report. Detailed findings are included for each quality element that impacted the usability of the reported results. Additional information or explanation is included as needed, to provide support for decisions made, based on the validator's best professional judgment.

Where a result was qualified J+ or J- and J, the J qualifier takes precedence. Where a result was qualified biased high and low for differing data quality excursions, the final qualifier is J with an indeterminate bias.

A. Calibration

Data for one Initial Calibration (IC) were provided, performed on instrument V111 on April 21, 2022. All of the IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable except for 1,4-dioxane (0.001). A review of other laboratory quality control data supports the laboratory's ability to detect and accurately quantify the compounds. No data were qualified on this basis.

An initial calibration verification (ICV) standard was analyzed after the IC; all percent differences (%Ds) were acceptable in the ICV standard.

Data for two continuing calibration standards were reported. All %Ds were acceptable except as summarized below. In every case, the excursion represented an increase in sensitivity and the analyte was not detected; therefore, no data required qualification.

Parameter	%D	Samples Affected	Qualifier Applied
Batch 1637730			
Vinyl chloride	25.9	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4)	none

Vinyl chloride	31.6	SB-20 (7-9) Reanalysis	none
n-Propylbenzene	24.5		
sec-Butylbenzene	23.5		
n-Butylbenzene	29.5		

B. Surrogates

Surrogate recoveries (70-130%R) were acceptable except for 1,2-dichloroethane-d_4 in both analyses of SB-20 (7-9) (164% and 169%). The results for acetone in the initial and reanalysis of SB-20 (7-9) were qualified as estimated (J+) and may be biased high.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

One LCS/LSCD pair was analyzed with the samples in this data set. Results were within acceptance limits with the exceptions summarized below.

Compound	LCS %R	LCSD %R	Samples Affected	Qualifier Applied
Batch1639494-3/4				
n-Butylbenzene	a	136	SB-14 (0-4)	J+
Vinyl chloride	132	140		none
sec-Butylbenzene	a	131		

a = acceptable

The result for n-butylbenzene in SB-14 (0-4) was qualified as estimated (J+) and may be biased high on this basis.

D. Field Duplicates

Based on documentation from the client, SB-DUP-1 was submitted as a field duplicate of SB-19 (7-9) [SDG L2223039].

Compound	SB-19 (7-9)	SB-19 (7-9) RL	SB-DUP-1	SB-DUP-1 RL
1,2,4-Trimethylbenzene	ND	2.2	0.4 J	2.3
1,3,5-Trimethylbenzene	ND	2.2	0.45 J	2.3
2-Butanone	ND	11	4.4 J	11
Acetone	ND	11	31	11
o-Xylene	ND	1.1	0.53 J	1.1

Results for 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 2-butanone, acetone, and o-xylene in all samples in this data set were qualified as estimated (J, UJ) on this basis.

E. Internal Standard Responses

Internal standard responses were acceptable except for SB-20 (7-9) [fluorobenzene (13%), chlorobenzene-d_5 (15%), and 1,4-dichlorobenzene-d_4 (14%)]. The sample was reanalyzed with similar results [fluorobenzene (10%), chlorobenzene-d_5 (12%), and 1,4-dichlorobenzene-d_4 (12%)]. Results for all compounds in SB-20 (7-9) were qualified estimated (J, UJ) on this basis. Acetone was the only analyte detected in either analysis and was reported at 42 µg/kg in the initial analysis and at 9.7 µg/kg in the reanalysis. Since acetone was reported at a higher concentration in the initial analysis and taking a more conservative approach, results from the initial analysis were identified as being reportable.

A. Calibration

Two initial calibrations were provided in support of the samples results, one performed on 1/22/22, on instrument GCMS5, and one on 3/31/22, on instrument SV109. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after each IC; all percent differences (%Ds) were acceptable (≤20%) in the ICV standards, for the target compounds reported for the associated samples.

B. Blanks

A laboratory blank was prepared and analyzed for each of the two extraction batches. None of the target compounds reported in the field samples were detected in either of the laboratory method blanks.

C. Surrogates

Six surrogate compounds were added before extraction to all QC and field samples. Recoveries for the surrogates were acceptable (70-130%) with the exceptions detailed below:

Sample	2FP	PHL	NBZ	FBP	TBP	TPHd14	Qualifier Applied
SB-20 (0-2)	a	a	a	a	a	53	J-, UJ
SB-20 (7-9)	a	a	a	a	a	53	
SB-DUP-1	62	68	65	56	53	47	

Results for all target compounds in SB-DUP-1 were qualified as estimated (J-, UJ) based on low recoveries for two or more surrogates in each of the acid and base/neutral extractables fractions.

Results for anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene in SB-20 (0-2) and SB-20 (7-9) were qualified as estimated (J-, UJ) based on low recovery for the associated surrogate.

D. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

One LCS/LCSD pair was prepared and analyzed with the field samples. Recoveries for spiked compounds assessed (data validation limits 70-130% R) and agreement between paired results (<20 RPD) were acceptable, with the following exceptions:

Results for acenaphthene, fluoranthene, naphthalene, benzo(a)anthracene, chrysene, anthracene, fluorene, phenanthrene, pyrene, dibenzofuran, and pentachlorophenol in SB-14 (0-4) were qualified as estimated (UJ) with potential low bias, based on low recoveries in the associated batch LCS and/or LCSD.

E. Field Duplicates

Sample SB-DUP-1 (included in this SDG) was submitted as a field duplicate of sample SB-19 (7-9), which was included in SDG L2223093. None of the reported target analytes were detected in either sample of the field duplicate pair.

A. Surrogate Recovery

Tetrachloro-m-xylene (TCX) and decachlorobiphenyl (DCB) were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1	TCX %R Column 2	DCB %R Column 1	DCB %R Column 2	Qualifier
SB-14 (0-4)	63	64	a	64	UJ

a = acceptable

Results for all target compounds in SB-14 were qualified as estimated (UJ) due to low surrogate recoveries.

B. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

An LCS/LCSD pair was prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch WG1635921-2/3					
delta-BHC	66	62	a	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	UJ

Results for delta-BHC, lindane, alpha-BHC, beta-BHC, heptachlor, aldrin, endrin, 4,4'-DDT, endosulfan I, endosulfan II, endosulfan sulfate, and cis-chlordane in SB-20 (0-2),

SB-20 (7-9), SB-14 (0-4), and SB-DUP-1 were qualified as estimated (UJ) due to low LCS and/or LCSD recoveries.

A. Blanks

One method blank was prepared and analyzed with the site samples. Aroclor 1260 was reported in the method blank at 9.7 J µg/kg. Results for Aroclor 1260 and Total PCBs in SB-20 (0-2), SB-20 (7-9), SB-14 (0-4), and SB-DUP-1 were qualified as not detected (U) at the RL due to associated method blank contamination.

B. Surrogate Recovery

TCX and DCB were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1	TCX %R Column 2	DCB %R Column 1	DCB %R Column 2	Qualifier
SB-20 (0-2)	51	52	50	52	UJ
SB-20 (7-9)	55	57	60	60	
SB-14 (0-4)	38	40	35	34	
SB-DUP-1	68	a	a	a	none

a = acceptable

Results for all target Aroclors in SB-20 (0-2), SB-20 (7-9), and SB-14 (0-4) were qualified as estimated (UJ) due to low surrogate recoveries. Total Aroclor results for these samples were also qualified as estimated. Since three of four surrogate recoveries for SB-DUP-1 were acceptable and no target Aroclors were detected in the sample, qualification of sample results due to the single low surrogate recovery was not necessary.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

An LCS/LCSD pair was prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch WG1635800-2/3					
Aroclor 1016	a / a	69 / a	a / a	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	None
Aroclor 1260	66 / a	67 / a	a / a		

Based on professional judgment, since all LCS/LCSD recoveries on the second column were acceptable and no target Aroclors were reported in the site samples after qualifications based on method blank contamination, no action was taken based on the slightly low recoveries on the initial column.

A. Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. One preparation blank for total metals was prepared and analyzed with the samples. Raw data was evaluated for negative blank concentrations, without any findings. Multiple analytes were detected above the MDL in the following blanks:

Blank ID	Analyte	Concentration (mg/kg)	Associated Samples	Qualifier
MB(WG1640166-1BLANK)	Chromium	0.296	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	none
	Manganese	0.064		
	Nickel	0.168		

Blank ID	Analyte	Concentration (mg/kg)	Associated Samples	Qualifier
CCB (R1566085-27) @ 16:43	Beryllium	0.016	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	none

The method blank and continuing calibration blank were detected at less than actionable contamination levels; therefore, field sample results did not warrant qualification.

B. Interference Check Samples (ICSA/ICSAB)

The interference check samples associated with these samples were acceptable for all analytes in the ICSA standard except as summarized below. All ICSAB recoveries were within acceptance criteria (85-115%).

ICSA Standard	Analyte	Concentration (mg/L)	Associated Samples	Qualifier
ICSA (R1566085-21) 5/19/22 @ 14:03	Arsenic	0.00420	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	J+
	Barium	0.00390		J+
	Cadmium	0.00140		J+
	Zinc	0.00310		J+
	Beryllium	-0.00040	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1	J-, UJ
	Selenium	-0.00870		UJ

The ICSA was detected at a concentration greater than the MDL for arsenic (MDL - 0.00208 mg/L), barium (MDL – 0.00174 mg/L), cadmium (MDL – 0.000980 mg/L), and zinc (MDL – 0.00293 mg/L), exhibiting an elevated response with potential for high bias in detected samples. The results for arsenic, barium, cadmium, and zinc in all samples were qualified as estimated (J+), due to elevated response in the ICSA standard. The results for beryllium and selenium in all samples were qualified as estimated (J-, UJ), biased low, due to negative responses in the ICSA standard.

C. Field and Laboratory Duplicates

A laboratory duplicate was performed on SB-20 (0-2) in compliance with the analytical method, and all analyte concentrations were within the acceptance limit (<50 RPD). SB-DUP-1 was collected as a field duplicate of SB-3 (0-2). This duplicate pair is split between two SDGs: L2223093 and L2223458. It will be identified in both validation reports, and only the samples included in SDG L2223458 will be discussed below. The field duplicate pair was within acceptance limits with exceptions noted in the table below:

Analyte	Original conc. (mg/kg)	Duplicate conc. (mg/kg)	RPD	Associated Sample
Field Duplicate Pair: SB-3 (0-2) : SB-DUP-1				
Arsenic	ND	0.898	N/C	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1
Barium	71.1	18.5	117	
Chromium	13.0	6.74	63.4	
Manganese	102	52.5	64	
Nickel	21.2	7.23	98.3	

N/C – Not Calculated
ND – not detected

Results for arsenic in all samples were qualified as estimated (J) due to lack of confirmation in the field duplicate pair. Results for barium, chromium, manganese, and nickel in all samples were qualified as estimated (J) due to elevated RPD between the field duplicate pair.

D. Matrix Spike (MS) and Post Digestion Spike (PDS)

SB-20 (0-2) was prepared as an MS and analyzed with the site samples. A PDS was prepared and analyzed, on the same sample, with the site samples. %Rs and RPDs were acceptable (validation QC 75-125%R, RPDs ≤20 RPD), with the exceptions noted below.

Analyte	MS %R	PDS
Barium	69	a
Beryllium	72	a
Chromium	67	a
Copper	139	a
Lead	68	a
Manganese	69	a
Nickel	64	73
Selenium	66	a
Silver	74	70
Zinc	71	a

a = acceptable

The results for barium, beryllium, chromium, lead, manganese, selenium, and zinc in SB-20 (0-2) were qualified as estimated (J, UJ) due to low MS recoveries and acceptable PDS recoveries. The results for nickel and silver in SB-20 (0-2) were qualified as estimated (J-, UJ) due to low MS and PDS recoveries. The result for copper in SB-20 (0-2) was qualified as estimated (J) due to elevated MS recovery and acceptable PDS recovery. The user is cautioned that matrix effects seen in the qualified sample may also be applicable to other site samples.

E. Serial Dilution

A 5-fold serial dilution was performed on SB-20 (0-2). Most percent differences (%Ds) were acceptable (<20%), with exception of copper (29%D) and manganese (49%D). The

results for copper and manganese in all samples were qualified as estimated (J) due to elevated percent differences in the serial dilution sample.

F. Analyte Quantitation

All samples were analyzed as prepared without secondary analytical dilutions. Calculations were verified from the raw data and preparation sheets provided in the data package. All sample concentrations, RLs, and MDLs were appropriately reported.

A. Field Duplicates

SB-DUP-1 was collected as a field duplicate of SB-3 (0-2). This duplicate pair is split between two SDGs: L2223093 and L2223458. It will be identified in both validation reports, but only the samples included in SDG L2223458 will be discussed below. The field duplicate pair was within acceptance limits with exceptions noted in the table below:

Mercury	2.0	ND	N/C	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4) SB-DUP-1

N/C – Not Calculated

The mercury results in all samples were qualified as estimated (J, UJ) due to lack of confirmation in the field duplicate pair.

B. Compound Quantitation

All samples were analyzed as prepared without secondary analytical dilutions. Calculations were verified from the raw data and preparation sheets provided in the data package. All sample concentrations, RLs, and MDLs were appropriately reported.

A. Labeled Analogs

Eighteen labeled analogs (also referred to as extraction standards) were used. Percent recoveries (%Rs) of the labeled analogs were assessed against validation criteria of 40-140%R. Exceedances that impacted sample results are detailed below:

Sample	Labeled Analog	%R	Native Compound	Qualifier Applied
SB-DUP-1	d3-NMEFOSAA	24	NMeFOSAA	UJ
	D5-NETFOSAA	34	NEtFOSA	

Results for NMeFOSAA and NEtFOSAA in SB-DUP-1 were qualified as estimated (UJ) due to low labeled analog recoveries.

B. Field Duplicate

Sample SB-DUP-1 was submitted as a field duplicate of SB-19 (7-9). Results for SB-19 (7-9) were reported in SDG L2223093. No target analytes were detected in either of these samples.

XI. Cyanide

Review Element	Acceptable?
Calibrations - ICs, ICVs, CCVs	Y
Laboratory Blanks	Y
Laboratory Control Samples	N
Field Duplicate	Y
Matrix Spike	Y
Compound Quantitation	Y

A. Laboratory Control Samples

Two LCS/LCSD pairs were prepared and analyzed with the site samples. Recoveries and precision were acceptable (80-120% R and <20% RPD), with the following exceptions:

Analyte	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch WG1639289-2/3					
Cyanide	42	a	67	SB-DUP-1	UJ
Batch WG1639561-2/3					
Cyanide	76	77	a	SB-20 (0-2) SB-20 (7-9) SB-14 (0-4)	UJ

The result for cyanide in SB-DUP-1 was qualified as estimated (UJ), due to low LCS recovery and elevated relative percent difference between the LCS and LCSD. The results for cyanide in SB-20 (0-2), SB-20 (7-9), and SB-14 (0-4) were qualified as estimated and biased low due to low LCS/LCSD recoveries.

B. Field Duplicate

SB-DUP-1 was collected as a field duplicate of SB-3 (0-2). This duplicate pair is split between two SDGs: L2223093 and L2223458. It is identified in both validation reports, to ensure all associated samples are assessed. The field duplicate pair was within acceptance limit (<30%).

Review Element	Acceptable?
Calibrations - ICs, ICVs, CCVs	Y
Laboratory Blanks	Y
Laboratory Control Samples	Y
Laboratory and Field Duplicates	Y
Matrix Spike and Post-Spike	Y
Compound Quantitation	Y

The hexavalent chromium results in all site samples were acceptable as reported. No qualification of data was warranted.

XIII. Total Solids

Review Element	Acceptable?
Field Duplicate	Y
Compound Quantitation	Y

The total solid results in all site samples were acceptable as reported. No qualification of data was warranted.

XIV. Trivalent Chromium

Review Element	Acceptable?
Compound Quantitation	Y

All results were correctly calculated from the total chromium and hexavalent chromium results. Since trivalent chromium results are based on total chromium and hexavalent chromium analyses, any qualifiers applied to either total chromium or hexavalent chromium results are also applied to trivalent chromium results.

EXECUTIVE SUMMARY

Validation of the organic and inorganic analyses data prepared by Alpha Analytical Westborough, Massachusetts for seven aqueous samples, one trip blank (TB), and one field blank (FB) from the 60 McLean Avenue Site has been completed by de maximis Data Management Solutions, Inc. (ddms). Stage 4 validation was performed on the samples. The data were reported by the laboratory under SDG No. L2223459. The following samples were reported:

MW-7A	MW-9A	MW-4A	MW-5A	WP-11
WP-12	FIELD BLANK	TRIP BLANK	MW-DUP-1	

Based on professional judgment results for non-detects should be considered to be "U," not detected, at the analyte-specific reporting limit (RL) to represent the lowest concentration at which the laboratory can detect and accurately quantitate sample concentrations based on the documentation provided. The laboratory reported results as not detected at the method detection limit (MDL). The MDL is an estimated value based on a statistical determination, not a quantitative measurement supported by the data provided and should not be used to report non-detect results. It should also be noted by the data user that the laboratory reported non-detect results, RLs, and MDLS to three significant figures. The level of accuracy portrayed at these concentrations and estimated concentrations is not supported by the data and should not be used.

Below is the Data Usability Summary Report (DUSR) associated with these samples.

INTRODUCTION

Analyses for the requested parameters were performed by the laboratory according to the following analytical methods:

Volatile Organic Compounds (VOCs)	SW846 Method 8260C
Semivolatile Organic Compounds (SVOCs)	SW846 Method 8270D SW846 Method 8270DSIM
Organochlorine Pesticides	SW846 Method 8081B
Polychlorinated Biphenyls	SW846 Method 8082A
Total and Dissolved Metals	SW846 Method 6020B SW846 Method 7470A
Polyfluorinated Alkyl Substances (PFAS)	EPA Method 537 (M)

Results of sample analyses are reported by the laboratory as either qualified or unoneualified; various qualifier codes are used to denote specific information regarding the analytical results.

ddms' validation was performed in conformance with the ddms' Standard Operating Procedures (SOPs) for the methods followed, the USEPA "National Functional Guidelines (NGF) for Organic Data Review" (1999), the USEPA "National Functional Guidelines for Inorganic Data Review" (2004), the requirements of the analytical methods followed, and the specifications of the project-specific Quality Assurance Project Plan (QAPP). Professional judgment was applied as necessary and appropriate.

The data validation process is intended to evaluate data on a technical basis rather than a contract compliance basis for chemical analyses conducted under the CLP. This requires that the data package be presented in accordance with the CLP requirements, so that sufficient supporting documentation is available to facilitate the validation effort. It is assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate quality review prior to submission for validation.

During the validation process, laboratory data are verified against all available supporting documentation. Based on the findings of the evaluation, qualifier codes may be added by the data validator. Validated results are, therefore, either qualified or unoneualified. Unoneualified results mean that the reported values may be used without reservation. Final validated results are annotated with the following codes as defined by the NFG:

U The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

NJ The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.

UJ The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

All data users should note two facts. First, the "R" qualifier means that the laboratory-reported value is unusable. In other words, due to significant quality control problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Rejected values should not appear on data tables because they cannot be relied upon, even as a last resort. Second, no concentration is guaranteed to be accurate even if all associated quality control is acceptable. Strict quality control conformance serves only to increase confidence in reported results; any analytical result will always contain some error.

The data user is also cautioned that the validation effort is based on the raw data printouts as provided by the laboratory. Software manipulation cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

I. Holding Times, Preservation and Sample Integrity

Copies of the applicable chain of custody (COC) records were included in the data package, documenting sample collection dates of May 4, 2022. The samples were received at the laboratory on May 4, 2022.

The temperatures of the coolers upon receipt at the laboratory (2.2°C to 5.4°C) were acceptable (QC <6°C). Appropriate sample preservation was noted on sample receipt checklists and sequence logs. All samples were prepared and analyzed within method holding times.

II. Documentation

The following documentation issues were observed during the validation effort:

- Samples identified as "FIELD BLANK" and "TRIP BLANK" were received but were not listed on the Chain of Custody (COC). TRIP BLANK was archived. At the client's request, FIELD BLANK sample was analyzed.

- VOCs were identified twice for analysis on one page of the COC, and analysis for SVOCs were not identified.

- The source of the reference spectra for the identification the semivolatile target compounds by SIM could not be determined. For instance, the retention time (3.022 min.) listed for 2-methylnaphthalene in the raw data for MW-7A is much earlier than the RT displayed for the reference spectrum (4.456 min.). Nor does the reference spectrum RT match the calibration standards analyzed in support of the sample analyses (3.2 min.)

- Raw data for the 1.0 ng/mL standard of the PFAS initial calibration run on April 27, 2022, on instrument LCMS01 were not included in the data package. Instead, two sets of raw data for the 0.50 ng/mL standard were provided. On request, the laboratory provided the raw data for the 1.0 ng/mL standard, which were reviewed and verified by the validator. At the discretion of the data user, the laboratory should be requested to revise the data package to include this documentation so that complete and accurate documentation is available for future reference.

- The internal standard used to calculate concentrations of PFTrDA in the calibration standards and laboratory QC samples could not be determined from the information in the data package as received. On request, the laboratory explained that the area used for this calculation is the average of the areas of internal standards M2PFTeDA and MPFDOA. This was confirmed by the validator. At the discretion of the data user, the laboratory should be requested to provide this information in the data package so that complete information is available for future reference.

The remainder of this report discusses the review effort for each of the parameters. The tables below document the quality control (QC) elements reviewed for each analysis parameter. Where a quality indicator was deemed acceptable after thorough review, no further discussion is included in this report. Detailed findings are included for each quality element that impacted the usability of the reported results. Additional information or explanation is included as needed, to provide support for decisions made, based on the validator's best professional judgment.

Where a result was qualified J+ or J- and J, the J qualifier takes precedence. Where a result was qualified biased high and low for differing data quality excursions, the final qualifier is J with an indeterminate bias.

A. Calibration

Data for two ICs were provided, one on instrument VOA130 and one on instrument 105. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable except for 1,4-dioxane (0.001 on both instruments). A review of other laboratory quality control data was performed, with further discussion below. Two initial calibration verification (ICV) standards were analyzed after each IC; all target compound percent differences (%Ds) were acceptable in the ICV standards except as summarized below.

Parameter	%D	Samples Affected	Qualifier Applied

Ethyl ether	+28.7		none

Results for dichlorodifluoromethane and vinyl acetate in MW-DUP-1 were qualified as estimated (UJ) due to an unacceptable %D between the IC and the ICV.

2-Butanone	-23.2		
1,4-Dioxane	-21.7		
Bromoform	-24.1		
trans-1,4-Dichloro-2-butene	-24.2		

Results were qualified estimated (J-, UJ) due to loss in sensitivity from the IC as summarized in the table above.

B. Laboratory and Field Blanks

Two method blanks were prepared and analyzed with these samples. No analytes were reported at a concentration greater than the analyte specific reporting limit. Acetone was reported in FIELD BLANK (4.0 µg/L) as well as in MW-4A (3.3 µg/L). The result for

acetone in MW-4A was qualified as not detected at the reporting limit (5.0 µg/L) due to field blank contamination.

C. LCS/LCSD

Two LCS/LCSD pair was prepared and analyzed with these samples. Recoveries for all spiked compounds assessed (70-130% R) and agreement between paired results (<20 RPD) were acceptable except as summarized below.

Parameter	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch 1639023-3/4					
Trichlorofluoromethane	150	160	a	MW-7A MW-9A MW-4A MW-5A WP-11 WP-12 FIELD BLANK	none
Bromomethane	140	130	a		none
Acetone	67	94	34		J, UJ

D. Field Duplicates

Sample MW-DUP-1 was submitted as a field duplicate of sample MW-7A. Paired results exceeding acceptance criteria (greater than 30% RPD) are summarized below.

Compound	MW-7A	MW-DUP-1	%RPD
Benzene	7.4	4.1	57
Toluene	48	27	56
n-Butylbenzene	6.3	12	-62
o-Xylene	300	210	35

p-Isopropyltoluene	11	21	-63
p/m-Xylene	1100	730	40
sec-Butylbenzene	7.9	11	-33

Results for benzene, toluene, n-butylbenzene, o-xylene, 1,4-diethylbenzene, p-isopropyltoluene, p/m-xylene, and sec-butylbenzene in all field samples in this data set were qualified estimated (J, UJ) due to failure to confirm in paired field samples.

A. Calibration

One initial calibration was provided in support of the sample results, performed on 4/20-21/22, on instrument DAKOTA. All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. Initial calibration verification (ICV) standards were analyzed after the IC and included all of the target analytes reported; all percent differences (%Ds) were acceptable (≤20%) in the ICV standards, for the target compounds reported.

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%) with the following exceptions:

CC Date	Compound	%D	Samples Affected	Qualifier Applied
5/8/22 @ 09:07 DAKOTA	2,4-Dinitrophenol 4,6-Dinitro-o-cresol	+49.9 +32.4	QC samples only	None
5/9/22 @ 07:32 DAKOTA	2,4-Dinitrophenol 4,6-Dinitro-o-cresol	+43.1 +31.3	MW-7A MW-9A MW-4A MW-5A WP-11 WP-12 FIELD BLANK MW-DUP-1	None

The high %Ds for 2,4-dinitrophenol and 4,6-dinitro-o-cresol are indicative of high bias or the presence of false positives and neither compound was detected in any of the field samples; therefore, no action was necessary.

A. Blanks

A method blank was prepared with the extraction batch that included the field samples. A field blank was submitted with the sample set. None of the target analytes were detected in the laboratory of field blanks.

B. Surrogates

Six surrogate compounds were added before extraction to all QC and field samples. Recoveries for the surrogates were acceptable (70-130%) with the exceptions detailed below:

Sample	2FP	PHL	NBZ	FBP	TBP	TPHd14	Qualifier Applied
MW-7A	61	45	68	58	50	64	J-, UJ
MW-9A	54	41	65	58	61	65

FIELD BLANK	55	43	69	65	59	67	
MW-DUP-1	53	44	69	62	47	63	

Results for all target compounds in MW-7A, MW-9A, MW-4A, MW-5A, WP-11, WP-12, FIELD BLANK, and MW-DUP-1 were qualified as estimated (J-, UJ) based on low recoveries for two or more surrogates in each of the acid and base/neutral extractables fractions.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

One LCS/LCSD pair was prepared and analyzed with the field samples. Recoveries for spiked compounds assessed (data validation limits 70-130% R) and agreement between paired results (<20 RPD) were acceptable, with the following exceptions:

(J-, UJ) with potential low bias, based on low recoveries in the LCS and/or LCSD. The results for benzoic acid in these samples were also qualified as estimated based on imprecision between the LCS and LCSD.

D. Field Duplicates

Sample MW-DUP-1 was submitted as a field duplicate of sample MW-7A. Bis(2-chloroethyl)ether was detected in MW-DUP-1 (2.3 µg/L) but was not detected in MW-7A. Results for bis(2-chloroethyl)ether in all field samples in this dataset were qualified as estimated (J, UJ) based on imprecision in the field duplicate pair. No other target analytes were detected in either sample of the field duplicate pair.

A. Calibration

One initial calibration, performed on 2/9/22 on instrument SV128, was provided in support of the PAHs and pentachlorophenol results for the samples. Another IC was performed on 5/4/22 on instrument PAH22 for 1,4-dioxane only. Calibration was established using internal standard methodology with average response factors, linear regression, and by isotope dilution (for 1,4-dioxane only). All IC relative response factors (RRFs) and percent relative standard deviations (%RSDs) were acceptable. An initial calibration verification (ICV) standard was analyzed after each of the ICs and all percent differences (%Ds) in these ICVs were acceptable (≤20%).

Continuing calibration (CC) standards were analyzed at the appropriate frequency and %Ds were acceptable (≤20%).

B. Blanks

Two method blanks were prepared with the field samples, one with the analytical batch extracted for acid- and base/neutral extractable compounds and a second for the extraction for 1,4-dioxane, only. One field blank was submitted with the field samples. The following compounds were detected in the method blanks and field blank at concentration below the RLs but above the MDLs:

Blank	Compound	%D	Samples Affected	Qualifier Applied
WG1635588-1	Benzo(a)anthracene	0.02 J µg/L	MW-9A	U
	Benzo(b)fluoranthene	0.01 J µg/L	FIELD BLANK	
FIELD BLANK	Benzo(b)fluoranthene	0.01 J µg/L	MW-9A	
	Benzo(k)fluoranthene	0.01 J µg/L		

Results for benzo(a)anthracene and benzo(b)fluoranthene in MW-9A and FIELD BLANK were qualified as not detected (U) at the reporting limits based on contamination at similar concentrations in the laboratory method blank. Results for benzo(b)fluoranthene and benzo(k)fluoranthene in MW-9A were qualified as not detected (U) at the reporting limit, based on the presence of these compounds in the associated field blank at similar concentrations.

C. Surrogates

Six surrogate compounds (2-fluorophenol [2FP], phenol-d_5 [PHL], nitrobenzene-d_5 [NBZ], fluorobiphenyl [FBP], 2,4,6-tribromophenol [TBP], and terphenyl-d_{14} [TPHd14]) were added before extraction to all QC and field samples. Of these, the three base/neutral extractable surrogate compounds (NBZ, FBP, and TPHd14), the acid-extractable compound 2,4,6-tribromophenol (TBP), and 1,4-dioxane-d_8 (DXd8, applicable to the 1,4-dioxane analyses only) have bearing on the selected target compounds. Recoveries for these surrogates were acceptable (70-130% for acid- and base/neutral extractable surrogates and 30-130% for 1,4-dioxane-d_8) with the exceptions detailed below:

Sample	DXd8	2FP	PHL	NBZ	FBP	TBP	TPHd14	Qualifier Applied
MW-7A	a	63	50	a	64	56	65	J-, UJ
MW-9A	a	68	52	a	69	a	a	
MW-4A	a	53	47	66	60	a	60	
MW-5A	a	50	45	64	58	69	62

FIELD BLANK	a	53	46	68	62	64	61	
MW-DUP-1	a	51	46	a	63	45	62	

Results for all target analytes in MW-7A, MW-5A, MW-5A, WP-11, WP-12, FIELD BLANK, and MW-DUP-1 were qualified as estimated (J-, UJ) with potential low bias, based on low recoveries for the associated surrogate compounds.

Results for 2-chloronaphthalene, hexachloroethane, and fluorene in MW-9A were qualified as estimated (J-, UJ) with potential low bias, based on low recovery for the associated surrogate compound.

D. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

Two LCS/LCSD pairs were prepared and analyzed with the field samples (one for acid/base/neutral extractable target list, and one for 1,4-dioxane only). Recoveries for spiked compounds assessed (data validation limits 70-130% R) and agreement between paired results (<20 RPD) were acceptable, with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch 1635588-2/3					
Hexachlorobutadiene	62	62	a	MW-7A MW-9A MW-4A MW-5A WP-11 WP-12 FIELD BLANK MW-DUP-1	J-, UJ
Acenaphthylene	68	67	a		
Hexachloroethane	65	68	a		

Results for hexachlorobutadiene, acenaphthylene, and hexachloroethane were qualified as estimated (J-, UJ) with potential low bias, as detailed in the table above, based on low recoveries in the associated batch LCS and/or LCSD.

E. Field Duplicates

MW-DUP-1 was submitted as a field duplicate of sample MW-7A. Results showed good agreement with the following exceptions:

Compound	MW-7A	MW-DUP-1	RPD	Qualifier Applied
1,4-Dioxane	64 J	144 U	nc	J, UJ
Naphthalene	47	33	35	

Results for 1,4-dioxane and naphthalene in all of the field samples were qualified as estimated (J, UJ), based on imprecision in the field duplicate pair.

A. Calibration

Two initial calibrations were associated with the sample analyses; these were run on January 31, 2022, on instrument PEST18 and on April 22, 2022, on instrument PEST20. Calibration factors (CFs) and %RSDs were correctly calculated and reported. All %RSDs were all less than the maximum acceptance limit of 20%. ICV standards for the single-component pesticides, multi-component chlordane, and multi-component toxaphene were analyzed after each IC. The %Ds for all target analyte peaks on both columns in the ICV standards were less than the maximum acceptance limit of 20%, except for the first selected toxaphene peak (toxaphene-1) on the primary column of the ICV standard run on January 31, 2022, at 14:01 on instrument PEST18. Based on professional judgment, since the secondary column %D for this peak was acceptable and toxaphene was not detected in the associated site sample, no action was taken on this basis.

Seven CC standards were analyzed with the samples. CFs and %Ds for all analyte peaks on both columns were correctly calculated and reported. The %D values were less than the maximum acceptance limit of 20%, with the following exceptions:

CC Standard	Analyte	Column	%D	Associated Samples	Qualifier Applied
5/10/22 @ 14:46 PEST20	4,4'-DDD	Column 1	22.8	Lab QC Samples Only	none
	Methoxychlor		25.4		
	4,4'-DDT	Column 2	24.2

5/10/22 @ 21:44 PEST20	4,4'-DDD	Column 1	26.7

	delta-BHC	Column 2	20.7		
	trans-Chlordane		27.9

	4,4'-DDD		30.6		
5/11/22 @ 22:22 PEST18	Toxaphene-1	Column 1	21.1	MW-DUP-1	none

The high %Ds for all peaks listed above resulted from an increase in sensitivity relative to the IC, which suggests the potential for reporting false positives. Since no target analytes were detected in any of the field samples, no action was necessary based on the high responses.

B. Surrogate Recovery

Tetrachloro-m-xylene (TCX) and decachlorobiphenyl (DCB) were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1	TCX %R Column 2	DCB %R Column 1	DCB %R Column 2	Qualifier
MW-7A	66	a	45	57	UJ
MW-9A	62	64	41	42

WP-12	69	67	61	56	
FIELD BLANK	a	a	64	62	
MW-DUP-1	59	61	50	44

Results for all target analytes in all samples in this data set were qualified as estimated (UJ) due to low surrogate recoveries.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

Two LCS/LCSD pairs were prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied

Results for delta-BHC, beta-BHC, heptachlor, aldrin, endrin, endrin aldehyde, 4,4'-DDT, endosulfan I, and cis-chlordane in MW-7A, MW-9A, MW-4A, MW-5A, WP-11, WP-12, and FIELD BLANK and for delta-BHC, heptachlor epoxide, endrin, endrin aldehyde, endrin ketone, dieldrin, 4,4'-DDE, 4,4'-DDT, endosulfan I, endosulfan II, endosulfan sulfate, methoxychlor, and cis-chlordane in MW-DUP-1 were qualified as estimated (UJ) due to low LCS and/or LCSD recoveries.

A. Calibration

One initial calibration, run on April 19-20, 2022, on instrument PEST2, was associated with the sample analyses. Calibration factors (CFs) and %RSDs were correctly calculated and reported. All %RSDs were all less than the maximum acceptance limit of 20%. ICV standards for Aroclor 1248 and the Aroclor 1016/1260, Aroclor 1242/1268, Aroclor 1232/1262, and Aroclor 1221/1254 mixtures were analyzed after the IC, and %Ds for all selected Aroclor peaks on both columns in the ICV standards were less than the maximum acceptance limit of 20%.

Two CC standards were analyzed with the samples on May 19, 2022, at 06:42 and12:27. CFs and %Ds for all selected Aroclor 1016 and 1260 peaks on both columns were correctly calculated and reported. The %D values were less than the maximum

acceptance limit of 20%, except for the fourth selected Aroclor 1260 peak (Aroclor 1260-4) on the CLP-Pesticide II column of the CC standard run at 12:27 (21.9%). Based on professional judgment, since all %Ds on the CLP-Pesticide column were acceptable, and no Aroclors were detected in any of the site samples, no action was necessary on this basis.

B. Surrogate Recovery

TCX and DCB were used as the surrogate compounds for these analyses. Recoveries of TCX and DCB for the reported site and laboratory QC samples were within the validation acceptance limits of 70-130%, with the following exceptions:

Sample	TCX %R Column 1*	TCX %R Column 2**	DCB %R Column 1	DCB %R Column 2	Qualifier
MW-9A	a	69	68	65	UJ
MW-4A	a	a	69	69	
WP-11	a	64	a	a	none

*CLP-Pesticide column
**CLP-Pesticide II column
a = acceptable

Results for all target Aroclors in MW-9A and MW-4A were qualified as estimated (UJ) due to low surrogate recoveries on both columns. Based on professional judgment, since DCB recoveries on both columns and the TCX recovery on the CLP-Pesticide column in WP-11 were acceptable, and no target Aroclors were detected in this sample, no action was necessary due to the low TCX recovery on the CLP-Pesticide II column.

C. Laboratory Control Sample (LCS)/LCS Duplicate (LCSD)

An LCS/LCSD pair was prepared and analyzed with the site samples. Recoveries and precision between paired recoveries were acceptable (70-130% R and <20% RPD), with the following exceptions:

Compound	LCS %R	LCSD %R	RPD	Samples Affected	Qualifier Applied
Batch WG1640120-2/3					
Aroclor 1016	a / a	a / a	22 / a	All samples	UJ
Aroclor 1260	64 / 63	65 / 64	a / a		

Results for all pcbs in all samples in this data set were qualified as estimated (UJ) due to low LCS/LCSD recoveries and/or LCS/LCSD imprecision. Total PCBs results were also qualified as estimated (UJ).

A. Calibrations – ICs, ICVs, CCVs

The initial calibration was established on 5/26/22 on instrument ICPMSQ. Calibration criteria (R^2 >0.995 for the linear regression) were met in for all reported analytes. The calculated percent differences for all non-zero standards were within the 30% limit with the exception of beryllium (-42%D) and cadmium (-34%D). All results for total and dissolved beryllium and total and dissolved cadmium were less than the calibration supported RL of 0.001 mg/L and were qualified as estimated (UJ) due to elevated %D in the low level calibration standard

A low level continuing calibration verification (LLCCV) was analyzed at the beginning and the end of the analytical sequence. All recoveries were within the 65-135% acceptance limits with exceptions following:

LLCCV ID	Analyte	%R	Associated Samples	Qualifier
LLCCV 5/26/22 @ 08:39:42	Beryllium, Total and Dissolved	63.5	All samples	J-, UJ
	Chromium, Total and Dissolved	56.1		
	Antimony, Total and Dissolved	55.2		
LLCCV 5/26/22 @ 22:50:52	Chromium, Total and Dissolved	62.6		
	Antimony, Total and Dissolved	58.4		
	Total and Dissolved Lead	61.8		

LLCCV ID	Analyte	%R	Associated Samples	Qualifier
	Iron, Total	178	MW-5A WP-12	J+
	Iron, Dissolved	178	MW-4A WP-12 FIELD BLANK	J+

Results for total and dissolved beryllium, chromium, and antimony were less than 10x the reporting limit and qualified as estimated (J-, UJ) due to low recoveries demonstrated in the LLCCV standard. Results may be biased low, or the limit of detection may be higher than reported. Results for total iron in MW-5A and WP-12 and dissolved iron in MW-4A, WP-12, and FIELD BLANK were less than 10x the RL and qualified as estimated (J+), biased high, due to elevated LLCCV recoveries.

B. Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. One preparation blank for total metals and one preparation blank for dissolved metals were prepared and analyzed with the samples. One field blank (FIELD BLANK) was submitted with this SDG. The following analytes were detected in these blanks:

Blank ID	Analyte	Concentration (mg/L)	Associated Samples	Qualifier

The method blank associated with the dissolved metals analysis was detected at an actionable contamination level for dissolved chromium. Results for dissolved chromium in MW-7A and MW-4A were qualified as not detected (U) at the reporting limit due to method blank contamination. The FIELD BLANK associated with the dissolved metals analysis was detected at actionable contamination levels for dissolved aluminum and dissolved manganese. Results for dissolved aluminum in MW-7A, MW-4A, and MW-DUP-1, as well as dissolved manganese in MW-5A, were qualified as not detected (U) at the reporting limit or reported value, whichever was greater, due to field blank contamination. The results for dissolved thallium in MW-7A, MW-9A, WP-11, and WP-12 were qualified as not detected (U) due to continuing calibration blank contamination. Results for total thallium in FIELD BLANK and MW-DUP-1 were qualified as not detected (U) due to continuing calibration blank contamination. Where blank contamination was detected at concentrations levels less than reported in the sample, or associated samples were not detected, exceedance were noted, but qualification of results was not warranted.

C. Interference Check Samples (ICSA/ICSAB)

The interference check samples associated with these samples were acceptable for all analytes with exceptions in the ICSA standard. All ICSAB recoveries were within acceptance criteria (85-115%).

The ICSA was detected at concentrations greater than the MDL for barium (MDL - 0.000173 mg/L), chromium (MDL – 0.000178 mg/L), cobalt (MDL – 0.000163), copper (MDL - 0.000384 mg/L), manganese (MDL – 0.000440 mg/L) , nickel (MDL – 0.000556 mg/L) , and zinc (MDL – 0.00341 mg/L), exhibiting an elevated response with potential for high bias in detected samples. The ICSAB was spiked with a known concentrations for aluminum (20 mg/L), calcium (60 mg/L), iron (50 mg/L), magnesium (20 mg/L), sodium (50 mg/L) and potassium (20 mg/L) and recovered within acceptance limits (85-115%). The results for total and dissolved barium in FIELD BLANK were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for total chromium in MW-7A, MW-9A, MW-4A, MW-5A, WP-11, WP-12, and MW-DUP-1 were

qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for total cobalt in MW-7A, MW-9A, MW-4A, WP-11, and MW-DUP-1 were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for total copper and total nickel in MW-7A, MW-9A, MW-4A, MW-5A, WP-11, WP-12, and MW-DUP-1 were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for dissolved copper in MW-5A and WP-12 were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for dissolved manganese in WP-11, WP-12, and FIELD BLANK were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard Results for dissolved nickel in MW-7A, MW-9A, MW-4A, MW-5A, WP-11, and MW-DUP-1 were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for total zinc in MW-7A, MW-9A, MW-4A, and MW-5A were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Results for dissolved zinc in MW-4A, MW-5A, and WP-12 were qualified as estimated and biased high (J+) due to elevated response in the ICSA standard. Where sample concentrations were not detected or significantly greater than the detected ICSA concentration, qualification was not warrant qualification.

D. Matrix Spike (MS), Matrix Spike Duplicate (MSD) and Post Digestion Spike (PDS)

One MS/MSD pair was prepared and analyzed with the site samples for the dissolved metals fraction. A single PDS was analyzed with the site samples. Percent recoveries (%Rs) and relative percent differences (RPDs) were acceptable (validation QC 75-125%R, RPDs ≤20 RPD), with the exceptions noted below.

Sample ID	Analyte	MS %R	PDS %R
QC Sample: MW-7A	Calcium, Dissolved	208	a
	Iron, Dissolved	160	a
	Magnesium, Dissolved	153	a
	Manganese, Dissolved	204	a
	Potassium, Dissolved	133	a
	Sodium, Dissolved	530	a

a-acceptable

The matrix spike recovered high for dissolved calcium, dissolved iron, dissolved magnesium, dissolved manganese, dissolved potassium, and dissolved sodium. The dissolved results for iron, magnesium, manganese, and potassium in MW-7A were qualified as estimated (J), due to elevated MS recoveries. Although spike recoveries fell outside of acceptance limits for dissolved calcium and dissolved sodium, the parent sample concentrations were more than four times the spike concentrations added. There

is no expectation of acceptable recoveries at these spike levels, and qualification was not warranted.

E. Duplicates

MW-DUP-1 was collected as a field duplicate of MW-7A and analyzed in support of this sampling event. The laboratory also analyzed the dissolved metals fraction of MW-7A in duplicate as part of their standard batch QC practices. Evaluation of these duplicate analyses were performed with acceptable relative percent differences (RPDs) and low-level comparability with exceptions noted in the table below.

Analyte	Original conc. (mg/L)	Duplicate conc. (mg/L)	RPD	Associated Sample
Field Duplicate Pair: MW-7A : MW-DUP-1

Copper, Dissolved	ND	0.00104	N/C	
Silver, Dissolved	ND	0.00018	N/C	
Zinc, Dissolved	ND	0.00415	N/C	

N/C – Not Calculated

The results for dissolved iron and total aluminum in all site samples were qualified as estimated (J, UJ) due to elevated RPD in the field duplicate pair. The results for dissolved antimony, dissolved copper, dissolved lead, dissolved silver, and total and dissolved zinc in all site samples were less than five times the RL and qualified as estimated (J, UJ) due to lack of confirmation in the field and/or laboratory duplicate.

F. Internal Standards

The laboratory used five internal standards (ISs), (^{6}Li, ^{45}Sc, ^{74}Ge, ^{115}In and ^{209}Bi) in support of sample analysis. The percent relative intensities (%RI) were monitored throughout the analytical run and were within the 70-130% limits in all site samples with exceptions noted in the table below.

Sample	^{6}Li	^{45}Sc	^{74}Ge	^{115}In	^{209}Bi
MW-4A (Diss)	166	143	a	a	a

W-5A (Total)	158	142	a	a	a
WP-11 (Total)	147	a	a	a	a
WP-12	142	a	a	a	131

a-acceptable

The total and dissolved results for aluminum, beryllium, calcium, chromium, cobalt, copper, iron, magnesium, manganese, nickel, and vanadium in MW-4A were qualified as estimated (J, UJ) due to IS %RI drift. The results for all dissolved metals in MW-5A were qualified as estimated (J, UJ) due to IS %RI drift. The dissolved results for aluminum, beryllium, calcium, chromium, cobalt, copper, iron, potassium, magnesium, manganese, nickel, sodium, and vanadium in WP-11 were qualified as estimated (J, UJ) due to IS %RI drift. The total and dissolved results for beryllium, lead and thallium in WP12 were qualified as estimated (J, UJ) due to IS %RI drift. The total results for lead and thallium in MW-9A were qualified as estimated (J, UJ) due to IS %RI drift. The total beryllium results for WP-11 were qualified as estimated (J, UJ) due to IS %RI drift.

G. Total Vs. Dissolved

Total and dissolved metals analysis was performed on all samples. The relationship is based on the logic that total concentrations can equal or be greater than the dissolved concentrations but cannot be less. The percent differences between the sample concentrations were within the 10% acceptance limit. Any exceptions are noted in the table below:

Analyte	Total Conc. (mg/L)	Dissolved Conc. (mg/L)	% Difference

Sodium	ND	0.0662	N/C
Sample: MW-DUP-1			
Sodium	270	277	2.6

N/C – Not Calculated

Results for total and dissolved antimony in MW-4A and total and dissolved copper and zinc in MW-5A were qualified as estimated (J) because the dissolved concentrations exceeded the total concentrations by more than ten percent difference. The results for total and dissolved cobalt in MW-5A, total and dissolved zinc in WP-12, and total and dissolved aluminum, antimony, iron, manganese, and sodium in Field Blank were qualified as estimated (J, UJ), because the dissolved concentrations were greater than the non-detected and unconfirmed total concentrations. In instances where the dissolved concentrations exceeded the total concentrations by less than 10% difference, the difference can be attributed to experimental error, and qualification of data is not warranted.

H. Analyte Quantitation

Dilutions were performed on one of the samples to bring the analyte concentrations within instrument calibration range. Sample WP-12 was analyzed at 5-fold dilution for total and dissolved potassium and sodium to bring the sample concentrations within the instrument calibration range. All sample concentrations, RLs, and MDLs were appropriately raised to reflect the dilution factors applied.

A. Analyte Quantitation

Preparatory dilutions were performed on all total mercury samples due to limited sample volume. Sample MW-7A was analyzed at a 25-fold dilution, and MW-9A, MW-4A, MW-5A, WP-11, WP-12 and FIELD BLANK were analyzed at 5-fold dilutions. All sample concentrations, RLs, and MDLs were appropriately raised to reflect the dilution factors applied.

A. Blanks

The following analyte was detected in an associated blank:

Blank	Analyte	Concentration	Affected Sample	Qualifier Applied
FIELD BLANK	6:2-FTS	19.8 ng/L	MW-7A MW-4A	U

Results for 6:2 FTS in MW-7A and MW-4A were qualified as not detected (U) at the RL due to field blank contamination.

B. Labeled Analogs

Eighteen labeled analogs (also referred to as extraction standards) were used. Percent recoveries (%Rs) of the labeled analogs were assessed against validation criteria of 40-140%R. Exceedances that impacted sample results are detailed below:

Sample	Labeled Analog	%R	Native Compound	Qualifier Applied
MW-7A	M2-6:2 FTS	194	6:2 FTS	J+
	M8FOSA	21	FOSA	UJ

Sample	Labeled Analog	%R	Native Compound	Qualifier Applied
MW-9A	M8FOSA	14	FOSA	
MW-4A	M5PFPEA	31	PFPeA	
	M4PFHXA	33	PFHxA	
	M2-6:2 FTS	323	6:2 FTS	J+
FIELD BLANK	M8FOSA	35	FOSA	UJ

Results were qualified as follows:

- Results for 6:2 FTS in MW-7A and MW-4A were qualified as estimated with potential high bias (J+) due to high labeled analog recoveries.
- Results for FOSA in MW-7A and FIELD BLANK were qualified as estimated (UJ) due to low labeled analog recoveries.
- Results for PFPeA and PFHxA in MW-4A were qualified as estimated (UJ) due to low labeled analog recoveries.

Where a labeled analog recovery was greater than 140%R and the associated compound was not detected in the sample, no qualification of sample results was warranted, and the recovery is not detailed above.

C. Internal Standard Responses

Recoveries of internal standards M3PFBA, M2PFOA, M4PFOS, and M2PFDA were within the acceptance limits of 50-150% with the following exceptions:

Sample	Internal Standard	%R	Affected Compounds	Qualifier Applied
MW-4A	M3PFBA	26	PFBA PFPeA	J, UJ
	M2PFOA	42	PFHxA PFHpA PFOA PFNA	

Results for PFBA, PFPeA, PFHxA, PFHpA, PFOA, and PFNA in MW-4A were qualified as estimated (J, UJ) due to low areas of the corresponding internal standard.

D. Identification

The result for PFNA in MW-9A was flagged by the laboratory with an “F” to indicate that this represents an estimated maximum possible concentration (EMPC). The mass ratio for this compound was slightly outside the criteria established by the reference standards. In keeping with a conservative approach, which errs on the side of false positives, this result was qualified as presumptively present and estimated (NJ) because the mass ratio was outside the established range.

A. Blanks

Initial and continuing calibration blanks were analyzed at the proper frequencies. Two preparation blanks and one field blank (FIELD BLANK) for total cyanide were prepared and analyzed with the samples. The following blank was detected for cyanide:

Blank ID	Analyte	Concentration (mg/L)	Associated Samples	Qualifier
Method Blank WG1639913-1BLANK	Cyanide	0.001	MW-DUP-1	none

The sample associated with the method blank contamination was not detected and did not warrant qualification.

B. Field Duplicates

MW-DUP-1 was collected as a field duplicate of MW-7A. MW-DUP-1 was not detected for cyanide, and MW-7A was detected at a low-level concentration between the MDL and RL (0.002 mg/L). Results for cyanide in MW-7A, MW-9A, MW-5A, WP-11, FIELD BLANK, and MW-DUP-1 were less than twice the reporting limit and were qualified as estimated (J, UJ) due to low level field duplicate imprecision.

A. Calibrations – ICs, ICVs, CCVs

A multi-point calibration was performed with an acceptable correlation coefficient (>0.995). The percent difference for each calibration level was within the acceptance limit (<30%). The initial calibration verification (ICV) was within acceptance limits (90-110%). The closing calibration verification (CCV) standard associated with MW-7A and MW-9A demonstrated elevated recovery (112%) and was biased high, outside acceptance limits (90-110%). Both reported samples were not detected and did not warrant qualification.

Blank ID	Analyte	Concentration (mg/L)	Associated Samples	Qualifier
CCB	Nitrogen, Nitrate	-0.03391	MW-7A MW-9A	NONE

NONE – Not Qualified

The continuing calibration blank (CCB) associated with the above samples indicated a negative instrument response slightly above the MDL and below the RL. Results for nitrogen, nitrate in MW-7A and MW-9A were more than ten times the negative blank and its effects and did not warrant qualification of samples.

EXECUTIVE SUMMARY

Validation of the organic analyses data prepared by Alpha Analytical Westborough, Massachusetts for 16 soil vapor samples from the 60 McLean Avenue Site has been completed by de maximis Data Management Solutions, Inc. (ddms). Stage 4 validation was performed on all of the sample data. The data were reported by the laboratory under SDG No. L2224094. The following samples were reported:

SV-2A	SV-3A	SV-5A	IA-2A	SV-6A	SV-7A
SV-8A	OA-1A	SV-DUP	SV-9A	SV-10A	IA-4A
IA-3A	IA-1A	SV-4A	OA-2A		

Below is the Data Usability Summary Report (DUSR) associated with these samples.

	Data Usability Summary Report	
1.	Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA CLP data deliverables?	Yes
2.	Have all holding times been met?	Yes
3.	Do all the QC data; blanks, instrument tunings, calibration standards, calibration verifications, surrogate recoveries, spike recoveries, replicate analyses, laboratory controls and sample data fall within the protocol required limits and specifications?	No – See following sections
4.	Have all of the data been generated using established and agreed upon analytical protocols?	Yes
5.	Does an evaluation of the raw data confirm the results provided in the data summary sheet and the quality control verification forms?	Yes
6.	Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?	Yes
7.	Have any quality control (QC) exceedances been specifically noted in the DUSR and have the corresponding QC summary sheet from the data package been attached to the DUSR?	Yes – See Attachment A

Based on the validation effort, the following data qualifiers were applied:

- Results for benzyl chloride and 1,2,4-trichlorobenzene in all samples were qualified as estimated (UJ) due to an unacceptable relative standard deviation (RSD) across the initial calibration (IC) range and/or percent difference (%D) between the initial calibration verification (ICV) and the IC.

- See Section C (Field Duplicates) for results qualified due to unacceptable field duplicate precision.

All other results were determined to be valid as reported by the laboratory. Review of Tentatively Identified Compounds (TICs) is outside the scope of this project.

This report should be considered part of the data package for all future distributions of the data.

INTRODUCTION

Analyses for the requested parameters were performed by the laboratory according to the following analytical method:

Volatile Organic Compounds (VOCs) TO-15

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used to denote specific information regarding the analytical results.

ddms' validation was performed in conformance with ddms' Standard Operating Procedures (SOPs) for the methods followed, the USEPA "National Functional Guidelines (NGF) for Organic Data Review" (1999), the requirements of the analytical methods followed, and the specifications of the project-specific Quality Assurance Project Plan (QAPP). Professional judgment was applied as necessary and appropriate.

The data validation process is intended to evaluate data on a technical basis rather than a contract compliance basis for chemical analyses conducted under the CLP. This requires that the data package be presented in accordance with the CLP requirements, so that sufficient supporting documentation is available to facilitate the validation effort. It is assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate quality review prior to submission for validation.

During the validation process, laboratory data are verified against all available supporting documentation. Based on the findings of the evaluation, qualifier codes may be added by the data validator. Validated results are, therefore, either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Final validated results are annotated with the following codes as defined by the NFG:

U The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

NJ The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.

UJ The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

All data users should note two facts. First, the "R" qualifier means that the laboratory-reported value is unusable. In other words, due to significant quality control problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Rejected values should not appear on data tables because they cannot be relied upon, even as a last resort. Second, no concentration is guaranteed to be accurate even if all associated quality control is acceptable. Strict quality control conformance serves only to increase confidence in reported results; any analytical result will always contain some error.

The data user is also cautioned that the validation effort is based on the raw data printouts as provided by the laboratory. Software manipulation cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

I. Holding Times, Preservation and Sample Integrity

Copies of the applicable chain of custody (COC) records were included in the data package, documenting a sample collection date of May 4, 2022. The samples were received at the laboratory on May 4, 2022. All samples were prepared and analyzed within method holding times.

II. Documentation

The following documentation issue was observed during the validation effort:

- The chain of custody records included one revised page with OA-17A added to the revised page. A note on page one of the COC indicated that water had been encountered at SV-1A, and the field crew had been told not to sample that location. The login report and sample list indicate that OA-17A was received.

The remainder of this report discusses the review effort for each of the parameters. The tables below document the quality control (QC) elements reviewed for each analysis parameter. Where a quality indicator was deemed acceptable after thorough review, no further discussion is included in this report. Detailed findings are included for each quality element that impacted the usability of the reported results. Additional information or explanation is included as needed, to provide support for decisions made, based on the validator's best professional judgment.

Where a result was qualified J+ or J- and J, the J qualifier takes precedence. Where a result was qualified biased high and low for differing data quality excursions, the final qualifier is J with an indeterminate bias.

A. Calibration

One initial calibration was prepared on instrument Airlab19 in association with the samples in this SDG. All relative response factors (RRFs) and relative percent differences (RPDs) [<30%] were acceptable with the exception of benzyl chloride (RPD = 31.3%). An initial calibration verification (ICV) standard was analyzed after the IC; all percent differences (%Ds) were acceptable in the ICV standard with the exception of benzyl chloride (-39.4%D) and 1,2,4-trichlorobenzene (-40.8%D). Results for benzyl chloride and 1,2,4-trichlorobenzene in all samples were qualified as estimated (UJ) due to and unacceptable RPD over the IC and/or RPD for the ICV.

B. LCS

LCS recoveries for 3-chloropropene (133%), dibromochloromethane (132%), bromoform (134%) and benzyl chloride (134%) are above the upper 130% acceptance limit. None of the samples associated with this LCS have reportable amounts of these analytes. Therefore, no data required qualification on this basis.

C. Field Duplicates

SV-DUP was collected as a field duplicate of SV-9A. Paired results, where detected in one or both samples, are summarized below.

n-Hexane	2.28	4.76	-70	1.41	no
o-Xylene	1.26	1.19	N/C	1.74	yes

N/C = not calculated

When one field duplicate result is positive but less than two times the analyte-specific RL, and the other result is not detected, it is ddms' policy to qualify for that analyte all associated sample results less than two times the RL, including non-detects, as estimated (J, UJ). Results summarized below were qualified as estimated (J, UJ) on this basis.

- 1,2,4-trimethylbenzene in SV-2A, SV-3A, SV-6A, SV-7A, SV-8A, SV-9A, SV-5A, SV-4A, and OA-2A
- 1,4-dioxane in all samples except SV-7A
- 2-hexanone in all samples except SV-6A
- benzene in SV-2A, SV-5A, SV-6A, SV-3A, SV-7A, SV-DUP, SV-4A, and OA-2A
- chloromethane in SV-5A, SV-6A, SV-7A, SV-9A, SV-2A, SV-3A, SV-8A, SV-DUP, SV-10A, and SV-4A
- ethylbenzene in SV-8A, OA-1A, SV-9A, SV-2A, SV-3A, SV-7A, SV-DUP, SV-10A, SV-4A, and OA-2A
- tetrahydrofuran in all samples
- o-xylene in SV-2A, SV-7A, SV-8A, SV-DUP, SV-9A, SV-10A, SV-3A, SV-4A, OA-2A, and IA-4A
- p/m-xylene in SV-2A, SV-3A, SV-7A, SV-8A, SV-DUP, SV-9A, SV-4A, OA-2A, and SV-10A

Results for acetone, ethyl alcohol, heptane, iso-propyl alcohol, tetrachloroethene, and n-hexane were qualified as estimated (J) due to unacceptable precision between results in the paired field samples as summarized below.

- acetone in all samples except OA-2A and SV-4A
- heptane in IA-2A, SV-6A, SV-7A, SV-8A, OA-1A, SV-DUP, SV-9A, SV-10A, IA-4A, IA-3A, IA-1A, and OA-2A
- ethyl alcohol, iso-propyl alcohol, and tetrachloroethene in all of the samples except SV-4A

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

May 27, 2022: This final report includes the results of all requested analyses.

May 25, 2022: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

The analyses of Functional Genes and Iron Reducing Bacteria were subcontracted. A copy of the laboratory report is included as an addendum. Please note: This data is only available in PDF format and is not available on Data Merger.

Sample Receipt

Due to a laboratory error during login, the requested MS/MSD could not be performed on any analysis.

L2223459-01 through -06 and -09: The analyses performed were specified by the client.

L2223459-07: A sample identified as "FIELD BLANK" was received, but not listed on the Chain of Custody. At the client's request, this sample was analyzed.

L2223459-08: A sample identified as "TRIP BLANK" was received, but not listed on the Chain of Custody and was not analyzed.

Semivolatile Organics

The WG1635587-1 Method Blank, associated with L2223459-01 through -07 and -09, has TICs detected. The results are qualified with a "B" for any associated samples that have detections of the same TICs.

Perfluorinated Alkyl Acids by Isotope Dilution

L2223459-01, -03, and -07: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.

L2223459-07: The Field Blank has a result for 6:2 FTS present above the reporting limit. The sample was

Project Number: 15514 **Report Date:** 05/27/22

Case Narrative (continued)

verified as being labeled correctly by the laboratory and the previous analysis showed there was no potential for carry over. There is no remaining volume for re-extraction confirmation.
WG1639295-3: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.

Total Metals
L2223459-01 through -07 and -09: The sample has an elevated detection limit for mercury due to the prep dilution required by the limited sample volume available for analysis.

Dissolved Metals
L2223459-07: The Field Blank has a result for manganese present above the reporting limit. The sample was verified as being labeled correctly by the laboratory and the previous analysis showed there was no potential for carry over.
The WG1642946-3 MS recoveries, performed on L2223459-01, are outside the acceptance criteria for iron (160%), magnesium (153%), manganese (204%) and potassium (133%). A post digestion spike was performed and was within acceptance criteria.
The WG1642946-3 MS recoveries for calcium (208%) and sodium (530%), performed on L2223459-01, do not apply because the sample concentrations are greater than four times the spike amounts added.

Hexavalent Chromium
L2223459-01: The sample has an elevated detection limit due to the dilution required by the sample matrix.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

collection date/time on the container label was 03-MAY-22 11:40. At the client's request, the collection date/time is reported as 03-MAY-22 12:50.
L2223093-27: Sample containers for PFAS were received for the "SB-5 (0-2)" sample, but were not listed on the chain of custody. At the client's request, the analysis was performed.

Volatile Organics
L2223093-13: The sample was received in appropriate containers (vials) for the Volatile Organics by EPA Method 5035/8260 Low-Level analysis; however, the initial analysis failed with low internal standards and the second Low-Level vial was disposed of due to laboratory error. With the client's authorization, a sample aliquot was taken from an unpreserved container (jar) and preserved appropriately. Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

Semivolatile Organics
L2223093-06: The surrogate recoveries were outside the acceptance criteria for 2-fluorophenol (4%) and 2,4,6-tribromophenol (1%); however, re-extraction achieved similar results: 2-fluorophenol (7%) and 2,4,6-tribromophenol (1%). The results of both extractions are reported.
The WG1635274-2/-3 LCS/LCSD recoveries, associated with L2223093-22 and -23, are below the acceptance criteria for 4-chloroaniline (7%/7%); however, it has been identified as a "difficult" analyte. The results of the associated samples are reported.

Semivolatile Organics by SIM
The WG1635276-1 Method Blank, associated with L2223093-22 and -23, has a concentration above the reporting limit for naphthalene. Since the associated sample concentrations are either greater than 10x the blank concentration or non-detect to the RL for this target analyte, no corrective action is required. Any results detected below the reporting limit are qualified with a "B".

Case Narrative (continued)

Perfluorinated Alkyl Acids by Isotope Dilution
L2223093-14, -19, -27, and WG1636990-3/-4: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.
L2223093-14, -19, and -27: The MeOH fraction of the extraction is reported for perfluorooctanesulfonamide (fosa) due to better extraction efficiency of the perfluoro[13c8]octanesulfonamide (m8fosa) Extracted Internal Standard.
The WG1636990-4 MSD recovery, performed on L2223093-27, is outside the acceptance criteria for perfluorotridecanoic acid (pftrda) (151%).

Pesticides
L2223093-06D: The sample has elevated detection limits due to the dilution required by the sample matrix.
L2223093-06D: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

Total Metals
L2223093-20: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by matrix interferences encountered during analysis.
L2223093-23: The Field Blank has a result for barium present above the reporting limit. The sample was verified as being labeled correctly by the laboratory and the previous analysis showed there was no potential for carry over.
The WG1639550-3 MS recoveries, performed on L2223093-01, are outside the acceptance criteria for beryllium (74%), cadmium (72%), lead (74%), nickel (73%), and zinc (74%). A post digestion spike was performed and yielded unacceptable recoveries for arsenic (69%), beryllium (63%), cadmium (68%), copper (63%), lead (57%), nickel (58%), selenium (63%), and zinc (58%). The serial dilution recoveries were not applicable; therefore, these elements fail the matrix test and the results reported in the native sample should be considered estimated.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

May 24, 2022: This final report includes the results of all requested analyses.

May 20, 2022: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L2223458-03: At the client's request, the analyses of Volatile Organics, Semivolatile Organics, Pesticides, PCBs, Total Metals, Hexavalent Chromium and Total Cyanide were not performed.

Volatile Organics

L2223458-02: The internal standard (IS) responses for fluorobenzene (13%), chlorobenzene-d5 (15%), and 1,4-dichlorobenzene-d4 (14%) and the surrogate recovery for 1,2-dichloroethane-d4 (164%) were outside the acceptance criteria; however, re-analysis achieved the following results: fluorobenzene (10%), chlorobenzene-d5 (12%), and 1,4-dichlorobenzene-d4 (12%) and 1,2-dichloroethane-d4 (169%). The results of both analyses are reported.

Perfluorinated Alkyl Acids by Isotope Dilution

L2223458-05: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.

L2223458-05: The MeOH fraction of the extraction is reported for perfluorooctanesulfonamide (fosa) due to better extraction efficiency of the perfluoro[13c8]octanesulfonamide (m8fosa) Extracted Internal Standard.

Total Metals

The WG1640166-3 MS recoveries, performed on L2223458-01, are outside the acceptance criteria for lead (68%), nickel (64%), silver (74%) and zinc (71%). A post digestion spike was performed and yielded

Case Narrative (continued)

unacceptable recoveries for lead (76%), nickel (73%), silver (70%) and zinc (75%). The serial dilution recovery was not applicable; therefore, this element fails the matrix test and the result reported in the native sample should be considered estimated.
The WG1640166-3 MS recoveries, performed on L2223458-01, are outside the acceptance criteria for barium (69%), beryllium (72%), cadmium (72%), chromium (67%), copper (139%), manganese (69%) and selenium (66%). A post digestion spike was performed and was within acceptance criteria.
The WG1640166-6 serial dilution analysis, associated with L2223458-01, had a %D above the acceptance criteria for copper (29%) and manganese (21%).

Cyanide, Total
The WG1639289-2 LCS recovery for cyanide, total (42%), associated with L2223458-05, is outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported. The LCS/LCSD RPD is above the acceptance criteria for cyanide, total (67%).
The WG1639561-2/-3 LCS/LCSD recoveries for cyanide, total (76%/77%), associated with L2223458-01, -02, and -04, are outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Volatile Organics in Air

Canisters were released from the laboratory on April 28, 2022. The canister certification results are provided as an addendum.

L2224094-15D: The sample has elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG1641106-3 LCS recoveries for 3-chloropropene (133%), dibromochloromethane (132%), bromoform (134%) and benzyl chloride (134%) are above the upper 130% acceptance limit. All samples associated with this LCS do not have reportable amounts of these analytes.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank.
