1.0 INTRODUCTION

SESI Consulting Engineers (SESI) has conducted this Phase II Environmental Site Assessment (Phase II ESA) on behalf of the Requestor, GS White Plains Owner, LLC for the property located at 50 Hamilton Avenue in the City of White Plains, New York (Site). The Site properties are identified on the Westchester County Clerk's as a portion of tax parcel map Section-Block-Lot number 125.66-5-2 (50 Hamilton Avenue) and a portion of Lot 125.66-5-2 (85 North Lexington Avenue). The property south of New Street totals approximately 1.53-acres and have been historically utilized for commercial and industrial purposes and a parking lot.

The Site is bounded to the north by a bus depot and parking garage, to the south by an office building across Hamilton Avenue, to the east by a church across Lexington Avenue, and to the west by a parking lot across Ferris Avenue. This report complies with the 2015 American Society for Testing and Materials Standard (ASTM E1903). **Figure 1** presents a Site Location Map.

This Phase II ESA Report summarizes the data of soil samples and soil vapor samples collected by SESI to further investigate the Site.

1.1 Sanborn Maps

Based on our review of the Certified Sanborn® Maps available for the property, some relevant past uses of the Site prior to and including 1950 include a lumber and storage yard, a freight house with railroad transport access, a fire department station, a builder supply storage and a wholesale feed supply and grinding company. The property was redeveloped into the current parking lot sometime after 1950.

1.2 Site Settings

The Site consists of an approximate 1.5-acres parcel that has been a parking lot since after 1950. The Site had been previous developed with commercial and industrial buildings. Based on the USGS topographic map, the Site elevation is approximately 200 feet above mean sea level (ft-msl) and is relatively flat. The nearest surface water body is the Bronx River located 0.11 miles west of the Site. The current Site conditions are shown on **Figure 2**.

1.3 Proposed Site Development

We understand that the current property exists as a visitor parking lot for the existing Gateway building and is proposed to be redeveloped into a 17-story tower containing mixed-use retail, hotel and residential components with subgrade parking levels.

2.0 SUBSURFACE INVESTIGATION

The field work was conducted by SESI on June and July 2019.

2.1 Geophysical Investigation

On June 8, 2019, a geophysical technician from Enviroprobe Service Inc. was mobilized to the subject property to perform a geophysical investigation. The purpose of the investigation was to clear proposed boring and soil vapor point locations, designate utilities in a parking lot and adjacent areas and detect possible underground storage tanks (USTs) in the front sidewalk area of property. The ground surface of the survey area consisted of concrete, asphalt, natural soil surfaces.

The results of the geophysical investigation identified underground utilities at the Site. Anomalies indicative of a UST were not detected. The geophysical report is included in **Appendix A**.

2.2 Soil Borings

On June 8, 2019, twenty-one (21) soil borings were advanced using a direct push Geoprobe® rig as shown on **Table 2.1** below. A total of thirty-five (35) soil samples were collected and analyzed for various parameters at a NYSDEC ELAP-certified laboratory, Test America. The soil samples were collected from varying depths based on field screening, which includes screening with Photo Iodization Detector (PID), visual observations, and olfactory observations. All soil samples were named based on their respective soil boring number and specified depth.

On July 27, 2019, eight (8) additional soil borings were advanced using a direct push Geoprobe rig. A total of sixteen (16) soil samples were collected and analyzed for TCL/TAL+30 at Test America. The soil samples were collected from varying depths based on field screening, which includes screening with Photo Iodization Detector (PID), visual observations, and olfactory observations. All soil samples were named based on their respective soil boring number and specified depth.

Based on the soil boring logs, the Site is underlain by 4-inches of asphalt overlying fill to a depth ranging from 0.5 to 4 feet below grade (ft-bg). The fill contains brick, coal ash and wood debris including possible railroad ties at some locations. Dark brown medium to fine sand with a trace of gravel and silt underlies the fill layer to the maximum depth explored, 16 ft-bg. The soil sample locations are depicted on **Figure 3.1**. The boring logs are included in **Appendix B**.

Table 2.1 below is a table summary of the borings conducted and the samples collected.

2.3 Soil Vapor Sampling

Eight (8) soil vapor points were installed via direct push methodologies. The soil samples were collected with 1-L Summa Canisters with flow controllers set for a flow rate of 200 ml/min. Soil vapor point locations are depicted in **Figure 3.2**. The soil vapor samples were delivered under chain-of-custody to Alpha for EPA TO-15 analysis. **Table 2.2** is a table summary of the vapor samples conducted and the samples collected.

On July 27, 2019, three (3) temporary well points (TW-1, TW-2 and TW-3) were installed at the Site. Groundwater was encountered at approximately 21.5 to 25.5 ft-bgs. One groundwater sample was collected from each temporary well using a dedicated bailer. The groundwater samples were analyzed for VOCs+10 and SVOCs+15 at Test America. **Table 2.3** below is a table summary of the vapor samples conducted and the samples collected.

3.0 ANALYTICAL RESULTS

3.1 Soil Investigation Results

In total, fifty (50) soil samples were collected by SESI from 29 borings as listed in Table 2.1. The soil samples were distributed and analyzed based on potential recognized environmental conditions (RECs) and dispersed throughout the Site to determine the subsurface conditions of the entire Site. The soil samples were sent to Test America on a chain-of-custody (COC) for the following analyses: All fifty (50) samples were analyzed for TCL/TAL + 30. Soil sample locations and a summary of the results is shown in **Figure 3.1**. The soil samples were collected at depths ranging from 1.5 to 12 ft bgs. The laboratory reports for the soil samples are included electronically in **Appendix C**. **Table 3.1** presents a summary of the soil analytical results compared to the SCOs. **Table 3.2** below contains the analytical results compared with their respective Soil Cleanup Objectives (SCOs).

As shown in Table 3.1, nineteen (19) soil samples exceeded the Unrestricted and/or Restricted Residential Use Soil Cleanup Objectives.

3.2 Soil Vapor Investigation Results

Eight (8) soil vapor samples were collected from the Site. The samples were sent to ELAP-Certified laboratory (Test America) with a chain of custody (COC) for TO-15 analysis. Soil vapor sample locations and a summary of the results are shown in **Figure 3.2**. **Table 3.3** presents a summary of the soil vapor analytical results. **Table 3.4** below contains the results for the soil vapor compared with their respective New York State Department of Health (NYSDOH) Air Guideline Values and/or USEPA Targeted Sub Slab Technical Guidance concentrations. The laboratory data packages for soil vapor are included electronically in **Appendix E**.

As shown in **Table 3.4** below, five (5) soil vapor samples exceeded the soil gas Guideline Values. Sample SV-1, collected from the northwest portion of the Site, exhibited exceedances of the soil gas guidance values for benzene and vinyl chloride. Sample SV-3, collected from the central portion of the Site, exhibited exceedances of the soil gas guidance values for benzene. Sample SV-6, collected from the southeast portion of the Site, exhibited exceedances of the soil gas guidance values for trichloroethene (TCE). Sample SV-7, collected from the central portion of

the Site, exhibited exceedances of the soil gas guidance values for benzene and vinyl chloride. Sample SV-8, located in the western portion of the Site, exhibited exceedances of the soil gas guidance values for benzene.

3.3 Groundwater Results

The results of the groundwater samples showed no exceedances to the New York State Groundwater Effluent Limitations (Class GA) for VOCs and SVOCs. A summary of analytical results is presented on **Table 3.5**. The laboratory data is presented in **Appendix E**.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The investigation results indicate the presence of pesticides, metals, PAHs and PCBs above the unrestricted or restricted residential use SCOs. The metals, PAHs and PCBs exceedances are typical of historic fill. The low-level pesticide exceedances to the unrestricted use SCO are likely the result of historically applied pesticides. Additional investigation and eventually remediation of the identified exceedances should be completed before the development on the Site.

The benzene exceedances in soil vapor that were detected in the central and western portions of the Site may be a result of historic petroleum releases from an unknown source.

The soil vapor exhibited significant exceedances of the NYSDOH Guidance value for TCE and vinyl chloride. Both the chlorinated VOCs and petroleum VOCs exceedances indicate a vapor intrusion risk potential that requires further investigation and possible remediation.

Additional investigation is required to determine the limit of the detected impacts to soil and soil vapor. Step-out investigation is required to complete the delineation of the reported exceedances. Based on the additional investigation, a remedial action should be performed to remediate the impacted areas prior to any development.
