The Volunteer was accepted into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program (BCP) to investigate and remediate the Site. A Brownfield Clean-up Agreement (BCA) has been executed between the NYSDEC and Warburton Avenue Apartments LLC, which is performing the remediation as a Volunteer. BCP Site No. C360227 was assigned to the Site.

The Site is comprised of the above parcels in a mixed residential and commercial area of Yonkers, New York. The Site is (±)1.166-acre property, comprised of 15 tax lots separated into two areas by Woodworth Avenue. The Site is comprised of undeveloped land and is improved with one vacant mixed-use (residential and commercial) building with a detached two-bay garage and one unoccupied formerly residential building. Prior uses of the Site have included residential, commercial, and dry-cleaning activities. All of the lots will be merged following closing.

The Volunteer plans to prepare the Site for remediation and redevelopment, which will include the demolition of existing buildings at 305 Warburton Avenue and 321 Warburton Avenue followed by the construction of a new 6-story residential affordable housing building. The future building will include a basement and a cellar. In addition, surface parking adjacent to the southwest portion of the proposed building as well as the across Woodworth Avenue (Block 2115, Lots 34 through 38) are also planned as part of the development. Construction of the foundation for the proposed building will include the excavation of soils throughout the building footprint up to approximately thirteen feet (ft) below ground surface (bgs) for the basement and up to approximately twenty-two ft bgs for the cellar. Areas outside of the building footprint will be excavated to between approximately four and ten ft bgs.

Adjacent properties include residential dwellings, commercial storefronts and undeveloped lots. Two of the adjacent commercial properties included former dry cleaners. Specifically, the two (2) former dry cleaners were located: 1) directly north of the 321 Warburton Parcel (across Point Street) and 2) northeast of the 321 Warburton Parcel on the east side of Warburton Street. A Site Location Map is included as **Figure 1**. A Tax Parcel Map is included as **Figure 2**.

This RI Report presents environmental data and findings from a Remedial Investigation (RI) performed by LaBella Associates between August 1, 2023, and April 2024, and is intended to document the results of the investigations within the property boundary and evaluate if off-Site adjacent properties may be impacted. The investigation was performed in accordance with the NYSDEC-approved Remedial Investigation Work Plan (RIWP), approved on April 24, 2023, through subsequent verbal communications with the NYSDEC. The RI work was also conducted in accordance with Title 6 of the New York Codes, Rules and Regulations (6 NYCRR) Part 375-1, 3.8, 6.8, NYSDEC Division of Environmental Remediation (DER) Program Policy: Technical Guidance for Site Investigation and Remediation (DER-10), and the New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006, with updates. The 2023 RI was performed under the supervision of Mr. Daniel Noll, a New York State (NYS) registered professional engineer (PE).

The objectives and goals of the RI were to:

- Address remedy-relevant data gaps identified by NYSDEC,
- Prepare a Conceptual Site Model,
- Define the nature and extent of contamination in all media at or emanating from the Site,
- Determine whether completed exposure pathways exist in connection with on-Site sources,
- Estimate the volume of soil that requires remediation,
- Generate sufficient data to evaluate the remedial action alternatives and prepare a Remedial Action Work Plan (RAWP) to be implemented concurrently with site redevelopment, and
- Generate sufficient data to evaluate the actual and potential threats to human health and the environment.

The remainder of the RIR is organized as follows:

- Section 2.0 describes the site setting and physical characteristics,
- Section 3.0 describes the site background including results of previous investigations,
- Section 4.0 presents the RI field sampling procedures, observations, and analytical results along with a summary of RI Findings,
- Section 5.0 presents a qualitative assessment of the exposure risks of site contaminants to human, fish, and wildlife receptors, and
- Section 6.0 summarizes the results of the investigation and presents conclusions and recommendations.

The delineation of constituents of potential concern (COPCs) to the applicable cleanup objectives has been substantially completed for the Site. The Remedial Investigation (RI) consisted of the collection of 185 soil samples from 23 borings, 4 groundwater monitoring wells, and a soil vapor intrusion investigation including 8 soil vapor points, 3 sub-slab samples, 9 off-Site soil vapor points, and one indoor air sample. Pursuant to receipt of RI comments and subsequent discussions with NYSDEC, LaBella performed an additional investigation of the suspect fuel oil tank fill port and a soil vapor and groundwater investigation consisting of the installation and sampling of two additional soil vapor sampling points (SV-19 and SV-20), two monitoring wells (MW-5 and MW-6), three borings in the basement of 321 Warburton Ave (SB-47 through SB-49), investigation of the sewer pipe along Warburton Ave, and an evaluation of the association of 28 Point Street with the Site.

Additional work performed as part of the Pre-Design Investigation (PDI) is ongoing, including high concentration lead area (HCLA) delineation of characteristic hazardous lead extent and exceedances of applicable RRSCOs and waste characterization for off-Site facility disposal and approval of soil targeted for on-Site reuse. Following the demolition of the building at 321 Warburton Ave, soil samples will be collected and analyzed for VOCs. The findings of the PDI will be presented in a Remedial Design Modification Memorandum which will further refine the extent of remedial excavation.

The planned goal of the remediation is to achieve a Track 2 cleanup.

2.0 SITE SETTING AND PHYSICAL CHARACTERISTICS

2.1 Site Description

The BCP Site is a (±)1.166-acre property and comprised of 15 tax lots located in a mixed residential and commercial area of Yonkers, New York. The 15 tax lots will be merged into one following closing. This RI Report is intended to document the results of the investigations within the property boundary and evaluate if off-Site adjacent properties may be impacted.

The Site is comprised of undeveloped land, a vacant mixed-use (residential and commercial) building, a detached two-bay garage, and an unoccupied formerly residential building. The Site has historically been a mixed-use property with both residential and commercial occupants. Commercial occupants included grocers, auto repair, a clothing store, a tailor, a restaurant, a pharmacy, a hardware store, a security service, and a barber shop. Although the City Directory indicates a connection between 28 Point Street, which appears to be co-located with a portion of 321 Warburton Ave. based on Sanborn mapping, and the Rappaport Plaza Cleaners in 1977 there is no current known evidence that the property was utilized as a dry-cleaning facility. Photographs of the Site are included in **Appendix A**.

The Site is located in a mixed residential and commercial area of Yonkers, New York. A Site Location Map is included as **Figure 1**. A Tax Parcel Map is included as **Figure 2**.

Adjacent properties include residential dwellings, commercial storefronts, and undeveloped lots. Two of the adjacent commercial properties included former dry cleaners. Specifically, the two (2) former dry cleaners were located: 1) directly north of the 321 Warburton Parcel (across Point Street) and 2) northeast of the 321 Warburton Parcel on the east side of Warburton Street (322 Warburton Ave). **Figure 3** presents surrounding land uses and the location of potential sensitive receptors, including schools and day care centers within a ½ mile radius.

2.2 Topography

According to the United States Geological Survey (USGS), elevation ranges from approximately 50 feet above mean sea level (amsl) in the western area to 80 feet amsl in the eastern area. The Site slopes west towards the Hudson River.

2.3 Wetlands

No surface water bodies, or wetlands are located on Site based on information obtained from the NYSDEC Info Locator database, however, the Hudson River is located approximately 0.2 miles west of the Site and the Site is located within a Critical Environmental Area.

2.4 Geology and Hydrogeology

2.4.1 Regional Geology/Hydrogeology

According to the NYSDOT Geotechnical Design Manual Chapter 3 NYS Geology, the region is located within the Manhattan Prong, a subdivision of the Hudson Highlands.

The geologic setting consists of intensely metamorphosed sediments. The rocks extend in parallel ridges; and folding has steeply upturned them so that differential erosion has developed the ridges. Resistant rocks of schist, gneiss and granodiorite form the ridges while less resistant marble is the valley maker. According to the USGS NYC Region Geologic Map, the area is underlain by Precambrian gneisses.

2.4.2 Site Geology/Hydrogeology

The Site's bedrock is mapped on the Geologic Map of New York as Precambrian-Middle Proterozoic-aged rocks consisting of Fordham gneiss, biotite, and granite. A review of the Surficial Geologic Map of New York (Lower Hudson Sheet, 1989) indicates that surficial soils in the area are mapped as till. Based on a review of available information, including area topography, regional groundwater flow in the vicinity of the Site is expected to be west towards the Hudson River. Municipal water supply is provided by the Water Bureau of Yonkers.

Based on previous geotechnical investigation, on-Site soil generally consists of fill material from surface to approximately 4 to 12 feet bgs. Fill material is underlain by dense to very dense brown coarse to fine Sand, with varying amounts of silt and gravel. Depth to groundwater in the on-Site monitoring well (MW-1) was observed to be 49.25 feet below ground surface (ft bgs). During the geotechnical investigation, bedrock was not observed up to 101 ft bgs. The geotechnical investigation is further discussed in **Section 3.3.4.**

Based on the RI, on-Site soil generally consists of fill material from surface to approximately 5 to 10 ft bgs. The non-native historic fill material generally appears to consist of fine brown sand, asphalt, brick, wood, glass, ash and other construction debris. Fill material is underlain by light brown medium-fine sand, with varying amounts gravel. Based on measurements taken in December 2023, depth to groundwater at monitoring wells MW-1 through MW-4 was observed to be approximately 35.9 to 64.8 ft bgs. Groundwater elevation at monitoring wells MW-1 through MW-4 was observed to be approximately 29.6 to 32.8 ft (assumed datum) at monitoring wells MW-1 through MW-4. Bedrock was encountered at approximately 71 ft bgs at MW-1D.

3.0 SITE BACKGROUND

3.1 Historical Use

The Site has historically been a mixed-use property with both residential and commercial occupants. Commercial occupants included grocers, auto repair, a clothing store, a tailor, a restaurant, a pharmacy, a hardware store, a security service, and a barber shop. The available information indicates that the building located at 321 Warburton Avenue may have been used as an office but there is no indication that it was utilized as a dry cleaning facility.

3.2 Proposed Redevelopment Plan

The Volunteer plans to prepare the Site for remediation and redevelopment, which will include the demolition of existing buildings at 305 Warburton Avenue and 321 Warburton Avenue followed by the construction of a new 6-story residential affordable housing building. The future building will include

a basement and a cellar. In addition, surface parking adjacent to the southwest portion of the proposed building as well as the across Woodworth Avenue (Block 2115, Lots 34 through 38) are also planned as part of the development. Construction of the foundation for the proposed building will include the excavation of soils throughout the building footprint up to approximately 13 ft bgs for the basement and up to approximately 22 ft bgs for the cellar. Areas outside of the building footprint will be excavated between approximately 4 and 10 ft bgs.

3.3 Prior Investigation Reports

The following previous investigation reports were reviewed during the RI to assist in the evaluation of subsurface Site conditions. Historic sampling results are included in **Appendix B.** Prior investigation reports can be provided upon request.

A summary of the findings from previous environmental reports is presented below.

3.3.1 Phase I Environmental Site Assessment – February 2022

A Phase I ESA was performed at the Site in February 2022 by LaBella. The Phase I ESA identified the following recognized environmental conditions (RECs):

- An approximately 4-foot by 30-foot area of discarded asphalt material was observed on Lot 27. This material appears to be debris, and the surrounding area is soil surface. Asphalt is a petroleum product, and this apparently discarded material on Lot 27 was considered a REC in the Phase I.
- Two adjacent off-Site properties were identified as historic dry cleaners in the Phase I – (1) the northern adjacent property located at 323 Warburton Ave north of Lot 24 was identified as a

dry cleaner on records from 1971 through 2004, and (2) the eastern adjacent property located as 322 Warburton Ave was identified as a dry cleaner in at least 1971. Additionally, the eastern adjoining property was previously occupied by a pest control company. Based on these prior adjacent uses, these adjoining properties were considered a REC in the Phase I.

- Based on findings and results from LaBella's Phase I ESA, the following significant data gaps (SDGs) were identified in connection with the Site:
    - SDG-1: While some municipal records were obtained, which indicated the mixed-use structures on Lot 24 and in the Lot 32 residence were both previously heated with fuel oil, and that abasement fuel oil AST was removed from Lot 32 circa 2017, no other information regarding heating oil storage at these structures or on the Site was provided. Ten prior buildings previously present, which were likely heated with fossil fuel-based heating systems. including coal, natural gas, and oil, but no information was provided regarding coal storage areas, coal ash disposal, or the location of the associated oil tanks. At least two fires were reported for prior buildings (1972 and 1980), and these structures were demolished between 1968 and 1983. No former owner interviews could be conducted since the buildings were all vacant or demolished. The lack of information regarding the storage of oil on the Site (both current and former structures) and the condition of the Site in relation to the prior oil storage and coal use is considered an SDG. LaBella notes that no information was provided as to if the former oil tanks were underground and/or removed from the property.
    - SDG-2: A detached garage was constructed on Lot 24 circa the early 1900s. No information was provided regarding prior uses of this garage (e.g., residential, or commercial use), and an owner interview could not be conducted. However, the prior use history summarized in the BCP Application suggests this Lot may have been used as an auto store. The lack of any detailed information regarding activities associated with this structure is considered an SDG.
    - SDG-3: Spill No. 1607103 was reported in 2016 for the grocery store at 323 Warburton Avenue (Block 2117, Lot 28), when a 550-gallon fuel oil UST was removed, and soil contamination was observed. Conflicting information was provided as to whether post removal soil sampling occurred, and the spill remains open. The lack of information regarding the condition of the subsurface in the area of the Site was considered an SDG in the Phase I report.

3.3.2 Phase II Environmental Site Assessment & Geophysical Survey – April 2022

A Phase II ESA was performed at the Site between March 7 and March 8, 2022, with an additional mobilization on March 28, 2022. The scope of work consisted of the installation of 22 soil borings and the collection of 31 soil samples. The Phase II ESA was conducted to assess potential subsurface impacts to the Site from past uses of the properties, to determine if any releases have occurred, and if so to evaluate potential BCP eligibility. The Phase II Investigation included sampling to address the RECs identified by LaBella's February 2022 Phase I ESA and the SDG suspect areas.

The findings and conclusions of the investigation are as follows:

- The geophysical survey indicated a metallic subsurface anomaly outside the footprint of former Site structures in the western portion of Lot 27. The anomaly was approximately 6-ft by 6-ft in size and approximately 2.5-ft. bgs. A metallic subsurface anomaly was also located along the eastern boundaries of Lot 36. This anomaly was approximately 11-ft by 10-ft in size and approximately 2.5-ft. bgs. Two underground lines with no identified use, four (4) underground gas lines, and one (1) underground water line was identified extending onto the Site from

Warburton Avenue. Two (2) underground gas lines and one (1) underground water line were identified extending onto the Site from Woodworth Avenue. One (1) underground gas line was identified extending onto the Site from Point Street. Additional investigation of these anomalies was performed as part of this RI and is detailed in **Section 4.2.**

Soil

- Soil borings adjacent to the metallic anomalies identified during the geophysical survey confirmed the presence of construction and demolition (C&D) debris but no evidence of a leaking UST; however, conditions beneath the anomalies / potential USTs were not evaluated and there may be the potential for an undetected release to have occurred.
- Exceedances of NYSDEC Soil Cleanup Objectives (SCOs) were observed at soil borings near the two metallic anomalies including pesticides and metals at SB-08 and SB-11, and SVOCs (Indeno(1,2,3-cd)pyrene) at SB-11.
- Field observations from soil borings and laboratory analytical results for soil samples indicate the presence of contaminated historic fill material containing C&D debris, brick, concrete, wire, ash, wood, plastics, glass, and asphalt throughout Lots 21, 22, 24, 26, 27, 28, 32, 34, 35, 36, 37, and 38 to depths ranging from ground surface to at least 4 ft bgs. [Note, borings were terminated at 4-ft. bgs and thus fill material depth was not fully assessed as part of the initial Phase II ESA work.]
- The following exceedances were detected in soil:

    - SB-13 at 2 to 4 ft bgs contained Lead (499 mg/kg vs 400 mg/kg RRSCO) and Mercury (0.936 mg/kg vs 0.81 mg/kg RRSCO).

Residential Use SCO Exceedances

- In addition to the RRSCOs exceedances listed above, soil samples from Lot 18 (SB-04), Lot 16 (SB-06), Lot 34 (SB-09), Lot 36 (SB-11), and Lot 37 (SB-12) contained COCs that exceeded the residential use SCO (RRSCO) as follows:

- SB-12 at 0 to 2 ft bgs contained Trivalent Chromium (41 mg/kg vs 36 mg/kg RUSCO).

Unrestricted Use SCO Exceedances

- Various exceedances of UUSCOs for volatile organic compounds (VOCs) (Methylene Chloride), polychlorinated biphenyls (PCBs) (4,4'-DDD; 4,4'-DDE; 4,4'-DDT; alpha-Chlordane; Dieldrin), Metals (Trivalent Chromium, Copper, Lead, Manganese, Zinc), and Total PCBs were observed at soil boring locations throughout the Site but below their respective RUSCOs. In summary,
  - The presence of metals in shallow sub-surface soils throughout the Site at concentrations that exceed CUSCOs and RRSCOs appear to present a direct contact risk under existing conditions.
  - The concentrations of lead observed in sub-surface soils throughout the Site indicate the potential for this material to be considered hazardous.
  - Soil vapor sampling results indicate the presence of petroleum hydrocarbon-related constituents throughout the Site as well as PCE at Lot 34 at concentrations that indicate that additional action may be warranted for the protection of human health.

Soil Vapor

On March 14, 2022, LaBella collected five (5) soil vapor samples (SG-01 through SG-05) to evaluate subsurface vapors with respect to the potential for a completed vapor intrusion pathway to exist under future development of the Site. Soil vapor samples were collected from approximately 5 ft bgs in Lots 24, 26, 32, 34, and 38. On March 28, 2022, LaBella collected an additional soil vapor sample in Lot 22 to address data gaps and further evaluate soil vapors downgradient of Lot 24.

Soil vapor sampling results indicated the presence of petroleum hydrocarbon-related constituents throughout the Site as well as tetrachloroethylene (PCE) at Lot 34. The concentrations detected indicated that additional action may be warranted for the protection of human health.

The Phase II report recommended the following:

- The contaminated historic fill and C&D material at the Site will require removal, including waste characterization sampling and special handling, transportation, and disposal, should the Site be redeveloped.
- Additional action may be required as part of the redevelopment of the Site to address the potential for soil vapor intrusion due to the presence of petroleum and chlorinated aliphatic hydrocarbon-related constituents in soil vapor at the Site.
- A groundwater investigation, which may require the installation of bedrock wells, should be performed to evaluate the potential for contamination that may have been caused by multiple dry cleaners on and surrounding the Site.
- Additional investigation of metallic anomalies observed at Lots 27 and 36 should be performed prior to, or during, remedial excavation.

3.3.3 Supplemental Phase II Environmental Site Assessment – July 2022

A Supplemental Phase II Environmental Site Assessment was performed at the Site on June 6 and June 17, 2022. The scope of work consisted of the installation of one permanent monitoring well (MW-1) to the west of the building on Lot 24 which appears to be in a hydraulically downgradient location, three shallow soil borings (S-01 through S-03) at Lot 28, two sub-slab soil vapor samples (SS-01 and SS-02), and one indoor air sample (AA-01) from Lot 24. The Supplemental Phase II ESA investigation was conducted to evaluate groundwater and soil vapor conditions in the vicinity of the former dry cleaner located at Lot 24 as well as to further evaluate subsurface conditions at Lot 28.

The findings and conclusions of the investigation are as follows:

Groundwater

- On June 6, 2022, Albert Hyatt & Sons Well Drilling installed a monitoring well (MW-1) on the eastern side of Lot 21, hydraulically downgradient of Lot 24. A steel casing was advanced to 25 feet below grade to allow for the installation of a 2-inch diameter PVC monitoring well to a depth of approximately 59 feet below grade with a screened interval of 49 to 59 ft bgs. Filter sand was packed around the screened portion of the monitoring well and the top 10 feet was sealed with bentonite.
- On June 17, 2022, MW-1 was developed and sampled by low-flow methodology. Depth to groundwater was measured at 49.25 feet bgs.
- Groundwater data were compared to the applicable 6 NYCRR Part 703 Groundwater Quality Standard or Technical and Operational Guidance Series (TOGS 1.1.1) Groundwater Standards and/or Guidance Values. The groundwater sample collected at MW-1 contained PCE at a concentration of 31.6 ug/l which exceeds the TOGS 1.1.1 Groundwater Standard of 5.0 ug/l.

Soil

- On June 17, 2022, LaBella personnel manually collected shallow soil samples from the 0 to 2 foot interval at three locations (S-01 through S-03) at Lot 28 using hand digging tools and a hand trowel and logged and prepared samples for laboratory analysis to further evaluate subsurface conditions, including the potential presence of contaminated historic fill material.
- Evidence of historic fill material was observed including loose sandy soil, bricks, shale, and miscellaneous debris. Soil samples were collected from each soil boring's corresponding sample depth(s).
- Soil analytical results were compared to NYCRR Part 375 Soil Cleanup Objectives (SCOs). The following exceedances were detected:

  Restricted Residential Use SCO (RRSCO) Exceedances

  - A soil sample collected from 0 to 2 feet below ground surface (ft bgs) at Lot 28 (S-02) contained Indeno(1,2,3-cd)pyrene at a concentration of 0.585 mg/kg which exceeds the RRSCO of 0.5 mg/kg.

Soil Vapor

- On June 17, 2022, LaBella personnel collected co-located sub-slab soil vapor and indoor air samples (SS-01 / AA-01) from the basement of 321 Warburton Ave (Lot 24) as well as a soil vapor sample (SS-02) from the alley immediately adjacent to the building. The indoor air sample was collected within the breathing zone approximately 5 ft above the floor. The indoor air samples were collected concurrently with the sub-slab vapor samples.

- Results of soil vapor samples were compared to NYSDOH air guideline values (AGV), soil vapor intrusion guidelines (SVIG) and USEPA Building Assessment and Survey Evaluation (BASE) Database - 90th Percentile.
- SS-01: Sub-slab soil vapor sampling results at Lot 24 indicate the presence of Tetrachloroethylene (PCE) in soil vapor (300 micrograms per cubic meter (µg/m³)) exceeding the applicable NYSDOH AGV of 30 µg/m³ and the USEPA Building Assessment and Survey Evaluation (BASE) Database - 90th Percentile as well as the presence of Trichloroethylene (TCE) in soil vapor (2.4 micrograms per cubic meter (µg/m³)) exceeding the applicable NYSDOH AGV of 2 µg/m³. With comparison to the DOH matrix, no further action is required based upon current site conditions and data available.

The Supplemental Phase II report concluded the following:

- Field observations from soil borings and laboratory analytical results for soil samples indicate the presence of contaminated historic fill material containing construction and demolition (C&D) debris in Lot 28 in at least the 0 to 2 ft bgs range. A soil sample collected from S-02 at 0 to 2 ft bgs on Lot 28 contained (Indeno(1,2,3-cd)pyrene) at a concentration that exceeds the applicable NYSDEC RRSCO.
- Soil vapor sampling results indicate the presence of chlorinated aliphatic hydrocarbon-related constituents including TCE and PCE at Lot 24. The groundwater sample collected at MW-1 contained PCE at a concentration of 31.6 µg/l which exceeds the applicable the applicable TOGS 1.1.1 Groundwater Standard.

Sampling results are depicted on the figure in **Appendix B.**

3.3.4 Geotechnical Investigation – October 2022

A Geotechnical Investigation performed in October 2022 by Geotechnical Engineering Services, P.C. (GES), attached as **Appendix C**, included the advancement of eleven geotechnical borings and one groundwater monitoring well. The findings and conclusions of the investigation are as follows:

- Ground surface elevations vary greatly across all properties and fill was found at grade in all boring locations.
- Stratum 1: Fill – The Fill generally consists of loose to very dense brown coarse to fine Sand, with varying amounts of gravel, brick fragments, silt, roots, concrete, wood, glass, and asphalt fragments. Stratum 1 was encountered at grade in all borings, though Borings B-6 to B-11C were terminated in the Fill, after extending between 4 and 12 feet below surrounding grade. Where Stratum 2 was encountered (Borings B-1 to B-5), the Fill was measured to range from about 6 to 11 feet thick.
- Stratum 2: Dense to Very Dense Sand – Encountered in Borings B-1 to B-5 only, Stratum 2 generally consists of dense to very dense brown coarse to fine Sand, with varying amounts of silt and gravel. While Stratum 2 is not uniform, there also does not appear to be consistent trends in the level of compactness of the soil encountered, or silt/gravel content when drilling deeper within Stratum 2, to subdivide Stratum 2 into other layers. As such, Borings B-1 to B-5 extended between 13.5 and 90.4 feet into Stratum 2, and bedrock was not encountered.
- Following the completion of Borings B-4W, a 20.2-foot-deep groundwater observation well was installed in the completed borehole. An electronic piezometer was installed in the boring to take hourly readings of the water level, from September 22 to October 12, 2022. Based on the readings obtained from the electronic piezometer, the groundwater level does not appear to be present within 20 feet of the ground surface at Boring B-4W and appears to be deeper

than about El. +75. Based on the results of the groundwater monitoring, GES is of the opinion that groundwater will not likely be encountered during redevelopment work.

- Refusal was encountered at boring location B-11A, boring logs indicated a possible obstruction at approximately 4 ft bgs. This boring was offset, and refusal was encountered again at B-11B at approximately 5.3 ft bgs. The final offset, B-11C, refusal was encountered a final time at approximately 4 ft bgs.

3.3.5 Phase I Environmental Site Assessment – February 2024

A Phase I ESA was performed at the Site in February 2024 by LaBella. The 2024 Phase I ESA identified the following RECs:

- Five monitoring wells, two 55-gallon drums of non-hazardous soil cuttings, and boring locations noted on the Site are associated with the ongoing remediation of the Site under the BCP (Site No. C360227). The BCP listing is related to historical uses of the Site and adjacent properties. Areas of concern include CHFM, metallic anomalies, and soil vapor and groundwater impacts from adjacent dry cleaner operations.

- Current and historical on-Site structures appear to have been used for residential and/or commercial purposes and would not be anticipated to have included the use or storage of hazardous substances or petroleum products under conditions that would pose a significant environmental concern. Municipal notes indicated that some structures were heated with oil.

Based on the results of the 2024 Phase I ESA, the following items were noted:

- A fill port was noted at 305 Warburton Avenue potentially associated with a fuel oil AST that was removed in 2017 when the building was converted to natural gas.

- A fill port in the sidewalk in front of the garage on 321 Warburton Avenue (Block 2116, Lot 24) which was further investigated as part of a geophysical study conducted in February 2024 (Section 4.2.1). This pipe is likely associated with a removed AST.

- One unlabeled bucket was identified in the backyard of 305 Warburton Avenue, likely associated with renovation activities. No staining was noted; however, as a best management practice, the buckets and contents will be disposed of properly.

- The City Directory indicates that the Rappaport Plaza Cleaners was associated with the address 28 Point Street in 1977. Sanborn mapping indicates that 28 Point Street appears to be co-located with the northern side of the building at 321 Warburton Ave.

The 2024 Phase I ESA is attached in **Appendix B.**

LaBella has further investigated the association of the Site with 28 Point Street since the preparation of the 2024 Phase I ESA based on discussions with the NYSDEC. The findings are summarized below.

The Sanborn maps indicate that 28 Point Street address appears on the North side of the building at the address 321 Warburton Avenue. Several city directory listings are associated with the address 28 Point Street. The City of Yonkers Tax Assessor does not have any record of a Block/Lot associated with the address 28 Point Street.

The following is a summary of the City Directory listings and Sanborn map observations for the addresses 322 Warburton Ave, 28 Point Street, and 321 Warburton Ave, listed in chronological order:

- The 1971 Sanborn map indicates the existence of a dry cleaner at 322 Warburton Ave. There appear to be stores in the building on 321 Warburton Ave.

- In 1972, the City Directory lists Plaza Cleaners, Rappaport Cleaners, and Rappy's Cleaners at the address 322 Warburton Ave. Bernard Cimons, Glenwood Pharmacy, and Philip A. Wrona are listed under the address 321 Warburton Ave. There is no listing under the address 28 Point Street.

- The 1989, 1990 and 1991 Sanborn maps indicate that there is a commercial building at 322 Warburton Ave constructed in 1979 and multiple stores in the building on 321 Warburton Ave.

- In 1992, The City Directory lists Plaza Cleaners & Launderers and Rappaport Plaza Cleaners & Launderers under the address 322 Warburton Ave. Glenwood Pharmacy and Ranardo Robinson are listed under the address 321 Warburton Ave. Hicks Agency and Q.J. Hicks are listed under the address 28 Point Street.

- In 1995, the City Directory lists Plaza Cleaners & Launderers and Rappaport Plaza Cleaners & Launderers under the address 322 Warburton Ave. Glenwood Pharmacy is listed under the address 321 Warburton Ave. Hicks Agency is listed under the address 28 Point Street.

- In 2000, the City Directory lists Plaza Cleaners & Launderers and Rappaport Plaza Cleaners & Launderers at the address 322 Warburton Ave. Glenwood Pharmacy and an unknown occupant are listed under the address 321 Warburton Ave. There is no listing for 28 Point Street.

- The 2004 Sanborn map indicates that there is a commercial building at 322 Warburton Ave and a store at the building on 321 Warburton Ave.

- In 2005, the City Directory lists Rappaport Cleaners at the address 322 Warburton Ave. Glenwood Pharmacy, Lehman Insurance Agency Inc, Crystal Edwards, Marvin Richards, and Frances Rodney are listed under the address 321 Warburton Ave. Sovereign Security Agency Inc is listed under the address 28 Point Street.

- In 2014, there is no listing in the City Directory under 322 Warburton Ave or 28 Point Street. Mark Martin and Mels Point Street Hardware Corporation are listed under 321 Warburton Ave.

- In 2017, the City Directory lists Rappaport Plaza Cleaners under 322 Warburton Ave. There is no listing under 28 Point Street. Mels Point Street Hardware Corporation are listed under 321 Warburton Ave.

Based on historical city directories and Sanborn mapping, it appears that several storefronts and potential offices or residences existed in the building at 321 Warburton Ave from 1971 through 2017. It appears that there were former dry cleaners at 322 Warburton Ave under several names from 1972 to 1977. The building at 322 Warburton Ave appears to have been demolished after 1977 and a new building was constructed in 1979. City directories indicate that there were several former dry cleaners at 322 Warburton Ave under multiple names from 1982 to 2010. There is no listing in the City Directory under 322 Warburton Ave in 2014, and Rappaport Plaza Cleaners is listed under 322 Warburton Ave in 2017. Although there is one listing for Rappaport Cleaners at 28 Point Street, there is no indication on Sanborn mapping that this address contained a dry cleaning facility. Sanborn mapping indicates the presence of several residential structures, storefronts, and private garages across the Site from 1886 to present. All of the buildings except the current structures on 321 Warburton Ave and 305 Warburton Ave have been demolished.

3.4 Standards, Criteria, and Guidance

The primary COPCs likely to be encountered at the Site are VOCs, SVOCs, pesticides, and metals. The applicable Standards, Criteria, and Guidance (SCGs) for soil, groundwater, and soil vapor characterization and remediation for this Site include:

4.0 REMEDIAL INVESTIGATION

The objectives and goals of the RI were to:

- Address remedy-relevant data gaps identified by NYSDEC,
- Prepare a Conceptual Site Model,
- Define the nature and extent of contamination in all media at or emanating from the Site,
- Determine whether completed exposure pathways exist in connection with on-Site sources,
- Estimate the volume of soil that requires remediation,
- Generate sufficient data to evaluate the remedial action alternatives and prepare a Remedial Action Work Plan (RAWP) to be implemented concurrently with Site redevelopment, and
- Generate sufficient data to evaluate the actual and potential threats to human health and the environment.

The following remedy-relevant data gaps were identified based on prior subsurface investigations that are pertinent to the evaluation of remedial alternatives and the selection of a remedy required for the Site:

1. Investigation and excavation of the metallic anomalies and source(s) of refusal observed during the 2022 geotechnical investigation at boring B-11A, B-11B, and B-11C located in the southwestern portion of the Site,
2. Determination of vertical extent of contaminated historic fill material (CHFM),
3. Further delineation of soil vapor in the vicinity of 321 Warburton Avenue by collecting additional soil vapor samples to identify potential for an on or off-Site source to exist and evaluate the potential for off-Site migration of soil vapor from an on-Site source,
4. Evaluation of the potential for dissolved-phase constituents to be migrating onto the Site from an off-Site source,
5. Evaluation of the potential for and conditions to support the monitored natural attenuation of dissolved-phase chlorinated aliphatic hydrocarbon-related constituents in groundwater after source removal, if present, and
6. Data necessary to develop remedial alternatives.

Deviations from the NYSDEC-approved RIWP are discussed in Section 4.2.4.

4.1 Areas of Concern

The following Areas of Concern (AOCs) were previously identified at the Site based on the data prior investigations. The AOCs are presented on **Figure 4.**

AOC 1 - Contaminated Historic Fill Material (CHFM)

AOC 1 is located throughout the Site, which is approximately 1.166 acres. CHFM was observed in nearly every boring location during the April 2022 Phase II ESA and geotechnical investigation. Historic fill was commonly used as backfill in urban areas to raise and level land. Fill soils typically exhibit elevated concentrations of PAHs and metals, as well as occasional pesticides, which is consistent with the soil analytical results from the Phase II ESA. The results of the Phase II ESA performed at the Site indicate the presence of elevated concentrations of SVOCs (specifically polyaromatic hydrocarbons [PAHs] and metals have been detected in shallow soil throughout the Site (up to at least 4 ft bgs) which was the maximum depth of the Phase II ESA borings.

The results of the geotechnical investigation indicate that the fill is present from the ground surface to at least 6 to 11 to 12 ft bgs. Visual observations of RI soil borings indicate the presence of a layer of contaminated historic fill material (CHFM) across the Site to depths of up to approximately 12 ft bgs. The non-native historic fill material generally appears to consist of gravel, brick fragments, silt, roots, concrete, wood, glass, asphalt, and construction debris, with occasional ash. Lead was detected at concentrations exceeding its RRSCO and CUSCO of 1000 mg/kg at multiple boring locations including a maximum concentration of 1,910 mg/kg. Several High-Concentration Lead Areas (HCLAs) were identified including a relatively large area containing hazardous lead to depths of approximately 6 ft bgs in the vicinity of the suspect historic furnace (Block 2115, Lots 34-36), two limited areas containing hazardous lead to depths of approximately 0 to 2 and 4 to 6 ft bgs, respectively, in the vicinity of wells MW-1 and MW-1D along Point Street (Block 2116, Lots 21-22), and another limited area containing hazardous lead approximately 6 and 8 ft bgs in the upper lot of Warburton Ave (Block 2115, Lot 28). The vertical extent of the CHFM and potential hazardous lead concentrations were investigated as part of the RI in August 2023 and further discussed in **Section 4.2.1.**

AOC 2 – Metallic Anomalies

Two metallic anomalies were discovered on-Site during the April 2022 geophysical survey that was conducted as part of the Phase II ESA. One anomaly is located in the western portion of the Site across Woodworth Avenue and the other is located on the eastern portion of the Site. The two metallic anomalies comprise AOC-2. AOC-2 was investigated as part of the RI in August 2023 and further discussed in **Section 4.2.1.**

AOC 3 – Off-Site Former Dry Cleaners / Soil Vapor

The results of the April 2022 Phase II ESA indicated the presence of Chlorinated Volatile Organic Compounds (CVOCs), including PCE and TCE in soil vapor both on and off-Site, which may be attributable, in part or in whole, to the off-Site properties. The presence of CVOCs including PCE and TCE in soil vapor on and off-Site comprises AOC-3. The potential for soil vapor intrusion condition was investigated as part of the RI and further discussed in **Section 4.2.2.**

AOC 4 – Off-Site Former Dry Cleaners / Groundwater

The results of the April 2022 Phase II ESA indicated the presence of Chlorinated Volatile Organic Compounds (CVOCs), including PCE and TCE in groundwater at the Site, which may be attributable, in part or in whole, to the off-Site properties. The presence of CVOCs including PCE and TCE in site-wide groundwater comprises AOC-4. A groundwater investigation was conducted as part of the RI and further discussed in **Section 4.2.3.**

AOC 5 – Off-Site Fill Port

A fill port to a former fuel oil tank is located is located Off-Site, in the sidewalk along Point Street in front of the two-bay garage associated with 321 Warburton Avenue. Results of a ground penetrating radar (GPR) survey and pipe investigation were inconclusive. There was no evidence of the presence of a UST or AST. However, it is possible that a UST may be present or that the fill port may have been associated with direct-fill fuel oil operations. The potential for a fuel oil UST in the Lot 24 comprises AOC-5.

LaBella and Laurel Environmental investigated the fill port in January 2024. A ground penetrating radar (GPR) survey and pipe investigation was performed, the fill port cap was removed, and no concrete was observed. A FOIA request was submitted to the City of Yonkers on January 18, 2024. The City of Yonkers did not have any pertinent information to the fill port. GPR was performed in the area in front of the garage, roughly in the vicinity of a patched concrete portion of the sidewalk in front of the northern garage door. The boundaries between materials appeared "soft," in contrast with "hard" boundaries that are indicative of a tank being present. A pipe was detected running approximately 3 feet to the west of the fill port. Using a pipe snake, it was determined that the pipe turns west about 10 inches below the top of the pipe and runs 2 feet until a blockage was encountered. Little to no water was detected in the pipe. There was no evidence of any ASTs or cut piping located at Block 2116, Lot 24.

Results of the investigation were inconclusive, and any anomalies were likely caused by differences in the material encountered (snow, concrete, sidewalk patch) or fill material located in the area where a tank may have been removed. The findings of the GPR study and the location of the sidewalk patch suggest that a UST may have been previously removed from beneath the sidewalk. However, it is possible that a UST may be present or that the fill port may have been associated with direct-fill fuel oil operations.

4.2 Subsurface Investigation Activities

Based on previous investigations at the Site, the primary chemicals of potential concern (COPC) likely to be encountered at the Site are petroleum and chlorinated VOCs, SVOCs, pesticides, and metals. Subsurface investigation activities in accordance with the NYSDEC-approved RIWP were performed from August 1, 2023 through November 9, 2023 to address the aforementioned remedy-relevant data gaps and investigate the AOCs. Deviations from the RIWP are discussed in **Section 4.2.4.**

The following sections present a summary of field and sampling methodologies, analytical results, and findings for all subsurface investigation activities performed during this RI.

4.2.1 Soil Investigation Activities

RI soil investigation activities from August 2023 through October 2023 consisted of advancing 23 soil borings (designated SB-23 through SB-44) and 5 test pits (designated TP-1, TP-2, B11A, B11B, and B11C) at representative locations throughout the Site. The goal of the soil investigation was to characterize the vertical and horizontal extent of contaminated soil that requires remediation, including targeted AOCs 1 and 2. Previous investigations identified the presence of CHFM throughout the Site; however, the depth of this material had not been fully delineated. To investigate these data gaps, soil borings SB-23 through SB-46 were advanced as presented on **Figure 5.** In the 2022 Phase II ESA, soil borings were terminated at 4 ft bgs, so further investigation was warranted to delineate the vertical extent of CHFM. Select locations were co-located with prior borings from the 2022 Phase II ESA to the degree practicable. Soil boring logs are included in **Appendix C.**

Drilling activities were performed by Core Down Drilling, LLC of Brewster, New York, Ephase2 of Huntington, New York, Enviroprobe Service Inc., of Mt. Laurel, New Jersey, and Aquifer Drilling and Testing (ADT) of Mineola, New York under the oversight of a LaBella environmental professional. Permits were obtained with the City of Yonkers prior to subsurface activities, as necessary.

Soil borings were advanced using a direct-push drill rig and soils were characterized using the Unified Soil Classification System (USCS). LaBella field screened samples for the presence of volatile organic compounds (VOCs) using a photoionization detector (PID). Soil borings were advanced to a maximum depth of 16 ft bgs and sampled in accordance with May 2010 NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation and the April 2023 NYSDEC-approved RIWP except for the deviations as noted in **Section 4.2.4.**

Soil cuttings generated from soil boring activities that are not grossly contaminated were placed back into the borehole. Soil cuttings that were observed to be grossly contaminated were stored in the 55-gallon drum on-Site. The management of investigation derived waste (IDW) is detailed in **Section 4.2.7.**

Additionally, in November 2023, LaBella oversaw the excavation of 3 test pits (B11A, B11B, and B11C) on Lot 18 to address data gaps from the previous Geotechnical Investigation conducted in October 2022 to support the Support of Excavation (SOE) design by Geotechnical Engineering Services, P.C. The test pits were advanced to a depth of 9 ft bgs.

After discussion with the NYSDEC, LaBella advanced 3 soil borings (SB-47 through SB-49) in the basement of 321 Warburton Ave on March 28, 2024.

4.2.1.1 Soil Sampling Methodology

Soil samples were collected from each boring starting from the two-foot interval immediately below the surface (0 to 2 ft bgs) until 8 ft bgs. Samples collected from 8 to 16 ft bgs were analyzed for VOCs and the rest of the Part 375 parameters were placed on hold with select samples activated based upon observed depth of fill material and analytical results of the shallow soil samples.

RI soil samples were analyzed according to Full NYCRR Part 375 protocol with Category B deliverables. The Quality Assurance / Quality Control (QA/QC) sampling consisted of one MS/MSD per sampling matrix, one field duplicate per sampling matrix, one trip blank, and one equipment blank per sampling matrix, for every 20 samples collected. In addition, twenty percent of soil samples were analyzed for PFAS (Method 1633) and 1,4-dioxane (8270 SIM). To minimize the potential for cross-contamination, non-dedicated drilling and sampling equipment was properly decontaminated prior to and between sampling / drilling locations.

All soil samples were collected in pre-cleaned laboratory-supplied glassware and stored in a cooler on ice for transport under proper chain of custody (COC) to a NYSDOH ELAP certified laboratory, Alpha Analytical, Inc., in Westborough, Massachusetts (ELAP Certification 11148) for analysis individually following NYSDEC Analytical Services Protocol (ASP) – Category B Deliverables.

Soil samples were analyzed for:

- VOCs by USEPA Method 8260
- SVOCs by USEPA Method 8270
- Metals by USEPA Methods 6010/7471
- Pesticides, Herbicides & Polychlorinated biphenyls (PCB) by USEPA Methods 8081/8082
- PFOS/PFOA (Method 1633) and 1,4-dioxane (8270 SIM) (selected samples)

RI soil samples were sent to Alpha under standard Chain of Custody procedures.

The basement soil borings were advanced to a depth of 6 feet below the basement surface in 321 Warburton Ave. SB-47 and SB-49 were advanced using a slam bar; SB-48 was advanced with a Geoprobe 420N drill rig. The ground surface below the basement slab is approximately 9.5 feet below ground surface. The table below indicates each boring and corresponding sample depth (ft bgs) and sample interval (ft below basement surface). VOC samples were collected at two-foot intervals at each boring and sent to Alpha Analytical Laboratories in Westborough, MA for analysis on a rush (2-day) turnaround.

Boring ID	Location	Sample Depth (ft bgs)	Sample Interval (ft below basement surface)	Analysis
SB-47	East of SB-46	9.5-11.5	0-2'	VOCs
		11.5-13.5	2-4'	VOCs
		13.5-15.5	4-6'	VOCs
SB-48	Southwest of SB-46	9.5-11.5	0-2'	VOCs

		11.5-13.5	2-4'	VOCs
		13.5-15.5	4-6'	VOCs

The laboratory analytical reports are included as **Appendix D.**

4.2.1.2 Soil Analytical Results Summary

AOC 1 – Contaminated Historic Fill Material

Soil borings from the 2022 Geotechnical Investigation and the RI indicate the presence of a layer of CHFM across the Site to a maximum depth of approximately 12 ft bgs. The non-native CHFM material across the Site generally appears to consist of gravel, brick fragments, silt, roots, concrete, wood, glass, asphalt, and construction debris.

The boring logs from the geotechnical investigation and the RI indicate the following depths of CHFM as follows:

- Block 2115: Lots 34 through 38 (West of Woodworth Ave): Geotechnical boring logs indicate the presence of CHFM to a depth of approximately 12 ft bgs. RI boring logs indicate the presence of CHFM to a depth of approximately 2.5 ft bgs in the western area and a depth of 3 to 9 ft bgs in the eastern area.
- Block 2116: Lots 16, 17, 18, 21, and 22 (East of Woodworth Ave): Both geotechnical boring logs and RI boring logs indicate the presence of CHFM to a depth ranging from approximately 1 to 3 ft bgs in Lots 16 to 18. Geotechnical boring logs indicate the presence of CHFM to a depth of approximately 12 ft in Lots 21 and 22; RI boring logs indicate the presence of CHFM to a depth from approximately 1.5 to 12.5 ft bgs in Lots 21 and 22.
- Block 2116: Lots 24, 26, 27, 28, 32 (Upper Lots West of Warburton Ave): Geotechnical boring logs indicate the presence of CHFM to a depth of approximately 6 to 11 ft bgs. RI boring logs indicate the presence of CHFM in this area to a depth of approximately 9 ft bgs.

Soil analytical results were compared to Part 375 Soil Cleanup Objectives. The soil analytical results were compared to the applicable RRSCOs and CUSCOs, and Protection of Groundwater SCOs (PGSCOs)

and are included as **Table 3**. Soil boring locations and exceedances are presented on **Figure 5**. Soil boring locations and hazardous lead characterization results are presented on **Figures 6A, 6B, and 6C**. Soil sampling analytical results are discussed below.

Characterization of High-Concentration Lead Areas (HCLAs)

As part of an ongoing characterization of HCLAs, samples containing a total lead concentration in exceedance of 100 mg/kg were further analyzed by toxicity characteristic leaching procedure (TCLP) to evaluate if they were characteristic for hazardous lead.

Based on the ongoing characterization of HCLAs performed to date, hazardous lead was identified in the following areas of the Site:

- The vicinity of SB-26 and a suspected former coal-burning furnace (Block 2115: Lots 34-37) to a depth of 2 to 6 ft bgs.
- The vicinity of SB-09 and SB-44 (Block 2116: Lots 21-22) to a depth of 2 to 8 ft bgs.
- The vicinity of SB-38 (Block 2116: Lot 28) to a depth of 2 to 8 ft bgs.

A pre-design investigation (PDI) will complete the characterization of the vertical and horizontal extent of lead above RRUSCO/CUSCOs and characterization of the extent of source material (i.e. soil that is considered characteristic hazardous lead based on TCLP analysis).

Preliminary pre-design investigation HCLA results are presented on **Figures 6A, 6B, and 6C** and the analytical data is summarized in **Table 4.**

In summary,

- Geotechnical and soil boring logs indicate that CHFM is present across the Site to a depth ranging from 1 to 12 ft bgs.
- Soil analytical results indicate that SVOCs are present at concentrations exceeding applicable CUSCOs and RRSCOs across the Site to a depth of approximately 12 ft bgs.
- Soil analytical results indicate that metals are present at concentrations exceeding applicable CUSCOs and RRSCOs across the Site to a depth of approximately 14 ft bgs.
- Hazardous lead is present at three main hot spots on-Site to a depth of 2 to 8 ft bgs.
- Characterization of HCLAs will be completed as part of a PDI before and / or during the remedial phase of the work.

AOC 2 – Metallic Anomalies

On August 1, 2023, two test pits were advanced in the locations where metallic anomalies were discovered during previous investigation. C&D debris was encountered at the test pit on the eastern metallic anomaly location, and a suspect historic furnace was encountered at the test pit advanced at the western metallic anomaly location. Photographs of the test pits and suspect historic furnace are included in **Appendix A**, and test pit logs are attached in **Appendix B**.

Soil borings were also advanced during the RI co-located with the test pit locations and conditions beneath the anomalies and potential USTs were evaluated. The soil boring SB-26 was advanced in the western metallic anomaly location where the suspect historic furnace was encountered, and SB-39 was advanced in the eastern metallic anomaly location. The soil boring locations and RRSCO and CUSCO exceedances are also included on **Figure 5.**

The analytical results for the two borings located at the metallic anomaly locations indicate the presence of elevated SVOC and metals at the western metallic anomaly and slightly elevated metal levels at the eastern metallic anomaly:

- SB-26 (Western Metallic Anomaly): Benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene were detected at concentrations in exceedance of RRSCOs from 0 to 2 ft bgs. Lead was detected in exceedance of RRSCOs from 0 to 2 ft bgs and 4 to 6 ft bgs. Barium was detected in exceedance

of CUSCO from 4 to 6 ft bgs.

- SB-39 (Eastern Metallic Anomaly): Mercury was detected at 0.839 mg/kg in exceedance of the RRSCO of 0.81 mg/kg from 2 to 4 ft bgs.

4.2.2 Soil Vapor Investigation

The results of the April 2022 Phase II ESA indicated the presence of Chlorinated Volatile Organic Compounds (CVOCs), including PCE and TCE in soil vapor both on and off-Site which appears to be attributable to the former off-Site dry cleaners at 322 and 323 Warburton Avenue. To further investigate AOC-3, in September 2023, the following soil vapor points were installed pursuant to the RIWP to evaluate the potential presence and/or source of a potential soil vapor intrusion condition:

- 4 on-Site soil vapor points (SV-07, SV-08, SV-09, SV-10) within the proposed building;
- 2 on-Site soil vapor points (SV-05, SV-06) west of the proposed building footprint;
- 2 off-Site soil vapor points (SV-02, SV-03) along the sidewalk of Point Street north of the Site;
- 3 sub-slab and 1 indoor air sample in the basement of the building on Lot 24.

The soil vapor sampling points were taken at depths between 13 and 22 ft bgs to evaluate the potential for future soil vapor intrusion within the proposed building footprint and soil vapor intrusion from adjacent properties. The indoor air sample was collected within the breathing zone approximately 5 ft above the floor. The sub slab vapor samples were collected concurrently with the indoor air sample.

The off-Site soil vapor samples SV-01 and SV-04 were tentatively removed from the scope pending the results of groundwater and soil vapor data. Following results of the September 2023 soil vapor data and October 2023 groundwater monitoring data and pursuant to discussions with the NYSDEC, an additional 9 soil vapor points were installed along the northeast site boundary to further evaluate the potential for future soil vapor intrusion from the adjacent former dry cleaner properties that comprise AOC-3.

Pursuant to discussions with the NYSDEC, SV-19 and SV-20 were installed in the Point Street/Woodworth Avenue lots (Block 2116, Lots 21-22) adjacent to MW-5 and MW-1 and MW-1D, respectively. Both supplemental soil vapor sampling points were installed to 13 ft bgs.

4.2.2.1 Soil Vapor Sampling Methodology

Soil vapor sampling was conducted in accordance with the NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in New York State," (NYSDOH Guidance) October 2006 and as amended through 2015. The soil vapor point installation and sampling were performed by Laurel Environmental of Huntington Station, New York. Samples were collected into 6.0-liter Summa® vacuum canisters fitted with 2-hour flow controllers. The samplers were batch certified clean by the laboratory (AAL). Proper QA/QC protocol was followed during the collection of soil gas samples to ensure that cross-contamination in the field did not occur. The samples were submitted for analysis of VOCs by USEPA Method TO-15 to Alpha Analytical, Inc. in Westborough, Massachusetts (ELAP Certification #11148).

Temporary soil vapor probes were installed through ground surface in accordance with procedures specified in the NYSDOH Guidance and RIWP. The on-Site soil vapor sampling points were each screened with a dedicated stainless-steel screen set at approximately 13 and 22 ft bgs (based upon proposed basement depths) with polyethylene tubing fitted to grade. The off-Site soil vapor points were set to approximately 8 and 13 ft bgs. Each sampling point was backfilled with #1 crushed stone and a bentonite slurry seal to prevent outdoor air infiltration. Prior to and after sampling the integrity

of the sampling port seals was tested using tracer gas analysis. The environment surrounding the seal was enriched with the tracer gas, helium, as readings were collected through the sampling probe with a Radio detection Dielectric MGD-2002 portable helium detector. Tracer gas readings collected from each soil vapor probe were acceptable (less than 10% Helium) indicating the seals were intact and the sampling probes were acceptable for sample collection.

After the initial tracer gas test was performed, one to three volumes of the sample tubing were purged prior to collecting samples. Flow rates for both purging and collecting did not exceed 0.2 liters per minute to minimize potential outdoor air infiltration during sampling. Soil vapor sampling logs are included in **Appendix G**.

4.2.2.2 Soil Vapor Investigation Results

Soil vapor analytical results were compared to EPA Noncancer Hazard Index (NHI) and the EPA Carcinogenic Target Risk (CTR) guidance levels. Soil vapor intrusion samples were also compared against the October 2006 (as amended) NYSDOH Soil Vapor Guidance document decision matrices and the United States Environmental Protection Agency (EPA) June 2015 Soil Vapor Guidance document. The soil vapor, air, and sub-slab analytical results are presented in **Table 5**. A figure depicting the soil vapor and air sampling locations and PCE and TCE exceedances of the EPA levels is included as **Figure 7**. The laboratory analytical report is included in **Appendix D**.

The soil vapor analytical data for PCE and TCE, the remedy drivers for soil vapor on-Site, is summarized by area as follows:

<u>On-Site Soil Vapor</u>
SV-07, SV-08, SV-09, and SV-10 were installed along the eastern portion of the Site where the proposed building footprint is located. The analytical results indicate minimal presence of PCE and TCE in soil vapors in this area. PCE (EPA NHI of 42 µg/m³; EPA CTR of 11 µg/ m³) was detected at the four soil vapor points at concentrations ranging from 1.46 to 48.6 µg/m³ and TCE was not detected at any of the four soil vapor points sampled.

SV-19 was installed on the western portion of the Point Street/Woodworth Ave (Block 2116, Lot 22) adjacent to MW-5. SV-20 was installed adjacent to MW-1/1D in the Point Street/Woodworth Ave Lots (Block 2116, Lot 22). The analytical results indicate that PCE and TCE were not detected at either soil vapor point sampled.

<u>Off-Site Soil Vapor</u>

SV-02, SV-03, SV-11, SV-12, and SV-13 were installed in the sidewalk along the northeast site boundary. The analytical results indicate the presence of PCE and TCE at elevated concentrations. PCE (EPA NHI of 42 µg/m³; EPA CTR of 11 µg/m³) was detected at concentrations ranging from 52.7 to 59,000 µg/m³ and TCE (EPA NHI of 2.1 µg/m³; EPA CTR of 0.48 µg/m³) was detected at concentrations ranging from 27 to 520 µg/m³.

SV-14, SV-15, and SV-16 were installed upgradient of the Site in the sidewalk adjacent to the Former Rappaport Plaza Cleaners northeast of the Site. The analytical results indicate the presence of PCE and TCE at highly elevated concentrations. PCE (EPA NHI of 42 µg/m³; EPA CTR of 11 µg/m³) was detected at concentrations ranging from 48,000 to 530,000 µg/m³ and TCE (EPA NHI of 2.1 µg/m³; EPA CTR of 0.48 µg/m³) was detected at concentrations ranging from 110 to 4200 µg/m³.

SV-18, SV-04, and SV-17 were installed in the sidewalk adjacent to the Former Glenwood Cleaners

north of the Site. The analytical results indicate the presence of PCE and TCE at highly elevated concentrations in exceedance of EPA Noncancer Hazard Index and Carcinogenic Target Risk levels. PCE (EPA NHI of 42 µg/m³; EPA CTR of 11 µg/m³) was detected at concentrations ranging from 5,600 to 200,000 µg/m³ and TCE (EPA NHI of 2.1 µg/m³; EPA CTR of 0.48 µg/m³) was detected at concentrations ranging from 150 to 9,900 µg/m³.

Results of the indoor air and sub slab vapor samples were compared to NYSDOH matrices. PCE was detected at both SS-04 and SS-03 at 2[illegible] µg/m³ and 1350 µg/m³, respectively. TCE was detected at SS-03 at 35.3 µg/m³. Sub-slab soil vapor and indoor air sampling indicate the presence of PCE in sub slab and indoor air at concentrations that warrant additional action as per the NYSDOH Guidance document (2006, updated 2017) at 321 Warburton Ave. The NYSDOH matrices are included in **Table 5.**

The highest concentrations of PCE and TCE were in the northeasternmost location at the corner of Point Street and Warburton Ave. The highest concentration detected was directly in front of the Former Rappaport Plaza Cleaners at SV-15 (530,000 µg/m³). Soil vapor sampling results from the sidewalk adjacent to the Former Glenwood Cleaners to the north of the Site also indicate the presence of PCE and TCE at highly elevated concentrations including PCE at a concentration of 200,000 µg/m3 directly in front of the Former Glenwood Cleaners. Concentrations of PCE and TCE in soil vapor decrease significantly with distance from these suspected off-Site sources.

Specifically, proceeding east from SV-15, located directly in front of the Former Rappaport Plaza Cleaners, which contained 530,000 µg/m3 PCE, concentrations decrease to 59,000 µg/m³ PCE at SV-13 µg/m³ PCE, 3450 µg/m³ PCE at SV-03, 52.7 µg/m³ PCE at SV-02, and non-detect for PCE and TCE at SV-20, which is located adjacent to MW-1 and MW-1D and SV-19, which is located adjacent to MW-5, along the eastern property boundary near the corner of Woodworth Avenue and Point Street. On-Site concentrations of PCE in soil vapor range were detected at a maximum concentration of 48.6 µg/m³ at SV-10, with two non-detect samples (SV-19 and SV-20). TCE was not detected in any of the eight on-Site soil vapor samples collected, compared to the TCE detections ranging from 27 µg/m³ to 9,900 µg/m³ detected in soil vapor samples taken from the sidewalks on the northeast of the site in front of the Former Rappaport Plaza Cleaners and the Former Glenwood Cleaners.

4.2.3 Groundwater Investigation Activities

From September 2023 through October 2023, a groundwater investigation was performed pursuant to the RIWP to evaluate existing groundwater quality conditions and evaluate AOC-4. A total of 4 permanent monitoring wells (MW-1D, MW-2, MW-3, and MW-4) were installed on-Site and sampled. Well MW-1 was previously installed as part of the 2022 Phase II. Groundwater elevation monitoring was performed, and a groundwater contour map was prepared to confirm the direction of groundwater flow.

The following sections present a summary of the field methodologies and analytical results.

4.2.3.1 Groundwater Monitoring Well Installation

On August 1 through August 4, 2023 Enviroprobe Services, Inc. (Enviroprobe) of Mt. Laurel, New Jersey, installed three monitoring wells (MW-2, MW-3 MW-4). On October 11 and October 12, 2023, Enviroprobe installed monitoring well MW-1D. MW-1D was installed in place of the previously proposed MW-5 pursuant to discussions with the NYSDEC. MW-1D was originally proposed to a depth of 80 ft bgs, however bedrock was encountered at approximately 71.5 ft bgs, so drilling was terminated. The

NYSDEC was notified and subsequently approved the installation of MW-1D at the maximum depth of 71.5 ft bgs.

Pursuant to discussions with NYSDEC, MW-5 and MW-6 were installed in March 2024. MW-5 was installed downgradient of wells MW-1/1D to further evaluate the nature and extent of the groundwater contamination. A monitoring well (MW-6) was also installed adjacent to the sidewalk on Warburton Ave in Block 2116, Lot 28 to further evaluate the migration of contaminated groundwater from upgradient, off-Site sources. In February 2024, Enviroprobe attempted installation of MW-5 in several locations at the western end of the Point Ave/Warburton Lots. Refusal was encountered from 13 to 26 ft bgs, and the Geoprobe was not able to advance to the final depth. Aquifer Drilling & Testing (ADT) of Mineola, New York, was retained to drill MW-5 and MW-6 in March 2024 with a heavy duty sonic rig (Frate XL Max). Refusal was encountered from 74 ft bgs while drilling MW-5, and encountered at 24 ft bgs, 35 ft bgs, and 80 ft bgs while drilling MW-6.

The monitoring wells were constructed of Schedule 40 2-inch diameter PVC. MW-5 and MW-6 were installed with pre-packed #00 sand screens. Filter sand was packed around the screened portion of the monitoring well and the top 10 feet was sealed with bentonite. Monitoring well construction logs are included in **Appendix E** and monitoring well locations are presented on **Figure 8.**

4.2.3.2 Groundwater Elevation Monitoring

In March 2024, Ward Carpenter Engineers, Inc. surveyed ground surface elevations and top of groundwater monitoring well casing elevations at groundwater monitoring wells MW-1, MW-1D, MW-2, MW-3, MW-4, MW-5, and MW-6 to NAVD88 datum. Based on monitoring well gauging data taken in March 2024, depth to groundwater measurements ranged from approximately 30 ft bgs at MW-3 to 60 ft bgs at MW-2. Groundwater generally flows to the west-northwest towards the Hudson River.

Table 6 presents a summary of groundwater elevation monitoring and survey data**. Figure 9** presents groundwater elevation contours and flow direction.

4.2.3.3 Groundwater Sampling Methodology

Monitoring wells were developed in October 2023 until groundwater at all 5 monitoring wells achieved turbidity measurements below 50 nephelerometric turbidity units (NTU). LaBella collected groundwater samples for laboratory analysis from MW-1, MW-1D and MW-2 through MW-4 on October 27, 2023. Samples were collected with low-flow methodology consistent with the approved RIWP at least 24 hours after well development and discussions with NYSDEC. A Horiba U52-2 water quality meter with flow-through cell was used to measure and monitor stabilization of field parameters including pH, temperature, turbidity, conductivity, and oxygen-reduction potential (ORP).

Groundwater samples were analyzed for Full NYCRR Part 375 parameters, plus PFAS and 1,4-dioxane, with Category B deliverables and QA/QC samples. The QA/QC set consists of one MS/MSD per sampling matrix, one trip blank, and one field duplicate per sampling matrix. All samples were sent under standard Chain of Custody procedures to Alpha for expedited turnaround.

Groundwater samples were also analyzed for geochemical and biological indicators to evaluate the potential for aerobic or anaerobic biodegradation of dissolved-phase CVOC-related constituents. Field-analyzed parameters included pH, oxidation/reduction potential, conductivity, temperature, dissolved oxygen. Total and dissolved iron, total and dissolved manganese, total and dissolved organic carbon (TOC and DOC), chloride, nitrate, sulfate, alkalinity, and total dissolved solids were analyzed by the laboratory.

Groundwater sampling logs are included in **Appendix F** and the laboratory analytical reports are included in **Appendix D.**

The groundwater analytical results indicate elevated levels of VOCs, specifically PCE and TCE, SVOCs, metals, and PFAS, specifically PFOS and PFOA, in exceedance of applicable AWQS across the Site. Highly elevated levels of PCEs were detected in the upgradient well MW-2 on the northeast corner of the site, closest to the off-Site former dry cleaners that was located to the east. PCE in groundwater appears to be elevated at the wells closest to MW-2. PCE was detected at the lowest concentration at well MW-3, which is the furthest downgradient well. TCE was detected in exceedance of AWQS in one monitoring well, MW-4. SVOCs were detected at levels in exceedance of the AWQS at wells MW-1, MW-3, MW-4, MW-5, and MW-6. Metals were detected in exceedance of the AWQS at all of the wells on-Site. PFOA and PFOS were detected in exceedance of the AWQS at all of the wells on-Site.

Geochemical and biological indicator data was collected as part of the RI and included the following:

- Dissolved Oxygen
- ORP
- Alkalinity
- Chloride
- Nitrate
- Sulfates
- Organic Carbon

Anaerobic reductive dichlorination typically requires dissolved oxygen concentrations of less than 1 mg/L and highly reducing conditions with ORP values of -50 mV or greater. DO and ORP readings were collected during the October 27th, 2023 groundwater sampling event and are included in **Appendix F.** None of the wells had ORP values stabilized at less than –50 mV and only MW-3 and MW-4 stabilized with DO less than 1 mg/L. Based on these parameters, it does not appear that groundwater conditions are currently conducive to anaerobic reductive dichlorination.

4.2.4 Deviations from the RI Work Plan

The following presents a summary of deviations from the approved RIWP.

- Soil boring SB-25 was terminated with a final depth of 10 ft bgs due to refusal encountered
- Soil boring SB-46 was proposed to be drilled in the basement of the building on Lot 24. An attempt was made with a Geoprobe 6712DT, however due to the unstable structural integrity of the basement floor, the boring was terminated at 6 ft bgs.
- During the installation of soil vapor points SV-18, SV-04 and SV-17, refusal was encountered at 8 ft bgs and the three soil vapor points were terminated at 8 ft bgs.
- SV-01 replaced by 15,
- SB-45 eliminated, and MW-5 moved to MW-1D because of logistical limitations.

4.2.5 *Air Monitoring*

During all intrusive activities performed during the RI on parcels accepted into the BCP, air monitoring was performed for site personnel and the community (Community Air Monitoring Program [CAMP]) as per the NYSDEC-approved RIWP.

Dust emissions were monitored using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10). Organic odors were monitored with a PID equipped with a 10.6 eV bulb. Dust and odor suppression measures (e.g., water misting, odor suppressant) were not required. Air monitoring of the breathing zone was performed periodically during drilling and sampling activities to evaluate health and safety protection for the field personnel. No VOC or dust emissions were observed during the RI.

In addition to air monitoring in the worker breathing zone, LaBella also performed community air monitoring in compliance with the NYSDOH Generic CAMP and NYSDEC DER-10 Appendix 1A and Appendix 1B. During the RI, a single exceedance of CAMP was detected on September 7th on the work zone unit at 14:30 due to a nearby anthropogenic source.

4.2.6 *Field Equipment Decontamination*

Reusable down-hole drilling equipment was decontaminated between each boring where impacts were encountered and consisted of cleaning the drilling rods. Water used to decontaminate equipment was containerized in 55-gallon drums which were left on-Site with proper labeling.

4.2.7 *Management of Investigation Derived Waste*

Waste materials generated during the RI were containerized in a 55-gallon drum to be disposed of as hazardous or non-hazardous waste based upon their characteristic qualities generated in accordance with applicable regulations. Purge water from groundwater well development and sampling were treated with an activated carbon filtration system before being discharged into the earth in Lot 18. During test pitting activities on the Northeastern and center Lots, material was placed back in the excavation on a first-out, last-in basis.

4.2.8 *Quality Assurance/Quality Control*

The following QA/QC samples were collected during the RI.

<u>Soil QA/QC Samples</u>

- Ten duplicate samples
- Eight matrix spike/matrix spike duplicate (MS/MSD) samples
- Eight field blank samples
- Eight trip blank samples

<u>Groundwater QA/QC Samples</u>

- One duplicate sample
- One MS/MSD sample
- One field blank sample
- One trip blank sample

<u>Soil vapor QA/QC Samples</u>

- Two duplicate samples
- Two outdoor air samples

Field duplicate samples were collected to assess the precision of the analytical methods relative to the sample matrix. The duplicates were collected from the same material as the primary sample (i.e., parent sample) by splitting the volume of homogenized sample collected in the field into two sample containers.

MS/MSD samples were collected to assess the effect of the sample matrix on the recovery of target compounds or target analytes. Similarly, to duplicate samples, MS/MSD samples were collected from the same material as the primary sample by splitting the volume of homogenized sample collected in the field into three sample containers.

Field blanks were collected to determine the cleanliness of unused tubing, nitrile gloves and acetate liners used to collect groundwater and/or soil samples. Field blank samples consisted of deionized, distilled water provided by the laboratory that has passed through the sampling apparatus. Field blank samples were analyzed for the same list of analytes as the corresponding sampling event and sample matrix.

Trip blank samples were collected to assess the potential for contamination of the sample containers and samples during transport from the laboratory to the field, and back to the laboratory for analysis. Trip blanks contain about 40 milliliters of acidic water (doped with hydrochloric acid) that is prepared and sealed by the laboratory when the empty sample containers are shipped to the field, and then unsealed and analyzed for VOCs by the laboratory when the sample shipment is received from the field.

4.2.9 Data Validation / Data Usability Summary Reports

Laboratory analyses of soil, groundwater, sub-slab vapor and air samples were conducted by Alpha in accordance with USEPA SW-846 methods and analytical data was reported consistent with the NYSDEC Analytical Services Protocol (ASP) Category B deliverable format. Analytical data packages were sent to Maxine Wright-Walters of Environmental Data Validation Inc (EDV, Inc) of Pittsburgh, PA for systematic data validation to assure that the data was adequate for its intended use. Data validation was performed in accordance with the USEPA validation guidelines for organic and inorganic data review. All data was deemed acceptable by the data validator, incorporating data qualifiers as appropriate. Data acceptability was defined as being compliant with established protocols and meeting the project's data quality objectives. Laboratory analytical results tables have been updated accordingly. Environmental data was reported electronically using the database software application EQuIS as part of NYSDEC's Environmental Information Management System (EIMS).

A Data Usability Summary Report (DUSR) has been prepared for each sampling group. The DUSRs present the results of the data validation, including a summary assessment of laboratory data packages, sample preservation, and chain of custody procedures, and a summary assessment of precision, accuracy, representativeness, comparability, and completeness for each analytical method. Data Validation narratives and the full data validation reports are included in **Appendix D**.

5.0 QUALITATIVE HUMAN HEALTH EXPOSURE ASSESSMENT

A qualitative human health exposure assessment has been performed for the Site, characterizing the current and future exposure setting, identifying exposure pathways, and evaluating contaminant fate and transport. The qualitative human health exposure assessment was performed consistent with DER-10, appendix 3B and Section 3.3 (b) 8 and includes a conceptual site model. A Fish and Wildlife Resources Impact Analysis was determined to not be required given there are no ecological resources present nor in the vicinity of the Site.

The purpose of the Qualitative Human Exposure Assessment is to evaluate and document how people might be exposed to Site-related contaminants and to identify and characterize the potentially exposed population(s) now and under the reasonably anticipated future use of the Site.

Human health exposure risk was evaluated for both current and future site and off-Site conditions. The assessment includes an evaluation of potential sources and migration pathways of site contamination, potential receptors, exposure media, and receptor intake routes and exposure pathways.

In addition to the human health exposure assessment, DER-10 requires an on-Site and off-Site Fish and Wildlife Resources Impact Analysis (FWRIA) if certain criteria are met. Based on the requirements stipulated in Section 3.10 and Appendix 3C of DER-10, there was no need to prepare an FWRIA for the Site. A completed version of the DER-10 Appendix 3C decision key is included as **Appendix H.**

5.1 Current Conditions

The Site is comprised of undeveloped land, a vacant mixed-use (residential and commercial) building, a detached two bay garage, and an unoccupied formerly residential building. Prior uses of the Site have included residential and commercial auto repair. The available information indicates that the building located at 321 Warburton Avenue may have been used as an office but there is no indication that it was utilized as a dry-cleaning facility.

The Site is located in a mixed residential and commercial area of Yonkers, New York. A Location Map is included as **Figure 1**. A Site Plan that presents tax map parcels is included as **Figure 2**. Description of Surrounding Properties

Adjacent properties include residential dwellings, storefronts, including a former dry-cleaning facility on the east side of Warburton Ave. (the former Rappaport Plaza Cleaners), a former dry-cleaning facility on the north side of Point St. (the former Glenwood Cleaners), and undeveloped lots. **Figure 3** presents surrounding land uses and the location of potential sensitive receptors, including schools and daycare centers with a ½ mile radius.

5.2 Proposed Conditions

Redevelopment will include the demolition of existing buildings at 305 Warburton Avenue and 321 Warburton Avenue followed by the construction of a new 6-story residential affordable housing building that will include a basement and cellar. Surface parking adjacent to the southwest portion of the proposed building will be located on either side of Woodworth Avenue on Block 2116, lots 16-18 and Block 2115, lots 34-38). Subsurface stormwater infrastructure will be located on these parcels. Construction of the foundation for the proposed building will include the excavation of soils throughout the building footprint up to approximately thirteen feet (ft) below ground surface (bgs) for the partial cellar and up to approximately twenty-two ft bgs for the partial sub-cellar on Block 2216, lots 24, 216, 27, 28, and 32. The support-of excavation will involve 1:1 sloping with the exception of several locations which will require soldier piles and lagging top to ensure structural stability of adjacent building and / or infrastructure.

5.3 Summary of Environmental Conditions

Soil contaminants of concern (COC) include SVOCs, pesticides, PCBs, metals, and PFAS. Visual observations indicate the presence of a layer of historic fill material across the Site to depths of approximately 12 ft bgs. The non-native historic fill material generally appears to consist of gravel, brick fragments, silt, roots, concrete, wood, glass, asphalt, and construction debris. Analytical results indicate that the depth CHFM is present to a depth of approximately 12 ft bgs across the Site. The depth of CHFM fill varies across the Site based upon topographic conditions. PFOA and PFOS were

detected at eight soil samples in exceedance of PGSCOs. In addition, three hazardous lead hot spots were identified in the vicinity of the suspect historic furnace (Block 2115, Lots 34-36), in the vicinity of wells MW-1 and MW-1D along Point Street (Block 2116, Lots 21-22), and in the upper lot of Warburton Ave (Block 2115, Lot 28)

Sub-slab soil vapor and indoor air sampling indicate the presence of PCE in sub-slab and indoor air at concentrations that warrant additional action as per the NYSDOH Guidance document (2006, updated 2017) at 321 Warburton Ave. Soil vapor sampling results from the sidewalk adjacent to the Former Rappaport Plaza Cleaners to the east of the Site indicate the presence of PCE and TCE at highly elevated concentrations including PCE at a concentration of 530,000 PCE µg/m^3 directly in front of the former commercial dry-cleaning facility. Soil vapor sampling results from the sidewalk adjacent to the Former Glenwood Cleaners to the north of the Site also indicate the presence of PCE and TCE at highly elevated concentrations including PCE at a concentration of 200,000 µg/m^3 directly in front of the former dry-cleaning facility. Concentrations of PCE and TCE in soil vapor decrease significantly with distance from these suspected off-Site sources.

Groundwater samples contained VOCs, SVOCs, metals, PCB, and PFAS at concentrations that exceed their applicable AWQS. PCE was present at the highest concentration of 16,000 µg/L at MW-2 which represents groundwater that is migrating onto the Site from a potential off-Site, upgradient source. based upon soil vapor sampling results. PFOA and PFOS were detected in exceedance of the AWQS at all of the wells on-Site. PCE concentrations decrease by an order of magnitude to 1,600 µg/L at MW-1D and 1,500 µg/L at MW-4 and decrease to 160 µg/L at MW-1 and 8.1 µg/L at MW-3. PFAS, specifically PFOS and PFOA, were detected at concentrations ranging from 0.0108 µg/L to 0.0731 µg/L at all of the wells on-Site in exceedance of the AWQS.

5.4 Conceptual Site Model

Pursuant to DER-10 Section 3.2.2, a conceptual site model (CSM) has been developed based on the RI findings and previous investigations to produce a simplified framework for understanding the distribution of impacted materials, potential migration pathways, and potentially complete exposure pathways. The CSM provides a general understanding of the Site and considers Site history and context, including the factors that influence distribution, and fate and transport of remedy-relevant constituents, as well as potential receptors and pathways for exposure. These factors include potential sources and release mechanisms, the physical-chemical mechanisms that control constituent fate and transport, and the likely exposure pathways that govern the potential for adverse effects to human and ecological receptors. Based on the CSM, there does not appear to be any immediate and/or significant threat to human health or the environment at the Site. However, the data support that conclusion that there are multiple potential off-Site source of CVOCs in the subsurface beneath the former Rappaport Plaza Cleaners located at 322 Warburton Avenue, the former Glenwood Cleaners located at 323 Warburton Avenue, and / or the sewer main located on Warburton Avenue, which requires immediate attention. The available data has also not yet fully eliminated the Site as a possible source.

5.4.1 Potential Sources of Contamination

Potential on-Site sources of contamination include CHFM, including several hazardous lead hotspots. Site-wide historic fill contains SVOCs, pesticides, and metals in soil. Visual observations indicate the presence of a layer of historic fill material across the Site to depths of up to approximately 12 ft bgs. The non-native historic fill material generally appears to consist of gravel, brick fragments, silt, roots, concrete, wood, glass, asphalt, and construction debris. Analytical results indicate that the depth CHFM is present to a depth of up to approximately 12 ft bgs across the Site. Historic fill was commonly

used as backfill in urban areas to raise and level land. In addition, a subsurface feature that is suspected to have been a furnace was identified on the western side of Woodworth Ave, at Block 2115, Lot 36. Concentrations of lead, including hazardous lead concentrations, may be attributable to the former suspected furnace as well as the CHFM. Two other hazardous lead spots were identified including one in the upper lots along Warburton Ave (Block 2116, Lot 28) and another in the vicinity of wells MW-1 and MW-1D along Point Street (Block 2116, Lots 21-22).

Potential off-Site sources of contamination include two former dry cleaners, including a former dry-cleaning facility on the east side of Warburton Ave. (the former Rappaport Plaza Cleaners), a former dry-cleaning facility on the north side of Point St. (the former Glenwood Cleaners) as indicated by analytical results from the upgradient monitoring well MW-2 and MW-6, as well as soil vapor sampling performed in the sidewalks adjacent to these facilities and throughout the area surrounding 321 Warburton Ave on the corner of Warburton Ave and Point St. In addition, sewer maps provided by the City of Yonkers show a 20-inch vitrified clay sewer pipe on Warburton Avenue that flows to the south, from the vicinity of the former Rappaport Plaza Cleaners. Further, two pipe joints are present at the corner of Warburton Avenue and Wicker Street, which appears to be immediately upgradient of MW-6 and MW-4. The sewer pipe and these joints represent a potential source of release of PCE to the subsurface and ultimately groundwater.

However, the available data has not yet fully eliminated the Site as a possible source.

5.4.2 Exposure Media

Impacted media include CHFM across the Site to a depth of approximately 12 ft bgs with several localized hazardous lead hot spots.

5.4.3 Environmental Fate and Transport

Chemicals are transported or transformed in the environment through physical and kinetic processes. Physical processes including dissolution, vaporization, and adsorption result in the transfer of substances across media and phases. Kinetic processes, which include biotic and abiotic chemical transformations, decrease the concentration of a chemical by degrading it into other products. The current understanding of the fate and transport of COPCs is summarized below for each of the environmental media of interest at the Site.

5.4.3.1 Soil

CHFM is a source of SVOCs, pesticides, PCBs and metals in soil. The results indicate that these COPCs are non-mobile, have not migrated vertically in the sub-surface, and do not represent a source of contamination of groundwater or soil vapor. There is no evidence of the presence of COPCs in soil in connection with the former off-Site dry cleaning facilities.

5.4.3.2 Groundwater

Depth to groundwater varies from approximately 30 to 65 ft bgs subject to topographic variations across the Site. The fate and transport mechanisms that affect groundwater include advection, dispersion, dissolution, and natural degradation which may work to reduce the concentration of any dissolved-phase constituents. Groundwater flow direction is generally to the west.

While VOCs and other contaminants are present in groundwater above the groundwater standards, the concentrations are not sufficient to require active groundwater remediation. The fate and transport mechanisms that affect groundwater include advection, dispersion, dissolution, and

potentially, natural degradation. The RI data indicates that groundwater conditions at the Site are not conducive to reductive dechlorination under current conditions.

5.4.3.3 Soil Vapor

There is the potential for contaminated groundwater to contribute to the presence of vapor-phase constituents to enter buildings through cracks and joints in foundation walls in the vicinity of former dry-cleaning facilities at which CVOC-related constituents have been released to the subsurface. There is no current evidence that a release of CVOC-related constituents has occurred at the Site. However, the sub-slab soil vapor and indoor air sampling indicate the presence of PCE in sub-slab and indoor air at concentrations that warrant additional action as per the NYSDOH Guidance document (2006, updated 2017 and 2024) at 321 Warburton Ave.

5.5 Potential Exposure Pathways – On-Site

5.5.1 Current Conditions

The Site is located in a mixed residential and commercial area of Yonkers, New York. The Site is comprised of undeveloped land and is improved with one vacant mixed-use (residential and commercial) building with a detached two-bay garage and one unoccupied formerly residential building. Prior uses of the Site have included residential and commercial auto repair. The City of Yonkers prohibits utilizing groundwater as a source of drinking water without a permit. The Site is currently vacant with restricted access to authorized guests and the project development team. The majority of the Site is currently covered by a parking lot or building pads, limiting exposure.

Exposure to contaminated groundwater is possible during subsurface investigations through dermal absorption, inhalation and ingestion pathways. The potential exists for soil vapor to accumulate below the building slabs and intrude into the buildings through potential cracks in the building slabs. Exposure to contaminated vapors is primarily a concern during subsurface investigations through inhalation. The buildings are vacant.

The proposed remedy should include excavation to remove soil at concentrations that exceed RRSCOs as part of an overall remedy that will be protective of human health and the environment. Groundwater is not expected to be used for any purposes in the foreseeable future. Soil vapor sampling results indicate that engineering controls may be necessary to address potential exposure to these media until such time that sources have been remediated.

During future subsurface investigations and remediation where human exposure to contaminated soil, groundwater and soil vapor is possible, the potential exposure pathways (dermal absorption, inhalation, and ingestion) will be controlled through implementation of a HASP or CHASP.

5.5.2 Construction/Remediation Condition

In the absence of engineering and institutional controls, potential exposure pathways exist for dermal absorption, ingestion, and/or inhalation during construction/remediation. Construction and remedial activities include demolition, excavation and off-Site disposal of impacted soil, potential localized dewatering of contaminated groundwater and construction of foundation components. These exposure pathways will be controlled through the implementation of a Construction Health and Safety Plan (CHASP), CAMP, and use of vapor and dust suppression techniques.

5.5.3 Proposed Future Conditions

Redevelopment will include the demolition of existing buildings at 305 Warburton Avenue and 321 Warburton Avenue followed by the construction of a new 6-story residential affordable housing building that will include a basement and a cellar. Surface parking adjacent to the southwest portion of the proposed building will be located on either side of Woodworth Avenue on Block 2116, Lots 16-18 and Block 2115, Lots 34-38). Subsurface stormwater infiltration infrastructure will be located on these parcels. Construction of the foundation for the proposed building will include the excavation of soils throughout the building footprint up to approximately 13 ft bgs for the partial cellar and up to approximately 22 ft bgs for the partial sub-cellar on Block 2216, Lots 24, 216, 27, 28, and 32.

The remedy will involve the excavation and proper off-Site disposal of contaminated soil above RRSCOs, including hazardous lead. A sub-slab depressurization system (SSDS) will be installed to mitigate the potential for soil vapor intrusion in connection with CVOCs in soil vapor and groundwater.

5.6 Potential Exposure Pathways – Off-Site

In the absence of CAMP and a CHASP, soil has the potential to be transported off-Site by wind in the form of dust or on the tires of vehicles or equipment leaving the Site during remediation and development and can create an exposure risk to the public adjacent to the Site.

The potential for off-Site soil vapor intrusion may warrant evaluation at the apartment buildings at 256 - 258 Woodworth Ave.

The potential off-Site migration of Site contaminants in soil is not expected to result in a complete exposure pathway for current, construction and remediation, or future conditions for the following reasons:

- The Site is located in an urban area with continuous and relatively impervious surface covering (i.e. building foundations and concrete and asphalt paving),
- During Site redevelopment and remediation, the following protective measures will be implemented:
    - Air monitoring will be conducted for particulates (i.e., dust) and VOCs during all intrusive activities as part of a CAMP. Dust and/or vapor suppression techniques will be employed to limit potential for off-Site migration of soil and vapors.
    - Vehicle tires and undercarriages will be washed as necessary prior to leaving the Site to prevent tracking material off-Site.

5.7 Evaluation of Human Health Exposure

Based upon the CSM and the review of environmental data, complete on-Site and off-Site exposure pathways do not appear to be present under current conditions. During construction and remediation there is a risk of exposure to humans from Site contaminants via exposure to soil. The HASP will mitigate this risk.

Complete exposure pathways have the following five elements: 1) a contaminant source; 2) a contaminant release and transport mechanism; 3) a point of exposure; 4) a route of exposure; and 5) a receptor population. A discussion of the five elements comprising a complete pathway as they pertain to the Site is provided below.

5.7.1 Current Conditions

CHFM contain SVOCs, pesticides, PCBs and metals in soil. Contaminant release and transport mechanisms include contaminated soil transported as dust, contaminated groundwater flow and volatilization of contaminants from the soil and groundwater matrices to the soil vapor phase, and transport of existing soil vapor contaminants. Under current Site conditions, the likelihood of exposure to humans is limited, as the Site is vacant, mostly covered by impervious surfaces, and potable water is obtained from an off-Site source. Subsurface investigations were conducted in accordance with a HASP to minimize exposure risk.

5.7.2 Construction/Remediation Activities

During development and remediation, points of exposure include disturbed and exposed soil during excavation, dust and organic vapors generated during excavation, and contaminated groundwater that may be encountered during excavation and/or localized dewatering operations. Potential routes of exposure include ingestion and dermal absorption of contaminated soil. The receptor population includes construction and remediation workers and, to a lesser extent, the public adjacent to the Site.

The potential for completed exposure pathways is present since all five elements exist; however, the risk will be minimized by the implementation of appropriate health and safety measures during construction and remediation, such as monitoring the air for organic vapors and dust, using vapor and dust suppression measures, cleaning truck undercarriages prior to exiting the Site to prevent off-Site soil tracking, maintaining site security, and wearing the appropriate personal protective equipment (PPE).

In accordance with a Remedial Action Work Plan (RAWP), which will include a CHASP, a Soil/Materials Management Plan (SMMP), and a CAMP, measures such as conducting an air monitoring program, donning PPE, covering soil stockpiles, altering work sequencing, maintaining a secure construction entrance, proper housekeeping, and applying vapor and dust suppression measures to prevent off-Site migration of contaminants during construction will be implemented. Such measures will prevent completion of these potential exposure pathways.

5.7.3 Proposed Future Conditions

Under the proposed future condition and after remediation, direct exposure routes for COPCs in soil will be eliminated. A soil vapor mitigation system will be proposed to prevent VOCs from entering the building.

5.7.4 Human Health Exposure Assessment Conclusions

Human exposure to Site contaminants is limited under current conditions on the Site. The primary exposure pathways are for dermal contact, ingestion, and inhalation of soil, soil vapor, or groundwater by Site investigation workers. The exposure risks can be avoided or minimized by following the appropriate health and safety and vapor and dust suppression measures outlined in the site-specific HASP during investigation activities.

The COPCs detected at the Site have the potential to have adverse effects on human health and may be absorbed after ingestion, inhalation, or dermal exposure. Acute exposure symptoms may include headache, dizziness, unconsciousness, abdominal pain, nausea, diarrhea, and skin and eye irritation among other effects. Chronic exposure may cause harm to the central nervous system, liver, kidneys, and dermatitis among other effects. Many of the compounds are known or probable human carcinogens.

In the absence of institutional and engineering controls, there is potential for exposure during construction and remediation activities. The primary exposure pathways are:

- Dermal contact, ingestion and inhalation of contaminated soil, groundwater, or soil vapor by construction workers.
- Dermal contact, ingestion and inhalation of soil (dust) and inhalation of soil vapor by the community in the vicinity of the Site.

These exposure risks can be avoided or minimized by performing community air monitoring and by following the appropriate health and safety, vapor and dust suppression and Site security measures outlined in a site-specific CHASP.

The existence of a complete exposure pathway for Site contaminants to human receptors during proposed future conditions is unlikely, as contaminated soil will be excavated and transported to an off-Site disposal facility and any residual soil that remains will be below a cover system. The potable use of groundwater is prohibited and an SSDS will mitigate the potential for soil vapor intrusion.

It is possible that a complete exposure pathway exists for the migration of Site contaminants to off-Site human receptors for current, construction phase, or future conditions. Monitoring and control measures will be used during investigation and construction to prevent community exposure to contaminated dust and vapors.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The nature and extent of COPCs to the applicable SCOs has been substantially completed for the Site. Most groundwater and soil vapor data gaps and the unidentified fill port along Point Street were investigated as part of the ongoing PDI.

Additional work performed as part of the Pre-Design Investigation (PDI) is ongoing, including high concentration lead area (HCLA) delineation of characteristic hazardous lead extent and exceedances of applicable RRSCOs and waste characterization for off-Site facility disposal and approval of soil targeted for on-Site reuse. Following the demolition of the building at 321 Warburton Ave, soil samples will be collected and analyzed for VOCs. The findings of the PDI will be presented in a Remedial Design Modification Memorandum which will further refine the extent of remedial excavation.

The following presents a summary of the RI findings along with conclusions and recommendations for each AOC.

6.1 AOC 1 – Contaminated Historic Fill Material

The results of the geotechnical investigation indicate that the fill is present from the ground surface to at least 6 to 11 to 12 ft bgs. Visual observations of RI soil borings indicate the presence of a layer of contaminated historic fill material (CHFM) across the Site to depths of up to approximately 12 ft bgs. The non-native historic fill material generally appears to consist of gravel, brick fragments, silt, roots, concrete, wood, glass, asphalt, and construction debris, with occasional ash.

Lead was detected at concentrations exceeding its RRSCO and CUSCO of 1000 mg/kg at multiple boring locations including a maximum concentration of 1,910 mg/kg. Several High-Concentration Lead Areas (HCLAs) were identified including a relatively large area containing hazardous lead to depths of approximately 6 ft bgs in the vicinity of the suspect historic furnace (Block 2115, Lots 34-

36), two limited areas containing hazardous lead to depths of approximately 0 to 2 and 4 to 6 ft bgs, respectively, in the vicinity of wells MW-1 and MW-1D along Point Street (Block 2116, Lots 21-22), and another limited area containing hazardous lead approximately 6 and 8 ft bgs in the upper lot of Warburton Ave (Block 2115, Lot 28). The vertical extent of the CHFM and potential hazardous lead concentrations were investigated as part of the RI in August 2023.

Additional characterization of the HCLAs will be performed as part of a Pre-Design Investigation (PDI) to confirm the vertical and horizontal extent of lead in soil at concentrations that exceed the RRSCOs as well as to confirm whether the material may be considered characteristic hazardous for lead.

To confirm that Track 2 clean-up requirements have been achieved, post-excavation confirmation soil samples will be collected at the excavation depth throughout the Site to ensure that target contaminant concentrations have been achieved as per DER-10.

6.2 AOC 2 – Metallic Anomalies

Test pits were also performed at both locations revealing a suspect historic coal burning furnace constructed with brick at TP-1 / SB-26 and construction and demolition debris (C&D) at TP-2 / SB-39. Small pieces of metal were observed at the test pits but no tanks were revealed.

The analytical results for the two soil borings indicate the presence of elevated SVOCs and metals SB-26 at the western metallic anomaly where the suspect historic furnace was encountered. Lead was detected in exceedance of RRSCOs to a depth of 6 ft bgs. This location is also a hazardous lead hot spot based on the results of Toxic Characteristic Leaching Procedure (TCLP) analyses.

The analytical results for SB-39 at the eastern metallic anomaly indicate that mercury was detected at a concentration slightly in exceedance of the RRSCO to a depth of 4 ft bgs.

Are-design investigation will properly characterize for waste disposal and confirm final limits as part of remediation efforts.

6.3 AOC 3 - Off-Site Former Dry Cleaners / Soil Vapor

Two former dry cleaning facilities were historically located adjacent to the Site, including the Former Rappaport Plaza Cleaners, located across the street to the east at 322 Warburton Avenue, and the Former Glenwood Cleaners, located across the street to the north at 323 Warburton Avenue. The data indicate that the former dry cleaning facilties, as well as the sewer main on Warburton Avenue that services the former Rappaport Plaza Cleaners, may represent off-Site sources of CVOCs in soil vapor that is migrating onto the Site.

Soil vapor sampling results from the sidewalk adjacent to the Former Rappaport Plaza Cleaners to the east of the Site indicate the presence of PCE and TCE at highly elevated concentrations including PCE at a concentration of 530,000 PCE µg/m³ directly in front of the former commercial dry-cleaning facility. Soil vapor sampling results from the sidewalk adjacent to the Former Glenwood Cleaners to the north of the Site also indicate the presence of PCE and TCE at highly elevated concentrations including PCE at a concentration of 200,000 µg/m³ directly in front of the former dry-cleaning facility. Concentrations of PCE and TCE in soil vapor decrease with distance from these suspected off-Site sources.

Sub-slab soil vapor and indoor air sampling indicate the presence of PCE in sub-slab and indoor air at concentrations that warrant additional action as per the NYSDOH Guidance document (2006, updated 2017) at 321 Warburton Ave.

Should CVOC contamination be encountered during remedial activities spill reporting requirements will be followed and the material will be characterized, handled, transported, and disposed according to applicable local, state, and federal regulations.

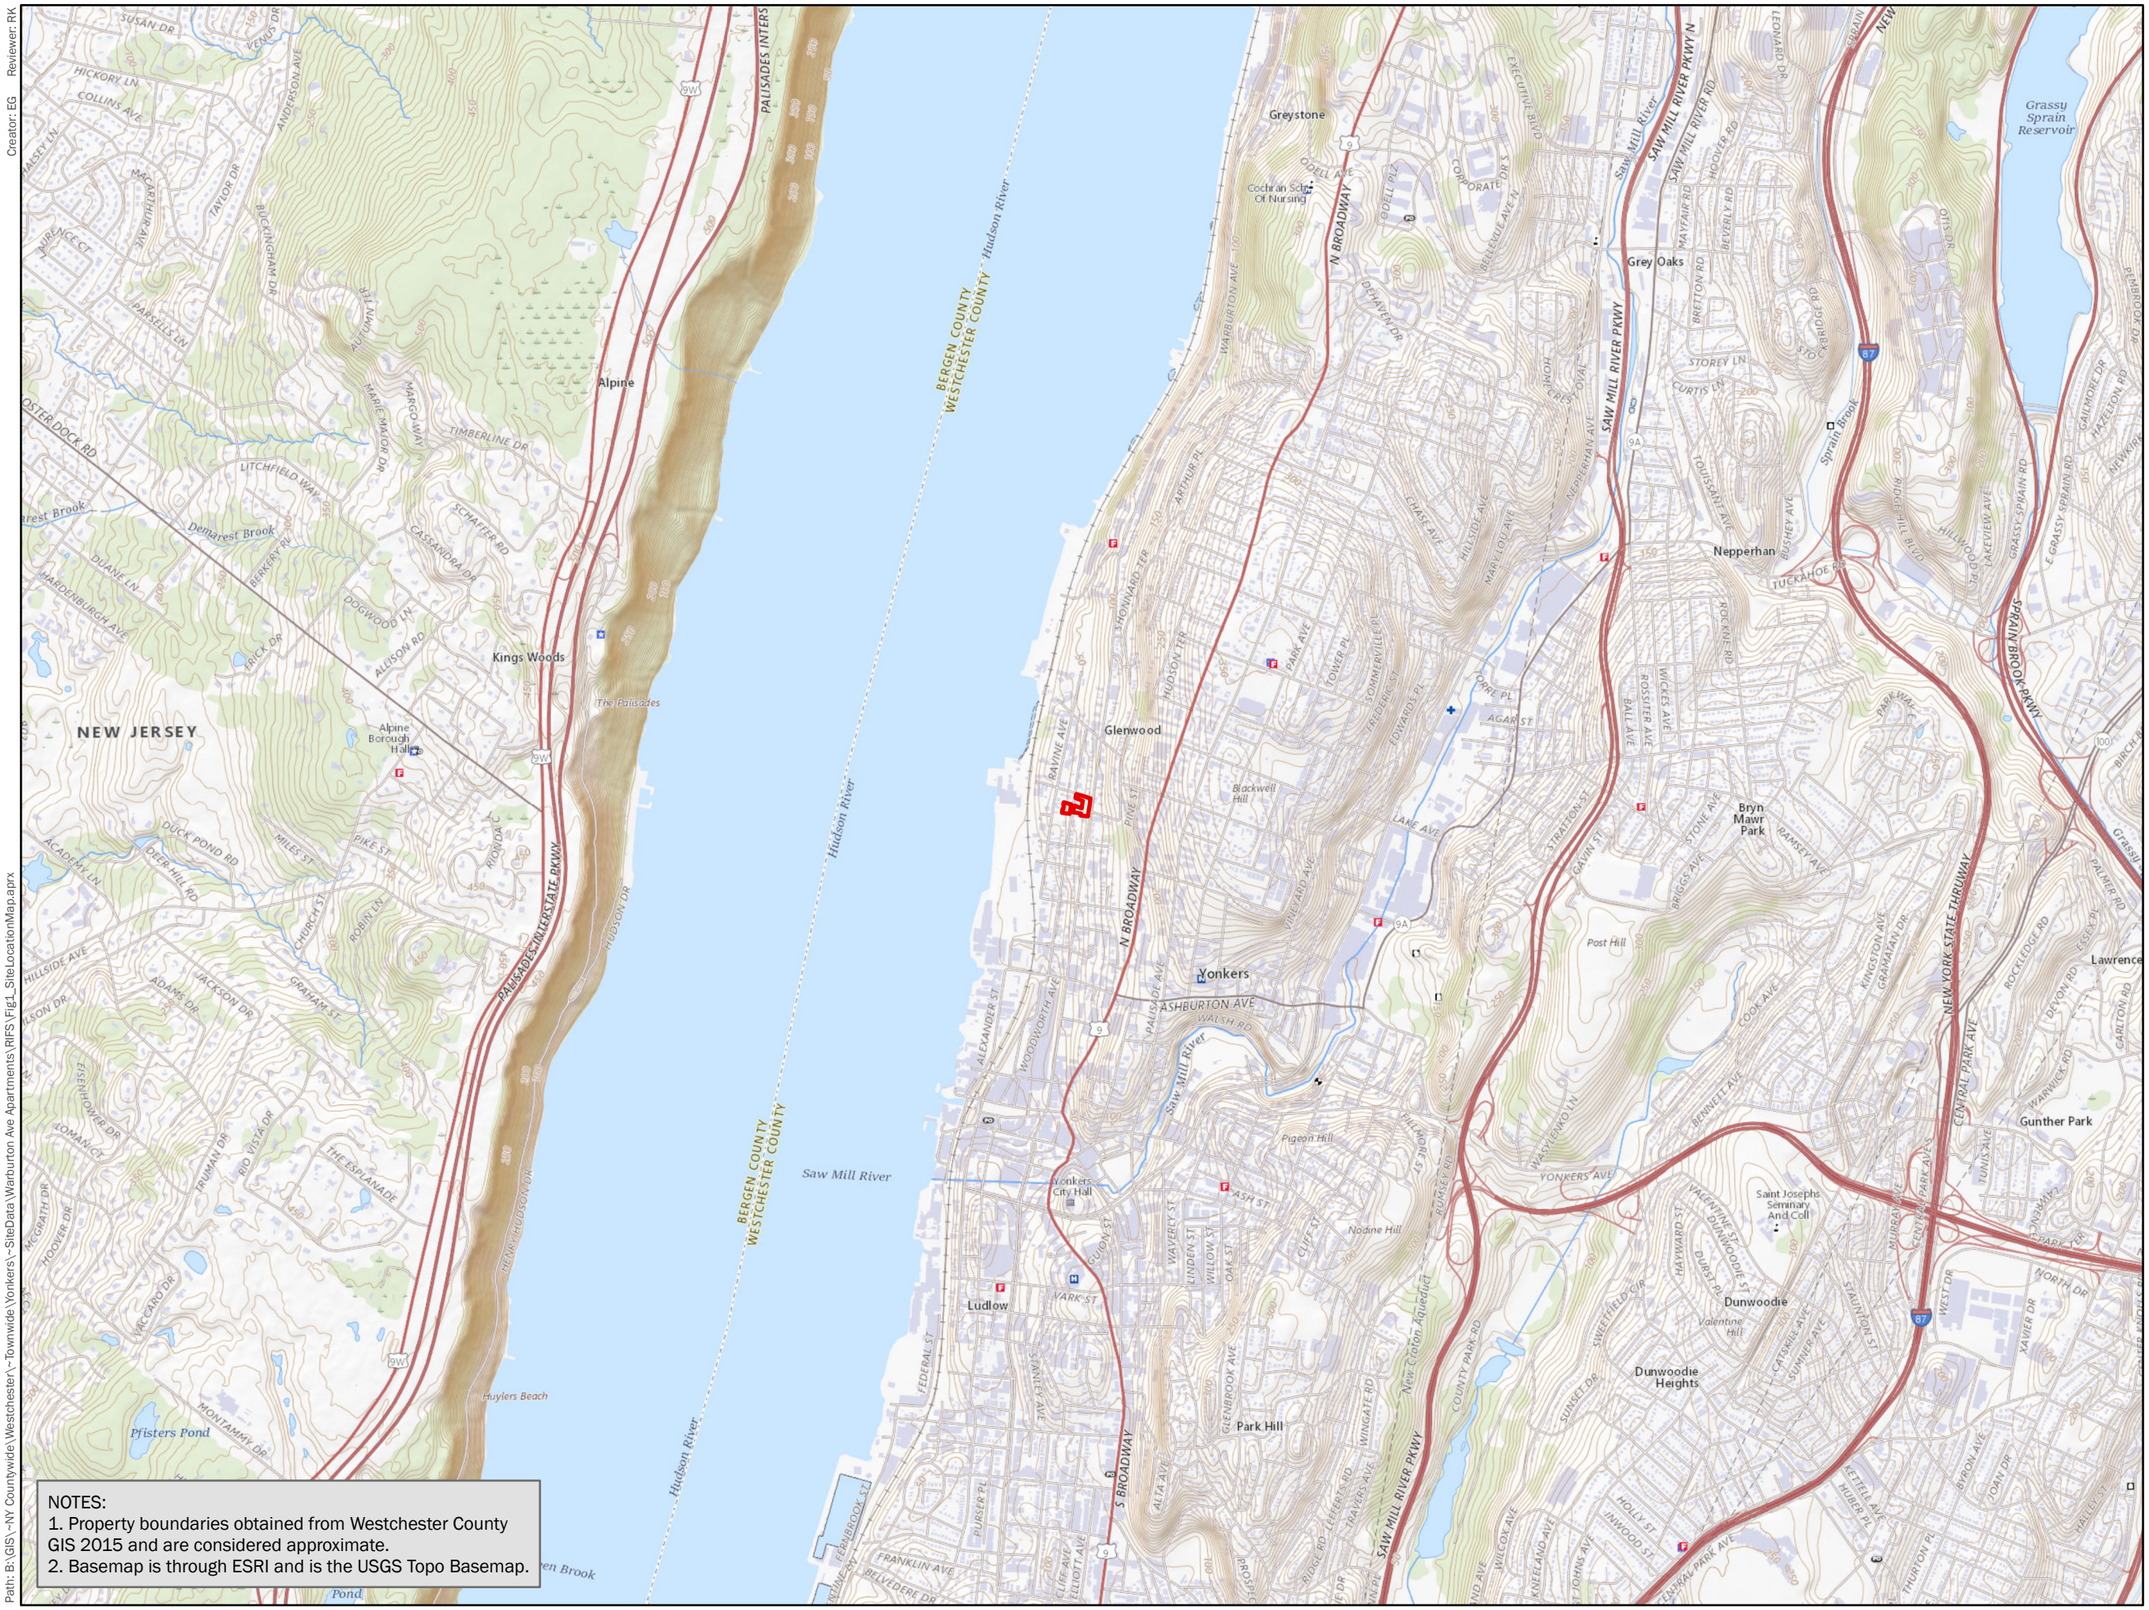
A Sub-Slab Depressurization System (SSDS) is recommended to be installed for any future building to mitigate the potential for soil vapor intrusion. No other actions are warranted in connection with AOC-3.

6.4 AOC 4 - Off-Site Former Dry Cleaners / Groundwater

Two former dry cleaning facilities were historically located adjacent to the Site, including the Former Rappaport Plaza Cleaners, located across the street to the east at 322 Warburton Avenue, and the Former Glenwood Cleaners, located across the street to the north at 323 Warburton Avenue. The data indicate that the former dry cleaners as well as the sewer main that services the former Rappaport Plaza Cleaners, may represent an Off-Site source of CVOCs in groundwater that is migrating onto the Site.

Groundwater samples contained VOCs, SVOCs, metals, and PCB at concentrations that exceed their applicable AWQS. The metals, SVOCs and PCB concentrations in groundwater are relatively low and do not appear to be a remedial concern and as such, further assessment or remediation of these constituents is not warranted. Chlorinated Volatile Organic Compounds (CVOCs) in groundwater are elevated with the highest concentrations in the northeast corner of the Site which appear to be migrating onto the Site from an off-Site, upgradient source, which is suspected to be the former Rappaport Plaza Cleaners. PCE was present at a concentration of 16,000 µg/L at MW-2 which represents groundwater that is migrating onto the Site from an off-Site, upgradient source, which is suspected to be the former Rappaport Plaza Cleaners located across the street at 322 Warburton Ave, based upon soil vapor sampling results. PCE concentrations decrease by an order of magnitude to 1,600 µg/L at MW-1D and 1,500 µg/L at MW-4 and decrease to 160 µg/L at MW-1 and 8.1 µg/L at MW-3.

Geochemical data indicate that groundwater conditions at the Site are not conducive to reductive dechlorination under exiting conditions. Further, remediation of CVOCs is not technically feasible without addressing the off-Site source of impacts (i.e., any remediation work would only provide temporary improvements to groundwater quality on-Site or require to be permanent measures without addressing the source of the contamination). Based on this, it is recommended that the NYSDEC identify the responsible party or parties for the off-Site source(s) of CVOCs and investigation and remediation of the off-Site source be implemented. The Volunteer is prepared to provide reasonable access to allow for the Responsible Party and / or NYSDEC, or other responsible third party, to perform an Off-Site investigation to facilitate the timely remediation of the source and related off-Site impacts.



6.5 AOC 5 - Off-Site Fill Port

A fill port to a former fuel oil tank is located is located Off-Site, in the sidewalk along Point Street in front of the garages associated with 321 Warburton Avenue. Results of a ground penetrating radar (GPR) survey and pipe investigation were inconclusive. There was no evidence of the presence of a UST or AST. However, it is possible that a UST may be present or that the fill port may have been associated with direct-fill fuel oil operations.

Any ASTs, USTs, and / or related-piping encountered during the remedy will properly removed, handled, and disposed.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Semivolatile Organics

L2344338-01D, -06D, -15D, -23D, -24D, and -25D: The sample has elevated detection limits due to the dilution required by the sample matrix.

L2344338-05, -11, -12, -19, -20, -27, -36, and -37: The sample was extracted with the method required holding time exceeded.

L2344338-23D: The surrogate recoveries were outside the acceptance criteria for 2-fluorophenol (2%) and 2,4,6-tribromophenol (3%); however, re-extraction achieved similar results: 2-fluorophenol (4%) and 2,4,6-tribromophenol (0%). The results of both extractions are reported.

L2344338-25D: The surrogate recoveries were outside the acceptance criteria for 2-fluorophenol (11%) and 2,4,6-tribromophenol (4%); however, re-extraction achieved similar results: 2-fluorophenol (19%) and 2,4,6-tribromophenol (7%). The results of both extractions are reported.

The WG1811652-6/-7 MS/MSD recoveries, performed on L2344338-34, are below the acceptance criteria for 2,4-dinitrophenol (MSD 0%) and benzoic acid (0%/0%) due to the concentrations of these compounds in the MS/MSD falling below the reported detection limits.

Pesticides

L2344338-05, -11, -12, -19, -20, -27, -28, -36, and -37: The sample was extracted with the method required holding time exceeded.

L2344338-34: The internal standard (IS) response for 1-bromo-2-nitrobenzene (731%) was above the acceptance criteria on column A; however, the sample was not re-analyzed due to obvious interferences. The surrogate recoveries are outside the method acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (10%) and decachlorobiphenyl (10%) due to interference with the Internal Standard.

L2344338-34: The surrogate recovery is outside the acceptance criteria for decachlorobiphenyl (165%); however, the sample was not re-extracted due to coelution with obvious interferences.

The WG1811642-7 MSD recoveries, performed on L2344338-34, are outside the acceptance criteria for cis-chlordane (0%) and trans-chlordane (0%). The unacceptable percent recoveries are attributed to the elevated concentrations of target compounds present in the native sample.

Herbicides

L2344338-05, -11, -12, -19, -20, -27, -28, -36, and -37: The sample was extracted with the method required holding time exceeded.

Total Metals

L2344338-01 through -12, -15 through -20, -23 through -28, -31 through -37: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by the sample matrix.

L2344338-12, -20, and -28: The sample was analyzed with the method required holding time exceeded for mercury.

The WG1811533-3/-4 MS/MSD recoveries for aluminum (1630%/1210%), iron (3710%/2370%), and manganese (1260%/291%), performed on L2344338-10, do not apply because the sample concentrations are greater than four times the spike amounts added. The MS/MSD RPD for manganese (68%) is above the acceptance criteria.

Case Narrative (continued)

The WG1811533-3/-4 MS/MSD recoveries, performed on L2344338-10, are outside the acceptance criteria for antimony (34%/39%). A post digestion spike was performed and yielded an unacceptable recovery of 72%. The serial dilution recovery was not applicable; therefore, this element fails the matrix test and the result reported in the native sample should be considered estimated.
The WG1811533-3/-4 MS/MSD recoveries, performed on L2344338-10, are outside the acceptance criteria for magnesium (147%/133%). A post digestion spike was performed and yielded an unacceptable recovery of 67%. The serial dilution recovery was acceptable; therefore, the matrix test passed for the sample matrix.
The WG1813227-3/-4 MS/MSD recoveries, performed on L2344338-34, are outside the acceptance criteria for antimony (MSD at 63%), arsenic (54%/34%), barium (143%/0%), chromium (66%/71%), copper (66%/46%) and nickel (MS at 73%). A post digestion spike was performed and was within acceptance criteria.
The WG1813227-3/-4 MS/MSD recoveries for aluminum (0%/149%), calcium (MS at 746%), iron (5970%/0%), lead (1090%/430%), magnesium (MS at 285%), manganese (MSD at 151%), and zinc (222%/132%), performed on L2344338-34, do not apply because the sample concentrations are greater than four times the spike amounts added.
The WG1813227-3/-4 MS/MSD RPDs for antimony (26%), barium (49%), calcium (34%), iron (32%), lead (32%) and magnesium (24%), performed on L2344338-34, are above the acceptance criteria.
The WG1821955-3 MS recoveries for aluminum (460%), iron (0%) and magnesium (148%), performed on L2344338-12, do not apply because the sample concentrations are greater than four times the spike amounts added.

Cyanide, Total
L2344338-05, -11, -12, -19, -20, -27, -28, -36, and -37: The sample was analyzed with the method required holding time exceeded.
The WG1821851-3 LCSD recovery for cyanide, total (121%), associated with L2344338-12, -20, and -28, is outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.

cyanide, total (210%/210%); however, the associated LCS recovery is within criteria. No further action was taken.

Hexavalent Chromium

The WG1810850-5 MSD recovery for chromium, hexavalent (62%), performed on L2344338-34, is outside the acceptance criteria. A post analytical spike was performed and was within acceptance criteria. The MS/MSD RPD for chromium, hexavalent (29%) is above the acceptance criteria.

The WG1812152-5 Insoluble MSD recovery for chromium, hexavalent (67%), performed on L2344338-34, is outside the acceptance criteria. The Soluble MS recovery for chromium, hexavalent (61%) was also outside criteria. This has been attributed to matrix interference. A post-spike was performed with a recovery of 88%.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

August 29, 2023: This final report includes the results of all requested analyses.

August 15, 2023: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L2344627-26: Sample containers for PFAS were received for the "SB-30 (0-2)" sample, but were not listed on the chain of custody. At the client's request, the analysis was performed.

Semivolatile Organics

L2344627-19D: The sample has elevated detection limits due to the dilution required by the sample matrix.

The WG1813750-2/-3 LCS/LCSD recoveries, associated with L2344627-09, are below the acceptance criteria for hexachlorocyclopentadiene (LCS 9%), 2,4-dinitrophenol (0%/0%), 4,6-dinitro-o-cresol (5%/6%) and benzoic acid (0%/0%); however, they have been identified as "difficult" analytes. The results of the associated sample are reported.

Total Metals

L2344627-01 through -04, -09 through -13, -18 through -21, -26 through -29, -34 through -38, and -43 through -46: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by the sample matrix.

The WG1811390-3/-4 MS/MSD recoveries for aluminum (865%/1020%) and iron (955%/1870%), performed on L2344627-10, do not apply because the sample concentrations are greater than four times the spike amounts added.

The WG1811390-3/-4 MS/MSD recoveries, performed on L2344627-10, are outside the acceptance criteria for antimony (57%/56%), magnesium (MSD 143%), and manganese (186%/161%). A post digestion spike was

performed and was within acceptance criteria.
The WG1811390-7/-8 MS/MSD recoveries for aluminum (423%/0%), iron (0%/3370%), and manganese (47%/52%), performed on L2344627-35, do not apply because the sample concentrations are greater than four times the spike amounts added.
The WG1811390-7/-8 MS/MSD recoveries, performed on L2344627-35, are outside the acceptance criteria for antimony (48%55%), copper (MSD 141%) and magnesium (MSD 72%). A post digestion spike was performed and was within acceptance criteria. The MS/MSD RPD for copper (29%) is above the acceptance criteria.

Cyanide, Total
The WG1812980-2/-3 LCS/LCSD recoveries for cyanide, total (78%/73%), associated with L2344627-01 through -04, are outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.

Hexavalent Chromium
The WG1813235-2 LCS recovery for chromium, hexavalent (77%), associated with L2344627-37, -38, and -43 through -46, is outside our in-house acceptance criteria, but within the vendor-certified acceptance limits. The results of the original analyses are reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.
