Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

PCBs Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

General Comments:

The samples were analyzed using a dual column ECD GC. Data files are labeled date-seq-A for the “A” channel and date-seq-B for the “B” channel. An acid cleanup was performed on all extracts.
The reporting levels (PQL) are supported by the lowest calibration standard. The laboratory defines the LOD/MDL as equivalent to the PQL/RL. It is part of Phoenix Lab's procedure to dilute all soil extracts prior to analysis.

Calibration:

As per the method, a five-point calibration of aroclors 1016 and 1260 is used to verify the linearity of all the aroclors. Aroclor 1254 was also analyzed as part of this run for verification. If any other aroclors had been detected, the samples would have been reanalyzed with that aroclor.

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

PCBs Water Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

General Comments:

The samples were analyzed using a dual column ECD GC. Data files are labeled date-seq-A for the “A” channel and date-seq-B for the “B” channel. An acid cleanup was performed on all extracts.
The reporting levels (PQL) are supported by the lowest calibration standard. The laboratory defines the LOD/MDL as equivalent to the PQL/RL. It is part of Phoenix Lab's procedure to dilute all soil extracts prior to analysis.

Calibration:

As per the method, a five-point calibration of aroclors 1016 and 1260 is used to verify the linearity of all the aroclors. Aroclor 1254 was also analyzed as part of this run for verification. If any other aroclors had been detected, the samples would have been reanalyzed with that aroclor.

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

Pesticides Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

General Comments:

The samples were analyzed using a dual column ECD GC. Data files are labeled date-A-seq for the A channel and date-B-seq for the B channel. In order to report a concentration, both channels need to have the compound detected.
A Florisil cleanup was performed on all extracts.
The reporting levels (PQL) are supported by the lowest calibration standard. The laboratory defines the LOD/MDL as equivalent to the PQL/RL.It is part of Phoenix Lab's procedure to dilute all soil extracts prior to analysis
A calibration curve for the single component pesticides was analyzed with the samples. The standards for the multi-component pesticides Toxaphene and Chlordane calibration standards are analyzed only if the pattern is detected in the samples. Toxaphene and Chlordane daily standards are provided at the end of the pesticides calibration verification forms.
This data package provides summary forms for the single component pesticides only; please refer to the Phoenix report for the full list. Alpha and gamma chlordane were spiked and analyzed instead of technical chlordane. Gamma chlordane recovery is reported as chlordane in the LCS and LCSD.

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

Pesticides Water Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

General Comments:

The samples were analyzed using a dual column ECD GC. Data files are labeled date-A-seq for the A channel and date-B-seq for the B channel. In order to report a concentration, both channels need to have the compound detected.
A Florisil cleanup was performed on all extracts.
The reporting levels (PQL) are supported by the lowest calibration standard. The laboratory defines the LOD/MDL as equivalent to the PQL/RL.It is part of Phoenix Lab's procedure to dilute all soil extracts prior to analysis
A calibration curve for the single component pesticides was analyzed with the samples. The standards for the multi-component pesticides Toxaphene and Chlordane calibration standards are analyzed only if the pattern is detected in the samples. Toxaphene and Chlordane daily standards are provided at the end of the pesticides calibration verification forms.
This data package provides summary forms for the single component pesticides only; please refer to the Phoenix report for the full list. Alpha and gamma chlordane were spiked and analyzed instead of technical chlordane. Gamma chlordane recovery is reported as chlordane in the LCS and LCSD.

Inorganic Data Flags

• C (Concentration) Qualifiers:

J – The reported value was obtained from a reading that was less than the Reporting Level (RL) but greater than or equal to the Instrument Detection Limit (IDL)

U – The analyte was analyzed for but not detected at or above the IDL

• Q Qualifiers:

E - The reported value is estimated because of the presence of interference. An explanatory note shall be included in the project narrative (if the problem applies to all samples) or on the specific FORM I-IN (if it is an isolated problem).

M- Duplicate injection precision not met.

N - Spiked sample recovery not within control limits.

S - The reported value was determined by the Method of Standard Additions (MSA).

W - Post-digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

* - Duplicate analysis not within control limits.

+ - Correlation coefficient for the MSA is less than 0.995.

• M (Method) Qualifiers:

"P" - ICP
"A" - Flame AA
"F" - Furnace AA
"PM" - ICP when Microwave Digestion is used
"AM" - Flame AA when Microwave Digestion is used

• C (Concentration) Qualifiers:

J – The reported value was obtained from a reading that was less than the Reporting Level (RL) but greater than or equal to the Instrument Detection Limit (IDL)

U – The analyte was analyzed for but not detected at or above the IDL

• Q Qualifiers:

E - The reported value is estimated because of the presence of interference. An explanatory note shall be included in the project narrative (if the problem applies to all samples) or on the specific FORM I-IN (if it is an isolated problem).

M- Duplicate injection precision not met.

N - Spiked sample recovery not within control limits.

S - The reported value was determined by the Method of Standard Additions (MSA).

W - Post-digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

* - Duplicate analysis not within control limits.

+ - Correlation coefficient for the MSA is less than 0.995.

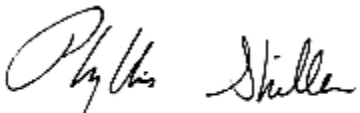
1 = This parameter is not certified by the primary accrediting authority (NY NELAC) for this matrix. NY NELAC does not offer certification for all parameters at this time.



RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

The canister was received under no vacuum, therefore sample results may not be representative.

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· · Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the "U" represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

F. History and Nature of Site

Historic records document industrial development of the Site beginning in ± 1881. Tannery operations of the *Haight and Company, American Hide & Leather*, and *Howes Leather* which were the focus of an ECI IRM, reportedly occurred during the period from 1887 to 1960. The most recent operator of the Site was Angelica, which acquired the Site and the business entity, Linen Systems for Hospitals, Inc. ("Linen Systems") in 1977 and officially changed Linen Systems name to Angelica on or about 1984. Linen Systems acquired title to the Site in 1977 (Ref. Exhibit B of the BCP application, including the deed). Linen Systems and later Angelica performed laundering of garments with detergents on the Site and warehoused linens from approximately 1977 through 2011 without the use of dry cleaning chemicals. Angelica has ceased operations on Site.

Environmental contamination associated with the Angelica Site was first discovered in July 2010 following an extended rain fall event, in the vicinity of a former 100,000 gallon No. 6 oil above ground storage tank (AST) that historically operated northeast of the 2017 demolition IRM work zone. Upon discovery, the NYSDEC assigned Spill No. 1004405 to the release (Ref. Exhibit K of the BCA application). Remedial investigation (RI) work conducted at the Site by Environmental Compliance, Inc. (ECI) sufficiently demonstrated that the nature and extent of the

contaminants warranted the inclusion of the Site into the NYSDEC Brownfields Cleanup Program (BCP). The Site was accepted in the BCP on January 31, 2013.

Demolition interim remedial measure (IRM) work at the Site in 2017 was completed specifically to facilitate supplemental remedial investigation (SRI) work below (6) condemned manufacturing structures, a large smoke stack and foundational ruins located west of the ±80,000 square foot commercial manufacturing structure and historically operated as the Former Haight/American Hide Tannery manufacturing facility. The demolitions IRM work included the closure of abandoned fuel storage systems, undocumented vessels found to exist in one of the former manufacturing structures as well as the demolition of a pump house and storage buildings outside the SRI area of concern located along the Gordon Creek. The ± 80,000 square foot commercial manufacturing structure (most recently operated by Angelica) located along the eastern road frontage of the Site was excluded from the demolition IRM work. The demolition IRM work zone comprised a footprint of ± 2.5 acres. (Ref, Interim Remedial Measure Construction Completion Report Demolition of Site Buildings dated April 2018).

The HASP describes protection standards, practices and procedures pertaining to the SRI work to be performed at the Site. The HASP is written with the intent of developing the awareness of site personnel to the health and safety hazards, which may exist, thereby avoiding unnecessary risks. The HASP establishes safety practices, procedures and personal protection standards and applies to all on Site activities. All personnel who perform project activities associated with the SRI work will familiarize themselves with this HASP and comply with its requirements

Note:

1. All information contained herein shall be reviewed by on site personnel prior to entering the work zone.

2. This HASP applies to all personnel. Outside agent/contractors are also responsible for their own internal Health and Safety Plan(s) prior to entering the site.

G. Project Objectives:

The Site is an active NYSDEC Brownfield Cleanup Agreement (BCA) site (i.e., BCA No. C546055-10-12). Information developed at the Site thus far suggests that the chemical impacts associated with prior commercial/industrial use of the Site include volatile organic compounds (VOC), semi-VOC and heavy metals. NETC has developed this HASP to manage impacts encountered at the site (if any) with the goal of protecting human health and the environment.

H. Site/Waste Characteristics

Waste Types: Liquid X Solid X Sludge Gas X
Characteristics: Corrosive Ignitable Radioactive Volatile X
Toxic Reactive Unknown X

I. Field Work Description:

To address data gaps identified by the NYSDEC that prevented a significant threat determination in 2014, and to pursue a certificate of completion (COC) determination for the entire Site, the supplemental inspection and invasive testing services will be in locations below and immediately adjacent to the network of condemned manufacturing structures, which were removed during the 2017 IRM, located west of the vacant commercial manufacturing structure most recently operated by Angelica Textile Services, Inc.

J. Project Work Tasks:

- o Site Inspection Services
- o Soil Boring & Well Installation Program
- o Survey / Mapping Services
- o Soil and Groundwater Sampling Services
- o Soil Vapor Intrusion Sampling Services

Project Team Members:

Project Engineer:	Keith Rupert PE
Project Coordinator & Safety Officer (PCSO):	Jeff Wink PG
Geologists & Scientists:	Jeff Wink PG, Robert Gray PG, Austin Meys
Equipment Operator:	Steven Cline, Ray Hammond
Field Technician	Matthew Wink,

Comments: *Based on site conditions a modification to the scope of work may be deemed necessary. Any modification to the scope of services outlined in this HASP will first be endorsed by NETC.*

K. Hazard Evaluation

The suspected hazards which may exist at the Site during site activities can be grouped into three categories; chemical; heat stress; and physical hazards associated with the operation of machinery

Chemical Hazards

NETC understands chemical compounds previously identified at the site can be categorized as petroleum based hydrocarbons and heavy metals & that all previous work has been performed in level "D" protection. On this basis, continuous respiratory protection is not indicated for most field activities. However, the necessity of respiratory protection will be based on continuous gas monitoring to be performed during all invasive earthwork activities.

Heat Stress / Cold Stress

Field activities conducted during the summer and winter months have the potential to cause heat / cold related stresses. Heat / Cold stress prevention and symptoms are further discussed in Section T.

Physical Hazards

Physical hazards exist during the operation of pilot test generator, air compressor and blower equipment. These types of accidents may involve a wide range of bodily injuries and will be managed using conventional first responder first aid pursuant to EMS protocol as outlined in Sections S.

L. Personnel & Responsibilities

Listed below are key personnel involved with the project. Their responsibilities are also included:

1. PROJECT COORDINATOR / SITE SAFETY OFFICER

The project coordinator / site safety (PCSO) officer will direct the site investigation. After the project starts and the PCSO has had time to evaluate the potential for hazardous site conditions, he or she may determine that a member of the project team may assume site safety officer duties. The primary responsibilities of the PCSO are:

- Assuring that all personnel are aware of the potential hazards of the site as well as the proper and improper procedures for handling those hazards, should they occur, including all health and safety provisions and standards in this HASP.

- Assuring that the proper personnel protection equipment is available and utilized properly by all site personnel.

- Assure that site personnel observe the appropriate work practices procedures.

- Monitoring the performance of personnel to ensure that mandatory health and safety procedures are adequate and correcting any performances that do not comply with the HASP.

- Preparation and submittal of any and all project reports including progress, accident incident and contractual.

2. SITE PERSONNEL

Site personnel will be those individuals involved in field operations. Their primary responsibilities will be:

- Perform all required work safely.

- Familiarize them with and understand the HASP, including proper use of personal protection equipment.

- Report any unsafe conditions to supervisory personnel.

- Be aware of signs and symptoms of potential exposure to site contaminants and weather stress. Based on the limited scope to the SI on site personnel will be responsible for multi tasks as designated by the PCSO.

M. Emergency Services

Emergency services (fire, police, ambulance, and local hospitals) will be notified as applicable to activities at the site. Emergency telephone numbers will be conspicuously posted next to the field telephone. All field personnel will be made aware of the location of the site telephone and the directions to the closest emergency facility.

All field personnel will be trained in the recognition of heat stress (heat cramps, heat exhaustion, heat stroke) related to working in warm weather conditions. No person will work alone in the field; the buddy system will be strictly enforced and each will visually monitor his buddy as often as possible. Heat stress is discussed in more detail in Section T.

Water and first aid supplies will be strategically located on site for immediate access by on-site personnel. In the event of skin or eye contact with hazardous materials, the affected personnel will be immediately rinsed and brought to a physician. Subsequent to any emergency incident, a report describing the incident and those persons involved will be written and submitted to the PSOC.

N. Health & Safety Training

All field personnel will have received a "Health and Safety Training Course" for hazardous waste operations mandated by OSHA (29 CFR 1910.120). Appropriate personnel will receive the additional 8-hour supervisor's training.

Prior to starting work, the PCSO will conduct a training session to assure that all field personnel understand their safety responsibilities. All personnel will be instructed on potential health and safety hazards.

Specifically, the following topics will be covered in the initial training session:

- Potential routes of contact with contaminants.

- Types, proper use, limitations and maintenance of applicable protective clothing and equipment.

- respiratory protection using air-purifying respirators equipped with organic vapor and acid gas cartridges. This will include use, maintenance, storage, and limitations of use.

- Proper decontamination procedures and adherence to work zone boundaries.

- Proper waste/cuttings handling and disposal procedures.

- Reporting of accidents and availability of medical assistance.

- Recognition of symptoms and signs which indicate overexposure to contaminants or other hazards.

Each morning prior to the commencement of the day's work, on-site personnel will review the scheduled work for the day and health and safety procedures to be utilized with all team members. Additional training sessions will be conducted whenever any changes in health and safety hazards or procedures warrant it.

O. Standard Operating Safety Procedures

Standard operating safety procedures include precautions and operating practices that all responding personnel should follow. These include:

1. PERSONAL PRECAUTIONS

- No contact lenses may be worn on-site.

- Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases the probability of hand-to-mouth transfer and ingestion of material is prohibited in any area designated contaminated.

- Whenever decontamination procedures for outer garments are in effect, the entire body should be thoroughly washed as soon as possible after the protective garment is removed.

- No facial hair which interferes with a satisfactory fit of the mask-to-face-seal is allowed on personnel required to wear respirators.

- Contact with contaminated or suspected contaminated surfaces should be avoided. Whenever possible, do not walk through puddles, leachate, discolored surfaces, kneel on ground, lean, sit or place equipment on drums, containers, or the ground.

- Medicine and alcohol can increase the effects from exposure to toxic chemicals. Unless specifically approved by a qualified physician, prescribed drugs should not be taken by personnel where the potential for absorption, inhalation or ingestion of toxic substances exists. Alcoholic beverages should be avoided during off-duty hours, if possible.

2. OPERATIONS

- All personnel entering the site must be thoroughly briefed on anticipated hazards, equipment to be worn, safety practice to be followed, emergency procedures, and communications.

- Any required respiratory protection and chemical protective clothing must be worn by all personnel entering areas designated for wearing protective equipment.

- Personnel on-site must use the buddy system at all times.

- Visual contact must be maintained between field and safety personnel.

- During continual operations, on-site workers act as safety backup to each other. Off-site personnel provide emergency assistance.

- Personnel should practice unfamiliar operations prior to performing the actual procedure.

- Entrance and exit locations shall be designated and emergency escape routes delineated by the PCSO.

- Communications using radios, hand signals, signs, or other means must be maintained between personnel at all times. Emergency communications will be prearranged by the PCSO in case of radio failure, necessity for evacuation of site, or other reasons.

- Personnel and equipment in the contaminated area should be minimized, consistent with effective site operations.

- All field personnel should make full use of their senses to alert themselves to potentially dangerous situations which they should avoid, e.g., presence of strong and irritating or nauseating odors.

- Field personnel should be familiar with the physical characteristics of the site, including:
  + wind direction in relation to contamination zones;
  + accessibility to associates, equipment, and vehicles;
  + communications;
  + operation zones;
  + site access; and
  + nearest safety shower and eyewash station.

- Procedures for leaving a contaminated area must be planned and implemented in accordance with the HASP prior to going on site.

- All visitors to the job site must comply with the HASP procedures. Personal protective equipment may be modified for visitors depending on the situation. Any modifications must be approved by the site PCSO.

P. Personal Protection Program

1. PROTECTIVE EQUIPMENT

Protective clothing and respiratory protection will help prevent on-site workers from coming in contact with contaminants. The selection of protective equipment will be based upon the types, concentrations, and routes of exposure that may be encountered. The appropriate level of protection for initial site entry will be based upon a conservative assessment of the best available site contamination information.

Based upon known facts relative to the site, Level D protective equipment is indicated during on-site work. During these activities, the minimum required personal protective equipment for personnel within the work zone (Hot Zone) will consist of the following:

Hard-hat
Safety glasses (when full-face respirator is not indicated)
Steel-toe work boots
Tyvek suit (optional) or equivalent coverall clothing
Gloves
Safety glasses
Hearing protection
Use of the full face APR (equipped with organic vapor and acid gas cartridges) will be required when 5 PPM vapor is recorded on the Photoionization detector (PID) or a published TLV is documented within the ambient air of the work zone, after which use of the respirator will be mandatory.

2. FIELD MONITORING

During all drilling operations, monitoring of breathing space in proximity to the drilling equipment will be conducted with a PID calibrated to read 1:1 for Benzene. The results of PID monitoring will be used to advise personnel regarding existing conditions and to determine policy relative to the use of protective equipment. Monitoring will also be conducted during all drilling operations to detect any release of volatile organic compounds (VOC). This monitoring will be used to protect personnel from unsafe and/or unhealthful conditions. During other on-site activities not involving heavy equipment, sampling or the potential exposure to hazardous materials, Level D equipment is optional at the discretion of the site PCSO. Additional personal monitoring may be instituted based on the results of the initial field services.

Q. Site Control - Work Zones

1. CONTROL AT THE SITE

The site will be controlled to reduce the possibility of: (1) contact with any contaminants present and (2) removal of contaminants by personnel or equipment leaving the site. The possibility of exposure or translocation of substances will be reduced or eliminated by:

- Setting up security and physical barriers to exclude unauthorized personnel from the general area.
- Minimizing the number of personnel and equipment on-site consistent with effective operations.
- Establishing work zones within the site.
- Establishing control points to regulate access to work zones.
- Conducting operations in a manner to reduce the exposure of personnel and equipment and to eliminate the potential for airborne dispersion.
- Implementing appropriate decontamination procedures.

Three contiguous work zones are recommended:

Zone I:	Exclusion Zone
Zone II:	Contamination Reduction Zone
Zone III:	Support Zone

Zone I: Exclusion Zone

The Exclusion Zone, the innermost of three areas, is the zone where contamination could occur. This zone will generally correspond to the immediate work zone surrounding the pilot test equipment. All people entering the Exclusion Zone must wear prescribed levels of protection. An entry and exit checkpoint will be established at the periphery of the Exclusion Zone to regulate the flow of personnel and equipment into and out of the zone. This will assist in verifying the procedures established to enter and exit are followed.

The outer boundary of Zone I, the Hotline, has been established to be a 25 foot radius from the test wells. The Hotline will be defined by marker cones or similar barriers. During subsequent site operations, the boundary may be modified or adjusted as more information becomes available.

All personnel within the Exclusion Zone must wear the required level of protection. Personnel protective equipment is designed based on site-specific conditions including the type of work to be performed and the hazards that might be encountered. Different levels of protection may be justified within the Exclusion one as determined by the site PCSO after reviewing the specific operations.

Zone II: Contamination Reduction Zone

Between the Exclusion Zone and the Support Zone is the Contamination Reduction Zone which provides a transition between contaminated and clean zones. Based on the nature of this field services this will be a flexible zone, but will generally correspond with the sites property line. At this time, the Contamination Reduction Zone is considered to be that area outside the network of monitoring wells. In the event gross contamination is encountered a designated site-specific contamination zone and associated reduction corridors will be established by the designated PCOS.

Unless otherwise specified by the PCSO, during pilot test personnel entering Contamination Reduction Zone will be required to wear the prescribed personnel protective equipment, as required.

Zone III: Support Zone

The Support Zone, the outermost part of the site, is a non-contaminated or clean area. Support equipment is located in the zone; traffic is restricted to authorized site personnel. Since normal work clothes are appropriate within this zone, potentially contaminated personnel clothing, equipment, and samples are not permitted, but are left in the Contamination Reduction Zone until they are decontaminated.

R. Decontamination Procedures

Contaminated equipment and materials leaving the site must be decontaminated or isolated appropriately. All materials will be assumed contaminated if they have been used within the Exclusion Zone. Procedures for decontamination will vary based on the level of work. Decontamination procedures may require water, soap and brushes, and a collection system for the contaminated wash water. Requirements for decontamination will be to permit safe travel of equipment leaving the property.

NETC understands water will be made available to its staff for rinsing off contaminated material. Tyvek outer clothing (if used) will be discarded. The decontamination area will be set up to decontaminate clothing and equipment of team members leaving the Exclusion Zone on an as needed basis. Decontamination will consist of a thorough soap and water wash. Personal decontamination will become necessary only after personnel encountering gross contamination.

S. Emergency Information

1. EMERGENCY SITUATION

All on site activities present a potential risk to on-site personnel. During routine operations, risk is minimized by establishing good work practices, staying alert, and using proper personal protective equipment. Unpredictable events such as physical injury, chemical exposure, or fire may occur and must be anticipated.

Emergency conditions are considered to exist if:

- Any member of the field crew is involved in an accident or experiences any adverse effects or symptoms of exposure while on site; or
- A condition is discovered that suggests the existence of a situation more hazardous than anticipated.

2. EMERGENCY PROCEDURES

a) General: The following emergency procedures should be followed: In the event of emergency, the appropriate contacts identified in the emergency phone numbers list at the front of this HASP shall be notified. This list should be posted conspicuously at the site.

- Personnel on site should use the "buddy" system (teams).
- Buddies should prearrange hand signals or other means of emergency signals for communications in case of being out of hearing range.
- Visual contact should be maintained between "teams" in order to assist each other in case of emergencies.
- In the event that any member of the field crew experiences any adverse effects or symptoms of exposure while on site, the entire crew should immediately halt work and act according to the instructions provided by the PCSO.
- The discovery of any condition that would suggest the existence of a situation more hazardous than anticipated should result in the evacuation of personnel and reevaluation of the hazard and the level of protection required.
- In the event an accident occurs, the PCSO will complete an Accident Report Form (see Attachment A). Follow-up action shall be taken to correct any situation that caused the accident.

b) Personal Injury: In case of personal injury at the site, the following procedures will be implemented:

- On-site personnel administer treatment to an injured worker.
- The victim will be transported to the nearest hospital or medical center. If necessary, an ambulance will be called to transport the victim.

c) Chemical Exposure: If a member of the field crew is exposed to hazardous chemicals, theprocedures outlined below will be followed:

- Another crewmember (buddy) will remove the individual from the immediate area of contamination.
- Precautions will be taken to avoid exposure of other individuals to the chemicals.

- If the chemical is on the individual's clothing, first rinse the clothing if possible, and then the clothing should be removed if it is safe to do so.

- If the chemical has contacted the skin, the skin will be washed with copious amounts of water.

- In case of eye contact, an emergency eyewash will be used.

- If necessary, the victim will be transported to the nearest hospital or medical center. The nature of the injury may require that an ambulance should be called to transport the victim.

- All chemical exposure incidents must be reported in writing by the PCSO on an Accident Report Form.

d) Escape Routes: Flags will be positioned at various other locations to indicate wind direction. In the event of a sudden release of fire, all personnel will move away from the immediate area in an upwind direction and then to the site exit point. Personnel downwind of the incident will first move to the perimeter of the site and then upwind to a safe distance.

e) Signal for Evacuation: In the event of a sudden release or fire requiring immediate evacuation of personnel, the signal for evacuation will be three quick horn signals from the NETC carrier vehicle or equivalent signal source. The horns will be kept in a conspicuously visible location for quick access by all on site personnel.

f) Other Signals: NETC equipment will be equipped with a fire extinguisher. It will also be the operator's responsibility to practice fire prevention measures such as periodically cleaning the equipment to keep it free of accumulated oil/grease or other combustible materials. In the event of an equipment fire or any other fire which cannot be controlled with available fire extinguishers, the local fire department will be summoned.

T. Thermal Exposure Monitoring

1. GENERAL: Adverse weather conditions are important considerations in planning and conducting site operations.

a) HEAT STRESS

Heat stress can result when the protective clothing decreases natural body ventilation. This can occur even when temperatures are moderate. Various levels of personal protection require low permeability disposable suits, gloves and boots, which prevent most natural body ventilation. Discomfort due to increased sweating and body temperature (heat stress) will therefore be expected at the work site. Some signs and symptoms of heat stress are:

Heat Rash - Continuous exposure to heat or humid air

Heat Cramps - Inadequate electrolyte replacement
- muscle spasm
- pain in the hands and feet

Heat Exhaustion - Inadequate blood circulation
- pale, cool, moist skin
- heavy sweating
- dizziness
- nausea
- fainting

Heat Stroke - Temperature regulation fails and the body temperature rises to critical levels
- red, hot, usually dry skin
- lack of or reduced perspiration
- nausea
- dizziness and confusion
- strong, rapid pulse
- coma

b) Monitoring

Heart Rate - Radial pulse will be recorded during a 30-second period as early as possible in the rest period.

If the heart rate is >110 beats/minute at the beginning of the rest period, the next work cycle will be shortened by one-third and the rest period will remain the same.

If the heart rate is still >110 beats/minute at the next period, the following work cycle will be shortened by one-third.

Strip thermometers will be used if deemed necessary to record an individual's temperature at time intervals as follows:

Ambient Air Temperature	Interval
>70oF	every 3 hours
>80oF	every 2 hour
>90oF	every 1/2 hour

If normal temperature exceeds 99.6oF (37.6oC), the next work cycle will be shortened by one-third.

If oral temperature still exceeds 99.6oF (37.6oC) at the beginning of the next rest period, the following work cycle will be shortened by one-third.

No worker will be permitted to wear a semi-permeable garment when his/her oral temperature exceeds 100oF (38.1oC).

Recommendations to reduce heat stress:

Drink plenty of fluids (to replace loss through sweating)

Make adequate shelter available for taking rest breaks to cool off.

For extremely warm weather, follow these additional recommendations:

Wear cooling devices to aid in ventilation (the additional weight may affect efficiency.

Install portable showers or hose down facilities to cool clothing and body.

Shift working hours to early morning and early evening avoiding the hottest time of the day.

Rotate crews wearing the protective clothing.

c) COLD EXPOSURE

Prolonged exposure to cold will occur without proper protection, and the effects of cold exposure can be felt in temperatures above freezing as well as below freezing. Exposure to cold can cause severe injury (frostbite) or an overall drop in body temperature. Fingers, toes, and ears are most susceptible to frostbite. Both the outdoor temperatures and wind velocity play a part in cold weather injuries. Wind chill is used to describe the chilling effect of moving air in combination with low temperatures. Cold exposure is a serious threat to the site personnel that remove protective clothing and expose perspiration soaked underclothing to the cool air. Water conducts heat 240 times faster than air, thus rapidly cooling the body and wet clothing.

Systemic hypothermia is caused by exposure to freezing or rapidly dropping temperatures - its symptoms are usually seen in 5 stages:

- shivering
- apathy, listlessness, sleepiness and rapid body cooling
- unconsciousness, glassy stare slow pulse and respiratory rates
- freezing of the extremities (most sensitive to freezing first are the fingers, toes and ears)
- death

U. Record Keeping

1. PERSONNEL EXPOSURE

A site daily log with a required sign-in, sign-out procedure will document the time spent by each team member on the site. This information will be supplemented by AECOM provided air monitoring in the work zone.

2. PROTECTIVE EQUIPMENT

A checklist will track all protective equipment brought into the field each day. This will ensure that decontamination is performed in the field that any additional preparation, such as sanitizing face masks (if deemed necessary), is performed in the decontamination area prior to reuse. Any equipment malfunction must be noted on the checklist and repaired before reuse. Other routine maintenance checks will be scheduled and recorded on a regular basis to ensure that protective equipment is effective at all times.

3. INCIDENT REPORTS

Any chemical release to air, water, or soil must be reported to the PCSO. Any exposure to personnel resulting from such a release or from protective equipment failures must be reported immediately to the PCSO and / or other designated personnel as well as in writing within 24 hours.

4. MONITORING EQUIPMENT

Unless otherwise directed NETC is not responsible air monitoring at the property.

V. Sample Handling , Transportation & Shipment

1. HANDLING

Unless otherwise directed NETC is not responsible for sample collection. Any samples collected by NETC will be properly labeled and placed in clean containers before being removed from the site. To minimize the hazards to laboratory personnel associated with sample handling, sample volumes sent to the lab will be no larger than necessary and all sample containers will be sealed prior to shipment.

2. TRANSPORT

All samples collected at the site will be taken to a pre designated sample bank to be established / designated by the PCSO for preparation for shipment to appropriate laboratories. No samples, specimens, or other materials will be removed from the site other than those, which will be transmitted to the sample bank, or to designated disposal areas. All samples will be properly packaged following the sampling protocols to preserve the integrity of the sample and to prevent the inadvertent escape of contaminants. In addition, all samples will be placed in a suitable container before transport to prevent leakage.

3. SHIPPING

Shipping containers and labeling procedures will follow established protocols. Samples will be packed in ice chests filled with packing material and "Blue Ice". Department of Transportation regulations for sealing and marking the ice chests will be followed. At this time it is anticipated that all samples will be shipped by NETC to its laboratory subcontractor designated for this work.
