ENGINEERING CERTIFICATION

I Keith Rupert, am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for the implementation of supplemental remedial investigation activities completed during the 2017 – 2019 period, and I certify that the supplemental remedial investigation activities were implemented in general accordance with requirements pursuant to Title 6 of the New York Codes, Rules, and Regulations (6NYCRR) Part 375 Environmental Remediation Programs Subpart 375.3 Brownfield Cleanup Program as well as applicable guidance documents including NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation issued May 2010 (DER-10) and New York State Department of Health (NYSDOH) Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York issued October 2006 as updated May 2017 (Guidance Documents).

Further, I certify that the supplemental remedial investigation information submitted to the Department demonstrates that the requirements set forth in the approved remedial investigation and demolition interim remedial measure work plans dated May 2013 and May 2016 respectively, have been achieved.

Keith D. Rupert, P.E. License No. 066843-1

1.0 INTRODUCTION

Northeastern Engineering Technologies, PLLC (NET) initiated on behalf of RFID Textile Services, Inc. (f/k/a Angelica Textile Services, Inc.) Supplemental Remedial Investigation (SRI) work at the Former Haight/American Hide Tannery (hereinafter termed the Site) located at 125 Bath Street in Ballston Spa, New York. This SRI is being submitted to the New York State Department of Environmental Conservation (NYSDEC) to facilitate the reporting responsibilities of JJB 125 Bath LLC; the entity that acquired the Site from RFID Textile Services, Inc. on September 21, 2018, for Brownfield Cleanup Agreement (BCA) No. C546055-10-12.

The SRI work was completed in accordance with NYSDEC DER-10 / Technical Guidance for Site Investigation and Remediation Policy [May 2010] and is intended to address specific data gaps identified by the NYSDEC following its review of a prior Remedial Investigation (RI) Report prepared by Environmental Compliance, Inc. (ECI) in 2014. The SRI work also address directives received from the NYSDEC following demolition Interim Remedial Measure (IRM) work at the Site during the 2017 – 2019 period.

1.1 Supplemental Remedial Investigation Objectives

To address data gaps identified by the NYSDEC that prevented a significant threat determination in 2014, and to pursue a certificate of completion (COC) determination for the entire Site, the supplemental inspection and invasive testing services were completed beginning in 2017 in conjunction with demolition IRM work activities in locations below and immediately adjacent to the network of condemned manufacturing structures located west of the vacant commercial manufacturing structure most recently operated by Angelica Textile Services, Inc. (*see* **Appendix A**). The following SRI work tasks were completed to address the data gaps identified in the area of concern (AOC) occupied by the condemned manufacturing buildings:

1. Verify a concrete surfaces exist below the AOC occupied by condemned manufacturing structures.
2. Characterize the nature and extent of chemical impacts to soil and groundwater below the AOC.
3. Identify the source(s) of contamination below the AOC.
4. Assess the impact of contamination identified below the AOC on public health and the environment.
5. Provide information to support the development of a proposed remedy to address the contamination at the Site.

1.2 Site Description

The Site; a single 6.35 acre commercial business district (CBD) zoned parcel of land (see **Appendix B**, for zoning code), is located in the Town of Milton, Village of Ballston Spa, Saratoga County, New York (see **Appendix C**, **Figure 1**). The Site, located at 125 Bath Street immediately north of Gordon Creek and the intersection of Bath Street and Hamilton Avenue is identified by the Village of Ballston Spa as Tax Map No. 216.32 – 1- 96.2. A mixture of single family and multi-family residential properties exist north, south, and east of the Site. Unimproved wooded land, a bike path of the Village of Ballston Spa and the Saratoga County Fairgrounds exist west of the Site. A tributary of the Kayaderosseras Creek (i.e., Gordon Creek) boarders the southern property line of the Site. The Porter's Auto Body Shop is located south of Gordon Creek. The Site is situated in a low valley at an approximate elevation of 244 feet above mean sea level (AMSL). Half a mile north and south of the Site, elevations increase by approximately 100 feet.

Improvements at the Site include a ± 80,000 square foot commercial manufacturing structure most recently operated by Angelica Textile Services, Inc. (Angelica) which is located along the Bath Street road frontage of the Site. A series of foundation ruins of the Former Haight/American Hide Tannery manufacturing facility exist south and west of the 80,000 square foot commercial manufacturing structure. The

commercial manufacturing structure is currently unoccupied. With the exception of steeply sloping forested portions of the western property line, areas of the Site not occupied by the above noted structures are improved by asphalt, concrete and gravel surfaces, are covered by beneficial hard fill materials (i.e., brick and concrete) generated as a result of the demolition IRM completed in 2017 or exist as landscaped green space.

1.3 Site History

Historic records document industrial development of the Site beginning in ± 1881. Tannery operations of the *Haight and Company, American Hide & Leather,* and *Howes Leather* which were the focus of an ECI IRM, reportedly occurred during the period from 1887 to 1960. The most recent operator of the Site was Angelica, which acquired the Site and the business entity, Linen Systems for Hospitals, Inc. ("Linen Systems") in 1977 and officially changed Linen Systems name to Angelica on or about 1984. Linen Systems acquired title to the Site in 1977 (Ref. Exhibit B of the BCP application, including the deed). Linen Systems and later Angelica performed laundering of garments with detergents on the Site and warehoused linens from approximately 1977 through 2011 without the use of dry cleaning chemicals. Angelica has ceased operations on Site.

Environmental contamination associated with the Angelica Site was first discovered in July 2010 following an extended rain fall event, in the vicinity of a former 100,000 gallon No. 6 oil above ground storage tank (AST) that historically operated northeast of the 2017 demolition IRM work zone. Upon discovery, the NYSDEC assigned Spill No. 1004405 to the release (Ref. Exhibit K of the BCA application). Site investigation work conducted by ECI sufficiently demonstrated that the nature and extent of the contaminants warranted the inclusion of the Site into the NYSDEC Brownfields Cleanup Program (BCP). The Site was accepted in the BCP on January 31, 2013.

Demolition IRM work at the Site in 2017 was completed specifically to facilitate the SRI work below (6) condemned manufacturing structures, a large smoke stack and foundational ruins located west of the ±80,000 square foot commercial manufacturing structure and historically operated as the Former Haight/American Hide Tannery manufacturing facility. The demolitions IRM work included the closure of abandoned fuel storage systems, undocumented vessels found to exist in one of the former manufacturing structures as well as the demolition of a pump house and storage buildings outside the SRI AOC located along the Gordon Creek. The ± 80,000 square foot commercial manufacturing structure (most recently operated by Angelica) located along the eastern road frontage of the Site was excluded from the demolition IRM work. The demolition IRM work zone comprised a footprint of ± 2.5 acres. (Ref, Interim Remedial Measure Construction Completion Report Demolition of Site Buildings dated April 2018).

1.4 Previous Investigations

Previous Investigations conducted at the Former Haight/American Hide Tannery manufacturing facility include a June 2008 Phase I Environmental Site Assessment (ESA) prepared by Gaia Tech; a 1993 Underground Storage Tank (UST) Removal Investigation; a July 2010 Site Investigation and Sampling Program conducted by ECI; a February 2012 Phase I Addendum Report prepared by Gaia Tech; and a March 2014 RI report updated June 2014 prepared by ECI.

1.4.1 Phase I Environmental Site Assessment (ESA)

A Phase I ESA E-1527-05 (ASTM-05) was performed by Gaia Tech in June 2008 to facilitate the environmental due diligence requirements involving a real property financial transaction and the Site. The Phase I ESA Report concluded that Angelica's use of the Site to launder garments did not create recognized environmental conditions (RECs), but prior tannery operations by Haight and Company Tannery from 1881 to 1899, American Hide & Leather from 1899 to 1955, and Howes Leather Company, Inc., from 1956 to 1960 may have caused RECs.

The Phase I ESA Report describes the Haight Tannery's operations as including a bark mill, a leach house, an engine room, and finishing areas. The Site's central area included a "vat yard." Several tanning liquor tanks, and a rail spur, were present on the western portion of the Site by the late 1890s. *See* Sanborn Maps attached to the Phase I Report.

Subsequently, American Hide & Leather was present from 1899 to 1955. By 1904, the Tannery contained 15 buildings. *See* Exhibit N of the BCP application. A 1924 map reveals the presence of "waste tanks" added to the main Tannery building. Additionally, a sewage disposal and a chlorine plant were present along Gordon Creek. A large area of empty barrels appeared to be present in the Site's northeast portion at this time. By 1942, a 100,000 gallon fuel oil AST and 100,000 gallon water AST were present on the Site's northern portion. The Tannery discharged water containing lime, salt, tanning liquors, and lactic acid into Gordon Creek; the effluent was highly colored.

In 1945, the current Site building was constructed on the south and east portions of the Site to replace a former building. By 1950, the Tannery was expanded to include a fuel handling building, coal silos, ash silos, additional fuel oil tanks, and paint shed. *See* 1950 Sanborn Map in Phase I. According to the updated Phase I February 2012 Addendum, for one year the Site was owned by General American Industries, Inc. from 1955 to 1956. *See* Exhibit N of the BCP application. General American sold the Site to Howes Leather Company, Inc., which continued to operate the tannery from 1956 to 1960 when Tannery operations apparently ceased. The Site was vacant from 1960 until 1970 when laundering of linens began by a company named Northern Hospital Linen Service, Inc. Laundering of lines continued at the Site until 2011.

According to the Phase I Report, there are no USTs currently at the Site. A single UST was installed in 1973 and removed in 1993; this stored 4,000 gallons of diesel fuel. No spills, leaks, or indications of product release were reported. The tank was allegedly removed in accordance with NYSDEC regulatory requirements, and soil tests beneath the tank performed by the NYSDEC found no impact. One 5,000 gallon fuel oil aboveground storage tank (AST) that stores back up fuel when natural gas is unavailable was on-Site from November 2000 until July 2012. *See* Exhibit D of the BCP application Site Layout and Area Map. [NOTE: This AST was present west of the Site building, but was permanently closed on or about July 18, 2012.] Additionally, two water ASTs located in the boiler room did not represent a REC. Angelica formerly stored laundering chemicals in state registered plastic ASTs, but changed to using portable totes and drums early in the 2000's; these ASTs also did not represent a REC in the Phase I ESA Report.

According to the Phase I, Angelica did not generate or dispose of hazardous waste and no waste disposal occurs on Site. Sanitary wastewater was discharged to the municipal sewer system by Angelica. Wash water was discharged through a network of grate drains equipped with lint filters to a concrete sump/wastewater pit in the boiler room, which pH adjusted the water prior to discharge to the sewer system. The sump/wastewater was inspected and pumped out every 3 to 5 years. However, the Phase I did not contain any data confirming no impacts from the sump. Two natural gas-fired boilers were identified as the Site's only combustion emissions, but were not deemed as posing a physical impact to the Site in the Phase I Report. The Report also concluded the Site's transformers did not appear to pose a polychlorinated biphenyl (PCB) hazard.

The Phase I ESA Report also evaluated if there was any potential environmental impact to the Site from surrounding properties. The most significant adjacent former use was located across the channelized creek to the South, and was known as the former Ballston Spa Electric Light & Power Company, which was present southwest of the Site from 1892 to 1911, and may have been a manufactured gas plant Site. However, other than this historic use, which is separated by the Site via the creek, there were no other former adjacent uses noted of any environmental significance. See Exhibit I of the BCP application - Adjacent Property Owner Map.

There have been release incidents on adjacent or nearby Sites, which were identified and are summarized below:

A. *Old Village Garage, Thompson Street.* This Site, which is approximately 350 feet north-northeast, is down-gradient from the Site, and reported a leaking gasoline UST in 1998. NYSDEC has not apparently issued a closure letter, but this spill is listed as "corrective action taken", and therefore, was not deemed as having a potential impact on the Site in the Phase I Report.

B. Vicinity Oil Spills. Four spills with minimal potential for hazard have been closed after corrective action was taken in the vicinity, and were not deemed to represent a potential impact concern in the Phase I Report. These were all within 650 feet of the Site, and included: a diesel fuel spill south-southeast of the Site in 1998, an oil and gas spill in 1993 at a commercial business east-southeast, a gasoline spill at Cumberland Farms east-northeast in 1988, and a water spill at a dentist office south of the Site in 1993.

C. *Herbicides and Pesticides Spill.* Herbicides and pesticides were released by an Agway store that burned down in 1977, 750 feet south of the Site. This Site is allegedly under continued NYSDEC monitoring, although materials are buried and leachate is allegedly being controlled. Because of this Site's status, it cross-gradient relationship to the Site, and distance from the Site, the Agway Site was not deemed to pose an impact on this Site in the Phase I Report.

1.4.2 UST Removal Investigation

In 1993, Angelica removed a 4,000 gallon diesel fuel UST and associated distribution pump equipment from behind the vacant ± 80,000 square foot commercial manufacturing structure. An investigation of the soils in 1993 beneath the excavated UST did not detect contamination. The tank registration lists this tank as closed as of August 1, 1993.

1.4.3 Surface Soil Petroleum Incident Data

Environmental contamination associated with this Site was first discovered in July 2010 in the vicinity of a former 100,000 gallon former fuel oil AST in the northwest corner of the Site during an unusual release of No.6 fuel oil from under the ground to the surface due to what was believed to be saturated soil conditions from extensive rain events that had occurred at this time. Observations of the oil release were reported to the NYSDEC upon discovery. NYSDEC Spill #1004405 was assigned to this release. *See* Exhibit K of the BCP application. A subsequent Site investigation and sampling program performed by ECI confirmed the presence of petroleum contamination in the vicinity of the former AST. Leather waste and ash solid waste materials associated with the former tannery were later discovered to be buried in the vicinity of the base of the former AST during remediation of the petroleum spill. Additional areas of tannery related contamination were slated for investigation during implementation of the RIWP. No reports were generated in relation to the petroleum spill remediation and excavation work but the data investigation results were shared with the Department and are summarized below:

On September 29, 2010, excavation work was performed in and around the area of the discovered petroleum. Approximately 102.07 tons of petroleum contaminated soil (PCS) was removed and sent to Environmental Soil Management Inc. (ESMI) for incineration. ECI's subcontractor Galloway Technical Services (GTS) had to cease excavation on or about October 1, 2010 due to wet weather issues. On October 18, 2010, further excavation was performed until October 21, 2010. PCS was stockpiled on-Site for disposal.

On November 28th through December 13th, 2010, further excavation was performed in an attempt to fully determine the nature and extent of the PCS. Approximately 270.7 tons of additional PCS was removed from the Site and sent to the Colonie Landfill and 14,933 gallons of groundwater was sent to a the Schenectady wastewater treatment facility located in Schenectady, New York as was all groundwater removed from the Site. The 270.7 tons of PCS sent to the landfill represented PCS that had been excavated from the pit (EP1) since October 2010.

Before the remnants of the vertical steel tank and concrete pad could be uncovered and removed, first the soil deposition and tree growth had to be removed. Since some of the trees were 30 to 40 feet tall, a third party, Donavan Tree Service, was called in to remove eight (8) of the largest trees in early December 2010.

On May 21, 2011 through June 17, 2011, further excavation was performed with the goal of removing the remaining soil, trees and the tank bottom and additional contaminated soil. The tank was estimated to be about 25 feet in diameter; this would estimate the height of the tank to be about 27 to 30 feet tall in order to contain 100,000 gallons. What remained of the bottom portion of the tank was the bottom and about 7 feet of a collapsed vertical section of the sidewall of the steel tank. The remnants of the tank bottom and collapsed side wall were filled with ash and soil backfill. GTS removed the contents of the tank bottom and then cut up the remaining portion of the steel. The condition of the above ground vertical petroleum tank indicated it had previously undergone demolition.

The vertical tank sat on a heavily reinforced concrete pad that was supported by a number of piers that were in the ground. The piers are still in place and the depth of the piers has not yet been determined at that time.

GTS removed an additional 379.26 tons of PCS, which was sent to the Fulton County Landfill, and 54,112 gallons of groundwater was sent to the Schenectady wastewater treatment facility. The remnants of the vertical steel wall and bottom of the tank and concrete pad was cut up and sent for recycling and disposal. The location of this tank bottom corresponds to the location of a former 100,000 gallon AST vertical steel tank and structural support pad shown on historic Sanborn maps. On or about June 17, 2011, leather scraps were unearthed, and the excavation was halted. As of June 2013 there was a stock pile(s) of petroleum contaminated leather scrap on-Site. The Baker 20,000 gallon tank used to store ground water from the excavation was cleaned on October 23rd, 2012 and removed from the Site on October 24th, 2012. At that time another 1,477 gallons of ground water and rinse water extracted from the Baker tank was sent to the Schenectady wastewater treatment facility.

In addition, a 5,000 gallon above ground diesel tank was permanently closed on July 18, 2012 as reflected in the NYSDEC's Petroleum Bulk Storage (PBS) registration documentation.

All of the above excavation started at the location of the initial test pit and moved in an outward direction from the initial point in an attempt to delineate the contaminated area. Despite several rounds of excavation, the full extent of the PCS was not determined during the completion of this first phase of work because tannery related solid waste leather material was uncovered. An IRM was planned to address this area.

The soil samples were collected so that approvals from either the thermal treatment or landfill disposal companies would accept the soils for treatment/disposal off-Site. The soil analytical parameters that were tested during this time period were mostly TLCP related. The

groundwater samples were collected so that the wastewater treatment facility (i.e., located in Schenectady, New York) would accept the groundwater for treatment and disposal. The data results from the collected soil and groundwater samples confirmed that No. 6 fuel oil (Diesel Range Organics mostly identified as a match to Lube Oil based on laboratory analysis/comparison) was present in the ground/excavation area. Additionally, soils contain multiple semi-volatile organic compounds (SVOC), including acenapthhene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i) perylene, benzo(k)fluoranthene, chrysene, 2-methylnapthalene, dibenz(a,h) anthracene, fluoranthene, fluorene, indeno(1,2,3-cd) pyrene, phenanthyrene, and pyrene. The VOCs m,p-xylene and o-xylene were also detected, but only in one sample and at levels slightly above non-detect levels. Low levels of heavy metals, including but not limited to, arsenic, barium, chromium, and lead were also detected, with barium identified in most samples. All barium sample results were below the Industrial soil clean-up objectives (SCOs). In addition, the testing for metals during this time period indicated that the metals were not present at hazardous waste levels.

1.4.4 Phase I Addendum Report

The Phase I consultant GaiaTech received NYSDEC FOIL documents, which it summarized in its updated February 2012 Phase I Addendum Report. In addition, since the initial Phase I Report did not contain any data confirming there were no impacts from Angelica's own operations to the sump, GaiaTech asked Angelica for its past data for analysis.

Based on updated information and data provided by Angelica, and documented in the February 2012 Phase I Addendum Report dated May 2009, analysis of sludge from the sump pit (located inside the main building and boiler room), was analyzed for pH, solids, SVOCs, acids, halocarbons, aromatics, ketones, carbon disulfide and vinyl acetate. The analysis was performed so that sludge, if present, could be characterized for disposal. The data indicated that the pH was slightly basic, barium was detected at 1.79 micrograms per kilogram (µg/kg), toluene was detected at 19.6 µg/kg, acetone was detected at 1,350 µg/kg, 2-butanone was identified at 142 µg/kg, and carbon disulfide was identified at 224 µg/kg. GaiaTech concluded the sump pit did not receive discharges of oils, solvents or other unauthorized materials while in use and all detections were below the respective unrestricted use cleanup standards in 6 NYCRR 375-6.8(a), which are 0.7 parts per million (ppm) for toluene; and 350 ppm for barium. Acetone exceeded the 0.05 ppm unrestricted use cleanup standards in 6 NYCRR 375-6.8(a) but was well under the 4.8 ppm standard acetone for restricted residential use pursuant to 6 NYCRR 375-6.8(b). Acetone is also a frequent lab contaminant. While there are no regulatory standards for 2-butanone and carbon disulfide, the catch all residential cleanup guidance standard in NYSDEC CP-51 is 100 ppm for each of these substances. Given the nature of material laundered and detergents used, lack of staining or indications of releases to the wastewater system observed in 2008, and the results of sludge sampling in 2009, the potential for significant impact to the Site as a result of unauthorized releases to the wastewater system appeared low to the Phase I consultant in this Addendum Report. *See* Exhibit P of the BCP application– Sump Pit Data.

1.4.5 Remedial Investigation Report

In the summer of 2013 ECI, on behalf of the BCP volunteer participant [Angelica] implemented a NYSDEC approved IRM and RI program for the Former Haight / American Hide Tannery Site. The purpose of the IRM and RI work was to further remove grossly contaminated soils based upon visual observations from areas adjacent to and downgradient of the 2010 & 2011 soil removal zone (i.e., EP1), dispose of stock piled petroleum contaminated leather scrap previously generated during the initial remedial excavation of EP1 as well as to delineate the nature and extent of sub-surface contamination, if any, at the Site.

The implementation of the IRM work occurred during the period from June 2013 through August 2013. During that period an additional 1,697 tons of PCS and leather scrap solid waste material was removed from the excavation pit area and transported to the Fulton County Landfill for offsite disposal. To facilitate the excavation work, approximately 57,000 gallons of groundwater was removed from the excavation on an as needed basis and sent to the Schenectady, New York wastewater treatment plant for disposal. Upon completion of the of the IRM PCS removal work the excavation was completed with approximately 2,130 cubic yards of clean backfill.

Upon the conclusion of the IRM PCS removal work (5) endpoint soil samples (i.e., CS1-West-10, CS2-East-10, CS3-South-10, CS4-Bottom-12 and CS6-North-10) were selected to characterize the conditions remaining in the EP1 PCS removal zone. Soil quality condition that remained in the EP1soil removal zone generally conformed to the Commercial Use SCOs with only two (2) metals, Barium and Copper, being reported at concentrations above their respective Commercial Use SCOs for two (2) samples: CS2-East-10 and CS6-North-10.

Only sample CS6-North-10 contained sample results that were are above their respective Commercial Use SCOs for SVOCs: Benzo (b) fluoranthene, Benzo (a) anthracene and Dibenz (a,h) anthracene. Endpoint sample CS6-North-10 was also reported to contain the SVOC Benzo(a)pyrene at a concentration above its Industrial Use SCOs. Based upon the elevated concentration of Benzo(a)pyrene additional soil removal efforts were pursued in the area of endpoint soil sample CS6-North-10. An additional endpoint soil sample, CS7-North-10, was collected and analyzed for the SVOC Benzo(a)pyrene. CS7-Noth-10 was reported to contain the SVOC at a concentration below the Commercial Use SCOs. Thus, only three SVOCs: Benzo (b) fluoranthene, Benzo (a) anthracene and Dibenz (a,h) anthracene remain above their respective Commercial Use SCOs (see **Table 1**).

Table 1
Restricted Residential Use Soil Cleanup Objective Exceedances
EPI Excavation Area

Sample ID	Chemical Parameter	Result	NYS 375 Restricted Residential Use	NYS 375 Commercial Use
CS6-North-10	Barium	431	400	400
CS6-North-10	Copper	590	270	270
CS6-North-10	Benzo(b)flouranthene	6.76	1	5.6
CS6-North-10	Benzo (a) anthracene	5.91	1	5.6
CS6-North-10	Benzo (a) pyrene	7.05	1	1
CS6-North-10	Dibenz(a,h)anthracene	0.94	.330	0.560
CS6-North-10	Indeno (1,2,3-cd) pyrene	4.28	0.5	5.6
CS2-East-10	Barium	8590	400	400
CS2-East-10	Copper	513	270	270

Note: All units on Table 1 are in parts per million (ppm or mg/Kg).

The RI work consisted of a geophysical survey; the installation of (20) soil borings and (5) monitoring wells; the collection and analysis of (80) soil and (5) groundwater samples; the collection and analysis of (2) sub-slab soil vapor samples; and the collection and analysis of (1) sediment/sludge sample.

The geophysical survey was conducted using electromagnetic conductivity (EM) and magnetometer methods. The EM consisted of establishing survey grids with 20-foot by 20-foot dimensions and 5-foot data node spacing at each well and boring location. Due to the prevalence of concrete with steel reinforcement (rebar) from former foundations still present both above ground and underground as well as other metal scrap material at the Site, numerous geophysical anomalies were identified. However, no geophysical anomaly signatures indicative of spherical metal objects such as underground tanks or buried drums were identified in the geophysical survey areas.

The results from the geophysical survey were utilized to strategically position the soil boring and monitoring well installations. Drilling locations were selected at a point within each survey grid that demonstrated a low geophysical gradient in order to reduce the risk of hitting any buried metal objects.

Fill material consisting of sand, gravel, brick and coarse black ash were observed at (13) of the (20) soil boring locations to depths as great at 13 feet below grade, immediately behind the "main building". Native deposits underlying the fill materials were identified to consist of glacially derived gravels, sands, silt and clay. A dense glacial till consisting of varying amounts of clay, silt, and fine to medium size, sub-angular gravel was identified to exist beneath the shallow surficial deposits.

Each subsurface soil sample was screened upon recovery for the presence of volatile organic compound (VOC) vapors using a handheld photoionization detector (PID). There were no PID responses observed above background conditions identified in any of the soil samples recovered from the Site. Subsurface soil samples were collected for laboratory analysis at each of the borings Sites. The analytical suite for the soil samples included the following:

1. VOCs - analyzed by EPA Method 8260B.
2. SVOCs - analyzed by EPA Method 8270C.
3. Target Analyte List Metals (ICP) – Aluminum, Antimony, Arsenic, Barium, Berylium, Cadmium, Calcium, Chromium (total), Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc - analyzed by EPA Method 6010C
4. Mercury – analyzed by EPA Method 7471B
5. Hexavalent Chromium – Method SW7196
6. Pesticides - analyzed by EPA Method 8081B.
7. PCBs - analyzed by EPA Method 8082A.
8. Cyanide – analyzed by Method SW9014

A total of 80 soil samples were submitted for chemical analysis and were analyzed for approximately 82 different analytes. Of the 80 soil samples, only 24 were reported to contain analyte(s) above Commercial SCOs. Specific analytes identified above the respective Commercial and Restricted Residential SCOs are listed on **Tables 2A**, **2B**, **2C** & **2D** for consideration.

Five (5) monitoring wells (MW1, MW2, MW3, MW4, and MW6) were installed during the 2013 RI work. Groundwater elevations measured to the nearest 0.01 feet in each of the monitoring wells, by ECI on 6/30/13, identified groundwater flow beneath the Site to be primarily in an easterly direction towards Bath Street.

Each of the newly installed monitoring wells were sampled, via low flow conditions, and submitted for chemical analysis for the following parameters;

1. VOCs - analyzed by EPA Method 8260B.
2. SVOCs - analyzed by EPA Method 8270C.
3. Target Analyte List Metals (ICP) – Aluminum, Antimony, Arsenic, Barium, Berylium, Cadmium, Calcium, Chromium (total), Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc - analyzed by EPA
Method 6010C
4. Mercury – analyzed by EPA Method 7471B
5. Hexavalent Chromium – analyzed by EPA Method 218.6
6. Pesticides - analyzed by EPA Method 8081.
7. PCBs - analyzed by EPA Method 8082.
8. Cyanide – analyzed by Method SM4500 –CN E

With the exception of iron, identified in groundwater samples MW1, MW2, MW3, MW4, and MW6 and manganese identified in groundwater samples MW1 and MW4 each chemical parameters were reported at concentrations below the applicable groundwater quality standards or reported at concentrations below laboratory detection limits. However, it should be noted that a number of substances whose reported laboratory non-detect limits exceeded their respective allowable groundwater quality objective.

At the direction of the New York State Department of Health (NYSDOH), ECI collected two (2) sub-slab vapor samples (i.e., C1 and C2) from beneath the floor slab of the ± 80,000 square foot vacant manufacturing structure. Each sample was collected using EPA Method TO-15 VOC air sampling and analysis. The VOCs Trichloroethene, Carbon Tetrachloride, Tetrachloroethene, Methylene Chloride, and 1,1,1-Trichloroethane were identified in each of the sub-slab vapor samples at low level concentrations ranging from 1.1 – 19 ug/m³. No additional indoor air or sub-slab vapor samples were collected during the 2013 RI work.

Inside the ± 80,000 square foot vacant manufacturing structure the wastewater discharge system was sampled for sludge/sediment within a small above ground sump located in the former maintenance shop. The building had been shuttered and the sump that was originally designated for sampling (located below ground in the boiler room downstream of the maintenance shop) was not accessible and did not contain sufficient sludge/sediment for sample collection. The originally designated sump was the sump sampled by GaiaTech which it summarized the results in its updated February 2012 Phase I Addendum Report. The sludge/sediment sample was subjected to the same chemical parameters as conducted during the soil investigation work.

The location chosen for sampling was up stream/line of the original sump location and very little sediment was available for sampling (IS1). The results indicated that the metals mercury, barium, cadmium, copper and nickel were each reported at a concentration above Commercial Use SCOs. All remaining chemical parameters were reported to be at concentrations below Commercial Use SCOs.

Based upon the completed work the following conclusions were offered by ECI;

1. Groundwater was minimally impacted. Only iron and manganese results were greater than the allowable groundwater quality objective for all five (5) groundwater sample locations. All other groundwater results were below the allowable groundwater quality objective shown in Table 3 of Chapter X of the Division of Water, NYCRR Part 703.6. The area surrounding Ballston Spa, New York is known to contain high metals concentrations in the groundwater that were historically used as spa treatments. There were a number of substances whose reported laboratory non-detect limits exceeded their respective allowable groundwater quality objective. However, the allowable groundwater quality objectives are established for drinking water and there are no groundwater wells located anywhere near the Site (*see* Section 2.4). At this time there does not seem to be any Site related contamination in the groundwater from the aforementioned monitoring well locations. Therefore, groundwater remediation is not required.

2. The soil samples indicate there are only two (2) Site locations where multiple sample location results identified specific metal and SVOCs that were above the Industrial Use SCOs; these were in the southwest corner and north driveway areas of the Site. Based on soil sample results, which identify the presence of fill with SVOCs and metals, as well as the bore logs, and visual observations, portions of the fill contain fragments of coal, coal ash, and/or asphalt, specifically in the southwest corner of the Site. Coal, coal ash, and

asphalt contain SVOCs and metals identified in the sample results located in the southwest corner of the Site and in the same range of their respective concentrations. The fact that there may be SVOCs below the detection limit in the north driveway area of the Site, the metals in this location may also be related to coal, coal ash, and asphalt. However, this is more inconclusive than in the southwest corner of the property where both SVOCs and metals exceeded the Industrial Use SCOs in Table 375- 6.8(b). Never the less there is strong evidence that the metals and SVOCs in both the north and southwest portions of the Site are related to coal, coal ash, and asphalt fill that is visually present in both locations. While there are two fill areas that contain SVOCs and metals which exceed Industrial Use SCOs, there are a few other random locations identified throughout the Site where SVOCs and metals exceed Industrial Use SCOs. All of these other locations which contain fill seem to be relatively small and isolated areas. Specific to the two (2) Site locations where multiple sample location results identified specific metals and SVOCs that were above the Industrial Use SCOs, the southwest corner and north driveway areas of the Site have significantly different groundwater flow rates. The southwest corner has very little horizontal groundwater flow while the north driveway location has significant horizontal groundwater flow. It is likely that both have glacial till under their respective locations, which prevents vertical migration of potential compounds of concern (COC). Capping in either location will have minimal impact on horizontal groundwater flow in their respective locations. Thus, both areas may require only minimal capping because the glacial till prevents vertical migration of any potential COC, capping will have a minimal impact on horizontal migration of any potential COC, and the COC are stable in the soil matrix and are not impacting groundwater.

3. The inside wastewater discharge sludge/sediment sample results from the maintenance shop were below the Industrial Use SCOs in Table 375-6.8(b) with one (1) exception, mercury. The mercury sample result was 61.2 mg/Kg whereas the Industrial Use Cleanup Objectives is 5.7 mg/Kg. The mercury could have come from old paint or other material that was used in the building since its construction in the middle 1900s. This small above ground sump can easily be cleaned to remove any residual mercury.

4. Only low level VOCs were identified in the sub-slab vapor results, which did not warrant further investigation or mitigation.

2.0 PHYSICAL AND ENVIRONMENTAL SETTING

2.1 Site Features

The Site is located in the central portion of the Village of Ballston Spa. Site resides at an average elevation of approximately 244 feet AMSL and topographically ranges from steeply sloping, in areas along the western Site boundary, to generally flat along the central and eastern portions of the Site. The majority of the Site had been fully developed for industrial purposes associated with the Former Haight/American Hide Tannery facility. With the exception of the steeply sloping forested portions of the western property line; areas of the Site that are not otherwise occupied by the vacant [former Angelica] 80,000 square foot building located along Bath Street and the slab on grade concrete floor and foundation surfaces of the condemned manufacturing buildings razed during the 2017 demolition IRM work, the remaining areas of the Site are improved by asphalt, concrete and gravel surfaces, are covered by beneficial hard fill materials (i.e., brick and concrete) generated as a result of the demolition IRM completed in 2017 or exist as landscaped green space.

2.2 Soils / Geology

Based upon a review of the Surficial Geologic Map of New York, the overburden at the Site consists of lacustrine delta (ld) deposits of coarse to fine gravel and sand, stratified, generally well sorted, deposited at a former shore line, and variable with thicknesses of 3 to 15 meters (Caldwell, D.H., et al. 1978).

Based on Soil Survey map accessed through the United States Department of Agriculture (USDA) Soil Conservation Service web site, at www.websoilsurvey.nrcs.usda.gov, the Property is mapped with (2) different soil series as discussed below:

Chenango silt loam, loamy substratum, undulating (ChB) - This soil series accounts for approximately 85% of Site soils. This series is described as very deep, well-drained soil is formed in water sorted sand and gravel on outwash plains, kames eskers, and alluvial fans. Slopes range of 8 to 15 percent and are complex. Individual areas typically range from 5 to 50 acres and are oval or irregular in shape.

Oakville and Windsor soils, 25 to 30 percent slopes (OeE) – This soil series accounts for approximately 15% of the Site soils. This soil series is described very deep, well drained to excessively drained soils formed in water-sorted sand. The soils are on steep eroded sides of gullies in glacial outwash plains, lake plains, and beach ridges. Individual areas range mainly from 10 to 80 acres and are long, narrow, and irregularly shaped. This unit is about 40 percent Oakville soils, 40 percent Windsor soils, and 20 percent other soils. The Oakville and Windsor soils were mapped together because their use and management are the same. Some areas are mostly Oakville soils, some are mostly Windsor soils, and many contain both kinds of soils.

Based upon a review of the Geologic Map of New York dated March 1970 compiled and edited by D.W. Fisher, Y.W. Isachesn and L.V. Richard bedrock at the Site is mapped as Canajoharie Shale. This black shale is a member of the Trenton Group and is of Middle Ordovician age, forming approximately 465 million years ago. Previous RI work conducted at the Site did not encounter bedrock in any of the soil boring, monitoring well or excavation sites. The depth to bedrock is estimated at 10 – 40 feet below grade.

Structurally, the area contains a number of sub-parallel, generally north-south oriented faults. The Saratoga fault is a normal fault located approximately one mile east of Ballston Spa. Another significant normal fault, the McGregor fault is located to the northeast and controls the location of several carbonated mineral springs in the Saratoga region.

2.3 Hydrology

According to the United States Geologic Map (https://water.usgs.gov/GIS/regions.html), the Property is located in the Mid-Atlantic Hydrologic Unit in the Upper Hudson River Drainage Basin. According to the Environmental Protection Agency's Designated Sole Source Aquifers (SSA) mapping website accessed at (https://epa.maps.arcgis.com/apps/webappviewer/index.html?id=9ebb047ba3ec41ada1877155fe31356b),the Property is not located in the area of a mapped sole source aquifer. Groundwater in the vicinity of the Property is not used for drinking water. The majority of properties in the study area are supplied drinking water from the municipal system of the Village of Ballston Spa which in turn obtains its municipal supply from the Great Flats Aquifer via the Town of Glenville. There are no public water supply wells located within 1,500 feet of the site. No potable or private domestic use wells are located down-gradient of the Site.

Additional research using NYSDEC available lists indicate there are groundwater wells as follows:

- Two groundwater wells at below ground surface (BGS) depths of 100 feet and 200 feet located 5,400 feet north west of the Site (up gradient);
- One groundwater well at BGS depth of 35 feet located 5,980 feet south of the Site (down gradient);
- One groundwater well at BGS depth of 645 feet located 4,000 feet south east of the Site (down gradient); and
- One groundwater well at BGS depth of 27 feet located 11,800 feet north of the Site (up gradient).

The current use of the groundwater wells remain undetermined at this time.

3.0 SUPPLEMENTAL REMEDIAL INVESTIGATION ACTIVITIES

3.1 Supplemental Remedial Investigation Scope of Work

The SRI work included the installation of (15) soil borings and (9) monitoring wells, the analysis of (18) soil samples and (5) groundwater samples was completed as part of the demolition IRM in 2017. One soil vapor intrusion (SVI) risk assessment sampling event was also complete in the vacant [former Angelica] 80,000 square foot building located along Bath Street during the winter heating season of 2019. Professional inspection and operational field services required for the soil boring, monitoring well and vapor sampling services were conducted by Northeastern Environmental Technologies Corporation (NETC). The following tasks comprised the SRI work:

- Soil Boring Investigation;
- Groundwater Investigation;
- Soil Vapor Intrusion Risk Assessment;
- Quality Assurance/Quality Control (QA/QC) Samples;
- Health and Safety Plan; and
- Community Air Monitoring Program

The soil and groundwater sample locations as well as the (SVI) sample locations are depicted on the Sampling Location Map prepared by, Ausfeld & Waldroff Land Surveyors LLP (see **Appendix C**, **Figure 2**).

3.2 Soil Investigation Methodology

During the period from April 14, 2017 through July 6, 2017 (15) soil borings (i.e., B2-1, B3-1, B3-2, B4-1, SW-1, MW-6, NE-1, FD-4, NW-1, BB-1, BB-2, BB-3, DB-1,USB-1 and USB-2) were advanced at the Site, by NETC, to depths ranging from ± 4.0 – 20.0 feet below grade to facilitate the acquisition of near surface soil and / or groundwater samples. Each soil boring was completed in a manner to provide a geological log of the subsurface conditions and / or provide data on the soil and / or groundwater quality condition of the areas evaluated. Each soil boring was advanced utilizing NETC's track mounted Geoprobe 6620DT sampling platform following standard direct push drilling methods. Copies of the individual soil boring logs are included as **Appendix D**, **Exhibit D-1**. Samples (i.e., FD-1, FD-1A, FD-2, FD-3, FD-3A, FD-4A and G Creek Stg Bld) were also collected to document sediment conditions in the network of floor drains exposed in the former manufacturing structures following the demolition IRM work.

3.2.1 Soil Sampling

A series of macro core soil samples were completed at each soil boring location following continuous sampling methods. All soil samples were logged on site as they were extracted, labeled and retained for additional field VOC soil gas screening measures. New unused clear polyethylene terephthalate macro core sample liners were used for all soil sampling work. All soil samples collected were examined and described using the Burmister and Unified Soil Classification Systems. In compliance with ASTM methods, the samples were labeled with the following information: boring number, sample number and depth of sample penetration record.

3.2.2 Soil Gas Screening

As noted, this SRI has included field headspace soil gas screening on each soil sample collected at the Property. A properly calibrated PID (MiniRae Model 3000) was used for the testing work. Direct soil gas measurements were obtained from the headspace of each soil sample collected. The field soil gas concentrations were documented on a ± 2.5 ft. interval or as deemed necessary for the field conditions. The VOC soil gas testing data was used to document the presence and [if applicable] vertical extent of impacted soil, as well as a means to short list soil samples for additional laboratory analysis. The VOC soil gas concentrations recorded during the SRI work ranged from background

conditions of 0.0 ppm to 24.2 ppm and are included on the individual soil boring logs (i.e., see Appendix C, Exhibit C-1).

Based on the field results, a representative number of cultural fill, sediment and native unconsolidated deposits samples were submitted to Phoenix Environmental Laboratories, Inc. (PEL) for laboratory analysis inclusive of the chemical COC (see **Table 3)**. All samples were submitted as a category B data deliverable for the purpose of developing a data usability summary report (DUSR). KOMAN Government Solutions, LLC (KOMAN) performed all third party data validation services.

3.3 Groundwater Investigation Methodology

To facilitate the collection of groundwater samples (9) soil boring locations (i.e., B3-2, B4-1, MW-6, NE-1, FD-4, NW-1, BB-2, DB-1and USB-2) were completed with a 1.0" diameter PVC monitoring well. The monitoring wells installed are composed of two basic components; the well screen and riser or blank. The well screen is the intake portion of the monitoring well. The basic purpose of the riser is to provide storage and a connection to the surface from the well screen. Each monitoring well installed is constructed with threaded, flush joint, schedule 40 PVC pipe with ± 5.0 – 15.0 feet of 0.010 inch slotted well screen. The wells were constructed at depths of ± 10.0 to 19.5 feet below grade and installed in such a manner as to screen (i.e., straddle) the uppermost groundwater table. The annular space around the well screen has been filled with sand pack (0.010 grade). A ± 1.0 – 2.0 foot bentonite seal has been installed above the sand pack. NETC personnel have performed all aspects of the monitoring well installation. Copies of the individual well logs are included as **Appendix D**, **Exhibit D-2**. Ground surface elevations and top of PVC elevations were recorded for monitoring well locations B4-1, NW-1, FD-4, B3-2, NE-1 and MW-6 by Ausfeld & Waldroff Land Surveyors LLP, on October 10, 2017.

3.3.1 Groundwater Sampling*

Groundwater samples were collected from monitoring well locations BB-2, MW-6[1], NE-1, B4-1 and NW-1 on July 27, 28 & 3, 2017[2]. Prior to any groundwater sample collection services, static water levels were measured to the nearest one-hundredth of a foot in each monitoring well. The presence of non-aqueous phase liquids (NAPL) were evaluated in the network of monitoring well using an interface probe. Concomitant with the development process temperature, pH, specific conductance, dissolved oxygen and turbidity were measured until these parameters showed little change, indicating that fresh, representative groundwater is entering the well.

Sampling services occurred when a sufficient volume of water had recovered (i.e., fresh aquifer water has entered the well) in the designated wells. Sampling was performed using low flow sampling methods. Low flow sample collection occurred at the mid-point of the well screen after a minimum of 3 well volumes have been removed. All sample containers and preservatives were provided by PEL. All samples were maintained at a temperature of 4^{o}C by using commercially available (pre-frozen) "ice-packs" and appropriate holding and transportation times were followed. Copies of field sampling data sheets are included in **Appendix E**, **Exhibit E-1**.

All samples were collected in such a manner as to minimize agitation and other disturbing conditions, which may cause physio-chemical changes and bring about losses due to volatilization, adsorption, redox changes or degradation. Formal chain of custody documentation was maintained throughout the shipment of the samples. Each sample was analyzed for the chemical parameters inclusive of EPA Method 8260, EPA Method 8270, EPA Method 8021, EPA Method 8082, and TAL Metals. All samples were submitted as a category B data deliverable for the purpose of developing a DUSR. KOMAN performed all third party data validation services.

3.4 Soil Vapor Intrusion Risk Assessment Methodology

Simultaneous interior air, sub slab vapor and background ambient outdoor air samples were obtained from the ± 80,000 square foot vacant manufacturing structure pursuant to the methods advocated by the NYS Department of Health (NYSDOH) Soil Vapor Intrusion (SVI) Guidance Document entitled Guidance for Evaluating Soil Vapor Intrusion in the State of New York dated October 2006 and updated May 2017, hereinafter termed the guidance document.

*NOTES:

[1]Groundwater samples were collected at monitoring well MW-6 using new unused bottom filled, check valve PVC bailers using mono filament to lower and raise the bailer due to low yield / high turbidity conditions.

[2]The completed SRI included groundwater analysis for 1-4 Dioxane or Perfluoroalkyl and Polyfluoroalkyl substances (PFAS) at (4) onsite monitoring well locations (i.e., NW-1, MW-1, MW-2 and MW-4) the results of which will be presented in a separate addendum report.

3.4.1 Sub Slab Vapor Probe Installation Services

On March 29, 2019 as part of the SVI risk assessment work (1) sub slab vapor probe implant was installed in the former maintenance shop, near the center of the ± 80,000 square foot vacant manufacturing structure. The relative location of the sub slab implant is illustrated on Figure 2 - Appendix C. The vapor probe installation was completed based on the regulatory criteria specified in the NYSDOH guidance document. Rotary methods were used to create a 5/8 inch penetration through the concrete floor slab. A stainless steel Vapor Pin® equipped with a silicone sleeve was then inserted into the 5/8 inch penetrations. The Vapor Pin® was capped with a silicone cover after installation. The sub slab vapor probe implant equipment was purchased new for this matter. All installation equipment was decontaminated prior to use on the Site.

3.4.2 Vapor Sampling

Following the sub slab implant installation services, three volumes of soil vapor at the sampling location was removed and transferred into a 1 liter tedlar bag prior to sampling. Soil vapor purge rates of < 0.2 liters per minute were maintained throughout the vapor implant purging process. The soil vapor probe was screened using a hand held PID for the presence of VOCs. On March 29, 2019 a sub slab vapor sample was collected from the Vapor Pin® sub slab implant. The sub slab sample was collected over a 24 hour sampling period using Summa canister sampling methods. Pursuant to the NYSDOH guidance documents, a trace gas (i.e., Isobutylene) was used as a quality assurance / quality control measure to verify the integrity of the sub slab implant. A copy of the sub slab implant integrity check field sheet is included as **Appendix E**, **Exhibit E-2**.

During the sampling event a simultaneous indoor air sample was collected from the former maintenance shop area that the sub slab sampling occurred. One simultaneous outdoor air sample was also collected during each sampling event at an upwind location (free of obstructions) adjacent to the remaining Site building. Each indoor and outdoor air sample was obtained from a 3 foot elevated platform via 1L Summa canisters equipped with the same 24 hour sample regulators.

All Summa canisters were certified as clean by the laboratory. A sampling log was maintained for the sampling event which document sample ID, date and time of the sample collection, sample height, the names of NETC staff, pertinent weather conditions, sampling methods and devices used, volume of air sampled, applicable pre and post sample vacuum and ambient air temperature data and chain of custody information. All samples were analyzed via Method TO-15. All data sets were reported in micrograms per cubic meter (ug/m3) using selective ionization measuring services (SIMS) with minimum sample reporting limits ranging from 0.20 - 1.0 ug/m^3. All chemical testing services were performed by a NYS ELAP certified laboratory.

3.4.3 Product Inventory Survey

A product inventory survey was conducted concurrent with the soil vapor sampling (as outlined in Appendix B of the guidance document) to consider other potential contributing sources for the detection of VOCs in the structure. Copies of the Product inventories complete at the site during the SVI sampling event is included as **Appendix E**, **Exhibit E-3**.

3.5 Quality Assurance/Quality Control (QA/QC)

QA/QC samples for the investigation were collected to ensure the integrity of the resulting analytical laboratory data. DUSRs discussing the adequacy of the analytical data obtained from the laboratory and any pertinent data excursions or limitations on the use of the data were prepared and are contained in **Appendix F**, **Exhibit F-1**.

The third party data validator validated all data with the exception of the following;

- Hexachlorocyclopentadiene in soil samples B3-2 S-2 and G Creek Stg Bld
- Benzoic acid in soil samples BB-2/S-1, BB-3/S-1, DB-1/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, USB-2/S-3A and G Creek Stg Bld
- Chrysene, 2,4-Dinitrophenol and 4,6-Dinitro-2-methylphenol in soil sample G Creek Stg Bld

Tables contained in Appendix F, with DUSRs, indicate rejected data results with and "R". The rejected data results had no significant impact on the findings of this report.

3.6 Health & Safety Plan (HASP)

All IRM work performed at the Site was conducted in full compliance with governmental requirements, including site and worker safety requirements mandated by Federal OSHA (see **Appendix G**). No safety related incidents occurred during the SRI work.

3.7 Community Air Monitoring Plan (CAMP)

The CAMP included a combination of continuous ambient air monitoring and periodic visual inspection for particulate matter and VOCs at the perimeter of the Site. Ambient VOC air quality conditions as well particulate's (i.e., dust) were documented upwind and downwind of the Site using a properly calibrated hand held PID and a real-time dust monitor (i.e., PID – RAE Model 3000 and Dust Trak II Model 8530). Visual and olfactory conditions at the perimeter of the Site were also recorded during the CAMP testing services. The visual and olfactory inspection work with the objective of document evidence, if any, of dust particulate accumulation on adjacent properties and olfactory nuisance conditions. Each day prior to the demolition activities, a base line survey was performed at each of the surrounding properties to establish Site specific background readings / conditions. Readings obtained during the demolition activities were compared to the base line reading. In the event elevated VOCs and / or physical observations are attributed to work at the Site, IRM activities would cease until an appropriate remedy could be implemented.

With the exception of equipment failure due to weather/moisture conditions on June 6th and June 19th, no elevated VOCs were recorded during the field work. Similarly, no elevated dust conditions were recorded during the field work. Copies of the CAMP records are included in NET's IRM construction completion report (CCR).

4.0 SUPPLEMENTAL REMEDIAL INVESTIGATION FINDINS

4.1 Soil Investigation

4.1.1 Geo-Environmental Conditions

The unconsolidated deposits encountered during the SRI work consist of, in descending order a heterogeneous cultural fill layer (i.e., sand, gravel, brick, concrete, etc.), a finning downward sequence of glaciolacustrine sand, gravel, silt and clay deposits and glacial till. No visual or olfactory impacts indicative of a chemical release were documented during the soil boring installation work. Total VOC soil gas concentrations recorded during the SRI work ranged from background conditions (i.e., 0.0 ppm) to 24.2 ppm. Bedrock was not encountered during the SRI work. Drilling refusal documented at soil boring BB-1 is attributed to buried concrete. Site specific conditions documented at each of the SRI boring sites are documented on the soil boring logs contained in Appendix C, Exhibit C-1.

With the exception of soil boring location SW-1, improved concrete surfaces were confirmed below each of the Former Haight/American Hide Tannery manufacturing buildings razed as a result of the 2017 demolition IRM. (Ref, Interim Remedial Measure Construction Completion Report Demolition of Site Buildings dated April 2018). The concrete surfaces below the manufacturing structure ranged in thickness from ± 3.0 – 6.0" and extend from the gravel covered parking surfaces located east of the 2017 demolition IRM work zone, to (in some cases) areas beyond the western property line. The concrete floor surfaces that exist along the southwest portion of the Site contain (4) abandoned concrete vaults and a network of drains. The apparent capacity of the vaults ranges from ± 1000 – 5000 gallons and the apparent depth of each vault ranges from ± 4 – 5 feet below the improved slab on grade concrete surface.

With the exception of soil boring SW-1, the cultural fill horizons encountered during the SRI work are in most cases covered by the concrete floor and foundations of the former manufacturing structures or are contained in the network of abandoned concrete vaults and drains. The cultural fills relative position to improved concrete surfaces suggest its existence on Site is relates to historic grading activities completed during the construction of the Former Haight/American Hide Tannery manufacturing buildings as well as material used to close the network of vaults and drains.

Cultural fill that resides in the concrete vaults and a horizon of organic detritus (i.e., < 0.5 ft.) that has accumulated above the concrete surfaces supports both primary and secondary vegetation growth, which include areas located west of the 2017 demolition IRM work zone.

4.1.2 Soil Quality Results

Soil samples BB-2/S-1, BB-3/S-1, DB-1/S-1, DB-1/S-2, USB1-/S-3, USB-2/S-2, USB-2/S-3A, B4-1 S-2, B3-2 S-2 and SW-1 S-3 were each reported to contain the chemical COC at concentrations below the NYSDEC *Restricted Residential Use* SCOs as outlined in General Remedial Program requirements Subpart 375-6.3 and the SSCOs as outlined in CP-51 / Soil Cleanup Guidance and in most cases at concentrations below *Unrestricted Residential Use* SCOs.

With the exception of the compounds listed in **Table 4** each of the remaining (8) samples; which include (5) samples of cultural fill, (2) samples of sediment and a sample of the near surface native unconsolidated deposits were reported to contain the chemical parameters at a concentration below the NYSDEC *Restricted Residential Use* SCOs;

Table 4
Table 375-6.8(b): Restricted Residential Use Soil Cleanup Objective Exceedances

Chemical Parameter	NYS 375 Restricted Residential Use	NYS 375 Commercial Use	Sample ID							
			B4-1 S-1 (0-4')	B3-2 S-1 (0-4')	B2-1 S-1 (0-4')	MW-6 S-1 (0-5')	FD-4 S-1 (0-3')	FD-1 (Surface Sediment)	USB-1/S-1 (0-5')	G. Creek Stg Bld. (Surface Sediment)

Ideno(1,2,3-cd)pyrene	.500	5.6	.740	.690	9.6	.530	.850	-----	-----	4.0

Note: All units on Table 4 are in parts per million (ppm or mg/Kg). Concentrations identified below Restricted Residential use SCOs and laboratory detection limits are not listed in the table.

Copies of the PEL analytical reports are included in **Attachment F**, **Exhibit F-2** for consideration.

4.2 Groundwater Investigation

4.2.1 Hydrogeologic Conditions

Shallow groundwater was encountered during the soil boring installation at depths ranging from ±3.0 – 13.0 feet below grade. Groundwater levels were measured to the nearest 0.01 feet in each of the newly installed monitoring wells on July 28, 2017 and April 10, 2018 using an oil/water interface probe. These measurements were converted to elevations and plotted on the Site survey map (*see* **Appendix C**, **Figure s 3 & 4**). Based on the respective groundwater elevation recorded at each monitoring well, groundwater flow beneath this area of the Site appears to be in a south-southeasterly direction towards Gordon Creek & Bath Street. The shallow groundwater aquifer flow direction appears to mimic the Site topography, which slopes dramatically downward to the east from the hill located on the west side of Site. **Appendix H** contains the field groundwater monitoring data recorded at the site on July 28, 2017 and April 10, 2018.

4.2.2 Groundwater Quality Results

With the exception of select chemical elements listed in **Table 5,** the groundwater sample collected at the Sites were reported to contain concentrations of the target compounds of concern below the NYSDEC 6NYCRR Part 703 groundwater quality standards and / or the laboratory minimum reporting limit;

Table 5

6NYCRR Part 703 Groundwater Quality Exceedances

Chemical Parameter	6NYCRR Part 703 GA Standards	Monitoring Well Location					
		BB-2	BB-2 DUP	MW-6	NE-1	B4-1	NW-1
Aluminum	100	-----	-----	52700	123000	2390	6710

Benz(a)anthracene	.002	0.02	-----	0.18	-----	-----	-----
Benzo(b)fluoranthene	.002	-----	-----	0.14	-----	-----	-----
Benzo(k)fluoranthene	.002	-----	-----	0.14	-----	-----	-----
Chrysene	.002	0.02	-----	0.16	-----	-----	-----
Ideno(1,2,3-cd)pyrene	.002	-----	-----	0.09	-----	-----	-----
Trichlorofluoromethane	5	-----	-----	-----	-----	17	-----

Note:
All units on Table 5 are in parts per billion (ppb or ug/L).
Concentrations identified below NYSDEC 6NYCRR Part 703 groundwater (GA) quality standards and laboratory detection limits are not listed in the table.
Total matrix metal concentrations reported in the samples collected at monitoring wells MW-6, NE-1, NW-1 and B4-1 may reflect turbidity conditions in the samples.

Copies of the PEL analytical reports are included in Attachment F, Exhibit F-2 for consideration.

4.3 Soil Vapor Intrusion Risk Assessment

The data developed as a result of the March 2019 *"winter heating season*" SVI sampling event demonstrates that cVOCs regulated under the NYSDOH CEH BEEI's SVI guidance document and detected during the sampling event were limited to Carbon Tetrachloride in indoor, outdoor and sub slab vapor samples. The detections of and Carbon Tetrachloride was reported at the *"No Further Action"* concentration thresholds listed in Air Matrix Table A of the NYSDOH CEH BEEI Guidance Document. Additional VOCs identified at concentrations above laboratory detection limits are depicted in **Table 6** below. Copies of the PEL analytical reports are included in Attachment F, Exhibit F-2 for consideration.

Table 6
Soil Vapor Intrusion T0-15 Laboratory Detection Results

Chemical Parameter	Sample ID			
	SS	IA	IA DUP	OA
Acetone	48	3.96	3.63	3.42
Carbon Tetrachloride	0.21	0.4	0.37	0.43
Chloromethane	-----	-----	-----	1.14
Dichlorodifluoromethane	3.99	2.14	2.02	2.07
Ethanol	241	2.35	2.28	7.55
Isopropylalcohol	7.12	-----	-----	1.03
Methyl Ethyl Ketone	2.62	-----	-----	-----
Toluene	1.33	-----	-----	-----
Trichlorofluoromethane	26.3	11.5	11.1	1.61

Note: All units on Table 6 are in micrograms per cubic meter (ug/m^3). Concentrations identified below laboratory detection limits are not included in Table 6.

5.0 CONCLUSIONS

Data developed during the SRI demonstrate conditions below and adjacent to the network of condemned manufacturing structures that were razed during the 2017 demolition IRM are consistent the 2013 ECI RI data.

The results of the completed SRI further demonstrate that with the exception of steeply sloping forested portions of the western property line, the network of condemned manufacturing structures AOC as well as areas surrounding the vacant ± 80,000 square foot commercial manufacturing structure most recently occupied by Angelica, are improved by asphalt, concrete and gravel surfaces, are covered by beneficial hard fill materials (i.e., brick and concrete) generated as a result of the demolition IRM completed in 2017 or exist as landscaped green space (see **Appendix C - Figure 5**). Gordon Creek, which flows adjacent to the Site along the southern property boundary also, has a significant portion improved with concrete (i.e., lined bottom and sidewalls).

The SRI data further documents the manufacturing structures AOC is unaffected by VOCs soil detections above NYSDEC Restricted Residential Use SCOs. With the exception of the samples of cultural fill collected from the concrete vaults (i.e., B2-1/S-1, B3-2/S-1 & B4-1/S-1), a floor drain (FD-4/S-1) and from below the concrete floor slab of the former manufacturing buildings (USB1/S-1), sediment samples collected from an abandoned drainage system that served the Site (FD-1 and G.Creek Stg Bld) and one near surface native unconsolidated deposit (MW-6/S-1); the (18) soil samples collected to document soil quality conditions in and below the Former Haight/American Hide Tannery manufacturing buildings AOC were found to be unaffected by the NYSDEC Restricted Residential Use SCOs. The reported soil quality exceedances for the cultural fill, sediment and soil samples are overall low in chemical concentration, limited to the heavy metals Arsenic, Barium, Cadmium, Chromium, Copper, Lead and Mercury, the semi-VOC Benz(a)anthracene, Benzo(a)pyrene, Benzo(b)flouranthene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene and Ideno(1,2,3-cd)pyrene) and the detection of PCB-1254.

Similarly, groundwater quality exceedances to the NYSDEC 6NYCRR PART 703 water quality standards are limited to metals, low concentration (i.e., < 1 ppb) semi-VOCs and the VOC Trichlorofluoromethane (i.e., 17ppb) at B4-1, only.

With the exception of the cVOC Carbon Tetrachloride the March 2019 "*winter heating season*" SVI sampling event has not identified cVOCs regulated under the NYSDOH CEH BEEI's SVI guidance document. Carbon Tetrachloride was reported at the *"No Further Action"* concentration thresholds listed in Air Matrix Table A of the NYSDOH CEH BEEI Guidance Document. Additional VOCs not regulated under the NYSDOH CEH BEEI Guidance Document identified during the SVI sampling event were identified at low level concentrations that are not considered to warrant further investigation or remediation.

In general the soil, vapor and groundwater quality data assimilated during the course of this SRI demonstrate chemical signatures and concentrations that are consistent with prior data developed in other areas of the site by ECI in 2013 and confirm that concrete surfaces exist over or isolate historic cultural fill from the environment below the Former Haight/American Hide Tannery manufacturing buildings AOC.

The information developed during the course of this SRI and the results of the previous RI provide sufficient information for establishing remedial action objectives, evaluating remedial action alternatives, and selecting a remedy that is protective of human health and the environment that is consistent with the Site's CBD zoning.

1.0 INTRODUCTION

Environmental Compliance, Inc. (ECI) on behalf of the Brownfields Cleanup Program (BCP) applicant Angelica Textiles Services, Inc. has prepared this Remedial Investigation Report (RIR) summarizing the soil, groundwater and soil vapor results obtained during the Remedial Investigation (RI) performed at the approximately 6.35 acre property identified by the New York State Department of Environmental Conservation (NYSDEC) in a Brownfield Cleanup Agreement Index No. C546055-10-12 as the Former Haight/American Hide Tannery Site located at 125 Bath Street, Ballston Spa, New York, Saratoga County, NYSDEC BCP Site No. C546055.

The RI was conducted in accordance with the NYSDEC June 7, 2013 approved Remedial Investigation Work Plan as updated May 8, 2013 included as Appendix A, and the RI protocols were developed in general accordance with the NYSDEC Draft DER-10 Technical Guidance for Site Investigation and Remediation issued May 2010 (DER-10) and the New York State Department of Health (NYSDOH) Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York issued October 2006. In addition, the NYSDEC, and New York State Department of Health (NYSDOH) project managers provided guidance on location and number of samples that were required for the RI and Interim Remedial Measures (IRM) work that took place at the Site, which is also summarized in this RIR.

1.1 RIR Organization

The RIR is organized in accordance with the following sections:

Section 1.0 – Introduction: This Section provides a brief description of the objectives of the RI, identifies the location of the Site, and provides an overview of historical operations.

Section 2.0 – Physical and Environmental Setting: This Section discusses the physical and environmental setting of the Site, including information regarding topography, geology, and hydrogeology.

Section 3.0 – Summary of Previous Investigations: This Section summarizes the previous investigative activities conducted at the Site.

Section 4.0 – RI Scope of Work: This Section summarizes the investigative actions performed at the Site, as well as the procedural aspects of their implementation.

Section 5.0 – Investigation Findings: This Section presents the findings of the RI performed as described herein.

Section 6.0 – Exposure Assessment: This Section presents the Qualitative Human and Fish/Wildlife exposure assessment.

Section 7.0 – Conclusions: This Section presents the conclusions of the RI.

1.2 RI Objectives

The RIWP stated the following overall RIWP objectives (*see* Appendix A):

1. Define the nature and extent of contamination in soil, groundwater, soil vapor and any other parts of the environment that may be affected.
2. Identify the source(s) of the contamination.
3. Assess the impact of the contamination on public health and the environment.
4. Provide information to support the development of a proposed remedy to address the contamination.

1.3 Site Location and Description

The Site constitutes one tax lot (Section 1, Block 96, Lot 2) totaling approximately 6.35 acres in the Village of Ballston Spa, New York, Saratoga County. *See* Exhibit D of the BCP application, and the Site Survey Map (Figure 2 of the RIWP) for the 6.35 acre site. The Site is located at 125 Bath Street, immediately north of a channelized creek known as Gordon Creek, and northwest of the intersection of Bath Street and Hamilton Ave. The Site is zoned for industrial use. Private residences are located to the north, south, and east of the site. The western portion is an undeveloped wood lot. Saratoga County fairgrounds are located to the northwest. Porter's Auto Body Shop is adjacent, across Gordon Creek. Ballston Spa Lanes bowling alley is to the southeast, across Bath Street.

An 80,000 square foot building occupies the eastern portion of the Site. This main building on the Site was constructed between 1945 and 1950 according to Sanborn maps, and replaced many of the former tannery buildings (*See* Figure 4 of the RIWP). A machine shop and administrative areas occupy the eastern portion of this building; former laundering and garment storage areas are located in the western and central areas of the building. The northern portion of the building has most recently been used for shipping and receiving laundry. A wastewater treatment sump/wastewater pit and a boiler room occupy a subgrade area at the building's center. The Site's southeastern border and central portion still contain several small buildings associated with former Site tannery operations (former "sewage disposal" and chlorine plant"). These buildings were reportedly never used by the current owner/Volunteer Angelica Textile Services, Inc. or its predecessors. Asphalt driveways join the southern and northern portions of the building through a paved area located at the back (west side) of the main building. Only remnants and foundations of former tannery buildings remain present near these driveways and in the far western wooded portion of the Site. A metal trailer previously used for linens storage is located in an asphalt parking lot west of the building. The eastern portion of the building's exterior faces Bath Street, where the main foot access entrance is present.

1.4 Site History

The most recent owner and occupant of the Site is Angelica Textile Services, Inc. ("Angelica"), a New York State corporation, which acquired the entity, Linen Systems for Hospitals, Inc. ("Linen Systems") in 1977, and officially changed Linen Systems name to Angelica in or about 1984. Linen Systems acquired title to the Site in 1977. The deed remains in the name of Linen

Systems for Hospitals, Inc. *See* Exhibit B of the BCP application, including the deed. Linen Systems and later Angelica performed laundering of garments with detergents on the Site and warehoused linens from approximately 1977 through 2011 without the use of dry cleaning chemicals. In 2011, Angelica recently ceased operations on the Site. Therefore, the Site is now vacant.

Historically, industrial development began at the Site in 1881. Tannery operations occurred from 1887 to 1960 according to historic Sanborn maps and other local historical resources. Three tanneries – Haight and Company, American Hide & Leather, and Howes Leather – occupied the Site during these years. The former tanneries also spanned across the adjacent Gordon Creek to a second lot (Tax Block 216.32.1.96.1; hereinafter "Lot 1"). However, this lot was not purchased by Linen Systems in 1977, and, is therefore, not part of the BCP Site. *See* Exhibits B & C of the BCP application, including Title Information and Deed to Rickett's, Inc. for Lot 1; Phase I at 4.

After all tannery operations ceased in or about 1960, there was an approximately ten year period in time the Site was not occupied. An individual and then his estate owned the site from 1960 to 1969. There may have been an antique dealer (Gordon Creek Inc.), which owned and occupied the Site for a year between 1969 and 1970. Gordon Creek Inc. sold the Site to Paul J. Rickett Sr., and the Site was later purchased by Rickett's, Inc. The operator was Northern Hospital Linen Service, Inc., Mr. Rickett's company. Northern Hospital Linens operated the site from 1970 to 1976.

Ricketts, Inc. sold the BCP Site Lot 2 (not Lot 1 located across the creek on the Southside) and his newly formed corporation named Linen Systems for Hospitals Inc. to Angelica in 1977. Angelica kept the Linen Systems name until 1983, when it changed its corporate name to Angelica Healthcare Services Group, Inc. In 1996, there was another corporate name change to Angelica Textile Services, Inc. Rickett's is still a local Ballston Spa laundry company. As noted above, title to the Site remains under the name Linen Systems, which is still a valid corporation in New York State.

Laundering operations continued from 1977 until recently in 2011, when Angelica ceased all laundering and warehousing operations at this facility. Angelica would like to sell or lease this facility to another volunteer for a viable reuse, and intends to work with any interested buyer to resolve the contamination issues.

As of 1904, there were 15 buildings associated with tannery operations. The former tannery conducted bulk storage of chlorine, fuel oil, and stored tanning liquors and wastes in containers ranging in size from 55 gallon drums to 100,000 gallon above ground storage tanks (ASTs) during what appears to be its entire more than 70 year history. Historically tannery sites in general have used suspected contaminants of concern (COC) in their operations such as: chlorine, formaldehyde, sulfuric acid, glycol ether EB, glycol ether PMA, methyl isobutyl ketone, toluene, xylol, phosphoric acid, methanol, manganese sulfate, chromium III, ethylene glycol, lead, copper, lime, and zinc.

Only limited investigation had been performed prior to the implementation of the RIWP by Angelica, which was restricted to the tank area (*see* Figure 1 for the location of EP1/OU1, the

former 100,000 gallon above ground vertical No. 6 fuel oil tank) in the northern portion of the Site. At this location the remediation of a reported petroleum spill (from an unknown source at the time) started the excavation of EP1/OU1 (*see* Figure 1 for the Site location). During the excavation and remediation of the petroleum spill tannery related items were unearthed and the excavation was halted to allow discussion with the Department related to the Site entering the BCP. Although a report was not produced for this initial remediation effort all data obtained from the excavation/remediation was provided to the Department.

2.0 PHYSICAL AND ENVIRONMENTAL SETTING

2.1 Physical Setting

The Site is located within the Village of Ballston Spa, Saratoga County, New York. Specifically, the Site is situated in a low valley at an approximate elevation of 244 feet above mean sea level (AMSL). Half a mile north and south of the Site, elevations increase by approximately 100 feet.

2.2 Geology

This area experienced major drainage changes during Pleistocene glaciation. Nearby to the southeast and east, respectively, Round and Saratoga Lakes are thought to be kettle lakes that lie in glacial debris, which now fills the pre-glacial Colonie Channel (Van Diver, B.B., 1985). The Site is bordered on the south by Gordon Creek, a small tributary of the more significant Kayaderosseras Creek. Gordon Creek flows easterly to its confluence with Kayaderosseras Creek approximately 0.5 miles northeast of the site. The latter creek meanders further north and east to enter Saratoga Lake. At some point, the Gordon Creek adjacent to the Site was channelized with concrete and large slabs of granite rock. The creek bed itself is concrete and rock and allows for very shallow ponding of water and gradual decrease in elevation. The channeling of the creek was likely performed to preventing flooding of this area.

Bedrock beneath the Site (estimated at 10 to 40 feet below the ground surface) is mapped as the Canajoharie Shale, Unit NYOc;1 (D.W. Fischer, et al., 1961). This black shale is a member of the Trenton Group of black shale(s). The Trenton Group is of Middle Ordovician age, formed approximately 460.90 - 471.80 million years ago. The depth to bedrock beneath the Site was not encountered in excavation on the north part of the site (the excavation pit was approximately eight to ten feet deep) or during the RI.

Middle Ordovician Canajoharie Shale is one of several black shales in a belt of autochthonous Paleozoic rocks (exclusive of the Taconic sequence) that occupies the Champlain, Hudson, and Mohawk valleys. Also included in the Trenton Group are the Utica and Snake Hill Shale members. The Snake Hill member is found to the northeast in the Saratoga Springs area. Found east of the site is the Normanskill Formation of the Trenton Group – Taconic Area. This formation is comprised of greywacke, black and gray and black shale(s), also of Middle Ordovician age.

Structurally, the area contains a number of sub-parallel, generally north-south oriented faults. The Saratoga fault is a normal fault located approximately one mile east of Ballston Spa.

Another significant normal fault, the McGregor fault is located to the northeast and controls the location of several carbonated mineral springs in the Saratoga region.

According to the Surficial Geologic Map of New York, the overburden at the Site consists of lacustrine delta (ld) deposits of coarse to fine gravel and sand, stratified, generally well sorted, deposited at a former shore line, and variable with thicknesses of 3 to 15 meters (Caldwell, D.H., et al. 1978). Further west of the Site is the contact between this lacustrine delta material and glacial till (t), variable texture, (e.g., clay, silt clay, boulder clay), usually poorly sorted, deposited beneath glacial ice, and variable with thicknesses of 1 to 50 meters.

There are two United States Department of Agriculture (USDA) soil types identified at the Site. Chenango silt loam, loamy substratum, undulating [ChB] occupies the east-central and north portions of the site. This very deep, well-drained soil is formed in water sorted sand and gravel on outwash plains, kames eskers, and alluvial fans. Oakville and Windsor [OeE] soils – 25 to 30 percent slopes occupy the western portion of the site. These very deep well drained to excessively drained soils are formed in water sorted sand. Additionally, a third soil type, Tioga fine sandy loam [Tg] may occupy the areas near the banks of Gordon Creek on the south part of the site. This very deep well drained soil formed in recent alluvium and is found in floodplain areas. It should be noted that the uppermost sequences of these soils may have been altered through onsite construction and demolition activities over time.

Groundwater has been observed at 4 to 6 feet below ground surface (BGS) depth interval in the aforementioned soil excavation area at the north side of the Site during a period frequent precipitation and may represent a higher than average water level at this location. It is important to note that water levels are expected to vary at other parts of the site, such as near the creek or during significant rain events.

2.3 Hydrogeology

The RI demonstrated that the direction(s) of groundwater flow mimics the topography with eventual discharge to Gordon and Kayaderosseras Creeks. Due to the terrain/topography, and an understanding of the underlying geology, the movement of groundwater seems to be in the eastern and southeastern direction. (See more information in Section 4.6).

2.4 Surrounding Wells

Residences located to the north, south, and east of the Site and are connected to municipal utilities. The village obtains its water from Great Flats Aquifer through the Town of Glenville. There are no public water supply wells located within 1,500 feet of the site. No potable or private domestic use wells are located down-gradient from the site. Therefore, an impact to wellhead protection or groundwater recharge areas in not required (*See* GaiaTech Phase I Report at 6 submitted with the BCP Application). Further investigation using NYSDEC available lists indicate there are groundwater wells as follows:

- Two groundwater wells at BGS depths of 100 feet and 200 feet located 5,400 feet north west of the Site (up gradient);

- One groundwater well at BGS depth of 35 feet located 5,980 feet south of the Site (down gradient);
- One groundwater well at BGS depth of 645 feet located 4,000 feet south east of the Site (down gradient); and
- One groundwater well at BGS depth of 27 feet located 11,800 feet north of the Site (up gradient).

The current use of the groundwater wells is undetermined at this time.

3.0 SUMMARY OF PREVIOUS INVESTIGATIONS

3.1 Previous Investigations

3.1.1 June 2008 Phase I Environmental Site Assessment ("Phase I Report")

A Phase I Environmental Site Assessment E-1527-05 (ASTM-05) was performed by GaiaTech in June 2008. The Phase I report was prepared in relation to due diligence required for a financial transaction. This was essentially the first time the long industrial history associated with the Site was summarized, and became known to Angelica. The Phase I Report concluded that Angelica's use of the Site to launder garments did not create recognized environmental conditions (RECs), but prior tannery operations may have caused RECs. As noted above in the Site History section, three (3) tanneries operations were present dating back to the 1880's - - Haight and Company Tannery from 1881 to 1899, American Hide & Leather from 1899 to 1955, and Howes Leather Company, Inc., from 1956 to 1960 .

The Phase I Report describes the Haight Tannery's operations as including a bark mill, a leach house, an engine room, and finishing areas. The Site's central area included a "vat yard." Several tanning liquor tanks, and a rail spur, were present on the western portion of the Site by the late 1890s. *See* Sanborn Maps attached to the Phase I Report.

Subsequently, American Hide & Leather was present from 1899 to 1955. By 1904, the Tannery contained 15 buildings. *See* Exhibit N of the BCP application. A 1924 map reveals the presence of "waste tanks" added to the main Tannery building. Additionally, a sewage disposal and a chlorine plant were present along Gordon Creek. A large area of empty barrels appeared to be present in the Site's northeast portion at this time. By 1942, a 100,000 gallon fuel oil AST and 100,000 gallon water AST were present on the Site's northern portion. The Tannery discharged water containing lime, salt, tanning liquors, and lactic acid into Gordon Creek; the effluent was highly colored.

In 1945, the current Site building was constructed on the south and east portions of the Site to replace a former building. By 1950, the Tannery was expanded to include a fuel handling building, coal silos, ash silos, additional fuel oil tanks, and paint shed. *See* 1950 Sanborn Map in Phase I. According to the updated Phase I February 2012 Addendum, for one year the Site was owned by General American Industries, Inc. from 1955 to 1956. *See* Exhibit N of the BCP application. General American sold the Site to Howes Leather Company, Inc., which continued

to operate the tannery from 1956 to 1960 when Tannery operations apparently ceased. The Site was vacant from 1960 until 1970 when laundering of linens began by a company named Northern Hospital Linen Service, Inc. Laundering of lines continued at the Site until 2011.

According to the Phase I Report, there are no underground storage tanks (USTs) currently at the site. A single UST was installed in 1973 and removed in 1993; this stored 4,000 gallons of diesel fuel. No spills, leaks, or indications of product release were reported. The tank was allegedly removed in accordance with DEC regulatory requirements, and soil tests beneath the tank performed by the DEC found no impact. One 5,000 gallon fuel oil AST that stores back up fuel when natural gas is unavailable was on-site from November 2000 until July 2012. *See* Exhibit D of the BCP application Site Layout and Area Map. [NOTE: This AST was present west of the Site building, but was permanently closed on or about July 18, 2012.] Additionally, two water ASTs located in the boiler room did not represent a REC. Angelica formerly stored laundering chemicals in state registered plastic ASTs, but changed to using portable totes and drums early in the 2000's; these ASTs also did not represent a REC in the Phase I Report.

According to the Phase I, Angelica did not generate or dispose of hazardous waste and no waste disposal occurs on Site. Sanitary wastewater was discharged to the municipal sewer system by Angelica. Wash water was discharged through a network of grate drains equipped with lint filters to a concrete sump/wastewater pit in the boiler room, which pH adjusted the water prior to discharge to the sewer system. The sump/wastewater was inspected and pumped out every 3 to 5 years. However, the Phase I did not contain any data confirming no impacts from the sump. Two natural gas-fired boilers were identified as the Site's only combustion emissions, but were not deemed as posing a physical impact to the Site in the Phase I Report. The Report also concluded the Site's transformers did not appear to pose a PCB hazard.

The Phase I Report also evaluated if there was any potential environmental impact to the Site from surrounding properties. The most significant adjacent former use was located across the channelized creek to the South, and was known as the former Ballston Spa Electric Light & Power Company, which was present southwest of the Site from 1892 to 1911, and may have been a manufactured gas plant site. However, other than this historic use, which is separated by the Site via the creek, there were no other former adjacent uses noted of any environmental significance. See Exhibit I of the BCP application - Adjacent Property Owner Map.

There have been release incidents on adjacent or nearby sites, which were identified and are summarized below:

A. Old Village Garage, Thompson Street. This site, which is approximately 350 feet north-northeast, is down-gradient from the Site, and reported a leaking gasoline UST in 1998. NYSDEC has not apparently issued a closure letter, but this spill is listed as "corrective action taken", and therefore, was not deemed as having a potential impact on the site in the Phase I Report.

B. Vicinity Oil Spills. Four spills with minimal potential for hazard have been closed after corrective action was taken in the vicinity, and were not deemed to represent a potential impact concern in the Phase I Report. These were all within 650 feet of the site, and included: a diesel

fuel spill south-southeast of the site in 1998, an oil and gas spill in 1993 at a commercial business east-southeast, a gasoline spill at Cumberland Farms east-northeast in 1988, and a water spill at a dentist office south of the site in 1993.

C. Herbicides and Pesticides Spill. Herbicides and pesticides were released by an Agway store that burned down in 1977, 750 feet south of the site. This site is allegedly under continued DEC monitoring, although materials are buried and leachate is allegedly being controlled. Because of this site's status, it cross-gradient relationship to the Site, and distance from the Site, the Agway site was not deemed to pose an impact on this Site in the Phase I Report.

3.1.2. 1993 UST Removal Investigation

In 1993, Angelica removed a 4,000 gallon UST of diesel fuel and pump. This tank was located near the location of MW2 (See Sampling Map, Appendix B). The investigation of soils in 1993 beneath the excavated UST did not detect contamination. The tank registration lists this tank as closed as of August 1, 1993. MW2 soil sample results indicated that there was only one petroleum related COC that exceeded the Industrial Use Cleanup Objective, which is Benzo (a) pyrene at the 8 to 10 foot BGS depth interval. The Benzo (a) pyrene sample result was 1.64 mg/Kg and the Industrial Use Cleanup Objective is 1.1 mg/Kg. It was noted in the bore log for MW2 that fill was used to a depth of approximately 13 feet BGS and included black fragments of coal or ash material. This fill material may be the reason for the sample result concentration of Benzo (a) pyrene from the 8 to 10 foot BGS depth interval rather than from the former UST.

3.1.3. July 2010 Surface Soil Petroleum Incident Data

Environmental contamination associated with this Site was first discovered in July 2010 in the vicinity of a former 100,000 gallon former fuel oil above ground storage tank (AST) in the northwest corner of the Site during an unusual release of No.6 fuel oil from under the ground to the surface due to what was believed to be saturated soil conditions from extensive rain events that had occurred at this time. Observations of the oil release were reported to the NYSDEC upon discovery. DEC Spill #1004405 was assigned to this release. *See* Exhibit K of the BCP application. A subsequent Site investigation and sampling program performed by ECI confirmed the presence of petroleum contamination in the vicinity of the former AST. Leather waste and ash solid waste materials associated with the former tannery were later discovered to be buried in the vicinity of the base of the former AST during remediation of the petroleum spill. Additional areas of tannery related contamination were slated for investigation during implementation of the RIWP. No reports were generated in relation to the petroleum spill remediation and excavation work but the data investigation results were shared with the Department and are summarized below:

On September 29, 2010, excavation work was performed in and around the area of the discovered petroleum. Approximately 102.07 tons of petroleum contaminated soil (PCS) was removed and sent to Environmental Soil Management Inc. (ESMI) for incineration. ECI's subcontractor Galloway Technical Services (GTS) had to cease excavation on or about October 1, 2010 due to wet weather issues.

On October 18, 2010, further excavation was performed until October 21, 2010. PCS was stockpiled on-site for disposal.

On November 28th through December 13th, 2010, further excavation was performed in an attempt to fully determine the nature and extent of the PCS. Approximately 270.7 tons of additional PCS was removed from the Site and sent to the Colonie Landfill and 14,933 gallons of groundwater was sent to a the Schenectady wastewater treatment facility located in Schenectady, New York as was all groundwater removed from the Site. The 270.7 tons of PCS sent to the landfill represented PCS that had been excavated from the pit (EP1) since October 2010.

Before the remnants of the vertical steel tank and concrete pad could be uncovered and removed, first the soil deposition and tree growth had to be removed. Since some of the trees were 30 to 40 feet tall, a third party, Donavan Tree Service, was called in to remove eight (8) of the largest trees in early December 2010.

On May 21, 2011 through June 17, 2011, further excavation was performed with the goal of removing the remaining soil, trees and the tank bottom and additional contaminated soil. The tank was estimated to be about 25 feet in diameter; this would estimate the height of the tank to be about 27 to 30 feet tall in order to contain 100,000 gallons. What remained of the bottom portion of the tank was the bottom and about 7 feet of a collapsed vertical section of the sidewall of the steel tank. The remnants of the tank bottom and collapsed side wall were filled with ash and soil backfill. GTS removed the contents of the tank bottom and then cut up the remaining portion of the steel. The condition of the above ground vertical petroleum tank indicated it had previously undergone demolition.

The vertical tank sat on a heavily reinforced concrete pad that was supported by a number of piers that were in the ground. The piers are still in place and the depth of the piers has not yet been determined at that time.

GTS removed an additional 379.26 tons of PCS, which was sent to the Fulton County Landfill, and 54,112 gallons of groundwater was sent to the Schenectady wastewater treatment facility. The remnants of the vertical steel wall and bottom of the tank and concrete pad was cut up and sent for recycling and disposal. The location of this tank bottom corresponds to the location of a former 100,000 gallon AST vertical steel tank and structural support pad shown on historic Sanborn maps. On or about June 17, 2011, leather scraps were unearthed, and the excavation was halted. As of June 2013 there was a stock pile(s) of petroleum contaminated leather scrap on-site. The Baker 20,000 gallon tank used to store ground water from the excavation was cleaned on October 23rd, 2012 and removed from the site on October 24th, 2012. At that time another 1,477 gallons of ground water and rinse water extracted from the Baker tank was sent to the Schenectady wastewater treatment facility.

In addition, a 5,000 gallon above ground diesel tank was permanently closed on July 18, 2012 as reflected in the DEC's Petroleum Bulk Storage (PBS) registration documentation.

All of the above excavation started at the location of the initial test pit and moved in an outward direction from the initial point in an attempt to delineate the contaminated area. Despite several

rounds of excavation, the full extent of the PCS was not determined during the completion of this first phase of work because tannery related solid waste leather material was uncovered. An IRM was planned to address this area, which is summarized below is Sections 4.4 and 5.1.

The soil samples were collected so that approvals from either the thermal treatment or landfill disposal companies would accept the soils for treatment/disposal off-site. The soil analytical parameters that were tested during this time period were mostly TLCP related. The groundwater samples were collected so that the wastewater treatment facility (i.e., located in Schenectady, New York) would accept the groundwater for treatment and disposal. The data results from the collected soil and groundwater samples confirmed that No. 6 fuel oil (Diesel Range Organics mostly identified as a match to Lube Oil based on laboratory analysis/comparison) was present in the ground/excavation area. Additionally, soils contain multiple SVOCs, including acenapthhene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i) perylene, benzo(k)fluoranthene, chrysene, 2-methylnapthalene, dibenz(a,h) anthracene, fluoranthene, fluorene, indeno(1,2,3-cd) pyrene, phenanthyrene, and pyrene. The VOCs m,p-xylene and o-xylene were also detected, but only in one sample and at levels slightly above non-detect levels. Low levels of heavy metals, including but not limited to, arsenic, barium, chromium, and lead were also detected, with barium identified in most samples. All barium sample results were below the Industrial SCO. In addition, the testing for metals during this time period indicated that the metals were not present at hazardous waste levels.

3.1.4 February 2012 Phase I Addendum Report

The Phase I consultant GaiaTech received DEC FOIL documents, which it summarized in its updated February 2012 Phase I Addendum Report. In addition, since the initial Phase I Report did not contain any data confirming there were no impacts from Angelica's own operations to the sump, GaiaTech asked Angelica for its past data for analysis.

Based on updated information and data provided by Angelica, and documented in the February 2012 Phase I Addendum Report dated May 2009, analysis of sludge from the sump pit (located inside the main building and boiler room), was analyzed for pH, solids, semi-volatile organic compounds (SVOCs), acids, halocarbons, aromatics, ketones, carbon disulfide and vinyl acetate. The analysis was performed so that sludge, if present, could be characterized for disposal. The data indicated that the pH was slightly basic, barium was detected at 1.79 micrograms per kilogram (µg/kg), toluene was detected at 19.6 µg/kg, acetone was detected at 1,350 µg/kg, 2-butanone was identified at 142 µg/kg, and carbon disulfide was identified at 224 µg/kg. GaiaTech concluded the sump pit did not receive discharges of oils, solvents or other unauthorized materials while in use and all detections were below the respective unrestricted use cleanup standards in 6 NYCRR 375-6.8(a), which are 0.7 parts per million (ppm) for toluene; and 350 ppm for barium. Acetone exceeded the 0.05 ppm unrestricted use cleanup standards in 6 NYCRR 375-6.8(a) but was well under the 4.8 ppm standard acetone for restricted residential use pursuant to 6 NYCRR 375-6.8(b). Acetone is also a frequent lab contaminant. While there are no regulatory standards for 2-butanone and carbon disulfide, the catch all residential cleanup guidance standard in DEC CP-51 is 100 ppm for each of these substances. Given the nature of material laundered and detergents used, lack of staining or indications of releases to the wastewater system observed in 2008, and the results of sludge sampling in 2009, the potential for

significant impact to the Site as a result of unauthorized releases to the wastewater system appeared low to the Phase I consultant in this Addendum Report. *See* Exhibit P of the BCP application– Sump Pit Data.

4.0 REMEDIAL INVESTIGATION SCOPE OF WORK

The RI, which was implemented pursuant to the NYSDEC approved RIWP, included the installation of six (6) Monitoring Wells, seven (7) Soil Borings, and eight (8) Deep Borings were performed for a total of 21 investigation locations. A deviation from the RIWP occurred when only five (5) monitoring wells could be installed due to dry subsurface conditions this past summer; however, soil samples were removed from all six (6) planned well locations.

The following tasks comprised the Scope of Work for the RI:

- Site Mobilization Activities;
- Community Air Monitoring Program;
- Decontamination Area;
- Interim Remedial Measure (OU1/EP1)
- Confirmation Sampling;
- Soil Investigation;
- Groundwater Investigation;
- Inside Soil Vapor Investigation;
- Inside Sediment Investigation;
- Collection of Samples;
- Quality Assurance/Quality Control (QA/QC) Samples;
- Equipment Decontamination;
- Quality Assurance Project plan; and
- Health and Safety Plan.

Final sample locations were approved by the NYSDEC project manager Mr. Mike McLean P.E. on June 7, 2013. During the implementation of the RIWP, Mr. McLean worked closely with the ECI project manager Mr. Marc Schneckenberger to insure that the sample locations were appropriate. There were a few deviations from the sample locations depicted in the RIWP) to facilitate proper sampling protocols and utility location issues with Mr. McLean's approval. In addition, the DOH project manager Ms. Scarlett McLaughlin directed ECI personnel as to the final location for the two (2) indoor sub-slab vapor/air samples inside the building. The actual sample locations are depicted on the Sampling Map (*see* Appendix B).

4.1 Site Mobilization Activities

Prior to Site mobilization, equipment was obtained or rented through predominantly two companies, Pine Environmental Services and Geonics Ltd., The drilling contractor - Parratt-Wolff, Inc. - was also retained to perform drilling work. The laboratory and third party sample validation companies were retained (Paradigm Environmental Services, Inc. and KR Applin & Associates, respectively) to facilitate the analytical requirements contained within the RIWP.

The drilling contractor contacted New York State's Dig Safely program before commencing work. The existing utility company then staked out the location of all utilities on the Site before commencing the drilling activities to avoid impact to existing utilities. Because of the 100 year industrial history of the Site, ECI also conducted a geophysical survey to identify any unknown former utilities not being serviced by existing utility companies and therefore, not part of the New York State's Dig Safely program), and unknown underground structures. The geophysical survey incorporated specific instrument responses that were plotted on survey grids to determine the best location for drilling activities (See Section 4.5 for further details). In addition, ECI contacted a number of former facility employees who were helpful in understanding the locations of potential utility and underground structures located on the Site. The potential utility locations were mostly running east to west and were on the driveways at both the south and north locations running adjacent to the main building. In addition, the front of the main building, which boarders Bath Street was also an area that contained numerous underground utilities. The underground structures were mostly located in the parking lot directly behind (i.e., west) of the main building. These seemed to be related to the drying ovens that were once located in a covered building that no longer remains on-Site, but has been turned into a driveway and parking area. There were concrete foundations, flat work and tunnels that covered this driveway and parking area. The result was that at no time were physical utilities or structures encountered in the drilling activities as these locations were identified prior to drilling activities (*see* Section 4.5.1 for more details on the geophysical survey).

In addition to the standard mobilization work above, stock-piled petroleum contaminated soil and leather scrap piles that were temporary stored on Site were removed as the first part of the IRM effort to make room for equipment and to clear sampling locations required for the RI, further described below in Section 4.4.

4.2 Community Air Monitoring Program

A Community Air Monitoring Plan (CAMP) was conducted for all ground intrusive work during the RI and IRM implementation activities at the Site. The CAMP has been developed based on the New York State Department of Health (NYSDOH) Generic CAMP document dated January 6, 2000. The CAMP results summary is presented in Appendix K.

Purpose:

The purpose of the CAMP was to provide a measure of protection for the community from potential airborne contamination releases as a result of ground intrusive activities involved with the investigative and remedial work activities. In addition, the CAMP implementation helped confirm that work activities did not spread airborne contamination off-site.

Sampling Protocol:

Two (2) stationary monitoring stations were positioned based on wind direction and Site activity location to determining if any airborne PM or VOCs extended to the site property boundary during the RI and IRM Site activities (See Sampling Map in Appendix B). In addition to the stationary monitoring stations, a hand held monitor was used to determine ambient levels of

VOCs directly at both intrusive and non-intrusive activities. Also, logs documenting observations of any visible dust leaving the property were maintained.

Particulate Monitoring, Response Levels, and Actions:

Continuous monitoring for particulate less than 10 micrometers in diameter (PM-10) was conducted during all ground intrusive activities with a DUSTRAK II, Real Time Monitor. Air monitoring, alarm set points, 15-minute time weighted averaging action level parameters and visible dust action criteria are identified below.

If the downwind PM-10 concentration level was noted as 100 micrograms per cubic meter (mcg/m3) greater than background (upwind perimeter) for any 15-minute period or if airborne dust is observed leaving the work area, then ECI was positioned to notify the construction foreman that dust suppression techniques must be employed.

Due to the physical parameters of the site, considering the hillside and building positions, the wind was typically very slight in the work area and the upwind and downwind directions changed frequently throughout any given day. As such, the two fulltime monitoring stations, labeled "North" and "South" varied as upwind or downwind sites, accordingly. Monitoring was maintained to determine if either instrument site exceeded the 100 mcg/m3 difference; no exceedances were recorded.

Volatile Organic Compounds (VOC) Monitoring, Response Levels, and Actions:

Volatile organic compounds (VOCs) were monitored at the both the north and south perimeters of the worksite on a continuous basis with a MiniRAE 3000.

If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeded 5 parts per million (ppm) above background for a 15-minute average, ECI was positioned to notify the construction foreman that work activities must be temporarily halted while monitoring continued; no exceedances were recorded.

Periodic monitoring for VOCs was also performed during non-intrusive activities such as the collection of soil and sediment samples or the collection of groundwater samples from the monitoring wells. "Periodic" monitoring during sample collection would typically consist of taking a reading upon arrival at a sample location, monitoring while opening a well cap or overturning soil, monitoring during well baling/purging, and taking a reading prior to leaving a sample location. At no time during the field activities did either the north or south monitoring site exceed the alarm parameters for PM-10 or VOC, of 100 mcg/m3 or 5 ppm, respectively.

QA/QC:

The Dustrak II was within the timeframe of the factory span calibration and was zero-checked each morning prior to use. The MiniRAE was span calibrated each day with 100 ppm isobutylene gas and zero-checked prior to each use.

Wind Speed and Direction:

Several wind flags were positioned around the site and used to indicate wind direction on-site. As noted above, due to the physical parameters of the site, the wind direction changed multiple times each day, but was overall low.

4.3 Decontamination Area

ECI established the decontamination area prior to any intrusive activities. A filled 2,000 gallon potable water tank and lavatory was installed on the outside of the northwest side of the main building. Located adjacent to the water tank was a blacktop area that sloped towards the building and had a trench drain to contain any run-off water. The trench drain was blocked off/plugged and the area was cleared of any debris and used as the decontamination pad.

The trench drain plug and the decontamination area were left intact after the RI effort was completed at the end of June 2013. The reason for leaving it intact was to use the same decontamination pad, water tank, and lavatory for the IRM effort that was implemented July through August 2013.

4.4 Interim Remedial Measure [Operable Unit 1 ("OU1"/EP1)]

The IRM for OU1/EP1 was performed according to the NYSDEC approved IRM Work Plan updated May 23, 2013. The NYSDEC project manager Mr. Mike McLean P.E. approved the IRM Work Plan on June 7, 2013. The property covered by this IRM remediation effort is about one third (1/3) acre of surface area.

For the entire IRM implementation which took place from June through August 2013, and included the work effort in 2010, approximately 3,300 tons of PCS and leather scrap material were removed from the excavation pit area and sent off site for proper disposal. In addition, about 2,130 cubic yards of clean backfill were brought on-Site to fill the excavation pit. During the July through August 2013 time period, 47,000 gallons of groundwater was also removed from the excavation pit and sent to a wastewater treatment plant; this facilitated the excavation process and allowed the PCS and leather scrap going to the landfill to be accepted as dry solid material. The Fulton County Landfill, where the PCS and leather scrap were sent in 2013, required dry solid materials. This was accomplished by excavating the solids and allowing the water to gravity drain back into the excavation pit and/or mixing very dry solids with slightly wet solids that had been excavated so that the resultant solid mixture was consider sufficiently dry to be accepted by the landfill. Table 4.4-1 identifies the receiving facilities and quantities of soil and groundwater that were transported off-site for disposal.

Table 4.4-1

OU1/EP1 Remediation Summary (5/12/14)			
Material	**Estimated Date**	**Disposal Site**	**Estimated Amount**
PCS	10/10/2010	ESMI Incinerator Ft. Edward, NY	102.07 Tons
PCS	12/10/2010	Town of Colonie, NY Landfill	270.7 Tons
PCS	6/20/2011	Fulton County Landfill	450.4 Tons
PCS	8/31/2013	Fulton County Landfill	870 Tons
Commercial Soild Waste	8/31/2013	Fulton County Landfill	1,697 Tons
Subtotal (Tons)			**3,390.17 Tons**
Wastewater	12/7/2010	Wastewater Treatment Plant Schenectady, NY	15,000 gal.
Wastewater	6/8/2011	Wastewater Treatment Plant Schenectady, NY	54,112 gal.
Wastewater	8/31/2013	Wastewater Treatment Plant Schenectady, NY	57,012 gal.
Subtotal (Gallons)			**126,124 gal.**

Due to the geology and topography related elevations during the excavation of EP1, there were a number of remediation/excavation practices that were required. First, the steep slope/grade on the west side of EP1 had to be addressed. While not requiring shoring, the slope did require that portions of EP1 that had been excavated to visually clean status had to be sampled and then backfilled before the entire pit was remediated to prevent erosion. This allowed the excavator to move in a north-south direction along the western boundary of EP1. The excavation was also very deep in many areas, with some excavation points reaching as deep as 12 feet to 20 feet BGS due to the elevation difference at grade. Thus, confirmation samples were taken from EP1 in a phased approach and in a practicable and safe manner.

Once an area of EP1 was visually inspected by the excavation contractor and deemed to be visual free of any grossly contaminated soil, confirmatory samples were taken and sent to the laboratory for analysis. The first confirmatory samples were taken on July 17th, 2013 from the west side (sample ID: CS1-West-10) indicating that the sample was removed from a depth of 10 feet from the west side of EP1. Sample ID: CS2-East-10 was also taken on July 17th, 2013 from a depth of 10 feet on the east side of EP1. Both samples were analyzed for metals and SVOCs. Both samples had non-detect results for all SVOCs, and the metals were well below the Restricted Commercial Cleanup Objectives [Table 375-6.8(b)].

Additional confirmatory samples were taken on July 18th, 2013 from the south end and bottom of EP1. Sample ID: CS3-South-10 was removed from a depth of 10 feet on the south side of EP1. DEC project manager Mike McLean requested that one confirmatory sample be analyzed for all of the contaminants as depicted in Appendix A1 of the RIWP; sample CS3-South-10 was this sample. Sample ID: CS4-Bottom-12 was removed from a depth of 12 feet towards the middle of EP1. Both samples were analyzed for metals and SVOCs. Both samples had non-detect results for all SVOCs, with the exception of Bis (2-ethylhexyl) phthalate, where the results for both samples were estimated to be between the quantitation limit and half the quantitation limit. Bis (2-ethylhexyl) phthalate is not a compound listed on Table 375-6.8(b). The metals for both samples were well below the Restricted Commercial Cleanup Objectives [Table 375-6.8(b)]. In addition, sample CS3-South-10 was analyzed for PCBs, pesticides, hexavalent chromium, total cyanide, and VOCs, all of which were non-detects with the exception of an extremely low result for Acetone.

An additional confirmatory sample was taken on August 2, 2013 after backfilling up to the north wall, and removing visually contaminated PCS and leather scrap. Sample ID: CS6-North-10 was removed from a depth of 10 feet on the north side of EP1. The metals results from this sample were below the Restricted Commercial Cleanup Objective with the exception of Barium and Copper, which were above the Restricted Commercial Cleanup Objective, but below the Restricted Industrial Cleanup Objective. The SVOCs were all below the Restricted Commercial Cleanup Objective with the exception of Benzo (a) pyrene, Benzo (b) flouranthene, Dibenz (a,h) anthracene, which were above the Restricted Commercial Cleanup Objective, but below the Restricted Industrial Cleanup Objective. Only one SVOC was over both the Restricted Commercial and Industrial Cleanup Objective, which was Benzo (a) pyrene. After further excavation a second sample (CS7-North -10) was taken from the north wall on August 20, 2013 and analyzed for Benzo (a) pyrene; the results for this sample were below the Restricted Commercial Cleanup Objective. The following Table 4.4-2 shows all the results from the six (6) confirmation soil samples, which exceeded the Restricted Commercial Cleanup Objective during the confirmatory sampling effort:

Table 4.4-2

North Wall Sampling Effort (August 2nd and 20th, 2013)					
Sample ID	**Metal/Compound**	**Sample Date**	**Result (ppm)**	**Restricted Commercial Cleanup Objective (ppm)**	**Restricted Industrial Cleanup Objective (ppm)**
CS6-North-10	Barium	8/2/2013	431	400	10,000
CS6-North-10	Copper	8/2/2013	590	270	10,000
CS6-North-10	Benzo (a) anthracene	8/2/2013	5.91	5.6	11
CS6-North-10	Benzo (a) pyrene	8/2/2013	7.05	1	1.1
CS6-North-10	Benzo (b) flouranthene	8/2/2013	6.76	5.6	11
CS6-North-10	Dibenz (a,h) anthracene	8/2/2013	0.904	0.56	1.1
CS7-North-10	Benzo (a) pyrene	8/20/203	0.939	1	1.1

It should be noted that further excavation of the north wall area would have undermined the integrity of the north wall. The north wall prevented off-Site migration of groundwater and surface water from the hillside and EP1. In addition, the north wall seemed to be visually consistent with its contents. The north wall is a short distance from the property boundary to the north and east at its location. A decision at the time of the IRM was made to halt further excavation to avoid possible groundwater and surface water issues. Based on this reasoning, the approval to backfill the north dike area was provided by the DEC project manager Mike McLean on August 13, 2013.

In general, the IRM was completed on schedule by August 23, 2013 and clean backfill, consisting of virgin sand and shale from the local excavation of an off-ramp for Route 87 was used to fill the excavation. The virgin shale was an excellent choice of material for use as backfill as it was stable (supported the machinery required for the excavation and backfill of EP1) and supported the west slope area of EP1. The sampling results for the clean fill material

are contained in the IRM Report dated February 4, 2014, which can also be reviewed for further details of the IRM.

What remains in OU1/EP1 excavation area is historical fill. The historic fill that is contained in many locations on the Site will be addressed in the alternative analysis/remedial action work plan. The PCS and leather scrap from the initial remediation effort started in 2010 was removed in its entirety. OU1/EP1 was remediated to Unrestricted Use Soil Cleanup Objectives and Restricted Use Commercial/Industrial Soil Cleanup Objectives contained in Tables 375-6.8(a) and 375-6.8(b) respectively (*see* Appendix C of the IRM CCR).

What remains in OU1/EP1 meets mostly Restricted Use Commercial SCOs with only two (2) metals Barium and Copper above their respective Restricted Use Commercial SCOs for two (2) samples: CS2-East-10 and CS6-North-10. Only sample CS6-North-10 contained sample results that are above their respective Restricted Use Commercial SCOs for SVOCs: Benzo (a) pyrene, Benzo (b) fluoranthene, and Dibenz (a,h) anthracene. Sample CS7-North-10 was removed after further excavation in the area of CS6-North-10 and the result for Benzo (a) pyrene was below the Unrestricted Use SCO. Thus, only two SVOCs: Benzo (b) fluoranthene, and Dibenz (a,h) anthracene remain above their respective Restricted Use Commercial SCOs but meet their respective Restricted Use Industrial SCOs. Appendix B of the IRM CCR contains a number of maps that identify where the six (6) aforementioned samples were taken/located.

The area surrounding Ballston Spa, New York is known to contain high metals concentrations in the groundwater that were historically and currently used as spa treatments. Barium is known to be in relatively high concentrations in background levels. EPA's Fact Sheet on Barium indicates that barium background levels in soil may be between 100-3000 ppm. All of the confirmation samples were below 3000 mg/Kg (ppm) with the exception of CS2-East-10. In the area where sample CS2-East-10 was removed from EP1 there was building debris including building bricks. The EPA Fact Sheet on Barium states the following:

- Barium carbonate: 25% of its use is for brick and clay products;
- Barium hydroxide is used in lubricating oil and greases and as a component in motor oils; and
- Barium chloride is used in pigments in glass, dyeing, leather tanning, and in water softening.

With the above stated the barium from sample CS2-East-10 or any other confirmation sample, all of which are below the Industrial SCO could have come from a number of historical on-Site uses such as the brick, lubricating oil and greases, motor oil, leather tanning, or water softening or another use that has not been identified. These uses/processes have been known to be used historically on-Site. Barium is also contained in coal, coal ash, and No. 6 fuel oil, all materials historically used on-Site.

4.5 Soil Investigation

4.5.1 Geophysical Survey

A geophysical survey was conducted as part of the RI using electromagnetic conductivity (EM) and magnetometer methods. Therefore, the primary purpose of the geophysical survey was to identify anomalies that may indicate the presence of subsurface objects such as tanks or drums at the drilling locations. If present, these objects might have resulted in a safety hazard or release during drilling. Survey grids with 20-foot by 20-foot dimensions and 5-foot data node spacing were established at each well and boring location (*see* Appendix C).

The DEC approved RIWP contained general (macro level) locations of where the borings were to be drilled (*see* Appendix A of the RIWP). The RIWP map located in Appendix A of the RIWP shows on a macro level the locations of the proposed sample locations which indicate where the survey grids contained in Appendix C are located. The map contained in Appendix B shows the specific (micro level) boring/sample locations that were selected as a result of the survey grids. The intent of the geophysical survey was to establish specific and exact locations (micro level) of the borings so as to avoid potential hazardous and to allow the drilling to occur in the most appropriate locations. The geophysical survey accomplished this as there were no metal objects encountered during the drilling activities. However, there was one location (see DB2 location) where the surface of gravel and concrete was impenetrable and could not be drilled as intended in the RIWP.

The EM survey was performed using a Geonics Limited EM-31 unit which measures subsurface conductivity in units of millimhos per meter. Both the conductivity (quadrature phase) and in-phase EM components were measured during the survey. The conductivity component is more representative of natural subsurface conditions. The in-phase component is more responsive to the presence of large metallic objects, such as drums and tanks. The EM measurements were taken in the horizontal dipole mode with an effective depth of penetration of approximately 10 feet BGS. The EM-31 instrument was zeroed daily prior to the survey at a background location that is free of geophysical anomalies.

The magnetometer survey was performed using a Schoenstedt MAC-51B unit. The receiver for the unit responds in direct proportion to the difference in magnetic field strength between two sensors that are 20 inches apart. The MAC-51B unit does not require zeroing.

While the EM-31 instrument is sensitive to all conductive materials, the MAC-51B unit is sensitive to ferrous metals only. Thus, the results from the two surveys are used in conjunction. For example, an anomaly observed with the EM-31 but not with the MAC-51B would represent a non-ferrous conductive metal such as copper. Ferrous objects such as steel drums or tanks will potentially be recognized by both instruments.

The geophysical instrument responses are plotted on the survey grids at each respective data collection node (*see* Appendix C). Respective well and boring locations are also shown on the survey grids. As indicated below each of the grids: C = EM-31 conductivity (horizontal dipole) in mMhos/meter; I = EM-31 in-phase (horizontal dipole) in mMhos/meter; and M = magnetometer response (L - Low, M - Medium, H - High).

Due to the prevalence of concrete with steel reinforcement (rebar) from former foundations still present both above ground and underground as well as other metal scrap material at the Site,

numerous associated geophysical anomalies were present. In addition, there were several responses or interferences attributed to the presence of surface metal or underground or overhead utility lines. These features are observed in the data as high or negative EM values and/or high magnetometer responses. For example, negative EM responses observed at the DB7 survey grid at nodes 0,5 through 0,25 are attributed to interference from the electrical service on the exterior of the adjacent residence. Negative EM responses were also observed at the MW4 survey grid at nodes 0,20 and 5,20 where a large, steel industrial washing machine was present.

However, there were no anomaly signatures indicative of spherical metal objects such as underground tanks or buried drums in the survey areas. Further, there were no underground tanks shown on the facility drawings or encountered during drilling or subsequent PCS excavation activities. Identification of final drilling locations was based on an in-field review of the geophysical survey data. Drilling locations were selected at a point within each survey grid with a low geophysical gradient in order to reduce the risk of hitting any buried metal objects.

4.5.2 Soil Boring Investigation Methodology

The soil samples were taken using two (2) distinct methods: the first was split spoon samples from the drill rig when the drill rig was used for sample collection. The second sampling method was used when the samples were hand dug.

A total of twelve (12) soil borings were advanced using a drill rig fitted with a split-barrel spoon sampler: including six (6) monitoring well borings (MW1 through MW6), five (5) deep borings (DB1, DB3, DB4, DB7, and DB8), and one (1) soil boring (SB4) were advanced at the Site (see Appendix B). The drillers attempted deep boring DB2 however; the drill rig was rejected as there was sufficient gravel and concrete on the surface to create penetration problems. It should be noted that a number of attempts at relocating DB2 were made with the same penetration problems. Deep boring DB8 was moved slightly west of the initial location to allow the drill rig to be on more level ground and the asphalt during its operations.

Deep borings DB5 and DB6 were hand dug due to potential utilities in the area that prevented the use of a drill rig. The depths of the well borings and deep borings were adjusted in the field to reach the anticipated depth of the water table. However, efforts were made to avoid penetration of any confining layer, such as glacial till, that may act as a barrier between the overburden soils and bedrock beneath the site. Subsurface soils at the borings were logged in the field by an on-site geologist (*see* Appendix D).

A total of eight (8) shallow borings were hand dug (SB1, SB2, SB3, SB5, SB6, SB7, DB5, and DB6). Initially DB5 and DB6 were to be drilled using a drill rig, but were later hand dug due to potential utilities being too close to their locations (See Appendix B). Also, SB4 was drilled using a drill rig rather than trying to hand dig in the location of the asphalt driveway (*see* Appendix B). The soil borings SB1, SB2, SB3, SB5, and SB6 were hand dug due to the inaccessibility of their locations; where the drill rig could not be safely used. The only location where a utility or inaccessibility was not a factor was soil bore location SB7 and this was a location in the same area as MW2 and DB3 which were drilled and sampled to the depths of 14’

and 10' respectively. Thus, it was determined that only surface and 0' to 2' depth intervals were required to be sampled for SB7 as depicted in the RIWP.

The drill rig was owned and operated by Parratt-Wolff, Inc. and the ECI personnel that were taking the samples were a licensed professional geologist and his assistant that is a degreed environmental engineer. The ECI personnel that provided official documentation of the samples including chain-of-custody and shipping were a licensed professional engineer and his assistant that has been in the environmental sampling industry for over three (3) decades.

Each subsurface soil sample was screened upon recovery for the presence of organic vapors using a photoionization detector (PID). There were no PID responses observed above background in any of the soil recoveries. The PID was auto-calibrated on a daily basis prior to the commencement of work. Subsurface soil samples were collected for laboratory analysis at each of the borings.

The analytical suite for the soil samples included the following:

1. Volatile Organic Compounds - analyzed by EPA Method 8260B.
2. Semi-Volatile Organic Compounds - analyzed by EPA Method 8270C.
3. Target Analyte List Metals (ICP) – Aluminum, Antimony, Arsenic, Barium, Berylium, Cadmium, Calcium, Chromium (total), Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc - analyzed by EPA Method 6010C
4. Mercury – analyzed by EPA Method 7471B
5. Hexavalent Chromium – Method SW7196
6. Pesticides - analyzed by EPA Method 8081B.
7. PCBs - analyzed by EPA Method 8082A.
8. Cyanide – analyzed by Method SW9014

The soil samples for VOCs were placed into 4oz glass jars and the soil samples for SVOCs, Metal, Pesticides and PCBs were placed into 9oz glass jars using clean metal spoons. The sample jars were placed directly on ice and shipped daily to the analytical laboratory under fully documented chain-of-custody.

4.6 Groundwater Investigation

Five (5) monitoring wells were installed to collect groundwater samples at specific locations. The RIWP called for six (6) monitoring wells (i.e., MW1 through MW6) to be installed, however, subsurface conditions at the MW5 boring location at the southwest area of the Site were too dry for sufficient well recharge. At this MW5 boring location, silt and clay were prevalent starting at below approximately 4.2 feet of fill over tight glacial till and these soils did not yield appreciable water such as the sands and gravels observed in the other well locations. Also located in the vicinity of the MW5 boring were deep borings, DB3 and DB4, which exhibited similar soil characteristics and low potential for recharge. Therefore, with DEC approval, the MW5 well was not constructed and the DB3 and DB4 borings were not used as substitute locations. Monitoring well MW2 was relocated slightly west of the initial location to

avoid potential underground pipelines that may have existed closer to the building. Monitoring well MW4 was also relocated to the west of the initial location as utilities were too close to the original location for use of the drill rig. The NYSDEC project manager Mike McLean was informed of these conditions and approved all of these deviations from the RIWP.

The monitoring wells that were constructed used a 2-inch diameter, schedule 40 polyvinyl chloride (PVC) well casing. The well screens are 0.010-inch slot size, with No. 0 size, quartz sand packs. The screen intervals were constructed so that they intercepted the top of the water table. Bentonite pellets were used to seal the top of the sand packs. Flush-mount surface completions were used for each of the wells.

Following their construction, each of the wells was surveyed by a licensed surveyor. The coordinates of the well casings and elevations of the ground surfaces and top of the inner casings were determined by the survey and plotted on the Map (*see* Appendix B). Groundwater levels were taken in each of the wells using an electric water level indicator and converted to elevations above mean sea level (AMSL) based on the survey (*see* Appendix B). Groundwater flow direction was then contoured and gradient calculated (*see* Appendix F).

After a period of at least 48 hours following monitoring well construction, the wells were developed by surging and bailing. This process continued until several standing well volumes of groundwater were removed and stability (less than 10% variance) of pH, specific conductance, and temperature was achieved. In addition, turbidity was measured and continually improved during development.

At least 24 hours following development, groundwater samples were collected from each of the monitoring wells using low-flow methods. This method has been demonstrated to minimize stress on the aquifer prior to and during sampling by minimizing the amount of aquifer drawdown. Thus, the low flow method is designed to provide more representative groundwater samples.

For the low-flow sampling, the groundwater was pumped at each well using a peristaltic pump at a rate of 100 to 200 milliliters per minute. The intake of the pump tubing was placed at the mid-point of the well screen interval. An electronic water-level indicator was used to monitor the amount of drawdown that occurred in the well during pumping. This drawdown was nominal and ranged from 1.25% to 6.99% of the initial water levels at MW3 and MW2, respectively (see Appendix E).

Additionally, a flow-through cell was used to monitor pH, specific conductance, oxidation-reduction potential (ORP), dissolved oxygen (DO), temperature, and turbidity prior to and during sampling. Low-flow purging was continued until stability of these measurements was achieved. Specifically, this stability was determined by at least three consecutive readings within $\pm$ 0.1 pH (standard units), 3% specific conductance (mS/cm), $\pm$ 10 ORP (mv), 10% DO (mg/L), 3% temperature (°C), and 10% turbidity (NTUs) (see Appendix E). To reach these parameters for stability, the volume of groundwater removed from the wells using low-flow rates ranged from 10.6 liters to 15 liters at MW1 and MW6, respectively. Final turbidities of the groundwater samples were low and ranged from 0.43 NTUs to 11.5 NTUs.

Following the stability of these parameters, groundwater samples were collected at each well. The analytical suite for the groundwater samples included the following:

1. Volatile Organic Compounds - analyzed by EPA Method 8260B.
2. Semi-Volatile Organic Compounds - analyzed by EPA Method 8270C.
3. Target Analyte List Metals (ICP) – Aluminum, Antimony, Arsenic, Barium, Berylium, Cadmium, Calcium, Chromium (total), Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc - analyzed by EPA Method 6010C
4. Mercury – analyzed by EPA Method 7471B
5. Hexavalent Chromium – analyzed by EPA Method 218.6
6. Pesticides - analyzed by EPA Method 8081.
7. PCBs - analyzed by EPA Method 8082.
8. Cyanide – analyzed by Method SM4500 –CN E

The groundwater samples for VOCs were poured into pre-preserved vials using new, dedicated Teflon® micro bailers. The remainder of the samples were collected directly into pre-preserved (where applicable) sampling containers using the peristaltic pump. The laboratory required that the hexavalent chromium sample be filtered in the field. This was done after sample collection with the filter media and sampling containers supplied by the laboratory.

The sample jars were placed directly on ice and shipped daily to the analytical laboratory under fully documented chain-of-custody.

4.7 Soil Vapor Investigation

NYSDOH project manager Ms. Scarlett McLaughlin required two (2) sub-slab VOC air samples using EPA Method TO-15 VOC air sampling and analysis. Ms. McLaughlin was on-Site to direct the sampling effort and determined the location of the two (2) sub-slab air samples within the main operations building (*see* Appendix B for the sample locations). ECI personnel used the helium sampling protocol pursuant to the DOH Soil Vapor guidance document where helium is used to avoid/detect any air in leakage to the air sample canister. The reason for sampling sub-slab air samples and not ambient air samples within the building was to first test the sub-slab air and if there were issues with the laboratory results, then and only then would indoor air sampling be initiated. In addition, the building was not in use so this approach was deemed appropriate by Ms. McLaughlin as she approved this methodology and observed the sub-slab sampling.

ECI first drilled a hole through the concrete sub-slab that was 4 to 6 inches thick. The hole was cleaned with a clean rag and the clear tubing that was connected to the air sample canister was inserted into the hole and the area around the hole sealed. Using the helium sampling protocol, a 5-gallon bucket was placed over the hole. The clear tubing ran from the air sampling canister through the sidewall of the bucket and into the sub-slab hole. Another clear tube was connected to the source of the helium (i.e., a pressurized canister of helium) and inserted into the bucket. The holes in the bucket were sealed with a moldable material. A weight was placed on the bucket to reduce the air/helium leakage between the sub-slab flooring and the bucket. The helium

canister was then opened and allowed to empty at a slow rate. Once the bucket was filled with helium (i.e., after a few minutes) the air sampling canister under vacuum was then opened to start the sub-slab air sampling process. When the air sampling was completed, the air sampling canister valve was closed. Next, the helium canister valve was closed and the equipment removed from the sampling location. Air sample C1 (#1132426-01) and C2 (#132426-02) were sampled for 8-hours and 10-minutes and 8-hours and 30 minutes respectively.

In addition, PID readings/measurements were taken during all drilling activities. The PID instrument was calibrated and implemented as described in the QAPP.

4.8 Quality Assurance/Quality Control (QA/QC) Samples and Data Usability Summary Reports (DUSRs)

Quality Assurance/Quality Control (QA/QC) samples for the investigation were collected to ensure the integrity of the resulting analytical laboratory data. The field sampling procedures contained in Appendix B of the RIWP were followed. In addition, the Quality Assurance Project Plan (QAPP) that was included as Appendix G in the RIWP was used without exception for QA/QC of the samples.

Data Usability Summary Reports (DUSRs) discussing the adequacy of the analytical data obtained from the laboratory and any pertinent data excursions or limitations on the use of the data were prepared and are contained in Appendix J.

The laboratory data provided by the laboratory is also part of the DUSRs and included in Appendix J. In general the third party data validator validated almost all of the data with few rejected data results. Tables contained in Appendices G, H, and I indicate rejected data results with numbers shown in red. The most frequently rejected results were for VOCs: 1,4-dioxane and 2-Butanone. The rejected data results had no significant impact on the findings of this report.

4.9 Equipment Decontamination

The field equipment cleaning procedures that are identified in Appendix C of the RIWP were followed. The drilling equipment was decontaminated each time between sample locations and the sampling equipment used decontaminated sampling spoons and mixing bowls for each soil sample (*see* the RIWP QAPP in Appendix G). Groundwater samples were removed with virgin apparatus from the laboratory or equipment that had been decontaminated between sample locations.

4.10 Health and Safety Plan

The Site Health and Safety Plan (HASP) that is included in Appendix F of the RIWP were followed throughout the RI effort. No safety related incidents occurred during the RI.

5.0 INVESTIGATION FINDINGS

5.1 Interim Remedial Measure (OU1/EP1)

The Interim Remedial Measure (IRM) report was submitted under separate cover to the DEC in February 2014. The confirmation sample results indicate that all remaining soils in the EP1/OU1 location are below Industrial Use Soil Cleanup Objectives ("SCOs") pursuant to Table 375-6.8(b), see Table 1 of the IRM report. Six (6) SCOs whose sample results exceeded the commercial SCOs were summarized above in Section 4.4. The backfill sample results (*see* Appendix C of the IRM report) indicate that the backfill is appropriate for use as fill at the EP1/OU1 location. The IRM of OU1 is complete and Angelica has requested formal closure of the OU1 remedial work based on the confirmatory sampling results. A Track 2 industrial SCO remediation was achieved.

It should be noted that Test Pit (EP1) samples TP1 through TP3 were collected and analyzed for TAL Metals. Only Arsenic exceeded the Industrial Use Soil Cleanup Objective. However, all of the Test Pit samples from OU1/EP1 were in locations that were subsequently excavated and removed from the Site.

5.2 Soil Investigation

The 86 soil samples collected during the RI consisted of the following:

- Soil Bore: 14 soil samples from 7 Site locations;
- Deep Bore: 27 soil samples from 7 bore hole Site locations;
- Monitoring Well: 33 soil samples from 6 bore hole Site locations;
- Test Pit: 6 soil samples for TAL metals only from 3 Site locations at the OU1/EP1 location: and
- Confirmation Samples: 6 soil samples from 6 Site locations at the EP1/OU1 location.

Fill material consisting of sand, gravel, brick, coarse black ash was observed at the following Site borings: MW1, MW2, MW3, MW4, MW5, MW6, SB4, DB1, DB3, DB4, DB5, DB6, and DB8. Based on its prevalence, it appears that historic fill was used for grading purposes over much of the site. Further, the source of the fill appears to be primarily associated with various building demolition that has occurred at the site, including coal, coal ash, and/or asphalt which are known to contain SVOCs. The greatest thickness of fill was approximately 13 feet at the MW2 boring located directly west of (behind) the main building. The thickness of fill appears to be consistent in this area based on the raised ground surface elevation relative to that of the building foundation. Fill was not present in DB7 located in the most northern area of the Site.

In-situ naturally occurring soils, consisting of glacially deposited gravel, sand, silt, and clay, were observed below the fill. This is consistent with the glacial history of the region. Highly compacted, dense, glacial till was observed at the lower depth intervals in the following Site borings: MW2, MW4, MW5, DB3, and DB4. The till consists of varying percentages of clay, silt, and fine to medium size, sub-angular gravel. This composition is typical of lodgment till which was deposited during glacial advancement under the weight and pressure of the ice. The sub-angular gravel within the till is the result of the scouring of the bedrock surface during glacial advancement.

The borings where the till was observed as identified above are located at the west, central, and south areas of the site. As mentioned above, efforts were made to avoid penetration of this till, as it may serve as a natural barrier between the overburden soils and bedrock further beneath the site. At some locations, the till was so dense that it resulted in split-spoon refusal. In these instances, 50 blows with a 140 pound drill hammer did not advance the split-spoon sampler a full 6 inches deeper in the till (*see* Appendix D). It is anticipated that this till may extend below the entire Site, but its depth may not have been reached in all of the borings.

Soil Sample Results:

The tables presented in Appendix G are color coded to reflect soil sample results that are below or above specific Track 1 and 2 SCOs. All data results, as well as the SCOs presented in the soil tables are in mg/Kg, which equate to parts per million (ppm). The color "green" indicates that the sample result is below Unrestricted Use SCOs pursuant to Table 375-6.8(a). The color "yellow" indicates that the sample result is above Unrestricted Use SCOs pursuant to Table 375-6.8(a), but below Restricted Commercial Use SCOs pursuant to Table 375-6.8(b). The color "tan" indicates that the sample result is above Restricted Commercial Use SCOs, but below Restricted Industrial Use SCOs pursuant to Table 375-6.8(b). When the "tan" cell has a bolded boarder and bold number then the sample result is above the Restricted Industrial Use SCOs pursuant to Table 375-6.8(b). The table numbers in red are results that were rejected by the third party data validator and identified as rejected data results in the Data Usability Summary Reports (See Section 5.6). The less than sign (<) indicates that the value is below the laboratory detection limit, which exceeds the Unrestricted Use SCOs. Thus, only yellow or tan color coded cells contain less than signs and the values contained within the cells are non-detect.

The tables contained in Appendix G are associated with the soil samples that were collected from the following sample locations:

- Monitoring Well samples MW1 through MW6;
- Deep Bore samples DB1 through DB8 with the exception of DB2 where drilling attempts were unsuccessful due to the prevalence of surface gravel and concrete;
- Soil Bore samples SB1 through SB7;
- Test Pit (EP1) samples TP1 through TP3; and
- Confirmation Samples CS1 through CS7 with the exception of CS5 as that number designation was not used for the Test Pit EP1 samples.

The results in the above referenced tables presented in Appendix G were further evaluated. After careful review of the data, it was determined that all PCBs, Pesticides, and VOCs, sample results were below the Industrial Use SCOs shown in Table 375-6.8(b). There were two (2) metals and twelve (12) SVOCs that were reported above the Industrial Use SCOs identified in Table 375-6.8(b) for the entire 6.35 acre Site; these are summarized below in Table 5.2-1. Therefore, Table 5.2-1 contains all contaminants currently on-Site that exceed the Industrial Use SCOs; only Metals and SVOCs exceed the Industrial Use SCOs for the Site. Test Pit samples TP1 through TP3 are not included in Table 5.2-1 as the soil from their locations within EP1 was removed and clean backfill replaced the soils (*see* IRM CCR dated May 2014). The Metals and SVOCs

contained within Table 5.2-1 are identified with their respective sample identification/location numbers on the Site map (See Figure 1).

Table 5.2-1
Reported Results Which Exceed the Industrial Use Cleanup Objectives [Table 375-6.8(b)]

Angelica Soil Sample Results Comparison: Result Concentrations that Exceed Industrial Use Soil Cleanup Objectives (mg/Kg)

There were a total of 86 samples removed and analyzed during the RI implementation effort. Of these 6 samples were related to soils that were removed from the Site. Thus, the above Table 5.2-1 represents a sum of 80 samples removed and analyzed for approximately 82 analytes representing approximately 6,500 analyte samples. Of the 80 samples only 18 had analyte(s) above their respective Industrial SOC. Of the 6,560 analyte samples only 45 exceeded their respective Industrial SCO of which 6 were laboratory non-detect levels. Thus, only 39 analyte samples of the approximately 6,500 analyte samples had results that exceeded their respective Industrial SCO.

Figure 1 identifies two (2) locations where some specific metal and SVOC results were above the Industrial Use SCOs. The first location is at the north portion of the property currently under an asphalt driveway (See SB4 and DB8 soil sample locations). These sample locations are hydraulically down-gradient of the EP1/OU1 location that was remediated in the summer of 2013 (*see* Groundwater Flow Map in Appendix F). Mercury was found in SB4 at 8.9 mg/Kg in the 4 to 6 foot depth interval. This result is the maximum result for mercury at SB4 and it marginally exceeds the Industrial Use Cleanup Objective of 5.7 mg/Kg. The maximum result of arsenic found in SB4 was at 40.4 mg/Kg; whereas the Industrial Use SCOs is 16 mg/Kg. The two SVOC compounds Benzo (a) pyrene and Dibenz (a,h) anthracene found in SB4 were reported as laboratory non-detection levels, but these non-detection levels exceeded the Industrial Use SCOs. DB8 is also at the north portion of the property under the asphalt driveway. The concentration of mercury found in DB8 at 2 to 4 foot depth interval was 5.84 mg/Kg, which marginally exceeds the Industrial Use SCO of 5.7 mg/Kg. The maximum result of arsenic found

in DB8 was 74.9 mg/Kg in the 2 to 4 foot depth interval, compared to the Industrial Use SCO of 16 mg/Kg. Boring logs from SB4 and DB8 indicate that there is fill present to a depth of at least 4 feet BGS, below the asphalt driveway. Although SB4 and DB8 sample results did detect acetone, acetone is also a frequent lab contaminant as such the results are highly suspect for this compound. Much of the fill located on the Site has visual characteristics with portions similar to coal, coal ash, or asphalt particles; this type of fill was also readily observed at the EP1/OU1 location, where it was predominantly removed.

The second of the two (2) locations is in the southwest corner of the Site where MW5, DB4, and SB7 soil sample locations are collectively located. MW5 soil boring results contained SVOCs Benzo (a) pyrene, Benzo (a) anthracene, Benzo (b) fluoranthracene, Dibenz (a,h) anthracene, and Indeno (1,2,3-cd) pyrene in the 0 to 2 foot depth interval, which exceeded the Industrial Use SCOs. Below two (2) feet BGS, the results from the MW5 soil samples do not contain SVOCs that exceed Industrial Use SCOs suggesting surficial only fill contamination in this area. However, 4 to 6 feet BGS in the MW5 boring location there is a mercury result of 30.1 mg/Kg, which exceeds the Industrial Use SCO of 16 mg/Kg.

DB4 has SVOCs in the 2 to 4 and 4 to 6 foot BGS depth intervals at concentrations, which exceed Industrial Use SCOs, but not below 6 feet. The metal results for the DB4 location do not exceed the Industrial Use SCOs.

SB7 was sampled at the surface and at the 0 to 2 foot BGS depth interval. There was only one SVOC - Benzo (a) pyrene at 3.38 mg/Kg and 4.35 mg/Kg - which exceeded the Industrial Use SCO at the surface and 0 to 2 foot BGS depth interval respectively. The Industrial Use SCOs for Benzo (a) pyrene is 1.1 mg/Kg. Boring logs from MW5 and DB4 indicate that there is fill present to 6 feet BGS in this location. DB3 is in the same general location as is MW5 and DB4, but the results from DB3 did not exceed the Industrial Use SCOs for any contaminant. Much of the fill located on the property and in the general location of MW5, DB4, and SB7 also had visual characteristics of coal, coal ash, or asphalt particles..

With the exceptions of SB1 and MW2 there were no other soil sample results that exceeded Industrial Use SCOs for metals. The SB1 surface sample result for mercury was 7.86 mg/Kg, compared to the Industrial Use SCO of 5.7 mg/Kg. MW2 had a result between the 12 and 14 foot depth interval, which was 17.0 mg/Kg of arsenic, only slightly above the Industrial Use SCO of 16 mg/Kg; fill was observed at both sample locations. Specifically, the MW2 boring log indicated the presence of fill to at least 13 feet BGS.

With the exceptions of SB2 and DB5, there was no other soil sample result that exceeded Industrial Use SCOs for SVOCs. In both of these locations the fill that was present had visual characteristics with portions of the fill being similar to coal, coal ash, or asphalt (*see* Figure 1).

During all drilling activities PID measurements were taken to determine if VOCs were present at specific BGS depths and potentially at what concentration. Boring logs contain the results of PID measurements/readings (*see* Appendix D). A review of these PID measurements indicates that there were very minor amounts of VOCs present. Most measurements for all of the drilling

activities were 0.0 ppm or 0.1 ppm above or below background; potentially attribute to background variation.

The bore logs contain background (ambient) concentrations and concentrations at BGS depths. The only readings/measurements that exceeded back ground reading levels were measured at MW5 and MW2 locations. The BGS depth measurement should be considered relative to the background measurement concentration. The maximum response was 0.4 ppm at MW3 at the BGS depth interval of 14-16 foot; 1.2 ppm BGS depth interval less 0.8 ppm background is 0.4 ppm. This response which is less than 1 ppm is considered very minor and could even be attributed to background variation.

An initial LEL of 70% was obtained in the well casing at MW-2 when it was first opened on 6/28/13 for development purposes. It dissipated to 0% LEL within 15 minutes after the casing vented. VOCs were 0.2 ppm (background) initially and then lowered to 0.0 ppm in the same period.

Surface Soil Exceedences:

Surface soils considered for this report are to a depth of 2' BGS depth. The surface soil sample results that exceed Industrial SCOs are as follows: SB1, SB2, DB4, MW5, SB7, DB5, SB4, DB8, and TP1-TP3. Appendix G contains color coded tables for each sample which depicts their respective surface results. Figure 1 identifies the COCs that exceed the Industrial SCOs. SB1 surface mercury result is 7.86 mg/Kg which is slightly above the 5.7 mg/Kg Industrial SCO. SB2 surface BaP result is 2.19 mg/Kg which is slightly above the 1.1 mg/Kg Industrial SCO. DB4 surface SVOCs sample results have twelve (12) SVOCs above their respective Industrial SCO. MW5 surface SVOCs sample results have five (5) SVOCs above their respective Industrial SCO. SB7 surface arsenic and BaP results 17.8 mg/Kg and 3.38 mg/Kg are slightly above their respective Industrial SCOs 16 mg/Kg and 1.1 mg/Kg. DB5 surface BaP result is 2.39 mg/Kg which is slightly above the 1.1 mg/Kg Industrial SCO. SB4 surface BaP and Dibenz (a,h) anthracene sample results are laboratory non-detects at <1.69 mg/Kg each which exceed their Industrial SCOs 1.1 mg/Kg each. DB8 surface arsenic result is 42.3 mg/Kg which exceeds the 16 mg/Kg Industrial SCO. TP1 through TP3 surface sample results for arsenic are as follows: TP1 is 25.3 mg/Kg, TP2 is 42.5 mg/Kg, and TP3 is 30.6 mg/Kg which exceed the Industrial SCO of 16 mg/Kg.

5.3 Groundwater Investigation

Five (5) monitoring wells were installed and developed with sufficient recharge to obtain groundwater samples. A total of five (5) groundwater samples were removed from the monitoring wells: MW1, MW2, MW3, MW4, and MW6. Due to the relatively dry conditions, and the presence of finer grained soils with low anticipated yield, no monitoring well was installed at the MW5 location.

Groundwater levels were measured to the nearest 0.01 feet in each of the new monitoring wells (6/30/13) using an electronic water-level indicator. These measurements were converted to elevations and plotted on the Site survey map (*see* Appendix B). Based on the respective

groundwater elevations, groundwater contours were drawn to illustrate the apparent direction of groundwater flow. As shown in Appendix F, the direction of groundwater flow beneath the Site is primarily easterly. This flow direction mimics the Site topography, which slopes dramatically downward to the east from the hill located on the west side of Site. The groundwater gradient is steeper nearer to the base of the hill and flatter to the east below the main building. The steeper gradient is expected based on the relatively high elevation of the hill on the west side of the Site and abrupt change in slope at the base of the hill.

Additionally, it is expected that a secondary, southeastern component of groundwater flow is likely to exist in proximity to Gordon Creek on the south side of the Site. However, the flow in this area is less defined due to the drier subsurface conditions observed at MW5, DB4, and DB3. Thus, a decision was made, which was confirmed by the DEC project manager, to forgo the monitoring well installation of MW5. As described above, the soils beneath the fill in this area are fine grained (silt, clay, and till) with lower recharge potential than the coarser sand and gravel soils observed at the central and northern portions of the Site. Further, it is probable that any southeastern component of groundwater flow in this area is intermittent, occurring during significant, prolonged rain events. During such events, additional flow may emanate from the southern flank of the hill on the west side of the Site, assuming that groundwater flow mimics topography at that location as it does in other areas of the Site. The Gordon Creek channel flows primarily east along the southern boundary of the Site. However, where Gordon Creek flows past the Site the channel is mostly lined with concrete.

Groundwater Sample Results:

All groundwater sampled were collected from monitoring wells MW1 through MW4 and MW6. The groundwater table sample results, as well as the groundwater quality objectives, are provided in Appendix H. These groundwater results are shown in ug/L which equates to parts per billion (ppb). This table incorporates a color code whereby "green" indicates that the sample result is below the respective allowable groundwater quality objective shown in Table 3 of Chapter X of the Division of Water, NYCRR Part 703.6. The color "yellow" indicates that the number is non-detect (i.e., below the laboratory limit) but greater than the allowable groundwater quality objective. The color "tan" indicates that the sample result was greater than the respective allowable groundwater quality objective. The less than sign (<) indicates that the value is a laboratory reported non-detect limit.

As shown in Appendix H, only iron and manganese results were greater than their respective allowable groundwater quality objective. All other results were below the allowable groundwater quality objective. There were however a number of substances whose reported laboratory non-detect limits exceeded their respective allowable groundwater quality objective. After further investigation of the groundwater sample results, groundwater does not appear to be adversely impacted at the Site by the Site-wide fill conditions.

5.4 On-Site Sub-Slab Soil Vapor Investigation

Appendix I contains the results of the sub-slab air sampling. The table shows the results for five (5) contaminants: Trichloroethene, Carbon Tetrachloride, Tetrachloroethene, Methylene Chloride, and 1,1,1 Trichloroethane. The table reports the soil vapor concentrations in ug/m^3.

The table is color coded with the color "green" indicating that the sample result was below the comparison values shown. VOCs were detected at low levels in the sub-slab samples, at concentrations that do not warrant further investigation or remediation. In addition, Angelica purchased the Site and operated laundering equipment in the building since 1977. Angelica did not use VOC containing materials in their laundering operations. By the physical nature of VOCs any historical VOCs that would have been inside the building prior to 1977 would have evaporated. Thus, it is reasonable to state that the building itself does not contain VOCs in any concentrations that would be problematic to workers or employees.

5.5 Inside Sludge Investigation

Inside the main building the wastewater discharge system was sampled for sludge/sediment within a small above ground sump located in the former maintenance shop. The building had been shuttered and the sump that was originally designated for sampling (located below ground in the boiler room downstream of the maintenance shop) was not accessible and did not contain sufficient sludge/sediment for sample collection. The originally designated sump was the sump sampled by GaiaTech which it summarized the results in its updated February 2012 Phase I Addendum Report (see Section 3.1.4).

The location chosen for sampling was up stream/line of the original sump location and very little sediment was available for sampling. Appendix I provides the table with the sediment sample results for IS1 compared to soil cleanup objectives in mg/Kg which equates to ppm. The table was color coded identical to the soil samples (*see* Section 5.2 for table color code description). The results indicated that only the mercury result of 61.2 mg/Kg exceeds the Industrial Use Cleanup Objective of 5.7 mg/Kg. The sludge sample was very black and its contents could not be individually identified. However, there were chips (i.e., small flat chips the size of a pencil eraser head) that were black but seemed to be either rusted metal and/or paint. Up until the early 1990s Mercury was a component of certain paints, so there is a strong possibility that the chips came from painted surfaces due to the historical background of the Site.

Regarding the sludge sample all PCBs, Pesticides, SVOCs, and VOCs were below the Industrial Use Cleanup Objective. Only three (3) other metals Barium, Cadmium, and Nickel were above Commercial SCOs. All PCBs were below Unrestricted Use SCOs. All pesticides were below Unrestricted SCOs with only one exception 4,4-DDE which met Commercial SCOs. All SVOCs met Unrestricted SCOs with the exception of Pentachlorophenol which met Unrestricted Commercial SCOs.

6.0 EXPOSURE ASSESSMENT (Qualitative Human and Fish/Wildlife)

6.1 Site Setting

This Section contains a summary of environmental conditions and conceptual site model.

6.1.1 Summary of Environmental Conditions

The analytical data obtained during the RI at the Site for soil, and groundwater (the exposure media) were investigated and summarized in Section 5.0. Historic soil and groundwater COCs were those tied to potential tannery processes and waste streams, which were considered when developing the approved RIWP. Historically tannery sites in general have used suspected COCs in their operations such as: chlorine, formaldehyde, sulfuric acid, glycol ether EB, glycol ether PMA, methyl isobutyl ketone, toluene, xylol, phosphoric acid, methanol, manganese sulfate, chromium III, ethylene glycol, lead, copper, lime, and zinc. Essentially, the chemicals typically associated with tannery sites were not identified at the Site. However, a petroleum contaminated area and pit/landfill that included leather scrap was found adjacent to remnants of a former large above ground vertical petroleum tank and tank support foundation with pillars was uncovered as well as area-wide historic fill related contamination.

6.1.2 Conceptual Site Model

A conceptual Site model has been developed based on the findings of the Site surface and subsurface investigations. The purpose of the conceptual Site model is to develop a simplified framework for understanding the distribution of impacted media, potential migration pathways, and potentially complete exposure pathways, as discussed below.

Potential Sources of Contamination:

Potential sources of contamination at the Site have been identified in the RIWP and in this RIR. The potential sources of contamination appears to originate from the heterogeneous, site-wide historic fill, comprised of various amounts of gravel, coal, coal ash, cinders, wood, black fragments and staining as described in Sections 4.0 and 5.0 including the soil boring logs contained in Appendix D. The SVOCs (PAHs) and Metals that exceed the Industrial Use SCOs are associated with the composition of the historic fill. Although there has been significant historic use of the Site the groundwater does not seem to be greatly or adversely impacted. Any potential impacts associated with the OU1/EP1 petroleum contaminated area have already been remediated through the IRM remedial effort. Therefore, this former area of contamination on the Site is not addressed in this Qualitative Exposure Assessment.

Exposure Media:

Soil media (surface and subsurface soil) on the 6.35 acre property is made up of a significant amount of historic fill whose composition contains metals and SVOCs, while under laden with glacial till. It is anticipated that this glacial till may extend below the entire Site, but its depth may not have been reached in all of the borings (*see* Section 5.2). It is anticipated that the glacial till forms an impenetrable layer, which appears to be preventing the vertical migration of any on-Site COCs. The groundwater is relatively unaffected by Site COCs, even though there seems to be a reasonable horizontal flow of groundwater through the Site, and the groundwater is close to the Site surface. Only iron and manganese were reported in the groundwater to exceed Part 703.6 Table 3 levels. This coincides with the data from the OU1/EP1 IRM location, which suggests the Site soil COCs are relatively stable and are not leaching into the groundwater. There were a number of quantitative sample results where the COCs laboratory detection limit exceeded Part 703.6 Table 3 and NYSDOH Part 5 standards. However, there are no groundwater or drinking

water wells in the area (*see* Section 2.4), nor is it likely that anyone uses groundwater at 12' BGS as drinking water (i.e., the depth in which the wells were developed).

6.2 Human Health Exposure Assessment

Human health exposure risk was evaluated for the Site in general accordance with the NYSDEC Draft DER-10 Technical Guidance for Site Investigation and Remediation. The assessment includes an evaluation of potential sources and migration pathways of the Site-wide contamination from the historic fill, potential receptors, exposure media, and receptor intake routes and exposure pathways.

Receptor Populations:

Human receptors under current on-Site conditions are limited to the few personnel who provide limited and infrequent Site security or guests visiting the Site. Recently here is evidence of trespassers on-Site, the duration of their stay is short as security from local and county law enforcement frequents the Site and removes trespassers. When future on-Site physical construction or remediation activities are required, human receptors will include construction and remediation workers. Potential ambient air (i.e., dust and organics) issues may arise during such work, which could impact the on-Site workers and the local/adjacent population. Under future conditions, receptors will include the building occupants (i.e., industrial workers), and visitors. However, the implementation of the Health and Safety Plan (HASP) should address all exposure scenarios during the remediation, and an environmental easement referencing the Site Management Plan (SMP) will be in place that shall ensure ground intrusive activities will be implemented in accordance with the SMP, which should mitigate all exposure scenarios post mitigation. In addition, an approved CAMP will be in place and required during any excavation activities, which will protect the downwind community.

Potential Exposure Pathways — On-Site *Current Conditions*:

The composition of the historic fill at the Site contains various SVOCs (PAHs) and metals. The Site is primarily covered by buildings, concrete building foundations and flat work, and some exposed soil and vegetation. In localized areas where human exposure to the historic fill is possible (i.e., southwest portion of the property) potential migration pathway is likely complete for dermal absorption and ingestion. This pathway may be complete since there is recent evidence of trespassers on the Site. However, access to the southwest portion of the property where uncovered soil is present is limited under current conditions since this area is normally overgrown with vegetation that exceeds 8 feet in height during the summer and covered by snow in the winter.

Groundwater beneath the Site contains only iron and manganese metals that exceed Part 703.6 Table 3 levels. Based on groundwater elevations obtained during the remedial investigation, groundwater appears to flow onto the Site from the west (see Appendix F). This groundwater flow emanates from the steep hillside and moves across the Site towards the east (i.e., Bath Street) and possibly in a southeast direction at the southernmost portion of the Site. Since this

groundwater is not used for drinking water purposes and there is no other use of this groundwater, there is no completed pathway for groundwater exposure.

Sub-slab soil vapor sample results collected during this investigation indicated that actions are not needed to address exposures to soil vapor intrusion in the on-Site building. Soil vapor intrusion is not currently a completed exposure pathway for this site

The inside sludge sample (from an open wastewater pit, part of the wastewater piping system) had a mercury result of 61.2 mg/Kg which exceeds the Industrial Use Cleanup Objective of 5.7 mg/Kg. However, all PCBs, Pesticides, SVOCs, and VOCs, where applicable, were below the Industrial Use SCOs. As noted in Section 5.5 the sludge sample was very black and its contents could not be individually identified. However, there were chips (i.e., small flat chips the size of a pencil eraser head) that were black but seemed to be either rusted metal and/or paint. Up until the early 1990s Mercury was a component of certain paints, so there is a strong possibility that the chips came from painted surfaces due the historical background of the Site. Thus, the exposure from potential mercury inside an interior aboveground small sump is minimal from dermal absorption, ingestion or inhalation and would only potentially impact future industrial personnel if disturbed. This small above ground sump can easily be cleaned to remove any residual mercury.

Construction/Remediation Activities:

Should further physical construction or remediation activities be required, only the two (2) areas depicted as the southwest portion of the Site and the north driveway/parking area could result in significant potential exposure. Therefore, the potential exists for exposure of soil COCs to construction workers via dermal absorption, ingestion, and inhalation, but such exposures can be readily mitigated from HASP implementation With respect to adjacent property owners near the Site; potential exposures to off-site receptors to site contamination during ground intrusive activities will be managed with implementation of an approved CAMP.

Therefore, while there is potential exposure to the public and construction workers through volatilization of vapors into the air and through generation of dust containing Site COCs during construction and remediation activities, due to the non-volatile nature of SVOCs and Metals, only minor vapors that can result from the few VOCs present, and dust will be mitigated pursuant to the HASP and SMP requirements to mitigate dermal absorption, ingestion and inhalation

Any construction and remediation work should be performed in accordance with a HASP, SMP, and CAMP including such measures as implementing the air monitoring program, donning personal protective equipment, and applying vapor and dust suppression measures to prevent off-site migration of contaminants during construction (should it be necessary). If these measures are employed, the potential exposure pathway will become incomplete.

Should groundwater be encountered during excavation activities, exposure of groundwater COCs to construction workers is also possible via dermal absorption, ingestion, and inhalation. However, due to only iron and manganese being in the groundwater at levels exceeding the Part

703.6 Table 3 levels it is unlikely that the exposure would become an issue. As noted above, there is no off-Site exposure pathway for groundwater since it is not being used for drinking water.

Should excavation or construction for the above ground sump or wastewater pipelines inside the building be required, exposure to mercury potentially contained in paint would require a HASP and indoor air monitoring program.

Proposed Future Conditions:

The Site is targeted for industrial development. Complete details regarding the industrial development have not yet been developed, as a buyer has yet to be identified. However, the Site is being marketed as an industrial site for sale. As previously mentioned, the Site is mostly covered by concrete building foundations and flat work, and paved driveway and parking areas, which, limits exposure to any Site personnel or local/adjacent population. Any future construction will require compliance with the SMP, which shall include a Soil Management Plan, HASP and CAMP.

Potential Exposure Pathways - Off-Site:

Because of the overall easterly groundwater flow direction, the groundwater is not expected to result in a complete exposure pathway for the proposed industrial use, potential construction/remediation, or future conditions for the following reasons:

- The Site and surrounding areas do not use groundwater as a source of drinking water;
- The groundwater sample results and the OU1/EP1 excavation TCLP sample results indicate the Site COCs are not readily leachable and relatively stable in the soil;
- The glacial till that is anticipated to be under the entire Site prevents vertical migration of any COCs; and
- The Gordon Creek adjacent to the Site is essentially a channelized canal, and there is no sediment on the walls or bottom to impact from COCs.

Therefore, the COCs are not expected to reach a surface water body that is used as a drinking water source to potentially complete an exposure pathway.

Summary:

Complete on-Site exposure pathways may exist between the historic fill and human receptors during current conditions, construction and remediation activities, and proposed conditions. The pathways include direct contact (dermal absorption), ingestion, and inhalation of soil and groundwater contaminants. Complete off-site exposure pathways are not thought to exist between the Site media and human receptors during current conditions and proposed future conditions. During construction and remediation activities, precautions will be required to protect construction workers and the general public. The following table summarizes the exposure pathways for the Site.

Source	Contaminant/Release Transport Mechanism	Receptor	Potential Exposure Pathway
Contaminated Soil	- Historic fill and soil contamination - Post IRM OU1/EP1 Residual Contaminated Soil	Current: Limited and infrequent site security personnel, and visitors	Current: Dermal absorption and ingestion of soil
		Construction: Construction/ remediation workers, local population	Construction: Inhalation of dusts/vapors, dermal absorption and ingestion of soil (workers only)
		Future: Industrial personnel and visitors	Future: Dermal absorption and ingestion of soil
Contaminated Groundwater	- Releases associated with historic fill or Post IRM OU1/EP1 Residual Contaminated Soil	Current: Limited and infrequent site security personnel, and visitors	Current: no completed pathways
		Construction: Construction/ remediation workers, local population	Construction: Inhalation of vapors, dermal absorption and ingestion of groundwater (workers only)
		Future: Industrial personnel and visitors	Future: Dermal absorption and ingestion, and inhalation of indoor air vapors (mercury)
Mercury Impacted Sump Sediment	-Historic use contamination	Current: Limited and infrequent site security personnel, and visitors	Current: Dermal absorption and ingestion Future: Will be removed, no completed pathway

6.3 Evaluation of Human Health Exposure

Based upon the conceptual Site model and the review of environmental data, complete on-Site exposure pathways appear to be present, but are limited based on current and future conditions, and can be controlled during potential construction and remediation. The complete exposure pathways indicate there is a risk of exposure to humans from Site contaminants.
Complete exposure pathways have the following five elements:

1. Contaminant source.
2. Contaminant release and transport mechanism.
3. Point of exposure.
4. Route of exposure.
5. Receptor population.

A discussion of the five elements comprising a complete pathway as they pertain to the Site is provided below.

Current Conditions:

Contaminant sources include the historic fill in surface soil, subsurface soil and groundwater. Contaminant release and transport mechanisms include the chemical composition of the historic fill. The composition of the historic fill has minimally affected the groundwater as a result of direct contact between the historic fill and the groundwater. Points of exposure include those areas on-Site where contaminated soil is present with no surface cover. Routes of exposure may include ingestion and dermal absorption of contaminated soil and possible inhalation during construction or remediation activities. However, these routes may not exist if adequate surface cover is present over the historic fill. There were no appreciable VOCs identified in sample results as they were below Unrestricted Use SCOs. The current receptor population may include limited and infrequent security personnel and visitors to the Site. Four of the five elements exist under current conditions for a potential exposure pathway, and the fifth (route of exposure), may also be a pathway. The fifth element can be controlled through management of limited site operations of the security personnel and potential guests.

Construction/Remediation Activities:

Contaminant sources and contaminant release and transport mechanisms are those identified for during soil excavation and disturbance activities. Points of exposure include the disturbed and exposed historic fill during excavation, dust and organic vapors arising from the excavation of the historic fill, and contaminated groundwater, if any, encountered during excavation and dewatering operations. Routes of exposure include ingestion and dermal absorption of the historic fill and groundwater, inhalation of organic vapors arising from historic fill and inhalation of dust arising from the disturbance of the historic fill. The receptor population includes the construction and remediation workers and, to a lesser extent, the local population. All five elements exist; therefore, completed exposure pathways are present. However, the risk can be minimized by applying appropriate health and safety measures (i.e., HASP) and CAMP for monitoring the air for organic vapors and dust, using vapor and dust suppression measures when appropriate, maintaining site security, and wearing the appropriate personal protective equipment.

Proposed Future Conditions:

Contaminant sources and contaminant release and transport mechanisms are those identified for the current conditions and use as an industrial facility. Points of exposure would be limited to the areas that are exposed to surface conditions (i.e., previously noted southwest area) or to the small above ground sump located in the maintenance shop area. However, soil and groundwater sampling results indicate there is minimal presence of completed exposure pathways because the Site lacks VOC contamination post OU1/EP1 remediation. Moreover, since the SMP requires all future owners to maintain the Site all future routes of exposure to future industrial personnel and visitors should be addressed and minimized.

6.4 Ecological, Fish and Wildlife Exposure Risk

The Site is located in an urban town predominantly commercial and partially residential developed area. The current substantial surface cover on the Site provides protection against exposure to the Site COCs to the nearby ecological receptors and these receptors will be further protected by implementation of a HASP and CAMP should construction or remediation be required and an SMP should future industrial activities be commenced. The Gordon Creek is located to the south and adjacent to the Site. The creek bed is essentially a channelized canal, and there is no sediment on the walls or bottom to be impacted from COCs. Thus, due to the lack of: (1) a pathway to the creek; (2) significant groundwater contamination that could impact the creek; and (3) suitable habitat and limited ecological receptors, the ecological risks are negligible and do not required an ecological exposure assessment.

A fish and wildlife assessment is not required because: (1) The composition of the historic fill has minimally affected the groundwater as a result of direct contact between the historic fill and the groundwater; (2) the Site is predominately covered by buildings, concrete building foundations and flat work, and asphalt and with only minimal areas of exposed soil; (3) groundwater flow on-Site is predominately towards the east (i.e., Bath Street) a downtown area of Ballston Spa; and (4) the creek is essentially a channelized canal and there is no sediment on the walls or bottom to be impacted by any COCs.

6.5 Human Health Exposure Assessment Conclusions

The following conclusions were developed from this human health exposure assessment:

1. The potential for complete exposure pathways for Site contaminants to Site human receptors for current conditions exist; however, management of the limited operations of future security personnel and guests prevent a completed pathway. This would be dependent on limiting access to portions of the Site that remain uncovered (i.e., not currently covered by building foundations and flat work, paved driveway, and paved parking areas). However, it is extremely difficult to access the woods where the surface soils are exposed and the risk to humans under current conditions for the accessible portions of the Site is relatively low, because of the significant surface cover already present across the Site.

2. There is a moderate risk of exposure during the potential construction and remediation activities. However, this risk can be minimized by following the appropriate health and safety measures in the HASP and SMP, including but not limited to vapor and dust suppression (when applicable), personnel protective equipment (when appropriate) and Site security measures.

3. The existence of a complete exposure pathway for Site contaminants to human receptors during proposed future conditions is unlikely, since exposure from the grossly contaminated fill (i.e., OU1/EP1) at the northwest portion of the Site was eliminated during completion of the IRM in August 2013.

4. It is unlikely that complete exposure pathways exist from the migration of Site contaminants to off-site human receptors for current, construction, or future conditions.

5. There are negligible risks to the ecological environment based on current conditions. The future conditions at the Site should not impact the ecological conditions at the Site if appropriate HASP and SMP measures are utilized to control dust.

7.0 CONCLUSIONS

The Site has been an industrial location since the late 1800s. Numerous buildings, building foundations and concrete flooring, and asphalt used for driveways, loading areas, and parking areas cover most of the Site. Gordon Creek, which flows adjacent to the Site on its southern boundary also, has a significant section covered with concrete (i.e., lined bottom and sidewalls). See Figure 1 for the locations of contaminants that exceeded the Industrial Use SCOs in Table 375-6.8(b).

The sample results and Site RI in total indicated the following:

1. Groundwater was minimally impacted. Only iron and manganese results were greater than the allowable groundwater quality objective for all five (5) groundwater sample locations. All other groundwater results were below the allowable groundwater quality objective shown in Table 3 of Chapter X of the Division of Water, NYCRR Part 703.6. The area surrounding Ballston Spa, New York is known to contain high metals concentrations in the groundwater that were historically used as spa treatments. There were a number of substances whose reported laboratory non-detect limits exceeded their respective allowable groundwater quality objective. However, the allowable groundwater quality objectives are established for drinking water and there are no groundwater wells located anywhere near the Site (*see* Section 2.4). At this time there does not seem to be any Site related contamination in the groundwater from the aforementioned monitoring well locations. Therefore, groundwater remediation is not required.

2. The soil samples indicate there are only two (2) Site locations where multiple sample location results identified specific metal and SVOCs that were above the Industrial Use SCOs; these were in the southwest corner and north driveway areas of the Site. Based on soil sample results, which identify the presence of fill with SVOCs and metals, as well as the bore logs, and visual observations, portions of the fill contain fragments of coal, coal ash, and/or asphalt, specifically in the southwest corner of the Site. Coal, coal ash, and asphalt contain SVOCs and metals identified in the sample results located in the southwest corner of the Site and in the same range of their respective concentrations. The fact that there may be SVOCs below the detection limit in the north driveway area of the Site, the metals in this location may also be related to coal, coal ash, and asphalt. However, this is more inconclusive than in the southwest corner of the property where both SVOCs and metals exceeded the Industrial Use Cleanup Objectives in Table 375-6.8(b). Never the less there is strong evidence that the metals and SVOCs in both the north and southwest portions of the Site are related to coal, coal ash, and asphalt fill that is visually present in both locations. While there are two fill areas that contain SVOCs

and metals which exceed Industrial Use SCOs, there are a few other random locations identified throughout the Site where SVOCs and metals exceed Industrial Use SCOs. All of these other locations which contain fill seem to be relatively small and isolated areas.

Specific to the two (2) Site locations where multiple sample location results identified specific metals and SVOCs that were above the Industrial Use SCOs, the southwest corner and north driveway areas of the Site have significantly different groundwater flow rates. The southwest corner has very little horizontal groundwater flow while the north driveway location has significant horizontal groundwater flow. It is likely that both have glacial till under their respective locations, which prevents vertical migration of potential COC. Capping in either location will have minimal impact on horizontal groundwater flow in their respective locations. Thus, both areas may require only minimal capping because the glacial till prevents vertical migration of any potential COC, capping will have a minimal impact on horizontal migration of any potential COC, and the COC are stable in the soil matrix and are not impacting groundwater.

3. The inside wastewater discharge sludge/sediment sample results from the maintenance shop were below the Industrial Use Cleanup Objectives in Table 375-6.8(b) with one (1) exception, mercury. The mercury sample result was 61.2 mg/Kg whereas the Industrial Use Cleanup Objectives is 5.7 mg/Kg. The mercury could have come from old paint or other material that was used in the building since its construction in the middle 1900s. This small above ground sump can easily be cleaned to remove any residual mercury.

4. Only low level VOCs were identified in the sub-slab vapor results, which did not warrant further investigation or mitigation.

APPENDIX B

VILLAGE OF BALLSTON SPA ZONING INFORMATION

Village of Ballston Spa, NY
Tuesday, January 23, 2018

Chapter 205. Zoning

Article X. Supplementary Use Regulations

§ 205-55.2. Retail use in the Central Business District Zone.

[Added 10-23-2006 by L.L. No. 6-2006; amended 4-23-2007 by L.L. No. 3-2007]

A. Any change of use on the ground floor of a structure located within the Central Business District Zone shall be used only for retail space with the following exceptions:

(1) Vital human services.

(2) Offices by special permit.

(3) Churches and houses of religious worship.

(4) Libraries.

(5) Museums.

(6) Hotels.

(7) Banks and financial institutions.

(8) Parking garages.

B. Any existing use of the ground floor of a structure at the time of this section's enactment may continue until such time that the existing use is discontinued.

C. To qualify as retail space in the Central Business District Zone, at least 80% of the total square footage of the ground floor of such structure must be dedicated to and be used for retail business use.
[Added 4-22-2013 by L.L. No. 1-2013]

Village of Ballston Spa, NY

Chapter 205. Zoning

Article III. District Boundaries

§ 205-8. Purpose of districts.

A. Residential Zoning Districts R-1 and R-2 are planned to increase the values of buildings and property used for permanent living occupancy and to meet the purposes as stated in Article I of this chapter.

B. Buildings used for purposes other than permanent occupancy should be constructed and maintained in the other districts as described below, except that nonresidential special permit uses may be allowed as outlined in Schedule A.[1]

(1) The Central Business District is planned to include various appropriate types of nonresidential buildings and property that can serve the residents of the entire Village and which are permitted by Article IV of this chapter.

(2) The Commercial Zoning District is planned to include nonresidential buildings and property that serve businesses.

(3) The Industrial Zoning District is similarly nonresidential and restricted particularly to manufacturing uses.

(4) The Cultural/Economic Enhancement Zone is a nonresidential nonretail zone which shall include a mixture of high tech manufacturing, office uses, low-impact industrial uses and cultural development areas. Notwithstanding Schedule A of this chapter, permitted uses shall be limited to electrical manufacturing or repairs, office use, professional use, storage, schools of instruction and light industrial uses.
[Added 7-24-2000 by L.L. No. 1-2000]

[1] *Editor's Note: Schedule A is located at the end of this chapter.*

C. Area and bulk regulations for the five zoning districts can be found in Schedule B.[2]

[2] *Editor's Note: Schedule B is located at the end of this chapter.*

APPENDIX D

LOGS

Exhibit D-1

SOIL BORING LOGS

PRESENTATION OF IDENTIFICATIONS

BASED ON THE

BURMISTER SYSTEM

Fully Written Descriptions

Start the description with the color, first letter of first color capitalized (e.g. Brown, Yellow brown, Yellow and brown). The color should be the same as field description, since with oxidation the color sometimes changes between the time the sample is recovered and when it is viewed in the laboratory.

Determine the primary component (e.g. sand, gravel, or silt) and whether the component represents 50% (by weight) or more of the sample.

1. If more than 50% sand, the word sand gets fully capitalized. Preceding the word sand, are the terms coarse, medium and/or fine as follows:

   a. If there are approximately equal amounts of coarse, medium and fine sand, the description reads "coarse to fine SAND". If there is more coarse sand, the description reads "coarse (+) to fine SAND". The same holds true for the fine sand predomination. If medium sand predominates, the description reads "coarse medium (+) to fine SAND". In order for a term coarse, medium or fine to be included in a description, it must represent at least 10% of the sand fraction. For example, if a sample contains 70% sand, the sample must contain at least 7% of coarse sand for the word coarse to be included in the description. The above usage of coarse, medium and fine applies to gravel as well as sand.

      Unless advised to the contrary on a specific job, the differentiation between coarse and fine silt shall not be made.

   b. A comma always appears immediately after the word sand. Next comes the adjective giving the approximate percentage of soil by weight passing the #200 sieve as follows:

and:	35-50%	some:	20-35%
little:	10-20%	trace:	1-10%

      with a (+) sign indicating the upper third of percentage, a (-) sign indicating the lower third of percentage, and no sign indicating the middle third of percentage. Next comes a description of the soil passing the #200 sieve, based exclusively on plasticity as follows:

PI	Description	Organic
0 - 1%	Silt	(non-plastic)
1 - 5%	Clayey Silt	(Slight P.I.)
5 - 10%	Silt & Clay	(Low P.I.)
10 - 20%	Clay & Silt	(Medium P.I.)
20 - 40%	Silty Clay	(High P.I.)
40% and more	Clay	(Very High P.I.)

If the soil is organic, the term Organic Silt is used instead of the terms listed under "Description" and the terms listed under "Organic" are used at the very end of the full description (in parentheses).

c. A comma is placed immediately after the term describing the soil passing the #200 sieve (e.g. Silt & Clay). Next the usage of and, some, little or trace (with a (+) or (-) if needed) is used to indicate the percent of gravel, followed by the use of coarse, medium and/or fine to describe the gravel gradation, with the word gravel always using a capital "G".

d. An illustration of description of a soil having more than 50% sand is as follows:

Brown coarse to fine SAND, little Clayey Silt, some (-) medium to fine (+) Gravel.

2. <u>If the major component is less than 50% of the total sample</u>, the description is written exactly as for Item 1 above (with sand coming first), except that in the word sand, only the S is capitalized rather than the full word.

3. <u>If there is more than 50% gravel</u>, the description once more starts with the color, followed by the applicable terms of coarse, medium and fine, followed by the word GRAVEL in all capitals.

a. The adjective giving the percentage of all the soil except gravel is placed after the word gravel, and then a comma (e.g. if there is 62% gravel, a partial description would be "Brown medium to fine (+) GRAVEL and (-),...."). The sand is then described by coarse, medium and/or fine without its own percent adjective (with only the S in sand being capitalized). A comma is placed immediately after the word Sand, after which the soil passing the #200 sieve is indicated with the adjective for percentage as given in Item 1b above.

b. An example is: Gray medium to fine (+) GRAVEL and (-), coarse to fine Sand, trace Silt.

4. If there is more than 50% passing the #200 sieve, the description once more starts with the color, followed by the #200 description based exclusively on plasticity as follows:

PI	Description	Organic
0 - 1%	SILT	(non-plastic)
1 - 5%	Clayey SILT	(Slight P.I.)
5 - 10%	SILT & CLAY	(Low P.I.)
10 - 20%	CLAY & SILT	(Medium P.I.)
20 - 40%	Silty CLAY	(High P.I.)
40% or more	CLAY	(Very High P.I.)

If the soil is organic, the term Organic SILT is used instead of the terms listed under "Description", and the terms listed under "Organic" are used at the very end of the full description (in parentheses).

a. The description is written as discussed in Section 3, with sand preceding gravel.

b. An example is: Brown Clayey SILT some (+), coarse to fine Sand, trace fine Gravel.

c. In the foregoing example, if the fines are organic the identification would be:

Brown Organic SILT some (+), coarse to fine Sand, trace fine Gravel (Slight P.I.).

5. If pockets, layers, etc., of other soil are present in the sample, include it at the end of the previously written description with a comma at the end of the previously written description.

6. If closely layered (partings, seams, or layers) soils, such as varved clays, are involved, each layer must be completely identified along with a sketch in the remarks column showing layer thicknesses.

7. Organic soils are identified as Organic Silt (as previously described) or as Peat.

a. Characteristics of <u>Organic Silt</u> are:

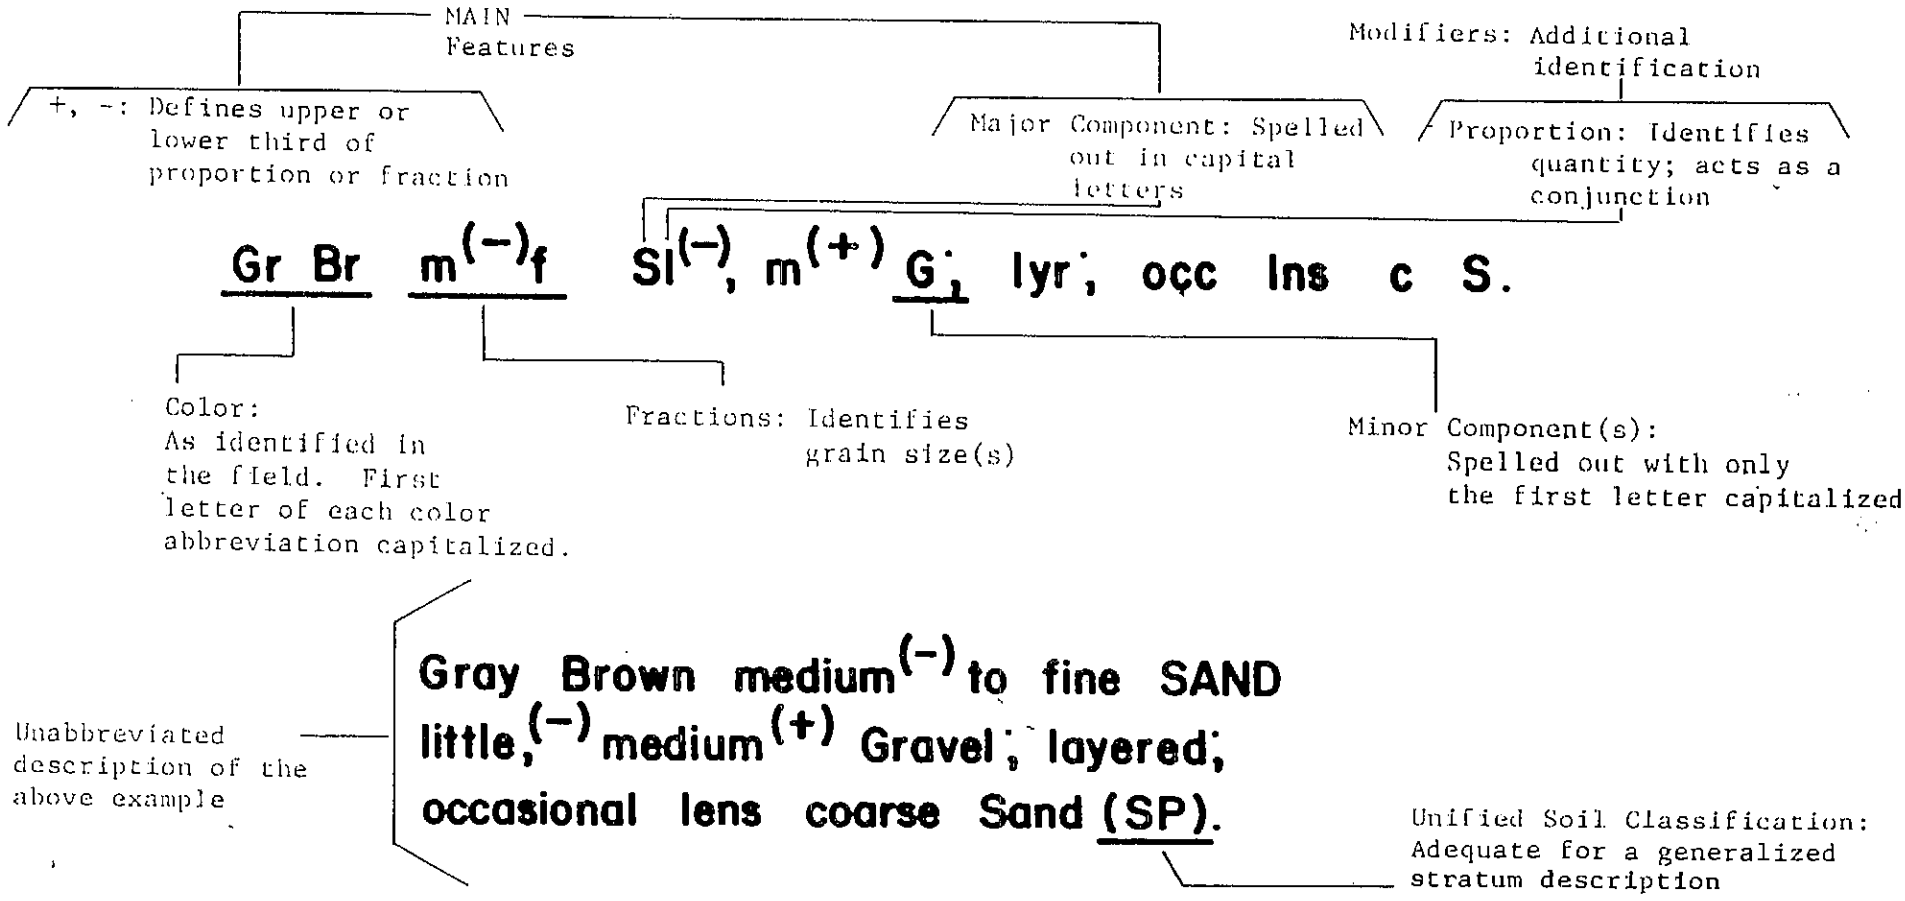
(1) Usually light gray to very dark gray (or black) color

(2) Odor caused by decomposition of plant or animal life imparting H_2S, CO_2 and other organic gases

(3) Plastic properties, usually very compressible

(4) May contain shells and fragments of partly decayed vegetable matter

b. Characteristics of Peat are:



(1) Fibrous aggregate of undecayed or partially decayed vegetable matter, found in swamps

(2) Frequently contains organic silt

(3) Usually light brown to black in color

(4) Distinctive odor, as for organic silt

MODIFIED BURMISTER SYSTEM

VISUAL IDENTIFICATION OF SAMPLES

The samples were identified in accordance with the American Society for Engineering Education System of Definition.

I. Definition of Soil Components and Fractions

Material	Symbol	Fraction	Sieve Size	Definition
Boulders	Bldr	—	9" +	Material retained on 9" sieve.
Cobbles	Cbl	—	3" to 9"	Material passing the 9" sieve and retained on the 3" sieve.
Gravel	G	coarse (c) medium (m) fine (f)	1" to 3" ⅜" to 1" No. 10 to ⅜"	Material passing the 3" sieve and retained on the No. 10 sieve.
Sand	S	coarse (c) medium (m) fine (f)	No. 30 to No. 10 No. 60 to No. 30 No. 200 to No. 60	Material passing the No. 10 sieve and retained on the No. 200 sieve.
Silt	$	—	Passing No. 200 (0.074 mm)	Material passing the No. 200 sieve that is non plastic in character and exhibits little or no strength when air dried.

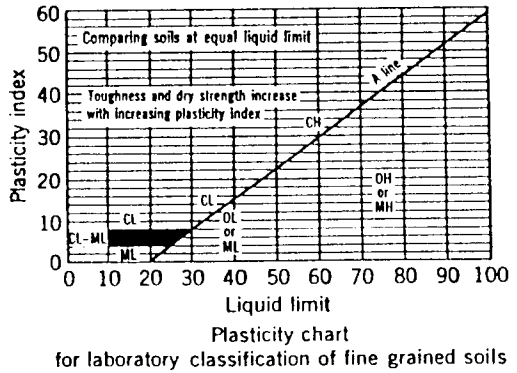
Organic Silt (O$)
Material passing the No. 200 sieve which exhibits plastic properties within a certain range of moisture content, and exhibits fine granular and organic characteristics.

		Plasticity	Plasticity Index
Clayey SILT	Cy$	Slight (Sl)	1 to 5
SILT & CLAY	$&C	Low (L)	5 to 10
CLAY & SILT	C&$	Medium (M)	10 to 20
Silty CLAY	$yC	High (H)	20 to 40
CLAY	C	Very High (VH)	40 plus

Clay-Soil
Material passing the No. 200 sieve which can be made to exhibit plasticity and clay qualities within a certain range of moisture content, and which exhibits considerable strength when air-dried.

II. Definition of Component Proportions

Component	Written	Proportions	Symbol	Percentage Range by Weight *
Principal	CAPITALS	—		50 or more
Minor	Lower Case	and	a.	35 to 50
		some	s.	20 to 35
		little	l.	10 to 20
		trace	t.	1 to 10



* Minus sign (—) lower limit, plus sign (+) upper limit, no sign middle range.

III. Glossary of Modifying Abbreviations

Category	Symbol	Term	Symbol	Term	Symbol	Term

	w	with				
	prt	parting	— 0 to 1/16" thickness			
	seam	seam	— 1/16 to ½" thickness			
	lyr	layer	— ½ to 12" thickness			
	stra	stratum	— greater than 12" thickness			
	vvd c	varved Clay	— alternating seams or layers of sand, silt and clay			
	pkt	pocket	— small, erratic deposit, usually less than 1 foot			
	lns	lens	— lenticular deposit			
	occ	occasional	— one or less per foot of thickness			
	freq	frequent	— more than one per foot of thickness			

Table 3.5 Unified Soil Classification

Field Identification Procedures (Excluding particles larger than 3 in. and basing fractions on estimated weights)				Group Symbols[a]	Typical Names	Information Required for Describing Soils	Laboratory Classification Criteria
Coarse-grained soils: More than half of material is *larger* than No. 200 sieve size[b] (For visual classification, the ¼ in. size may be used as equivalent to the No. 4 sieve size)	Gravels: More than half of coarse fraction is larger than No. 4 sieve size	Clean gravels (little or no fines)	Wide range in grain size and substantial amounts of all intermediate particle sizes	*GW*	Well graded gravels, gravel-sand mixtures, little or no fines	Give typical name; indicate approximate percentages of sand and gravel; maximum size; angularity, surface condition, and hardness of the coarse grains; local or geologic name and other pertinent descriptive information; and symbols in parentheses For undisturbed soils add information on stratification, degree of compactness, cementation, moisture conditions and drainage characteristics Example: *Silty sand*, gravelly; about 20% hard, angular gravel particles ½-in. maximum size; rounded and subangular sand grains coarse to fine, about 15% nonplastic fines with low dry strength; well compacted and moist in place; alluvial sand; (*SM*)	Use grain size curve in identifying the fractions as given under field identification Determine percentages of gravel and sand from grain size curve Depending on percentage of fines (fraction smaller than No. 200 sieve size) coarse grained soils are classified as follows: Less than 5% *GW, GP, SW, SP* More than 12% *GM, GC, SM, SC* 5% to 12% *Borderline* cases requiring use of dual symbols $C_U = \frac{D_{60}}{D_{10}}$ Greater than 4 $C_C = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3 Not meeting all gradation requirements for *GW* Atterberg limits below "A" line, or *PI* less than 4 — Above "A" line with *PI* between 4 and 7 are *borderline* cases requiring use of dual symbols Atterberg limits above "A" line, with *PI* greater than 7 $C_U = \frac{D_{60}}{D_{10}}$ Greater than 6 $C_C = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3 Not meeting all gradation requirements for *SW* Atterberg limits below "A" line or *PI* less than 5 — Above "A" line with *PI* between 4 and 7 are *borderline* cases requiring use of dual symbols Atterberg limits below "A" line with *PI* greater than 7
		Gravels with fines (appreciable amount of fines)	Nonplastic fines (for identification procedures see *ML* below)	*GM*	Silty gravels, poorly graded gravel-sand-silt mixtures		
			Plastic fines (for identification procedures, see *CL* below)	*GC*	Clayey gravels, poorly graded gravel-sand-clay mixtures		
	Sands: More than half of coarse fraction is smaller than No. 4 sieve size	Clean sands (little or no fines)	Wide range in grain sizes and substantial amounts of all intermediate particle sizes	*SW*	Well graded sands, gravelly sands, little or no fines		
			Predominantly one size or a range of sizes with some intermediate sizes missing	*SP*	Poorly graded sands, gravelly sands, little or no fines		
		Sands with fines (appreciable amount of fines)	Nonplastic fines (for identification procedures, see *ML* below)	*SM*	Silty sands, poorly graded sand-silt mixtures		
			Plastic fines (for identification procedures, see *CL* below)	*SC*	Clayey sands, poorly graded sand-clay mixtures		
Fine-grained soils: More than half of material is *smaller* than No. 200 sieve size (The No. 200 sieve size is about the smallest particle visible to naked eye)	Identification Procedures on Fraction Smaller than No. 40 Sieve Size						
		Dry Strength (crushing characteristics)	Dilatancy (reaction to shaking)	Toughness (consistency near plastic limit)			
	Silts and clays: liquid limit less than 50	None to slight	Quick to slow	None	*ML*	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands with slight plasticity	Give typical name; indicate degree and character of plasticity, amount and maximum size of coarse grains; colour in wet condition, odour if any, local or geologic name, and other pertinent descriptive information, and symbol in parentheses For undisturbed soils add information on structure, stratification, consistency in undisturbed and remoulded states, moisture and drainage conditions Example: *Clayey silt*, brown; slightly plastic; small percentage of fine sand; numerous vertical root holes; firm and dry in place; loess; (*ML*)
		Medium to high	None to very slow	Medium	*CL*	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays	
		Slight to medium	Slow	Slight	*OL*	Organic silts and organic silt-clays of low plasticity	
	Silts and clays: liquid limit greater than 50	Slight to medium	Slow to none	Slight to medium	*MH*	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts	
		High to very high	None	High	*CH*	Inorganic clays of high plasticity, fat clays	
		Medium to high	None to very slow	Slight to medium	*OH*	Organic clays of medium to high plasticity	
Highly Organic Soils		Readily identified by colour, odour, spongy feel and frequently by fibrous texture			*Pt*	Peat and other highly organic soils	

Plasticity chart
for laboratory classification of fine grained soils

From Wagner, 1957.

[a] *Boundary classifications*. Soils possessing characteristics of two groups are designated by combinations of group symbols. For example *GW-GC*, well graded gravel-sand mixture with clay binder.

[b] All sieve sizes on this chart are U.S. standard.

Field Identification Procedure for Fine Grained Soils or Fractions

These procedures are to be performed on the minus No. 40 sieve size particles, approximately 1/64 in. For field classification purposes, screening is not intended, simply remove by hand the coarse particles that interfere with the tests.

Dilatancy (Reaction to shaking):

After removing particles larger than No. 40 sieve size, prepare a pat of moist soil with a volume of about one-half cubic inch. Add enough water if necessary to make the soil soft but not sticky.

Place the pat in the open palm of one hand and shake horizontally, striking vigorously against the other hand several times. A positive reaction consists of the appearance of water on the surface of the pat which changes to a livery consistency and becomes glossy. When the sample is squeezed between the fingers, the water and gloss disappear from the surface, the pat stiffens and finally it cracks or crumbles. The rapidity of appearance of water during shaking and of its disappearance during squeezing assist in identifying the character of the fines in a soil.

Very fine clean sands give the quickest and most distinct reaction whereas a plastic clay has no reaction. Inorganic silts, such as a typical rock flour, show a moderately quick reaction.

Dry Strength (Crushing characteristics):

After removing particles larger than No. 40 sieve size, mould a pat of soil to the consistency of putty, adding water if necessary. Allow the pat to dry completely by oven, sun or air drying, and then test its strength by breaking and crumbling between the fingers. This strength is a measure of the character and quantity of the colloidal fraction contained in the soil. The dry strength increases with increasing plasticity.

High dry strength is characteristic for clays of the CH group. A typical inorganic silt possesses only very slight dry strength. Silty fine sands and silts have about the same slight dry strength, but can be distinguished by the feel when powdering the dried specimen. Fine sand feels gritty whereas a typical silt has the smooth feel of flour.

Toughness (Consistency near plastic limit):

After removing particles larger than the No. 40 sieve size, a specimen of soil about one-half inch cube in size, is moulded to the consistency of putty. If too dry, water must be added and if sticky, the specimen should be spread out in a thin layer and allowed to lose some moisture by evaporation. Then the specimen is rolled out by hand on a smooth surface or between the palms into a thread about one-eight inch in diameter. The thread is then folded and re-rolled repeatedly. During this manipulation the moisture content is gradually reduced and the specimen stiffens, finally loses its plasticity, and crumbles when the plastic limit is reached.

After the thread crumbles, the pieces should be lumped together and a slight kneading action continued until the lump crumbles.

The tougher the thread near the plastic limit and the stiffer the lump when it finally crumbles, the more potent is the colloidal clay fraction in the soil. Weakness of the thread at the plastic limit and quick loss of coherence of the lump below the plastic limit indicate either inorganic clay of low plasticity, or materials such as kaolin-type clays and organic clays which occur below the A-line.

Soil Characteristics Pertinent to Roads and Airfields

Major Divisions		Letter (1)	Name	Value as Subgrade When Not Subject to Frost Action	Value as Subbase When Not Subject to Frost Action	Value as Base When Not Subject to Frost Action	Potential Frost Action	Compressibility and Expansion	Drainage Characteristics	Compaction Equipment	Unit Dry Weight lb. per cu. ft. Highly Organic Soils		Pt	Peat and other highly organic soils	Not suitable	Not suitable	Not suitable	Slight	Very high	Fair to poor	Compaction not practical	—	—	—

Note:

(1) Unit Dry Weights are for compacted soil at optimum moisture content for modified AASHO compaction effort. Division of GM and SM groups into subdivision of d and u are for roads and airfields only. Subdivision is basis of Atterberg limits; suffix d (e.g., GMd) will be used when the liquid limit (LL) is 25 or less and the plasticity index is 6 or less; the suffix u will he used otherwise.

(2) The maximum value that can be used in design of airfields is, in some cases, limited hy gradation and plasticity requirements.

INDOOR AIR QUALITY QUESTIONNAIRE AND BUILDING INVENTORY

NEW YORK STATE DEPARTMENT OF HEALTH
INDOOR AIR QUALITY QUESTIONNAIRE AND BUILDING INVENTORY
CENTER FOR ENVIRONMENTAL HEALTH

This form must be completed for each residence involved in indoor air testing.

Preparer's Name Robert Gray Date/Time Prepared 3/29/19 12:30pm

Preparer's Affiliation NETC Phone No. 518-884-8545

Purpose of Investigation Soil Vapor Risk Assessment

1. OCCUPANT:

Interviewed: Y / (N)

Last Name: _____ First Name: _____

Address: _____

County: _____

Home Phone: _____ Office Phone: _____

Number of Occupants/persons at this location 0 Age of Occupants N/A

2. OWNER OR LANDLORD: (Check if same as occupant ___)

Interviewed: Y (N)

Last Name: _____ First Name: _____

Address: _____

County: _____

Home Phone: _____ Office Phone: _____

3. BUILDING CHARACTERISTICS

Type of Building: (Circle appropriate response)

Residential	School	Commercial/Multi-use
(Industrial)	Church	(Other) Vacant Former Industrial

If the property is residential, type? (Circle appropriate response) N/A

Ranch	2-Family	3-Family
Raised Ranch	Split Level	Colonial
Cape Cod	Contemporary	Mobile Home
Duplex	Apartment House	Townhouses/Condos
Modular	Log Home	Other:_____

If multiple units, how many? _____

If the property is commercial, type?

Business Type(s) Former Tannery & Laundry

Does it include residences (i.e., multi-use)? Y / (N) If yes, how many? _____

Other characteristics:

Number of floors 2 Building age Circa 1945

Is the building insulated? Y / N How air tight? Tight / Average / Not Tight

4. AIRFLOW

Use air current tubes or tracer smoke to evaluate airflow patterns and qualitatively describe:

Airflow between floors

—

Airflow near source

—

Outdoor air infiltration

Broken windows on first & 2nd floors

Infiltration into air ducts

—

5. BASEMENT AND CONSTRUCTION CHARACTERISTICS (Circle all that apply)

a. Above grade construction:	wood frame	concrete	stone	brick
b. Basement type:	full	crawlspace	slab	other Partial
c. Basement floor:	concrete	dirt	stone	other _____
d. Basement floor:	uncovered	covered	covered with _____	
e. Concrete floor:	unsealed	sealed	sealed with Carpet / Rug, Tile	
f. Foundation walls:	poured	block	stone	other _____
g. Foundation walls:	unsealed	sealed	sealed with _____	
h. The basement is:	wet	damp	dry	moldy
i. The basement is:	finished	unfinished	partially finished	
j. Sump present?	Y / N			
k. Water in sump?	Y / N / not applicable			

Basement/Lowest level depth below grade: 8' (feet)

Identify potential soil vapor entry points and approximate size (e.g., cracks, utility ports, drains)

Cracks Drains

6. HEATING, VENTING and AIR CONDITIONING (Circle all that apply)

Type of heating system(s) used in this building: (circle all that apply – note primary)

Hot air circulation	Heat pump	Hot water baseboard	
Space Heaters	Stream radiation	Radiant floor	
Electric baseboard	Wood stove	Outdoor wood boiler	Other Hot water Boiler

The primary type of fuel used is:

Natural Gas	Fuel Oil	Kerosene
Electric	Propane	Solar
Wood	Coal	

Domestic hot water tank fueled by: Nat Gas

Boiler/furnace located in:	Basement	Outdoors	Main Floor	Other _____
Air conditioning:	Central Air	Window units	Open Windows	None

Are there air distribution ducts present? Y / (N)

Describe the supply and cold air return ductwork, and its condition where visible, including whether there is a cold air return and the tightness of duct joints. Indicate the locations on the floor plan diagram.

N/A

7. OCCUPANCY

Is basement/lowest level occupied? Full-time Occasionally Seldom (Almost Never)

Level	**General Use of Each Floor (e.g., familyroom, bedroom, laundry, workshop, storage)**
Basement	Crawl Space N/A
1st Floor	Vacant
2nd Floor	Vacant
3rd Floor	
4th Floor	

8. FACTORS THAT MAY INFLUENCE INDOOR AIR QUALITY

a. Is there an attached garage? Y / (N)

b. Does the garage have a separate heating unit? Y / (N) / NA

c. Are petroleum-powered machines or vehicles stored in the garage (e.g., lawnmower, atv, car) (Y) / N / NA Please specify Fork Lift

d. Has the building ever had a fire? Y / N When? Unknown

e. Is a kerosene or unvented gas space heater present? Y / (N) Where? No

f. Is there a workshop or hobby/craft area? Y / (N) Where & Type? _____

g. Is there smoking in the building? Y / (N) How frequently? _____

h. Have cleaning products been used recently? Y / (N) When & Type? _____

i. Have cosmetic products been used recently? Y / (N) When & Type? _____

j. Has painting/staining been done in the last 6 months? Y / (N) Where & When? _____

k. Is there new carpet, drapes or other textiles? Y / (N) Where & When? _____

l. Have air fresheners been used recently? Y / (N) When & Type? _____

m. Is there a kitchen exhaust fan? Y / (N) If yes, where vented? _____

n. Is there a bathroom exhaust fan? Y / N If yes, where vented? Unknown

o. Is there a clothes dryer? (Y) / N If yes, is it vented outside? (Y) N

p. Has there been a pesticide application? Y / (N) When & Type? _____

Are there odors in the building? Y / (N)
If yes, please describe: _____

Do any of the building occupants use solvents at work? Y (N)
(e.g., chemical manufacturing or laboratory, auto mechanic or auto body shop, painting, fuel oil delivery, boiler mechanic, pesticide application, cosmetologist

If yes, what types of solvents are used? _____

If yes, are their clothes washed at work? Y (N)

Do any of the building occupants regularly use or work at a dry-cleaning service? (Circle appropriate response)

Yes, use dry-cleaning regularly (weekly) (No)
Yes, use dry-cleaning infrequently (monthly or less) Unknown
Yes, work at a dry-cleaning service

Is there a radon mitigation system for the building/structure? Y (N) Date of Installation: _____
Is the system active or passive? Active/Passive

9. WATER AND SEWAGE

Water Supply: (Public Water) Drilled Well Driven Well Dug Well Other: _____

Sewage Disposal: (Public Sewer) Septic Tank Leach Field Dry Well Other: _____

10. RELOCATION INFORMATION (for oil spill residential emergency)

a. Provide reasons why relocation is recommended: N/A

b. Residents choose to: remain in home relocate to friends/family relocate to hotel/motel

c. Responsibility for costs associated with reimbursement explained? Y / N

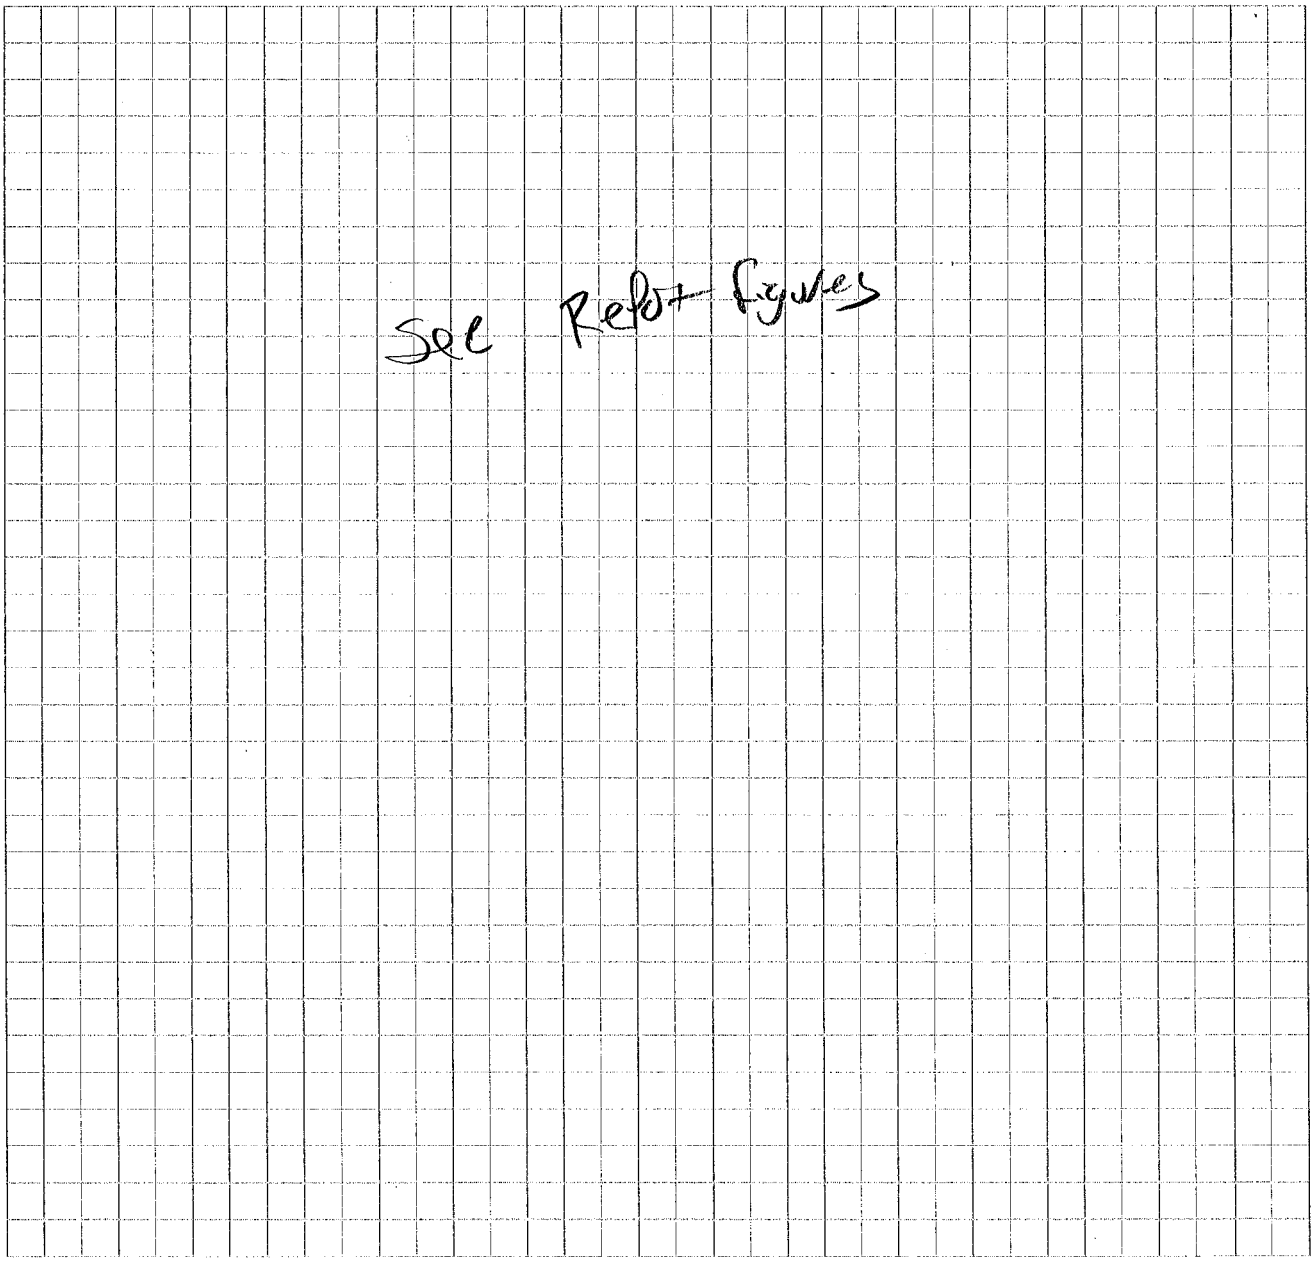
d. Relocation package provided and explained to residents? Y / N

11. FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

Basement:

SEE Report Figures



First Floor:

SEE Report Figures

12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

13. PRODUCT INVENTORY FORM

Make & Model of field instrument used: RAE 3000

List specific products found in the residence that have the potential to affect indoor air quality.

Location	Product Description	Size (units)	Condition*	Chemical Ingredients	Field Instrument Reading (units)	Photo ** Y / N
Maintenance Room	Various household Cleaners & Detergents	1 qt	U	Typical of Cleaners	0.0	Y

* Describe the condition of the product containers as **Unopened (UO), Used (U),** or **Deteriorated (D)**
** Photographs of the **front and back** of product containers can replace the handwritten list of chemical ingredients. However, the photographs must be of good quality and ingredient labels must be legible.

KOMAN Government Solutions, LLC Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-35A, Revision 0, June 2015, Semi-volatile Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
B4-1 S-1	BY06958	04/14/2016	SVOCs	Soil
B4-1 S-2	BY06959	04/14/2016	SVOCs	Soil
B3-2 S-1	BY06961	04/14/2016	SVOCs	Soil
B3-2 S-2	BY06962	04/14/2016	SVOCs	Soil
B2-1 S-1	BY06966	04/14/2016	SVOCs	Soil
SW-1 S-3	BY06969	04/14/2016	SVOCs	Soil
MW-6 S-1	BY06970	04/14/2016	SVOCs	Soil
FD-4 S-1	BY06975	04/17/2016	SVOCs	Soil
FD-1	BY06980	04/17/2016	SVOCs	Soil

Summary - Data validation was performed on the data for nine (9) samples collected and submitted for Semi-Volatile Organic (SVOC) analysis by EPA Method SW-846 8270D.

Narrative and Completeness Review – The Chains-of custody (COCs), case narrative, and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 04/19/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were extracted within 14 days from sample collection and analyzed within the 40-days following sample extraction.

Qualification: None required.

GC/MS Tuning – DFTPP tunes in the initial and continuing calibrations met the percent relative abundance criteria.

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria with the exception of a few compounds. 2,4-Dinitrophenol (48.8%)in the ICV; results for 2,4-dinitrophenol were non-detect no qualifications were required. Hexachlorocyclopentadiene (94.5%), 2,4-dinitrophenol (92.1%), 4,6-dinitro-2-methylphenol (89.6%) in the CCVs for instrument CHEM06 and 2,4,5-trichlorophenol (-20.6%), 2,6-dinitrotoluene (20.7%), and acenaphthylene (20.9%) in the CCVs for instrument CHEM27.

Qualification: Results for 2,4-dinitrophenol, hexachlorocyclopentadiene, 4,6-dinitro-2-methylphenol were qualified as estimated (UJ/J) in Samples B4-1 S-1, B4-1 S-2, B3-2 S-1, SW-1 S-3, MW-6 S-1, FD-4 S-1, FD-1, and B3-2 S-2 (Hexachlorocyclopentadiene was qualified as rejected (R) due to zero MS/MSD recovery). Results for 2,4,5-trichlorophenol, 2,6-dinitrotoluene, and acenaphthylene were qualified as estimated (UJ) in Sample B2-1 S-1. in Sample B3-2 S-2.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY06962 were within %R/RPD control limits with the exception of pyridine (29%, 28%), benzoic acid (5%, 6%), 2,4-dinitrophenol (5%, 9%), 4,6-Dinitro-2-methylphenol (20%, 27%), and benzidine (11%, 9%).

Qualification: Results for pyridine, benzoic acid, 2,4-dinitrophenol, 4,6-Dinitro-2-methylphenol, and benzidine were qualified as estimated (UJ/J) in Samples B4-1 S-1, B4-1 S-2, B3-2 S-1, B3-2 S-2, SW-1 S-3, MW-6 S-1, FD-4 S-1, and FD-1.

Matrix Spike/Matrix Spike Duplicate – Sample B3-2 S-2 (Lab Sample ID: BY06962) was spiked and analyzed as matrix spike/matrix spike duplicate samples. The %Rs for pyridine (28%), benzoic acid (7%, 8%), hexachlorocyclopentadiene (0%, 0%) and benzidine (14%, 11%) were outside the control limits.

Qualification: Results for pyridine, benzoic acid, benzidine were qualified as estimated (UJ) in Sample B3-2 S-2. Hexachlorocyclopentadiene was qualified as rejected (R) in Sample B3-2 S-2.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination.

Qualification: None required.

Field Blanks – No field blank samples were submitted with this SDG.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – Sample B2-1 S-1 (Lab Sample ID: BY06966), required dilution of 10 times due to high level of target SVOCs. Analyte non-detections were reported as "U." Analyte detections below the LOQ were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - Hexachlorocyclopentadiene in Sample B3-2 S-2 was not usable. The rest of the SVOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY06958. Validation qualifiers (if required) were entered into the EDD for SDG: GBY06958. The data may be used for its intended purpose.

FD-4 S-1	BY06975	04/17/2016	VOCs	Soil
FD-1	BY06980	04/17/2016	VOCs	Soil

Summary - Data validation was performed on the data for nine (9) samples collected and submitted for VOCs by EPA Method SW-846 8260C.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 04/19/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the 14-day holding time required for soil samples.

Qualification: None required.

Instrument Performance Check – Instrument performance check sample was analyzed at the beginning of each 12-hour period during sample analysis. Samples were analyzed within the 12-hour period. The method ion abundance criteria were met for bromofluorobenzene (BFB).

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria.

Qualification: None required.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance criteria except for 1,4-dichlorobenzene-d4 in samples B3-2 S-2 LL, B3-2 S-1 LL, and FD-4 S-1 LL. These sample were also run at high level and were within the method specific acceptance criteria. Sample results associated with 1,4-dichlorobenzene-d4 were reported from the high level run, therefore, no qualifications were required.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY06962 were within %R/RPD control limits.

Qualification: None required.

– Percent recoveries for the LCS/LCSD BY08831 were within %R/RPD control limits.

Qualification: None required.

– Percent recoveries for the LCS/LCSD BY09784 were within %R/RPD control limits.

Qualification: None required.

Matrix Spike/Matrix Spike Duplicate – Sample B3-2 S-2 (Lab Sample ID: BY06962) was spiked and analyzed as matrix spike/matrix spike duplicate samples. The %Rs for trichlorofluoromethane (68%, 69%) and acetone (64%) were outside the control limits.

Qualification: Acetone was qualified as estimated (J) in Sample B3-2 S-2. Trichlorofluoromethane was qualified as estimated (UJ) in Sample B3-2 S-2.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination.

Qualification: None required.

Field Blanks – No field blank samples were submitted with this SDG.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – Samples B2-1 S-1, B3-2-S-1, B3-2 S-2, B4-1 S-1, FD-1, FD-4 S-1, and SW-1 S-3 (Lab Sample ID: BY06966, BY06961, BY06962, BY06958, BY06980, BY06975, and BY06969), required dilutions of 50 times due to high level of target VOCs. Analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The VOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY06958. Validation qualifiers (if required) were entered into the EDD for SDG: GBY06958. The data may be used for its intended purpose.

FD-4 S-1	BY06975	04/17/2016	Pesticides/PCBs	Soil
FD-1	BY06980	04/17/2016	Pesticides/PCBs	Soil

Summary - Data validation was performed on the data for nine (9) samples submitted for Pesticide/PCBs analyses by EPA method SW846/8081B/8082A.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 04/19/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were analyzed within the 14-day holding time required by the QAPP for preserved aqueous samples.

Qualification: None required

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSD and RRF were within the method criteria.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs were within the method acceptance criteria.

Qualification: None required.

Surrogates –The %R for surrogate, tetrachloro-m-xylene from sample B3-2 S-1 (BY06961) was below control limits on column A and sample B2-1 S-1 (BY06966) was above control limits on column A. Surrogate recoveries for all other samples were within the control limits.

Qualification: The non-detect pesticide/PCB results were qualified as estimated (UJ) and the positive pesticide/PCB results were qualified as estimated (J) in samples B3-2 S-1. Result for PCB-1254 in sample B2-1 S-1 was qualified as estimated (J).

Laboratory Control Sample – One LCS/LCSD pair were prepared and analyzed with these samples in prep batch BY06962. The %Rs and RPDs were within control limits for PCBs. RPDs were outside the control limits for pesticides: 4,4'-DDT (30.1%) and methoxychlor (45.2%). The %Rs and RPDs for the remaining pesticides compounds were within control limits. The results for 4,4'-DDT and methoxychlor in samples SW-1 S-3, MW-6 S-1, B4-1 S-2, and B3-2 S-2 were non-detect.

Qualification: None required.

MS/MSD – Sample B3-2 S-2 (Lab Sample ID: BY06962) was spiked and analyzed as matrix spike/matrix spike duplicate samples for both pesticides/PCBs. The MS/MSD %Rs/RPDs for PCB compounds were within control limits. The %Rs were all within control limits for pesticides. The RPD for gamma-BHC (31.4%) was outside the control limit. The %Rs and RPDs for the remaining pesticides compounds were within control limits. Gamma-BHC was not detected in sample B3-2 S-2.

Qualification: None required.

Method Blank –Method blanks prepared and analyzed for pesticides/PCBs were free of contamination.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – All sediment samples required dilutions due to matrix effects; reporting limits for these samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The pesticide/PCB results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY06958. Validation qualifiers (if required) were entered into the EDD for SDG: GBY06958. The data may be used for its intended purpose.

FD-4 S-1	BY06975	04/17/2016	Total Metals	Sediment
FD-1	BY06980	04/17/2016	Total Metals	Sediment

Summary – Data validation was performed on the data for nine (9) sediment samples collected submitted for total metals analysis by method SW6010C and mercury by SW7471B

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No other discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 4/19/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were analyzed within the 6-month holding time.

Qualification: None required

Initial and Continuing Calibration Verification (ICV/CCV) – ICV and CCVs were within QC limits for ICP-AES and mercury.

Qualification: None required

CRQL Check Standard (CRI) – Iron (148%, 156%) exceeded the upper QC limit and mercury (68.8%) exceeded the lower QC limit. The remaining CRI %Rs were within the control limits.

Qualification: Results for iron in samples B3-2 S-1, B2-1 S-1, SW-1 S-3, MW-6 S-1, FD-4 S-1 were qualified as estimated (J).

ICP-AES Interference Check Sample –All ICS %R values were within the QC limits.

Qualification: None required.

Method Blanks (Preparation, ICB, and CCB) – Sodium (67 µg/L) was detected in one CCB. Results for sodium were greater than the CCB concentration. All other method blanks associated and analyzed with these samples were non-detect for all analytes.

Qualification: None required.

Laboratory Control Sample – The LCS recoveries (%R) for the all target analytes met the %R control limits.

Qualification: None required.

MS/MSD – Sample B3-2 S-2 (Lab Sample ID: BY06961) was spiked and analyzed as matrix spike/matrix spike duplicate samples. %R for potassium and manganese exceeded the upper control limits. The remaining %Rs and calculated RPDs were within control limits.

Qualification: Results for potassium and manganese in sample B3-2 S-2 were qualified as estimated (J).

Laboratory Duplicate– The laboratory duplicate Sample B3-2 S-2 (Lab Sample ID: BY06961). The RPD for mercury (44.4%) exceeded the QC limit. Remaining RPDs were within control limits.

Qualification: The result for mercury in sample B3-2 S-2 was qualified as estimated (J).

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

ICP-AES Serial Dilution – ICP serial dilution was performed on sample B3-2 S-2 (Lab Sample ID: BY06961). %Ds were within QC limits.

Qualification: None required.

Compound Quantitation – All sediment samples required dilutions (10x, 100x, and 1000x) due to matrix effects; reporting limits for the samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The metals (including mercury) results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY06958. Validation qualifiers (if required) were entered into the EDD for SDG: GBY06958. The data may be used for its intended purpose.

DATA USABILITY SUMMARY REPORT (DUSR)
Semi-Volatile Organic Compounds
EPA Method SW-846 8270D
EPA Region 2

Site: Angelic Textile Services	SDG #: GBY54991
Laboratory: Phoenix Environmental Laboratories, Inc.	Date: 8/03/2017
KOMAN Government Solutions, LLC Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-35A, Revision 0, June 2015, Semi-volatile Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
BB-2/S-1	BY54991	07/06/2017	SVOCs	Soil
BB-3/S-1	BY54992	07/06/2017	SVOCs	Soil
DB-2/S-1	BY54993	07/06/2017	SVOCs	Soil
DB-1/S-2	BY54994	07/06/2017	SVOCs	Soil
USB-1/S-1	BY54995	07/06/2017	SVOCs	Soil
USB-1/S-3	BY54996	07/06/2017	SVOCs	Soil
USB-2/S-2	BY54997	07/06/2017	SVOCs	Soil
USB-2/S-3A	BY54998	07/06/2017	SVOCs	Soil

Summary - Data validation was performed on the data for eight (8) samples collected and submitted for Semi-Volatile Organic (SVOC) analysis by EPA Method SW-846 8270D.

Narrative and Completeness Review – The Chains-of custody (COCs), case narrative, and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 07/7/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were extracted within 14 days from sample collection and analyzed within the 40-days following sample extraction.

Qualification: None required.

GC/MS Tuning – DFTPP tunes in the initial and continuing calibrations met the percent relative abundance criteria.

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria.

Qualification: None required.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY54998 were within %R/RPD control limits with the exception of benzoic acid (%R: 0%, 0%), 2,4-dinitrophenol (%R: 19%, 16%), and benzidine (%R/RPD: 6%, 9%/35.3%).

Qualification: Results for benzoic acid were qualified as rejected (R) in Samples BB-2/S-1, BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, and USB-2/S-3A. Results for 2,4-dinitrophenol and benzidine were qualified as estimated (UJ) in Samples BB-2/S-1, BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, and USB-2/S-3A.

Matrix Spike/Matrix Spike Duplicate – Sample USB-2/S-3A (Lab Sample ID: BY54998) was spiked and analyzed as matrix spike/matrix spike duplicate samples. The %Rs for benzoic acid (%R: 2%, 3%), hexachlorocyclopentadiene (%R/RPD: 22%, 14%/44.4%) and benzidine (%R: 4%, 3%) were outside the control limits.

Qualification: Result for benzoic acid was qualified as rejected (R) in Sample USB-2/S-3A. Hexachlorocyclopentadiene and benzidine were qualified estimated (UJ) as in Sample USB-2/S-3A.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination.

Qualification: None required.

Field Blanks – No field blank samples were submitted with this SDG.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – Analyte non-detections were reported as "U." Analyte detections below the LOQ were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does

not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table – Results for benzoic acid in all eight samples were not usable. The rest of the SVOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY54991. Validation qualifiers (if required) were entered into the EDD for SDG: GBY54991. The data may be used for its intended purpose.

Evaluating Document(s): USEPA Region-II SOP HW-33A, Revision 0, July 2015, SOM02.2, Low/Medium Volatile Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
BB-2/S-1	BY54991	07/06/2017	VOCs	Soil
BB-3/S-1	BY54992	07/06/2017	VOCs	Soil
DB-2/S-1	BY54993	07/06/2017	VOCs	Soil
DB-1/S-2	BY54994	07/06/2017	VOCs	Soil
USB-1/S-1	BY54995	07/06/2017	VOCs	Soil
USB-1/S-3	BY54996	07/06/2017	VOCs	Soil
USB-2/S-2	BY54997	07/06/2017	VOCs	Soil
USB-2/S-3A	BY54998	07/06/2017	VOCs	Soil

Summary - Data validation was performed on the data for eight (8) samples collected and submitted for VOCs by EPA Method SW-846 8260C.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 07/07/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the 14-day holding time required for soil samples.

Qualification: None required.

Instrument Performance Check – Instrument performance check sample was analyzed at the beginning of each 12-hour period during sample analysis. Samples were analyzed within the 12-hour period. The method ion abundance criteria were met for bromofluorobenzene (BFB).

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria.

Qualification: None required.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance criteria.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY54998 were within %R/RPD control limits.

Qualification: None required.

Matrix Spike/Matrix Spike Duplicate – Sample USB-2/S-3A (Lab Sample ID: BY54998) was spiked and analyzed as matrix spike/matrix spike duplicate samples. The %Rs for dichlorodifluoromethane (131%), chloroethane (41%, 42%), and trichlorofluoromethane (43%, 33%) were outside the control limits. Results for dichlorodifluoromethane were non-detect; no qualifications were required.

*Qualification: C*hloroethane and trichlorofluoromethane were qualified as estimated (UJ) in Sample USB-2/S-3A.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination.

Qualification: None required.

Field Blanks – No field blank samples were submitted with this SDG.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation –Analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process.

No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The VOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY54991. Validation qualifiers (if required) were entered into the EDD for SDG: GBY54991. The data may be used for its intended purpose.

Pesticides/PCBs

KOMAN Government Solutions, LLC. Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-37A, Revision 0, June 2015, PCB Data Validation and SOP HW-36A, Revision 0, June 2015, Pesticide Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
BB-2/S-1	BY54991	07/06/2017	Pesticides/PCBs	Soil
BB-3/S-1	BY54992	07/06/2017	Pesticides/PCBs	Soil
DB-2/S-1	BY54993	07/06/2017	Pesticides/PCBs	Soil
DB-1/S-2	BY54994	07/06/2017	Pesticides/PCBs	Soil
USB-1/S-1	BY54995	07/06/2017	Pesticides/PCBs	Soil
USB-1/S-3	BY54996	07/06/2017	Pesticides/PCBs	Soil
USB-2/S-2	BY54997	07/06/2017	Pesticides/PCBs	Soil
USB-2/S-3A	BY54998	07/06/2017	Pesticides/PCBs	Soil

Summary - Data validation was performed on the data for eight (8) samples submitted for Pesticide/PCBs analyses by EPA method SW846/8081B/8082A.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 07/07/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were analyzed within the 14-day holding time required by the QAPP for preserved aqueous samples.

Qualification: None required

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSD and RRF were within the method criteria.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs were within the method acceptance criteria. Results were reported from column A (with the exception of the result of 4,4'-DDT in sample DB-2/S-1 (BY54993).

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits for PCBs and pesticides.

Qualification: None required.

Laboratory Control Sample – One LCS/LCSD pair were prepared and analyzed with these samples in prep batch BY54998. The %Rs and RPDs were within control limits for PCBs. RPDs were outside the control limits for all pesticides. The %Rs for pesticides compounds were within control limits. The results for all pesticides were non-detect with the exception of 4,4'-DDT in sample DB-2/S-1.

Qualification: The result for 4,4'-DDT in sample DB-2/S-1 was qualified as estimated (J).

MS/MSD – Sample USB-2/S-3A (Lab Sample ID: BY54998) was spiked and analyzed as matrix spike/matrix spike duplicate samples for both pesticides/PCBs. The MS/MSD %Rs for PCB compounds were within control limits. The RPDs for Aroclor-1016 (53.9%) and Aroclor-1260 (57.9%) were outside the control limits. The %Rs were all within control limits for pesticides. The RPD for all pesticide compounds were outside the control limits. The results for pesticides and PCBs in Sample USB-2/S-3A were non-detect.

Qualification: None required.

Method Blank –Method blanks prepared and analyzed for pesticides/PCBs were free of contamination.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – All sediment samples required dilutions due to matrix effects; reporting limits for these samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The pesticide/PCB results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY54991. Validation qualifiers (if required) were entered into the EDD for SDG: GBY54991. The data may be used for its intended purpose.

Total and Dissolved Metals

USB-2/S-2	BY54997	07/06/2017	Total Metals	Sediment
USB-2/S-3A	BY54998	07/06/2017	Total Metals	Sediment

Summary – Data validation was performed on the data for eight (8) sediment samples collected submitted for total metals analysis by method SW6010C and mercury by SW7471B

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No other discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 7/07/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were analyzed within the 6-month holding time.

Qualification: None required

Initial and Continuing Calibration Verification (ICV/CCV) – ICV and CCVs were within QC limits for ICP-AES and mercury.

Qualification: None required

CRQL Check Standard (CRI) – Calcium (159.8%), iron (213.4%, 180%, 148.4%), lead (144.6%), and sodium (166.3%) exceeded the upper QC limit. The remaining CRI %Rs were within the control limits.

Qualification: Results for calcium in samples BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, USB-2/S-3A were qualified as estimated (J). Results for iron in samples BB-2/S-1, BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2 were qualified as estimated (J). Results for lead in samples BB-2/S-1, BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, were qualified as estimated (J). Results for sodium in samples BB-2/S-1, BB-3/S-1, DB-2/S-1, DB-1/S-2, USB-1/S-1, USB-1/S-3, USB-2/S-2, USB-2/S-3A were qualified as estimated (J).

ICP-AES Interference Check Sample –All ICS %R values were within the QC limits.

Qualification: None required.

Method Blanks (Preparation, ICB, and CCB) –Selenium (20 µg/L, 19 µg/L, 22 µg/L, and 22 µg/L), sodium (201 µg/L and 67 µg/L) was detected in a few CCBs. Iron (5.3 mg/Kg) and sodium (7.4 mg/Kg) were detected in the method blank (MB). Results for sodium were greater than the CCB concentration. Results for iron and sodium were greater than the MB concentration. Results for selenium were non-detect. All other method blanks associated and analyzed with these samples were non-detect for all analytes.

Qualification: None required.

Laboratory Control Sample – The LCS recoveries (%R) for the all target analytes met the %R control limits.

Qualification: None required.

MS/MSD – Sample USB-2/S-3A (Lab Sample ID: BY54998) was spiked and analyzed as matrix spike/matrix spike duplicate samples. %R for potassium and sodium exceeded the upper control limits. The remaining %Rs and calculated RPDs were within control limits.

Qualification: Results for potassium and sodium in sample USB-2/S-3A were qualified as estimated (J).

Laboratory Duplicate– The laboratory duplicate Sample USB-2/S-3A (Lab Sample ID: BY54998). RPDs were within control limits.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

ICP-AES Serial Dilution – ICP serial dilution was performed on sample USB-2/S-3A (Lab Sample ID: BY54998). %Ds were within QC limits.

Qualification: None required.

Compound Quantitation – All sediment samples required dilutions (10x and 100x) due to matrix effects; reporting limits for the samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The metals (including mercury) results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY54991. Validation qualifiers (if required) were entered into the EDD for SDG: GBY54991. The data may be used for its intended purpose.

DATA USABILITY SUMMARY REPORT (DUSR)
Semi-Volatile Organic Compounds
EPA Method SW-846 8270D
EPA Region 2

Site: Angelic Textile Services	SDG #: GBY76292
Laboratory: Phoenix Environmental Laboratories, Inc.	Date: 8/26/2017
KOMAN Government Solutions, LLC Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-35A, Revision 0, June 2015, Semi-volatile Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
G CREEK STG BLD	BY76292	07/31/2017	SVOCs	SOIL
BB-2	BY76293	07/27/2017	SVOCs	GROUNDWATER
BB-2 DUP	BY76294	07/27/2017	SVOCs	GROUNDWATER
MW-6	BY76295	07/28/2017	SVOCs	GROUNDWATER
NE-1	BY76297	07/28/2017	SVOCs	GROUNDWATER
B4-1	BY76298	07/31/2017	SVOCs	GROUNDWATER
NW-1	BY76299	07/31/2017	SVOCs	GROUNDWATER

Summary - Data validation was performed on the data for one (1) soil sample and six (6) groundwater samples collected and submitted for Semi-Volatile Organic (SVOC) analysis by EPA Method SW-846 8270D and EPA Method SW-846 8270D SIM.

Narrative and Completeness Review – The Chains-of custody (COCs), case narrative, and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 08/1/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – Soil samples were extracted within 14 days from sample collection and analyzed within the 40-days following sample extraction.

Qualification: None required.

– Groundwater samples were extracted within 7 days from sample collection and analyzed within the 40- days following sample extraction.

Qualification: None required.

GC/MS Tuning – DFTPP tunes in the initial and continuing calibrations met the percent relative abundance criteria.

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds with the exception of 2,4-dinitrophenol (60.8%). Results for 2,4-dinitrophenol were non-detect; no qualifications were required.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria with the exception of 2,4-dinitrophenol (60.3%).

Qualification: Results for 2,4-dinitrophenol were qualified as estimated non-detect (UJ) in samples BB-2, BB-2 DUP, MW-6, NE-1, B4-1, and NW-1.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits for soil samples.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY76292 were within %R/RPD control limits with the exception of bis(2-chloroethyl)ether (%R: 177%, RPD: 97.5%), aniline (%R: 26%, RPD: 79.1%), 3&4-methylphenol (RPD: 44.1%), benzoic acid (%R: 8%, 0%), 4-chloroaniline (RPD: 33.1%), hexachlorocyclopentadiene (%R: 29%, RPD: 41.1%), 2,4-dinitrophenol (%R: 0%), 4,6-dinitro-2-methylphenol (%R: 8%, RPD: 144.3%), pentachlorophenol (RPD: 63.6%), and benzidine (%R: 20%, 15%). Results for bis(2-chloroethyl)ether, pentachlorophenol, 3&4-methylphenol, and 4-chloroaniline were non-detect in the soil sample; no qualifications were required.

Qualification: Results for benzoic acid, and 2,4-dinitrophenol were qualified as rejected (R) in Sample G CREEK STG BLD. Result for aniline was qualified as estimated (UJ) in Sample G CREEK STG BLD. Results for hexachlorocyclopentadiene, 4,6-dinitro-2-methylphenol, and benzidine were qualified as reject due to zero matrix spike recovery (see below).

– Percent recoveries for the LCS BY76293 were within %R control limits with the exception of 1,3-dichlorobenzene (%R: 40%), 1,4-dichlorobenzene (%R: 41%), 2,4-dinitrophenol (%R: 165%), 2-Nitroaniline (%R: 133%), 4,6-dinitro-2-methylphenol (R: 132%). Results for 2,4-dinitrophenol, 2-Nitroaniline, and 4,6-dinitro-2-methylphenol were non-detect in the aqueous samples; no qualifications were required.

Qualification: Result for 1,3-dichlorobenzene and 1,4-dichlorobenzene was qualified as estimated (UJ) in Sample G CREEK STG BLD.

Matrix Spike/Matrix Spike Duplicate – Sample G CREEL STG BLD (Lab Sample ID: BY76292) was spiked and analyzed as matrix spike sample. The %Rs for benzoic acid (%R: 5%), hexachlorocyclopentadiene (%R: 0%), 2,4-dinitrophenol (%R: 0%), 4,6-dinitro-2-methylphenol (0%), phenanthrene (%R: 8%), benzidine (%R: 0%), pyrene (%R: 14%), benz(a)anthracene (%R: 8%), chrysene (%R: 0%), 3,3'-dichlorobenzidine (%R: 0%), benzo(b)fluoranthene (%R: 18%),

benzo(a)pyrene (%R: 11%), indeno(1,2,3-cd)pyrene (%R: 26%) and were outside the control limits.

Qualification: Result for benzoic acid, hexachlorocyclopentadiene, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, benzidine, chrysene, and 3,3'-dichlorobenzidine were qualified as rejected (R) in Sample G CREEK STG BLD. Phenanthrene, pyrene, benz(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, and indeno(1,2,3-cd)pyrene were qualified estimated (UJ) as in Sample G CREEK STG BLD.

– Sample BB-2 (Lab Sample ID: BY76293) was spiked and analyzed as matrix spike/matrix spike duplicate sample. The %Rs for 1,3-dichlorobenzene (%R: 49%, 42%), 1,4-dichlorobenzene (%R: 50%, 43%), 2,4-dinitrophenol (%R: 175%, 166%), 2,4-dinitrotoluene (%R: 106%, 104%), 2-nitroaniline (%R: 133%), 4,6-dinitro-2-methylphenol (R%: 144%, 132%), and benzidine (%R: 0%, 0%) were outside the control limits. Results for 2,4-dinitrophenol, 2,4-dinitrotoluene, 2-nitroaniline, and 4,6-dinitro-2-methylphenol were non-detect; no qualifications were required.

Qualification: Result for benzidine was qualified as rejected (R) in Sample BB-2.

– Sample BB-2 (Lab Sample ID: BY76293) was spiked and analyzed as matrix spike/matrix spike duplicate sample sim scan. The %Rs for bis(2-ethylhexyl)phthalate (%R: 137%) were outside the control limits. The result for bis(2-ethylhexyl)phthalate was non-detect; no qualifications were required.

Qualification: None required.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination with the exception of nitrobenzene (0.05 µg/L).

Qualification: The result for nitrobenzene was qualified as non-detect (U) in sample BB-2.

Field Blanks – No field blank samples were submitted with this SDG.

Qualification: None required.

Field Duplicate – Sample BB-2 and BB-2 DUP (Lab Sample IDs: BY76293 and BY76294) were field duplicate samples. The results of both samples were non-detect with the exception of chrysene and benz(a)anthracene in sample BB-2.

Qualification: Results for chrysene and benz(a)anthracene were qualified as estimated (J/UJ) in samples BB-2 and BB-2 DUP.

Compound Quantitation – Analyte non-detections were reported as "U." Analyte detections below the LOQ were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table – Results for benzoic acid, chrysene, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, hexachlorocyclopentadiene were not usable in the soil sample. The rest of the SVOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY76292. Validation qualifiers (if required) were entered into the EDD for SDG: GBY76292. The data may be used for its intended purpose.

DATA USABILITY SUMMARY REPORT (DUSR)
Volatile Organic Compounds

KOMAN Government Solutions, LLC Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-33A, Revision 0, July 2015, SOM02.2, Low/Medium Volatile Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
G CREEK STG BLD	BY76292	07/31/2017	VOCs	SOIL
BB-2	BY76293	07/27/2017	VOCs	GROUNDWATER
BB-2 DUP	BY76294	07/27/2017	VOCs	GROUNDWATER
MW-6	BY76295	07/28/2017	VOCs	GROUNDWATER
NE-1	BY76297	07/28/2017	VOCs	GROUNDWATER
B4-1	BY76298	07/31/2017	VOCs	GROUNDWATER
NW-1	BY76299	07/31/2017	VOCs	GROUNDWATER
TRIP BLANK	BY76300	07/31/2017	VOCs	TRIP BLANK

Summary - Data validation was performed on the data for one (1) soil sample and six (6) groundwater samples and one (1) trip blank collected and submitted for VOCs by EPA Method SW-846 8260C.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Sample Delivery and Condition – All samples arrived at the laboratory on 08/01/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the 14-day holding time required.

Qualification: None required.

Instrument Performance Check – Instrument performance check sample was analyzed at the beginning of each 12-hour period during sample analysis. Samples were analyzed within the 12-hour period. The method ion abundance criteria were met for bromofluorobenzene (BFB).

Qualification: None required.

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSDs and RRFs were within the method and validation criteria for the target compounds.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs for the target analytes were within the method and validation acceptance criteria.

Qualification: None required.

Internal Standards – The internal standard areas and retention times were within the method specific acceptance criteria.

Qualification: None required.

Surrogates – Surrogate recoveries were within the control limits for all samples.

Qualification: None required.

Laboratory Control Sample/Laboratory Control Sample Duplicate – Percent recoveries for the LCS/LCSD BY75710 were within %R/RPD control limits.

Qualification: None required.

– Percent recoveries for the LCS/LCSD BY76293 were within %R/RPD control limits with the exception of dichlorodifluoromethane (%R: 136%).

Qualification: Result for dichlorodifluoromethane was qualified as estimated bias high (J+) in sample B4-1.

Matrix Spike/Matrix Spike Duplicate – Sample G CREEK STG BLD (Lab Sample ID: BY76292) was spiked and analyzed as matrix spike/matrix spike duplicate samples. All the %Rs/RPDs were inside the control limits.

Qualification: None required.

– Sample BB-2 (Lab Sample ID: BY76293) was spiked and analyzed as matrix spike/matrix spike duplicate samples. All the %Rs/RPDs were inside the control limits.

Qualification: None required.

Method Blanks – The method blanks prepared and analyzed with these sample were free of contamination with the exception of 1,2,3-trichlorobenzene (0.34 µg/L). Sample results for 1,2,3-trichlorobenzene were non-detect.

Qualification: None required.

Field Blanks – Sample Trip Blank (Lab Sample ID:BY76300) was analyzed on 8/3/2017 and was free of contamination.

Qualification: None required.

Field Duplicate – One set of field duplicate samples were submitted with this sample set: samples BB-2 and BB-2 Dup (Lab Sample IDs: BY76293 and BY76294). The detected results for the FD sample pair BB-2 and BB-2 Dup (Lab Sample IDs: BY76293 and BY76294) are summarized in the table below.

	BB-2	BB-2 DUP	
	BY76293	BY76294	
Analyte	Result (ug/L)	Result (ug/L)	RPD (%)
1,3-Dichlorobenzene	0.26	0.27	3.8

Qualification: None required.

Compound Quantitation – Carbon disulfide in the sediment sample required 50x dilution due to matrix effects; reporting limit for this sample was elevated accordingly. Analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The VOC results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY76292. Validation qualifiers (if required) were entered into the EDD for SDG: GBY76292. The data may be used for its intended purpose.

Pesticides/PCBs

KOMAN Government Solutions, LLC. Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP HW-37A, Revision 0, June 2015, PCB Data Validation and SOP HW-36A, Revision 0, June 2015, Pesticide Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Client Sample ID	Lab Sample ID	Date Sampled	Analysis	Matrix
G CREEK STG BLD	BY76292	07/31/2017	Pesticides/PCBs	SOIL
BB-2	BY76293	07/27/2017	Pesticides/PCBs	GROUNDWATER
BB-2 DUP	BY76294	07/27/2017	Pesticides/PCBs	GROUNDWATER
MW-6	BY76295	07/28/2017	Pesticides/PCBs	GROUNDWATER
NE-1	BY76297	07/28/2017	Pesticides/PCBs	GROUNDWATER
B4-1	BY76298	07/31/2017	Pesticides/PCBs	GROUNDWATER
NW-1	BY76299	07/31/2017	Pesticides/PCBs	GROUNDWATER

Summary - Data validation was performed on the data for one (1) soil sample and six (6) groundwater samples submitted for Pesticide/PCBs analyses by EPA method SW846/8081B/8082A.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 08/01/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were extracted within 7 days from sample collection and analyzed within 40 days following sample extraction. No qualifications were required.

Qualification: None required

Initial Calibration – Appropriate initial calibrations were performed for each analyte. The laboratory calculated percent relative standard deviation (%RSD) of the relative response factor (RRFs). The %RSD and RRF were within the method criteria.

Qualification: None required.

Initial and Continuing Calibration Verification (ICV and CCV) – The ICVs and CCVs were performed at the required frequency. The percent differences (%Ds) between the RRFs in the initial calibration and the ICVs or CCVs were within the method acceptance criteria on the reporting columns.

Qualification: None required.

Surrogates – Surrogate recoveries for all samples were within the control limits for PCBs and pesticides.

Qualification: None required.

Laboratory Control Sample – One LCS/LCSD pair were prepared and analyzed with these samples in prep batch BY76292 for soil PCB/pesticides. The %Rs and RPDs were within control limits for PCBs/pesticides.

Qualification: None required.

– Two LCS/LCSD pairs were prepared and analyzed with these samples in prep batch BY76293 for PCBs/pesticides and BY76573 for PCB GW. The %Rs and RPDs were within control limits for PCBs. Delta-BHC %RPD (21.2%) was outside the control limits. Results for delta-BHC were non-detect in the field samples.

Qualification: None required.

MS/MSD – Sample G CREEK STG BLD (Lab Sample ID: BY76292) was spiked and analyzed as matrix spike/matrix spike duplicate samples for both pesticides/PCBs. The MS/MSD %Rs for PCB/pesticides compounds were within control limits. The RPDs for PCBs were within the control limits. The RPDs for beta-BHC (50.7%), heptachlor (97.1%) and aldrin (38.8%) were outside the control limits. The results for pesticides in Sample G CREEK STG BLD were non-detect.

Qualification: None required.

– Sample BB-2 (Lab Sample ID: BY76293) was spiked and analyzed as matrix spike/matrix spike duplicate samples for both pesticides/PCBs. The MS/MSD %Rs for PCB compounds were within control limits. The RPDs for heptachlor (29.0%), gamma-chlordane (20.2%), and aldrin (23.3%) were outside the control limits. The %Rs were all within control limits for pesticides. The results for pesticides and PCBs in Sample BB-2 were non-detect.

Qualification: None required.

Method Blank –Method blanks prepared and analyzed for pesticides/PCBs were free of contamination.

Qualification: None required.

Field Duplicate – Sample BB-2 and BB-2 DUP (Lab Sample IDs: BY76293 and BY76294) were field duplicate samples. The results of both samples were non-detect.

Qualification: None required.

Compound Quantitation – All sediment samples required dilutions due to matrix effects; reporting limits for these samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The pesticide/PCB results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY76292. Validation qualifiers (if required) were entered into the EDD for SDG: GBY76292. The data may be used for its intended purpose.

Total and Dissolved Metals

USEPA Level II Review

Site: Angelic Textile Services	SDG: GBY76292
Laboratory: Phoenix Environmental Laboratories, Inc.	Date: 8/3/2017
KOMAN Government Solutions, LLC. Reviewer: Sherri Pullar	Project: 3004-003
Evaluating Document(s): USEPA Region-II SOP No. HW-2a, Revision 0, July 2015, ICP-AES Data Validation and USEPA Region-II SOP No. HW-3c, Revision 0, July 2016, Mercury and Cyanide Data Validation	NYSDEC, Analytical Services Protocol (ASP) Format

Lab Sample ID	Client Sample ID	Collection Date	Analysis	Matrix
G CREEK STG BLD	BY76292	07/31/2017	Total Metals	SOIL
BB-2	BY76293	07/27/2017	Total Metals	GROUNDWATER
BB-2 DUP	BY76294	07/27/2017	Total Metals	GROUNDWATER
MW-6	BY76295	07/28/2017	Total Metals	GROUNDWATER
NE-1	BY76297	07/28/2017	Total Metals	GROUNDWATER
B4-1	BY76298	07/31/2017	Total Metals	GROUNDWATER
NW-1	BY76299	07/31/2017	Total Metals	GROUNDWATER

Summary – Data validation was performed on the data for one (1) soil sample and six (6) groundwater samples collected submitted for total metals analysis by method SW6010C, 7010, and mercury by SW7471B and SW7470.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No other discrepancies were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 8/01/2017 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required

Holding Times – All samples were analyzed within the 6-month holding time.

Qualification: None required

Initial and Continuing Calibration Verification (ICV/CCV) – ICV and CCVs were within QC limits for ICP-AES and mercury.

Qualification: None required

CRQL Check Standard (CRI) – Lead (69.5%), iron (137.2%), and calcium (359.4%) exceeded the QC limits. The remaining solid CRI %Rs were within the control limits.

Qualification: Results for lead, iron, and calcium in sample G CREEK STG BLD were qualified as estimated (J).

– mercury (39.3%), thallium (62.2%), and thallium (57.2%) exceeded the QC limits. The remaining aqueous CRI %Rs were within the control limits.

Qualification: Results for mercury and thallium in samples BB-2, BB-2 DUP, MW-6, NE-1, B4-1, and NW-1 were qualified as estimated (J/UJ).

ICP-AES Interference Check Sample –All ICS %R values were within the QC limits.

Qualification: None required.

Method Blanks (Preparation, ICB, and CCB) –Selenium (27 µg/L, 27 µg/L, and 25 µg/L), sodium (62 µg/L, 64 µg/L, and 54 µg/L) was detected in a few solid CCBs. Zinc (0.70 mg/Kg) and sodium (7.5 mg/Kg) were detected in the solid method blank (MB). Results for sodium were greater than the CCB concentration. Results for zinc and sodium were greater than the MB concentration. Results for selenium were non-detect. All other method blanks associated and analyzed with these samples were non-detect for all analytes.

Qualification: None required.

–sodium (101 µg/L, 8/4 12:54) was detected in an aqueous CCB. The aqueous method blank (MB) was contaminate free. Results for sodium were not associated with this CCB; no qualifications were required. All other method blanks associated and analyzed with these samples were non-detect for all analytes.

Qualification: None required.

Laboratory Control Sample – The LCS recoveries (%R) for the all target analytes met the %R control limits.

Qualification: None required.

MS/MSD – Sample G CREEK STG BLD (Lab Sample ID: BY76292) was spiked and analyzed as matrix spike/matrix spike duplicate samples. %Rs and calculated RPDs were within control limits.

Qualification: None required.

– Sample BB-2 (Lab Sample ID: BY76293) was spiked and analyzed as matrix spike/matrix spike duplicate samples. %Rs and calculated RPDs were within control limits.

Qualification: None required.

Laboratory Duplicate– The laboratory duplicate Sample G CREEK STG BLD (Lab Sample ID: BY76292). RPDs for arsenic (80.4%), cobalt (111.5%), chromium (51.3%), copper (63.0%), iron (168.8%), manganese (141.0%), nickel (116.4%), and lead (38.5%) were within control limits.

Qualification: Results for arsenic, cobalt, chromium, copper, iron, manganese, nickel, and lead were qualified as estimated (J) in Sample G CREEK STG BLD.

– The laboratory duplicate Sample BB-2 (Lab Sample ID: BY76293). RPDs for arsenic (80.4%), cobalt (111.5%), chromium (51.3%), copper (63.0%), iron (168.8%), manganese (141.0%), nickel (116.4%), and lead (38.5%) were within control limits.

Qualification: Results for arsenic, cobalt, chromium, copper, iron, manganese, nickel, and lead were qualified as estimated (J) in Sample BB-2.

Field Duplicate – Samples BB-2 and BB-2 DUP (Lab Sample IDs: BY76293 and BY76294) were field duplicate samples. The calculated relative percent differences (RPDs) between detected analytes were less than 30%. The FD sample results are summarized in the table below.

	BB-2	BB-2 DUP	
	BY76293	BY76294	
Analyte	Result (ug/L)	Result (ug/L)	RPF (%)
ARSENIC	0.014	0.014	0
BARIUM	0.103	0.104	1.0
CALCIUM	119	120	0.8
CHROMIUM	0.002	0.002	0
COBALT	0.004	0.004	0
COPPER	0.002	0.002	0
IRON	2.58	2.62	1.5
MAGNESIUM	26.2	26.5	1.1
MANGANESE	0.438	0.443	1.1
MERCURY	0.0008	0.0009	11.8
NICKEL	0.008	0.009	11.8
POTASSIUM	18.0	18.4	2.2
SODIUM	23.8	24.1	1.3
ZINC	0.046	0.047	2.2

Qualification: None required.

ICP-AES Serial Dilution – ICP serial dilution was performed on sample G CREEK STG BLD (Lab Sample ID: BY76292). %Ds were within QC limits.

Qualification: None required.

– ICP serial dilution was performed on sample BB-2 (Lab Sample ID: BY76293). %Ds were within QC limits with the exception of potassium (18.3%) and sodium (28.2%).

Qualification: Results for potassium and sodium in sample BB-2 were qualified as estimated (J).

Compound Quantitation – Sodium required 100x dilution in sample B4-1, aluminum, iron, manganese, and sodium required 10x dilution in sample NE-1, aluminum, manganese, sodium, ad calcium required 10x dilution in sample MW-6 and sodium required 100x dilution in sample NW-1 due to matrix effects; reporting limits for the samples were elevated accordingly. The sample analyte non-detections were reported as "U." Analyte detections below the LOD were reported as J qualified results. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Electronic Data Deliverable Review –Regarding results on QC summary forms versus included raw data, due to calculations made at the instrument where many significant figures may be used, there may be slight discrepancies between the summary report result and that recorded on the raw data. This does not affect data usability. Results and sample IDs in the EDD were reviewed against the information

provided by the associated Level IV report at a minimum of 20% as part of the data validation process. No discrepancies were identified between the Level IV report and the EDD.

Qualification: None required.

Qualification Summary Table - The metals (including mercury) results reported in this SDG are acceptable with the noted qualifications. Summary of the qualified data is listed in the Data Summary Table for SDG: GBY76292. Validation qualifiers (if required) were entered into the EDD for SDG: GBY76292. The data may be used for its intended purpose.

DATA USABILITY SUMMARY REPORT (DUSR)
Volatile Organic Compounds
Method TO-15
USEPA Level 4 Review

Site: Angelic Textile Services	SDG #: GCC81347
Laboratory: Phoenix Environmental Laboratories, Inc.	Date: 05/31/19
KGS Reviewer: Sherri Pullar	Project: 3020

Lab Sample ID	Client Sample ID	Collection Date	Analysis	Matrix
CC81347	SS	3/29/19	VOA	Air
CC81348	IA	3/29/19	VOA	Air
CC81349	IA DUP	3/29/19	VOA	Air
CC81350	OA	3/29/19	VOA	Air

Summary - Data validation was performed on the data for four (4) air samples collected from Angelic Textile Services, 125 Bath Street, NY on 3/29/2019 and submitted for Volatile Organic (VOC) analyses by Method TO-15. Samples were analyzed and reported for VOCs. All sample results in this SDG were subjected to Level 4 data validation, which includes evaluation of preparatory batch, instrument-related QC results and calculations. The USEPA Region-II SOP # HW-31, Revision 6, June 2014, Validating Air Samples Volatile Organic Analysis of Ambient Air in Canister by Method TO-15 was used in evaluating the Volatiles data in this summary report.

Narrative and Completeness Review – The case narrative and data package were checked for completeness.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory on 4/3/2019 in acceptable condition and temperature and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – All air samples were analyzed within the method holding time for summa canisters (30 days).

Qualification: None required.

GC/MS Tuning - All BFB tunes in the initial and continuing calibrations met the percent relative abundance criteria.

Qualification: None required.

Initial Calibration - Initial calibration curve analyzed on 03/20/2019 (Chem24) exhibited acceptable %RSDs (≤30.0%) for all compounds and average RRF values (≥0.050) for all compounds with the exception of some compounds listed in Table 4 in SOP # HW-31, were ≥0.01.

Qualification: None required.

Continuing Calibration Verification (CCV): - The %D for the CCVs analyzed and reported with these samples on 04/03/2019 were within acceptance limits.

Qualification: None required.

Surrogates –4-Bromofluorobenzene (BFB) surrogate spike recovered within the laboratory control limits.

Qualification: None required.

Internal Standard (IS) Area Performance: - Samples exhibited acceptable area counts for all internal standards.

Qualification: None required.

LCS –LCS percent recoveries (%R) for the reported analytes were within control limits.

Qualification: None required.

Method Blank – The method blank prepared and analyzed with these samples was free of contamination.

Qualification: None required.

Canister Blank – The canister blanks prepared and analyzed with these samples were free of contamination.

Qualification: None required.

Field Blanks – No field blanks were included in this SDG.

Qualification: None required.

Field Duplicate – One set of field duplicate samples were submitted with this sample set: samples IA and IA Dup (Lab Sample IDs: CC81348 and CC81349). The detected results for the FD sample pair IA and IA Dup (Lab Sample IDs: CC81348 and CC81349) are summarized in the table below.

	IA	IA DUP	
	CC81348	CC81348	
Analyte	Result (ug/m3)	Result (ug/m3)	RPD (%)
Acetone	3.96	3.63	8.7
Carbon Tetrachloride	0.40	0.37	7.8
Dichlorodifluoromethane	2.14	2.02	5.8
Ethanol	2.35	2.28	3.0
Trichlorofluoromethane	11.5	11.1	3.5
Trichlorotrifluoroethane	1.07	ND	NC

Qualification: Results for trichlorotrifluoroethane were qualified as estimated (J/UJ) in Samples IA and IA DUP.

Compound Quantitation –Analyte non-detections were reported as "U"; these results should be considered the equivalent of "RL (reporting limit) U."

Qualification: None required.

– All sample results were reported within the linear calibration range with the exception of ethanol in sample SS.

Qualification: Ethanol was qualified as estimated (J) in sample SS.

Manual Calculation

$$\text{Concentration } (\mu g/m^3) = \frac{\text{Result (ppbv) x Molecular weight x DF}}{24.46}$$

SS (CC81347)

Toluene
Result (ppbv) = 0.352
Molecular Weight @ 25ºC=92.14
DF = 1

$$\text{Concentration } (\mu g/m^3) = \frac{0.352 \times 92.14 \times 1}{24.46} = 1.33 \mu g/m^3$$

Compound	Laboratory ($\mu g/m^3$)	Validation ($\mu g/m^3$)	%D
Toluene	1.33	1.33	0.0

Data Review Summary – Volatile air data package meet requirement for New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocol (ASP) Category B Deliverables.
– The VOC air results reported in this SDG are acceptable as reported and may be used for their intended purpose.
– Validation qualifiers (if required) were entered into the EDD and a summary of the data are listed in the Data Summary Table for SDG: GCC81347 at the end of the data validation report.

Qualifiers

U — The compound was anlayzed for but not detected at or above the MDL.
The number immediately preceding the "U" represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J — The value is estimated. This flag is used
a) on form 1 when the compound is reported above the MDL, but below the PQL, and
b) on the Tentatively Identified Compounds (TIC) form for all compounds identified.

N — The concentration is based on the response fo the nearest internal. This flag is used on the TIC form for all compounds identified.

S — This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

D — The reported concentration is the result of a diluted analysis.

(*) — See report for comment.

Result Detected

Soil Vapor / Indoor Air Matrix A

Trichloroethene (TCE), cis-1,2-Dichloroethene (c 1 2-DCE), 1,1-Dichloroethene (1 1-DCE) & Caron Tetrachloride

125 Bath Street Ballston Spa, New York
NYSDEC BCP Site No. C546055

	Indoor Air Concentration of Compound (mcg/m³)		
Sub-Slab Vapor Concentration of Compound (mcg/m³)	< 0.2	0.2 to < 1.0	1.0 and above
< 6	1. No Further Action	2. No Further Action	3. Identify Source(s) and Resample or Mitigate
6 to < 60	4. No Further Action	5. Monitor	6. Mitigate
60 and above	7. Mitigate	8. Mitigate	9. Mitigate

Sample Location	Compound	Indoor Air (mcg/m³)	Sub-Slab Vapor (mcg/m³)	Matix Action
Former Maintenance Shop	TCE	<0.20	<0.20	**1**
Former Maintenance Shop	c 1 2 - DCE	<1.00	<1.00	**1**
Former Maintenance Shop	1 1 - DCE	<1.00	<1.00	**1**
Former Maintenance Shop	Carbon Tetrachloride	0.21	0.4	**2**

Note: The March 2019 Outdoor Air sample was reported to contain Carbon Terachloride at a concetration of 0.43 ug/m^3.

Soil Vapor / Indoor Air Matrix B

Tetrachloroethene (PCE), 1,1,1-Trichloroethane (1 1 1 - TCA), Methylene Chloride

125 Bath Street Ballston Spa, New York
NYSDEC BCP Site No. C546055

	Indoor Air Concentration of Compound (mcg/m³)		
Sub-Slab Vapor Concentration of Compound (mcg/m³)	< 3.0	3.0 to < 10.0	10.0 and above
< 100	1. No Further Action	2. No Further Action	3. Identify Source(s) and Resample or Mitigate
100 to < 1,000	4. No Further Action	5. Monitor	6. Mitigate
1,000 and above	7. Mitigate	8. Mitigate	9. Mitigate

Sample Location	Compound	Indoor Air (mcg/m³)	Sub-Slab Vapor (mcg/m³)	Matix Action

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory. This report is incomplete unless all pages indicated in the pagination at the bottom of the page are included.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller
Laboratory Director

Methodology Summary

Accelerated Solvent Extraction (ASE)

Soil Sample - USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed.Update III, Method 3545A.

Mercury Prep

Soil Sample - USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 7471B.

Metals

ICP :
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 6010C.
Mercury:
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, 7471

Pesticides:

USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 8081B.

Polychlorinated Biphenyls (PCBs):

USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 8082A.

Semivolatile Organic Compounds

USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 8270D.

Volatile Organic Compounds:

USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed.Update III, Method 8260C and Environmental Protection Agency, EPA-600/4-79-020, Revised March 1983 (Methods 624) as printed in 40CFR part 136.

SDG Comments

July 11, 2017

SDG I.D.: GBY06958

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Version 1: Complete report with QC, minus forms.

Version 2: Complete report with QC and forms.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Pesticide Comment:
A dilution of the pesticide extract was necessary due to matrix interference caused by the presence of PCBs in the sample, the requested criteria could not be met for all pesticide compounds.

PCB Comment:
Due to matrix interference from non target compounds in the sample, surrogate could not be reported.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.
This report must not be reproduced except in full as defined by the attached chain of custody.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:
There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

Pesticide Comment:
A dilution of the pesticide extract was necessary due to matrix interference caused by the presence of PCBs in the sample, the requested criteria could not be met for all pesticide compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

Volatile Comment:
There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Semi-Volatile Comment:
Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, a dilution was required resulting in an elevated RL for the semivolatile analysis.

Semi-Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

Pesticide Comment:
A dilution of the pesticide extract was necessary due to matrix interference caused by the presence of PCBs in the sample, the requested criteria could not be met for all pesticide compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:
Poor IS recoveries were observed for low level volatiles due to dirt in the threads of the vial preventing the sample from purging. Both low level vials had this problem, results are reported from the methanol high level.

Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

Semi-Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

Volatile Comment:
There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

Pesticide Comment:
Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, an elevated RL was reported for the affected compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.

1 = This parameter is not certified by NY NELAC for this matrix. NY NELAC does not offer certification for all parameters at this time.

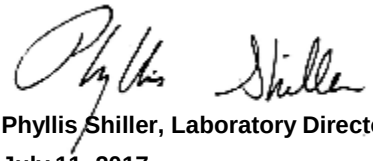
RL/PQL=Reporting/Practical Quantitation Level (Equivalent to NELAC LOQ, Limit of Quantitation) ND=Not Detected BRL=Below Reporting Level L=Biased Low J=Estimated Below RL LOD=Limit of Detection MDL=Method Detection Limit1
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Please be advised that the NY 375 soil criteria for chromium are based on hexavalent chromium and trivalent chromium.

Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.



Semi-Volatile Comment:
Where the LOD justifies lowering the RL/PQL, the RL/PQL of some compounds are evaluated below the lowest calibration standard in order to meet criteria.

Pesticide Comment:
Due to a matrix interference and/or the presence of a large amount of non-target material in the sample, an elevated RL was reported for the affected compounds.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

S - Laboratory solvent, contamination is possible.

If there are any questions regarding this data, please call Phoenix Client Services.
This report must not be reproduced except in full as defined by the attached chain of custody.

Comment:

Alpha and gamma chlordane were spiked and analyzed instead of technical chlordane. Gamma chlordane recovery is reported as chlordane in the LCS, LCSD, MS and MSD.

Phoenix Laboratories does not assume responsibility for the data contained in this report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

Hi Sarah,

The samples we would like to take off hold are highlighted below in this email chain.

If you have any questions about this work we would like to get started, just let me know.

Thanks very much for your help w/ this, all the best.

Jeff

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

Semi-Volatile Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

The samples were analyzed for a semivolatile list of compounds by GC/MS full scan analysis.

Form 1 (Analysis):

No observations noted.

Form 2 (Surrogates):

All surrogates met criteria with the following exceptions: None.

Form 3 (Laboratory Control/Matrix Spike):

Sample: BY06962 LCS
All LCS recoveries met criteria with the following exceptions: Pyridine 29%, Benzoic Acid 5%, 2,4-Dinitrophenol 5%, 4,6-Dinitro-2-methylphenol 20%, Benzidine 11%
All LCSD recoveries met criteria with the following exceptions: Pyridine 28%, Benzoic Acid 6%, 2,4-Dinitrophenol 9%, 4,6-Dinitro-2-methylphenol 27%, Benzidine 9%
All LCS/LCSD RPDs met criteria with the following exceptions: 2,4-Dinitrophenol 54.3%

Sample: BY06962 MS
All MS recoveries met criteria with the following exceptions: Pyridine 28%, Benzoic Acid 7%, Hexachlorocyclopentadiene 0%, Benzidine 14%
All MSD recoveries met criteria with the following exceptions: Benzoic Acid 8%, Hexachlorocyclopentadiene 0%, Benzidine 11%
All MS/MSD RPDs met criteria with the following exceptions: None.

Form 4 (Method Blank):

File: CHEM06 0424_13.D
All compounds were non-detect with the following exceptions: None.

Form 5 (Tune):

File: CHEM06 0424_01.D
All Tune criteria was met with the following exceptions: None.

File: CHEM06 0424_11.D
All Tune criteria was met with the following exceptions: None.

File: CHEM27 0419_01B.D
All Tune criteria was met with the following exceptions: None.

File: CHEM27 0425_01.D
All Tune criteria was met with the following exceptions: None.

Form 6 (Initial Calibration):

Calibration: CHEM06 04/24/17 - 04/24/17
97% of method compounds met criteria.
The following compounds did not meet % deviation criteria: Hexachlorocyclopentadiene 24.1% (20) , 2,4-Dinitrophenol 48.8% (20)
The following compounds did not meet maximum % deviations: 2,4-Dinitrophenol 48.8% (40)
The following compounds did not meet recommended response factors: 2-Nitrophenol 0.067 (0.1) , Bis(2-chloroethoxy)methane 0.294 (0.3) , Hexachlorobenzene 0.083 (0.1)

Semi-Volatile Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

The following compounds did not meet minimum response factors: None.

Calibration: CHEM27 04/19/17 - 04/19/17
98% of method compounds met criteria.
The following compounds did not meet % deviation criteria: Benzidine 22.6% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: 2-Nitrophenol 0.095 (0.1) , Hexachlorobenzene 0.082 (0.1)
The following compounds did not meet minimum response factors: None.

Form 7 (Continuing Calibration):

File: CHEM06 0424_12.D (Opening)
99% of method compounds met criteria.
Internal standard areas were within 50%-200% of the initial calibration with the following exceptions: None.
The following compounds did not meet % deviation criteria: Pyridine 21.0% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: 2-Nitrophenol 0.061 (0.1) , Bis(2-chloroethoxy)methane 0.267 (0.3) , Acenaphthene 0.856 (0.9) , Hexachlorobenzene 0.075 (0.1)
The following compounds did not meet minimum response factors: None.

File: CHEM06 0424_41.D (Closing)
The following compounds did not meet maximum % deviations: Hexachlorocyclopentadiene 94.5% (50), 2,4-Dinitrophenol 92.1% (50), 4,6-Dinitro-2-methylphenol 89.6% (50)
The following compounds did not meet minimum response factors: Hexachlorocyclopentadiene 0.009 (0.01)

File: CHEM27 0425_02.D (Opening)
94% of method compounds met criteria.
Internal standard areas were within 50%-200% of the initial calibration with the following exceptions: None.
The following compounds did not meet % deviation criteria: N-Nitrosodimethylamine 34.4% (20) , Pyridine 35.9% (20) , 2,4,5-Trichlorophenol -20.6% (20) , 2,6-Dinitrotoluene 20.7% (20) , Acenaphthylene 20.9% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: 2-Nitrophenol 0.091 (0.1) , Acenaphthene 0.824 (0.9) , Hexachlorobenzene 0.069 (0.1)
The following compounds did not meet minimum response factors: None.

File: CHEM27 0425_31.D (Closing)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet minimum response factors: None.

Form 8 (Internal Standard and Retention Time):

File: CHEM06 - 0424_02.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

File: CHEM06 - 0424_12.D
All samples met internal standard area and retention time critieria with the following exceptions:
0424_41.D - CCAL 30: Chrysene-d12; Area 1505590 (347932 - 1440931)

File: CHEM27 - 0419_02B.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

Semi-Volatile Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

File: CHEM27 - 0425_02.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

Observations:
The client requested the 8270 compound list for this delivery group.

Sample(s) required a dilution for Semi Volatiles due to a matrix interference and/or the presence of non-target material in the sample. This resulted in elevated reporting limits that may exceed the requested criteria for one or more analytes.

Volatiles (Soil)
Ver 1

Organic Data Flags

LOD(MDL): Limit of Detection or Method Detection Limit
The minimum reportable concentration that can be measured with confidence.

PQL(RL): Practical Quantitation Level or Reporting Level
This value is at or above the MDL and is supported by the lowest calibration standard.

· Q Qualifiers:

U - The compound was analyzed for but not detected at or above the MDL. The number immediately preceding the “U” represents the PQL reporting level corrected for percent solids, weight and/or volume calculations, and dilution factors.

J - Indicates an estimated value, may indicate one of the following, depending on the situation:
a) The reported value is estimated and below the MDL
b) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the indentification criteria, but the results is less than the quantitation limit, but greater than zero.
c) QC associated with this analyte is within warning limits.

X - The concentration is not reported. This quantitation file was not evaluated for this compound at this dilution; a volatile purging or related issue may be the cause.

L - Biased Low

N - The concentration is based on the response of the nearest internal. This flag is used on the TIC form for all compounds identified.

S - This compound is a solvent that is used in the laboratory. Laboratory contamination is suspected if concentration is less than five times the reporting level.

B - This compound was also present in the method blank

D - The reported concentration is the result of a diluted analysis.

E - The reported value is estimated because the concentration exceeded the calibration range.

A - Indicates that the tentatively identified compound is a suspected aldol condensation product. Aldol condensation products are produced during the extraction process.

Q - For TICS, this compound was quantitated using a calibration curve. This compound is part of the instrument method, but not part of the client target list.

P- Percent difference is greater than 25% between the two GC columns and the lower result is reported.

Volatile Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

Form 1 (Analysis):

No observations noted.

Form 2 (Surrogates):

All surrogates met criteria with the following exceptions: None.

Form 3 (Laboratory Control/Matrix Spike):

Sample: BY06962 LCS
All LCS recoveries met criteria with the following exceptions: None.
All LCSD recoveries met criteria with the following exceptions: None.
All LCS/LCSD RPDs met criteria with the following exceptions: None.

Sample: BY06962 MS
All MS recoveries met criteria with the following exceptions: Trichlorofluoromethane 68%
All MSD recoveries met criteria with the following exceptions: Trichlorofluoromethane 69%, Acetone 64%
All MS/MSD RPDs met criteria with the following exceptions: None.

Sample: BY08831 LCS
All LCS recoveries met criteria with the following exceptions: None.
All LCSD recoveries met criteria with the following exceptions: None.
All LCS/LCSD RPDs met criteria with the following exceptions: None.

Sample: BY08831 MS
All MS recoveries met criteria with the following exceptions: None.
All MSD recoveries met criteria with the following exceptions: None.
All MS/MSD RPDs met criteria with the following exceptions: None.

Sample: BY09784 LCS
All LCS recoveries met criteria with the following exceptions: None.
All LCSD recoveries met criteria with the following exceptions: None.
All LCS/LCSD RPDs met criteria with the following exceptions: None.

Sample: BY09784 MS
All MS recoveries met criteria with the following exceptions: None.
All MSD recoveries met criteria with the following exceptions: None.
All MS/MSD RPDs met criteria with the following exceptions: None.

Form 4 (Method Blank):

File: CHEM18 0424M17.D
All compounds were non-detect with the following exceptions: None.

File: CHEM18 0425M07.D
All compounds were non-detect with the following exceptions: None.

File: CHEM18 0426M07.D
All compounds were non-detect with the following exceptions: None.

All Tune criteria was met with the following exceptions: None.

Form 6 (Initial Calibration):

Calibration: CHEM18 04/21/17 - 04/21/17
99% of method compounds met criteria.
The following compounds did not meet % deviation criteria: Methylene Chloride 23.7% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: None.
The following compounds did not meet minimum response factors: None.

Form 7 (Continuing Calibration):

File: CHEM18 0424M11.D (Opening)
99% of method compounds met criteria.
Internal standard areas were within 50 to 200% of the initial calibration with the following exceptions: None.
The following compounds did not meet % deviation criteria: Methylene Chloride 24.3% (20) , 1,2,4-Trichlorobenzene 20.3% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: None.
The following compounds did not meet minimum response factors: None.

File: CHEM18 0424M40.D (Closing)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet minimum response factors: None.

File: CHEM18 0425M02.D (Opening)
91% of method compounds met criteria.
Internal standard areas were within 50 to 200% of the initial calibration with the following exceptions: None.
The following compounds did not meet % deviation criteria: Methylene Chloride 25.6% (20) , Acetone 24.4% (20) , Tetrahydrofuran (THF) 22.5% (20) , Methyl Ethyl Ketone 29.1% (20) , 1,2,3-Trichloropropane 20.9% (20)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: Acetone 0.093 (0.1) , Bromoform 0.098 (0.1)
The following compounds did not meet minimum response factors: None.

File: CHEM18 0425M32.D (Closing)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet minimum response factors: None.

File: CHEM18 0426M02.D (Opening)
100% of method compounds met criteria.
Internal standard areas were within 50 to 200% of the initial calibration with the following exceptions: None.

PHOENIX
Environmental Laboratories, Inc.

SDG: GBY06958

Volatile Soil Conformance / Non-Conformance Summary

Project ID / Client ID: 125 BATH STREET, NETC

The following compounds did not meet % deviation criteria: None.
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet recommended response factors: None.
The following compounds did not meet minimum response factors: None.

File: CHEM18 0426M29.D (Closing)
The following compounds did not meet maximum % deviations: None.
The following compounds did not meet minimum response factors: None.

Form 8 (Internal Standard and Retention Time):

File: CHEM18 - 0421M12.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

File: CHEM18 - 0424M11.D
All samples met internal standard area and retention time critieria with the following exceptions:
0424M22.D - B3-2 S-2 LL: 1,4-Dichlorobenzene-d4; Area 82520 (83939 - 347625)
0424M25.D - B3-2 S-1 LL: 1,4-Dichlorobenzene-d4; Area 79049 (83939 - 347625)
0424M29.D - FD-4 S-1 LL: 1,4-Dichlorobenzene-d4; Area 75475 (83939 - 347625)
-There is no impact to the data because all compounds reported from 1,4-Dichlorobenzene-d4 were reported from the HL analyses, which were within criteria.

File: CHEM18 - 0425M02.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

File: CHEM18 - 0426M02.D
All samples met internal standard area and retention time critieria with the following exceptions: None.

Observations: The client requested the 8260 compound list for this delivery group.
Sample(s) required a dilution for volatiles due to the presence of target and/or non-target compounds. This resulted in elevated reporting limits that exceed the requested criteria for one or more analytes.

IS5 (DXN) = 1,4-Dioxane*D8

Due to the poor response for certain compounds, 1,4-Dioxane-d8 is used as the internal standard for this delivery group.
Note, there are no recovery ranges for this internal standard.

AREA UPPER LIMIT = +100% of internal standard area
AREA LOWER LIMIT = - 50% of internal standard area
RT UPPER LIMIT = +0.50 minutes of internal standard RT
RT LOWER LIMIT = -0.50 minutes of internal standard RT
