EP Certification:

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in 40 CFR Part 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Thomas S. Seguljic, P.G., P.E., Vice President

1.0 INTRODUCTION

HRP Associates, Inc. (HRP) was contracted by the Herkimer County Industrial Development Agency (HCIDA) to conduct a Remedial Investigation (RI) at the Former Duofold Facility, located at 7 Spruce Street, Ilion New York, under a United States Environmental Protection Agency (EPA) Brownfield Assessment Grant (Agreement: BF-96261019-0). The Site, which has a long history of industrial activities dating back to the early 1900s has been the subject of several previous investigations by others that determined:

- Several metals are present in the soils across the property with isolated areas of elevated metal concentrations.
- Low concentrations of chlorinated solvents are present in the Site's soil gas, groundwater and soils.

Based on the previous investigations the Site is listed on the NYSDEC "Registry of Inactive Hazardous Waste Disposal Sites" as a "P" Site which is designated by the NYSDEC as a Site where:

> *"preliminary information indicates that a Site may have contamination that makes it eligible for consideration for placement on the Registry of Inactive Hazardous Waste Disposal Sites (commonly referred to as the list of State Superfund Sites). Further information and/or investigation, in the form of a Site characterization, is needed to determine if a Class P Site qualifies for listing of the Site on the Registry. Generally, to qualify for placement on the Registry, there must be evidence that hazardous waste was disposed on the Site and that any resulting contamination presents a significant threat (or reasonably foreseeable threat) to public health or the environment."*

To address the NYSDEC concerns, the Village of Ilion (Site owner) entered into a NYSDEC Order on Consent and Administrative Settlement (6-20200103-1) which in summary stated that the Village would submit a Remedial Investigation Sampling and Analysis Plan (RISAP), conduct a Remedial Investigation (RI) in accordance with the approved plan and submit an Investigation Report to the NYSDEC. The purpose of the investigation was to:

- Confirm that no drinking water wells are located in the area
- Determine if dissolved phase VOC is present in the areas of elevated soil gas concentrations
- Evaluate the extent of detected lead contamination
- Evaluate if soil gas and /or groundwater contamination is migrating of-Site

Therefore in accordance with the Order on Consent and EPA Brownfield Assessment Grant requirements, HRP prepared and submitted to the NYSDEC Region 6 and the EPA Region 2 a RISAP prepared in accordance with NYSDEC Program Policy DER-10 (Technical Guidance for Site Investigation and Remediation) and EPA Region 2 Quality Assurance Project Plan (QAPP) requirements. The documents were approved by the NYSDEC and EPA on March 20, 2020 and August 12, 2020, respectively.

Once approval was obtained, HRP initiated the following field activities:

- Review of the area for drinking water wells
- Sampling and analysis of surface and subsurface soil for metals and VOCs
- Sampling and analysis of groundwater for VOCs from new and existing groundwater monitoring wells.
- Soil Vapor Investigation for analysis of TO-15 VOCs in accordance with the October 2006 NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York

1.1 Site Description

The Site, known as the former Duofold Manufacturing Facility is located at 7 Spruce Street, Ilion, New York, in a suburban setting bordered in all directions by residential and mixed-use properties. The irregular shaped 12.23-acre Site, which is zoned Planned Use District consists of three contiguous parcels identified by the Herkimer County tax assessor as Parcel IDs: 120.29-1-63, 120.29-2-74.1, and 120.29-1-26. The Site is occupied by three (3) buildings totaling approximately 134,500 ft^2, which were constructed in 1907, including:

- Building A, a 124,000 ft^2, four-story building with a basement that formerly housed manufacturing and office activities. The building appeared to be in general fair to good condition with some areas of deterioration from water damage.
- Building B, a 4,500 ft^2 former boiler house appeared to be in generally poor condition, with areas of collapsed roof and floors.
- Building C, a 6,000 ft^2 one-story building formerly used for storage appeared to be in generally poor condition, with areas of collapsed roof and floors.

The remainder of the Site consists of parking and driveway areas, overgrown areas, and a fenced secured area.

A Topographic Map depicting the Site, surrounding areas, and topographic gradient is provided as Figure 1 – Site Location Map. A summary of surrounding areas includes:

North: Private residences, followed by Carquest, an automotive supply store
East: Private residences, followed by Irr Supply Centers Inc., a plumbing supply store, followed by Central Ave.
South: Private residences, followed by W. River St. followed by residential properties
West: Vacant land, followed by Pleasant Ave, followed by 4 Seasons Tire and Auto Center

1.2 Site History

Based on a review of historical documents, the Site was used for commercial/industrial use since approximately 1907. The Site was originally owned by the Library Bureau and utilized to manufacture wood veneer and furniture. Multiple railroad tracks associated with the West Shore Railroad were located on-Site with railroad sidings that access the Site buildings. The Library Bureau owned the property until at least 1923. By the 1930s, the property was owned by Remington-Rand Corporation and utilized to manufacture adding machines and typewriters. By WWII, the facility was retooled to manufacture naval shells. Between 1947 and 1949, the company merged with Sperry to become

Sperry-Rand Corporation. The on-Site facility was used to assemble and test computers and was utilized as a school to train technicians. The company changed its name to Sperry-Univac at some time in the 1950s, and computer manufacturing operations ceased by 1968 when Sperry-Univac moved to Utica; the property remained vacant for some time. In the early 1970's, the property was sold to Donald J. Retile and he began leasing portions of the buildings to the Duofold Corporation for knitting operations. Duofold, or other business names that represent Duofold including Ilion Properties, owned the Site since 1979 and utilized the Site to cut and sew winter clothes and underwear from pretreated and pre-dyed materials. The Site has remained vacant since 2001. The property was purchased by the Village of Ilion on March 12, 2019, from Coolidge Ilion LLC.

1.3 Previous Investigations

Available previous Site investigation reports are summarized below:

Final Draft Site Inspection Report- Sperry Univac
Prepared by NUS Corporation – Prepared for USEPA – August 31, 1990.

- The report provides a background of Site tenants and operations that have occurred on-Site since the property was developed in 1910, however, available background information concerning specific manufacturing activities conducted on-Site was limited. No specific waste sources related to manufacturing activities could be identified from available information, however, a coal-fired power plant was utilized for many years on-Site to provide heat and power to on-Site structures. Cinder covered driveway/parking areas from historical coal burning were identified at least on the north, south, and northeast portions of the Site.
- On May 8, 1990, NUS Corporation performed a sampling Site inspection with collection of ten soil samples. Low concentrations of polycyclic aromatic hydrocarbons were detected throughout the Site shallow soils, likely from cinders found on-Site and historical use of coal. Significant concentrations of lead, arsenic, and antimony were detected in the northeast corner of the Site. Tetrachloroethylene and significant concentrations of copper were detected near the loading dock in the central portion of the property, and dibenzofuran was detected on the western portion of the property. The quantity and extent of the contamination was not well defined. Also, it was unknown if soil contamination that was detected extends to off-Site properties. The Site has EPA ID number of NYD980532592.
- The report states that the Site is situated on the flood plain of the Mohawk River within the 100-year flood zone.
- The report recommends that monitoring wells and additional soil samples be installed on-Site and off-Site to determine the extent of contamination.

Phase I ESA
Plumley Engineering – December 2009

This Phase I did not identify Recognized Environmental Conditions (RECs) associated with the Site, however, it does not appear that Plumley reviewed historical reports associated with the Site. The Plumley report lists conditions that "pose the potential for environmental concern". These conditions generally include the historical use of the Site since the early 1900's for manufacturing purposes, the Site's listing as a CERCLIS NFRAP and scheduled participation in the State's Environmental

Restoration Program (ERP), the presence of a 30,000-gallon fuel oil tank, and the presence of significant debris within the building that was observed during Site reconnaissance that would require proper disposal.

Subsurface Investigation Report, Duofold Corporation, NYSDEC Site #622030
Prepared by Nature's Way Environmental – Prepared for the NYSDEC Region 6 Division of Environmental Restoration – January 6, 2015 (Revised).

Nature's Way conducted a subsurface investigation through installation of soil borings and monitoring wells. The investigation was performed at the request of the NYSDEC in response to CVOC, SVOC, and metals contamination identified during previous limited investigation of the Site. In total, 24 surface soil samples, six sub-foundation soil samples, and 12 subsurface soil samples were advanced and collected, and 12 subsurface sampling locations were converted to groundwater monitoring wells for assessment of soil and groundwater across the Site. Findings of the investigation include the following:

Subsurface:

- Fill material with variable texture is present across the entire Site at depths ranging from 0.5 ft. – 13.0 ft. across the Site. In general, the groundwater table identified at approximately 6 – 8 ft. bg. VOC headspace screening readings above background of 0.0 ppm were not identified in surface soils and subsurface soils that were collected.

Soil Sample Analytical Findings:

- PBCs were identified in three surficial samples analyzed from 0.19 to 0.84 ppm. PBCs were identified in three subsurface samples analyzed from 0.19 to 0.73 ppm.
- Pesticides were not identified in surficial samples at concentrations exceeding Part 375-6.8(b) Protection of Groundwater, Commercial, and Industrial SCOs. One pesticide, Eledrin was identified in one subsurface sample analyzed at 91 ppm. Other pesticides were identified that were flagged which may be correlated with a laboratory contamination event.
- One VOC, acetone was identified in one surficial sample analyzed at 160 ppb. Acetone was identified in three subsurface samples analyzed from 79 to 90 ppb.
- Metals were reported in ten surficial samples analyzed. Reported constituents for samples secured from six of these locations exceed Industrial SCOs. Detected constituents identified include arsenic, barium, copper, lead, mercury, nickel, and selenium. One to two metals were reported in four subsurface samples analyzed. Reported constituents for samples secured from each of these locations have at least one constituent that exceeds Industrial SCOs. Detected constituents identified include arsenic and lead.

SVOCs were reported in nine surficial samples analyzed. Reported constituents for samples secured from each of these locations exceed Industrial SCOs. Four SVOC constituents were reported in two of the subsurface samples analyzed. One constituent, benzo(a)pyrene in one location exceeds Industrial SCOs.

Groundwater Sample Analytical Findings:

- One to five VOC constituents were reported in eight groundwater samples analyzed. Constituents including chlorinated solvents were reported above TOGS 1.1.1 guidance values in six wells. Constituents include chloroform, tetrachloroethene, cis-1,2 dichloroethene, trans-1,2 dichloroethene, and trichloroethene.
- One to three SVOC constituents were reported in eight groundwater samples analyzed.
- PCBs were not identified in any of the groundwater samples.
- Pesticides were not identified in samples from eleven of twelve wells. Two constituents were identified in one groundwater sample, but both do not have an established TOGS 1.1.1 guidance values.
- Numerous metals constituents were identified above TOGS 1.1.1. guidance values in samples secured from each monitoring well.

Phase II Environmental Site Assessment (Targeted Brownfield Assessment Prepared for EPA)
Prepared by CDM Smith – April 10, 2017

- This report was a Targeted Brownfields Assessment prepared for the USEPA as part of the Region 2 Remedial Action Contract. The CDM Smith Phase II ESA was performed to investigate and confirm the findings of previous investigation results.

Conclusions and Recommendations of the report include the following:

- The geophysical survey was successful in identifying the utilities leading to the subject property, as well as, confirming the location of a backfilled pond used for fire suppression to the northwest of the main building. The geophysical survey identified several unknown utilities that may need to be further investigated in the case of Site rehabilitation.
- Based on the data generated during this Phase II ESA, CDM Smith concluded that the contaminated soil and groundwater exist at the Site and the presence of contaminants is most likely the result of former activities at the Site. Arsenic, barium, cadmium, chromium, copper, lead, nickel, selenium and zinc were metals detected at concentrations above the Unrestricted Use SCOs. The highest metal concentrations were identified at 4 to 5 ft. bg in borings closest to the former smokestack and silo. VOC impacted groundwater was identified on the western portion of the Site downgradient of a previously identified area that had PCE impacted soil. The VOCs observed in groundwater are breakdown products of PCE and VOC contamination appears to be degrading by natural attenuation.
- On-Site buildings were identified as unsafe for access as well as difficult to access in regard to sampling equipment. Contamination within the building or underneath the building is unknown.

Based on the findings of the CDM Smith Phase II and prior investigations, CDM Smith made the following recommendations:

- VOC-impacted groundwater may be easily managed via natural attenuation at the relatively low levels identified if the proper conditions exist. TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl

chloride area all present in groundwater samples indicating that PCE is breaking down. PCE and TCE concentrations are lower than what was identified in previous investigations, and cis-DCE, trans-DEC and vinyl chloride are significantly higher than in previous investigations. This is consistent with the notion that PCE is following its breakdown pathway. Samples should be collected for dehalococcoides, the dechlorinating bacteria, in addition to their catalyzing enzymes BAV1 vinyl chloride reductase (BVC), tceA reductase (tceA), and vinyl chloride reductase (VCR) to determine if there is a strong potential for reductive dichlorination. If the bacteria and specific Site conditions are not present other remedial options may be considered.

- Metal concentrations exceed Industrial Use SCOs adjacent to Building A. At DF-SB-11 the lead concentration exceeds the Industrial Use SCO more than 20 times. It is recommended that the contaminated subsurface soil adjacent to Building A is excavated and disposed of off-Site at an appropriate State or Federally regulated landfill. Additional sampling is recommended in this area of high subsurface soil metal contamination adjacent to Building A to delineate the vertical and horizontal extent. If necessary, the soil from the delineated sample area should be excavated and disposed off-Site at a regulated landfill.
- Surface soil throughout the Site did exhibit metal contamination at concentrations Unrestricted Use SCOs. Depending on the future use of the Site, these concentrations are manageable at the residential level. However, it would still be recommended that either a surface scrape be conducted in some areas removing 6 to 12 inches of soil, or a cap be placed over these areas to reduce exposure to the general public.
- A comprehensive inventory of all contents of the on-Site structures and containers should be performed prior to removal. Development of a recycling/waste disposal recycling plan can assist with sustainable disposal of discarded and abandoned materials. All waste removal should be conducted in accordance with State and Federal regulations and guidance documents.
- When undertaking Site development, it is recommended that the developer enlist a professional engineer or scientist to prepare a health and safety plan, construction contingency plans, and a soils management plan in order to safely and appropriately remove (and control) impacted materials. It is recommended that any work performed at the Site be performed by an environmental professional (or if necessary, a professional engineer) following approved plans and a Site specific health and safety plan approved by a certified industrial hygienist (CIH).
- In the absence of excavation, engineering controls should be implemented. These controls would require (1) the installation of pavement or topsoil/vegetative cover or installation and maintenance of a perimeter fence; and (2) that any construction involving the disturbance of soils, fill materials, or demolition of uncharacterized structures located on-Site (including non-emergency excavation, which may be part of utility repair or maintenance, or construction) should not be performed without the involvement of a professional engineer, and must be conducted in accordance with local, State, and Federal rules and regulations and provide adequate engineering controls and worker protection. In the absence of remediation, the values of adjacent and surrounding properties may be (and currently be) negatively impacted. The loss of property value may represent some risk to the public welfare, yet this risk may not be considered a significant risk.

2019 - Phase I Environmental Site Assessment - HRP Associates, Inc. (HRP)

In August 2019, HRP conducted a Phase I ESA of the subject property. The assessment revealed no recognized environmental conditions in connection with the property with exception of the following:

- Based on the historical use of the Site for manufacturing purposes between 1907 and 2001, areas of the Site are documented to have been impacted with heavy metals, PCBs, SVOCs, pesticides, and chlorinated solvents in areas of surface soil, subsurface soil, and/or groundwater. Some areas may require remediation and/or other environmental controls prior to future usage/development of the Site.

This assessment has revealed evidence of the following Historical Recognized Environmental Conditions (HREC) in connection with the Site:

- A spill (#0650005) was reported on-Site. Notes indicate that a transformer was disconnected and leaking. The transformer, concrete pedestal, and soil in the vicinity of the pedestal were removed for off-Site disposal, and confirmatory soil samples were collected for analysis of PCBs. Two detections were identified in eight samples collected at trace levels below applicable SCOs of 1 mg/kg. The spill was closed by the NYSDEC on January 10, 2008. Based on removal of equipment and spill closures this spill is not considered a REC to the Site.

This assessment has identified the following Business Environmental Risks (BERs) in connection with the Site:

- Based on the Site's vacancy since 2001 with no apparent upkeep since that time, significant water damage and general degradation was observed throughout all Site buildings. Apparent structural damage was observed in portions of Building A.
- A hazardous material survey is required prior to any renovations or demolitions of Site buildings. Suspect asbestos containing materials were observed to be significantly damaged condition within portions of the Site building.
- Minor oil staining was observed beneath the boiler in Building B and near the coal silo. This observation is not considered a REC as observed minor staining is considered a de minimus condition.
- Prior environmental reports indicate that monitoring wells remain on-Site, and there is no indication that they have been decommissioned. Based on the overgrown nature of exterior surfaces on-Site, monitoring wells, if any, were not observed during Site reconnaissance.
- Few empty drums and other containers were observed throughout observed areas of Site buildings. If raw materials are identified during further inspection/demolition of the building, they will need to be sampled and properly disposed.
- Transformers with PCBs have been documented as being removed from the Site, however, transformers may remain on-Site. If additional transformers are identified during further inspection/demolition of the building, they will need to be sampled and properly disposed.

- Few gravel piles and construction equipment are located along the southern perimeter of the Site on Parcel B. The gravel piles and equipment should be removed from the Site if materials do not belong to the owner of the Site.
- The area to the east of Building A consists of concrete, asphalt, and wood surfaces at grade where the Site was historically developed with building structures. Areas have become overgrown with vegetation. Prior to future development on-Site, these areas should be assessed by a structural engineer to determine risks associated with development.
- A spill (#1808311) was reported on-Site. Notes indicate that this spill was opened administratively to facilitate the cleaning and removal of the 30,000-gallon fuel oil AST on November 5, 2018. The report states that there was no known release at the time of issuance of this spill. The spill remains open with the NYSDEC. As such, follow up should be conducted with the NYSDEC to close the spill.
- The Site is located in FEMA Flood Zone AE where base flood elevations have been determined.

Summary of Previous Investigations

The findings of previous investigations conducted at the Site between 1990 to 2017 indicate that on-Site soil is impacted with metals constituents primarily including lead, chromium, mercury, and arsenic that slightly exceed NYSDEC applicable standards. Although impacted soils are widespread across the Site, their occurrence is generally limited to the upper strata of soil on-Site (less than 2 feet below grade) and correlates with historical fill including demolished building materials and ash from historical burning of coal. At one location to the west of the boiler plant, elevated concentrations of lead exceeding industrial cleanup standards were identified at 4-5 feet below grade (ft. bg). Areas may require additional characterization to determine if soils would require removal and management as hazardous waste. Its possible limited soil removal and capping could be completed.

On-Site groundwater is impacted with relatively low concentrations of chlorinated solvents with breakdown products of TCE present on-Site. The majority of impacts are present on the eastern portion of the Site, with higher concentrations of breakdown products relative to parent materials (PCE, TCE). Minor detections of other VOC constituents such as benzene, toluene, and xylene are present, but at concentrations that generally do not exceed TOGS standards.

Based on the results of previous investigations, the following data gaps were identified as requiring further investigation:

- No source of contamination has been identified. The origin of contaminants may be from materials spilled in small quantities, chemical storage areas, etc. with weathering of materials based on older releases.
- Metals were identified across the property with isolated areas of elevated metal concentrations.
- Low concentrations of level chlorinated solvents detected within groundwater with higher concentrations of breakdown products identified indicating that materials are naturally breaking down (i.e. Natural Attenuation).

- Off-Site impacts to groundwater and soil gas were not investigated.
- Elevated concentrations of lead were noted in the vicinity of the former boiler house, their extent and characteristics need to be determined.

2.0 SITE CHARACTERISTICS

2.1 Land Use

The Site is currently zoned as Planned Development District, as directed by the Village of Ilion, Chapter 250, Zoning Schedule A. The regulations for planned development districts are intended to provide a means for the development of residential, business, commercial, manufacturing, or recreational subdivision, or combinations thereof.

2.2 Topography

Topography at the Site is generally flat, and consists of glacially induced regional geomorphology, according to the Ilion 7.5-minute Quadrangle Map, (2013). Notable features such as till, glaciolacustrine silt and clay, and glacial outwash are present in the rural areas surrounding the Village of Ilion.

The ground surface is covered with concrete in the eastern section of the Site and asphalt surrounding the existing Site building. A landscaped lawn covers the remaining ground surface not covered by the asphalt or concrete. The surrounding topography located within one-half mile to the north, south, and east is relatively flat at an elevation of approximately 400 feet above mean sea level (amsl).

2.3 Hydrology

2.3.1 Surface Water

The Mohawk River, a NYSDEC Class "B" waterbody, is located approximately 800 feet north of the Site. Steele Creek (#876-407), a Class C stream, is located approximately 1000 feet southwest of the Site. Surface water in the general area runs off to the northeast, and recharges to the Mohawk River.

2.3.2 Wetlands

No obvious wetlands were observed on-Site during the RI. According to the New York State Environmental Resource Mapper (ERM), no New York State regulated freshwater wetlands are present at, or adjacent to, the Site. The nearest NYSDEC regulated wetland is IN-5, located approximately 800 feet west of the Site. IN-5 is a class 2 wetland, and measures 132.3 acres according to the ERM.

According to the U.S. Fish and Wildlife Service Wetlands Inventory, there are no federally recognized wetlands identified on-Site. The nearest federal wetland, PF01-E is located approximately 2100 feet west of the Site. PF01-E measures 5.9994 acres and is described as a freshwater forested/shrub wetland.

2.3.3 Floodplains

The Site is located in an area designated as FEMA Flood Zone AE where base flood elevations have been determined. AE flood zones are areas that present a flooding and a 26% chance over the life of a 30-year mortgage, according to FEMA. These regions are clearly defined in Flood Insurance Rate Maps and are paired with detailed information about base flood elevations. Most AE flood zones are located in close proximity to floodplains, rivers and lakes, though low-lying regions without large bodies of water may also be classified under this designation.

2.4 Geology

2.4.1 Surficial Geology

The Site is located on a relatively flat parcel at 400 feet above sea level in the Mohawk River Valley of central New York. According to the Surficial Geologic Map of New York, Hudson Mohawk Sheet, surficial geology on-Site is classified as outwash sand and gravel. Materials are characterized as coarse to fine gravel with sand from proglacial fluvial deposition, well rounded and stratified, generally with finer materials away from ice border, with variable thickness of 2-20 meters.

Previous Site investigations indicated that fill materials were encountered at depths varying from form of 0 to 6.5 ft below grade throughout the Site, underlain by native lake deposited sediment, then predominantly sand and gravel. Depth to bedrock is unknown as previous investigations investigated to a maximum depth of 20 feet below ground surface, and bedrock was not encountered during investigation.

2.4.2 Bedrock Geology

According to the Geologic Map of New York, Hudson Mohawk Sheet, underlying bedrock is the Hamilton group. The Hamilton Group is described by the United States Geological Survey (USGS) as Middle Devonian siltstone, mudstone, and sandstone. The Hamilton Group consists of the Mahantango Formation, a gray, dark gray, brown, and olive laminated shale; siltstone; and very fine-grained sandstone or claystone containing marine fossils. It overlies the Marcellus Shale, a fissile gray-black to black, thinly laminated, pyritic, carbonaceous thin shale with sparse marine fauna and siderite concretions. In New York State, the Hamilton Group thickens from 250 feet near Lake Erie to over 2,500 feet in Ulster and Greene counties.

No bedrock outcrops were observed on the Site during the reconnaissance. Further, depth to bedrock is unknown as previous investigations investigated to a maximum depth of 20 ft. bg, and bedrock was not encountered.

2.4.3 Hydrogeology

Groundwater at the Site is generally shallow and was measured at approximately six to eight (6 to 8) ft. below grade during the RI, and previous investigations. The groundwater gradient at the Site is 0.0011 ft/ft to the east-northeast towards the Mohawk River.

The nearest known water supply well is a Federal USGS Well located approximately 1/4 to 1/2 mile north-northeast of the Site. No active water supply wells were reported by the Town of Ilion within 1.0 miles of the Site. Potable water at the Site is provided by a public water supply.

3.0 RI SCOPE OF WORK

The work completed for this RI was generally consistent with the scope of work described in the Remedial Investigation Sampling and Analysis Plan (RISAP) dated February 19, 2020 (approved by NYSDEC on March 20, 2020). The RI was also conducted according to procedures and protocols outlined in the Quality Assurance Project Plan (QAPP), approved by the United Stated Environmental Protection Agency (USEPA) on August 12, 2020. A copy of the RISAP, QAPP, and the corresponding NYSDEC & USEPA approval letters are presented in Appendix A. Tasks included in the RI included sampling, analysis, and evaluation of soil, groundwater, and soil vapor.

Field work for this RI was conducted in several mobilizations to the Site and included the following tasks:

- Installation of 12 soil borings, installed from August 26-27, and September 9-11, 2020.
- Collection of ten (10) subsurface soil samples from August 26-27 and September 9-11, 2020.
- Collection of 19 surface soil samples from September 9-10, 2020.
- Collection of ten (10) groundwater samples from September 21–September 23, 2020.
- Collection of seven (7) soil vapor probes installed from September 9-14, 2020.
- Installation of five (5) monitoring wells installed from September 9-14, 2020.

To evaluate the degree and extent of contamination and condition of the Site's subsurface soils, HRP and NW Contracting mobilized to the Site on August 26 to 27th, and September 9 to 11, 2020, to install a total of twelve (12) soil borings (HRPB-1 through HRPB-12), five (5) groundwater monitoring wells (HRPMW-1, HRPMW-2, HRPMW-3, TMW-1, TMW-2), and seven (7) soil vapor probes (SV-1. SV-2, SV-3, SV-4, SV-5, SV-6, SV-7). In addition, nineteen (19) surface soil samples were collected from ten locations to better understand the degree and extent of surface soil contamination at the Site.

3.1 Soil Investigations

Soil boring were installed in locations (see Figure 2) to further investigate the areas of elevated soil gas and lead detections, NW and HRP collected representative soil samples from each soil boring using a truck-mounted drill rig. Soil boring locations are described below in the Soil Boring Location Summary table. Soil boring logs can be found in Appendix B.

SOIL BORING LOCATION SUMMARY		
Soil Boring ID	**Location**	**Justification**
HRPB – 1	Central portion of Site, located on former building footprint, downwind of the coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 2	Central portion of Site, located on former building footprint, downwind of the coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.

SOIL BORING LOCATION SUMMARY		
Soil Boring ID	**Location**	**Justification**
HRPB – 3	East-Central portion of Site, located on former building footprint, downwind of the coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 4	North portion of Site, adjacent to former loading dock area.	Evaluate degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 5	East portion of Site, near residential properties to the East of Site	Evaluate degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 6	East portion of Site, near plumbing supply store to the East of Site	Evaluate degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 7	West portion of the Site, upgradient, and upwind of the former coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 8	West portion of the Site, upgradient, and upwind of the former coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 9	Central portion of the Site, adjacent to the former coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB - 10	West portion of the Site, upgradient, and upwind of the former coal silo.	Identify unknown source of previously documented CVOC impacts in groundwater and soil vapor. Determine degree and extent of metals impacts beneath previously documented fill layer.
HRPB – 11	Central portion of Site, located on former building footprint, downwind of the coal silo.	Evaluate degree and extent of previously documented CVOC impacts in subsurface soil by PID analysis.
HRPB - 12	Central portion of Site, located on former building footprint, downwind of the coal silo.	Evaluate degree and extent of previously documented CVOC impacts in subsurface soil by PID analysis.

During soil boring installation, soil samples were obtained in new acetate liners, using a 2.25-inch outer diameter (O.D.) macro core sampler at each soil boring. Samples were screened in five-foot increments, to a total depth of approximately 16 feet below ground surface, or refusal.

After sample collection, a small portion (1-2 oz.) of each sample was placed in a polyethylene bag and allowed to attain ambient temperature before PID headspace analysis. PID headspace measurements are collected by inserting the PID probe tip into the polyethylene bag. During PID headspace analysis, each sample is evaluated for obvious physical evidence of contamination (i.e.

odor, staining). each sample was placed in laboratory-provided containers, labeled, and preserved on ice in a cooler. PID headspace analysis measurements and soil descriptions are presented as Appendix B – Soil boring Logs.

All non-disposable soil sampling equipment was decontaminated between samples using an Alconox wash followed by a clean water rinse. Boreholes that were not completed as monitoring wells were abandoned (backfilled) using native material and bentonite chips. All abandoned borings were checked 24-48 hours following abandonment to confirm that subsidence had not occurred and to backfill further if subsidence had occurred.

Based on the results of the field screening and observations, HRP selected one soil sample, from the subsurface interval exhibiting the highest PID reading, from each soil boring for laboratory analysis. When no elevated PID readings were observed, the soil samples that are described in the RISAP, or areas of staining or fill material were selected. It should be noted that due to the presence of concrete only one sample was collected at SS-9 from 0 -2 feet from soil boring SS-9.

HRP collected twenty-nine (29) soil samples total from the ten (10) soil borings, and ten (10) surface soil samples. Seven (7) subsurface samples were analyzed for TCL VOCs via USEPA Method 8260B, and twenty-nine (29) surface and subsurface samples for NYSDEC part-375 Metals via EPA Method 6010. All nineteen (19) surface soil samples were analyzed for Toxicity Characteristic Leaching Procedures (TCLP). The soil samples that were collected and analyzed are listed below.

SUBSURFACE SOIL SAMPLE SUMMARY		
Sample ID	**Depth**	**Justification**
HRPB-1	15.0′ - 16.0′	Evaluate metals and CVOC impacts to deep subsurface soils in elevated soil gas areas, adjacent to CDM Smith Soil Gas Sample #42.
HRPB-2	16.0′ - 17.0′	Evaluate metals and CVOC impacts to deep subsurface soils in elevated soil gas areas, adjacent to CDM Smith Soil Gas Sample #62
HRPB-3	15.0′ - 16.0′	Evaluate metals and CVOCs impacts to deep subsurface soils in elevated soil gas areas, adjacent to CDM Smith Soil Gas Sample #53
HRPB-4	6.5′ - 7.5′	Evaluate metals impacts to subsurface soils beneath the impacted fill layer, adjacent to former loading dock.
HRPB-5	6.5′ - 7.5′	Evaluate soils downwind of the coal silo, to quantify impacts beneath fill layer, observed at CDM Smith boring DF-SB-16.
HRPB-6	6.5′ - 7.5′	Evaluate soils at the East portion of Site, beneath observed fill layer.
HRPB-7	15′ - 16′	Evaluate deep overburden soils at the West/Central to evaluate areas of elevated soil gas adjacent to CDM-Smith soil gas sample #36

Sample ID	Depth	Justification
HRPB-8	15′ - 16′	Evaluate deep overburden soils at the West/Central to evaluate areas of elevated soil gas adjacent to CDM-Smith soil gas sample #35
HRPB-9	15′ - 16′	Evaluate deep overburden soils adjacent to former building and coal silo, to evaluate condition of soil beneath elevated lead impacts observed at CDM Smith boring DF-SB-11.
HRPB-10	6.5′ - 7.5′	Evaluate condition of subsurface soils upgradient, and upwind of the former coal silo, adjacent to CDM Smith soil boring DF-SB-2.
SS-1A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigations at locations DF-SS-2, and SB-25.
SS-1B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigations at locations SS-2, and SB-25.
SS-2A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during the NW Site characterization at locations SB-22 and SB-23
SS-2B	2″ – 24″	Confirm degree and extent of metals impacts identified in surface soil during the NW Site characterization at locations SB-22 and SB-23.
SS-3A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during the NW Site characterization at locations SB-22 and SB-15.
SS-3B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during the NW Site characterization at locations SB-22 and SB-15.
SS-4A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigations at SB-19 and MW-12.
SS-4B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigations at SB-19 and MW-12.
SS-5A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigation by NW Contracting at SB-14.
SS-5B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigation by NW Contracting at SB-14.
SS-6A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil identified during the NW Site characterization at SB-12 and SB-8.
SS-6B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during the NW Site characterization at SB-12 and SB-8.
SS-7A	0″ – 2″	Confirm absence of metals impacts to shallow surface soil identified during the NW Site characterization at soil borings SB-10 and SB-11.
SS-7B	2″ – 24″	Confirm absence of metals impacts to shallow surface soil identified during previous investigations at locations SB-10 and SB-11.
SS-8A	0″ – 2″	Confirm degree and extent of metals impacts to shallow surface soil, unidentified during previous investigations.
SS-8B	2″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil, unidentified during previous investigations.
SS-9	0″ – 24″	Confirm degree and extent of metals impacts to shallow surface soil identified during previous investigations at locations MW-9 and SB-8.
SS-10A	0″ – 2″	Confirm absence metals impacts to shallow surface soil identified during previous investigation by NW Contracting at SB-7 and SB-9.
SS-10B	2″ – 24″	Confirm absence metals impacts to shallow surface soil identified during previous investigations at SB-7 and SB-9.

3.2 Groundwater Monitoring: Overburden Monitoring Well Installation, Development, Sampling

To evaluate if the area of elevated soil gas concentration is the source of elevated groundwater VOC concentrations and if the groundwater contamination is migrating off-Site HRP and NW mobilized to the Site on August 26 to 27th, and September 9 to 14, 2020, to install (5) groundwater monitoring wells (HRPMW-1, HRPMW-2, HRPMW-3, TMW-1, TMW-2). Groundwater monitoring well sampling procedures were conducted as outlined in the RISAP. The locations of the monitoring wells are presented on Figure 3.

Monitoring well locations were chosen with approval from NYSDEC and NYSDOH and are described as follows.

Sample ID	Sample Location	Justification
HRPMW-1	Downgradient of former Duofold Facility	Evaluate condition of groundwater quality beneath former facility, evaluate groundwater in areas of previously documented CVOC impacts.
HRPMW-2	Downgradient of former Duofold Facility	
HRPMW-3	Downgradient of former Duofold Facility	
TMW-1	Downgradient of former Duofold Facility	Evaluate off-Site migration of contaminants.
TMW-2	Downgradient of former Duofold Facility	
ANALYSES		
All samples were analyzed for the following: TCL VOCS EPA 8260		

Overburden Monitoring Wells - Methods of Installation

Monitoring wells were installed at the Site within unconsolidated overburden material to enable the monitoring of groundwater elevation and acquisition of groundwater samples for laboratory testing. Five (5), 2-inch diameter, PVC monitoring wells were installed in the shallow saturated zone beneath the Site (see Appendix C for Monitoring Well Construction Details). The monitoring wells were installed using the procedures described below:

- Soil borings were advanced to the desired depth using a Geoprobe.
- The 2-inch diameter Schedule 40 PVC well screen (0.010-inch slot) and riser pipe were inserted and placed on the bottom of the borehole and extended to intersect the water table. The riser was capped to prevent well construction materials from entering the well.
- Washed silica was poured into the annular space between the well material and the borehole sidewall. The sand pack continued to at least 2 feet above the top of the screen section.

- Above the sand, a seal (bentonite pellets) was formed in the borehole. The bentonite seal extended at least 2 feet above the top of the sand pack section.
- Clean water was periodically added to the borehole to hydrate the pellets. The pellets were then allowed to hydrate for at least 30 minutes.
- The well risers were cut to approximately 2-inches below grade and a gripper plug was inserted onto the top of each well casing. Flush mount road boxes were then installed over each well riser for protection.

Overburden Monitoring Wells - Methods of Development

On September 14, 2020, HRP mobilized to the Site to develop the five (5) recently installed monitoring wells. HRP developed the wells utilizing a peristaltic pump and new polyethylene tubing. This method was chosen as the appropriate well development method based on water depth, well productivity, and sediment content of the water. Non-disposable equipment (i.e. water level indicator) was decontaminated prior to use in each well. Care was taken not to introduce contaminants to the equipment during installation.

Overburden Monitoring Wells - Methods of Sampling

To evaluate the groundwater quality beneath the Site, HRP mobilized to the Site on September 21-23, 2020, and groundwater samples were collected from all five (5) new monitoring wells. Five (5) existing monitoring wells (DF-MW-2, DF-MW,7, DF-MW-8, DF-MW-9, DF-MW-10) were also selected for sampling, according to the NYSDEC and EPA approved RISAP during field activities.

A minimum of 48 hours following development elapsed prior to commencing groundwater sampling. Groundwater samples were collected from each monitoring well in accordance with USEPA Low Flow purge and sample guidelines. Field parameters, including dissolved oxygen (DO), oxidation-reduction potential (ORP), hydrogen ion activity (pH), temperature, specific conductivity (SC), and turbidity, were measured using a multi-parameter meter with a flow-through cell connected directly to the pump discharge. Purging required removing water from the well at a rate of at least 250 milliliters per minute, but not exceeding 1 liter per minute for a sufficient length of time for water quality parameters to stabilize (a.t least 30 minutes). Drawdown did exceed ten percent of the standing water column due to poor recharge. Sampling commenced immediately after purging, without adjusting the flow rate or water intake depth. Groundwater purged during sampling activities was appropriately handled in accordance with DER-10 procedures and protocols. A copy of Groundwater Monitoring Well Sampling Logs is presented as Appendix D.

Groundwater samples from ten (10) selected monitoring wells (DF-MW-2, DF-MW-7, DF-MW-8, DF-MW-9, DF-MW-10, HRP-MW-1, HRP-MW-2, HRP-MW-3, TMW-1, TMW-2) were submitted to Hampton-Clarke, Inc. ELAP certified laboratory of Fairfield, New Jersey for analysis of 6 NYCRR Part 375 VOCs by USEPA Method 8260. Groundwater samples were decanted directly into laboratory-supplied containers and placed in a cooler with ice. All samples were delivered to the laboratory under chain of custody procedures in accordance with the QAPP.

3.3 Well Surveying and Water Levels

Groundwater monitoring well elevations were surveyed by Labella Associates (LaBella) on October 14, 2020 using a transit level. Monitoring well elevations surveyed during the RI were referenced to previously measured top-of-well elevations provided during previous investigations, and were measured to the nearest 0.01 foot, above mean sea level (Ft. AMSL).

Table 1 presents the depth to water measurements, date of measurement, corresponding water level elevations, and total well depth. The depth to groundwater was measured to the nearest 0.01 foot using an electronic water level meter at groundwater monitoring wells HRP-MW-1, HRP-MW-2, HRP-MW-2, TMW-1, TMW-2, DFMW-2, DFMW-7, DFMW-8, DFMW-9, and DFMW-10 on September 21, 2020. Depth to groundwater from the top-of-well casing ranged from 6.28 feet at TMW-1 to 11.98 feet at HRP-MW-3. Groundwater contour elevations calculated from the September 21, 2020 measurements are presented as Figure 3 – Groundwater Elevation Contour Map.

3.4 Soil Vapor Probe Installation

Installation and Sampling

To evaluate the shallow soil vapor conditions within the areas of detected soil gas and downgradient (presumed downgradient locations) seven (7) temporary soil vapor probe (SV-1 through SV-7) were installed at the locations summarized below and noted on Figure 4 . The selected locations were coordinated with the NYSDEC and NYSDOH and selected based on the results of previous investigations conducted at the Site. Each of the collected soil vapor samples was submitted to state certified laboratory for analysis of VOCs via Method TO-15.

Sample ID	Sample Location	Justification
SV-1	Central portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate soil vapor in areas of documented CVOC impacts, adjacent to CDM Smith sample location #42.
SV-2	Central portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate soil vapor in areas of documented CVOC impacts, adjacent to CDM Smith sample location #62.
SV-3	Central/east portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate soil vapor in areas of documented CVOC impacts, adjacent to CDM Smith sample locations #53 and #54.
SV-4	Central/north portion of Site, downgradient of former Duofold Facility, located in loading dock area.	Evaluate downgradient soil vapor concentrations adjacent to loading dock and confirm results of CDM Smith soil vapor sample #12.

Sample ID	Sample Location	Justification
SV-5	East portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate downgradient soil vapor concentrations adjacent to residential areas to the east of the Site, and to Confirm findings of CDM Smith sample #16, #31, and #45
SV-6	East portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate downgradient soil vapor concentrations adjacent to residential areas to the east of the Site, and to Confirm findings of CDM Smith sample #54 and #64.
SV-7	West portion of Site, downgradient of former Duofold Facility, located in area of demolished factory building.	Evaluate upgradient soil vapor in areas of documented CVOC impacts, adjacent to CDM Smith sample #36.
ANALYSES		
All samples were analyzed for the following: TCL VOCS TO-15		

Soil vapor sampling points were installed in accordance with New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006.

A direct push drill rig was used to facilitate the collection of the soil vapor samples by boring a hole into the ground to immediately above the water table. The following procedures were followed during soil vapor sampling:

- Soil vapor samples were collected using ½-inch diameter by 6-inch long plastic screen fitted with polyethylene tubing.
- Porous backfill material (quartz filtration media) was used to create a sampling zone 1 to 2 feet in length around the plastic screen.
- Soil vapor probes were sealed above the sampling zone with a bentonite slurry to prevent outdoor air infiltration. The remainder of the borehole was backfilled with sand.
- One to three volumes of air were purged from the soil vapor probe using a motorized air pump with a low flow module. Flow rate did not exceed 0.2 liters per minute to minimize outdoor air infiltration during sampling.
- Soil vapor samples were collected into 1-liter canisters provided by the analytical laboratory.
- A tracer gas, helium, was used during soil vapor sample collection to verify that adequate sampling techniques were being implemented.

When collecting soil vapor samples, a tracer gas serves as a quality assurance/quality control device to verify the integrity of the soil vapor probe seal. Without the use of a tracer gas, there is no way to verify that a soil vapor sample has not been diluted by surface air.

HRP used balloon-grade helium as a tracer gas for this RI. After the soil vapor probe was set and the surface bentonite seal was in place, a new plastic pail was placed over the implant tubing, while allowing the tubing to protrude from the enclosure. The enclosure was sealed to the ground surface and the effluent tubing using additional bentonite slurry. Next the tracer gas was introduced into the enclosure up to a concentration of 50% helium. Using a geo-pump, a one (1) Liter Tedlar bag was filled from the protruding implant tubing. If high concentrations of the tracer gas (>20%) were noted by the MGD-2002 helium detection meter, the seal of the probe would have been re-evaluated. When high concentrations of tracer gas did not exist within the implant, purging and sampling commenced.

The volume of the sample train (implant and tubing) was calculated and slowly removed (purged) using a syringe. After the purge was completed, a 1-liter canister was directly attached to the tubing. The summa canister valve was then opened and allowed to fill. When the pressure gauge on the canister neared ambient level or after a time of approximately 120 minutes had elapsed, the valve was closed.

All sampling equipment was removed from the borehole. The canisters were appropriately labeled and stored in a shipping container. Soil vapor boreholes were abandoned (backfilled) using bentonite chips. Soil vapor probe construction diagrams are presented in Appendix E.

3.5 Quality Control Sampling and Analysis

Field quality control samples are intended to help evaluate conditions resulting from field activities and are intended to accomplish two primary goals: assessment of field contamination, and assessment of sampling variability. The former looks for substances introduced in the field due to environmental or sampling equipment and are assessed using blanks of different types. The latter includes variability due to sampling technique and instrument performance as well as variability possibly caused by the heterogeneity of the matrix being sampled and are assessed using replicate sample collection.

Equipment blank (EB) samples are obtained by decanting laboratory supplied water over or through the decontaminated equipment used for sampling. EB samples provide a means of assessing potential contamination present in sampling equipment, ambient conditions, sample containers, transportation, and the laboratory. Field reagent blank samples (FRB) are sample containers directly filled in the field using laboratory supplied water. FRB samples determine potential contamination from ambient conditions, sample containers, transit, and the laboratory. Trip blanks (TB) are prepared by the laboratory and shipped to and from the field. TBs assess contamination from shipping and the laboratory and are generally only collected in tandem with VOC samples.

Duplicate, Matrix and Matrix Spike Duplicate for soil and groundwater samples were collected at a minimum frequency of one (1) per 20 samples. Aqueous trip blanks were submitted in conjunction with samples collected for analysis of VOCs at a frequency of one (1) per 20 samples. Field blank (FB) samples were analyzed as a quality control measure to evaluate whether contaminants are being introduced from equipment, environmental sources, or the laboratory (EB) samples collected

for QA/QC (EB, TB, FB) were analyzed in accordance with the approved QAPP -party data validator, for Data Usability.

4.0 REMEDIAL INVESTIGATION RESULTS

This section presents the results of the Analytical Samples collected during the RI. As described above, all samples were collected and handled in accordance with the NYSDEC and EPA approved Remedial Investigation Sampling and Analysis Plan (RISAP) and Quality Assurance Project Plan (QAPP).

Compounds detected in the various media tested during this RI were compared to the following New York State guidance documents and standards:

- NYSDEC Regulation, 6 NYCRR Subpart 375-6, "Remedial Program Soil Cleanup Objectives (SCO)" which applies to the development and implementation of the remedial programs for soil and other media set forth in subparts 375-2 through 375-4 [Inactive Hazardous Waste Disposal Site Remedial Program, Brownfield Cleanup Program, and Environmental Restoration Program] and includes the soil cleanup objective tables developed pursuant to ECL 27-1415(6). A summary of soil sample locations is provided at Table 2

- Groundwater: NYSDEC Division of Water Technical and Operational Guidance Series (TOGS 1.1.1); Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations dated October 1993; Revised June 1998; ERRATA Sheet dated January 1999; and Addendum dated April 2000. A summary of groundwater sample locations is provided at Table 3.

- NYSDOH Soil Vapor: Guidance for Evaluating Soil Vapor Intrusion in the State of New York prepared by the New York State Department of Health dated October 2006. A summary of soil vapor sample locations is provided as Table 4.

At the time of the RI, the intended future use for the Site was unknown. For purposes of this RI Report, possible industrial, commercial, residential, and restricted residential uses have been considered. Accordingly, soil analytical results for this investigation were compared against Unrestricted, Residential, Restricted Residential, Commercial and Industrial Soil Cleanup Objectives (SCOs). Analytical results are included in Appendix F, and the Data Usability Summary Report (Table 5, Appendix G), and discussed below.

4.1 Surface Soil Results

As described above, a total of twenty (20) surface soil samples were collected and submitted for laboratory analysis. Samples were analyzed for Part 375 Metals (Total and TCLP). Sample results are tabulated in Table 6, presented on Figure 5 and discussed below.

Analytical Results

Metals including Mercury, Barium, Copper, Lead, Chromium (Cr III), Nickel, Zinc, Arsenic, are constituents of soil, and were detected at concentrations exceeding Unrestricted SCOs in all samples collected during the RI.

Specific metals identified as contaminants of concern in the RISAP included lead and arsenic. Lead was detected at concentrations exceeding the Unrestricted SCOs at samples SS-1A, SS-1B, SS-2A, SS-2B, SS-3A, SS-3B, SS-4A, SS-4B, SS-5A, SS-5B, SS-6A, SS-6B, SS-8B, and SS-9. Figure 5 presents the surface soil analytical data depicting only compounds that exceeded the Unrestricted SCO. The highest detection of lead was detected in SS-9, at a concentration of 1000 mg/kg, above Commercial SCOs.

Arsenic was detected at concentrations exceeding the Industrial SCO at surface soil sample location SS-1B, and SS-6B, at concentrations of 27 mg/kg and 18 mg/kg, respectively. Soil sample SS-6A exceeded the Unrestricted SCO at concentration of 16 mg/kg. No other samples exceeded Part 375 UUSCOs during the RI.

TCLP RCRA 8 Metals were not detected above regulatory levels established by 40 CFR § 261.24.

4.2 Subsurface Soil Results

As described above, a total of ten (10) subsurface soil samples were collected and submitted for laboratory analysis. Samples were analyzed for Part 375 Metals and VOCs. Sample results are tabulated in Table 7, presented on Figure 6 and discussed below.

Analytical Results

Subsurface soil samples collected by HRP during the RI indicate the presence of metals, specifically Chromium (III), Lead, Nickel, and Zinc above Part 375 Unrestricted SCOs in all samples collected during the RI. Lead was detected at concentrations above Part 375 Unrestricted SCO at HRPB-3, HRPB-4, and HRPB-7. Lead was detected at concentrations above the Commercial SCO at a concentration of 440 mg/kg at soil boring HRPB-3.

Arsenic was not detected at concentrations above applicable SCOs in any of the subsurface samples collected during the RI.

With the exception of acetone in HRPB-2 and HRPB-10, no VOCs were detected at concentrations exceeding applicable SCOs in any of the subsurface samples collected during the RI.

4.3 Groundwater Results

As described above, a total of ten (10) groundwater samples were collected and submitted for laboratory analysis of VOCs by USEPA Method 8260. A summary of the groundwater analytical results is tabulated as Table 8 and presented with the in Figure 7.

Analytical Results

CVOCs including 1,1-Dichloroethene, cis-1,2-Dichloroethene, Tetrachloroethene, trans-1,2-Dichloroethene, Trichloroethene, and Vinyl chloride were detected above TOGS 1.1.1 groundwater standards and guidance values in all groundwater monitoring wells at the Site. Total VOC concentrations ranged from 6.4 micrograms per liter (µg/l) at DF-MW-7 to 550 µg/l at HRP-MW-1.

Degradation products such as Cis-1,2-Dichloroethane were generally reported at higher concentrations than associated parent compounds such as TCE.

No petroleum-derived constituents were reported any groundwater sample collected during the RI.

4.4 Soil Vapor Results

Seven (7) soil vapor samples (SV-1, SV-2, SV-3, SV-4, SV-5, SV-6, and SV-7) were collected from the Site on September 22, 2020, and submitted for laboratory analysis of VOCs by USEPA Method TO-15. Sample results are presented on Figure 8, tabulated in Table 9, and discussed below.

Analytical Results

VOCs were detected in each of the soil vapor samples at concentrations greater than the laboratory reporting limit (RL).

PCE and TCE were the most prevalent compounds reported in soil vapor samples. The highest TCE concentration reported during the RI was at HRP-SV-1 at a concentration of 17,100 µg/m^3. PCE was detected at 7,320 µg/m^3 HRP-SV-3 µg/m^3. PCE and/or TCE was reported in all samples collected during the RI. Degradation products such as Cis-1,2-Dichloroethane (Cis 1,2-DCE) and Vinyl Chloride were generally reported at lower concentrations than associated parent compounds such as TCE and PCE.

Cis 1,2-DCE was detected above the RL at SV-1, SV-2, SV-3, and SV-5. Cis 1,2-DCE was not detected above the RL at SV-4, SV-6, and SV-7. Degradation compound Cis 1,2-DCE was detected at HRP-SV-1 at 1650 µg/m^3 and represents the highest degradation compound concentration reported during the RI.

4.5 Data Validation and Usability

Analytical data obtained during the RI were validated to evaluate the usability of the data. Data Usability Summary Reports (DUSRs) are provided in Appendix G. The DUSRs indicate which data are subject to limitations and identify certain data that are flagged as rejected and should not be used. All data was qualified as usable with the following exceptions (table 5):

- The "not detected" volatile results for 2-butanone were qualified as rejected, unusable (R) in samples DF-MW-8 and TMW-1
- The "not detected" volatile results for dichlorodifluoromethane and chloromethane were qualified as rejected, unusable (R) in samples HRP-MW-2, TMW-2, and DUP
- The "not detected" volatile result for 2-chlorethylvinylether was qualified as rejected, unusable (R) in sample DF-MW-10
- The "not detected" volatile result for vinyl chloride was qualified as rejected, unusable (R) in sample HRP-MW-2

All data that are not qualified rejected, unusable (R) are considered usable, with estimated (J, J-, or UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the DUSR, and included as Appendix G.

5.0 NATURE AND EXTENT OF CONTAMINATION

The following sections present a discussion of the nature and extent of contamination, based on the results of all environmental investigations completed to date.

5.1 Primary Contaminants of Concern

Based upon a review of the documented history, previous investigations conducted at the Site, and data obtained during this RI, Contaminants of Concern (COCs) for the Site include VOCs (chlorinated VOCs (cis-1,2-Dichloroethene, Tetrachloroethene, trans-12-dichloroethene, Trichloroethene, and Vinyl Chloride), and metal compounds (Lead and Arsenic). The following sections provide a discussion of the analytical results of the COCs in the soil, groundwater, and soil vapor.

5.2 Nature and Extent of Soil Impacts

5.2.1 Metals

Lead
Metals are a constituent of soil and were detected in all soil samples during all previous subsurface investigations at the Site. Contaminated fill is believed to be a source of metals impacted soil at the Site. A large, approximately 110,660 square foot portion of the former factory was demolished between 1982 and 1985 and was likely discarded on-Site. Another approximately 35,000 square foot structure located on the west portion of the Site was also demolished between 1974 and 1982 and was understood to be the paint spraying area of the factory. The source of lead in the fill material is believed to be lead paint, as lead was commonly added to paint to increase durability, drying time, and resistance to moisture.

Arsenic
Arsenic impacts to shallow surface soils were in close proximity and mostly downwind of the coal silo at the Site. Prevailing winds at the Site are historically documented to be from the northwest.

Cinder, ash, and coal were identified in soils logged by Nature's Way, CDM Smith, and HRP in the overlying fill layer, present between 0.0 and 6.5 ft. bg across the Site. The Site Arsenic impacts to shallow soil are most-likely attributed to historic Site use and operations.

While no specific documentation was identified through historic research to identify a specific source of onsite arsenic detections, it is probable the presence of arsenic in fill is due to the activities described below. No. 6 fuel oil and coal were historically used to heat the facility, and a coal silo was identified at the Site. Arsenic impacts to shallow surface soils were identified by CDM Smith and HRP in close proximity and mostly downwind of the coal silo at the Site. Cinder, ash, and coal were identified in boring logs provided by Nature's Way, CDM Smith, and HRP to be present in the overlying fill layer, present between 0.0 and 6.5 ft. bg across the Site, depicted in the Geologic Cross Sections provided as Figure 9, and Appendix H.

Metals including Mercury, Copper, Lead, Chromium (Cr III), Nickel, Zinc, Arsenic were recorded above Part 375 UUSCOs in all samples collected during the RI. Figure 10 presents the surface soil

analytical data, and compounds that exceeded the NYSDEC UUSCOs. Geologic cross section B-B' identifies the thickness of surficial fill material approximately 6.5 thickness adjacent to CDM Smith soil boring DF-SB-11A, and Nature's Way soil boring SB-12 (SF). Impacted fill material is most likely the source of lead and arsenic impacted soil at the Site, due to the lateral and vertical extent.

Soil analyzed for metals below 6.5 feet did not generally exceed Part-375 commercial use SCOs. A table of COCs and the range of reported concentrations during previous investigations is presented below.

Contaminant of Concern (COC)	Concentration Range
Lead	[84,280 mg/l (DF-SB-11A) to 8 mg/l (DF-SB-06)]
Arsenic	[284 mg/l (SB-12) to 2.4 mg/l (SS-5A)]
Mercury	[1.2 mg/l (SB-15) to Non-Detect (SS-5A)]
Copper	[295 mg/l (SB 3 SS) to 11 mg/l (SB 27)]

The analytical results for the subsurface soil samples collected during the RI are presented in Table 7 and compared to all Part 375 SCOs. Subsurface soil samples collected by HRP during the RI indicate the presence of metals, specifically Chromium (III), lead, nickel, and Zinc above Part 375 UUSCOs in all samples collected during the RI. Figure 7 presents the soil analytical data, and compounds that exceed Unrestricted Use Soil Cleanup Objectives, per 6 NYCRR Part 375, Table 375-6.8(a). Figures 10 and 11 illustrate the nature and extent of surface and subsurface soil impacts.

Toxicity Leaching Characteristic Procedures (TCLP)
TCLP are designed to replicate the leaching of contaminants in municipal landfills, and were performed during the RI, and during the CDM Smith investigation. No metals were reported above 40 CFR § 261.24 regulatory levels by TCLP analysis during the RI. TCLP metals results indicate metals are not leaching from soil.

5.2.2 PCBs

PCBs were not recorded above the method detection limit (MDL) in all soil and groundwater samples collected by CDM Smith during the 2017 Site investigation. Nature's Way detected PCBs below Part-375 Residential Use Cleanup Objectives (RUSCOs) in fill material at surficial samples SB-5 SS (0.5'-2.0') and MW-8 (0.5'-1.5') at concentrations of 0.4 mg/l of 0.19 mg/l, respectively. PCBs were not identified as a COC during previous investigations at the Site and were not evaluated as a part of the RI.

5.2.3 Pesticides & Herbicides

Pesticides and herbicides were not recorded above the method detection limit in any of the surface soil samples collected by CDM Smith. Pesticides and Herbicides were reported at concentrations below CUSCOs in all surficial and subsurface samples collected by Nature's Way. Agricultural products were not produced at the Site and were not documented during HRP's Phase I Investigation. Agricultural activities were not conducted at Site, and previous industrial Site activities did not include the use or manufacturing of pesticides or herbicides. Pesticides and Herbicides were

not identified as COCs during previous investigations and were not evaluated during as a part of this RIR.

5.2.4 Volatile Organic Compounds (VOCs)

No petroleum or CVOCs were detected above part 375 RUSCOs in all surficial and subsurface soil collected during investigations by Nature's Way, CDM Smith, and HRP, with the exception of Acetone. Acetone is not derived from TCE, PCE, or petroleum, and is understood to be a laboratory artifact.

Various CVOCs have been detected and are understood to have been attributed to historical surface cleaner and coating storage at the Site. Chlorinated VOCs were commonly used throughout various industries in manufacturing to degrease and maintain machinery. There are no known source areas at the Site, and no other potential sources (i.e. Underground Storage Tank (UST), Dry-well, etc.) were identified during a previous ground penetrating radar survey (GPR) conducted at the Site in October 2016 by Delta Geophysics Inc (Delta), or by Susan A. Anacker, P.C. in 2020.

5.3 Nature and Extent of Groundwater Impacts

5.3.1 SVOCs and Pesticides and Herbicides

As described in Section 5, groundwater impacts are limited to the presence of VOCs in limited areas. SVOCs were detected above the AWQSs only in one duplicate sample during previous investigations. and not adversely impacted groundwater quality. Pesticides and herbicides were not detected at concentrations greater than the AWQSs in any of the wells sampled and have not adversely affected groundwater quality.

5.3.2 PCBs and Metals in Groundwater

Total PCBs were not detected at concentrations greater than the AWQS in any of the wells sampled and 1,4-dioxane was not detected in any groundwater samples above the laboratory reporting limit. Neither of these compounds has adversely affected groundwater quality. The only metal routinely detected above the AWQS is manganese, which is a naturally occurring compound often found at elevated concentrations. Manganese was not identified as a contaminant of concern in soil samples. Manganese in groundwater is not considered to be a result of contamination at the Site on this basis.

5.3.3 VOCs in Groundwater

VOCs were detected in groundwater above the AWQS are attributable to historical operations at the Site. Concentrations of chlorinated solvents were detected in groundwater above AWQS in all samples collected during the RI. CVOCs understood to have been attributed to historical surface cleaner and coating storage at the Site. CVOCs were commonly used throughout various industries in manufacturing to degrease and maintain machinery. There are no known source areas at the Site, and no other potential sources (i.e. Underground Storage Tank (UST), Dry-well, etc.) were identified during a previous ground penetrating radar survey (GPR) conducted at the Site in October 2016 by Delta Geophysics Inc (Delta), or by Susan A. Anacker, P.C. in 2020.

Ten (10) groundwater samples were collected and sent for laboratory analysis of VOCs by USEPA Method 8260. CVOCs including 1,1-Dichloroethene, cis-1,2-Dichloroethene, Tetrachloroethene, trans-1,2-Dichloroethene, Trichloroethene, and Vinyl chloride were detected above TOGS 1.1.1 in all groundwater monitoring wells at the Site. Six (6) of twelve (12) monitoring wells sampled during the Nature's Way investigation recorded CVOCs above TOGS 1.1.1. Standards and Guidance Values.

Contaminant of Concern (COC)	Concentration Range
Tetrachloroethylene (PCE)	[6.7 µg/l (MW-7) to Non-Detect (DF-MW-3)]
Trichloroethylene (TCE)	[210 µg/l (HRP-MW-1) to Non-Detect (DF-MW-3)]
Cis-1,2-Dichloroethylene	[370 µg/l (DF-MW-8) to Non-detect (DF-MW-3)]
Trans-1,2-Dichloroethylene	[17 µg/l (DF-MW-2) to Non-Detect (HRP-MW-3)]
Vinyl Chloride (VC)	[38 µg/l (TMW-1) to Non-Detect (DF-MW-3)]

No petroleum-derived constituents were reported in any groundwater samples collected during the RI. A summary of the groundwater analytical results is provided as Table 8 and depicted as Figure 8. A figure that depicts all exceedances of TOGS 1.1.1 groundwater standards and guidance values during the Nature's Way, CDM Smith, and HRP investigations, is presented as Figure 12 – Nature and Extent of Groundwater Impacts.

Groundwater monitoring wells TMW-1 and TMW-2 were installed to evaluate offsite groundwater at the Site. Samples collected from each offsite monitoring well indicate VOCs above TOGS 1.1.1 groundwater standards and guidance values. PCE and TCE, and degradation compounds Cis-1,2-DCE were the most prominent CVOCs detected. Data analyzed during the RI indicates the offsite migration of dissolved-phase chlorinated solvents from the central portion of the Site to the East-Northeast. A map depicting the extent of groundwater impacts is provided as Figure 12.

5.4 Nature and Extent of Soil Vapor Impacts

Analytical results from the RI indicate that VOCs were detected in each of the soil vapor samples at concentrations greater than the laboratory reporting limit (RL). Locations of soil vapor probes and analytical results compared to the 2017 CDM Smith soil gas survey as Figure 13 – Nature and Extent of Soil Vapor Impacts.

PCE and TCE were the most prevalent compounds reported in soil vapor samples. PCE and/or TCE was reported in all samples collected during the RI. The highest TCE concentration reported during the RI was at HRP-SV-1 at a concentration of 17,100 µg/m^3. PCE was detected at 7,320 µg/m^3 HRP-SV-3 µg/m^3. Degradation products such as Cis-1,2-Dichloroethane (Cis 1,2-DCE) and Vinyl Chloride were generally reported at lower concentrations than associated parent compounds such as TCE and PCE.

Contaminant of Concern (COC)	Concentration Range
Perchloroethylene (PCE)	[7,320 µg/m^3 (SV-3) to 1.8 µg/m^3 (SV-7)]
Trichloroethylene (TCE)	[17,100 µg/m^3 (SV-1) to 1.2 µg/m^3 (SV-4)]
Cis-1,2-Dichloroethylene	[1,650 µg/m^3 (SV-1) to Non-Detect (SV-4, SV-6, SV-7)
Trans-1,2-Dichloroethylene	[84.8 µg/m^3 (SV-1) to Non-Detect (SV-2, SV-3, SV-5, SV-6, SV-7)

Vinyl Chloride (VC)	[2.4 µg/m^3 (SV-2) to Non-Detect (SV-1, SV-2, SV-3, SV-5, SV-6, and SV-7]

Cis 1,2-DCE was detected above the RL at SV-1, SV-2, SV-3, and SV-5. Cis 1,2-DCE was not detected above the RL at SV-4, SV-6, and SV-7. Degradation compound Cis 1,2-DCE was detected at HRP-SV-1 at 1650 µg/m^3, and represents the highest degradation compound concentration reported during the RI. A summary of soil vapor analytical data is presented at Table 9. Soil vapor sampling results indicate accumulation of contaminated soil vapor in the unsaturated zone from chlorinated solvents and associated degradation compounds in the subsurface.

6.0 QUALITATIVE HUMAN HEALTH EXPOSURE ASSESSMENT

A qualitative human health exposure assessment was performed to evaluate the potential risk (if present) to receptors from Site-related contaminants. This assessment was performed for current and future conditions. The current Site conditions consist of a vacant building that is locked and posted to prevent unauthorized access to the area. Outside areas adjacent to the building are generally paved. The anticipated future Site conditions include potential rehabilitation of the building that will occupy nearly all of the property with areas adjacent to the building being paved. Based on the evaluation of offsite soil and groundwater data, there are low level detections of chlorinated VOCs offsite. Five elements must be present for a human health exposure to exist. These include: 1) a source of contamination, 2) a contaminant release and transport mechanism, 3) a point of exposure, 4) a route of exposure, and 5) a receptor. The following sections evaluate these elements and the risk of exposure.

6.1 Contaminant Source and impacted Media

The COCs (i.e., chlorinated VOCs and metals) are present in Site soil, groundwater, and/or soil vapor, based on the results previous investigations performed by Nature's Way Environmental, CDM Smith, and HRP in 2014, 2016, and 2020 respectively.

The approximate areas of impact of the chlorinated VOCs and metals are shown on Figures 10-13. The primary concern for metals exposure is the presence of these compounds detected in the upper fill layer (Figure 9 - Geologic Cross Section, Appendix H – Nature's Way Cross Section). These impacted areas will be the focus of future remediation before Site redevelopment occurs. The objective of the remedial measures will be to cover and/or excavate surficial soil, and to evaluate CVOC contaminant concentrations in groundwater and soil vapor. The location of the coal silo, and demolished buildings are depicted as Figure 14 – Site Source Areas.

6.2 Release and Transport Mechanisms

Transport of Site COCs is affected by sorption potential to organic material in soil, solubility in groundwater, and ability to migrate through the subsurface as vapors in the unsaturated zone above the water table. Surface soil samples collected during the RI reported Metals at concentrations greater than the Part 375 UUSCOs. These compounds could potentially come into direct contact with potential receptors, be transported by wind, or exposed to precipitation until all Site areas are paved, or capped.

Groundwater at the Site flows to the east-northeast, as described in Section 4.4. The results of the previous investigations indicate that VOCs are not a primary source of contamination in the Site soil. Analysis of groundwater samples indicates that VOCs are present in the groundwater and soil vapor at the Site. Chlorinated VOCs in soil gas samples collected and analyzed during the RI indicate that soil vapors originating from the identified area of soil and groundwater impact have not migrated through, and accumulated within, the unsaturated zone within the building footprint. The potential for release and transport of contaminants will be significantly reduced or eliminated under the anticipated future Site conditions. There would be no potential for release or transport of contaminants if remediation successfully removes or destroys all contamination. Future Site

conditions would not change the potential for residual contamination remaining after remediation in groundwater and soil vapor. The presence of a building and pavement occupying most of the property, surrounded by paving, reduces the possibility of transport via wind, eliminates vertical infiltration of groundwater through the soil, and eliminates the potential for direct contact with residual contaminants.

6.3 Exposure Analysis

The human health risk associated with Site COCs depends on the potential for exposure to soil, groundwater, or soil vapor containing these contaminants. Exposure occurs if a completed exposure pathway exists. Potential exposure pathways include ingestion, inhalation or dermal contact with impacted media by onsite workers, visitors, or trespassers.

Offsite areas are occupied by dwellings, and/or are paved. The area is served by a public water supply. The risk of exposure for potential onsite receptors is expected to be absent or minimal because of Site control measures. The Site currently is vacant and configured to prevent unauthorized access to the area formerly occupied by the building, which includes most of the Site.

Potential exposure pathways are summarized and evaluated in Table 11 according to potential onsite and offsite exposure to Site-related contaminants. A potential exists for dust from the Site during periods of high winds; however, this potential is limited by the relatively limited exposed area of soil, and the Site building that helps minimize the wind.

Exposure to the surrounding community during remediation will be monitored and minimized or eliminated by implementing a community air monitoring plan (CAMP). An exposure to metals in the surficial soil exists only if the property is illegally breached, and if an exposure pathway exists (i.e., ingestion).

Future workers at the Site may be required to use personal protective equipment, as deemed necessary by monitoring. Visitors will be allowed only under controlled conditions and will be subject to the same health and safety requirements as Site workers if a potential for exposure exists. Trespassers will be deterred by the presence of adequate signage.

Other exposures do not exist because analytical data indicate that other Site-related COCs are absent in the upper 0 to 6-inches of soil, groundwater is not present at the surface, and there is nowhere for potentially impacted soil gas to accumulate since the building has been removed. There will be no potential for exposure under the anticipated future Site conditions. A building and surrounding pavement will prevent direct contact with soil. The Site is served by public water and there will be no contact with, or ingestion of groundwater. The potential for vapor intrusion into the future building will be eliminated by engineering controls (i.e. sub-slab depressurization system and/or vapor barrier) if the Site is developed. The results of this qualitative exposure assessment indicate that there a slight chance of exposure to metals in the surficial soil exists if the Site is illegally breached, until Site remediation and redevelopment occurs. There is no potential for exposure to onsite receptors under the future Site conditions.

7.0 FISH AND WILDLIFE RESOURCES IMPACT ANALYSIS

The Site is in an urban setting and currently consists of a vacant lot that is placarded to prevent unauthorized access to the area formerly occupied by the building. Areas outside of the Site are generally paved and/or covered with structures. Adjacent properties are generally paved and occupied by buildings or City streets and paved parking lots.

There are no ecological resources present on or in the vicinity of the Site, as determined pursuant to NYSDEC's DER-10 Section 3.10.1(c)(1), because the Site is in an urban area which is not proximate to a surface water body, wetland, or other ecologically significant area. As such, a Fish and Wildlife Resources Impact Analysis is not required, and therefore, was not performed.

Compound	HRP-SV-7 9/22/2020
Volatiles	
Acetone	56.8
Benzene	13
Carbon disulfide	4.7
Chloroethane	1.3 J
Chloromethane	2.7
Cyclohexane	27
Dichlorodifluoromethane	2.4 J
Ethanol	48
Ethylbenzene	2.3 J
Ethyl Acetate	2.6 J
Heptane	1.6 J
Hexane	7
Isopropyl Alcohol	195
Methyl ethyl ketone	5.3
Methylmethacrylate	4.5
Propylene	5
1,2,4-Trimethylbenzene	1.9 J
1,3,5-Trimethylbenzene	1.9 J
Tertiary Butyl Alcohol	12
Tetrachloroethylene	1.8
Toluene	16
Trichloroethylene	2.5
m,p-Xylene	11
o-Xylene	5.2
Xylenes (total)	17

Compound	HRP-SV-1 9/22/2020
Volatiles	
Acetone	903
trans-1,2-Dichloroethylene	84.8 J
cis-1,2-Dichloroethylene	1650
Ethanol	334
Ethyl Acetate	233
Hexane	1250
Isopropyl Alcohol	4670
Methylene chloride	235
Methyl ethyl ketone	99.1
Tetrachloroethylene	739
Toluene	195
Trichloroethylene	17100

Compound	HRP-SV-4 9/22/2020
Volatiles	
Acetone	16
Carbon disulfide	1.9 J
Chloromethane	1.1 J
Dichlorodifluoromethane	2.3 J
trans-1,2-Dichloroethylene	2.3 J
Ethanol	23.2
Ethylbenzene	24
Ethyl Acetate	9
Isopropyl Alcohol	103
Tertiary Butyl Alcohol	2.0 J
Tetrachloroethylene	2.3
Trichloroethylene	1.2
Vinyl chloride	2.4
m,p-Xylene	103
o-Xylene	16
Xylenes (total)	118

Compound	HRP-SV-3 9/22/2020
Volatiles	
Acetone	218
Carbon disulfide	19 J
cis-1,2-Dichloroethylene	29
Ethanol	42.4
Isopropyl Alcohol	93.2
Methyl ethyl ketone	9.7 J
Propylene	5.2 J
Tetrachloroethylene	7320
Trichloroethylene	656

Compound	HRP-SV-5 9/22/2020
Volatiles	
Acetone	189
Benzene	3.5
Carbon disulfide	62.3
Chloroethane	1.3 J
Chloroform	9.8
Chloromethane	1.3 J
Cyclohexane	13
1,2-Dichloroethane	1.6 J
Dichlorodifluoromethane	3.1 J
cis-1,2-Dichloroethylene	2.5 J
m-Dichlorobenzene	9.6
Ethanol	83.7
Ethylbenzene	2.3 J
Ethyl Acetate	9.4
Heptane	26
Hexane	49.7
2-Hexanone	4.5
Isopropyl Alcohol	263
Methyl ethyl ketone	193
Propylene	50.5
2,2,4-Trimethylpentane	2.9 J
Tertiary Butyl Alcohol	11
Tetrachloroethylene	2.4
Toluene	288
Trichloroethylene	9.7
m,p-Xylene	6.1
o-Xylene	2.6 J
Xylenes (total)	8.7

Compound	HRP-SV-2 9/22/2020
Volatiles	
Acetone	83.6
Benzene	3.8
Carbon disulfide	27
Chloroethane	3.4
Chloromethane	4.1
1,2-Dichloroethane	1.6 J
cis-1,2-Dichloroethylene	2.2 J
Ethanol	30.1
Isopropyl Alcohol	102
Methyl ethyl ketone	6.8
Methylmethacrylate	2.4 J
Propylene	4.8
1,2,4-Trimethylbenzene	3.7 J
Tertiary Butyl Alcohol	9.4
Tetrachloroethylene	22
Toluene	3.2
Trichloroethylene	31
m,p-Xylene	4.3
Xylenes (total)	4.3

Compound	HRP-SV-6 9/22/2020
Volatiles	
Acetone	349
Benzene	12
Carbon disulfide	21
Chloroethane	2.2
Chloromethane	2.5
Cyclohexane	7.6
Dichlorodifluoromethane	2.0 J
Ethanol	52.4
Ethylbenzene	3.3 J
Ethyl Acetate	2.4 J
Heptane	8.2
Hexane	5.6
Isopropyl Alcohol	178
Methyl ethyl ketone	8.6
Methylmethacrylate	11
Propylene	8.8
1,2,4-Trimethylbenzene	4.9
1,3,5-Trimethylbenzene	4.3
Tertiary Butyl Alcohol	4.5
Tetrachloroethylene	462
Tetrahydrofuran	14
Toluene	11
Trichloroethylene	66.1
m,p-Xylene	8.7
o-Xylene	4.3
Xylenes (total)	13

Table 5
Data Usability Report Summary
Former Duofold Facility
7 Spruce Street
Ilion, New York 13357
BF-92621019-0

Media	Qualifier	Summary
Groundwater	"R"	The "not detected" volatile results for 2-butanone were qualified as rejected, unusable (R) in samples DF-MW-8 and TMW-1
Groundwater	"R"	The "not detected" volatile results for dichlorodifluoromethane and chloromethane were qualified as rejected, unusable (R) in samples HRP-MW-2, TMW-2, and DUP
Groundwater	"R"	The "not detected" volatile result for 2-chlorethylvinylether was qualified as rejected, unusable (R) in sample DF-MW-10
Groundwater	"R"	The "not detected" volatile result for vinyl chloride was qualified as rejected, unusable (R) in sample HRP-MW-2

*The DUSRs indicate which data are subject to limitations and identify certain data that are flagged as rejected and should not be used.

*All data that are not qualified rejected, unusable (R) are considered usable, with estimated (J, J-, or UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the DUSR, and included as Appendix G.

Notes:
Values Highlighted in Light Yellow Indicate Exceedance of referenced New York State (NYS) Part-375 Soil Cleanup Objectives (SCOs).
U - Denotes Value Was Detected Below The Method Detection Limit (MDL)
3+4-Methylphenol- The lowest Criteria of the Individual Isomers is listed.
Total criteria is listed for the individual isomers (ex. Xylenes(m+p and O), 1,3-Dichloropropene(cis and trans), Chlordane(alpha and gamma), Demeton(S and O), 1,2-Dichloroethene(Cis and Trans).
Laboratory Analytical Results and SCOs are reported in milligrams per kilogram (mg/kg), or parts per million (ppm).

Notes:
Values Highlighted in Light Yellow Indicate Exceedance of referenced New York State (NYS) Part-375 Soil Cleanup Objectives (SCOs).
U - Denotes Value Was Detected Below The Method Detection Limit (MDL)
NA - Not Applicable or No Criteria Listed in Regulatory Listing for Compound.
3+4-Methylphenol- The lowest Criteria of the Individual Isomers is listed.
Total criteria is listed for the individual isomers (ex. Xylenes(m+p and O), 1,3-Dichlropropene(cis and trans), Chlordane(alpha and gamma), Demeton(S and O), 1,2-Dichloroethene(Cis and Trans).
Laboratory Analytical Results and SCOs are reported in milligrams per kilogram (mg/kg), or parts per million (ppm).

Notes:
U - Denotes Value Was Detected Below The Method Detection Limit (MDL)
Laboratory Analytical Results and SCOs are reported in milligrams per kilogram (mg/kg), or parts per million (ppm).

Table 11
Potential Exposure Pathways
Former Duofold Facility
7 Spruce Street
Ilion, New York 13357
BF-92621019-0

Potential Receptor	Exposure Route, Contaminated Media, and Point of Exposure	Pathway Selected for Evaluation (Yes/No)	Reason for Selection or Exclusion
Offsite Residential/Offsite Workers	Ingestion or dermal contact with offsite soil	No	Adjacent properties are almost entirely paved or occupied by buildings. The existing conditions are not expected to change for the anticipated future site use. Analytical data indicate that offsite soil is not likely impacted with Site-related contaminants.
Offsite Residential/Offsite Workers	Ingestion or contact with off-site groundwater	No	Analytical data indicate that Site-related contaminants have not severely impacted offsite groundwater. Groundwater is not used for drinking water or other purposes and the area is served by public water supply. The depth to grounwater generally is 6 to 10 feet. Workers and the public are not exposed to groundwater. The existing conditions are not expected to change for the anticipated future site use.
Offsite Residential/Offsite Workers	Inhalation of impacted vapors	No	Analytical data indicate that soil vapor with Site-related contaminants are present within the footprint of the former building. Exposure to the general public to impacted soil vapor or air is considered negligible. The anticipated future use of this site includes construction of a mixed retail/residential use building that will include a vapor barrier and possibly a sub-slab venting system that will preclude exposure to residual VOCs in the soil vapor.
Onsite Workers	Ingestion or dermal contact with onsite soils	No	Onsite site soil is impacted above unrestricted use soil cleanup objectives. There is a potential for worker exposure to impacted soil during construction and remediation; however, exposure will be eliminated by the required use of personal protective equpment, if necessary, based on monitoring. Onsite workers will not be able to contact potentially impacted soil once a building is constructed as part of the anticipated future use
Onsite Workers	Ingestion or contact with onsite groundwater	No	Analytical data indicate that Site-related contaminants have not severely impacted offsite groundwater. Groundwater is not used for drinking water or other purposes and the area is served by public water supply. The depth to grounwater generally is 6 to 10 feet. Workers and the public are not exposed to groundwater. The existing conditions are not expected to change for the anticipated future site use.
Onsite Workers	Inhalation of impacted vapors or dust	No	Analytical data indicate that on-Site soil vapor contains Site-related contaminants; The removal/demolition of the building precludes accumulation of vapor. Dust generation is possible during construction. Onsite workers will be required to use appropriate personal protective equipment to prevent exposure, if necessary, based on monitoring. The anticipated future use of this site includes construction of a mixed retail/residential use building that will include a vapor barrier and possibly a sub-slab venting system that will preclude exposure to residual VOCs in the soil vapor
Trespassers/Visitors	Ingestion or dermal contact with onsite soil	No	Analytical data indicate that surficial soil (0"-6") contains certain metals and pesticides, but is not impacted by Site-related VOCs. There is a slight chance of exposre to ceratin metals and pesticides to trespassers who illegally breach the security fence. No contact with potentially impacted soil will be possible once a building is constructed as part of the anticipated future use
Trespassers/Visitors	Ingestion or contact with onsite groundwater	No	Analytical data indicate that Site-related contaminants have impacted groundwater; however, groundwater is not used for drinking water or other purposes and the area is served by public water supply. The depth to groundwater generally is 6 to 8 feet. Tresspassers/visitors are not exposed to groundwater. No contact with potentially impacted groundwater will be possible once a building is constructed as part of the anticipated future use.
Trespassers/Visitors	Inhalation of impacted vapors or dust	No	Analytical data indicate that on-Site soil vapor contains Site-related contaminants. The removal/demolition of the building precludes a vapor accumulation and the potential for exposure to the general public to impacted soil vapor or air is considered negligible. Dust will be controlled or eliminated during construction. The anticipated future use of this site includes construction of a mixed retail/residential use building that will include a vapor barrier and possibly a sub-slab venting system that will preclude exposure to residual VOCs in the soil vapor.

Thomas S. Seguljic
Vice President

EP Certification:

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in 40 CFR Part 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Thomas S. Seguljic – Vice President

1.0 INTRODUCTION

This remedial investigations sampling and analysis plan (RISAP) was developed to investigate the below-referenced Site in accordance with the requirements set forth in the EPA Brownfield Assessment Grant (Brownfields Assessment Cooperative Agreement: BF-96261019-0).

1.1 Site Name & Address

The subject site, known as the former Duofold Manufacuring Facility (DUOFOLD), is located at 7 Spruce Street, Ilion New York., and is referred to as "the Site" herein. A Topographic Map depicting the Site and surrounding areas is provided as **Figure 1** – Site Location Map. The Site is estimated to have been constructed in 1907, and has changed names at least five (5) times since the initial construction. A summary of the Site's history and historic operations is provided below in Section 2.2.

1.2 Site Location

The Site consists of three contiguous parcels of land identified by the Herkimer County tax assessor as Parcel IDs: 120.29-1-63, 120.29-2-74.1, and 120.29-1-26. The site measures 12.23 acres, and is located in a mixed commercial and residential use area. A figure depicting the Site and surrounding buildings is provided as **Figure 2**.

Three (3) buildings totaling approximately 134,500 square feet (ft^2) improve the Site and have been vacant since 2001. Building A is known as the primary manufacturing/office building, and the area measures approximately 124,000 ft^2. Building A consists of four-stories with a basement, and is located in the center of Parcel A. Building B is understood by HRP to be the former boiler house, and measures approximately 4,500 ft^2. Building B consists of one-story with a basement, and is also located in the center of Parcel A. Building C is known as a former storage building, and is situated the west-center portion of the site. Building C measures approximately 6,000 ft^2 in area, and consists of one-story with no basement. The remainder of the Site consists of parking and driveway areas, overgrown areas, and a fenced secured area. The nearest waterbody is the Mohawk River, which is located approximately 800 feet to the north of the Site.

1.3 Engineering and Geological Professional Services

HRP Associates, Inc. (HRP) was contracted by the Herkimer County Industrial Development Agency (IDA) to prepare this Remedial Investigation Sampling and Analysis Plan (RISAP). HRP is a New York State (NYS) licensed engineering and geology firm located at 1 Fairchild Square, Clifton Park, New York. HRP will be responsible for conducting the remedial investigation (RI), preparing the remedial action work plan (RAWP), and implementing the chosen remedy at the Site.

1.4 Project Organization

The HRP Project Team will implement the below-described scope of work. A summary of Key Project Personnel and Field Staff is provided below as **Table 1-1.**

Table 1-1 Key Project Personnel

2.0 SITE BACKGROUND

2.1 Site or Sampling Area Description

The Site is situated in an urban setting, and is bordered in all directions by residential and mixed use properties. Overgrown vegetation, pavement, debris, and various structures are present within the confines of the Site.

The site is occupied by three (3) primary structures: a 106,000-square foot, 4-story brick structure that housed former manufacturing and office operations, A powerhouse building complex located adjacent to the west side of the main building, and a 5,600-square foot maintenance garage located to the west of the powerhouse.

The remainder of tax parcel 120.29-1-63 consists of former building foundations/slabs to the east and a grassed area to the west. The area north of main building (parcel 120.29-1-26) is a paved parking lot area, and the area south (parcel 120.29.2-74.1) is an open grassy area with a paved unnamed roadway that gives access to the main building. Aerial imagery of the site is provided in **Figure 2**.

2.2 Operational History

The Site is estimated to have been developed for commercial/industrial use in 1907, and was originally owned by the Library Bureau. The property and newly constructed buildings were used as a manufacturing facility for wood veneer and furniture, and owned by the Library Bureau until at least 1923. By the 1930s, the property was owned by Remington-Rand Corporation and was used to manufacture adding machines and typewriters. By WWII, the facility was retooled to manufacture naval shells. Between 1947 and 1949, the company merged with Sperry to become Sperry-Rand Corporation. The on-site facility was one of three facilities owned by Sperry-Rand Corporation in Ilion. The on-site facility was used to assemble and test computers and was utilized as a school to train technicians. It is possible that electroplating occurred on-site in the 1960s. The company changed its name to Sperry-Univac at some time in the 1950s, and computer manufacturing operations ceased by 1968 when Sperry-Univac moved to Utica; the property remained vacant for some time. In the early 1970's, the property was sold to Donald J. Reile and he began leasing portions of the Site buildings to the Duofold Corporation for knitting operations. Duofold, or other business names that represent Duofold including Ilion Properties, owned the Site since 1979 and utilized the Site to cut and sew winter clothes and underwear from pretreated and pre-dyed materials. The Site has remained vacant since 2001.

Various metals, petroleum products, and solvents were identified on-site in soil, soil-vapor, and groundwater during previous investigations, and were likely used as part of historical manufacturing operations. The Site is vacant, and no wastes are being generated or handled on-site.

2.3 Previous Investigations

Previous environmental investigation reports were provided to HRP by various agencies for this assessment. A brief summary of available previous investigation(s) reports is presented below.

1990 - Final Draft Site Inspection Report - NUS Corporation
2009 - Phase I ESA – Plumley Engineering
2012 - Remedial Investigation Work Plan - Barton & Lugidice (B&L)
2015 - Subsurface Investigation Report - Nature's Way Environmental (Nature's Way)
2017 - Phase II Environmental Site Assessment - CDM Smith (CDM)
2019 - Phase I Environmental Site Assessment - HRP Associates, Inc. (HRP)

A summary of documented environmental impacts derived from the above-referenced investigations is presented below in section 2.5 of this report.

2.4 Geological Information

The Site is located on a relatively flat parcel at 400 feet above sea level in the Mohawk River Valley of central New York. According to the Surficial Geologic Map of New York, Hudson Mohawk Sheet, surficial geology on-site is classified as outwash sand and gravel. Materials are characterized as coarse to fine gravel with sand from proglacial fluvial deposition, well rounded and stratified, generally with finer materials away from ice border, with variable thickness of 2-20 meters.

Previous site investigations indicated that fill materials were encountered at depths varying from throughout the site, underlain by native lake deposited sediment, then predominantly sand and gravel. Depth to bedrock is unknown as previous investigations investigated to a maximum depth of 20 feet below grade (fbg), and bedrock was not encountered.

Groundwater was measured at six to eight (6 to 8) feet below grade (fbg) during previous investigations. The groundwater gradient at the site is relatively flat, and is estimated to be approximately 0.14% east-northeast towards the Mohawk River which is located 800 feet to the north of the site.

2.5 Environmental and /or Human Impact

Previous investigations conducted at the site have identified surficial and shallow onsite impacts to soil, groundwater, and soil vapor. Metal constituents including lead, chromium, mercury, and arsenic have been previously reported in surficial and subsurface soil at concentrations that exceed the New York State Department of Environmental Conservation (NYSDEC) Part-375 Industrial Use Soil Cleanup Objectives (IUSCOs). Impacted soils are understood by HRP to be widespread and sporadic across the site, and have been generally identified by previous investigations to be present in the overlying fill layer. The impacts to historical fill material is most-likely related to demolished building materials from the former paint spray booth areas, ash from historical burning of coal, maintenance of machinery, and treatment of wood products.

Groundwater at the Site is understood to be impacted with chlorinated solvents and degradation products on the eastern portion of the Site. Groundwater monitoring data from previous investigations suggest on/offsite migration of chlorinated volatile organic compounds (CVOCs) to the east-northeast. No domestic water wells (DWWs) are understood to be active in the area, and potable water at the Site is provided by the municipality.

Soil gas was measured during a previous investigation, and generally correlates with CVOC impacts measured in groundwater in previous investigations. Interpretation of passive soil gas survey data collected by CDM Smith suggests impacts to soil gas are generally localized in extent, and are confined to areas east of the former Duofold facility.

Concentrations of organic petroleum derived constituents such as benzene, toluene, and xylene have been reported at the Site, but at concentrations that do not generally exceed Division of Water Technical and Operations Guidance Series (TOGS) 1.1.1 standards and guidance values.

Previous investigations have not identified a primary source of soil and groundwater impacts. The origin of CVOC impacts soil and groundwater impacts is understood to be from materials spilled in small quantities over several decades. Details outlining the proposed investigation of environmental and/or human health impacts are provided in this RISAP, and presented below.

2.6 Qualitative Human Health Exposure Assessment

A qualitative human health exposure assessment will be performed during the RI to evaluate the risk to potential receptors from site-related contaminants of concern (COCs). This assessment will be performed with regard to current site conditions which consist of a vacant industrial property consisting of three (3) former industrial structures.

Five elements must be present for a human health exposure to exist. These include: 1) a source of contamination, 2) a contaminant release and transport mechanism, 3) a point of exposure, 4) a route of exposure, and 5) a receptor. The following sections evaluate these elements and the risk of exposure.

The following exposure pathways for the current and anticipated future use conditions and the potentially exposed population are detailed below

- Construction and Outdoor Worker or Visitor - direct contact, incidental ingestion, and inhalation of COCs during ground-intrusive activities, and inhalation of COCs via outdoor air migration.
- Indoor Worker or Visitor - inhalation of volatile organics via indoor air migration. This exposure pathway is mitigated by potential future installation of a vapor mitigation system (VMS).
- Visitor/Passerby/Fish & Wildlife - direct contact, incidental ingestion, and inhalation of COCs in offsite surface water due to groundwater migration into surface water.

These exposure pathways can be mitigated by implementing proven remedial measures and engineering controls, and with maintenance and proper operation of proper soil/fill management

during intrusive activities; engineering controls including placement of asphalt or landscape cover; and construction of vapor barriers in future building construction. Risks to human health and safety precautions are outlined in Attachment A – Health and Safety Plan (HASP). Potential exposure to COCs in airborne dust will be monitored using specialized equipment, and is outlined in Attachment B – Community Air Monitoring Plan (CAMP). If airbourne dust is recorded above action levels outline in the CAMP, best practice measures will be taken to control and mitigate the fugitive emissions. Best practice measures are outlined in **Attachment C** – Fugitive Emissions Management Plan.

3.0 PROJECT DATA QUALITY OBJECTIVES

3.1 Project Objectives, Problem Definition, and Contaminants of Concern

The proposed RI is designed to further delineate contaminants of concern (COC) identified in surficial, shallow soil, and groundwater during the previous site investigation efforts provided in Section 2.3. A summary of COCs is provided below in **Table 3-1**: Contaminants of Concern and **Table 3-2**: Contaminants of Concern – Groundwater.

3.1.1 Surficial Soil Impacts

Metals are a constituent of soil, and were identified in concentrations exceeding NYS Part 375 IUSCOS in shallow surficial soil samples collected by Nature's Way and CDM Smith. Surficial soils will be sampled during the RI, and analyzed for part 375 metals, as well as for leaching potential using Toxicity Characteristics Leaching Procedures (TCLP) to delineate the degree and extent of previously identified COC impacts.

Previously collected surficial samples by CDM Smith did not indicate soil leaching characteristics through prior TCLP analysis. The results from the surficial sampling will confirm the results provided by CDM Smith, and will allow for a proper development of the conceptual site model (CSM) to aid in the design of a Remediation Action Work Plan (RAWP). Details are presented below in Section 4.0 – Sampling Rationale.

3.1.2 Subsurface Soil Impacts

Metals impacts to shallow subsurface soil be will sampled and analyzed for Part-375 metals, as well as for leachate potential using toxicity characteristics leaching procedures (TCLP) delineate the degree and extent of previously identified COC impacts.

Previously collected subsurface samples by CDM Smith did not indicate signs of leaching through prior TCLP analysis. The results from this proposed will RI will confirm the results provided by CDM Smith, and will aid in the preparation of a proper remediation design to address previously documented impacts.

Table 3-1: Contaminants of Concern (COCs) – Soil

Contaminant of Concern (COC)	Protection of Groundwater SCO (mg/kg)	Unrestricted Use SCO (mg/kg)	Commercial Use SCO (mg/kg)	Industrial Use SCO (mg/kg)
Arsenic	16	13	16	16
Barium	820	350	400	10,000
Chromium, Hexavalent	19	1	400	800
Chromium, Trivalent	No Standard	30	1,500	6,800
Lead	450	63	1,000	3,900
Total Mercury	0.73	0.18	2.8	5.7

Contaminant of Concern (COC)	Protection of Groundwater SCO (mg/kg)	Unrestricted Use SCO (mg/kg)	Commercial Use SCO (mg/kg)	Industrial Use SCO (mg/kg)
Copper	1,720	50	270	10,000
cis-1,2-DCE	0.25	0.25	500	1,000
trans-1,2-DCE	0.19	0.19	500	1.000
Trichloroethene	0.47	0.47	200	400
Vinyl chloride	0.02	0.02	13	27

3.1.3 Soil Vapor Impacts

Soil borings will be installed in areas of elevated soil gas, presented as Attachment D - Beacon Environmental – Passive Soil-Gas Survey to define the vertical extent of chlorinated VOC impacts soil vapor. Soil borings will be installed above the water table to an approximate depth of six (6) fbg, and converted into soil vapor probes by the drilling contractor.

3.1.4 Groundwater Impacts

To evaluate the condition and natural attenuation of CVOCs, low flow sampling of existing wells and newly installed monitoring wells will be completed to determine VOC concentrations, measure geochemical indicators, microbial populations and indicator parameters, calculate hydraulic conductivity and estimate ground water seepage velocity/gradients.

To identify potential off-site downgradient receptors a review of downgradient properties (visual and water supply company record review) within ½ mile downgradient of the site will be completed.

Table 3-2: Contaminants of Concern (COCs) – Groundwater

Contaminant of Concern	Groundwater Standard (µg/L)
cis-1,2-DCE	5
trans-1,2-DCE	5
Trichloroethene	5
Vinyl chloride	2

3.2 Data Quality Objectives (DQOs)

Provided below is a description of the data quality decisions to be made based on the collected data and criteria on which these decisions will be made with regards to the environmental media.

3.2.1 Soil Sampling and Analysis DQOs

Soil analytical results will be compared to 6 New York Codes, Rules, and Regulations (NYCRR) Part 375 Unrestricted and Commercial Use Soil Clean-up Objectives (UUSCOS & CUSCOs). If COCs are detected below CUSCOs, no further action will be recommended. However if contaminant of

concerns are detected above commercial concentrations, then the collected date will be used in conjunction with the Conceptual Site Model (CSM), and will be included in the Remedial Action Work Plan (RAWP) in accordance with the procedures described in Chapter 4 Remedy selection of the New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) Technical Guidance for Site Investigation and Remediation (DER-10).

Soil analytical results will additionally be compared to 6 NYCRR Part 375 Protection of Groundwater Soil Clean-up Objectives (PGWSCOs) to determine if COC concentrations present in soil continue to contribute to previously defined groundwater contamination. If the COC is detected below PGWSCOs, no further action will be recommended. However if COCs are detected above PGWSCOs, then the collected data will be used in conjunction with CSM to select a remedy in accordance with the procedures described in DER-10.

3.2.2 Groundwater Sampling and Analysis DQOs

Groundwater analytical results will be compared the Ambient Water Quality Standards (AWQS) and Guidance Values and Groundwater Effluent Limitations published as the Technical Operations and Guidance Series (TOGS 1.1.1). If the COC is not detected at concentrations above AWQS, no further action will be recommended. However, if contaminants are detected above AWQS then a remedy will be selected based on process outlined in DER-10. Monitored natural attenuation (MNA) is anticipated to be the selected remedy at the Site due to low concentrations of COCs noted during previous investigations completed at the Site. Additional parameters as outlined in 3.3(c)5 of DER-10 will be collected during the RI to support MNA.

3.2.3 Air Sampling and Analysis DQOs

Soil gas analytical results will be compared to the Decision Matrix Provided in the New York State Department of Health (NYSDOH) October 2006 Guidance for Evaluating Soil Vapor Intrusion in the State of New York. Soil gas analytical results will be used as a screening tool to determine if there is potential for off-site impact.

Reasonable and practical actions will be taken by HRP to identify the source(s) affecting the indoor air quality and that actions be implemented to reduce indoor air concentrations to within background ranges. If COCs are detected above no further action (NFA) criteria defined in the NYSDOH Guidance, then NFA will be recommended.

If COCs are measured exceeding "Monitor" criteria, monitoring on a recurring basis will be recommended to determine whether concentrations in the indoor air or sub-slab vapor are affected by temporal influences. If COCs are measured above "Mitigate" criteria, remediation and mitigation remedies will be recommended.

3.3 Data Quality Indicators (DQIs) and Measurement Quality Objectives (MQOs)

Data quality indicators (precision, accuracy, representativeness, completeness, comparability and sensitivity [i.e., PARCCS parameters]) refer to quality control criteria established for various

aspects of data gathering, sampling, and/or analyses. Definitions of specific DQIs and MQOs are provided below.

Precision - Precision has meaning only when applied to a group of measurements, never to a single measurement. It refers only to the reproducibility of the results of measurement.

Accuracy **-** Accuracy refers to the degree of which the measurement indicates the truth. It can pertain to a single measurement or the average of a group of measurements.

Representativeness is the expression of the degree to which data accurately and precisely represent a characteristic of an environmental condition or population and relates to the method of collecting samples and determining sampling locations.

Completeness is expressed as the percent of valid usable data obtained compared to the amount that was expected. Data collection may be inhibited by geologic conditions and/or underground utilities. The project goal is to collect at least 90% of the soil samples outlined in this SAP.

Comparability expresses the degree of confidence with which one data set can be compared to another. Sensitivity is defined by laboratory detection limits is generally expressed in terms of method detection limits (MDLs) or reporting limits (RLs).

Sensitivity The laboratory reporting limit for each analyte is summarized in Table 2. The reporting limits are well below the action levels and provisional action levels and are adequate for this investigation.

3.4 Data Review and Validation

Verification of objective field and technical data will be performed at different levels and at different stages of the project. The first level of data verification will be performed at the time of collection by following standard procedures and QC checks. Field work sheets will be reviewed by the HRP Project Manager or his/her discretion for completeness and accuracy for each task performed during the RI. The Project Manager or designee will make any necessary inquiries with field personnel regarding potential missing information or data or suspected inconsistencies or errors in the field reports within one to two days of identifying such issues. Field review will ensure that necessary corrections or changes will been made based upon identified issues.

Final review of field work sheets will be conducted following completion of the field sampling activities and prior to placement of the work sheets into the project file. The work sheets, including any necessary corrections, will be included in the final project report.

Auditing of field activities by the Project Manager, Project QA Officer, or a qualified designee will provide random checks of sampling and field conditions as the field activities are occurring.

3.5 Data Management

Once field data has been organized and, as appropriate, entered into an electronic database, the Project Manager or designee will then review the data to ensure that the correct codes and units have been included and will review data sets for anomalous values and other issues that might affect the quality of the field data generated for the project. This task will generally be conducted as soon as possible after data has been organized into tables, graphs, and/or figures, with the objective of reviewing the data within a time-frame that will permit additional data collection, if necessary, to obtain a dataset that will meet the project-specific DQOs.

Data collected during the investigation will be reported by the analytical laboratory in a Category B data package. Data will be submitted to a third-party data validator for data usability summary report (DUSR). Data failing QC criteria will be qualified as estimated, biased high, biased low, non-detected, or rejected during data validation. The validated data in the DUSR shall be considered definitive level data and, except for the rejected data. All definitive level data is usable for the intended purpose which is to determine the extent of VOC and metal contamination and to allow for the grantee to best determine the appropriate future use of the Site based on the nature of the contamination.

3.6 Assessment Oversight

Prior to commencing with field activities, the RISAP will be reviewed by the Project Team. The QA Officer will oversee QC of all field activities, and if modifications to the proposed sampling program are required due to field conditions, the Project Manager shall be notified for direction. Any modifications to the sampling plan will be documented reported to the Project Manager.

4.0 SAMPLING RATIONALE

Proposed soil sample locations are proposed in areas where contaminants are suspected to be present based on previously documented site history and environmental investigations. Professional judgment by HRP was used to select sampling locations that are most-likely to provide data to completely address project DQOs (Table 1) presented in section 3.2 of this RISAP.

Evaluation of Site geology and surficial soil data collected from previous site investigations is presented below. Decision statements are provided in the project DQOs to outline the below-proposed sampling rationale.

4.1 Metals

Metals are a constituent of soil, and were detected in various soil samples during all previous subsurface investigations at the site. Soil borings DF-SB-11A and SB-12 (SF) recorded lead concentrations of 84,280 micrograms per liter (mg/l) and 39,600 mg/l, respectively, and represent the highest known total Metal concentrations in surficial soils at the Site. Soil sample SB-12 SS (0.5'-2.0') and MW-12 (0.5'-2.0) recorded Arsenic at concentrations of 254 mg/l and 113 mg/l, respectively, and represents the highest reported arsenic concentration at the Site.

Toxicity Leaching Characteristic Procedures (TCLP) are designed to replicate the leaching of contaminants in municipal landfills, and were performed on all soil samples collected by CDM Smith. TCLP metals results indicated metals were not leaching from soil, and were considered non-hazardous, as results from all soil samples collected were reported under EPA Reportable Quantities.

Metals that exceed Part-375 IUSCOs at the site (including arsenic, barium, cadmium, chromium, copper, lead, nickel, selenium, and Zinc) have generally been confined in the upper 0.0 - 6.5 feet of "fill" material identified by Nature's Way (**Attachment E** – Nature's Way Geologic Cross Sections) in 2015. Soil analyzed for metals below 6.5 feet did not generally exceed Part-375 commercial use soil cleanup objectives (CUSCOs) with the exception of Arsenic identified in Nature's Way soil samples MW-1 (8.5'-10.5') and MW-12 (9.0'-11.0'), slightly above the IUSCO of 16 mg/l at concentrations of 17.1 mg/l and 17.5 mg/l, respectively.

Thickness of the overlying fill at the Site ranges from approximately 1.5 to 6.5 fbg according to the Geologic Cross Sections provided in **Attachment 5**. Geologic cross section B-B' identifies the thickness of surficial fill material approximately 6.5 thickness adjacent to CDM Smith soil boring DF-SB-11A, and Nature's Way soil boring SB-12 (SF). Impacted fill material is most-likely the source of lead impacted soil at the Site.

The source of Lead in the fill material is believed to be lead paint, as lead was commonly added to paint to increase durability, drying time, and resistance to moisture. Paint spaying areas were identified at the Site on the 1959 Sanborn Fire Insurance Map provided in **Attachment 7** - Phase I Environmental Site Assessment Report - HRP. Paint spray booths were identified in the central and western parts of the Site, adjacent to the former Remington Plant #2. The spray booths appear to have been demolished between 1974 and 1982 according to aerial imagery provided in

Attachment 6. The spray booths were demolished in close proximity to the highest recorded metals (lead) concentrations at soil borings DF-SB-11A and SB-12 (SF), and are likely the cause of impacts to shallow fill material at those locations. Lead-based paint materials are also likely located on site; due to the age and condition of paint observed by HRP during the 2019 Phase I investigation.

While no specific documentation was identified though historic research to identify a specific source of onsite arsenic detections, it is probable the presence of arsenic is due to the activities below. Most arsenic used in industrial processes is used to produce antifungal wood preservatives. Arsenic was commonly used in the manufacturing of arsenic-containing pigments, antifouling paint, and certain alloys. Arsenic is also a persistent toxin known to be present in coal. The Site was originally utilized for use as a wood veneer and furniture manufacturing facility, and has also been used to manufacture machines, typewriters, brass shells for the navy, computers, textiles from pretreated and pre-dyed materials. No. 6 fuel oil and coal were historically used to heat the facility, and a coal silo was identified at the Site. Arsenic impacts to shallow surface soils were identified by CDM smith in close proximity and mostly downwind of the coal silo at the Site. Cinder, ash, and coal were identified in boring logs provided by Nature's Way and CDM Smith to be present in the overlying fill layer, present between 0.0 and 6.5 fbg across the Site. The Site has remained vacant since 2001, and no wastes are currently being generated or handled on-site. Arsenic impacts to shallow soil are most-likely attributed to historic site use and operations.

Soils will be collected as a part of this RI from the surficial fill material, and analyzed for Part 375 Metals (including RCRA 8 Total Metals) and TCLP Metals to support remediation and mitigation at the Site through the use of Engineering and Institution Controls (EC/IC). Surficial and shallow subsurface soil samples will be collected from the fill material at the site to further delineate the degree and extent of metals impacts at the Site, and are outlined in section 2.3 of this RISAP.

4.2 Polychlorinated Biphenyls (PCBs)

PCBs were not recorded above the method detection limit (MDL) in all soil and groundwater samples collected by CDM Smith during the 2017 Site investigation. Nature's Way detected PCBs below Part-375 Residential Use Cleanup Objectives (RUSCOs) in fill material at surficial samples SB-5 SS (0.5'-2.0') and MW-8 (0.5'-1.5') at concentrations 0.4 mg/l of 0.19 mg/l, respectively.

PCBs were not identified as a COC during previous investigations at the site, and will not be evaluated as a part of this proposed investigation.

4.3 Pesticides & Herbicides

Agricultural products were not produced at the Site, and were not documented during previous Phase I Investigations performed at the Site. Pesticides and herbicides were not recorded above the method detection limit in any of the surface soil samples collected by CDM Smith. Shallow subsurface samples were not analyzed by CDM Smith during the 2017 investigation.

Pesticides and Herbicides were reported at concentrations below CUSCOs and IUSCOs in all surficial and subsurface samples collected by Nature's Way and CDM Smith.

Agricultural activities were not conducted at Site, and previous industrial site activities did not include the use of pesticides or herbicides. Pesticides and Herbicides were not identified as COCs during previous investigations, and will not be sampled during the RI.

4.4 Volatile Organic Compounds

No petroleum or chlorinated solvent derived volatile organic compounds were detected above part 375 RUSCOs in all surficial and subsurface soil collected during previous investigations by Nature's Way and CDM Smith. Concentrations of chlorinated solvents were detected in groundwater above AWQS.

Various chlorinated volatile organic compounds (CVOCs) compounds have been detected, and are understood to have been attributed to historical surface cleaner and coating storage at the Site. Chlorinated VOCs were commonly used throughout various industries in manufacturing to degrease and maintain machinery. There are no known source areas at the Site, and no other potential sources (i.e. Underground Storage Tank (UST), Dry-well, etc.) were identified during a previous ground penetrating radar survey (GPR) conducted at the Site in October 2016 by Delta Geophysics Inc (Delta). A report of findings provided by Delta is provided in **Attachment 5** – Delta Geophysics Report.

To assess the viability of monitored natural attenuation (MNA) of VOCs in groundwater, which appears to be occurring, select existing monitoring wells will be sampled during the RI to estimate contaminant mass and timeframe for degradation. Samples will be collected for dehalococcoides, a common dechlorinating bacteria, in addition to their catalyzing enzymes BAV1 vinyl chloride reductase (BVC), tceA reductase (tceA), and vinyl chloride reductase (VCR) to determine if there potential for reductive de-chlorination. If the bacteria and specific Site conditions are not present other remedial options will be evaluated in the Remedial Action Work Plan (RAWP).

To evaluate if soil gas is migrating off-site, soil vapor sampling points will be installed on the sites downgradient property line. Collected soil gas samples will be analyzed for VOCs.

Table 4-1: Surface Soil Sampling Design and Rationale

Sampling Location/ID Number	Total Depth (Inches)	Analytical Parameter	Rationale *
HRP-SS-1	0″ – 2″ 2″ – 24″	Metals	Confirm degree and extent of metals impacts identified during previous investigations.

HRP-MW-2	VOCs	Determine degree and extent of VOCs in groundwater.
HRP-MW-3	VOCs	Determine degree and extent of VOCs in groundwater.
TMW-1	VOCs	Determine dissolved phase VOC concentrations in the off-site areas.
TMW-2	VOCs	Determine dissolved phase VOC concentrations in the off-site areas.

DF - Denotes existing monitoring well.

5.0 REQUEST FOR ANALYSES

5.1 Analyses Narrative

Surficial Soil Sampling and Analysis

It is anticipated that approximately 10 surficial and near-surface soil samples will be collected from the below-described locations for analytical testing. The soil samples will be collected as described in Section 4 and summarized below in **Table 5-1** - Summary of Proposed Surficial Samples & Laboratory Analytical Analysis.

Table 5-1 – Summary of Proposed Surficial Samples & Analytical Analysis

Sampling Location/ID Number	Total Depth (fbg)	Analytical Parameter	Analytical Method
HRP-SS-1	0″ – 2″	Metals	Part 375 Metals - EPA SW-846 Method#6020 TCLP RCRA Metals - EPA SW-846 Method#1311

Subsurface Soil Sampling

Approximately 20 total soil samples will be collected from the below-described locations for analytical testing. The soil samples will be collected as described in Section 4 and summarized below in **Table 5-2** - Summary of Proposed Surficial Samples & Laboratory Analytical Analysis.

5.2 Analytical Laboratory

Analytical testing shall be conducted according to all applicable standard operating procedures (SOPs) by a New York State Environmental Laboratory Accreditation Program (ELAP) certified laboratory. Samples will be collected following SOPs, and using clean, sterile glassware provided by the laboratory. Details pertaining to sampling are presented below in this RISAP, and QA/QC procedures are outlined in the QAPP.

Table 5-3: Soil Analytical Method, Containers, Preservation, and Holding Times Requirements

Analytical Parameter	Analytical Method Number	Containers (number, type, size/volume)	Preservation Requirements	Maximum Holding Times
Part 375 Metals	EPA SW-846 Method#6020	One (1) 8oz Glass Jar	None	180 Days
TCLP Metals	EPA SW-846 Method#1311		None	180 Days
VOCs	EPA SW-846 Method#8260B	1 x MeOH vial (5mL), 2 x Sodium Bisulfate vials or 2x DI Water vials	14 day (if using DI vials - 48hr to freeze)	14 Days

Table 5-4: Groundwater Analytical Method, Containers, Preservation, and Holding Time Requirements

Analytical Parameter	Analytical Method Number	Containers (number, type, size/volume)	Preservation Requirements (chemical, temperature, light protection)	Maximum Holding Times
VOCs	EPA SW-846 Method#8260B	Three (3) x 40ml Vial	Hydrochloric Acid (HCL) Preservation	14 Day

Table 5-5: Air Analytical Method, Containers, and Holding Time Requirements

Analytical Parameter	Analytical Method Number	Containers (number, type, size/volume)	Maximum Holding Times
VOCs	EPA SW-846 Method#TO-15 LL	One (1) one liter (1L) Summa Canister	14 Day

6.0 FIELD METHODS AND PROCEDURES

6.1 Field Equipment

List of Equipment Needed

During the implementation of the field sampling plan field equipment, various scientific instruments will be used to collect data at the site. The proposed equipment to be used at the Site will include, but not be limited to, the following:

Table 6-1: Field Equipment

Equipment	Manufacturer	Purpose
MiniRAE 3000 - Photoionization Detector (PID)	Rae Systems	Soil Screening, Air Monitoring
Horiba U-52 - Water Quality Analyzer	YSI	Water Quality Parameters, Low Flow Sampling
Water Level Indicator	Solonist	Groundwater Gauging
PDR1500 - Particulate Meter	Thermoscientific	Air Monitoring

6.1.1 Calibration of Field Equipment

All field equipment will be properly calibrated prior to use in the field. The calibration procedures will follow the manufacturer's instructions or routine HRP procedures to ensure that the equipment is functioning properly. Field personnel will document all instrument calibration in HRP daily field reports. All records generated will be maintained by field personnel and are subject to audit by the QA Manager.

MiniRAE 3000 PIDs will be used to screen soils and to properly implement the community air monitoring (CAMP) (**Attachment 2** – Community Air Monitoring Plan). PIDs will be calibrated to background ambient air, and a calibration gas standard of 100 parts per million (ppm) isobutylene.

All Thermoscientifc particulate meters will be used to implement the CAMP, and will be calibrated each day prior to use using a particulate filter provided by the manufacturer. The Horiba U-52 Water Quality Meter will be calibrated using calibration standard solution(s) provided by the manufacturer. The standard solution includes a multi-purpose standard including pH, DO, ORP, turbidity, and conductivity.

The detailed calibration, operation, and maintenance procedures for field instrumentation routinely used by HRP personnel are specific to manufacturer's instructions, and will be documented by HRP. These calibration records become part of the individual project files as documentation of QA objectives.

6.2 Surface Soil Sampling

Soils will be collected from the two (2) feet of soil using a stainless steel hand auger and trowel. Samples will be mixed by hand and homogenized using a clean decontaminated trowel and stainless steel mixing bowl. All sampling equipment will be decontaminated using phosphate-free alconox soap and rinsed with deionized (DI) water before and after collecting surficial soils samples at each of the eight (8) proposed locations.

6.2.1 Field Screening

Soil samples retrieved from each soil boring will be field screened using a PID equipped with a 10.6 electron volt (eV) lamp. After the soil core sample is retrieved, representative portions of the soil core will be placed into sealed plastic bags and allowed to equilibrate. The PID probe will be inserted into the headspace of the sample bag and the maximum reading will be recorded on soil boring logs at least every five (5) feet.

6.2.2 Soil Boring Installation

Soil borings will be installed by a drilling contractor using a track-mounted direct-push drilling rig, or similar. The direct-push Macrocore© sampling device consists of a stainless steel tube that is hydraulically advanced by the drill rig into the subsurface. The locations of soil borings to be installed during the RI are provided as **Figure 3** - Surficial Soil Sampling Locations. Public utilities will be marked by the drilling contractor in prior to drilling activities using 811 Dig Safely New York (DSNY), in accordance with New York State law. Each soil boring location may be hand-cleared to a minimum depth of five (5) fbg to ensure no utilities are present.

Soil borings will be installed using a drill rig capable of sampling continuously every two (2) feet with a two-inch (2") diameter sampling device or similar. All surface and subsurface soil samples will be collected in accordance with DER-10 procedures, as applicable.

6.2.3 Subsurface Soil Sampling

Soil samples will be collected using a 1.75-inch diameter plastic (acetate liner) sampling tube that is evacuated from the borehole, and split to allow inspection and sample collection by the HRP geologist. Each soil boring will be advanced up to a depth of 16 fbg to supplement previously identified subsurface information from prior investigations.

A geologic description of the samples will be recorded by the onsite geologist. The geologic description will include the soil boring identification, geology, depth interval, color, moisture, photoionization detector (PID) measurements, visual and olfactory indications of contamination, and other notable features.

6.2.4 Soil Sampling and Laboratory Analysis

After soil samples are screened by and HRP geologist, Soil will be collected and placed into sterile glassware provided by the laboratory. A unique sample name including the soil boring identification

will be assigned to each sample. All sample collection dates, times, analysis, and sampling personnel will be marked on a chain of custody form, and will be relinquished properly by HRP and laboratory personnel.

Sediments were not defined as a problem area during previous investigations. As such, no sediment samples will be collected as a part of this investigation.

6.3 Water Sampling

CVOCs impacts have been identified above TOGS 1.1.1 standards and guidance values during previous subsurface investigations at the Site. As such, groundwater samples will be collected from various locations at the Site, and is outlined in **Table 4-3**. Surface water features are not currently present at the Site, and have not been identified during previous investigations at the Site. As such, no surface water samples will be collected as a part of this investigation.

6.3.1 Groundwater Sampling

Prior to groundwater sampling, all accessible groundwater monitoring wells will be gauged from the top of each monitoring well casing using a Solonist© water level meter, graduated in 0.01 foot intervals. Depth to groundwater measurements will be used to determine the groundwater flow direction and gradient at the Site. Measurements will be collected in accordance with the EPA Low Stress (Low Flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells (2017).

All proposed monitoring wells will be purged using either a peristaltic suction, centrifugal, or bladder pump prior to sampling. The intake of the selected pump will be set in the center of each monitoring well screen to allow for representative water from the within the underlying geologic formation to enter the monitoring well screen. Pump rates will be adjusted to minimize drawdown of the water column, and will not be set to exceed the maximum drawdown of 0.3 feet. Groundwater will be pumped from the monitoring well into clear plastic flow cell, designed to allow the sampling team to see changes in groundwater quality through the cell. Groundwater will be pumped from the cell into a graduated bucket to determine the total purge volume at each monitoring well location.

Water quality parameters including temperature, pH, dissolved oxygen (DO), oxidation reduction potential (ORP), turbidity, and specific conductance will be collected every three (3) to five (5) minutes, and documented by HRP. Water quality is considered stable if for three consecutive readings:

- Turbidity (10% for values greater than 5 NTU; if three Turbidity values are less than 5 NTU, consider the values as stabilized),
- Dissolved Oxygen (10% for values greater than 0.5 mg/L, if three Dissolved Oxygen values are less than 0.5 mg/L, consider the values as stabilized),
- Specific Conductance (3%)
- Temperature (3%)
- pH (± 0.1 unit)

- Oxidation/Reduction Potential (±10 millivolts).

If water quality parameters are not stable after 30 minutes, purging will be curtailed, and ground water samples will be collected. If a well is pumped until dry during purging, that well will be allowed to recharge up to 80% of the static water column and dewatered once more. After water levels have recharged to 80% of the static water column, groundwater samples will be collected.

At each sampling location, all bottles designated for a particular analysis (e.g., volatile organic compounds) will be filled sequentially before bottles designated for the next analysis are filled (e.g., semivolatile organic compounds). If a duplicate sample is to be collected at this location, all bottles designated for a particular analysis for both sample designations will be filled sequentially before bottles for another analysis are filled. In the filling sequence for duplicate samples, bottles with the two (2) different sample designations will alternate. Groundwater samples will be decanted directly into the sterile, laboratory-supplied sample containers with preservative, if required. All samples will be placed in a cooler with ice, and transported under chain-of-custody protocol for shipment to the laboratory.

If the measured turbidity of the groundwater from a well is above 5.0 Nephelometric Turbidity Units (NTUs), both a filtered and unfiltered sample for metals analysis will be collected, if required. A 5-micron filter will be used to remove larger particles that have been entrained in the water sample. A sample number appended with an "Fl" will represent a sample filtered with a 5-micron filter.

6.4 Air Sampling

Soil vapor probes will be installed in a separate boring adjacent to soil borings to characterize the quality of soil vapor in the unsaturated zone at the site. Soil vapor and air sampling and analysis shall be performed in accordance with the October 2006 NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York. The location of the soil vapor probes and the location of the ambient/outdoor air sample are shown on **Figure 4** – Proposed Air Sample Locations. A figure depicting all previous investigation sample locations is included for reference as **Figure 5** – Previous Site Investigation Sample Locations.

The soil vapor probes will be constructed in general accordance with Section 2.7.1 of the NYSDOH Soil Vapor Guidance and consist of approximately factory-slotted well screen and riser pipe that may extend above the ground surface.

The soil vapor and air samples will be collected using Summa® canisters provided by the laboratory. The actual soil vapor sample collection flow rate shall be below the maximum flow rate of 0.2 Liter per minute recommended by the NYSDOH Soil Vapor Guidance.

Prior to soil vapor sampling, each soil vapor probe shall be purged a minimum one (1) volume to ensure soil vapor is drawn into the probe. Once purging is completed, sample tubing from the top of the soil vapor probe will be attached directly to a Summa® canister. Field documentation will be collected for each sub-slab soil vapor sample to note the conditions during sampling.

Prior to collecting a soil vapor sample, a helium tracer test will be conducted to ensure that the sampling tubing and sample port were properly sealed. The helium tracer test will be conducted using a shroud, helium gas as a tracer, and a helium detector. A shroud shall be placed over the sampling port and tubing and completely sealed to preclude intrusion of outside air. Helium detector testing is used to test the sampling port and tubing for the presence of helium to verify that helium did not leak into the sampling port and tubing.

The Summa® canister samples will be submitted to an ELAP certified analytical laboratory for analysis of VOCs by USEPA Method TO-15.

6.5 Decontamination Procedures

To assure that no outside contamination will be introduced into the samples/data, the following protocols will apply for all equipment used to collect the samples during the RI:

- The equipment will be washed in laboratory detergent solution (Alconox) and water;
- The equipment will undergo a rinse of tap water;
- The equipment will undergo a final rinse using deionized water; and,
- The equipment will be wiped dry with a paper towel.

Equipment will be decontaminated in a predesignated area will be stored on new plastic sheeting in uncontaminated areas before and after use. All water generated during decontamination procedures will be containerized in a 55-gallon drum, and will be disposed of at a licensed facility. Investigation derived waste (IDW) is discussed in Section 8.0 – Disposal of Residual Materials.

Table 6-2: Field Equipment/Instrument Calibration, Maintenance, Testing, and Inspection

Analytical Parameter	Field Equipment/ Instrument	Calibration	Frequency	Acceptance Criteria	Corrective Action
Volatile Organic Compounds (PPM)	Photoionization Detector	100 PPM Isobutylene	Daily, or as needed.	±3%	Re-calibrate, if needed. Clean 11.7ev Lamp using Lense Paper
Turbidity (NTUs)	Water Quality Meter	Turbidity Calibration Fluid	Daily, or as needed.	±10%	Re-calibrate, if needed.
Dissolved Oxygen (mg/l)	Water Quality Meter	DO Liquid Standard	Daily, or as needed.	±5%	Re-calibrate, if needed.
Specific Conductance (µs/l)	Water Quality Meter	SC Liquid Standard	Daily, or as needed.	±5%	Re-calibrate, if needed.
Temperature (˚C)	Water Quality Meter	N/A	Daily, or as needed.	±5%	Re-calibrate, if needed.
pH (su)	Water Quality Meter	pH 4.0 pH 7.0 pH 10.0 Standard Solutions	Daily, or as needed.	±10%	Re-calibrate, if needed.
Oxidation Potential (mV)	Water Quality Meter	N/A	Daily, or as needed.	±5%	Re-calibrate, if needed.

7.0 PACKAGING AND SHIPPING

The number and type of sample containers, volumes, and preservatives are listed above in **Table 5-4**. The laboratory provided containers are pre-cleaned and will not be rinsed prior to sample collection. Preservatives, if required, will be added prior to sampling by the laboratory to the containers prior to shipment of the samples to HRP.

All sample containers will be placed in a strong-outside shipping container (a steel-belted cooler). The following outlines the packaging procedures that will be followed for low concentration samples.

1. When ice is used, pack it in zip-locked, double plastic bags. Seal the drain plug of the cooler with fiberglass tape to prevent melting ice from leaking out of the cooler.

2. The bottom of the cooler should be lined with bubble wrap to prevent breakage during shipment.

3. Check screw caps for tightness and, if not full, mark the sample volume level of liquid samples on the outside of the sample bottles with indelible ink.

4. Secure bottle/container tops with clear tape and custody seal all container tops.

5. Affix sample labels onto the containers with clear tape.

6. Wrap all glass sample containers in bubble wrap to prevent breakage.

7. Seal all sample containers in heavy duty plastic zip-lock bags. Write the sample numbers on the outside of the plastic bags with indelible ink.

8. Place samples in a sturdy cooler(s) lined with a large plastic trash bag. Enclose the appropriate COC(s) in a zip-lock plastic bag affixed to the underside of the cooler lid.

9. Fill empty space in the cooler with bubble wrap or Styrofoam peanuts to prevent movement and breakage during shipment.

10. Ice used to cool samples will be sealed in a zip lock plastic bag, and placed on top and around the samples to chill them to the correct temperature.

11. Each ice chest will be securely taped shut with fiberglass strapping tape, and custody seals will be affixed to the front, right and back of each cooler.

8.0 DISPOSAL OF RESIDUAL MATERIALS AND INVESITGATION DERIVED WASTE

In the process of collecting environmental samples, the sampling team will generate different types of potentially contaminated IDW that include the following:

- Used personal protective equipment (PPE)
- Disposable sampling equipment
- Decontamination fluids
- Soil cuttings from soil borings
- Purged groundwater and excess groundwater collected for sample container filling

Investigation derived waste (IDW) generated (if any) from the installation of monitoring wells and the development and sampling of monitoring wells will be handled in accordance with NYSDEC DER-10. Drill cuttings and spoils generated will be containerized in a 55-gallon drum, and disposed at a properly permitted treatment, storage, or disposal facility. Representative samples of cuttings and spoils will have to be analyzed to determine classification, treatment, and disposal.

The drilling contractor will be responsible for supplying the equipment and materials necessary for the proper handling and storage of the IDW, such as DOT-approved 55-gallon drums, roll-off containers and/or holding tanks. All containers will be labeled and stored properly.

Drill cuttings shall be handled and disposed of in a manner that does not pose a threat to health and the environment. If off-site disposal of IDW is required, it will be disposed of or treated according to applicable local, state, and federal regulations.

9.0 SAMPLE DOCUMENTATION

9.1 Field Notes

Field notes are an essential component of the RI and are important in providing real-time updates to the HRP Project Manager. Field notes will be collected each day, and will be collected by the HRP Field Team Leader. Field notes collected during the RI will include, but aren't limited to: daily field report, daily health and safety checklist, soil boring logs, low-flow sampling logs, and community air monitoring logs.

At a minimum, the following information will be recorded during the collection of each sample:

- Sample location and description
- Site or sampling area sketch showing sample location and measured distances
- Sampler's name(s)
- Date and time of sample collection
- Designation of sample as composite or grab
- Type of sample (soil, sediment or water)
- Type of sampling equipment used
- Field instrument readings and calibration
- Field observations and details related to analysis or integrity of samples (e.g., weather conditions, noticeable odors, colors, etc.)
- Preliminary sample descriptions (e.g., for soils: clay loam, very wet; for water: clear water with strong ammonia-like odor)
- Sample preservation (if any)
- Sample identification numbers and chain-of-custody form numbers
- Shipping arrangements (overnight air bill number)
- Name(s) of recipient laboratory

In addition to the sampling information, the following specific information will also be recorded in field notes for each day of sampling:

- Team members present on Site
- Time of arrival/entry on site and time of site departure
- Other personnel on Site
- Summary of any meetings or discussions with tribal, contractor, or federal agency personnel
- Deviations from sampling plans, site safety plans, and QAPP procedures
- Changes in personnel and responsibilities with reasons for the changes
- Calibration readings for any equipment used and equipment model and serial number

9.2 Photo Documentation

Photographs will be taken at the sampling locations and at other areas of interest on the site or sampling area. They will serve to verify information entered in the field logbook. The time, date, location, and weather conditions will be noted for each photograph collected. Each photograph will

include a description of the subject photographed, and the name of person taking the photograph. Photographs will be included in the report following the RI.

9.3 Labeling

All samples collected will be labeled in a clear and precise way for proper identification in the field and for tracking in the laboratory. The samples will have pre-assigned, identifiable, and unique numbers. At a minimum, the sample labels will contain the following information: date and time of collection, analytical parameter(s), and method of preservation. Sample parameters and preservation method are discussed in **Table 5-4**.

9.4 Sample Chain-Of-Custody Forms and Custody Seals

All sample shipments for analyses will be accompanied by a chain-of-custody record. Form(s) will be completed and sent with the samples for each laboratory and each shipment (i.e., each day). If multiple coolers are sent to a single laboratory on a single day, form(s) will be completed and sent with the samples for each cooler.

The chain-of-custody form will identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorize personnel. The sampling team leader or designee will sign the chain-of-custody form in the "relinquished by" box and note date, time, and air bill number.

A self-adhesive custody seal may be placed across the lid of each sample. For VOC samples, the seal may be wrapped around the cap. The shipping containers in which samples are stored (usually a sturdy picnic cooler or ice chest) will be sealed with self-adhesive custody seals any time they are not in someone's possession or view before shipping. All custody seals will be signed and dated.

10.0 QUALITY CONTROL

10.1 Field Quality Control Samples

Field quality control samples are intended to help evaluate conditions resulting from field activities and are intended to accomplish two primary goals: assessment of field contamination, and assessment of sampling variability. The former looks for substances introduced in the field due to environmental or sampling equipment and are assessed using blanks of different types. The latter includes variability due to sampling technique and instrument performance as well as variability possibly caused by the heterogeneity of the matrix being sampled and are assessed using replicate sample collection. The following subsections discuss the suggested QC samples to be collected during the RI.

10.1.1 Assessment of Field Contamination Equipment Blanks (Blanks)

Contamination of samples throughout the sampling process may be assessed through the collection of additional different types of samples.

Equipment blank (EB) samples are obtained by decanting laboratory supplied water over or through the decontaminated equipment used for sampling. EB samples provide a means of assessing potential contamination present in sampling equipment, ambient conditions, sample containers, transportation, and the laboratory.

Field reagent blank samples (FRB) are sample containers directly filled in the field using laboratory supplied water. FRB samples determine potential contamination from ambient conditions, sample containers, transit, and the laboratory.

Trip blanks (TB) are prepared by the laboratory and shipped to and from the field. TBs assess contamination from shipping and the laboratory, and are generally only collected in tandem with VOC samples.

A maximum of one (1) blank sample per matrix per day should be collected, but at a rate not to exceed one blank per 20 samples. If equipment rinsate blanks are collected, field blanks and trip blanks are not required under normal circumstances.

10.1.2 Equipment Blank Samples (EB)

Equipment blank samples will be collected to evaluate field sampling and decontamination procedures by pouring laboratory supplied water over the decontaminated sampling equipment. One equipment rinsate blank will be collected per matrix each day that sampling equipment is decontaminated in the field. Equipment rinsate blanks will be obtained by passing water through or over the decontaminated sampling devices used that day.

The equipment rinsate blanks will be preserved, packaged, and sealed in the manner described for the environmental samples. A separate sample number and station number will be assigned to each sample, and it will be submitted blind to the laboratory.

10.1.3 Field Reagent Blank Samples (FRB)

Field blanks will be collected to evaluate whether contaminants have been introduced into the samples during the sampling due to ambient conditions or from sample containers. Field blank samples will be obtained by laboratory supplied VOC & metal-free water into a sampling container at the sampling point. The field blanks that are collected will be analyzed for Part 375 Metals and VOCs.

The field blanks will be preserved, packaged, and sealed in accordance with the ELAP-certified laboratory. A separate sample number and station number will be assigned to each "FRB" sample, and it will be submitted to the laboratory.

10.1.4 Trip Blank

Trip blanks will be prepared to evaluate if the shipping and handling procedures are introducing contaminants into the samples, and if cross contamination in the form of VOC migration has occurred between the collected samples. A minimum of one (1) trip blank will be submitted to the laboratory for analysis with every shipment of samples for VOC analysis. Trip blanks are 40-mL vials that have been filled with HPLC-grade water that has been purged so it is VOC free and shipped with the empty sampling containers to the site or sampling area prior to sampling. The sealed trip blanks are not opened in the field and are shipped to the laboratory in the same cooler with the samples collected for volatile analyses. The trip blanks will be preserved, packaged, and sealed in the manner described for the environmental samples. A separate sample number and station number will be assigned to each trip sample and it will be submitted blind to the laboratory.

10.1.5 Temperature Blanks

For each cooler that is shipped or transported to an analytical laboratory a 40-mL VOA vial will be included that is marked "temperature blank." This blank will be used by the sample custodian to check the temperature of samples upon receipt.

10.2 Assessment of Field Variability (Field Duplicate or Co-located Samples)

Duplicate samples are collected simultaneously with a standard sample from the same source under identical conditions but are placed into separate sample containers. Field duplicates will consist of a homogenized sample divided in two or else a co-located sample. Each duplicate portion should be assigned its own sample number so that it will be blind to the laboratory. A duplicate sample is treated independently of its counterpart to enable assessment of laboratory performance through comparison of the results. At least 5% of samples collected per event will be field duplicates. At least one (1) duplicate should be collected for each sample matrix.

10.2.1 Field Duplicate (DUP)

Duplicate soils samples will be collected at sample locations chosen in the field by HRP sampling personnel based at a frequency of one (1) per 20 samples. Soil samples to be analyzed for laboratory analysis will be homogenized in a stainless steel mixing bowl. Homogenized material

from the bucket will then be transferred to the appropriate wide-mouth glass jars for both the regular and duplicate samples. Equivalent samples from a co-located location will be collected identically to the original samples, assigned unique sample numbers and sent blind to the laboratory.

Duplicate samples will be preserved, packaged, and sealed in the same manner as other samples of the same matrix. A separate sample number and station number will be assigned to each duplicate, and it will be submitted blind to the laboratory.

10.3 Laboratory Quality Control Samples

Laboratory quality control (QC) samples are analyzed as part of standard laboratory practice. The laboratory monitors the precision and accuracy of the results of its analytical procedures through analysis of QC samples. Typically, laboratory QC samples consist of matrix spike/matrix spike duplicate (MS/MSD) samples for organic analyses, and matrix spike and duplicate samples (MS/DS) for inorganic analyses. The term "matrix" refers to use of the actual media collected in the field (e.g., routine soil and water samples).

Laboratory QC samples are collected in the field, but prepared by the laboratory. They are not a separate sample, but an aliquot (subset) of an existing field sample. Matrix Spikes do not include laboratory QC checks, such as calibration standards or surrogates.

Soil sample (a full 8-oz sample jar or two 120-mL sample vials) collected during the RI contain sufficient volume for both routine sample analysis and additional laboratory QC analyses. Therefore, a separate soil sample for laboratory QC purposes will not be collected.

Soil samples for volatile organic compound analyses for laboratory QC purposes will be obtained by collecting double the number of equivalent samples from a co-located location in the same way as the original samples.

For water samples, double volumes of samples are supplied to the laboratory for its use for QC purposes. Two sets of water sample containers are filled and all containers are labeled with a single sample number with the designation "MS/MSD".

The laboratory should be alerted as to which sample is to be used for QC analysis by a notation on the sample container label and the chain-of-custody record or packing list.

At a minimum, one laboratory QC sample (MS/MSD) is required per 14 days or one per 20 samples (including blanks and duplicates), whichever is greater. If the sample event lasts longer than 14 days or involves collection of more than 20 samples per matrix, additional QC samples will be designated.

11.0 FIELD VARIANCES

As conditions in the field may vary, it may become necessary to implement modifications to the sampling plan and rationale as presented in this plan. As appropriate, the QA Officer and HRP Project Manager will be notified and a verbal approval will be obtained before implementing the changes. Modifications to the approved plan will be documented in the sampling project report. Field variances to the CAMP, HASP, and QAPP may also be implemented by the field team, and will be documented by field personnel.

12.0 FIELD HEALTH AND SAFETY PROCEDURES

A Health and Safety Plan (HASP) was prepared in accordance with 40 CFR 1910 and 1926. The Site HASP addresses general construction health and safety issues and potential health and safety concerns associated with exposure to airborne dust and site-specific COCs. The site-specific HASP is provided in **Attachment 1**.

13.0 COMMUNITY AIR MONITORING PLAN

A Community Air Monitoring Plan (CAMP) was developed for the remediation project based on NYSDOH guidelines provided in NYSDEC DER-10. The CAMP will provide for real-time air monitoring at the upwind and downwind perimeter of the work area during active construction. The site-specific CAMP is provided in **Attachment 2**.

14.0 FUGITIVE EMISSIONS MANAGEMENT PLAN

A Fugitive Emission Management Plan (FEMP) was developed to monitor and manage fugitive emissions that may occur during active site work (e.g., odor, noise, and dust). Proper implementation of a FEMP is essential due to the proximity of adjacent residences. The FEMP is provided in **Attachment 3**, and includes the following minimum measures during remedial construction:

- Installation and maintenance of a visual barrier on temporary perimeter construction fence for offsite dust mitigation.
- Active dust suppression as necessary through water application to the construction area (by hose, water cannon, or water truck).
- Covering inactive work areas, including stockpiles, with plastic sheeting.
- Application of odor suppressant foam, as necessary, to exposed surfaces of soil during excavation.
- Restricting work hours as required by local regulations for construction noise.

15.0 FISH AND WILDLIFE IMPACT ANALYSIS

The site is in an urban setting and currently consists of a vacant lot and building that is partially surrounded by perimeter fencing to prevent unauthorized access. Areas outside of the limited perimeter fence generally are paved. Adjacent properties generally are paved and occupied by buildings or City streets and paved parking lots. There are no ecological resources present on or in the vicinity of the site because the site is in an urban area. As such, a Fish and Wildlife Resources Impact Analysis will not be performed.

2.0 INTRODUCTION

2.1 Purpose and Scope

This Health and Safety Plan (HASP) addresses the health and safety practices that will be employed by HRP Associates, Inc. personnel and our subcontractors participating in the remedial site investigation activities including the installation of test borings, monitoring wells, and soil vapor probes.

This HASP has been developed in accordance with HRP's Company Safety and Health Program as required under OSHA's Hazardous Waste Operations Standard (29 CFR 1910.120). This Plan has been developed to establish minimum standards necessary for soil excavation activities to protect the health and safety of HRP personnel. HRP site personnel have received the required level of training and field experience as required under subpart (e) of the Standard, and have received medical examinations in accordance with HRP's medical surveillance program as required under subpart (f) of the Standard. No other personnel will be permitted in the Exclusion Zone unless they have received training and medical surveillance under the Standard.

HRP personnel and associated contractors shall be familiar with this HASP prior to conducting the proposed remedial investigation. This plan must be present on site and be available for reference/inspection when the subject site work is being conducted.

2.1.1 Site Information and Description

Site Name: Vacant Industrial Property **-** Former Duofold Site

Site Address: 7 Spruce Street - Ilion, New York 13357

Site Contact: John Piseck

Phone Number: 315-868-4928

2.2 Background and Project Description

The subject site, known as the former Duofold Manufacturing Facility (DUOFOLD), is located at 7 Spruce Street, Illion New York. The Site consists of three contiguous parcels of land identified by the Herkimer County tax assessor as Parcel IDs: 120.29-1-63, 120.29-2-74.1, and 120.29-1-26. The site measures 12.23 acres, and is located in a mixed commercial and residential use area.

Three (3) buildings totaling approximately 134,500 square feet (ft^2) improve the Site and have been vacant since 2001. Building A is known as the primary manufacturing/office building, and the area measures approximately 124,000 ft^2. Building A consists of four-stories with a basement, and is located in the center of Parcel A. Building B is understood by HRP to be the former boiler house, and measures approximately 4,500 ft^2. Building B consists of one-story with a basement, and is also located in the center of Parcel A. Building C is known as a former storage building, and is situated the west-center portion of the site. Building C measures approximately 6,000 ft^2 in area, and consists of one-story with no basement. The remainder of the Site consists of parking and driveway areas,

overgrown areas, and a fenced secured area. The nearest waterbody is the Mohawk River, which is located approximately 800 feet to the north of the Site.

Previous investigations conducted at the site have identified surficial and shallow onsite impacts to soil, groundwater, and soil vapor. Metal constituents including lead, chromium, mercury, and arsenic have been previously reported in surficial and subsurface soil at concentrations that exceed the New York State Department of Environmental Conservation (NYSDEC) Part-375 Industrial Use Soil Cleanup Objectives (IUSCOs). Impacted soils are understood by HRP to be widespread and sporadic across the site, and have been generally identified by previous investigations to be present in the overlying fill layer. The impacts to historical fill material is most-likely related to demolished building materials from the former paint spray booth areas, ash from historical burning of coal, maintenance of machinery, and treatment of wood products.

HRP will be responsible for conducting a remedial investigation (RI) at the Site, to further delinate environmental impacts identified during previous site characterizations.

2.2.1 Personnel Designations

The following personnel are designated to perform the stated project activities and to ensure that the requirements of this HASP are met. The same person may fill more than one role, and/or serve as an alternate in the absence of the designated team member.

The following personnel are designated to perform the stated project activities and to ensure that the requirements of this HASP are met. The same person may fill more than one role, and/or serve as an alternate in the absence of the designated team member. All subcontractors must have received the required level of training and field experience as required under subpart (e) of OSHA 29 CFR 1910.120 and OSHA 29 CFR 1926.65 for Hazardous Waste Operations and Emergency Response (HAZWOPER).

Project Team Member	Responsibilities and Tasks
Mark Wright, CHMM, CSP, P.G.	**HSO – HRP Associates, Inc.** - Ensuring all site work is being performed in accordance with HRP Associates, Inc. Safety Program, as well as in accordance with local, state and federal regulations. - Directing and implementing HRP's HASP. - Reviewing the Subcontractor's HASP and being aware of the hazards detailed therein. - Conduct a job orientation meeting and routine safety meetings for HRP Associates, Inc. employees and subcontractors, as applicable. - Provide copies of these inspections, recordkeeping/personnel logs to the engineer/contractor as required. - Ensuring all project personnel have been adequately trained in the recognition and avoidance of unsafe conditions. - Authorizing Stop Work Orders that shall be executed upon the determination of an imminent health and safety concern, and will notify the appropriate contacts upon issuance of this order. - Authorizing work to resume, upon approval from the Contractor. - Directing activities, as defined in the HRP's and the Contractor's written HASP, during emergency situations. - Providing personnel monitoring where applicable. - Ensuring that adequate personal protective equipment and first aid supplies are available. - Ensure site security, to the extent practicable. - Ensure accident victims are promptly cared for, and the incident is investigated and properly reported.
Jesse Zahn, CHMM, P.G Thomas Seguljik, P.E., P.G.	**Site Supervisor/Project Manager – HRP Associates, Inc.** - Monitor and assist the site Health and Safety officer. - Maintain appropriate rules, regulations and codes at the job site. - Provide advance safety planning for all activities through the use of scheduling and administrative controls. - Obtain site-specific health and safety information and communicate that information with the appropriate personnel (i.e. contractors, client, etc.) - Report all injuries, illnesses and other incidents to the Director of Safety. - Ensure all HRP personnel are trained and qualified to perform site work.
Site Workers (Subcontractors)	**Site Workers** - Read and work in accordance with this HASP. - Report all unsafe work practices to the HSO. - Report all incidents, including near-misses to the HSO. - Work in a safe manner. - Provide Designated Competent Person
A complete list of HRP employee and subcontractor responsibilities (as applicable) can be found in the HRP Corporate Health & Safety Plan.	

3.0 AREAS OF ENVIRONMENTAL CONCERN

3.1 Scope of Work

In general, the work to be performed by HRP and HRP's subcontractors during the remedial investigation will consists of soil boring installation, monitoring well construction, and multimedia sampling (soil, groundwater, air). Soil sample locations are proposed in areas where contaminants are suspected to be present based on previously documented site history and environmental investigations.

The investigation is comprised of numerous tasks that are detailed in the Remedial Investigation Sampling and Analysis Plan (RISAP). This HASP is included as Attachment 1 – Health and Safety Plan of the RISAP.

Investigation derived waste (IDW) generated (if any) from the installation of monitoring wells and the development and sampling of monitoring wells will be handled in accordance with NYSDEC DER-10. Drill cuttings and spoils generated will be containerized in a 55-gallon drum, and disposed at a properly permitted treatment, storage, or disposal facility. Representative samples of cuttings and spoils will have to be analyzed to determine classification, treatment, and disposal.

The drilling subcontractor will be retained by either HRP or the Herkimer County IDA. HRP has the authority to stop work if unsafe conditions are encountered.

4.0 HAZARD ANALYSIS

The project hazard analysis below identifies the hazards that are anticipated to be encountered by the project team.

Physical Hazards Present	☐ Electricity ☒ Trips/Falls/Floor openings ☐ Holes/Pits ☒ Inclement weather ☒ Heat ☒ Cold ☒ Vibration ☒ Flying particles	☐ Ionizing radiation ☐ Non-Ionizing radiation ☐ Lasers ☒ Overhead hazards ☒ Noise ☒ Visible dust ☐ Falling objects ☐ Other _____
Health/Chemical Hazards Present [1]	☒ Dust/Fumes/Particulates ☒ Flammable/Combustible ☒ Compressed gas ☐ Explosive ☐ Water reactive ☐ Unstable ☒ Contact with contaminated media	☐ Oxidizer ☒ Corrosive ☒ Toxic ☐ Highly Toxic ☒ Irritant ☐ Sensitizer ☒ Carcinogen/Mutagen ☐ Other _____
Environmental/Equipment Hazards Present	☒ Heavy machinery ☒ Drilling ☐ Water operations ☒ Mobile equipment ☐ Road work ☐ Railroad work ☐ Forklifts ☐ Power tools ☐ Welding ☒ Gas cylinders ☒ Overhead/underground utilities	☐ Trenching/excavation ☐ Elevated heights/man lifts ☐ Scaffolding ☐ Ladders ☐ Confined spaces ☒ Energized equipment ☒ Overhead hazards ☒ Drums/container handling ☒ Insects/rodents/snakes ☒ Biological hazards ☐ Other _____
Personal Safety Considerations	☒ Security Issues ☐ Remote setting ☐ Employees working alone ☒ Limited lighting	☐ Off hour shifts ☐ Dangerous wildlife/animals ☐ Limited cell phone service ☐ Other _____
[1] **Table 1** (following the text of this HASP) provides a list of chemical substances for reference, along with odor threshold, permissible exposure limit (PEL), threshold limit value (TLV), OSHA ceiling, IDLH concentration, route of exposure and symptoms of acute exposure, if any. Refer to the RISAP for contaminants concentration levels.		

Details of specific hazards associated with individual tasks will be discussed in the Daily Job Brief Record (**Appendix F**).

4.1 Hazard Analysis Summary/Minimization

HRP's Corporate Health & Safety Plan (in conjunction with this HASP) will be cross-referenced in order to obtain the safe work practice procedures for mitigating and preventing project site hazards identified in the table above. Job site hazard prevention and minimization information can be found in HRP's Corporate Health & Safety Plan.

Confined Spaces

Only properly trained HRP personnel are authorized to enter confined spaces. Confined space entry may be performed by subcontractors who have the proper training and experience to conduct this work. No confined space activities are anticipated during the remedial investigation.

4.2 Changes in Conditions or Scope

Should conditions or the scope of work described herein change significantly, a HASP Addendum will be completed.

4.3 Monitoring Procedures

Air monitoring will be used to determine the concentrations of various chemicals while working in the exclusion zone to evaluate worker exposure to contaminated media. In order to determine potential health hazards and to determine the level of personal protection needed during sampling activities within the areas of concern, a Photoionization Detector (PID) and Particulate Monitor will be periodically operated to monitor air quality for the purpose of ensuring minimal exposure to volatile organic compounds and dust. Monitoring of atmospheres adjacent to on-going excavations and around the treatment area shall also be conducted with a PID.

The following environmental monitoring instruments/procedures shall be used on-site at the specified intervals. Air monitoring processes and procedures are provided in the RISAP as Attachment # 2 – Community Air Monitoring Program (CAMP).

Instrument/Procedure	**Sampling Interval**
Photoionization Detector (PID)	Periodically as deemed by the CAMP & HSO
Particulate Monitor	Periodically as deemed by the CAMP & HSO

Background ambient air levels will be established outside the exclusion zone prior to commencement of site work. Ambient air sampling will occur in the breathing zone of site workers for comparison to the action levels (described below). Additionally, air sampling will be conducted in the vicinity of any intrusive exploration (i.e. near excavations, trenches, etc.) to determine if any contaminants are present.

The following *Action Levels* will be used:

Instrument	Action Level	Level of Protection or Action Required
PID	No reading above background	▪ No action required. ▪ Continue PID monitoring. ▪ (Modified) Level D protection.
PID	Up to 5 ppm above background	▪ Evacuate exclusion zone. ▪ Recheck levels after 15 minutes. ▪ If levels are sustained, reassess. ▪ Use engineering controls to lower breathing zone vapors. ▪ Level C protection (at the HSO direction).
PID	>5 ppm above background	▪ Evacuate exclusion zone. ▪ Recheck levels after 15 minutes. ▪ Use engineering controls to lower breathing zone vapors. ▪ If levels are sustained, contact Safety Manager, and re-evaluate HASP.
Dust Monitor	No reading above background	▪ No action required. ▪ Continue particulate monitoring. ▪ (Modified) Level D protection.
Dust Monitor	100 ug/m^3 greater than upwind (background) level	▪ Recheck levels after 15 minutes. ▪ If levels are sustained, reassess. ▪ Use engineering controls (dust suppression) to lower breathing zone dust levels.
Dust Monitor	150 ug/m^3 above the upwind (background) level	▪ Evacuate exclusion zone. ▪ Recheck levels after 15 minutes. ▪ Use engineering controls to lower breathing zone dust levels. ▪ If levels are sustained, contact Safety Manager, and re-evaluate HASP.

When an action level is equaled or exceeded, the work area should be evacuated and the area re-tested with the sampling device. If the appropriate action level continues to be exceeded, the HSO will have to assess the use of engineering controls to lower vapor levels or availability of required increased personal protection equipment before authorizing re-entry.

Calibration of all instruments will occur at least once per day, when in use. An equipment calibration log is included in **Appendix C**.

5.0 ENGINEERING CONTROL MEASURES/GENERAL SAFETY

5.1 Air Monitoring

In order to determine potential health hazards and to determine the level of personal protection needed during drilling and sampling activities within the areas of concern, a PID and Dust Monitor will be periodically operated to monitor air quality for the purpose of ensuring minimal exposure to volatile organic compounds. Please refer to Section 4.2 of this plan for specific air monitoring procedures/action levels.

5.2 Protective Zones

Prior to commencement of work in area of suspected contamination, protective zones specific for each phase of the Plan will be established by the HSO if necessary prior to the start of field work. The purpose of the protective zones is to prevent potential cross-contamination of adjacent areas as well as to protect project personnel from exposure to contaminated areas.

Protective zones shall be delineated as follows:

- Exclusion Zone: This is the contaminated area in which intrusive activities are performed. The "Area of Environmental Concern" (AOEC) is located within this area. A single access point for entrance and exit should be established and maintained, if possible. This zone should be delineated from the Contaminant Reduction Zone via perimeter cones or caution tape, or other applicable method. Work areas are shown in the RISAP in **Figure 2-4**. The Exclusion Zone delineation and any necessary modifications will be based on site conditions.

- Contaminant Reduction Zone: This zone is a transition zone located between the Exclusion Zone and the Support Zone and is utilized to decontaminate personnel and equipment.

- Support Zone: This zone will be utilized by equipment and vehicle storage and will be kept free of contaminated material. The HSO will determine the location of this zone. In the event of a site evacuation, the rally point will be the corner of Spruce Street and Central Avenue. The designated rally point may be relocated by the HSO based on project or site conditions. All site workers will be notified of any relocation prior to implementation.

6.0 PERSONAL PROTECTIVE EQUIPMENT (PPE)

6.1 Level of Protection

As identified in Section 4.0, the overall health and safety risk associated with chemical hazards for HRP and associated contractors is considered moderate due to noted metals and VOC concentrations present during previous environmental investigations conducted at the Site. Therefore, the minimal level of protection for HRP personnel during the conduct of all the environmental work performed at the site will be Level D PPE, and will generally consist of the PPE listed below:

- Steel toe/shank work boots
- Hard hat, as necessary
- Safety vest, as necessary
- Coveralls/Tyvek, as necessary
- Safety glasses/goggles/face shield, as necessary
- Hearing protection, as necessary

If site conditions warrant, an upgrade to Level C PPE may be required (refer to Section 4.2 for the appropriate *Action Levels*) then the drilling contractor will make Level C personal protective equipment (PPE) readily available. Level C PPE generally includes:

- Full face, air purifying respirator with organic vapor and particulate cartridges
- Same as Level D, but also includes Tyvek taped pant/boot and glove/shirt

If it is determined protection beyond Level C is required, HRP will re-evaluate the HASP as well as the site conditions, and will revise the HASP as required.

The following table provides a summary of the minimum level of PPE required on site:

Description	Level of Protection [1]	
	D	C
Body		
Work Clothes	R	R
Chemical Protective Suit (Tyvek)	O	R
Visibility Vest	O [2]	O [2]
Apron	O	O
Fall Protection	O [2]	O [2]
Head		
Hard Hat	R	R
Head Warmer	O	O
Eyes & Face		
Safety Glasses	R	R
Goggles (based on hazard)	O	R
Face Shield	O	O
Ears		
Plugs or Muffs	R [2]	R [2]
Hands & Arms		
Work Gloves	R	O [2]
Chemical Resistant Gloves (Nitrile)	O	R

Description	Level of Protection [1]	
	D	C
Insulated Gloves	O	O
Foot		
Work Boots/Steel Toe Boots	R	R
Chemical Resistant Boots	O	O
Disposable Boot Covers	O	O
Respiratory Protection [3]		
½ Mask Air Purifying Respirator (APR)	NA	R
Full face APR	NA	R
Dust Protection	O	NA
Powered APR	NA	NA
SCBA/Supplied Air Respirator	NA	NA

R = Required, **O** = Optional, **NA** = Not Applicable
[1] The level of protection identified here does not include the necessary equipment for entering confined spaces. Refer to Moran Environmental Recovery's Safety Manual Confined Space Program for atmospheric sampling protocols and breathing and rescue equipment necessary for those operations.
[2] The use of this PPE may or may not be required depending on site conditions/location and will be addressed at the time of task assignment by the HSO.
[3] Respiratory protection necessary to protect against VOC, dusts/particulates and not oxygen deficient atmospheres.

The following table provides a general description of potential field activity tasks to be performed and associated (recommended) PPE. The use of this PPE may or may not vary depending on site conditions and will be addressed at the time of task assignment by the HSO.

Task Description	Invasive (Y/N)	Protection Level
Site Mobilization - Surveying, fence and barrier installation, hay bale installation, deacon and work zone set up, soil staging areas preparation	N	Level D
Soil and Water Sampling - Drilling, sampling, soil moving as needed.	Y	Modified Level D or Level C – Respirator as needed based on monitoring. Eye protection required during collection of any liquid sample
Soil Excavation, Staging and Load-Out	Y	Modified Level D – or Upgrade to Level C dependent on monitoring
Decontamination - Truck dry sweeping, deacon pressure wash of equipment, PPE change out	Y	Modified Level D – or Upgrade to Level C dependent on monitoring
Waste Management - Soil load-out for off-site disposal, water removal for disposal, PPE disposal	Y	Modified Level D – or Upgrade to Level C dependent on monitoring
Site Control (Exclusion, Decontamination, Support Zones)	N	Modified Level D – or Upgrade to Level C dependent on monitoring
Communications - Use of hand signals, backup alarms, and voice	N	NA
Site Restoration	Y	Level D

7.0 DECONTAMINATION

7.1 Decontamination Procedures

All personnel and equipment leaving the exclusion zone must be properly cleaned and decontaminated. When there is evidence of chemical contamination during the site operations, all personnel will be decontaminated under the direction of the HSO. Clean-up and/or decontamination of personnel shall consist of washing off excessively soiled PPE with a disinfectant detergent scrub and water. At the very least, all personnel should wash their hands and face before leaving the exclusion zone. After washing, all disposable clothing (Tyvek, gloves, etc.) will be removed and placed in a double lined plastic bag.

Sampling tools and any other non-disposable items will be decontaminated between sampling points, and at the direction of HRP personnel, to prevent cross-contamination of work areas or environmental samples, as applicable.

7.2 Emergency Decontamination

If immediate medical attention is required in an emergency, decontamination will be performed after the victim has been stabilized. If a worker has been exposed to an extremely toxic or corrosive material, then emergency decontamination will consist of flushing with copious amounts of water. If the victim cannot be decontaminated because it will interfere with emergency medical aid being administered, then the victim should be wrapped with plastic or other available items (i.e. an uncontaminated coverall) to reduce potential contamination of other personnel or medical equipment.

If a site worker has been overcome by heat related illness, then any protective clothing should be removed immediately. In the case of non-medical emergency evacuation, decontamination should be performed as quickly as possible, unless instant evacuation is necessary to save life or prevent injury.

7.3 Personal Hygiene

All employees will be required to wash hands and face prior to eating, smoking, drinking and going to the bathroom. Workers will be required to remove contaminated PPE and clothing prior to leaving the Contaminant Reduction Zone. All field personnel should avoid contact with potentially contaminated substances such as puddles, pools, mud, etc.

8.0 EMERGENCY ACTION PLAN/SPILL RESPONSE

In the event of a worker injury, fire, explosion, spill, flood, or other emergency that threatens the safety and health of site workers, the following procedure will be followed:

1. If the emergency originates within the work area covered by this Plan, the HRP HSO shall act as the Emergency Coordinator. The emergency evacuation signal is an air horn or a loud yell. All emergency situations (including worker injuries, no matter how small) will be reported to the HSO, who will determine the appropriate emergency response, up to and including evacuation. Only the HSO may initiate evacuation of the work area. The HSO will be responsible for reporting any emergency situation to the appropriate authorities, using a telephone or other appropriate method.

2. In the case of an evacuation, site workers will exit the site along the safest route(s) and assemble with team members at a safe rally point. Those workers in the Exclusion Zone will follow the emergency decontamination procedures outlined in Section 7.2. Accounting of all site personnel will be conducted by the HSO using the personnel log at a location determined by the HSO.

3. HRP personnel are not permitted to participate in handling the emergency. Fire and medical emergencies will be handled by the local fire department and ambulance service. In the case of a spill of hazardous materials, one of the following commercial spill clean-up firms should be contacted, as applicable:

    - **Environmental Products and Services – Glenmont, New York**
      1-800-577-4557 – 24 Hours
      518-465-4000 – Glenmont

    - **Clean Harbors Environmental Services – Glenmont, New York**
      1-800-645-8265 – 24 Hours
      518-434-0149 - Glenmont

    In addition, the HSO/Project Manager must advise the site contact that the New York Spill Hotline 1-800-457-7362 should be contacted and, if the spill quantity is greater than the Reportable Quantity (RQ) under CERCLA and/or SARA, the National Response Center (NRC) and Local Emergency Planning Committee should also be contacted. Any oil or petroleum products, chemical liquid, chemical solid, liquid product, gaseous product, or hazardous waste that is released in any manner which constitutes a spill, and poses a potential threat to human health or the environment, must be immediately reported to the NYSDEC.

    If the spill begins to flow overland and threatens to contaminate a storm drain or surface water, HRP personnel may attempt to contain and isolate the spill using any available resources, but only if, in the judgment of the HSO, such action will not expose the workers to dangerous levels of hazardous substances and is necessary to preserve life or property. In the event that a spill of material of any amount threatens to reach navigable waters, the NRC shall be contacted.

4. Once initial emergency procedures to protect worker safety and health have been addressed, and control of emergency has been completed, the HSO will complete an Investigation Report and submit this form to the appropriate personnel (HRP and/or client contact).

5. All site workers will be familiarized with the above procedures during the pre-entry briefing to be conducted before site work begins.

9.0 TRAINING/MEDICAL SURVEILLANCE

9.1 Training Requirements

All HRP and HRP subcontractor personnel who enter the work zone and/or Exclusion Zone must have successfully completed the 40-hour or 24-hour training requirement outlined in 29 CFR 1910(e). If the 40-hour or 24-hour training of any person occurred more than 12 months prior to commencement of work, then that person must have attended an 8-hour refresher course within the 12 months prior to commencement of work. If respirators are in use in the Exclusion Zone, then all personnel must have undergone respirator training and a fit test within the last 12 months. Training certificates and records for HRP employee(s) are on file at HRP. All other contractors will be required to supply written proof of training before being allowed into the Exclusion Zone.

9.2 Pre-Entry Briefing

Prior to commencement of work in an area of suspected contamination, HRP's Health and Safety Officer will conduct a pre-entry briefing with on-site contractors, which will include the following:

- Name of the HSO and person responsible for the visitor log.
- Description of the parcel as well as location of emergency telephones and the location/boundaries of the Exclusion Zone, Contamination Reduction Zone, and Support Zone, if established.
- Review of hospital locations and directions.
- Review of tasks to be conducted within the parcel by the site workers.
- Review of the Emergency Action Plan and rally point, including the nearest emergency communications and telephone numbers.
- The nature, level, and degree of anticipated hazards (physical and chemical) involved in the site work.
- Required personal protective equipment.
- Decontamination procedures.

The HSO should also, at this time, ensure that all on-site HRP and HRP subcontractor personnel have read the HASP and signed the last page of the original (Section 11.0). If additional information on the site becomes available, the HSO will call additional briefings as necessary.

9.3 Morning Safety (Tailgate) Meeting

The HRP HSO will conduct a safety overview meeting at the beginning of each workday on the site. The meeting will be given in addition to any tailgate meetings that the subcontractor conducts. A summary of the meeting topics signed by the personnel attending the meeting is included in **Appendix F**.

9.4 Medical Surveillance

All HRP and HRP subcontractor personnel entering the Exclusion Zone must have had a physical within the 12 months prior to commencement of site work. A physician's written opinion regarding fitness for work for each employee including work limitations, if any, is on file at HRP, as applicable. A written opinion for all other site personnel must be supplied prior to commencement of site work to the HRP HSO. Any work limitations for site personnel, or relevant medical information (i.e. allergic reactions to medication) should be included in this Plan.

10.0 AUTHORIZATIONS

Personnel authorized to enter the Exclusion Zone include the personnel listed in Section 2.4. Persons not listed in Section 2.4 may enter the Exclusion Zone only if the appropriate training and medical fitness certifications have been supplied to either the HRP Project Manager or Health and Safety Manager and the HSO or his/her designee on site has approved site entry. All personnel entering or leaving the Exclusion Zone must sign in and sign out with the record-keeper.

11.0 FIELD TEAM REVIEW

All HRP personnel shall sign below after reading this HASP and shall agree with the following statement:

*"I have read and understand this site specific Health and Safety Plan.
I will comply with the provisions set forth therein."*

Printed Name	Signature	Date

12.0 APPROVALS

This plan meets the minimum requirements of 29 CFR 1910.120 and 29 CFR 1929.65 and has been written for specified site conditions, dates, and personnel, and must be amended if conditions change. By their signature, the undersigned certify that this HASP is approved and will be utilized during Site investigation activities.

11/18/2019

NOTES

* = Constituent found in ETPH
**=Constituent found in Acid/Base/Neutral Extractable Compounds
***=Constituent found in Volatile Organic Compounds
****=Constituent found in Leaching Lead

[1]PEL = Permissible Exposure Limit. If no PEL is available, then the NIOSH Threshold Limit Value (TLV) should be used, if available.
[2]Ceiling limit or Short Term Exposure Limit (STEL), if available. Again, the NIOSH TLV may be used if no OSHA standard exists.
[3]Abbreviations are contained on the next page

[ ] = Potential Occupational Carcinogen
ND = Not Been Determined

ABBREVIATIONS

abdom = Abdominal
abs = Absorption
aggress = Aggressiveness
agit = Agitation
anor = Anorexia
anos = Anosmia (loss of the sense of smell)
Anxi = anxiety
anem – Anemia
aspir = Aspiration
asph – asphyxia
bron = Bronchitis
bron pneu = Bronchitis pneumonitis
[carc] = Potential occupational carcinogen
Card = Cardiac arrhythmias
CNS = Central nervous system
conf = Confusion
constip = Constipation
con = Skin and/or eye contact
conv = Convulsions
corn = Corneal
cyan = Cyanosis
defat = Defatting
depres = Depressant/Depression
derm = Dermatitis
diarr = Diarrhea
dist = Disturbance
dizz = Dizziness
drow = Drowsiness
dry = Dry mouth
dysp = Dyspnea (breathing difficulty)
emphy = Emphysema
epil-conv = Epileptiform convulsions
eryth = Erythema
euph = Euphoria
fib = Fibrosis
frost = frostbite
ftg = Fatigue
flush = Flushing
GI = Gastrointestinal
head = Headache
hyperpig = Hyperpigmentation
inco = Incoordination
ing = Ingestion
inh = Inhalation
inj = Injury
insom = Insomnia
irrit = Irritation
irrty = Irritability
lac = Lacrimination (discharge of tears)
lass = Lassitude (weakness, exhaustion)
li-head = Lightheadedness
liq = Liquid
low-wgt = Weight loss
mal = Malaise (vague feeling of discomfort)
malnut = Malnutrition
methem = Methemoglobinemia
myo = Myochonic (jerks of limbs)
mg/m = milligrams/cubic meter
muc memb = Mucous membrane
mus ftg = Muscle fatigue
narco = Narcosis
nau = Nausea
ner = Nervousness
numb = Numbness
optic = Optic nerve damage (blindness)
pall = Facial pallor
parap = Paralysis
ppm = Parts per million
pares = Paresthesia
paresi = Paresis
peri neur = Peripheral neuropathy
pneu = Pneumonitis
prot = Proteinuria
pulm = Pulmonary
peri neur = Peripheral neuropathy
pneu = Pneumonia
prot = Proteinuria
pulm = Pulmonary
repro = Reproductive
resp = Respiratory
skin sen = skin sensitization
salv = Salvation
som = Somnolence (sleepiness unnatural drowsiness)
subs = Substernal (occurring beneath the sternum)
stup = Stupor
sys = System
tingle = tingle limbs
trem – Tremors
verti = Vertigo
vis dist = Visual disturbance
vomit = Vomiting
weak = Weakness

Name	**Representing**	**Date**	**Time In**	**Time Out**

APPENDIX B
Supervisor's Investigation Report

INCIDENT REPORT

Section 1.0: Complete By Employee and Project Manager

(provide to Human Resources Manager) Incident Case No. _____

Employee Name: Employee Title/Position:	Age: Sex: □ Female □ Male	Time employee began work: Date of Incident: Time of Incident:	Weather Conditions: Date of Report: Time Report Completed:
Department: Office Location: Supervisor:			
Employee Address: Street: City/Town: Zip Code: Phone Number:	Location of Incident: Address: City/Town: State:		

Type of Incident:
□ Motor Vehicle Accident or □ Near Miss or □ Injury occurred during routine work

□ Company or □ Personal Vehicle?

First-Aid performed on-site? Yes / No
Other Medical Attention Provided? Yes / No

Time lost from work? Yes / No Number of Hours: or Number of Days:

If injuries occurred, list names and describe nature, degree, and body part injured: Number of injured:_____

1.

2.

3.

4.

Complete Section 3.0

WITNESS STATEMENT: WHAT HAPPENED AND WHAT WAS THE EMPLOYEE DOING BEFORE THE INCIDENT OCCURRED? WHAT WAS THE EMPLOYEE DOING WHEN THE INCIDENT OCCURRED? WHAT WAS THE EMPLOYEE DOING AFTER THE INCIDENT OCCURRED?	Describe what took place? Who was at fault for vehicle accidents, citation? Was power equipment involved, if so, describe?

WHAT WAS THE NATURE OF THE INJURY OR ILLNESS?	Tell us the body part that was affected and how it was affected – be specific Examples: strained lower back; chemical burn on hand
WHAT WAS THE ROOT CAUSE OF THE INCIDENT? List other individual involved in Section 3. COULD INCIDENT HAVE BEEN AVOIDED? HOW?	Get all the facts by studying the Job and situation involved. Question by use of WHY - WHAT – WHERE – WHEN – WHO – HOW Were there other factors (e.g., noise, ventilation, illumination, fatigue, age, medical conditions) that contributed to the accident?
WAS TRAINING FOR THE WORK ACTIVITY PROVIDED: TYPE: DATES:	WERE WARNING SIGNS OR LABELS POSTED:
WHAT SHOULD BE DONE? HOW CAN INCIDENT BE AVOIDED IN THE FUTURE?	WAS PERSONAL PROTECTIVE EQUIPMENT USED? NEEDED: AVAILABLE: CONTRIBUTED TO INJURY:
WHAT HAVE YOU DONE THUS FAR?	Take or recommend action, depending upon your authority. Follow up – was action effective?
HOW WILL THIS IMPROVE OPERATIONS?	OBJECTIVE Eliminate job hindrances

Completed by:	Reviewed by:	Date

Section 2.0: Complete By Supervisor or Human Resources Manager

Name: Role (witness, observer, injured, participant, etc.):	Address: Phone Number
Name: Role:	Address: Phone Number
Name: Role:	Address: Phone Number
Name: Role:	Address: Phone Number
Name: Role:	Address: Phone Number
Name: Role:	Address: Phone Number

Section 3.0: Corrective Actions (To be Completed by OHSM and CHSO)

Are corrective actions warranted? □ Yes □ No If so, proceed with corrective action list

Corrective Actions. List long term actions to be taken as a result of incident (use additional sheets if needed)	How was the corrective action implemented?	Target date of completion

OHSM Name:	CHSO Name:
OHSM Signature:	CHSO Signature:

End of incident report. Section 4.0 is to be completed and maintained by the Human Resources Department.

Section 4.0: Complete By Human Resources Manager

Incident Report Case No. _____

The information on this page is considered CONFIDENTIAL and must be treated as such. This page will only be available to Human Resources Department or the employee's supervisor.

Insured Name:	Employee Hire Dates: Start at Company: Current Position:
Policy Number:	Is employee a company: Owner, Officer, Neither.
Employee Soc. Sec. No.:	Marital Status: Spouse Name:
Was Employee Pay Interrupted, or paid in full for time:	Employee Pay Period: Weekly, Bi-Weekly, Monthly, Other (specify)
Employee Compensated by hourly or salary? Wage Information: (tips, bonuses, commission)	Typical No. of hours worked per day____, hours per week____. Typical Start of day time_____, end of day time_____.
Date of Stop Work: Date Returned to Work:	How often has employee visited doctor/hospital?
Doctor: Authorized by Co.: Y / N Street: City/Town: Zip Code: Phone Number: Authorized by Co.: Y / N	Hospital: Street: City/Town: Zip Code: Phone Number: Authorized by Co.: Y /N
Was the employee treated in an emergency room? □ Yes □ No	Was employee hospitalized overnight as an in-patient? □ Yes □ No If so, for how many days? _____

Health & Safety Comments / Topics & Safety Rules Reviewed / Questions / Concerns:

Contaminants of Concern: _____

HEALTH & SAFETY SIGNATURE: _____ Date: _____

Is there a Site-Specific or Generic Health & Safety Plan available on-site? Yes ☐ No ☐

☐ HAZARD ZONES NOT APPLICABLE, GENERAL WORK AREA

Level D ☐ Modified Level D ☐ Level C ☐

Anything above Level C, foreman should use a Confined Space Permit/Form.

Note: HOT WORK requires a hot work permit and minimum 20# fire extinguisher. Foreman or HSM must record at least one contaminant of concern above. Toxic plants may be considered a COC if no chemical hazards are expected.

LEVEL C
Respirator Type: _____

Name	Zone	Time In	Time Out	Decon Type

Before performing Level C work, ALL employees must review HRP's Respiratory Protection Program - a copy of which must be on-site along with a HASP.

COVID19
SITE SPECIFIC HASP ADDENDUM

This addendum will remain in effect until what time the CDC, NIAID, and/or Surgeon General guidance is provided that removes the heightened awareness of social distancing, hand washing, and other protocols in response to COVID-19.

NECESSARY ADDITIONAL SUPPLIES

- Hand sanitizer (minimum 60% alcohol)
- Squeeze bottles of water (if no running water at job site)
- Soap
- Disinfectant (for tools, vehicles, common areas, etc.)
- Caution tape, cones or similar to set up social distancing boundaries as needed

EMPLOYEE HEALTH PROTECTION – ZERO TOLERANCE

The following applies to both HRP employees and contracted staff working on behalf of the HRP or the client.

- ZERO TOLERANCE FOR SICK WORKERS REPORTING TO WORK. IF YOU ARE SICK, STAY HOME! IF YOU FEEL SICK, GO HOME! IF YOU SEE SOMEONE SICK, SEND THEM HOME!
- If you are exhibiting any of the symptoms below, you are to report this to your supervisor (via phone, text or email) right away, and head home from the job site or stay home if already there.
  If you notice a co-worker showing signs or complaining about such symptoms, he or she should be directed to their supervisor (via phone, text or email) and asked to leave the project site immediately.
  COVID-19 Typical Symptoms:
    - Fever
    - Cough
    - Shortness of Breath
    - Sore Throat
    - Loss of taste or smell
- Prior to starting a shift, each employee will verbally self-certify to their supervisor that they:
    - Have no signs of a fever or a measured temperature above 100.3 degrees or greater, a cough or trouble breathing within the past 24 hours.
    - Have not had “close contact” with an individual diagnosed with COVID-19. “Close contact” means living in the same household as a person who has tested positive for COVID-19, caring for a person who has tested positive for COVID-19, being within 6 feet of a person who has tested positive for COVID-19 for about 15 minutes, or coming in direct contact with secretions (e.g., sharing utensils, being coughed on) from a person who has tested positive for COVID-19, while that person was symptomatic.
    - Have not been asked to self-isolate or quarantine by their doctor or a public health official.
    - These self-certifications may be documented at the request of the site owner
- Workers that are working in a confined space or inside a closed building envelope will have to be temperature screened by a Medical Professional or designated individual. Such screening shall be performed out of public view to respect privacy and results are kept private.
- Employees exhibiting symptoms or unable to self-certify should be directed to leave the work

site and seek medical attention and applicable testing by their health care provider. They are not to return to the work site until cleared by a medical professional.

GENERAL ON-THE-JOB GUIDANCE TO PREVENT EXPOSURE & LIMIT THE TRANSMISSION OF THE VIRUS

All Job Sites

- No touching or direct contact with other individuals, including handshaking.
- Wash hands often with soap and water for at least 20 seconds or alternatively when soap and water are not available, use an alcohol-based hand sanitizer with at least 60% ethanol or 70% isopropanol
- A "No Congregation" policy is in effect, individuals must implement social distancing by maintaining a minimum distance of 6-feet from all other individuals
- Avoid face to face meetings – critical situations requiring in-person discussion must follow social distancing
- Conduct all meetings via conference calls, if possible. Do not convene meetings of more than 10 people. Recommend use of cell phones, texting, web meeting sites and conference calls for project discussion
- Be sure to use your own water bottle, and do not share
- To avoid external contamination, bring food from home
- Maintain Social Distancing separation during breaks and lunch.
- To avoid sharing germs, please clean up after yourself. DO NOT make others responsible for moving, unpacking and packing up your personal belongings
- If you or a family member is feeling ill, stay home!

Multi-person job sites (i.e. HRP and subcontractors, etc.)

- Contractor and Field Offices are to be locked down to all but authorized personnel
- Each jobsite should develop cleaning and decontamination procedures that are posted and shared (if multi-person job site). These Procedures must cover all areas including trailers, gates, equipment, vehicles, etc. and shall be posted at all entry points to the sites, and throughout the project site.
- All individual work crew meetings/tailgate talks should be held outside and follow social distancing
- Please keep all crews a minimum of 6' apart at all times to eliminate the potential of cross contamination
- At each job briefing/tool box talk, employees are asked if they are experiencing any symptoms, and are sent home if they are
- Each jobsite should have laminated COVID-19 safety guidelines and handwashing instructions (last page of this addendum)
- All restroom facilities/porta-potties should be cleaned and handwashing stations must be provided with soap, hand sanitizer and paper towels
- All surfaces should be cleaned at least twice a day, including desk, work stations, door handles, laptops, etc.
- All common areas and meeting areas are to be regularly cleaned and disinfected at least once a day but preferably twice a day

- Single person job sites (just one HRP employee, no subs, vendors, etc.)
  - It is that person's responsibility to clean and disinfect all tools and reusable supplies upon return to the office

- Cover coughing or sneezing with a tissue, then throw the tissue in the trash and wash hands, if no tissue is available then cough into your elbow
- Avoid touching eyes, nose, and mouth with your hands

WORK SITE RISK PREVENTION PRACTICES

- At the start of each shift, confirm with all employees that they are healthy.
- All employees will be required to wear gloves (either latex or cut resistant depending on the task at hand)
- Use of eye protection is required (Safety glasses or googles at a minimum with or without face shields).
- In work conditions where required social distancing is impossible to achieve, affected employees shall be supplied PPE including as appropriate a standard face covering, gloves, and eye protection.
- All employees shall drive to work site/parking area in a single occupant vehicle. No one should ride together in the same vehicle
- When entering a machine or vehicle which you are not sure you were the last person to enter, make sure that you wipe down the interior and door handles with disinfectant prior to entry
- In instances where it is possible, workers should maintain separation of 6' from each other per CDC guidelines.
- Multi person activities will be limited where feasible (two person lifting activities)
- Large gathering places on the site such as shacks and break areas will be eliminated and instead small break areas will be used with seating limited to ensure social distancing.
- Contact the cleaning person for your office trailer or office space and ensure they have proper COVID- 19 sanitation processes. Increase their cleaning visits to daily
- Clean all high contact surfaces a minimum of twice a day in order to minimize the spread of germs in areas that people touch frequently. This includes but is not limited to desks, laptops and vehicles

Wash Stations: All sites without ready access to an indoor bathroom or running water MUST install Wash Stations or provide other means for handwashing

- Install hand wash stations with hot water, if possible, and soap at fire hydrants or other water sources to be used for frequent handwashing for all onsite employees.
- All onsite workers must help to maintain and keep stations clean
- If a worker notices soap or towels are running low or out, immediately notify supervisors
- Garbage barrels will be placed next to the hand wash station for disposal of tissues/towels
- If no other alternative exists, bring squeeze bottles with water and soap (only authorized for single employee job sites)

Please Note: This document is not intended to replace any formalized procedures currently in place within the site specific HASP or any job related contracts.

Where this guidance does not meet or exceed the standards put forth by the state, municipality, site owner, contractor or subcontractor, everyone shall abide by the most stringent procedure.

A site-specific COVID-19 Officer (also known as the Health and Safety Officer) shall be designated for every site.

Print and post at each job site

COVID-19/ Health and Safety Officer Name: Stefan Truex

Phone Number: 518-877-7101

Any issue of non-compliance with these guidelines shall be a basis for pausing the work. The Health and Safety Officer will address corrective actions with the subcontractor. Any additional issues of non-conformance may be subject to action against the subcontractor's prequalification and certification status.

HRP #: HER1500.P2
Brownfields Assessment Cooperative Agreement: BF-96261019-0

Issued On: February 19, 2020

1.0 PURPOSE AND SCOPE

This Community Air Monitoring Plan (CAMP) has been prepared for the former Duofold facility located at 7 Spruce Street, in Ilion New York. This CAMP is to be utilized in tandem with the Health and Safety Plan (HASP), and provides the methods and procedures for real-time air monitoring to be implemented during the remedial investigation.

This CAMP provides for real-time air monitoring of particulates at the downwind perimeter of each designated work area when remedial investigation activities (such as excavation or drilling) are implemented at the Site. The CAMP was developed from the New York State Department of Health (NYSDOH) Generic CAMP provided in the DER-10 Technical Guidance for Site Investigation and Remediation. This CAMP provides a measure of protection for the downwind community (potential receptors include residences, businesses, and personnel not directly involved with work activities) from potential airborne contaminant releases as a direct result of investigation activities. Contractors should implement common sense measures to minimize dust and odors during the remedial investigation.

Requirements and guidelines in this HASP are subject to modification by the Project Manager in response to additional information obtained during field work regarding the potential for exposure to hazards. Updates will be communicated to field personnel as they are made.

Implementing this CAMP is the responsibility of all personnel. The Project Manager is responsible for overall project administration, including health and safety. The Field Team Leader is responsible for ensuring this CAMP is implemented in the field and is the primary point of contact to the Project Manager.

2.0 GENERAL INFORMATION

Site Name: **Former Duofold Facility**

Site Address: **7 Spruce Street – Ilion, New York 13357**

Site Contact: **John Piseck**

Phone Number: **315-866-3000**

Project Description

In general, the work to be performed by HRP consists of performing a remedial investigation to define to degree and extent of subsurface VOC and metals impacts to soil, groundwater, and soil gas. HRP personnel on site will not be directly involved in the anticipated drilling or excavation operations.

Drilling and excavation activities will be performed by a contractor working under a separate contract, under the direction of HRP. All construction and contracted personnel onsite are not covered under this HASP. HRP employees at the site will be collecting samples and acting as an environmental advisor to the Herkimer County Industrial Development Agency.

Each contractor must provide their own site-specific HASP that addresses minimum training requirements and potential hazards for each aspect of this remedial investigation.

3.0 VOC MONITORING

Volatile organic compounds (VOCs) shall be monitored on a continuous basis or as otherwise specified with a photoionization detector (PID). The downwind perimeter of the immediate work area (i.e., the exclusion zone) will be monitored using a PID. Upwind concentrations will be measured at the start of each workday and periodically thereafter to establish background conditions, particularly if wind direction changes. The monitoring work will be performed using appropriate equipment, calibrated at least once daily for the contaminant(s) of concern using an appropriate calibration standard. The equipment will be capable of logging measurements in 15-minute intervals, which will be compared to the levels specified below.

- If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds five (5) parts per million (ppm) above background for the 15-minute average, work activities must be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities can resume with continued monitoring.

- If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of five (5) ppm over background but less than 25 ppm, work activities must be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities can resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below five (5) ppm over background for the 15-minute average.

- If the organic vapor level is above 25 ppm at the perimeter of the work area at any single point during the remedial investigation, activities must be curtailed.

4.0 PARTICULATE MONITORING

Monitoring for particulates will be required during remediation-related ground intrusive activities and will include monitoring the upwind and downwind perimeters of the exclusion zone or work area, at a minimum. The particulate monitoring must use real-time monitoring equipment capable of measuring particulate matter less than ten (10) micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level.

As outlined in NYSDEC DER-10 Appendix 1B: Fugitive Dust & Particulate Monitoring, the monitoring equipment must meet, at a minimum, the following performance standards:

- Objects to be measured: Dust, mists or aerosols;
- Measurement Ranges: 0.001 to 400 mg/m^3 (1 to 400,000 :ug/m^3);
- Precision (2-sigma) at constant temperature: +/- 10 :g/m^3 for one second averaging; and +/- 1.5 g/m3 for sixty second averaging;
- Accuracy: +/- 5% of reading +/- precision (Referred to gravimetric calibration with SAE fine test dust (mmd= 2 to 3 :m, g= 2.5, as aerosolized);
- Resolution: 0.1% of reading or 1g/m3, whichever is larger;
- Particle Size Range of Maximum Response: 0.1-10;
- Total Number of Data Points in Memory: 10,000;
- Logged Data: Each data point with average concentration, time/date and data point number
- Run Summary: overall average, maximum concentrations, time/date of maximum, total number of logged points, start time/date, total elapsed time (run duration), STEL concentration and time/date occurrence, averaging (logging) period, calibration factor, and tag number;
- Alarm Averaging Time (user selectable): real-time (1-60 seconds) or STEL (15 minutes), alarms required;
- Operating Time: 48 hours (fully charged NiCd battery); continuously with charger;
- Operating Temperature: -10 to 50°C (14 to 122°F); and
- Particulate levels will be monitored upwind and immediately downwind at the working site and integrated over a period not to exceed 15 minutes.

The equipment will be equipped with an audible alarm to indicate exceedance of the action level. The action level is 150 micrograms per cubic meter (ug/m^3) measured as a 15 minutes average. In addition, fugitive dust migration will be visually assessed during all work activities. Calibration will be in accordance with the HASP and the instrument manufacturer's recommendations.

The upwind sampling station will be situated upwind of the largest dust producing activity occurring at the Site at the boundary of the work zone. Similarly, the downwind sampling station will be directly downwind of the largest dust producing activity at the boundary of the work zone.

If the downwind PM-10 particulate level is 100 ug/m^3 greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques must be employed. Work may continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 ug/m^3 above the upwind level and provided that no visible dust is migrating from the work area.

If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 ug/m^3 above the upwind level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 ug/m^3 of the upwind level and in preventing visible dust migration.

Should the action level of 150 ug/m^3 continue to be exceeded, work must stop and DER must be notified. The notification shall include a description of the control measures implemented to prevent further exceedances. All readings must be recorded and be available for review by the NYSDOH, NYSDEC and Herkimer County Health Department, if requested.

The sampling locations will be periodically adjusted to account for observed changes in wind direction.

HRP #: HER1500.P2
Brownfields Assessment Cooperative Agreement: BF-96261019-0

Issued On: February 19, 2020

1.0 INTRODUCTION

This Fugitive Emission Management Plan (FEMP) sets forth control methods that will be implemented during the remedial investigation, including the excavation, drilling, and sampling of impacted soils at 7 Spruce Street (Site) in Ilion, New York. The FEMP follows guidelines provided in the New York State Department of Environmental Conservation (NYSDEC) DER-10 Technical Guidance for Site Investigation and Remediation and the New York State Department of Health (NYSDOH) Generic Community Air Monitoring Plan (CAMP).

1.1 SITE DESCRIPTION AND BACKGROUND

The Site totals approximately 12.23 acres, and is and is located in a mixed commercial and residential use area. This FEMP applies to the drilling and excavation activities to be performed by the selected contractor to implement the remedial investigation addressing contaminated soil and groundwater. The Site contains soil and groundwater impacted by chlorinated volatile organic compounds (cVOC) at concentrations above NYSDEC recognized Soil Cleanup Objectives (SCOs) and Ambient Groundwater Quality Standards (AWQS)

2.0 SCOPE OF WORK TO COMPLETE SELECTED REMEDY FOR THE SITE

The scope of work to complete the selected remedy for the Site will include the following tasks:

- Establishing perimeter erosion and sediment controls, if necessary.
- Excavation and disposal of asphalt pavement, if necessary.
- Installation of direct push boreholes.
- Excavation of test pits, if necessary.

3.0 POTENTIAL FUGITIVE DUST EMISSION SOURCES AND CONTROL METHODS PLAN

This FEMP will be implemented during excavation, backfill, and handling of soils with the potential to generate fugitive dust and odors. Fugitive dust and VOC levels will be monitored in accordance with the site-specific CAMP. CAMP will be impletmented during all ground intrusive activities, and will be used as a means of managing and preventing fugitive emissions from migrating offsite. **Table 1** describes potential dust sources and control methods to be used to suppress dust emissions on or offsite.

TABLE 1		
1.1 Potential Emission Source	**1.2 Control Method [1]**	**Frequency of Application [2]**
Drilling & Injection Areas	Dampen area (if dry) before Drilling.	As needed.
Paved Roads (on-site and public roads)	Street sweeper.	As needed.

[1] Each potential source of dust emission will be documented by HRP field personnel, if necessary. The type of control method used, the frequency of application, and comments with regards to the method's effectiveness will be noted.

[2] The frequency of application may increase based on CAMP monitoring results.

Passive Soil Gas Survey – Analytical Report
Date: November 23, 2016

Beacon Project No. 3378

Project Reference:	Former Duofold Site, Herkimer, NY
Samplers Installed:	October 4 and 5, 2016
Samplers Retrieved:	October 20, 2016
Samples Received:	October 21, 2016
Analyses Completed:	October 26, 2016
Laboratory Data Issued:	November 2, 2016

EPA Method 8260C
All samples were successfully analyzed using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation to target a custom compound list following EPA Method 8260C. Laboratory results are reported in nanograms (ng) of specific compound per sample.

Laboratory QA/QC procedures included internal standards, surrogates, and blanks based on EPA Method 8260C. Analyses and reporting were in accordance with BEACON's Quality Assurance Project Plan.

Reporting limits
The reporting limit (RL) is 10 nanograms (ng) for vinyl chloride, 1,1-dichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, trichloroethene, and tetrachloroethene; 25 ng for the remaining individual compounds; and 5,000 ng for Total Petroleum Hydrocarbons (TPH). **Table 1** provides survey results in nanograms per sampler by sample-point number and compound name. For the six (6) compounds listed above, measurements below the limit of quantitation (10 ng) but above the limit of detection (5 ng) are flagged with a "J." The RLs represent a baseline above which results exceed laboratory-determined limits of precision and accuracy. Any field sample measurements above the upper calibration standard are estimated; however, these values are reported without qualifiers because all reported measurements are relative to each other and are appropriate to meet the survey objectives of locating source areas and vapor intrusion pathways and defining the lateral extent of contamination.

Calibration Verification
The continuing calibration verification (CCV) values for the calibration check compounds were all within ±20% of the true values as defined by the initial five-point calibration and met the requirements specified in Beacon Environmental's Quality Assurance Project Plan.

Method Blanks/Trip Blanks
Laboratory method blanks are run with each sample batch to identify contamination present in the laboratory. If contamination is detected on a method blank, measurements of identical compounds in that sample batch are flagged in the laboratory report. The laboratory method blanks analyzed in connection with the present samples revealed no contamination.

The trip blank is a sampler prepared, transported, and analyzed with other samples but intentionally not exposed. Any target compounds identified on the trip blanks are reported in the laboratory data. The analyses of the trip blanks (Trip-1 through Trip-4 in **Table 1**) reported none of the targeted compounds.

Passive Soil-Gas Survey Notes

When sample locations are covered with or near the edge of an artificial surface (*e.g.*, asphalt or concrete), the concentrations of compounds in soil gas are often significantly higher than the concentrations would be if the surfacing were not present. Thus, a reading taken below or near an impermeable surface is much higher than it would be in the absence of such a cap. Therefore, the sample location conditions should be evaluated when comparing results between locations.

Survey findings are exclusive to this project and when the spatial relationships are compared with results of other BEACON Surveys it is necessary to incorporate survey and site information from both investigations (*e.g.*, depth to sources, soil types, porosity, soil moisture, presence of impervious surfacing, sample collection times). BEACON recommends the guidelines stated in **Attachment 1** to establish a relationship between reported soil-gas measurements and actual subsurface contaminant concentrations, which will indicate those measurements representing significant subsurface contamination.

BEACON's passive soil-gas samplers are prepared with two sets of adsorbent cartridges for subsequent duplicate or confirmatory sample analysis. At the client's request, duplicate analysis was performed for four (4) field samples. The field sample duplicates were designated "D" following the sample number. When comparing quantitative results, a duplicate correspondence should be considered when the relative percent difference (RPD) between the two samples is less than or equal to 100%. For the purpose of calculating correspondences, all non-detections should be assigned, as a baseline value, the RL for the specific contaminant. Based on these assumptions, a 100% correlation was found between the field sample duplicates and their base samples.

Project Details

Samplers were deployed on October 4 and 5, 2016, and were retrieved on October 20, 2016. **Attachment 2** describes standard field procedures. Individual deployment and retrieval times will be found in the Chain of Custody Form (**Attachment 3**).

Eighty (80) field samples, four (4) field sample duplicates, and four (4) trip blanks were received by BEACON on October 21, 2016. Adsorbent cartridges from the passive samplers were thermally desorbed, then analyzed using gas chromatography/mass spectrometry (GC/MS) equipment, in accordance with EPA Method 8260C, as described in **Attachment 4**. BEACON's laboratory analyzed each sample for the targeted compounds; analyses were completed on October 26, 2016. Following a laboratory review, results were provided on November 2, 2016.

October 6, 2016

Delta Geophysics, Inc. (Delta) is pleased to provide the results of the geophysical survey conducted at 7 Spruce Street, Ilion, New York.

1.0 INTRODUCTION

From October 3rd through October 6th, 2016 Delta Geophysics personnel performed a limited geophysical investigation at 7 Spruce Street, Ilion, New York. Field activities concluded on October 6th, 2016. Multiple areas throughout the site were to be surveyed and were specified by the client. Subsurface conditions were unknown at the time of survey. Surface conditions consisted of asphalt, concrete, grass, soil and dense vegetation.

2.0 SCOPE OF WORK

The survey was conducted to locate and mark detectable underground utilities and/or anomalies throughout the client specified survey areas.

3.0 METHODOLOGY

Selection of survey equipment is dependent site conditions and project objectives. For this project the technician utilized the following equipment to survey the area of concern:

- Geophysical Survey Systems Inc. SIR-3000 cart-mounted Ground Penetrating Radar (GPR) unit with a 400 Mhz antenna.
- Geonics EM-31 Terrain Conductivity meter
- Radiodetection RD7000 precision utility locator.
- Fisher M-Scope TW-6 pipe and cable locator.
- Trimble Pathfinder Pro XRS DGPS.

Ground penetrating radar (commonly called GPR) is a geophysical method that has been developed over the past thirty years for shallow, high-resolution, subsurface investigations of the earth. GPR uses high frequency pulsed electromagnetic waves (generally 10 MHz to 1,000 MHz) to acquire subsurface information. Energy is propagated downward into the ground and is reflected back to the surface from boundaries at which there are electrical property contrasts. GPR is a method that is commonly used for environmental, engineering, archeological, and other shallow investigations.

The GSSI SIR-3000 GPR can accept a wide variety of antennas which provide various depths of penetration and levels of resolution. The 400 MHz antenna can achieve depths

of penetration up to about 20 feet, but this depth may be greatly reduced due to site-specific conditions. Signal penetration decreases with increased soil conductivity. Conductive materials attenuate or absorb the GPR signal. As depth increases the return signal becomes weaker. Penetration is the greatest in unsaturated sands and fine gravels. Clayey, highly saline or saturated soils, areas covered by steel reinforced concrete, foundry slag, or other highly conductive materials significantly reduces GPR depth of penetration.

The GPR was configured to transmit to a depth of approximately 10 feet below the subsurface, but actual signal penetration was limited to approximately 1-2 feet below ground surface (bgs). The limiting factor was signal attenuation from near surface soils.

The electromagnetic (EM) method uses the principle of electromagnetic induction to measure the variability of electrical conductivity of subsurface materials. The large EM response to metal makes this technique particularly well suited to identifying buried metal objects such as underground storage tanks, buried drums, pipelines, reinforced building foundations, or other metal components of buried structures. It is, however, equally sensitive to metal objects on the ground surface, and it is important to take careful field notes that indicate the position of surface metal to avoid misinterpretation. Instruments of this type are more sensitive to near surface features i.e. reinforced concrete and this fact may sometimes mask features underneath.

The EM-31 is an electromagnetic surveying technique where the direct readout of the instrument is the bulk electrical conductivity of an equivalent homogeneous earth at that position referred to as “terrain conductivity”. Terrain conductivity is commonly used to detect lateral variations in electrical conductivity along a traverse or over a broad region. These variations can be due to conductive contaminant plumes in the groundwater, shallow discontinuous clay and silt horizons, shallow bedrock features such as voids, disturbed filled-in areas such as buried trenches, or buried metallic objects such as drums, tanks, or utility lines.

For the interpretation of high conductivity targets (like steel drums or metallic containers in this case), the in-phase component is the most discriminative. Lower contrast targets such as clay layers, contaminant plumes, and filled-in trenches are better indicated in the conductivity or quadrature data set. For this survey the EM-31 was set to record at 1 second intervals, a distance equivalent of approximately 2.5 feet. Survey line spacing was approximately 5 feet on center.

The RD7000 precision utility locator uses radio emission to trace the location of metal bearing utilities. This radio emission can be active or passive. Active tracing requires the attachment of a radio transmitter to the utility, passive tracing uses radio emissions that are present on the utility. Underground electrical utilities typically emit radio signals that this device can detect.

The TW-6 is designed to find pipes, cables and other metallic objects such as underground storage tanks. One surveyor can carry both the transmitter and receiver together, making it ideally suited for exploration type searches of ferrous metal masses.

Metal detectors of this type operate by generating a magnetic field at the transmitter which causes metallic objects in the subsurface to generate a secondary magnetic field. The induced secondary field is detected by the receiver, which generates an audible tone equal to the strength of the secondary field.

The Pathfinder Pro XRS Mapping System is a 12 channel differential beacon GPS receiver. The Pro XRS uses an integrated differential beacon receiver and antenna to receive real-time differential corrections from a subscription-based satellite correction service. This system provides for real-time sub-meter position data collection. This system is used in a wide range of applications, including utility asset management, environmental monitoring, and natural resource and land management. Feature and attribute data are input with a hand-held Asset Surveyor data logger. The GPS Pathfinder was used to tag each EM-61 reading with geographic coordinate for processing and mapping purposes.

4.0 SURVEY FINDINGS

All accessible areas within the survey areas were examined during this investigation. All areas were examined with the RD7000 for potential subsurface utilities then surveyed with GPR and TW-6 for other potential anomalies. EM data was collected where possible. Based on the data gathered, the following utilities were detected: water, gas, sanitary sewer and storm sewer. Additionally, a potential building foundation was detected. All detectable utilities were marked onsite with appropriate colors. Anomalous features and unknown utilities were marked onsite in pink paint. Site map (100316.1) is included with all located subsurface features.

5.0 SURVEY LIMITATIONS

GPR depth of penetration was limited to approximately 1-2 feet bgs. The limiting factor was due to conductive soils. Building walls, parked cars, dense vegetation, area fencing and debris limited equipment usage over portions of the survey area. Delta did not have access to buildings located adjacent to the property. Interior access may aid Delta in detecting unknown utilities or utilities otherwise not detectable without a direct connection to the pipe or conduit.

6.0 WARRANTIES AND DISCLAIMER

As with any geophysical method, it must be stressed that caution be used during any excavation or intrusive testing in proximity to any anomalies indicated in this report. In addition, the absence of detected signatures does not preclude the possibility that targets may exist. To the extent the client desires more definitive conclusions than are warranted by the currently available facts; it is specifically Delta's intent that the conclusions stated herein will be intended as guidance.

This report is based upon the application of scientific principles and professional judgment to certain facts with resultant subjective interpretations. Professional judgments expressed herein are based on the facts currently available within the limit or scope of work, budget and schedule. Delta represents that the services were performed in a manner consistent with currently accepted professional practices employed by geophysical/geological consultants under similar circumstances. No other representations to Client, express or implied, and no warranty or guarantee is included or intended in this agreement, or in any report, document, or otherwise.

This report was prepared pursuant to the contract Delta has with the Client. That contractual relationship included an exchange of information about the property that was unique and between Delta and its client and serves as the basis upon which this report was prepared. Because of the importance of the understandings between Delta and its client, reliance or any use of this report by anyone other than the Client, for whom it was prepared, is prohibited and therefore not foreseeable to Delta.

Reliance or use by any such third party without explicit authorization in the report does not make said third party a third party beneficiary to Delta's contract with the Client. Any such unauthorized reliance on or use of this report, including any of its information or conclusions, will be at the third party's risk. For the same reasons, no warranties or representations, expressed or implied in this report, are made to any such third party.

NOTES:

This site plan was produced from data positioned by differential GPS measurments collected in the field. Due to the errors normally present in DGPS data, this document is not intended or represented to be of survey precision. Caution should be used in all field measurments based on this site plan.

As with any geophysical method, it must be stressed that caution be used during any excavation or intrusive testing in proximity of any anomalies indicated in this document The absence of detected signatures does not preclude the possibility that targets exist. The geophysical data and results presented in this site plan are based upon the application of scientific principles and professional judgements to certain facts with resultant subjective interpretations. Professional judgements expressed herein are based on the facts currently available within the limits of the existing data, scope of work, budget, and schedule.

Reliance or use by any such third party without explicit authorization in the document does not make said third party a third party benificiary to Delta's contract with the client. Any such unauthorized reliance on or use of this document, including any of its information or conclusions, will be at the third party's risk. For the same reasons, no warranties or representations, expressed or implied in this document, are made to any such third party.

Subject: **Phase I Environmental Site Assessment Report**
Former Duofold Site
7 Spruce Street
Ilion, New York 13357
HRP Project Number: HER1500.P2
Brownfields Assessment Cooperative Agreement: BF-96261019-0

Dear Mr. Piseck,

HRP has completed a Phase I Environmental Site Assessment (ESA) of the Former Duofold Facility located at 7 Spruce Street in Ilion, New York (herein referred to as the "Site"). HRP completed this assessment in accordance with the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, ASTM E1527-13.

Please review the attached report in its entirety, and contact us if you have any questions. If you have any questions or require additional information, please feel free to contact HRP at (518) 877-7101.

Sincerely,

James K. Charter
Senior Project Scientist

Jesse Zahn, CHMM, PG
Regional Office Manager

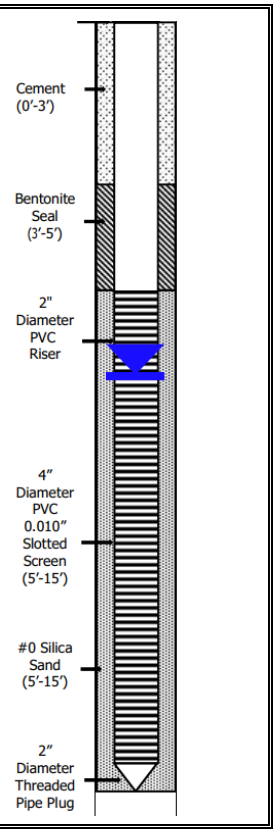
WELL NO.: TMW-2	**RISER PIPE:**	
PROJECT: Former Duofold Facility	**Material**: PVC	**Length**: 7.5'
JOB NUMBER: HER1500.P2	**Joint Type**: N/A	**Diameter**: 2.0"
DATE COMPLETED: 9/14/2020	**SCREEN:**	
DRILLING COMPANY: NW Contracting, Inc.	**Material**: PVC	**Length**: 10.0'
RIG TYPE: CME-55	**Slot Size**: 0.010-inch	**Diameter**: 2.0"
GENERAL NOTES:	**Stratigraphic Unit**: Grey fill; Moist; No odor	
Type of well: Monitoring Well	**PACKING:**	
Static Water Level: 6.5'-7.0'	**Sand**: Superior Quartz Filtatration Media- FilPro	**Gravel**: N.A
Measuring Point: N/A	**Interval**: 15.0 ft. bg to 5.0 ft.bg	
Date: 9/14/2020	**SEAL:**	
Total Well Depth: 15.0 ft. bg	**Type**: PureGold Medium Chips Bentonite	**Interval**: 5.0 ft. bg to 3.0 ft. bg
PROTECTIVE PLUG	**FILL and CEMENT:**	
Yes ✓ No	**Type**: Instant Concrete	**Interval**: 3.0 ft. bg to grade
Diameter: 2.0"		

ADDITIONAL NOTES: Bentonite was hydrated. 8' curbox installed in road.



HRP Associates, Inc.

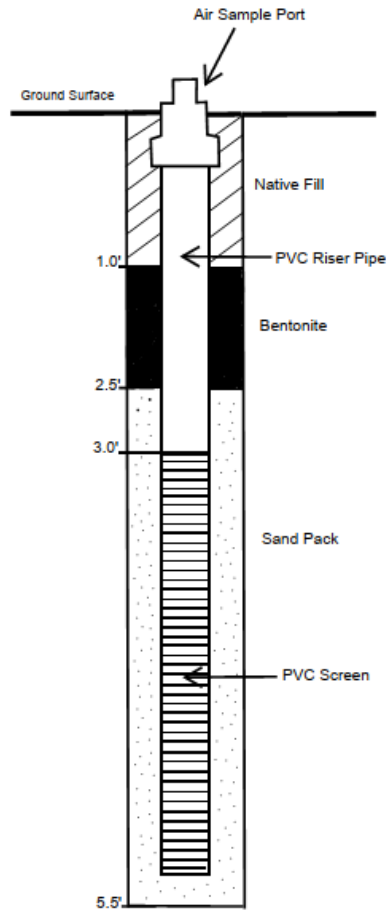
WELL NO.: HRPB-6	**RISER PIPE:**	
PROJECT: Former Duofold Facility	**Material**: PVC	**Length**: 3.0'
JOB NUMBER: HER1500.P2	**Joint Type**: N/A	**Diameter**: 1.0"
DATE COMPLETED: 9/9/2020	**SCREEN:**	
DRILLING COMPANY: NW Contracting, Inc.	**Material**: PVC	**Length**: 2.5'
RIG TYPE: CME-55	**Slot Size**: 0.010-inch	**Diameter**: 1.0"
GENERAL NOTES:	**Stratigraphic Unit**: Silt, Sand, and Gravel	
Type of well: Soil Vapor Probe	**PACKING:**	
Static Water Level: N/A	**Sand**: Superior Quartz Filtatration Media- FilPro	**Gravel**: N.A
Measuring Point: N/A	**Amount**: 20 lbs	**Interval**: 5.0 ft. bg to 2.5 ft. bg
Date: 9/9/20	**SEAL:**	
Total Well Depth: 5.5'	**Type**: PureGold Medium Chips Bentonite	**Interval**: 2.5 ft. bg to 1.0 ft. bg
PROTECTIVE COVER:	**FILL and CEMENT:**	
Yes ✓ No	**Type**: Native Fill	**Interval**: 1.0 ft. bg to 0.5 ft. bg
Diameter: 1.0"	**Type**: Instant Concrete	**Interval**: 0.5 ft. bg to grade

ADDITIONAL NOTES: Bentonite was hydrated. No Groundwater Observed During Drilling.



HRP Associates, Inc.

* - Indicates analysis was performed by a subcontracted laboratory.

This case narrative is in the form of an exception report. Method specific and/or QA/QC anomalies related to this report only are detailed below.

Volatile Organic Analysis:

Methylene chloride was recovered in samples AD18934-001, -003, -004, -006 due to possible laboratory contamination.

Chloroform was recovered in sample AD18934-006 due to possible laboratory contamination.

The Method Blank Spike for batches 87436, 87762 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

The MS/MSD, Matrix Spike and/or Matrix Spike Duplicate for batch 87762 had recoveries outside QC limits. Please refer to the applicable Form 3 for the recoveries.

Metals Analysis:

The Matrix Spike and/or Matrix Spike Duplicate for batch 85228 had recoveries outside QC limits. Please refer to the applicable Form 5/7 for the recoveries.

The RPD between the QC sample and the Method Replicate had recoveries outside QC limits in batch 85228. Please refer to the applicable Form 6/9 for the recoveries.

The MS/MSD RPD had recoveries outside QC limits in batch 85228. Please refer to the applicable Form 6/9 for the recoveries.

The serial dilution for batch 85228 is outside QC limits for one or more analytes. Please refer to the applicable Form 6/9 for the recoveries.

Wet Chemistry Analysis:

The MS Insoluble for Hexavalent Chromium, batch 779, recovered outside the QC limits. The batch was reset and recoveries confirmed. The results from first analysis are reported.

TCLP Metals Analysis:

Samples AD18934-002, -003, -004, -005 were reported at a dilution for Se due to Ca over linear range.

The serial dilution for batch 85218 is outside QC limits for one or more analytes. Please refer to the applicable Form 6/9 for the recoveries.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Sean Berls Quality Assurance Officer	Or	Jean Revolus Laboratory Director	9/17/20 Date

Reporting Limit Definitions

HC Reporting Limit Definitions/Data Qualifiers

REPORTING DEFINITIONS

DF = Dilution Factor

LCS = Laboratory Control Spike

MBS = Method Blank Spike

MS = Matrix Spike

MSD = Matrix Spike Duplicate

MDL = Method Detection Limit

NA = Not Applicable

ND = Not Detected

PS = Post Digestion Spike

RL* = Reporting Limit

RT = Retention Time

**Samples with elevated Reporting Limits (RLs) as a result of a dilution may not achieve client reporting limits in some cases. The elevated RLs are unavoidable consequences of sample dilution required to quantitate target analytes that exceed the calibration range of the instrument.*

DATA QUALIFIERS

A- Indicates that the Tentatively Identified Compound (TIC) is suspected to be an aldol-condensation product. These compounds are by-products of acetone and methylene chloride used in the extraction process.

B- Indicates analyte was present in the Method Blank and sample.

d- For Pesticide and PCB analysis, the concentration between primary and secondary columns is greater than 40%. The lower concentration is generally reported.

E- Indicates the concentration exceeded the upper calibration range of the instrument.

J- Indicates the value is estimated because it is either a Tentatively Identified Compound (TIC) or the reported concentration is greater than the MDL but less than the RL. For samples results between the MDL and RL there is a possibility of false positives or misidentification at the quantitation levels. Additionally, the acceptance criteria for QC samples may not be met.

R- Retention Time is out.

Y- Indicates a contaminant found in the blank at less than 10% of the concentration of a contaminant found in the sample.

Total Target Concentration 0.25

ColumnID: (^) Indicates results from 2nd column

U - Indicates the compound was analyzed but not detected.
B - Indicates the analyte was found in the blank as well as in the sample.
E - Indicates the analyte concentration exceeds the calibration range of the instrument.
R - Retention Time Out
J - Indicates an estimated value when a compound is detected at less than the specified detection limit.
d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used
Chlordane (Total) is sum of a-Chlordane and y-Chlordane.

Worksheet #: 565778

Total Target Concentration 0.0055

ColumnID: (^) Indicates results from 2nd column

U - Indicates the compound was analyzed but not detected.
B - Indicates the analyte was found in the blank as well as in the sample.
E - Indicates the analyte concentration exceeds the calibration range of the instrument.
R - Retention Time Out
J - Indicates an estimated value when a compound is detected at less than the specified detection limit.
d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used

Chlordane (Total) is sum of a-Chlordane and y-Chlordane.

Additional Notes

Comments, Notes, Special Requirements, HAZARDS

Indicate if low-level methods required to meet current groundwater standards (SPLP for soil):
- [ ] BN or BNA (8270D SIM)
- [ ] VOC (8260C SIM or 8011)
- [ ] SPLP (BN, BNA, Metals)
- [ ] 1,4 Dioxane

For NJ LSRP projects, indicate which standards need to be met:
- [ ] NJDEP GWQS
- [ ] NJDEP SRS
- [ ] NJDEP SPLP
- [ ] Other (specify):

Check if applicable:
- [ ] Project-Specific Reporting Limits
- [ ] High Contaminant Concentrations
- [ ] NJ LSRP Project (also check boxes above/right)

Cooler Temperature: 2.9

Please note NUMBERED items. If not completed your analytical work may be delayed.
A fee of $5/sample will be assessed for storage should sample not be activated for any analysis.

Internal use: sampling plan (check box) HC [ ] or client [ ] FSP#

CONDITION UPON RECEIPT

Batch Number AD18934 Entered By: Frantz

Date Entered 8/27/2020 11:25:00 AM

1	Yes	Is there a corresponding COC included with the samples?
2	Yes	Are the samples in a container such as a cooler or Ice chest?
3	Yes	Are the COC seals intact?
4	T-461	<--- Thermometer ID. Please specify the Temperature inside the container (in degC). 2.9
5	Yes	Are the samples refrigerated (where required)/have they arrived on ice?
6	Yes	Are the samples within the holding times for the parameters listed on the COC? IF no, list parameters and samples:
7	Yes	Are all of the sample bottles intact? If no, specify sample numbers broken/leaking
8	Yes	Are all of the sample labels or numbers legible? If no specify:
9	Yes	Do the contents match the COC? If no, specify
10	Yes	Is there enough sample sent for the analyses listed on the COC? If no, specify:
11	No	Are samples preserved correctly?
12	Yes	Was temperature blank present (Place comment below if not)? If not was temperature of samples verified?
13	NA	Other comments ...Specify (TB date, sample matrix, any missing info, etc.)
14	Yes	Corrective actions (Specify item number and corrective action taken). FB- preserved at lab with NaOH for CN.
15	No	Were any samples for ortho-phosphate or dissolved ferrous iron field filtered?

Worksheet #: 565778

Total Target Concentration 0.0055

ColumnID: (^) Indicates results from 2nd column

U - Indicates the compound was analyzed but not detected.
B - Indicates the analyte was found in the blank as well as in the sample.
E - Indicates the analyte concentration exceeds the calibration range of the instrument.
R - Retention Time Out
J - Indicates an estimated value when a compound is detected at less than the specified detection limit.
d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used.
Chlordane (Total) is sum of a-Chlordane and y-Chlordane.

Worksheet #: 565778

Total Target Concentration 0

ColumnID: (^) Indicates results from 2nd column

U - Indicates the compound was analyzed but not detected.
B - Indicates the analyte was found in the blank as well as in the sample.
E - Indicates the analyte concentration exceeds the calibration range of the instrument.
R - Retention Time Out
J - Indicates an estimated value when a compound is detected at less than the specified detection limit.
d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used

Chlordane (Total) is sum of a-Chlordane and y-Chlordane.

Flags

a - failed the min rf criteria

c - failed the minimum correlation coeff criteria(if applicable)

Note: Avg Rsd: 11.17

Corr 1 = Correlation Coefficient for linear Eq.

Corr 2 = Correlation Coefficient for quad Eq.

Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.

0082707 0119

Form 6
Initial Calibration

Flags

a - failed the min rf criteria

c - failed the minimum correlation coeff criteria(if applicable)

Note: Avg Rsd: 11.02

Corr 1 = Correlation Coefficient for linear Eq.

Corr 2 = Correlation Coefficient for quad Eq.

Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.

0082707 0149

Form 6
Initial Calibration

Method: EPA 8260C

Instrument: GCMS_2

Avg Rsd: 11.02

Flags

a - failed the min rf criteria

c - failed the minimum correlation coeff criteria(if applicable)

Note:

Corr 1 = Correlation Coefficient for linear Eq.

Corr 2 = Correlation Coefficient for quad Eq.

Fit = Indicates whether Avg RF, Linear, or Quadratic Curve was used for compound.

Worksheet #: 565778

Total Target Concentration 0

ColumnID: (^) Indicates results from 2nd column

U - Indicates the compound was analyzed but not detected.
B - Indicates the analyte was found in the blank as well as in the sample.
E - Indicates the analyte concentration exceeds the calibration range of the instrument.
R - Retention Time Out
J - Indicates an estimated value when a compound is detected at less than the specified detection limit.
d - Pesticide %Diff>40% between columns due to coelution. Lower concentration used.
Chlordane (Total) is sum of a-Chlordane and y-Chlordane.

192.168.1.87 9/1/2020 7:54:46 AM

Run ok. Report Ag, As, Be, Cd, Sb, Se, Tl, V. LRS fail for Ag. Ag LR = 100ppb.
Rerun Ag, Cd for 18932-002 (int. std. Fail.) PC.

9/3/20

Note: ICP-MS dilution factor column does not reflect dilution which is performed prior to analysis. Secondary analytical dilution is documented on prep log. Dilution Factor: 2 & 3 m

Calibrate using pH 4.0 and pH 10.0/Read and record pH 7.0*
(the pH 7.0 must agree within ±0.1 pH units).
Record temp and refer to table to determine target pH.
When using the pH meter more for analysis and more than 3 hours
has passed calibration, read and record pH 7.0
If pH 7.0 is off by ± 0.2 units, re-calibrate using the pH 4.0 and pH 10.0 buffers.
*For method 9040C,buffer pH must bracket sample pH. For acidic samples calibrate with pH 2.0 and 7.0, check with 4.0. For basic samples calibrate with 7.0 and 12. 0, check with 10.0

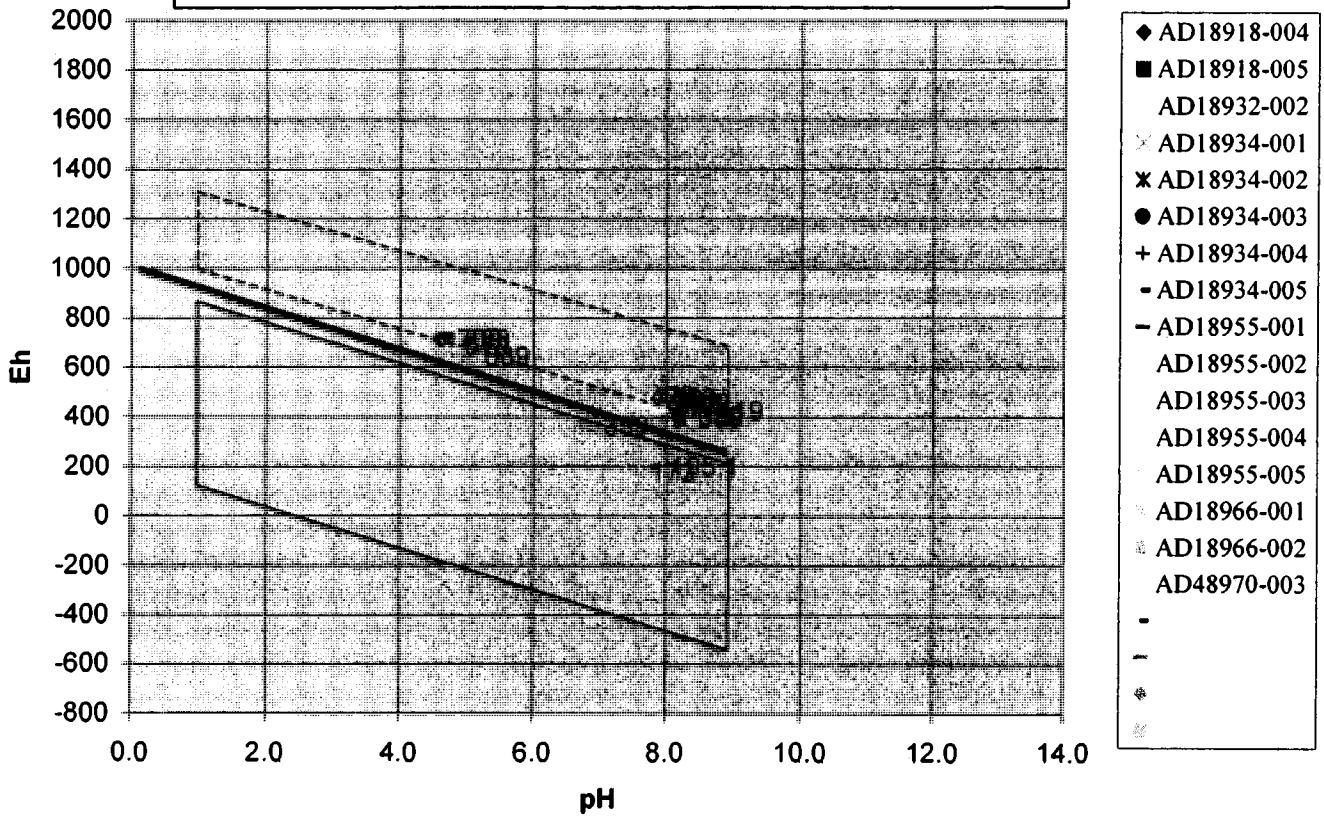
When using the pH meter more for analysis and more than 3 hours has passed calibration, read and record pH 7.0
If pH 7.0 is off by ± 0.2 units, re-calibrate using the pH 4.0 and pH 10.0 buffers.
*For method 9040C,buffer pH must bracket sample pH. For acidic samples calibrate with pH 2.0 and 7.0, check with 4.0. For basic samples calibrate with 7.0 and 12. 0, check with 10.0

Temp (deg. C)	pH 2	pH 4	pH 7	pH 10	pH 12
0	-	4.00	7.12	10.31	-
5	-	4.00	7.09	10.23	-
10	1.93	4.00	7.06	10.17	-
15	1.98	4.00	7.04	10.11	12.35
20	1.98	4.00	7.02	10.05	12.17
25	2.00	4.00	7.00	10.00	11.99
30	2.01	4.01	6.99	9.95	11.78
35	2.03	4.02	6.98	9.91	11.62
40	2.03	4.03	6.98	9.87	11.46
45	2.04	4.04	6.97	-	-
50	2.04	4.06	6.97	9.81	-

Eh/pH Phase Diagram

The boxes define Eh-pH boundaries commonly encountered in soils and sediments.



Sample	ORP	pH
AD18918-004	510	4.6
AD18918-005	510	4.7
AD18932-002	270	7.6
AD18934-001	160	6.8
AD18934-002	190	8.2
AD18934-003	200	8.2
AD18934-004	220	8.5
AD18934-005	-3.9	7.8
AD18955-001	250	7.9
AD18955-002	250	8.0
AD18955-003	250	7.9
AD18955-004	270	7.8
AD18955-005	-27	7.5
AD18966-001	480	4.7
AD18966-002	440	5.0
AD48970-003	280	7.5

Reducing | Oxidizing

*Note the Eh values plotted on this diagram are corrected for the reference electrode voltage :199 mV units was added for the combination platinum electrode used.
