Dear Ms. Cahill,

On behalf of the Bristol-Myers Squibb Company (BMS), Arcadis of New York, Inc. (Arcadis) is providing this letter report confirming the shutdown of the Air Treatment System (ATS) that had operated consistent with the Operation, Maintenance, and Monitoring (OMM) Plan – Building 3 Indoor Air Treatment System (Arcadis, May 2022) for the former BMS facility located at 3551 Burnet Avenue in East Syracuse, New York (the Site).

In a letter dated January 19, 2023, the New York State Department of Environmental Conservation (NYSDEC) provisionally approved shutdown of the ATS with the condition that BMS conduct a post-shutdown sampling event for Building 3 once the ATS was taken offline to evaluate whether the indoor air quality remains at levels consistent with New York State Department of Health (NYSDOH) guidance values (NYSDOH, 2006). As such, this letter summarizes the findings from that post-ATS shutdown event conducted on April 25, 2023, the formal shut down of the ATS, and the administrative building controls which remain in place.

Background

BMS operated a Boiler Control Room in the basement of Building 3 at the Site. Based on the presence of dissolved-phase volatile organic compound (VOC) concentrations in shallow groundwater in the vicinity of Building 3, an evaluation of the potential SVI migration pathway was conducted in 2016 for Building 3 as it was a downgradient or proximal building that remained occupied at the time of the Phase 1A investigation in 2016.

An elevated water table in proximity to the Building 3 slab elevation precluded collection of sub-slab or near building soil vapor samples. Therefore, BMS proposed to use the analytical results from monitoring wells upgradient of Building 3 (BDA-1WT and BDA-1F, shown on **Figure 2**) and compare compounds detected in the groundwater sample results to the compounds identified in the indoor air sample.

The initial SVI investigation consisted of two (2) rounds of sampling. One indoor air sample (with associated outdoor ambient air sample) was collected in the Building 3 basement (i.e., boiler control room) during each sampling event. The first round was conducted in March 2016. The second round of SVI sampling was conducted in December 2016. A summary of the findings from the 2016 sampling events was submitted to the NYSDEC and the NYSDOH on March 8, 2017 in a report titled *Soil Vapor Intrusion (SVI) Module Data Summary*.

Report (SVI Report, Arcadis 2017). The SVI Report concluded that based on the 2016 sampling results no additional sampling would be needed.

In May 2017, the NYSDOH updated the screening values listed in the decision matrices from the *2006 NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York*. The results of this change were discussed in an October 4, 2017 e-mail to BMS from the NYSDOH, and during an October 10, 2017 meeting between BMS, the NYSDEC, and the NYSDOH. The agencies expressed concern that the Building 3 measured indoor air concentrations of trichloroethene (TCE) at 0.93 and 1.6 micrograms per cubic meter [$\mu\text{g}/\text{m}^3$] were greater than the NYSDOH revised indoor air guidance values for monitoring ($0.2 \mu\text{g}/\text{m}^3$) and mitigation ($1.0 \mu\text{g}/\text{m}^3$) when a sub-slab or soil gas source is detected. During the October 10, 2017 meeting, BMS indicated that additional sampling of indoor air in Building 3 would be conducted following completion of on-going building renovations in Building 3 and the adjoining Building 2, and the onset of the heating season.

The third round of Building 3 indoor and ambient air sampling (one sample each) was conducted on January 17, 2018 after completing the renovation activities but prior to startup of a new heating, ventilation, and air conditioning (HVAC) system. The results identified a decrease in the TCE concentration versus the previous rounds with concentrations of $0.77 \mu\text{g}/\text{m}^3$ and $0.82 \mu\text{g}/\text{m}^3$ from the parent and duplicate indoor air samples, respectively. The results were below the revised indoor air guidance values for mitigation but above the guidance values for monitoring for TCE. These results were documented in the March 2018 monthly progress report to the NYSDEC and the NYSDOH.

The fourth round of Building 3 indoor and ambient air sampling (one sample each) was conducted on January 24, 2019 following the installation of the passive mitigation measures identified in the March 2018 work scope and May 2, 2018 approval letter, and with the new HVAC system in full operation. The results again identified a decrease in the TCE concentration versus the previous rounds with concentrations of $0.59 \mu\text{g}/\text{m}^3$ and $0.61 \mu\text{g}/\text{m}^3$ from the parent and duplicate indoor air samples, respectively. Again, the results were below the revised indoor air guidance values for mitigation but above the guidance values for monitoring for TCE.

In January 2021, mitigation measures were implemented within Building 3. The mitigation measures performed included installation of weather stripping on doorways and balancing of the Heating Ventilation and Air Conditioning (HVAC) and adjustments to the facility HVAC settings to allow the maximum fresh air mixing into the building. Differential pressure measurements were then collected using stationary OmniGuard 4® differential pressure monitors to assess pressure differences between the Building 3 boiler control room indoor air and the following locations:

- Building 2 (directly connected to Building 3) indoor air;
- Inside a floor drain in the boiler control room, and
- Outdoor ambient air.

On January 14, 2021, an indoor air sample and an ambient air sample was collected following the implementation of mitigation measures within Building 3. The analytical results from this event identified TCE concentrations of $0.54 \mu\text{g}/\text{m}^3$ and $0.52 \mu\text{g}/\text{m}^3$ from the parent and duplicate indoor air samples, respectively. The differential air pressure measurements collected during the January event confirmed that a positive pressure exists within the boiler control room relative to ambient conditions and the adjoining Building 2.

As described above, a downward trend in indoor air TCE concentrations was demonstrated based on sampling conducted in January 2021 following completion of the mitigation measures. However, the detected TCE

concentrations remained above the NYSDOH guidance value for monitoring of $0.2 \mu\text{g}/\text{m}^3$ for indoor air. Although active mitigation was not required based on NYSDOH Guidance, BMS opted to voluntarily install an ATS in the boiler control room as a supplemental mitigation measure to further reduce TCE concentrations in indoor air.

The Building 3 ATS was installed in April 2021 within the basement control room (**Figure 1**). The ATS included a Norair® 800 Negative Air Scrubber (Part #Y-A-1KPG-00: Amaircare AirWash® MultiPRO) containing a 25-pound activated carbon filter media to remove VOC from indoor air in the Building 3 Boiler Control Room.

The results of the June 24, 2021 indoor air sampling event following startup of the ATS demonstrated an initial reduction of TCE concentrations of $0.16 \mu\text{g}/\text{m}^3$ from the IA-3 parent sample and $0.15 \mu\text{g}/\text{m}^3$ from the duplicate sample.

Indoor and outdoor air samples were collected in accordance with the OMM Plan between April 2021 and June 2022 to evaluate ATS performance. TCE results indicated an expected seasonal variability with higher reported concentrations during the heating season, and lower concentrations reported outside of the heating season. Of the six samples collected during the 2021/2022 heating season between October 2021 and March 2022, four reported TCE concentrations above the monitoring guidance value of $0.2 \mu\text{g}/\text{m}^3$ (ranging from $0.32 \mu\text{g}/\text{m}^3$ in February 2022 to $0.54 \mu\text{g}/\text{m}^3$ in October 2021). These concentrations were similar to the January 2021 TCE concentration ($0.54 \mu\text{g}/\text{m}^3$), reported in indoor air prior to ATS start up. By contrast, indoor air samples collected during ATS operation outside of the heating season (April 2021-September 2021 and April 2022 to June 2022) had TCE concentrations reported below the monitoring guidance value shortly after startup of ATS operation.

A review of the historical TCE concentration data confirms that TCE concentrations in indoor air have been reported below the guidance value for mitigation ($1 \mu\text{g}/\text{m}^3$) since January 2018 and that the initial mitigation measures were successful at maintaining TCE concentrations below $1 \mu\text{g}/\text{m}^3$. Supplementing the initial mitigation measures with ATS operation was able to further reduce TCE in indoor air to levels below the guidance value for monitoring ($0.2 \mu\text{g}/\text{m}^3$) outside of the heating season; however, it was unable to maintain concentrations below the monitoring guidance value for the duration of the operation.

BMS requested to cease operation of the ATS in an email and formal letter dated December 12, 2022, which was conditionally approved by NYSDEC on January 19, 2023 pending completion of a post-shutdown sampling event.

Lotte Biologics USA, LLC (Lotte) purchased the Site from BMS and assumed operation in January 2023. Lotte verbally communicated Boiler Control Room staff had moved out of Building in Spring of 2023 and had provided BMS with a formal email confirmation that personnel were no longer occupying Building 3 in July 2023 (**Attachment 1**).

ATS Shutdown and OMM Program Termination

On March 31, 2023, BMS completed the ATS shutdown at Building 3 per NYSDEC conditional approval. Following shut down, BMS worked with Lotte to discuss system removal from Building 3 as well as receiving confirmation that Building 3 will no longer be occupied by future workers. As noted in **Attachment 1**, Lotte has circulated a memorandum detailing current/future building use and restrictions. In addition, Lotte will notify BMS and NYSDEC if they plan to reoccupy Building 3, at which time BMS will discuss with Lotte any additional monitoring/sampling that might be proposed. If future building occupancy is proposed, BMS will provide NYSDEC written notice within the Monthly Progress Reports for the Brownfield Cleanup Area. Indoor air testing and (if needed) mitigation measures beyond those that remain in place would be documented in a future work plan.

Ms. Karen Cahill
New York State Department of Environmental Conservation
August 4, 2023

Summary of Post-ATS Analytical Results

Indoor and outdoor air samples required by NYSDEC were collected in accordance with the OMM Plan on April 25, 2023 to evaluate VOC concentrations following cessation of ATS operation. A review of indoor air data for the Boiler Control Room (**Table 1**) indicates that the TCE concentration following cessation of the ATS operation remained below the 1 µg/m³ guidance value for mitigation. While the observed TCE concentration was observed above the indoor air monitoring guidance value of 0.2 µg/m³, further air monitoring would only be warranted if the Building 3 were to be reoccupied.

BMS will coordinate with LOTTE to ensure the maintenance of other building engineering and administrative controls detailed in the OMM Plan and has requested to be notified if the occupancy status of Building 3 changes.

Please contact Rich Mator of BMS at 609.252.4273 if you have any questions or need further details.

Sincerely,
Arcadis of New York, Inc.

Table 1
Building 3 Air Analytical Results

Building 3 - Post Air Treatment Shutdown Report

Bristol-Myers Squibb Company

Syracuse North Campus Restoration Area (Site #C734138)

East Syracuse, New York

Notes:

1. Samples were collected by Arcadis and analyzed by Eurofins Air Toxics Laboratories Environmental, LLC of Folsom, CA.
2. * = constituent included in the NYSDOH May 2017 Soil Vapor / Indoor Air Matrices - indoor air guidance values listed guidance may be used to identify whether to conduct additional monitoring or mitigation.
3. The Commercial Indoor Air Screening Level is the USEPA BASE Study 90th percentile value, when available (except for * constituents included in the NYSDOH Matrices). If a BASE value is not available, the USEPA Industrial Air RSL using the lower of a target cancer risk of 1x10-6 or a target hazard quotient of 1 is used, when available.
4. The Residential Indoor Air Screening Level is the NYSDOH Fuel Oil Study Upper Fence value (except for * constituents included in the NYSDOH Matrices). If a Fuel Oil Study Upper Fence value is not available, the USEPA Residential Air RSL value using the lower of a target cancer risk of 1x10-6 or a target hazard quotient of 1 is used, when available. If a USEPA Residential Air RSL value is not available, the USEPA Industrial Air RSL is used, when available.
5. Non-numerical values in the "CAS Number" column are a surrogate identification because no actual CAS number is available.
6. Analytes detected in sample are shown in black font and analytes that are not detected are shown in gray font.
7. Field duplicate sample results are presented in brackets, [].
8. The data has been validated.

9. Designations:

- **BOLD** = Result detected above constituent's Commercial VI Indoor Air Screening Value.

10. Abbreviations:

--- = Screening Value not available based on inquiry described in Notes 3 and 4.

AA = Ambient Air

ppbv = Parts per billion by volume

AL= NYSDOH Action Level

RL = Reporting limit

C = Notes the OSHA Ceiling Limit was used

RSL = Regional screening level

CAS = Chemical Abstracts Service

TIC = Tentatively identified compound

IA = Indoor Air

$\mu\text{g}/\text{m}^3$ = Micrograms per cubic meter

MDL = Method detection limit

USEPA = United States Environmental Protection Agency

NR = Not reported as a TIC

VI = vapor intrusion

NYSDOH = New York State Department of Health

OSHA = Occupational Safety and Health Administration

11. Qualifier Definitions:

B = Analyte was detected in the blank and sample.

E = Analyte exceeded calibration range.

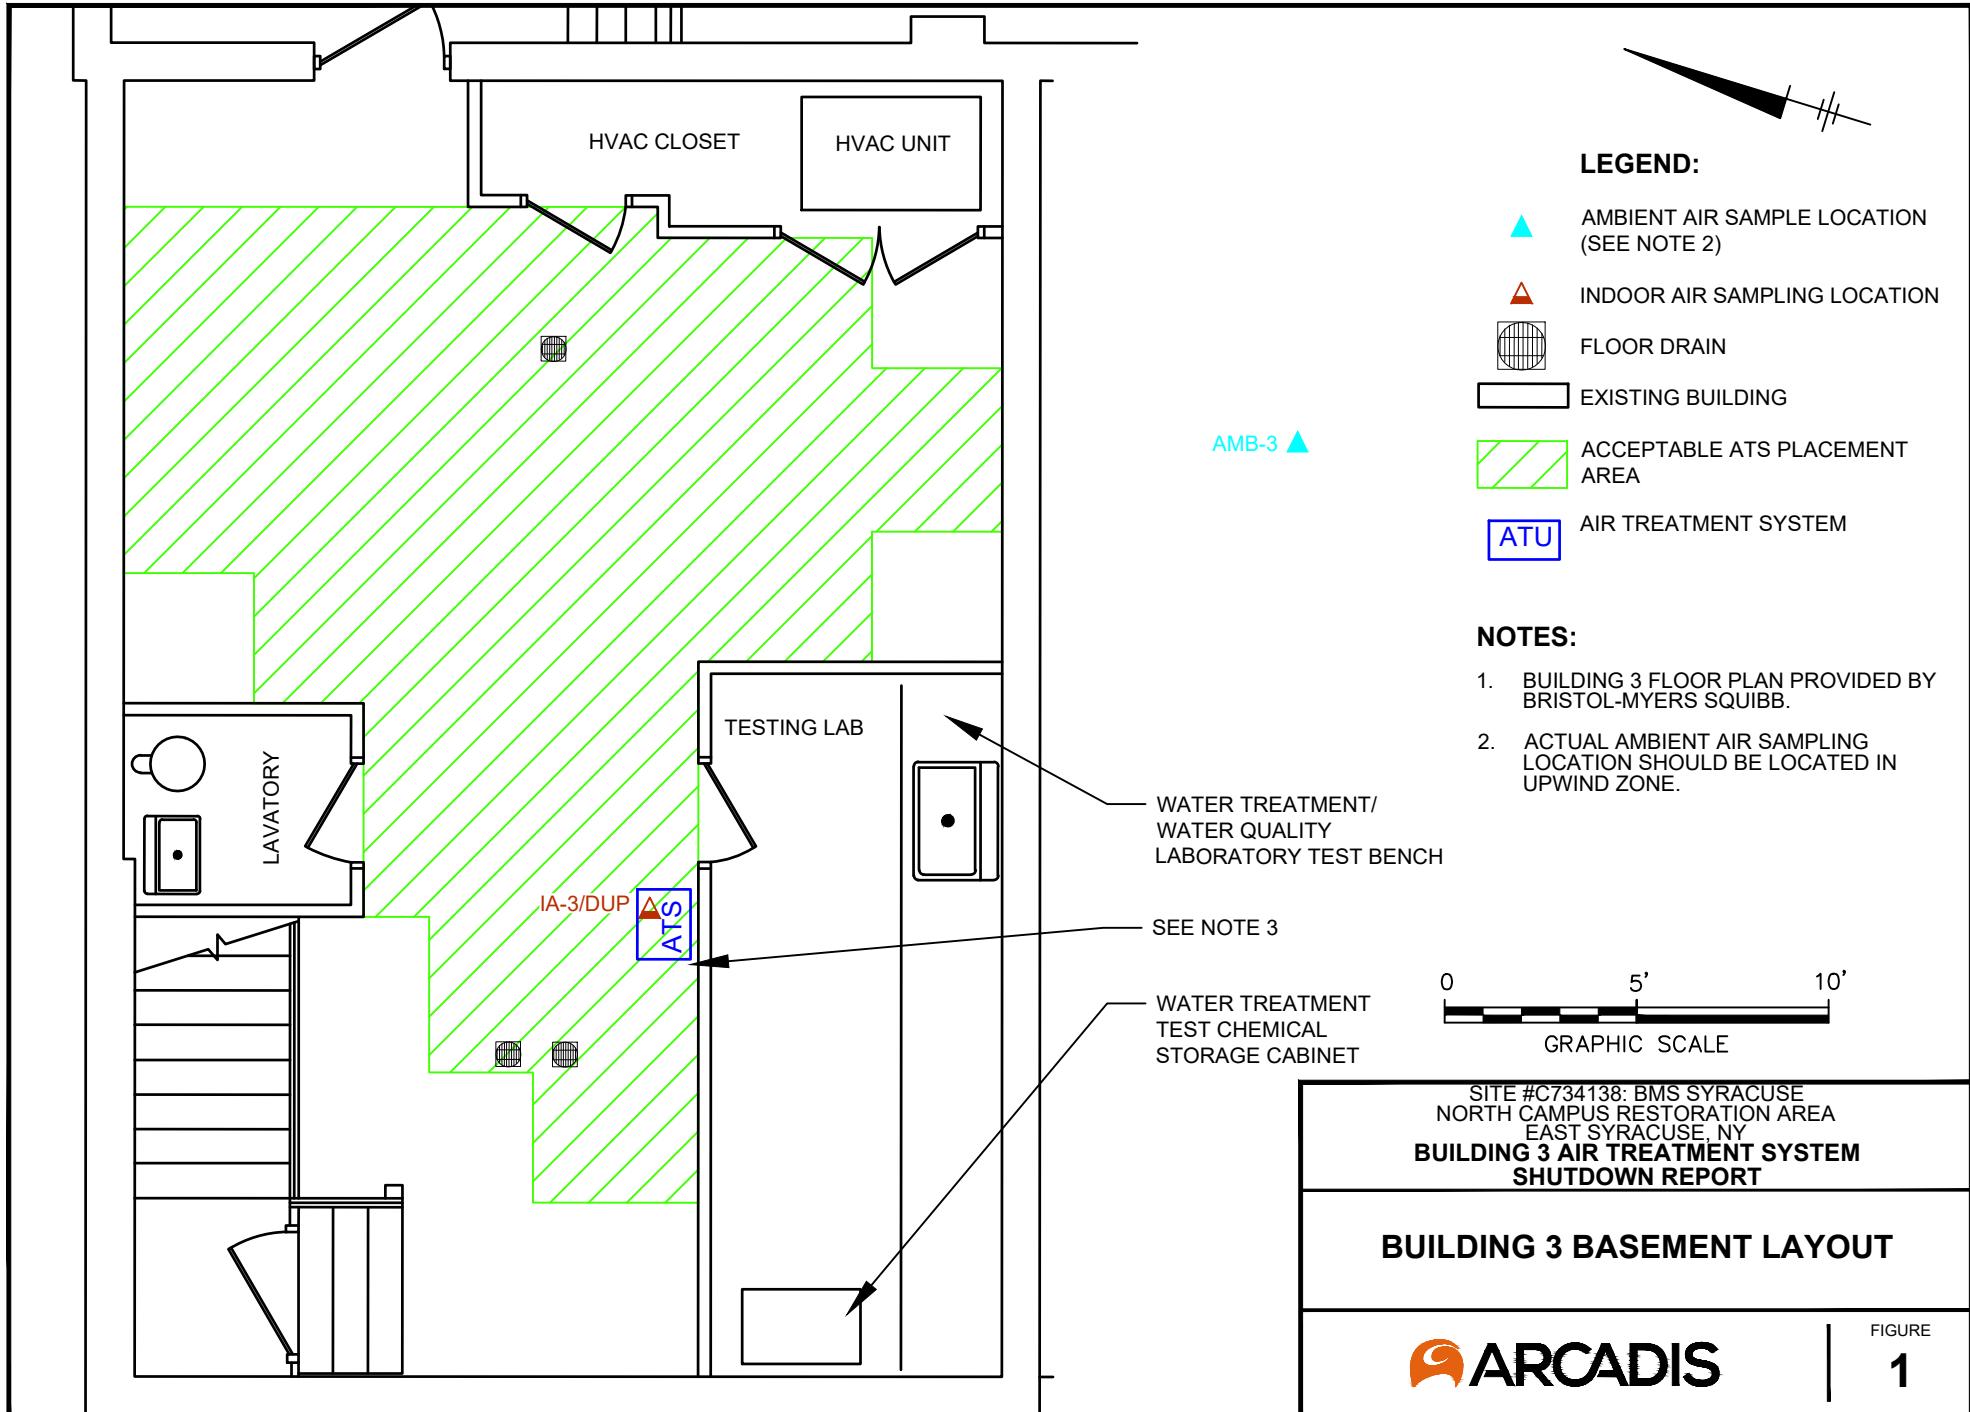

J = Estimated value. Result is greater than the MDL but less than the RL.

N = The analysis indicates the presence of a compound which there is presumptive evidence to make a tentative identification.

U = Analyte not detected above the method detection limit. The compound reporting limit is presented for reference.

UB = Analyte considered non-detect at the listed value due to associated blank contamination.

UJ = The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

Attachment 1

Notification LOTTE Discontinued Occupancy of Building 3

McCune, Bill

From: anne.locke@lotte.net
Sent: Tuesday, July 11, 2023 10:22 AM
To: richard.mator@bms.com
Cc: McCune, William; Ron Arcuri
Subject: C734138 - Change of Occupancy Notification

Rich,

JLL discontinued occupancy of the Building 3 control room in April 2023. JLL/LBA will no longer monitor or report pressure differential between this area and surrounding spaces.

Please advise if you have any questions.

Regards

Anne Locke

Manager, Environmental Protection

LOTTE Biologics USA, LLC

Syracuse Site

3551 Burnet Avenue

East Syracuse, NY 13057
