New York State Department of Environmental Conservation
Division of Environmental Remediation – Region 7
615 Erie Boulevard West
Syracuse, New York 13204-2400
Attn: Mr. Michael Belveg

RE: Revised Final Engineering Report
Former Coyne Textile Facility, City of Syracuse, New York
CHA Project No.: 059294.001
NYSDEC Site No.: C734144

Dear Mr. Belveg,

On behalf of Ranalli/Taylor St., LLC (Ranalli/Taylor St.), please find an enclosed copy of the Revised Final Engineering Report for the Former Coyne Textile Facility located at 140 Cortland Avenue in the City of Syracuse, New York. The document has been revised to reflect the comments provided in the New York State Department of Environmental Conservation's (NYSDEC's) and New York State Department of Health's (NYSDOH's) comment letter dated December 3, 2021. The NYSDEC/NYSDOH comments and CHA responses/report amendments applicable to the FER are summarized below:

Comment 1: Section 4.6, Contamination Remaining at the Site:

a. Include the depth of the demarcation layer.
b. Add a description of the depths at which the demarcation layer or surface of remaining contamination will be encountered, and at which contamination is no longer expected. If the upper surface of the remaining contamination zone varies due to differing cover types, a figure showing the elevations of top of remaining contamination zone should be included and referenced. Similarly, the thickness of the remaining contamination zone may be shown on a figure.
c. Discuss remaining groundwater contamination concentrations and provide associated reference figures and tables detailing remaining groundwater contamination.

Response 1*: Section 4.6.1 has been updated to include the depths at which the demarcation layer was installed. This section includes what would be anticipated at depths below the demarcation barrier, or areas in which there may be no barrier (as no work was done).*

Comment 2: Figure 4: Revise to label the type of treatment for each remedial zone presented on the figure; the area of the IRM excavation should also be indicated.

Response 2: *Figure 4 has been revised to include the type of remedy utilized (i.e. excavation, ZVI, etc.) in each remedial zone. A reference to the location of the IRM excavation (overlaps with TZ-2B) has also been included.*

Comment 3: Figure 5 through 7: On each figure, specify the type of treatment performed.

Response 3: *The title of each figure has been referenced to include the type of remedy performed in each treatment zone.*

One Park Place, 300 South State Street, Suite 600, Syracuse, NY 13202-2024
T 315.471.3920 ● F 315.471.3569 ● www.chacompanies.com

Comment 4: Figure 5 and 6: Only four USTs are shown, however, the text indicates five USTs were removed during the remedy. Please confirm and update the figures for consistency. For reference: subsection 2.2.2 lists four USTs in TZ1 (even if stacked, all should be indicated on the associated figure(s)), and subsection 2.2.2 indicates one UST in TZ2.

Response 4: *Figure 5 has been revised to show that there were four USTs in the excavation (one 250-gallon UST was stacked on top of the 10,000-gallon UST). Figure 6 did not change, only one UST was found in this excavation.*

Comment 5: Figures 5 and 6: Specify the depths of the former USTs.

Response 5: *The depths of the USTs has been included on these figures.*

Comment 6: Figures 8, 9, and 13: Include the BCP Boundary within the figures.

Response 6: *The BCP Boundary has been added to Figures 8, 9 and 13.*

Comment 7: Figure 10: Specify the depth of the excavation on the figure.

Response 7: *The depth of the excavation has been included on Figure 10 (9-10 feet bgs).*

Comment 8: Table 1 – Update the title of Table 1 to clearly identify the data (e.g., media type, data use).

Response 8: *Table 1 is now titled "Waste Characterization Data – Totals Analyzed", as this data was used as part of the Contained-In Rule that was utilized for landfill approval.*

Comment 9: Appendix O: Modify to include:

a. SSDS figures with P.E. stamp; and,
b. A table to clearly indicate start-up vacuum testing data

Response 9: *Appendix O includes a P.E. stamp on the SSDS As-Built figures, and a table which summarizes the start-up vacuum testing data shown on the figures.*

Comment 10: Appendix R: Replace the SMP with the revised, final/approvable version, when available.

Response 10: *The final/approvable version of the SMP is included in Appendix R.*

If you have any questions, please do not hesitate to contact me at (315) 257-7145. Again, we kindly request a response to this letter by December 3, 2021 so that we can address any additional comments you may have by close-of-business December 6, 2021 so as not to delay the COC process.

Sincerely,

Samantha J. Miller

CERTIFICATION

I, Scott M. Smith, am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for implementation of the remedial program activities, and I certify that the Remedial Design Work Plan was implemented and that all construction activities were completed in substantial conformance with the Department-approved Remedial Design Work Plan.

I certify that the data submitted to the Department with this Final Engineering Report demonstrates that the remediation requirements set forth in the Remedial Design and in all applicable statutes and regulations have been or will be achieved in accordance with the time frames, if any, established for the remedy.

I certify that all use restrictions, Institutional Controls, Engineering Controls, and/or any operation and maintenance requirements applicable to the Site are contained in an environmental easement created and recorded pursuant ECL 71-3605 and that all affected local governments, as defined in ECL 71-3603, have been notified that such easement has been recorded.

I certify that a Site Management Plan has been submitted for the continual and proper operation, maintenance, and monitoring of all Engineering Controls employed at the Site, including the proper maintenance of all remaining monitoring wells, and that such plan has been approved by the Department.

I certify that all documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department.

I certify that all data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Scott M. Smith, of CHA Consulting, Inc. located at 300 South State Street in the City of Syracuse, New York, am certifying as Owner's Designated Site Representative for the Site.

For CHA Consulting, Inc.:

1.0 BACKGROUND & SITE DESCRIPTION

1.1 INTRODUCTION

Ranalli/Taylor St., LLC (Ranalli/Taylor St.), entered into a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) in September 2017, to investigate and remediate a 3.262-acre property located in the City of Syracuse, Onondaga County, New York. The property was remediated to commercial use as described in NYSDEC's *Technical Guidance for Site Investigation and Remediation, dated May 3, 2010 (DER-10)*, which will allow for commercial and industrial re-use of the property only. The Site is currently being redeveloped as the JMA Wireless (JMA) 5G Campus.

The Site is located in the County of Onondaga, New York and is identified as Block 05 and Lot 06 as well as Block 20 and Lots 01 and 02 on Tax Map No. 94 as further described below:

- Two parcels of land which form a triangular shape located at, 1002-1022 South Salina Street/Cortland Avenue (Tax Map No. 094.-20-01.0) and 1024-1040 South Salina Street/Tallman Street (Tax Map No. 094.-20-02.0), totaling approximately 0.862-acres (0.126 and 0.736 acres, respectively) in size.
- One parcel of land, 140 Cortland Avenue (Tax Map No. 094.-05-06.0) totaling approximately 1.75-acres in size.
- Approximately 0.65-acres of the South Clinton Street roadway.

In 2021, three BCA amendments were requested by Ranalli/Taylor St. and approved by the NYSDEC. The amendments included:

- A minor amendment to add seven entities to the agreement. These seven entities were JMA Tech Properties Holdings, LLC, JMA Tech Properties, LLC, JMA Tech LLC, XRN LLC, JMA Edge Services LLC, Prevail NY LLC, and CELLH LLC.
- A minor amendment to add 0.65 acres of South Clinton Street into the BCA.
- A minor amendment to correct the parcel sizes of the two parcels east of Cortland Avenue. Tax Map No. 094.-20-01.0 was originally identified as a 0.57-acre parcel and Tax Map No. 094.-20-02.0 was originally identified as a 1.13-acre parcel for a total of 1.70-acres. Based upon the updated size of the parcels totaling 0.862-acreas as previously described, the Site area was reduced by 0.838-acres.

With these approved amendments, the site is situated on an approximately 3.262-acre area. The

Site is bounded by vacant parcels that formerly included a wastewater treatment plant and parking lot associated with the former Coyne Textile facility to the north; South Salina Street and Brownfield Cleanup Project (BCP) site owned by Salina 1st, LLC (BCP Site No. C734140) to the east; Tallman Street and a parking lot associated with the Central New York Regional Transportation Authority to the south; and vacant land formerly occupied by Syracuse Stamping Company, Catholic Charities of Onondaga County and a parking lot area to the west that is currently being redeveloped as parking area and greenspace for the JMA 5G Campus. See Figure 1 for the general site location.

The boundaries of the Site are fully described in Appendix A: Survey Map, Metes and Bounds. A figure depicting the Site parcels and overall boundaries superimposed over an aerial photograph prior the implementation of the remediation and Site redevelopment is included as Figure 2. An electronic copy of this Final Engineering Report (FER) with all supporting documentation is included on a file transfer site utilizing Microsoft OneDrive and information on how to access the file hosting site to download the file is included in Appendix B. The document was saved in as a Portable Document Format (PDF).

1.2 REPORT ORGANIZATION

This FER has been prepared by CHA Consulting, Inc. (CHA) as the "Engineer" for the project. The FER is divided into four major sections, including:

- Section 1: Provides an introduction of the project along with a brief description and Site background for the project.
- Section 2: Provides a summary of the selected Site remedy.
- Section 3: Provides a description of any interim remedial measures performed as part of the overall Site remedy and a summary of the separate construction contracts that were part of the overall remedial action for the Site, as applicable.
- Section 4: Provides a detailed description of the remedial action performed at the Site as well as other related Site preparation items.

1.3 SITE BACKGROUND

1.3.1 Site History

The 140 Cortland Avenue property was historically utilized as an industrial laundering facility since the mid-1930s under various entities of Coyne Textile Services. Coyne Textile Services filed for bankruptcy and ceased operations in late 2015.

Dry-cleaning activities using tetrachloroethylene (PCE) and Stoddard solvent (a petroleum mixture made from distilled alkanes, cycloalkanes (naphthenes) and aromatic compounds) were conducted at the property until 2000. These dry-cleaning liquids were noted to be stored in aboveground storage tanks (ASTs). Additionally, three underground storage tanks (USTs) were located beneath the dry-cleaning room floor (containing Stoddard solvent) and the boiler room at 140 Cortland Avenue. A gasoline filling station was present in the southern portion of the Site in the 1980s.

The former employee parking lot and park located east of the former laundering facility was owned by Coyne Textile Services from 1989 to 2016. Prior to Coyne Textile Services, previous Site uses included bus storage and repairs, the Syracuse Streetcar Barn, retail stores, and a gasoline filling station (circa 1950-1970).

1.3.2 Site Geology & Hydrogeology

According to the United States Department of Agriculture (USDA) Web Soil Survey, the soil beneath the Site is indicative of Urban Land, which is soil material having a non-agricultural, manmade surface layer that has been produced by mixing and filling in urban and suburban areas. Surficial geology consists mostly of lacustrine silts and clays. Bedrock at the Site is mapped by the United States Geological Survey (USGS) as the Syracuse formation, which consists of dolostone, shale, gypsum, and salts.

Field observations and stratigraphic cross-sections provided in the Remedial Investigation (RI) Report (CHA, February 2019) confirmed the presence of urban fill to a depth of approximately 8 to 10 feet below ground surface (bgs). Generally, silts and clays are present beneath the urban fill

to a depth of approximately 13 to 15 feet bgs. Alternating lacustrine silts and clays, then sands and gravel, were encountered beneath the fill material to the end of each boring. At least two silt and clay layers, one below the urban fill and one at varying depths, but approximately 26 to 30 feet bgs, are likely to act as semi-confining layers to impede the vertical transport of groundwater and contamination; however, they may not act as impermeable barriers.

Based on groundwater elevations measured on April 19, 2018, the depth to groundwater at the Site is typically less than 10 feet bgs. Beneath the building, groundwater contours are at a nearly flat gradient, apart from the northwestern portion of the building where slightly elevated groundwater levels indicates a localized flow path from the north-western portion of the building toward the center of the building. Regional groundwater flow is westerly towards Onondaga Creek, located approximately 0.2 miles west of the Site.

1.3.3 Previous Reports and Investigations

1.3.3.1 Phase I Environmental Site Assessment

A Phase I Environmental Site Assessment (ESA) was prepared in 2014 by GZA GeoEnvironmental of New York (GZA) in general accordance with the American Society for Testing and Materials (ASTM) Standard Practice E 1527-13. Based on historic use and conditions observed during the Phase I ESA, recognized environmental conditions (RECs) were identified and subsequent investigation activities were completed.

1.3.3.2 Initial Subsurface Investigations

Under the direction of the previous Site owner, multiple Site investigations were conducted in 2014 and 2015. The results of these investigations were detailed in the RI Report prepared by CHA and dated February 7, 2019. In short, these investigations are summarized as follows:

1. *November 2014 Phase II Subsurface Investigation by GZA:* Based on the results including high vapor concentrations as indicated by elevated photoionization detector (PID) readings, petroleum odors, black stained soil, and an oil-like sheen on groundwater samples from the Phase II, GZA recommended additional soil and groundwater sampling to further define the extent of contamination at the Site. Additionally, it was suggested to pursue additional sampling in areas where boring installation was unsuccessful, particularly where

floor trenches and drains are located in the former chemical storage and distribution room, and near the laundry machines. The primary contaminants of concern identified in the subsurface soil and groundwater included chlorinated solvents (e.g., PCE and trichloroethene (TCE)) and benzene.

2. *March 2015 Phase III Subsurface Investigation by GZA:* This investigation focused on delineation of the vertical and horizontal extent of petroleum contamination near temporary monitoring well TMW-2 and to further evaluate the soil and groundwater conditions near the boiler room and dry-cleaning area.
3. *2015 Vapor Intrusion Investigation by GZA:* A total of ten indoor air, samples were collected approximately four to five feet above the concrete floor, ten sub-slab vapor samples were collected within ten feet of the indoor air samples, and one outdoor air sample was collected from an exterior upwind location. The investigation revealed that PCE and its breakdown daughter products were present in the northern portion of the existing building on the Site where the laundering activities were conducted. The vapors were detected at concentrations that would require mitigation under New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion, dated 2006 guidelines. Monitoring and/or source identification and exposure measures were determined to be necessary throughout the remainder of the Site building. GZA recommended the installation of a vapor mitigation system, to address the potential vapor intrusion conditions.

1.3.3.3 Remedial Investigation

Ranalli/Taylor St. retained CHA to conduct an RI at the Site in 2018 to identify environmental concerns and provide additional information necessary for the development of an Alternatives Analysis Report (AAR). The RI used the data provided in the GZA reports to identify locations where additional investigation was required. The RI included a geophysical survey, surface soil sampling at Coyne Park, subsurface soil sampling at 24 boring locations, the installation and subsequent sampling of groundwater from six permanent monitoring wells, groundwater sampling from three existing permanent monitoring wells, indoor air sampling at two locations, and vapor intrusion sampling from six temporary sub-slab vapor points. The following summarizes the findings of the investigation:

- Human exposure to Site media such as soil and groundwater was limited due to the Site being primarily covered with buildings and paved asphalt parking areas and the presence of municipal water and sewer at and in the vicinity of the Site.
- The presence of two silty clay layers (beneath the fill material and at a depth of approximately 26 to 30 feet bgs) which have a relatively low hydraulic conductivity and have acted as a confining later to impede the vertical migration of contamination into the more permeable sand and gravel layers at depth.

- Subsurface soils were impacted with volatile organic compounds (VOCs) exceeding the Part 375 Commercial soil cleanup objectives (SCOs) in the approximate location of historical USTs near the northwest corner of the building (Source Area).
- Semivolatile organic compounds (SVOCs) were not detected in soil at concentrations exceeding the Part 375 Commercial SCOs since 2014. These historical exceedances were located beneath the northeastern portion of building and the former employee parking area.
- Metals in soil, detected at concentrations exceeding the Part 375 Commercial SCO, were located beneath the central portion of the building (barium in 2018) and the former employee parking lot area (arsenic in 2014).
- Polychlorinated biphenyls (PCBs) were detected at concentrations less than the Part 375 Commercial SCO beneath the central/northern portion of the building.
- VOCs, including PCE, were detected at concentrations exceeding the Class GA ambient water quality standards provided in the NYSDEC's Division of Water Technical and Operational Guidance Series *Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations* (TOGS 1.1.1). in groundwater. The highest concentrations of VOCs were adjacent to or downgradient of where historical USTs containing dry cleaning solvents were reportedly "closed in place". However, there was a lack of appropriate closure documentation for these USTs.
- Breakdown "daughter" products of PCE, including TCE, 1,2-dichloroethene (1,2-DCE), and vinyl chloride, were detected in groundwater beneath the building at concentrations exceeding TOGS 1.1.1 and are considered the contaminants of concern (COC) for the Site. These are often grouped together as chlorinated VOCs (CVOCs).
- A plume of VOC groundwater contamination originates from the northwestern portion of the building and had spread laterally beneath the building. This investigation was completed at a time of year when the groundwater table is typically high. Additionally, the location of physical structures beneath the slab were not well known. While there were many floor drains and vaults visible along the north end of the building, there was the potential that additional vaults or drains may be present throughout the building that had been filled in place and could have been potential preferential pathways influencing the direction of groundwater flow beneath the former slab.
- Metals, including aluminum, iron, magnesium, and manganese, were detected in groundwater at concentrations exceeding the TOGS 1.1.1. These compounds are commonly identified in groundwater and are relatively non-toxic metals (i.e. in comparison to hexavalent chromium or mercury).
- Per-and polyfluoroalkyl substances (PFAS) and 1,4-dioxane were detected at select groundwater monitoring wells.
- Elevated concentrations of PCE and TCE were identified in all ambient vapor and sub-slab vapor points. As a result, the sub-slab vapor and indoor air quality in the building had been impacted by soil vapor intrusion. According to the NYSDOH Decision Matrices (including the May 2017 updates), mitigation was the recommended action.

- Soil vapor points in the employee parking lot and asphalt area to the north of the building were not found to have any of the eight contaminants associated with the NYSDOH Decision Matrices. Therefore, the parking areas were not impacted by soil vapor intrusion.

Based on the RI and the proposed Site redevelopment plans, CHA developed Areas of Concern (AOCs) (refer to Section 1.4 for additional detail) and recommended the development of an interim remedial measure work plan (IRMWP) to address the soil contamination in one AOC, the Former UST Area, or Source Area. At that time, the Owner was looking to occupy the Site as soon as possible so an IRMWP to address soil vapor intrusion in the office and warehouse areas of the Site was developed. However, as redevelopment plans changed, the vapor mitigation IRMs were not implemented. This is discussed further in Section 3.1.2.

1.3.3.4 Supplemental Remedial Investigation for South Clinton Street

Ranalli/Taylor St. retained CHA to conduct a supplemental investigation of the South Clinton Street right-of-way in December 2020 with the intention of adding 0.65-acres to the BCA. CHA collected subsurface soil samples and groundwater samples. The investigation is detailed further in the Supplemental RI Report (CHA, August 2021). Based on the results of the investigation, CHA concluded the following:

- CVOC contamination in exceedance of Unrestricted Use SCOs was detected in soil sample SOIL-SB-126 which was collected directly downgradient of the contamination identified on the Former Coyne Textile Facility BCP (specifically Treatment Zone TZ-2 that was remediated in October 2020). The adjacent soil samples did not exceed Unrestricted Use SCOs for CVOCs, so the exceedance associated with this sample appears attributable to residual impacts from the upgradient source and not considered a separate "hot spot" necessitating additional active remediation.
- The CVOCs observed in the groundwater samples collected from monitoring wells MW-5A, MW-6A, MW-7A, TMW-101, TMW-112 are likely impacts from the migration of contamination of the source area and plume on the Former Coyne Textile Facility property.
- The exposure to Site media is limited due to the Site being primarily covered with paved asphalt roadway and the presence of municipal water at and in the vicinity of the Site. Redevelopment of this portion of the Site includes sidewalks, pavement, and limited vegetated areas. Buildings are not proposed on this portion of the Site at this time.

An AAR was developed to address the remaining contamination within the South Clinton Street right-of-way as part of the overall analysis of remedial alternatives for the BCP site. This

supplemental AAR or amendment to the AAR will be provided to the NYSDEC under separate cover.

1.4 AREAS OF CONCERN

As a result of the RI four primary AOCs were identified. The four AOCs are defined as: (1) the Former UST Area (Source Area); (2) Site-wide groundwater; (3) Office vapor; and (4) Warehouse vapor. It should be noted that during the remedial design, redevelopment planning altered the AOCs defined as Office and Warehouse Vapor. The final design of the JMA 5G Campus included demolition of the former warehouse section of the building that occupied the northern approximately two-thirds of the building footprint. The office section, occupying the southern approximately one-third of the building footprint, remained. However, the existing slab was removed, and the first-floor grade of the entire building was raised approximately five feet to mitigate flood zone concerns. With the raised grade, soil vapor intrusion was able to be managed as one AOC for the entire new/renovated building, henceforth referenced as Soil Vapor Intrusion. A discussion of the nature and extent of contamination in the soil, groundwater, and sub-surface vapor within these AOCs is provided in the following sections and Figure 3 identifies the AOCs.

1.4.1 Former UST Area (Source Area)

The Former UST Area is in the northwestern portion of the building. Several subsurface soil samples, several groundwater samples, and soil vapor samples have been collected in this area.

Historical subsurface soil sampling identified the presence of chlorinated VOC contamination, namely PCE, 1,2-DCE, and vinyl chloride, in soil samples SB-32 and SB-33, at concentrations exceeding their respective Part 375 Commercial SCO, which is consistent with the findings of the RI. During the RI, PCE was identified at concentrations exceeding its respective Part 375 Commercial SCO in sample SOIL-116 and lesser concentrations of TCE, 1,2-DCE, and vinyl chloride in samples SOIL-116 and SOIL-119. PCE was detected in excess of the Part 375 Commercial SCO throughout this area. Metals (mercury and lead) and total PCBs exceeded the Part 375 Unrestricted SCOs in this area but were detected at concentrations that are less than the respective Part 375 Commercial SCOs.

Historical groundwater sampling in this area identified the presence of chlorinated VOC contamination, including PCE, TCE, 1,2-DCE, and vinyl chloride, in the wells directly adjacent to the Former UST Area. During the RI, well Temp-GW001 and the well cluster at GW-103 were located within and adjacent to the Former UST Area, respectively. COC concentrations of PCE, TCE, 1,2-DCE, and vinyl chloride, among others, were detected at concentrations exceeding their applicable TOGS 1.1.1 groundwater standards and guidance values.

1.4.2 Site-Wide Groundwater

The groundwater samples collected as part of the RI confirmed the presence of VOCs and metals at concentrations exceeding their respective TOGS 1.1.1 groundwater standards and guidance values within the northwestern portion of the building. Chlorinated VOCs in groundwater were primarily found in the location of the former dry-cleaning room (Former UST Area/Source Area) and are consistent with the findings from historical Site investigations. The most recent analytical results for PCE indicates a decrease from the historical high of 2,420,000 micrograms per liter (µg/L) in well SB-32 to 21,400 µg/L in nearby temporary well Temp GW-001, and 7.1µg/L in GW-103S. While the concentration of PCE has decreased since the historical investigation, the concentrations of daughter products TCE, DCE, and vinyl chloride have increased, likely due to natural attenuation and the reductive dechlorination process. SVOCs were not detected in groundwater during the RI, apart from bis(2-Elthylhexyl)phthalate, which was detected at a concentration exceeding the TOGS 1.1.1. groundwater standards and guidance values for ambient water quality in temporary well Temp-GW001.

The groundwater samples collected as part of the RI confirmed the presence of VOCs, SVOCs and metals at concentrations exceeding their respective TOGS 1.1.1 groundwater standards and guidance values beneath the former building.

The shallow monitoring well (GW-101S) was found to have groundwater contamination exceeding applicable TOGS 1.1.1 groundwater standards and guidance values, but the deeper wells (GW-101I and GW-101D) were found to have either no appreciable contamination or the contaminant concentrations were at levels not exceeding applicable TOGS 1.1.1 groundwater standards and guidance values. The silty clay layer was relatively uniform across the Site and most likely

impeded contamination from reaching the intermediate and deeper portions of the aquifer.

The groundwater samples collected from the employee parking lot as part of the RI confirmed the presence of VOCs and metals. However, the concentrations exceeding the applicable TOGS 1.1.1 groundwater standards and guidance values in the employee parking lot are petroleum compounds, notably benzene, isopropyl benzene, and xylene, rather than chlorinated VOCs identified beneath the Site building. Additionally, the presence of contaminants in well GW-105D indicates that deep groundwater may be impacted from an off-site source.

1.4.3 Soil Vapor Intrusion

Soil vapor intrusion from the building footprint was managed as one AOC. The office section was is located on the southern portion of the Site where there was an expansion (circa 1980) of the building. This area is in the location of a former gasoline station and historically contained offices on the second and third floors while Coyne Textile was in operation. Current and historical soil vapor intrusion samples indicate that the presence of VOCs is impacting the indoor air quality in the office portion of the building. Ambient indoor air quality sampling identified PCE at a concentration of 34.1 micrograms per cubic meter (µg/m³) in the former office building, which exceeds the NYSDOH guidance value for indoor air.

Current and historical soil vapor intrusion sampling indicates that the presence of VOCs was impacting the indoor air quality in the warehouse portion of the former building, as well. Ambient indoor air quality sampling identified PCE concentration of 50.9 µg/m³, which exceed the NYSDOH guidance value for indoor air. Concentrations of TCE were identified at 1.1 µg/m³, which does not exceed the guidance value. Although these identified concentrations of PCE do not require immediate action, reasonable and practical actions to reduce exposure should be taken, and therefore, it was recommended that an active sub-slab depressurization system (SSDS) be installed under the entire new building footprint prior to building occupancy.

2.0 SUMMARY OF SITE REMEDY

This section summarizes the Remedial Action Objectives (RAOs) established for the Site as well as provides a brief description of the selected remedy for the Site.

2.1 REMEDIAL ACTION OBJECTIVES

The RAOs for the Site are media-specific objectives that are established for the protection of human health and the environment. RAOs are typically narrative statements that identify the contaminants and environmental media of concern, the potential exposure pathways to be addressed by remedial actions relative to the exposed populations and environmental receptors to be protected, as well as the acceptable contaminant concentrations/remediation goals for each environmental media. Based on the results of the Remedial Investigations, the following RAOs were identified for the Site.

2.1.1 Groundwater RAOs

RAOs for Public Health Protection

- Prevent ingestion of groundwater containing contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of, volatiles emanating from contaminated groundwater.

RAOs for Environmental Protection

- Restore the groundwater aquifer, to the extent practicable, to pre-disposal/pre-release conditions.
- Remove the source of ground or surface water contamination.

2.1.2 Soil RAOs

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation of, or exposure to, contaminants volatilizing from contaminated soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

2.1.3 Soil Vapor RAOs

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

2.2 DESCRIPTION OF SELECTED REMEDY

The Site was remediated in accordance with the remedy selected by the NYSDEC in the Decision Document dated July 2020 as well as *Remedial Design Work Plan* dated June 2020 (last revised July 27, 2020) and the NYSDEC's written approval of the design documents dated July 28, 2020. The factors considered during the selection of the remedy are those listed in 6NYCRR 375-1.8. Figure 4 identifies the individual treatment zones referenced below. The following were the components of the selected remedy:

1. Treatment Zone 1 (TZ-1)– Excavation & Backfill:
    - Excavation and off-site disposal of soil/fill exceeding Commercial Use SCOs listed in Table 375-6.8(b) to the depth of groundwater (approximately 10 feet below the ground surface [bgs]), including:
        - Grossly contaminated soil, as defined in 6 NYCRR Part 375-1.2(u);
        - Soils in the source area which exceeded the protection of groundwater soil cleanup objectives (PGWSCOs), as defined by 6 NYCRR Part 375-6.8 for those contaminants found in site groundwater above standards; and,
        - Soils that created a nuisance condition, as defined in Commissioner Policy CP-51 Section G.
    - Excavation and the removal of additional USTs that were discovered during the excavation activities, including associated underground piping and other structures associated with a source of contamination. The limits of excavation, UST locations, and confirmatory sampling associated with the excavation are depicted on Figure 5.
    - On-site soil that did not exceed the Commercial Use SCOs for any constituent was permissible for reuse anywhere on the BCP property including to backfill the excavation and/or re-grade the Site provided a cover system is installed. However, due to geotechnical and structural concerns with the existing Site soils, a majority of the excavated material was disposed of off-site.
    - Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) was imported to replace excavated soils and establish design grades at the Site. This includes imported fill required for the redevelopment, including raising of Site grades above flood elevations, backfill beneath foundation systems, backfill in utility trenches, etc.

2. Treatment Zone 2 (TZ-2)– Soil Mixing/In-Situ Reduction:
    - In-situ chemical reduction (ISCR) of contaminated soil was implemented in an approximately 6,000 square foot area located in the northwestern portion of the former building in the source area of VOC groundwater contamination.
    - The treatment zone extended from the top of the groundwater table, at approximately 9 feet bgs to the design depth of either 16 or 26 feet bgs, as indicated on Figure 6.
    - The contaminated soil was mixed in place with zero valent iron (ZVI) using a mixer head attachment on an excavator.
    - The soil from 9 feet bgs to the existing grade (equivalent to slab on grade of the former building) was mixed with a cement slurry to provide sufficient bearing grade for redevelopment of the Site.

3. Treatment Zone 3 (TZ-3) – Groundwater Extraction & Treatment:
    - Groundwater extraction, ex-situ treatment, and re-injection within the plume area was conducted through a series of extraction and injection wells (Figure 7). The extraction system was designed so that the capture zone was sufficient to cover the areal and vertical extent of the plume within the Site boundary. Air driven, double-diaphragm pumps were utilized for both the extraction and injection wells. Specific pumping design parameters (e.g. pumping rates, well spacing, injection rates, etc.) were selected based upon an on-site pilot scale study.
    - The treatment system included extraction of groundwater at approximately 64 gallons per minute, filtration through bag filters to reduce sediment loading to the system, then granulated activated carbon to treat benzene and other petroleum contaminants, ex-situ chemical oxidation (ESCO) with a dosing rate of 5 grams per liter (g/L) of 40 percent sodium permanganate solution in batch tanks to reduce the target contaminants, and re-injection within the plume area at approximately 70 gallons per minute. The dosing rate of the sodium permanganate was based upon bench scale studies conducted in a laboratory.
    - Two pore volumes (approximately 672,000 gallons of groundwater) within the contaminated groundwater zone were treated in total.

4. Cover System:
    - The existing Site cover in areas not occupied by buildings was considered sufficient to allow for commercial use of the Site, if maintained.
    - However, the majority of the existing Site cover was replaced as part of the Site redevelopment with a new, alternate cover system and the Site was re-graded as necessary to accommodate the installation of the cover system. Construction and maintenance of a soil cover system consisting of concrete slabs within the building footprint, asphalt paved surface parking areas, concrete sidewalks and soil in greenspace areas where the upper one foot of exposed surface soil meets the applicable Commercial Use SCOs. The intent of the cover systems is to prevent human exposure to remaining contaminated soil/fill remaining at the site.

- A demarcation layer consisting of a non-woven geotextile was installed to segregate existing Site soils from imported fill. Any fill material imported to the Site met the requirements for the identified Site use as set forth in 6NYCRR part 375-6.7(d). For green space areas, the top six inches of soil installed as part of the soil cover system was of sufficient quality to maintain a vegetation layer.

5. Vapor Mitigation: An SSDS was designed and installed beneath both the renovated portion of the existing building (south end of the Site) and the newly constructed building to mitigate the potential migration of any remaining vapors into the building(s) from the subsurface soil and groundwater.
6. Execution and recording of an Environmental Easement to restrict land use and prevent future exposure to any contamination remaining at the Site. The environmental easement for the controlled property will:
   - Require the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8(h)(3);
   - Allow the use and development of the controlled property for commercial use as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
   - Restrict the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH and/or Onondaga County Health Department; and
   - Require compliance with the Department approved Site Management Plan (SMP), including the installation and maintenance of soil vapor intrusion mitigation systems for all occupied on-site structures.
7. Development and implementation of a Site Management Plan for long term management of remaining contamination as required by the Environmental Easement, which includes plans for: (1) Institutional and Engineering Controls, (2) monitoring, (3) operation and maintenance (O&M) and (4) reporting. The SMP includes the IC/ECs necessary to (a) address residual contaminated soils that may be excavated from the Site during future redevelopment; including soil characterization and, where applicable, disposal/reuse in accordance with NYSDEC regulations; (b) provide for the O&M of the components of the remedy; (c) monitor the groundwater; and (d) restrict on-site redevelopment to commercial reuse.
8. Periodic certification of the institutional and engineering controls listed above.

2.2.1 Treatment Zone 1 – Excavation and Backfilling

The remedial investigation activities identified one potential UST in Treatment Zone TZ-1. The UST was identified within the first day of intrusive work at the Site and was found to be a 10,000-gallon UST that was previously closed-in-place and filled with controlled low strength material. A small tank that was likely a day tank (approximately 250 gallons) or similar was located on top

of the large UST. The UST was cut open and the low strength material was removed so the empty UST steel carcass could be removed from the subsurface. During excavation of contaminated soil around the tank grave, two additional USTs were identified to the south of the 10,000-gallon UST, each was approximately 500-gallons in size. The location of the four USTs and the final excavation limits is provided on Figure 5.

Petroleum contaminated soil in Treatment Zone TZ-1 was excavated and disposed off-site in accordance with the RDWP. To facilitate the soil excavation, steel sheet piles were driven along the western boundary of the excavation to product the concrete sidewalk and utilities within the South Clinton Street right-of-way from undermining. Additionally, a soil ramp/bench was installed along the eastern perimeter of the excavation to allow the excavator sufficient reach to the contaminated soils at the far west of the excavation.

All excavated soil was directly loaded into dump trucks for off-site disposal. Pre-excavation waste characterization samples were collected, and a waste profile was accepted by the disposal facility prior to commencing the excavation activities. In some circumstances, stockpiles were utilized to temporarily stage soils for disposal. Each temporary soil containment pad was of sufficient size to store up to the maximum amount of soil that can be excavated in one day and will be lined with a minimum of 20-mil polyethylene sheeting. A one-foot-high berm was constructed around the perimeter of the pad to control runoff/run-on to and from the stockpiles. All stockpiles will be covered with 10-mil thick polyethylene sheeting while awaiting loading and off-site disposal to prevent the contaminants from volatilizing into the air and/or causing potential odor problems around the project Site and/or to prevent surface water from potentially conveying contaminants away from the project Site. Additionally, contaminated soils were periodically stored within the active excavation area over other contaminated soils scheduled for removal.

Significant free-phase petroleum product (e.g. light non-aqueous phase liquid (LNAPL)) was identified beneath a concrete ballast mat the 10,000-gallon UST was set on. The product appeared to be No. 6 fuel oil based on the visually observed viscosity/consistency of the material. Contaminated soil was excavated beneath the groundwater table to remove the smear zone and the free-phase petroleum product. Two 20,000-gallon frac tanks were mobilized to the Site to manage

excavation dewatering while a vacuum truck was utilized to repeatedly empty loads of petroleum-impacted water from the frac tanks and transport it to Industrial Oil Tank Service Corporation located in Oriskany, New York for disposal. Additionally, oil absorbing booms and pads were used to remove free-phase petroleum product on the surface of the groundwater table.

As the excavation activities advanced, confirmatory sampling of the excavation sidewalls and bottom occurred over several days of work. Confirmatory sample locations are further described in Section 4.4.

Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) and the project specifications was imported to replace excavated soils and establish design grades at the Site. Backfilling of the excavation was conducted under the guidance of John P. Stopen Engineering, LLP (JPS) due to structural concerns for Site redevelopment. The excavation was backfilled with materials more fully described in Section 4.5 and in the following manner:

- Approximately one foot of New York State Department of Transportation (NYSDOT) Type 2 subbase (a run of crush stone material) was placed at the bottom of the excavation immediately after the excavation was dewatered and visually inspected for approval.
- No. 4 crushed stone was placed above the run of crush stone to the top of the static water table at approximately nine feet bgs.
- A 12-ounce orange, non-woven geotextile demarcation barrier was placed on top of the No. 4 run of crush stone.
- The remainder of the excavation was backfilled with compacted NYSDOT Type 2 subbase.

2.2.2 Treatment Zone 2 – ZVI Soil Mixing

The remedial alternative chosen for Treatment Zone TZ-2 was soil mixing with a ZVI slurry. ZVI slurry application is an ISCR technique used to reduce CVOC contamination. Specifically, the iron material de-halogenates PCE eventually reducing PCE to ethene, or simple alcohol. Based on the treatability study referenced in the RDWP that utilized samples from the Site, a four percent ZVI slurry application reduced total VOC concentration by 40 percent. ISCR of contaminated soil was implemented in an approximately 6,000 square foot area located in the northwestern portion of the former building in the source area of VOC groundwater and soil contamination. See Figure 6 for

the treatment zones, depth of treatment and location of any changes to the remedial design. Figure 6 also depicts the approximate limits of each mixing cell as implemented by the Contractor.

The ZVI/soil mixing sub-treatment zones included the following:

- Treatment Zone 2A – 2,450 SF area mixed from 9 to 16 feet bgs (approximately 640 CY)
- Treatment Zone 2B – 450 SF area mixed from 9 to 16 feet bgs (approximately 120 CY)
- Treatment Zone 2C – 2,025 SF area mixed from 9 to 26 feet bgs (approximately 1,275 CY)

Prior to injecting/mixing the ZVI slurry into the soils, the top two feet of concrete, subbase and soil were disposed of and the following seven feet of overburden material was excavated and stockpiled on-site as the Contractor was concerned about being able to advance the soil mixing equipment through the upper soils where mixing with ZVI was not desired. Following the completion of the ZVI mixing the top surface of the ZVI/soil mixture typically swelled to an elevation to approximately seven feet below the ground surface. The stockpiled overburden was then placed over the ZVI/soil mixture and blended with Portland cement for stabilization of the surface soils. Treatment Zone TZ-2B was somewhat unique because the overburden material consisted of No. 2 crushed stone used to backfill the excavation that occurred during the Source Removal IRM, as previously described in Section 3.1.1. However, this material was removed and stockpiled for reuse during the soil/cement mixing the same as other overburden soils.

The soil mixing with cement treatment zones will include the following:

- Treatment Zone 2A – 2,450 SF area mixed from 2 to 9 feet bgs (approximately 640 CY)
- Treatment Zone 2B – 450 SF area mixed from 2 to 9 feet bgs (approximately 120 CY)
- Treatment Zone 2C – 2,025 SF area mixed from 2 to 9 feet bgs (approximately 525 CY)

Soil mixing was accomplished using a transverse mixer-head attachment on an excavator, as previously discussed. ZVI slurry was mixed in an on-site cement batch plant and subsequently pumped to the mixer-head using a three-inch diameter flexible hose. The Contractor injected and mixed appropriate quantity of ZVI slurry in each cell before moving on to the next cell. The Contractor would return to the cell a minimum of 12 hours after the initial ZVI application to mix the swell volume (typically about two feet above the final mixing elevation) with Portland cement.

Again, the Contractor waited until at least the following day to return to the cell and replace the stockpiled overburden material for additional Portland cement mixing. Appendix D includes daily mixing logs and presents the quantity of ZVI and Portland cement applied. Cylinders for QA/QC purposes were collected in the soil/Portland cement mixing regions.

During the ZVI mixing in Treatment Zone TZ-2C obstructions were encountered at approximately 24 feet bgs. The mixer head appeared to be churning up wood based on splinters from trees surfacing in the mixing cells. Figure 6 identifies the locations where mixing ceased at 24 feet bgs.

During excavation of overburden material in Treatment Zone TZ-2C, an unexpected UST was identified. This UST was found to be approximately 10,000 gallons, closed-in-place with controlled low strength material, and previously containing a petroleum product based on the small quantity of sheen identified on the slurry adjacent to the UST. The UST was cut open, the low strength material was removed, and the tank carcass was removed from the subsurface in a similar manner to Treatment Zone TZ-1. However, confirmation samples were unable to be collected on the sidewalls or bottom of the UST excavation due to concurrent soil mixing operations on either side of the UST. Generally, the petroleum contamination identified, although not target for treatment by the ZVI, was stabilized by the cement/soil mixing application in a manner sufficient for containing the impacted soil.

2.2.3 Treatment Zone 3 – Groundwater ESCO and Recirculation

Groundwater extraction (29 wells) and injection (32 wells) wells were installed in accordance with the RDWP in the locations presented on the design drawings for ESCO of CVOCs with a 40 percent sodium permanganate solution. Sodium permanganate is a non-specific oxidizer that is highly reactive with CVOCs. Additionally, it has the added benefit of remaining in the subsurface for a moderately long time, continuing to treat groundwater after the active ESCO recirculation is complete. Specific chemical dosing requirements and pumping design parameters (e.g. pumping rates, well spacing, injection rates, etc.) were selected based upon a treatability study and an on-site pilot scale study.

The Contractor mobilized two track-mounted Geoprobe® drill rigs for installation of the extraction and injection/extraction wells. Each well was constructed identically with a two-inch diameter polyvinyl chloride (PVC) well screen placed from 15 to 25 feet bgs, solid PVC riser to the surface, and enhanced with either an injection well head or extraction tubing, in accordance with the RDWP. The wells were constructed with sand filter packs from the bottom of the well to approximately 14 feet bgs and the remaining depth was backfilled with hydrated bentonite. Following the installation of the injection/extraction wells, each well was developed until turbidity was reduced below 50 nephelometric turbidity units (NTUs) or for a maximum of two hours.

Two extraction wells were connected to each air-driven double-diaphragm pump and equipped with valves. Generally, water was extracted from half of the wellfield at one time while the valves to the other half of the wellfield were closed. After extracting half of one pore volume from Treatment Zone 3, the initially opened wells were closed, and the previously closed wells were opened so the second half of one pore volume could be extracted. After removal of one complete pore volume, the process was repeated to facilitate the extraction of a total of two pore volumes.

The extraction wells pumped water to a header system that entered the treatment system. The treatment system included extraction of groundwater at a rate of approximately 64 gallons per minute (gpm) (approximately 4 gpm from 16 wells at a time), filtration through bag filters to reduce sediment load, then filtration through granulated activated carbon to treat benzene and other petroleum contaminants. A two-inch double-diaphragm pump was utilized to inject approximately 70.5 gallons of 40 percent sodium permanganate solution (to achieve a chemical dosing rate of 5 grams per liter (g/L)) into the water stream exiting the carbon vessels. Following the injection point of the sodium permanganate, the liquid was routed through an in-line static mixer prior to discharging into a batch holding tank. The discharge piping inside the tank was completed with a horizontal pipe located near the edge of the cylindrical tanks to facilitate additional mixing within the batch holding tank. The contractor mobilize two batch tanks to the site so that one batch of water could be prepared/mixed while a second batch was being reinjected.

Finally, the treated groundwater was re-injected via the injection wells within the plume area at a flow rate of approximately 70 gallons per minute. The treated water was reinjected into half of the

injection wells at one time, which was controlled by a series of ball valves installed off of injection pipe header connected to an injection pump. Similar to the extraction wells, one half of one pore volume was injected into half of the wellfield and the second half of one pore volume was injected into the other half of the wellfield. Following the injection of one pore volume, the process was repeated to reinject a second full pore volume. A total of 678,510-gallons of treated water was reinjected within Treatment Zone TZ-3.

2.2.4 Sub-Slab Depressurization System

To expedite the SSDS design while CHA focused on the other remedial elements of the project, CHA subcontracted Alpine Environmental Services, Inc. (Alpine) to prepare the design drawings. During redevelopment of the Site, an SSDS was installed in accordance with the RDWP. The primary SSDS components included are discussed further in Section 4.8.1. During installation of each component, CHA inspected the final product. This included multiple site visits to inspect the placement of perforated piping and blended stone, inspect the placement and integrity of the vapor barrier system, inspect the installation of gauges, alarms, and fans, and to verify the location of vapor monitoring points. The SSDS will be monitored in accordance with the SMP.

3.0 INTERIM REMEDIAL MEASURES AND REMEDIAL CONTRACTS

The purpose of this section is to summarize work performed as an interim remedial measure (IRM) that were previously documented in an individual construction completion report (CCR), and to summarize the major project team members that were involved with the construction phase of the project.

3.1 INTERIM REMEDIAL MEASURES

3.1.1 Source Removal IRM

A Source Removal IRMWP (CHA, May 2019) was approved by the NYSDEC in June 2019 that addressed contaminant source removal via excavation within the Former UST/Source Area. The CCR for this Source Removal IRM is appended to this FER in Appendix E. In late June 2019, three USTs within the Former UST/Source Area were uncovered, removed and transported off-site to a permitted disposal facility. Approximately 253.9 tons of contaminated soil material and controlled low-strength material used to previously close the USTs in-place was disposed of, as well. Excavation of contaminated soil within the area was limited near load-bearing walls to maintain structural integrity of the building. Prior to backfilling, confirmation samples were collected along the sidewalls and bottom of the excavation, and indicated residual contamination exceeding Commercial SCOs remained. A complete summary of the work completed can be found within the CCR submitted and approved by the NYSDEC in October 2019. The remaining contamination in the Source Area was addressed during the 2020 remedial construction. The information and certifications made in the October 2019 Source Removal CCR (CHA, October 2019) were relied upon to prepare this report and certify that the remediation requirements for the site have been met.

3.1.2 Office Vapor IRM

Since the submission of the Office Vapor IRMWP, redevelopment plans for the Site were changed to raise the finished floor elevation of the new building by approximately five feet in order to avoid flood zone implications. Therefore, a redesign of the SSDS for the entire building was necessary. This work was conducted during remedial design construction, rather than as an IRM.

3.2 IRM REMEDIAL CONTRACTS

CHA was retained by Ranalli/Taylor St. LLC to oversee the Source Removal IRM and generate and submit a CCR. The general contractor to conduct the work was Top Notch Property Management. Top Notch Property Management was responsible for implementing the work in accordance with the Source Removal IRMWP.

4.0 DESCRIPTION OF REMEDIAL ACTION PERFORMED

Remedial activities completed at the Site were conducted in accordance with the NYSDEC-approved Remedial Design Work Plan (RDWP) documents for the Former Coyne Textile Facility dated June 2020 (Revised July 27, 2020). All deviations from the design are noted in Section 4.9 of this FER. This section provides a detailed summary of the remedial work performed during the redevelopment of the Site. Additional remedial activities that were completed under IRMs were included in Section 3.1 of this FER.

4.1 GOVERNING DOCUMENTS

4.1.1 Site Specific Health & Safety Plan (HASP)

A site-specific Health and Safety Plan (HASP) was prepared to provide specific guidelines and establish procedures for the protection of on-site personnel during construction activities. The HASP developed as part of the remedial design process is included as Appendix G of the RDWP. Contractors and subcontractors on-site during remedial activities were responsible for developing, implementing, and maintaining their own site-specific HASP. While the HASP prepared by CHA provided the minimum guidelines for worker safety for the project, each contractor was required to develop a detailed plan that addressed the specific job hazards their personnel was anticipated to encounter during implementation of the remedy.

All remedial work performed under this Remedial Action was in substantial compliance with governmental requirements, including Site and worker safety requirements mandated by Federal Occupational Safety and Health Administration (OSHA). The HASPs prepared for the project were complied with for all remedial and invasive work performed at the Site.

4.1.2 Quality Assurance Project Plan (QAPP)

The Quality Assurance Project Plan (QAPP) was included as Appendix J of the RDWP approved by the NYSDEC. The QAPP describes the specific policies, objectives, organization, functional activities and quality assurance/quality control activities designed to achieve the project data quality objectives. A QAPP was prepared to present the specific policies, objectives, organization, functional activities and specific Quality Assurance (QA) and Quality Control (QC) activities

designed to achieve the specific data quality objectives associated with the remedial activities. The QAPP also outlined field sampling requirements that were completed during the remedial activities in accordance with the field sampling procedures.

4.1.3 Construction Quality Assurance Plan (CQAP)

A site-specific, standalone Construction Quality Assurance Plan (CQAP) was not prepared for the project. However, construction quality assurance requirements were stipulated in the RDWP, namely the technical specifications for the project. The specifications included performance requirements for the Remedial Action tasks through specified QA/QC methodologies applied in the field and in the laboratory. A CHA environmental engineer was on-site during the implementation of the remedy to document compliance with the plans and specifications.

4.1.4 Soils/Materials Management Plan (S/MMP)

A site-specific Soil and Materials Management Plan was not prepared as part of the RDWP. All soil excavated from Treatment Zones TZ-1 and TZ-2 was characterized and disposed off-site at a properly permitted facility, as specified in the RDWP. Actual disposal quantities and associated documentation is provided in Appendix F and discussed in Section 4.3. This documentation includes waste profiles, test results, facility acceptance letters, manifests/bills of lading and facility receipts/weight tickets.

4.1.5 Stormwater Pollution Prevention Plan (SWPPP)

The erosion and sediment controls for all remedial construction were performed in conformance with requirements presented in the New York State Guidelines for Urban Erosion and Sediment Control. The area of disturbance for remedial construction was less than one-acre, and therefore, a full SWPPP was not prepared for the Site and only semi-permanent erosion control measures and best management practices were implemented during the remedial construction. A site-specific SWPPP was developed for the Site following the completion of the 2020 remedial activities as subsequent construction resulted in an overall site disturbance in excess of one acre. The SWPPP identified controls to be implemented during the redevelopment construction as well as permanent controls that would remain in place following the completion of the redevelopment construction.

4.1.6 Community Air Monitoring Plan (CAMP)

Air monitoring was performed during the remedial activities in accordance with the Community Air Monitoring Plan (CAMP) included in in Appendix H of the RDWP. The CAMP included requirements for monitoring both fugitive dust and organic vapors. In addition, the CAMP identified action levels during construction and appropriate mitigation methods to address any exceedances of the action levels.

4.1.7 Contractors Site Operations Plans & Submittals

The Remediation Engineer reviewed all plans and submittals for this remedial project (i.e. those listed above plus contractor and subcontractor submittals) and confirmed that they were in compliance with the RDWP. All remedial documents were submitted to NYSDEC and NYSDOH in a timely manner and prior to the start of work.

CHA reviewed all plans and submittals for this remedial project and confirmed that they were in substantial compliance with the RDWP. The NYSDEC did not require review and/or approval of the contractor's submittals prior to the start of work.

4.1.8 Community Participation Plan

A Community Environmental Response Plan (CERP) was implemented prior to and during the remedial construction. All major documents associated with the remedial investigation, decision document and remedial design were submitted to the document repository located at the NYSDEC Region 7 Headquarters and the Onondaga County Public Library Central Branch location. Additionally, a 45-day public comment period was allowed. No public comments were received.

During remedial construction, the components of the CERP were followed including off-site trucking routes that minimized disturbance to adjacent neighbors, vapor and odor management using the above-referenced CAMP, water and waste management practices, and decontamination of equipment.

4.2 REMEDIAL PROGRAM ELEMENTS

4.2.1 Contractors and Consultants

4.2.1.1 Engineering Consultant

CHA was the engineering consultant selected by GEC Consulting LLC (GEC), under contract with JMA Wireless and Ranalli/Taylor St LLC, to provide engineering design, construction oversight and construction administration services, and to serve as the certifying engineer for the overall remedy implementation. Scott M. Smith, of CHA, is the certifying Engineer of Record responsible for the inspection of the work. CHA subcontracted XDD Environmental, LLC (XDD) for technical assistance services related to the design of the bench scale and pilot studies that were utilized to determine the ZVI dosing rate for Treatment Zone TZ-2 and the flow and dosing rates for Treatment Zone TZ-3 groundwater treatment system. Additionally, CHA contracted with Alpine Environmental Services to assist with the design of the sub-slab depressurization system. Alpha Geoscience was contracted to provide data usability summary reports (DUSRs) for the required data analyses conducted by Alpha Analytical, Inc.

4.2.1.2 General Contractor

As part of the overall Site redevelopment, Ranalli/Taylor St LLC retained The Pike Company, Inc. (Pike) headquartered in Rochester, New York to be the General Contractor for the project. Pike had the primary responsibility in developing bid packages for the various portions of the redevelopment construction as well as the selection of various subcontractors, including the remedial contractor.

4.2.1.3 Remedial Contractor

Based on environmental experience, qualifications, and the selected remedial alternatives, Pike contracted Paragon Environmental Construction, Inc. (PEC) of Brewerton, New York (hereinafter referred to as the "Contractor") to complete the remedial construction activities.

The following table summarizes the major subcontractors and vendors that completed work or provided services, subcontracted to the Contractor, associated with the remedial construction:

Table 4-1. Key Subcontractors & Vendors

Subcontractor/Vendor	Responsibility/Duties
Matrix Environmental Technologies Inc. 3730 California Rd Orchard Park, NY 14127 (716) 662-0745	With the assistance of PEC, constructed the groundwater treatment system including the extraction and injection well network of sub-headers and piping and the treatment train for TZ-3. Provided one crew member for the operation of the groundwater treatment system for the duration of operation.
Slurry Engineering 1721 Eastern Avenue Suite 15 Sacramento, CA 95864 (916) 798-4176	Provided the equipment necessary for an on-site slurry plant to mix the ratio of ZVI and cement for treatment of soils in TZ-2. With the assistance of PEC, operated the slurry plant for the duration of work associated with TZ-2.
NYEG Drilling, LLC 5664 Mud Mill Road Brewerton, NY 13029 (315) 752-0110	Completed the installation of groundwater extraction and injection wells, well development, and decommissioning of wells at the end of treatment.
Hepure P.O. Box 5784 Hillsborough, NJ 08844 (866) 727-4776	Supplied Ferox Flow ZVI powder for treatment of chlorinated solvents in TZ-2.
Carus Remediation 315 Fifth Street Peru, IL 61354 (815) 223-1500	Supplied 40% sodium permanganate solution for groundwater treatment in TZ-3.

4.2.2 Site Preparation

4.2.2.1 Preconstruction Meeting

A pre-construction meeting was held with all contractors on July 30th, 2020 with representatives from the Pioneer Companies (who provided overall coordination for the project), Pike, PEC and CHA. Representatives from the NYSDEC and NYSDOH were invited to the meeting but did not attend. Topics discussed included:

- The requirements of the HASP and emergency contacts/key personnel
- Safety orientation requirements
- CAMP monitoring requirements
- Emergency action plan
- Contract and insurance requirements

- Site logistics, including access points, truck routes, laydown areas, employee parking, etc.
- Stockpiling locations and requirements
- Project schedule for each treatment zone
- Process for managing change orders requests and requests for information (RFIs)
- Quality control testing and confirmation soil testing requirements
- Coordination with other trades
- Permit requirements

4.2.2.2 Agency Approvals

A NYSDEC-approved project sign was erected at the project entrance and remained in place during all phases of the Remedial Action.

CHA submitted a *Remedial Design Report – Former Coyne Textile* which included the major design elements for reach treatment zone and applicable project plans to the NYSDEC on June 26, 2020. CHA resubmitted the design report under the title *Remedial Design Work Plan - Former Coyne Textile Facility* on July 27, 2020 to the NYSDEC to address the Department's and NYSDOH's comments received via letter on July 21, 2020. The RDWP was approved by the NYSDEC on July 28, 2020. Documentation of agency approvals required by the RDWP is included in Appendix G.

While CHA had included preliminary SSDS design information in the RDWP, the foundation design and a floor layout plan had not been advanced enough to facilitate the completion of the SSDS design at that time. The *Sub-Slab Depressurization System Remedial Design Work Plan – Former Coyne Textiles* was submitted to NYSDEC on October 2, 2020. CHA resubmitted the document on November 6, 2020 to address the NYSDEC comments received on October 21, 2020 via letter. The Department approved the SSDS design on November 12, 2020. A copy of this approval is also included in Appendix G.

4.2.2.3 Permits

Permits associated with the remedial implementation were retained either prior to or during the remedial construction. Permits included a City of Syracuse Application for Tank Removal,

registration of the USTs under a Petroleum Bulk Storage (PBS) Permit, and hydrant use permit from the City of Syracuse Department of Water. The hydrant use permit was shared between the Contractor and the demolition contractor acting as a subcontractor to Pike. Additional permits for the redevelopment of the Site were obtained by the General Contractor, Pike, or appropriate subcontractors.

4.2.2.4 Mobilization

The Contractor started mobilization to the Site on August 3rd, 2020 at which time the general contractor, Pike, had already mobilized the Site and had completed the demolition of the northern approximately two-thirds of the existing building on-site. The superstructure had been completely removed; however, the existing slabs on grade and foundations had been left in place.

Upon arrival to the Site, all personnel were required to complete site-specific health and safety orientation per the requirements of Pike. Additionally, on-site workers were required to submit to a temperature check and complete a health screening questionnaire daily to reduce the potential for the spread of coronavirus disease (COVID-19). Workers also donned face masks when socially distancing of at least six feet could not be maintained during the construction activities.

4.2.2.5 Fencing

Temporary chain link fencing had been installed around the perimeter of the Site upon the Contractor's mobilization Site wherever existing site fencing was absent and the remaining southern portion of the on-site building was not secured. The location of the perimeter fencing was adjusted periodically to accommodate the various activities occurring at the Site. Most deliveries and truck traffic were directed through the main Site entrance located along the northwest side of Cortland Avenue and east of Treatment Zone TZ-2. The existing sliding gate along the southeast side of Cortland Avenue was utilized to secure the employee parking areas and field office trailers.

4.2.2.6 Clearing & Grubbing

No clearing or grubbing was performed as part of the remedial action construction activities. Treatment Zones TZ-1, TZ-2 and TZ-3 were all located within the footprint of the portion of the

Coyne Textile building that was demolished with the exception of the southern end of Treatment Zone TZ-3. All vegetation located around the perimeter of the employee parking lot and the park area located on the north end of the employee parking lot was maintained during the remedial construction.

4.2.2.7 Erosion & Sediment Controls

As previously indicated, the Site disturbance associated the remedial construction activities was less than one acre, and therefore, a SWPPP was not required for the project. Given that the proposed remedy for Treatment Zones TZ-1 and TZ-2 included excavation activities that resulted in the Site being a low spot with no runoff to surrounding properties, erosion and sediment controls implemented during the remedial construction were generally limited to the following:

- Installation and maintenance of a tracking pad near the main Site entrance to minimize tracking onto Cortland Avenue. While tracking onto the roadway was not a significant issue during the remedial construction, a tractor with a sweeper attachment was maintained on-site.
- Berms were installed around all temporary stockpiles to minimize the potential for runoff until the stockpiles were removed from the Site for off-site disposal. If existing Site soils were stockpiled on-site, they were placed on a temporary soil containment pad or stockpiled within an active excavation and covered with polyethylene sheeting while awaiting disposal.

4.2.2.8 Decontamination Pads & Truck Wash

All excavation activities within Treatment Zones TZ-1 and TZ-2 were performed using a hydraulic excavator. Precautions were taken so that only the bucket of the excavator came into contact with the contaminated soil and debris. Typically, the excavator bucket was kept within the excavation overnight and was only decontaminated following the completion of the load out activities associated with off-site disposal discussed further in Section 4.3. The hollow stem augers, drill rods, and tools associated with the drilling necessary for the installation of the injection and extraction wells in Treatment Zone TZ- 3 were only decontaminated following the installation of all wells. The decontamination activities were performed over a temporary decontamination pad and the water collected on the containment pad was managed in accordance with the water removed from Treatment Zone TZ-1, which is also discussion in Section 4.3.

An Alpine Sales & Rental Corp. transverse mixing head was utilized to mix the Site soils with ZVI within Treatment Zone 2 following the excavation of the top nine feet of soil (see Section 4.2.6). The mixing head was washed/decontaminated at the end of each working day to remove any soil/ZVI slurry and/or cement/soil slurry that would potentially harden overnight. All washing/decontamination was performed directly over the treatment zone given that the remedy for Treatment Zone 2 did not result in the immediate removal of all contaminated media and the water was captured in the cement slurry near the ground surface.

All truck traffic was kept on existing concrete slabs associated with the former buildings and/or stone tracking pads near the main Site entrance near Cortland Avenue. Since the truck tires did not come into contact with contaminated soils and there were no issues with tracking of mud off-site, there was no need for a truck wash for this project.

4.2.2.9 Utility Marker Layout

Prior to the start of construction activities on the Site, the Contractor contacted Dig Safely New York (1-800-962-7962) to obtain a mark out of public utilities at the Site. Pike was responsible for coordinating with the various infrastructure owners to disconnect utilities servicing the Site prior to the remedial Contractor commencing with the excavation and drilling activities. Given the age the facility, there was limited available documentation showing the historical location of on-site utilities.

4.2.3 General Site Controls

4.2.3.1 Site Security

In addition to the Site fencing, Pike coordinated with the Onondaga County Sheriff's office to provide additional patrols in the vicinity of the Site overnight and on the weekends during the early phases of construction. However, major and minor disturbances overnight and on the weekend occurred on several occasions. As a result, Pike retained a security company to provide overnight and weekend Site security.

4.2.3.2 Job-Site Recordkeeping

CHA maintained daily observation reports that summarized daily work activities, visitors, samples collected, and CAMP station activity. The daily observation reports are included in Appendix H.

4.2.3.3 Erosion & Sediment Controls

As previously indicated, the Site disturbance associated the remedial construction activities was less than one acre, and therefore, a SWPPP was not required for the project. Given that the proposed remedy for Treatment Zones TZ-1 and TZ-2 included excavation activities that resulted in the Site being a low spot with no runoff to surrounding properties, erosion and sediment controls implemented during the remedial construction were generally limited to the following:

- Installation and maintenance of a tracking pad near the main Site entrance to minimize tracking onto Cortland Avenue. While tracking onto the roadway was not a significant issue during the remedial construction, a tractor with a sweeper attachment was maintained on-site.
- Berms were installed around all temporary stockpiles to minimize the potential for runoff until the stockpiles were removed from the Site for off-site disposal. If existing Site soils were stockpiled on-site, they were placed on a temporary soil containment pad or stockpiled within an active excavation and covered with polyethylene sheeting while awaiting disposal.

4.2.3.4 Equipment Decontamination and Residual Waste Management

As previously stated, the decontamination activities were performed over a temporary decontamination pad and the water collected on the containment pad was managed in accordance with the water removed from Treatment Zone TZ-1.

4.2.3.5 Soil Screening Results

Soils excavated during the remedial construction activities were screened for visual, olfactory and photoionic evidence of contamination. Due to the safety concerns associated with large, deep excavations, the Contractor collected representative soil samples from areas selected by CHA using an excavator and brought them to the Site surface for CHA to screen and/or collect confirmation soil samples. CHA selected material that had not contacted the sides of the excavator bucket when filling containers being submitted for laboratory analysis. The Technical Specifications for the project indicated that soils that exhibited vapor concentrations in excess of

ten parts per million (ppm) would be stockpiled for off-site disposal. While PID readings exceeded this threshold in sections of the Treatment Zone TZ-1 excavation (e.g. south end within the "smear" zone just above the groundwater table), the confirmation samples documented that all remaining contamination was below the Part 375 Commercial Use SCOs, as discussed in Section 4.6. No significant field evidence of contamination was observed in the top five feet of soil excavated from Treatment Zones TZ-1 and TZ-2. CHA notes that the top five feet of soil in Treatment Zone TZ-2 had to be removed prior to the mixing operations to account for the swell that would occur from the addition of the ZVI, cement and water to the existing soils.

4.2.3.6 Temporary Soil Stockpiling

A temporary soil containment pad was installed in the northeast corner of Treatment Zone TZ-1 at the beginning of the construction activities to manage material excavated around the existing 10,000-gallon UST. The temporary containment pad was constructed in accordance with the Technical Specifications, including polyethylene sheeting on the existing Site ground surface (bottom sheeting), raised side walls and additional polyethylene sheeting to cover the stockpiled material. Since the temporary containment pad was constructed within Treatment Zone TZ-1, the soils immediately beneath the stockpile were also excavated and disposed of off-site as the excavation activities progressed. However, after the initial load out of soils for off-site disposal, additional soil was either stockpiled within the limits of Treatment Zone TZ-1 or direct loaded into dump trucks for off-site disposal.

While upper soils within Treatment Zone TZ-1 appeared to be acceptable for on-site reuse based upon the field screening activities previously described all soils from Treatment Zone TZ-1 were disposed of off-site due concerns about the non-homogenous geotechnical properties of the soil and the concern about potential future settlement beneath the new building be constructed within that zone. The only exception was that a small amount of material from Treatment Zone TZ-1 with no field evidence of contamination was mixed with cement at a depth interval of approximately two to seven feet below the ground surface in Treatment Zone TZ-2, as the Contractor was running short of material for that operation.

4.2.4 Nuisance Controls

4.2.4.1 Tracking Pad and Egress Housekeeping

As previously described, a stone tracking pad was installed at the main access gate off Cortland Avenue to reduce the potential for tracking onto the public roadway. The tracking pad combined with existing concrete slabs and pavement on the Site minimized contact between truck tires and Site soils. Cortland Avenue was occasionally swept to maintain a clean roadway surface but tracking onto the roadway was limited during the remedial construction activities.

4.2.4.2 Dust Control

Potable water was sprayed on the Site surface to control dust emissions, as needed. The exposed soils were only wetted sufficiently to control dust and were not saturated or wetted to the point where water accumulated on the surface.

4.2.4.3 Odor Control

The primary form of odor control during the remedial construction activities was to direct load and immediately cover dump trucks with tarpaulins prior to offsite transportation and disposal. Additionally, due to direct loading of excavated materials, the area of exposed soil was limited and/or excavation activities were slowed based upon available trucks. Any contaminated soils that were temporarily stockpiled on-site were covered with polyethylene sheeting.

4.2.4.4 Truck Routing

Truck routing for the remedial construction activities consisted of trucks entering and exiting the Site through the main gate on Cortland Avenue. Trucks generally pulled ahead in a northerly direction and then backed up Treatment Zone TZ-1 for loading of contaminated soils. Deliveries were routed to various laydown areas on the Site, although most equipment and materials associated with the Treatment Zone TZ-2 area were unloaded between the north end of that zone and the northern property line and deliveries for equipment and materials associated with Treatment Zone TZ-3 were generally routed southward along the west side of Cortland Avenue where the treatment and recirculation equipment was setup.

Most truck traffic utilized Cortland Avenue to travel towards South Salina Street and then headed north towards Adams Street. Truck drivers then traveled westward to West Street and headed

northward towards Interstate 690. The only exception was that South Clinton Street was utilized for delivery and removal of the frac tanks utilized during the Treatment Zone TZ-1 remedial construction and for access when the vacuum truck was used to removed groundwater from the excavation and frac tanks.

4.2.5 CAMP Results

In accordance with the CAMP included as part of the RDWP, air monitoring was performed by CHA during intrusive remedial activities where there was a potential to encounter existing soil/fill between August 4, 2020 through October 12, 2020. Additionally, Pike coordinated CAMP monitoring during intrusive activities on the Site associated with the redevelopment of the property. CAMP monitoring continued during intrusive activities and was managed by the contractor retained to conduct intrusive excavations for foundations and utilities which was the same contractor retained for the remedial design, PEC.

Three CAMP stations, one on the upwind and two on the downwind sides of the active excavation(s), were setup daily. Figure 8 identifies the general location of the CAMP stations during remedial construction. Please note the location of CAMP stations during redevelopment construction of the Site is not available and was not provided to CHA. The CAMP enclosures contained a DustTrak 8530 particulate meter unit to monitor airborne dust concentrations in real time as well as a MiniRae 3000 PID to monitor for potential volatile organic vapors traveling downwind of the exclusion zone.

CHA operated CAMP station instruments were connected to the Netronix system mounted within the enclosure that uploaded real-time data and automatically calculated 15-minute average concentrations for both the DustTrak and PID. The system was programmed to notify field personnel via short message service (SMS) text message or email in the instance of an exceedance, to facilitate rapid investigation and/or corrective action. The CAMP stations operated by PEC did not transmit notifications by SMS or email in the instance of an exceedance.

In addition to the CAMP stations, one handheld PID was utilized within the work area to facilitate field screening of excavated materials and monitor breathing zone vapor concentrations during the

intrusive remedial activities completed for Treatment Zones TZ-1 through TZ-3. The following subsections summarize the CAMP results.

4.2.5.1 CAMP Results During Remedial Construction

During the implementation of the remedial construction, the upwind CAMP monitoring station was identified as CHA-1 and the downwind stations were identified as CHA-2 and CHA-3. The locations of each CAMP station were generally the same each day as depicted on the Construction Observation Reports included in Appendix H; however, the CAMP stations were periodically relocated based upon the prevailing wind direction each day. In summary, the CAMP results collected during the implementation of the remedial construction indicated:

- **Particulate Results:** The particulate results did not exceed the time-weighted average threshold of 150 micrograms per cubic meter (µg/m³), although periodic instantaneous exceedances were documented. These instantaneous exceedances do not indicate an exceedance of the PM-10 action level. A summary of the date, time, station ID, cause and/or mitigation measures are identified in a table at the beginning of Appendix I and the complete CAMP data is included behind the summary table. In almost all instances, the dust exceedances were related to truck traffic and when the air brakes on the trucks were engaged (sometimes within only a few feet of the monitoring station). In these cases, the visible dust was dissipated within a minute or less, although occasionally it took the dust meter longer to return back to background levels. When CHA on-site personnel were notified of an instantaneous exceedance via a text message or observed visible dust, CHA instructed the Contractor to lightly water the haul roads and reduce on-site vehicular speeds. Other on-site contractors performing non-remedial activities were also requested to minimize dust generation from demolition and other non-environmental related activities occurring at the Site.
- **Volatile Results:** No VOC concentrations exceeded the action level of five parts per million (ppm) over a 15-minute period during the construction for either the upwind or the downwind station.
- **Odors:** No significant odor problems were encountered during the implementation of the remedial construction. Periodic petroleum odors were encountered during the Treatment Zone 1 excavation activities but were typically present in the immediate vicinity of the excavation. No complaints were made the CHA or PEC during the remedial construction activities.

Raw air monitoring data downloaded from the Netronix unit(s) for each monitoring station are included Appendix I.

4.2.5.2 CAMP Results During Site Redevelopment Activities

After remedial construction was complete, PEC remained on-site to conduct all ground-intrusive activities for work involving foundations, subsurface utilities, and the underground stormwater chamber systems. The Contractor retained responsibility for operating the CAMP stations during all ground intrusive activities. An upwind CAMP station (Station # 48691 and labelled "Upwind") and two downwind CAMP stations (Station # 48692 labelled "Downwind #1" and Station # 47987 labelled "Downwind #2") were stationed around the active work zone to capture the daily prevailing wind direction.

The raw air monitoring data made available to CHA by the Contractor, was downloaded from each monitoring station and uploaded to the OneDrive file transfer site and accessed vis the following link: *https://chaconsulting-my.sharepoint.com/:f:/g/personal/smiller_chacompanies_com/EmzKg9-mE1BIlf65iZ3ExQwBI7Mr4vljVUFCpiJORfsOLg?e=YwQGAi*.

Significant data gaps and potential instrument errors, noted by constant readings over several days, were observed in the Contractor-provided data. Additionally, multiple exceedances of the 150 µg/m³ over 15-minute average action level occurred at various times in June and July 2021. CHA was not present during active construction at this time and does not have records of dust mitigation methods being implemented. However, it should be noted there are no sensitive receptors downwind of the prevailing wind direction at the Site. The surrounding properties are generally vacant land, vacant commercial businesses, or active construction. It should also be noted that CHA was provided access to the data starting in July 2021, at which point the ground intrusive work at the Site was nearly complete.

4.2.6 Reporting

CHA completed daily observation reports for each day spent on-Site during the remedial construction activities. All daily reports are included in electronic format in Appendix H. Additionally, a digital photograph log, required by the RDWP, documenting major components and milestones of the remedial construction is included in electronic format in Appendix J.

4.3 CONTAMINATED MATERIALS REMOVAL

A list of the soil cleanup objectives (SCOs) for the contaminants of concern for this project is provided in Table 4-2, below.

Table 4-2. Summary of Site-Specific Soil Cleanup Objectives

Soil Cleanup Objectives	
Contaminants of Concern	
	Part 375 Commercial Use (mg/kg)
Tetrachloroethene	150
Trichloroethene	200
Cis-1,2-dichloroethene	500
Vinyl Chloride	13
Benzene	44

A figure of the location of areas where excavations were performed is shown in Figures 5 and 10.

The following table and subsections provide a summary of disposal details for all phases of the Site remedy.

Table 4.3 shows the total quantities of each category of material removed from the site and the disposal locations are described in the subsequent sections. A summary of the samples collected to characterize the waste are described below, and associated analytical results are summarized on Tables1 and 2.

Letters from Applicants to disposal facility owners and acceptance letters from disposal facility owners are attached in Appendix F. Manifests and bills of lading are also included in electronic format in Appendix F.

Table 4-3. Summary of Contaminated Materials Removed

Material	Description of Waste Generation	Required Environmental Sampling	Quantity Exported
Interim Remedial Measure – Source Removal			
Non-Hazardous Contaminated Soil	From excavation of contaminated soil around the three USTs identified in the source area.	Toxicity Characteristic Leaching Potential (TCLP) VOCs, TCLP SVOC, TCLP Resource Conservation and Recovery Act (RCRA) 8 Metals, TCLP Herbicides, TCLP Pesticides, Total PCBs,	253.9 tons

		ignitability, corrosivity, reactivity, pH and any additional parameters required by the disposal facility	
Remedial Construction Activities			
Non-Hazardous Contaminated Soil	From excavation of TZ-1	TCLP VOCs, TCLP SVOC, TCLP RCRA 8 Metals, TCLP Herbicides, TCLP Pesticides, Total PCBs, ignitability, corrosivity, reactivity, pH and any additional parameters required by the disposal facility	2,503.83 tons
Stained Concrete	From foundation removal and concrete vaults/obstructions identified during work in TZ-1 and TZ-2. Determined to be stained and requiring disposal based upon visual inspection.	None	901.66 tons
Clean Concrete	From foundation removal. Determined to be clean based upon visual inspection.	None	310.58 tons
Steel	UST carcasses from the five USTs following cleaning	None	11.84 tons
Petroleum-Impacted Groundwater	From the dewatering efforts associated with TZ-1.	Total VOCs, Total SVOCs, RCRA 8 Metals and any additional parameters required by the disposal facility	82,767 gallons
Granular Activated Carbon	From the groundwater recirculation treatment system	Disposal facility specific requirements	3 tons
Redevelopment Construction Activities			
Non-Hazardous Contaminated Soil	From installation of stormwater chamber systems beneath parking lots, previous building foundation removal and excavation for new building foundation installation, and installation of new underground utilities including stormwater, natural gas, and electrical.	TCLP VOCs, TCLP SVOC, TCLP RCRA 8 Metals, TCLP Herbicides, TCLP Pesticides, Total PCBs, ignitability, corrosivity, reactivity, pH and any additional parameters required by the disposal facility	11,717.3 tons

4.3.1 Non-Hazardous Contaminated Soil – Remedial Construction

The non-hazardous contaminated soil was petroleum or chlorinated solvent impacted soil removed from Treatment Zone TZ-1 during the remedial constriction. A figure of estimated cut and fill thicknesses for remedial activities at the site are included in Figure 5.

4.3.1.1 Disposal Details

Based upon the waste characterization sampling and analysis performed by the Contractor as well as the data provided to the Contractor from previous investigation, the soil was determined to by non-hazardous waste as defined by Title 6 of the New York Code, Rules and Regulations (6 NYCRR) Part 371. From August 19th, 2020 through September 3rd, 2020, 2,503.83 tons of contaminated soil from Treatment Zone TZ-1 was hauled to the landfill for disposal in dump trucks owned and operated by PEC under waste transporter permit number 7A-516. A copy of the approved waste profile from Waste Connections, Inc. for the Seneca Meadows Landfill located in Waterloo, New York is included in Sub-Appendix F.1. The data provided to Seneca Meadows Landfill for total and toxicity characteristic leaching potential of site soils is provided in Tables 1 and 2, appended to this report. A copy of the 6 NYCRR Part 364 permits are included in Appendix K.

4.3.2 Non-Hazardous Contaminated Soil – Redevelopment Construction

During continued redevelopment of the Site, PEC was contracted to conduct intrusive activities at the Site including, but not limited to, removal of existing foundation walls hindering the redevelopment, installation of underground utilities and installation of stormwater retention structures.

4.3.2.1 Disposal Details

From mid-October 2020 through the conclusion of intrusive activities in October 2021, PEC excavated and disposed of an additional 11,717.3 tons of non-hazardous contaminated soil at the Seneca Meadows Landfill under the same waste hauler permit identified above. Excavation areas post-remedy are shown on Figure 9.

Additionally, on August 27th, 2021 PEC identified petroleum contamination while trenching for stormwater conveyance pipes on the western perimeter of Tax Map Number 094.-20-02.0 (the former employee parking lot area). PEC contacted CHA to describe the contamination and CHA responded to the Site within two hours of discovery. The crew had encountered a pocket of petroleum-saturated soil extending from approximately six to eight feet bgs, as visible during the initial discovery. Work was halted for the day due to the time required to manage the contaminated soil. On August 30th, 2021, CHA oversaw PEC excavate and direct-load the petroleum-saturated soil into dump trucks for off-site disposal at Seneca Meadows Landfill.

A figure of estimated cut and fill thicknesses for redevelopment activities at the site are included in Figures 9 and 10.

4.3.3 Stained Concrete

Concrete stained with was petroleum or chlorinated solvent impacted soil and/or groundwater was excavated and disposed of during the remedial construction. During the excavation activities in Treatment Zone TZ-1, stained concrete associated with what appeared to be a tank vault as well as building foundations were encountered. Additional stained concrete was also encountered immediately north and east of Treatment Zone TZ-2 when investigating voids/subterranean structures that had been abandoned in the ground.

4.3.3.1 Disposal Details

The stained concrete excavation and disposal occurred between August 26th, 2021 and September 10th, 2021. Given the staining on the concrete and elevated PID readings near the surface of the concrete, this material was also disposed off-site at the Seneca Meadows Landfill in Waterloo, New York. No waste characterization was conducted on this material due to the lack of fine particles associated with concrete. A total of 901.66 tons of concrete were disposed off-site. The approved waste profile and copies of the waste manifests and associated weight tickets are included in Sub-Appendix F.2.

4.3.4 Clean Concrete

While not considered a contaminated material, CHA notes that an additional 310.58 tons of non-stained, clean concrete was also removed from Treatment Zones TZ-1 & TZ-2 and was primarily associated with shallow foundations and concrete slabs.

4.3.4.1 Disposal Details

The clean concrete removal for recycling occurred between August 4th, 2021 and August 18th, 2021. All clean concrete was transported by PEC to T.H. Kinsella, Inc. in Fayetteville, New York for crushing and recycling. This material was not classified as a waste, and therefore, was not shipped under a manifest and waste characterization sampling was not conducted. However, weight tickets documented the quantity of clean concrete shipped off-site are included in Sub-Appendix F.3.

4.3.5 Scrap Steel

As discussed in further detail in Sections 4.2.5 and 4.2.6, a total of five USTs were found during the excavation of Treatment Zone TZ-1 and the initial excavation within Treatment Zone TZ-2.

4.3.5.1 Disposal Details

Following cleaning and removal of the tanks, the remaining scrap steel was transported by the Contractor to Ben Weitsman of Syracuse for recycling between August 5th and September 10th, 2021. This material was not classified as a waste, and therefore, was not shipped under a manifest and waste characterization sampling was not conducted. Per the weight tickets in Sub-Appendix F.4, a total of 23,680 pounds (11.84 tons) of scrap steel were disposed of off-site.

4.3.6 Contaminated Groundwater

During the Treatment Zone 1 excavation activities, contaminated groundwater was encountered. In some areas, particularly towards the southern end of the excavation, LNAPL was observed. Impacted groundwater and LNAPL were pumped out of the excavation and into one of two frac tanks staged along the western side of the Site or directly into a vacuum truck. A vacuum truck was also used to transfer water stored in the frac tanks to the disposal facility.

4.3.6.1 Disposal Details

Contaminated groundwater disposal occurred between August 19th and September 9th, 2021. A total of 82,767 gallons of non-hazardous contaminated water was transported to Industrial Oil Tank Service Corporation located in Oriskany, New York for disposal/treatment. Manifests associated with the disposal of contaminated liquid are included in Sub-Appendix F.5.

4.3.7 On-Site Reuse

The following subsections summarize the Site materials that were reused onsite.

4.3.7.1 Run of Crush Stone Material from Treatment Zone 2B

As previously described, following the ZVI-soil and cement-soil mixing operations with Treatment Zone TZ-2, the top of the cement-soil matrix was approximately two feet lower than the surrounding Site grades because the Contractor had run short of additional on-site soil to mix with the cement. The NYSDOT Type 2 run of crush material that was originally used to backfill Treatment Zone TZ-2B following the implementation of the Source Removal IRM was temporarily stockpiled on-site during the soil mixing activities and used as backfill in Treatment Zone TZ-2 to restore the grades within the treatment area to match surrounding grades.

4.3.7.2 Upper Soils in Treatment Zones TZ-1 and TZ-2

While the geotechnical properties of the on-site soils were heterogenous and not used as backfill material, some on-site soils were mixed with Portland cement within Treatment Zone TZ-2. To start the work in Treatment Zone TZ-2, the Contractor initially excavated on-site soils to a depth of nine feet below the ground surface and stockpiled that material on-site. This material was considered non-contaminated based on no visual, olfactory and photoionic evidence of contamination. Following the soil mixing with ZVI at a depth of nine feet bgs and below, the finished surface was typically at a depth of seven feet bgs due to swell. The Contractor then placed the stockpiled soil from Treatment Zone TZ-2 back into the excavation and blended it with water and Portland cement. However, due to the run of crush removed from Treatment Zone TZ-2B and the discovery of a UST in Treatment Zone TZ-2C, the Contractor ran short of having enough soil to mix with cement. Therefore, some of the upper soils in Treatment Zone 1 with no field evidence of significant contamination were also mixed with cement to help restore Treatment Zone TZ-2.

4.3.7.3 Soil from Redevelopment Activities

As part of the redevelopment activities, two stormwater retention systems were installed underground. Excavations for these systems, shown on Figure 11, included the removal of 5,100 cubic yards of soil. This material was stockpiled on-Site for reuse within berms. The berms were capped with a clean, imported fill and seeded, as described in Section 4.7.

4.4 REMEDIAL PERFORMANCE/DOCUMENTATION SAMPLING

The following subsections describe the quality control/quality assurance testing, record-keeping, and inspections performed during the remedial construction to comply with the project specification.

4.4.1 Compaction Testing for Treatment Zone TZ-1

Treatment Zone 1 was backfilled with approximately one foot Type 2 subbase stone at the bottom of excavation followed by No. 4 clean stone material that was placed beneath the water table to approximately 8 feet bgs. While the material was compacted with the back side of the excavator bucket as it was placed, formal compaction of this type of material is generally impractical. Type 2 subbase was then placed to final grade. For quality control during the placement of imported fill, in-place density testing was performed during the placement of the subbase material utilizing a nuclear density meter. The material was placed in a maximum of 12-inch-thick lifts and each lift was tested in accordance with the Technical Specifications. The compaction test results are included in Appendix L, but any tests results that did not initially meet the compactions requirements was reworked and retested until a passing result was achieved.

4.4.2 Confirmation Sampling for Treatment Zone TZ-1

CHA collected confirmatory samples for the excavation at Treatment Zone TZ-1 prior to backfilling. The samples were submitted for analysis of VOCs and SVOCs and compared to the Commercial Use SCOs. Soil sample results were found not to exceed the Commercial Use SCOs. Upon receipt of the analytical results, CHA conversed with the NYSDEC regarding the results and authorized backfilling of the excavation, upon approval from the NYSDEC.

A table and figure summarizing all end-point sampling is included in Table 3 and Figure 12, respectively, and all exceedances of SCOs are highlighted.

Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. These DUSRs and associated raw data are included in Appendix C.

4.4.3 Compressive Strength Testing for Treatment Zone TZ-2

Fresh cement/soil mixing samples were collected from multiple cells within Treatment Zone TZ-2. The Contractor identified two mixing zones and labelled the samples according to the following nomenclature:

[Cell #].[Zone #]

- Where cells were identified as Cells 1 through 13.
- Zone 1 was the deepest mixing zone with only ZVI and soil mixed. Compressive strength testing was not required.
- Zone 2 was the swell volume of Zone 1, therefore containing ZVI, and was mixed with cement which required a minimum 28-day compressive strength of 75 pounds per square inch (psi).
- In Treatment Zone TZ-2C where mixing was implemented to 26 ft bgs, a third zone (Zone 3) was identified for the cement/soil mixing which required a minimum 28-day compressive strength of 75 psi.

The Contractor collected fresh cement/soil mixed material each day in laboratory provided cylindrical forms and allowed them to cure for a minimum of 24-hours in the field. The compressive strength testing was conducted by CME Associates and results, included in Appendix M, were generally in exceedance of the specified minimum compressive strength. The minimum compressive strength requirement is not associated with the remedial goals of the Site, but rather for geotechnical purposes associated with the redevelopment of the Site.

As previously stated, the quantity of soil available for cement/soil mixing in Treatment Zone TZ-2 ran short due to the unexpected orientation of the UST in Treatment Zone TZ-1 and the unexpected UST in Treatment Zone TZ-2C. Additional soil from Treatment Zone TZ-1 was used to make up the difference, but final grade remained lower than the desired final product. Therefore,

approximately 12 inches of Type 2 subbase stone was placed over the entirety of Treatment Zone TZ-2 to create a level pad for trades coming in to continue redevelopment. The Type 2 subbase was compacted and tested for in-place field density in accordance with the technical specification, as discussed in Section 4.4.2.

4.4.4 Treatment Quantities for Treatment Zone TZ-3

The groundwater recirculation system was managed in four phases (one-half of a pore volume each) with 22 batches of groundwater extraction, treatment, and injection in each phase. Each batch consisted of the extraction of approximately 7,700 gallons of groundwater, treatment with approximately 70.5 gallons of 40 percent sodium permanganate chemical solution, and injection of the treated groundwater. Batch logs were maintained to track the quantity of extracted groundwater, chemical injection, and treated groundwater injection and are included in Appendix N.

A total of 6,600 gallons of 40 percent sodium permanganate solution was used during treatment although the batch logs indicate less because the flow totalizer was reset after Batch #9 when the quantity of chemical removed from the 275-gallon totes did not match with the quantity of chemical measured at the flow meter. Additional measures were implemented to ensure the correct quantity of chemical was injected during each batch. As previously indicated, a total of 678,510 gallons of treated groundwater was injected into the subsurface.

4.4.5 SSDS Installation Inspections

CHA conducted inspections on the major components of the SSDS throughout the redevelopment. CHA periodically observed and approved the installation of the perforated piping and open-graded stone, and the placement of the vapor barrier with mastic tape used for all rips, tears, perforations, and boots from April 21st, 2021 through June 15th, 2021. Generally, these components were installed in conformance with the remedial design and specifications.

The Fantech RN4 roof-mounted fans were installed and activated by Alpine Environmental Services, Inc. during the week of October 18th, 2021. Two monitoring panels with pressure gauges and audible alarms were installed and the 14 vapor monitoring point locations were verified and

tested for sub-slab vacuum pressure. The as-built drawings of the SSDS and results of the start-up testing are included in Appendix O.

4.4.6 Petroleum Contamination – Redevelopment Construction

As previously described, on August 27th, 2021 PEC identified petroleum contamination while trenching for stormwater conveyance pipes on the western perimeter of Tax Map Number 094.-20-02.0 (the former employee parking lot area). Five documentation samples were collected from the bottom and sidewalls of the excavation for analysis of VOCs and SVOCs and comparison to the Commercial Use SCOs. Figure 12 identifies the location of the petroleum impacted soil and the documentation sampling locations. However, the excavation was backfilled prior to the receipt of those analyses. Upon receipt, it was noted that one parameter slightly exceeded the Commercial Use SCO. Specifically, benzo(a)pyrene was detected at a concentration of 1.5 milligrams per kilogram (mg/kg) compared to the Commercial Use SCO of 1 mg/kg. This low level SVOC detection does not warrant further investigation or further remediation. No source of the petroleum contamination was identified during the excavation and removal activities. Table 4 identifies the remaining contamination associated with this location.

4.5 IMPORTED BACKFILL

A table of all sources of imported backfill with quantities for each source is shown in Table 4-4. Tables summarizing chemical analytical results for backfill, in comparison to allowable levels, are provided in Table 5.

Various stone and soil products were imported to the Site for the purposes of backfilling excavations and placing a soil cover system across the Site. Table 4-3 below and the following subsections summarize all the fill materials that were imported to the Site as part of the remedial construction as well as the redevelopment construction that occurred following the remedial construction. Imported fill weight tickets are included in Appendix P and analytical data for materials required testing in accordance with the DER-10 requirements are included in Appendix Q. Grab samples were analyzed for VOCs while other analyses were performed on composite samples.

Table 4-4. Summary of Imported Fill Materials

General Material Type	Material	Use	Source of Material	Required Environmental Sampling Frequency	No. Samples Submitted	Quantity Imported (CY or Tons)
Remedial Construction Activities						
Aggregate	NYSDOT No. 4 Stone	Used to backfill Treatment Zone 1 below the water table.	T.H. Kinsella, Inc. Fayetteville, New York	None per sieve test and DER-10	NA	729.38 Tons
	NYSDOT Type 2 Subbase	Used as backfill in Treatment Zone 1 and placed in 12-inch lifts.	T.H. Kinsella, Inc. Jamesville, New York	None per sieve test and DER-10	NA	1978.17 Tons
Redevelopment Construction Activities						
Fill	NYSDOT Type 2 Subbase Stone	Crushed stone used beneath asphalt and concrete soil cover systems, to raise the grade of the building by approximately 5 feet, and in the underground stormwater detention basins	T.H. Kinsella, Inc. Jamesville, New York	None per sieve test and DER-10	NA	20,131.2 tons
	NYSDOT #1 and #2 Stone Blend	Vapor migration stone for the SSDS	T.H. Kinsella, Inc. Jamesville, New York		NA	3,748 tons

General Material Type	Material	Use	Source of Material	Required Environmental Sampling Frequency	No. Samples Submitted	Quantity Imported (CY or Tons)
	NYSDOT Crushed #1 Stone and Rounded 1's and 2's	Various uses	T.H. Kinsella, Inc. Jamesville, New York		NA	267 tons
	NYSDOT 4" Crusher Run	Various uses			NA	587.06 tons
Soil	Topsoil	Green space areas across the Site and in the "Coyne Park" section of the Site	Brutus and Skaneateles topsoils submitted by DeMarco & Sons Nursey LLC	See DER-10 Table 5.4(e)10	9 Grab Samples, 3 Composite Samples	1,925 cubic yards [1]

NA – Not Applicable

[1] At the submission of this report, redevelopment activities are on-going. Once the information for final quantity of imported fill is available, an updated FER will be submitted to the NYSDEC.

The following subsections provide additional details regarding the material imported to the Site as remedial activities and Site redevelopment. Imported fill material associated with the Source Removal IRM is discussed in the Source Removal CCR.

4.5.1 NYSDOT No. 4 Stone

The No. 4 stone was imported to the Site to backfill the Treatment Zone TZ-1 excavation to the top of the water table at approximately 9 feet bgs. The stone was manufactured by T.H. Kinsella, Inc. in their Fayetteville, New York quarry. Per DER-10 guidelines, laboratory analytical tests per DER-10 were not completed on the material because a sieve test indicated less than 10 percent of material by weight would pass through the No. 80 sieve for this material. This information is provided in Appendix P.

4.5.2 NYSDOT Type 2 Subbase

NYSDOT Type 2 subbase was imported to the Site to backfill the Treatment Zone 1. The material consisted of virgin limestone that was mined and crushed by T.H. Kinsella, Inc. in their Jamesville, New York quarry. Per the particle size analysis included in Appendix M, less than ten percent of the material passed a size No. 80 sieve, and therefore, chemical testing was not performed. However, a letter from T.H. Kinsella, Inc. attesting to the fact that the material was sourced form uncontaminated, virgin materials in included in Appendix P.

4.5.3 Other Stone Products

Additional stone products were imported to the Site during the redevelopment. The overall site grade within the building footprint was raised five feet from original grade using NYSDOT No. 2 crushed stone. Vapor mitigation venting stone consisting of a 50/50 blend of NYSDOT No.1 and No. 2 stone was placed around the perforated piping placed beneath the concrete slab within the building. Additionally, No. 2 crushed stone and Type 2 subbase were imported to backfill pipe trenches and the stormwater chamber systems. These products are included in Appendix P.

4.5.4 Topsoil

During redevelopment of the Site, landscaping improvements were implemented at various locations across the Site. As part of these upgrades, topsoil was placed. Topsoil was imported from by DeMarco and Sons Nursery, LLC, from their facility located in Elbridge, New York. Per DER-10 table 5.4(e)10, five grab samples were collected and analyzed for VOCs and two grab samples were collected and analyzed for SVOCs, Metals, PCBs, Pesticides, Herbicides, and PFAS-compounds. Results were compared to DER-10 soil cleanup guidance criteria for Unrestricted Use and were found to be less than the soil guidance values. Analytical laboratory reports for the topsoil are in Appendix Q and the results are presented in Table 5.

4.6 CONTAMINATION REMAINING AT THE SITE

At the submission of this FER, the remedial construction is complete and the SSDS system is operational. However, contamination remains contamination at the Site.

The remedial program and its' effectiveness will be addressed in the periodic review reports until

the RAO's have been reached. Since contaminated soil, groundwater, and soil vapor remains beneath the site after completion of the Remedial Action, Institutional and Engineering Controls will be required to protect human health and the environment. These Engineering and Institutional Controls (ECs/ICs) are described in the following sections. Long-term management of these EC/ICs and residual contamination will be performed under the Site Management Plan (SMP) approved by the NYSDEC, included in Appendix R.

4.6.1 Contaminated Soil Remaining at the Site

Based on the remediation in Treatment Zone TZ-1, the contamination remaining at the Site associated with this area is limited to lesser concentrations of VOCs in exceedance of the Unrestricted Use SCOs, but not in exceedance of the applicable Commercial Use SCOs based on confirmatory sampling on the bottom and sidewalls of the excavation. The contaminants detected include acetone (non-detect [ND] to 0.74 mg/kg, benzene (ND to 0.53 mg/kg), 2-butanone (ND to 0.4 mg/kg) and vinyl chloride (ND to 0.36 mg/kg) as shown on Figure 12.

Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) and the project specifications was imported to replace excavated soils and establish design grades at the Site. Backfilling of the excavation for Treatment Zone TZ-1 was conducted under the guidance of John P. Stopen Engineering, LLP (JPS) due to structural concerns for Site redevelopment. The excavation was backfilled with materials more fully described in Section 4.5 and in the following manner:

- Approximately one foot of New York State Department of Transportation (NYSDOT) Type 2 subbase (a run of crush stone material) was placed at the bottom of the excavation immediately after the excavation was dewatered and visually inspected for approval.
- No. 4 crushed stone was placed above the run of crush stone to the top of the static water table at approximately nine feet bgs.
- A 12-ounce orange, non-woven geotextile demarcation barrier was placed on top of the No. 4 run of crush stone.
- The remainder of the excavation was backfilled with compacted NYSDOT Type 2 subbase.

Remaining contamination at Treatment Zone TZ-2 has been treated by the ZVI slurry application or has been contained in the cement/soil slurry. Based on the treatability study for ZVI slurry application, it is anticipated the CVOC mass has been reduced by approximately 40 percent of the

original mass in Treatment Zone TZ-2. The treatability study was over a relatively short time period and ZVI is expected to continue to treat soils until all ZVI has been consumed in the reduction reaction. Therefore, it is anticipated to continue to reduce the CVOC mass over time. However, at the submission of this FER it is anticipated approximately 60 percent of the VOC mass in Treatment Zone TZ-2 remains.

Table 3 and Figure 12 summarize the results of all soil samples remaining at the site after completion of Remedial Action that exceed the Track 1 (unrestricted) SCOs.

Figure 12 also shows the location of all confirmatory soil samples collected. Locations shown that do not include data tables on the figure indicate that results meet the SCOs for unrestricted use of the site.

Soil cover systems and demarcation barriers were placed across the Site, as described in Section 4.7 and identified on Figures 9 and 14. To identify the location of where clean fill material meets existing soil, the following lists the demarcation barrier depth:

- Treatment Zone TZ-1 was backfilled in a manner described in Section 2.2.1. The demarcation barrier within Treatment Zone TZ-1 was placed at 9 feet bgs.
- The demarcation barrier placed beneath the stormwater main replacement in S. Clinton Street and in Cortland Avenue were placed 7.5 feet bgs.
- The demarcation barrier placed beneath the stormwater detention basin in the north parking lot was placed 7.8 feet bgs.
- The demarcation barrier beneath the stormwater detention basin on the east parking lot was placed 7.5 feet bgs.
- The demarcation barrier was placed 1 foot bgs beneath areas enhanced with a topsoil cover system.
- The demarcation barrier was placed 9 feet bgs in the petroleum contamination area identified post remedial construction and detailed further in Section 4.4.6 and on Figure 10.

Results from the RI (CHA 2018) indicate that primary COCs were observed less than 26-feet bgs for chlorinated compounds and less than 15 feet for petroleum compounds. While the remedial actions performed addressed much of the contamination, there is the potential that some contamination remains across the Site.

4.6.2 Contaminated Groundwater Remaining at the Site

While conducting the supplemental remedial investigation (RI), groundwater samples were collected from the two newly installed temporary wells and the three permanent wells installed in 2015 by GZA. Results are summarized in Table 6. Based on the groundwater contours, these wells represent the most down-gradient extension of the groundwater plume, much of which was treated via a recirculation program (TZ-3).

Based on the results of the investigation presented by CHA in the Supplemental RI Report (CHA, August 2021), CHA concluded:

- The chlorinated VOCs observed in the groundwater samples collected from monitoring wells MW-5A, MW-6A, MW-7A, TMW-101, TMW-112 are likely impacts from the migration of contamination of the source area and plume on the Former Coyne Textile Facility property.
- The exposure to Site media is limited due to the Site being primarily covered with paved asphalt roadway and the presence of municipal water at and in the vicinity of the Site. Redevelopment of this portion of the Site includes sidewalks, pavement, and limited vegetated areas. Buildings are not proposed on this portion of the Site at this time.

It is expected that groundwater contamination within Treatment Zone TZ-3 is significantly reduced compared to before the remediation. The groundwater plume targeted for remediation was treated with sufficient sodium permanganate to reduce target CVOC compounds to ethene, or simple alcohol. Additionally, the sodium permanganate is expected to remain in the subsurface and continue treating groundwater and reduce the CVOC mass within the plume and downgradient from the plume over time. As noted in the results from the Supplemental RI Report, groundwater outside of the remedial treatment zone was found to be contaminated at a level consistent with that prior to remedial action implementation. This was anticipated and the concentrations are expected to decrease over time via attenuation since the source areas has been treated.

4.7 SOIL COVER SYSTEM

Exposure to remaining contamination in soil/fill at the site is prevented by a soil cover system placed over the site. This cover system is comprised of a minimum of 12 inches of clean soil, asphalt pavement, concrete-covered sidewalks, and concrete building slabs. These are more fully detailed, below:

1. Asphalt Cover Areas: All asphalt cover areas include a geotextile fabric beneath a minimum of 12-inch thick imported NYSDOT Type 2 Subbase material. The asphalt is a minimum of four inches in thickness including the binder and top course.
2. Concrete Walkway Cover Areas: All concrete walkway cover areas include a six-ounce non-woven geotextile demarcation barrier beneath a minimum of six inches of imported NYSDOT Type 2 Subbase material. The concrete is a minimum of five inches of 4,000 psi concrete.
3. Green Space Areas: All green space areas include a minimum of a one-foot thick layer of imported, clean topsoil placed above a six-ounce non-woven geotextile demarcation barrier that will provide a physical barrier to any potential remaining contamination in existing Site soils. Topsoil has been analyzed for the required parameters referenced on Table 5.4(e)10.

Figure 13 shows the as-built cross sections for each remedial cover type used on the site and the location of each cover type built at the Site. An Excavation Work Plan (EWP), which outlines the procedures required in the event the cover system and/or underlying residual contamination are disturbed, is provided in Appendix E of the SMP.

4.8 OTHER ENGINEERING CONTROLS

The NYSDEC has defined an engineering control as "any physical barrier or method employed to actively or passively contain, stabilize, or monitor contamination, restrict the movement of contamination to ensure the long-term effectiveness of a remedial program, or eliminate potential exposure pathways to contamination. Engineering controls include, but are not limited to, pavement, caps, covers, subsurface barriers, vapor barriers, slurry walls, building ventilation systems, fences, access controls, water supply via connection to an existing public water supply, adding treatment technologies to such water supplies, and installing filtration devices on private water supplies." Since remaining contaminated soil, groundwater, and soil vapor exists beneath the Site, EC's are required to protect human health and the environment. The Site has two primary Engineering Controls which were installed in various phases of the redevelopment, as described in the following subsections. Procedures for monitoring, operating and maintaining the engineering controls on-site are provided in the Operation and Maintenance Plan in Section 4 of the SMP. The Monitoring Plan also addresses inspection procedures that must occur after any severe weather condition has taken place that may affect on-site ECs.

4.8.1 Sub-Slab Depressurization System

As part of the Site redevelopment, an active SSDS mitigation system was installed beneath the concrete slab for the main building constructed on the Site. The SSDS is separated into five sub-systems, each with its own blower located on the roof of the building.

During redevelopment of the Site, an SSDS was installed in accordance with the RDWP. Generally, the primary SSDS components included:

- 4-inch diameter perforated PVC piping placed horizontally in the locations identified on the design drawings.
- A minimum of 4-inches of NYSDOT No. 1 and No. 2 crushed stone (50/50 blend) above and beneath the PVC piping to create a 12-inch thick vapor venting stone layer and that also protects the pipe from excessive stress.
- A Class A, 15-mil polyethylene resin vapor barrier meeting or exceeding all requirements of ASTM 1745-17 was specified above the gas vapor collection system and beneath the slab-on-grade. The vapor will be in direct contact with the slab beneath the entire building. A combination of vapor barrier boots, pressure sensitive seam tape, and mastic, as specified, was utilized to seal the barrier around penetrations in the vapor barrier.
- Vapor monitoring points were installed in the locations identified on the design drawings to facilitate post-mitigation sub-slab vapor sampling concurrent with indoor air sampling.
- Vertical PVC exhaust stacks to transfer sub-slab vapors to the roof mounted exhaust system.
- To avoid entry of subsurface vapors into the building, the exhaust/discharge pipe were installed in accordance with the following:
    1. A minimum of 18 to 24 inches above the surface of the roof (preferably above the highest level of the roof)
    2. At least ten feet above the ground level
    3. At least ten feet away from any opening that is less than two feet below the exhaust point
    4. At least ten feet from any adjoining or adjacent buildings, or heating, ventilation and air conditioning (HVAC) intakes or supply registers
    5. All exhaust pipes were fitted with a protective screen or cover to reduce the potential for water and vector intrusion.
    6. All pipes were properly supported to prevent potential wind damage, such a constructing a unistrut system to mount the fans.
- Each sub-system includes a fan to induce a vacuum beneath the entire floor slab and induce a pressure gradient between the sub-slab of the building and the interior space. The fan

specified for each sub-system was the Fantech Rn4 Inline Radon Fan. All fans are installed on the exterior of the building.

- Pressure gauges were installed in the locations identified on the design drawings.
- Alarms were installed to signal a change in vacuum pressure that is inconsistent with the design vacuum pressure.

During installation of each component, CHA inspected the final product. This included multiple site visits to inspect the placement of perforated piping and blended stone, inspect the placement and integrity of the vapor barrier system, inspect the installation of gauges, alarms, and fans, and to verify the location of vapor monitoring points. Alpine Environmental Services installed the fans, gauges and alarms and verified the sub-slab vacuum pressure at each of the pressure monitoring points was less than -0.004 inches of water column. As-built drawings for the SSDS and results from the initial pressure monitoring points are included in Appendix O. Going forward, the SSDS will be monitored in accordance with the operations, monitoring and maintenance plan provided in the SMP.

4.9 INSTITUTIONAL CONTROLS

The NYSDEC has defined an institutional control (IC) as "any non-physical means of enforcing a restriction on the use of real property that limits human and environmental exposure, restricts the use of groundwater, provides notice to potential future owners, operators, or members of the public, or prevents actions that would interfere with the effectiveness of a remedial program or with the effectiveness and/or integrity of operation, maintenance, or monitoring activities at or pertaining to a remedial Site."

The Site remedy requires that an environmental easement be placed on the property to (1) implement, maintain and monitor the Engineering Controls; (2) prevent future exposure to remaining contamination by controlling disturbances of the subsurface contamination; and, (3) limit the use and development of the Site to commercial uses only.

There are two environmental easements for the Site. The environmental easement includes the area labelled "Parcel 1" on the Land Title Survey dated July 7th, 2021 prepared by Timothy J. Coyer, L.L.S. of Ianuzi & Romans Land Surveying, P.C., provided in Appendix A. The environmental easement for Parcel 1 was executed by the Department on October 6th, 2021 and filed with the

Onondaga County Clerk on October 12th, 2021. The County Recording Identifier number for this filing is 2021-00048743. A copy of the easement and proof of filing is provided in Appendix A.

The second environmental easement includes the areas labelled "Parcel 2" and "Parcel 3" on the Land Title Survey. The environmental easement for Parcels 2 and 3 was executed by the Department on October 6th, 2021 and filed with the Onondaga County Clerk on October 12th, 2021. The County Recording Identifier number for this filing is 2021-00048750. A copy of the easement and proof of filing is provided in Appendix A.

The IC's required by the Environmental Easement and implemented as part of the SMP include:

- Compliance with the SMP by all legal entities listed on the BCA, as previously mentioned, successors and assigns.
- All Engineering Controls must be operated and maintained as specified in the SMP.
- All Engineering Controls on the Site will be inspected at a frequency and in a manner defined in the SMP.
- Groundwater and soil vapor intrusion monitoring must be performed as defined in the SMP.
- Data and information pertinent to Site management of the Controlled Property must be reported at the frequency and in a manner defined in the SMP.

Institutional Controls that will be specified in the Environmental Easement may not be discontinued without an amendment to or extinguishment of the Environmental Easement.

The Site also has a series of Institutional Controls in the form of Site restrictions. Adherence to these IC's are required by the Environmental Easement. Site restrictions that apply to the Controlled Property are:

- The property may be used for commercial or less restrictive use.
- All ECs must be operated and maintained as specified in the SMP.
- All ECs must be inspected at a frequency and in a manner defined in the SMP.
- The use of groundwater underlying the property is prohibited without necessary water quality treatment as determined by the NYSDOH or the Onondaga County Department of Health to render it safe for use as drinking water or for industrial purposes, and the user must first notify and obtain written approval to do so from the Department.

- Groundwater and other environmental or public health monitoring must be performed as defined in the SMP.
- Data and information pertinent to site management must be reported at the frequency and in a manner as defined in the SMP.
- All future activities that will disturb remaining contaminated material must be conducted in accordance with the SMP.
- Monitoring to assess the performance and effectiveness of the remedy must be performed as defined in the SMP.
- Operation, maintenance, monitoring, inspection, and reporting of any mechanical or physical component of the remedy shall be performed as defined in the SMP.
- Access to the site must be provided to agents, employees or other representatives of the State of New York with reasonable prior notice to the property owner to assure compliance with the restrictions identified by the Environmental Easement.
- The potential for vapor intrusion must be evaluated for any buildings developed in the area within the IC boundaries noted on Figure 2, and any potential impacts that are identified must be monitored or mitigated.
- Vegetable gardens and farming on the site are prohibited.

4.10 DEVIATIONS FROM THE WORK PLAN

Minor deviations were made from the requirements of the RDWP during the course of remedial construction, which are discussed in the following table.

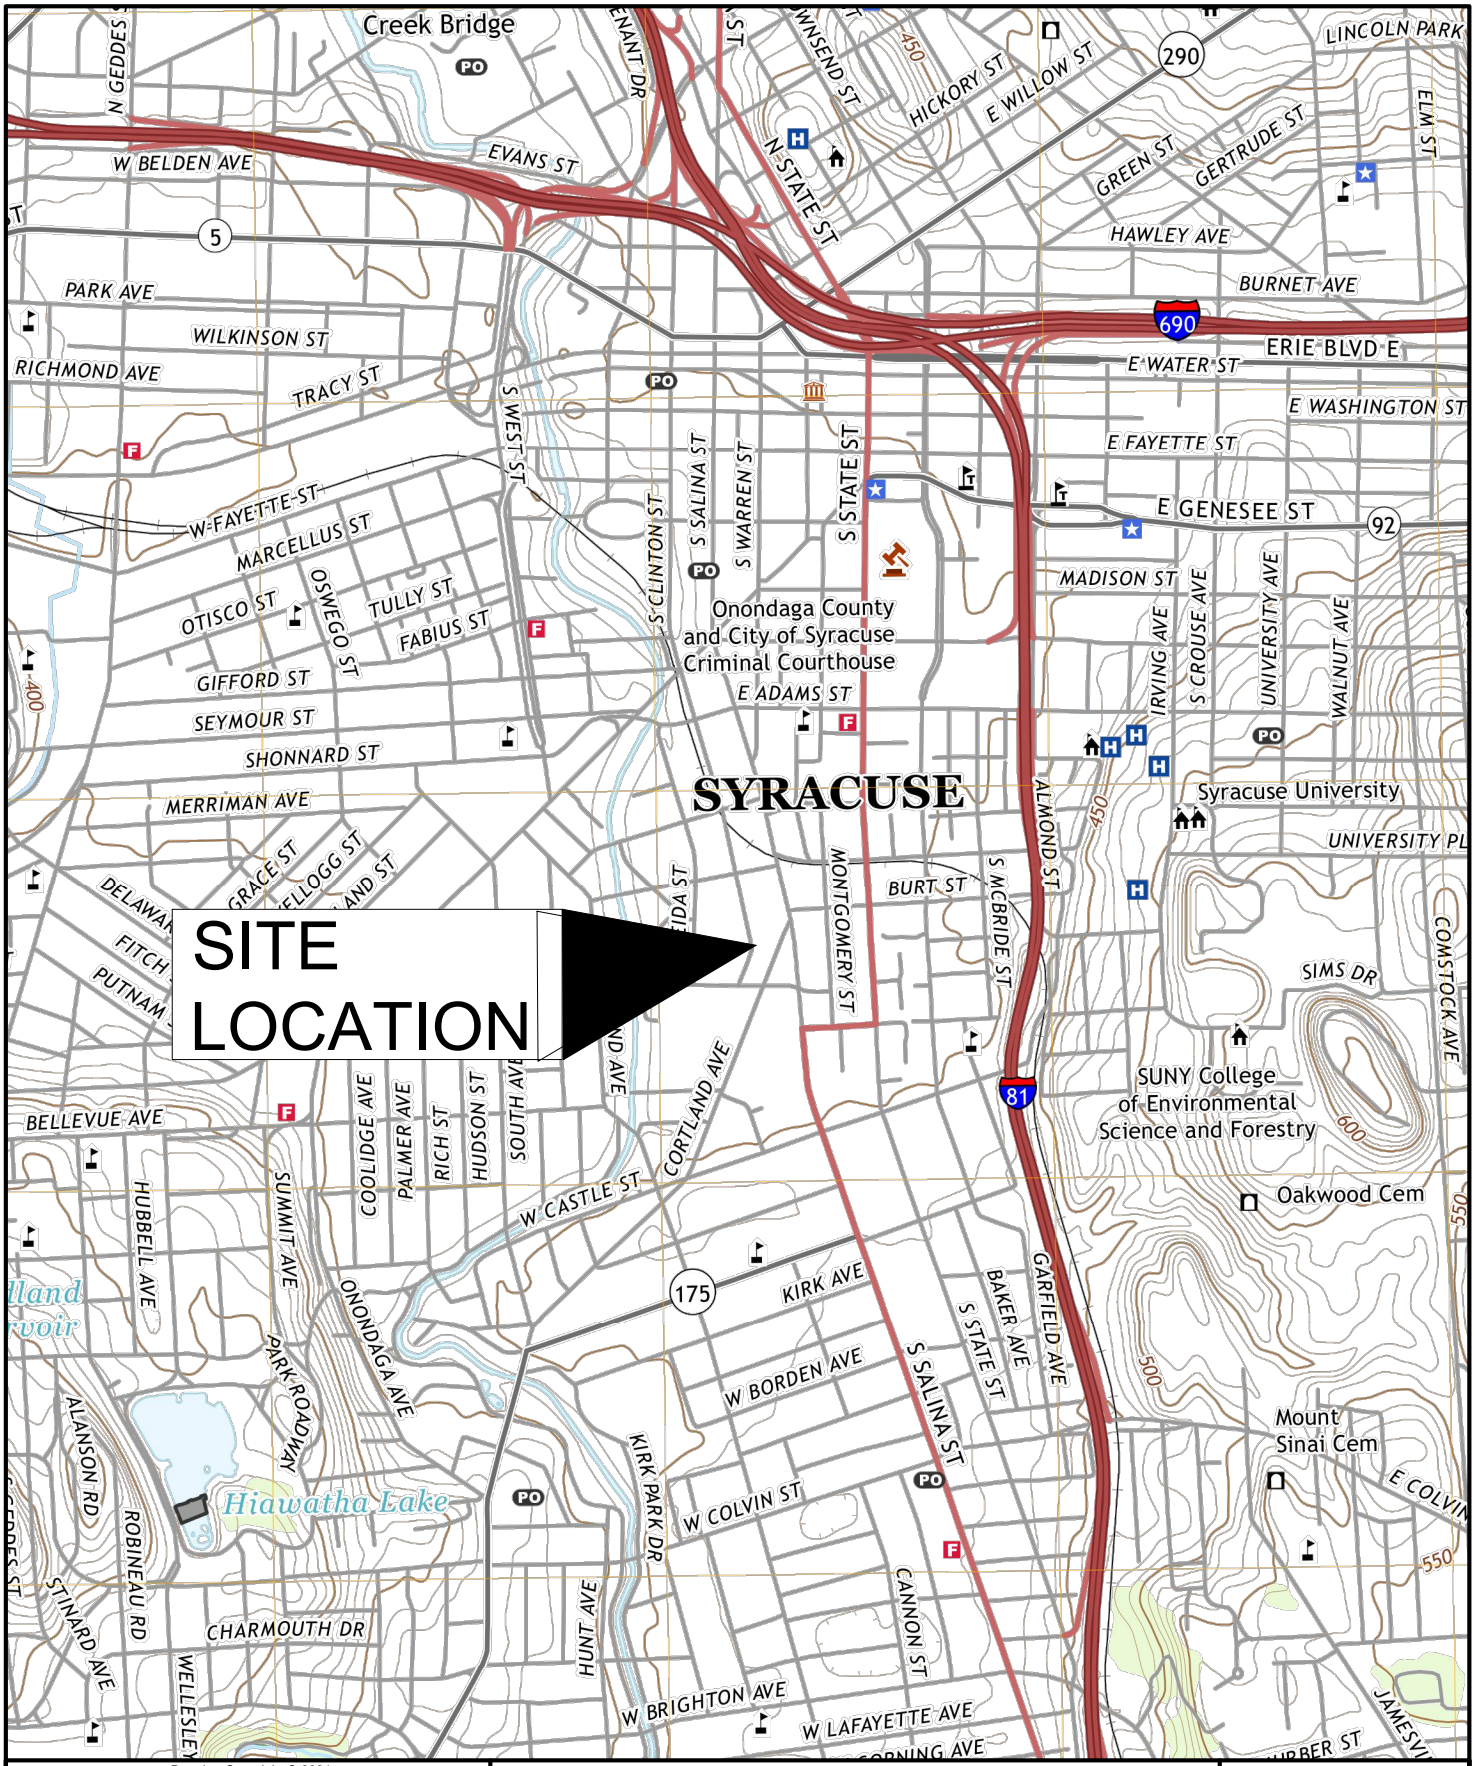

Table 4-5. Deviations from the Workplan

Original Design	Description of Deviation	Action Taken	Impact on the Remedial Design
The exact location of the 10,000-gallon UST was unknown, but the UST was thought to be perpendicular with the room in which the fill ports were previously located.	The 10,000-gallon UST located in TZ-1 was oriented so that is extended into TZ-2. This altered the proposed location and limits of excavation. Additionally, a smaller day tank was identified on top of the 10,000-gallon UST.	Additional soil excavation and disposal was conducted around the UST and to the northwest of the UST, extending into TZ-2 Cell #1. This reduced the quantity of non-contaminated overburden soil in TZ-2 Cell #1 available for cement/soil mixing to stabilize the surface soils of the Cell #1. Some overburden material from TZ-1, identified to be non-contaminated using field screening techniques, was used in Cell #1 to supplement the soil volume.	No significant impact on the remedial design.

Original Design	Description of Deviation	Action Taken	Impact on the Remedial Design
Location of Extraction Well EW-1 was to be located at 1106692.62 N, 935854.89 E.	Refusal was encountered at two separate locations at the design location and off-set two feet from the design location.	CHA allowed PEC to use the existing permanent monitoring well (GW-100) located approximately 8 feet to the south of the design location for EW-1. GW-100 is screened from 13 to 23 feet below ground surface and the well construction is similar to the other extraction/injection wells.	A slight alteration to the extraction well location changed area of groundwater treatment by extending the radius of influence of EW-1 to the south by approximately 8 feet. This had little to no impact on the overall remedial design.
One UST was anticipated in TZ-1.	Three additional USTs were identified and removed on 8/20/2020.	The two USTs were removed, cleaned, and disposed of by the Contractor. Soil directly around the tanks did not appear to be significantly impacted, despite the apparent corrosion of the UST bottom. The excavation limits of TZ-1 were extended beyond the location of these two newly identified USTs.	No significant impact on the remedial design.
No USTs were anticipated in TZ-2.	One 10,000-gallon UST identified in TZ-2C on 8/26/2021.	The 10,000-gallon UST was removed by the Contractor on 9/3/2020. A small quantity of free product from the UST was cleaned using absorbent pads and several buckets of soil were removed and disposed of. Due to the ongoing ZVI and soil mixing operations, it was not possible to collect samples from the subsurface soils. Additionally, this reduced the quantity of overburden soils available for cement/soil mixing to stabilize the surface soils in TZ-2C. It was discussed that overall swelling of the cement/soil mixture would accommodate some of the volume but leaving the surface elevation approximately one-foot lower than the design is acceptable. One-foot of run-of-crush stone was placed across TZ-2 at the end of soil mixing.	A one-foot decrease of the final surface elevation post soil-mixing occurred due to this deviation in the remedial design. Twelve inches of run-of-crush stone was placed across TZ-2 at the end of soil mixing to alleviate building design implications and allow for an even construction work zone for other trades.

Original Design	Description of Deviation	Action Taken	Impact on the Remedial Design
Soil mixing to a depth of 26 feet below ground surface for the area labelled TZ-2C.	Obstructions were encountered at several locations at approximately 24 feet below ground surface in TZ-2C.	It was determined the design intent was met by mixing to 24 feet below ground surface in areas where obstructions were not encountered. The few locations where mixing ceased at 24 feet below ground surface were deemed acceptable.	No significant impact on the remedial design.
The groundwater treatment system called for 15 injection sub headers to facilitate injection of treated groundwater in two phases.	Only 14 injection sub headers were installed rather than the 15 injection sub headers as proposed on the design drawings.	Injection Well IW-29 was rotated into the injection phases accordingly to inject water across the design area.	No significant impact on the remedial design.
Well decommissioning with a bentonite-cement grout mixture to 18 inches below the surface, then a bentonite seal installed to the ground surface.	Concern was brought to attention regarding displacement of sodium permanganate treated water during well decommissioning and a change to the well abandonment procedure was proposed.	In order to prevent sodium permanganate treated water from surfacing during the well abandonment, it was decided to use bentonite to approximately 10 feet below ground surface, then seal the monitoring well with cement grout to the surface.	No significant impact on the remedial design.

ND – PARAMETER NOT DETECTED
NR – PARAMETER NOT REPORTED

PARAMETERS SHOWN EXCEED TOGS 1.1.1 AMBIENT GROUNDWATER QUALITY CRITERIA FOR CLASS GA WATERS

[1] – GUIDANCE VALUES OBTAINED FROM THE NYSDEC OCT. 2020 GUIDANCE
[2] – GUIDANCE VALUE FROM NYSDOH SECTION 225 FOR DRINKING WATER
[3] – VALUE DOES NOT EXCEED TOGS 1.1.1

Notes:

Only detected parameters are listed.
Samples collected by Paragon Environmental Construction or CHA Consulting, Inc., as noted.

Sampled collected by Paragon Environmental Construction were analyzed by Paradigm Environmental Services, Inc.

Samples collected by CHA Consulting, Inc. were analyzed by Alpha Analytical.

Blank cells represente non-detects, unless otherwise stated.

J - The reported results is an estimate. The value was detected at a concentration less than the reporting limit, but greater than the method detection limit.

U - Not detected at the reported detection limit for the sample.
J - Estimated value.

Notes:

Samples were collected by CHA Consulting, Inc. between 8/19/2020 and 8/26/2020.
Samples were analyzed by Alpha Analytical, Inc.

NY-RESC - Part 375 Soil Cleanup Objective for Commercial Use
NY-UNRES - Part 375 Soil Cleanup Objective for Unrestricted Use
U - Not detected at the reported detection limit for the sample.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

	Detection exceeds the Part 375 Unrestricted Use SCO
BOLD FONT	Detection exceeds the Part 375 Commercial Use SCO
	Note - no detections meet this criteria

Notes:

NY-AWQS: New York TOGS 111 Ambient Water Quality Standards criteria reflects all addendum to criteria through June 2004.

[1] - Guidance value for 1,4-Dioxane obtained from the NYSDOH Section 225 of the Public Health Law, Subpart 5-1, Section 5-1.52 Table 3. Organic Chemicals Maximum Contaminant Level Determination, effective August 26, 2020.

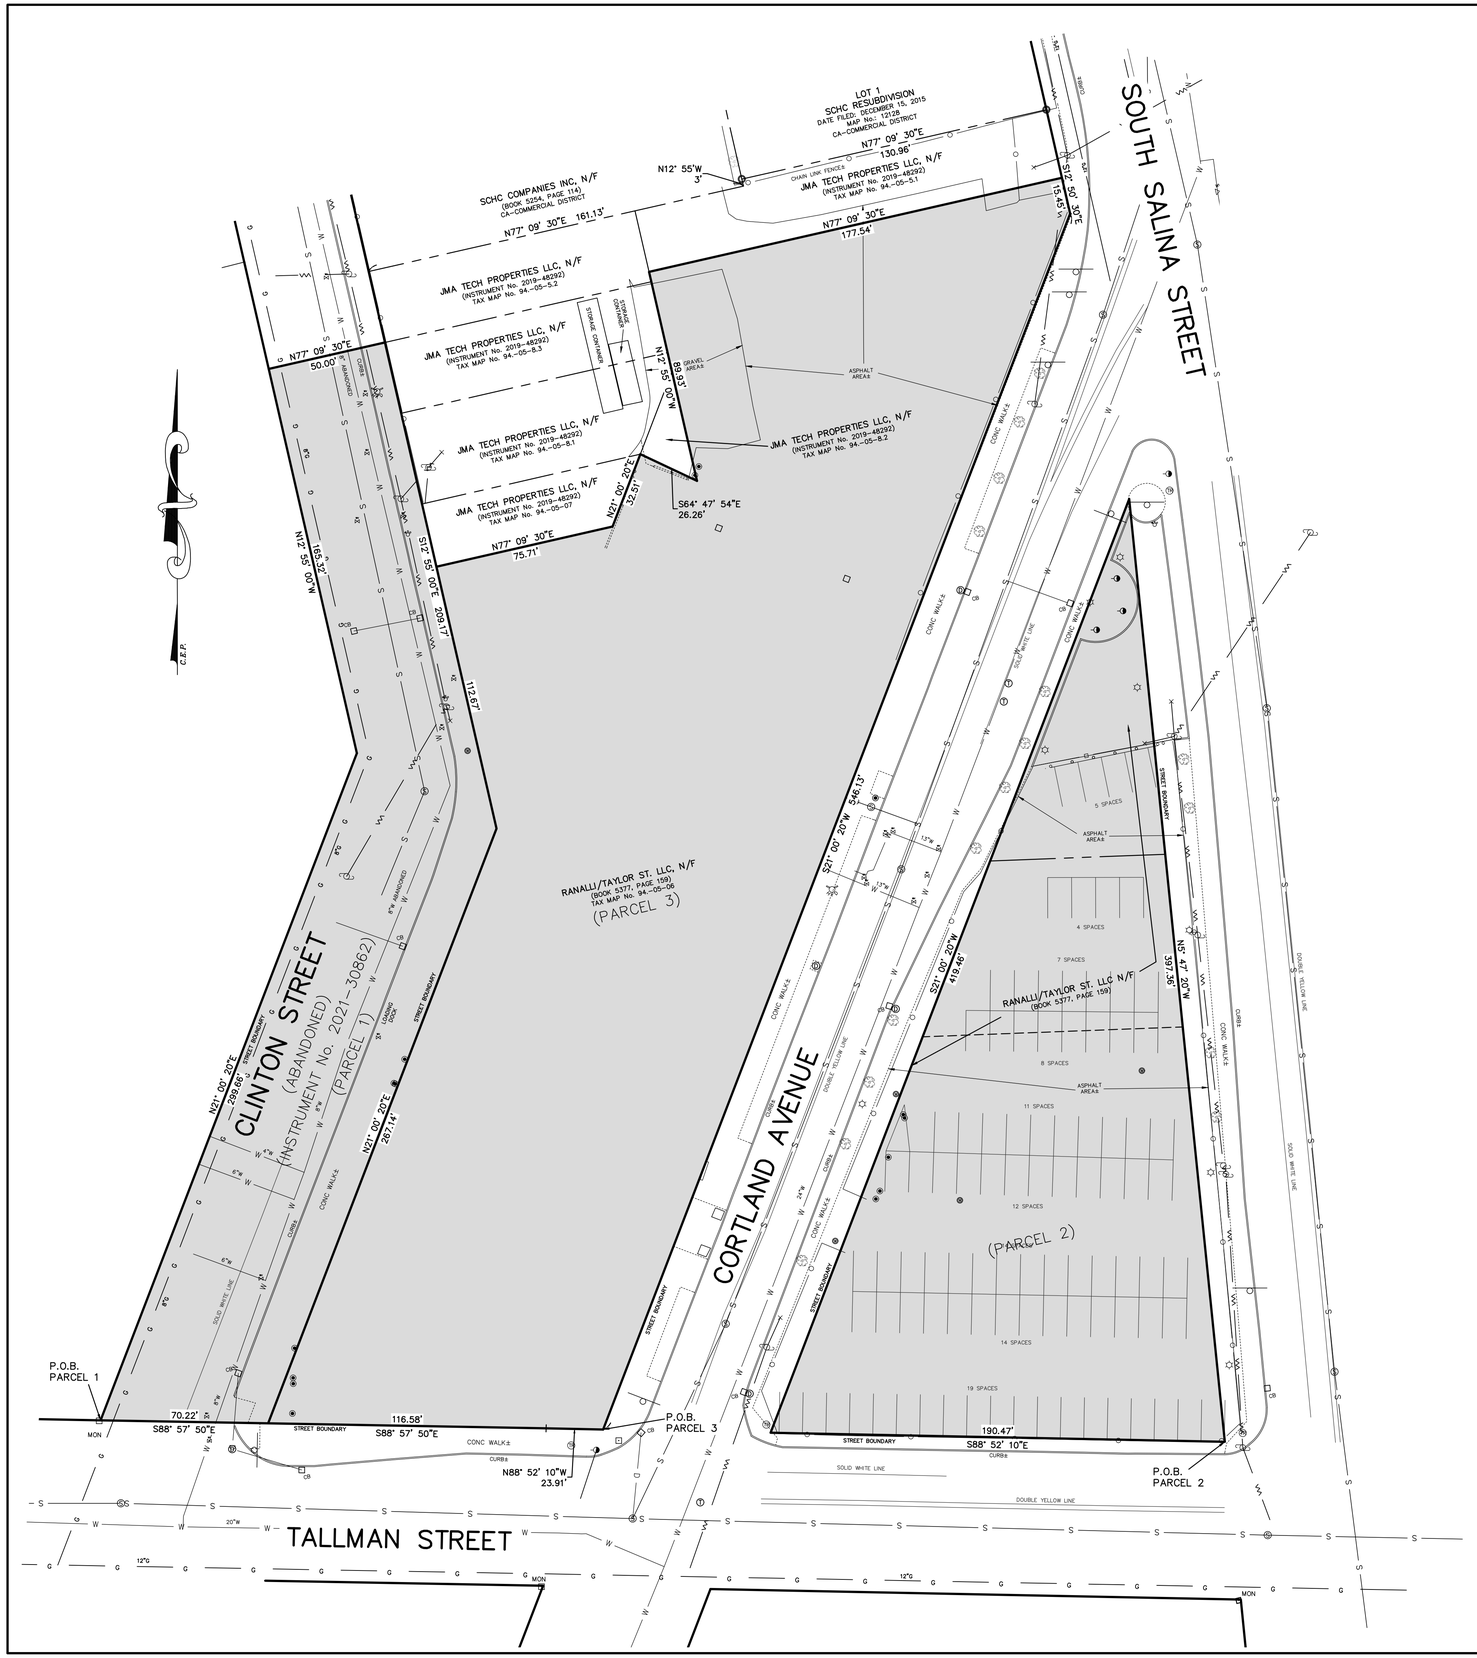
[2] - Guidance values obtained from the NYSDEC October 2020 Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS).

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank.

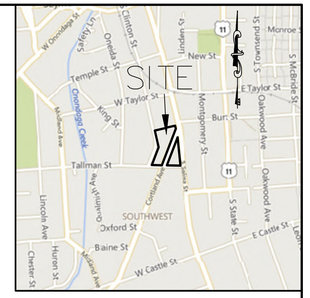
F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

U - Not detected at the reported detection limit for the sample.



* Comparison is not performed on parameters with non-numeric criteria.



July 2015 samples collected at monitoring well MW-4 and the monitoring well clusters MW-5, MW-6, and MW-7 were collected by GZA Environmental of New York as part of the Off-Site Environmental Characterization Report

NS - Parameter not sampled as part of the August 2015 groundwater monitoring

ENVIRONMENTAL EASEMENT DESCRIPTION

PARCEL 1:
Beginning at a point in the westerly boundary of Clinton Street at its intersection with the northerly boundary of Tallman Street; running thence N 21°00'20" E along said westerly boundary of Clinton Street, a distance of 299.66 feet to an angle point therein; thence N 12°55'00" W continuing along said westerly boundary of Clinton Street, a distance of 165.32 feet to a point therein; thence N 77°09'30" E through said Clinton Street, a distance of 50.00 feet to a point in the easterly boundary of said Clinton Street; thence S 12°55'00" E along said easterly boundary of Clinton Street, a distance of 209.17 feet to an angle point therein; thence S 21°00'20" W continuing along said easterly boundary of Clinton Street, a distance of 267.14 feet to a point in said northerly boundary of Tallman Street; thence N 88°57'50" W along the westerly prolongation of said northerly boundary of Tallman Street, a distance of 70.22 feet to the point of beginning.
Area=0.644± acres

PARCEL 2:

Beginning at a point in the westerly boundary of South Salina Street at its intersection with the northerly boundary of Tallman Street; running thence N 5°47'20" W along said westerly boundary of South Salina Street, a distance of 397.36 feet to a point in the southeasterly boundary of Cortland Avenue; thence S 21°00'20" W along said southeasterly boundary of Cortland Avenue, a distance of 419.46 feet to a point in said northerly boundary of Tallman Street; thence S 88°52'10" E along said northerly boundary of Tallman Street, a distance of 190.47 feet to the point of beginning.
Area = 0.862± acres

PARCEL 3:
Beginning at a point in the northerly boundary of Tallman Street at its intersection with the westerly boundary of Cortland Avenue; running thence N 88°52'10" W along said northerly boundary of Tallman Street, a distance of 23.91 feet to an angle point therein; thence N 88°57'50" W continuing along said northerly boundary of Tallman Street, a distance of 116.58 feet to a point in the easterly boundary of Clinton Street; thence N 21°00'20" E along said easterly boundary of Clinton Street, a distance of 267.14 feet to an angle point therein; thence N 12°55'00" W continuing along said easterly boundary of Clinton Street, a distance of 112.67 feet to a point in the southerly boundary of lands conveyed to JMA Tech Properties LLC by deed recorded in the Onondaga County Clerk's Office as Instrument No. 2019-48292; thence easterly, northeasterly, southeasterly, northerly and easterly along said southerly boundary of lands conveyed to JMA Tech Properties LLC the following courses and distances: 1) N 77°09'30" E, 75.71 feet; 2) N 21°00'20" E, 32.51 feet; 3) S 64°47'54" E, 26.26 feet; 4) N 12°55'00" W, 89.93 feet; 5) N 77°09'30" E, 177. 54 feet to a point in the westerly boundary of South Salina Street; thence S 12°50'30" E along said westerly boundary of South Salina Street, 15.45 feet to a point in said westerly boundary of Cortland Avenue; thence S 21°00'20" W along said westerly boundary of Cortland Avenue, a distance of 546.13 feet to the point of beginning.
Area=1.749± acres

"This property is subject to an environmental easement held by the New York State Department of Environmental Conservation pursuant to Title 36 of Article 71 of the New York Environmental Conservation Law. The engineering and institutional controls for this Easement are set forth in more detail in the Site Management Plan (SMP). A copy of the SMP must be obtained by any party with an interest in the property. The SMP can be obtained from NYS Department of Environmental Conservation, Division of Environmental Remediation, Site Control Section, 625 Broadway, Albany, NY 12233 *or at derweb@dec.ny.gov".*

ENVIRONMENTAL EASEMENT GRANTED PURSUANT TO ARTICLE 71, TITLE 36 OF THE NEW YORK STATE ENVIRONMENTAL CONSERVATION LAW

THIS INDENTURE made this 6th day of October, 2021, between Owner, JMA Tech Properties, LLC, having a mailing address at P.O. Box 678, Liverpool, New York 13088 (the "Grantor"), and The People of the State of New York (the "Grantee"), acting through their Commissioner of the Department of Environmental Conservation (the "Commissioner", or "NYSDEC" or "Department" as the context requires) with its headquarters located at 625 Broadway, Albany, New York 12233,

WHEREAS, the Legislature of the State of New York has declared that it is in the public interest to encourage the remediation of abandoned and likely contaminated properties ("sites") that threaten the health and vitality of the communities they burden while at the same time ensuring the protection of public health and the environment; and

WHEREAS, the Legislature of the State of New York has declared that it is in the public interest to establish within the Department a statutory environmental remediation program that includes the use of Environmental Easements as an enforceable means of ensuring the performance of operation, maintenance, and/or monitoring requirements and the restriction of future uses of the land, when an environmental remediation project leaves residual contamination at levels that have been determined to be safe for a specific use, but not all uses, or which includes engineered structures that must be maintained or protected against damage to perform properly and be effective, or which requires groundwater use or soil management restrictions; and

WHEREAS, the Legislature of the State of New York has declared that Environmental Easement shall mean an interest in real property, created under and subject to the provisions of Article 71, Title 36 of the New York State Environmental Conservation Law ("ECL") which contains a use restriction and/or a prohibition on the use of land in a manner inconsistent with engineering controls which are intended to ensure the long term effectiveness of a site remedial program or eliminate potential exposure pathways to hazardous waste or petroleum; and

WHEREAS, Grantor, is the owner of real property being known as the Abandoned Road Bed of a Portion of Clinton Street in the City of Syracuse, County of Onondaga and State of New York, known and designated on the tax map of the County Clerk of Onondaga as tax map parcel number: Section N/A Block N/A Lot N/A, being a portion of the property conveyed to Grantor by deed dated June 30, 2021 and recorded in the Onondaga County Clerk's Office in Instrument No. 2021-00030862. The property subject to this Environmental Easement (the "Controlled Property") comprises approximately 0.644 +/- acres, and is hereinafter more fully described as "Parcel 1" in the Land Title Survey dated July 7, 2021 prepared by Timothy J. Coyer, L.L.S. of Ianuzi & Roman Land Surveying, P.C., which will be attached to the Site Management Plan. The Controlled Property description is set forth in and attached hereto as "Parcel 1" in Schedule A; and

WHEREAS, the Department accepts this Environmental Easement in order to ensure the protection of public health and the environment and to achieve the requirements for remediation established for the Controlled Property until such time as this Environmental Easement is extinguished pursuant to ECL Article 71, Title 36; and

NOW THEREFORE, in consideration of the mutual covenants contained herein and the terms and conditions of Brownfield Cleanup Agreement Index Number: C734144-05-17, Grantor conveys to Grantee a permanent Environmental Easement pursuant to ECL Article 71, Title 36 in, on, over, under, and upon the Controlled Property as more fully described herein ("Environmental Easement").

1. Purposes. Grantor and Grantee acknowledge that the Purposes of this Environmental Easement are: to convey to Grantee real property rights and interests that will run with the land in perpetuity in order to provide an effective and enforceable means of encouraging the reuse and redevelopment of this Controlled Property at a level that has been determined to be safe for a specific use while ensuring the performance of operation, maintenance, and/or monitoring requirements; and to ensure the restriction of future uses of the land that are inconsistent with the above-stated purpose.

2. Institutional and Engineering Controls. The controls and requirements listed in the Department approved Site Management Plan ("SMP") including any and all Department approved amendments to the SMP are incorporated into and made part of this Environmental Easement. These controls and requirements apply to the use of the Controlled Property, run with the land, are binding on the Grantor and the Grantor's successors and assigns, and are enforceable in law or equity against any owner of the Controlled Property, any lessees and any person using the Controlled Property.

A. (1) The Controlled Property may be used for:

Commercial as described in 6 NYCRR Part 375-1.8(g)(2)(iii) and Industrial as described in 6 NYCRR Part 375-1.8(g)(2)(iv)

(2) All Engineering Controls must be operated and maintained as specified in the Site Management Plan (SMP);

(3) All Engineering Controls must be inspected at a frequency and in a manner defined in the SMP;

(4) The use of groundwater underlying the property is prohibited without necessary water quality treatment as determined by the NYSDOH or the Onondaga County Department of Health to render it safe for use as drinking water or for industrial purposes, and the user must first notify and obtain written approval to do so from the Department;

(5) Groundwater and other environmental or public health monitoring must be performed as defined in the SMP;

(6) Data and information pertinent to Site Management of the Controlled Property must be reported at the frequency and in a manner defined in the SMP;

(7) All future activities on the property that will disturb remaining contaminated material must be conducted in accordance with the SMP;

(8) Monitoring to assess the performance and effectiveness of the remedy must be performed as defined in the SMP;

(9) Operation, maintenance, monitoring, inspection, and reporting of any mechanical or physical components of the remedy shall be performed as defined in the SMP;

(10) Access to the site must be provided to agents, employees or other representatives of the State of New York with reasonable prior notice to the property owner to assure compliance with the restrictions identified by this Environmental Easement.

B. The Controlled Property shall not be used for Residential or Restricted Residential purposes as defined in 6NYCRR 375-1.8(g)(2)(i) and (ii), and the above-stated engineering controls may not be discontinued without an amendment or extinguishment of this Environmental Easement.

C. The SMP describes obligations that the Grantor assumes on behalf of Grantor, its successors and assigns. The Grantor's assumption of the obligations contained in the SMP which may include sampling, monitoring, and/or operating a treatment system, and providing certified reports to the NYSDEC, is and remains a fundamental element of the Department's determination that the Controlled Property is safe for a specific use, but not all uses. The SMP may be modified in accordance with the Department's statutory and regulatory authority. The Grantor and all successors and assigns, assume the burden of complying with the SMP and obtaining an up-to-date version of the SMP from:

Site Control Section
Division of Environmental Remediation
NYSDEC
625 Broadway
Albany, New York 12233
Phone: (518) 402-9553

D. Grantor must provide all persons who acquire any interest in the Controlled Property a true and complete copy of the SMP that the Department approves for the Controlled Property and all Department-approved amendments to that SMP.

E. Grantor covenants and agrees that until such time as the Environmental Easement is extinguished in accordance with the requirements of ECL Article 71, Title 36 of the ECL, the property deed and all subsequent instruments of conveyance relating to the Controlled Property shall state in at least fifteen-point bold-faced type:

This property is subject to an Environmental Easement held by the New York State Department of Environmental Conservation pursuant to Title 36 of Article 71 of the Environmental Conservation Law.

F. Grantor covenants and agrees that this Environmental Easement shall be

incorporated in full or by reference in any leases, licenses, or other instruments granting a right to use the Controlled Property.

G. Grantor covenants and agrees that it shall, at such time as NYSDEC may require, submit to NYSDEC a written statement by an expert the NYSDEC may find acceptable certifying under penalty of perjury, in such form and manner as the Department may require, that:

(1) the inspection of the site to confirm the effectiveness of the institutional and engineering controls required by the remedial program was performed under the direction of the individual set forth at 6 NYCRR Part 375-1.8(h)(3).

(2) the institutional controls and/or engineering controls employed at such site:

(i) are in-place;

(ii) are unchanged from the previous certification, or that any identified changes to the controls employed were approved by the NYSDEC and that all controls are in the Department-approved format; and

(iii) that nothing has occurred that would impair the ability of such control to protect the public health and environment;

(3) the owner will continue to allow access to such real property to evaluate the continued maintenance of such controls;

(4) nothing has occurred that would constitute a violation or failure to comply with any site management plan for such controls;

(5) the report and all attachments were prepared under the direction of, and reviewed by, the party making the certification;

(6) to the best of his/her knowledge and belief, the work and conclusions described in this certification are in accordance with the requirements of the site remedial program, and generally accepted engineering practices; and

(7) the information presented is accurate and complete.

3. Right to Enter and Inspect. Grantee, its agents, employees, or other representatives of the State may enter and inspect the Controlled Property in a reasonable manner and at reasonable times to assure compliance with the above-stated restrictions.

4. Reserved Grantor's Rights. Grantor reserves for itself, its assigns, representatives, and successors in interest with respect to the Property, all rights as fee owner of the Property, including:

A. Use of the Controlled Property for all purposes not inconsistent with, or limited by the terms of this Environmental Easement;

B. The right to give, sell, assign, or otherwise transfer part or all of the underlying fee interest to the Controlled Property, subject and subordinate to this Environmental Easement;

5. Enforcement

A. This Environmental Easement is enforceable in law or equity in perpetuity by Grantor, Grantee, or any affected local government, as defined in ECL Section 71-3603, against the owner of the Property, any lessees, and any person using the land. Enforcement shall not be defeated because of any subsequent adverse possession, laches, estoppel, or waiver. It is not a defense in any action to enforce this Environmental Easement that: it is not appurtenant to an interest in real property; it is not of a character that has been recognized traditionally at common

law; it imposes a negative burden; it imposes affirmative obligations upon the owner of any interest in the burdened property; the benefit does not touch or concern real property; there is no privity of estate or of contract; or it imposes an unreasonable restraint on alienation.

B. If any person violates this Environmental Easement, the Grantee may revoke the Certificate of Completion with respect to the Controlled Property.

C. Grantee shall notify Grantor of a breach or suspected breach of any of the terms of this Environmental Easement. Such notice shall set forth how Grantor can cure such breach or suspected breach and give Grantor a reasonable amount of time from the date of receipt of notice in which to cure. At the expiration of such period of time to cure, or any extensions granted by Grantee, the Grantee shall notify Grantor of any failure to adequately cure the breach or suspected breach, and Grantee may take any other appropriate action reasonably necessary to remedy any breach of this Environmental Easement, including the commencement of any proceedings in accordance with applicable law.

D. The failure of Grantee to enforce any of the terms contained herein shall not be deemed a waiver of any such term nor bar any enforcement rights.

6. Notice. Whenever notice to the Grantee (other than the annual certification) or approval from the Grantee is required, the Party providing such notice or seeking such approval shall identify the Controlled Property by referencing the following information:

County, NYSDEC Site Number, NYSDEC Brownfield Cleanup Agreement, State Assistance Contract or Order Number, and the County tax map number or the Liber and Page or computerized system identification number.

Parties shall address correspondence to:

Site Number: C734144
Office of General Counsel
NYSDEC
625 Broadway
Albany New York 12233-5500

With a copy to:

Site Control Section
Division of Environmental Remediation
NYSDEC
625 Broadway
Albany, NY 12233

All notices and correspondence shall be delivered by hand, by registered mail or by Certified mail and return receipt requested. The Parties may provide for other means of receiving and communicating notices and responses to requests for approval.

7. Recordation. Grantor shall record this instrument, within thirty (30) days of execution of this instrument by the Commissioner or her/his authorized representative in the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

8. Amendment. Any amendment to this Environmental Easement may only be executed by

the Commissioner of the New York State Department of Environmental Conservation or the Commissioner's Designee, and filed with the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

9. Extinguishment. This Environmental Easement may be extinguished only by a release by the Commissioner of the New York State Department of Environmental Conservation, or the Commissioner's Designee, and filed with the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

10. Joint Obligation. If there are two or more parties identified as Grantor herein, the obligations imposed by this instrument upon them shall be joint and several.

11. Consistency with the SMP. To the extent there is any conflict or inconsistency between the terms of this Environmental Easement and the SMP, regarding matters specifically addressed by the SMP, the terms of the SMP will control.

ENVIRONMENTAL EASEMENT GRANTED PURSUANT TO ARTICLE 71, TITLE 36 OF THE NEW YORK STATE ENVIRONMENTAL CONSERVATION LAW

THIS INDENTURE made this 6th day of October, 2021 between Owner, Ranalli/Taylor St., LLC, having a mailing address of P.O. Box 678, Liverpool, New York 13088 (the "Grantor"), and The People of the State of New York (the "Grantee"), acting through their Commissioner of the Department of Environmental Conservation (the "Commissioner", or "NYSDEC" or "Department" as the context requires) with its headquarters located at 625 Broadway, Albany, New York 12233,

WHEREAS, the Legislature of the State of New York has declared that it is in the public interest to encourage the remediation of abandoned and likely contaminated properties ("sites") that threaten the health and vitality of the communities they burden while at the same time ensuring the protection of public health and the environment; and

WHEREAS, the Legislature of the State of New York has declared that it is in the public interest to establish within the Department a statutory environmental remediation program that includes the use of Environmental Easements as an enforceable means of ensuring the performance of operation, maintenance, and/or monitoring requirements and the restriction of future uses of the land, when an environmental remediation project leaves residual contamination at levels that have been determined to be safe for a specific use, but not all uses, or which includes engineered structures that must be maintained or protected against damage to perform properly and be effective, or which requires groundwater use or soil management restrictions; and

WHEREAS, the Legislature of the State of New York has declared that Environmental Easement shall mean an interest in real property, created under and subject to the provisions of Article 71, Title 36 of the New York State Environmental Conservation Law ("ECL") which contains a use restriction and/or a prohibition on the use of land in a manner inconsistent with engineering controls which are intended to ensure the long term effectiveness of a site remedial program or eliminate potential exposure pathways to hazardous waste or petroleum; and

WHEREAS, Grantor, is the owner of real property located at the addresses of 1002-22 Salina Street and Cortland Avenue, and 1024-40 Salina Street and Tallman Street in the City of Syracuse, County of Onondaga and State of New York, known and designated on the tax map of the County Clerk of Onondaga as tax map parcel numbers: Section 094. Block 20 Lots 01 and 02, respectively, being a portion of the property conveyed to Grantor by deed dated June 2, 2016 and recorded in the Onondaga County Clerk's Office in Liber and Page 5377/159. The property subject to this Environmental Easement (the "Controlled Property") comprises approximately 0.862 acres +/- acres, and is hereinafter more fully described as "Parcel 2" in the Land Title Survey dated July 7, 2021 prepared by Timothy J. Coyer, L.L.S. of Ianuzi & Romans Land Surveying, P.C., which will be attached to the Site Management Plan. The Controlled Property description is set forth in and attached hereto as "Parcel 2" in Schedule A; and

WHEREAS, Grantor, is the owner of real property located at the address of 120-154 Cortland Avenue and Tallman Street in the City of Syracuse, County of Onondaga and State of New York, known and designated on the tax map of the County Clerk of Onondaga as tax map parcel number: Section 094. Block 05 Lot 06, being a portion of the property conveyed to Grantor

by deed dated June 2, 2016 and recorded in the Onondaga County Clerk's Office in Liber and Page 5377/159. The property subject to this Environmental Easement (the "Controlled Property") comprises approximately 1.749 acres +/- acres, and is hereinafter more fully described as "Parcel 3" in the Land Title Survey dated July 7, 2021 prepared by Timothy J. Coyer, L.L.S. of Ianuzi & Romans Land Surveying, P.C., which will be attached to the Site Management Plan. The Controlled Property description is set forth in and attached hereto as "Parcel 3" in Schedule A; and

WHEREAS, the Department accepts this Environmental Easement in order to ensure the protection of public health and the environment and to achieve the requirements for remediation established for the Controlled Property until such time as this Environmental Easement is extinguished pursuant to ECL Article 71, Title 36; and

NOW THEREFORE, in consideration of the mutual covenants contained herein and the terms and conditions of Brownfield Cleanup Agreement Index Number: C734144-05-17, Grantor conveys to Grantee a permanent Environmental Easement pursuant to ECL Article 71, Title 36 in, on, over, under, and upon the Controlled Property as more fully described herein ("Environmental Easement").

1. Purposes. Grantor and Grantee acknowledge that the Purposes of this Environmental Easement are: to convey to Grantee real property rights and interests that will run with the land in perpetuity in order to provide an effective and enforceable means of encouraging the reuse and redevelopment of this Controlled Property at a level that has been determined to be safe for a specific use while ensuring the performance of operation, maintenance, and/or monitoring requirements; and to ensure the restriction of future uses of the land that are inconsistent with the above-stated purpose.

2. Institutional and Engineering Controls. The controls and requirements listed in the Department approved Site Management Plan ("SMP") including any and all Department approved amendments to the SMP are incorporated into and made part of this Environmental Easement. These controls and requirements apply to the use of the Controlled Property, run with the land, are binding on the Grantor and the Grantor's successors and assigns, and are enforceable in law or equity against any owner of the Controlled Property, any lessees and any person using the Controlled Property.

A. (1) The Controlled Property may be used for:

Commercial as described in 6 NYCRR Part 375-1.8(g)(2)(iii) and Industrial as described in 6 NYCRR Part 375-1.8(g)(2)(iv)

(2) All Engineering Controls must be operated and maintained as specified in the Site Management Plan (SMP);

(3) All Engineering Controls must be inspected at a frequency and in a manner defined in the SMP;

(4) The use of groundwater underlying the property is prohibited without necessary water quality treatment as determined by the NYSDOH or the Onondaga County Department of Health to render it safe for use as drinking water or for industrial purposes, and

the user must first notify and obtain written approval to do so from the Department;

(5) Groundwater and other environmental or public health monitoring must be performed as defined in the SMP;

(6) Data and information pertinent to Site Management of the Controlled Property must be reported at the frequency and in a manner defined in the SMP;

(7) All future activities on the property that will disturb remaining contaminated material must be conducted in accordance with the SMP;

(8) Monitoring to assess the performance and effectiveness of the remedy must be performed as defined in the SMP;

(9) Operation, maintenance, monitoring, inspection, and reporting of any mechanical or physical components of the remedy shall be performed as defined in the SMP;

(10) Access to the site must be provided to agents, employees or other representatives of the State of New York with reasonable prior notice to the property owner to assure compliance with the restrictions identified by this Environmental Easement.

B. The Controlled Property shall not be used for Residential or Restricted Residential purposes as defined in 6NYCRR 375-1.8(g)(2)(i) and (ii), and the above-stated engineering controls may not be discontinued without an amendment or extinguishment of this Environmental Easement.

C. The SMP describes obligations that the Grantor assumes on behalf of Grantor, its successors and assigns. The Grantor's assumption of the obligations contained in the SMP which may include sampling, monitoring, and/or operating a treatment system, and providing certified reports to the NYSDEC, is and remains a fundamental element of the Department's determination that the Controlled Property is safe for a specific use, but not all uses. The SMP may be modified in accordance with the Department's statutory and regulatory authority. The Grantor and all successors and assigns, assume the burden of complying with the SMP and obtaining an up-to-date version of the SMP from:

Site Control Section
Division of Environmental Remediation
NYSDEC
625 Broadway
Albany, New York 12233
Phone: (518) 402-9553

D. Grantor must provide all persons who acquire any interest in the Controlled Property a true and complete copy of the SMP that the Department approves for the Controlled Property and all Department-approved amendments to that SMP.

E. Grantor covenants and agrees that until such time as the Environmental Easement is extinguished in accordance with the requirements of ECL Article 71, Title 36 of the ECL, the

property deed and all subsequent instruments of conveyance relating to the Controlled Property shall state in at least fifteen-point bold-faced type:

This property is subject to an Environmental Easement held by the New York State Department of Environmental Conservation pursuant to Title 36 of Article 71 of the Environmental Conservation Law.

F. Grantor covenants and agrees that this Environmental Easement shall be incorporated in full or by reference in any leases, licenses, or other instruments granting a right to use the Controlled Property.

G. Grantor covenants and agrees that it shall, at such time as NYSDEC may require, submit to NYSDEC a written statement by an expert the NYSDEC may find acceptable certifying under penalty of perjury, in such form and manner as the Department may require, that:

(1) the inspection of the site to confirm the effectiveness of the institutional and engineering controls required by the remedial program was performed under the direction of the individual set forth at 6 NYCRR Part 375-1.8(h)(3).

(2) the institutional controls and/or engineering controls employed at such site:

(i) are in-place;

(ii) are unchanged from the previous certification, or that any identified changes to the controls employed were approved by the NYSDEC and that all controls are in the Department-approved format; and

(iii) that nothing has occurred that would impair the ability of such control to protect the public health and environment;

(3) the owner will continue to allow access to such real property to evaluate the continued maintenance of such controls;

(4) nothing has occurred that would constitute a violation or failure to comply with any site management plan for such controls;

(5) the report and all attachments were prepared under the direction of, and reviewed by, the party making the certification;

(6) to the best of his/her knowledge and belief, the work and conclusions described in this certification are in accordance with the requirements of the site remedial program, and generally accepted engineering practices; and

(7) the information presented is accurate and complete.

3. Right to Enter and Inspect. Grantee, its agents, employees, or other representatives of the State may enter and inspect the Controlled Property in a reasonable manner and at reasonable times to assure compliance with the above-stated restrictions.

4. Reserved Grantor's Rights. Grantor reserves for itself, its assigns, representatives, and successors in interest with respect to the Property, all rights as fee owner of the Property, including:

A. Use of the Controlled Property for all purposes not inconsistent with, or limited by the terms of this Environmental Easement;

B. The right to give, sell, assign, or otherwise transfer part or all of the underlying fee

interest to the Controlled Property, subject and subordinate to this Environmental Easement;

5. Enforcement

A. This Environmental Easement is enforceable in law or equity in perpetuity by Grantor, Grantee, or any affected local government, as defined in ECL Section 71-3603, against the owner of the Property, any lessees, and any person using the land. Enforcement shall not be defeated because of any subsequent adverse possession, laches, estoppel, or waiver. It is not a defense in any action to enforce this Environmental Easement that: it is not appurtenant to an interest in real property; it is not of a character that has been recognized traditionally at common law; it imposes a negative burden; it imposes affirmative obligations upon the owner of any interest in the burdened property; the benefit does not touch or concern real property; there is no privity of estate or of contract; or it imposes an unreasonable restraint on alienation.

B. If any person violates this Environmental Easement, the Grantee may revoke the Certificate of Completion with respect to the Controlled Property.

C. Grantee shall notify Grantor of a breach or suspected breach of any of the terms of this Environmental Easement. Such notice shall set forth how Grantor can cure such breach or suspected breach and give Grantor a reasonable amount of time from the date of receipt of notice in which to cure. At the expiration of such period of time to cure, or any extensions granted by Grantee, the Grantee shall notify Grantor of any failure to adequately cure the breach or suspected breach, and Grantee may take any other appropriate action reasonably necessary to remedy any breach of this Environmental Easement, including the commencement of any proceedings in accordance with applicable law.

D. The failure of Grantee to enforce any of the terms contained herein shall not be deemed a waiver of any such term nor bar any enforcement rights.

6. Notice. Whenever notice to the Grantee (other than the annual certification) or approval from the Grantee is required, the Party providing such notice or seeking such approval shall identify the Controlled Property by referencing the following information:

County, NYSDEC Site Number, NYSDEC Brownfield Cleanup Agreement, State Assistance Contract or Order Number, and the County tax map number or the Liber and Page or computerized system identification number.

Parties shall address correspondence to:
Site Number: C734144
Office of General Counsel
NYSDEC
625 Broadway
Albany New York 12233-5500

With a copy to:
Site Control Section
Division of Environmental Remediation
NYSDEC
625 Broadway
Albany, NY 12233

All notices and correspondence shall be delivered by hand, by registered mail or by Certified mail

and return receipt requested. The Parties may provide for other means of receiving and communicating notices and responses to requests for approval.

7. Recordation. Grantor shall record this instrument, within thirty (30) days of execution of this instrument by the Commissioner or her/his authorized representative in the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

8. Amendment. Any amendment to this Environmental Easement may only be executed by the Commissioner of the New York State Department of Environmental Conservation or the Commissioner's Designee, and filed with the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

9. Extinguishment. This Environmental Easement may be extinguished only by a release by the Commissioner of the New York State Department of Environmental Conservation, or the Commissioner's Designee, and filed with the office of the recording officer for the county or counties where the Property is situated in the manner prescribed by Article 9 of the Real Property Law.

10. Joint Obligation. If there are two or more parties identified as Grantor herein, the obligations imposed by this instrument upon them shall be joint and several.

11. Consistency with the SMP. To the extent there is any conflict or inconsistency between the terms of this Environmental Easement and the SMP, regarding matters specifically addressed by the SMP, the terms of the SMP will control.

Notes:

	Exceeds the Unrestricted Use Critera
Bold Text	Exceeds the Commercial Use Criteria

Samples collected by CHA Consulting, Inc. and analyzed by Alpha Analytical, Inc.

* Comparison is not performed on parameters with non-numeric criteria.

NY-UNRES: New York NYCRR Part 375 Groundwater Criteria, New York Unrestricted Use Criteria per 6 NYCRR Part 375 Environmental Remediation Programs, effective December 14, 2006.

NY-RESC: New York NYCRR Part 375 Commercial Criteria, New York Restricted use Criteria per 6 NYCRR Part 375 Environmental Remediation Programs, effective December 14, 2006.

NY-RESGW: New York NYCRR Part 375 Groundwater Criteria, New York Restricted use Criteria per 6 NYCRR Part 375 Environmental Remediation Programs, effective December 14, 2006.

U - Not detected at the method detection limit for the sample.
J - Estimated value. Detection is above the method detection limit but below the reporting limit.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L2033945
Project Number:	59294	**Report Date:**	08/28/20

Case Narrative (continued)

Report Submission

August 28, 2020: This final report includes the results of all requested analyses.

August 27, 2020: This preliminary report includes the results of the Volatile Organics and Semivolatile Organics analyses performed on L2033945-11 through -18.

August 26, 2020: This preliminary report includes the results of the Volatile Organics and Semivolatile Organics analyses performed on L2033945-05 through -10.

August 24, 2020: This preliminary report includes the results of the Semivolatile Organics analysis performed on L2033945-01.

August 21, 2020: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L2033945-05: The surrogate recovery is outside the method acceptance criteria for dibromofluoromethane (66%) due to interference with the Internal Standard.

L2033945-05: The sample was analyzed as a High Level Methanol in order to quantitate results within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial Low Level analysis. The results of both analyses are reported.

L2033945-07: The sample was analyzed as a High Level Methanol based upon screen results. The sample was then analyzed as a Low Level in order to achieve lower reporting limits. The results of both analyses are reported. Differences were noted between the results of the analyses which have been attributed to vial discrepancies.

The following surrogate recoveries are outside the acceptance criteria; however, the samples were not re-analyzed due to coelution with an obvious interference. Copies of the chromatograms are included as an attachment to this report:

L2033945-07: 4-bromofluorobenzene (153%),

Project Name: FORMER COYNE TEXTILE **Lab Number:** L2033945
Project Number: 59294 **Report Date:** 08/28/20

Case Narrative (continued)

L2033945-09: 4-bromofluorobenzene (171%),
L2033945-10: 4-bromofluorobenzene (136%),
L2033945-11: 4-bromofluorobenzene (131%),
L2033945-12: 4-bromofluorobenzene (360%),
L2033945-13: toluene-d8 (61%) and 4-bromofluorobenzene (712%),
L2033945-14: 4-bromofluorobenzene (166%),
L2033945-15: 4-bromofluorobenzene (189%),
L2033945-16: 4-bromofluorobenzene (140%),
L2033945-17: 4-bromofluorobenzene (144%), and
L2033945-18: 4-bromofluorobenzene (224%).
L2033945-09: The sample has elevated detection limits due to the dilution required by the elevated concentrations of non-target compounds in the sample.
L2033945-13: The sample was analyzed as a High Level Methanol in order to quantitate results within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial Low Level analysis. The results of both analyses are reported. Differences were noted between the results of the analyses which have been attributed to vial discrepancies.
L2033945-18: The analysis of Volatile Organics by EPA Method 5035/8260 Low Level could not be performed due to the elevated concentrations of non-target compounds in the sample.

Semivolatile Organics
L2033945-12, -16 and -17: The sample has elevated detection limits due to the dilution required by the sample matrix.

Solids, Total
L2033945-11, -12, -13, -14, -15 and -18: A Laboratory Duplicate was prepared with the sample batch; however, analysis of the native sample was cancelled; therefore, the QC result could not be reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L2033945
Project Number:	59294	**Report Date:**	08/28/20

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

Report Format: DU Report with 'J' Qualifiers

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L2033945
Project Number:	59294	**Report Date:**	08/28/20

Data Qualifiers

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L2033945
Project Number:	59294	**Report Date:**	08/28/20

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
EPA TO-12 Non-methane organics
EPA 3C Fixed gases
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2**: Nitrate-N**, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300: Chloride, Sulfate, Nitrate.**
EPA 624.1: Volatile Halocarbons & Aromatics,
EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs
EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045**: PCB-Oil.
Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water
EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1** Hg.
EPA 522.

Non-Potable Water
EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.
EPA 200.8: Al, Sb**,** As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.
EPA 245.1 Hg.

Syracuse, New York 13202-3920

Re: Data Usability Summary Report
Former Coyne Textile Facility
August 2020 Soil Sampling Events

Dear Ms. Miller:

The data usability summary report (DUSR) and data validation summaries are attached to this letter for the former Coyne Textile Facility, August 2020 soil sampling events. The data for Alpha Analytical Labs, SDG number L2033945 were acceptable with some minor issues identified in the DUSR and the validation summaries. There were no data that were qualified as either rejected, unusable (R) or estimated in the data pack.

A list of common data validation acronyms and data validation qualifiers are attached to this letter to assist you interpreting the validation summaries. If you have any questions concerning the work performed, please contact me at (518) 348-6995. Thank you for the opportunity to assist CHA.

Sincerely,
Alpha Geoscience

Donald Anné
Senior Chemist

DCA/bms

Data Validation Acronyms

AA	Atomic absorption, flame technique
BHC	Hexachlorocyclohexane
BFB	Bromofluorobenzene
CCB	Continuing calibration blank
CCC	Calibration check compound
CCV	Continuing calibration verification
CN	Cyanide
CRDL	Contract required detection limit
CRQL	Contract required quantitation limit
CVAA	Atomic adsorption, cold vapor technique
DCAA	2,4-Dichlophenylacetic acid
DCB	Decachlorobiphenyl
DFTPP	Decafluorotriphenyl phosphine
ECD	Electron capture detector
FAA	Atomic absorption, furnace technique
FID	Flame ionization detector
FNP	1-Fluoronaphthalene
GC	Gas chromatography
GC/MS	Gas chromatography/mass spectrometry
GPC	Gel permeation chromatography
ICB	Initial calibration blank
ICP	Inductively coupled plasma-atomic emission spectrometer
ICV	Initial calibration verification
IDL	Instrument detection limit
IS	Internal standard
LCS	Laboratory control sample
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate
MSA	Method of standard additions
MS/MSD	Matrix spike/matrix spike duplicate
PID	Photo ionization detector
PCB	Polychlorinated biphenyl
PCDD	Polychlorinated dibenzodioxins
PCDF	Polychlorinated dibenzofurans
QA	Quality assurance
QC	Quality control
RF	Response factor
RPD	Relative percent difference
RRF	Relative response factor
RRF(number)	Relative response factor at concentration of the number following
RT	Retention time
RRT	Relative retention time
SDG	Sample delivery group
SPCC	System performance check compound
TCX	Tetrachloro-m-xylene
%D	Percent difference
%R	Percent recovery
%RSD	Percent relative standard deviation

Data Validation Qualifiers Used in the QA/QC Reviews for USEPA Region II

U	=	Not detected. The associated number indicates the approximate sample concentration necessary to be detected significantly greater than the level of the highest associated blank.
R	=	Unreliable result; data is rejected or unusable. Analyte may or may not be present in the sample. Supporting data or information is necessary to confirm the result.
N	=	Tentative identification. Analyte is considered present. Special methods may be needed to confirm its presence or absence during future sampling efforts.
J	=	Analyte is present. Reported value may be associated with a higher level of uncertainty than is normally expected with the analytical method.
J-	=	Analyte is present. Reported value may be biased low and associated with a higher level of uncertainty than is normally expected with the analytical method.
J+	=	Analyte is present. Reported value may be biased high andassociated with a higher level of uncertainty than is normally expected with the analytical method.
UJ	=	Not detected, quantitation limit may be inaccurate or imprecise.

Note: These qualifiers are used for data validation purposes. The data validation qualifiers may differ from the qualifiers that the laboratory assigns to the data. Refer to the laboratory analytical report for the definitions of the laboratory qualifiers.

Data Usability Summary Report
for Alpha Analytical Labs
SDG Number: L2033945

17 Soil Samples and 1 Field Duplicate
Collected August 19-26, 2020

Prepared by: Donald Anné
September 18, 2020

The data package contained the documentation as required by NYSDEC ASP. The proper chain of custody procedures were followed by the samplers. All information appeared legible and complete. The data pack contained the results of volatile and semi-volatiles analyses for 17 soil samples and 1 field duplicate.

The overall performances of the analyses are acceptable. Alpha Analytical Labs did fulfill the requirements of the analytical methods.

The data are mostly acceptable with some issues that are identified in the accompanying data validation reviews. The following data were qualified:

- The positive volatile result for 2-butanone was qualified as "estimated, biased low" (J-) in sample SOIL-SW-300 because 2 of 2 percent recoveries for 2-butanone were below QC limits, but not below 10% the associated soil LCS/LCSD.

- The "not detected" volatile results for 2-butanone were qualified as "estimated" (UJ) in samples SOIL-B-300, SOIL-B-301, and SOIL-SW-301 because 2 of 2 percent recoveries for 2-butanone were below QC limits, but not below 10% the associated soil LCS/LCSD.

- The positive volatile results for target compounds were qualified as "estimated, biased low" (J-) and "not detected" results for target compounds were qualified "estimated" (UJ) in sample SOIL-SW-302 because 1 of 4 surrogate recoveries was below control limits, but not below 10% in the sample.

- The positive and "not detected" volatile results for target compounds were qualified as "estimated" (J or UJ respectively) in sample SOIL-B-305 (low) because 1 of 4 surrogate recoveries was below control limits, but not below 10% 1 of 4 surrogate recoveries was above control limits in the sample.

679 Plank Road ● Clifton Park, New York 12065 ● (518) 348-6995 ● Fax (518) 348-6966
www.alphageoscience.com

- The positive volatile results for target compounds were qualified as "estimated, biased high" (J+) in the following samples because 1 of 4 surrogate recoveries was above control limits in the samples.

SOIL-SW-304 (low)	SOIL-B-303	SOIL-B-304	SOIL-SW-305
SOIL-SW-306	SOIL-B-306	SOIL-B-307	SOIL-B-308
SOIL-B-309	SOIL-DUP-001		

- The "not detected" semi-volatile result for hexachlorocyclopentadiene was qualified as "estimated" (UJ) in samples SOIL-SW-300 because 2 of 2 percent recoveries for hexachlorocyclopentadiene were below QC limits, but not below 10% in the associated soil LCS/LCSD.

All data are considered usable with estimated (J, J-, J+, or UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the data validation reviews.

QA/QC Review of Method 8270D Semi-Volatiles
Data for Alpha Analytical, SDG Number: L2033945

17 Soil Samples and 1 Field Duplicate
Collected August 19-26, 2020

Prepared by: Donald Anné
September 18, 2020

Holding Times: Samples were extracted and analyzed within USEPA SW-846 holding times.

GC/MS Tuning and Mass Calibration: The DFTPP tuning criteria were within control limits.

Initial Calibration: The average RRF for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 for GCMS5 on 04-01-20. The average RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 for JULIET on 06-12-20. The average RRF for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 for SV103 on 08-03-20. No action is taken on fewer than 20% of the compounds with method criteria outside control limits per calibration, provided no average RRF is less than 0.010.

The average RRFs for target compounds were above the allowable minimum (0.010) and the %RSDs were below the allowable maximum (30%), as required.

Continuing Calibration: The RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 on 08-20-20 (WG1400909-3). The RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 on 08-21-20 (WG1401346-3). The RRF for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimum, but not below 0.010 on 08-26-20 (WG1402979-3). The RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 on 08-26-20 (WG1403007-3). The RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 on 08-27-20 (WG1403370-3). The RRFs for 2-chloronaphthalene and 2,6-dinitrotoluene were below the method minimums, but not below 0.010 on 08-27-20 (WG1403561-3). No action is taken on fewer than 20% of the compounds with method criteria outside control limits per calibration, provided no RRF is less than 0.010.

679 Plank Road ● Clifton Park, New York 12065 ● (518) 348-6995 ● Fax (518) 348-6966
www.alphageoscience.com

The RRFs for target compounds were above the allowable minimum (0.010) and the %Ds were below the allowable maximum (25%), as required.

Blanks: The analyses of the method blanks reported target compounds as not detected.

Internal Standard Area Summary: The internal standard areas and retention times were within control limits.

Surrogate Recovery: One of three base/neutral surrogate recoveries for samples SOIL-SW-306, SOIL-B-307, SOIL-B-308, and SOIL-DUP-001 was above control limits. One of three acid extractable surrogate recoveries for sample SOIL-B-308 was above control limits. No action is taken on one surrogate recovery per fraction outside control limits, provided no recovery is less than 10%.

Laboratory Control Sample: The relative percent differences (RPDs) for target compounds were below the allowable maximum and the percent recoveries (%Rs) were within QC limits for soil samples WG1401314-2/3, WG1402944-2/3, and WG1403378-2/3.

The RPDs for target compounds were below the allowable maximum, but 2 of 2 %Rs for hexachlorocylopentadiene were below QC limits, but not below 10% for soil samples WG1400603-2/3. Positive results for phenol should be considered estimated, biased high (J+) in associated soil samples.

Field Duplicate: The analyses of soil field duplicate pair SOIL-B-307/SOIL-DUP-001 reported target compounds as either not detected or below the lowest standard in one or both samples; therefore, valid relative percent differences could not be calculated. The analyses for the field duplicate pair were acceptable.

Compound ID: Checked compounds and surrogates were within GC/MS quantitation limits. The mass spectra for detected compounds contained the primary and secondary ions, as outlined in the method.

QA/QC Review of Method 8260C Volatiles Data
for Alpha Analytical, SDG Number: L2033945

17 Soil Samples and 1 Field Duplicate
Collected August 19-26, 2020

Prepared by: Donald Anné
September 18, 2020

Holding Times: Samples were analyzed within USEPA SW-846 holding times.

GC/MS Tuning and Mass Calibration: The BFB tuning criteria were within control limits.

Initial Calibration: The average RRFs for acetone, 2-butanone, and 4-methyl-2-pentanone were below the method minimums, but not below 0.010 for VOA126 on 06-04-20. The average RRFs for acetone, methyl acetate, 2-butanone, 4-methyl-2-pentanone, and 2-hexanone were below the method minimums, but not below 0.010 for VOA117 on 07-10-20. The average RRFs for acetone, 2-butanone, and 4-methyl-2-pentanone were below the method minimums, but not below 0.010 for VOA100 on 08-13-20. No action is taken on fewer than 20% of the compounds with method criteria outside control limits per calibration, provided no average RRF is less than 0.010.

The average RRFs for target compounds were above the allowable minimum (0.001 for 1,4-dioxane, 0.010 for all other compounds) and the %RSDs were below the allowable maximum (30%), as required.

Continuing Calibration: The RRFs for methyl acetate, 2-butanone, and 4-methyl-2-pentanone were below the method minimums, but not below 0.010 on 08-21-20 (V00200821A01). The RRFs for methyl acetate and 2-hexanone were below the method minimums, but not below 0.010 on 08-26-20 (V17200826A01). The RRFs for methyl acetate, 2-butanone, and 4-methyl-2-pentanone were below the method minimums, but not below 0.010 on 08-26-20 (V00200826A01). The RRFs for 2-butanone and 4-methyl-2-pentanone were below the method minimums, but not below 0.010 on 08-27-20 (V26200827A01). The RRFs for methyl acetate and 2-hexanone were below the method minimums, but not below 0.010 on 08-27-20 (V17200827A01). The %Ds for trichlorofluoromethane, methyl acetate, 2-butanone, 4-methyl-2-pentanone, and 2-hexanone were above the method maximum on 08-21-20 (V00200821A01). The %D for vinyl chloride was above the method maximum on 08-26-20 (V17200826A01). The %Ds for trichlorofluoromethane, freon 113, carbon tetrachloride, 1,1,1-trichloroethane, 2-butanone, and tetrachloroethene were above the method maximum on 08-26-20 (V00200826A01). The %Ds for dichlorodifluoromethane, trichlorofluoromethane, acetone, and carbon tetrachloride were above the method maximum

679 Plank Road ● Clifton Park, New York 12065 ● (518) 348-6995 ● Fax (518) 348-6966
www.alphageoscience.com

on 08-27-20 (V26200827A01). The %Ds for vinyl chloride, chloroethane, trichlorofluoromethane, and carbon disulfide were above the method maximum on 08-27-20 (V17200827A01). No action is taken on fewer than 20% of the compounds with method criteria outside control limits per calibration, provided no RRF is less than 0.010.

The RRFs for target compounds were above the allowable minimum (0.001 for 1,4-dioxane, 0.010 for all other compounds), as required.

The %D for 2-butanone was above the allowable maximum (25%) on 08-21-20 (V00200821A01). The %Ds for trichlorofluoromethane, freon 113, and tetrachloroethene were above the allowable maximum (25%) on 08-26-20 (V00200826A01). The %Ds for dichlorodifluoromethane, trichlorofluoromethane, acetone, and carbon tetrachloride were above the allowable maximum (25%) on 08-27-20 (V26200827A01). The %Ds for vinyl chloride and chloroethane were above the allowable maximum (25%) on 08-27-20 (V17200827A01). Positive results for these compounds should be considered estimated (J) in associated samples.

Blanks: Method blank WG1401428-5BLANK (low) contained traces of 1,4-dichlorobenzene (0.18 ug/kg), 1,2,3-trichlorobenzene (0.74 ug/kg), and 1,2,4-trichlorobenzene (0.54 ug/kg). Method blank WG1403630-5BLANK (low) contained a trace of bromomethane (1.0 ug/kg). Method blank WG1403701-5BLANK (high) contained a trace of bromomethane (52 ug/kg). Positive results for these compounds that are less than 5 times the method blank level should be considered not detected (U) in associated samples.

Internal Standard Area Summary: The internal standard areas and retention times were within control limits.

Surrogate Recovery: One of four surrogate recoveries for the following samples was above control limits. Positive results for these samples should be considered estimated, biased high (J+).

SOIL-SW-304 (low)	SOIL-B-303	SOIL-B-304	SOIL-SW-305
SOIL-SW-306	SOIL-B-306	SOIL-B-307	SOIL-B-308
SOIL-B-309	SOIL-DUP-001		

One of four surrogate recoveries for sample SOIL-SW-302 (low) was below control limits, but not below 10%. Positive results for SOIL-SW-302 (low) should be considered estimated, biased low (J-) and "not detected" results estimated (UJ).

One of four surrogate recoveries for sample SOIL-B-305 (low) was below control limits, but not below 10% and 1 of 4 surrogate recoveries was above control limits. Positive and "not detected" results for sample SOIL-B-305 should be considered estimated (J or UJ respectively).

Matrix Spike/Matrix Spike Duplicate: The relative percent differences for target compounds were below the allowable maximum, but 2 of 2 percent recoveries for 1,1,2-trichloroethane was above QC limits for soil MS/MSD sample SOIL-B-308. Sample SOIL-B-308 reported 1,1,2-trichloroethane as "not detected"; therefore, no action is taken.

Laboratory Control Sample: The relative percent differences (RPDs) for target compounds were below the allowable maximum and the percent recoveries (%Rs) were within QC limits for soil samples WG1403102-3/4 and WG1403667-3/4.

The RPDs for target compounds were below the allowable maximum, but 2 of 2 %Rs for tetrachloroethene were above QC limits for soil samples WG1403079-3/4. The RPDs for target compounds were below the allowable maximum, but 2 of 2 %Rs for dichlorodifluoromethane were above QC limits for soil samples WG1403630-3/4 and WG1403701-3/4. Positive results for tetrachloroethene and dichlorodifluoromethane should be considered estimated, biased high (J+) in associated soil samples.

The RPDs for target compounds were below the allowable maximum, but 2 of 2 %Rs for 2-butanone were below QC limits, but not below 10% for soil samples WG1401428-3/4. Positive results for 2-butanone should be considered estimated, biased low (J-) and "not detected" results estimated (UJ) in associated soil samples.

Field Duplicate: The relative percent differences for isopropylbenzene and methyl cyclohexane were above the allowable maximum (35%) for soil field duplicate pair SOIL-B-307/SOIL-DUP-001 (attached table). Positive results for isopropylbenzene and methyl cyclohexane should be considered estimated (J) in samples SOIL-B-307 and SOIL-DUP-001.

Compound ID: Checked surrogates and compounds were within GC/MS quantitation limits. The mass spectra for detected compounds contained the primary and secondary ions, as outlined in the method.

The results for cyclohexane and methylcyclohexane in sample SOIL-SW-302 (low) and the result for isopropylbenzene in sample SOIL-B-305 (low) were quantitated by extrapolating data above the highest calibration standard and marked 'E' by the laboratory. The samples were re-analyzed by the laboratory at a high level; therefore, the results that are flagged as 'E' in the low level samples should be considered estimated (J). The use of the high level results for these compounds is recommended for these samples. It is recommended that the low level results be used for all other compounds.

Volatiles

Calculations for Field Duplicate Relative Percent Difference (RPD)
SDG No. L2033945

S1= SOIL-B-307 **S2=** SOIL-DUP-001

Analyte	S1	S2	RPD (%)	
Benzene	**58**	ND	NC	
1,4-Dichlorobenzene	**110**	**350**	NC	
Isopropylbenzene	6000	17000	96%	*
Cyclohexane	**250**	**760**	NC	
Methyl cyclohexane	4200	11000	89%	*

* RPD is above the allowable maximum 35%.

Results are in units of ug/kg.

Bold numbers were values that are below the CRQL or above the high standard.
ND - Not detected.
NC - Not calculated, both results must be within the linear range for valid RPDs to be calculated.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

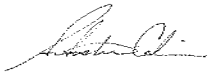
All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

Volatile Organics

L2146570-01: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (241%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.



L2146570-02: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (212%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.

L2146570-03: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (389%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.

L2146570-04: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (299%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.

L2146570-05: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (414%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	COYNE	**Lab Number:**	L2146570
Project Number:	059294.001	**Report Date:**	08/31/21

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name:	COYNE	**Lab Number:**	L2146570
Project Number:	059294.001	**Report Date:**	08/31/21

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

Report Format: DU Report with 'J' Qualifiers

Project Name:	COYNE	**Lab Number:**	L2146570
Project Number:	059294.001	**Report Date:**	08/31/21

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 625/625.1: alpha-Terpineol
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine, alpha-Terpineol; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2**: Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300: Chloride, Sulfate, Nitrate.**
EPA 624.1: Volatile Halocarbons & Aromatics,
EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs
EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045**: PCB-Oil.
Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603, SM9222D.**

Mansfield Facility:

Drinking Water
EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1** Hg.
EPA 522, EPA 537.1.

Non-Potable Water
EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.
EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.
EPA 245.1 Hg.
SM2340B

Contaminant Source Removal Construction Completion Report

Dear Mr. Ranalli:

Thank you for providing the above referenced Construction Completion Report dated October 14, 2019 for the Former Coyne Textile site in Syracuse, New York.

The NYSDEC and the NYSDOH have determined the Report to be satisfactory. Please place a copy of the final Report in the sites document repository.

Should you have any questions please contact me at (315) 426-7446 and thanks again for your efforts in continuing to move this project forward.

Sincerely,

Michael Belveg
Assistant Engineer (Environmental), Division of Environmental Remediation

CERTIFICATION

I, the undersigned, certify that I am currently a NYS registered professional engineer, I had primary direct responsibility for the implementation of the subject construction program, and I certify that the Interim Remedial Measure Work Plan was implemented and that all construction activities were completed in substantial conformance with the New York State Department of Environmental Conservation and New York State Department of Health-approved Interim Remedial Measure Work Plan.

I certify that the data submitted to the Department with this Construction Completion Report demonstrates that the remediation requirements set forth in the Interim Remedial Measure Work Plan and in all applicable statutes and regulations have been or will be achieved in accordance with the time frames, if any, established for the remedy.

I certify that all documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department. I certify that all data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, the undersigned, of CHA Consulting, Inc. am certifying as Owner's Designated Site Representative for the Site.

1.0 INTRODUCTION

The Former Coyne Textile Facility (Site) is located at 140 Cortland Avenue in Syracuse, New York. The owner, Ranalli/Taylor St., LLC (Ranalli/Taylor St.), entered into a Brownfield Cleanup Agreement (BCA) in September 2017 through the New York State Department of Environmental Conservation's (NYSDEC's) Brownfield Cleanup Program (BCP) and is registered as BCP Site No. C734144.

CHA Consulting, Inc. (CHA) was retained by Ranalli/Taylor St. to prepare an Interim Remedial Measure Work Plan (IRMWP) to detail the Site IRM to address the contaminant source area identified during the Remedial Investigation (RI) conducting during 2018. The results of the RI and a summary of historical sampling efforts conducted by the previous Site owner are detailed in the RI Report (CHA, February 2019). The Source Removal IRMWP (CHA, June 2019) was prepared for the Site and approved by the NYSDEC in a letter dated June 25, 2019, provided in Appendix A. The IRMWP recommended the removal of three underground storage tanks (USTs) and associated impacted soils for off-Site transportation and disposal. Work was implemented between June 24 and July 15, 2019. As a requirement of the IRMWP, this Construction Completion Report (CCR) has been prepared in general conformance with sections 5.5 and 5.8 of the NYSDEC's "Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation" (May 2010).

1.1 REPORT ORGANIZATION

This CCR is divided into five major sections, including:

- Section 1: Provides an introduction of the project along with a brief description and Site background for the project.
- Section 2: Provides a summary of the selected Site remedy.
- Section 3: Provides a description and summary of governing documents for the Site.
- Section 4: Provides a description of the remedial action performed at the Site.
- Section 5: Provides CHA's conclusions relative to the remedial action performed.

1.2 SITE BACKGROUND

1.2.1 Site Description

The Former Coyne Textile Facility is located in an urban area at 140 Cortland Avenue in the City of Syracuse, Onondaga County, New York (Figure 1). The Site limits are generally bounded by commercial buildings to the north, South Salina Street to the east, Tallman Street to the south and South Clinton Street to the west (Figure 2). Several rows of multi-family houses are located northwest of the Site. The Site is currently unoccupied, apart from use as a storage facility for Ranalli/Taylor St. and is zoned for commercial use. The Site is identified as two non-contiguous areas as described below:

- The former main laundry facility and offices are known as 140 Cortland Avenue (Tax Map No. 094.-05-06.0) and consist of one parcel of land totaling approximately 1.75 acres in size. This parcel consists of the currently vacant former laundering facility and offices (approximately 118,500 square feet), and concrete sidewalks. The building is a concrete block building with a slab-on-grade foundation.
- The park area and employee parking area are known as 1002-1022 South Salina Street/Cortland Avenue (Tax Map No. 094.-20-01.0) and 1024-1040 South Salina Street/Tallman Street (Tax Map No. 094.-20-02.0) and consist of two parcels totaling approximately 1.70 acres (0.57 and 1.13 acres, respectively) in size. These parcels consist of a small park and a fenced in asphalt parking lot.

Four areas of concern (AOCs) were identified as shown on Figure 3: the Former UST Area, Office Vapor, Warehouse Vapor, and Site-wide Groundwater. This CCR focuses on a section of the former main laundry facility known as 140 Cortland Avenue. Specifically, the AOC focused on in this CCR is the Former UST Area located in the northwest portion of the building previously described as the former main laundry facility. Additional remedial measures have been proposed for the remainder of the Site, including a sub-slab depressurization system to mitigate the impact of soil vapor within the office section of the building. Future remedial action conducted for the other AOCs will be submitted under separate cover.

1.2.2 Geologic and Hydrogeologic Condition

According to the United States Department of Agriculture (USDA) Web Soil Survey, the soil beneath the Site is indicative of urban land, which is a soil material having a non-agricultural, manmade surface layer that has been produced by mixing and filling in urban and suburban areas. Surficial geology consists mostly of lacustrine silts and clays. Bedrock at the Site is mapped by

the United States Geological Survey (USGS) as the Syracuse formation, which consists of dolostone, shale, gypsum and salts.

The Site is generally flat, with a gentle slope from the east to the west across the employee parking lot and beneath the main building. Generally, the slope indicates groundwater flows in the westerly direction and toward Onondaga Creek, located approximately 0.2 miles to the west of the Site. Field observations and the stratigraphic cross sections provided in the RI Report (CHA, February 2019) confirmed the presence of urban fill to approximately 8 to 10 feet below ground surface (ft bgs). Generally, silts and clays are beneath the urban fill to a depth of approximately 13 to 15 ft bgs. Alternating lacustrine silts and clays, then sands and gravels, were encountered beneath the fill material to the end of each boring. At least two silt and clay layers, one below the urban fill and one at varying depths, but approximately 26 to 30 ft bgs, may act as confining layers to impede the vertical transport of contamination.

Based on groundwater elevations measured on April 19, 2018, the depth to groundwater at the Site is typically less than 15 ft bgs. Beneath the building, groundwater contours are nearly flat, apart from the northwestern portion of the building where slightly elevated groundwater indicates a localized flow path from the north-western portion of the building toward the center of the building, near monitoring well GW-102.

1.2.3 Nature and Extent of Contamination, Former UST Area

Based on the RI, four AOCs were identified: the Former UST Area, Office Vapor, Warehouse Vapor, and Site-wide Groundwater. The AOC that is the subject of this CCR is the Former UST Area, located in the northwestern portion of the building. Additional details associated with the remaining AOCs, including the results of several subsurface soil, groundwater, and soil vapor samples, are provided in the RI Report (CHA, February 2019). Analytical results from previous investigative sampling events in the Former UST Area are summarized on Figure 4

Historical subsurface soil sampling identified the presence of chlorinated VOC contamination, namely tetrachloroethene (PCE), 1,1-dichlorethene (DCE), and vinyl chloride, in soil samples SB-32 and SB-33 located within the northwestern portion of the building, at concentrations exceeding their respective Part 375 Commercial Soil Cleanup Objectives (SCOs). These results are consistent with the findings of the RI in which PCE was identified at concentrations exceeding its respective Part 375 Commercial SCO in sample SOIL-116 and lesser concentrations of trichloroethene (TCE), DCE, and vinyl chloride in samples SOIL-116 and SOIL-119, located within the

northwestern portion of the building. PCE was detected in excess of the Part 375 Commercial SCO throughout this area. Metals (mercury and lead) and total polychlorinated biphenyls (PCBs) exceeded the Part 375 Unrestricted SCO in this area but are less than the respective Part 375 Commercial SCOs.

Historical groundwater sampling identified the presence of chlorinated VOC contamination, including PCE, TCE, DCE, and vinyl chloride, in the wells directly adjacent to the Former UST Area. During the RI, well Temp-GW001 and the well cluster at GW-103 were located within and adjacent to the Former UST Area, respectively. Concentrations of PCE, TCE, DCE, and vinyl chloride, among others, were detected at concentrations exceeding their applicable Technical and Operational and Guidance Series (TOGS 1.1.1) Class GA Ambient Water Quality Standards.

2.0 REMEDIAL ACTION

The IRM implemented at the Site included the excavation and removal of three USTs identified in the Former UST Area and associated impacted soil. The IRM activities generally followed the NYSDEC-approved IRMWP (CHA, June 2019). Figure 5 identifies the overall layout and work zones implemented for remedial construction activities.

2.1 DESCRIPTION OF THE INTERIM REMEDIAL MEASURE

The factors considered during the selection of the Site interim remedial measure are those listed in Title 6 of New York Codes, Rules, and Regulations (NYCRR), Part 375-1.8. Generally, the remedial action to be completed was source removal from the AOC identified as the Former UST Area. The following activities were completed to implement the interim remedial measure at the Site:

- Site controls were established, including setup of work zones, a decontamination pad, and a temporary soil containment pad.
- In the Former UST Area, the concrete slab was sawcut and sized for removal using a hydraulic hammer mounted on a mini excavator to provide access to the USTs.
- One smaller, empty UST was removed from the excavation and staged for off-Site transportation and disposal.
- Two larger USTs were found to be previously closed-in place and filled with a cementitious material leaving no remaining headspace in the top of the tanks. An oxy-acetylene torch was utilized to cut the top off the tanks and then to cut each tank into sections. Using a hydraulic hammer attachment on a miniature excavator, the cementitious material within each tank was broken up and removed. The material was stockpiled separately from the surrounding soil, sampled for waste characterization purposes, and disposed of off-Site.
- Concrete, stone, and soil were removed from around the two larger USTs as the tanks were removed from the subsurface. Contaminated soil within the AOC was excavated to a depth of approximately 9 feet below grade and to within approximately 18 inches from the building foundation walls. Excavation ceased at that depth to in order to prevent compromising the structural integrity of the building via undermining.
- Excavated material was placed on polyethylene sheeting in the designated stockpile area adjacent to the loading dock. Material was covered with additional polyethylene sheeting at the end of each day, then transported off-Site for disposal.
- Waste characterization samples were collected to facilitate off-Site disposal. All samples collected by CHA and analyzed by Alpha Analytical, Inc. (Alpha) resulted in a non-hazardous classification.
- The USTs were removed and transported for off-Site disposal.

- Four post-excavation soil samples were collected along the excavation sidewalls and two post-excavation soil samples were collected from the bottom of the excavation.
- An 8-ounce nonwoven geotextile material was placed along the bottom and sidewalls of the excavation to act as a demarcation barrier.
- The excavation area was backfilled with clean, imported structural fill material.

3.0 GOVERNING DOCUMENTS

3.1 INTERIM REMEDIAL MEASURE WORK PLAN

The IRMWP was prepared by CHA (June 2019) and approved by the NYSDEC in a letter dated June 25, 2019, included in Appendix A. The IRMWP defined the implementation of remedial activities; including, excavating contaminated soil within the Former UST Area, removing the USTs, properly disposing of the waste, and backfilling the excavation appropriately. Provisions for health and safety, community air monitoring, and procedures for field sampling were included in the IRMWP. The work was conducted during this IRM was completed in substantial conformance with the IRMWP. Figure 5 of the IRMWP presented the Site Plan for remedial construction. The figure has been updated to indicate work practices and conditions encountered during construction, such as the shape of the USTs, location of the Exclusion Zone, and stockpile area, and is included in this CCR as Figure 5.

3.2 SITE-SPECIFIC HEALTH & SAFETY PLAN

A Site-specific Health and Safety Plan (HASP) was prepared by CHA to provide guidance to workers performing intrusive activities at the Site where exposure to contaminated soils and/or fill materials was possible. The HASP was followed during intrusive work performed at the Site and is included in the June 2019 IRMWP.

The general contractor for the remediation of the Site, Top Notch Property Management, prepared a separate Site-specific HASP to address both general construction and environmental health and safety. The Contractor maintained a copy of this HASP on-Site during implementation activities.

3.3 COMMUNITY AIR MONITORING PLAN/COMMUNITY AND ENVIRONMENTAL RESPONSE PLAN

Air monitoring was performed at the Site during all intrusive activities where there was a potential to contact existing soil/fill in accordance with the Community Air Monitoring Plan (CAMP) included in the June 2019 IRMWP. The CAMP included monitoring of fugitive dust and organic vapors upwind and downwind of the intrusive activity. Additionally, the plan identified action levels during construction and mitigation methods to address potential exceedances. The results of air monitoring are discussed in Section 4.3.

Construction activities were performed in accordance with the Community and Environmental Response Plan (CERP) included in the June 2019 IRMWP. Temporary security measures were followed, apart from the discovery of an unlocked gate on neighboring property that would allow unwanted access to the Site. Once identified, a lock was placed on the gate in order to properly secure the Site. Traffic control measures, equipment decontamination, and waste management were conducted according to the CERP.

3.4 QUALITY ASSURANCE PROJECT PLAN

A Quality Assurance Project Plan (QAPP) was prepared to present the policies, organization, objectives, functional activities, and specific Quality Assurance (QA) and Quality Control (QC) activities designed to achieve the specific data quality goals associated with the remediation. The QAPP identified the procedures for sample preparation and handling, sample chain-of-custody, laboratory analyses, and reporting requirements to confirm the accuracy and integrity of the data generated during the investigation. The QAPP was followed throughout the IRM performed at the Site and is included in the June 2019 IRMWP.

3.5 FIELD SAMPLING PLAN

A Field Sampling Plan (FSP) was prepared for the activities described in the Source Removal IRMWP. The FSP describes the sampling approach and rationale. Major elements of the FSP including the frequency of sampling, analytical parameters, sample designation and handling, decontamination procedures, and field documentation. The FSP was followed throughout the IRM performed at the Site and is included in the June 2019 IRMWP.

4.0 DESCRIPTION OF REMEDIAL ACTIVITIES

4.1 GENERAL SITE CONTROLS & SITE PREPARATION

4.1.1 Jobsite Record Keeping

While CHA retained most project files electronically at the office some records were maintained on-Site. The types of records kept on-Site, typically included the following:

- A copy of the CHA prepared Source Removal IRMWP including the Site-Specific HASP, FSP, CAMP, and QAPP.
- A copy of CHA construction observation logs.
- 40-Hour Hazardous Waste Operations and Emergency Response (HAZWOPER) certifications for qualified CHA field personnel.

4.1.2 Site Security

Excavation of contaminated soil and removal of the USTs was conducted within a secured building. The remainder of the Site is secured with a chain link fence along Cortland Avenue and around the northern perimeter. The chain link fence extends onto property not owned by Ranalli/Taylor St. to the northwest of the building and along South Clinton Street. NYSDEC personnel identified an unlocked gate along South Clinton Street on Thursday June 27, 2019. Although the gate and that section of the fence is not owned by Ranalli/Taylor St., a lock was placed on the gate to secure the Site. At the end of each work day, the access gate utilized during remedial activities was secured.

Orange construction cones and caution tape were installed at the door to South Clinton Street at the location of the excavation. This door was required to remain open during remedial activities in order to ventilate the excavation area. At the end of each work day, the door was secured.

4.1.3 Construction Observation

CHA completed daily observation reports for each day spent on-Site during remedial activities. Daily construction observation reports are included in Appendix B. Additionally, a digital photograph log documenting the major activities completed during the implementation of the IRM is included in Appendix C.

4.1.4 Work Zones

Prior to remedial construction, work zones as depicted on Figure 5 were identified on Site with signs and caution tape. The Exclusion Zone included the Former UST Area and pathway of soil transport to the stockpiles, located to the north of the building and adjacent to the loading dock doors. The Contamination Reduction Zone was established within the warehouse and adjacent to the stockpile area to facilitate decontamination of the personnel and equipment that come into contact with impacted soils. The Support Zone was established in close proximity to the Contamination Reduction Zone and consisted of equipment and supplies required for implementing the remedy.

4.1.5 Containment Pads

Temporary soil stockpiles were contained on three sides by concrete barriers lined with polyethylene sheeting. Material was placed on top of the polyethylene sheeting, then covered with additional sheeting at the end of each day. Concrete blocks were utilized to contain the stockpiled soil, prevent run-on of water, and to secure the polyethylene sheeting covering the stockpiles.

Additionally, a decontamination pad was located within the Contaminant Reduction Zone inside the building. Polyethylene sheeting was placed beneath several plastic containers used to decontaminate personnel and equipment before exiting the Contaminant Reduction Zone to contain any splashes.

4.1.6 Erosion and Sediment Control

Intrusive work was conducted within the enclosed building and stockpiled material was placed on polyethylene sheeting and covered at the end of each day; therefore, erosion and sediment control measures were not necessary for the implementation of this IRM.

4.2 WASTE CHARACTERIZATION SAMPLING

Prior to mobilization for remedial activities, waste characterization samples were collected. Sampling procedures indicated in the FSP and QAPP were followed for all waste characterization sampling. On May 17, 2019 two soil samples from adjacent to the tanks; SOIL-WC-102 from 6 ft bgs and SOIL-WC-103 from 9 ft bgs. During remedial activities, it was determined the cementitious material used to fill the USTs in place should also be analyzed for waste

characterization parameters. On June 25, 2019 a sample of the cementitious material, SOIL-WC-104, was collected.

The samples were submitted for laboratory analysis to Alpha Analytical, Inc. (Alpha) in Westborough, Massachusetts under proper chain of custody for analysis of:

- Toxicity Characterization Leaching Procedure (TCLP) VOCs by United States Environmental Protection Agency (USEPA) Method 8260;
- TCLP SVOCs by USEPA Method 8270;
- TCLP Resource Conservation and Recovery Act (RCRA) 8 Metals by USEPA Methods 6010;
- TCLP Pesticides via USEPA Method 8081;
- TCLP Herbicides via USEPA Method 8151;
- Total PCBs via USEPA Method 8082;
- Ignitability (flashpoint);
- Corrosivity (pH);
- Reactivity; and,
- Percent Solids.

Results indicated the soil material and tank contents could be disposed of as non-hazardous waste. Laboratory data associated with waste characterization sampling is summarized in Table 1 and the full laboratory reports are in Appendix D.

Seneca Meadows, Inc., a solid waste landfill in Waterloo, New York, requested a "contained-in" determination of the soil prior to accepting the material. Additional soil sampling was conducted on June 10, 2019 and submitted to Alpha under proper chain of custody for analysis of:

- Target Compound List (TCL) VOCs by USEPA Method 8260;
- TCL SVOCs by USEPA Method 8270;
- Target Analyte List (TAL) Metals via USEPA Method 6010; and,
- Pesticides via USEPA Method 8081.

Results of the additional sampling indicated the concentrations of the constituents were less than the current "contained-in" soil action levels. In a letter dated June 25, 2019, the NYSDEC submitted their "contained-in" determination and indicated the soil may be managed as non-

hazardous waste. Laboratory data associated with additional "contained-in" determination sampling is presented in Table 2 and the full laboratory report is in Appendix D.

4.3 CAMP RESULTS

Community air monitoring was conducted at one upwind and two downwind locations of the exclusion zone during ground intrusive activities. Locations of the CAMP stations were as follows:

- CHA-1 was placed at a downwind location near the northern perimeter of the Site;
- CHA-2 was placed at a downwind location between the loading dock doors and Cortland Avenue; and,
- CHA-3 was placed at an upwind location and near the open door to South Clinton Street.

The exact locations of the CAMP stations are presented on Figure 5.

The CAMP included monitoring of both fugitive dust and organic vapors. In accordance with the CAMP, fugitive dust monitoring was performed using a DustTrack 8530 particulate meter and organic vapor monitoring was performed using a MiniRAE 3000 photoionization detector (PID). Action levels of 150 micrograms per cubic meter (µg/m³) for fugitive dust and 5 parts per million (ppm) for organic vapors over a fifteen-minute running average were used.

Enclosures containing the DustTrak 8530 particulate meter and the MiniRAE 3000 PID were mounted on tripods and programmed to activate a flashing light when action levels were exceeded. Additionally, two handheld PIDs were utilized within the exclusion zone to facilitate field screening of excavated materials and to monitor breathing zone organic vapor concentrations.

A summary of the air monitoring results is provided in the following sections and was made available to the NYSDEC and New York State Department of Health (NYSDOH) each day. Raw air monitoring data downloaded from the CAMP Stations is included in Appendix E.

4.3.1 Particulate Results

CHA-1

While temporary particulate levels occasionally exceeded the threshold of 150 µg/m³, these were typically encountered for one minute or less and the 15- minute averages were below the action level. One exception was during final backfilling and cleanup operations conducted on July 15, 2019, where exceedances of the action level occurred between 10:15 and 10:37. The maximum

concentration recorded during that time was 597 µg/m³. Dust suppression techniques, such as wetting down the access ramp and slowing the movement of traffic, were employed to reduce the impact of dust migration.

CHA-2

While temporary particulate levels occasionally exceeded the threshold of 150 µg/m³, these levels were typically encountered for two minutes or less and the 15-minute averages were below the action level. Exceptions included:

- 6/24/2019 – Exceedance of the action level from 10:42 to 11:27. The maximum concentration recorded was 401 µg/m³.
- 6/26/2019 – Exceedance of the action level from 07:25 to 07:55, 08:42 to 09:13, and 11:24 to 11:39. The maximum concentration recorded was 451 µg/m³.
- 6/28/2019 – Exceedance of the action level from 13:32 to 13:47. The maximum concentration recorded was 1970 µg/m³.

Dust suppression techniques, including wetting down the access ramp and slowing the movement of equipment, were applied. During the above exceedances, CHA noted vehicular traffic along Cortland Avenue was agitating dust within the road and likely contributing to exceedances at CHA-2.

CHA-3

While temporary particulate levels occasionally exceeded the threshold of 150 µg/m³, these levels were typically encountered for one minute or less and the 15-minute averages did not exceed the action level.

4.3.2 Organic Vapor Results

CHA-1

There were no 15-minute averages in excess of 5 ppm which was the action level established in the CAMP during the intrusive work conducted at the Site.

CHA-2

While temporary organic vapor levels occasionally exceeded the threshold of 5 ppm, these levels were typically encountered for two minutes or less and seldom for longer than three minutes. There were no instances of organic vapors exceeding 25 ppm, indicating a need to stop work based on the CAMP, occurred.

On June 24, 2019 the organic vapor data collected by the PID was corrupted and unable to be recovered. CHA had periodically checked the CAMP station throughout the day and the station appeared to be in working order. Therefore, organic vapor levels were not manually recorded. CHA did not observe organic vapor data values exceeding 5 ppm during these periodic checks.

On June 27, 2019 the maximum recorded organic vapor concentration was 16.1 ppm. At approximately 07:11 on that same day, the recorded organic vapor concentration at CHA-2 was 14.3 ppm. CHA observed increased odors outside of the warehouse and adjacent to the loading dock, in the proximity of CHA-2. At that time, CHA stopped work in the exclusion zone in order to discuss work practices and organic vapor mitigation. To prevent off-Site migration of organic vapors, several overhead doors were closed; however, this reduced ventilation within the warehouse. At that time, the exclusion zone was expanded to include the entire warehouse to improve the interior ventilation near the work zone and protect worker safety. Additionally, odor suppression techniques were discussed with the contractors. The contractors ordered BioSolve® Pinkwater, a vapor suppression chemical, to be delivered early the following day. On June 28, 2019 exceedance of the organic vapor action level were not observed. However, the contractors opted to spray the BioSolve® Pinkwater along the sidewalls and bottom of excavation due to previous exceedances.

CHA noted an idling truck waiting to be fully loaded with soil for off-Site disposal and additional front-loading equipment moving in the loading dock area, in the vicinity of CHA-2, that may have been contributing to the organic vapor readings identified on this day.

CHA-3

While organic vapor levels occasionally exceeded the threshold of 5 ppm, these levels were typically encountered for one minute or less and seldom for longer than two minutes. There were no 15-minute averages in excess of 5 ppm which was the action level established in the CAMP during the intrusive work conducted at the Site.

On June 27, 2019 the most significant contamination was encountered within the excavation. A single instance of organic vapors exceeding 25 ppm occurred at 09:56 on this day. The average for the minute was 12.4 ppm, so work was not stopped. Rather, a fan was placed pointing inward to the building to enhance ventilation by drawing clean air in toward the excavation and prevent the off-Site migration of organic vapors.

4.4 CONTAMINATED MATERIAL REMOVAL

As summarized in Section 4.2, material generated during the IRM activities was determined to be non-hazardous waste. Excavated soil and UST contents were removed from the Former UST Area using a mini excavator. The excavator placed material into the skid steer bucket for transport to the stockpile area adjacent to the loading dock doors. Materials were stockpiled prior to being loaded into trucks for off-Site disposal at the Seneca Meadows Landfill. A backhoe and front-end loader were used to load trucks with the material. None of the excavated materials were re-used on-Site.

Upon completion of the source removal, polyethylene sheeting and other temporary containment materials were disposed off-Site. The concrete floor within the building and the asphalt loading dock area were swept clean and additional debris was disposed off-Site.

The limits of excavation were approximately 21.5 feet by 24.5 feet, which is the area of the Former UST Area room less approximately 18 inches around the perimeter of the room, as shown on Figure 6. The depth of excavation was 9 ft bgs, several feet below a footer that was exposed. To prevent damage to the building foundation from potential undermining, the excavation was terminated at this depth.

Weight tickets for materials excavated and disposed of off-Site are provided in Appendix F. Approximately 253.9 tons of non-hazardous soil was transported to the Seneca Meadows Landfill in Waterloo, New York and 1.8 tons of steel associated with the tank carcasses were taken to Ben Weitsman of Syracuse scrap yard for recycling. The steel tanks were cut into pieces to facilitate removal. A summary of the materials, quantities and disposal locations are provided below.

Weight of Waste Disposed Off-Site

Material	Quantity	Units	Disposal Location
Steel Tank Carcass – 3 tanks cut into pieces	1.8	tons	Ben Weitsman of Syracuse 333 Bridge Street Solvay, New York 13209
Non-hazardous Soil	253.9	tons	Seneca Meadows Landfill 1786 Salcman Road Waterloo, New York 13165

4.5 WASTEWATER DISPOSAL

Wastewater generated from the decontamination of equipment and surfaces upon completion of the excavation was containerized in 55-gallon drums. National Response Corporation (NRC) was contracted to sample the wastewater and coordinate disposal. On September 17, 2019 the drums of wastewater were removed from the Site and transported to Industrial Oil Tank Service Corporation at 120 Dry Road, Oriskany, New York for proper treatment/disposal. The manifest documenting the wastewater disposal is provided in Appendix F.

4.6 POST-EXCAVATION SAMPLING

Upon completion of UST removal and excavation activities, post-excavation samples were collected from the sidewalls and bottom of the excavation pursuant to DER-10 and the approved Source Removal IRMWP. One sidewall sample was collected for every thirty (30) linear feet of sidewall, and one (1) bottom sample was collected for every 900 square-feet of bottom area. A total of four sidewall samples and two bottom samples were collected at the locations shown on Figure 6 and submitted for laboratory analysis of:

- TCL VOCs via USEPA Method 8260;
- TCL SVOCs via USEPA Method 8270;
- Total PCBs via USEPA Method 8082; and
- TAL Metals via USEPA Method 6010.

Additionally, three of the six samples collected were analyzed for the emerging contaminants 1,4-dioxane via USEPA Method 8270 and perfluoroalkyl substances (PFAS) via USEPA Method Modified 537. Complete analytical reports are provided in Appendix G.

Post-excavation results, with the exception of emerging contaminants, were submitted to the NYSDEC on July 8, 2019. As shown in Tables 3, results indicated the sidewall and bottom samples met Part 375 SCOs in four of six samples.

- PCE was identified at a concentration of 170 mg/kg in sample SOIL-SW-200 which exceeds the Part 375 Commercial SCO of 150 mg/kg.
- PCE was also identified at a concentration of 920 mg/kg in sample SOIL-B-201, which exceeds the Part 375 Commercial and Industrial SCOs of 150 mg/kg and 300 mg/kg, respectively.
- Vinyl chloride (22 mg/kg) and mercury (3.59 mg/kg) were detected at concentrations exceeding their respective Part 375 Commercial SCO in sample SOIL-B-201.

- Total PCBs were detected at concentrations exceeding the Part 375 Commercial SCO of 1 mg/kg in sample SOIL-B-200 (3.76 mg/kg), SOIL-B-201 (1.21 mg/kg), SOIL-SW-202 (4.69 mg/kg), and SOIL-SW-203 (1.72 mg/kg).

Results of PFAS sampling are summarized in Table 4 and identified total Perfluorooctanoic Acid (PFOA) and Perfluorooctanesulfonic Acid (PFOS) of 20.7 µg/kg in sample SOIL-B-200 and 0.671 µg/kg in sample SOIL-SW-201. PFOS was the predominant compound detected in sample SOIL-B-200. Additional detections of PFAS compounds are presented on Figure 7. At the time of this report, guidance on soil cleanup objectives for PFAS contaminants is not available and there is no standard in which to compare the soil sample results.

Post-excavation analytical results indicated soil not meeting the Commercial SCO standard remained in the Former UST Area, particularly on the south and east sidewalls and beneath the limits of excavation. Excavation did not continue due to concerns with compromising the building integrity.

On July 8, 2019 the NYSDEC approved the post-excavation sampling results and granted permission to backfill the excavation with clean, imported fill. This correspondence is provided in Appendix A. Analytical results from post-excavation sampling have been uploaded to the NYSDEC electronic database, EQuIS™.

4.7 DEMARCATION BARRIER

On July 15, 2019 the contractor mobilized to backfill the excavation. Prior to placement of clean fill material, a demarcation barrier of Carthage Mills' FX-35HS 8-ounce nonwoven geotextile was placed within the excavation. A product data sheet for the geotextile material used is provided in Appendix H.

4.8 IMPORTED FILL

Following the installation of the demarcation barrier, No. 2 crushed stone was imported to the Site to backfill the excavation. This stone was imported from T.H. Kinsella, Inc. of Jamesville, New York and contained less than 10 percent by weight material which would pass through a Size 80 sieve and did not require analytical testing, as per NYSDEC DER-10. Additionally, crusher run was placed at the top of the excavation, and although this material had a higher amount of fines in it, it was formed from the crushing of the same bedrock material used to produce the No. 2 stone. A letter from the quarry stating that this material originates from an uncontaminated, virgin source

is included in Appendix I. A total of 218.1 tons of No. 2 crushed stone and 42.3 tons of crusher run were imported as backfill. Weight tickets and sieve tests are provided in Appendix I.

As previously mentioned, the limits of excavation were approximately 24.5 feet by 21 feet and to a depth of 9 feet bgs. A schematic cross-sectional view of the completed source removal, including the demarcation barrier, No.2 crushed stone, and crusher run stone placed within the excavation is presented on Figure 8.

4.9 DEVIATIONS FROM THE IRMWP

There were no deviations from the Source Removal IRMWP, apart from the Site security deviation previously mentioned and the unfinished cap on the excavation. No issues with public access to the Site were encountered during IRM activities and the unlocked gate was secured the same day it was identified. It is anticipated the excavation area will be finished with a concrete slab in the future.

5.0 SUMMARY AND CONCLUSIONS

Upon completion of the IRM, the objectives of the Source Removal IRMWP were achieved. The USTs within the Former UST Area were removed and approximately 253.9 tons of contaminated material was removed from the Former UST Area. In summary:

- Remedial activities were completed in accordance with the Source Removal IRMWP (CHA, June 2019) between June 24, 2019 and July 15, 2019.
- Additional Site remedial activities are planned. The work described in this CCR was performed as part of an IRM to remove USTs and address a potential source area.
- Waste characterization samples were collected to facilitate off-Site disposal. All samples resulted in a non-hazardous classification. Additionally, the waste soil was determined to have concentrations of contaminants below the "contained-in" criteria and the NYSDEC provided a letter indicating the waste material does not have to be handled as hazardous waste.
- Three USTs were found within the Former UST Area. All three were removed and transported for off-Site disposal.
- Contaminated soil within the AOC was excavated to a depth of approximately 9 feet below grade and approximately 18-inches from the foundation walls. Excavation ceased at that depth to in order to prevent compromising the structural integrity of the building.
- Four confirmation soil samples were collected along the excavation sidewalls and two confirmation soil samples were collected at the bottom of the excavation.
- An 8-ounce nonwoven geotextile material was placed along the bottom and sidewalls of the excavation to act as a demarcation barrier.
- The excavation area was backfilled with clean imported fill material. It is anticipated the concrete slab will be restored in the future.

Based on the post-excavation sampling, several Site contaminants of concern exceed the Commercial SCO in some sidewall and bottom of excavation samples. While further excavation of the source areas was not possible without compromising the structural integrity of the building, removal of the USTs and the most impacted soils surrounding the tanks has resulted in the successful implementation of the IRM. It is anticipated that the remaining contamination will be managed with future IRMs and Site restrictions that prevent direct contact with Site contaminants of concern. For example, a work plan to mitigate the soil vapor impacts within the Office are of the building has been submitted to and approved by the NYSDEC. Upon completion of the IRM(s), an alternatives analysis report will be prepared to evaluate the effectiveness of remedial designs with respect to the criteria listed in Section 4.2(a) of DER-10.

RE: Former Coyne Textile, Syracuse, NY
NYSDEC site# C734144
Contaminant Source Removal Interim Remedial Measure Work Plan

Dear Mr. Ranalli:

Thank you for providing the above referenced Interim Remedial Measure (IRM) dated June 17, 2019 for the Former Coyne Textile site in Syracuse, New York.

The NYSDEC and the NYSDOH have determined the IRM to be satisfactory. Please place a copy of the final IRM (along with the most recent response to comment letter) in the sites document repository.

Should you have any questions, please contact me at (315) 426-7446 and thanks again for your efforts in continuing to move this project forward.

Sincerely,

Michael Belveg
Assistant Engineer (Environmental), Division of Environmental Remediation

Ec: Harry Warner, NYSDEC

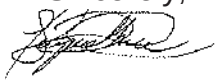
Re: **Revised** - "Contained-In" Determination Request
Former Coyne Textile Facility
BCP Site No. C734144

Dear Ms. Ehmann:



The New York State Department of Environmental Conservation has reviewed the analytical soil data (Lab Sample ID: 1906268-002, L1920945-01, L1920945-02, L1924709-01 and L1924709-02) submitted with your letter dated May 30, 2019 and June 20, 2019 requesting for a "contained-in" determination for contaminated soils from which were encountered during a remedial investigation of the above project.

Concentrations detected for individual VOCs, SVOCs, metals and Pesticides were all significantly less than their current "contained-in" soil action levels, and Land Disposal Restriction concentrations. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations (Lab Sample ID: 1906268-002, L1924709-01 and L1924709-02) for tetrachloroethene, cis-1,2-dichloroethene and trichloroethene were below the soil "contained-in" action level and the Land Disposal Restriction concentration. Excavated soils from the UST Area, approximately 200 cubic yards, do not have to be managed as hazardous waste and can be transported off-site to Seneca Meadows, Inc. landfill in Waterloo, New York, for disposal as a solid waste.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Sincerely,

Henry Wilkie
Assistant Environmental Engineer
RCRA Permit Section

CHA

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	001
PAGE NO.	2 OF 3
DATE:	6/24/19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA on site at 0630 - checked in with Josh.
Crew setting up decontamination area, stockpiling area, etc.
Several fans set up to circulate air, No Draeger tubes available
Dustrack and PID (CAMP) systems set up and started between 0750 and 0805

0810 breathing zone PID readings ~1 ppm
0817 Crew begins excavating soil/concrete
0910 Break — breathing zone PID readings still ~1 ppm
1120 Excavator moved large section of concrete and revealed black, odorous soil. PID in breathing zone jumped to 3ppm, crew screened the ~~so~~ black soil and found >20 ppm
Josh decided to allow that soil to off-gas while crew goes to lunch
1215 Return from lunch. PID readings around excavation 2-3ppm, within the excavation 4-10ppm. Josh decided one person would ~~put~~ don tyvek and respirator to be in excavation. All others would stay out.
1250 Breathing zone PID levels increase to 3-5ppm. Work stopped for the day.
Crew to continue working elsewhere → reinforcing stockpile containment, covering stockpile, etc.
1345 CHA begins turning off CAMP stations

FORM #2

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	002
PAGE NO.	2 OF 3
DATE:	6.25.19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA onsite at 0605 (Karyn Ehmann)
Set up CAMP Stations 0615 - 0640
0650 - PID readings, breathing zone 2.0 - 5.6 ppm; used Vinyl Chloride Draeger Tube → no color
Crew to continue working in Level D
0710 - Excavation work begins
0720 - PID readings, breathing zone adjacent to excavation ~12 ppm
" within excavation >20 ppm
Crew decides to upgrade to Level C PPE
0725 - CHA calls Meghan Platt to inform project manager of the PPE upgrade
0815 - Sam Miller (CHA) on site to deliver equipment (new CAMP enclosures, bottle order, isobutylene)
0915 - CHA (Karyn) donned Level C PPE to enter exclusion zone
Sam Miller offsite
1105 - Crew began cutting the top of one tank
1130 → 1215 Lunch Break
1215 - Crew continues cutting the tank and removing soil
1330 - Anthony Russo (CHA) arrived on site to bring bottles for a sample
1400 - CHA (Karyn) collects one TCLP sample from the contents of the tank. Dons Level C PPE to collect sample
Contents are a dense sandy material, grey.
To be sampled for hazardous waste characteristics
Sent to Alpha for 3 day rush TAT

CHA

DATE:	6·26·19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA on site at 0605

Set up CAMP stations, wind from the south

Calibrations

CHA #1 @ 0622 — PID Bump Test - pass; Dustrak - zero cal.

CHA #2 @ 0630 — PID Bump Test - pass; Dustrack - zero cal.

CHA #3 @ 0640 — PID Bump Test - fail; recalibrated PID; Bump Test #2 - pass; Dustrack - zero cal.

Extra PID for field screening
PID Bump Test - pass

Crew set up a second stockpiling area between the warehouse and the initial stockpiling area.

0650 - Crew putting on Level C PPE to begin intrusive work

Using a jack hammer mounted to a mini excavator, the contents to the tank were broken up. Contents of the tank removed via mini excavator and stockpiled separately. (pending analytical)

CHA

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	003
PAGE NO.	3 OF 4
DATE:	6·26·19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0745 CHA #2 Dustrak monitor indicates an exceedance of STEL. Karyn discussed dust suppression techniques with Josh.

0755 Matt (crewmember) begins wetting the #2 stone access ramp he is using to enter/exit the building.

Highest level noticed on the Dustrak monitor = 0.236mg/m^3

CHA checked upwind Dustrak (CHA#3) ⇒ level = 0.008 mg/m^3

CHA checked downwind Dustrak (CHA #1) ⇒ level = 0.014mg/m^3

0807 Matt finished wetting the access ramp, CHA#2 level still exceeding the 0.150 mg/m^3 limit.

CHA notes that traffic along Cortland Ave may be contributing to dust.

Visible emissions from access ramp reduced after wetting.

0811 CHA Stopped CHA #2 Dustrak and re-calibrated to zero.

0813 CHA restarted CHA#2

0815 reading @ CHA #2 = 0.131 mg/m^3

0826 reading @ CHA #2 = 0.076 mg/m^3

0855 CHA checked CHA#2 again → level = 0.285 mg/m^3

Note: Skid steer has not driven on access ramp for more than 20 minutes. Access ramp still appears wet.

CHA concludes traffic on Cortland Ave is contributing to PM10 measurements.

→

FORM #2

Before 1130 → Crew has removed enough contents of the tank to saw off ~3 ft of the tank wall.
Removed top ~3ft and crush it on poly sheeting inside the warehouse.

1130 - 1230 lunch

1230 CHA checked CHA #2, reading at 0.009 mg/m^3

1245 CHA getting into Level C to approach exclusion zone to take pictures and oversee tank removal.

1405 CHA out of exclusion zone.

Crew has removed almost all contents of the tank (one of the tanks) and is working to dislodge it.

Brian (crew member) used a torch to cut off the top of the other tank.

1505 Crew finished with intrusive work for the day. Unable to dislodge the remaining section of the first tank.

Covering up stockpiles.

1515 - 1525 CHA shuts down CAMP stations

1530 CHA offsite.

↳ 1 hour at the office to download data and set up equipment to charge overnight.

CHA

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA on site at 0600
Setting up CAMP Stations
Field Screen (extra) PID @ 0610
Bump test - fail ; recalibrated ; Bump test #2 - pass 105.0ppm

CHA #2 @ 0615
Dustrak zero calibrated; PID Bump test - pass 104.5 ppm

CHA #1 @ 0625
Dustrak zero calibrated; PID Bump test - pass 102.2 ppm

CHA #3 @ 0635
Dustrak zero calibrated; PID Bump test - fail (114.4ppm) recalibrated; Bump test #2 - pass (106.0) ppm

0640 Riccelli dump truck arrives - lining it with poly
Truck # 352 offsite at 0730

0715 CHA observes increased smell of contamination and immediately checks CHA 2 PID (reading at least 17.4ppm). CHA stopped work inside the excavation zone to discuss work practices and safety.

→

CHA

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	004
PAGE NO.	3 OF 4
DATE:	6-27-19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

Crew to wet all haul roads and the access ramp, wet the excavation, and close most doors to the outside. Therefore, the exclusion zone now includes the entire warehouse because ventilation is limited.
PID in warehouse ~ 25 ppm, PID near excavation ~ 50ppm

0735 Work resumes
0755 CHA checked PID at CHA2 PID = 1.1 ppm
Dustrak = 0.073 mg/m^3

Note: Riccelli truck and front loaders are idling at the loading dock and near the stockpiles. Likely contributing to elevated PID and Dustrak readings at CHA2.

Truck # 353 off site @ 0820
1050 CHA observes diesel fumes impacting outdoor air.
PID at CHA2 reading ~~2p~~ ~45ppm
1052 CHA checked CHA1 → found Dustrak reading ~0.170 mg/m^3
Front loader is moving construction debris from the northern perimeter of the site.
CHA spoke with Ben (crewmember) about wetting down that area of the site to reduce migration of dust.
1100 Ranalli's are ordering odor/vapor suppression material for use tomorrow
1100 Truck #353 offsite
1127 Front loader moving soil into a truck, again. CHA2 indicating an exceedance. Ben is implementing dust suppression techniques.

1140 Truck #353 offsite

1200 - 1230 CHA offsite for Lunch

1230 Discussion with Meghan regarding confirmation samping, limits of excavation, and disposal of steel.
Steel carcass from the tank has been cut into pieces and no longer have soil or cementous material caked on. Therefore, the steel can be sent to a scrap yard.

Soil in drums from the Remedial Investigation will be placed on the stockpile to be disposed of as non-hazardous waste.

1350 ~~to~~ Harry Warner and Mike Belveg, DEC, arrive on site.
Mike requested the daily logs - Meghan and Sam are working on it.

1420 DEC offsite

Truck # 352 offsite at 1445

1500 Intrusive work concluded for the day
CHA ran a Draeger tube near the excavation
clean for vinyl chloride and PCE/TCE.
PID readings significantly less than earlier in the day (~10ppm)

1515 James Trasher and Jim Ranalli (Sr) arrive on site to check progress

1530 CHA offsite

~ 1.5 hours at the office to download data, charge equipment, and write daily report.

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	005
PAGE NO.	2 OF 4
DATE:	6-28-19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA on site at 0605

Setting up CAMP stations

CHA #2 @ 0620
PID Bump test - pass
Dustrak zero calibrated

CHA #1 (KD) @ 0625
PID Bump test - pass
Dustrak zero calibrated.

CHA #3 @ 0630
PID Bump test - pass
Dustrak zero calibrated

0640 Ran a Draeger tube for site ~~COC~~ COCs within the exclusion zone → no change in color for vinyl chloride nor PCE/TCE.

Crew resetting their stockpiling area with new poly sheeting

0650 Intrusive work begins

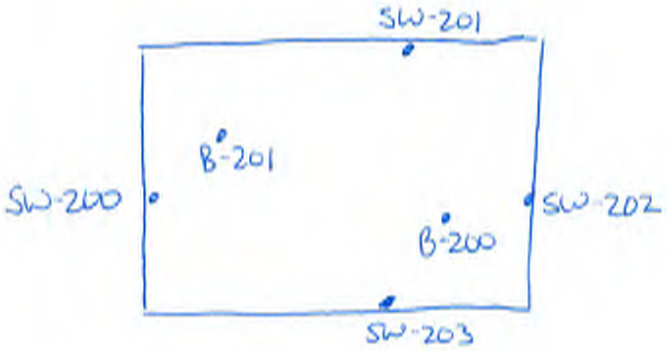
0810 One tank completely removed and placed in the stockpile area. Bottom of tank severely corroded with multiple holes and worn out areas.
Multiple punctures noted from the use of a jackhammer to remove the cementious contents of the tank.
Attempted to crush the tank - unsuccessful.
But the tank had been cut into ~~piece~~ pieces and cannot be reused in current condition.
Tank rinsed with water in stockpiling area and sent offsite for disposal.

CHA

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 005
PAGE NO. 3 OF 4
DATE: 6-28-19

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:



0845 Second tank completely removed. Similar condition to the first tank.

Crew excavating the remaining soil within the excavation area and crushing the small tank that was removed previously.

CHA prepares for confirmation sampling.

SOIL - B-200 @ 0930 → PFAS, 1,4-Dioxane
SOIL - B-201 @ 0950
SOIL - SW-200 @ 1005 → PFAS, 1,4-Dioxane
SOIL - SW-201 @ 1020 → PFAS, 1,4-Dioxane
SOIL - SW-202 @ 1035
SOIL - SW-203 @ 1050

} Sent to Alpha for analysis of VOCs, SVOCs, Metals, PCBs

Crew sprayed excavation area with Biosolve after confirmation sampling was complete.

Crew cleaned interior of the building/warehouse, decontaminated equipment, and covered the stockpiles remaining at the site. Continued to implement dust suppression techniques when needed.

1400 intrusive work and cleaning procedures that generated dust are done for the day.

1400 - 1420 CHA turns off CAMP stations. ~~and~~.

1430 CHA offsite.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L1920945-01 and -02: The sample was received in an inappropriate container for the TCLP Volatile Organics analysis.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	COYNE TEXTILE	**Lab Number:**	L1920945
Project Number:	33525	**Report Date:**	05/28/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensation Product".

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Number:	33525	**Report Date:**	07/01/19

Case Narrative (continued)

Report Submission

July 01, 2019: This final report includes the results of all requested analyses.

June 28, 2019: This is a preliminary report.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PCBs

WG1252777: An MS/MSD was not analyzed because the dilution required by the elevated concentrations of non-target compounds present in the native sample would have caused the spike compounds to be diluted below the range of calibration.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Kelly Stenstrom

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	COYNE TEXTILE SERVICES	**Lab Number:**	L1927834
Project Number:	33525	**Report Date:**	07/01/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensation Product".

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L1928651-01, -04 and -05: The sample has elevated detection limits due to the dilution required by the elevated concentrations of non-target compounds in the sample.

The surrogate recovery for the following samples is outside the acceptance criteria for 4-bromofluorobenzene; however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report.

L1928651-01: 233%

L1928651-04: 253%

L1928651-05: 175%

L1928651-06: 136%

1,4-Dioxane by 8270-SIM

L1928651-01 and -04: The sample has an elevated detection limit due to the dilution required by the elevated concentrations of non-target compounds in the sample.

L1928651-03: The sample has an elevated detection limit due to the dilution required by the sample matrix.

Total Metals

L1928651-01 through -06: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by matrix interferences encountered during analysis.

The WG1255915-3 MS recoveries for aluminum (577%), calcium (0%), iron (2080%), and magnesium (0%), performed on L1928651-01, do not apply because the sample concentrations are greater than four times the spike amounts added.

The WG1255915-3 MS recoveries, performed on L1928651-01, are outside the acceptance criteria for lead

Project Name: FORMER COYNE TEXTILE **Lab Number:** L1928651
Project Number: 33525 **Report Date:** 07/03/19

Case Narrative (continued)

(270%), thallium (74%) and zinc (34%). A post digestion spike was performed and was within acceptance criteria.

The WG1255915-3 MS recovery, performed on L1928651-01, is outside the acceptance criteria for manganese (162%). A post digestion spike was performed and yielded an unacceptable recovery of 74%. The serial dilution recovery was acceptable; therefore, the matrix test passed for the sample matrix.

The WG1255915-4 Laboratory Duplicate RPD for zinc (29%), performed on L1928651-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L1928651
Project Number:	33525	**Report Date:**	07/03/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensation Product".

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L1931047
Project Number:	33525	**Report Date:**	07/30/19

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PCBs

L1931047-01, -02, -03, -04, -05, and -06 were extracted with the method required holding time exceeded.

L1931047-01, -05, and -06: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (0%) and decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Lisa Westerlind

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L1931047
Project Number:	33525	**Report Date:**	07/30/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensation Product".

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Perfluorinated Alkyl Acids by Isotope Dilution

WG1260546-1, WG1260546-2, and WG1260546-3: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.

The WG1260546-3 LCSD recovery, associated with L1928493-01 through -03, is above the acceptance criteria for 1h,1h,2h,2h-perfluorodecanesulfonic acid (8:2fts) (139%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported.

The WG1260546-4 MS recoveries, performed on L1928493-01, are outside the acceptance criteria for perfluorooctanesulfonic acid (pfos) (17%) and perfluorodecanesulfonic acid (pfds) (145%).

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

SAMPLE RESULTS

Lab ID: L1928493-03 Date Collected: 06/28/19 10:20

Client ID: SOIL-SW-201 Date Received: 06/28/19

Sample Location: 140 CORTLAND AVE., SYRACUSE Field Prep: Not Specified

Sample Depth:

Parameter	Result	Qualifier	Units	RL	MDL	Dilution Factor
Perfluorinated Alkyl Acids by Isotope Dilution - Mansfield Lab						

Surrogate (Extracted Internal Standard)	% Recovery	Qualifier	Acceptance Criteria
Perfluoro[13C4]Butanoic Acid (MPFBA)	89		60-153
Perfluoro[13C5]Pentanoic Acid (M5PFPEA)	86		65-182
Perfluoro[2,3,4-13C3]Butanesulfonic Acid (M3PFBS)	97		70-151
Perfluoro[1,2,3,4,6-13C5]Hexanoic Acid (M5PFHxA)	92		61-147
Perfluoro[1,2,3,4-13C4]Heptanoic Acid (M4PFHpA)	93		62-149
Perfluoro[1,2,3-13C3]Hexanesulfonic Acid (M3PFHxS)	97		63-166
Perfluoro[13C8]Octanoic Acid (M8PFOA)	89		62-152
1H,1H,2H,2H-Perfluoro[1,2-13C2]Octanesulfonic Acid (M2-6:2FTS)	107		32-182
Perfluoro[13C9]Nonanoic Acid (M9PFNA)	92		61-154
Perfluoro[13C8]Octanesulfonic Acid (M8PFOS)	92		65-151
Perfluoro[1,2,3,4,5,6-13C6]Decanoic Acid (M6PFDA)	88		65-150
1H,1H,2H,2H-Perfluoro[1,2-13C2]Decanesulfonic Acid (M2-8:2FTS)	123		25-186
N-Deuteriomethylperfluoro-1-octanesulfonamidoacetic Acid (d3-NMeFOSAA)	79		45-137
Perfluoro[1,2,3,4,5,6,7-13C7]Undecanoic Acid (M7-PFUDA)	99		64-158
Perfluoro[13C8]Octanesulfonamide (M8FOSA)	71		1-125
N-Deuterioethylperfluoro-1-octanesulfonamidoacetic Acid (d5-NEtFOSAA)	111		42-136
Perfluoro[1,2-13C2]Dodecanoic Acid (MPFDOA)	110		56-148
Perfluoro[1,2-13C2]Tetradecanoic Acid (M2PFTEDA)	77		26-160

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name:	FORMER COYNE TEXTILE	**Lab Number:**	L1928493
Project Number:	33525	**Report Date:**	07/19/19

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensation Product".

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B**

APPENDIX H

Geotextile Cut Sheet

FX®-35HS

Carthage Mills' FX-35HS is a multipurpose nonwoven geotextile of 100% polypropylene staple fibers which are formed into a random network, needlepunched and heatset for dimensional stability. FX-35HS is part of the Carthage **FX-HS Series** of nonwoven geotextiles, is inert to biological degradation and resistant to naturally encountered chemicals, alkalis, and acids.

AASHTO M 288-06: FX-35HS exceeds the geotextile requirements for TEMPORARY SILT FENCE (NONWOVEN – SUPPORTED).

PROPERTY	TEST METHOD	DATA	
		METRIC	ENGLISH
☐ **Mechanical** Grab Tensile Strength	ASTM D 4632	0.40 kN	90 lbs
Grab Tensile Elongation		50%	
Trapezoidal Tear	ASTM D 4533	0.18 kN	40 lbs
CBR Puncture	ASTM D 6241	1.09 kN	245 lbs
☐ **Endurance** UV Resistance	ASTM D 4355	70% @ 500 hrs	
☐ **Hydraulics / Filtration** Permittivity (1)	ASTM D 4491	2.00 sec^{-1}	
Water Flow Rate (1)		5908 lpm/m^2	145 gpm/ft^2
Apparent Opening Size (AOS) (1)	ASTM D 4751	0.300 mm	50 US Std. Sieve
☐ **Physical** Mass Per Unit Area (Typical)	ASTM D 5261	118.7 g/m^2	3.5 oz/yd^2
Thickness (Typical)	ASTM D 5199	1.2 mm	50 mils
Standard Roll Sizes / Packaging / Weight	Measured (Typical)	3.81 m x 109.7 m 418.1 m^2 63.5 kg	12.5 ft x 360 ft 500 yd^2 140 lbs
		4.57 m x 109.7 m 501.6 m^2 77.1 kg	15.0 ft x 360 ft 600 yd^2 170 lbs

NOTES: Mullen Burst Strength ASTM D 3786 is no longer recognized by ASTM D35 on Geosynthetics. Puncture Strength ASTM D 4833 is not recognized by AASHTO M 288-06 and has been replaced with CBR Puncture ASTM D 6241.

(1) At the time of manufacturing. Handling, storage and shipping may change these properties.

- Unless otherwise stated, all values stated here are Minimum Average Roll Values (MARV).
- The properties reported above are effective 02-03-14 and are subject to change without notice.

Dear Ms. Miller,

Please know that all #2 crushed stone furnished from the T. H. Kinsella, Inc. Jamesville, NY location was sourced from uncontaminated, virgin material. This source has received NYS DOT approval, **number 3-3R**. The materials do not come from a hazardous waste site, nor do they come from a previously contaminated location. This location is registered with and operates under the authority of the NYS DEC (Permit # **7-3126-000122**).

If you have any other questions, please feel free to contact me.

Sincerely,

Aaron Howard

Sieve Analysis of Soil/Aggregate

Project Title: Laboratory Testing

Project #: L-18005
Test Method: ASTM C136 & C117

Report #: 16
Report Date: April 30, 2018

Source: T.H. Kinsella, Inc. - Jamesville, NY		**Sieve Size - Percent Passing Sieve**														
Lab I.D. #	**Sample I.D.**	**1 1/2"**	**1"**	**3/4"**	**1/2"**	**3/8"**	**1/4"**	**#4**	**#10**	**#30**	**#40**	**#60**	**#100**	**#200**		
35097	#2 Stone	100	99.2	40.6	3.0	1.3	1.2	1.2	1.1	1.0	1.0	0.9	0.8	0.7		
	NYSDOT Specifications Table 703-4 #2 Size	**100**	**90-100**	**--**	**0-15**	**--**	**--**	**--**	**--**	**--**	**--**	**--**	**--**	**0-1.0 (1)**		
		(1) The minus 200 material requirements apply only to aggregate for use in Portland cement concrete surface treatments and cold mix bituminous pavements. The test (NYSDOT 201) will be performed on the entire sample of the designated size aggregate. Primary size does not apply in the determination of the minus #200 material.														

Sample mass, as received, meets minimum mass requirements of test method: **Yes** X **No** _____

Performed By: A.M. **Checked By:** Patrick Edmiston

Remarks:

Prewashed

Entire Sample **X**

Mass Retained on #200 Only _____

Not Prewashed: _____

MATERIAL

Is this an Industrial Waste Stream? ◯ Yes ● No
Common Name: Petroleum Contaminated Soil (PCS)
Generation Process: Brownsfield Cleanup
Preferred Disposal Methods: NH002
Source of Contamination: Oil Tank and Dry Cleaner

MATERIAL COMPOSITION

Constituent	Dirt	90% TO %	
Constituent	Concrete/Brick/Block	9% TO %	
Constituent	Other	1% TO %	

State Waste Codes: N/A
Color: Brown
Physical state at 70° F: ● Solid ◯ Liquid ◯ Sludge ◯ Dust ◯ Other
pH TO
Strong Odor No Describe Odor
Reactivity No
Flash Point ● < 140°F ◯ 140°-199°F ◯ > 200°F ◯ N/A

REGULATORY

EPA Hazardous Waste? ◯ Yes ● No

If **No**, Attached Non-Hazardous Determination Document(s) *(Check all that apply)*

☐ Process Knowledge Process Details
☐ SDS
☑ Certified Analytical Sample
Is the data derived from testing a representative sample in accordance with 40 CFR 261 and/or other applicable laws? ● Yes ◯ No
If **Yes,** Type of Analytical Sample ● Composite ◯ Grab Sample ID #
☐ Exempt Waste

Applicable Exempt Waste Item

◯ UST Corrective Action - 40 CFR 261.4 (b)(10) ◯ PCB Bulk Product Waste - 40 CFR 761.62 ◯ Oil & Gas E&P Waste - 40 CFR 261.4 (b)(5) ◯ RCRA-Empty Containers - 40 CFR 261.7 ◯ Other

If **Other**, Provided reference _____

State Hazardous Waste? ◯ Yes ● No

Is this material non-hazardous due to treatment, delisting, or exclusion? ◯ Yes ● No

From an industry regulated under Benzene NESHAP? ◯ Yes ● No

Facility remediation subject to 40 CFR 63 GGGGG? ◯ Yes ● No

CERCLA or State-Mandated clean-up? ◯ Yes ● No

Regulated, Licensed or NORM Radioactive Waste? ◯ Yes ● No

Contains PCBs? ◯ Yes ● No

Regulated and/or Untreated Medical/Infectious Waste? ◯ Yes ● No

Contains Asbestos? ◯ Yes ● No

Subject to RCRA Subpart CC controls? ◯ Yes ● No

SHIPPING & DOT

Event Frequency ◯ One Time ● On-Going

Estimated Annual Qty 3800

Unit of Measure ● Tons ◯ Yards ◯ Drums ◯ Gallons ◯ Other _____

Shipping Frequency

◯ Once ◯ Daily ◯ Weekly ● Monthly ◯ Other _____

Qty Per Shipment 20 tons

Container Type Dump Truck

Container Size 20 Tons

USDOT Shipping Name Non-Regulated Material

PROFILE CERTIFICATION

I hereby certify that (1) all information submitted on this form and on supplemental materials is complete and accurate to the best of my knowledge and ability to determine; (2) the information provided herein, including any supplemental information, such as laboratory analytical, MSDS, etc., accurately describes the waste stream to be delivered to the facility and that all known or suspected hazards have been disclosed. I understand that, once the waste stream is approved by Destination Facility based on this information, any deviation in the source, composition, constituents or characteristics of the waste stream from the information described herein, may render the waste stream unacceptable for disposal, at the sole discretion of Destination Facility. I further understand that any deviation from the information contained herein will require immediate notification to the Destination Facility and cessation of disposal.
