WASTE DESCRIPTION

Waste Stream Name: Impacted Carbon

EPA Hazardous? ○ Yes ◉ No

DOT Hazardous Waste? ○ Yes ◉ No

State Hazardous Waste? ○ Yes ◉ No

Non-hazardous due to treatment, delisting, or exclusion? ○ Yes ◉ No

From an industry regulated under Benzene NESHAP ○ Yes ◉ No

Regulated, Licensed or NORM Radioactive Waste ○ Yes ◉ No

Contains PCBs ○ Yes ◉ No

Regulated and/or Untreated Medical/Infectious Waste ○ Yes ◉ No

Contains Asbestos ○ Yes ◉ No

Subject to RCRA Subpart CC controls ○ Yes ◉ No

Shipping Description: Non-Regulated Material - carbon used onsite for groundwater remediation

MATERIAL DETAILS

Is this an Industrial Waste Stream? ○ Yes ◉ No

Common Name: Carbon

Generation Process: onsite groundwater treatment system

Preferred Disposal Methods: NH002

Source of Contamination: Petroleum Tanks

MATERIAL COMPOSITION

Constituents

Constituent: Carbon TO 99

Color: Black

Physical state at 70° F: (•) Solid ( ) Liquid ( ) Sludge ( ) Dust ( ) Other

Free Liquid Range % TO %

pH 6.94 TO

Strong Odor No

Describe Odor

Reactivity No Reactivity Explanation

Flash Point: ( ) < 140°F ( ) 140°F - 199°F ( ) ≥ 200°F (•) N/A

EPA HAZARDOUS INFORMATION

Please complete this section if you answered **Yes** to *EPA Hazardous?*

Characteristic Waste

Characteristic PPM (MG/KG)

Listed Codes

Is this material subject to the Alternative DEBRIS standards (40 CFR 268.45)? ( ) Yes ( ) No

Is this material subject to the Alternative SOIL standards (40 CFR 268.49)? ( ) Yes ( ) No

Underlying Hazardous Constituents

Constituent:

Is this material exempt from subpart CC controls (40 CFR 264.1083)? ( ) Yes ( ) No

If **Yes**

( ) Waste meets LDR or treatment exemptions for organics (40 CFR 264.1082(c) or (c)(4))

( ) Waste contains VOCs that average <500 ppmw (40 CFR 264.1082(c)(1)). [Will require annual update]

NON-EPA HAZARDOUS INFORMATION

Please complete this section if you answered **No** to *EPA Hazardous?*

[ ] Process Knowledge

If **Yes**, Process Details

[ ] SDS

[x] Certified Analytical Sample

Is the data derived from testing a representative sample in accordance with 40 CFR 261 and/or other applicable laws?

(•) Yes ( ) No

If **Yes**, Type of Analytical Sample: (•) Composite ( ) Grab Sample ID #: 204708-01

[ ] Exempt Waste

Applicable Exempt Waste Item:

( ) UST Corrective Action - 40 CFR 261.4 (b)(10) ( ) PCB Bulk Product Waste - 40 CFR 761.62

( ) Oil & Gas E&P Waste - 40 CFR 261.4 (b)(5) ( ) RCRA-Empty Containers - 40 CFR 261.7 ( ) Other

If **Other**, Provided reference: 204708-01

NON-HAZARDOUS WASTE

Please complete this section if you answered **Yes** to *Non-hazardous due to treatment, delisting, or exclusion?*

( ) Delisted Hazardous Waste

( ) Treated Hazardous Waste Debris

( ) Excluded Waste under 40 CFR 261.4

If Excluded Waste, Specify Exclusions

( ) Treated Characteristic Hazardous Waste

STATE HAZARDOUS WASTE

Please complete this section if you answered **Yes** to *State Hazardous Waste?*

State Waste Codes:

BENZENE

Please complete this section if you answered **Yes** to *From an industry regulated under Benzene NESHAP?*

Are you a TSDF? ○ Yes ○ No

If **Yes**, Please complete the Benzene NESHAP questionnaire.

If **No**,

Does this material contain benzene? ○ Yes ○ No

If **Yes**, Flow Weighted Average Concentration in PPMW _____

What is your current facility's total annual benzene quantity in megagrams?

○ Less than (<) 1 Mg

○ 1 - 9.99 Mg

○ More than (>) 10 Mg

Is this waste soil from a remediation? ○ Yes ○ No

If **Yes**, Benzene Concentration in PPMW _____

Does the waste contain more than (>) 10% water/moisture? ○ Yes ○ No

Has material been treated to remove 99% of the benzene or to achieve less than 10ppmw? ○ Yes ○ No

Is material exempt from controls in accordance with 40 CFR 61.342? ○ Yes ○ No

If **Yes**, Specify Exemption _____

Is this waste stream subject to treatment and control requirements of 40 CFR Part 61, Subpart FF? ○ Yes ○ No

FACILITY REMEDIATION & CLEAN UP

Facility remediation subject to 40 CFR 63 GGGGG? ○ Yes ◉ No

If **Yes**, Does the material contain less than (<) 500 ppmw VOHAPS at the point of determination? ○ Yes ○ No

CERCLA or State-Mandated clean-up? ○ Yes ◉ No

If **Yes**, Please submit the Record of Decision or other documentation to assist others in the evaluation for proper disposal.

RADIOACTIVE WASTE

If you answered **Yes** to *Regulated, Licensed or NORM Radioactive Waste?*, please complete this section.

Identify Isotopes and pCi/g

Isotope _____ PCI/G _____

PCBS

Please complete this section if you answered **Yes** to *Contains PCBs?*

Regulated by 40 CFR 761? ○ Yes ○ No

Remediation under 40 CFR 761.61 (a)? ○ Yes ○ No

PCB imported into the US? ○ Yes ○ No

ASBESTOS

Please complete this section if you answered **Yes** to *Contains Asbestos?*

Is the Asbestos Friable or Non-Friable? ○ Friable ○ Non-Friable ○ Non-Friable regulated

PROFILE CERTIFICATION

I hereby certify that (1) all information submitted on this form and on supplemental materials is complete and accurate to the best of my knowledge and ability to determine; (2) the information provided herein, including any supplemental information, such as laboratory analytical, MSDS, etc., accurately describes the waste stream to be delivered to the facility and that all known or suspected hazards have been disclosed. I understand that, once the waste stream is approved by Destination Facility based on this information, any deviation in the source, composition, constituents or characteristics of the waste stream from the information described herein, may render the waste stream unacceptable for disposal, at the sole discretion of Destination Facility. I further understand that any deviation from the information contained herein will require immediate notification to the Destination Facility and cessation of disposal.

Re: Former Coyne Textile
Site ID No. C734144
Syracuse, Onondaga County, NY
Alternatives Analysis Report & Decision Document

Dear Mr. Peios:

The New York State Department of Environmental Conservation (DEC) and the New York State Department of Health (NYSDOH) have reviewed the Alternative Analysis Report (ARR) for the Former Coyne Textile site dated March 2020 and prepared by CHA Consulting, Inc. on behalf of Ranalli/Taylor St., LLC. The AAR is hereby approved. Please ensure that a copy of the approved AAR is placed in the document repository(ies). The draft plan should be removed.

Enclosed is a copy of DEC's Decision Document for the site. The remedy is to be implemented in accordance with this Decision Document. Please ensure that a copy of the Decision Document is placed in the document repository(ies).

Please contact the Department's Project Manager, Michael Belveg, at 315-426-7446 or Michael.belveg@dec.ny.gov at your earliest convenience to discuss next steps. Please recall the DEC requires seven day's notice prior to the start of field work.

Sincerely,

Susan L. Edwards

DECISION DOCUMENT

Former Coyne Textile
Brownfield Cleanup Program
Syracuse, Onondaga County
Site No. C734144
July 2020

Prepared by
Division of Environmental Remediation
New York State Department of Environmental Conservation

DECLARATION STATEMENT - DECISION DOCUMENT

Former Coyne Textile
Brownfield Cleanup Program
Syracuse, Onondaga County
Site No. C734144
July 2020

Statement of Purpose and Basis

This document presents the remedy for the Former Coyne Textile site, a brownfield cleanup site. The remedial program was chosen in accordance with the New York State Environmental Conservation Law and Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York (6 NYCRR) Part 375.

This decision is based on the Administrative Record of the New York State Department of Environmental Conservation (the Department) for the Former Coyne Textile site and the public's input to the proposed remedy presented by the Department.

Description of Selected Remedy

The elements of the selected remedy, as shown in Figure 3 are as follows:

1. Remedial Design

A remedial design program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows:

• Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
• Reducing direct and indirect greenhouse gases and other emissions;
• Increasing energy efficiency and minimizing use of non-renewable energy;
• Conserving and efficiently managing resources and materials;
waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
• Maximizing habitat value and creating habitat when possible;
• Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals;
• Integrating the remedy with the end use where possible and encouraging green and sustainable re-development; and

• Additionally, to incorporate green remediation principles and techniques to the extent feasible in the future development at this site, any future on-site buildings will include, at a minimum, a 20-mil vapor barrier/waterproofing membrane on the foundation to improve energy efficiency as an element of construction.

2. Excavation

Part of the existing on-site building will be demolished and materials which can't be beneficially reused on site will be taken off-site for proper disposal in order to implement the remedy.

Excavation to groundwater (approximately 10 feet) and off-site disposal of contaminant source areas, including:

• Grossly contaminated soil, as defined in 6 NYCRR Part 375-1.2(u);
• Soils in the source area which exceed the protection of groundwater soil cleanup objectives (PGWSCOs), as defined by 6 NYCRR Part 375-6.8 for those contaminants found in site groundwater above standards; and
• Soils that create a nuisance condition, as defined in Commissioner Policy CP-51 Section G.

Excavation and removal of any additional underground storage tanks (USTs) that may be found, fuel dispensers, underground piping or other structures associated with a source of contamination.

3. Backfill

On-site soil which does not exceed the above excavation criteria or commercial use SCOs for any constituent may be used anywhere beneath the cover system, including below the water table, to backfill the excavation or re-grade the site.

Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) will be brought in to replace the excavated soil and establish the designed grades at the site.

The site will be re-graded to accommodate installation of a cover system as described in remedy element 4.

4. Cover System

A site cover currently exists in areas not occupied by buildings and will be maintained to allow for commercial use of the site. Any site redevelopment will maintain the existing site cover or be replaced with an alternate cover. The site cover may include paved surface parking areas, sidewalks or soil where the upper one foot of exposed surface soil meets the applicable soil cleanup objectives (SCOs) for commercial use. A demarcation layer will be needed in any areas where fill will need to be brought in. Any fill material brought to the site will meet the requirements for the identified site use as set forth in 6NYCRR part 375-6.7(d).

5. Soil Mixing / In-Situ Reduction

In-situ reduction of contaminated soil will be implemented in an approximately 6,000 square foot area located in the northwestern portion of the building, as indicated on Figure 3, in the source area of VOC groundwater contamination. The treatment zone will extend from the top of the groundwater table, at approximately 9 feet below grade to approximately 16 feet below grade. The contaminated soil will be mixed in place with zero valent iron (ZVI) using an excavator or augers. During mixing, VOCs may be released, and the capture of any released VOCs will be assessed during design.

6. Groundwater Remedies

Monitoring

Monitoring for contaminants of concern will be required up-gradient, down-gradient, and within the treatment zone of the source area and the plume.

Groundwater Extraction & Treatment

Groundwater extraction and treatment will be implemented to treat contaminants in groundwater and to ensure contaminated groundwater does not migrate off-site. The groundwater extraction system will be designed and installed so that the capture zone is sufficient to cover the areal and vertical extent of the plume within the site boundary and intercept the groundwater contaminant plume to stop further migration. The extraction system will create a depression of the water table so that contaminated groundwater is directed toward the extraction wells within the plume area. Groundwater will be extracted from the area of the groundwater contaminant plume shown on Figure 3 using a submersible pump placed in one or more extraction wells. Further details of the extraction system will be determined during the remedial design. The extraction system will be designed to minimize the drawdown of the water table in order to reduce smearing of non-aqueous phase liquid in the area of drawdown.

Prior to the full implementation of this technology, studies will be conducted to define design parameters, including extraction well spacing.

The extracted groundwater will be treated using Ex-situ Chemical Oxidation (ESCO).

Ex-Situ Chemical Oxidation or Reduction

Ex-situ chemical oxidation (ESCO) and reinjection will be implemented to treat contaminants in groundwater. A chemical oxidant will be mixed into the extracted groundwater to destroy the contaminants. Groundwater recirculation in combination with oxidant addition would be performed in the central portion of the plume indicated on Figure 3. Groundwater would be removed through extraction wells, amended with oxidizing reagents, and reinjected into the subsurface through a series of injection wells once it has met TOGS 1.1.1 ambient water quality standards for Class GA waters.

As part of design and prior to the full implementation of this technology, laboratory and on-site pilot scale studies will be conducted to refine design parameters.

Monitored Natural Attenuation

Groundwater contamination remaining after active remediation has been completed or has been performed to the extent practicable, as determined by the Department will be addressed with monitored natural attenuation (MNA). Groundwater will be monitored for site related contamination and also for MNA indicators which will provide an understanding of the (biological activity) breaking down the contamination. Reports of the attenuation will be provided at yearly intervals, and active remediation will be proposed if it appears that natural processes alone will not address the contamination. The contingent remedial action will be In-Situ Chemical Oxidation, unless information available at the time indicates this is not the appropriate remedial action.

7. Treatment Remedy Shutdown

The operation of the treatment components of the remedy will continue until the remedial objectives have been achieved, or until the Department determines that continued operation is technically impracticable or not feasible.

8. Vapor Mitigation

Any on-site buildings will be required to have an active sub-slab depressurization system, or other acceptable measures, to mitigate the migration of vapors into the building from soil and/or groundwater.

9. Institutional Control
Imposition of an institutional control in the form of an environmental easement for the controlled property which will:

• Require the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8 (h)(3);
• Allow the use and development of the controlled property for commercial use as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
• Restrict the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or County DOH; and
• Require compliance with the Department approved Site Management Plan.

10. Site Management Plan

A Site Management Plan is required, which includes the following:

A. An Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:

Institutional Controls: The Environmental Easement discussed in Remedial Element 9 above.

Engineering Controls: The soil cover discussed in Remedial Element 4, the groundwater extractions and treatment system in Remedial Element 6 and the sub-slab depressurization system(s) discussed in Remedial Element 8 above.

This plan includes, but may not be limited to:

- An Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination;
- A provision for demolition of on-site buildings if and when they become unsafe or inactive or vacant;
- Descriptions of the provisions of the environmental easement including any land use, and groundwater use restrictions;
- A provision that should a building foundation or building slab be removed in the future, a cover system consistent with that described in remedial element 4 above will be placed in any areas where the upper one foot of exposed surface soil exceeds the applicable soil cleanup objectives (SCOs)
- Provisions for the management and inspection of the identified engineering controls;
- Maintaining site access controls and Department notification; and
- The steps necessary for the periodic reviews and certification of the institutional and/or engineering controls.

B. A Monitoring Plan to assess the performance and effectiveness of the remedy. The plan includes, but may not be limited to:

- Monitoring of groundwater, indoor air, and soil vapor to assess the performance and effectiveness of the remedy;
- A schedule of monitoring and frequency of submittals to the Department; and
- Monitoring for vapor intrusion for any buildings on the site, as may be required by the Institutional and Engineering Control Plan discussed above.

C. An Operation and Maintenance (O&M) Plan to ensure continued operation, maintenance, optimization, monitoring, inspection, and reporting of any mechanical or physical components of the remedy. The plan includes, but is not limited to:

- Procedures for operating and maintaining the remedy;
- Compliance monitoring of treatment systems to ensure proper O&M as well as providing the data for any necessary permit or permit equivalent reporting;
- Maintaining site access controls and Department notification; and
- Providing the Department access to the site and O&M records.

Declaration

The remedy conforms with promulgated standards and criteria that are directly applicable, or that are relevant and appropriate and takes into consideration Department guidance, as appropriate. The remedy is protective of public health and the environment.

Remedial Bureau D

DECISION DOCUMENT

Former Coyne Textile
Syracuse, Onondaga County
Site No. C734144
July 2020

SECTION 1: SUMMARY AND PURPOSE

The New York State Department of Environmental Conservation (the Department), in consultation with the New York State Department of Health (NYSDOH), has selected a remedy for the above referenced site. The disposal of contaminants at the site has resulted in threats to public health and the environment that would be addressed by the remedy. The disposal or release of contaminants at this site, as more fully described in this document, has contaminated various environmental media. Contaminants include hazardous waste and/or petroleum.

The New York State Brownfield Cleanup Program (BCP) is a voluntary program. The goal of the BCP is to enhance private-sector cleanups of brownfields and to reduce development pressure on "greenfields." A brownfield site is real property, the redevelopment or reuse of which may be complicated by the presence or potential presence of a contaminant.

The Department has issued this document in accordance with the requirements of New York State Environmental Conservation Law and 6 NYCRR Part 375. This document is a summary of the information that can be found in the site-related reports and documents.

SECTION 2: CITIZEN PARTICIPATION

The Department seeks input from the community on all remedies. A public comment period was held, during which the public was encouraged to submit comment on the proposed remedy. All comments on the remedy received during the comment period were considered by the Department in selecting a remedy for the site. Site-related reports and documents were made available for review by the public at the following document repository:

DECInfo Locator - Web Application
https://www.dec.ny.gov/data/DecDocs/C734144/

Onondaga County Public Library
447 South Salina Street
Syracuse, NY 13202
Phone: (315) -435-1900

Receive Site Citizen Participation Information by Email

Please note that the Department's Division of Environmental Remediation (DER) is "going paperless" relative to citizen participation information. The ultimate goal is to distribute citizen participation information about contaminated sites electronically by way of county email listservs. Information will be distributed for all sites that are being investigated and cleaned up in a particular county under the State Superfund Program, Environmental Restoration Program, Brownfield Cleanup Program and Resource Conservation and Recovery Act Program. We encourage the public to sign up for one or more county listservs at http://www.dec.ny.gov/chemical/61092.html.

SECTION 3: SITE DESCRIPTION AND HISTORY

Location: The site is located at 140 Cortland Avenue in the City of Syracuse and consists of two non-contiguous site areas. The former and currently vacant main laundry facility and offices are known as 140 Cortland Avenue and consist of one parcel of land totaling approximately 1.75 acres. The other site area is known as 1002-1022 South Salina Street/Cortland Avenue and 1024-1040 South Salina Street/Tallman Street, and constitute two parcels totaling approximately 1.70 acres. The site limits are generally bounded by commercial buildings to the north, South Salina Street to the east, Tallman Street to the south and South Clinton Street to the west. The site is currently inactive/unoccupied and zoned for commercial use.

Site Features: 140 Cortland Ave. consists of the currently vacant former laundering facility and offices, sidewalks and limited vegetation. The building is a concrete block building with a slab-on-grade foundation. The other area consists of a small park and a fenced in asphalt parking lot.

Current Zoning and Land Use: The site is currently inactive and is zoned for commercial use. The general area surrounding the site is highly developed and consists of commercial and industrial facilities. Several rows of multifamily houses are located northwest of the site.

Past Use of the Site: For more than 100 years, the site was used for industrial purposes, including a machine shop and rug manufacturing before Coyne Textile Services began operation in 1938. As an industrial dry-cleaning facility, the site utilized tetrachloroethene (PCE) and Stoddard solvent (a non-chlorinated solvent) until 2000. Several property owners had structures on what is now the employee parking lot, dating back to 1892 when the location was a brick and mortar building that housed a stone cutting facility. Syracuse Transit Corporation had a bus storage and repair building on the parcel beginning in 1951. From 1989 until acquisition by the current owner, the parcel was used for employee parking and a small greenspace.

Coyne Textile Services filed for bankruptcy and ceased operations in late 2015. Ranalli/Taylor St. LLC purchased the property in 2016 and entered a Brownfield Cleanup Agreement (BCA) in September 2017.

Site Geology and Hydrogeology: The site has an approximate elevation of 390 feet above mean sea level and is relatively flat. The surrounding areas to the east and west have a relatively steep topographic gradient, which slopes downward to Onondaga Creek. Site soils are tight and consist of Urban Land with the bedrock anticipated to be of Paleozoic era, stratified sequence. The bedrock geology underlying the site is the Syracuse Formation, which consists of dolostone,

shale, gypsum, and salts. The exact depth of the bedrock is unknown at the site, but it is known to be at a depth greater than 80 feet bgs.

The estimated depth to groundwater is less than 15 feet below ground surface. The groundwater in the area appears to be brackish saline. Groundwater at the site is assumed to flow to the northwest toward Onondaga Creek. However, localized flow directions in the area of the site may vary as a result of underground utilities or other heterogeneous subsurface conditions. Onondaga Creek is located approximately 600 feet west of the site, which flows in a northerly direction towards Onondaga Lake.

A site location map is attached as Figure 1 and a site boundary map is attached as Figure 2.

SECTION 4: LAND USE AND PHYSICAL SETTING

The Department may consider the current, intended, and reasonably anticipated future land use of the site and its surroundings when evaluating a remedy for soil remediation. For this site, alternatives that restrict the use of the site to commercial use (which allows for industrial use) as described in Part 375-1.8(g) were evaluated in addition to an alternative which would allow for unrestricted use of the site.

A comparison of the results of the Remedial Investigation (RI) to the appropriate standards, criteria and guidance values (SCGs) for the identified land use and the unrestricted use SCGs for the site contaminants is available in the RI Report.

SECTION 5: ENFORCEMENT STATUS

The Applicant under the Brownfield Cleanup Agreement is a Volunteer. The Volunteer does not have an obligation to address off-site contamination. The Department has determined that this site poses a significant threat to human health and the environment and there are off-site impacts that require remedial activities; accordingly, enforcement actions related to the off-site are necessary and a search for potential responsible parties is being performed.

The Department entered a Brownfield Cleanup Agreement with Ranalli/Taylor St., LLC for the Former Coyne Textile site on July 13, 2015 (Index No. C734144-06-15). The agreement governs the submission and implementation of work plans for the site investigation, remediation and operation, maintenance and monitoring.

SECTION 6: SITE CONTAMINATION

6.1: Summary of the Remedial Investigation

A remedial investigation (RI) serves as the mechanism for collecting data to:

- characterize site conditions;
- determine the nature of the contamination; and
- assess risk to human health and the environment.

The RI is intended to identify the nature (or type) of contamination which may be present at a site and the extent of that contamination in the environment on the site or leaving the site. The RI reports on data gathered to determine if the soil, groundwater, soil vapor, indoor air, surface water or sediments may have been contaminated. Monitoring wells are installed to assess groundwater and soil borings, or test pits are installed to sample soil and/or waste(s) identified. If other natural resources are present, such as surface water bodies or wetlands, the water and sediment may be sampled as well. Based on the presence of contaminants in soil and groundwater, soil vapor will also be sampled for the presence of contamination. Data collected in the RI influence the development of remedial alternatives. The RI report is available for review in the site document repository and the results are summarized in section 6.3.

The analytical data collected on this site includes data for:

- ambient (outdoor) air
- groundwater
- soil
- soil vapor
- indoor air
- sub-slab vapor

6.1.1: Standards, Criteria, and Guidance (SCGs)

The remedy must conform to promulgated standards and criteria that are directly applicable or that are relevant and appropriate. The selection of a remedy must also take into consideration guidance, as appropriate. Standards, Criteria and Guidance are hereafter called SCGs.

To determine whether the contaminants identified in various media are present at levels of concern, the data from the RI were compared to media-specific SCGs. The Department has developed SCGs for groundwater, surface water, sediments, and soil. The NYSDOH has developed SCGs for drinking water and soil vapor intrusion. For a full listing of all SCGs see: http://www.dec.ny.gov/regulations/61794.html.

6.1.2: RI Results

The data have identified contaminants of concern. A "contaminant of concern" is a contaminant that is sufficiently present in frequency and concentration in the environment to require evaluation for remedial action. Not all contaminants identified on the property are contaminants of concern. The nature and extent of contamination and environmental media requiring action are summarized below. Additionally, the RI Report contains a full discussion of the data. The contaminants of concern identified at this site are:

tetrachloroethene (PCE)
benzene
isopropylbenzene
vinyl chloride
cis-1,2-dichloroethene
trans-1,2-dichloroethene
trichloroethene (TCE)
xylene (mixed)

iron sodium
magnesium

The contaminants of concern exceed the applicable SCGs for:

- groundwater
- soil
- soil vapor intrusion
- indoor air

6.2: Interim Remedial Measures

An interim remedial measure (IRM) is conducted at a site when a source of contamination or exposure pathway can be effectively addressed before issuance of the Decision Document.

The following IRMs have or will be completed at this site based on conditions observed during the RI.

Source Removal IRM

In June of 2019, an excavation program was undertaken to remove three underground storage tanks (USTs) and associated contaminated soils at the site. The excavation took place in the northwestern portion of the building in the former UST area. See green hashed area on Figure 3. The excavations went to a depth of approximately 9 feet below ground surface (bgs). The excavation ceased at that depth in order to prevent compromising the structural integrity of the building via undermining.

In addition to the tanks, approximately 354 tons of contaminated soil was removed from the site. A demarcation layer was placed along the limits of the excavation area and clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) was brought in to replace the excavated soil. More details of the work completed under this IRM are within the Construction Completion Report (CCR) submitted to the Department in October 2019.

Office Area Vapor Intrusion IRM

In June of 2019, the Department received an IRM proposal to address soil vapor intrusion within the office area of the building. This IRM called for a sub-slab depressurization system (SSDS) to be installed within the office portion of the building. The IRM work plan was approved by the Department on June 25, 2019. Due to an anticipated structural change of the office building, the IRM remedial work was put in hold. This IRM will be completed during the remedial action work.

6.3: Summary of Environmental Assessment

This section summarizes the assessment of existing and potential future environmental impacts presented by the site. Environmental impacts may include existing and potential future exposure

pathways to fish and wildlife receptors, wetlands, groundwater resources, and surface water. The RI report presents a detailed discussion of any existing and potential impacts from the site to fish and wildlife receptors.

Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Groundwater was also sampled for emerging contaminants (ECs). Soil vapor was analyzed for VOCs. Based upon investigations conducted to date, the primary contaminants of concern appear to be VOCs and metals with minor detections of ECs, PCBs, and SVOCs.

Soil

Surface Soils:
Only one VOC, acetone, was detected in the surface soil sample at a concentration of 0.427 parts per million (ppm) which exceeds the unrestricted soil cleanup objective (SCO) of 0.05 ppm but is less than the commercial SCO of 500 ppm. SVOCs, PCBs, metals, and pesticides were not detected above their respective unrestricted SCOs.

No off-site surface soil samples were taken during the RI.

Subsurface Soils:
Only one VOC was detected at a concentration exceeding the Part 375 commercial SCO, tetrachloroethene (PCE), at a maximum concentration of 460 ppm compared to the commercial SCO of 150 ppm. This sample was located in the northwest corner of the building. There were several compounds that were also found in groundwater and that exceeded their respective Protection of Groundwater SCOs (PGW SCOs) in soil, including benzene at a maximum of 0.39 ppm, which exceeds the PGW SCO of 0.06 ppm, vinyl chloride at a maximum of 12.3 ppm, which exceeds the PGW SCO of 0.02 ppm, cis-1,2-dichloroethene at a maximum of 424 ppm, which exceeds the PGW SCO of 0.25 ppm, trans-1,2-dichloroethene at a maximum of 3.46 ppm, which exceeds the PGW SCO of 0.19 ppm, 1,1-dichloroethene at a maximum of 1.45 ppm, which exceeds the PGW SCO of 0.33 ppm, tetrachloroethene at a maximum of 460 ppm, which exceeds the PGW SCO of 1.3 ppm, and trichloroethene at a maximum of 38.3 ppm, which exceeds the PGW SCO of 0.47 ppm. There are several other volatile compounds, including 1,2,4 trimethylbenzene at a maximum of 4.31 ppm, 2-butanone (MEK) at a maximum of 0.115 ppm, and acetone at a maximum of 5.9 ppm that were detected above unrestricted SCOs but below the commercial use SCOs.

SVOCs detected at concentrations exceeding their respective unrestricted SCOs, but below commercial SCOs, include benzo(a)anthracene at a maximum of 2.42 ppm, benzo(a)pyrene at a maximum of 2.28 ppm, benzo(b)fluoranthene at a maximum of 3.06 ppm, benzo(k)fluoranthene at a maximum of 1.64 ppm, chrysene at a maximum of 2.42 ppm, and indeno(1,2,3-cd)pyrene at a maximum of 0.79 ppm. No SVOCs were detected at concentrations exceeding the commercial SCOs or the protection of groundwater SCOs.

Pesticides were not detected in any of the subsurface samples.

PCBs, including Aroclor 1242 and Aroclor 1260 were detected at concentrations above their respective unrestricted SCO of 0.1 ppm, but below the commercial SCO. The maximum Total PCBs concentration was 0.74 ppm.

Low concentrations of metals were found across the site. Barium was detected at a concentration of 404 ppm, which exceeds the commercial SCO of 400 ppm. This sample was located near the location of the former folding/product storage area. Lead was detected at a concentration of 776 ppm, which exceeds its respective PGW SCO of 450 ppm. Several other metals were detected above unrestricted SCOs, but below the commercial SCO including copper at a maximum of 114 ppm, nickel at a maximum of 56.2 ppm, zinc at a maximum of 315 ppm, and mercury at a maximum of 1.4 ppm.

No off-site subsurface samples were taken during the RI. However, four off-site soil borings were sampled previously in 2015 for VOCs and SVOCs. These borings were located to the northwest of the site. No VOCs exceeded their commercial SCOs, however several VOCs were found in groundwater and also exceeded their Part 375 PGW SCOs. These include 1,1-dichloroethene at a maximum of 1.0 ppm, which exceeds the PGW SCO of 0.33 ppm, tetrachloroethene at a maximum of 150 ppm, which exceeds the PGW SCO of 1.3 ppm, benzene at a maximum of 0.68 ppm, which exceeds the PGW SCO of 0.06 ppm, vinyl chloride at a maximum of 0.75 ppm, which exceeds the PGW SCO of 0.02 ppm, trans-1,2-dichloroethene at a maximum of 1.0 ppm, which exceeds the PGW SCO of 0.19 ppm, trichloroethene at a maximum of 14 ppm, which exceeds the PGW SCO of 0.47 ppm, and cis-1,2-dichloroethene at a maximum of 4.2 ppm, which exceeds the PGW SCO of 0.25 ppm. There were several SVOCs that exceeded their respective commercial SCOs. These included benz(a)anthracene at a maximum concentration of 20 ppm with an SCO of 5.6 ppm, benzo(a)pyrene at a maximum concentration of 17 ppm with an SCO of 1.0 ppm, benzo(b)fluoranthene at a maximum concentration of 21 ppm with an SCO of 5.6 ppm, dibenz(a,h)anthracene at a maximum concentration of 2.4 ppm with an SCO of 0.56 ppm, and indeno(1,2,3-cd)pyrene at a maximum concentration of 8.8 ppm with an SCO of 5.6 ppm. Off-site impacts will be addressed under site C734144A.

Groundwater

No PCBs or pesticides were detected in the groundwater.

VOCs detected in groundwater above the standard of 5 parts per billion (ppb) include 1,1-dichloroethene at a maximum of 18 ppb, isopropylbenzene (Cumene) at a maximum of 121 ppb, tetrachloroethene at a maximum of 21,400 ppb, trichloroethene at a maximum of 1,980 ppb, xylene (Total) at a maximum of 6.3 ppb with, cis-1,2-dichloroethene at a maximum of 4,550 ppb, and trans-1,2-dichloroethene at a maximum of 27.5 ppb. Other VOCs that were above groundwater standards include benzene at a maximum of 104 ppb with a standard of 1 ppb, and vinyl chloride at a maximum of 1,560 ppb with a standard of 2 ppb. Most of the VOC groundwater impacts were located in the northwest portion of the building, but VOC impacts were detected throughout the site.

Only one SVOC exceeded groundwater standards and that was bis(2-Ethylhexyl)phthalate at a maximum of 11 ppb with a standard of 5 ppb. This was located in the northwest portion of the building.

Metals that exceeded the groundwater standards include barium at a maximum of 2940 ppb with a standard of 1000 ppb, beryllium at a maximum of 7 ppb with a standard of 3 ppb, chromium at a maximum of 55 ppb with a standard of 50 ppb, copper at a maximum of 1,120 ppb with a standard of 200 ppb, lead at a maximum of 27 ppb with a standard of 25 ppb, magnesium at a maximum of 204,000 ppb with a standard of 35000 ppb, and thallium at a maximum of 14.5 ppb with a standard of 0.5 ppb. Metals within the groundwater were detected throughout the whole site.

Emerging contaminants (ECs) detected in the groundwater include numerous per and poly fluorinated alkyl substances (PFAS). The maximum total PFAS found was 3674.8 parts per trillion (ppt), considerably higher than the screening level of 500 ppt. The individual PFAS included: 6:2 fluorotelomer sulfonate (6:2FTS) at a maximum of 33 ppt, perfluorobutanesulfonic acid (PFBS) at a maximum of 14 ppt, perfluorobutanoic acid (PFBA) at a maximum of 330 ppt, perfluorodecanoic acid (PFDA) at a maximum of 2.1 ppt, perfluoroheptanesulfonic Acid (PFHpS) at a maximum of 24 ppt, perfluoroheptanoic acid (PFHpA) at a maximum of 160 ppt, perfluorohexanesulfonic acid (PFHxS) at a maximum of 25 ppt, perfluorohexanoic acid (PFHxA) at a maximum of 350 ppt, perfluorononanoic acid (PFNA) at a maximum of 75 ppt, perfluorooctanesulfonic acid (PFOS) at a maximum of 2,000 ppt exceeding the screening level of 10 ppt, perfluorooctanoic acid (PFOA) at a maximum of 300 ppt exceeding the screening level of 10 ppt, perfluoropentanoic acid (PFPeA) at a maximum of 360 ppt. 1,4-dioxane was found at a maximum of 1.7 ppb exceeding the screening level of 1 ppb. Most of the ECs were detected in the northwest portion of the building.

No off-site wells were sampled during the remedial investigation. However, four off-sites wells were sampled previously in 2015 for VOCs and SVOCs. These wells are located to the northwest of the site. Each of these wells have contaminants that exceed water quality standards and guidance values. The following contaminants were detected above the groundwater standards at one or more of the wells: tetrachloroethene at a maximum of 3100 ppb with a standard of 5 ppb, benzene at a maximum of 4.4 ppb with a standard of 1 ppb, vinyl chloride at a maximum of 3200 ppb with a standard of 2 ppb, trans-1,2-dichloroethene at a maximum of 230 ppb with a standard of 5 ppb, trichloroethene at a maximum of 2000 ppb with a standard of 5 ppb, cis-1,2-dichloroethene at a maximum of 5600 ppb with a standard of 5 ppb, and 1,1-dichloroethene at a maximum of 15 ppb with a standard of 5 ppb. Off-site impacts will be addressed under site C734144A.

Soil Vapor Intrusion

Elevated indoor air and sub-slab soil vapor concentrations needing additional action were detected throughout the building. Compounds detected in the indoor air that need additional action include: tetrachloroethene at a maximum of 50.9 ug/m^3 and trichloroethene at a maximum of 1.1 ug/m^3.

Compounds detected in the sub-slab vapor include: tetrachloroethene at a maximum of 1090 ug/m^3, trichloroethene at a maximum of 106 ug/m^3, 1,1,1-trichloroethane at a maximum of 5.3 ug/m^3, and cis 1,2-dichloroethene at a maximum of 38.4 ug/m^3.

No off-site indoor or sub-slab soil vapor samples were taken during the RI. However, it is possible that there is potential for impacts to indoor air from site contaminants via the soil vapor intrusion pathway in off-site buildings.

6.4: Summary of Human Exposure Pathways

This human exposure assessment identifies ways in which people may be exposed to site-related contaminants. Chemicals can enter the body through three major pathways (breathing, touching or swallowing). This is referred to as *exposure*.

People who enter the site may contact contaminants in the soil by walking on it, digging or otherwise disturbing the soil. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the subsurface may move into soil vapor (air spaces within the soil), which in turn may move into buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings is referred to as soil vapor intrusion. Environmental sampling indicates that the potential exists for the inhalation of site contaminants due to soil vapor intrusion off-site and for future on-site buildings.

6.5: Summary of the Remediation Objectives

The objectives for the remedial program have been established through the remedy selection process stated in 6 NYCRR Part 375. The goal for the remedial program is to restore the site to pre-disposal conditions to the extent feasible. At a minimum, the remedy shall eliminate or mitigate all significant threats to public health and the environment presented by the contamination identified at the site through the proper application of scientific and engineering principles.

The remedial action objectives for this site are:

Groundwater

RAOs for Public Health Protection

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of volatiles, from contaminated groundwater.

RAOs for Environmental Protection

- Restore ground water aquifer to pre-disposal/pre-release conditions, to the extent practicable.
- Remove the source of ground or surface water contamination.

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation of or exposure from contaminants volatilizing from contaminants in soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

Soil Vapor

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

SECTION 7: ELEMENTS OF THE SELECTED REMEDY

The alternatives developed for the site and the evaluation of the remedial criteria are presented in the Alternative Analysis. The remedy is selected pursuant to the remedy selection criteria set forth in DER-10, Technical Guidance for Site Investigation and Remediation and 6 NYCRR Part 375.

The selected remedy is referred to as the Source Area Treatment, Groundwater Extraction, Treatment and Recirculation and Vapor Intrusion Mitigation remedy.

The elements of the selected remedy, as shown in Figure 3 are as follows:

1. Remedial Design

A remedial design program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows:

• Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
• Reducing direct and indirect greenhouse gases and other emissions;
• Increasing energy efficiency and minimizing use of non-renewable energy;
• Conserving and efficiently managing resources and materials;
waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
• Maximizing habitat value and creating habitat when possible;
• Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals;
• Integrating the remedy with the end use where possible and encouraging green and sustainable re-development; and

• Additionally, to incorporate green remediation principles and techniques to the extent feasible in the future development at this site, any future on-site buildings will include, at a minimum, a 20-mil vapor barrier/waterproofing membrane on the foundation to improve energy efficiency as an element of construction.

2. Excavation

Part of the existing on-site building will be demolished and materials which can't be beneficially reused on site will be taken off-site for proper disposal in order to implement the remedy.

Excavation to groundwater (approximately 10 feet) and off-site disposal of contaminant source areas, including:

• Grossly contaminated soil, as defined in 6 NYCRR Part 375-1.2(u);
• Soils in the source area which exceed the protection of groundwater soil cleanup objectives (PGWSCOs), as defined by 6 NYCRR Part 375-6.8 for those contaminants found in site groundwater above standards; and
• Soils that create a nuisance condition, as defined in Commissioner Policy CP-51 Section G.

Excavation and removal of any additional underground storage tanks (USTs) that may be found, fuel dispensers, underground piping or other structures associated with a source of contamination.

3. Backfill

On-site soil which does not exceed the above excavation criteria or commercial use SCOs for any constituent may be used anywhere beneath the cover system, including below the water table, to backfill the excavation or re-grade the site.

Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) will be brought in to replace the excavated soil and establish the designed grades at the site.

The site will be re-graded to accommodate installation of a cover system as described in remedy element 4.

4. Cover System

A site cover currently exists in areas not occupied by buildings and will be maintained to allow for commercial use of the site. Any site redevelopment will maintain the existing site cover or be replaced with an alternate cover. The site cover may include paved surface parking areas, sidewalks or soil where the upper one foot of exposed surface soil meets the applicable soil cleanup objectives (SCOs) for commercial use. A demarcation layer will be needed in any areas where fill will need to be brought in. Any fill material brought to the site will meet the requirements for the identified site use as set forth in 6NYCRR part 375-6.7(d).

5. Soil Mixing / In-Situ Reduction

In-situ reduction of contaminated soil will be implemented in an approximately 6,000 square foot area located in the northwestern portion of the building, as indicated on Figure 3, in the source area of VOC groundwater contamination. The treatment zone will extend from the top of the groundwater table, at approximately 9 feet below grade to approximately 16 feet below grade. The contaminated soil will be mixed in place with zero valent iron (ZVI) using an excavator or augers. During mixing, VOCs may be released, and the capture of any released VOCs will be assessed during design.

6. Groundwater Remedies

Monitoring

Monitoring for contaminants of concern will be required up-gradient, down-gradient, and within the treatment zone of the source area and the plume.

Groundwater Extraction & Treatment

Groundwater extraction and treatment will be implemented to treat contaminants in groundwater and to ensure contaminated groundwater does not migrate off-site. The groundwater extraction system will be designed and installed so that the capture zone is sufficient to cover the areal and vertical extent of the plume within the site boundary and intercept the groundwater contaminant plume to stop further migration. The extraction system will create a depression of the water table so that contaminated groundwater is directed toward the extraction wells within the plume area. Groundwater will be extracted from the area of the groundwater contaminant plume shown on Figure 3 using a submersible pump placed in one or more extraction wells. Further details of the extraction system will be determined during the remedial design. The extraction system will be designed to minimize the drawdown of the water table in order to reduce smearing of non-aqueous phase liquid in the area of drawdown.

Prior to the full implementation of this technology, studies will be conducted to define design parameters, including extraction well spacing.

The extracted groundwater will be treated using Ex-situ Chemical Oxidation (ESCO).

Ex-Situ Chemical Oxidation or Reduction

Ex-situ chemical oxidation (ESCO) and reinjection will be implemented to treat contaminants in groundwater. A chemical oxidant will be mixed into the extracted groundwater to destroy the contaminants. Groundwater recirculation in combination with oxidant addition would be performed in the central portion of the plume indicated on Figure 3. Groundwater would be removed through extraction wells, amended with oxidizing reagents, and reinjected into the subsurface through a series of injection wells once it has met TOGS 1.1.1 ambient water quality standards for Class GA waters.

As part of design and prior to the full implementation of this technology, laboratory and on-site pilot scale studies will be conducted to refine design parameters.

Monitored Natural Attenuation

Groundwater contamination remaining after active remediation has been completed or has been performed to the extent practicable, as determined by the Department will be addressed with monitored natural attenuation (MNA). Groundwater will be monitored for site related contamination and also for MNA indicators which will provide an understanding of the (biological activity) breaking down the contamination. Reports of the attenuation will be provided at yearly intervals, and active remediation will be proposed if it appears that natural processes alone will not address the contamination. The contingent remedial action will be In-Situ Chemical Oxidation, unless information available at the time indicates this is not the appropriate remedial action.

7. Treatment Remedy Shutdown

The operation of the treatment components of the remedy will continue until the remedial objectives have been achieved, or until the Department determines that continued operation is technically impracticable or not feasible.

8. Vapor Mitigation

Any on-site buildings will be required to have an active sub-slab depressurization system, or other acceptable measures, to mitigate the migration of vapors into the building from soil and/or groundwater.

9. Institutional Control
Imposition of an institutional control in the form of an environmental easement for the controlled property which will:

- Require the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8 (h)(3);
- Allow the use and development of the controlled property for commercial use as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
- Restrict the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or County DOH; and
- Require compliance with the Department approved Site Management Plan.

10. Site Management Plan

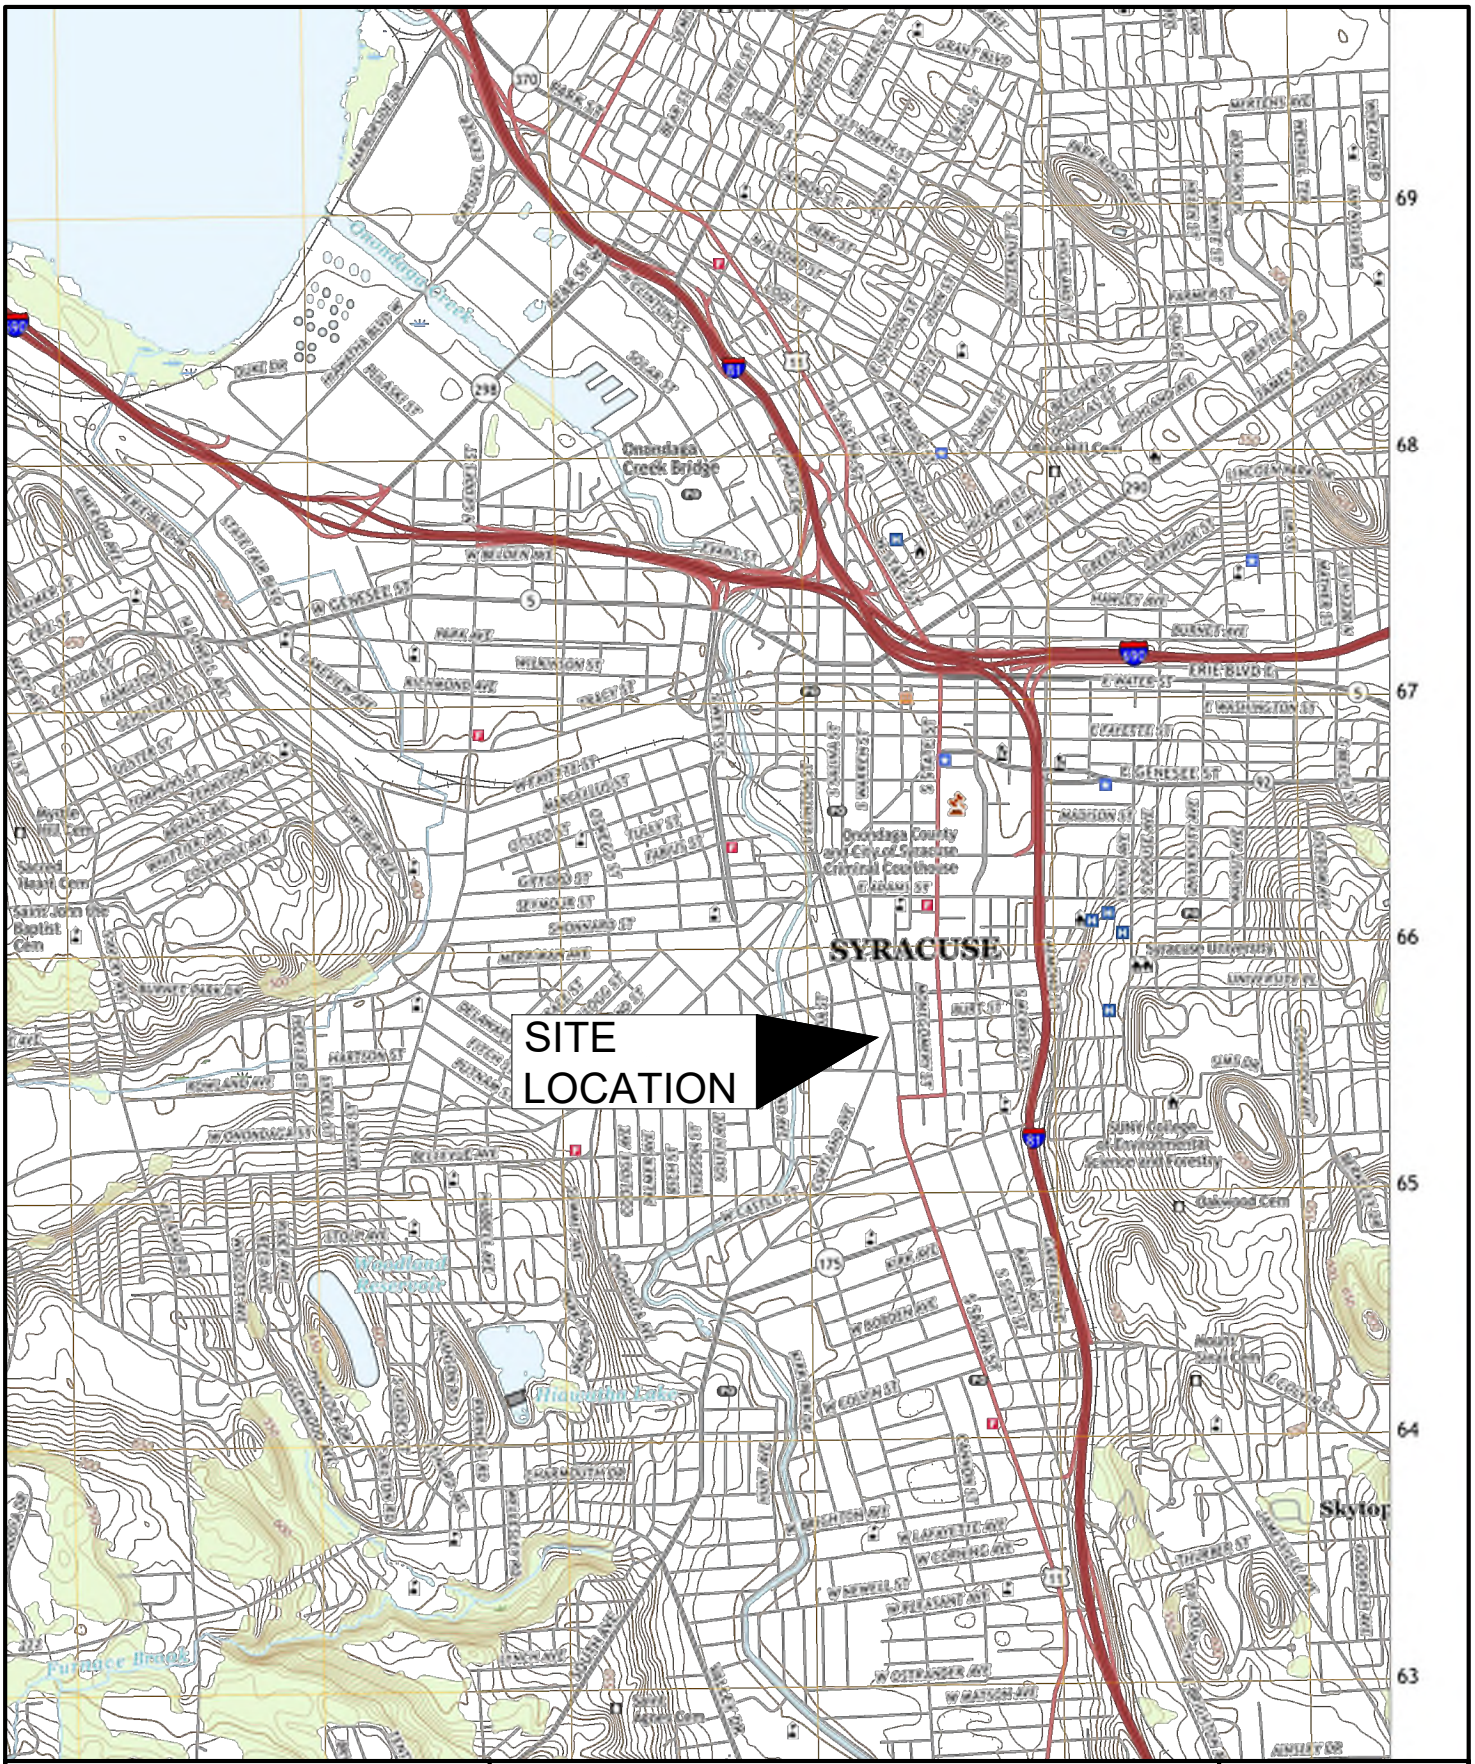
A Site Management Plan is required, which includes the following:

A. An Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:

Institutional Controls: The Environmental Easement discussed in Remedial Element 9 above.

Engineering Controls: The soil cover discussed in Remedial Element 4, the groundwater extractions and treatment system in Remedial Element 6 and the sub-slab depressurization system(s) discussed in Remedial Element 8 above.

This plan includes, but may not be limited to:



- An Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination;
- A provision for demolition of on-site buildings if and when they become unsafe or inactive or vacant;
- Descriptions of the provisions of the environmental easement including any land use, and groundwater use restrictions;
- A provision that should a building foundation or building slab be removed in the future, a cover system consistent with that described in remedial element 4 above will be placed in any areas where the upper one foot of exposed surface soil exceeds the applicable soil cleanup objectives (SCOs)
- Provisions for the management and inspection of the identified engineering controls;
- Maintaining site access controls and Department notification; and
- The steps necessary for the periodic reviews and certification of the institutional and/or engineering controls.

B. A Monitoring Plan to assess the performance and effectiveness of the remedy. The plan includes, but may not be limited to:

- Monitoring of groundwater, indoor air, and soil vapor to assess the performance and effectiveness of the remedy;
- A schedule of monitoring and frequency of submittals to the Department; and
- Monitoring for vapor intrusion for any buildings on the site, as may be required by the Institutional and Engineering Control Plan discussed above.

C. An Operation and Maintenance (O&M) Plan to ensure continued operation, maintenance, optimization, monitoring, inspection, and reporting of any mechanical or physical components of the remedy. The plan includes, but is not limited to:

- Procedures for operating and maintaining the remedy;
- Compliance monitoring of treatment systems to ensure proper O&M as well as providing the data for any necessary permit or permit equivalent reporting;
- Maintaining site access controls and Department notification; and
- Providing the Department access to the site and O&M records.

Remedial Design Work Plan

Dear Mr. Peios:

Thank you for providing the above referenced Remedial Design Work Plan (RDWP) dated July 2020 for the Former Coyne Textile site in Syracuse, New York.

The NYSDEC and the NYSDOH have the determined that the RDWP is satisfactory. Please place a copy of the final RDWP (along with the response to comment letter) in the sites document repository.

Please notify the Department before any field work begins to allow Department personnel the opportunity to be present during the activities outlined.

Should you have any questions please contact me at (315) 426-7446 and thanks again for your efforts in continuing to move this project forward.

Sincerely,

Michael Belveg
Assistant Engineer (Environmental), Division of Environmental Remediation

PAGE NO.	OF
DATE:	8.3.2020

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0650 - CHA on site, Covid check in
Spoke with Mike Clancy → foreman for ERSI is Hank

0710 - Dan Warner (PEC) on site

0800 - Dan in the excavator removing concrete to uncover the tank

0815 - PEC crew on site
Mark - Superintendent
Rick
Randy

0825 - SUN Environmental on site to meet with ERSI

0840 - Safety orientation

1100 - PEC truck with stone for the stockpiling pad arrives
2nd truck comes around 1200pm
Two loads of stone to create containment pad with berm. Pay not placed today due to high winds forecast overnight.

1300 - Peter Paragon on site → pushed crew to continue digging. Uncovered the tank manway and found it to be closed in place with flowable fill. Appears to be positioned in a ~~the~~ section between the former WWTP room and the former boiler room.

1430 - CHA offsite to pick up CAMP air monitoring stations and set them up for tomorrow.

REPORT NO. 062
PAGE NO. 2 OF 4
DATE: 8-4-20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0640 CHA and PEC on site
waiting for Covid check-in

0630-0700 setting up CAMP stations

by 0730 - PEC uncovered tank
1 small tank (~500-750 gallons)
1 large tank (10,000 gallons)

10,000 gallon tank -
Some oil leaking through hole in side of tank
Sheen on water/soil
mild petroleum odor
holes visible
manway filled with flowable fill
double wall steel tank
Only ~1/2 full of flowable fill near other end of tank (not by manway)

multiple truckloads of stone delivered for a ramp/staging area

Pike/PEC - PEC requested ERSI clean slab in location of wells outside the building; discussion w/ Pike, PEC agreed to use brush attachment to clean slab on 8/5

0842 backup alarm not working on the excavator - Mike (Pike) stopped work on the tank removal

Chris Sanson, Sean (PEC) on site

Fixed backup alarm on excavator and continued work

Chris, Sean, and I laid out well locations within the building based on offsets from exterior walls.

1100 Checked Environet CHA # 3 not reporting (PID & Dustrak)
CHA # 1 not reporting (PID)

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

PROJECT #	059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

before 1100 - tank had been removed

worked on fixing CAMP stations, but unsuccessful.

1140 - Peter and I discussed location of the tank extending into TZ-2A will chase contaminated soil to the south and east, but not north. TBD regarding extent of ZVI/soil mixing in the location of excavation.
Must make JPS aware of new location of structural fill vs ZVI/ cement mixing.

1245 - Sam Miller (CHA) on site to discuss location of tank within limits of TZ-2A.

1330 - Sam offsite
call w/ Scott Smith (CHA) to discuss progress and schedule
decide Anthony & Scott will be on-site at 0730 on 8/5/20 for safety orientation.

~1400 - Heard a loud bang from the site. I was in the trailer still. Mike and I went to investigate - a PEC excavator had hit a utility pole which caused a distribution line to snap and fall to the ground. Multiple breakers also blew.

DATE: 9·7·2020

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA & PEC onsite

0650-0710 set up CAMP Stations

no wind, but wind is generally ~~N~~ SW → NE in this area.

0820 Checked CHA #3 because environet indicated a flow block error. Dustrak appears to be working fine. Reset it anyway.

0830 → Checked CHA #3 again, same issue
Several trucks of concrete hauled offsite for recycling.

1110 Discussion with Mark regarding concrete vaults and concrete debris found as deep as 12 ft below grade in the location of TZ-2C.
Deep vault and other large concrete pieces removed.
Concrete stained and smells of solvent; set aside for disposal (ideally at Seneca Meadows)

1130 ~~Reste~~ Reset entire CAMP Station CHA #3; appears to have fixed the problem.

1145 P. Paragon on site, Sean delivers Geoprobe

1200 Spraying concrete slab w/ water and using brush attachment to clean the surface
Second office trailer for Pike delivered.

1300 Dan Warner and Sam Miller on site to discuss soil mixing and the amount of debris encountered

1330 Second drill rig delivered

1430 PEC ~~complet~~ done for today and offsite

1515 CHA offsite

DATE: 8·11·20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0640 CHA and PEC on site
Covid checkin, grab equipment from the trailer

0700-0725 set up CAMP stations, bump test PIDs, zero-calibrate the Dusttraks.

PEC informs Pike of a break-in over night. Bolt cutters appear to have been used to cut a hole in the fence along S. Clinton St. and to cut the lock on the PEC trailer. Bolt cutters and cut lock found at the trailer. Multiple hand tools, a welder, and a small generator were stolen.
Police on site ~ 0715 to file a report.

0830 Sam Miller on site
0900 Mike Belveg (DEC) onsite for walk through and check on progress.
0916 Dust (particulate matter) exceedance at CHA #2. CHA stopped the excavator breaking up concrete in that area to discuss slowing work, wetting surfaces, and placing piles in another area further from the perimeter.
0924 Exceedance resolved.

PEC ~~sto~~ excavated and stockpiled concrete for disposal.
PEC excavated soil in the location where sheet piles will be placed. backfilled with soil before placing the fence back around the open tank excavation.

Drilling team continued to core drill well locations
Placed 2 wells EW-6, EW-5
Have to offset to the north the wells ~~at~~ EW-5 and west due to obstruction.

Some PEC crew offsite at 1600.
Drill crew offsite at
CHA offsite at 1630

DATE: 8.13.2020

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 - CHA onsite, set up CAMP stations
0640 - PEC onsite
0700 Call with Sam to discuss communication issues experienced yesterday (8.12.20)
0715 Peter Paragon onsite

labelled previously placed stickup well risers. Eight (8) wells completed yesterday. Plan to continue core drilling, installing wells, and will mix ~~cement~~ cement to finish already placed wells.

~0830 Chris Sanson on site

Mark and crew will continue driving sheet piles on sidewalk side of TZ-2.
Still waiting on soil profile approval for the trucking and disposal of soil from the site. → likely won't happen until next week.

Edin from JPS onsite to observe drilling and placement of wells.
~1000 discussed soil sample jars collected by JPS and where they might have been placed. Called Gail to see if she placed them somewhere safe (as discussed with here back in April/May when this first came up) but she doesn't recall what happened to them.

CHA walked the building to see if they were stashed somewhere and did not find them. Samples were likely discarded during the demolition.

~1200 PEC unable to drive sheet pile due to obstruction — likely concrete
~1250 Exploration of the obstruction with excavator. Concrete appears to be vertical, ~~with the~~ and in line with the building foundation (approx 2ft ~~in~~ to the east of the building foundation). Slightly angled the sheet pile to avoid the concrete.

PEC was able to drive sheet piles to protect the sidewalk from activities within TZ-2

CHA

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

WEATHER	TEMPERATURE
hot sunny	HIGH 88
	LOW 68

Project Number: 059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

1300 Soils with a heavy sheen and odor identified ~ 10-14ft bgs during the exploration for concrete at the sheet pile perimeter. Very strong fuel oil odor.

1303 Dust exceedance at CHA #1 (upwind) Exceedance is from the demolition crew loading piles of waste (trash) into roll offs for disposal. Excavator with clamp attachment picking up and moving debris created excess dust. CHA moved CHA #1 further south (within perimeter of work) to avoid disturbance from building demolition activities.

1320 Last sheet pile placed.

1530 Mark, Randy, Rick offsite for the day ; drillers still working

1530 Check in with drillers, labelled well risers
Conversation with Ed (JPS) regarding soil samples ; asked me to call Jay (JPS)

1545 Called Jay (JPS) and explained the soil sample situation. He seemed appeased. Will plan to come to the site on Monday to observe drilling.

~1600 tear down CAMP Stations – drillers just grouting wells and cleaning up

1700 NYEG (Drill crew) and CHA offsite

0630 CHA onsite, PEC already on site

0640 - 0705 Set up CAMP Stations
Crew Checkin

mixer head attachment for soil mixing arrived on Friday; technician from Alpine to be onsite today for setup / installation / testing.

~1000 Dave, of Pioneer, on site to check in with Mike

Multiple deliveries today including:
- GAC vessels
- last tank (4900 gallon)
- slurry plant
- Cement silo

Crew set up secondary containment and began placing the treatment train equipment in the containment area.

Completed all but one well (EW-1) inside the building. Drill rig at EW-1 hit refusal at ~5 ft bgs. Geoprobe needed on another site, so it was demobilized and will be brought back to complete EW-1 when available. offset location ~2 ft and will need to be core drilled prior to drilling.

Tore down CAMP Stations ~1600-1615.

CHA and PEC offsite at 1630

0635 CHA onsite, PEC already onsite

0645 - 0725 Set up CAMP Stations - waited to set CHA #1 until I spoke to Mike regarding the perimeter fence being moved over night.

Vandalism - people moved the gate to enter on the SW corner of the building. Broke the metal door off of the control panel for the slurry mixing equipment. Several things appeared altered but not significantly damaged.

PEC requesting Pike to move forward on full time overnight security. Mike (Pike) also set up a meeting with the police department to discuss these issues.

Mike commented that the Catholic Charities Men's Shelter may not be relocated until next fall (Fall 2021).

Jay, from Slurry Engineering, on site at ~0650.
Cement silo not in the best shape, so Jay to work on fixing it all day today.

Air Compressor delivered.

Trucks of clean concrete removed from site for recycling.

Marked out location of IW-8 for the drillers.

~1245 discussed building facade removal with Dan and Mike.
ERSI to begin facade removal by the end of this week. Will forego doing the first floor until the security issue is figured out. Will put holes in the wall on NE corner of remaining building

PAGE NO.	3 OF 3
DATE:	8-18-20

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

WEATHER	TEMPERATURE
	HIGH
	LOW

PROJECT #	059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

1323 - Call from Mark asking me to check something on site. Area directly NE of previous tank excavation (GPS pin available) appears to be a concrete vault. Explored with excavator. Found a vertical steel pipe ~4ft long, but no tank found. Soil and gw heavily stained, sheen, and smells like fuel oil. Excavated deeper in attempt to find tank - nothing found. Excavation filled back in for safety. Will remove contaminated soils once approved & by Landfill.

1415 - Mark moved south and used hydraulic hammer to break up concrete. Fill port beneath the slab surface found. Placed a pole down the fill port. Tank appears to be mostly empty with ~8 inches of water mixed with fuel oil. Crew removed soil and concrete around tank. PID reading inside fill port = 96.7ppm. 2 copper lines extending E/W from tank PID readings ≈ 215ppm. Mark called P. Paragon to have crew set up for tank cleaning and removal tomorrow. Danger tape placed around the excavation.

1630 Take down CAMP Stations, PEC offsite

1645 CHA offsite

0545 CHA and PEL onsite
0600 - 0615 Set up camp stations
covid-19 checkin
0625 dump trucks begin to arrive - 5 on rotation today
0630 Mike (Pike) signing Bills of Lading for soil disposal.
2 additional PEL crew members onsite to clean out small (~500 gallon) tank found on 8.18.20 and assist with well development.
0700 - 0900 CHA offsite for dentist appointment

Delivery of Sodium Permanganate - 24 totes

Began excavating contaminated soil from UST excavation. Northern sidewall appears moderately clean. PID readings ~1.2 ppm.
Soil sidewall sample collected at 10:05 SOIL-SW-300 to be analyzed for VOCs and SVOCs by Alpha Analytical.
~1000 Sam Miller onsite
1015 Small tank out of the ground. Appears to be corroded and have multiple holes in the bottom.
1018 Crane arrived for setting the slurry plant silo.
1110 Sam Miller offsite
1110 test pit to the south of current excavation limits, contaminated soil identified ~ 9ft bgs, PID = 2245 ppm
1115 test pit ~~near~~ ~~test~~ approximately 20 ft N of southern perimeter of TZ-1 and near the western building limits. Found a tank. Excavated to the east of the tank. Contamination found ~11ft bgs. PID = 392.1 ppm. Smells of solvent rather than petroleum.
Tank found to be empty. Removed cautiously and set aside to be cut open to make sure it is clean.

	LOW

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

PROJECT #	059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

Small tank excavation filled back in for safety.

~1130 Test pit on southeastern limit of TZ-1. Stained soils and PID = ~500ppm. Strong odor

Copper piping identified 8-18-20 explored. Did not find end of piping yet. Test pit in that same location. Clays 7-10 ft bgs. Dark clays but no odor and very low PID readings (< 1.0 ppm)
∴ moderately uncontaminated soils to the east of TZ-1.

Crew using ho-ram jackhammer attachment to break up concrete to the southern limits of TZ-1 identified a circular covering and shallow water. To be investigated.

Continue excavating in the hole from the 10,000 gallon tank. Hit concrete ~ 8.5 ft below the surface. Use ho-ram and excavator to remove the concrete. Concrete appears to have been for the base of the tank, not along the sides.
Beneath the concrete was stone that is saturated with black, viscous, sticky fuel oil. PID readings 77–158 ppm recorded.
Bottom of concrete is ~12 ft bgs.

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA onsite, unable to get gate open with access code.

0702 Mike got the mandoor at the fence gate open and manually opened the gate.

Covid check-in

0720 - 0730 Set up CAMP stations.

0810 Shawn hit refusal (again) while drilling for EW-1. CHA looked into feasibility of using GW-100 instead. GW-100 screen is set from 13 - 23 ft bgs. CHA approved using GW-100 as EW-1.

0828 Checked CAMP stations. CHA#3 switched to Survey mode. Switched it back to Manual mode.

Visible dust from truck / equipment traffic. Spoke with Mark regarding dust mitigation. Currently working on running underground water to the slurry plant and will have a hose near the haul routes to spray down the roads soon.

0855 Mike Belveg (DEC) onsite
Walked the site with Mike. Asked about end-point sampling requirements. According to Mike, we should look at the Protection of GW SCO and if the detections exceed that standard and TOGS 1.1.1 GW standard (from RI sampling), then the "source" has not fully been removed... Checking with Sam because I was under the impression we are using the Commercial SCO as guidance for where to end the excavation.

10 trucks on rotation today

0640 CHA on site
PEC already on-site and pumping out the excavation, placing water into the fractank.

0650 - 0710 set up CAMP stations
Dan and Montez laying out grids for the soil mixing cells.

0730 - Cement delivery - placed directly into the silo

trucks hauling soil off for disposal.

0806 crew moved sump out to dig the sump area deeper

trucks lined with poly sheeting to handle more saturated material.

0830 Edin (JPS) on site. Phone call with Jim to describe the excavation
Jim called Peter → Jim concerned about backfilling the excavation with the soft clays and in the water table.
PEC to do best at dewatering and smoothing the bottom for JPS approval.

Jim Stewart scheduled a full meeting for 2:30 this afternoon.

1130 excavating 2-9 ft bgs from cell 7 in ~~8~~ TZ-2C

1150 setting up mixer head controls (GPS)

1220 - 1300 rain delay

1300 - 1400 setting up to start mixing operations

1406 First attempt - hose for the ZVI mixture is plugged up. Caused leak at hose connection. Hose appers to be filled with dry slurry when not properly cleaned after previous use.
Delay while crew cleaned injection line.

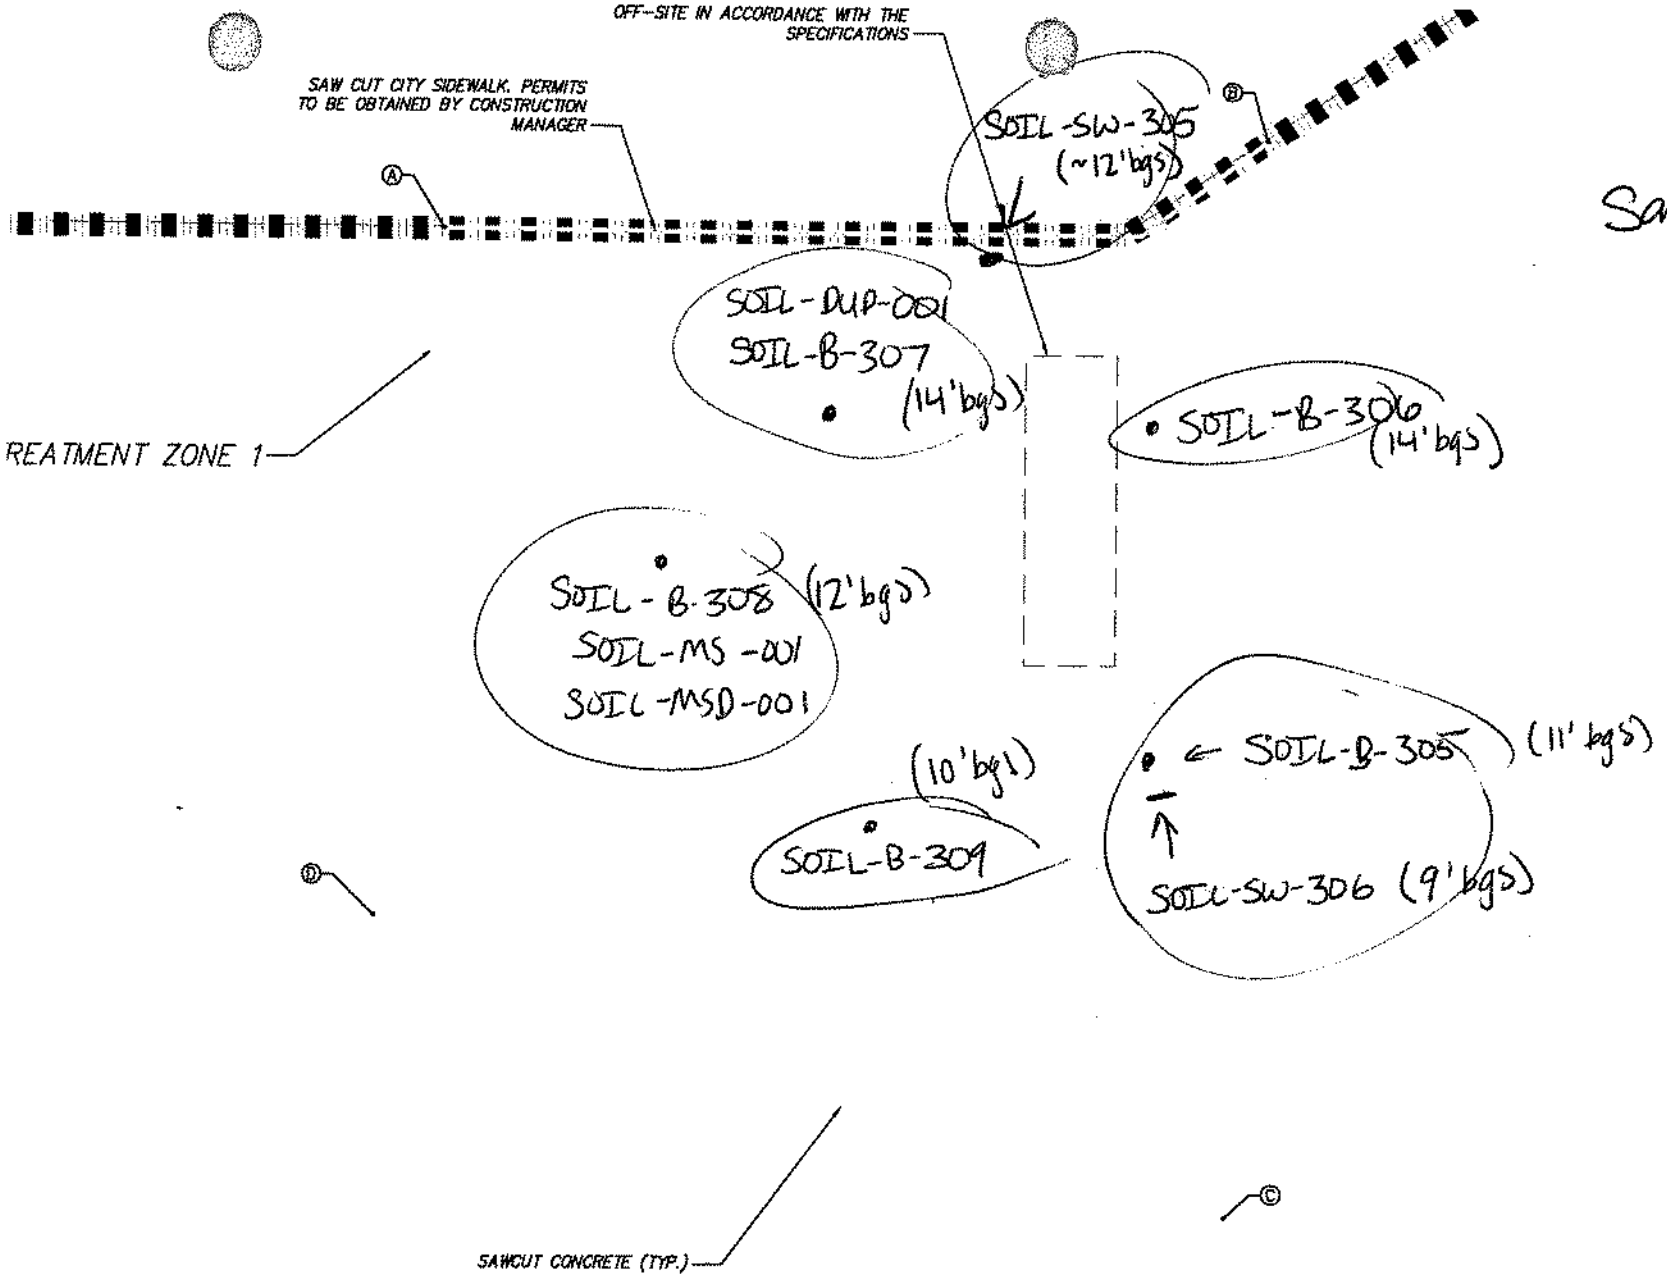
0630 CHA on Site, PEC already loading trucks

0640 - 0700 CHA set up CAMP Stations
on 8.25, winds shifted from SW → NE to nearly W → E.
Prepared CAMP stations for wind shift today due to forecast.

0830 - began Pumping from the excavation

Jim Stewart on Site ~ 11:00
Jim concerned with excavation backfill and the consistency of the slurry in the soil mixing zone.

Collected 10 confirmatory Samples – including duplicate and MS/MSD. See attached plan with sampling locations.



Finished mixing cell 7 with ZVI slurry

1515 - Mark calls CHA to say they found another tank in the adjacent cell within TZ-2C. Tank appears to be ~ 8ft in diameter, filled with grout or sand, and likely contained diesel or other light fuel oil - based on sheen on surrounding soils.

1600 - CHA takes down CAMP stations

16:30 - CHA offsite

0630 PEL and CHA on site

0630 - 0650 CHA set up CAMP stations

0715 PEL using booms attached to string in attempt to push free product towards one corner of the site.

0725 explored the area south of the current excavation limits

uncovered 3 pipes leaking fuel and water

uncovered 2 catchbasins (concrete) filled with black oil stained sediment/debris.

Removed 2 catchbasins and associated piping from W. proj. limit to ~ 60 feet to the E.

Did not go further to remove piping due to interfering with gw treatment wells.

Collected soil samples

SOIL-SW-307	2.5' bgs
SOIL-SW-308	3' bgs
SOIL-B-310	4' bgs

See attached plan for locations.

PEL delivered a trench box

Continued soil mixing in Cell 6, south of the tank that was found within Cell 6.

ERSI took down most of the privacy fence.

1305 - hose broke off the mixing head riser, again.

Dan Warner said they intend to have a pipe extension fabricated to keep the hose attachment out of the slurry.

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 021
PAGE NO. 2 OF 2
DATE: 8-31-20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0615 CHA on Site, PEL onsite
0630-0635 Set up CAMP Stations.
Full calibration of all 3 PIDs in CAMP Stations
Covid Check-in.
0655 2 vacuum trucks on rotation to remove water from the frac tanks and dispose of the water/oil off site.
Allan (Matrix Environmental) on site to continue setting up the groundwater treatment system configuration.
0718 One excavator removed from the site

PEL installing attachment to piping for slurry injection on the excavator with the mixer head and riser.

Spoke with Gail Cauley – requested a sample of the wooden block floor at Syracuse Stamp be collected and analyzed. Connected with Sam to discuss specific parameters/test methods and how to sample → she'll get back to me.
PEL installed sheet piles between TZ-1 and TZ-2A.
Shawn and Montez installed IW-4 with drill rig.

Rick fished out 3 large boulders from Cell 6 in TZ-2A. Was able to continue mixing to depth until the slurry plant broke down. Continued mixing Cell 6 and Cell 2.
~1530 working on the slurry plant.
Since the full depth of soil mixing in TZ-2B (Cell 2), CHA allowed slurry to be poured at the top and fully mixed. The soil had already been agitated, so adequate mixing was achieved.
1630 take down CAMP Stations, CHA offsite at 1650.

0545 CHA and PEC on site
0555 - 0610 set up CAMP Stations

Crew begins pumping water from the excavation. Doesn't appear to have accumulated more free product overnight.

0650 Portland cement delivery to the Slurry plant.

Checked on cement/slurry mixed on 9.1.20 → seems to be stiffening up well.

Continued pumping gw and sheen. Only sheen remaining on the water surface. Free product and black saturated stone removed.

CHA decided not to have a temporary well placed in the sump location due to very little contamination remaining. Sheen only, no free product.

Pumping on the well would remove a significant amount of water and very little contamination.

No petroleum free product appears to be entering the excavation from sidewalls or bottom.

~0800 wind direction changed; swirling winds; unable to move "upwind" CAMP station due to work being conducted by ERSI.

Checked CHA #1 → minor PID readings (<2 ppm)

0800 CME on site - Joe - sent to do safety training

0900 Jim Stewart and Ed (JPS), Dave (Pioneer) onsite to discuss backfilling procedures.

0935 PEC began placing ROC in the SE section of the excavation. ~18" thick for bottom lift. Compacted w/ plate tamper, passed testing.

Multiple dust exceedances at CHA #3 this morning. Dust from haul roads, clean stone stockpiles and debris piles. Requested water truck. Winds intense.

PROJECT # 059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

Rick and slurry crew mixing soil/cement slurry on top of Cells 6 and 2. Mixed ~ 6" into the cement mixture from 9.1.20 to bind the two layers.

Rick began working on a portion of Cell 4 with ZVI mixing. ZVI clogged the slurry plant causing it to shut down.

~1500 decision on secondary containment for individual pumps to be placed around the well-field. CHA allowing individual pumps (not the chemical feed pumps) to be placed outside secondary containment.

PEL continued moving #3 stone around excavation to be able to place ROC on the bottom - upon approval by Jim or Ed (JPS). One small (~15' by 26) area left to place bottom stone at EOD.

PEL creating 'pier' of ROC along sheetpiles placed between TZ-1 and TZ-2A to contain soil mixing operations when sheet piles are removed.

PEL placing ROC up the whole way where wells still need to be installed.

DATE:	9.3.20

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

WEATHER	TEMPERATURE
	HIGH
	LOW

PROJECT #	059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

11:50 AM. Scott Smith (CHA) arrived on-site and completed a COVID-19 questionnaire and a temperature check.

12:00 PM. Met with Karyn Ehmann (CHA) to walk the site to review current activities at the site, review procedures for the shutdown of the CAMP stations and briefly discuss options being considered relative to the remediation and redevelopment of the Syracuse Stamp property. Current major site activities included:

- Treatment Zone 1: Paragon Environmental Construction (PEC) was had completed the placement of the No. 3 & 4 stone in Treatment Zone. In three quadrants of the excavation (all but the southwest quadrant/corner), the No. 3 & 4 washed stone had been covered with an orange non-woven geotextile to serve as a demarcation barrier and placement of run-of-crush imported fill had commenced. Specifically, PEC was placing material into the excavation using a hydraulic excavator and compacting the material with a walk behind plate tamper. CME Associates was on-site to complete in-place density testing. Karyn Ehmann indicated that they had no problems achieving the 95 percent of the maximum dry density for the material.
- Treatment Zone 2: The UST has been removed and PEC has continued with the soil mixing operations.
- Treatment Zone 3: PEC is coordinating the on-going fabrication of plumbing for Treatment Zone 3.

12:45 PM. Karyn Ehmann left the site. Immediately before her departure, she met with Peter Paragon (PEC) to direct them to stop the placement of additional No. 3 & 4 washed stone in the southwest quadrant of Treatment Zone 1. Apparently PEC thought that corner was going to be filled to match existing grades using the No. 3 & 4 stone, but CHA directed them to stop the placement of the wash stone, level it off, place the demarcation barrier on top and backfill the entire footprint of the Treatment Zone 1 excavation with structural fill (e.g. run of crush).

1:00 PM. Scott Smith and Samantha Miller (CHA) attend the on-site progress meeting. Highlights relative to the environmental work included:

- Jim Stewart (Stopen) indicated that he was satisfied with the placement of the filter layer of run of crush stone as well as the No. 3 & 4 stone in Treatment Zone 1. PEC indicated that they plan to complete the backfilling of Treatment Zone 1 by midday tomorrow so that the completion of the Treatment Zone 3 wells can commence Tuesday morning following the Labor Day holiday.
- There is a void space (suspected former locker room) adjacent to Treatment Zone 2 that will not be addressed by the remedial construction. Jim Stewart requested PEC show him this area following the meeting as it will need to be addressed (filled) regardless of whether it part of the remedial contract or not.
- Jim Stewart requested two soil borings immediately following the completion of Treatment Zone 2. Specifically, he requested a 20-foot deep boring in Treatment Zone 1 (exact location to be determined by Stopen after review of the in-place density testing reports) and a 30-foot deep boring in Treatment Zone 2C. Jim requested that PEC collect continuous samples in each boring using a 3-inch standard split-spoon sampler. Stopen will have an inspector on-site to record boring logs and standard penetration blow counts.

- Chris Sanson (PEC) indicated that they should have the installation of the Treatment Zone 3 treatment system complete by Wednesday next week and will be ready to operate the system next Thursday. When Pike inquired as to whether or not they would finish on-time, Chris indicated that he thought that was still possible. He stated that the wells were easy to developed (e.g. the turbidity dropped quickly) and that he is now more confident that they will be able to reinject the treated water. He did state that a couple of the wells were dry, but they could still be used as injection wells.

2:00 PM. Following the progress meeting, PEC had completed the placement of the demarcation barrier across the entire Treatment Zone 1 excavation and had placed the first couple of lifts using an excavator to place the stone and compacting the material with a plate tamper. Now that the first lifts were installed, PEC had constructed a run of crush stone ramp into the excavation and was now using a bulldozer to place additional lifts which were being compacted using a smooth drum vibratory roller. The sheet piles are planned to be extracted tomorrow. In Treatment Zone 2, PEC was working on mixing the top 9 feet in Treatment Zone 2 with soil and cement.

2:30 PM. Scott Smith met with Chris Sanson (PEC) to review the setup of the Treatment Zone 3 treatment system. Chris asked if they could use the flow meters to monitor the batch sizes rather than continuously climbing the non-translucent tank levels. Scott said that we should do some spot checks early on to get a comfort level, but that since the tanks were oversized reducing the potential for overfilling the tanks that this was acceptable. Chris noted that Matrix will be working on connecting the flow meters to an electrical service tomorrow.

2:50 PM (approximately). One of PEC's trucks delivering run of crush material to the site drove very close to the northern CAMP station. In addition to driving on dry, silty soil near the station, the air brakes discharged compressed air while in proximity to the station resulting in a temporary exceedance of the dust action level. CHA warned PEC that this could not continue and the access roads may need wetting if the dust was observed again. However, this was the last round of deliveries for today. Additionally, PEC had started to use a hose to wet the run of crush material being placed in Treatment Zone 1 as the material being imported was dry and they had a couple of failed in-place density tests that required additional working of the material and retesting.

4:00 PM. While walking the site, CHA observed that well EW-29 was not equipped with a gripper plug or taped to seal the well. CHA will request to cap this well tomorrow morning as Matrix had demobilized for the day.

4:10 PM. PEC completed backfilling operations in Treatment Zone 1 for the day and secured the excavation.

4:30 PM. PEC completed soil mixing with cement Cell Nod. 4 and 6 and collected test cylinders. Since the only remaining activity at the site today was the washing of the Alpine mixing tool, CHA started to prepare to shut down the CAMP stations.

5:05 PM. PEC has completed the collection of test cylinders and washing the Alpine tool being used for the soil mixing activities. They were then installing barricades around the mixing zones.

5:15 PM. Scott Smith left the site for the day following setting up the CAMP stations on chargers and locking the engineer's end of the intermodal container.

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 028
PAGE NO. 2 OF 2
DATE: 9.10.20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA / PEC on site
Set up CAMP Stations, bump cal. Covid check-in.
PEC to develop the wells installed on Tuesday / Wednesday, mix cement in Cell #1, then work on ZVI in Cell #8.
PEC / Matrix to work on GW treatment system
0730 CHA offsite to get water quality instrument rental.

0900 Laurel Crawford (XDD) on site.
CHA weekly meeting also at 0900
CHA and XDD discuss the treatment zones, walk the site, go over the treatment train for gw recirculation.
Discuss Sodium permanganate neutralization solution.

1300 Weekly meeting - Pike, Pioneer, JPS, CHA, PEC
Sam Miller on site for meeting
1450 PEC leak testing the treatment train.
leaks along inlet manifold near the GAC inlet.
leaks at 2 pressure gauges on injection side

~~1500~~ 1600 Laurel (XDD) offsite.
PEC working on repairs to treatment train.
PEC working on un-clogging the slurry plant for ZVI/cement mixing.

1530 PEC done with intrusive work.
CHA taking down CAMP Stations

1630 CHA offsite.

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 029
PAGE NO. 1 OF 2
DATE: 9.11.20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA on site, Load check-in, CAMP setup.

0700 Laurel (XDD) on site.
Programmed flow meters
PEL working on ZVI in cell #10
Matrix reconfiguring the piping into/out of the GAC unit b/c of leaking connections.

0900 Scott Smith on site
PEL/Matrix start up gw extraction pumps to test connections.
Pumps working well, Pulling sufficient water when both and when just one ex. well are "on".
Flow meter totalizers working, instantaneous flow rates are jumping around due to air in the lines.

1100 Sam Miller onsite
Continue testing/fixing GW recirc system.

1300 Mike Belveg (DEC) on site for walkthrough
Sam and Mike walked the site and discussed progress.

1400 Sam Miller/Mike off site

1530 Soil mixing done for the day; take down CAMP stations.

1530 Scott Smith off site

1530 Laurel off site

1630 CHA/PEL offsite

PAGE NO. 2 OF 2
DATE: 9.14.20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA onsite, PEC already here
COVID check-in.
Set up CAMP stations

0700 NICK (PEC) and Pat (Matrix) to bypass carbon filters and surge wells → pumped water into Tank #2 ~1800 gallons in attemp to get the wells to clear up.
Drained water into extra poly tank for holding/settling

0730 CHA call w/ Scott & Son (CHA)

PEC working on cement slurry in Cell #1
Gearing up to start Batch #1 → reset all flow meters prior to start.

0938 Start Batch #1 extraction
Lag Carbon (GAC unit) hatch not on tight → spilled over. Stopped system at "T" into bag filters to fix GAC hatch.

0950 - 1200 changed bag filters at least 6 times - lots of sediment.

~1230 piping at bag filters broke apart - worked on repair/gluing the piping back together → currently at 6,939 gallons ext.

PEC working on removing the concrete vault on N side of TZ-2
→ generally within Cell #13
1600 PEC done w/ soil mixing and intrusive work for today. Take down CAMP stations.
PEC operated gw recirc. system through 2nd batch of extraction
Stopped extraction at 1724

2 batches extracted, 1 injected.

minor breaks/leaks on injection well heads → to be fixed/worked on tomorrow.

CHA offsite at ~~15~~ 1730, PEC/Matrix offsite at 1745

Set up CAMP Stations

0725 Start extraction

0729 Start injection

0800 Glenn (JPS) on site for boring (HSA drilling) in TZ-1.

0810 Portland Cement delivery

0845 Chris Sanson on site

JPS and NYEG (Shawn & Montez) working on boring in TZ-1 → CHA moved them toward the center of excavation b/c location chosen by JPJ was right on the edge → as noted by hitting soil at ~8ft bgs.

0950 Call from Mark.
Rick is encountering wood piles (logs) at ~24 ft bgs in TZ-2C again. Wanted to inform me of situation. Unable to mix below 24 ft bgs.

Continue GW Recir operations and tweaking pumps.
Bag filter change-outs are often occurring 2x per hour.

1200 Pink water identified in EW-17

~2,000 gallons of water pumped to poly tank on 9.14 was loaded into batch tanks during Batch #5 and 6. ~~Not~~ Not accounted for in extraction FM readings, but will be accounted for in injection FM readings.

1600 done with intrusive work for the day. CHA pick up CAMP stations.

1700 CHA offsite
PEC wrapping up.

DATE: 9-17-20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA on site, COVID checkin, setup CAMP stations
PEC collecting injection & extraction well flow totals from previous day

0645 Cement delivery arrived.

0730 Fixed injection well headers to have one phase A well and one phase B well on each subheader (as the design shows) This will elimnate ~~the double vel~~ having one Flow Meter recording two injection wells.

0800 Anthony Russo (CHA) on site.
Walked site, gave explanation of progress since his past visit.
Showed Anthony record keeping and introduced him to Pat & Nick.

0900 CHA weekly meeting

PEC working on topsoil & cement slurry mixing in TZ-2
→ Cells 9, 10, 11, 12, 13.

Extraction well WQ measurements collected at 10:25
15.5°C
10.21 DO $\frac{mg}{L}$
3.13 SPC $\frac{mS}{cm}$
7.30 pH
249.3 ORP mV

10:30 Anthony offsite
Continued operation of GW recirculation system.

1215 Sam Miller (CHA) onsite
1250 Scott Smith (CHA) onsite
1300 weekly meeting
→ TZ-2 should be complete by end of next week
→ TZ-B on track → concerned with diaphragm pumps freezing up in cold weather and swith to phase B causing slow down due to turbidity issues.

CHA

CONSTRUCTION OBSERVATION REPORT

REPORT NO.
PAGE NO. 2 OF 3
DATE: 09/21/2020

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0600. Scott Smith (CHA) arrived on-site. Gate locked but opened and waited arrival of Pike as site trailers were still locked. 0620, Mike Clancy (Pike) arrived and began health check in.

0630. Began bump testing of PIDs in CAMP stations after Pike opened the trailer where CHA CAMP stations located for charging. 0640: Began setup of CAMP stations. Completed by 0700. Matrix Environmental Technologies, Inc. (Matrix) had already started up the Treatment Zone (TZ) No. 3 recirculation system by approximately 6:45. Starting readings were collected at the end of the day on Friday, though, so no missing data.

0700. In TZ-3, Matrix commenced pumping Batch No. 19 to mixing tanks and injecting Batch No. 18. Matrix is hoping to complete four batches today for a total of 22 so that they can switch to the second half of the well field tomorrow morning. They are anticipating a lot of bag filter change outs at the beginning. Paragon Environmental Construction, Inc. (PEC) is using a front-end loader and excavator to add run of crush material to TZ-1 as they are running short of material (overburden) for mixing in with the Portland cement.

0715. The injection pump for TZ-3 has frozen. Still injecting some waster via gravity, but air temp is still relatively cold and resulting in freezing on the exhaust port of the pump. 0810. Matrix and Nick (PEC) begin change out of the injection pump as one of the gaskets was leaking and they snapped at least two stainless steel bolts attempting to disassemble it.

0910. Injection pump back online with standby pump. Nick (PEC) has informed Chris Sanson (PEC) of the situation so that they can order parts for the broken pump and get it back prepped for standby. While Matrix was working on the injection pump, Nick checked the bag filters to see if they need replacement, but they were still pretty clean so no change out was completed.

0920. About 75 percent of Batch No. 18 still in the tanks for the injection side, so the extraction side is temporarily shutdown while PEC catches up on the injection process.

1015. PEC/Matrix completes injection of Batch No. 18 and start injection of Batch No. 19. PEC/Matrix start extraction of Batch No. 20. I spoke with Dan Warner and they are ordering the last delivery of cement today. All ZVI mixing is complete and they will continue mixing soil/cement in TZ-2A today with the hope of finishing tomorrow. They are currently working on pulling the steel sheet piles between TZ-1 and TZ-2A prior to starting the soil/cement mixing. They are using the excavator with a vibratory hammer to extract the sheets. Another excavator is being used with a pneumatic hammer to size concrete but is unrelated to the environmental work.

1140. First bag filter change out of the day. Less turbidity come from the wellfield today. 1144: PEC/Matrix finishes injecting Batch No. 19 and begin Batch No. 20 as well as getting ready to start the extraction of Batch No. 21.

1220. I spoke with Chris Sanson (PEC) regarding the static mixer. The mixer is only really useful when injecting the chemical and is causing a lot of backpressure in the system. While they are trying to add the sodium permanganate relatively slowly, it does not take the entire extraction batch time. Thus, CHA authorized them to install a bypass that can be utilized whenever the chemical injection is not active to help reduce system backpressure and speed up the batching process. The extraction of Batch No. 21 is underway as well as the injection of Batch No. 21. TZ-1 soil/cement mixing and sheet pile extraction is ongoing.

1305. Soil mixing complete for the day. PEC ran out of cement but has last shipment scheduled for delivery tomorrow to complete the cement/soil mixing in TZ-2. The crew cleaned the mixing tool, pulled samples, and was continuing sheet pile removal along the west side of TZ-2.

1340. Checked the CAMP stations. No issues. The PID in CHA-2 is creeping to around 0.4 ppm, but this was suspected to be drift in the instrument as no detectable vapors or obvious sources of vapor were present.

1345. Karyn Ehmann (CHA) arrived on-site and we discussed this morning's activities and upcoming plans. I left the site at 1415 and Karyn took over.

CONSTRUCTION OBSERVATION REPORT

REPORT NO.	036
PAGE NO.	2 OF 2
DATE:	Tuesday 9/22/20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

- CHA (Karyn) on-site first thing This morning w/ contractor(s)
  - SoT up Camp Stations / Calibration

9:00am CHA (Jamie Harnish) on-site.
- met w/ Karyn - given run down on site / personnel / operations.
- Received CoVid check
- given site safety Training by Pike Personnel

≈ 11:00 am Karyn left site

- operations for day

(1) Injection / Extraction system
- even wells Today ; Total 5 batches ran Through I/E cycle Today
- no Issues

(2) Continue Breaking up of contaminated concrete

(3) Separate Rebar from clean concrete for Recycling.

(4) mix grout w/ Batch plant however many issues kept plugging up (finally got running at ≈ 3:30pm)

(5) Back fill excavation area (cell 5) w/ crusher Run

(6) install grout + mix w/ excavator in excavation area where sheeting was Removed until excavator went down late in afternoon (Hydraulic issues).

3:30pm PEC personnel complete w/ soil activities - Camp Stations Taken down

4:00pm PEC personnel off-site — no detections / alarms

4:45pm Pike personnel off-site

5:10pm - I/E System shut down - Totalizer Readings Taken

5:30pm CHA / PEC (Nick) / Matrix (Pat) leave site
- Site is Secure

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 037
PAGE NO. 2 OF 3
DATE: Wed 9/23/20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

6:17 - CHA (on-site)

by 6:30 all PEC, matrix, pike personnel on-site / Covid checkin.

6:36-7:00am - CHA sets up Comp equipment (Comp test pit's + Fresh air Dust monitors)

7:00am - PEC/matrix start up Extraction/Injection system.

Note: Tracy Equipment on-site first thing this AM to look at mixing excavator
- Required part has to come from Japan - will be here monday
The earliest - NO mixing operations until Then.

PEC - clean and load out shoring (all shoring piles have been removed.)

PEC - loaded + hauled out 5 loads (2-Dump Trailers / 3 Trucks, 1 of contaminated concrete/soil/Rebar mix material + sent to Seneca Meadows L.F.
- PEC sign manifest (This material was non-contractual material (under T&M) From Vault area - material was very comingled + not able to be Separated for Recycling)

PEC - utilize exc. to break up Recyclable concrete as well as to break-up walls of Vault (buried)

Note: ~ 9:00am PEC began exc. of buried Vault area. Soil that was debris free was stockpiled for future on-site use. - material encountered between walls of vault was mixed debris (Rebar, concrete, soil, some wood) - all unable to be Separated for Recycling / Re use purposes.
Mark from PEC went to CG Servs This + verify that material could not be Separated. This material was placed in pile to go to Landfill.
- Stained concrete walls of Vault was broken up and also included in This pile. (This material is considered a non-contractual (environmental) material and Tracked as T&M Through pike.

DATE: Thursday 9/24/20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

CHA on-site at 6:19am
prep camp Equipment + prepare for set-up

by 6:30 am - all PIC, PEC + materix personnel were on-site
- CHA setup Camp Equipment (Gump Net PID/Zero cal Dust meter) by 7:00 am

≈ 7:00 am - PEC/materix startup I/E system. (even wells)
Note: at ≈ 7:20 am CHA was informed that 2 wells in bldg 4 and 2 wells out in the field were/ gone dry + and system was down to 60gpm from 70gpm on intake. Operators wanted to switch to odd wells in these areas.
- obtained confirmation from Karyn
7:30 am made the following well switches: 14→15; 30→29; 2→1 and 10→11
- system back up very quickly to 70gpm
- wells were switched back periodically throughout day, but went dry only after a few (2-5) gallons were removed.

PEC (soils) - operations for today
- no trucks hauling material off site today to landfill
- no batch plant or mixing operations (excavator w/ mixer still down)
- however batch plant operator on-site performing maintenance on the plant
- continue to excavate out soil/concrete/rebar material from vault area and stock pile (all contaminated) / unable to separate for recycling)
- all T+M item / non-contracted
- material was stock piled for loadout to landfill
- also hammer out southern concrete wall of vault and place stained concrete in pile to be sent to LF (also T+M / non-contractual work)
- load shoring on to Truck - load + ship out Fencing Sections
- PEC left site at 3:30 pm

Camp monitoring

at ≈ 9:30 am Dust Alarm Gem Station #3 came in (North End of site. After investigation it was due to a loader passing.

Camp Equipment shut down + picked up after PEC completed soil operations for the day ≈ 4:00pm.

CONSTRUCTION OBSERVATION REPORT

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA / PEC onsite, COVID check-in
Set up CAMP Stations

0700 Start extraction / injection system

0725 Call from Nick → all 4 tanks open to accept extracted/treated water which messed up the batch quantities. ~~batch~~ ~30 min and all 4 tanks at same level of water. Took about 1 hour to get back on track with this batch.

PEC hauling off stained concrete to SMI.

~0930 Jay from Stapen on site → requested PEC excavate to ~~the~~ see extent of wood material on south face of vault excavation. Small amount of wood found. Wood is decaying; no petroleum Saturated. Did not remove wood / debris.

1145 Scott Smith (CHA) onsite

12-1300 CHA meeting

1330 Michael Belveg (DEC) on site. Site walk. Discussed the following:

Basement room off the BCP but directly adjacent to TZ-2C. Small amount of sheen on groundwater noted. Potential manhole ~15' North of northern TZ-2C limit found beneath the concrete.

Discussed potentially wrapping this possible tank / contaminated soil removal into the FER for the BCP rather than doing a separate spill report / program. Email to be sent to Michael Belveg and Harry Warner (of DEC) to propose this → include in BCP FER.

~1400 Crane on site to dismantle the Slurry plant.

CONSTRUCTION OBSERVATION REPORT

REPORT NO. 043
PAGE NO. 2 OF 3
DATE: 10.1.20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA/PEC on site, COVID checkin
Set-up CAMP Stations — 1 tripod missing screw to attach the CAMP box. Placed CHA #2 on the ground. Searched for missing screw.
0645 Start up gw injection/extraction system
PEC loading out concrete for disposal at SMI
0800 CME on site (stained) / Glenn (JPS) on site
0845 Email from Harry Warner (DEC) requesting we call in the petroleum contamination identified yesterday (10.9.30) as a spill.
0900 Discussion with Scott (CHA) - he will inform client, I will inform Paragon, then call in spill
~1100 Called in spill - Spill # 2005960
~1130 PEC excavating the contaminated soils - place on poly sheeting.
~1145 Call with Mike Belveg (DEC) to discuss sampling requirements
agreed on sampling for VOCs and SVOCs only
agreed to compare results to Commercial SCOs.
1215 - 1230 Collect 2 soil confirmation samples SOIL-01 and SOIL-02 submitted to Alpheon a Scott onsite 24-hr TAT.
1300 - 1400 weekly progress meeting w/ Pike, PEC, ERSI, JPW, Stopen (JPS)
PEC stockpiling material from the vault excavation on poly to be hauled off tomorrow.
PEC backfilling vault excavation with run of crush. Placed orange demarcation barrier at bottom of excavation.

CHA

FIELD OBSERVATION REPORT

REPORT NO.	043

DATE:	10.1.20

PROJECT Former Coyne Textile Facility

LOCATION 140 Cortland Ave Syracuse, NY

WEATHER	TEMPERATURE
	HIGH
	LOW

PROJECT #	059294.001

SPECIFY: LOCATION, NATURE OF WORK BY CONTRACTOR & SUB-CONTRACTOR FOR EACH OPERATION.

DESCRIPTION OF WORK PERFORMED AND OBSERVED:

CME onsite for compaction testing of run-of-crush structural backfill

Stockpile covered with poly for overnight – will have trucks online tomorrow to remove.

Will keep weight ticket from spill, contaminated material separate → label as "basement" to have quantity of material excavated.

1610 - CHA takes down CAMP stations

1715 - end gw recirculation for today.

1730 - CHA/PEC offsite

0630 CHA/PEC On Site - COVID checkin
Set up CAMP Stations

~0650 Start groundwater recirculation system

PEC removing and hauling offsite soil from excavation of basement and vault area.

PEC bringing in loads of ROC

0800 Glenn (JPS) on site, NYEG Drillers on site
CME onsite for compaction testing in vault backfilling.

PEC finishes backfilling excavation for the vault.
PEC places ~1 ft lift of ROC across most of TZ-2 and TZ-1; area left uncovered where the drill rig is working.

NYEG completes 2 HSA borings: 1 in TZ-2B and 1 in TZ-2C.
Glenn (JPS) requested a third boring in TZ-2C to be completed next week.

NYEG grouted the 2 borings.

~1445 CHA receives sample results for confirmation samples SOIL-01 and SOIL-02 for Spill # 2005960
transmit data to Mike Belveg (DEC) and Scott Smith (CHA).

~1500 Finished last extraction batch of Phase 2A → started Phase 2B.

1700 Finish extraction/injection for today.

1715 CHA offsite.

PAGE NO.	2 OF 2
DATE:	10·5·20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA/PEC onsite COVID checkin
Set up CAMP stations

0700 Start groundwater recirculation system

0700 Conversation with Dana and Rick → need permission to backfill the basement (Spill # 2005960) excavation.
Call to Mike Belveg (DEC) - no answer, left message
Call to Scott Smith (CHA) - discussed contaminant levels. Compared results to Unrestricted & Commercial SCOs. Results are below both standards ∴ okay to backfill.

0727 Called Dan to give permission to backfill.

0730 CME onsite
PEC pumped water from excavation into the poly tank used during the pilot study; backfilled the excation in accordance with approved backfilling method after Glenn (from JPS) approved bottom of excavation.
CME on site to take compaction readings
~3ft #3/#4 clean stone → orange demarcation barrier
~6ft #2 RDL compacted.

Excavation filled
JPW mobilizing
1600 done with intrusive work; take down CAMP stations
1700 CHA/PEC end gw recirculation for today and are offsite.

PAGE NO.	2 OF 2
DATE:	10.6.20

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA / PEL on site, COVID check-in
Set up CAMP Stations - full PID calibrations

0650 PEL starts groundwater recirculation system

0700 CME (Joseph) on site
PEL hauling in RoC today to finish backfilling the basement excavation and placing RA to even out the site.

~0930 Daylighting of Sodium permanganate at IW-14 - turned off IW-4 and IW-14 for most of the day.
PEL used up all neutralizing chemical trying to clean the spill - more to be delivered by PEL today

JPW on site setting up their crane caused dust exceedances at the CAMP Stations (CHA #3). Alarm not associated with remedial work.

PEL moved silo to get out of JPWs way and placed an empty roll-off container adjacent to the air compressors for the gw treatment system decommissioning.

1530 PEL done with intrusive work

1610 CHA takedown CAMP Stations

1650 PEL ends gw recirculation for the day

1700 CHA / PEC offsite.

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA onsite, covid checkin
no intrusive work will be done today therefore CAMP Stations are not set up.
PEC on site for groundwater recirculation system

0700 Montez (PEC) on site to clean SK500 Kobelco excavator.

Continued operation of groundwater recirculation system.

~1100 Montez and Mark off-site after cleaning the SK500 excavator.

1145 Scott Smith on site

1300 weekly meeting
~~highlights~~ highlights
- last boring to be placed 10/12 – must keep CAMP Stations until then
- gw recirc to be complet 10/9
- decomission next week
- wash water can be injected to IDWs
- tanks from Rain for Rent to be picked up 10/16

1340 Scott Smith offsite

GW recirculation appears to be ~30 min slower each batch today; likely due to cold morning
Only finished 4 batches today

PEC/CHA offsite at 1630.

Summarize all observations, progress made for each operation, key conversations and decisions made, quantities measured, design changes, testing or sampling performed, issues, delays, etc.:

0630 CHA / PEC on site
no intrusive work planned for today therefore CAMP stations were not set up.

Start gw recirculation system.
Kobelco hauled offsite
~915 CHA collects final injection and extraction samples.

11:18 done with final extraction batch.

PEC began dismanting wells (above ground equipment and hosing) in the building.

Removed tubing in extraction wells

EW-6 Smelled like fuel oil when hose removed
CHA picked up a bailer to see if free product on the surface of the groundwater. No LNAPL in well.

water smells like petroleum.

Contacted Scott Smith

Proceed with well decomissioning as planned (next week).

1300 CHA off site.
