Certification

I, Wendy Moore, P.E., certify that I am currently a registered professional engineer licensed by the State of New York and that I had primary direct responsibility for implementation of the remedial program activities. I certify that the Interim Remedial Measure was implemented and that construction activities were completed in substantial accordance with applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10).

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Wendy Moore, P.E., of GEI Consultants Engineering, Geology, Architecture & Landscape Architecture, 400 Unicorn Park Drive #8, Woburn, MA 01801, am certifying as Owner's Designated Site Representative.

PREPARED BY:
GEI Consultants, Inc.

1. Background and Site Description

1.1. Background

The UniFirst Corporation (UniFirst) entered into a Brownfields Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) in October 2021 to investigate and remediate a 3.25-acre property located at 113 7th North Street in Liverpool, Town of Salina, New York (Figure 1). The Property is zoned for commercial and light industrial use and its use is expected to continue as a commercial laundry facility.

The Property is in Onondaga County, New York and is identified as Block 02 and Lot 02.1 on the Town of Salina Tax Map #086. It is bordered by Luther Avenue to the northwest and Old 7th North Street to the northeast. The Property is bordered to the southeast and southwest by commercial and industrial properties owned by others. (Figure 2).

1.2. Site Description

Based on available topographic maps and aerials, the former UniFirst facility building was constructed between 1958 and 1959 and expanded in the mid-1970s. The former building was demolished in 2022, and a larger facility building was built in its place, as further discussed below. According to city directories and information available from UniFirst, UniFirst had operated the former facility as an industrial laundry facility since the 1970s. Prior to UniFirst's ownership, the parcel on which the original facility was located was occupied by a "steel service center" and a "dried beef" operation.

Several additional adjacent parcels along Luther Avenue were acquired over the years and have become part of the current UniFirst Property. Most of these parcels were formerly improved with buildings used primarily for offices, storage space, and a wastewater treatment system. In 2017, in anticipation of the construction of the new laundry facility, six of the seven separate parcels making up the Property were combined into a single tax property. In 2019, another property along Luther Avenue was acquired and combined with the single tax property in 2020. Collectively, these UniFirst parcels are hereafter referred to as "the Property" (Figure 2).

Historically, tetrachloroethene (PCE), the principal constituent of concern (COC), was used in the dry-cleaning process. UniFirst ceased its dry-cleaning operations and use of PCE by 1987 and does not store PCE at the Site. Dry cleaning activities occurred only within the former facility building, which was replaced by a new 55,700 square foot 1-story facility in 2023. The new facility was constructed in two phases to facilitate continuous laundry operations during the facility expansion. The construction phases are illustrated in Figure 2.

To prepare for construction, the buildings on the more recently acquired parcels along Luther Avenue, including administrative, storage and wastewater treatment, were demolished between 2017 and 2020. The first phase of the facility renovation (Phase 1), consisting of an approximately 31,000 square-foot structure was then constructed adjacent to Luther Avenue between summer 2020 and spring 2022.

While Phase 1 was under construction, UniFirst continued operating in the pre-existing facility in the east/northeast side of the Property.

Once the Phase 1 building was completed, facility operations moved to the new Phase 1 building, the pre-existing facility building was demolished in spring of 2022, and Phase 2 construction began in its place between May 2022 and October 2023. Upon completion of Phase 2 in October 2023, the new facility was joined as a single building housing UniFirst's laundry facility and administrative operations. The remainder of the Property is paved, except for a strip of landscaped grass at the front of the new facility building along Old 7th North Street, the stormwater retention pond in the southern portion of the Property, and a rip-rap-lined drainage swale between the southeastern wall of the building and the Property boundary. The current site configuration is shown in Figure 2.

There is a fence enclosing the property along the southern and eastern Property lines, which attaches to the facility building, limiting access to the Property from the adjacent truck stop and gas station.

In conjunction with Phase 2 construction preparation and throughout the new facility construction, GEI performed certain subsurface investigations at the Property to begin characterizing Site conditions. The subsurface investigation included collection of soil, groundwater, and soil vapor samples for laboratory analysis of volatile organic compounds (VOCs) and, to a certain extent, other parameters recommended by NYSDEC guidance for Remedial Investigations. Results of the subsurface investigations performed through November 2021 were described in the Remedial Investigation Work Plan, submitted as final on September 2, 2022, and approved by the NYSDEC on September 9, 2022. Investigations performed after February 2022 will be included in a future Remedial Investigation Report (RIR).

1.3. Document Purpose and Scope

The purpose of this Revised Construction Completion Report (CCR) is to document the performance of Interim Remedial Measures (IRMs) that were incorporated into the "Phase 2" portion of laundry facility renovations undertaken by UniFirst.[1] As further described in Section 2, the IRMs generally involved:

- Demolition of the pre-existing building, followed by injection of treatment reagents into the subsurface near the source area to facilitate dechlorination of VOCs, primarily PCE and its daughter products in groundwater.
- Installation and testing of a vapor barrier and venting system beneath the new Phase 2 building to mitigate potential vapor intrusion associated with VOCs, primarily PCE, detected in soil and groundwater.

The IRM approach was described in the Interim Remedial Measure Work Plan (IRMWP) for Phase 2 Construction Area (Revision 3) dated September 2, 2022 (GEI, 2022), which was approved by NYSDEC on

[1] The Draft CCR for Phase 2 Building IRM was submitted to the New York State Department of Environmental Conservation (NYSDEC) and New York State Department of Health (NYSDOH) in August 2024 for review. NYSDEC provided comments on the draft on April 21, 2025 and NYSDOH provided comments in a letter to the NYSDEC dated May 21, 2025.These comments were addressed in the CCR for Phase 2 Building IRM submitted on August 29, 2025. NYSDOH provided additional comments in a letter to the NYSDEC dated February 2, 2026, which are addressed in this revision.

September 9, 2022. This CCR has been modeled after the NYSDEC's Final Engineering Report (FER) template and includes the information that will ultimately be required in the FER in accordance with the DER-10.

2. Summary of Interim Remedial Measure Implementation

2.1. Interim Remedial Measure Objectives

The IRM for Phase 2 was conducted for the purpose of reducing source mass of VOCs and VOC exposure potential in a manner that could be feasibly implemented in conjunction with the facility renovation scope and schedule.

2.2. Description of Interim Remedial Measure

The IRM was implemented in general accordance with the NYSDEC-approved IRM Work Plan for Phase 2 Construction submitted final on September 2, 2022. The following are the components of the IRM:

- Demolition of the pre-existing building and subsequent source area treatment (i.e., injection of treatment reagents to address the source area of PCE-impacted soil and groundwater located beneath the pre-existing facility building before construction of Phase 2 of the new facility) and associated post-treatment monitoring.
- Installation of a vapor mitigation system (VMS) for new Phase 2 building, consisting of the following components:
    - **Sub-Slab Vapor Barrier:** A continuous vapor barrier was installed below the Phase 2 building slab to minimize the potential for vapor intrusion to occur from soil vapor to indoor air.
    - **Sub-Slab Depressurization System:** An active sub-slab depressurization system (SSDS) was incorporated into Phase 2 building design. The sub-slab components included a continuous layer of crushed stone and perforated PVC collection header pipes beneath the foundation and beneath the vapor barrier. The sub-slab header pipes connect to several vertical PVC risers that extend through the concrete slab and above the building roof to the atmosphere. Vacuum blowers are attached to the pipes above the roof level and operate continuously to maintain a vacuum beneath the building slab to mitigate the vapor intrusion pathway.
    - **Indoor Air Testing:** Samples of indoor air were collected inside the completed Phase 2 building and analyzed for VOCs to evaluate the effectiveness of the VMS.
- The contingent task of managing excess shallow soil removed as part of construction activities, containing concentrations greater than the Industrial SCO if observed and encountered following the removal of the pre-existing building slab.

Note that the VMS (Item 2 above) was an integrated and uniform design to address both Phase 1 and Phase 2 (the subject of this CCR) portions of the new facility building. A separate IRM Work Plan was submitted for Phase 1, and the associated work is described in a separate CCR for the Phase 1 IRM.

Additionally, with respect to the contingent task of removing impacted shallow soil (Item 3 above): although impacts greater than Industrial SCOs were not present in excess soils excavated during construction, ultimately all excess soil was managed consistent with an Excavation Work Plan (EWP) and disposed of off-site at a permitted facility because it could not be reused on Site.

Design drawings, specifications, and manufacturer information were provided in the Phase 2 IRM Work Plan. The information and certifications made in the Phase 2 IRM Work Plan, along with observations during and following the implementation of the remedial measures, were considered in preparing this CCR and certifying the IRM implementation.

Additional details regarding the Phase 2 IRM components and support activities are provided in the following subsections.

2.3. Governing Documents

IRM activities described herein were conducted in accordance with the NYSDEC-approved Phase 2 IRM Work Plan (submitted as final September 2, 2022). Deviations from the IRM Work Plan for Phase 2 are noted in Section 3.3.

Several project plans were appended to the IRM Work Plan for Phase 2, including:

- **Community Air Monitoring Plan (CAMP):** The NYSDEC Generic CAMP is intended to provide a measure of protection for the downwind community (i.e., off-Site receptors, including residences and businesses and on-Site workers not involved with Site activities) from potential airborne contaminant releases as a direct result of intrusive activities.
- **Quality Assurance Project Plan (QAPP):** The QAPP describes the specific policies, objectives, organization, functional activities and quality assurance/quality control activities designed to achieve the project data quality objectives.
- **Field Sampling Plan (FSP):** The FSP describes the methods for performing investigation field activities and details regarding project organization.
- **Health and Safety Plan (HASP):** Remedial work was performed in compliance with governmental requirements, including Site and worker safety requirements mandated by Federal OSHA. A Site-specific HASP was prepared and used for remedial and ground-intrusive work performed at the Site.

An EWP and a Citizen Participation Plan (CPP) are also available for this Site. The EWP identifies the specific plans and procedures to be followed for handling of impacted materials potentially disturbed during intrusive work during construction (Appendix A). The CPP was prepared to provide opportunities for citizens affected by and interested in the Site's environmental response actions to participate more fully in Site decisions that affect their health, environment, and social well-being. The CPP was published by NYSDEC in February 2022. The CPP is available at this web address: https://www.dec.ny.gov/data/DecDocs/C734152/.

3. Description of Interim Remedial Measures Performed

3.1. Remedial Program Elements

3.1.1. Project Team

The key firms who were involved with implementing IRM activities at the Site are identified in Appendix B.

3.1.2. Site Preparation

The following pre-remediation/Site preparation activities were conducted by UniFirst or its representatives prior to initiation of the IRM activities:

- Prepare the Site for implementation of IRM activities, including obtaining NYSDEC approval of the Phase 2 IRM Work Plan.
- Survey and stake injection points.
- Establish Site access control.
- Perform utility clearances.
- Set up equipment for dust monitoring during implementation of the IRM (discussed in Section 3.1.3).
- Coordinate and arrange for IRM activities in concert with the facility renovation schedule.

Additional information regarding these activities is provided in the following subsections.

3.1.2.1. Survey Control

Warren Ramie Surveying used Global Positioning System (GPS) methods to survey and mark the injection point layout and to measure the ground elevations of the injection points (Appendix C). The same surveyor also conducted survey control on C&S Companies' (C&S; the Construction Contractor) behalf for the facility renovation.

3.1.2.2. Site Security and Support Area

Access to the Phase 2 construction area was controlled by the Construction Contractor during facility renovations. C&S erected perimeter fencing and gates to limit unauthorized access to the work area. C&S also provided support areas inside the perimeter fence, including a mobile office trailer and portable sanitation.

During implementation of source area treatment, GEI and IET (the Remedial Contractor for injection work) implemented safe work practices throughout the drilling and injection process in accordance with

their respective HASPs. The remediation support areas were fully self-contained inside a mobile trailer containing the injection chemical storage and delivery components, onboard generator, mobile office space, and health and safety components (safety shower and eyewash).

Contractor equipment was regularly inspected prior to use and checked periodically for performance and corrective repair. Equipment was cleaned prior to arrival on the project Site, as well as prior to demobilization from the Site.

3.1.2.3. Utility Clearance

Utilities were protected, relocated, and constructed by the Construction Contractor as part of construction activities not related to this IRM. As part of remedial injections, and throughout the duration of the facility construction project, areas and locations of intrusive work were pre-marked and the New York State one-call center ("Dig Safely NY") was contacted at least three days prior to commencing intrusive work to request that utilities be located and marked. Additionally, the Construction Contractor consulted existing UniFirst utility plans for locations of on-Site utilities.

3.1.2.4. Site Safety Protocol

On behalf of Unifirst, GEI recommended health and safety protocols for the Construction Contractor to employ for its workers while conducting maintenance and redevelopment work at or below grade. The Construction Contractor used this information to develop their own safety program, which generally consisted of:

- Video training for each site worker prior to entering the site to perform work.
- Employment of a health and safety contractor to provide personnel air monitoring during ground intrusive activities.
- Employment of OSHA trained personnel to perform the ground-intrusive work.

3.1.2.5. Approvals

Copies of NYSDEC's approval of the IRM Work Plan for Phase 2, NYSDEC approval letters for imported soils, and approvals of the contained-in requests for off-site management of excess soil that was generated during Phase 2 construction are included in Appendix D. No other permits or approvals were required for the Phase 2 construction interim remedial activities.

3.1.3. CAMP Monitoring

Phase 2 construction activities included intrusive activities into native soil, so continuous vapor and dust monitoring was performed. Vapor and dust monitoring requirements, action levels, appropriate corrective actions and reporting requirements are presented in the CAMP (Appendix E). On UniFirst's behalf, GEI performed CAMP monitoring using three automated stations with datalogging during intrusive activities into native soil within site limits. The automated stations were equipped with photoionization detectors (PID) with 11.7-volt lamps, dust monitors, and a cellular modem to transmit data back to a voice-data-video (VDV) system. GEI provided data to NYSDEC, NYSDOH, and UniFirst on a

weekly basis via email during the active monitoring periods (Appendix E). The data reports identified work locations and monitoring locations during the applicable reporting period, summarized air monitoring results, and discussed exceedances when applicable. The reports also included a qualitative odor monitoring log.

During the first few months of construction, while the foundation was being constructed, a GEI employee was on site full-time during intrusive activities to observe the excavations and maintain the CAMP stations.

GEI addressed exceedances of air monitoring action levels in real time in consultation with the Contractor and notified UniFirst and NYSDEC as soon as the exceedance was identified (i.e., the same day or the next business day, if after hours). GEI sent a follow-up e-mail to NYSDEC, NYSDOH, and UniFirst within approximately 24 hours of each action level exceedance that summarized the data, the cause of the exceedance and corrective measures implemented in response to the exceedance.

Occasions on which the concentration of dust (PM_{10}) or Total Volatile Organic Compounds (TVOC) were measured at concentrations higher than the applicable Action Limits are described below. Exceedances were either unrelated to site work or were addressed quickly without stopping work.

- Between May 10 and May 21, 2022, several exceedances of the PM_{10} Action Limit were measured at monitor AIR-101. However, these exceedances were suspected to be occurring due to an error with the dust monitor. During this time, GEI attempted to fix the dust monitor, and it was ultimately replaced. After replacement, the meter operated as expected and exceedances of the PM_{10} Action Limit were no longer detected.
- Particulate matter was detected above the PM_{10} Action Limit at one station and above the PM_{10} Response Level at another station on May 27, 2022, at 10:45 PM. There was no work occurring at the Site at this time.
- On June 22 and 23, 2022 PM_{10} was detected above the Action Limit a few times. Each time, heavy vehicular traffic was present near the monitoring stations and concentrations returned to below the applicable limits within 15 to 30 minutes without intervention.
- On August 5, 2022, and August 22-24, 2022, occasional exceedances of the TVOC Action Limit were measured. These exceedances occurred during non-working hours.
- One measurement exceeding the TVOC Action Limit was detected on October 5, 2022, while forms for footings were being built. The concentration returned below the Action Level within 15 minutes without intervention.
- TVOC levels were occasionally measured above the Action Limit on October 13 and 14, 2022. These exceedances occurred during non-working hours.
- Occasional measurements of TVOCs were above the Action Limit on October 25 and 26, 2022. Most exceedances occurred during non-working hours, potentially due to idling trucks on the adjacent property close to the monitor. TVOC concentrations remained high when work began on the Site but did not elevate higher than they had been prior to the work beginning for the day.

- Concentrations of PM_{10} were measured above the Action Limit in two CAMP stations during one 15-minute interval on November 2, 2022. These measurements occurred during non-working hours.
- On November 11, 2022, PM_{10} was measured above the Action Limit during one 15-minute interval while work was being performed on the Site. The concentration returned below the Action Limit within the following 15 minutes without intervention.
- TVOCs were measured above the Action Limit on November 12, 2022, while no work was being conducted on the Site.
- TVOCs were measured above the Action Limit during a 45-minute period on December 7, 2022. Vehicles were idling near the station where the exceedance was measured during this period, and the monitor had a low battery and moisture in the tubing. Once the issues with the sensor were resolved, the concentration of TVOCs returned below the Action Limit.
- PM_{10} levels were measured above the Action Limit during two 15-minute intervals on May 24, 2023 and one 15-minute interval on May 30, 2023. Traffic was heavy near the monitoring station during these times, and concentrations decreased to acceptable levels without intervention.

3.1.4. Reporting

GEI's construction observation reports associated with the injections, ground intrusive work, and VMS installation are in Appendix F. A photographic log is in Appendix G. Additionally, monthly summary reports relating to Phase 2 Construction were submitted to the NYSDEC (reporting relevant to this IRM started in April 2022 and ended in October 2023). These reports summarized construction and BCP-related activities performed during the preceding month.

3.2. Interim Remedial Measure Elements

3.2.1. Remedial Injections

3.2.1.1. Injection Program

As described in the IRM Work Plan, the source area remediation was expedited because the area was only accessible for a short period of time between demolition of the prior building and construction of the new facility. Demolition of the pre-existing laundry facility building was necessary prior to performing the in-situ treatment within the target area. The injection program was designed to be completed in a limited time to minimize building construction delays and it was designed as a one-time injection because new building limits access to the source area for supplemental injections or other remedial measures. The target treatment area (Figure 3) was identified in consideration of existing characterization data and included an area of approximately 10,000 square feet located primarily beneath the pre-existing laundry facility building. The target treatment zone extended from approximately 8 to 20 feet beneath the floor elevation of the pre-existing building.

The source area treatment component of the IRM was designed to facilitate accelerated in-situ dechlorination of chlorinated volatile organic compounds (CVOCs; specifically, PCE and its degradation products) within the target treatment area using both abiotic and microbial processes. It was designed to promote groundwater quality improvements over time in the adjacent downgradient areas. This treatment approach included injecting emulsified zero-valent iron (EZVI), zero valent iron (ZVI), and colloidal suspensions consisting of biostimulants and various organic hydrogen donors via temporary injection points. These materials typically facilitate reduction of the dissolved phased CVOCs while initiating the production of hydrogen for ongoing microbial mineralization processes.

The injections were conducted in four specific areas shown on Figure 3. These include three permeable reactive barrier (PRB) features and the primary target treatment area. The three PRB zones were injected first. Once the PRB zones were injected, the primary target area was injected in a circular pattern beginning at the southern perimeter of the area and working inward to minimize displacement outside the zone. Figure 3 illustrates the injection locations and target radius associated with each injection point.

Between May 23 and June 3, 2022, a total of 5,200 gallons of EZVI and 14,400 gallons of slurry containing ZVI and nutrients were injected within the target depth zone (8 to 20 feet below grade). The details of the injection program were reported in a memo to UniFirst on January 18, 2023 (Appendix H).

3.2.1.2. Monitoring Well Installation

Two new downgradient well couplets (MW3S/I and MW4S/I) and an upgradient well couplet (MW5S/I) were installed after the injection program was complete. Each pair consists of one shallow well set at the water table within the silt and clay layer, and one deeper well set with the top of the screen at the top of the underlying sand layer. When drilling below 20 feet to install the deeper well of each couplet, cased auger drilling techniques were used to minimize vertical migration potential. The upgradient well couplet (MW5S/I) was installed between the Phase 1 portion of the new laundry facility and Luther Avenue (Figure 2). The two downgradient well couplets (MW3S/I and MW4S/I) were installed between the southeastern wall of the Phase 2 building and UniFirst's southeastern property line (Figure 2), in the area at the downgradient edge of the injected source zone where the highest PCE impacts were previously observed in groundwater. MW3S was installed at the approximate location of temporary well point TW6, and MW4S was installed at the approximate location of temporary well point TW9. The data from samples collected from TW6 and TW9 serve as pre-injection data points for MW3S and MW4S, respectively. Two existing cross-gradient water table wells (MW1 and MW2) were intended for use as part of the IRM but had to be decommissioned due to Phase 2 construction. Decommissioning Records are in Appendix I. These wells were replaced after construction was completed (and named MW1R and MW2R). Installation of all monitoring wells occurred later than originally planned due to access limitations related to the building construction. Further, although MW-5S and MW-5I were able to be installed prior to the first round of post-injection groundwater sampling, the remainder could not be installed due to ongoing construction. As such, to allow for collection of the first round of post-injection groundwater samples from the MW1R through MW4S/I locations, grab samples were collected from temporary (Hydropunch) well screens in February 2023 (further discussed in Section 3.2.1.3). Permanent wells were later installed (in June 2023) in these locations prior to the second of three planned rounds of post-injection groundwater sampling.

The permanent wells are of standard construction, with 2-inch diameter SCH-40 PVC 0.010-inch slotted well screen threaded to 2-inch diameter SCH-40 PVC riser pipe to the ground surface and a 1-foot sump. Chemically inert silica sand was backfilled to 1 to 2 feet above the top of the screen. A bentonite seal was placed above the screen and sand pack. The bentonite seal is a minimum of 24-inches thick. MW1R and MW5S/I have flush mount completion and the remaining wells have stick-up completion. Monitoring well construction logs are in Appendix I.

Monitoring wells were developed and monitored for drawdown and recovery immediately following installation. Development was performed by alternately surging and pumping until the development water appeared to have low turbidity, or until a maximum of approximately 10 well volumes had been removed. Drill cuttings were stored on Site for proper transportation and off-Site disposal. Well development fluids were pumped into 55-gallon drums and stored on Site for proper transportation and off-Site disposal. Disposal documentation is in Appendix J.

3.2.1.3. Post-Injection Groundwater Monitoring

A network of eight groundwater monitoring wells (six of which are co-located well pairs) have been used to monitor upgradient, source area, and downgradient groundwater conditions around the source zone treatment area. Specifically, groundwater from the locations of the following wells (Figure 2) were sampled on three occasions as part of the injection-related monitoring program: MW-1R, MW-2R, MW3S, MW3I, MW4S, MW4I, MW5S, and MW5I. The IRMWP proposed three post-injection groundwater sampling events at six, nine, and 12 months following the injection. Due to access and well installation limitations associated with ongoing construction, the groundwater sampling events were conducted eight, 13-, and 18-months post injection, as indicated below.

3.2.1.4. Round 1

On February 6 to 8, 2023, grab samples were collected via a Hydropunch sampling device from borings in the eventual locations of the permanent monitoring wells MW1R through MW4S/I. Grab groundwater samples were collected from the top of the water table at each shallow well location. After the top-of-water-table grab groundwater samples were collected, the borings at the MW3 and MW4 locations were drilled deeper to obtain the intermediate grab groundwater sample from depths of 30 to 35 feet below grade at each location. The grab groundwater samples collected from each boring were analyzed for VOCs, sulfate, dissolved gases, total iron, dissolved iron, and volatile fatty acids (VFAs). This grab sampling method was employed during this initial round of post-injection monitoring because permanent monitoring wells MW1R through MW4S/I could not be installed due to ongoing construction activities in these locations.

On February 21, 2023, monitoring wells MW5S and MW5I were purged via the low-flow method and the first round of post-injection groundwater samples were collected from these two permanent upgradient wells for analysis of VOCs.

3.2.1.5. Round 2

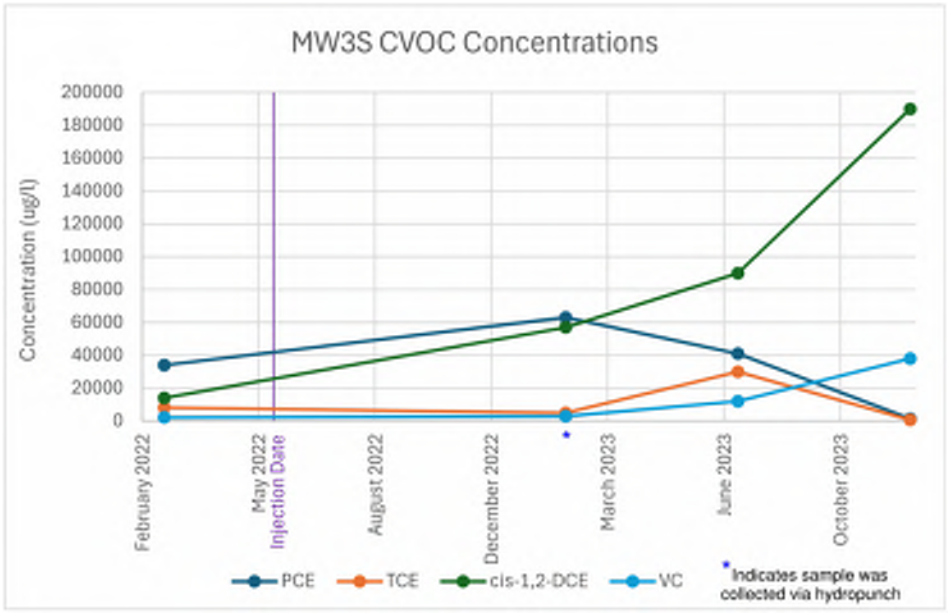
On July 5 and 6, 2023, the second post-injection groundwater monitoring event was conducted. Monitoring wells were gauged for depth to groundwater, depth to well bottom, and potential NAPL

presence. Monitoring wells MW1R, MW2R, MW3S, MW3I, MW4S, MW4I were purged via the low-flow method, and groundwater samples were collected for analysis of VOCs, dissolved gases, sulfate, total iron, dissolved iron, and VFAs.

Background wells MW5S and MW5I were purged via the low-flow method and groundwater samples were collected for analysis of VOCs.

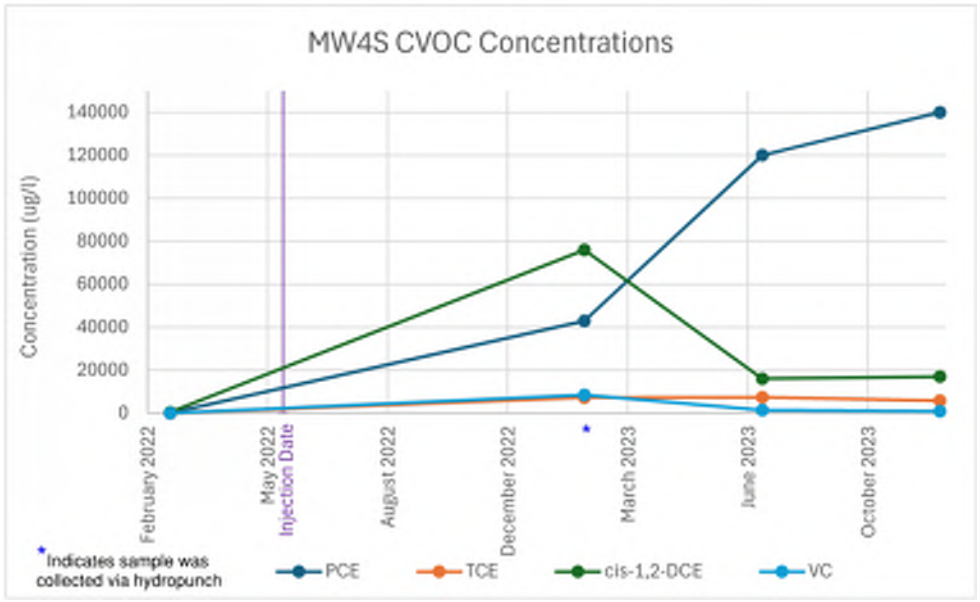
3.2.1.6. Round 3

The third and final post-injection IRM groundwater monitoring event was conducted on November 30 and December 1, 2023. Monitoring wells were gauged for depth to groundwater, depth to well bottom, and potential NAPL presence. Monitoring wells MW1R, MW2R, MW3S, MW3I, MW4S, MW4I, MW5S and MW5I were purged via the low-flow method, and groundwater samples were collected for analysis of VOCs, dissolved gases, sulfate, total iron, dissolved iron, and VFAs. Unrelated to the IRMWP, sampling of additional wells and analysis of more parameters at the wells subject to the IRM groundwater monitoring were also conducted during this event in support of the Remedial Investigation. The additional results will be reported in the forthcoming RIR.



Periodic post-injection monitoring is expected to continue as part of a long-term monitoring plan, as discussed in Section 3.5.

3.2.1.7. Post-Injection Groundwater Results



The remedial injection program was intended to reduce concentrations of CVOCs in groundwater including PCE and its daughter products: trichloroethene (TCE), dichloroethenes (cis- and trans-DCE), and vinyl chloride (VC). Groundwater analytical results related to the IRM injection monitoring are summarized in Table 1 and laboratory data sheets are in Appendix K. The IRM injection-related data is discussed below, and graphical depictions of concentration trends are included in Appendix L. The following is a summary of the parameters of interest in monitoring wells related to the injection program.

3.2.1.8. CVOCs

Monitoring wells MW3S and MW4S, are directly within/downgradient of the injection area, thus expected to be most influenced by the injection. As indicated in the graph below, PCE concentrations in MW3S decreased steadily after the injection while daughter product (TCE, cis-1,2-DCE, and VC) concentrations increased. This is a classic illustration of reductive dechlorination, suggesting that the injection had the desired effect. Both PCE and TCE concentrations were on the decline at the end of the monitoring period while cis-1,2-DCE and VC trended upward, indicating continued effectiveness.

At MW4S, the graph below shows a temporary increase in cis-1,2-DCE concentration during the first post-injection monitoring event, suggesting some degree of reductive dechlorination was achieved. However, changes in other degradation products (TCE and VC) were minimal. Also, the PCE concentration continued to increase at this location throughout the post-injection monitoring period.

Wells MW3I and MW4I are screened below the shallow silt/clay zone adjacent to shallow wells MW3S and MW4S, respectively. These wells were installed after the remedial injection, so baseline (pre-injection) data are not available at these locations. Trend graphs for these locations are in Appendix L. At MW3I, concentrations of all CVOCs decrease consistently over the post-injection monitoring period. At MW4I, the post-injection PCE concentration initially increased slightly, then decreased while concentrations of daughter products increased. Both datasets suggest the injection effectiveness extended to the deeper groundwater zone.

Monitoring wells MW1R and MW2R are side gradient of the injection area, thus less likely to be directly influenced by the injection. In each of these wells, there was an increasing trend in PCE and daughter products after the injection, followed by a significant decrease. At MW1R, which is located further from the injection area than MW2R, the timing of the peak concentrations was delayed relative to MW2R (Appendix L), suggesting the trends were likely attributable to groundwater redistribution during and following the injection.

However, the PRBs were effective at minimizing the effects of injection-based redistribution, as evidenced by the sharp decline in CVOC concentrations following their initial post-injection peaks.

As expected, CVOCs were not detected above laboratory reporting limits in the upgradient monitoring wells during any sampling event.

3.2.1.9. Monitored Natural Attenuation Parameters

Charts depicting the concentration trends for each monitored natural attenuation (MNA) parameter in all wells are in Appendix L. MNA-related data are also summarized in Table 1.

Sulfate was generally stable during the post-injection sampling events, except in MW3S and MW4S (which were closest to the source injection zone) and MW2S (side-gradient of the source injection zone), which had decreasing trends during the three events. Reduction in sulfate is an indicator of anaerobic degradation (EPA, 2023), suggesting that the injections enhanced conditions for biological degradation in this area as intended.

Dissolved iron concentrations increased during the post-injection period in monitoring wells MW1R, MW2R, MW3S, and MW3I. By the third post-injection sampling event, dissolved iron concentrations fell below pre-injection concentrations at MW4S and MW4I and only MW3S had a concentration of dissolved iron that was higher than the background concentrations measured in MW5S and MW5I. The elevated concentrations of dissolved iron (Fe^{2+}) in MW3S suggest that the ZVI is enhancing the reductive dechlorination of PCE in this well[2], as intended.

Concentrations of total iron generally decreased in all downgradient monitoring wells during the post-injection monitoring period. The total iron concentrations from the first post-injection event in February 2023 sampling event may be artificially high due to high turbidity in the grab samples from the temporary well points. Discounting the first round of post- injection data, by the third post-injection sampling event, total iron concentrations in the downgradient wells were generally stable relative to pre-injection concentrations and comparable to the background concentrations in MW5S and MW5I, with the exception of MW3S. The increased concentration of total iron in MW3S is likely due to the injected ZVI reaching this area.

Overall, VFAs had decreasing trends in most of the wells that were sampled during the post-injection sampling events. Many VFAs were not detected at all in some wells and/or had high detection limits for

[2] Fe0 (ZVI) is oxidized to Fe2+ (which is measured as dissolved iron) during the reductive dechlorination of PCE. Fe0 is also oxidized to Fe2+ in a reaction with water, which supplies hydrogen to further the dechlorination reaction of PCE to TCE.

certain events so concentration trends are not well defined. The injection program was designed for VFAs to be present and aid in the dechlorination process for only a short period (maximum 100 days) after the injections, a time period that was not captured by the post-injection monitoring events because the timing of the events could not be achieved as discussed above.

Nevertheless, propionic acid[3] was detected at elevated concentrations (compared to results from other wells during the same sampling event) in MW3S, MW3I, MW4S, and MW4I during the first post-injection sampling event, suggesting some longevity beyond 100 days. During the following sampling events, the concentrations of propionic acid were very low or not detected, with the exception of MW3S. Concentrations of propionic acid in MW3S remained significantly higher than concentration of propionic acid in other monitoring wells but had a decreasing trend during the three sampling events.

Between the first post-injection event in February 2023 and the third event in November 2023, methane concentrations increased in monitoring wells MW1R, MW2R, MW3S, MW3I, MW4S, and MW4I. The highest concentrations of methane during this time were in MW3S and MW4S, which are the wells within/immediately adjacent to the source zone injection. The presence of elevated methane concentrations indicates active methanogenesis (a form of anaerobic degradation).

Ethane was present at elevated and increasing concentrations in monitoring wells MW3S and MW4S. The presence of elevated ethane concentrations indicates anaerobic degradation of PCE.

Ethene was present at elevated and increasing concentrations in MW3S. Ethene is the final product of aerobic PCE degradation. Increasing ethene concentrations indicate increased degradation of PCE. Ethene was also detected at an elevated concentration in MW4 during the first post-injection event, indicating that aerobic degradation of PCE was likely occurring immediately following the injection.

3.2.1.10. Summary

Trends in concentrations of CVOCs and MNA parameters in MW3S, MW3I, and MW4I (directly downgradient of the injection area) indicate that aerobic and anaerobic dechlorination of PCE is occurring and is likely enhanced by the injected compounds.

As noted in Section 3.2.3, construction-related dewatering of Phase 2 footing excavations, including the area near MW4S and MW4I, removed an unknown amount of injection fluid from the subsurface, which occurred intermittently for approximately 6 months after the injections were conducted. The removal of some of the injection fluid may have reduced the effectiveness of the injection in MW4S and MW4I.

An extended groundwater monitoring program, discussed further in Section 3.5, is being performed for this Site to observe ongoing groundwater quality and evaluate the continued effectiveness of the injection program and natural attenuation.

[3] Although ten forms of VFAs were analyzed during the post-injection events, propionic acid is of particular interest because calcium propionate was included in the injection fluid. Calcium propionate is a salt made up of calcium hydroxide and propionic acid. It was included in the injection fluid as a soluble, slow, controlled source of propionic acid, which provides a source of hydrogen for reductive dechlorination.

3.2.2. Vapor Mitigation System

3.2.2.1. Vapor Barrier Installation

The sub-slab vapor mitigation barrier, referred to in the Phase 2 IRM Work Plan as the Gas Barrier, is MonoShield®, manufactured by Land Science, a division of REGENESIS, Inc. MonoShield® includes a 30-mil composite geomembrane (MonoBase) composed of a metallized film laminated to a nonwoven geotextile and reinforcement layers. Seams and penetrations through the MonoBase membrane (e.g., steel piles) were spray sealed with 60-millimeter-thick layer(s) of Nitra-Core, a water-based, liquid nitrile-modified asphalt latex. Additional information about the vapor barrier material – including manufacturer's standard details for sealing seams, membrane penetrations, and termination to the foundation walls – were provided in the Phase 2 IRM Work Plan.

The MonoShield® barrier was sealed to each penetration, overlapping seams, and the inside of the outer foundation wall using the Nitra-Core latex spray to create a continuous barrier beneath the interior slab, then smoke tested. During installation of the vapor barrier, the installer performed smoke testing to identify and repair initial defects before overlying material was placed and the slab poured. Smoke tests were observed and documented by GEI. Observed defects were repaired before the vapor barrier material was covered. After the smoke testing, a layer of non-woven geotextile was placed over the vapor barrier material to protect it during addition of a layer of crushed stone fill and construction of the concrete floor slab above. GEI's construction observation reports associated with the vapor barrier installation are in Appendix F. A photographic log documenting vapor barrier installation is in Appendix G. Additionally, monthly summary reports relating to Phase 2 Construction were previously submitted to the NYSDEC between April 2022 and October 2023. These reports also summarized construction and BCP-related activities performed during the preceding month.

3.2.2.2. Sub-Slab Depressurization System

The sub-slab vapor barrier for the Phase 2 building was underlain with a minimum 6-inch-thick layer of porous, crushed stone (majority particle size $^{3}/_{8}$"-1", less than 5% passing No. 4 sieve) to create a vapor collection layer for the SSDS. The building contains two venting zones - one for Phase 1 and one for Phase 2 - each zone includes 6-inch perforated, SCH 40 PVC collection headers set in the crushed stone layer (see as-built drawings in Appendix C). As with the other sub-slab utilities for the new facility building, pipe hangers were used to install the vent header pipes and support them from the slab above. Where the Phase 1 portion of the building abuts the Phase 2 portion, a concrete structural beam bisects the crushed stone vent layer and serves to isolate the sub-slab depressurization zones in Phase 1 from those in Phase 2 (see Appendix C).

The sub-slab pipe headers connect to solid 6-inch PVC risers that penetrate the slab and extend up through the roof (Appendix C). Two PVC risers are included within the Phase 2 portion of the building and are labeled with the stack IDs S4 and S5 (as shown on Figure 2). Each riser is affixed with a 6-inch PVC ball valve that enables the riser to be shut off. The Phase 2 risers turn 90 degrees and run horizontally from the point above where they penetrate the slab in the interior of the Phase 2 building to the southeastern outside edge of the building before turning up and venting through the roof.

The PVC risers extend approximately 8 feet above the roof, above the elevation of the nearest roof-level fresh air intakes, which are located more than 30 feet away from the discharge stacks. The discharge stacks were braced with guy wires and roof anchors. Sometime between October 2023 and December 2024, discharge stack S5 broke and the fan fell to the roof. In June 2025, the fan was replaced and a metal bracket was installed to support this stack in lieu of guy wires.

The discharge point is angled up 45-degrees to allow for an upward discharge trajectory away from the roof and to reduce potential rainwater intrusion. Photographs of the roof vents are in Appendix G.

To enable vapor extraction and create a vacuum field of at least 0.004 inches water column in the sub-slab vent layer below the vapor barrier, a 6-inch inline axial "radon" fan was mounted in each rooftop discharge stack. Fan product information is in Appendix M. Power to the roof-mounted extraction fans is provided from a 15-amp dedicated circuit, single phase, 120 volts. The estimated power consumption for each extraction fan is 3 amps or less.

The SSDS riser piping was visually inspected by the Engineer's representatives to determine conformance with the design after it was installed. The Phase 1 blowers were confirmed to be operational post-startup, with the initial measurement of pressure readings, conducted on January 17, 2024, indicating vacuums of 0.42 and 1.35 inches of water column in the Phase 2 stacks.

Pressure was measured via sub-slab monitoring points (discussed in Section 3.2.2.3) on January 18, 2024 following system start-up, as well as December 12, 2024, March 20, 2025, June 2025 (June 16 and 26), and December 10, 2025[4] as part of subsequent inspection and repair events to record that as-built conditions meet design criteria for the sub-slab vacuum. The results are on Figure 4 and the measurements are discussed in more detail in Appendix N.

Pressure measurements were made on multiple occasions between late 2024 and mid 2025 because repairs were necessary following the December 2024 inspection event. One blower and discharge stack (S5 in Figure 2) were damaged sometime in early 2025, and insufficient negative pressure was observed in one monitoring point (MP6 in Figure 2) due to incorrect cap installation. The S5 stack was repaired on June 11, 2025, and monitoring point MP6 was repaired on June 26, 2025. Following repairs, sub-slab pressure measurements confirmed that the SSDS effectively creates a negative pressure zone in the sub-slab under normal operating conditions.

3.2.2.3. Vapor Mitigation Monitoring Points

Monitoring points for the VMS were installed as follows:

- **Sub-Slab Monitoring Points:** six pairs of sub-slab monitoring points were installed through the Phase 2 building slab prior to completing the vapor barrier installation. The monitoring point locations are indicated on Figures 2, 4 and 5. The slab design includes thickened reinforced sections (tie beams) with a crushed stone fill layer in between, and the vapor barrier was set below this fill layer and bottom of tie beams. This unique slab profile provides an opportunity to

[4] Monitoring Point MP6D was not accurately measured on December 10, 2025 (i.e., probe was not properly sealed to the port) so a technician returned on January 8, 2026 to successfully measure the MP6D pressure.

monitor sub-slab conditions both above and below the vapor barrier, if necessary. Each pair of sub-slab monitoring points consists of a shallow (above vapor barrier) and a deep (below vapor barrier) monitoring point. Each sub-slab monitoring point was constructed similar to a flush-set plumbing cleanout, the interior gasketed and threaded cap on the sample pipe provides a vapor-tight seal and the means to attach temporary fittings for monitoring. Seals to the vapor barrier around the deep monitoring points were verified during the smoke testing described in Section 3.2.2.1.

- The deep monitoring points can be used to collect soil vapor from below the vapor barrier, which is the type of monitoring typically performed for sub-slab VMSs. The deep monitoring points can also be used to measure sub-slab vacuum. The contingency shallow monitoring points will only be used if collecting samples from the zone between soil vapor and indoor air is necessary.
- **Riser Pipe Monitoring Points:** At the first-floor level, each riser includes a threaded tee for in-pipe flow velocity measurements and is fitted with a pressure gauge (details in Appendix M), and a separate miniature ball valve sample port for collecting samples or measuring pressure with a manometer. A visual alarm was installed in each riser to alert if the vacuum within the riser drops below 0.25 inches of water column. Power to the indoor riser alarms is provided from nearby 120-volt receptacles.

3.2.2.4. Indoor Air Testing and Soil Vapor Sampling

After both phases of building construction were completed and the laundry was fully operational, heating-season sampling of indoor air and soil vapor was performed in January 2024 simultaneously with sub-slab monitoring port pressure testing (Section 3.2.2.3) to evaluate the effectiveness of the vapor barrier and venting system. The post-startup indoor air and soil vapor sampling is reported in the summary included in Appendix N.

The sampling event included air sampling at one ambient upwind location outside the building (to serve as background conditions) and six locations inside the Phase 2 portion of the building, consistent with the IRM Work Plan for Phase 2. Two additional indoor air locations were also sampled in the Phase 1 portion of the building to support the IRM for that phase of the building.[5]

Additionally, UniFirst elected to collect samples of sub-slab soil vapor from the deep monitoring points at four of the interior air monitoring locations in the Phase 2 portion of the building (and one of the Phase 1 locations).[6] Although sub-slab soil vapor sampling was not required as part of the IRM scope, sub-slab soil vapor samples were collected in certain areas for the purpose of comparison between the

[5] An 8-hour sampling duration for indoor (and ambient) air samples was employed because conditions in the facility change throughout the day as doors are opened and closed, different machines and processes are used, and the HVAC system may operate differently throughout the day. The 8-hour samples are representative of indoor air concentrations during a worker shift.

[6] The voluntary sub-slab soil vapor samples had a 1-hour sampling duration because there are not changes to conditions in the sub-slab throughout the day, so the 1-hour sample is considered representative. Despite differing sample durations, the data from the two types of samples were considered to be comparable for the screening-level evaluations.

sub-slab and indoor air concentrations to help determine which compounds are potentially related to the environmental source and which are related to laundry facility operations[7].

Indoor air, ambient air, and sub-slab soil vapor samples were analyzed by Alpha Analytical for VOCs via USEPA Method TO-15. Analytical results are provided in the summary in Appendix N and Figure 5, which shows the sub-slab and indoor air data from the post remedial sampling event.. Figure 6 shows the groundwater analytical results for CVOCs at each well. Note that the results of VI sampling in the Phase 1 portion of the building are also included in the memo and separately discussed in the CCR for Phase 1 IRM.

As discussed in Appendix N and summarized in the table below, PCE and its daughter compounds (TCE, DCE, and VC) are the primary constituents of concern regarding vapor intrusion. PCE was detected in the indoor air in five of the six samples collected from the Phase 2 portion of the building at a maximum concentration of 1.96 ug/m^3 (IA4); which is significantly less than the applicable NYSDOH Air Guidance value of 30 ug/m^3 and the USEPA 2001 Building Assessment and Survey Evaluation (BASE) 90th percentile (P90) value of 15.9 ug/m^3. TCE was detected in one of the six samples collected from the Phase 2 portion of the building, at a concentration of 0.156 ug/m^3 (IA5), which is significantly less than the applicable NYSDOH Air Guidance value of 2 ug/m^3 and the USEPA 2001 BASE P90 value of 4.2 ug/m^3. Trans-1,2-DCE was detected in one indoor air sample in the Phase 2 portion of the building, at a concentration of 1.21 ug/m^3 (IA8). There is not currently an applicable NYSDOH Air Guidance value or USEPA 2001 BASE P90 value for trans-1,2-DCE. Cis-1,2-DCE and VC were not detected in the indoor air samples collected within the Phase 2 portion of the building. This evaluation of CVOCs in indoor air satisfies the scope of work included in the IRM Work Plan and helps to demonstrate the effectiveness of the VMS that was installed through IRM implementation during Phase 2 construction.

	DOH AA Guideline	AA1	IA1	IA2	IA3	IA4	IA5	IA6	IA7	IA8
PCE	30	0.136 U	6.7	1.51	1.8	1.96	1.46	1.59	1.25	0.136 U
TCE	2	0.107 U	0.107 U	0.107 U	0.107 U	0.107 U	0.156	0.107 U	0.107 U	0.107 U
Cis-1,2-DCE	N/A	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U
Trans-1,2-DCE	N/A	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	0.079 U	1.21
VC	N/A	0.051 U	0.051 U	0.051 U	0.051 U	0.051 U	0.051 U	0.051 U	0.051 U	0.051 U

Notes: Results are reported in uh/m^3
DOH AA Guideline is the NYSDOH Ambient [Indoor] Air Guidance value, as published on their "Soil Vapor Intrusion Guidance and Updates" webpage.
Samples were collected on January 17 and 18, 2024. Samples with "IA" identifiers are indoor air samples. The "AA" identifier is associated with an outdoor (ambient) air sample.
Results for site-related CVOCs are summarized above. Other VOCs were detected in certain samples. Refer to the VI data tables in Appendix H for all indoor and ambient air results.

While typically not part of post-startup performance testing, UniFirst also elected to collect sub-slab soil vapor data from a subset of the air monitoring locations in January 2024, as noted above, to provide additional evidence to indicate that the VMS is effective. As discussed in Appendix N, the presence of

[7] As discussed in Appendix N, UniFirst launders textiles from numerous commercial and industrial facilities. Many of these textiles are likely soiled with substances that can elevate indoor air chemical levels.

most of the compounds detected above background in indoor air is likely attributable to chemicals stored or used in laundry operations, chemicals being brought on site in the soiled textiles for laundering (e.g. benzene, toluene, chloroform, ethylated and methylated benzenes and toluenes) and/or result from the recent construction (e.g. tetrahydrofuran and MEK found in PVC glue) rather than volatilization from COCs present below the building. With respect to chemicals that were present in the subsurface, maximum concentrations of these compounds in indoor air were orders of magnitude below the maximum soil vapor concentrations, serving as an additional line of evidence that the VMS is effective in controlling the potential intrusion pathway.

The active SSDS will remain operational to provide continued mitigation. Annual inspections of the SSDS commenced in December 2024 and include visual inspections of the system, confirmation of negative pressure readings, and verification that no air intakes have been installed near the discharge points for the system. The 2024 and 2025 Annual Inspection Reports are included as attachments to Appendix N. Details of system operation, monitoring, and maintenance are described in the Interim Site Management Plan, submitted separately to the NYSDEC.

3.2.3. Management of Excess Soil and Dewatering Fluids

Phase 2 construction also required the removal of soil and dewatering operations associated with foundations and site features, resulting in the need for management of excess soil and dewatering fluids containing CVOCs. Several excavations related to footings, grade beams, loading dock grade modifications and utilities were conducted in areas that were known or suspected to be impacted to some degree by CVOCs. The excess soils generated during the construction work could not be reused on site and therefore required off-site management. Though the IRMWP scope included management of soil above applicable SCOs and the excess material generated during construction did not exceed those criteria, UniFirst did manage the excess soil and associated dewatering fluid consistent with NYSDEC guidance, as described in this subsection.

As discussed in Section 2.3, GEI developed an EWP (Appendix A) to guide the proper staging, transportation and disposal of excess soil and dewatering fluid generated during construction. The EWP describes appropriate methods for stockpiling, monitoring, transportation, and disposal of soil. Soil management and dust monitoring was conducted in accordance with the EWP for all construction-related soil removal within the Site limits.

A total of 4,453 tons of excess soil and concrete, and several tanks of dewatering fluid generated during Phase 2 construction-related excavations was managed appropriately and transported offsite for proper disposal, as further discussed below. Waste tracking information is included in Table 2 and documentation is in Appendix J.

3.2.3.1. Non-Hazardous Excess Soil Disposal

Except for a small volume of soil from the excavation of one footing, the excess soils were managed as non-hazardous waste with NYSDEC contained-in determinations (Appendix D). Five contained-in requests were submitted to NYSDEC for disposal of excess soil and concrete generated by the Contractor.

The first request letter was submitted on June 21, 2022, prior to the Contractor beginning the site work, for the extent of soil that was expected to be removed during Phase 2 construction, based on prior analytical results. This included approximately 4,800 tons of soil containing PCE, TCE, and cis-1,2-DCE with concentrations less than the applicable NYSDEC "contained in" soil action levels and Land Disposal Restrictions. The NYSDEC accepted this contained-in request in a letter dated July 19, 2022, and approved disposal of the soil as non-hazardous waste.

A second contained-in request was submitted on August 10, 2022, for the management of the concrete floor slab that was removed during demolition of the pre-existing facility building (approximately 800 tons of concrete). As discussed in the contained-in request, the concrete was sampled, and the analytical results found concentrations to be below the applicable NYSDEC contained-in soil action levels. On October 14, 2022, NYSDEC sent an approval letter, confirming that the concrete could be disposed as non-hazardous waste.

On October 3, 2022, the third contained-in request was submitted to NYSDEC for approximately 400 cubic yards of additional excess soil from an excavation near the southern corner of the building, which is a location that was not anticipated in the original June 21, 2022, contained-in request. Similar to the concrete, the excess soil was sampled and found to be below applicable NYSDEC contained-in soil action levels, as described in the request letter. The request was approved by NYSDEC on October 14, 2022.

An additional 30 cubic yards of soil was excavated to install a sewer main between the front of the Site building and Old 7th North Street, which was also not anticipated in prior contained-in requests. Similar to the other excess soils, this material was sampled, and concentrations were below their current NYSDEC contained-in soil action levels. The fourth contained-in request letter was submitted to NYSDEC on December 4, 2022, for this additional soil and NYSDEC approved the contained-in request in a letter dated December 13, 2022.

Finally, an additional approximately 2,500 cubic yards of excess shallow soils were removed for pavement subgrade, retention pond and drainage piping. These areas are located on the Property, but largely outside of the defined Site boundaries, and also had not been included in prior contained-in requests. Like the prior requests, samples were collected and analyzed to support this contained-in request and concentrations were less than their current NYSDEC contained-in soil action levels. This is further described in the fifth contained-in request letter, which was submitted on May 16, 2023, and NYSDEC approved the request in a letter dated May 18, 2023.

During Phase 2 Construction, a total of 3,215 tons of non-hazardous soil and concrete were stockpiled and then transported for disposal at Seneca Meadows in Waterloo, New York under the NYSDEC contained-in approvals dated July 19, 2022, October 14, 2022, and December 13, 2022. The approximate 800 tons of concrete (contained-in approval dated October 14, 2022) was combined with the soil and transported for disposal at Seneca Meadows. Finally, the approximately 1,165 tons of shallow material excavated from the southern portion of the property under contained-in approval dated May 18, 2023, was disposed at the Camillus Landfill.

3.2.3.2. Hazardous Excess Soil Disposal

Soil that was removed for installation of a footing in the northeast corner of the Phase 2 footprint was found to contain PCE with a concentration greater than the NYSDEC "contained in" action level of 12 mg/kg based on the analytical result for sample B204, but still below the applicable Industrial SCO (81 mg/kg). Additional samples (5W, 5S, 5N, 5E, and 10E) were collected to delineate PCE concentrations in that area, and the excess soil from within those limits was segregated into a separate stockpile and disposed as F002 (spent solvent) hazardous waste. The area where this soil originated is depicted in Figure 2. A total of 65,520 kilograms (72.22 tons) of hazardous soil was removed from the Site and disposed at Englobe Montreal-East Soil Treatment facility. Disposal documentation is in Appendix J and is summarized in Table 2.

3.2.3.3. Dewatering Fluid Disposal

The footing and grade beam excavations extended below the water table and needed to be dewatered to allow for foundation construction. The resulting water was stored, transported, and properly treated or disposed. The first two fractionation (frac) tanks of water that were generated during foundation construction were transported to Norlite, LLC in Cohoes, New York in August 2022. Water from these two tanks was not sampled, but both were transported and treated as hazardous waste as a conservative measure. Certificates of Destruction were provided by Tradebe Environmental Services, LLC. Several additional tanks of dewatering fluid were characterized tank-by-tank and transported by Sun Environmental as non-hazardous waste to the Onondaga County wastewater treatment facility or American Recyclers Company. Relevant disposal documentation available to GEI is included in Table 2 and Appendix J.

The wastewater vault beneath the new Phase 1 section of the building, which is the apparent source of the PCE in the subsurface at the Site, was pumped out and closed during the Phase 2 construction. Approximately 10 tons of sludge was removed from the wastewater vault and transported in a tanker truck to Chaffee Landfill in Chaffee, New York as non-hazardous waste.

The Bill of Lading is included in Appendix J. Closure of the wastewater pit is discussed further in Section 3.4.

3.2.3.4. Imported Materials

Clean material that was imported to the Site included gravel and topsoil. Gravel was used as the sub-base beneath the building, and topsoil was used in landscaped areas. Requests to Import Fill or Soil and NYSDEC approval of these requests are included in Appendix D. Documentation of transportation of imported materials to the Site was not available to GEI for inclusion in this CCR.

3.3. Deviations from the IRM Work Plan

Certain minor deviations from the Phase 2 IRM Work Plan occurred during implementation. These deviations and rationale are summarized below.

The PVC risers inside the building were not insulated as described in the IRM Work Plan for Phase 2. However, condensation has not been observed on the pipes during any Site visits, which have been conducted during multiple seasons.

Construction of the rooftop discharge stacks differs from the configuration proposed in the VMS Design Documents that were attached to the IRM Work Plan. The actual construction of the rooftop stacks positions the axial fan approximately 3 feet above the roof and approximately 3 more feet of stack above the fan. Guy wires are attached to the stack above the axial fan. The original design positioned the axial fan at the top of the stack with guy wires below. The modified design maximizes stability of the entire discharge stack and does not affect VMS performance. The as-constructed condition of the stacks is visible in photos 33 and 35 in the Photo Log (Appendix G). As described in Section 3.2.2.2, the guy wires on discharge stack S5 were replaced with a support bracket in June 2025 after the stack sustained damage, presumably in late 2024.

The initial post-startup pressure testing of the sub-slab monitoring points, conducted in January 2024, included measuring three of the five sub-slab monitoring points in the Phase II portion of the facility. The other two monitoring points were not accessible during this mobilization. Pressure readings from the three measured points confirmed effective depressurization in the sub-slab. Repairs were subsequently made to the other two ports and full rounds of pressure testing were completed in March 2025, June 2025, and December 2025-January 2026.

During the ZVI/EZVI injections, a limited amount of injection fluid was observed expressing at the ground surface (a/k/a “daylighting”). The injection fluid soaked into the ground near the injection points, and none was observed migrating beyond the immediate injection area.

An unknown portion of the injection fluid, which was intended to remain in the subsurface to facilitate CVOC degradation, was removed during subsequent dewatering of footing excavations once Phase 2 building construction resumed. The contractor had not indicated the need for dewatering during footing installation, so this issue was not considered when the remedial injection program was designed. The contractor began excavations for building footings in July 2022; the water was containerized and disposed as discussed in Section 3.2.3.3 above. It is not known how much injection fluid (as opposed to groundwater or stormwater accumulation), or treatment reagents was removed during this process or how it will impact the source remediation.

As noted above, the post-injection monitoring plan was altered from the original plan to conduct sampling events at 6, 9-, and 12-months post-injection because the intended locations for the planned monitoring wells were inaccessible for an extended period of time due to facility construction. The three events were instead performed at 8, 13, and 18 months post-injection.

In addition to the planned work scope described in the Phase 2 IRM Work Plan, the suspected source area was also addressed during Phase 2 of construction when the former underground wastewater pit was closed.[8] The former underground wastewater pit, consisting of a concrete structure that extended

[8] It was reported in the IRMWP for Phase 2 that the underground wastewater pit had been filled with concrete in 2021. This was later found to be inaccurate. Concrete was poured to build a new underground wastewater pit in 2021, but the old pit remained in use until 2022.

from the surface to approximately 8 feet below grade, was suspected of leaking and had been in use during the time in which the facility did dry cleaning. After UniFirst ceased dry cleaning operations in 1987, the wastewater pit continued to be used for non-dry-cleaning-related wastewater until a new wastewater pit with an impermeable liner was installed during Phase 1 construction.

In August 2023, the remaining sludge in the wastewater pit was pumped out and transported to Chaffee Landfill in Chaffee, New York as non-hazardous waste (Appendix J) then the pit was backfilled with flowable fill and the area was covered with the vapor barrier before pouring the concrete floor. The closure of the former wastewater pit is considered additional source area remediation because leaks from the pit will no longer influence the existing plume.

There were no other significant deviations from the IRM Work Plan for Phase 2.

3.4. Contamination Remaining at the Site

Impacted soils and groundwater are located primarily beneath the southern half of the former UniFirst laundry facility building (i.e., beneath the southern half of the Phase 2 portion of the new facility). Investigation results suggest that the former wastewater collection pit on the southwest exterior of the laundry building (decommissioned during Phase 2, as discussed in Section 3.4) was a suspected source of soil and groundwater impacts related to historical dry-cleaning operations. Site conditions, to the extent currently known, are described in prior submittals to the NYSDEC and will be further discussed in the future RIR.

This IRM included remedial injections to aid in the degradation of CVOCs present in groundwater and installation of a VMS to prevent potential vapor intrusion into the new facility building.

The VMS component of this IRM does not change the nature or extent of impacted media present at the Site.

With respect to the remedial injections, while the remedial injection program was conducted to facilitate accelerated in-situ dechlorination of CVOCs in groundwater, PCE and its daughter products currently remain in Site groundwater at concentrations above the NYSDEC ambient water quality standards. Concentrations of PCE decreasing in most monitoring wells since the May to June 2022 injections and daughter compounds increased in some wells as measured during the post-injection monitoring program, indicating that PCE is degrading. Detailed information on groundwater conditions within monitoring wells included in the post-injection monitoring plan are discussed in Section 3.2.1.4.

To continue to monitor post-injection conditions, GEI performs quarterly groundwater monitoring as part of an Interim Site Management Plan, submitted to NYSDEC under separate cover. Under this Interim Site Management Plan, monitoring wells MW1R, MW2R, MW3S, MW3I, MW4S, and MW4I continue to be sampled quarterly and analyzed for VOCs and MNA parameters to evaluate the attenuation of PCE downgradient of the source area. Quarterly samples from additional monitoring wells are analyzed for VOCs to monitor the side-gradient and downgradient plume behavior. These results are reported in quarterly groundwater monitoring reports submitted to the NYSDEC.

Table 1. Pre- and Post-Injection Groundwater Analysis Results
UniFirst Laundry Facility
Liverpool. NY

Notes:

Analytes in blue are not detected in any sample

ng/L = nanogram per liter (ppt)

s.u. = standard units

ug/L = micrograms per liter or parts per billion (ppb)

NYS AWQS = New York State Ambient Water Quality Standards and

* indicates the value is a guidance value and not a standard

CAS No. = Chemical Abstracts Service Number

ND = Not Detected

NE = Not Established

NA = Not Analyzed

Bolding indicates a detected result concentration

Shading indicates that the detected concentration is above the NYS AWQS guidance to which it was compared

Validation Qualifiers: Note validation performed by LDC

J = The result is an estimated value

R = The result is rejected

U = The result was not detected above the reporting limit.

UJ = The results was not detected at or above the reporting limit shown

LEGEND:

- AMBIENT (OUTDOOR) AIR SAMPLING POINT
- SOIL VAPOR SAMPLING POINT
- ESTIMATED SITE BOUNDARY
- PROPERTY BOUNDARY
- RIGHT-OF-WAY BOUNDARY

NOTES:

1. "SSV" DESIGNATED IDs ARE SUB-SLAB SOIL VAPOR SAMPLES. "IA" DESIGNATED IDs ARE INDOOR AIR SAMPLES. (INDOOR AIR SAMPLES WERE COLLECTED AT BREATHING HEIGHT, CO-LOCATED WITH THE SOIL VAPOR SAMPLES.)
2. INDOOR AIR (IA) AND SUB-SLAB VAPOR (SSV) RESULTS ARE REPORTED IN $\mu g/m^3$. GROUNDWATER RESULTS ARE REPORTED IN µg/L.
3. IA AND SSV SAMPLES WERE COLLECTED ON JANUARY 17 & 18, 2024.
4. PCE = TETRACHLOROETHENE.
5. TCE = TRICHLOROETHENE.
6. DCE = DICHLOROETHENE.
7. VC = VINYL CHLORIDE.
8. CHLORINATED VOLATILE ORGANIC COMPOUNDS (CVOC) RESULTS ARE SUMMARIZED ON THIS FIGURE BECAUSE THEY ARE THE PRIMARY SITE CONSTITUENTS OF CONCERN. OTHER VOCS WERE DETECTED IN CERTAIN SAMPLES. REFER TO THE VI DATA TABLES AND GROUNDWATER SAMPLING SUMMARY REPORTS.
9. ACCORDING TO WARREN RAMIE SURVEYING, THE DEED DESCRIPTIONS, ON WHICH THE PROPERTY BOUNDARIES SHOWN HEREON WERE BASED, PREDATE ONONDAGA COUNTY'S RIGHT OF WAY TAKING FOR 7TH NORTH STREET.

B. Site Related Contact Information

1. Introduction

This Excavation Work Plan (EWP) was prepared on behalf of Unifirst Corporation to provide plans and procedures for the proper handling of impacted media that may be disturbed during maintenance and/or redevelopment work on UniFirst's Property located at the corner of Old 7th North Street and Luther Avenue in Liverpool, Onondaga County, New York (Figures 1 and 2).

Due to the presence of chlorinated volatile organic compounds (CVOCs) in soil and groundwater within a portion of this Property (discussed in Section 1.1), it was registered with the New York State Department of Environmental Protection (NYSDEC) as Brownfield Cleanup Program (BCP) Site No. C734152 in October 2021, and UniFirst is a "Participant" in this program as defined by ECL 27 1405(1)(a) of the BCP.

Site Description

Since being acquired by UniFirst in the mid-1960s, the original facility has been operated as an industrial laundry and is currently being redeveloped, a project that will ultimately result in a new, larger laundry facility.

The Property is currently made up of the original industrial laundry facility parcel and several additional adjacent parcels located along Luther Avenue that UniFirst acquired over the years. The Property is approximately 3.25 acres, currently improved with a new 31,000 square foot building located along Luther Avenue (completed in early 2022; referred to hereafter as the "Phase 1" of the new laundry facility), and is in a commercial / industrial-zoned area. Currently, Phase 2 of the new laundry facility is under construction in the area of the original laundry facility (the original facility was demolished in 2022 and Phase 2 is being constructed in its place). The other areas of the Property are currently reworked soil, covered by gravel, or paved. There is a fence along the southwestern property line, limiting access to the Property from the adjacent truck stop and gas station.

In support of this construction, environmental investigations conducted between April 2020 and present, to evaluate the nature and extent of potential release(s) to the environment due to dry cleaning previously performed in the industrial laundry facility and evaluate construction may be impacted by these potential releases. CVOCs were identified in soil and groundwater near and downgradient of a former wastewater pit, the source of which is likely PCE (which was reportedly used as the dry cleaning solvent during historical operations) in wastewater historically processed through the former wastewater pit.

Applicability

This EWP outlines the procedures required to be implemented in the event that intrusive activities occur within the Site limits (Figure 2). Work conducted pursuant to the EWP must also be conducted in accordance with the procedures defined in the New York State Department of Health (NYSDOH) Community Air Monitoring Plan (CAMP) (Appendix A) and Site-specific Health and Safety Plan(s) (HASP[s]) prepared the entity(ies) working onsite for the specific work being conducted. Work is to be overseen by a qualified environmental professional as defined in 6 NYCRR Part 375, a Professional Engineer (PE) who is licensed and registered in New York State, or a qualified person who directly reports to a PE who is licensed and registered in New York State.

2. Notification

At least 15 days prior to the start of any activity that is anticipated to encounter Site impacts, the site owner or their representative will notify the NYSDEC. Table 1 includes contact information for the above notification. The information on this table will be updated as necessary to provide accurate contact information. A full listing of site-related contact information is provided in Appendix B.

Table 1: Notifications*

Michael Belveg NYSDEC Project Manager	315.426.7446 michael.belveg@dec.ny.gov NYSDEC Region 7 615 Erie Boulevard West Syracuse, New York 13204
Johnathan Robinson NYSDOH Project Manager	518.402.7881 Johnathan.Robinson@health.ny.gov Empire State Plaza Corning Tower Room #1787 Albany, New York 12237

* Note: Notifications are subject to change and will be updated, as necessary.

This notification will include:

- A detailed description of the work to be performed, including the location and areal extent of excavation, plans/drawings for site re-grading, intrusive elements or utilities and estimated volumes of impacted soil to be excavated, and modifications of truck routes (if applicable);
- A summary of environmental conditions anticipated to be encountered in the work areas, including the nature and concentration levels of contaminants of concern, potential presence of grossly contaminated media, and plans for any pre-construction sampling;
- A schedule for the work, detailing the start and completion of all intrusive work;
- A summary of the applicable components of this EWP;
- A statement that the work will be performed in compliance with this EWP and 29 CFR 1910.120;
- A copy of the contractor's health and safety plan (HASP), in electronic format.
- Identification of disposal facilities for potential waste streams; and

- Identification of sources of any anticipated backfill, along with the required request to import form and all supporting documentation including, but not limited to, chemical testing results.

The NYSDEC project manager will review the notification and may impose additional requirements for the excavation that are not listed in this EWP.

3. Soil Screen Methods

Visual, olfactory and instrument-based (e.g. photoionization detector) soil screening will be performed by a qualified environmental professional (as defined in 6 NYCRR Part 375) during all excavations into known or potentially impacted material. Currently, the area of known contaminated material is around and downgradient from (i.e., west of) the existing wastewater pit. Soil screening will be performed when invasive work is done and will include all excavation and intrusive work performed during development, such as excavations for foundations and utility work, prior to issuance of the Certificate of Completion (COC).

Soils will be segregated based on previous environmental data and screening results into material that requires off-site disposal and material that requires testing to determine if the material can be reused on-site as soil beneath a cover (building or pavement). Further discussion of off-site disposal of materials and on-site reuse is provided in Sections 7 and 8.

4. Soil Staging Methods

Temporary stockpiled soil (excavated soils stockpiled for less than 24-hours) will be loaded directly into trucks. When soil is stockpiled for longer than 24-hours, the methods detailed in this section will be followed and maintained.

Soil stockpiles will be continuously encircled with a berm and/or silt fence. Hay bales will be used as needed near catch basins, surface waters and other discharge points.

Stockpiles will be kept covered at all times with appropriately anchored tarps unless it is actively being added to in volume or trucks are loading. Stockpiles will be routinely inspected and damaged tarp covers will be promptly replaced.

Stockpiles will be inspected at a minimum once each week and after every storm event. Results of inspections will be recorded in a logbook and maintained at the site and available for inspection by the NYSDEC.

5. Materials Excavation and Load-Out

A qualified environmental professional or person under their supervision will oversee the excavation and load-out of excavated material.

The owner of the property and its contractors are responsible for safe execution of all intrusive and other work performed under this Plan.

The presence of utilities and easements will be investigated by the qualified environmental professional. It will be determined whether a risk or impediment to the planned work under this EWP is posed by utilities or easements on the site. Utilities will be pre-cleared prior to ground intrusive activities.

Loaded vehicles leaving the site will be appropriately lined, tarped, securely covered, manifested, and placarded in accordance with appropriate Federal, State, local, and New York State Department of Transportation (NYSDOT) requirements (and all other applicable transportation requirements).

A truck wash will be operated on-site, as appropriate. The qualified environmental professional will be responsible for ensuring that all outbound trucks will be washed at the truck wash before leaving the site until the activities performed under this section are complete Truck wash waters will be collected and disposed of off-site in an appropriate manner.

Locations where vehicles enter or exit the site shall be inspected daily for evidence of off-site soil tracking.

The qualified environmental professional will be responsible for ensuring that all egress points for truck and equipment transport from the site are clean of dirt and other materials derived from the site during intrusive excavation activities. Cleaning of the adjacent streets will be performed as needed to maintain a clean condition with respect to site-derived materials. Material accumulated from the street cleaning and egress cleaning activities will be disposed off-site at a permitted landfill facility in accordance with all applicable local, State, and Federal regulations.

6. Materials Transport Off-Site

All transport of materials will be performed by licensed haulers in accordance with appropriate local, State, and Federal regulations, including 6 NYCRR Part 364. Haulers will be appropriately licensed and trucks properly placarded.

Material transported by trucks exiting the site will be secured with tight-fitting covers. Loose-fitting canvas-type truck covers will be prohibited. If loads contain wet material capable of producing free liquid, truck liners will be used.

Truck transport routes are to be submitted with Notification (Section 2) once disposal facilities are identified, but is expected to be directly to and from the I-81 on- and off-ramps via 7th North Street.

All trucks loaded with site materials will exit the vicinity of the site using only the approved truck routes. The most appropriate route will take into account: (a) limiting transport through residential areas and past sensitive sites; (b) use of city mapped truck routes; (c) prohibiting off-site queuing of trucks entering the facility; (d) limiting total distance to major highways; (e) promoting safety in access to highways; and (f) overall safety in transport.

Trucks will be prohibited from stopping and idling in the neighborhood outside the project site.

Egress points for truck and equipment transport from the site will be kept clean of dirt and other materials during site remediation and development.

Queuing of trucks will be performed on-site in order to minimize off-site disturbance. Off-site queuing will be prohibited, unless directed by the Site supervisor or a qualified environmental professional.

7. Materials Disposal Off-Site

Material excavated and removed from the site will be treated as contaminated and regulated material and will be transported and disposed in accordance with all local, State and Federal regulations. Unregulated off-site management of materials from this site will not occur without formal NYSDEC approval.

Off-site disposal locations for excavated soils will be identified in the pre-excavation notification. This will include estimated quantities and a breakdown by class of disposal facility if appropriate (e.g., hazardous waste disposal facility, solid waste landfill, petroleum treatment facility, C&D debris recovery facility). Actual disposal quantities and associated documentation will be reported to the NYSDEC. This documentation will include but will not be limited to: waste profiles, test results, facility acceptance letters, manifests, bills of lading and facility receipts.

Non-hazardous historic fill and contaminated soils taken off-site will be handled consistent with 6 NYCRR Parts 360, 361, 362, 363, 364 and 365. Material that does not meet Unrestricted SCOs is prohibited from being taken to a New York State C&D debris recovery facility (6NYCRR Subpart 361-5 registered or permitted facility). However, NYSDEC is providing site specific approvals for disposal at the Camillus C&D facility.

8. Materials Reuse On-Site

The qualified environmental professional will ensure that procedures defined for materials reuse in this EWP are followed and that unacceptable material does not remain on-site. Impacted on-site material, including historic fill and soil, that is acceptable for reuse on-site will be placed below the demarcation layer or impervious surface, and will not be reused within a cover soil layer, within landscaping berms, or as backfill for subsurface utility lines.

Proposed materials for reuse on-site must be sampled for full suite analytical parameters including per- and polyfluoroalkyl substances (PFAS) and 1,4-dioxane. The sampling frequency will be in accordance with DER-10 Table 5.4(e)10 unless prior approval is obtained from the NYSDEC project manager for modification of the sampling frequency. The analytical results of soil/fill material testing must meet the site use criteria presented in NYSDEC DER-10 Appendix 5 – Allowable Constituent Levels for Imported Fill or Soil for all constituents listed, and the NYSDEC Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (dated January 2021 or date of current version, whichever is later) guidance values. Approvals for modifications to the analytical parameters must be obtained from the NYSDEC project manager prior to the sampling event.

Soil/fill material for reuse on-site will be segregated and staged as described in this EWP. The anticipated size and location of stockpiles will be provided in the 15-day notification to the NYSDEC project manager. Stockpile locations will be based on the location of site excavation activities and proximity to nearby site features. Material reuse on-site will comply with requirements of NYSDEC DER-10 Section 5.4(e)4. Any modifications to the requirements of DER-10 Section 5.4(e)4 must be approved by the NYSDEC project manager.

Any demolition material proposed for reuse on-site will be sampled for asbestos and the results will be reported to the NYSDEC for acceptance. Concrete crushing or processing on-site will not be performed without prior NYSDEC approval. Organic matter (wood, roots, stumps, etc.) or other solid waste derived from clearing and grubbing of the site will not be reused on-site.

9. Fluids Management

All liquids to be removed from the site, including but not limited to, excavation dewatering, decontamination waters and groundwater monitoring well purge and development waters, will be handled, transported and disposed off-site at a permitted facility in accordance with applicable local, State, and Federal regulations. Dewatering, purge and development fluids will not be recharged back to the land surface or subsurface of the site, and will be managed off-site, unless prior approval is obtained from NYSDEC.

If discharge to the County sewer system is desired, dewatering will be conducted by the contractor in accordance with the Metropolitan Syracuse Wastewater Treatment Plant (Metro) issued permit which may include collection of groundwater samples for analyses prescribed by Metro, and pretreatment of effluent to comply with Metro discharge criteria. Dewatering engineering controls will be approved by the Metro.

Discharge of water generated during large-scale construction activities to surface waters (i.e., a local pond, stream or river) will be performed under a SPDES permit.

10. Backfill From Off-Site Sources

All materials proposed for import onto the site will be approved by the qualified environmental professional and will be in compliance with provisions in this EWP prior to receipt at the site. A Request to Import/Reuse Fill or Soil form, which can be found at http://www.dec.ny.gov/regulations/67386.html, will be prepared and submitted to the NYSDEC project manager allowing a minimum of 5 business days for review.

Material from industrial sites, spill sites, or other environmental remediation sites or potentially contaminated sites will not be imported to the site.

All imported soils will meet the backfill and cover soil quality standards established in 6NYCRR 375-6.7(d). Based on an evaluation of the land use, protection of groundwater and protection of ecological resources criteria, the resulting soil quality standards consist of Industrial Soil Cleanup Objectives (SCOs). Soils that meet 'general' fill requirements under 6 NYCRR Part 360.13, but do not meet backfill or cover soil objectives for this site, will not be imported onto the site without prior approval by NYSDEC project manager. Soil material will be sampled for the full suite of analytical parameters, including PFAS and 1, 4-dioxane. Solid waste will not be imported onto the site.

Trucks entering the site with imported soils will be securely covered with tight fitting covers. Imported soils will be stockpiled separately from excavated materials and covered to prevent dust releases.

11. Stormwater Pollution Prevention

Barriers and hay bale checks will be installed and inspected once a week and after every storm event. Results of inspections will be recorded in a logbook and maintained at the site and available for inspection by the NYSDEC. All necessary repairs shall be made immediately.

Accumulated sediments will be removed as required to keep the barrier and hay bale check functional.

All undercutting or erosion of the silt fence toe anchor shall be repaired immediately with appropriate backfill materials.

Manufacturer's recommendations will be followed for replacing silt fencing damaged due to weathering.

Erosion and sediment control measures shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters.

Silt fencing or hay bales will be installed around the entire perimeter of the construction area.

12. Excavation Contingency Plan

If underground tanks or other previously unidentified contaminant sources are found during subsurface excavations or development related construction, excavation activities will be suspended until sufficient equipment is mobilized to address the condition. The NYSDEC project manager will be promptly notified of the discovery.

Sampling will be performed on product, sediment and surrounding soils, etc. as necessary to determine the nature of the material and proper disposal method. Chemical analysis will be performed for a full list of analytes (TAL metals; TCL volatiles and semi-volatiles [including 1,4-dioxane], TCL pesticides, PCBs, and PFAS), unless the site history and previous sampling results provide a sufficient justification to limit the list of analytes. In this case, a reduced list of analytes will be proposed to the NYSDEC for approval prior to sampling. Any tanks will be closed as per NYSDEC regulations and guidance.

Identification of unknown or unexpected contaminated media identified by screening during intrusive site work will be promptly communicated by phone within two hours to NYSDEC's Project Manager. Reportable quantities of petroleum product will also be reported to the NYSDEC spills hotline. Findings will be summarized in a report to the NYSDEC.

13. Community Air Monitoring Plan

The location of air sampling stations based on generally prevailing wind conditions are shown on Figure 2. These locations will be adjusted on a daily or more frequent basis based on actual wind directions to provide an upwind and at least two downwind monitoring stations.

Exceedances of action levels listed in the CAMP will be reported to NYSDEC and NYSDOH Project Managers.

The CAMP is in Appendix A. Exceedances of action levels listed in the CAMP will be reported to NYSDEC and NYSDOH Project Managers.

14. Odor Control Plan

This odor control plan is capable of controlling emissions of nuisance odors off-site. Specific odor control methods to be used on a routine basis will include foaming, if necessary, to suppress vapors and odors that are generated during the excavations. Foam will be applied, if warranted, to stockpiled soil and excavation sidewalls to maintain work zone and perimeter air monitoring criteria established in the HASP and CAMP. Tarps will also be employed to suppress vapor and odors from stockpiled soil in the staging area, if necessary. If nuisance odors are identified at the site boundary, or if odor complaints are received, work will be halted and the source of odors will be identified and corrected. Work will not resume until all nuisance odors have been abated. NYSDEC and NYSDOH will be notified of all odor events and of any other complaints about the project. Implementation of all odor controls, including the halt of work, is the responsibility of the remedial party, and any measures that are implemented will be included in completion reporting.

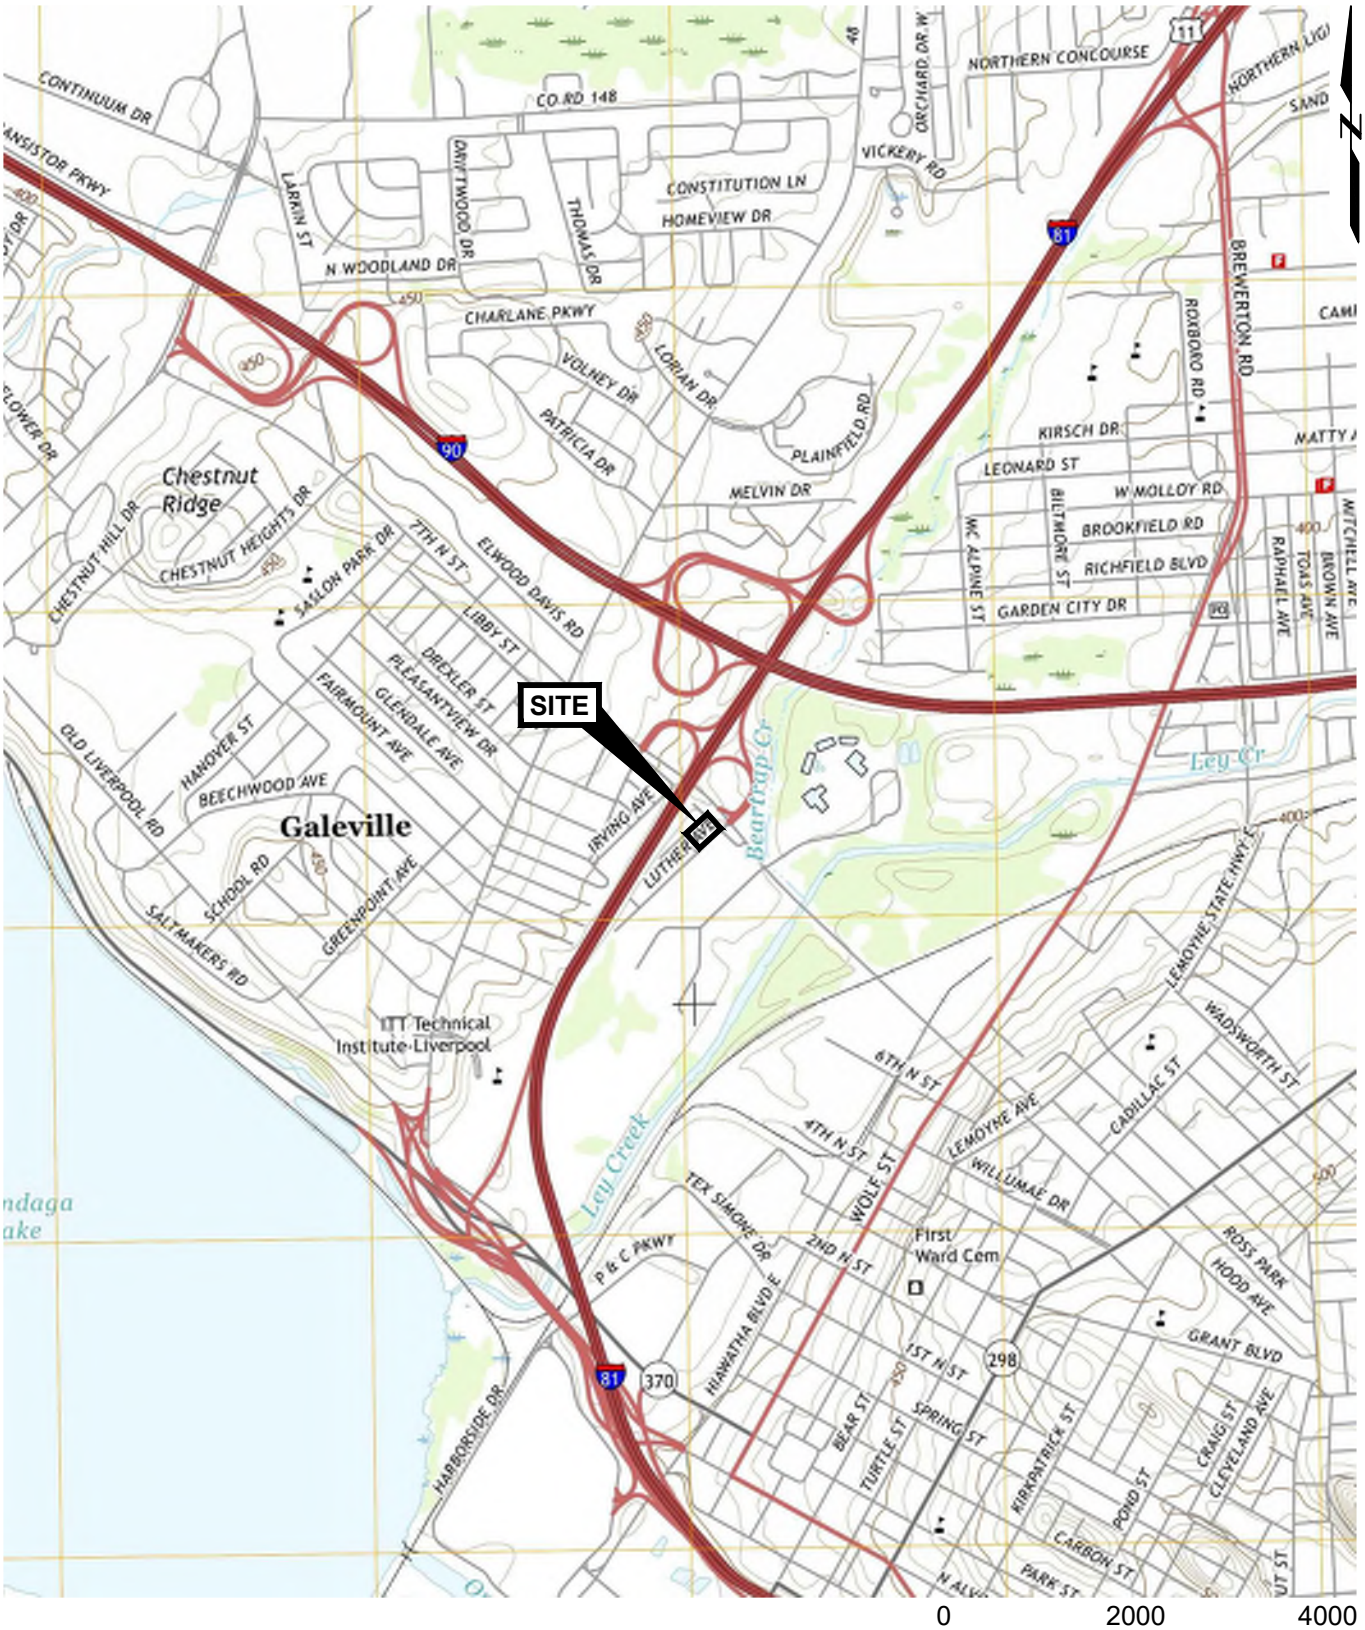
All necessary means will be employed to prevent on- and off-site nuisances. At a minimum, these measures will include: (a) limiting the area of open excavations and size of soil stockpiles; (b) shrouding open excavations with tarps and other covers; and (c) using foams to cover exposed odorous soils. If odors develop and cannot be otherwise controlled, additional means to eliminate odor nuisances will include: (d) direct load-out of soils to trucks for off-site disposal; (e) use of chemical odorants in spray or misting systems; and (f) use of staff to monitor odors in surrounding neighborhoods.

If nuisance odors develop during intrusive work that cannot be corrected, or where the control of nuisance odors cannot otherwise be achieved due to on-site conditions or close proximity to sensitive receptors, odor control will be achieved by sheltering the excavation and handling areas in a temporary containment structure equipped with appropriate air venting/filtering systems.

15. Dust Control Plan

Particulate monitoring must be conducted according to the CAMP provided Appendix A. If particulate levels at the site exceed the thresholds listed in the CAMP or if airborne dust is observed on the site or leaving the site, the dust suppression techniques listed below will be employed. The remedial party will also take measures listed below to prevent dust production on the site.

A dust suppression plan that addresses dust management during invasive on-site work will include, at a minimum, the items listed below:



- Dust suppression will be achieved through the use of a dedicated on-site water truck for road wetting. The truck will be equipped with a water cannon capable of spraying water directly onto off-road areas including excavations and stockpiles.
- Clearing and grubbing of larger sites will be done in stages to limit the area of exposed, unvegetated soils vulnerable to dust production.
- Gravel will be used on roadways to provide a clean and dust-free road surface.
- On-site roads will be limited in total area to minimize the area required for water truck sprinkling.

16. Other Nuisances

If needed, a plan for rodent control will be developed and utilized by the contractor prior to and during site clearing and site grubbing, and during all remedial work.

A plan will be developed and utilized by the contractor for all remedial work to ensure compliance with local noise control ordinances.

Appendix A

NYSDOH Generic CAMP

Appendix 1A
New York State Department of Health
Generic Community Air Monitoring Plan

Overview

A Community Air Monitoring Plan (CAMP) requires real-time monitoring for volatile organic compounds (VOCs) and particulates (i.e., dust) at the downwind perimeter of each designated work area when certain activities are in progress at contaminated sites. The CAMP is not intended for use in establishing action levels for worker respiratory protection. Rather, its intent is to provide a measure of protection for the downwind community (i.e., off-site receptors including residences and businesses and on-site workers not directly involved with the subject work activities) from potential airborne contaminant releases as a direct result of investigative and remedial work activities. The action levels specified herein require increased monitoring, corrective actions to abate emissions, and/or work shutdown. Additionally, the CAMP helps to confirm that work activities did not spread contamination off-site through the air.

The generic CAMP presented below will be sufficient to cover many, if not most, sites. Specific requirements should be reviewed for each situation in consultation with NYSDOH to ensure proper applicability. In some cases, a separate site-specific CAMP or supplement may be required. Depending upon the nature of contamination, chemical- specific monitoring with appropriately-sensitive methods may be required. Depending upon the proximity of potentially exposed individuals, more stringent monitoring or response levels than those presented below may be required. Special requirements will be necessary for work within 20 feet of potentially exposed individuals or structures and for indoor work with co-located residences or facilities. These requirements should be determined in consultation with NYSDOH.

Reliance on the CAMP should not preclude simple, common-sense measures to keep VOCs, dust, and odors at a minimum around the work areas.

Community Air Monitoring Plan

Depending upon the nature of known or potential contaminants at each site, real-time air monitoring for VOCs and/or particulate levels at the perimeter of the exclusion zone or work area will be necessary. Most sites will involve VOC and particulate monitoring; sites known to be contaminated with heavy metals alone may only require particulate monitoring. If radiological contamination is a concern, additional monitoring requirements may be necessary per consultation with appropriate DEC/NYSDOH staff.

Continuous monitoring will be required for all ground intrusive activities and during the demolition of contaminated or potentially contaminated structures. Ground intrusive activities include, but are not limited to, soil/waste excavation and handling, test pitting or trenching, and the installation of soil borings or monitoring wells.

Periodic monitoring for VOCs will be required during non-intrusive activities such as the collection of soil and sediment samples or the collection of groundwater samples from existing monitoring wells. "Periodic" monitoring during sample collection might reasonably consist of taking a reading upon arrival at a sample location, monitoring while opening a well cap or

overturning soil, monitoring during well baling/purging, and taking a reading prior to leaving a sample location. In some instances, depending upon the proximity of potentially exposed individuals, continuous monitoring may be required during sampling activities. Examples of such situations include groundwater sampling at wells on the curb of a busy urban street, in the midst of a public park, or adjacent to a school or residence.

VOC Monitoring, Response Levels, and Actions

Volatile organic compounds (VOCs) must be monitored at the downwind perimeter of the immediate work area (i.e., the exclusion zone) on a continuous basis or as otherwise specified. Upwind concentrations should be measured at the start of each workday and periodically thereafter to establish background conditions, particularly if wind direction changes. The monitoring work should be performed using equipment appropriate to measure the types of contaminants known or suspected to be present. The equipment should be calibrated at least daily for the contaminant(s) of concern or for an appropriate surrogate. The equipment should be capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

1. If the ambient air concentration of total organic vapors at the downwind perimeter of the work area or exclusion zone exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities must be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities can resume with continued monitoring.

2. If total organic vapor levels at the downwind perimeter of the work area or exclusion zone persist at levels in excess of 5 ppm over background but less than 25 ppm, work activities must be halted, the source of vapors identified, corrective actions taken to abate emissions, and monitoring continued. After these steps, work activities can resume provided that the total organic vapor level 200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or residential/commercial structure, whichever is less - but in no case less than 20 feet, is below 5 ppm over background for the 15-minute average.

3. If the organic vapor level is above 25 ppm at the perimeter of the work area, activities must be shutdown.

4. All 15-minute readings must be recorded and be available for State (DEC and NYSDOH) personnel to review. Instantaneous readings, if any, used for decision purposes should also be recorded.

Particulate Monitoring, Response Levels, and Actions

Particulate concentrations should be monitored continuously at the upwind and downwind perimeters of the exclusion zone at temporary particulate monitoring stations. The particulate monitoring should be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The equipment must be equipped with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration should be visually assessed during all work activities.

1. If the downwind PM-10 particulate level is 100 micrograms per cubic meter (mcg/m^3) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques must be employed. Work may continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 mcg/m^3 above the upwind level and provided that no visible dust is migrating from the work area.

2. If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 mcg/m^3 above the upwind level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 mcg/m^3 of the upwind level and in preventing visible dust migration.

3. All readings must be recorded and be available for State (DEC and NYSDOH) and County Health personnel to review.

December 2009

Appendix 1B
Fugitive Dust and Particulate Monitoring

A program for suppressing fugitive dust and particulate matter monitoring at hazardous waste sites is a responsibility on the remedial party performing the work. These procedures must be incorporated into appropriate intrusive work plans. The following fugitive dust suppression and particulate monitoring program should be employed at sites during construction and other intrusive activities which warrant its use:

1. Reasonable fugitive dust suppression techniques must be employed during all site activities which may generate fugitive dust.

2. Particulate monitoring must be employed during the handling of waste or contaminated soil or when activities on site may generate fugitive dust from exposed waste or contaminated soil. Remedial activities may also include the excavation, grading, or placement of clean fill. These control measures should not be considered necessary for these activities.

3. Particulate monitoring must be performed using real-time particulate monitors and shall monitor particulate matter less than ten microns (PM10) with the following minimum performance standards:

(a) Objects to be measured: Dust, mists or aerosols;
(b) Measurement Ranges: 0.001 to 400 mg/m3 (1 to 400,000 :ug/m3);
(c) Precision (2-sigma) at constant temperature: +/- 10 :g/m3 for one second averaging; and +/- 1.5 g/m3 for sixty second averaging;
(d) Accuracy: +/- 5% of reading +/- precision (Referred to gravimetric calibration with SAE fine test dust (mmd= 2 to 3 :m, g= 2.5, as aerosolized);
(e) Resolution: 0.1% of reading or 1g/m3, whichever is larger;
(f) Particle Size Range of Maximum Response: 0.1-10;
(g) Total Number of Data Points in Memory: 10,000;
(h) Logged Data: Each data point with average concentration, time/date and data point number
(i) Run Summary: overall average, maximum concentrations, time/date of maximum, total number of logged points, start time/date, total elapsed time (run duration), STEL concentration and time/date occurrence, averaging (logging) period, calibration factor, and tag number;
(j) Alarm Averaging Time (user selectable): real-time (1-60 seconds) or STEL (15 minutes), alarms required;
(k) Operating Time: 48 hours (fully charged NiCd battery); continuously with charger;
(l) Operating Temperature: -10 to 50° C (14 to 122° F);
(m) Particulate levels will be monitored upwind and immediately downwind at the working site and integrated over a period not to exceed 15 minutes.

4. In order to ensure the validity of the fugitive dust measurements performed, there must be appropriate Quality Assurance/Quality Control (QA/QC). It is the responsibility of the remedial party to adequately supplement QA/QC Plans to include the following critical features: periodic instrument calibration, operator training, daily instrument performance (span) checks, and a record keeping plan.

5. The action level will be established at 150 ug/m3 (15 minutes average). While conservative,

this short-term interval will provide a real-time assessment of on-site air quality to assure both health and safety. If particulate levels are detected in excess of 150 ug/m3, the upwind background level must be confirmed immediately. If the working site particulate measurement is greater than 100 ug/m3 above the background level, additional dust suppression techniques must be implemented to reduce the generation of fugitive dust and corrective action taken to protect site personnel and reduce the potential for contaminant migration. Corrective measures may include increasing the level of personal protection for on-site personnel and implementing additional dust suppression techniques (see paragraph 7). Should the action level of 150 ug/m3 continue to be exceeded work must stop and DER must be notified as provided in the site design or remedial work plan. The notification shall include a description of the control measures implemented to prevent further exceedances.

6. It must be recognized that the generation of dust from waste or contaminated soil that migrates off-site, has the potential for transporting contaminants off-site. There may be situations when dust is being generated and leaving the site and the monitoring equipment does not measure PM10 at or above the action level. Since this situation has the potential to allow for the migration of contaminants off-site, it is unacceptable. While it is not practical to quantify total suspended particulates on a real-time basis, it is appropriate to rely on visual observation. If dust is observed leaving the working site, additional dust suppression techniques must be employed. Activities that have a high dusting potential--such as solidification and treatment involving materials like kiln dust and lime--will require the need for special measures to be considered.

7. The following techniques have been shown to be effective for the controlling of the generation and migration of dust during construction activities:

(a) Applying water on haul roads;
(b) Wetting equipment and excavation faces;
(c) Spraying water on buckets during excavation and dumping;
(d) Hauling materials in properly tarped or watertight containers;
(e) Restricting vehicle speeds to 10 mph;
(f) Covering excavated areas and material after excavation activity ceases; and
(g) Reducing the excavation size and/or number of excavations.

Experience has shown that the chance of exceeding the 150ug/m3 action level is remote when the above-mentioned techniques are used. When techniques involving water application are used, care must be taken not to use excess water, which can result in unacceptably wet conditions. Using atomizing sprays will prevent overly wet conditions, conserve water, and provide an effective means of suppressing the fugitive dust.

8. The evaluation of weather conditions is necessary for proper fugitive dust control. When extreme wind conditions make dust control ineffective, as a last resort remedial actions may need to be suspended. There may be situations that require fugitive dust suppression and particulate monitoring requirements with action levels more stringent than those provided above. Under some circumstances, the contaminant concentration and/or toxicity may require additional monitoring to protect site personnel and the public. Additional integrated sampling and chemical analysis of the dust may also be in order. This must be evaluated when a health and safety plan is developed and when appropriate suppression and monitoring requirements are established for protection of health and the environment.

Interim Remedial Measure Work Plan for Phase 2 Construction Area

Dear Timothy Cosgrave:

Thank you for providing the above referenced Interim Remedial Measure (IRM) dated August 2022 for the 113 7th North Street site in Liverpool, New York.

The New York State Department of Environmental Conservation (DEC) and the New York State Department of Health (DOH) have reviewed the IRM and determined that the work plan is satisfactory.

Please place a copy of the final IRM in the site's document repository.

Prior to performing any fieldwork detailed in your work plans for this site please follow notification requirements in the Brownfield Cleanup Agreement.

Should you have any questions please contact me at (315) 426-7446 and thanks again for your efforts in continuing to move this project forward.

Sincerely,

Michael Belveg

Project 2001642

Mr. Henry Wilke
Division of Solid and Hazardous Materials
NYSDEC
625 Broadway
Albany, NY 12233

Dear Mr. Wilke:

Re: "Contained-In" Determination Request
Soil Excavation Associated with Phase 2 Construction
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

The purpose of this letter is to request a determination that soil to be excavated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility at 113 7th North Street, Liverpool, Onondaga County, New York (the Property; Figure 1) does not require management as a hazardous waste under the "Contained-In" Action Levels as outlined in Technical and Administrative Guidance Memorandum (TAGM) 3028.

1. Site Description

Since being acquired by UniFirst in the mid-1960s, the facility has been operated as an industrial laundry. The Property is currently made up of the original industrial laundry facility parcel and several additional adjacent parcels located along Luther Avenue that UniFirst acquired over the years. The Property is approximately 3.25 acres, currently improved with a new 31,000 square foot building located along Luther Avenue (completed in early 2022; referred to hereafter as the "Phase 1" of the new laundry facility), and is in a commercial/industrial-zoned area. Currently, Phase 2 of the new laundry facility is under construction in the area of the original laundry facility (i.e., the original facility was demolished in 2022 and Phase 2 is being constructed in its place). The other areas of the Property are reworked soil, covered by gravel, or paved. There is a fence along the southwestern property line, limiting access to the Property from the adjacent truck stop and gas station.

As previously mentioned, construction is currently underway as part of a facility replacement and expansion project. Construction of the new facility is being undertaken in two phases to allow for continued operation of the facility throughout construction. The construction phases are illustrated on Figure 2. The first phase of construction (Phase 1) included the 31,000 square-foot structure adjacent to Luther Street. Phase 1 was completed in April 2022 and is now being used by UniFirst for laundry operations. While Phase 1 was under construction, UniFirst continued operating in the existing facility at the rear (south side) of the Property. Now that Phase 1 is completed and operations have moved to the new building, the existing facility was recently demolished. Site preparation is underway and construction of the Phase 2 building is

GEI Consultants, Inc., P.C.
301 Trumansburg Road, Suite N, Ithaca, NY 14850
607.216.8955

commencing (June 2022). Once complete, the combined Phase 1 and Phase 2 the new facility will be joined as a single 55,700 square foot one-story building housing UniFirst's laundry facility and administrative operations.

2. Regulatory Status

On September 14, 2020, during initial redevelopment activities at the UniFirst Property, the New York State Department of Environmental Conservation (NYSDEC) was notified of a release of chlorinated volatile organic compounds (CVOCs) in groundwater and potentially soil around wastewater treatment pits and a sewer line on the Property. NYSDEC assigned Spill No. 2005410.

In March 2021, UniFirst applied to the NYSDEC to participate in the Brownfield Cleanup Program (BCP) and entered into a Brownfields Cleanup Agreement (BCA) through the BCP in October 2021. This spill number was closed by the NYSDEC on October 12, 2021, the date the BCA was executed.

The Site is now registered as BCP Site No. C734152 and UniFirst is a "Participant" in the program as defined by ECL 27 1405(1)(a) of the BCP. A Citizen Participation Plan (CPP) has been prepared and was published by the NYSDEC in February 2022. No other BCP milestones have been achieved to date.

3. Summary of Contamination

Between April 2020 and present, on behalf of UniFirst, GEI has collected soil vapor, sub-slab soil vapor, soil and groundwater samples at the Property to evaluate the nature and extent of potential release(s) to the environment due to dry cleaning previously performed in the industrial laundry facility and evaluate if excess soil generated during construction may be impacted by historical operations. Samples were collected across the Property, in the footprints of both the Phase 1 and Phase 2 construction areas including near an underground wastewater collection pit (hereafter referred to as the "former wastewater pit;" filled in place in March 2021). Note that this former wastewater pit is not within the area that is subject to this request.

The locations of soil borings and groundwater monitoring wells installed to date are provided in in Figure 3. Soil analytical data collected to date are included in Tables 1A (VOCs) and 1B (non-VOCs). Depending on depth and location, soil samples were submitted for VOCs, semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and/or metals. Based on investigations performed to date, the primary constituents of concern identified in soil are CVOCs, including tetrachloroethylene (PCE), trichloroethene (TCE), 1,2-dichloroethene (1,2-DCE), 1,1-dichloroethene (1,1-DCE) and vinyl chloride (VC). These CVOCs were primarily identified in soil around and downgradient from the former wastewater pit (Figure 3) at depths ranging from 10.5 to 20+ feet below ground surface (bgs), which is at or below the bottom elevation of the former wastewater pit (approximately 8 to 11 feet bgs). This area is hereafter referred to as the "source area," with the source of the PCE (which was reportedly used as the dry cleaning solvent during historical operations) likely being attributed to the release of dry cleaning solvents to the wastewater pit.

Concentrations of CVOCs (primarily including PCE and VC) exceed the TAGM 3028 "Contained-In" Action Levels in several samples collected from the deeper intervals (i.e., at least 10.5 feet bgs) within the source area which will not be excavated during the construction. Although these CVOCs were also encountered in samples collected from shallow soil overlying

the source area soils (i.e., shallower than 10.5 feet bgs) and in areas outside of the source area, the CVOC concentrations do not exceed the TAGM 3028 "Contained-In" Action Levels with one exception, as further discussed Section 4.

4. Scope of Work

Work will consist of the excavation and disposal of excess soil generated prior to installation of pile caps, grade beams and construction of an elevator pit within the Phase 2 construction area (Figure 2). The maximum depth of soil excavation for pile caps and grade beams within the main portion of the Phase 2 construction area will be a maximum of 6 feet, and the elevator pit will be excavated to a depth of no more than 10.5 feet (Figure 2). This work is being performed for UniFirst by C&S Companies, Inc. of Syracuse, New York (C&S) and is scheduled to commence on or about June 20, 2022.

Due to the size of the site, the current excavation plan is to live-load the soil directly into trucks for off-site disposal. As shown in Table 2, analytical results identified one area where PCE exceeds the TAGM 3028 "Contained-In" Action Level of 12 mg/kg.[1] Specifically, as shown in Table 2 and on Figure 3, the only location that planned for excavation that is above the "Contained-In" Action Levels is around B204, where PCE results are between 19 and 90 mg/kg (vs. an action level of 12 mg/kg). As such, soil excavated from within the delineated limits will be segregated and handled separately from the soil that is subject to this request. This area is shown with a red outline on Figure 3.

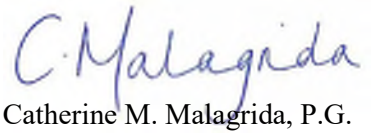
With the exception of B204 discussed above, CVOCs detected within Phase 2 work zone from the surface to the maximum working depth of 6 feet bgs in the general area and 10.5 feet bgs in the elevator shaft do not exceed the "Contained-In" Action Levels outlined in the TAGM 3028. As such, on UniFirst's behalf, GEI is requesting a "Contained-In Determination" from NYSDEC for these Phase 2 work area soils within the area shaded in brown on Figure 3 (i.e., soils located above 10.5 feet and outside the delineated area around B204).

The requested "Contained-In Determination" letter will indicate that the material does not require management as hazardous waste under the "Contained-In" policy and can be sent to a Part 360 permitted land disposal facility. The volume of this non-hazardous soil is approximately 3,000 cubic yards, or approximately 4,800 tons.

5. Contaminated Soil Disposal

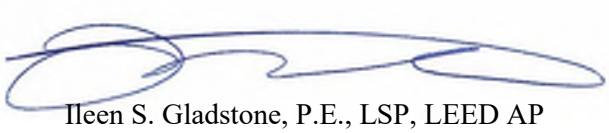
The soil generated during the Phase 2 redevelopment will be characterized and disposed of off-Site and in accordance with local, state, and federal regulations.

Based on requirements from the disposal facilities being solicited for quotes, the "Contained-In" non-hazardous areas were sampled for VOCs, SVOCs, pesticides, PCBs, and metals (these data are provided in Table 3 and the Form 1 sheets from the laboratory data reports for these samples are in Attachment 1). The non-hazardous soil is expected to go to the Camillus Landfill on Bell Isle Road in Camillus, NY and/or Seneca Meadows in Seneca Falls, NY.



---

1 A comparison of the CVOC soil data within the Phase 2 redevelopment zone to the TAGM 3028 Contained-In Action Levels is provided in Table 2. Figure 3 also includes a depiction of this CVOC data.



If you have any questions or comments regarding the information presented in this report, please contact Ms. Ileen Gladstone at (781) 424-9924 or igladstonegeiconsultants.com.

Sincerely,

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. mg/kg = milligrams per kilogram
3. CAS No. = Chemical Abstracts Service Number
4. BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
5. NE = Not Established
6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:
J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. mg/kg = milligrams per kilogram
3. CAS No. = Chemical Abstracts Service Number
4. BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
5. NE = Not Established
6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:
J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. mg/kg = milligrams per kilogram
3. CAS No. = Chemical Abstracts Service Number
4. BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
5. NE = Not Established
6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:
J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. mg/kg = milligrams per kilogram
3. CAS No. = Chemical Abstracts Service Number
4. BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
5. NE = Not Established
6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:
J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. mg/kg = milligrams per kilogram
3. CAS No. = Chemical Abstracts Service Number
4. BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
5. NE = Not Established
6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:

J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

6. NT = Not Taken (sample was not analyzed for this parameter group)
7. NA = Not Applicable
8. H = from high level analysis of EPA 5035
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:

J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Table 1B. Site-Wide Other Constituents Soil Analytical Results
Contained-in Determination
UniFirst Facility
Liverpool, NY

Notes:
1. Data have not been validated. Qualifiers are lab qualifiers.
2. % = Percent
3. mg/kg = milligrams per kilogram
4. ug/kg = micrograms per kilogram
5. CAS No. = Chemical Abstracts Service Number
6. NE = Not Established
7. NT = Not Taken (sample was not analyzed for this parameter group)
8. NA = Not Applicable
9. Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater (for constituents that also exceed applicable groundwater standards)
10. NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
11. Bolding indicates a detected result concentration
12. Shading and bolding indicates that the detected concentration is above the guidance it was compared to
13 Orange shading and bolding indicates that the detected result value exceeds the Unrestricted SCO
14. Red shading and bolding indicates that the detected result value exceeds the Industrial SCO
15. Underline indicates that the detected result value exceeds Protection of Groundwater SCO (for constituents to which these SCOs apply [i.e., constituents that are bolded in the table])
16. Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:
J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Table 3. Phase 2 Work Area Soil Charaterization Results
Contained-in Determination
UniFirst Facility, Liverpool, NY

Notes:

Data have not been validated; qualifiers are lab qualifiers
% = Percent
Units are in milligrams per kilogram (mg/kg)
CAS No. = Chemical Abstracts Service Number
BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
NE = Not Established
NT = Not Taken (sample was not analyzed for this parameter group)
NA = Not Applicable
H = from high level analysis of EPA 5035
Bolding indicates a detected result
Analytes detected in at least one sample are presented herein

Laboratory Qualifiers:

J = The result is an estimated value
UJ= The analyte was not detected above the reported sample quantitation limit. The data may be biased low
E = The concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Re: "Contained-In" Determination Request
Soil Excavation Associated with Phase 2 Construction
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

Dear Ms. Gladstone:

The New York State Department of Environmental Conservation (NYSDEC or the Department) has reviewed your letter dated June 21, 2022, requesting a "contained-in" determination for soil to be excavated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility at 113 7th North Street, Liverpool, New York.

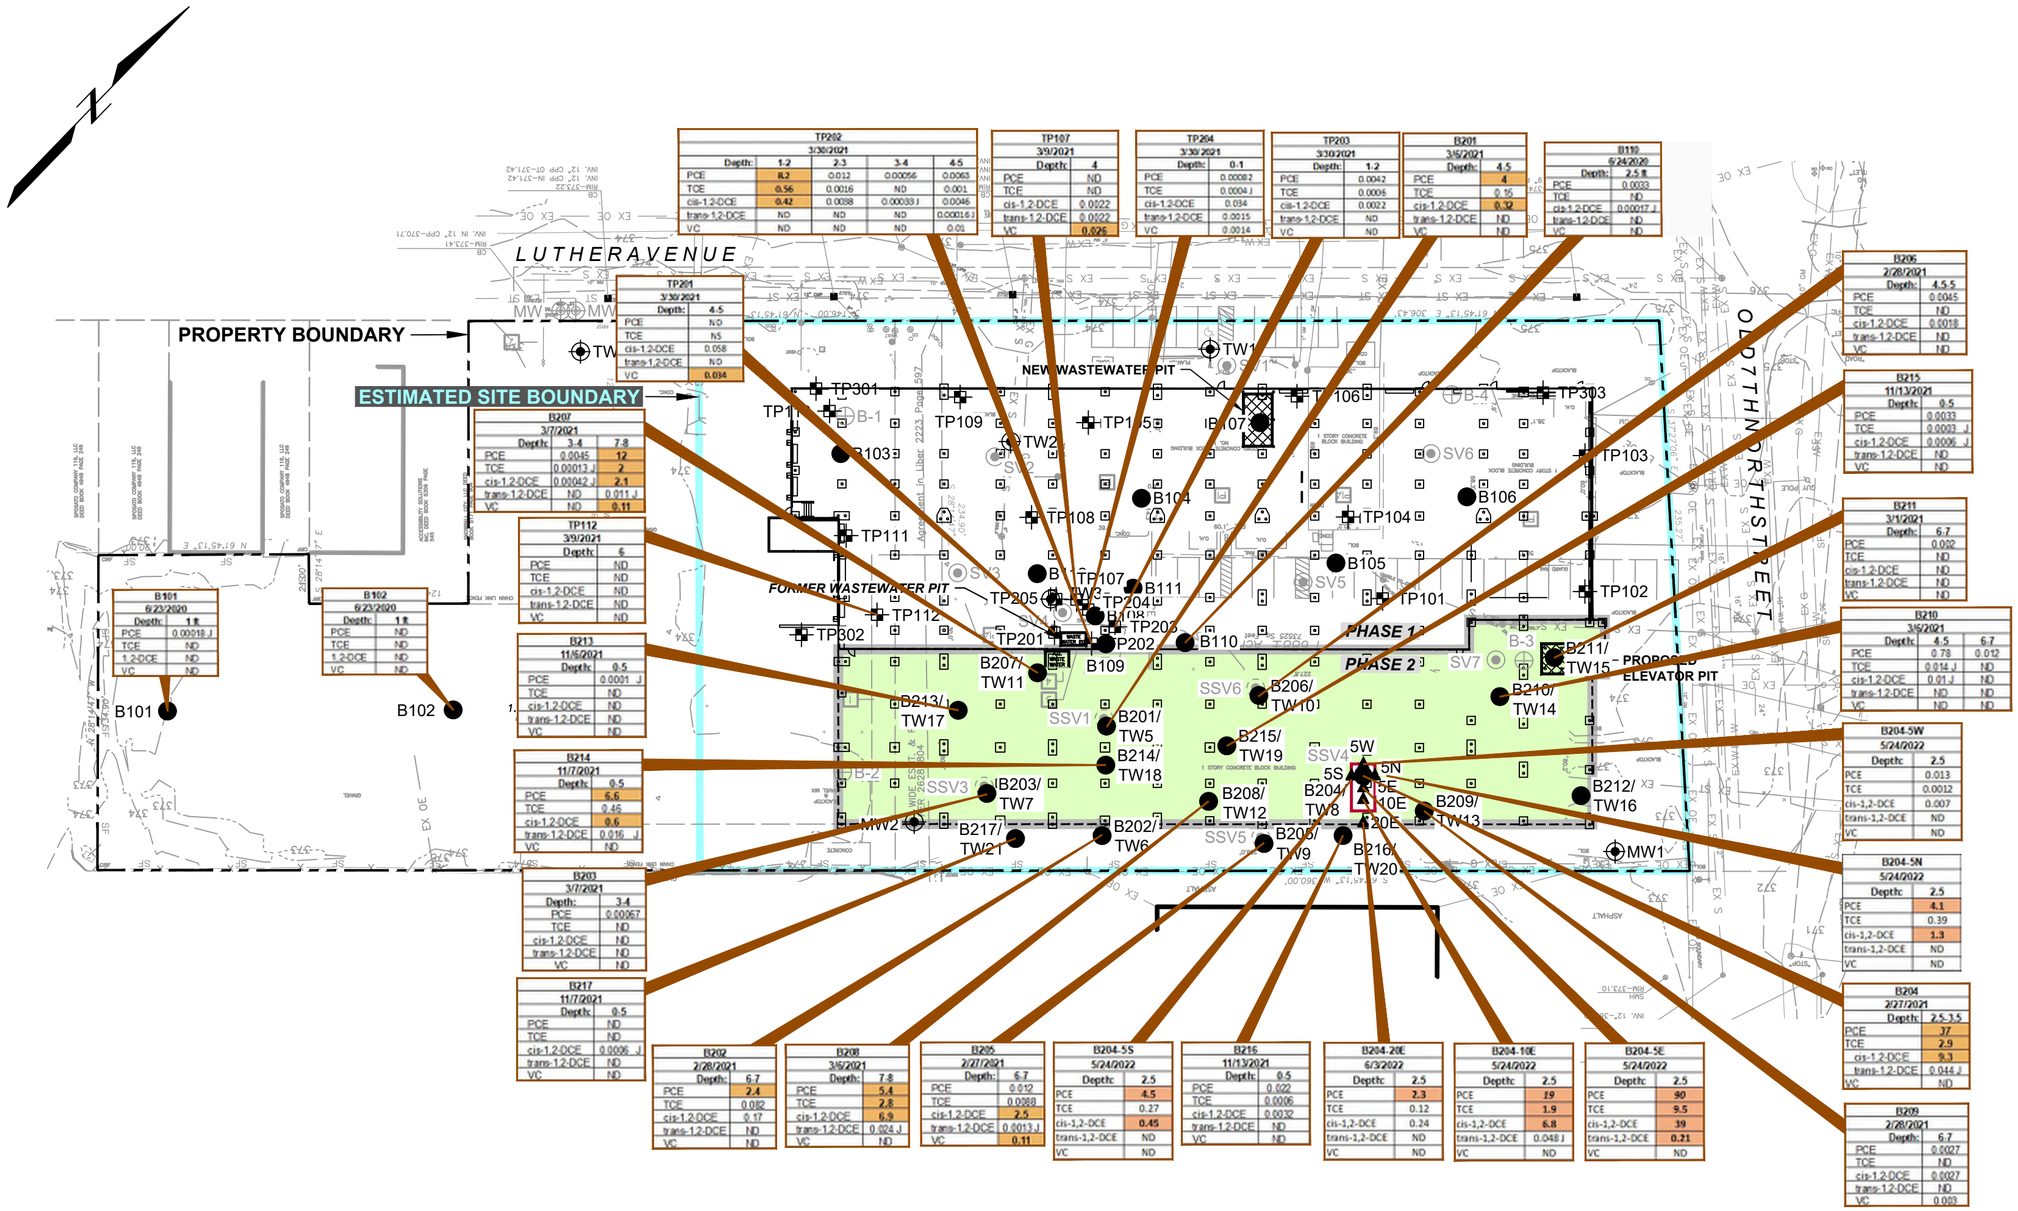
Evaluation

Concentrations (Lab Report ID: L2021883-04, L2026478-08, L2026478-09, L2026675-03, L2110097-03, L2110097-06, L2110097-09, L2110097-10, L2110097-12, L2110097-16, L2110097-18, L2111243-07, L2111243-08, L2111243-18, L2111243-19, L2111243-21, L2111243-22, L2111243-23, L2114867-03, L2161381-01, L2161384-08, L2162707-03, L2162707-09, and L2224334) detected for individual volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pesticides and PCBs were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Most of the individual VOCs, SVOCs, metals and PCBs were not detected above the reporting limit. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene detected in the soil samples (Lab Sample ID: L2021883-04, L2026478-08, L2026478-09, L2026675-03, L2110097-03, L2110097-06, L2110097-09, L2110097-12, L2110097-16, L2111243-07, L2111243-08, L2111243-18, L2111243-19, L2111243-21, L2111243-23, L2114867-03, L2161381-01, L2161384-08, L2162707-03, L2162707-09 and

L2224334-04) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Therefore, approximately 4,800 tons of soil, to be excavated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility located in Liverpool, New York do not have to be managed as a hazardous waste and can be transported off-site to Camillus Landfill on Bell Isle Road in Camillus, NY and/or Seneca Meadows in Seneca Falls, NY able to accept this material, for disposal as non-hazardous waste.

This contained-in determination does not apply to soils within **B204** delineated area, identified as the hazardous waste hot spot area in **Figure 3**. This area, failed to meet the “contained-in” determination policy, must be handled and disposed as F002 Hazardous waste.



During the soil excavation, if GEI CONSULTANTS, INC may encounter stain, discoloration or exhibits odors suggesting contamination, such material shall be separated from the excavated material and should be properly stockpiled and analyzed as per the Phase 2 Soil Management Plan and depending on the results; GEI CONSULTANTS, INC may request a “Contained-In” determination for this material.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Sincerely,

Henry Wilkie
Assistant Environmental Engineer

Dear Mr. Wilke:

Re: "Contained-In" Determination Request for Concrete Demolition Associated with Phase 2 Construction
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

The purpose of this letter is to request a determination that the concrete floor slab removed during the Phase 2 redevelopment of the UniFirst Corporation laundry facility at 113 7th North Street, Liverpool, Onondaga County, New York (the Property; Figure 1) does not require management as a hazardous waste under the "Contained-In" Action Levels as outlined in Technical and Administrative Guidance Memorandum (TAGM) 3028.

Site Description

Since being acquired by UniFirst in the mid-1960s, the facility has been operated as an industrial laundry. The Property is currently made up of the original industrial laundry facility parcel and several additional adjacent parcels located along Luther Avenue that UniFirst acquired over the years. The Property is approximately 3.25 acres, currently improved with a new 31,000-square foot building located along Luther Avenue (completed in early 2022; referred to hereafter as the "Phase 1" of the new laundry facility) and is in a commercial/industrial-zoned area. Currently, Phase 2 of the new laundry facility is under construction in the area of the original laundry facility (i.e., the original facility was demolished in 2022 and Phase 2 is being constructed in its place). The other areas of the Property are reworked soil, covered by gravel, or paved. There is a fence along the southwestern property line, limiting access to the Property from the adjacent truck stop and gas station.

As previously mentioned, construction is currently underway as part of a facility replacement and expansion project. Construction of the new facility is being undertaken in two phases to allow for continued operation of the facility throughout construction. The construction phases are illustrated on Figure 2. The first phase of construction (Phase 1) included the 31,000-square foot structure adjacent to Luther Street. Phase 1 was completed in April 2022 and is now being used by UniFirst for laundry operations. While Phase 1 was under construction, UniFirst continued operating in the existing facility at the rear (south side) of the Property. Now that Phase 1 is completed and operations have moved to the new building, the existing facility was recently demolished. Site preparation is underway and construction of the Phase 2 building is commencing (June 2022). Once complete, the combined Phase 1 and Phase 2 the new facility

GEI Consultants, Inc., P.C.
301 Trumansburg Road, Suite N, Ithaca, NY 14850
607.216.8955

will be joined as a single 55,700-square foot one-story building housing UniFirst's laundry facility and administrative operations.

Regulatory Status

On September 14, 2020, during initial redevelopment activities at the UniFirst Property, the New York State Department of Environmental Conservation (NYSDEC) was notified of a release of chlorinated volatile organic compounds (CVOCs) in groundwater and potentially soil around wastewater treatment pits and a sewer line on the Property. NYSDEC assigned Spill No. 2005410.

In March 2021, UniFirst applied to the NYSDEC to participate in the Brownfield Cleanup Program (BCP) and entered into a Brownfields Cleanup Agreement (BCA) through the BCP in October 2021. This spill number was closed by the NYSDEC on October 12, 2021, the date the BCA was executed.

The Site is now registered as BCP Site No. C734152 and UniFirst is a "Participant" in the program as defined by ECL 27 1405(1)(a) of the BCP. A Citizen Participation Plan (CPP) has been prepared and was published by the NYSDEC in February 2022. No other BCP milestones have been achieved to date.

Summary of Site Impacts

Between April 2020 and present, GEI has collected soil vapor, sub-slab soil vapor, soil and groundwater samples on behalf of UniFirst to evaluate the nature and extent of potential release(s) to the environment due to dry cleaning previously performed in the industrial laundry facility and evaluate if excess soil generated during construction may be impacted by historical operations. Samples were collected across the Property, in the footprints of both the Phase 1 and Phase 2 construction areas including near an underground wastewater collection pit (hereafter referred to as the "former wastewater pit;" filled in place in March 2021). Specifically, soil and groundwater samples were submitted for VOCs, semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and/or metals (analyses varied depending on location, date, and depth). Based on investigations performed to date, the primary constituents of concern are CVOCs, including tetrachloroethylene (PCE), trichloroethene (TCE), 1,2-dichloroethene (1,2-DCE), 1,1-dichloroethene (1,1-DCE) and vinyl chloride (VC). These CVOCs were primarily identified in soil and groundwater around and downgradient from the former wastewater pit (Figure 2) at depths ranging from 10.5 to 20+ feet below ground surface (bgs), which is at or below the bottom elevation of the former wastewater pit (approximately 8 to 11 feet bgs). This area is hereafter referred to as the "source area," with the source of the PCE (which was reportedly used as the dry cleaning solvent during historical operations) likely being attributed to the release of dry cleaning solvents to the wastewater pit (the concrete associated with the wastewater permit remains in-place on site).

On UniFirst's behalf, GEI submitted a prior request to NYSDEC on June 21, 2022 to provide a Contained-In determination for the soils to be excavated from within the Phase 2 construction area. The determination approved by NYSDEC on July 19, 2022. (This prior Contained-In determination request included details related to the analytical data collected to date.) During NYSDEC's review of that request, NYSDEC requested that the demolished floor slab material also be tested for VOCs (via both Total and TCLP analytical methods), and that a separate Contained-In determination request be submitted for the concrete material. As a result, on behalf of UniFirst, GEI collected six samples from the demolished floor slab. The VOC results for these pulverized concrete samples are summarized in Table 1 and the laboratory data package is provided in Attachment 1.

Scope of Work

Waste-generating work associated with construction consists of demolition of the former laundry facility floor slab (outlined in pink on Figure 2), and excavation and disposal of excess soil generated in association with pile cap and grade beam installations, and construction of an elevator pit within the Phase 2 construction area (Figure 2). This work is being performed for UniFirst by C&S Companies, Inc. of Syracuse, New York (C&S).

As summarized in Table 1, analytical data shows that TCLP VOCs were not detected in the concrete samples and are therefore not a characteristic hazardous waste. Certain VOCs analyzed via totals analysis were detected at low concentrations, but below the applicable Contained-In Action Levels outlined in the TAGM 3028 (for soil/sediment). Therefore, on UniFirst's behalf, GEI is requesting a "Contained-In Determination" from NYSDEC for the concrete demolition material.

The requested "Contained-In Determination" letter will indicate that the material does not require management as hazardous waste under the "Contained-In" policy and can be sent to a Part 360 permitted land disposal facility. The volume of this demolition material is less than 400 cubic yards, or approximately 800 tons.

Concrete Demolition Material Disposal

Some of the floor slab material is currently stockpiled onsite. This concrete demolition material generated during the Phase 2 redevelopment will be disposed of off-Site and in accordance with local, state, and federal regulations. Specifically, the non-hazardous demolition waste is expected to go to the Camillus Landfill on Bell Isle Road in Camillus, NY or Seneca Meadows in Seneca Falls, NY.

If you have any questions or comments regarding the information presented in this report, please contact Ms. Ileen Gladstone at (781) 424-9924 or igladstonegeiconsultants.com.

Notes:

1. Comparison of detected results are performed against NYSDEC Technical Administrative Guidance Memorandum 3028, Contained-In Criteria for Environmental Media, dated November 30, 1992. Although the sampled media is pulverized concrete, the soil/sediment values were used in this evaluation, for screening purposes.
2. Data have not been validated; qualifiers are lab qualifiers
3. Units are in micrograms per kilogram (ug/kg)
4. CAS No. = Chemical Abstracts Service Number
5. Bolding indicates a detected result
6. -- indicates none or not applicable

Laboratory Qualifiers:

J = The result is an estimated value
U = Compound was not detected; associated value is laboratory detection limit

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name:	UNIFIRST - LIVERPOOL	**Lab Number:**	L2239676
Project Number:	2001642	**Report Date:**	07/28/22

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L2239676-01, -02, -03, -04, -05, and -06:Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

L2239676-01: The surrogate recovery is below the acceptance criteria for dibromofluoromethane (40%), possibly due to the matrix effect caused by the high pH of the sample (>10).

L2239676-02 and -03: The surrogate recovery is below the acceptance criteria for dibromofluoromethane (45%), possibly due to the matrix effect caused by the high pH of the sample (>10).

L2239676-04: The surrogate recovery is below the acceptance criteria for dibromofluoromethane (54%), possibly due to the matrix effect caused by the high pH of the sample (>10).

L2239676-05: The surrogate recovery is below the acceptance criteria for dibromofluoromethane (42%), possibly due to the matrix effect caused by the high pH of the sample (>10).

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Name:	UNIFIRST - LIVERPOOL	**Lab Number:**	L2239676
Project Number:	2001642	**Report Date:**	07/28/22

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	UNIFIRST - LIVERPOOL	**Lab Number:**	L2239676
Project Number:	2001642	**Report Date:**	07/28/22

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Gasoline Range Organics (GRO): Gasoline Range Organics (GRO) results include all chromatographic peaks eluting from Methyl tert butyl ether through Naphthalene, with the exception of GRO analysis in support of State of Ohio programs, which includes all chromatographic peaks eluting from Hexane through Dodecane.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively

Report Format: DU Report with 'J' Qualifiers

Project Name:	UNIFIRST - LIVERPOOL	**Lab Number:**	L2239676
Project Number:	2001642	**Report Date:**	07/28/22

Data Qualifiers

Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Report Format: DU Report with 'J' Qualifiers

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 625/625.1: alpha-Terpineol
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine, alpha-Terpineol; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

Re: "Contained-In" Determination Request
Soil excavated and stockpiled
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

Dear Ms. Gladstone:

The New York State Department of Environmental Conservation (NYSDEC or the Department) has reviewed your e-mail dated October 3, 2022, requesting a "contained-in" determination for approximately 400 cubic yards of soil has been excavated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility at 113 7th North Street, Liverpool, New York.

Evaluation

Concentrations (Lab Sample ID: L2248272-01, L2248272-02, L2248272-03 and L2248272-04) detected for individual volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pesticides and PCBs were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Most of the individual VOCs, SVOCs, metals and PCBs were not detected above the reporting limit. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene detected in the soil samples (Lab Sample ID L2248272-02, L2248272-03 and L2248272-04) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Therefore, approximately 400 cubic yards of soil has been excavated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility located in Liverpool, New York do not have to be managed as a hazardous waste and can be transported off-site to Camillus Landfill on Bell Isle

Road in Camillus, NY and/or Seneca Meadows in Seneca Falls, NY able to accept this material, for disposal as non-hazardous waste.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Sincerely,

Henry Wilkie

Re: "Contained-In" Determination Request for Concrete Demolition Associated with Phase 2 Construction
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

Dear Ms. Gladstone:

The New York State Department of Environmental Conservation (NYSDEC or the Department) has reviewed your letter dated August 10, 2022, requesting a "contained-in" determination for concrete floor slab removed during the Phase 2 redevelopment of the UniFirst Corporation laundry facility at 113 7th North Street, Liverpool, New York.

Evaluation

Concentrations (Lab Sample ID: L2239676-01, L2239676-02, L2239676-03, L2239676-04, L2239676-05 and L2239676-06) detected for individual volatile organic compounds (VOCs) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Most of the individual VOCs were not detected above the reporting limit. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene detected in the soil samples (Lab Sample ID: L2239676-01, L2239676-02, L2239676-03, L2239676-04, L2239676-05 and L2239676-06) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Therefore, approximately 800 tons of concrete demolition materials generated during the Phase 2 redevelopment of the UniFirst Corporation laundry facility located in Liverpool, New York do not have to be managed as a hazardous waste and can be transported off-site to Camillus Landfill on Bell Isle Road in Camillus, NY and/or Seneca

Meadows in Seneca Falls, NY able to accept this material, for disposal as non-hazardous waste.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Sincerely,

Henry Wilkie

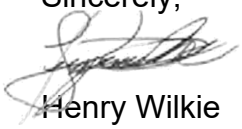
Re: "Contained-In" Determination Request
Additional soil excavated and stockpiled
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

Dear Ms. Gladstone:

The New York State Department of Environmental Conservation (NYSDEC or the Department) has reviewed your e-mail dated December 4, 2022, requesting a "contained-in" determination for additional soil excavated and stockpiled at the UniFirst Liverpool facility, specifically, to install a sewer main connection.



Evaluation

Concentrations (Lab Report ID: L2266529) detected for individual volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pesticides and PCBs were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Most of the individual VOCs, SVOCs, metals and PCBs were not detected above the reporting limit. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene detected in the soil samples (Lab Report ID: L2266529) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Therefore, approximately 30 cubic yards of soil has been excavated during the installation of the sewer main connection at the UniFirst Corporation laundry facility located in Liverpool, New York do not have to be managed as a hazardous waste and can be transported off-site to Camillus Landfill on Bell Isle Road in Camillus, NY and/or Seneca Meadows in Seneca Falls, NY able to accept this material, for disposal as non-hazardous waste.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Re: "Contained-In" Determination Request
Upcoming Site Redevelopment Activities
UniFirst Liverpool Property
113 7th North Street, Liverpool, New York

Dear Ms. Gladstone:

The New York State Department of Environmental Conservation (NYSDEC or the Department) has reviewed your e-mail dated May 16, 2023, requesting a "contained-in" determination for upcoming site redevelopment activities at the UniFirst Liverpool facility, specifically, excavations 3 feet deep or less (depending on location) for pavement subgrade, constructing a stormwater retention basin, and installing drainage piping (see attached **Figure 1**).

Evaluation

Concentrations (Lab Report ID: L2026478, L2317089 and L2326021) detected for individual volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pesticides and PCBs were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Most of the individual VOCs, SVOCs, metals and PCBs were not detected above the reporting limit. No hazardous constituents exhibited a hazardous waste characteristic by exceeding their TCLP regulatory level.

Concentrations for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene detected in the soil samples (Lab Report ID: L2026478 and L2326021) were all less than their current NYSDEC "contained in" soil action levels and Land Disposal Restriction concentrations. Therefore, approximately 2500 cubic yards of excess soil will be generated as part of the site redevelopment activities in the southern portion (stormwater retention pond, parking/loading area, underdrain piping) inside the orange

area shown and described in the legend in the attached **Figure 1** at the UniFirst Corporation laundry facility located in Liverpool, New York do not have to be managed as a hazardous waste and can be transported off-site to Camillus Landfill on Bell Isle Road in Camillus, NY and/or Seneca Meadows in Seneca Falls, NY able to accept this material, for disposal as non-hazardous waste.

During the soil excavation, if GEI Consultants may encounter stain, discoloration or exhibits odors suggesting contamination, such material shall be separated from the excavated material and should be properly stockpiled and analyzed as per the approved work plan, and depending on the results, GEI Consultant may request a "Contained-In" determination for this material.

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-9611 or email me at henry.wilkie@dec.ny.gov.

Sincerely,

Henry Wilkie
Assistant Environmental Engineer

D.3. Imported Fill Approvals

NEW YORK STATE
DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Request to Import/Reuse Fill or Soil

This form is based on the information required by DER-10, Section 5.4(e). Use of this form is not a substitute for reading the applicable Technical Guidance document.

SECTION 1 – SITE BACKGROUND

The allowable site use is: Commercial or Industrial Use

Have Ecological Resources been identified? no

Is this soil originating from the site? no

How many cubic yards of soil will be imported/reused? >1000

If greater than 1000 cubic yards will be imported, enter volume to be imported: 1500

SECTION 2 – MATERIAL OTHER THAN SOIL

Is the material to be imported gravel, rock or stone? yes

Does it contain less than 10%, by weight, material that would pass a size 10 sieve? no

Does it contain less than 10%, by weight, material that would pass a size 100 sieve? Yes

Is this virgin material from a permitted mine or quarry? yes

Is this material recycled concrete or brick from a DEC registered processing facility? no

SECTION 3 - SAMPLING

Provide a brief description of the number and type of samples collected in the space below:

Type 2 crushed limestone (bedrock) from DOT-approved source at T.H. Kinsella, Inc. in Jamesville NY (identified as Fayetteville in DOT database).

Example Text: 5 discrete samples were collected and analyzed for VOCs. 2 composite samples were collected and analyzed for SVOCs, Inorganics & PCBs/Pesticides.

If the material meets requirements of DER-10 section 5.4(e)5 (other material), no chemical testing needed.

SECTION 3 CONT'D - SAMPLING

Provide a brief written summary of the sampling results or attach evaluation tables (compare to DER-10, Appendix 5):

Sieve analysis attached.

Example Text: Arsenic was detected up to 17 ppm in 1 (of 5) samples; the allowable level is 16 ppm.

If Ecological Resources have been identified use the "If Ecological Resources are Present" column in Appendix 5.

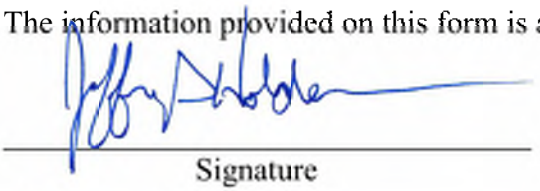
SECTION 4 – SOURCE OF FILL

Name of person providing fill and relationship to the source:

T.H. Kinsella, Inc. (owner)

Location where fill was obtained:

Jamesville NY quarry



Identification of any state or local approvals as a fill source:

NYSDOT-approved bedrock source (3- 13RFM)

If no approvals are available, provide a brief history of the use of the property that is the fill source:

Provide a list of supporting documentation included with this request:

The information provided on this form is accurate and complete.

Subject: UniFirst Liverpool Site, request to import crushed limestone

ATTENTION: This email came from an external source. Do not open attachments or click on links from unknown senders or unexpected emails.

Hi Mike-

As we discussed earlier this week, the contractor for the UniFirst facility expansion project intends to use crushed limestone for fill around foundation supports and beneath the paved parking area. The estimated total volume is approximately 1500 CY. Under the prior DEC guidance, the material did not meet sieve requirements triggering sampling and the material is not used for site remediation purposes… just for construction purposes. In any case, we confirmed the source is a DOT-approved location and we have included sieve data. Based on this, can you provide approval for use at the site? Otherwise, please let us know what additional information would be needed.

Note that the DEC form did not allow a "yes" entry in the question regarding the #100 sieve size, so we added that manually.

Thanks,
-Jeff

ATTENTION: This email came from an external source. Do not open attachments or click on links from unknown senders or unexpected emails.

Hi Mike-

Attached are two requests for import of coarse stone to be used by the contractor as part of the UniFirst facility expansion project. This includes Type 1A stone (~1000 CY) and Type 2 stone (~500 cy). These are coarse materials that do not meet sieve requirements triggering chemical analysis (sieve results are attached to each request), and they are from a DOT-approved location. Based on this, can you provide approval for use at the site?

Thanks,
-Jeff

Sieve Analysis of Soil / Aggregate

Project Title: Laboratory Testing

Project #: L-22019
Test Method: ASTM C117 & C136

Report #: 5
Report Date: May 3, 2022

Source:	T.H. Kinsella, Inc. - Jamesville, NY	Sieve Size - Percent Passing Sieve

Subject: C734152 - UniFirst Liverpool request to import topsoil

ATTENTION: This email came from an external source. Do not open attachments or click on links from unknown senders or unexpected emails.

Hello Mike – attached is the request to import topsoil that I mentioned on our call today. Please let us know if you have any questions.
Thanks
Wendy

Request to Import/Reuse Fill or Soil

This form is based on the information required by DER-10, Section 5.4(e). Use of this form is not a substitute for reading the applicable Technical Guidance document.

SECTION 1 – SITE BACKGROUND

The allowable site use is: Commercial or Industrial Use

Have Ecological Resources been identified? no

Is this soil originating from the site? no

How many cubic yards of soil will be imported/reused? 200-300

If greater than 1000 cubic yards will be imported, enter volume to be imported: N/A

SECTION 2 – MATERIAL OTHER THAN SOIL

Is the material to be imported gravel, rock or stone? no

Does it contain less than 10%, by weight, material that would pass a size 10 sieve? no

Does it contain less than 10%, by weight, material that would pass a size 100 sieve? no

Is this virgin material from a permitted mine or quarry? yes

Is this material recycled concrete or brick from a DEC registered processing facility? no

SECTION 3 - SAMPLING

Provide a brief description of the number and type of samples collected in the space below:

One composite sample was collected and analyzed for herbicides, pesticides, PFAS, PCBs, SVOCs, and total metals. Four grab samples were collected and analyzed for VOCs.

Example Text: 5 discrete samples were collected and analyzed for VOCs. 2 composite samples were collected and analyzed for SVOCs, Inorganics & PCBs/Pesticides.

If the material meets requirements of DER-10 section 5.4(e)5 (other material), no chemical testing needed.

SECTION 3 CONT'D - SAMPLING

Provide a brief written summary of the sampling results or attach evaluation tables (compare to DER-10, Appendix 5):

There were no exceedances detected in any of the samples tested.

Example Text: Arsenic was detected up to 17 ppm in 1 (of 5) samples; the allowable level is 16 ppm.

If Ecological Resources have been identified use the "If Ecological Resources are Present" column in Appendix 5.

SECTION 4 – SOURCE OF FILL

Name of person providing fill and relationship to the source:

Kinsella Quarries

Location where fill was obtained:

8086 E. Genesee Street, Fayetteville, NY 13066

Identification of any state or local approvals as a fill source:

GSN02300 : KINSELLA (QUARRY), TOWNSEND RD. - NYS Department of Transportation approval

If no approvals are available, provide a brief history of the use of the property that is the fill source:

Manufactured commercial-grade topsoil: manufactured by blending sandy loam with screened material from on-site mine.

Provide a list of supporting documentation included with this request:

Table comparing data to I/C SCOs
Chemical analytical data package
Grain size analysis results

The information provided on this form is accurate and complete.

Note:
C/I SCOs: New York DER-10 Commercial or Industrial Use Allowable Constituent Levels for Imported Fill & Soil Criteria per DER-10 Technical Guidance for Site Investigation & Remediation issued May 3, 2010.

Alpha Analytical Labs provides this custom reporting format as a convenience to our clients. As such, we cannot be held liable for errors or omissions associated with the regulatory standards listed above and/or the sample results highlighted by comparison with the standards

New York DER-10 Commercial or Industrial Use Allowable Constituent Levels for Imported Fill & Soil Criteria per DER-10 Technical Guidance for Site Investigation & Remediation issued May 3, 2010.

Only compounds detected with reporting limits that exceed

the corresponding regulatory standard in at least one sample are included on the summary sheets.
Refer to the laboratory report in Adobe Acrobat (.PDF) format to check results or read any associated project narrative that may be present. In all cases, the signed, hardcopy Alpha Analytical Labs laboratory report is the

official document for reporting laboratory results.

Qualifier Key

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.
C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)
Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)
I - The lower value for the two columns has been reported due to obvious interference.
G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.
A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
RE - Analytical results are from sample re-extraction.
R - Analytical results are from sample re-analysis.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
P - The RPD between the results for the two columns exceeds the method-specified criteria.
U - Not detected at the reported detection limit for the sample.
M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
S - Analytical results are from modified screening analysis.
B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Tim Cosgrave and Cat Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: October 14, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
October 2, 2022 through October 8, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measured fifteen-minute average concentrations of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. There was one measured exceedances of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period, as summarized below.

Monitored Site Construction Activities

After a period of temporary work suspension, the construction contractor remobilized to the Site starting on October 3, 2022.

During this reporting period, site activities were performed on October 3, 5, 6, and 7, 2022 and included:

- Redeployment of CAMP equipment (October 3, 2022)
- Mobilization of equipment to all areas of the site throughout the week

- Dewatering of existing excavations on north end of site throughout the week
- Excavating (cleaning out) bottoms of existing excavations on north end of site and placing new stone into bottoms (October 5, 2022)
- Building footer forms at the north end of the site (October 6 and 7, 2022)

Air Monitoring Activities and Summary

The three solar-powered, GEI-owned air monitoring stations (AIR-101, AIR-102, and AIR-103) were redeployed on October 3, including cleaning and recalibration of each station. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Real-time monitoring for TVOC and PM_{10} was performed at the three air monitoring stations thereafter.

TVOCs were measured above the Action Limit of 5.0 ppm during this monitoring period on one occasion. Between 0900 and 0915 on October 5, 2022, VOCs were measured at AIR-102 above Action Limit. During this time, a loader was idling adjacent to the monitoring station, and tractor trailer trucks were idling to the east/southeast at the Pilot truck stop. Site work was occurring on the northern end of the site at the time, approximately 350 feet northwest of AIR-102. Wind was approximately 3.5 mph out of the west during the exceedance. The idling loader was moved out of the area of AIR-102 and VOC concentrations returned to normal levels.

Table 1 provides a daily summary of maximum fifteen-minute average air concentrations. Typically, figures are included that summarize weather data collected by the Site's meteorological station that is co-located at AIR-101 (Vaisala® WXT-530). However, the station data could not be downloaded due to a connection issue. We anticipate that the data will be provided under an addendum once available.

If you have any questions regarding the information in this report, please contact me.

Johnathan Robinson, Project Manager (NYSDOH)

From: Jeff Holden, Project Manager (GEI)

Copy to: Tim Cosgrave, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: October 21, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
October 9 through 15, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measured fifteen-minute average concentrations of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. There were measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. These occurred during non-working hours. These exceedances are summarized below.

Monitored Site Construction Activities

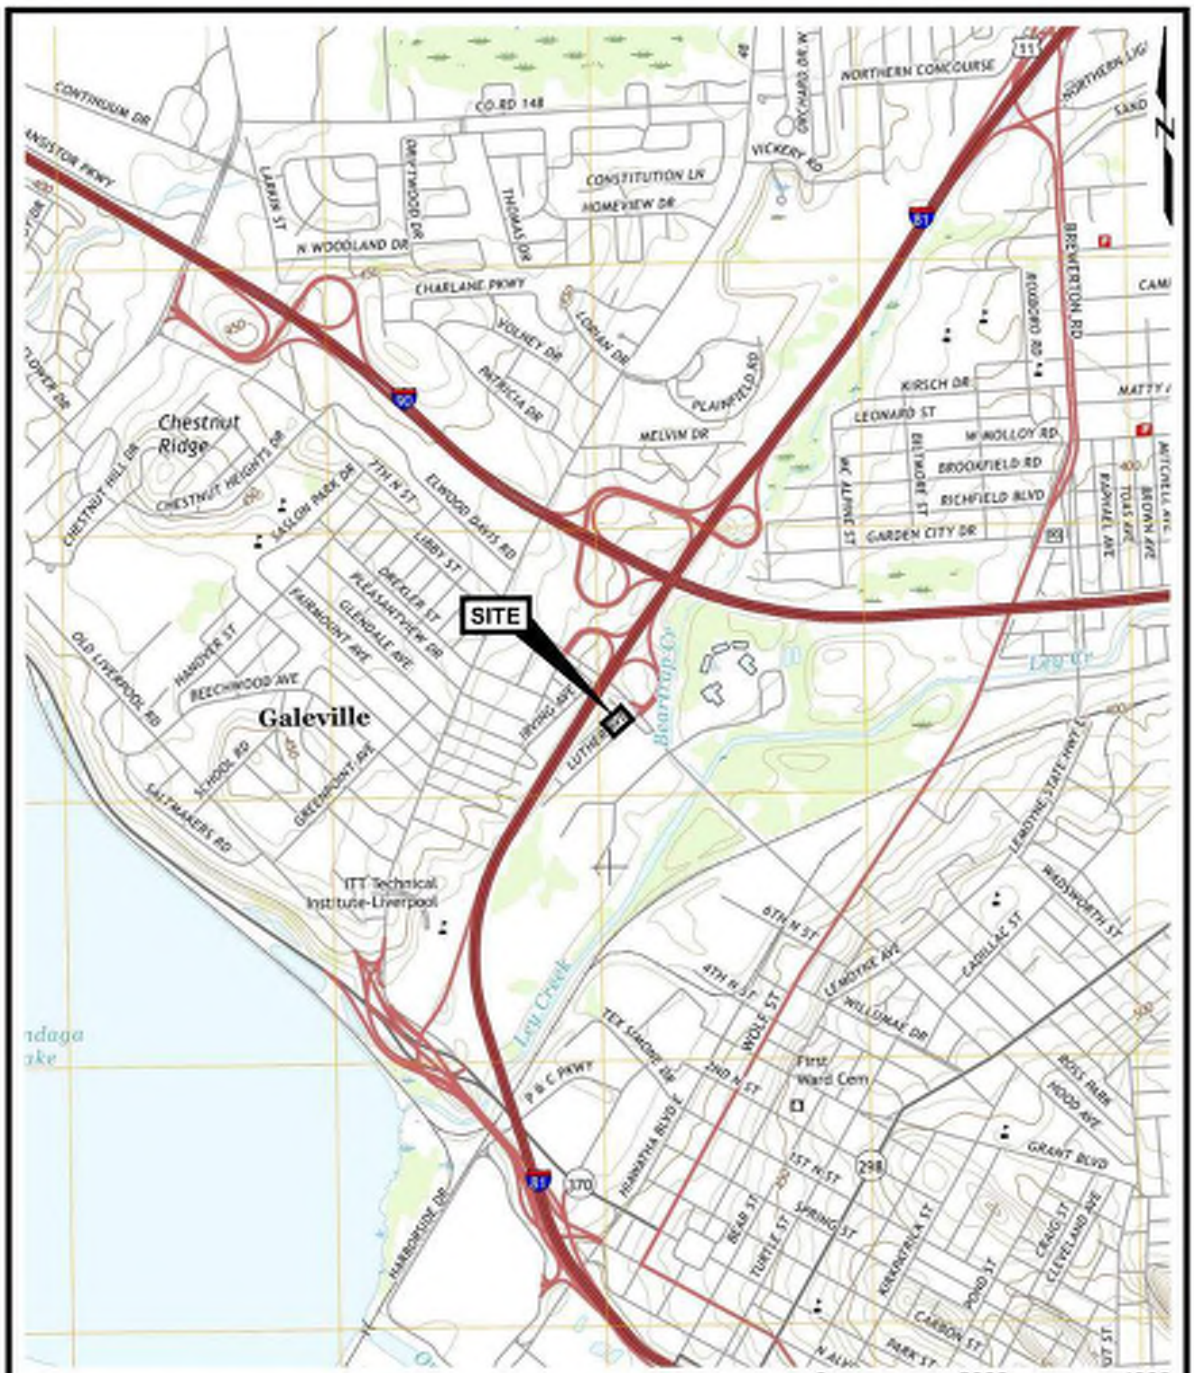
During this reporting period, monitoring was performed during on-Site construction activities, which included:

- Dewatering excavations
- Surveying of construction area
- Form building
- Pouring concrete
- Form stripping

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}.

Total Volatile Organic Compounds (TVOC) levels were occasionally measured above the Action Limit of 5 ppm during this monitoring period at station AIR-102 The first measurement above 5 ppm occurred during non-working hours, starting at 1800 hours on October 13 and remaining above the action level until 2115 hours. Wind during this exceedance was predominately from the North and Northeast between 0.3 and 3 mph. The temperature was approximately 55° F, and the Relative Humidity was 85%-87%.



The second exceedance also occurred during non-working hours between 1300 hours and 1330 hours on October 14, 2022. The wind at the time of this exceedance was predominately from the south with speeds between 0.4 and 2.3 mph, the temperature was 51° F, and the relative humidity was 81%-85%.

Table 1 provides a daily summary of maximum fifteen-minute average air concentrations, and Figures 3 through 7 provide weather data collected by the Site's meteorological station that is co-located at AIR-101 (Vaisala® WXT-530).

If you have any questions regarding the information in this report, please contact me.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeff Holden, Project Manager (GEI)

Copy to: Tim Cosgrave, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: October 24, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
October 15, 2022 through October 22, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no exceedances of the measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements in fifteen-minute average concentrations of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

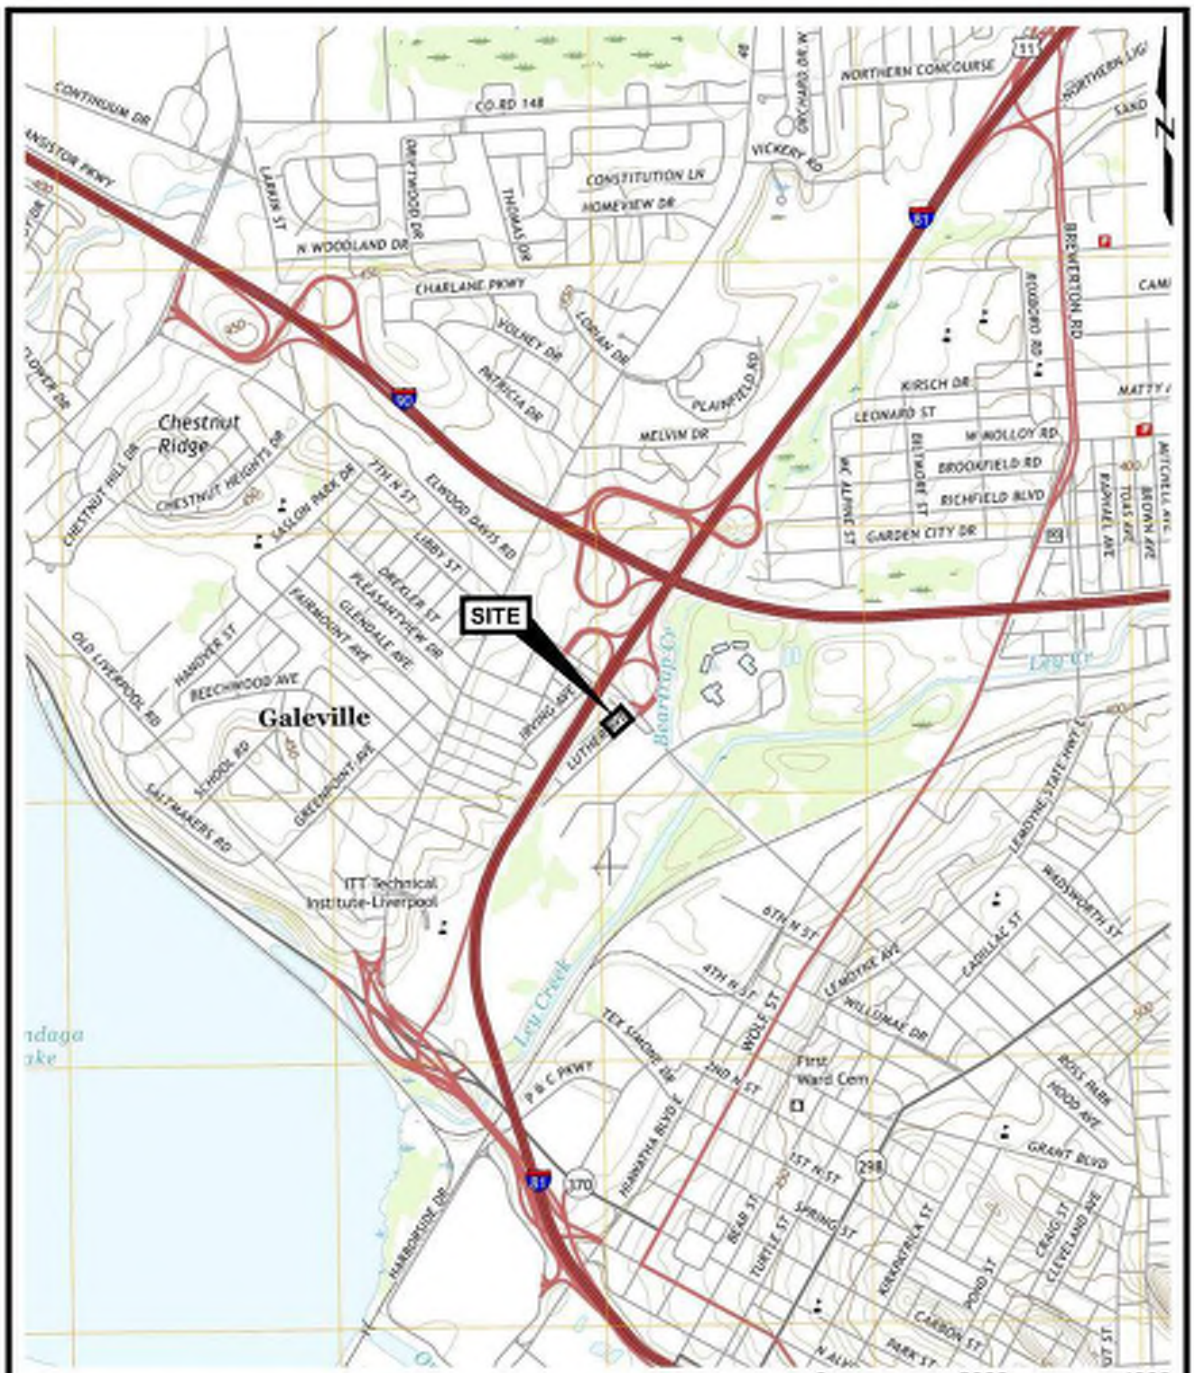
Monitored Site Construction Activities

During this reporting period, monitoring was performed during on-Site construction activities, which included:

- Dewatering excavations
- Surveying of construction area
- Building forms for concrete foundation structures
- Pouring concrete
- Form stripping

- Footer excavation
- Test pit excavations

Air Monitoring Activities and Summary



Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}.

Table 1 provides a daily summary of maximum fifteen-minute average air concentrations, and Figures 3 through 7 provide weather data collected by the Site's meteorological station that is co-located at AIR-101 (Vaisala® WXT-530).

If you have any questions regarding the information in this report, please contact me.

Date: November 1, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
October 23, 2022 through October 29, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measured fifteen-minute average concentrations of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during working hours this reporting period. There were occasional exceedances of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. Exceedances are summarized below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Equipment delivered onsite;
- Dewatering;

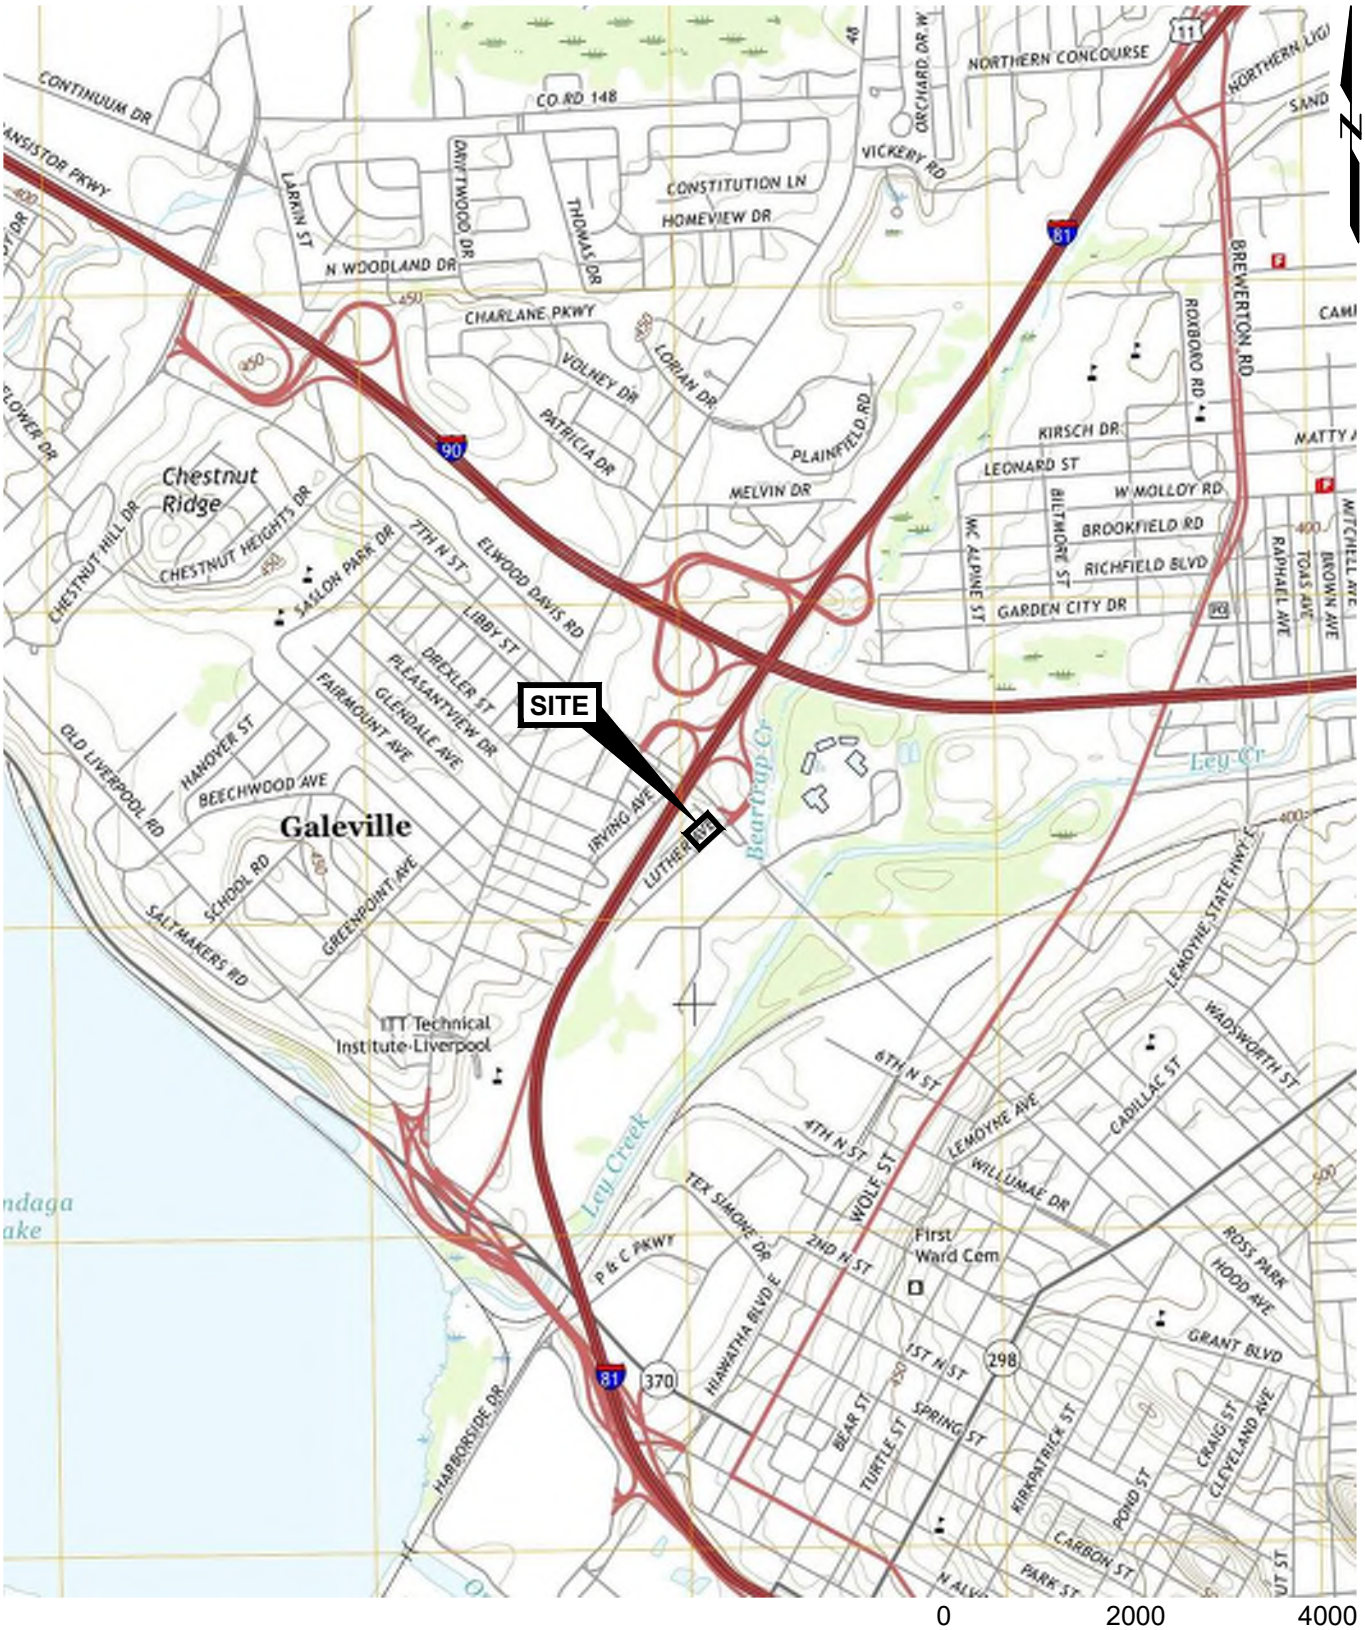
- Construction of pile cap forms and elevator form wall;
- Loading trucks with material from stockpile for disposal offsite;
- Material excavation and transfer to stockpile; and
- Backfill in areas where concrete forming is complete (northern portion of site) and in areas that are being prepared for forming (southern portion of site).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

TVOCs were occasionally measured above the Action Limit of 5.0 ppm during this monitoring period during both working and non-working hours at station AIR-102, as follows:



- VOCs were measured above Action Limit of 5.0 (ppmv) at AIR-102 on October 25, 2022 between 0530 and 0915 hours. No work was occurring onsite when the monitor began reading VOC concentrations above 5.0 ppm at 0530. When GEI personnel arrived onsite at 0615, multiple semi-trucks were observed idling on the adjacent Pilot station property, located east of the monitor. Onsite activities began at 0730, including management of the existing soil stockpile located west of the monitor and were performed continuously until approximately 1215. No increase in VOC concentration was observed after initiation of site-related soil stockpile management work. Concentrations fell below 5.0 ppm at 0915. Wind direction was measured primarily from the east during this time, at speeds of approximately 1-3 mph. Soil stockpile management continued throughout the majority of the work day.

- VOCs were measured above Action Limit of 5.0 (ppmv) at AIR-102 on October 26, 2022 between 0115 and 0315 hours. No work was occurring onsite during this time period.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Tim Cosgrave and Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: November 8, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
October 30, 2022 through November 5, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were occasional measurements in fifteen-minute average concentrations of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. These exceedances are summarized below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Equipment delivered onsite;
- Dewatering;

- Construction of pile cap forms and elevator form wall;
- Material excavation and transfer to stockpile;
- Loading trucks with material from stockpile for disposal offsite; and
- Backfill in areas where concrete forming is complete (eastern portion of site) and in areas that are being prepared for forming (southern portion of site).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

PM_{10} [dust] levels were measured above the Action Limit of 150 ug/m^3 during this monitoring period during non-working hours at stations AIR-101 and AIR-102, as follows:

- PM_{10} levels were measured above the Action Limit of 150 (ug/m^3) at AIR-101 on November 2, 2022 between 0100 and 0115 hours.
- PM_{10} levels were measured above the Action Limit of 150 ug/m^3 at AIR-102 on November 2, 2022 between 0100 and 0115 hours.

As noted above, these levels were measured outside of working hours and measured PM10 concentrations fell below the exceedance threshold after 15 minutes before start of the work day. Further, based on wind direction during this timeframe, AIR-101 was the upwind perimeter monitor. The level measured at the downwind monitor (AIR-102) was not greater than 150 ug/m^3 above the upwind monitor level.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
November 6, 2022 through November 12, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There was one measurement during non-working hours of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There was one measurement of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. These exceedances are summarized below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Equipment delivery;
- Dewatering;
- Assembly of elevator scaffolding, elevator shaft construction, and disassembly of scaffolding;

- Construction and/or removal of pile cap forms and elevator form wall;
- Emptying frac tanks;
- Material excavation and transfer to stockpile; and
- Backfill in areas where concrete forming is complete (eastern portion of site) and in areas that are being prepared for forming (southern portion of site).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

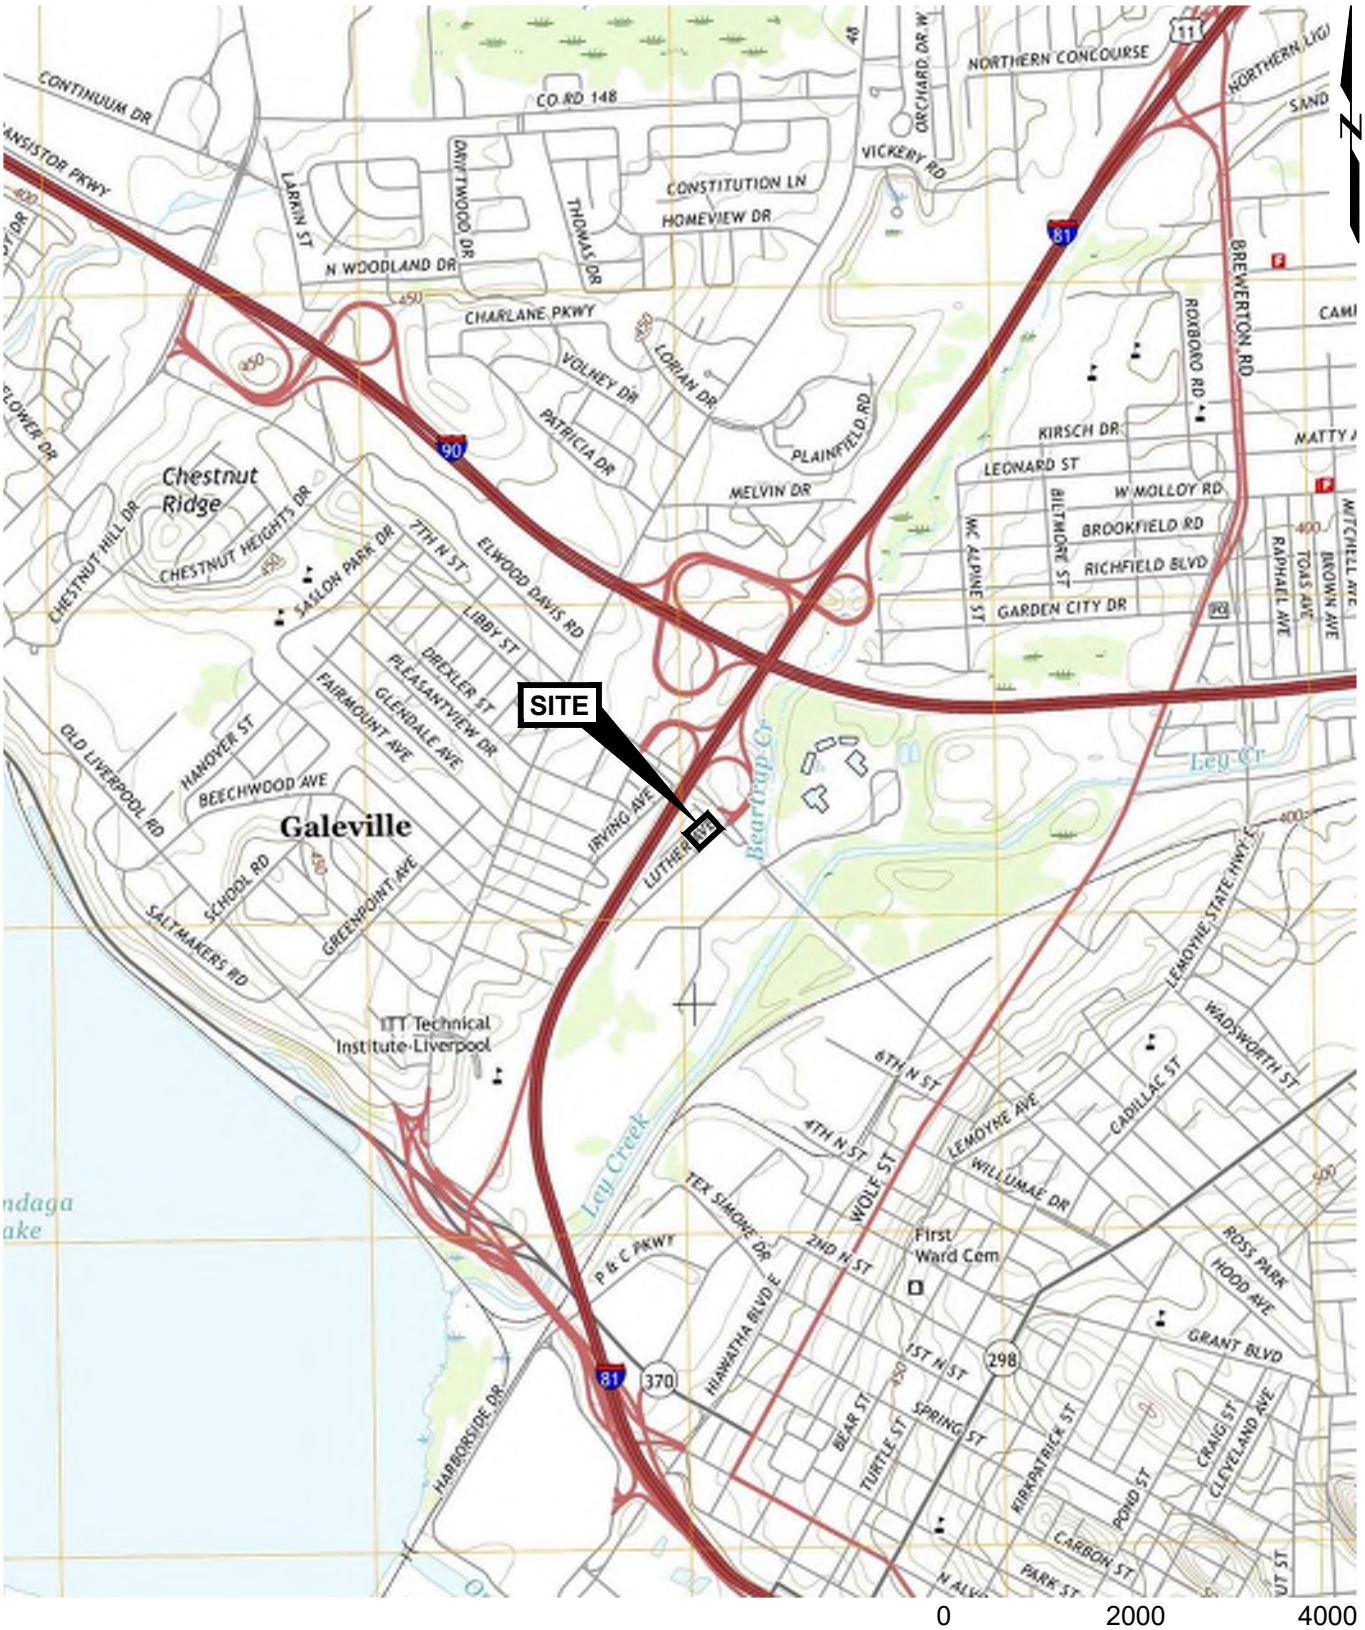
Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

PM_{10} [dust] levels were measured above the Action Limit of 150 ug/m^3 during this monitoring period during working hours at station AIR-103, as follows:

- PM_{10} [dust] levels were measured above the Action Limit of 150 ug/m^3 at AIR-103 on November 11, 2022 between 1015 and 1030 hours.

Scaffolding being used to form an elevator shaft near AIR-103 was being disassembled during this time. The scaffolding was down by 1030 and the dust monitor returned to baseline levels without intervention.

TVOC levels were measured above the Action Limit of 5 ug/m^3 during this monitoring period during non-working hours at station AIR-102, as follows:



- TVOCs were measured above the Action Limit of 5 ug/m^3 at AIR-102 on November 12, 2022 between 1145 and 1245 hours.

No work was performed onsite during this time.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Tim Cosgrave and Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: November 22, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
November 13 through November 19, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103), are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

Monitored Site Construction Activities

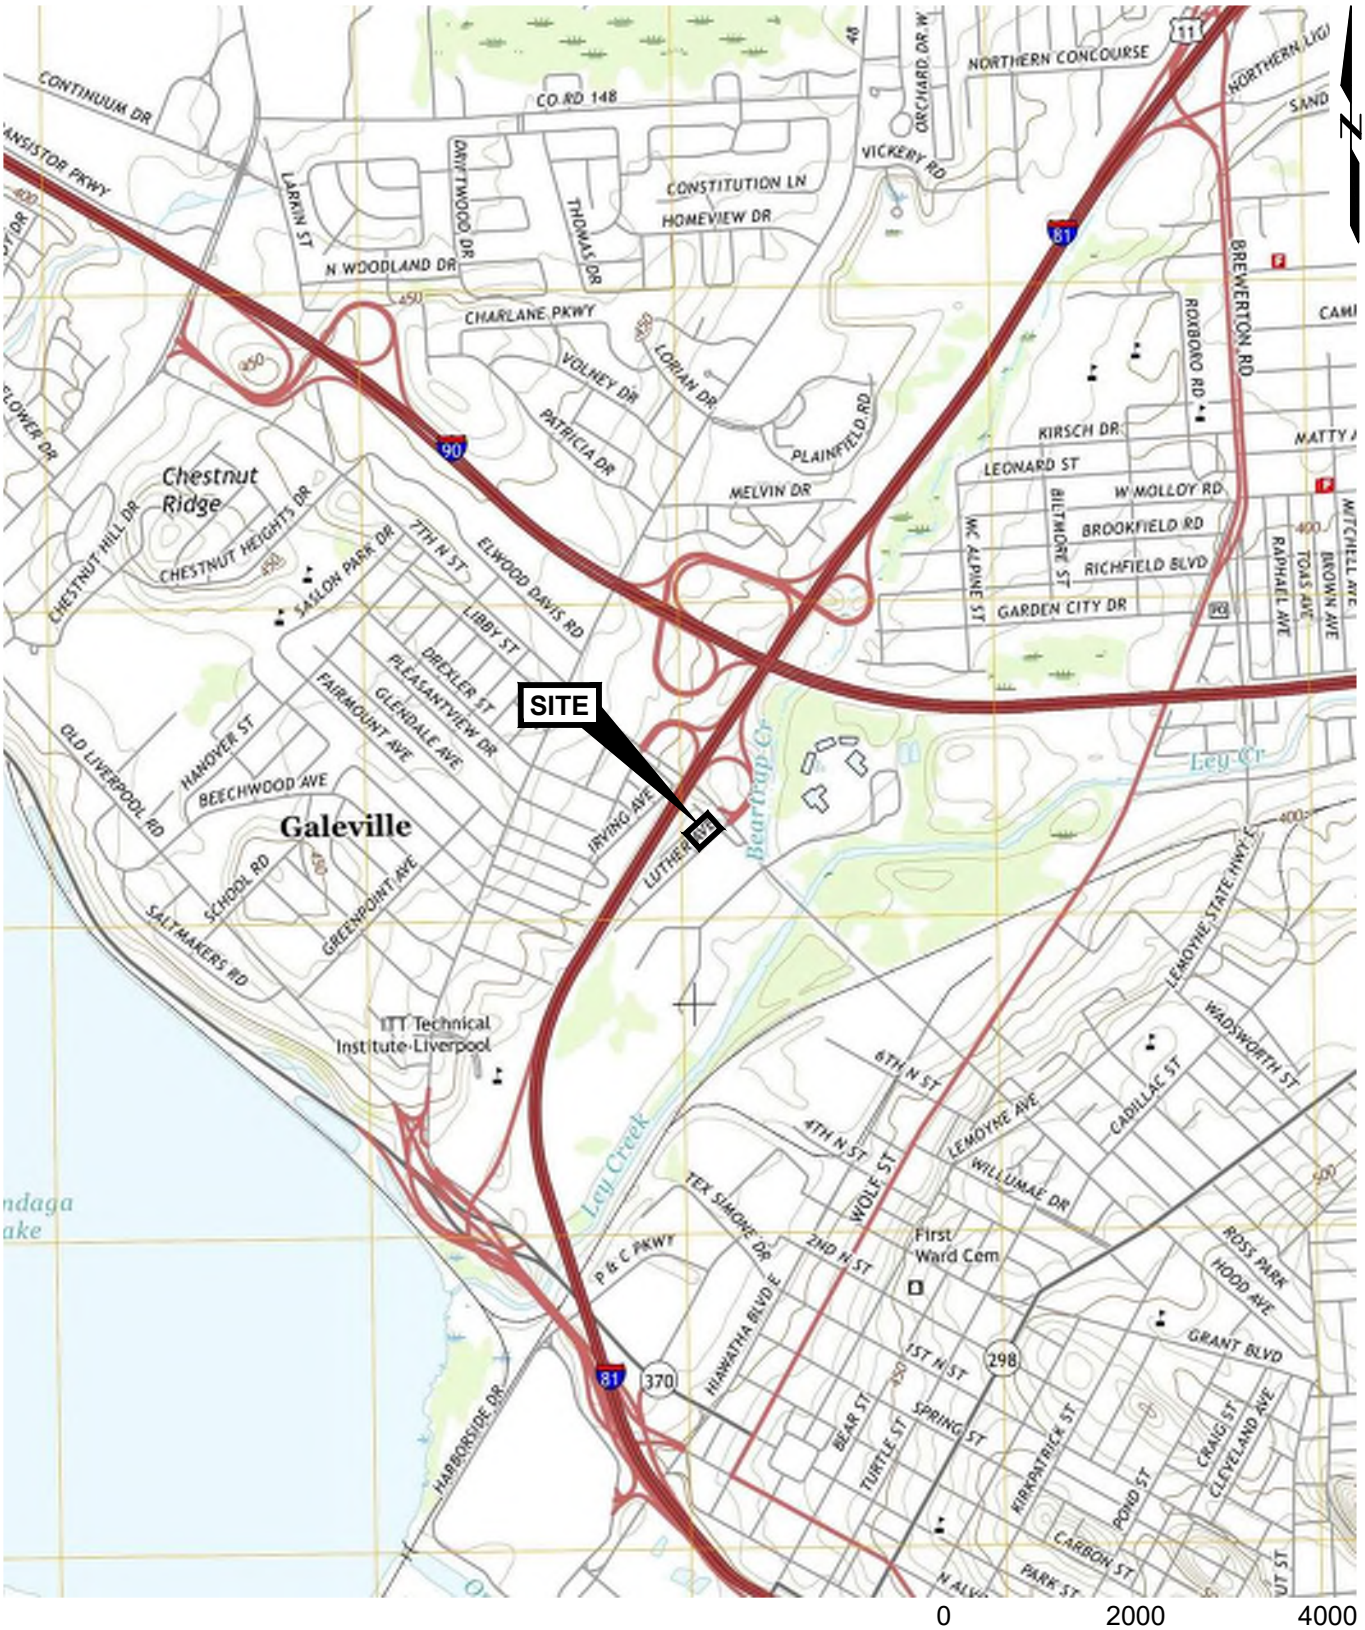
During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Dewatering;
- Dismantling bracings and forms along Southeastern wall;
- Preparing forms in South and East portions of the building;

- Excavation for plumbing line in East; and
- Material excavation and transfer to stockpile, followed by transfer offsite.

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary



Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

Figures 3 through 7 typically summarize the weather data collected continuously by the Site's meteorological station that is co-located at AIR-101 (Vaisala® WXT-530). However, the station experienced connection issues during the week subject to this submittal and not all of the data could be downloaded, including weather conditions between November 15 08:51 and November 16 08:31, and after November 16 22:25. We are currently troubleshooting the issue and will provide an addendum if/when the data becomes available.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Daily CAMP Report

System Operations		General Observations
Sampling Date	11/14/2022	General Weather Conditions
System Start Time	0.01	34-39 F, cloudy, light snow
System Stop Time	23.59	
Total Hours Monitored	24	General Description of Site Activities:
System Calibrations	YES	C&S removing bracing and forms of section of east wall concrete poured on 11/11/22; Sun conducting personal air monitoring; Sun dewatering the water filled in the building wall trench from the rain storm over the weekend, and emptying into the frac tanks.
(Time/Status)	7:00:00 AM	

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Rang	Total # of Alarms	Notes	Site Person/Time Notified
7:30	103					manual measurement - 0.0	
9:00	103					manual measurement - 0.0	
9:30	103					manual measurement - 0.0	
10:30	103					manual measurement - 0.0	
11:00	103					manual measurement - 0.0	

Notes:
On Saturday 11/12/22, Air 102 had an exceedence for VOC between 11:45 and 12:45 - the maximum was 18.65 ppm during this time. No site work was occuring at this time.
Upon arrival on site on Monday 11/14/22, Air 103 was not communicating with the data server - it had stopped communicating over the weekend. First, when calibrating, it was noticed the PID was off - so it was turned on (had full battery in the PID itself) and calibrated. However, it was then noticed that the power and wifi of the CAMP station itself was off. Troubleshooting commenced at 08:00 and finished at 10:45. It appears that the solar battery had died and needed time to recharge. In the meantime, manual readings of VOC were taken and for the duration of troubleshooting it was 0.0 ppm. Dust readings could not be taken at this location during the period because it is directly powered by the CAMP station. No intrusive site work was occuring during this time.

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)

7:00	103					manual measurement - 0.0	
8:00	101					manual measurement - 0.2	
8:00	103					manual measurement - 0.0	
9:00	103					manual measurement - 0.0	

Notes:
No exceedences.
Upon arrival at site, both Air 101 and Air 103 were offline/powered down. Manual measurements of VOC were taken during the down time and no exceedences for VOC occurred. At approximately 08:15 and 09:00, air 101 and air 103, repsectively, were back online. According to VDV data, the instruments were recording but not communicating during this time period as the data gaps were filled in (no exceedences for VOC or dust). The battery fuses were checked for these stations and no issues were observed, so it appears that the continued cloudy and cold weather is limiting battery lifetime right now.
Additionally, between 05:30 and 08:15, Air 102 dust was off. During this period and during the offline periods for air 101 and 103, no instrusive site work was occuring. Dewatering and form preperation were taking place in the south and east building areas.

Copy to: Tim Cosgrave and Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: November 29, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
November 20, 2022 through November 26, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103) are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Dewatering;
- Construction of pile cap forms;
- Excavation and transfer to stockpile (southern corner of site);

- Pouring concrete and testing rebar and concrete; and
- Backfill in areas where concrete forming is complete (northern portion of site).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

The onsite weather station WX-1 has malfunctioned and requires off-site service. As such, a summary of general weather conditions collected from the local Syracuse Hancock International Airport for WE 11/26/22 is presented in Table 2 in place of the on-site weather data. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Tim Cosgrave and Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: December 8, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
November 27, 2022 through December 3, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103) are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period.[1] There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

Monitored Site Construction Activities

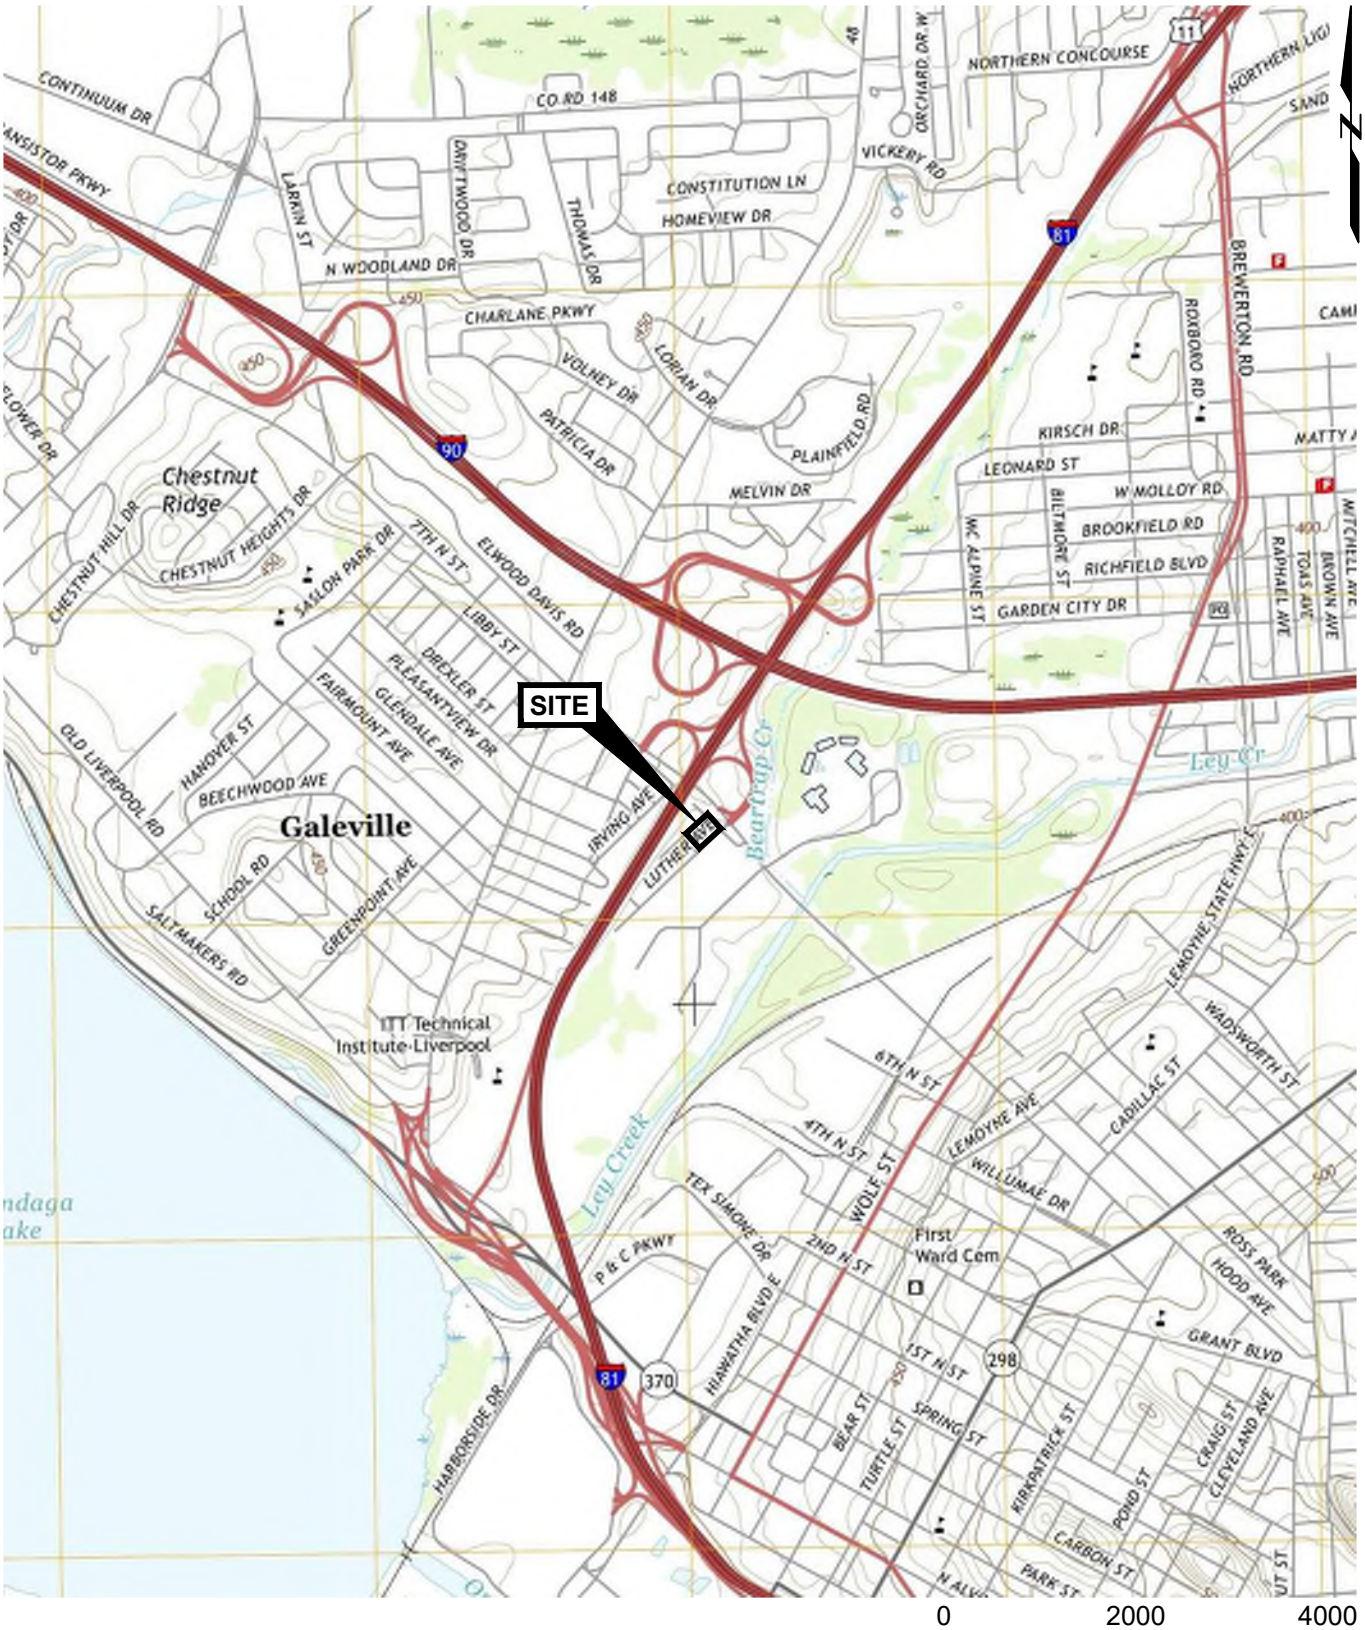
During this reporting period, monitoring was performed for on-Site construction activities, which included:

[1] As shown in Table 1, the maximum 15-minute average TVOC concentration at AIR-103 was 25.6ppmv on December 1, 2022 at 1030. This reading was made while the 100ppm calibration gas remained hooked up to the monitor following calibration.

- Installation of ramp for new building footprint (western corner);
- Installation of vapor sampling point (northeast corner);
- Construction of pile cap forms;
- Removal of pile cap forms (eastern wall);
- Staging imported fill for future use;
- Backfill in areas where concrete forming is complete (north, southwest); and
- Excavation and transfer to stockpile (southern corner);

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary



Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

The onsite weather station WX-1 has malfunctioned and requires off-site service. As such, a summary of general weather conditions collected from the local Syracuse Hancock International Airport (SYR) for WE 12/03/22 is presented in Table 2 in place of the on-site weather data. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Notes:

ug/m^3 = micrograms per cubic meter

ppmv = parts per million by volume

TVOC = total volatile organic compounds

PM_{10} = particulate matter (i.e. dust) 10 microns or less in diameter

NM = Not Measured.

Weather conditions and equipment location did not provide sufficient solar power to run this station. TVOC readings associated with personnel air monitoring were below detectable levels for the duration of intrusive activities on 11/30/22.

Daily CAMP Report

System Operations	
Sampling Date	11/28/2022
System Start Time	0.01
System Stop Time	23.59
Total Hours Monitored	24
System Calibrations	Yes
(Time/Status)	8:15:00 AM

General Observations

General Weather Conditions

38-50 degrees, clear

General Description of Site Activities:

- Install ramp in western portion of new building footprint for truck access using imported backfill
- Poured concrete in footer forms along southern section of the proposed building.

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Rang	Total # of Alarms	Notes	Site Person/Time Notified

Notes:
The PID lamp from station 101 would not fire. Replaced with a backup being stored on site.

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm	
Response Limit:	100 ug/m^3	5.0 ppm	
Action Limit:	150 ug/m^3	25 ppm	3 (n-butanol)

Notes:

UW - Upwind
CW - Crosswind
DW - Downwind

P - Particulate/ Dust
Particulate recorded in ug/m^3
V - Total VOC
Total VOC measured in ppm

Field Representative: Adam Grossman
Date: 11/28/2022

Daily CAMP Report

System Operations		General Observations
Sampling Date	11/29/2022	General Weather Conditions
System Start Time	0.01	28-30 degrees, overcast
System Stop Time	23.59	
Total Hours Monitored	24	General Description of Site Activities:
System Calibrations	Yes	• Placing fabric and backfilling in northwest portion of proposed building – by elevator shaft
(Time/Status)	10:15:00 AM	• Backfilling sewer trench
		• Removing forms along eastern wall of proposed building

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Rang	Total # of Alarms	Notes	Site Person/Time Notified

Notes:
Air monitoring stations were down upon arrival to the site due to limited battery life as a result of overcast skies.The PID at station 102 was still operating. GEI monitored the PID throughout the morning, and the readings did not exceed 0.1 ppm. The air monitoring stations were calibrated once they were powered back on.

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm	
Response Limit:	100 ug/m^3	5.0 ppm	
Action Limit:	150 ug/m^3	25 ppm	3 (n-butanol)

System Operations	
Sampling Date	11/30/2022
System Start Time	0.01
System Stop Time	23.59
Total Hours Monitored	24
System Calibrations	Yes
(Time/Status)	12:15:00 PM

General Observations

General Weather Conditions

35-47 degrees, rain and wind

General Description of Site Activities:

- Backfilling northern portion of proposed building with imported backfill
- Removing forms along eastern wall of proposed building
- Fisher excavated 6-8 feet bgs in the southwestern portion of the proposed building to locate construction trailer's temporary water line that broke last week. Soil was either placed adjacent to the trench or kept in the hole and contained mostly of imported fill. The soil that was placed next to the trench was placed back in the trench after locating the water line.

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Rang	Total # of Alarms	Notes	Site Person/Time Notified

Notes:

Air monitoring stations were down upon arrival to the site due to limited battery life as a result of inclement weather. GEI calibrated the air monitoring stations after they were powered on. Station 103 did not power on.during duration of work.

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm

System Calibrations	Yes	• Backfilling northeastern and southwestern portion of proposed building with imported backfill • Removing forms along walls of proposed building • Installed vapor sampling point in northwestern portion of proposed building • At the end of the day, Fisher set aside top layer of imported fill in preparation of next activity in the western portion of the proposed building
(Time/Status)	10:15:00 AM	

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Range	Total # of Alarms	Notes	Site Person/Time Notified
10:30	103	VOC	DW	25.7	1	Due to a loose cap on the PID, the instrument was giving off erroneous high readings during initial calibration, which resulted in a false alarm. GEI tightened the cap and resolved the calibration issue.	Adam Grossman/10:30

Notes:
Air monitoring stations were down upon arrival to the site due to limited battery life as a result of inclement weather. GEI monitored the PID throughout the morning, and the readings did not exceed 0.1 ppm. The air monitoring stations were calibrated once they were powered back on.

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm	
Response Limit:	100 ug/m^3	5.0 ppm

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Tim Cosgrave and Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: December 13, 2022

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site) (Figure 1)
December 4, 2022 through December 7, 2022

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site. Three air monitoring stations (AIR-101, AIR-102, and AIR-103) are located on the perimeter of the Site (Figure 2).

Full-time CAMP monitoring concluded mid-day on December 7, 2022 as no intrusive earthwork will be routinely occurring for the next several months. CAMP will be reinstated on an as-needed basis for remaining intrusive activities.

Exceedances

There was one measurement of Total Volatile Organic Compounds (TVOC) above the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. All exceedances are summarized below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed during on-Site construction activities, which included:

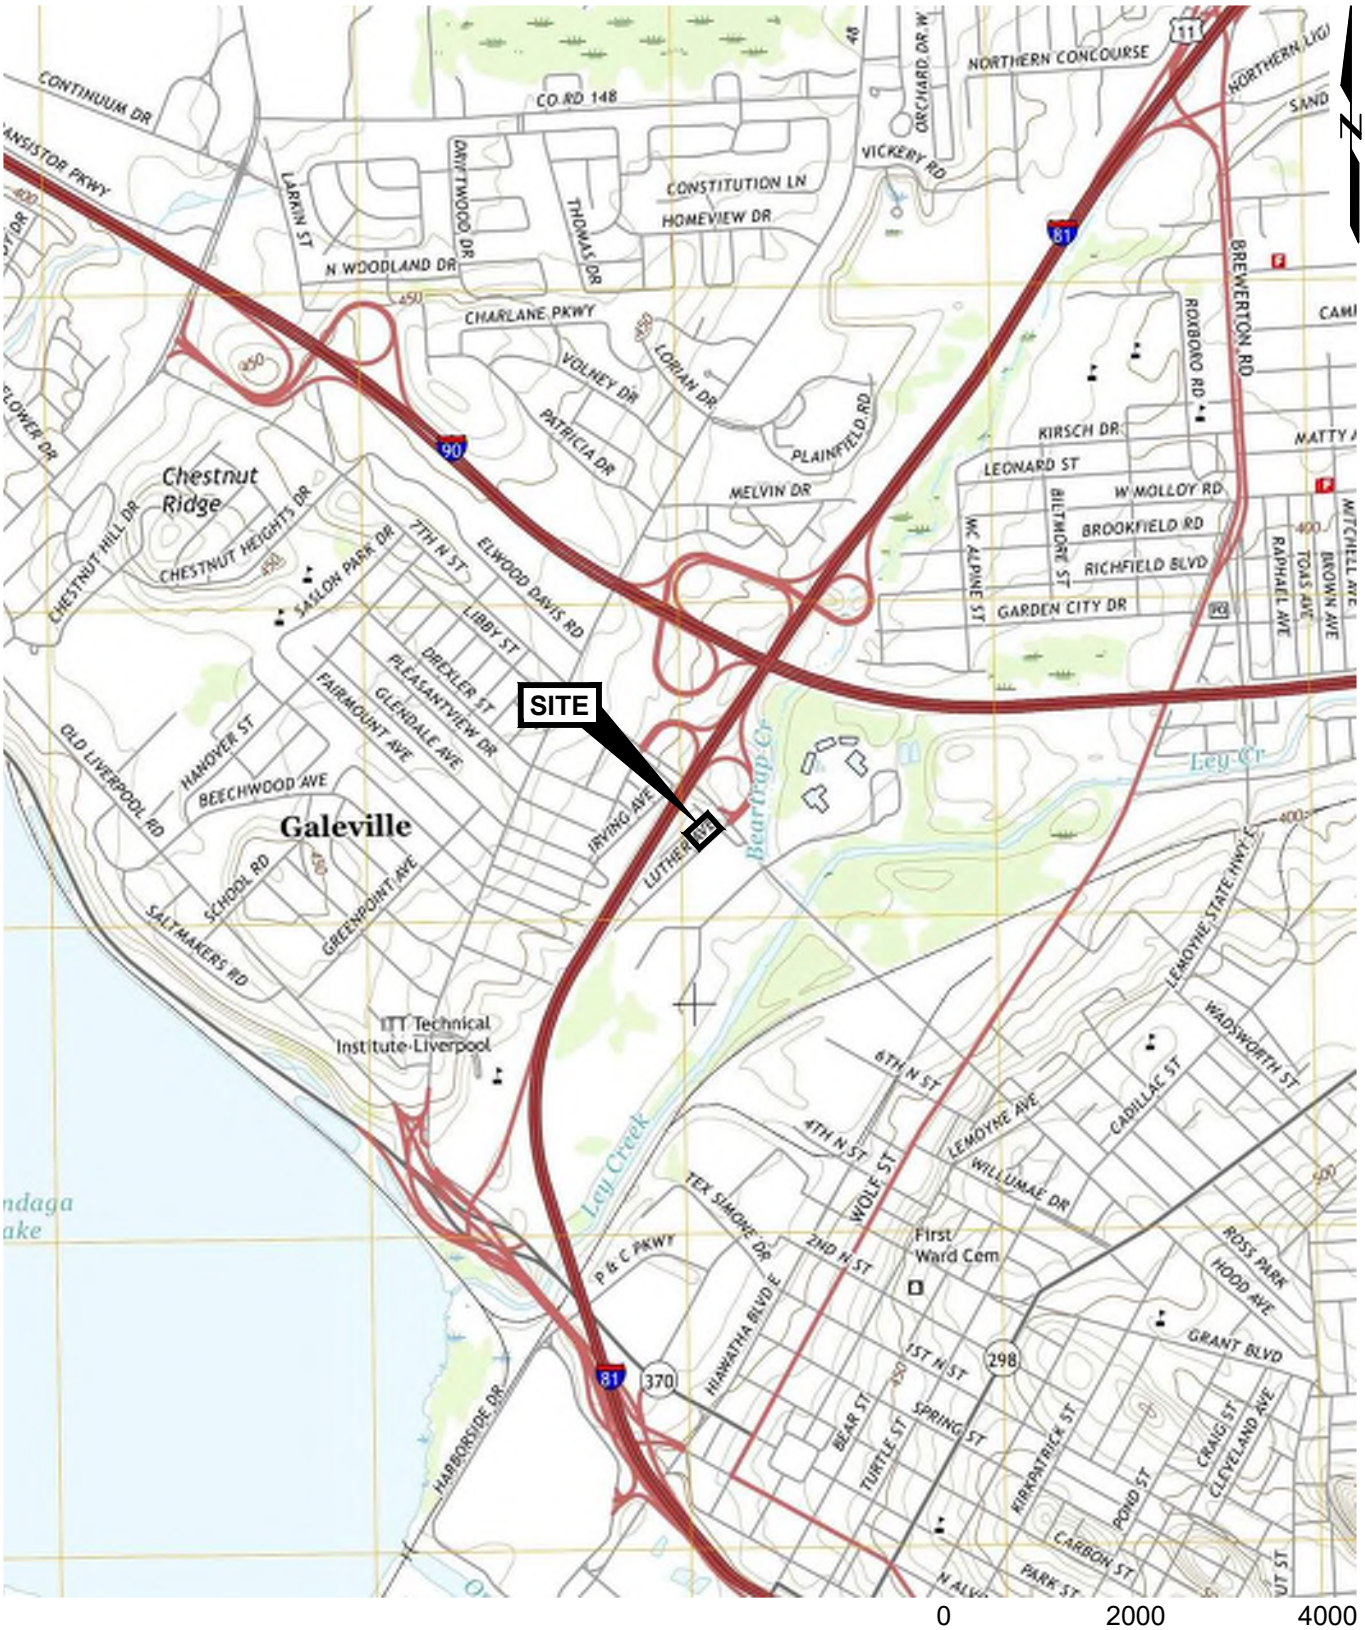
- Equipment transported offsite;
- Site cleanup and preparation for concrete slab pour following installation of vapor barrier;
- Backfilling in southeastern corner;
- Vapor Barrier installation in northern portion of site;
- Deliveries and staging of imported fill for future use; and
- Excavation and transfer to stockpile (central portion of Phase 2 construction area).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at three solar-powered, GEI-owned air monitoring stations. Each station included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter [dust monitor] to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

TVOC levels were measured above the Action Limit of 5 ug/m^3 during this monitoring period during non-working hours at station AIR-102, as follows:



- TVOCs were measured above the Action Limit of 5 ug/m^3 at AIR-102 on December 7, 2022 between 1300 and 1345 hours. The elevated concentration was measured upon starting the PID manually on low battery. Moisture was present in the tubing, which after manual cleaning and evaporation returned the measurements below the Action Limit by 1345. A loader was working and idling vehicles were also observed in the vicinity of AIR-102 during the exceedance period.

The onsite weather station WX-1 malfunctioned recently and requires off-site service. As a result, a summary of general weather conditions have been collected from the local Syracuse Hancock International Airport (SYR) for WE 12/10/22 is presented in Table 2 in place of the on-site weather data. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Daily CAMP Report

System Operations	
Sampling Date	12/5/2022
System Start Time	0.01
System Stop Time	23.59
Total Hours Monitored	24
System Calibrations	Yes
(Time/Status)	0915

General Observations

General Weather Conditions

Low in 30s, High in mid 40s degrees, mostly sunny

General Description of Site Activities:

- Clean up of work surface at center of Phase 2 building, removed broken concrete slab from former building and some historical fill to level the surface
- Removal of frac tank located near construction entrance on Luther Ave
- General site cleanup & preparation for concrete slab pour in office area following installation of vapor barrier

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Range	Total # of Alarms	Notes	Site Person/Time Notified
1530	101	Dust	UW	105	1	see below	

Notes:
Truck fire on an adjacent property to the south resulted in visible smoke onsite. Upwind air monitoring station AIR101 read 105 ug/m3 during the fire (not considered an exceedance).

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm	
Response Limit:	100 ug/m^3	5.0 ppm	
Action Limit:	150 ug/m^3	25 ppm	3 (n-butanol)

Notes:

UW - Upwind
CW - Crosswind
DW - Downwind

P - Particulate/ Dust
Particulate recorded in ug/m^3
V - Total VOC
Total VOC measured in ppm

Field Representative: Wendy Moore
Date: 12/5/2022

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: April 7, 2023

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
March 26, 2023 through April 1, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site (Figure 1). Two air monitoring stations (Upwind and Downwind) are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

Monitored Site Construction Activities

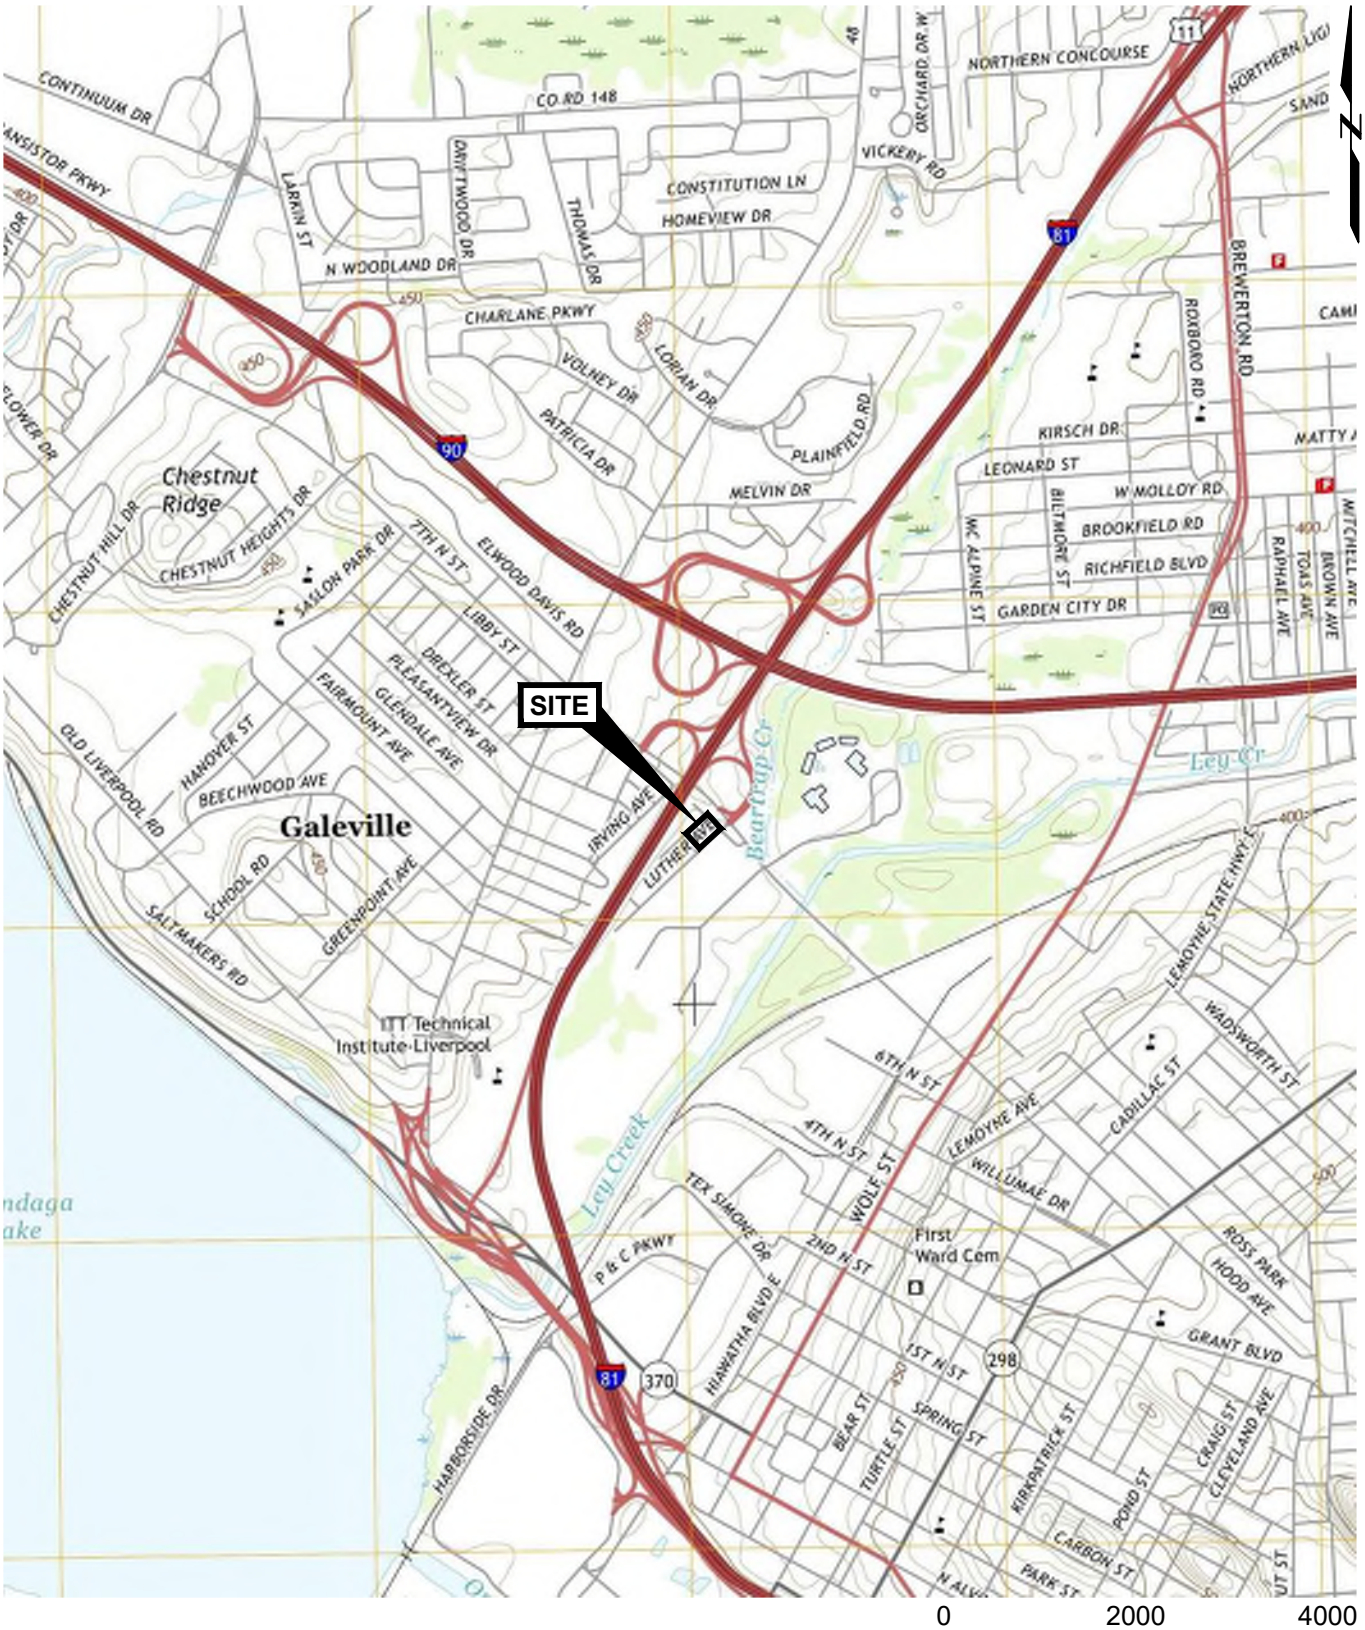
During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Excavation of soil for installation of stormwater basin (northeastern corner);
- Loadout of soil stockpile (eastern corner); and
- Test pit soil sampling (eastern corner);

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.



No PM_{10} or TVOC levels were measured above the project Action Limits. While the attached Table 1 indicates TVOC concentrations above the 5 ppm Action Level on March 27 and 28, those readings were recorded during the equipment calibration process and were not representative of ambient air conditions.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) for WE 04/01/23 and are presented in Table 2 in place of the on-site weather data. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: May 17, 2023

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
May 4, 2023 through May 11, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site (Figure 1). Two air monitoring stations (Upwind and Downwind) are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

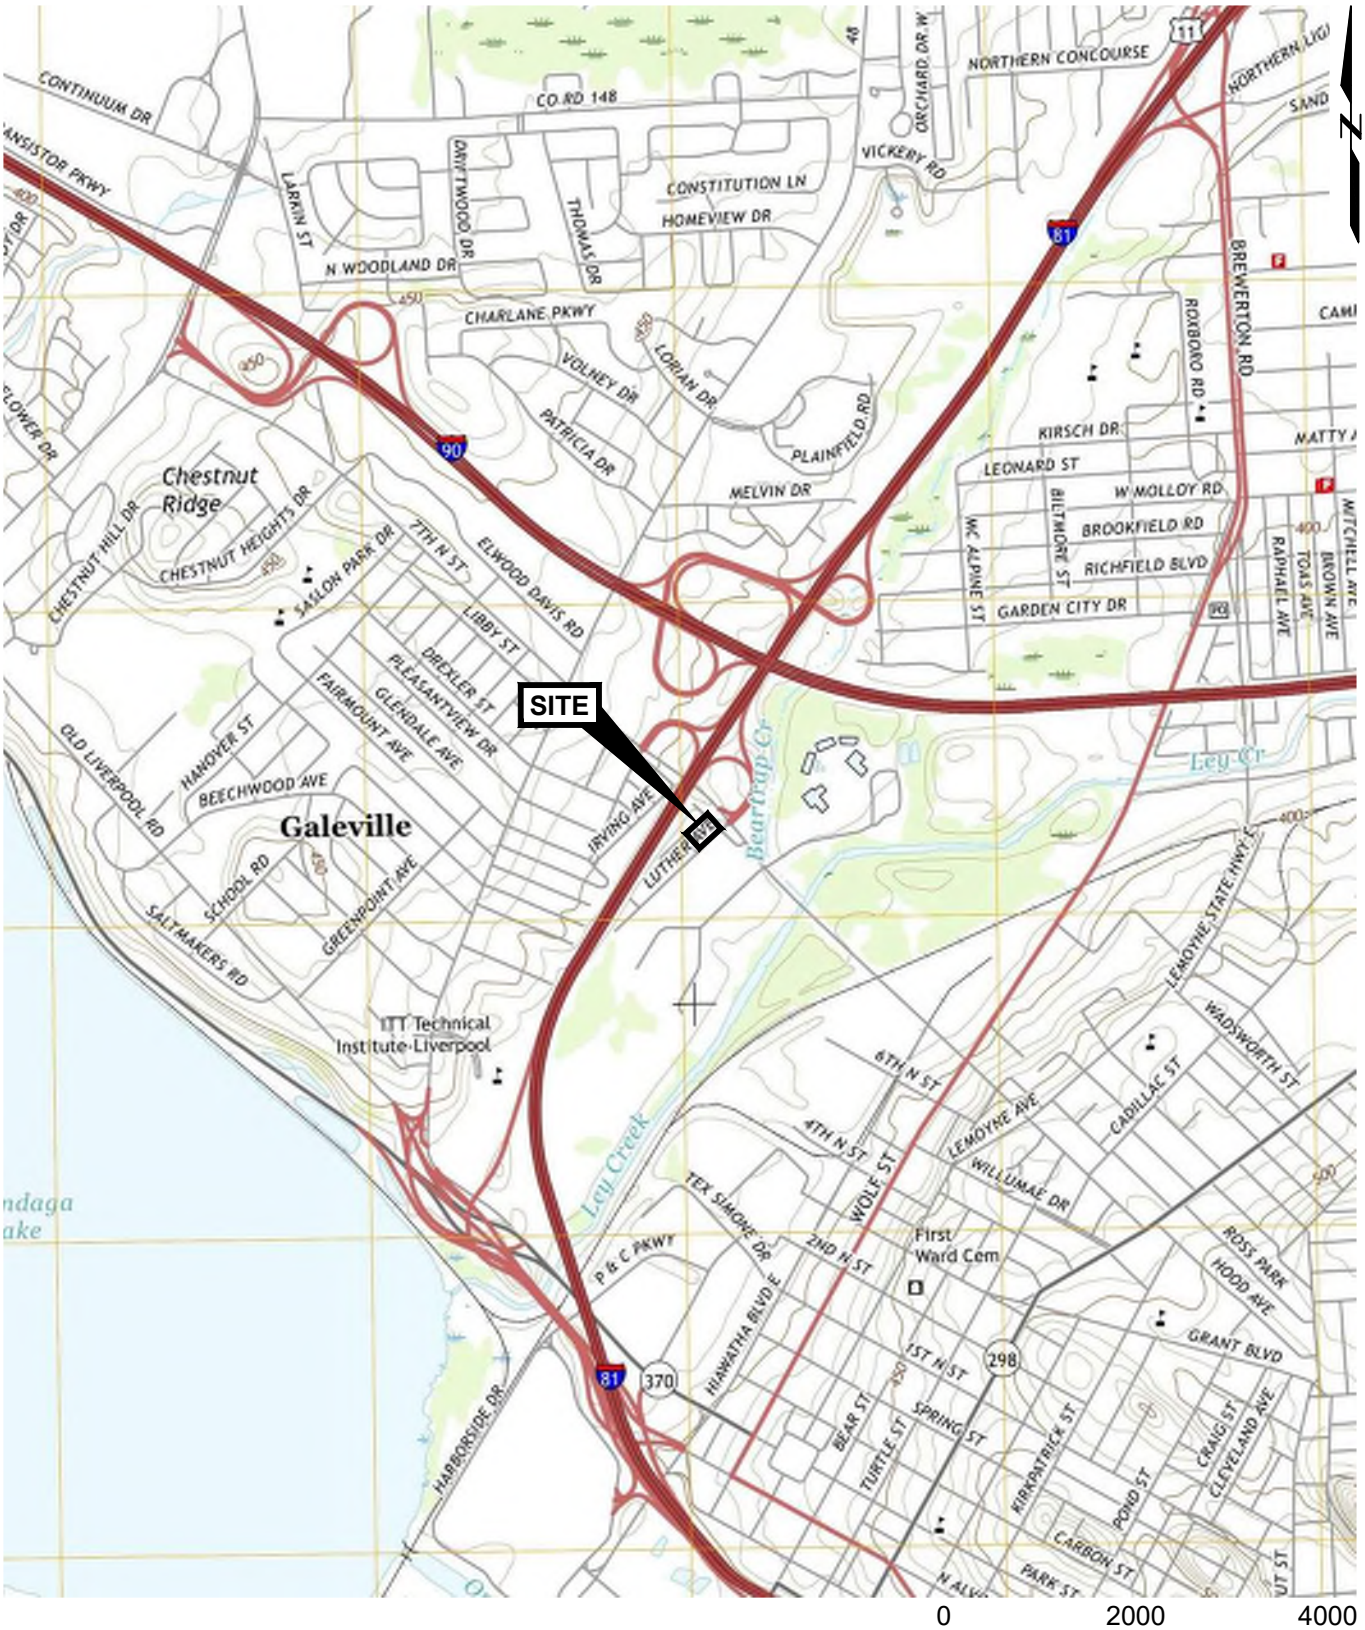
Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Excavation for swale (southeastern site border);
- Loadout of soil stockpile (southern corner); and
- Waste characterization soil sampling (southern portion).

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary



Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) for May 4, 2023 through May 11, 2023 and are presented in Table 2. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: May 30, 2023

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
May 17, 2023 through May 26, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan during Phase 2 Construction at the Site (Figure 1). Two air monitoring stations (Upwind and Downwind) are located on the perimeter of the Site (Figure 2).

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were two measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. All exceedances are detailed below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

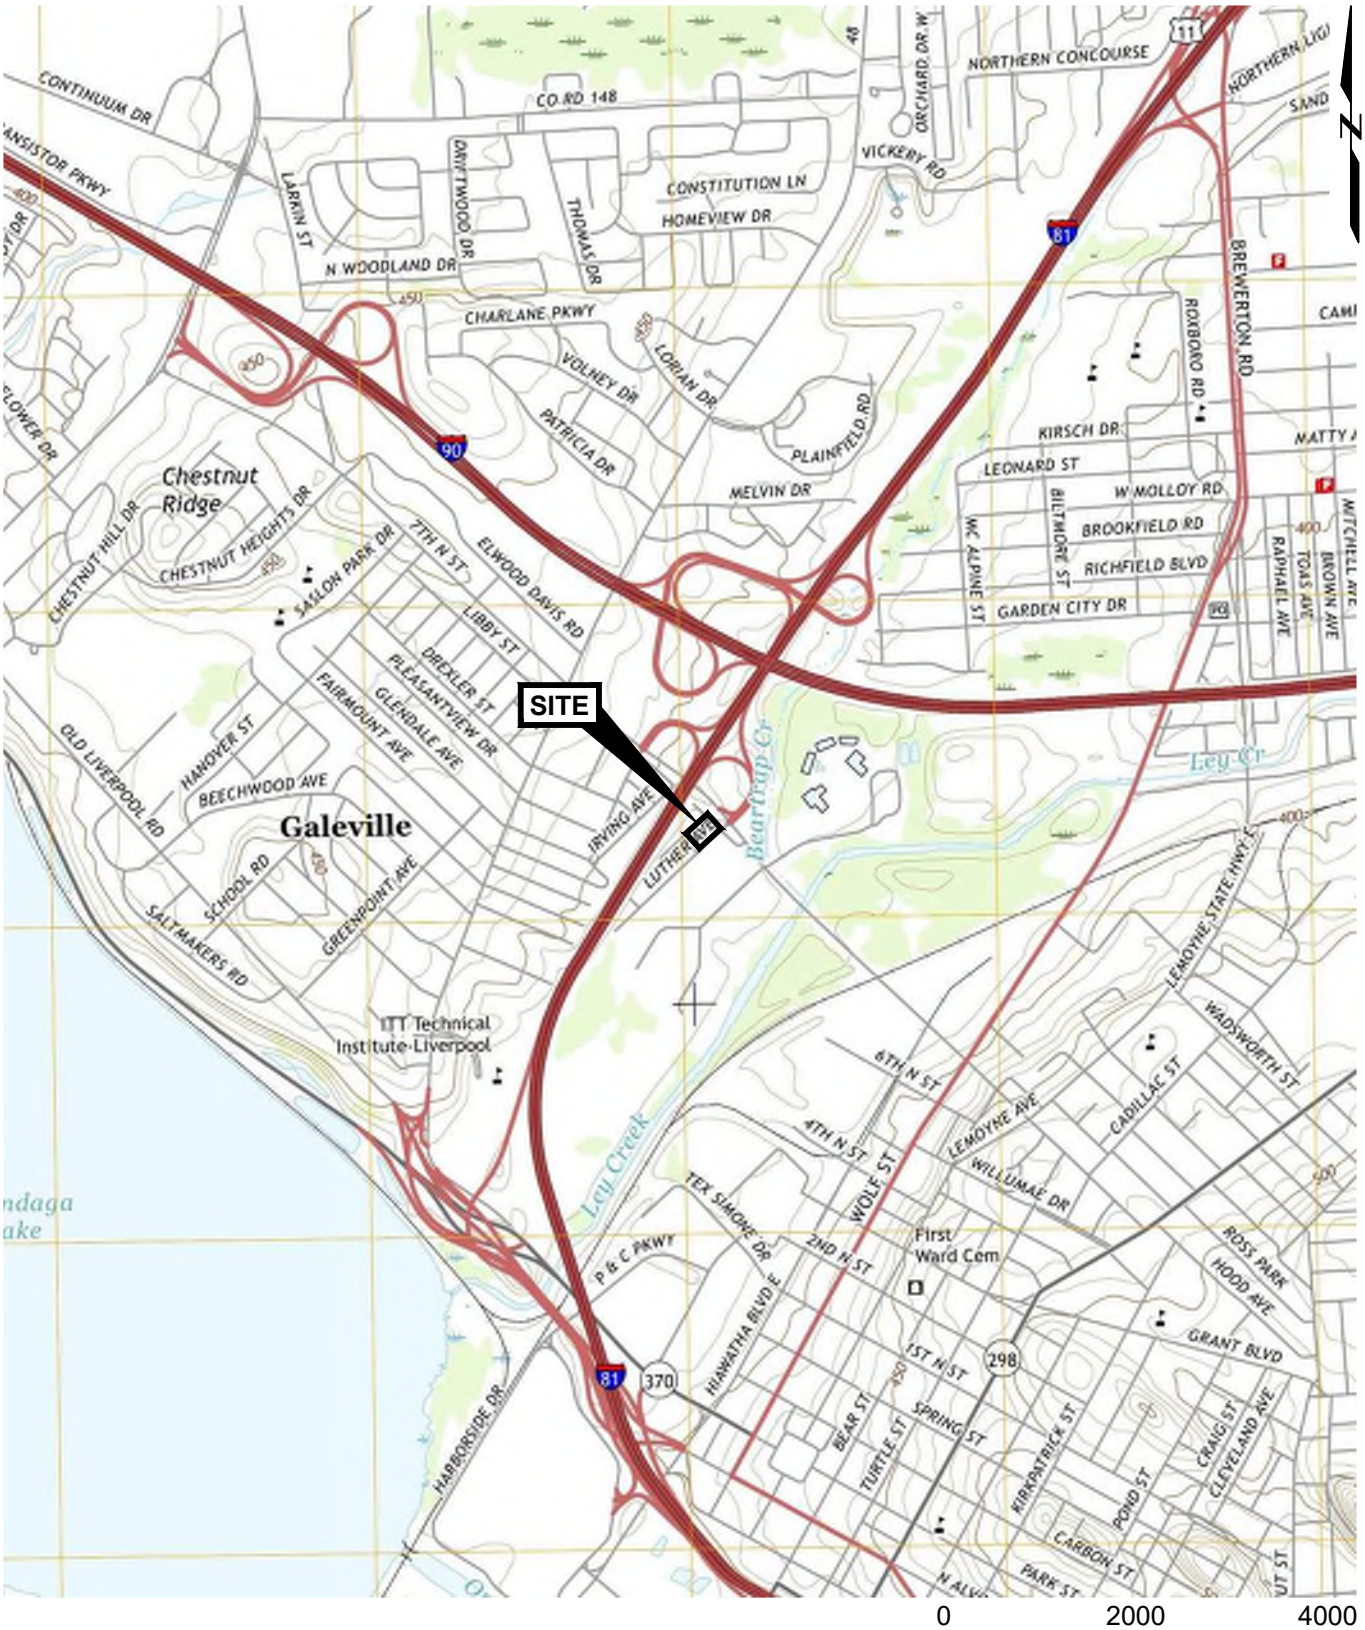
- Excavation/grading for drainage and parking lot construction (southeastern site border);
- Excavation/installation for loading bay (rear of new Unifirst building); and
- Loadout of soil stockpile (southern corner);

The primary areas where intrusive activities took place during the reporting period can be found on the site map (Figure 2).

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

Particulate Matter (PM10) levels were measured above the Action Limit of 150 ug/m3 during this monitoring period at the DW station, as follows:



- PM10 levels were measured above the Action Limit at the DW station on May 24th between 10:15-10:30 and 10:45-11:00. Site excavation and equipment traffic was occurring near the DW monitoring station during this time. PM10 levels fell to acceptable levels without intervention.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) for May 17, 2023 through May 26, 2023 and are presented in Table 2. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: June 13, 2023 (Revised June 21, 2023)

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
May 30 through June 6, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan at the Site (Figure 1). Two air monitoring stations (Upwind and Downwind) were located on the perimeter of intrusive work areas as shown on Figure 2. These locations varied from day to day as they were dependent on the location of the intrusive work being conducted each day.

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There was one measurement of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period. All exceedances are detailed below.

Monitored Site Construction Activities

During this reporting period, monitoring was performed for on-Site construction activities, which included:

- Excavation/grading for drainage and parking lot construction (southeastern site border);
- Excavation around rear loading bay (southern rear of new building);

- Drilling for soil investigation and monitoring well installations (southeastern site border); and
- Loadout of soil stockpile (southern corner).

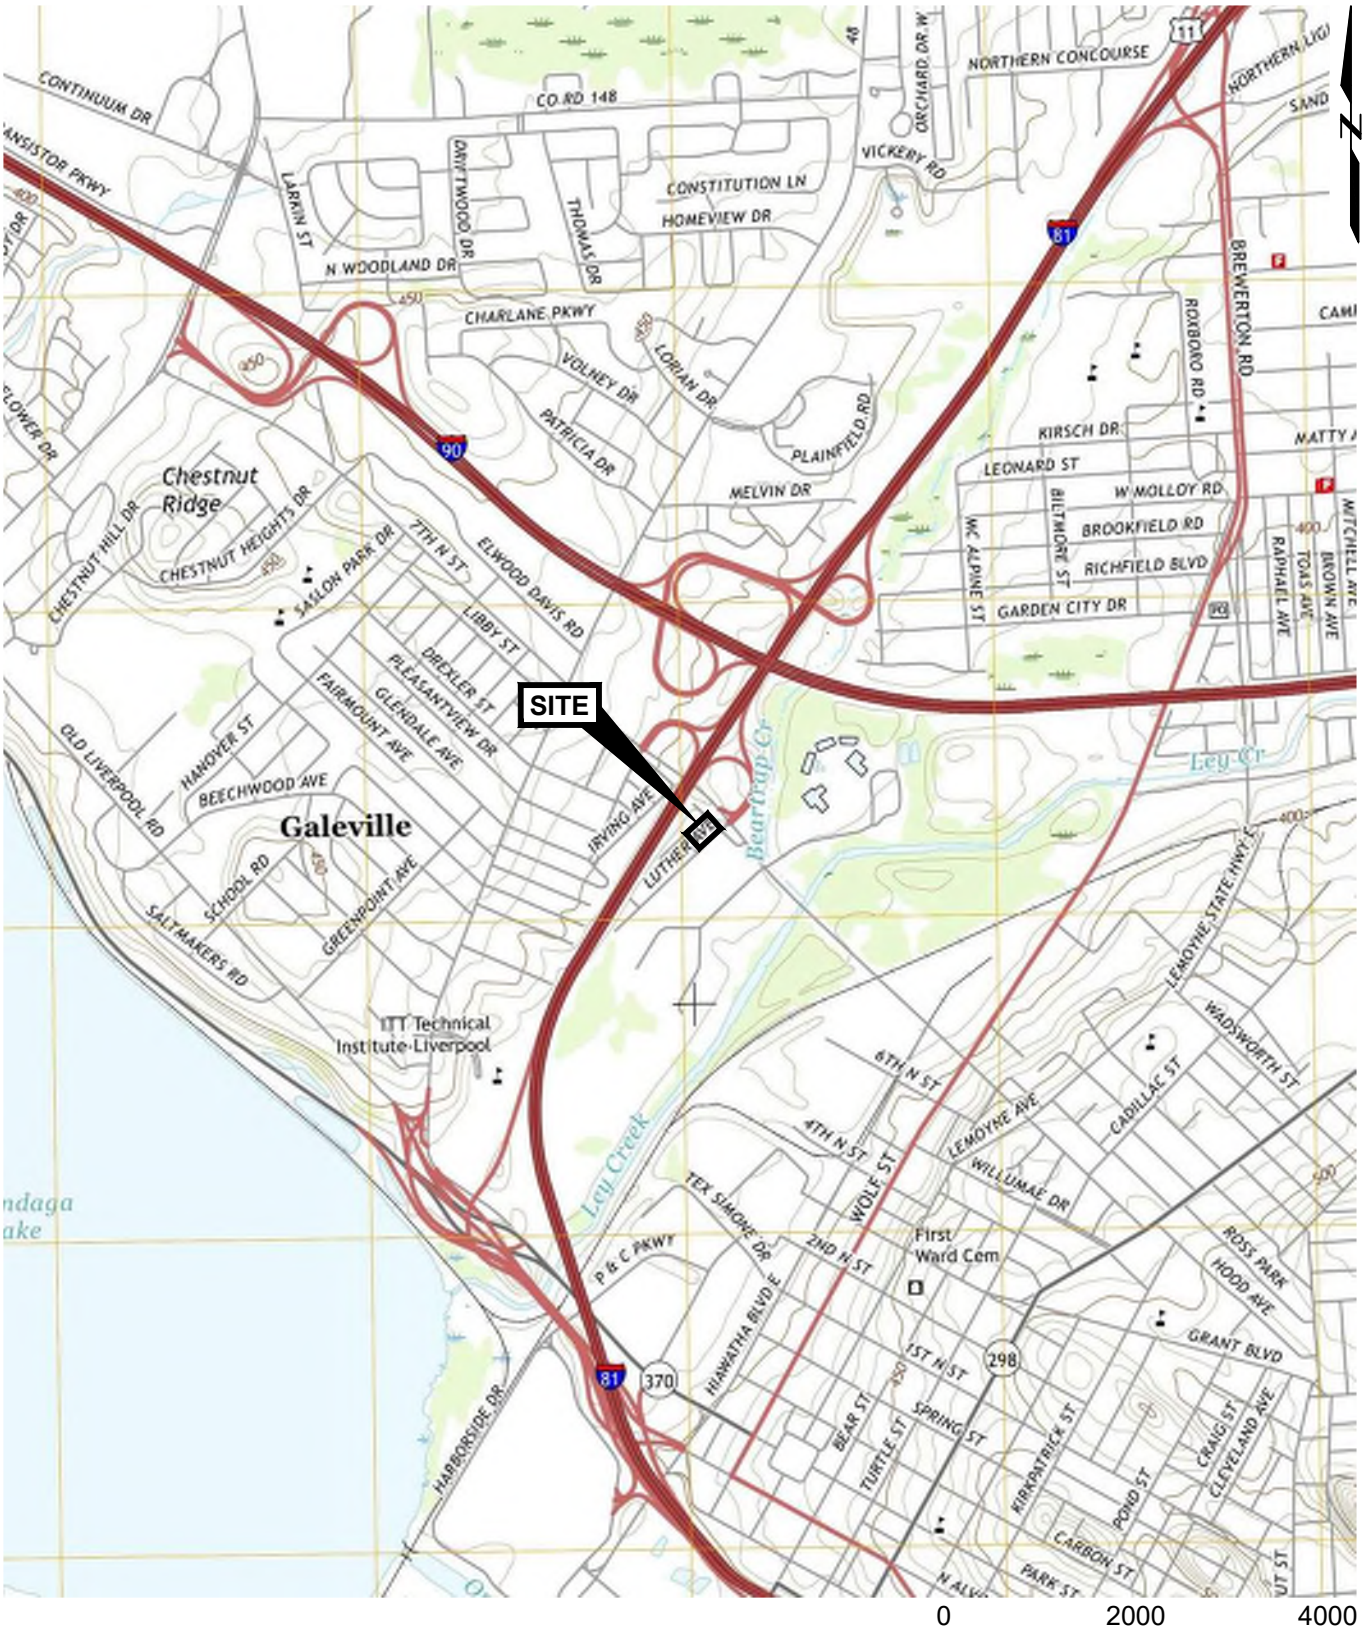
Figure 2 shows the primary areas where intrusive activities took place during this reporting period.

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

Particulate Matter (PM_{10}) levels were measured above the Action Limit of 150 ug/m^3 during this monitoring period at the Downwind station, as follows:

- PM_{10} levels were above the Action Limit at the Downwind station on May 30th for the 15-minute measurement period between 13:15-13:30. Intrusive activities were not occurring at the time, although Site equipment traffic was occurring near the Downwind monitoring station during this time. PM_{10} levels fell to acceptable levels without intervention.



Please note that elevated particulate readings (upwind and downwind) occurred on 6/6/2023, but at no point exceeded the action level based on the difference between the downwind and upwind locations. These readings were concurrent with NYSDEC-issued Air Quality Health Advisories for Central New York due to regional impacts from wildfires in Canada, which are attributed as the source of the elevated particulate levels at the site that day. This is noted on Table 1 and copies of the NYSDEC advisories for 6/5 and 6/6 are included in Appendix 1.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) for May 30 through June 6, 2023 and are presented in Table 2. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Notes:

ug/m^3 = micrograms per cubic meter

ppmv = parts per million by volume

TVOC = total volatile organic compounds

PM_{10} = particulate matter (i.e. dust) 10 microns or less in diameter

NM = Not Measured.

Elevated particulate readings (upwind and downwind) on 6/6/2023 are attributed to wildfire smoke. The NYSDEC issued Air Quality Health Advisories for Central New York on 6/5 and 6/6 due to regional impacts from wildfires in Canada.

NEW YORK STATE | Department of Environmental Conservation

For Release: Monday, June 5, 2023

Air Quality Health Advisory Issued for Adirondacks, Eastern Lake Ontario, Central New York and Western New York

In Effect for Monday, June 5, 2023

New York State Department of Environmental Conservation (DEC) Commissioner Basil Seggos and State Department of Health (DOH) Commissioner Dr. James McDonald issued an Air Quality Health Advisory for the **Adirondacks, Eastern Lake Ontario, Central New York, and Western New York regions for Monday, June 5, 2023.**

The pollutant of concern is: **Fine Particulate Matter**

The advisory will be in effect from **10 a.m. through 11:59 p.m.**

DEC and DOH issue Air Quality Health Advisories when DEC meteorologists predict levels of pollution, either ozone or fine particulate matter are expected to exceed an Air Quality Index (AQI) value of 100. The AQI was created as an easy way to correlate levels of different pollutants to one scale, with a higher AQI value indicating a greater health concern.

Fine Particulate Matter

Fine particulate matter consists of tiny solid particles or liquid droplets in the air that are 2.5 microns or less in diameter. PM 2.5 can be made of many different types of particles and often come from processes that involve combustion (e.g. vehicle exhaust, power plants, and fires) and from chemical reactions in the atmosphere.

Exposure can cause short-term health effects such as irritation to the eyes, nose, and throat, coughing, sneezing, runny nose, and shortness of breath. Exposure to elevated levels of fine particulate matter can also worsen medical conditions such as asthma and heart disease. People with heart or breathing problems, and children and the elderly may be particularly sensitive to PM 2.5.

When outdoor levels are elevated, going indoors may reduce exposure. If there are significant indoor sources of PM 2.5 (tobacco, candle or incense smoke, or fumes from cooking) levels inside may not be lower than outside. Some ways to reduce exposure are to minimize outdoor and indoor sources and avoid strenuous activities in areas where fine particle concentrations are high.

New Yorkers also are urged to take the following energy saving and pollution-reducing steps:

1. use mass transit instead of driving, as automobile emissions account for about 60 percent of pollution in our cities. During the current COVID-19 pandemic, people are strongly advised to carpool only with members of their households;
2. conserve fuel and reduce exhaust emissions by combining necessary motor vehicle trips;
3. turn off all lights and electrical appliances in unoccupied areas;
4. use fans to circulate air. If air conditioning is necessary, set thermostats at 78 degrees;
5. close the blinds and shades to limit heat build-up and to preserve cooled air;

6. limit use of household appliances. If necessary, run the appliances at off-peak (after 7 p.m.) hours. These would include dishwashers, dryers, pool pumps and water heaters;
7. set refrigerators and freezers at more efficient temperatures;
8. purchase and install energy efficient lighting and appliances with the Energy Star label; and
9. reduce or eliminate outdoor burning and attempt to minimize indoor sources of PM 2.5 such as smoking.

Additional information on ozone and PM 2.5 is available on DEC's website and on DOH's website (leaves DEC website). To stay up-to-date with announcements from DEC, sign up to receive Air Quality Alerts through DEC Delivers: DEC's Premier Email Service.

The **Monday, June 5,** Air Quality Health Advisory regions consist of the following: **Adirondacks** which includes Clinton, Essex, Franklin, Hamilton, northern Herkimer, Lewis, St. Lawrence, and Warren counties; **Eastern Lake Ontario** which includes northern Cayuga, Jefferson, Monroe, Oswego, and Wayne counties; **Central New York** which includes Allegany, Broome, southern Cayuga, Chemung, Chenango, Cortland, Delaware, southern Herkimer, Livingston, Madison, Onondaga, Oneida, Ontario, Otsego, Tioga, Tompkins, Schuyler, Seneca, Steuben, and Yates counties; and **Western New York,** which includes Cattaraugus, Chautauqua, Erie, Genesee, Niagara, Orleans, and Wyoming counties.

NEW YORK STATE OF OPPORTUNITY | Department of Environmental Conservation

Today's Air Quality Index (AQI) Forecast for New York State

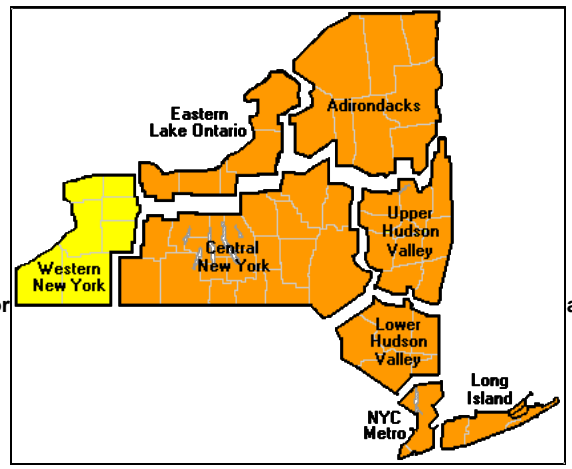
New York State Air Quality Hotline: (800) 535-1345

If you would like to be notified when daily air quality reaches a level of your choice, you can sign up for Enviroflash at enviroflash.info.

Yesterday's Observed :: Today's Forecast :: Extended Forecast :: AQI Information
Complete set of forecast values

For Tuesday, June 6, 2023 (Updated 06/06/2023 @ 9:50AM)

Air Quality Health Advisories in Effect For Long Island, NYC Metro, Lower Hudson Valley, Upper Hudson Valley, Adirondacks, Eastern Lake Ontario, and Central Regions.



Region	Maximum AQI	Air Quality
Long Island	**122** (Fine Particles)	Unhealthy for Sensitive Groups
NYC Metro	**138** (Fine Particles)	Unhealthy for Sensitive Groups
Lower Hudson Valley	**119** (Fine Particles)	Unhealthy for Sensitive Groups
Upper Hudson Valley	**111** (Fine Particles)	Unhealthy for Sensitive Groups
Adirondacks	**128** (Fine Particles)	Unhealthy for Sensitive Groups
Eastern Lake Ontario	**101** (Fine Particles)	Unhealthy for Sensitive Groups
Central	**113** (Fine Particles)	Unhealthy for Sensitive Groups
Western	**93** (Fine Particles)	Moderate

AQI Legend

Data Not Available

Good (0-50)
Moderate (51-100)
Unhealthy for Sensitive Groups (101-150)
Unhealthy (151-200)
Very Unhealthy (201-300)
Hazardous (301-500)

More Information

- 

The ozone for asts of fine particles are made year round.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: July 24, 2023

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
July 17 and18, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan at the Site (Figure 1). Two air monitoring stations (Upwind [UW] and Downwind [DW]) were located on the perimeter of intrusive work areas as shown on Figure 2.

Exceedances

There were no construction-related measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

One elevated TVOC reading was recorded on Tuesday, July 17, 2023 while calibrating the UW station at the start of day. TVOC levels fell to normal levels immediately following standard calibration. On Tuesday, July 18, 2023, the MetOne® ES-642 optical sensing aerosol meters (dust monitors) stopped communicating via the satellite modem, resulting in a loss of dust data for the duration of the work on that date.

Monitored Site Construction Activities

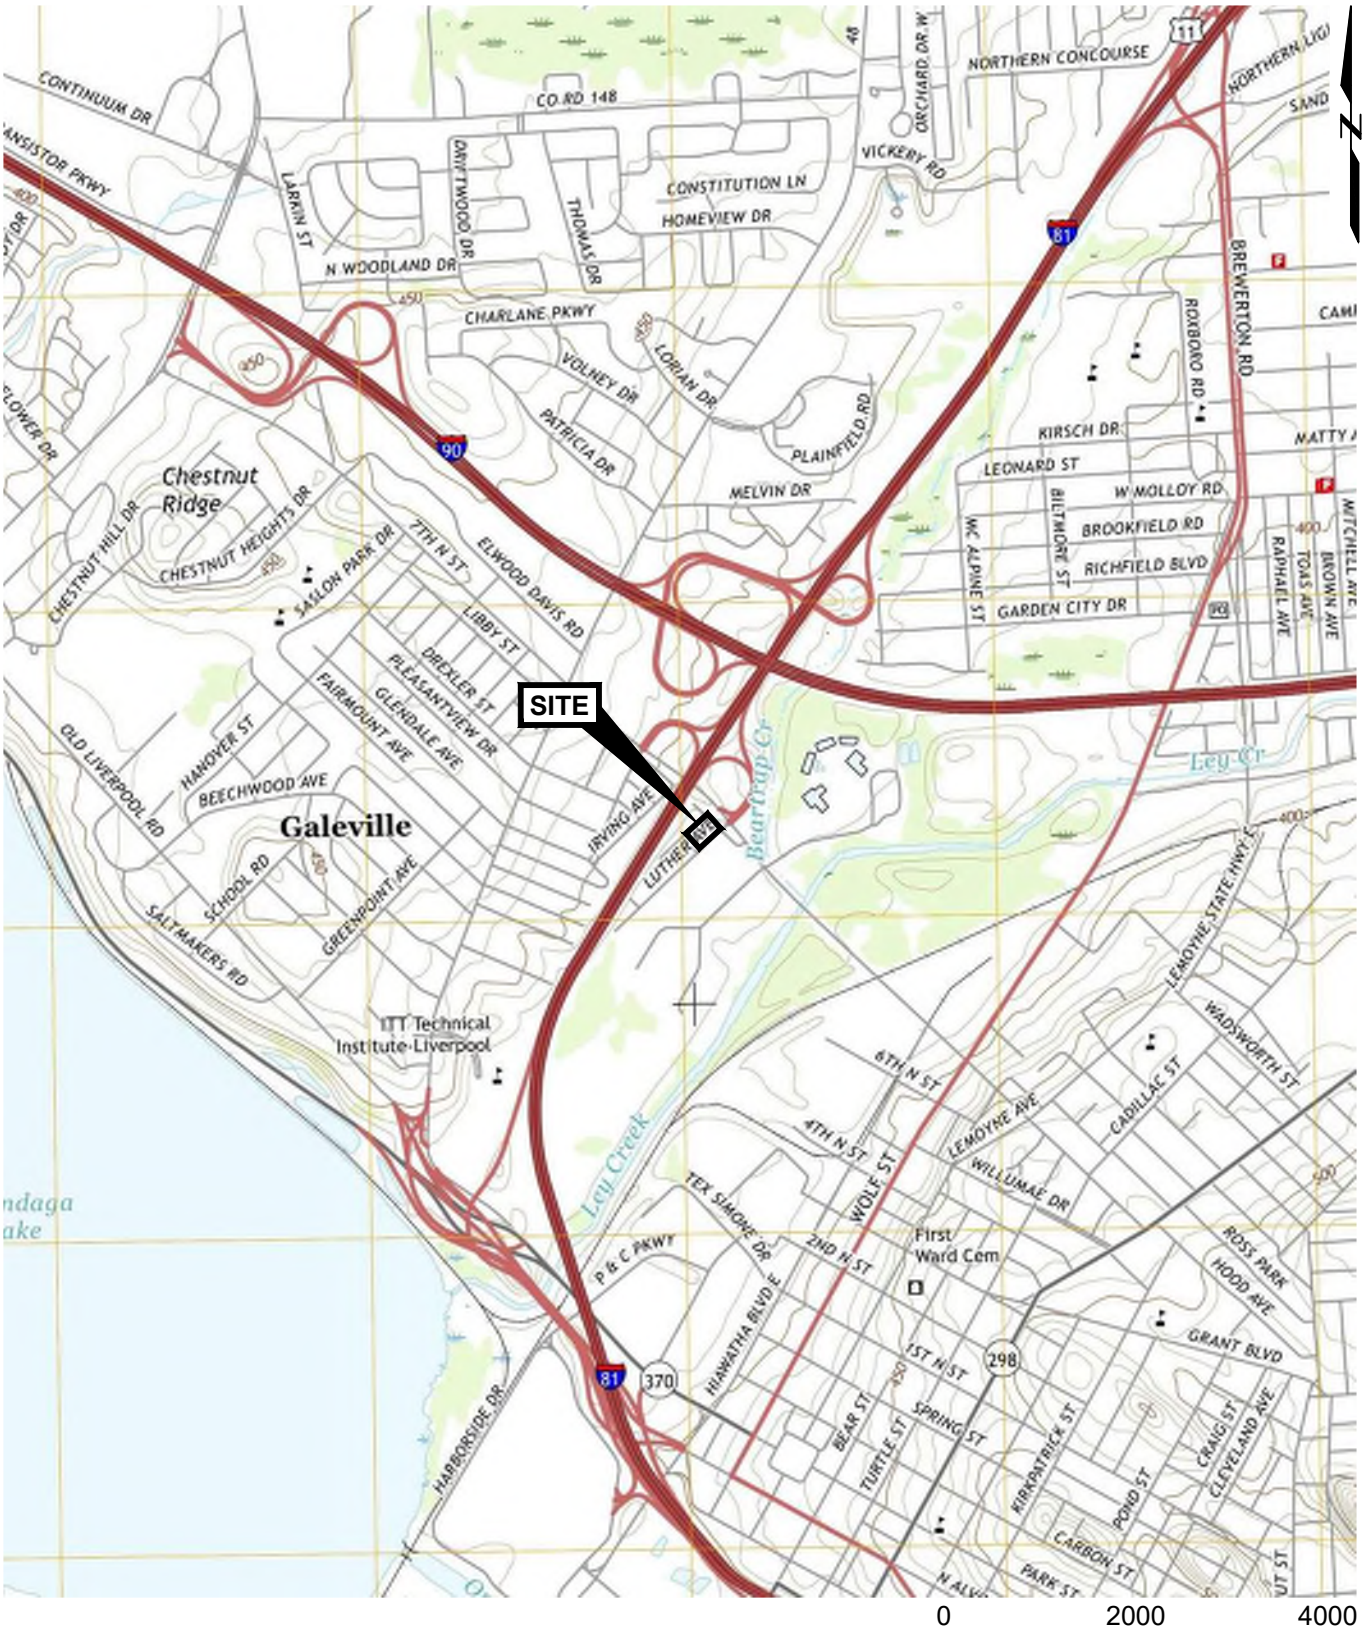
During this reporting period, monitoring was performed for the following activities:

- Excavation and removal of two underground storage tanks (UST) (northeastern property corner) on Monday, July 17, 2023; and
- Backfill UST excavation area with imported clean stone (northeastern property corner) on Tuesday, July 18, 2023.

Figure 2 shows the primary areas where intrusive activities took place during this reporting period.

Air Monitoring Activities and Summary

Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.



Please note that elevated particulate readings (both upwind and downwind) occurred but at no point exceeded the alert level. These readings were concurrent with NYSDEC-issued Air Quality Health Advisories for Central New York due to regional impacts from wildfires in Canada. This is noted on Table 1 and copies of the NYSDEC advisories for July 17 and 18, 2023 are included in Appendix 1.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) for July 17 and 18, 2023 and are presented in Table 2. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Table 1. Daily Maximum 15-Minute Average Concentrations of TVOC and PM-10
UniFirst Corporation
Liverpool, NY

	TVOC (ppmv)		PM_{10} (ug/m^3)	
Alert Limit	3.7		100	
Action Limit	5.0		150	
Stop Work Limit	25.0		-	
Date	**Downwind**	**Upwind**	**Downwind**	**Upwind**
Mon 7/17/2023	0.8	7.2	70	83
Tue 7/18/2023	0.8	0.8	NR	NR

Notes:

ug/m^3 = micrograms per cubic meter

ppmv = parts per million by volume

TVOC = total volatile organic compounds

PM_{10} = particulate matter (i.e. dust) 10 microns or less in diameter

NR = Not Recorded (data logging function on dust monitors malfunctioned, resulting in no data being recorded on that date)

The NYSDEC issued Air Quality Health Advisories for Central New York on 7/17 and 7/18 due to regional impacts from wildfires in Canada.

NEW YORK STATE | Department of Environmental Conservation

For Release: Sunday, July 16, 2023

Air Quality Health Advisory Issued for All Regions of New York State

In Effect for Monday, July 17, 2023

New York State Department of Environmental Conservation (DEC) Commissioner Basil Seggos and State Department of Health (DOH) Commissioner Dr. James McDonald issued an Air Quality Health Advisory for the Long Island, New York City Metro, Lower Hudson Valley, Upper Hudson Valley, Adirondacks, Eastern Lake Ontario, Central New York, and Western New York regions for Monday, July 17, 2023.

The pollutants of concern are:

- **Fine Particulate Matter for New York City Metro, Lower Hudson Valley, Upper Hudson Valley, Adirondacks, Eastern Lake Ontario, Central New York, and Western New York**
- **Ozone for Long Island, New York City Metro**

The fine particulate matter advisory will be in effect from **12 a.m. through 11:59 p.m**.

The ozone advisory will be in effect from **11 a.m. until 11 p.m.**

DEC and DOH issue Air Quality Health Advisories when DEC meteorologists predict levels of pollution, either ozone or fine particulate matter are expected to exceed an Air Quality Index (AQI) value of 100. The AQI was created as an easy way to correlate levels of different pollutants to one scale, with a higher AQI value indicating a greater health concern.

Ozone

Summer heat can lead to the formation of ground-level ozone, a major component of photochemical smog. Automobile exhaust and out-of-state emission sources are the primary sources of ground-level ozone and are the most serious air pollution problems in the northeast. This surface pollutant should not be confused with the protective layer of ozone in the upper atmosphere.

Ozone and PM2.5 are two different pollutants that form in different ways: PM2.5 is often produced directly as smoke from wildfires and other sources of small particles emitted into the air.

Ozone is not a direct emission, and is produced indirectly when sunlight chemically reacts with nitrogen oxides (NOx) and volatile organic compounds (VOCs) from automobile exhaust and industrial emissions. High ozone isn't as visible as PM2.5 because it's a colorless gas, but it will produce hazy skies and reduce visibility in high concentrations.

The smoky and hazy sky in an otherwise mostly sunny, stagnant air mass can be very conducive for ozone production. The wildfire smoke can enhance the ozone production, but it's not the primary component.

People, especially young children, those who exercise outdoors, those involved in vigorous outdoor work and those who have respiratory disease (such as asthma) should consider limiting strenuous outdoor physical activity when ozone levels are the highest (generally afternoon to early evening). When outdoor levels of ozone are elevated, going indoors will usually reduce your exposure. Individuals experiencing symptoms such as shortness of breath, chest pain or coughing should consider consulting their doctor.

Ozone levels generally decrease at night and can be minimized during daylight hours by curtailment of automobile travel and the use of public transportation where available.

Fine Particulate Matter

Fine particulate matter consists of tiny solid particles or liquid droplets in the air that are 2.5 microns or less in diameter. PM 2.5 can be made of many different types of particles and often come from processes that involve combustion (e.g. vehicle exhaust, power plants, and fires) and from chemical reactions in the atmosphere.

Exposure can cause short-term health effects such as irritation to the eyes, nose, and throat, coughing, sneezing, runny nose, and shortness of breath. Exposure to elevated levels of fine particulate matter can also worsen medical conditions such as asthma and heart disease. People with heart or breathing problems, and children and the elderly may be particularly sensitive to PM 2.5.

When outdoor levels are elevated, going indoors may reduce exposure. If there are significant indoor sources of PM 2.5 (tobacco, candle or incense smoke, or fumes from cooking) levels inside may not be lower than outside. Some ways to reduce exposure are to minimize outdoor and indoor sources and avoid strenuous activities in areas where fine particle concentrations are high.

New Yorkers also are urged to take the following energy saving and pollution-reducing steps:

- use mass transit instead of driving, as automobile emissions account for about 60 percent of pollution in our cities. People are strongly advised to carpool only with members of their households;
- conserve fuel and reduce exhaust emissions by combining necessary motor vehicle trips;
- turn off all lights and electrical appliances in unoccupied areas;
- use fans to circulate air. If air conditioning is necessary, set thermostats at 78 degrees;
- close the blinds and shades to limit heat build-up and to preserve cooled air;
- limit use of household appliances. If necessary, run the appliances at off-peak (after 7 p.m.) hours. These would include dishwashers, dryers, pool pumps and water heaters;
- set refrigerators and freezers at more efficient temperatures;
- purchase and install energy efficient lighting and appliances with the Energy Star label; and
- reduce or eliminate outdoor burning and attempt to minimize indoor sources of PM 2.5 such as smoking. A toll-free Air Quality Hotline (1-800-535-1345) has been established by DEC to keep New Yorkers informed of the latest Air Quality situation.

Additional information on ozone and PM 2.5 is available on DEC's website and on DOH's website (PM 2.5) / DOH's website (ozone). To stay up-to-date with announcements from DEC, sign up to receive Air Quality Alerts through DEC Delivers: DEC's Premier Email Service.

NEW YORK STATE | Department of Environmental Conservation

For Release: Monday, July 17, 2023

Air Quality Health Advisory Issued for Adirondacks, Central New York, Eastern Lake Ontario, and Upper Hudson Valley Regions of New York State

In Effect for Tuesday, July 18, 2023

New York State Department of Environmental Conservation (DEC) Commissioner Basil Seggos and State Department of Health (DOH) Commissioner Dr. James McDonald issued an Air Quality Health Advisory for the **Adirondacks, Central New York, Eastern Lake Ontario, and Upper Hudson Valley regions for Tuesday, July 18, 2023.**

The pollutants of concern are:

- **Fine Particulate Matter**

The fine particulate matter advisory will be in effect from **12 a.m. through 11:59 p.m.**

DEC and DOH issue Air Quality Health Advisories when DEC meteorologists predict levels of pollution, either ozone or fine particulate matter, are expected to exceed an Air Quality Index (AQI) value of 100. The AQI was created as an easy way to correlate levels of different pollutants to one scale, with a higher AQI value indicating a greater health concern.

FINE PARTICULATE MATTER

Fine particulate matter consists of tiny solid particles or liquid droplets in the air that are 2.5 microns or less in diameter. PM 2.5 can be made of many different types of particles and often come from processes that involve combustion (e.g. vehicle exhaust, power plants, and fires) and from chemical reactions in the atmosphere.

Exposure can cause short-term health effects such as irritation to the eyes, nose, and throat, coughing, sneezing, runny nose, and shortness of breath. Exposure to elevated levels of fine particulate matter can also worsen medical conditions such as asthma and heart disease. People with heart or breathing problems, and children and the elderly may be particularly sensitive to PM 2.5.

When outdoor levels are elevated, going indoors may reduce exposure. If there are significant indoor sources of PM 2.5 (tobacco, candle or incense smoke, or fumes from cooking) levels inside may not be lower than outside. Some ways to reduce exposure are to minimize outdoor and indoor sources and avoid strenuous activities in areas where fine particle concentrations are high.

New Yorkers also are urged to take the following energy saving and pollution-reducing steps:

- use mass transit instead of driving, as automobile emissions account for about 60 percent of pollution in our cities. During the current COVID-19 pandemic, people are strongly advised to carpool only with members of their households;
- conserve fuel and reduce exhaust emissions by combining necessary motor vehicle trips;
- turn off all lights and electrical appliances in unoccupied areas;
- use fans to circulate air. If air conditioning is necessary, set thermostats at 78 degrees;
- close the blinds and shades to limit heat build-up and to preserve cooled air;
- limit use of household appliances. If necessary, run the appliances at off-peak (after 7 p.m.) hours. These would include dishwashers, dryers, pool pumps and water heaters;
- set refrigerators and freezers at more efficient temperatures;
- purchase and install energy efficient lighting and appliances with the Energy Star label; and
- reduce or eliminate outdoor burning and attempt to minimize indoor sources of PM 2.5 such as smoking. A toll-free Air Quality Hotline (1-800-535-1345) has been established by DEC to keep New Yorkers informed of the latest Air Quality situation.

Additional information on ozone and PM 2.5 is available on DEC's website and on DOH's website (PM 2.5) / DOH's website (ozone) (leaves DEC website). To stay up-to-date with announcements from DEC, sign up to receive Air Quality Alerts through DEC Delivers: DEC's Premier Email Service.

The **Tuesday, July 18, Air Quality Health Advisory** regions consists of:

- **Upper Hudson Valley**, which includes Albany, Columbia, Fulton, Greene, Montgomery, Rensselaer, Saratoga, Schenectady, Schoharie, and Washington counties;
- **Adirondacks**, which includes Clinton, Essex, Franklin, Hamilton, northern Herkimer, Lewis, St. Lawrence, and Warren counties;
- **Eastern Lake Ontario**, which includes northern Cayuga, Jefferson, Monroe, Oswego, and Wayne counties; and
- **Central New York**, which includes Allegany, Broome, southern Cayuga, Chemung, Chenango, Cortland, Delaware, southern Herkimer, Livingston, Madison, Onondaga, Oneida, Ontario, Otsego, Tioga, Tompkins, Schuyler, Seneca, Steuben, and Yates.

Memorandum

To: Michael Belveg, Project Manager (NYSDEC)
Johnathan Robinson, Project Manager (NYSDOH)

From: Jeffrey Holden, Project Manager (GEI)

Copy to: Catherine Malagrida, UniFirst Corporation
Wendy Moore, Project Engineer, (GEI)
Christopher Gordon, Air Monitoring Practice Leader (GEI)

Date: September 11, 2023

Regarding: Air Monitoring Summary
Phase 2 Construction
UniFirst Corporation
113 7th North Street, Liverpool, NY (the Site)
August 21 through August 25, 2023

Dear Mr. Belveg and Mr. Robinson:

This report includes a summary of data collected during implementation of the Community Air Monitoring Plan at the Site (Figure 1). Two air monitoring stations (Upwind [UW] and Downwind [DW]) were located on the perimeter of intrusive work areas as shown on Figure 2.

Exceedances

There were no measurements of Total Volatile Organic Compounds (TVOC) that exceeded the Action Limit of 5.0 ppm during this reporting period. There were no measurements of particulate matter of 10 microns or less (PM_{10}) [dust] that exceeded the Action Limit of 150 ug/m^3 during this reporting period.

Note that elevated TVOC readings were recorded on Friday, August 25, 2023 while calibrating the UW station at the start of day. TVOC levels fell to normal levels immediately following standard calibration.

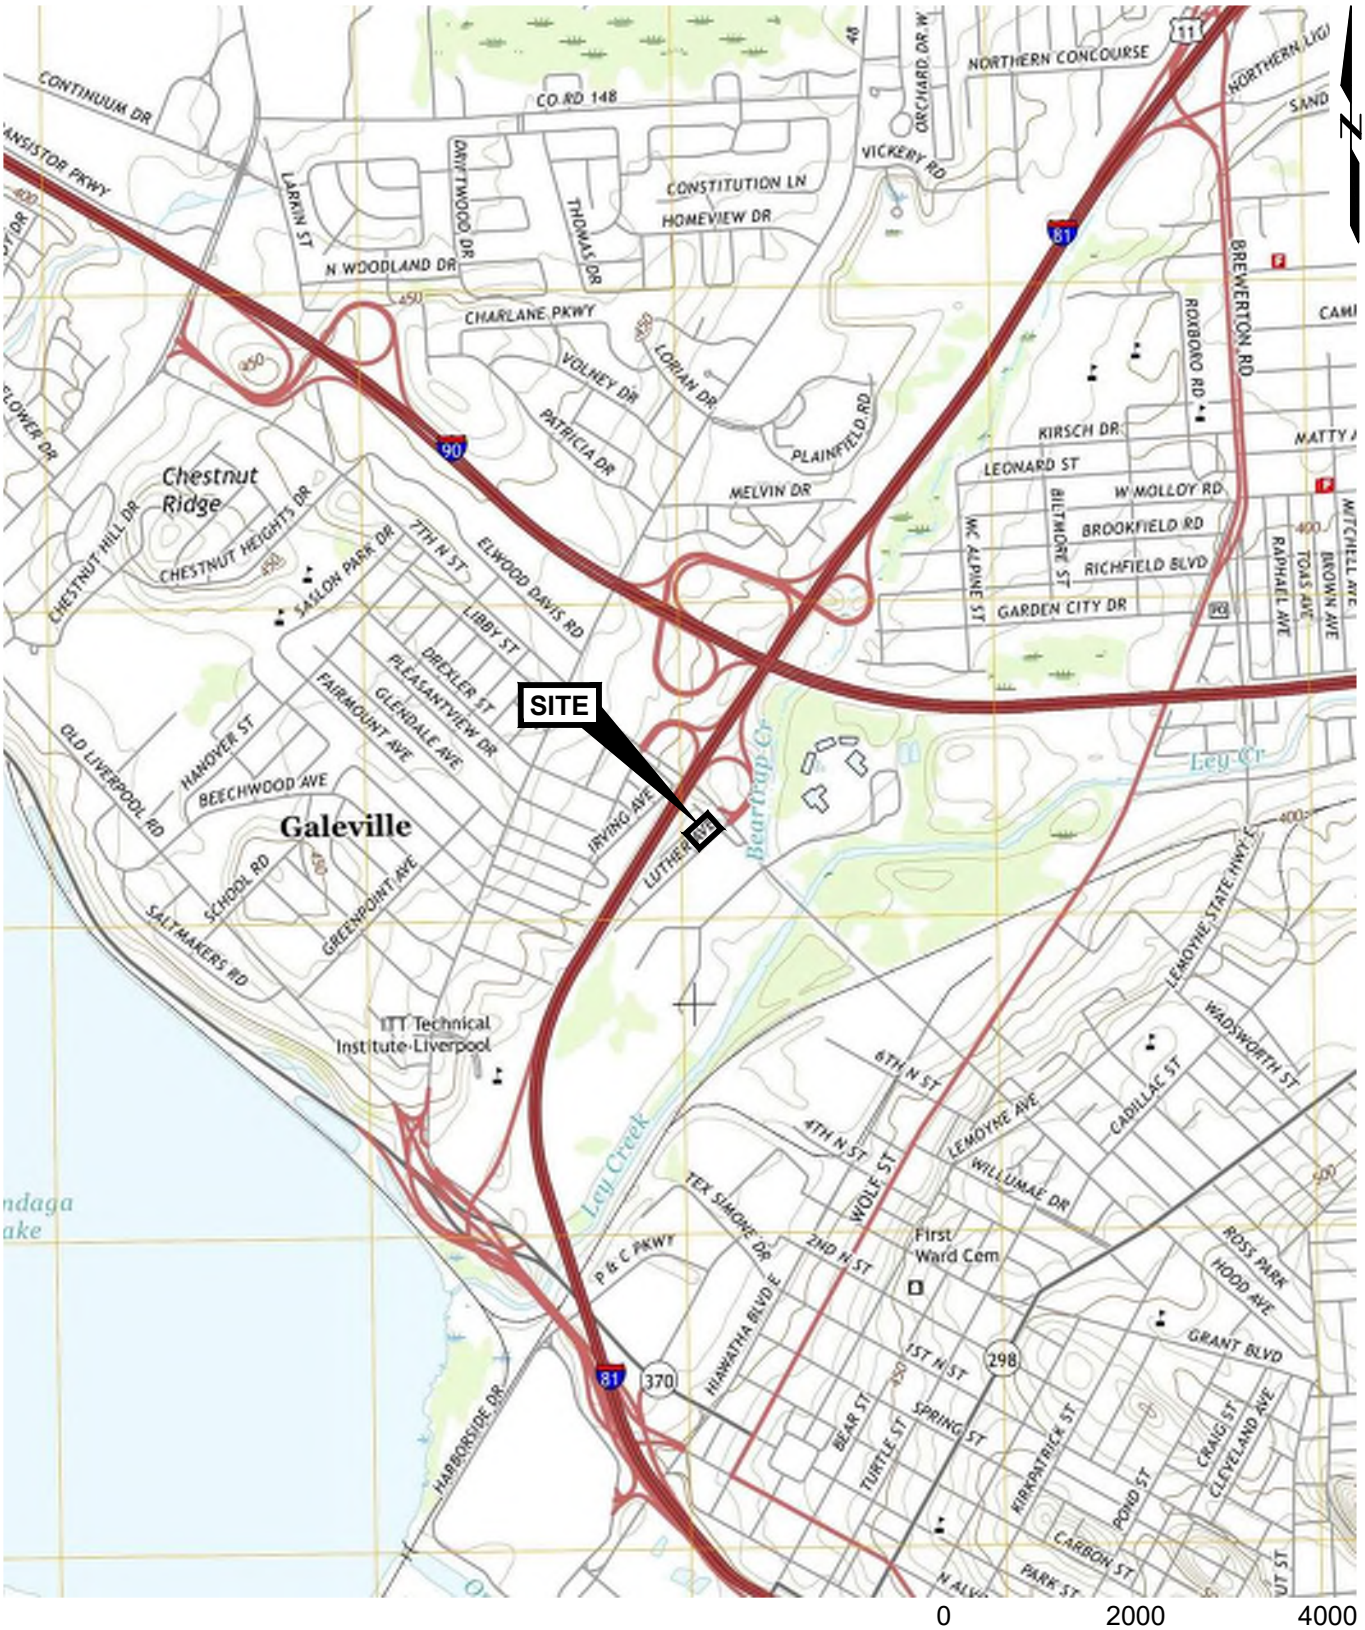
Monitored Site Construction Activities

During this reporting period, monitoring was performed for the following activities:

- Loadout and offsite transportation of a temporarily-staged soil pile originating from the previously-completed underground storage tank (UST) removal on Monday, August 21, 2023; and
- Installation of six (6) monitoring wells and one (1) soil boring from Monday, August 21 through Friday, August 25, 2023.

Figure 2 shows the areas where intrusive activities took place during this reporting period.

Air Monitoring Activities and Summary



Real-time monitoring for TVOC and PM_{10} was performed at two battery-powered, GEI-owned air monitoring stations. Both stations included a RAE Systems® MiniRAE 3000 photoionization detector (PID) to detect TVOCs and a MetOne® ES-642 optical sensing aerosol meter (dust monitor) to measure PM_{10}. Routine maintenance and calibrations were performed on the PIDs in the stations daily during working hours.

Weather conditions were obtained from the local Syracuse Hancock International Airport (SYR) and are presented in Table 2. SYR is located approximately 3 miles northeast of the site.

If you have any questions regarding the information in this report, please contact me at jholden@geiconsultants.com.

Daily CAMP Report

System Operations		General Observations
Sampling Date	8/21/2023	General Weather Conditions
System Start Time	0730	Overcast, high 70's
System Stop Time	1530	
Total Hours Monitored	8	General Description of Site Activities:
		Arrival: 0645 Departure: 1600
System Calibrations	YES	UST impacted material loadout
(Time/Status)	7	MW installations

System Alarm Log

Time	Station No.	Alarm (Dust, VOC)	Location (UW, CW, DW)	Dust/TVOC/Odor 15-min avg conc. Rang	Total # of Alarms	Notes	Site Person/Time Notified

Notes:

	Particulate (15-min)	TVOC (15-min)	Odor (15-min)
Alert Limit:	N/A	3.7 ppm	
Response Limit:	100 ug/m^3	5.0 ppm	
Action Limit:	150 ug/m^3	25 ppm	3 (n-butanol)

Notes:

UW - Upwind
CW - Crosswind
DW - Downwind

P - Particulate/ Dust
Particulate recorded in ug/m^3
V - Total VOC
Total VOC measured in ppm

Field Representative: Josh Prygon
Date: 8/21/2023

- GEI calibrated CAMP PIDs
- AIR-102 had high alarm starting around 5:30 AM. When on site at 6:30, I observed a reading of 7.7 ppm. Observed truck activity in the Pilot station adjacent to the site here, and wind was coming out of the east.

Major Equipment On-Site

1	VOLVO Loader	1	CAT Mini Excavator
1	Skid Steer (Fisher)	1	CAT off Road Dump
1	CAT Dozer	1	Vac Truck (Sun Environmental)
1	JLG Extended boom forklift	1	Kobelco Excavator (Sun Environmental Rental)

Analytical Sampling

- none

Materials Management

- Loadout of stockpiled soils for trucking to Seneca Meadows by TJ Allen. 13 truckloads total today.
- Dewatering of pits along the site boundary in the east (starting with the northern-most pit). Emptying into frac tanks.

Site Work

- Concrete pouring throughout the day – starting with elevator wall form, and poured pile cap forms constructed adjacent to eastern pits. Poured pile caps in central area as well. 4 pile caps poured today.
- Backfilling and compacting around NE footer wall continued. Additionally in this area a ramp was constructed using backfill soil over the wall (for future site access from the north)

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

- Removing forms on pile caps previously poured in central area

Notes and Comments

- GEI calibrated CAMP PIDs

Analytical Sampling

- none

Materials Management

- Loadout of stockpiled soils for trucking to Seneca Meadows by TJ Allen. 11 truckloads total today. The large stockpile is gone with last load; Sun tidies up the area and removes soil from excavator tracks.
- Dewatering of pits along the site boundary in the east (6 most southern, and large pit in SE). Emptying into frac tanks. Additional dewatering of decontamination station.

Site Work

- C&S works on removing the forms from concrete poured yesterday (elevator form, two pile caps in NE pits, and two in central area)
- Sun conducts personal air monitoring throughout the day
- C&S continues constructing pile cap forms for pits along the east

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

- The two most NE pits, after forms are removed, are backfilled with crushed stone up to the level of the concrete pile cap. The elevator wall is backfilled around the outside and compacted
- Concrete arrives on site again, and C&S continues pouring in pile caps in the east pits

Notes and Comments

- GEI calibrated CAMP PIDs

101	1.0	35	
102	0.0	13	
103	0.0	10	

Analytical Sampling

- none

Materials Management

- Sun dewatering in the eastern pits
- Excavated bottom of 6 pits (~1.5 yards material per pit) and stockpiled this impacted soil in new pile in South staging area (on top of and covered by poly). Backfilled stone into these pits prior to adding pile cap form on top

Site Work

- Personal air monitoring conducted throughout the day
- C&S removing forms of pile caps already poured in pits in NE; also dropping pile cap forms into remaining pits (after excavation and backfill)
- Backfilling stone around concrete pile caps in NE (after forms removed)

Notes and Comments

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

- GEI calibrated CAMP PIDs
- In excavated materials from pits, observed what appeared to be a viscous black liquid stuck on soil/stone (determined to be emulsified ZVI from treatment injection). Residual groundwater was still in pit when excavating, but minimal if any free liquid visually observed in the soil stockpile

Analytical Sampling

- none

Materials Management

- Sun dewatering around pile cap forms of deep pits in southern building area
- Sun continues emptying frac tank #2 by Luther Ave. Planned to begin frac tank #3 (between office trailer and south building area) but truck had mechanical issues

Site Work

- C&S removes forms on the five pile caps in the deep pits of south building area
- To remove one form (the pile cap most west in the southern building area), Fisher had to excavate sloughed material. The soil was kept within the pit.
- Masons continue construction of the elevator shaft
- Sun conducts personal air monitoring
- Fisher backfills around the five pile caps with clean stone
- Fisher begins excavating the shallower soil left in place between the pits (the wall of adjacent deep pits) to create the trench for the wall. They begin with the soil

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

between the last shallow pit and first deep pit in the SE and end with that today
- Excavated material is added to the large stockpile from the deep pit excavations and covered

Analytical Sampling

- none

Materials Management

- Sump pumps still in place dewatering in the trench spanning the south building wall and east building wall area
- Six trucks loaded today from the major stockpile in the staging area for transportation and disposal of soil (to Seneca Meadows)
- Stockpiling of material excavated by W&A (added to the major stockpile, approximately 10 cubic yards of soil)

Site Work

- C&S continue prepping and constructing forms for wall in south building area – finish the deep (8') forms and work their way back north along the east section to the shallow (4') section
- Forms covered with tarp at end of day in case of rain, and sump pumps left in

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

corners by the forms to pump into frac tank overnight
- Sun conducted personal air monitoring throughout the day
- W&A on site – dig trench (~2' depth and width) around the elevator shaft in the north of the site for plumbing; add pipe and backfill along the excavation as they go

Notes and Comments

- GEI calibrated CAMP PIDs
- CAMP PIDs 101, 102, and 103 were not communicating with the data server until 08:40, 09:00, and 09:00, respectively (continued issue of solar battery life due to recent weather); in this time, manual measurements of VOC were taken and did not exceed action levels

CAMP

Station	TVOC Daily Max (PPM)	PM-10 Daily Max (ug/m^3)	Comments
101	0.22	32.1	
102	0.14	31.7	
103	0.07	31.4	

TVOC exceedance of 5 ppm above background will initiate a work stoppage and requires notification be sent to NYS DOH and DEC.

Downwind PM-10 exceedance of 100 ug/m^3 above background will initiate dust control measures and downwind PM-10 concentration exceedance of 150 ug/m^3 above background will initiate work stoppage.

Analytical Sampling

- None

Materials Management

- Footer excavations dewatered by Sun Environmental

Site Work

- Dewater excavations
- Strip forms from East footer wall
- Install forms for South footer wall
- Excavate SW corner of new building footer foundation

THIS REPORT IS INTENDED ONLY FOR THE USE OF GEI CONSULTANTS INC FOR INFORMATIONAL PURPOSES AND MAY CONTAIN INFORMATION THAT IS PRIVILEGED, CONFIDENTIAL, AND EXEMPT FROM DISCLOSURE UNDER APPLICABLE LAW.

FIELD OBSERVATION REPORT

Project: UniFirst-Liverpool
Engineer: GEI Consultants
Contractor: C&S
Client: UniFirst

Date: 11/22/2022
Project Number: 2001642

Notes and Comments

- GEI Calibrated CAMP PIDs
- Water in south wall foundation area was pumped into empty frac tank that was scheduled to be cleaned and removed. Two 2-inch pumps were used to keep up with the water. C&S believes they broke a water line causing the excess water.

- Gas Barrier work paused mid-morning during heavier rain. Rain and cold temperatures may be affecting short-term adhesion, installer confirmed they are heating the liquid product and will use leaf blower to remove standing water from seams before applying the final seals. Areas with bridging of membrane over voids near foundation walls/footings corrected and re-sealed.
- Will allow the area to cure overnight and apply final seals around pipe penetrations on Wednesday11/7/22; area will be checked for proper adhesion and smoke tested before installation accepted as complete.

Station	TVOC Daily Max (PPM)	PM-10 Daily Max (ug/m^3)	Comments
101	0.0	106	
102	28.12	84.3	Unit was manually powered up on low battery at 1300, when this reading was recorded. Appears to be erroneous/resulting from power-up on low battery. No auto-email notification was sent, and the 15-min average fell to 3.39 before it powered down again due to low battery at 1345. Loader working with clean fill near the unit all day. Temp 50*, dew pt 48*
103	0.11	70.5	Early AM readings, before work began. Unit powered down due to low battery before work began and remained down all day.

TVOC exceedance of 5 ppm above background will initiate a work stoppage and requires notification be sent to NYS DOH and DEC.

Downwind PM-10 exceedance of 100 g/m^3 above background will initiate dust control measures and downwind PM-10 concentration exceedance of 150 ug/m^3 above background will initiate work stoppage.

Analytical Sampling

- None

Materials Management

- Receipt of additional imported material deliveries

FIELD OBSERVATION REPORT

Project: UniFirst-Liverpool
Engineer: GEI Consultants
Contractor: C&S
Client: UniFirst

Date: 12/7/2022
Project Number: 2001642

Site Work

- Backfilling southeast corner of foundation (Phase 2 foundation backfill complete mid-day)
- Receipt of imported fill deliveries for use in Phase 2 foundation backfill
- Gas Barrier inspection in northern portion of site (“office area”)

Notes and Comments

- GEI calibrated CAMP PIDs for the morning work, then shut the monitors down upon completion of foundation backfill at mid-day
- Gas Barrier seals tested by inspector at 0700; adhesion has not improved Discussions with C&S, gas barrier installer (Budget Concrete) and manufacturer (Land Science) resulted in plan to postpone until Thursday 12/8 to smoke test and reseal as needed (precipitation expected to end by Thursday morning)
- Budget Concrete prepared a “test sample” of the gas barrier seal, which was taken into the construction trailer to cure

Major Equipment On-Site

1	CAT Loader	1	CAT Mini Excavator
2	Skid Steer	1	CAT off Road Dump
1	CAT Dozer	1	Vac Truck (Sun Environmental)
1	JLG Extended boom forklift	1	Cat Extended boom forklift

GEI Representatives

- Larry Welch, Sub-Slab Gas Barrier Inspector

Site Visitors

Site Work

- Gas Barrier installation in northern portion of site (“office area”)

Notes and Comments

- [0730] Kick-off meeting with lead installer from Budget Concrete to review Land Science recommendations for improving results Gas Barrier work postponed early morning until rain ends; NitraCore product being heated with power supplied by C&S; test sample from 12/08/22 showed better adhesion but improvement needed, inner seal NitraCore appears less than 60mil required – installer does not have a thickness gauge for QC.
- [1200] Clean/prep one previous seam for NitraCore re-spray, stop to fix nozzle, catalyst spray is not maintaining proper direction.
- [1300] Work resumes on first seam, after sample collected from this seam GEI requested thicker application of inner seam NitraCore, 2nd sample collected – thickness looks acceptable.
- [1400] Progress on second seam suspended due to heavy rain.
- [1430] Crew is cleaning seams to repair and blowing water off membrane. NitraCore spray application postponed until Friday, 12/09/22.
- [13 30] Leaving site, installers placing C&S insulation blankets over seams to help prevent water freezing overnight. Reportedly a second crew is traveling tonight to assist with installation Friday, 12/09/22.

GEI Representatives

- Wendy Moore, CAMP and soil loadout observation/manifesting

Site Visitors

Site Work

- Load out of remaining soil pile for Seneca Meadows (2 total loads)

Notes and Comments

- The 3 CAMP stations were powered on and used during load-out
- Sun attempted to break up several large pieces of concrete from building demolition (greater than Seneca Meadows' requirement of 2-ft-minus). Successful in sizing all but two large chunks, which were set aside for C&S to size before the next round of excavations.
- One truck made two trips to load out all of the waste material approved for disposal Seneca Meadows (with exception of two large concrete pieces, see above).
- Once load out was completed, the CAMP stations were turned off and the PIDs were removed and transported to the GEI Ithaca Office (one of the 4 PIDs on the Liverpool site was a monthly rental from Pine, and was returned to Pine in Syracuse)
- One small stockpile remains on site, consisting of material considered to be listed hazardous waste. This is underlain by poly and covered by poly held down with pallets. Low side (adjacent to Pilot Station) is surrounded by silt fencing.

GEI Representatives

- Frank Clougherty, G.I.T. and Jordan DesRosier, CAMP and stormwater tank excavation, and vapor intrusion barrier installation.

Site Visitors

Christopher Medvetz	Land Science	Technical Manager			

Site Work

- A total of two (2) CAMP stations were powered on and used during stormwater tank excavation. One (1) in the upwind direction, and one (1) in the downwind direction.
- Fisher Companies (Fisher) excavated a pit with the approximate dimensions of 12-feet deep by 15-feet wide. The excavation was benched, and a trench box was placed inside before stormwater tank installation (see Photograph 1). Approximately 1-foot of clean stone was placed in the bottom of the excavation. The spoils from the excavation were stockpiled on-site and covered with poly.
- Fisher installed the stormwater tank. The annulus of the excavation was backfilled with clean stone (see Photograph 2).
- Budget Concrete (Budget) commenced vapor intrusion barrier deployment. Land Science Mono-base vapor barrier product was deployed. The vapor barrier seams were overlapped a minimum of 6-inches, and Nitra-core was applied in general accordance with the manufacturers detail recommendations (see Photograph 3). Approximately 7,000 square feet (SF) was deployed on this date.
- Budget performed detail work on the vapor barrier, patches were used to cover defects and seal penetrations through the barrier system (see Photograph 4). The penetrations were repaired in general accordance with the manufacturer's penetration sequence detail. The on-site Land Science technical representative (C. Medvetz) agreed with the installer's work completed.

Notes and Comments

- Budget arrived on-site at approximately 11:00 AM with a total of five (5) people.
- Budget completed on-site safety video upon arrival.
- Approximately 7,000 SF out of 9,000 SF was completed on this date.
- Approximate extent of vapor barrier installation, stormwater tank excavation limit/ spoils stockpile location, and CAMP monitoring locations are shown on attached figure.

Site Visitors

Site Work

- A total of two (2) CAMP stations were powered on and used during stormwater tank excavation. One (1) in the upwind direction, and one (1) in the downwind direction.
- Fisher Companies (Fisher) continued installing the stormwater tank. The annulus of the excavation was backfilled with clean stone.
- Budget Concrete (Budget) continued vapor intrusion barrier panel deployment. Land Science Mono-base vapor barrier product was deployed. The vapor barrier seams were overlapped a minimum of 6-inches, and Nitra-core was applied in general accordance with the manufacturers detail recommendations (see Photograph 1). Approximately 2,000 square feet (SF) was deployed on this date.
- Budget continued performing detail work on the vapor barrier panels, patches were used to cover defects and seal penetrations through the barrier system (see Photograph 2). The penetrations were repaired in general accordance with the manufacturer's penetration sequence.
- Budget performed smoke testing on the vapor barrier system. A total of seven (7) locations were selected to test the system (see Photograph 3). The locations were spatially distributed so that testing covered the entire footprint of the vapor barrier system. Defects detected during the smoke test were repaired in general accordance with the manufacturer's recommendations. Repair patches were placed and repaired over the punctures made for the fog machine injection prior to testing and sealed with Nitra-core.
- Budget deployed cushion geotextile over the vapor barrier geomembrane (see Photograph 4). The geotextile was overlapped a minimum of 6-inches and covered the entire vapor barrier footprint.

Notes and Comments

- Approximately 2,000 SF of vapor barrier was installed on this date.
- Upwind CAMP monitoring exceedance recorded at 7:30 AM during failed calibration process. No actual exceedance event occurred on this date.
- Approximate extent of vapor barrier installation, stormwater tank excavation limit/ spoils stockpile location, and CAMP monitoring locations are shown on attached

Time of Arrival: 0630 **Time of Departure: 1600**
Weather: Low: mid 40s °F **High**: mid 50s °F, overcast, slight breeze

GEI Representatives

- Wendy Moore

Site Visitors

- Wayne Nielson, Parratt Wolff

Site Work

- Excavation of swale along eastern wall of Phase 2 building.
- Dump truck used to transport excavated soil across the site to stockpile at the south end for loadout to Seneca Meadows the following week.

Notes and Comments

- PID was used to screen stockpile each time a truck offloaded a load of soil: PID 0.0 ppm throughout.
- Parratt Wolff visited the site at 1000 to discuss installation of MW3S/I and MW4S/I within the finished swale. C&S Superintendent (Dave Taillie) met with GEI and Parratt Wolff to discuss the details and timing of the work.

Site Visitors

- None

Site Work

- Excavation and shaping of swale along eastern wall of Phase 2 building.
- Dump truck and loader were used to transport excavated soil across the site to stockpile at the south end for loadout to Seneca Meadows on Thursday 5/11.
- Collection of soil samples from test pits (dug by C&S's subcontractor) for waste characterization/contained-in approval.

Notes and Comments

- PID was used to screen stockpile each time a truck offloaded a load of soil: PID ranged from 0.0 to 32.3 ppm, with the higher readings coming from soils excavated from the known "source zone."
- Samples were collected and taken to Alpha's Syracuse Service Center. A photograph of each sample are available in the project file.

GEI Representatives

- Wendy Moore

Site Visitors

- Michael Belveg, NYSDEC Project Manager
- Johnathan Robinson, NYSDOH Project Manager

Site Work

- Excavation and shaping of swale along eastern wall of Phase 2 building.
- Dump truck and loader were used to transport excavated soil across the site to stockpile at the south end for loadout to Seneca Meadows on Thursday 5/11.
- Load out of two trucks for transportation to Seneca Meadows

Notes and Comments

- PID was used to screen stockpile throughout day: PID ranged from 0.0 to 0.5 ppm.
- Four loads scheduled for transportation to Seneca Meadows (two trucks making two trips); however, 2nd truck's license plate was not recorded on Part 364 permit, so it was turned away and only two loads were removed by the one remaining truck.
- NYSDEC and NYSDOH arrived at approximately 1500. GEI took them on a tour of the site, including NYSDOH inspection of the CAMP stations, observation of day's excavation/swale shaping work and the soil stockpile, as well as observation/discussion of the downgradient area and potential alternate Remedial Investigation downgradient investigation locations (on non-Sposato-owned lands). NYSDOH also discussed dust control measures with the C&S (fill-in) Superintendent.
- GEI discussed both dust control and erosion control measures with C&S (fill-in) Superintendent (Joe C.), including the need to repair the silt fence that borders the southern property lines and encompasses the soil stockpile, and the fact that their SWPPP is not in the site SWPPP mailbox as it should be.

GEI Representatives

- Frank Clougherty, G.I.T., vapor intrusion barrier installation.

Site Visitors

Site Work

- Budget Concrete (Budget) completed vapor intrusion barrier installation. Cushion geotextile was deployed vault footprint. Land Science Mono-base vapor barrier product was utilized to patch area of former wastewater pit. The vapor barrier tie-in seams were overlapped a minimum of 6-inches, and Nitra-core was applied in general accordance with the manufacturers detail recommendations (see Photograph 1).
- Budget performed detail work on the vapor barrier, patches were used to cover defects of the existing barrier system (see Photograph 2). The repairs were performed in general accordance with the manufacturer's recommendations.
- Budget performed smoke testing on the vapor barrier system. A total of three (3) locations were selected to test the system (see Photograph 3). The locations were spatially distributed so that testing covered the entire footprint of the vapor barrier system installed on this date. Defects detected during the smoke test were repaired in general accordance with the manufacturer's recommendations. Repair patches were placed and repaired over the punctures made for the smoke testing and sealed with Nitra-core.
- Budget deployed cushion geotextile over the vapor barrier geomembrane (see Photograph 4). The geotextile was overlapped a minimum of 6-inches and covered the entire vapor barrier footprint.

Notes and Comments

- Approximate extent of vapor barrier installation is shown on attached figure.

Meeting Minutes:

1. **General**
   - Cat Malagrida introduced as a project manager now with UniFirst, working with Tim Cosgrave
   - C&S indicates that Hayden Haas will be the full time onsite H&S officer for C&S; Dave Taillie will remain site superintendent, and Tom Rotella will remain project manager. Nevin Bradford will continue to be involved to assist C&S team with environmental remediation aspects of work
   - C&S indicates that it will be self-performing the concrete work, may slow the construction schedule
2. **Construction Schedule**
   - C&S indicated that remobilization would begin on Monday, October 3, 2022
     - First day or two of C&S operations will consist of general mobilization and dewatering of rainwater from open excavations, including the elevator pit and foundation trenches (with assistance from Sun)
     - Two empty tanks are on site; has capacity for a third if needed
   - GEI will remobilize CAMP equipment on Monday, October 3, 2022 as well

- Excavations likely will not commence again for another 4 weeks
- Schedule/scope beyond that which is described above was not discussed, but 2-week look-ahead schedules will be provided by C&S to this team on a weekly basis

3. <u>Roles & Responsibilities / Action Items</u>

GEI

- Notify NYSDEC that work is recommencing on Monday, October 3, 2022 (completed on 9/27/22)
- Provide a full-time on-site observer during ground-intrusive activities to document the activities for the agencies
- Remobilize monitors and continue to run CAMP during ground-intrusive activities and submit associated reporting to the agencies weekly
- Coordinate with NYSDEC, Sun and UniFirst regarding acceptance of excavated material, transportation, and disposal

C&S

- Provide GEI with the volumes of soil that still must be excavated from within the limits that can be sent to Camillus, and within the limits that can be sent to Seneca Meadows
- Provide Site Safety Training to their workers and subcontractors on Monday, October 3, 2022 and on an as-needed basis as new employees come onsite
- Give daily safety briefings to on-site workers each morning
- Provide 2-week look-ahead schedules on a weekly basis

Sun

- Provide quotes to C&S for excavators and for personal air monitoring
- Provide quotes to UniFirst for transportation and disposal of dewatering effluent
- Provide UniFirst and GEI with copy of Site-Specific HASP
- Remove rainwater from existing trenches starting on Monday, October 3, 2022; continually dewater trenches throughout duration of below-grade construction
- Arrange for analytical testing, transportation, and treatment/disposal of dewatering effluent for UniFirst
- Responsible for equipment & truck decon, including providing a decontamination pad
- Provide C&S with personnel air monitoring for C&S employees using PID and 4-gas meter
- Provide C&S (or Fisher?) with 40-hour trained workers for excavation activities

4. <u>Health and Safety</u>

- Sun will perform personnel air monitoring for themselves and C&S employees using PID and 4-gas meter
- GEI will perform personnel air monitoring for themselves
- C&S to provide Site Safety Training to their workers and subcontractors on Monday, October 3, 2022 and on an as-needed basis as new employees come onsite
- C&S to give daily safety briefings to on-site workers each morning

- C&S has prepared a Site-Specific HASP and has shared it with UniFirst; Sun will prepare a Site-Specific HASP and share with UniFirst
- GEI's Site-Specific HASP was previously provided to UniFirst and C&S

5. Future Meetings

- Weekly coordination meetings will be scheduled for 10am on Wednesdays, hybrid format via Microsoft Teams and in-person meeting, construction trailer conference room.
- Meetings will continue weekly until construction is above-grade, or until group agrees that frequency should change or meeting can be discontinued.

6. Next Meeting

- October 5, 2022 at 10am.

\\geiconsultants.com\data\Data_Storage\Working\UNIFIRST\2001642 Unifirst-Liverpool NY\08_MEETINGS\Construction Meetings\9-28-22\9-28-22.docx

Construction Coordination Call Notes
UniFirst Liverpool Phase 2 Construction
GEI Project: 2001642

Date of Meeting: October 5, 2022
Location: Hybrid – Microsoft Teams and Construction Trailer
Attendees:

Tim Dixon	GEI	TDixon@geiconsultants.com	585.808.0472	

Meeting Minutes:

1. **General**
   - Jeff Holden is GEI's Project Manager and will lead the construction coordination meetings going forward
   - No comments on last week's meeting minutes; therefore, minutes previously routed to team are approved as final
   - Ileen Gladstone routed a proposed agenda before the call; that agenda will generally serve as a basis for discussion on the coordination calls
2. **Coordination with UniFirst**
   - None this week
3. **Construction Schedule**
   - C&S will provide written 3-week look ahead schedules to this team on a weekly basis starting later this week
   - C&S began remobilizing on Monday, October 3, 2022
     - General mobilization of equipment and personnel; personnel training; survey; dewatering of standing rainwater and groundwater from open excavations near the elevator pit and northern foundation trenches (with assistance from Sun); and cleaning up pits (i.e., excavating and replacing silted-in stone with assistance from

Sun). Soil/stone removed to re-prepare the pits was placed with the existing soils stockpiled for disposal.

- Remainder of week and into next week include form work along northern ("front") section of building and the elevator pit; no additional excavations are planned this week or next.
- 3-week look ahead includes continuing the above process of dewatering (daily), cleaning out pits in which formwork will be performed, and concrete forming and pouring.

- GEI's full-time on-site observer mobilized on Monday, October 3, 2022, and will be onsite for the duration of intrusive activities. CAMP was brought online on Monday, as well. Weekly CAMP reports to DEC/DOH will resume next week.
- Sun will be onsite daily to dewater and provide personnel air monitoring using PID and 4-gas meter, and Sun personnel will be onsite as needed to clean up pits for C&S (i.e., excavate and replace stone) over the next several weeks
    - Two frac tanks are on site. One is ~3/4 full and will be sampled on Wednesday 10/5/22. This tank will remain on site until results are available and the tank can be profiled and transported off site. 2nd tank will be used in the meantime for dewatering effluent collected after Wednesday

4. RFIs

- C&S reiterated the need for soil pile to be transported offsite as soon as possible, and to be provided progress updates. GEI indicated that NYSDEC needs to provide a Contained-In Determination before the soil can be disposed. The request has been made to NYSDEC and GEI will follow up. Mara requested Sun's involvement in any discussions with NYSDEC regarding the contained-in determination to the extent that Sun would be handling transport and disposal of this material.
- UniFirst/GEI requested volume estimate for the material that is being excavated from existing pits to clean up in preparation for formwork. C&S estimated 10 cubic yards was excavated to clean up pile cap excavations; materials was added to existing stockpile. C&S also indicated a conservative estimate of 2500 to 3000 additional cubic yards of soil would be removed under the project and require offsite disposal. Tom will prepare a map showing the expected excavation areas that will contribute to that volume.

5. Construction/Technical Issues

- C&S has submitted gradation information for four types of fill material expected to be used on site. GEI responded to indicate that chemical characterization would not be needed for three of those based on the grain size information. The fourth (stone dust) would require chemical characterization and DEC approval. However, C&S no longer anticipates using stone dust, and is working with their plumbing subcontractor to identify what type of bedding material may be used in pipe trenches with the goal of avoiding materials that would require chemical testing.
- C&S has identified a topsoil source and is currently working with the supplier to secure the needed volume. Topsoil will not be needed for several months, but will require chemical testing and DEC approval prior to use at the site.

6. Health and Safety

- C&S has made PPE available to workers, and is working to bring a Connex box onsite for use as the CRZ

- A truck decontamination pad will be constructed by Sun prior to the phase of construction where equipment will be leaving the site (currently, all site equipment remains within the work limits)
- C&S provided live Site Safety Training to their workers on Monday, October 3, 2022 and will continue giving the in-person training on an as-needed basis as new employees come on site
- C&S gives daily safety briefings to on-site workers in the job trailer each morning before work begins
- Sun will perform personnel air monitoring for themselves and C&S employees using PID and 4-gas meter (PID will be added this week) in excavations.

7. Action Items

GEI

- Continue to work with DEC in an effort to accelerate approvals needed to arrange for offsite transport and disposal of the existing stockpile, as well as additional soils to be excavated for the work

C&S

- Provide GEI with a figure showing expected future excavation areas that will contribute to the estimated 2500-3000 cubic yards of additional soil to be excavated for construction purposes
- Provide GEI and UniFirst with data for any backfill being brought onsite including pipe bedding material (if different from what has already been provided) and topsoil [no immediate need for topsoil]
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis)

Sun

- Provide UniFirst and GEI with copy of Site-Specific HASP
- Sample frac tanks as they become full
- Build decontamination pad
- Add a PID for personnel air monitoring

8. Next Meeting

- October 12, 2022 at 10am.

Meeting Minutes:

1. **General**
   - Tom Rotella provided a comment on last week's meeting minutes; a revised summary of the 10/5 call is distributed with this summary.
   - Jeff Holden indicated that DEC responded to latest "contained-in" determination request stating intent to provide a determination by October 14. DEC's contained-in determination is needed before the next step can be made in transporting the current stockpile off site.
   - Jeff Holden noted that he contacted the environmental consultants for the adjacent property owner (Sposato) to inquire about the status of the access request. The consultant indicated he was still awaiting direction from his client. Tim Cosgrave asked Shawn Musachio to reach out to Mr. Sposato at the site to advance the issue.
2. **Coordination with UniFirst**
   - No topics this week
3. **Construction Schedule**
   - C&S provided a 3-week look ahead schedule on 10/11 and reviewed it on the call. Key points as follows:
     - First concrete pour scheduled for 10/13/2022

- Concrete pours will continue for next several weeks, with the goal of two pours per week, starting along the "front wall" (north side) and continuing down the center pile caps toward the south
- After pours are completed, pits will be backfilled to reduce the amount of dewatering
- C&S expects to start excavating to clean out the east foundation wall trench on 10/21, and additional clean-out excavations on 10/28
- C&S expects that the "deep" foundation excavations along the south end will occur during the week of 10/31
- Elevator pit pour planned for 10/13 pushed to 10/18 due to expected rain
- Water being pumped from excavations as needed; generally less than a few hundred gallons per day total; pumping expected to take place every day this week
- No Saturday work is currently planned

- Likely several months away from being able to install planned new monitoring wells because the "alley" along the east side of the property will be key accessway for equipment operations during building construction

- Now that operations are underway, C&S will prepare an updated master schedule for next week

4. RFIs

- No RFI's submitted. C&S indicted a need to test soils from planned "deep" excavation area at the south end as an upcoming data need (further discussed below)

5. Construction/Technical Issues

- C&S provided a figure showing planned future "deep" excavation area (attached). Target excavation depth will be approximately 10 feet below grade, and the excavation will be benched. Assuming 10-foot excavation throughout the area, GEI estimated a maximum in-situ volume of approximately 1440 CY. C&S indicated this is the only planned future excavation area and is the basis for the estimate of a total of 2500-3000 additional cubic yards of excavation mentioned last week. That estimate was intentionally conservative and accounted for ex-situ fluffing.

- C&S indicated none of the excavated soil will be suitable for use as backfill at the site due to geotechnical specifications. Offsite disposal will be required, but the planned excavation extends into areas where minimal existing soil characterization data exist. The approach and schedule for sampling was discussed among the team. It was agreed to plan for sampling on 10/17 using excavator. Details about number of samples, lab to be used, and who would do the sampling were tabled to be determined outside of the construction call. Depending on the results of the additional sampling, further "contained-in" determinations may be needed from the DEC before the additional material can be disposed off site.

- GEI asked what materials/equipment may be present on site in the event we need to take contingency measures as a result of CAMP exceedances that are attributable to site operations. Discussed that prior CAMP alert/action level exceedances were generally attributed to non-site factors, such as offsite trucks and moisture effect on PIDs. Some also attributable to site equipment. Water spray is available on site and could help address dust or low-level VOC issues as needed. Work zone monitoring has indicated no elevated levels, so need for additional onsite control measures is minimal. C&S agreed to look into local availability of foam-based suppression measures that could be mobilized to the site as a contingency measure if a site-related exceedance occurs.

- C&S confirmed they spoke with plumbing subcontractor and confirmed Type 1A stone would be used for pipe bedding. Therefore, no imported granular material subject to chemical testing

would be needed apart from future topsoil needs. C&S indicated that Fisher is acquiring and will characterize topsoil.

- Sun sampled one frac tank last week and expects lab data on 10/13-14. Minimal volume (~4000 gal) is currently stored in the second frac tank, so capacity is available.
- Sun has disposed two loads of water so far. Sun will resend the manifests and certificates of destruction for those loads to GEI (Wendy) and UniFirst (Cat and Rick).
- Sun inquired about status of decon pad construction information provided to UniFirst via email. UniFirst review is pending.
- The approach for decommissioning the existing wastewater pit was discussed. C&S indicated a need to remove a portion of the top of the concrete structure to access the interior and to install the vapor barrier over the top. The concrete will need to be characterized for offsite disposal if it cannot be left onsite (i.e., in the vault space). C&S did not think the concrete could be placed inside the vault because the vault needed to be filled (concrete or stone) before the top was removed. C&S agreed to further review conditions and propose an approach for access/sampling the vault.
- C&S inquired whether the vapor mitigation design plans included blower specifications, or just passive components. GEI to confirm.

6. Health and Safety

- Sun is performing personnel air monitoring for themselves and C&S employees using PID and 4-gas meter in excavations. No issues to date
- Sun submitted a copy of their HASP, which GEI will review
- GEI notified DEC/DOH of one CAMP exceedance last week that was attributed to nearby equipment operations
- No health and safety incidents

7. Action Items

GEI

- Continue to work with DEC in an effort to accelerate approvals needed to arrange for offsite transport and disposal of the existing stockpile, as well as additional soils to be excavated for the work
- Provide weekly CAMP reports to DEC/DOH and copy UniFirst and C&S H&S officer (Hayden Haas)
- Provide updated summary of 10/5/22 call reflecting C&S comment
- Develop a plan for additional soil characterization in the planned excavation area; assume excavator will be on site 10/17 to assist with sampling. Coordinate laboratory analysis on rapid TAT
- Confirm blower specifications for vapor mitigation systems
- Provide any comments on Sun HASP

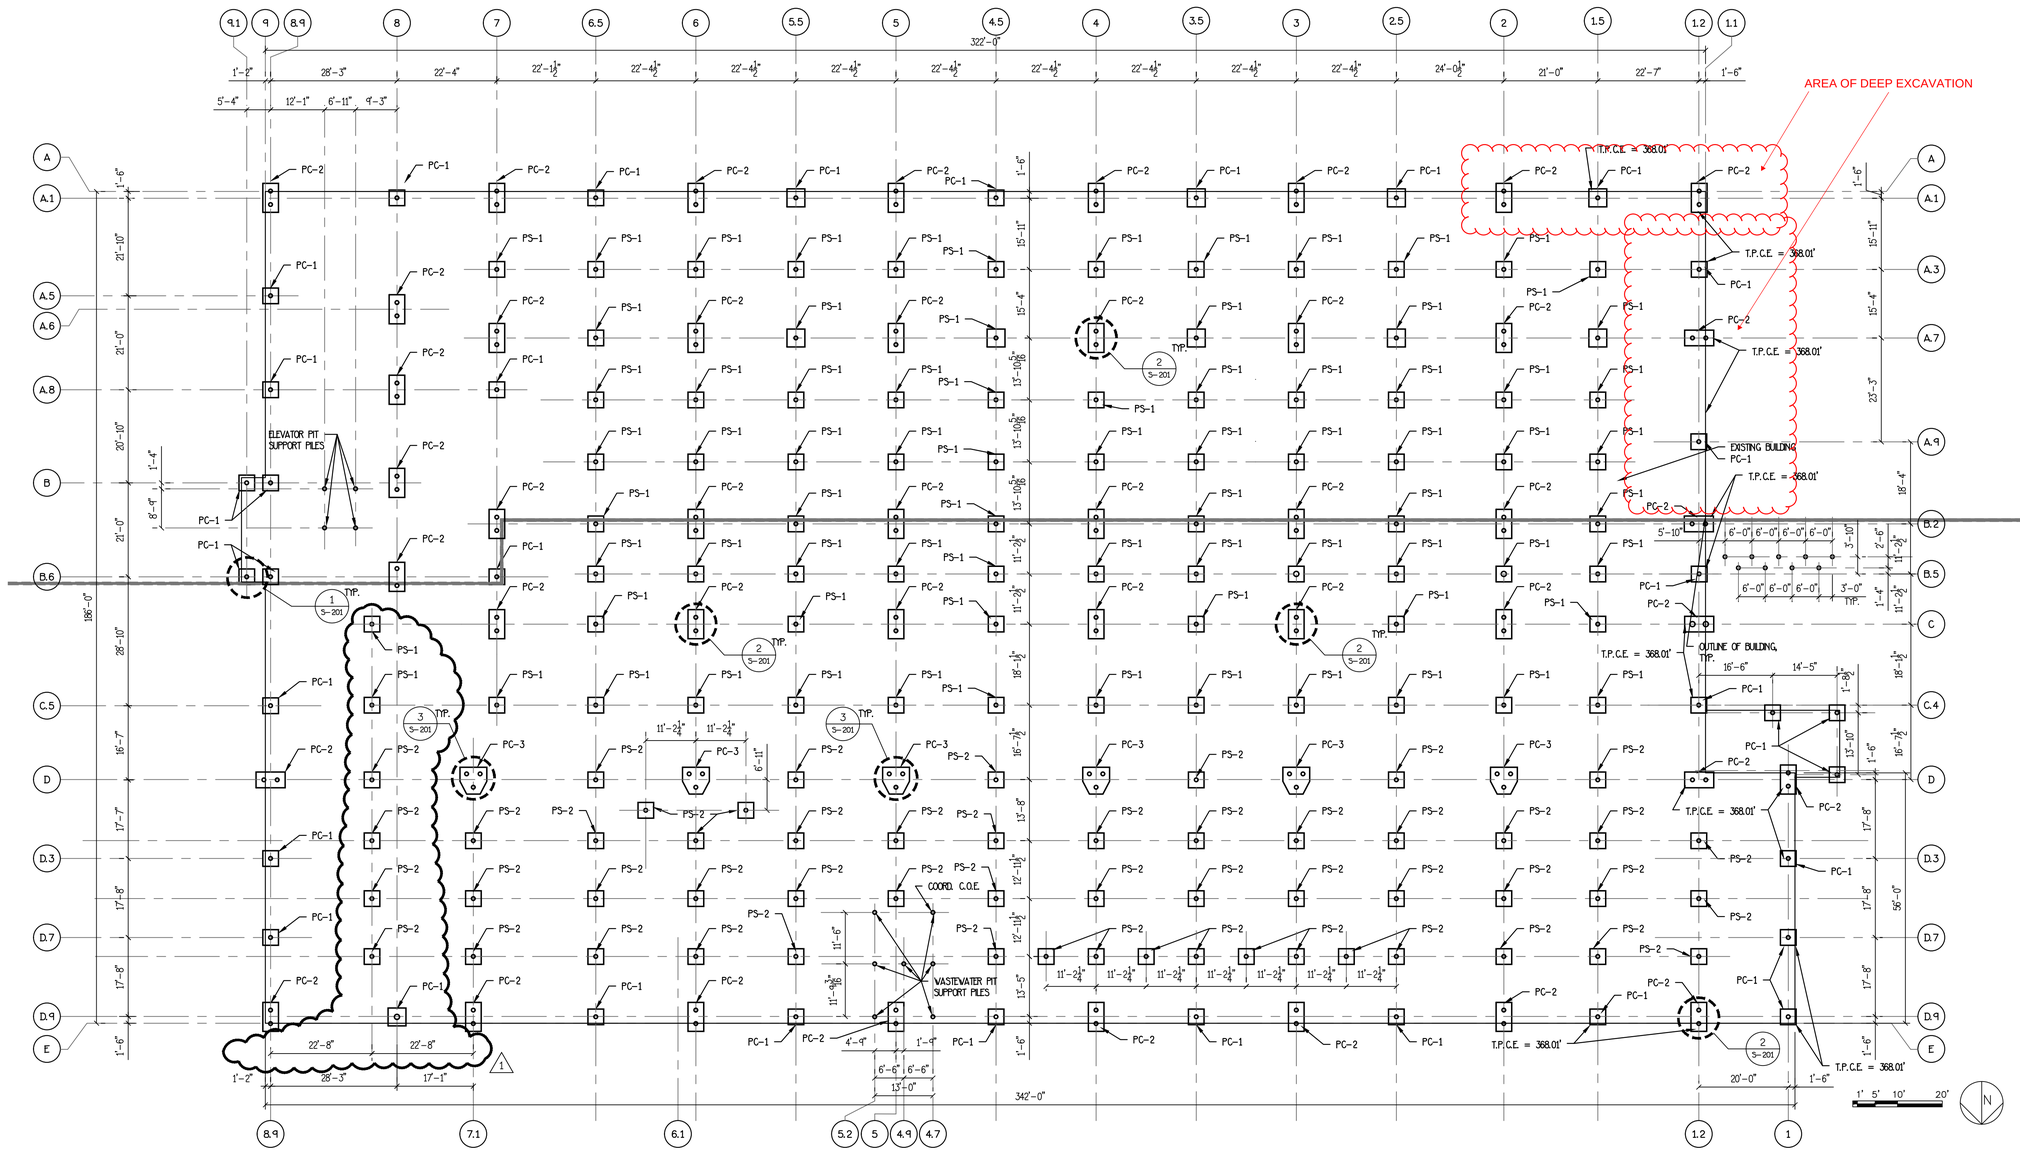
C&S

- Look into availability and response time of providing foam-based dust/odor/VOC suppression if needed based on CAMP monitoring results
- Propose an approach for access, sampling, and abandoning the existing wastewater pit structure
- Provide GEI and UniFirst with data for any backfill being brought onsite including pipe bedding material (if different from what has already been provided) and topsoil [no immediate need for topsoil]
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis)
- Provide master project schedule

Sun

- Re-send manifest copies and certificates of destruction for the first two loads of water; continue to send for future loads as they are transported offsite
- Sample frac tanks as they become full
- Build decontamination pad

UniFirst



- Review and respond to Sun's request regarding decon pad construction
- Contact adjacent property owner (Sposato) regarding access request

8. Next Meeting

- October 19, 2022 at 10am

PILE CAP PLAN

Scale: 1/16" = 1'-0"

PLAN NOTES:

1. ALL ELEVATIONS ARE REFERENCED (+) OR (–) FROM TOP OF SLAB ON GRADE, ESTABLISHED AS DATUM ELEVATION 376.08'
2. TOP OF PILE CAP ELEVATION(EXTERIOR) (T.P.C.E) = 371.08' (UNLESS NOTED OTHERWISE ON PLAN). ADJUST T.O. PILE CAP ELEVATION ACCORDINGLY WITH SITE GRADING. SEE DRAWING S-201 FOR PILE CAP SCHEDULE & REQUIREMENTS.
3. TOP OF PILE CAP ELEVATION(INTERIOR) = 375.08' (UNLESS NOTED OTHERWISE ON PLAN).
4. PILE CUT OFF ELEVATION NOTED AS C.O.E. UNLESS NOTED OTHERWISE ON PLAN
5. CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND ELEVATIONS WITH ARCHITECTURAL DRAWINGS. NOTIFY ENGINEER/ARCHITECT OF ANY DISCREPANCIES BETWEEN DRAWINGS BEFORE PROCEEDING WITH WORK.
6. SEE DWG. S-100 FOR GENERAL NOTES.

Davis Miller	GEI	DMiller@geiconsultants.com	X

Meeting Minutes:

1. **General**

- Revised summary of the 10/5 call was distributed with the 10/12 call summary. No comments were provided regarding either of the two call summaries.
- Per Mara's email Monday, one of the Sun representatives on site last week tested positive for COVID.
- GEI's onsite representative beginning Monday, 10/24 will be Davis Miller.

2. **Coordination with UniFirst**

- No additional progress in advancing the Sposato access agreement for RI activities.
- UniFirst has contracted with Capitol Environmental Services (CES) to transport and dispose soils from the existing soil stockpile at the Seneca Meadows facility. Related issues discussed:
    - Copies of pre-printed manifests were sent from CES to Tim Dixon for delivery today (10/19). They will be at the site tomorrow (10/20). Rick Montgomery will sign them on behalf of UniFirst while onsite on 10/20.
    - Seneca Meadows has restrictions on water content (no free liquids) and concrete/debris sizing. Water content is not expected to be an issue for the stockpile. Concrete/debris size must be 2'(-) and concrete slabs must be <4' in largest dimension. C&S is unsure whether any materials in stockpile may exceed

these sizes. Excavator operator will need to be on the lookout and set aside or break up larger pieces.
- Sun will be responsible for providing operator(s) and equipment for loading trucks and manning the wash station.
- C&S can accommodate truck loadout around other work, but not to the extent that it prevents Sun from performing excavations on days when that is scheduled. Some coordination with UniFirst operations may also be needed to make sure trucks do not block loading dock operations at the facility.
- CES is preparing to provide 30-yd trucks as soon as tomorrow morning (10/20). However, with Sun unable to attend today's call and staffing uncertainty noted in prior correspondence, Thursday doesn't look feasible.
- GEI will follow up with Sun to convey information for them to begin scheduling soil loadout and direct coordination with CES for requesting dates, numbers, and timing of trucks.

3. Construction Schedule

- C&S provided a 3-week look ahead schedule on 10/18 and reviewed it on the call. Key points as follows:
  - Still on schedule relative to last week's projections
  - Concrete slabs for elevator and some pile caps poured yesterday; concrete pours will continue for next several weeks with the goal of two pours per week
  - C&S (Sun) to start excavating to clean out the east foundation wall trench on 10/21, and additional clean-out excavations on 10/28
  - C&S expects that the "deep" foundation excavations along the south end will occur during the week of 10/31; timing may depend on ability to stockpile and/or dispose soil based on results of samples collected 10/18
  - C&S expects work involving impacted soil/groundwater to be completed the week of 11/28
- C&S expects to need to pump water from excavations on 10/21. Results from Sun's 10/7 frac tank sampling delayed by lab issue (Sun now expects data receipt on 10/19), so not yet able to arrange for disposal of water from that tank. If second tank staged at the site doesn't have capacity and the first one isn't emptied before Friday, a third tank may be needed.
- Test pits were excavated and soil samples collected yesterday (10/18) to characterize soils from planned deep excavation area at south end of building. Samples are at lab with requested 5-day turnaround time. The need for additional contained-in determination from NYSDEC will be determined based on lab results.
- Truck wash station is constructed and ready for use.
- C&S preparing an updated master schedule (target distribution for end of week).

4. RFIs

- No RFIs submitted or expected in near term.

5. Construction/Technical Issues

- C&S noted that test pit from deep excavation area has filled with groundwater since yesterday and asked whether it would be helpful to sample that water. GEI suggested that T&D of water would likely be determined based on concentrations in frac tank when the broader area is excavated and dewatered in the future, so data representing the test pit may not be helpful.
- The approach for decommissioning the existing wastewater pit was discussed. Due to access constrictions inside Phase 1 of the new building (which covers most of the pit), it was agreed

that any efforts to pump, clean, or fill the concrete structure would be pushed until after Phase 2 of the new building is constructed and the mezzanine stairs are relocated. It is expected that 6 to 8 inches of the top of the pit will need to be removed to accommodate placement of the vapor barrier over the former pit. In the meantime, the pit will be boxed out and a vapor barrier material flap will be left for closure and sealing once the tank is cleaned and filled.

- GEI issued revised vapor mitigation system design drawings reflecting NYSDOH's requirement for active blowers to UniFirst. UniFirst forwarded them to C&S by email today (10/19).

6. Health and Safety

- GEI notified DEC/DOH of two overnight (non-work-hours) CAMP exceedances last week.
- GEI and C&S will evaluate potential for relocation of one air monitoring station in an effort to eliminate elevated readings attributable to potential sources on adjacent property.
- GEI and UniFirst reviewed the HASP submitted by Sun last week.
- Sun continues to perform personnel air monitoring for themselves and C&S employees using PID and 4-gas meter in excavations. No issues to date.
- C&S using disposable booties and reusable coveralls. UniFirst is laundering used coveralls and returning to C&S.
- No health and safety incidents.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Provide soil T&D disposal confirmation to Sun, along with information needed for Sun to begin scheduling and loading trucks for offsite T&D of the soil stockpile.
- Issue revised meeting invite to reflect new start time for weekly meetings (see below).

C&S

- Look into availability and response time of providing foam-based dust/odor/VOC suppression if needed based on CAMP monitoring results.
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).
- Provide updated master project schedule.

Sun

- Arrange for transport and disposal of frac tank water once lab results are received.
- Sample frac tanks as they become full.
- Provide a third frac tank for dewatering on Friday, 10/21 if sufficient capacity isn't available in two tanks currently on site.
- Begin arranging equipment and labor for loading stockpiled soils for T&D, and coordinate with CES to schedule trucks.

UniFirst

- Contact adjacent property owner (Sposato) regarding access request.

- Sign manifests for soil T&D.

8. <u>Next Meeting</u>

- October 19, 2022 at **9:30am** (new start time going forward based on UniFirst request)

\\geiconsultants.com\data\Data_Storage\Working\UNIFIRST\2001642 Unifirst-Liverpool NY\08_MEETINGS\Construction Meetings\10-19-22\10-19-22.docx

Construction Coordination Call Notes
UniFirst Liverpool Phase 2 Construction
GEI Project: 2001642

Date of Meeting: October 26, 2022
Location: Microsoft Teams
Attendees:

Name	Org	Email	Attended
Tim Cosgrave	UniFirst	Timothy_Cosgrave@unifirst.com

Wendy Moore	GEI	WMoore@geiconsultants.com	X
Tim Dixon	GEI	TDixon@geiconsultants.com	
Davis Miller	GEI	DMiller@geiconsultants.com	X

Meeting Minutes:

1. **General**
   - A summary of the 10/19 call was distributed on 10/20. The team had no comments on the summary, so it will be considered final.
   - Tim Dixon will be back on site 10/31-11/2 as GEI's onsite representative; Davis Miller will return on 11/3.
2. **Coordination with UniFirst**
   - No additional progress in advancing the Sposato access agreement for RI activities.
   - UniFirst is currently looking into offsite disposal options for the current soil stockpile that exceeds Seneca Meadows acceptance criteria and that was previously expected to be used as backfill at the site. C&S has indicated that no-one on site is able to backfill the soil, so offsite transport and disposal of the limited volume is being considered as an alternative to hiring an additional contractor and equipment to backfill the pile. The plan for managing this soil will be discussed once suitable options are evaluated.
3. **Construction Schedule**
   - C&S provided a 3-week look ahead schedule on 10/26 and reviewed it on the call. Key points as follows:

  - Still on schedule relative to last week's projections.
  - Concrete pour for elevator pit walls and some pile caps planned for today; concrete pours will continue for next several weeks with the goal of two pours per week
  - C&S (Sun) to clean out additional areas on Friday, 10/28.
  - C&S expects that the "deep" foundation excavations along the south end will begin on 11/1.
  - C&S still expects work involving impacted soil/groundwater to be completed the week of 11/28.
  - Loadout of the soil stockpile commenced 10/25; 9 loads transported 10/25 and 8-9 more expected for 10/26; Current estimate is approximately 16 more trucks will be needed to completely remove the pile.

- The goal will be to remove the current stockpile by end of day on Monday, 10/31 so that the stockpile area is available for additional soil placement associated with the start of deep excavation on 11/1.

- C&S expects to excavate a sanitary sewer line on the north side of the building starting on 12/7 and is wondering how to handle the soils. The preferred method will be to backfill the soils into the trench. C&S routed a figure during the call to show the excavation area. GEI agreed to review available soil data from that area to assess what disposal options may exist if material cannot be reused onsite.

- CES (soil T&D contractor) was inquiring about truck loading schedule for the next several days. Mara indicated Sun is not available Thursday (10/27) and is booked with cleaning out excavated areas for C&S on Friday (10/28). Monday, 10/31 was identified as the next target day for soil loadout. **Note: Sun confirmed after the call that a change in schedule will allow for truck loadout on Thursday, 10/27.**

- C&S preparing an updated master schedule (target distribution end of day on 10/26).

4. <u>RFIs</u>

- No RFIs submitted or expected in near term.

5. <u>Construction/Technical Issues</u>

- Soil loadout from the stockpile is progressing. No oversize debris has required segregation and no excess water content issues. There was a slight delay at the start of the loadout because trucks requested bed liners, which Sun was able to provide. Liners were generally not used by trucks for subsequent loads.

- Sun is covering the soil stockpile at the end of each shift.

- More manifests will be needed for soil transport. Sun is able to generate manifest paperwork as needed, and CES can ship more. There was discussion of how many might be needed, who will sign them, and where/when to ship them. Mara indicated that Sun has delegated signature authority from UniFirst. Given various options and no expected need for more manifests until 10/31, it was agreed the issue would be resolved outside of this call.

- After a delay at the lab, Sun received analytical data from the frac tank sampled on 10/7. The results indicate the water in the tank is non-hazardous, so will not require incineration. Sun is working with the nearby Metro facility for disposal of this volume. Metro has requested additional analytes (oil & grease, 310, total copper, and total nickel); results expected from the lab later today. Assuming acceptable results, Sun will begin arranging for transport of the water as soon as possible. Sun is requesting a consolidated lab report and will route when available.

- Sun sampled the second frac tank and the samples are at the lab. A third frac tank was brought on site and currently has sufficient capacity.
- GEI received results for the deep excavation soil characterization samples collected on 10/18. PCE was non-detect in all samples, and only one chlorinated solvent was detected at a very low, estimated concentration. The total lead concentration in one sample marginally exceeded the 20X criterion, so that sample has been released for TCLP lead analysis on a rapid turnaround time. GEI is coordinating with CES to determine if the soils can be added to the profile for Seneca Meadows without the need for additional contained-in determination from the DEC.
- C&S inquired whether HAZWOPER training will be required for excavation and handling of soils excavated from the "deep excavation area" based on the soil sampling results. UniFirst and GEI agreed to discuss after the call and then respond to C&S.

6. Health and Safety

- No CAMP exceedances last week. Weekly report submitted to DEC/DOH.
- VOCs at one CAMP monitoring location exceeded action levels beginning during pre-work hours on 10/25. The source appeared to be trucks at Pilot facility. VOC concentrations actually got lower once site work commenced. Notification was made to DEC/DOH within 24 hours as required.
- Sun continues to perform personnel air monitoring for themselves and C&S employees using PID and 4-gas meter in excavations. No issues to date.
- No health and safety incidents.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Review figure from C&S showing sewer excavation area and evaluate what chemical characterization data may exist for the area.
- Work with team to get additional manifest copies delivered, signed, and ready for use.
- Reply to C&S about whether HAZWOPER training is required for handling soils from the deep excavation.

C&S

- Look into availability and response time of providing foam-based dust/odor/VOC suppression if needed based on CAMP monitoring results.
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).
- Provide updated master project schedule.
- Provide figure showing sanitary line excavation (provided by email during call)

Sun

- Arrange for transport and disposal of "first" frac tank water at Metro once lab results are received.

- Evaluate and arrange for disposal of “second” frac tank once lab data are available.
- Review schedule and indicate when truck loading from soil stockpile can be continued.
- Provide Cat a copy of the manifest signature authority letter.
- Route consolidated frac tank characterization data when available.

UniFirst

- Contact adjacent property owner (Sposato) regarding access request.
- Sign manifests for soil T&D.

8. Next Meeting

- November 2, 2022 at 9:30am

\\geiconsultants.com\data\Data_Storage\Working\UNIFIRST\2001642 Unifirst-Liverpool NY\08_MEETINGS\Construction Meetings\10-5-22\10-5-22.docx

Wendy Moore	GEI	WMoore@geiconsultants.com	X
Tim Dixon	GEI	TDixon@geiconsultants.com	X
Davis Miller	GEI	DMiller@geiconsultants.com	X

Meeting Minutes:

1. **General**

- A summary of the 10/26 call was distributed on 10/28. C&S noted that the summary did not mention the need for a letter from the DEC to approval backfill of the soil stockpile not meeting Seneca Meadows disposal requirements. GEI noted that the discussion last week was related to the alternative option of disposing those soils at a commercial facility, and that a decision to pursue DEC approval versus pay for offsite disposal would be made once offsite disposal options were identified.

2. **Coordination with UniFirst**

- No additional progress in advancing the Sposato access agreement for RI activities.
- Based on the data collected from the deep soil excavation area characterization, including non-detect results for TCLP lead, soil from this area has been accepted by Seneca Meadows and the profile has been modified to include these soils. The revised profile was provided yesterday to UniFirst. Once signed, we can begin arranging for transport and disposal of those soils at Seneca Meadows. There is no need to segregate this material from other recent soils excavated for disposal at Seneca Meadows.
- UniFirst is currently looking into offsite disposal options for the current soil stockpile that exceeds Seneca Meadows acceptance criteria and that was previously expected to be used as backfill at the site. At least one quote is expected today, and the cost will depend on

400 Unicorn Park Drive
Woburn, MA 01801
781-721-4000

whether additional data is collected to confirm the soil does not exceed TCLP criteria for lead. C&S indicated it is not time-critical to remove these soils, so UniFirst prefers to collect a sample for TCLP lead analysis on a rapid-turn basis. GEI will proceed with sampling as soon as sample jars are delivered. Once disposal options and costs are available, UniFirst will decide whether to pursue a written approval from DEC for backfill, or transport the soils for offsite disposal.

- Sun provided 10 manifests for soil stockpile transport activities last week. Sun has been provided signature authority from UniFirst, and so executed the manifests on UniFirst's behalf when needed last week. Going forward, UniFirst prefers UniFirst employees sign the manifests whenever possible. Approximately 50 additional manifests have been sent to the site. UniFirst identified a representative to sign the manifests (Ed Gerland).

3. <u>Construction Schedule</u>

- C&S provided a 3-week look ahead schedule on 11/1 and reviewed it on the call. Key points as follows:
    - Still on schedule relative to last week's projections.
    - Pouring concrete for pile caps today and for beam wall on Friday. Concrete pours will continue for next several weeks.
    - Excavation commenced in the "deep excavation" area today.
    - The schedule was adjusted to accommodate the mason's availability to construct the elevator shaft next week; plumbing work was push back.
    - 12/15 is current target timeframe for floor slab construction.
    - Areas of deeper soil excavation are expected to be completed and backfilled by 11/9.
    - The expected date for completion of soil-intrusive work associated with the building foundation is now 12/2.
    - The schedule shows work on the day after Thanksgiving, but final determination of the need for work that day is pending; discuss on future calls based on progress.
- C&S expects to excavate a sanitary sewer line on the north side of the building starting on 11/17. Based on C&S's inquiry from last week, GEI had indicated that, per the Interim Excavation Work Plan, excavated site soils cannot be reused as backfill within utility trenches. GEI asked whether other areas were subject to excavation in the future; C&S identified several areas that will be excavated after substantial completion of the building in early 2023, and will provide a map showing expected locations and depths. GEI will compare those areas to previous characterization data and approvals. The team will need to develop a plan to characterize soils in areas not represented by the existing dataset.
- Target next week to start transport and disposal of soils currently being excavated from the "deep excavation" area. Sun will confirm dates when an operator will be available for loading trucks.
- C&S preparing an updated master schedule (revised target distribution this week).
- Indoor air sampling for the Phase 1 building must be performed during the heating season (starting in November) and at least 30 days after the blowers are installed and operating. C&S is awaiting supplier pricing on the blowers and does not yet have a planned installation date.

4. <u>RFIs</u>

- No RFIs submitted or expected in near term.

5. Construction/Technical Issues

- TCLP lead was not detected in soils from the "deep excavation" area; therefore, these soils have been added to the Seneca Meadows profile. Loadout can commence once UniFirst executes and returns the amended profile and once Sun's operator is available for loading trucks.
- Soil loadout from the prior soil stockpile is complete. No oversize debris needed to be segregated from the stockpile.
- C&S asked last week whether HAZWOPER training was required to excavate "deep excavation" soils based on analytical results. GEI provided suggestions in an email dated 10/27. Currently, Fisher is doing the excavations with assistance and personnel air monitoring provided by Sun.
- Lab data from frac tank sampling are still delayed. Results from the first and second frac tank sampling are expected tomorrow. Results from the third tank are expected next week. A fourth tank has been brought on site and has sufficient capacity for this week. Pending the additional requested data for the first tank, the profile can be finalized for Metro and that water can be transported for disposal, possibly this week.
- C&S identified a surfactant product (Rusmar odor control foam AC645) from Atmos Technologies in PA available within approximately 24 hours in the event necessary to control dust or odors at the site.

6. Health and Safety

- Two periods of CAMP exceedances last week were reported to DEC/DOH and determined to be non-site-related. Weekly report submitted to DEC/DOH on 11/1.
- DEC/DOH suggested relocating AIR-102 to eliminate periodic exceedances from adjacent property use. No suitable alternate location has been identified due to space limitations. Continue to assess as conditions change.
- Sun continues to perform personnel air monitoring for themselves and C&S employees using PID and 4-gas meter in excavations. No issues to date.
- No health and safety incidents.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Arrange sampling and TCLP analysis of the non-Seneca Meadows soil stockpile.
- Begin developing a plan to characterize soils excavated from the planned sewer line and other previously uncharacterized areas to be identified by C&S based on expectations of future excavations.

C&S

- Provide a figure showing additional future excavations outside the building footprint, including utility trenches, drain lines, oil/water separator, stormwater detention basin, etc. Include excavation depths or elevations relative to existing.
- Identify target date for blower installation in Phase 1 building in order to plan for indoor air sampling.

- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).
- Provide updated master project schedule.

Sun

- Arrange for transport and disposal of “first” frac tank water at Metro once lab results are received and profile is finalized.
- Evaluate and arrange for disposal of “second” and “third” frac tanks once lab data are available.
- Review schedule and indicate when truck loading from soil stockpile (currently being produced with soil from “deep excavation”) can commence.
- Route consolidated frac tank characterization data and waste manifests when available (ongoing).

UniFirst

- Contact adjacent property owner (Sposato) regarding access request.
- Sign manifests for soil T&D.
- Identify preferred approach for soil stockpile not suitable for disposal at Seneca Meadows (i.e., disposal offsite or on-site reuse with DEC approval).

8. Next Meeting

- November 9, 2022 at 9:30am

Tim Dixon	GEI	TDixon@geiconsultants.com	
Davis Miller	GEI	DMiller@geiconsultants.com	X

Meeting Minutes:

1. **General**
   - A summary of the 11/2 call was distributed on 11/2. No comments or issues noted by the team, so the summary is considered final.
2. **Coordination with UniFirst**
   - Based on the data collected from the deep soil excavation area characterization, the Seneca Meadows profile has been amended and signed by UniFirst.
   - UniFirst is still evaluating options for the current soil stockpile that exceeds Seneca Meadows acceptance criteria. GEI sampled the stockpile last week for TCLP lead analysis and the results indicated the soil is not characteristically hazardous for lead. That data has been provided to brokers for final pricing evaluation of disposal options. Once disposal options and costs are available, UniFirst will decide whether to pursue a written approval from DEC for backfill, or transport the soils for offsite disposal.
   - Sun arranged for water disposal at Metro based on sampling data and UniFirst has signed the profile. Water transport commenced 11/8.
   - Approximately 50 additional manifests were sent to the site last week (for soil disposal at Seneca Meadows). UniFirst signed the manifests (Ed Gerland), so they are ready for use as needed.

3. Construction Schedule

- C&S provided a 3-week look ahead schedule on 11/9 and reviewed it on the call. Key points as follows:
    - Still on schedule relative to last week's projections.
    - One sequence modification was made in order to accelerate the completion the deep foundation area along the south portion of the building, including backfill.
    - Concrete pours will continue for next several weeks; last pour expected 11/28. Forms will be stripped and foundation areas backfilled later that week.
    - The sewer installation area along the north portion of the building will be cleared by One Call tomorrow. GEI provided a proposed plan for sampling the soils in advance of sewer install. However, masons are currently staged in the area working on the elevator shaft. Current plan is to excavate soils as needed during sewer install, sample the stockpiled materials for disposal characterization, and then arrange disposal based on results.
    - Vapor barrier installation for office portion of Phase 2 building targeted for 12/6-12/7. Schedule is flexible based on weather and conditions. C&S is currently working with supplier regarding schedule, duration, and temperature conditions needed for the install. Will keep team apprised so GEI can arrange for field observation of the barrier install.
    - Interior plumbing rough cut work next week will result in limited additional soil excavation. This is from previously characterized area and material can go in Seneca Meadows stockpile.
    - No work planned for the day after Thanksgiving.
- C&S provided an updated master schedule before the call. Preliminary discussion as follows:
    - GEI noted Line 47 mentions PCB-related injections. Injections actually targeted PCE, and schedule should be corrected to avoid potential confusion by DEC.
    - The vapor barrier install for the Phase 2 building will be done in three phases. The first in December 2022 in the "office" area. The next two phases are planned for spring 2023.
    - GEI will review the schedule in more detail and provide any comments.
- Sun/C&S plan to start loadout of soils for disposal at Seneca Meadows starting next Wednesday,11/16.
- GEI asked if there was a target date where soils will no longer be exposed such that CAMP monitoring can be discontinued. C&S indicated that only the office portion of the Phase 2 building would be covered this year… soils will remain exposed in other areas until the vapor mitigation barrier and slabs are poured in the spring.

4. RFIs

- No RFIs submitted or expected in near term.

5. Construction/Technical Issues

- Most of the deep excavation area along the southern wall of the new building will be done this week. A portion closest to the existing Phase 1 building will occur later to minimize operation impacts.
- Loadout of soils from the deep excavation (and other previously characterized areas) is expected to commence on Wednesday, 11/16.
- C&S indicated the current small stockpile of soils not planned for disposal at Seneca Meadows is not impacting work, so UniFirst can proceed with evaluation of management options.

- Sun began transporting water from the first frac tank yesterday and second frac tank is expected to start today. Characterization data from third frac tank reportedly close to being available. Fourth frac tank is approximately ¾ full, but has not yet been tested.
- GEI inquired about the plan for management of "sludge" in the bottom of the first frac tank before it is demobilized. Sun was not on the call to discuss the plan.

6. Health and Safety

- CAMP exceedances last week were reported to DEC/DOH, but occurred during non-work hours. Elevated dust readings occurred last week during foggy conditions at the site, but dust-based action levels were not exceeded.
- On 11/4, work zone monitoring indicated elevated CO readings and negative LEL readings in a trench. A vac truck was parked near the trench. The truck was moved, the meters were recalibrated, and the issue cleared, so work resumed.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Provide comments on updated master schedule provided by C&S.
- Contact Sun about the plan for sludge management from the frac tanks.

C&S

- Provide a figure showing additional future excavations outside the building footprint, including utility trenches, drain lines, oil/water separator, stormwater detention basin, etc. Include excavation depths or elevations relative to existing.
- Contact vapor barrier supplier about schedule and weather/temperature conditions needed for installation.
- Identify target date for blower installation in Phase 1 building in order to plan for indoor air sampling.
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).

Sun

- Arrange for transport and disposal of "second" and "third" frac tanks once lab data are available.
- Sample water from "fourth" frac tank.
- Clean and remove "first" frac tank.
- Route consolidated frac tank characterization data and waste manifests when available (ongoing).

UniFirst

- Contact adjacent property owner (Sposato) regarding access request **(no updated information as of 11/9)**.

- Identify preferred approach for soil stockpile not suitable for disposal at Seneca Meadows (i.e., disposal offsite or on-site reuse with DEC approval).

8. Next Meeting

Meeting Minutes:

1. **General**
   - A summary of the 11/9 call was distributed on 11/9. No comments or issues noted by the team, so the summary is considered final.
2. **Coordination with UniFirst**
   - UniFirst is still evaluating options for the current soil stockpile that exceeds Seneca Meadows acceptance criteria. One T&D proposal is pending. UniFirst plans to make a decision by the end of this week.
   - C&S inquired whether the stockpile can be relocated on site because work activities are approaching that area. It was agreed the pile could be relocated as long as it was separate from the stockpile of material going to Seneca Meadows.
3. **Construction Schedule**
   - C&S provided a 3-week look ahead schedule on 11/9 and reviewed it on the call. Key points as follows:
     - Still on schedule relative to last week's projections.
     - The only excavation/backfill planned for this week is a portion of the sewer line within the previously characterized soil area. That excavation will extend into next week. The portion north of the building where soils have not been characterized will

be excavated next week at the end of the sewer install process and will be stockpiled for characterization per the prior plan.
    - Two more concrete wall pours are planned: one on 11/21 and the other on 11/28. Forms will be stripped and foundation areas backfilled following each pour.
    - One small excavation is pending between the Phase 1 building and the deep foundation area. Those soils have been characterized and planned for disposal at Seneca Meadows.
    - C&S has not gotten feedback from the vapor barrier installer regarding schedule or weather/temperature issues, and is planning for the installation to occur 12/5-6. Approximately 5000 square feet of barrier is to be installed in the office portion of the Phase 2 building. C&S will notify of any schedule changes or feedback from installer.
    - The office portion of the building will be prepared following the vapor barrier installation, with a planned concrete slab pour date of 12/15.
- GEI provided comments to C&S regarding the updated master schedule routed last week. Comments focused on activities involving soil management, CAMP implementation, and GEI on-site observation. C&S had no issues with the comments provided.
- In an email on 11/15, GEI proposed that CAMP equipment and full-time onsite observation by GEI could be discontinued on 12/2 based on the indications on the look-ahead schedule that intrusive earth work would not be occurring after this date. It was discussed that the date may be flexible as the work progresses, but that once stockpiles were gone, soil excavation was not routinely being performed, and backfill was complete, those measures could be discontinued. GEI would still be available to provide onsite support and CAMP monitoring on an as-needed basis going forward with advanced notice.
- C&S asked whether the CAMP stations could be removed once no longer needed because they could interfere with snow plowing. GEI agreed to remove them as soon as practical and that, once CAMP monitoring was no longer needed, they could be powered down and placed elsewhere on the site, away from site operations, until they could be physically removed.
- Loadout of soils for disposal at Seneca Meadows started this morning (11/16). Nine truckloads are scheduled for 11/16, and may be enough to remove the current stockpile. If not, Sun will plan additional loadout days based on availability.
- DEC has reportedly modified the criteria for when testing of imported fill is required. Under the old policy, the crushed limestone being used on site did not require testing. Under the revised policy, it may require some level of testing. C&S indicated the material has been used on site and a stockpile is available for sampling if needed. GEI will look further into the new DEC policy and testing requirements and requested a total estimated use volume estimate from C&S as a basis for assessing how many analyses may be required.
- GEI asked about the potential to install some or all of the wells needed for the RI and to monitor the performance of the injected material. Based on current schedule, target areas may not be accessible until next spring, which would be much longer than the post-injection monitoring program and RI schedule called for. If GEI need to get data, options were discussed such as grab samples and temporary well installations and replacements. It was agreed that GEI would provide a map of target locations as a basis for further discussion of this issue.
- C&S had a call with the supplier for the blowers to be installed in the Phase 1 building as part of the active vapor mitigation system. The supplier asked whether the blowers need to operate continuously or intermittently, and whether the blowers could be mounted inside the roof. They also had questions about the connection to the discharge riser. C&S will consolidate the questions into an RFI.

4. RFIs

- No RFIs submitted, but C&S will be preparing one as indicated above.

5. Construction/Technical Issues

- Four frac tanks on site have water in them; approximately 20,000 gallons was pumped from excavation areas on Monday after the weekend rain. Frac Tank #1 had previously been emptied and was slated to be cleaned and removed, but instead was used for water storage. Another tank has been sampled and will be emptied tomorrow (11/17) for disposal at Metro.
- Most of the deep excavation area along the southern wall of the new building will be done this week. A portion closest to the existing Phase 1 building will occur later to minimize operation impacts.
- Sun has developed an approach for cleaning and disposal of accumulated sediment in frac tanks prior to their removal from the site. Sun will submit the proposal to UniFirst for approval. Based on data from the first frac tank, disposal is anticipated to include stabilization and landfill disposal in Tonawanda. Alternative disposal may be required for some tanks depending on material characterization.

6. Health and Safety

- CAMP exceedances last week were reported to DEC/DOH. One was a dust exceedance that was attributed to mortar dust during removal of scaffolding. The other was a VOC exceedance that occurred during non-work hours.
- Work zone monitoring continues with no issues noted.
- No health and safety incidents reported.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Provide a site plan with target locations as a basis for further discussion of when and where wells may be feasible for sampling.
- Research new test imported fill testing requirements and potential impacts related to the use of crushed limestone fill.
- Arrange for onsite observation of vapor barrier system installation and testing scheduled for 12/5-6.

C&S

- Provide a figure showing additional future excavations outside the building footprint, including utility trenches, drain lines, oil/water separator, stormwater detention basin, etc. Include excavation depths relative to existing grade.
- Prepare and submit an RFI related to Phase 1 building blower installation questions.
- Provide an estimate of the volume of crushed limestone fill used at the site to assist with determining the number of samples that may be needed for characterization under DEC's modified policy for imported fill.
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).

Sun

- Continue to arrange for characterization and disposal of collected water (ongoing).
- Provide a proposal to UniFirst for cleaning and disposal of residue from frac tanks prior to demobilizing them from the site.
- Route consolidated frac tank characterization data and waste manifests when available (ongoing).

UniFirst

- Contact adjacent property owner (Sposato) regarding access request **(no success contacting owner as of 11/16)**.
- Identify preferred approach for soil stockpile not suitable for disposal at Seneca Meadows (i.e., disposal offsite or on-site reuse with DEC approval).

8. Next Meeting

- November 23, 2022 at 9:30am

Wendy Moore	GEI	WMoore@geiconsultants.com	
Tim Dixon	GEI	TDixon@geiconsultants.com	X
Adam Grossman	GEI	AGrossman@geiconsultants.com	X

Meeting Minutes:

1. **General**
   - A summary of the 11/16 call was distributed on 11/18. No comments or issues noted by the team, so the summary is considered final.
   - Mike Sherlock is new Director of Safety at C&S and has been added to the weekly call.
   - Adam Grossman will be taking over GEI on-site role starting Monday, 11/28.
2. **Coordination with UniFirst**
   - UniFirst has elected to transport and dispose soils from the current "small" soil stockpile that exceeds Seneca Meadows acceptance criteria. Profiling and contracting are underway; loading and transport can be scheduled once those are complete.
   - C&S has worked around the stockpile and does not anticipate it will need to be relocated prior to loading for offsite disposal.
3. **Construction Schedule**
   - C&S provided a 3-week look ahead schedule on 11/22 and reviewed it on the call. Key points as follows:

  - One concrete pour occurred on 11/21 and the next will occur on 11/28.
  - Backfill of structural fill is expected to be complete by the end of next week (12/2).
  - The sewer line excavation is scheduled for Monday, 11/28. The soils will be stockpiled for characterization.
  - One small excavation was completed this week between the Phase 1 building and the deep foundation area. Those soils have been characterized and are stockpiled for disposal at Seneca Meadows.
  - C&S is planning for the vapor barrier installation on 12/5-6. Mobilization and installation start on 12/5; installation complete and smoke testing on 12/6. GEI will provide onsite observer for this work (Larry Welch).
  - The office portion of the building will be prepared following the vapor barrier installation, with a planned concrete slab pour date of 12/15.
  - Structural steel installation starts 12/19.

- In an email on 11/15, GEI proposed that CAMP equipment and full-time onsite observation by GEI could be discontinued on 12/2 based on the indications on the look-ahead schedule that intrusive earth work would not be occurring after this date. Backfill is expected to be complete by then, but it's possible stockpile loadout will not be complete. CAMP and GEI observer may extend into the following week.

- Apart from the sewer excavation planned for next week, no other soil excavation is planned for the near term.

- GEI showed a site plan indicating well locations necessary for the RI and for IRM-related monitoring (copy attached). Three couplets are needed for near-term sampling for the IRM; circled in red on figure. One (MW-5S/I) is in a landscape area west of the Phase 1 building. C&S foresees no issues with installing that well. Two others (MW-3S/I and MW-4S/I) are along the east property line. This area will be active for a while. It was agreed the best option would be to collect grab samples from these locations rather than install wells pending completion of building construction. C&S indicated these locations would likely be accessible for a drill rig early during the week of 12/15. After that, weekend work might be needed and would have to be coordinated to ensure materials are not being stored in that area. GEI will look into driller availability. C&S also noted that the overhead utilities in this area are communication lines and have been disconnected from service.

4. RFIs

- C&S submitted an RFI on 11/21 related to Phase 1 building blower installations. GEI will review and respond.

5. Construction/Technical Issues

- DEC has modified the criteria for when testing of imported fill is required but has not yet communicated revised testing frequency/requirements. Under the revised policy, crushed limestone used at the site may require some level of testing. C&S estimated 1500 cy of material will be used, including areas outside the brownfield boundaries beneath paved parking areas. GEI will look further into the new DEC policy and testing requirements; unless further clarification is available from DEC, we expect to test using pre-existing frequency and analytes.

- Four frac tanks on site have water in them. Samples from two tanks are currently at the laboratory. A tank filled this week will be sampled on 11/28 to avoid hold time issues over the holiday. One tank was emptied during the last week; was disposed at Metro based on testing data.

- Sun has developed an approach for cleaning and disposal of accumulated sediment in frac tanks prior to their removal from the site. They currently have approval for non-haz sludge disposal facility. A second facility (in case of hazardous determination for subsequent loads) has been identified, but not yet profiled pending data indicating haz disposal may be needed. Sun's proposal for tank cleaning and sludge disposal not yet submitted to UniFirst.

6. Health and Safety

- No CAMP exceedances last week; weekly report submitted to DEC/DOH on 11/22.
- Work zone monitoring continues with no issues noted.
- No health and safety incidents reported.

7. Action Items

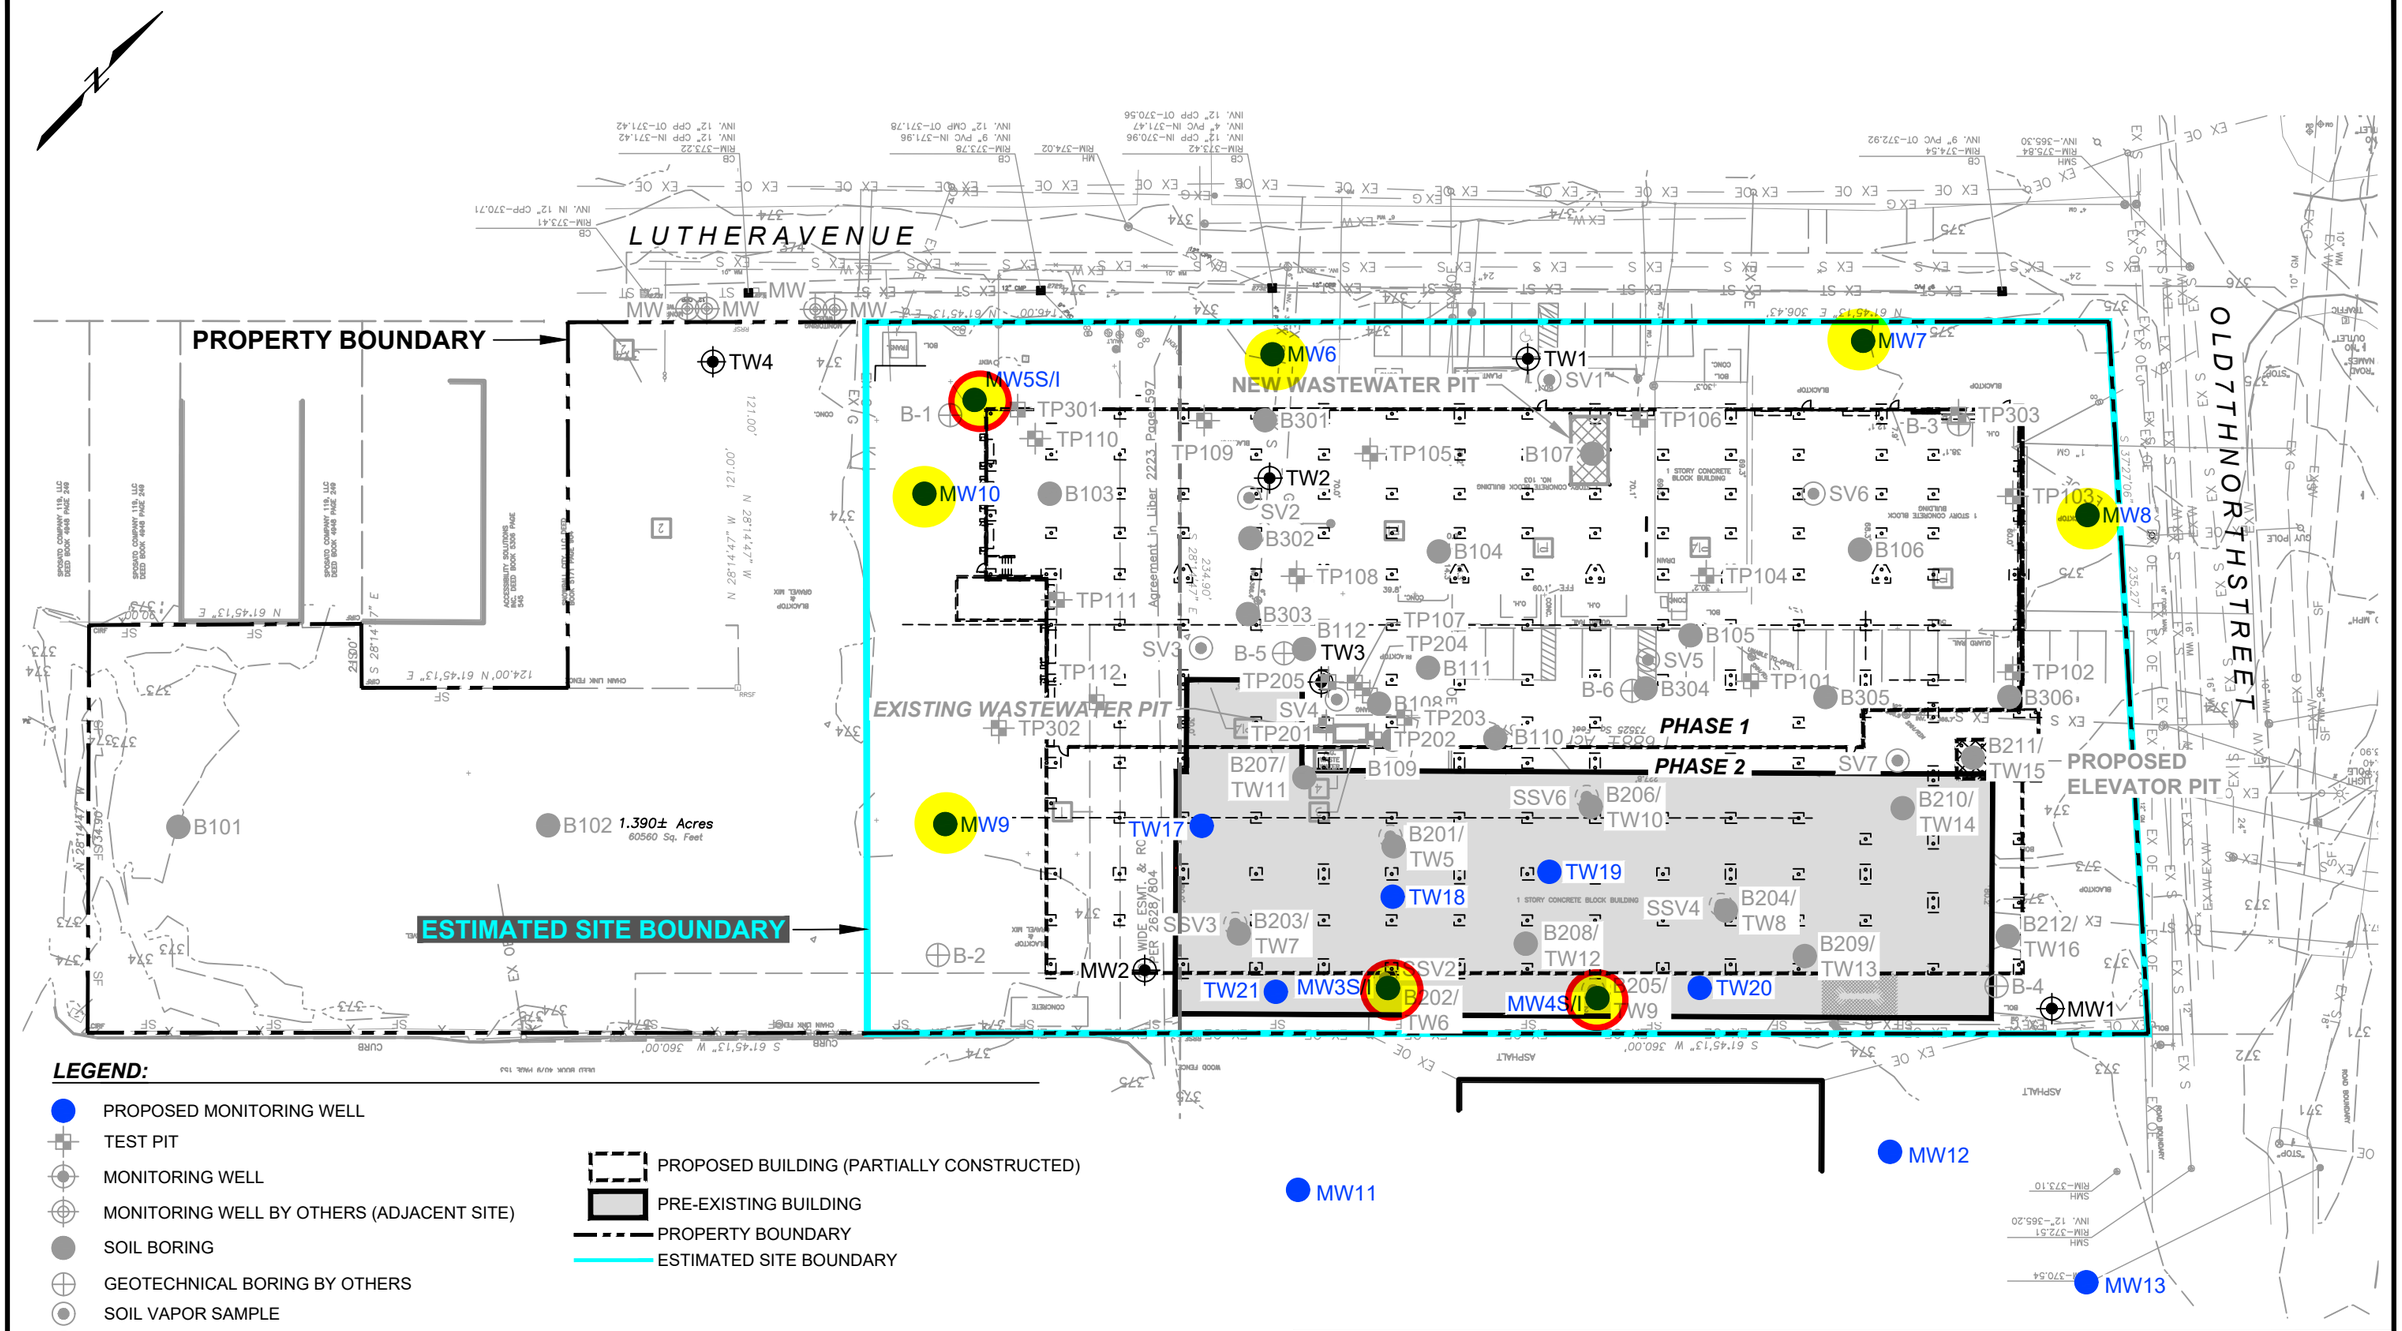
GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Contact drillers regarding schedule for well installations and groundwater sampling.
- Research new test imported fill testing requirements and potential impacts related to the use of crushed limestone fill.
- Review and respond to C&S's RFI regarding vapor mitigation system blowers.

C&S

- Provide a figure showing additional future excavations outside the building footprint, including utility trenches, drain lines, oil/water separator, stormwater detention basin, etc. Include excavation depths relative to existing grade. **(C&S confirmed during the 11/23 call that no near-term excavation is planned apart from the sewer line excavation. Since the point of identifying excavation areas was to consolidate a plan for material testing where needed, the timing of this submittal is no longer critical. No additional excavation is planned until spring 2023.)**
- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).

Sun



- Continue to arrange for characterization and disposal of collected water (ongoing).
- Provide a proposal to UniFirst for cleaning and disposal of residue from frac tanks prior to demobilizing them from the site.
- Route frac tank characterization data and waste manifests when available (ongoing).

UniFirst

- Contact adjacent property owner (Sposato) regarding access request **(no success contacting owner as of 11/23)**.

1. **General**
   - A summary of the 11/23 call was distributed on 11/23. No comments or issues noted by the team, so the summary is considered final.
2. **Coordination with UniFirst**
   - UniFirst has elected to transport and dispose soils from the current "small" soil stockpile that exceeds Seneca Meadows acceptance criteria. Profiling and contracting are underway. We are told it could take 2-3 weeks to arrange transport. C&S indicated soil pile needs to be removed by 12/15 else pile will no longer be accessible due to steel operations. GEI will see if more aggressive T&D schedule can be accommodated. Otherwise, soil stockpile may not be accessible until steel work is complete.
   - UniFirst received response from Sposato last week requesting attorney involvement. UniFirst has a call set up later today to discuss Mr. Sposato's issues.
3. **Construction Schedule**
   - C&S provided a 3-week look ahead schedule on 11/30 and reviewed it on the call. Key points as follows:

400 Unicorn Park Drive
Woburn, MA 01801
781-721-4000

  - The final concrete foundation pour occurred on 11/28. Forms are currently being stripped.
  - Backfill of structural fill is expected to be complete by the end of this week (12/2) but could be delayed by rain expected later today.
  - The sewer line excavation, installation, and backfill was completed yesterday. The soil from the excavation is stockpiled and samples are at the laboratory with results expected end of week.
  - C&S is currently removing used forms and steel deliveries have started.
  - C&S is currently preparing the subslab beneath the office portion of the Phase 2 building in advance of vapor mitigation system installation planned for 12/5-6. Weather currently looks favorable for install.
  - The office portion of the building will be prepared following the vapor barrier installation, with a planned concrete slab pour date of 12/15.
  - Structural steel installation starts 12/19.

- GEI asked whether vapor monitoring points were planned for the office pour area and C&S confirmed. C&S also noted that one of the planned vapor points is near a planned slab joint. GEI and C&S agreed to evaluate the need for relocating that point outside the scope of the weekly call.
- Regarding soil transport and disposal, C&S suggested awaiting analytical results for the sewer line soils before scheduling next loadout. Assuming analytical results support disposal at Seneca Meadows, those soils could be combined with the existing approved soils for one truckload. If timing allows, target loadout for next week.
- In an email on 11/15, GEI proposed that CAMP equipment and full-time onsite observation by GEI could be discontinued on 12/2 based on the indications on the look-ahead schedule that intrusive earth work would not be occurring after this date. Backfill is expected to be complete by then, but it's unlikely stockpile loadout will be complete. GEI will plan to continue CAMP and field observer into next week.
- GEI contacted drillers following last week's call to assess availability to install wells and collect grab groundwater samples the week of 12/12. No drillers have availability until the end of January at the earliest. GEI will contact them again about the possibility of weekend work, else get on the schedule for late January/early February before those slots are gone.

4. <u>RFIs</u>

- GEI responded to C&S's RFI regarding blower installation on 11/29. In overview, blower installation inside the roof or at floor level is not an option based on DOH requirements. Exterior wall-mount may be possible for some locations. GEI offered some suggestions for supporting the pipe connections above the roof. C&S indicated exterior wall mount may be helpful for Phase 2 building, but not Phase 1. C&S will evaluate vent pipe support options and include them in required submittal. C&S also asked about vent pipe direction relative to wind direction and further discussion was tabled until GEI's vapor mitigation designer (Larry Welch) is on site next week for the vapor mitigation system installation.

5. <u>Construction/Technical Issues</u>

- Four frac tanks on site have water in them. One is being emptied today for disposal at Metro based on data received yesterday. Two more were recently sampled with results pending. The fourth has capacity for any needed dewatering between now and the completion of backfill (expected complete on 12/2).

- Sun has prepared two proposals that are currently with UniFirst for review. One is for tank cleanout and the other for non-hazardous sludge disposal. UniFirst has received and is reviewing.
- GEI's field observer noted a water line break in a daily report last week. C&S confirmed that the water line supplying the field trailer was broken, shut off, and is being repaired.

6. Health and Safety

- No CAMP exceedances last week; weekly report submitted to DEC/DOH on 11/29.
- Work zone monitoring continues with no issues noted.
- No health and safety incidents reported.

7. Action Items

GEI

- Continue to provide weekly CAMP reports to DEC/DOH; copy UniFirst and C&S.
- Contact drillers to schedule well installations and groundwater sampling.
- Submit imported fill material requests to DEC using source certification data.
- Coordinate with C&S regarding the need for relocation of the vapor monitoring point near the floor slab joint.
- Discuss blower vent orientation with C&S while onsite next week for vapor mitigation system installation.

C&S

- Provide 3-week look-ahead schedules (ongoing - on a weekly basis).

Sun

- Continue to arrange for characterization and disposal of collected water (ongoing).
- Route frac tank characterization data and waste manifests when available (ongoing).

UniFirst

- Review and respond to Sun proposals for tanks cleaning and non-hazardous sludge disposal.

8. Next Meeting

- December 7, 2022 at 9:30am

Meeting Minutes:

1. **General**
   - A summary of the 11/30 call was distributed on 12/1. No comments or issues noted by the team, so the summary is considered final.
2. **Coordination with UniFirst**
   - Profiling and contracting are underway for transport and disposal of soils from the current soil stockpile that exceeds Seneca Meadows acceptance criteria. A sample was sent to the disposal facility last week for testing; results pending. Disposal company is aware the goal is to remove the soil pile by 12/15 else pile will no longer be accessible until steel work is complete.
3. **Construction Schedule**
   - No discussion of 3-week lookahead schedule because planned construction activities on the schedule are related to building construction rather than impacted material management which is the focus of this call.
   - No target date is available yet for loadout of the remaining Seneca Meadows and the sewer excavation soils. A low PCE concentration was detected in the sewer line excavation soils, so

either another contained-in determination is needed from DEC or TCLP testing is needed to confirm acceptability. Both options are being pursued.

- Vapor barrier install was scheduled to start 12/5 but was delayed one day by vapor barrier installation subcontractor. Work is now underway.
- GEI will discontinue CAMP monitoring and full-time onsite observation by GEI this week because intrusive work is no longer being performed. CAMP equipment and personnel will be remobilized on a day-to-day basis as required, including for soil loadout once scheduled.
- GEI booked drillers for 2/6/23 to install the one permanent well pair near the facility entrance at Luther Ave and collect grab samples at two other locations along the property boundary with Sposado for post-injection monitoring. This schedule is based on C&S's expectation that steel work will be complete and access to target locations will be available by then.

4. RFIs

- C&S will submit a design proposal for the roof-mounted blower vents. There was no minimum height specified for the blower motors above the roof, but GEI confirmed they should be at least 3 feet above the roof to be above potential snow levels.

5. Construction/Technical Issues

- GEI and C&S discussed the blower vent orientation in the field. The design called for vents to be directed away from air intake units, which, in this case, resulted in vents opening toward the prevailing upwind location. GEI's vapor mitigation system engineer confirmed this was not a problem for unit operation.
- The vapor barrier subcontractor mobilized later than expected and began work early on 12/6. The liner was installed and joint seams were sprayed on despite rain during the day. As of the morning of 12/7, the adhesive was not bonding to the liner nor to the concrete walls or utility penetrations. Due to forecasted rain for 12/7, it was decided that liner work would be cancelled for the day and Larry Welch (GEI) would work with the liner manufacturer to develop an approach and instructions for the installation contractor to reapply the materials on 12/8 when improved weather was expected. The liner manufacturer is located in California, so Larry was not expecting the plan to be fully developed until the end of the day due to the time difference. He will share the plan once developed. Meanwhile, a test seam was also sprayed and placed in the field trailer to test its performance when not affected by the weather.
- One frac tank has been emptied, cleaned, and removed from the site since last week. Analytical results for a second tank were received and indicate that tank is suitable for disposal at Metro, so Sun plans to transport the water and remove the tank next week. Two other tanks have water and are awaiting analytical characterization.
- UniFirst approved Sun's proposal for tank cleaning and sludge disposal, so Sun is implementing that plan.
- NYSDEC approved the import request for 1500 cy of crushed limestone fill. GEI will forward the approval to C&S.
- The group discussed the need for continuing these coordination calls given that soil and groundwater management will not be routinely needed over the next several months. C&S indicated that they would issue 3-week lookahead schedules to the group and that those would be used as a basis for coordinating and scheduling work as needed (e.g., soil loadout, well installations, etc.). Additional calls will be scheduled on an as-needed basis.
- C&S indicated that future soil excavation will be needed for the retention pond and parking areas, and that there won't be room for soil stockpiling when this work occurs in the spring.

Provisions for direct loading would be preferred. GEI noted that C&S was preparing a figure showing areas where future excavation is expected, along with associated volumes. Once received, that information can be used as a basis for evaluating any additional soil characterization needs, profiling, and arranging for transport and disposal, as needed.

6. Health and Safety

- No CAMP or personnel air monitoring exceedances last week. Personnel air monitoring was discontinued on 12/2.

7. Action Items

GEI

- Forward DEC approval for imported crushed limestone fill to C&S.
- Develop a plan for vapor barrier repair/re-installation to be implemented on 12/8.
- Continue to finalize soil profiles and contracts for soil disposal.

C&S

- Provide 3-week look-ahead schedules on a weekly basis. These will be the trigger for identifying future activities where coordination is required among this team.

Sun

- Continue to arrange for characterization and disposal of collected water (ongoing).
- Route frac tank characterization data and waste manifests when available (ongoing).

8. Next Meeting

- None planned. Schedule as needed if issues arise.

Date:	January 18, 2023
Re:	Summary of Interim Remedial Measure Injections during Phase 2 Facility Renovation UniFirst Laundry Facility, 113 7th North Street, Liverpool, NY GEI Project No. 2001642

This memorandum summarizes the implementation of remedial injections performed to address chlorinated volatile organic compounds (CVOCs) in soil and groundwater beneath the former building at UniFirst's laundry facility located at 113 7th North Street in Liverpool, NY. The remedial injections were one component of an Interim Remedial Measure (IRM) Work Plan for Phase 2 facility renovations (GEI 2022) that was submitted to the New York State Department of Environmental Conservation (NYSDEC) in February 2022 (with revisions in May, July, and September 2022). The IRM Work Plan was conditionally approved by the NYSDEC on May 19, 2022, and formally approved on September 9, 2022.

The injections were designed and implemented to address CVOCs in soil and groundwater beneath a portion of the pre-existing facility building following its demolition and prior to commencing construction of Phase 2 facility building renovations in its place. As discussed in the IRM Work Plan, the injections included zero valent iron (ZVI), emulsified zero-valent iron (EZVI), and several carbon and nutrient amendments to facilitate in-situ abiotic and biotic reductive processes to treat residual CVOCs between approximately 8 and 20 feet deep below the original building floor slab elevation.

Entities involved in the project included:

- UniFirst – Facility owner undertaking the facility renovations and the IRM activities.
- C&S Companies – contractor performing the facility renovations on behalf of UniFirst. Remedial injections were planned and scheduled with C&S to minimize impacts on the facility renovation schedule, but C&S was not involved with the injections and temporarily discontinued site operations during the two-week window when the injections were performed.
- GEI – Identified the remedial scope and application area, prepared the IRM Work Plan, observed the remedial injections, and performed Community Air Monitoring Plan (CAMP) monitoring over the course of the work.

GEI Consultants, Inc.
400 Unicorn Park Drive, Woburn, MA 01801
781.721.4000

- Warren Ramie Surveying (Ramie) – staked target injection locations in the field per the injection layout identified in the IRM Work Plan.
- Innovative Environmental Technologies, Inc. (IET) – Specialty contractor supporting and implementing the remedial injection as a subcontractor to GEI.

GEI, IET, and Ramie mobilized to the site to commence the injection component of the IRM on May 23, 2022. At that time, the floor slab from the former facility building had been demolished by C&S, such that the working surface was generally bounded to the northwest by the new Phase 1 building and to the southeast by an approximately one-foot step-up to adjacent grade. The site was surrounded by a locked perimeter security fence already in place for the facility renovation work. GEI commenced CAMP operations and conducted an initial safety orientation briefing prior to beginning onsite work. Ramie began staking the three permeable reactive barrier (PRB) injection lines as well as the grid-based injection points within the main injection target area as indicated in the IRM Work Plan and shown on the attached Figure.

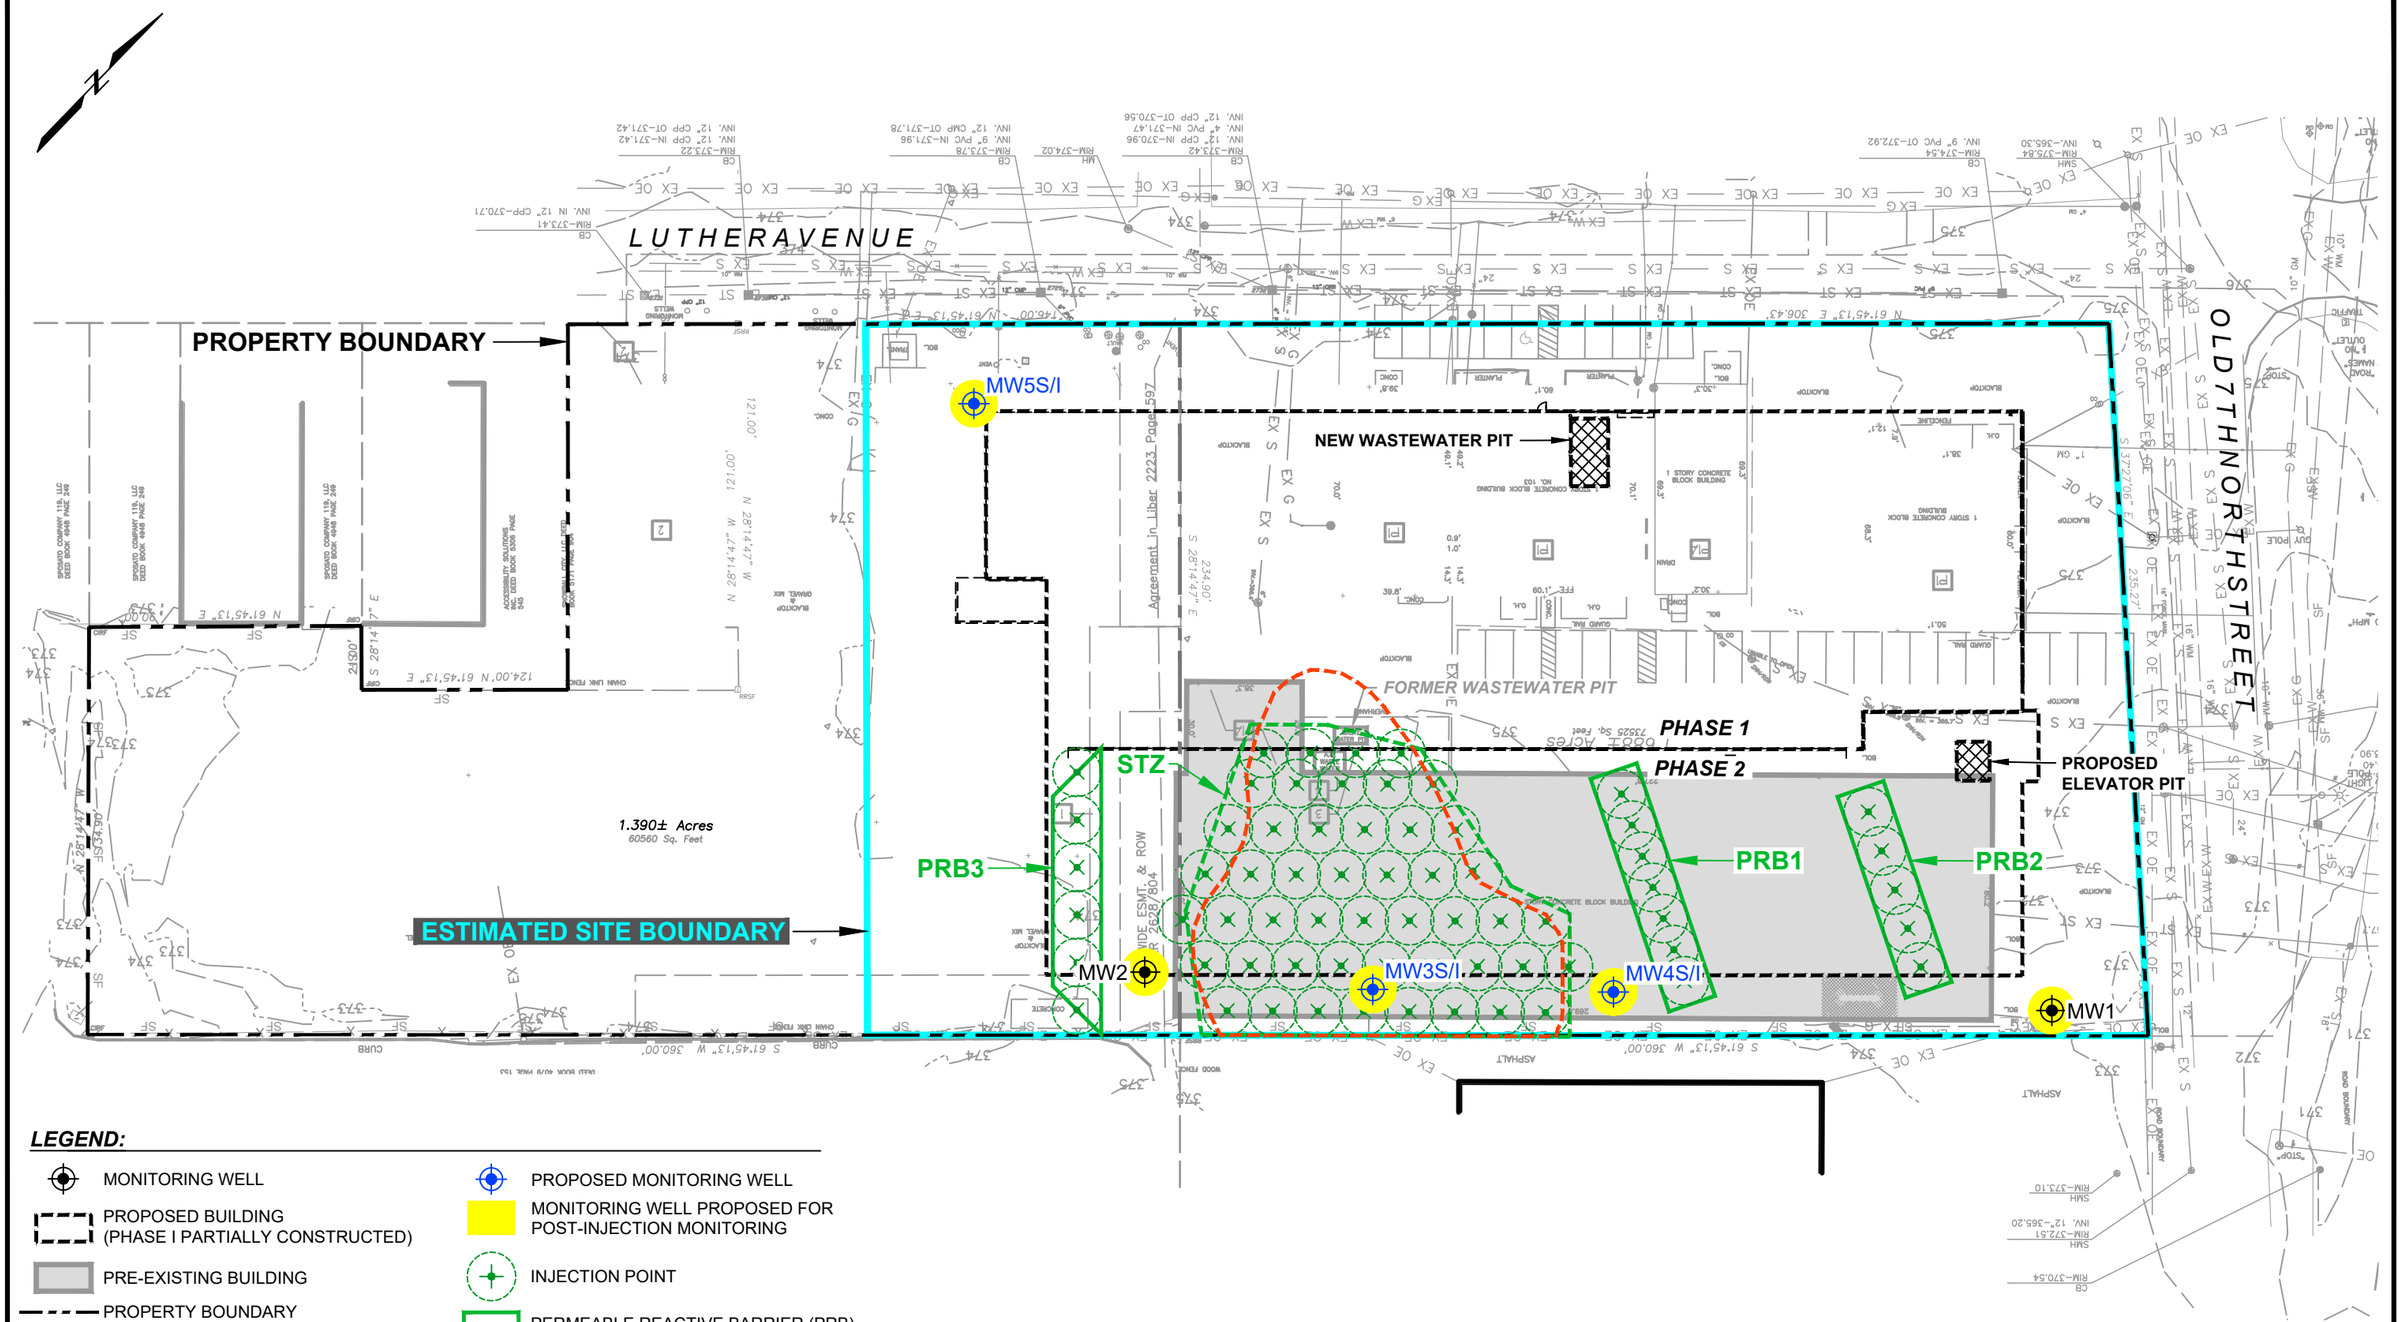
Upon completion of survey work, IET began injection activities on May 23, 2022 using two crews – each with a trailer-based mixing and injection system and a direct-push drilling rig – working at opposite ends of the injection area, starting with the PRBs and working inward toward the source zone injection area. PRBs were injected first to counteract anticipated mounding in the primary injection area. Once the PRBs were complete, IET commenced injections in the source zone injection area (see Figure). The NYSDEC (Project Manager Mike Belveg) visited the site on May 25, 2022 to observe injection activities. IET discontinued work activities on May 27,2022 and resumed on May 31, 2022 after the holiday weekend. The injections were completed on June 3, 2022 and IET cleaned up the work area demobilized personnel and equipment.

In general, injections were performed in accordance with the plan and approach described in the IRM Work Plan. However, certain modifications were required, as follows:

- Several locations along the northwest edge of the primary injection area were immediately adjacent to the new Phase 1 building and needed to be moved approximately 4 feet southeast to avoid hitting the new building footers.

- Subsurface obstructions were encountered at a few locations and the injection point was relocated a foot or more to avoid the obstruction.

- At some locations the injection process caused daylighting of injection materials either at the injection point or at some other location several feet away. The daylighting occurred in localized areas and did not result in overland flow beyond the work area. When daylighting occurred, injection pressures were reduced to slow the injection process. Also, because the daylighting frequently occurred at nearby prior injection points, drilling tools were left in place, when possible, to minimize daylighting through the borehole. Also, in cases where all the target injection quantity could not be reasonably injected at a given location, the remaining material was distributed among adjacent injection points such that the total design injection volume could still be delivered to the subsurface.



A photolog (Appendix A) and IET's field summary report (Appendix B) are attached. As indicated in IET's documentation, the target quantities of all materials were delivered to the subsurface, although the distribution varied from target quantities at each location based on field conditions. In total, 5,200 gallons of EZVI and 14,400 gallons of slurry containing ZVI and nutrients were injected within the target depth zone of approximately 8 to 20 feet below grade.

No exceedances of CAMP action levels occurred during the course of the injection activities and there were no health and safety incidents.

Please feel free to contact us with any questions.

Executive Summary

On behalf of GEI, Innovative Environmental Technologies, Inc. (IET) has prepared the following injection report. This report has been prepared to document remediation activities conducted at the site.

The injection program was implemented from May 23rd to June 3rd, 2022. The remedial approach employed synergistic reductive dechlorination chemistry, utilizing zero valent iron, various organic hydrogen donors, nutrients and vitamins. The integration of both abiotic and biotic remedial compounds allow for rapid dechlorination reactions and long lasting biological attenuation.

The materials introduced across Areas PRB-1, PRB-2, PRB-3 and Area A included 12,209 pounds of Zero Valent Iron, 1,080 pounds of Nutrient, 3,138 pounds of Hydrolyzed Kelp, 13,256 pounds of Calcium Propionate, 1,080 pounds of Sodium Sulfite, 17,000 pounds of Provect-IR, 1,080 pounds of Yeast Extract, 5,200 gallons of EZVI, 1,962 grams of Vitamin B12, 27,648 grams of Vitamin B2, and 29,460 grams of Red Yeast Rice suspended in water to create approximately 21,600 gallons of injectant volume. Daylighting of the injected reagent occurred from several locations across the site and in these instances injectant volume was distributed to adjacent or nearby injection locations. The point by point dosages along with instances of daylighting are also noted in the attached field logs.

Introduction

The 113 7th North St. site located in Liverpool, New York was identified as having soils and groundwater impacted by the historical release of chlorinated solvents. The primary compounds of concern were Tetrachloroethene (PCE) and its associated daughter products. An injection program was proposed by IET for the remediation of CVOC impacts in Area A and 3 downgradient PRB Areas (PRB-1, PRB-2 and PRB-3) utilizing direct push tooling and synergistic reductive dechlorination technologies.

Remediation Implementation

Injection Procedures

IET completed the fifty-six injection locations (56 intervals total) proposed for the Treatment Area and 3 permeable reactive barriers (PRBs). Details regarding each injection attempt are provided in the field logs in the Appendix.

FIGURE 1: AMS 9500 VTR

Direct-Push-Driven Perforated Rod Placement

An AMS DPT unit comparable to the one pictured in Figure 1, was utilized to drive the injection screen (as seen in Figure 2) to depths ranging from 8 to 20 feet below ground surface (bgs). It is at these depths, that the likelihood exists of being in close proximity to the targeted waters in the more permeable layers that were identified during characterization of the site. These more permeable layers are those believed to have historically provided the preferential pathways taken by the dissolved-phase CVOCs.

Subsurface Pathway Development

Compressed nitrogen was used to propel all injectants into the subsurface. Compressed nitrogen was first injected into the subsurface at approximately 150 pounds per square inch (psi) until a significant pressure drop was observed at the injection pressure vessel. This process is referred to as pathway development. The intent of this step is to open pathways in the subsurface for the injectants to follow. These pathways are believed to be those more permeable pathways along which CVOCs are more likely to have

FIGURE 2: RETRACTABLE INJECTION SCREEN

migrated, both in the vadose and saturated zones. Liquid and liquid-entrained injectants are then delivered with pressurized gas to the pathways that were produced during the development step.

ZVI, Organic Hydrogen, Nutrient and Vitamin Injection

A colloidal suspension of 15-40 micron zero valent iron (ZVI) was immediately injected into the subsurface fractures and voids that were developed during the compressed nitrogen injection step. Immediately following, under constant pressure the injectant slurry was then introduced.

Liquid Rinse

A small amount of water was injected to clear the injection lines of the injectant and promotes mounding of groundwater into the vadose zone.

Post Injection Line Purge

Compressed nitrogen was injected to clear the lines of all material and to force the remedial components further into the formation before moving to the next injection location.

Site Map

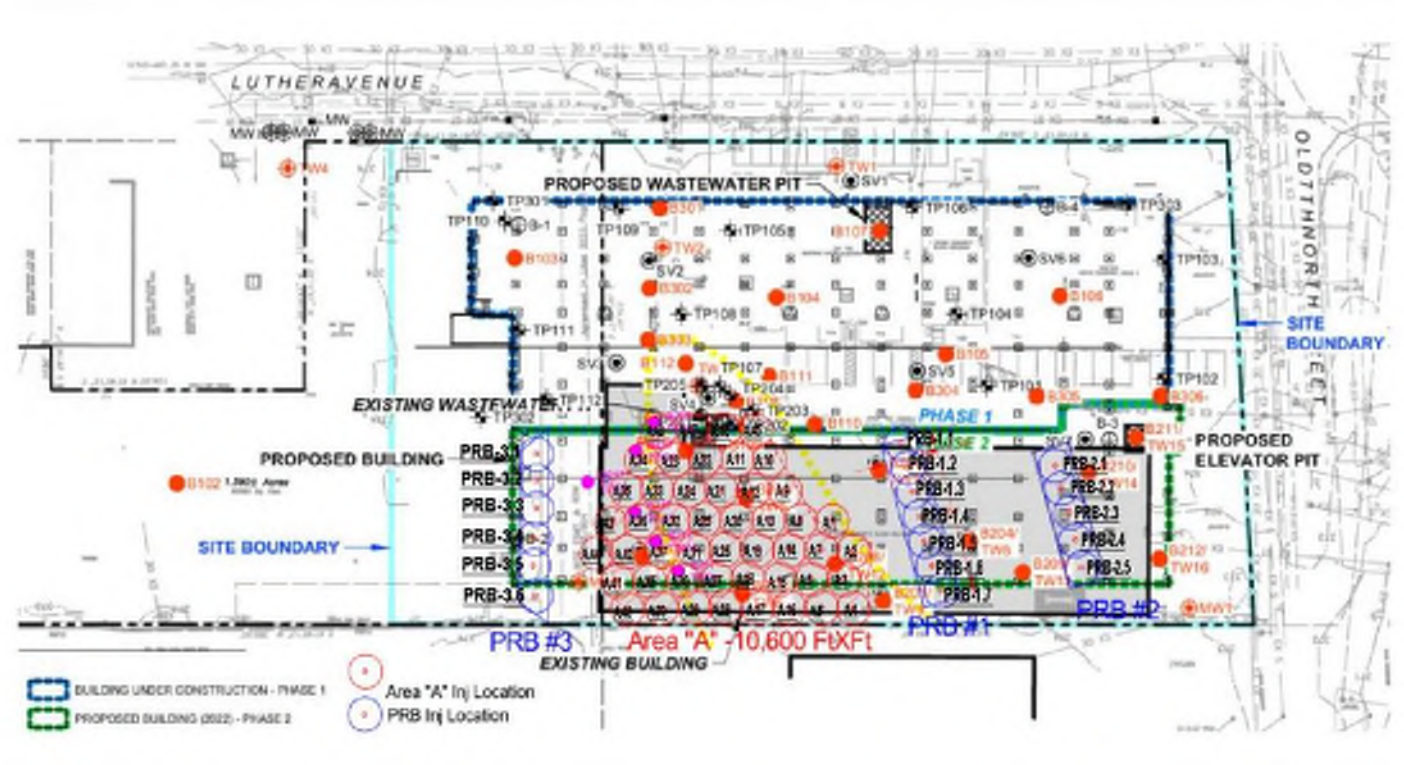

FIGURE 3: GENERAL INJECTION IMPLEMENTATION – INJECTION LOCATIONS

Conclusion

The injection program at the 113 7th North St. site was implemented based on the proposed design with slight field modifications which were required because of daylighting. It is expected that the injection event will yield positive results in the areas targeted. IET looks forward the assessing the data following future sampling events and following up with any additional work required at the site.

WELL DECOMMISSIONING RECORD

Site Name: Unifirst Liverpool Laundry Facility	Well I.D.: MW1
Site Location: 113 7th North Street, Liverpool, NY 13088	Driller: Roger Buley
Drilling Co.: Cascade Remediation Services	Inspector: Yusef Taylor
	Date: 3/11/2022

DECOMMISSIONING DATA
(Fill in all that apply)

OVERDRILLING	
Interval Drilled	
Drilling Method(s)	
Borehole Dia. (in.)	
Temporary Casing Installed? (y/n)	
Depth temporary casing installed	
Casing type/dia. (in.)	
Method of installing	
CASING PULLING	
Method employed	
Casing retrieved (feet)	
Casing type/dia. (in)	
CASING PERFORATING	
Equipment used	
Number of perforations/foot	
Size of perforations	
Interval perforated	
GROUTING	
Interval grouted (FBLS)	0-15
# of batches prepared	1
For each batch record:	
Quantity of water used (gal.)	7
Quantity of cement used (lbs.)	94
Cement type	Portland
Quantity of bentonite used (lbs.)	1
Quantity of calcium chloride used (lbs.)	
Volume of grout prepared (gal.)	8
Volume of grout used (gal.)	6

AUTHORIZED WASTE TYPES BY DESTINATION FACILITY:

The Permittee is Authorized to Transport the Following Waste Type(s) to the Destination Facility listed :

Destination Facility	Location	Waste Type(s)	Note
Adirondack Plastics & Paper Recycling, Inc.	Argyle , NY	Non-Hazardous Industrial/Commercial	
AERC RECYCLING SOLUTIONS (MITCHELL AVE)	ALLENTOWN , PA	Non-Hazardous Industrial/Commercial Petroleum Contaminated Soil Hazardous Industrial/Commercial Universal Waste	
Allied Waste Niagara Falls Landfill	Niagara Falls , NY	Non-Hazardous Industrial/Commercial Petroleum Contaminated Soil	
AMERICAN LAMP RECYCLING, LLC	MARLBORO , NY	Non-Hazardous Industrial/Commercial Hazardous Industrial/Commercial Universal Waste	
American Recyclers Transfer Station	Tonawanda , NY	Non-Hazardous Industrial/Commercial Petroleum Contaminated Soil Hazardous Industrial/Commercial Waste Oil Universal Waste	
AUBURN (C) STP	AUBURN , NY	Non-Hazardous Industrial/Commercial Grease Trap Waste Septage only (residential) Non-Residential Raw Sewage or Sewage-Contaminated Wastes	
Auburn Landfill No 2	Auburn , NY	Non-Hazardous Industrial/Commercial	

*** AUTHORIZED WASTE TYPES BY DESTINATION FACILITY LISTING (continued on next page) ***

NOTE: By acceptance of this permit, the permittee agrees that the permit is contingent upon strict compliance with the Environmental Conservation Law, all applicable regulations, and the General Conditions printed on the back of this page.

ADDRESS:

New York State Department of Environmental Conservation
Division of Materials Management - Waste Transporter Program
625 Broadway, 9th Floor
Albany, NY 12233-7251

AUTHORIZED SIGNATURE: Laura Stevens Digitally signed by Laura Stevens Date: 2023.02.28 14:28:23 -05'00' Date:____/____/____

WASTE TRANSPORTER PERMIT

GENERAL CONDITIONS

The permittee must:

1. Carry a copy of this waste transporter permit in each vehicle to transport waste. Failure to produce a copy of the permit upon request is a violation of the permit.

2. Display the full name of the transporter on both sides of each vehicle and display the waste transporter permit number on both sides and rear of each vehicle containing waste. The displayed name and permit number must be in characters at least three inches high and of a color that contrasts sharply with the background.

3. Transport waste only in authorized vehicles. An authorized vehicle is one that is listed on this permit.

4. Submit to the Department a modification application for additions/deletions to the authorized fleet of vehicles. The permittee must wait for a modified permit before operating the vehicles identified in the modification application.

5. Submit to the Department a modification application to add a new waste category or a new destination facility, or to change the current waste or destination facility category. The permittee must wait for a modified permit before transporting new waste types or transporting to new destination facilities.

6. Submit to the Department a modification application for change of address or company name.

7. Comply with requirements for placarding and packaging as set forth in New York State Transportation Law as well as any applicable federal rules and regulations.

8. Contain all wastes in the vehicle so there is no leaking, blowing, or other discharge of waste.

9. Use vehicles to transport only materials not intended for human or animal consumption unless the vehicle is properly cleaned.

10. Comply with requirements for manifesting hazardous waste, regulated medical waste, or low-level radioactive waste as set forth in the New York State Environmental Conservation Law and the implementing regulations. Transporters who provide a pre-printed manifest to a generator/shipper/ offeror of regulated waste shall ensure that all information is correct and clearly legible on all copies of the manifest.

11. Deliver waste only to transfer, storage .. treatment and disposal facilities authorized to accept such waste. Permittee must demonstrate that facilities are so authorized if requested to do so.

12. Maintain liability insurance as required by New York State Environmental Conservation Law.

13. Maintain records of the amount of each waste type transported to each destination facility on a calendar-year basis. The transporter is obligated to provide a report of this information to the Department at the time of permit renewal, or to any law enforcement officer, if requested to do so.

14. Pay regulatory fees on an annual basis. Non-payment may be cause for revocation or suspension of permit.

15. This permit is not transferrable. A change of ownership will invalidate this permit.

16. This permit does not relieve the permittee from the obligation to obtain any other approvals or permits, or from complying with any other applicable federal, state, or local requirement.

17. Renewal applications must be submitted no less than 30 days prior to the expiration date of the permit to:
