Phase I Environmental Site Assessment

18 EAST CAYUGA STREET OSWEGO, NEW YORK

This Phase I Environmental Site Assessment was conducted in accordance with the EPA's All Appropriate Inquiries Rule – Environmental Site Assessments, Phase I Investigations and ASTM's revised Phase I Environmental Site Assessment Standard (ASTM E 1527-13) – that established the specific regulatory requirements and standards. Any exceptions to, or deletions from, this practice are described in Section 2.0 of this report.

The findings, recommendations, and conclusions contained in this report are based solely upon EMS Environmental Incorporated's (EMS) assessment and are subject to the limitations set forth in this report at the time it was prepared. Use of and/or reliance upon this report shall be subject to the Terms and Conditions under this report was provided to SRE Midtown Garage Acquisitions LLC, SRE Midtown Acquisitions LLC and The Sutton Companies and such use or reliance shall only be authorized by EMS.

EXECUTIVE SUMMARY

Phase I Environmental Site Assessment Findings and Environmental Considerations

EMS Environmental, Inc. (EMS) was contracted by The Sutton Companies to conduct this Phase I Environmental Site Assessment (ESA) at the Subject Property located at 18 East Cayuga Street and 83-87 East 1st Street, Oswego, NY. The purpose of this report was to provide an environmental review for the redevelopment and financial applications of the Subject Property. We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 18 East Cayuga Street and 83-87 East 1st Street, Oswego, New York (the Subject Property). This assessment has revealed the following recognized environmental conditions in connection with the Subject Property:

REC- 1

The Subject Property is listed in the State Superfund Program as a non-registry, Class A state hazardous waste site (HSWDS/SHWS). The NYSDEC define a Class A SHWS, as a property that has been placed in a state remedial program (i.e., Brownfields Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective Action Program) where assessment/investigative work is underway and not yet complete. It appears the Subject Property is located within a Brownfields Opportunity Area (BOA) when the City of Oswego applied for State funding for renovation of underutilized properties. The City of Oswego and its consultant identified past uses of the Subject Property included a machine shop, filling station, multiple auto repair facilities and potentially a photography studio. The NYSDEC Database Site Record is presented in **Appendix G**. The Subject Property can be removed or reclassified from the State Superfund Program if it is determined that there are no environmental concerns through investigation and does not qualify for listing on the Registry.

EMS completed a Limited Phase II ESA of the 83-87 East 1st Street parking lot parcel (tax parcel ID #128.47-02-05), in April 2013. The Limited Phase II ESA targeted areas of the property where the locations of the former machine shop, auto repair, and filling stations were located. The subsurface investigation consisted of the installation of eight soil borings, and laboratory analysis of soil samples from four of the eight soil borings. Laboratory analytical results of soil samples indicated all concentrations were below NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values, and concluded no further investigation was warranted at that time. The Report is included in **Appendix H**.

While it is the opinion of the Environmental Professional that past use of the Subject Property has minimal potential to have impacted the subject site, and have investigated the parking lot parcel of the Subject Property, the need for additional investigation is within the footprint of the building could be warranted to delist or reclassify the Subject Property from the State Superfund Program.

1.0 INTRODUCTION

This report presents the results of the All Appropriate Inquiries (AAI) Phase I Environmental Site Assessment (ESA) conducted by EMS Environmental, Inc. (EMS) at the property located at 18 East Cayuga Street and 83-87 East 1st Street, City of Oswego, Oswego County, New York (Subject Property). EMS was contracted by The Sutton Companies, SRE Midtown Garage Acquisitions LLC and SRE Midtown Acquisitions LLC (SRE) to conduct this Phase I ESA. The Subject Property (tax parcel ID #128.47-02-04 & #128.47-02-05) consists of approximately two adjacent parcels totaling approximately 2-acres. The Subject Property is developed with a 71,272 sq.ft commercial building and 31,000 sq.ft asphalt parking lot.

The location of the Subject Property is depicted in **Figure 1**. An aerial map showing the Subject Property and surrounding properties is provided as **Figure 2**.

2.0 PURPOSE AND SCOPE OF PHASE I ENVIRONMENTAL SITE ASSESSMENT

2.1 Purpose

The objectives of the ESA are to assess the Subject Property's environmental integrity, provide environmental due diligence for submission for funding applications, and provide appropriate actions during the redevelopment of the parcels. The results of the ESA are also intended to demonstrate that the client has exercised due diligence in accordance with accepted industry practices and standards (i.e., American Society for Testing and Materials document *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process [ASTM Standard Practice E 1527-13]*).

2.2 Detailed Scope-of-Services

This ESA was conducted to determine environmental conditions associated with the approximate 2-acre property located at 18 East Cayuga Street and 83-87 East 1st Street, Oswego, New York. The Site is referred to in the ESA report as the "Subject Property". EMS was contracted on January 31, 2018 to perform the ESA by Sutton. The Subject Property is currently owned by SRE Midtown Acquisitions LLC.

EMS performed the Phase I ESA in general conformance with the standards set forth in the ASTM Standard Practice E 1527-13. The ESA included identification and evaluation of *recognized environmental conditions* (RECs) at the Subject Property, within the scope, time constraints, and budgetary considerations of the ESA. The term *recognized environmental condition*, as defined by ASTM Standard Practice E 1527-13, is defined as "the presence or likely presence of any *hazardous substances* or *petroleum products* in, on or at a *property* due to any release to the environment, under conditions indicative of a release to the environment, or under conditions that pose a *material threat* of a future release to the environment". Conditions determined to be *de minimis* are not *recognized environmental conditions*. ASTM Standard Practice E 1527-13 provides definitions for the terms used above that are presented in italics.

The tasks comprising the ESA were conducted as an initial screening to provide a reasonable level of investigation for identifying *recognized environmental conditions*. A Phase I Environmental Site Assessment is less rigorous than an environmental audit and is not intended to address regulatory compliance. EMS makes no representation or warranty that the past or current operations, at the Subject Property, are, or have been, in compliance with all applicable Federal, State, and local laws, regulations and codes.

The scope of this assessment is intended to aid in evaluating whether additional investigation, such as qualitative or quantitative contamination studies, would be prudent. EMS utilized a trained environmental professional to conduct the ESA in conformance with Section 7.5 of ASTM Standard Practice E 1527-13 to identify, to the extent feasible, RECs in connection with the Subject Property. The ESA consists of four components:

- A visual inspection of the Subject Property and nearby properties;
- An evaluation of the historical property use by review of the following sources:
 - Fire Insurance Maps;
 - Aerial Photographs;
 - Historic Topographic Maps;
 - City Directories;
 - A review of records obtained from federal, state and local regulatory agencies for documented soil and/or groundwater investigations conducted at the Subject Property and the vicinity;
 - A review of available documents from local agencies to evaluate development of the Subject Property and, where reasonably available or relevant to the Subject Property and adjacent properties.
- Interviews with personnel familiar with the Subject Property and surrounding areas;
- A review of any available previous Environmental Site Assessments conducted at the Subject Property or adjacent properties.

Under the 2002 Small Business Liability and Brownfields Revitalization Act, Congress ordered the U.S. EPA to codify the first federal environmental site assessment rule to address each of ten steps that must be satisfied prior to a property purchase, to qualify a landowner for liability protection under CERCLA. Effective November 1, 2006, a property purchaser must comply with either the federal rule entitled “Standards and Practices for All Appropriate Inquiries” (40 CFR Part 312) or ASTM’s “Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527-13) effective November 6, 2013, to qualify as an innocent landowner, contiguous property owner or bona fide prospective purchaser under CERCLA.

The ESA activities described herein were conducted in accordance with generally accepted standards, practices, and procedures (expressed or implied) in effect at the time of the ESA, relative to 40 CFR Part 312 and ASTM E 1527-13.

2.3 Limitations and Exceptions

The ESA was prepared as a result of a contractual agreement that defined the approach and scope of services to be employed during the course of the investigation. The opinions and conclusions expressed in this study have been based on the results of these contracted services. The services provided by EMS should not be construed to be a warranty or guarantee that no environmental impairments exist at the Subject Property, or that all environmental impairments have been uncovered. Findings within the ESA are based on information collected from observations made on the day of the inspection and from reasonably ascertainable information obtained from select public agencies and private sources.

No conclusions are stated or implied concerning the suitability of the Subject Property for its current or eventual use. This document is not intended for purposes other than those expressly set forth herein, or for use by parties other than the client.

Changes in the condition of the Subject Property may occur with time due to either natural processes or human activities. The findings presented in this report are based on site conditions observed at the time of the investigation. Also, EMS has relied, in part, on good faith representations made to EMS regarding known conditions at the Subject Property or adjoining properties. EMS cannot be responsible for any errors or omissions in this investigation resulting from incomplete or inaccurate disclosures by the client or other contacts.

This report has been based only on information that was obtained and reviewed over the period of study. EMS represents that the contracted services to assess the site for existing environmental impairments were carried out diligently by an environmental professional.

In accordance with ASTM Standard Practice E 1527-13, this ESA does not include a formal assessment of wetlands, endangered species, indoor air quality, mold or radon. However, EMS has obtained some information related to some of the proceeding issues, as discussed below within this report. EMS did contract for an asbestos-containing materials (ACM), lead-based paint (LBP) survey to be completed, and the findings will be submitted under separate cover.

2.4 User Reliance

EMS provides the Phase I ESA for the use and reliance of Sutton. No other person or entity is authorized to rely on the information and conclusions in this report, without the expressed written consent of EMS.

3.0 DESCRIPTION AND CURRENT USE

3.1 Site Location

The Subject Property is located at 18 East Cayuga Street (tax parcel ID #128.47-02-04) and 83-87 East 1st Street (tax parcel ID #128.47-02-05). The Subject Property is situated on the south side of East Cayuga Street, and occupies almost the entire block between East Cayuga Street and East Bridge Street to the south, and between East 1st Street to the west and East 2nd Street to the east. Figure 1 identifies the location of the Subject Property.

3.2 Site Description

The Subject Property exists as a rectangular shaped parcel of land covering approximately 2 acres. The topography at the Subject Property is at grade with the street frontage along East 1st street, and approximately 10 feet above the grade of East 2nd street. The Subject Property is developed with a two-story commercial building and asphalt parking lot. Concrete driveways, sidewalks and courtyard surrounds the entire building. An Aerial Map showing the Subject Property and surrounding properties is included as **Figure 2**. Photographs of the Subject Property are provided in **Appendix A**.

3.3 *Building Construction and Site Operation*

The commercial building and two-story parking garage was constructed in 1966. Prior to the construction of the existing building and parking garage, the Subject Property was sub-divided with multi parcels developed with various commercial establishments that included hotels, auto sales, auto repair, filling station, machine shop, printing press, hardware stores, lumber yards, flour and feed storage, and beer bottling. All these structures were razed, prior to the construction of the existing plaza and parking lot. The existing multi-unit commercial building has contained Rite-Aid pharmacy, an Eckerd Pharmacy, a Joann Fabrics, an Off-Track Betting, Mid China Buffet, RadioShack, and a dollar store. Current tenants include Post City Copy Centers, Green Planet Grocery Natural Foods Store, Oswego County Opportunities, Inc. and Edge Artistic Dance Center.

The Subject Property is currently developed with a two-story 71,272 sq.ft commercial building and 31,000 sq.ft asphalt parking lot. The top floor of the parking garage was removed in 2015. The commercial building, is constructed with steel, masonry and wood on a poured concrete slab-on-grade foundation.

The Subject Property is serviced by municipal water supply and sanitary sewer. Natural gas and electricity is provided to the Subject Property via underground gas lines and power lines. Stormwater catch basin were not observed on the Subject Property.

3.4 *Adjacent and Surrounding Land Use*

The Subject Property is in a commercial area of the City of Oswego and is bordered by:

North:	East Cayuga Street, then Port City Day Spa, and Wet Paint Company;
South:	Farmers Insurance Office/Summit Physical Therapy, East Bridge Street, Pathfinder Bank, and office building;
East:	East 2nd Street, then Infinity Auto, Goodyear Auto Center, the Lighthouse Tavern, and Food Chow City;
West:	East 1 st Street, then a Subway Restaurant, Cricket Wireless, a Quality Inn & Suites, and the Oswego River.

4.0 *PHYSIOGRAPHIC FEATURES*

4.1 *Regional Topography*

Based on the 7.5 minute USGS topographic quadrangle map for Oswego West, New York the Subject Property is at an elevation of approximately 281 feet above mean sea level (msl). The topography in the immediate vicinity of the Subject Property slopes to the west - northwest.

4.2 *Regional Soil and Geology*

The Envirosearch Corporation (ESC) Government Records report names the soil type as Urban Land. The Phase II ESA completed by EMS in April 2103 identified overburden soil deposits consisting of brown sand and gravel with clayey silt to depths ranging from approximately 0.5 feet to twelve feet below ground surface (bgs).

4.3 Regional Hydrogeology

No surface water features exist at the Subject Property. Based on the topography of the area, groundwater is likely to flow west-northwest. Groundwater in the area is estimated to be approximately 10 feet below ground surface. The Oswego River is located approximately 320 feet to the west (behind the Quality Inn & Suites) and Lake Ontario is approximately 0.5 miles to the north.

4.4 Floodplains

According to Federal Emergency Management Agency floodplain maps reviewed within the ESC report, the Subject Property does not lie within a mapped floodplain.

4.5 Wetlands

A U.S. Fish and Wildlife Service National Wetland Inventory Map covering the Subject Property was reviewed within the ESC report. The map did not indicate the presence of mapped wetlands at the Subject Property.

5.0 HISTORIC RECORD

EMS reviewed various forms of historical documentation to produce a historic record of the Subject Property. Based on this historic research, the Subject Property was developed since as early as 1890. Since at least 1890 the Subject Property has been utilized for commercial purposes to present.

5.1 Certified Sanborn Map Report

Sanborn Fire Insurance Maps were developed for use by insurance companies to depict facilities and properties and their uses for many locations throughout the United States. These maps provide prior land use history and assist in assessing whether there may be potential environmental contamination on or near the Subject Property. These maps, which have been periodically updated since the late 19th century, often provide valuable insight into historical site uses. The following Sanborn Fire Insurance Maps were reviewed through the ESC Certified Sanborn Map Report and are attached as **Appendix B**:

- Map dated 1890
- Map dated 1897
- Map dated 1907
- Map dated 1924
- Map dated 1960
- Map dated 1972

Using the referenced Sanborn Fire Insurance Maps, EMS was able to form the following inferences of the subject property and surrounding areas:

- 1890 Map – Map shows the Subject Property contained several commercial properties that included: the Hamilton Hotel, lumber yard, storage facilities, stables, hardware stores, tin shop, saloon, restaurant, beer storage, general stores, and offices. Adjacent properties to the east, west and south, were utilized as commercial properties similar to the Subject Property. The properties to the north were lumber and grain storage and an iron works facility.

- 1897 Map – Map shows the Subject Property and surrounding properties relatively unchanged from the 1890 map, with the exception that a beer bottling facility and flour and feed store exist on the northern end and a cycle repair shop exists towards the southeast end of the Subject Property.
- 1907 Map – Map shows the Subject Property and surrounding properties relatively unchanged from the 1897 map.
- 1924 Map – Map shows the Nacey Hotel, auto sales and repair shops, a machine shop and a wholesale grocery store exists on the Subject Property. The surrounding properties are relatively unchanged from the 1907 map.
- 1960 Map – Maps shows the Nacey Hotel is now the Hotel Lannon, and an auto repair and filling station exists on the Subject Property. The surrounding properties are relatively unchanged from the 1924 map.
- 1972 Map – Map lists the Subject Property as Oswego Midtown Center, and illustrates the layout of the property as it currently exists. The maps lists the building as containing 7 stores and parking lot as a two deck parking garage with the 2nd deck at grade with East 2nd Street and the 1st level at grade with East 1st Street. The iron works to northeast has been razed. The property to the west is now a Holiday Inn (where the current Quality Inn & Suites exists).

The Sanborn Fire Insurance Maps indicate the Subject Property has been developed since at least 1890, and that the area was mostly commercial properties from 1890 to present.

5.2 City Directories

EMS reviewed the attached ESC City Directory Abstract for the Subject Property and surrounding properties in order to gather information pertaining to past site occupants and site uses. The ESC City Directory Abstract is a screening tool in evaluating potential liability on a Subject Property resulting from past activities. The ESC City Directory Abstract is attached as **Appendix C**.

The following is a summary of city directory results for the site and surrounding properties.

Subject Property Search Addresses:

5.3 *Historical Aerial Photographs*

Historical land use at the Subject Property and the immediate surrounding areas was further investigated using historical aerial photographs from 1960, 1970, 1972, 1981, 1985, 1994, 2006, and 2008. The aerial photographs are presented in **Appendix D**. The aerial photographs indicated the following:

1960 (scale 1" = 1000') – A review of this aerial photo shows that the Subject Property developed prior to the construction of the Midtown Plaza building. The Quality Inn building to the west has not been constructed. The iron work facility to the northeast is visible. The surrounding properties have been developed.

1970 (scale 1" = 500') – A review of this aerial photo shows that the Subject Property developed as it currently exists. The hotel to the west has been constructed, and the iron work building has been razed and re-developed. The remaining surrounding properties appear similar to the 1960 photo.

1972 (scale 1" = 1000') – A review of this aerial photo shows that the Subject Property and surrounding properties appear similar to the 1970 photo.

1981 (scale 1" = 1000') – A review of this aerial photo shows that the Subject Property appears similar to the 1972 photo. A building has been constructed on the property to the northwest of the Subject Property.

1985 (scale 1" = 1000') – A review of this aerial photo shows that the Subject Property is unchanged from the 1981 photo.

1994 (scale 1" = 500') – A review of this aerial photo shows that the Subject Property and surrounding properties are unchanged from the 1985 photo.

2006 (scale 1" = 500') – A review of this aerial photo shows that the Subject Property and surrounding properties are relatively unchanged from the 1994 photo.

2008 (scale 1" = 500') – A review of this aerial photo shows that the Subject Property and surrounding properties are relatively unchanged from the 2006 photo.

5.4 *Historical Topographic Maps*

Historical land use at the Subject Property and the immediate surrounding areas was further investigated using historical topographic maps from 1900, 1960 and 1978. The Historic Topographic Maps are presented in **Appendix E**. The topographic maps indicated the following:

1900 (Scale 1:62,500) – A review of the map identifies no structures or symbols on the Subject Property or significant development in the general area surrounding the Subject Property.

1960 (Scale 1:24,000) – A review of the map identifies no structures or symbols on the Subject Property. It appears that development is illustrated on the property to the west and the iron work building to the northeast of the Subject Property.

1978 (Scale 1:24,000) – A review of the map identifies no structures or symbols on the Subject Property. The hotel to the west has been constructed, and the iron works property has been redeveloped.

5.5 *Previous Environmental Reports*

EMS was able to review the following the Environmental Reports:

- A Phase I ESA completed by PES Associates, dated November 23, 2010. The Phase I ESA found no RECs, however several data gaps were identified.
- A Historic Property Usage Survey, dated May 9, 2012, was completed by EMS to close the historic data gaps in the PES Associates Phase I ESA. The survey identified the property did historically contain a machine shop, auto sales, repair and a filling station.
- A Limited Phase II ESA of the parking lot parcel, dated April 19, 2013, completed by EMS. The Limited Phase II ESA consisted of the installation of eight soil borings, and laboratory analysis of soil samples from four of the eight soil borings. Laboratory analytical results of soil samples indicated all concentrations were below New York State Department of Conservation (NYSDEC) CP-51 Unrestricted Use Soil Cleanup Guidance Values, and concluded no further investigation is warranted at that time.

6.0 REGULATORY REVIEW

EMS obtained a report of environmental regulatory agency database listings from ESC to fulfill the historical document review requirements. The list and definitions of the databases searched, and the associated search distances from the Subject Property are identified in the regulatory agency report presented in **Appendix F**.

The regulatory agency database search report listed a number of sites identified as “orphaned.” The database search firm was unable to confirm the physical locations of these sites relative to the Subject Property or assess whether they were located within the designated search radii. EMS independently reviewed the locations of these orphaned sites, to the extent possible, using various maps and knowledge of the Subject Property area. The orphaned sites determined to be within the designated search radii were included in our evaluation.

EMS reviewed the results of the database search report to identify reported release sites in the vicinity of the Subject Property that were considered to have a potential to have adversely impacted the Subject Property (i.e., are known to have or expected to result in potential environmental risks). Reported release sites identified in the regulatory agency database search report were evaluated with respect to the nature and extent of a given release, the distance of the reported release site from the Subject Property, the stratigraphy of soils, the expected soil permeability, and the topographic position of a reported release site with respect to known or expected local and/or regional groundwater flow direction.

Generally, reported release sites located within 0.25 miles upgradient or 0.125 miles cross-gradient or immediately adjacent in the downgradient direction are considered to have potential to have impacted the Subject Property and were further assessed by reviewing agency records and/or interviewing agency personnel. Sites that were listed in the database search report, but not identified as a release site (for example, a site listed as a hazardous waste generator but not as having had a release), and sites that were listed as being “closed” were not considered to have a potential to have impacted the Subject Property.

HW/Contaminated Sites	0.50 miles	No	0
Manifest/FINDS	0.125 miles	No	3
Brownfields	0.50 miles	No	9
Dry Cleaners	0.25 miles	No	1

The Subject Property was listed in the Hazardous Substance Waste Disposal Site / State Hazardous Waste Site (HSWDS/SHWS) databases searched within the ESC report. As referenced in the above Table, sixty-two (62) area properties were identified within their respective search radius. Due to the amount of properties identified, only documented properties adjacent to or with known locations of equal or higher elevations that could impact the Subject Property identified within the ASTM-prescribed search radii have been reorganized below:

6.1 Federal Records

6.1.1 NPL/SEMS/SEMS-ARCHIVE

National Priority List (NPL) identifies sites for priority cleanup under the Superfund Program. Superfund Enterprise Management System (SEMS), formerly known as CERCLIS, tracks hazardous waste sites, potential hazardous waste sites, and remedial activities performed in support of the Superfund Program. SEMS-ARCHIVE is a lists of sites that are no longer listed or tracked within the SEMS system. There are two NPL, SEMS or SEMS-Archive sites within a 1.0 mile radius of the Subject Property.

Breneman Inc. – 8 East Utica Street – Is listed as a SEMS site, and is located 0.4 mile southeast of the Subject Property. This site is now in the brownfields program, and has known contamination from the past existence of the former Breneman manufacturing facility. The contamination of soils and groundwater at this site are not believe to pose a threat to the Subject Property due to its location and local groundwater flow.

Pollution Abatement Services – 55 East Seneca Street – Is listed as a NPL and SEMS site, and is located approximately 1.5 mile to the west of the Subject Property. This site is actively being remediated and is currently utilizing institutional and engineering controls to contain and cleanup soil and groundwater contamination. The contamination of soils and groundwater at this site are not believe to pose a threat to the Subject Property due to its location and engineering controls in place.

6.1.2 RCRA CORRACTS

Resource Conservation and Recovery Act (RCRA) Corrective Action Listed Sites (CORRACTS) is a list of handlers with RCRA Corrective Action Activity. There are no CORRACTS sites located within a 1.0 mile radius of the subject properties.

6.1.3 RCRA Generator / Non-Generator

RCRA generator lists are EPA's comprehensive database which includes information on sites which generate, transport, store, treat and/or dispose of hazardous waste. There are one RCRA large quantity generators (LQG), no small quantity generators (SQG), two conditionally exempt small quantity generators (CESQG), and four non-generator (do not presently generate hazardous waste) facilities located within a 0.25 mile radius of the subject properties.

Based on the locations of these facilities, they have been determined to have not adversely impacted the environmental integrity of the Subject Property, with the exception of:

Goodyear Auto Service Center – 61 East 2nd Street – Is listed as a CESQG property is the adjacent property to the west of the Subject Property. The Goodyear Auto Service Center has no violation listed.

6.2 State and Tribal Records

6.2.1 HSWDS/SHWS

The State Hazardous Waste Sites (SHWS) records are the states' equivalent to CERCLIS. The data comes from the NYSDEC. There are ten HSWDS/SHWS within a 0.5 mile radius of the Subject Property. The Subject Property is included on this list.

Midtown Plaza (Subject Property) – 18 East Cayuga Street and 83-87 East 1st Street – The Subject Property is was assigned Site Code #738045 on April 20, 2012 in the State Superfund Program. The Site has also been assigned Classification A (active) which is defined by the NYSDEC as a non-registry site that has been placed in any state remedial program (i.e., Brownfields Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective Action Program) where assessment/investigative work is underway and not yet complete. It appears the Subject Property is located within a Brownfields Opportunity Area (BOA) when the City of Oswego applied for State funding for renovation of underutilized properties. The City of Oswego and its consultant identified past uses of the Subject Property included a machine shop, filling station, multiple auto repair facilities and potentially a photography studio. The NYSDEC Database Site Record is presented in **Appendix G**. The Subject Property can be removed or reclassified from the State Superfund Program if it is determined that there are no environmental concerns through investigation and does not qualify for listing on the Registry.

As mentioned in **Section 5.5**, EMS completed a Limited Phase II ESA of the parking lot parcel (tax parcel ID #128.47-02-05), in April 2013. The Limited Phase II ESA targeted areas of the property where the locations of the former machine shop, auto repair, and filling stations were located. The subsurface investigation consisted of the installation of eight soil borings, and laboratory analysis of soil samples from four of the eight soil borings. Laboratory analytical results of soil samples indicated all concentrations were below NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values, and concluded no further investigation was warranted at that time. The Limited Phase II ESA is presented in **Appendix H**.

Based on their location, it has been determined that the remaining 9 sites identified in this list, have not adversely impacted the environmental integrity of the Subject Property.

6.2.2 SWF/LF

The Solid Waste Facility/Landfill Sites (SWF/LF) are the states' inventory of solid waste disposal facilities or landfills. No SWF/LF sites were identified within a 0.50 miles radius of the Subject Property.

6.2.3 LUST/HIST LUST

The Leaking Underground Storage Tank/Historical Leaking Underground Storage Tank (LUST/HIST LUST) incident reports are a listing of leaking underground storage tanks reported. The causes of the incidents are tank test failures, tank failures, or overfill. There are thirteen (13) LUST sites located within 0.25 miles of the Subject Property.

The 13 sites identified all have been closed, therefore they are not believe to have adversely impacted the environmental integrity of the Subject Property.

6.2.4 UST/AST

The UST, and aboveground storage tank databases contain registered tanks listed in the NYSDEC database. There is eight UST and two AST facilities within a 0.25 mile radius of the Subject Property.

Based on the locations of these facilities, they have been determined to have not adversely impacted the environmental integrity of the Subject Property.

6.2.5 NY SPILLS/NY HIST Spills

NY Spills/NY HIST Spills are databases containing records of chemical and petroleum spill incidents. There were three NYSDEC listed spill incidents within a 0.125 mile radius of the subject properties. The three spill incidents were minor and due to their location and closed status were determined to have not adversely impacted the Subject Property.

6.2.7 Orphaned Sites

Sites unplotable by the ESC database were reviewed to determine whether they were located within the designated search radii. EMS has reviewed this list of orphaned sites and has determined from their location and the information reported that these sites are not considered to have negatively impacted the Subject Property.

7.0 INTERVIEWS

Interviews were conducted to obtain information relating to past uses of the site and to determine if RECs exist in connection with the Subject Property. The following is a summary of interviews conducted for this Phase I ESA.

7.1 *Site Representatives*

EMS interviewed Mr. Jim Smith, the Midtown Plaza property manager for Sutton to inquire about present and past use of the property. Mr. Smith has been associated with the Subject Property for 5 years. During the interview, Mr. Smith stated that he has no knowledge of past or present existence of USTs, storage of hazardous materials or an environmental condition that would affect the Subject Property. Additionally, Mr. Louis Fournier, President of Sutton filled out the owner interview sections of the ASTM questionnaire regarding the Subject Property. The completed ASTM questionnaire is attached as **Appendix I**.

8.0 SUBJECT PROPERTY RECONNAISSANCE

8.1 *General Subject Property Observations*

EMS conducted a visual site inspection of the Subject Property on January 31, 2018. The on-site inspection was conducted by Mr. Robert Nigolian. Mr. Nigolian was accompanied by Mr. Smith who provided access to the building. The site reconnaissance included the exterior areas of the Subject Property as well as the interior portions of the Subject Property building. As part of the visual site inspection, Mr. Nigolian filled out the on-site observation sections of the questionnaire regarding the Subject Property. The questionnaire is attached as **Appendix I**.

Access to the Subject Property is provided via driveway from East 1st Street. The Subject Property is developed with one (1) two-story commercial building and asphalt parking lot. The 71,270 square foot slab-on-grade building, is constructed masonry, steel and sheetrock walls. Outside of the footprint of the building, the entire property, with exception of landscaping in the courtyard, is a 31,000 square foot asphalt parking lot, and concrete courtyard and sidewalks that surround the entire property.

The Subject Property is serviced by municipal water supply. Natural gas and electricity is provided to the Subject Property via underground gas lines and power lines. The building is connected to the municipal sewer system. Stormwater catch basins were not observed on the Subject Property.

The building is divided into retail and office space on both the 1st and 2nd floor of the building. Utility and storage rooms are located in the rear of each unit (north end of the building). The building is finished with sheetrock walls, ceiling tile, and linoleum flooring. The roof is finished with a rubber membrane roofing system. The building HVAC units are located on the roof.

Floor drains are located in the restrooms and utility rooms of each unit. No chemicals (outside of typical household cleaners), monitoring wells, or drinking water wells were observed on the Subject Property.

8.2 *Aboveground Storage Tanks*

No evidence of existing ASTs (i.e., secondary containment structures or fueling areas) was observed at the Subject Property. No registered AST's were listed for the Subject Property in the in the ESC report that was obtained as part of this investigation.

8.3 *Underground Storage Tanks*

No evidence of existing USTs (i.e., secondary containment structures or fueling areas) was observed at the Subject Property. No registered UST's were listed for the Subject Property in the in the ESC report that was obtained as part of this investigation.

8.4 *Hydraulic Lifts*

No evidence of past or present hydraulic lifts was identified during the Subject Property reconnaissance.

8.5 *Dry Wells*

No dry wells were identified at the Subject Property during the Subject Property reconnaissance, nor were any identified during the historical research.

8.6 *Polychlorinated Biphenyls*

Electrical transformers, hydraulic equipment, capacitors, and similar equipment may contain polychlorinated biphenyls (PCBs) in hydraulic or dielectric insulating fluids within the units. The federal Toxic Substances Control Act (TSCA) generally prohibited the domestic manufacture of PCBs after 1979; therefore, there is a potential for the dielectric fluid in electrical and hydraulic equipment manufactured prior to that date to contain PCBs.

Electrical service is provided to the Subject Property via underground power lines. Therefore no transformers were observed on or near the Subject Property.

Fluorescent light fixtures were observed within the Subject Property building. Current PCB regulations do not require the removal of non-leaking ballasts/capacitors; however, the EPA recommends that ballasts in older light fixtures be removed and disposed of as part of a regular maintenance program. Fluorescent light fixtures that contain PCBs, but are in good condition, do not ordinarily represent a significant environmental hazard. As part of a regular maintenance program, if any fluid leakage from such fixtures is found, it should be handled by qualified personnel in accordance with current regulations.

8.7 *Hazardous Materials*

No hazardous materials were identified at the Subject Property during the site reconnaissance.

8.8 *Hazardous Waste*

No evidence of hazardous waste storage, generation, or disposal was observed at the Subject Property.

8.9 *Subject Property Utilities/Underground Structures*

The Subject Property is serviced by municipal water supply, sanitary sewer service, electric and natural gas via underground lines. Telecommunications is provided via overhead lines.

8.10 *Solid (non-hazardous) Waste*

During Subject Property reconnaissance, refuse dumpsters were observed on the rear loading dock of the building on the Subject Property.

8.11 *Non-Scope Additional Issues*

According to radon data obtain from the USEPA, Oswego County is identified in Zone 2 in the Federal EPA radon zone. Zone 2 has an average indoor radon level of between 2 and 4 pCi/L and is considered a moderate risk for human exposure. A radon concentration greater than 4 pCi/L would be a health risk.

9.0 PHASE I ESA FINDINGS

EMS has performed this Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 of 18 East Cayuga Street and 83-87 East 1st Street, Oswego, New York, the Subject Property. Any exceptions to, or deletions from, this practice are described in **Section 2.0** of this report. Based on the findings of the Phase I ESA, one REC was identified with the potential to impact the Subject Property.

REC- 1

The Subject Property is listed in the State Superfund Program as a non-registry, Class A state hazardous waste site (HSWDS/SHWS). The Subject Property has been placed in a state remedial program (i.e., Brownfields Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective Action Program) where assessment/investigative work is underway and not yet complete. It appears the Subject Property is located within a Brownfields Opportunity Area (BOA) when the City of Oswego applied for State funding for renovation of underutilized properties. The City of Oswego and its consultant identified past uses of the Subject Property included a machine shop, filling station, multiple auto repair facilities and potentially a photography studio. The NYSDEC Database Site Record is presented

in **Appendix G**. The Subject Property can be removed or reclassified from the State Superfund Program if it is determined that there are no environmental concerns through investigation and does not qualify for listing on the Registry.

EMS completed a Limited Phase II ESA of the 83-87 East 1st Street parking lot parcel (tax parcel ID #128.47-02-05), in April 2013. The Limited Phase II ESA targeted areas of the property where the locations of the former machine shop, auto repair, and filling stations were located. The subsurface investigation consisted of the installation of eight soil borings, and laboratory analysis of soil samples from four of the eight soil borings. Laboratory analytical results of soil samples indicated all concentrations were below NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values, and concluded no further investigation was warranted at that time. The Report is included in **Appendix H**.

While it is the opinion of the Environmental Professional that past use of the Subject Property has minimal potential to have impacted the subject site, and have investigated the parking lot parcel of the Subject Property, the need for additional investigation is within the footprint of the building could be warranted to delist or reclassify the Subject Property from the State Superfund Program.

10.0 OPINION

ASTM Standard Practice E 1527-13 requires the report to include the environmental professional's opinion of the impact on the property of conditions identified in the findings section.

In the interest of presenting a Phase I Environmental Site Assessment that is relatively concise, opinions (and recommendations) which are associated with each finding are presented together within the Findings Section (in the previous **Section 9.0**).

10.1 Data Gaps

The following data gaps were identified:

- A deed or title abstract for the parcels on the Subject Property was not provided and was not reviewed during the writing of this report.

11.0 CONCLUSIONS

EMS has performed this Phase I Environmental Site Assessment, in conformance with the scope and limitations of ASTM Standard Practice E 1527-13, of the Midtown Plaza property located at 18 East Cayuga Street and 83-87 East 1st Street, Oswego, New York (Subject Property). The Subject Property is located in a commercial area of the City of Oswego. The Subject Property is owned by SRE Midtown Garage Acquisitions LLC and SRE Midtown Acquisitions LLC and managed by The Sutton Companies. The Subject Property lands consist of approximately 2 acres that is developed with a 2-story commercial use 71,272 square foot building and 31,000 square foot parking lot. The development of the Subject Property began in at least the 1890s, and was used for commercial purposes. Prior to 1966 when the Plaza was constructed, the property was sub-divided into multiple parcels. Other Subject Property improvements include on grade asphalt paved parking, concrete courtyard and sidewalks. We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of the Subject Property.

This assessment has revealed the following recognized environmental conditions in connection with the Subject Property:

REC- 1

The Subject Property is listed in the State Superfund Program as a non-registry, Class A state hazardous waste site (HSWDS/SHWS). The NYSDEC define a Class A SHWS, as a property that has been placed in a state remedial program (i.e., Brownfields Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program and RCRA Corrective Action Program) where assessment/investigative work is underway and not yet complete. It appears the Subject Property is located within a Brownfields Opportunity Area (BOA) when the City of Oswego applied for State funding for renovation of underutilized properties. The City of Oswego and its consultant identified past uses of the Subject Property included a machine shop, filling station, multiple auto repair facilities and potentially a photography studio. The NYSDEC Database Site Record is presented in **Appendix G**. The Subject Property can be removed or reclassified from the State Superfund Program if it is determined that there are no environmental concerns through investigation and does not qualify for listing on the Registry.

EMS completed a Limited Phase II ESA of the 83-87 East 1st Street parking lot parcel (tax parcel ID #128.47-02-05), in April 2013. The Limited Phase II ESA targeted areas of the property where the locations of the former machine shop, auto repair, and filling stations were located. The subsurface investigation consisted of the installation of eight soil borings, and laboratory analysis of soil samples from four of the eight soil borings. Laboratory analytical results of soil samples indicated all concentrations were below NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values, and concluded no further investigation was warranted at that time. The Report is included in **Appendix H**.

While it is the opinion of the Environmental Professional that past use of the Subject Property has minimal potential to have impacted the subject site, and have investigated the parking lot parcel of the Subject Property, the need for additional investigation is within the footprint of the building could be warranted to delist or reclassify the Subject Property from the State Superfund Program.

13.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONAL

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Robert S. Nigolian
Sr. Project Manager

14.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

Robert S. Nigolian

Mr. Nigolian has been working in the environmental business sector since 1989, both in consulting and in industry. His work has focused on hydrogeology, subsurface assessment, and subsurface remediation of sites affected by hazardous substances and petroleum products, as well as environmental compliance issues and environmental management systems improvement. His responsibilities have include substantial due diligence (both Phase I and Phase II) for property acquisitions, post-acquisition transitions, emergency response planning, emergency response training, pollution prevention plans, remediation management, water quality management, waste management & minimization, and environmental auditing. Mr. Nigolian has prepared Site Monitoring Reports, Remedial Action Plans, Remedial Action Reports, Soil Management Plans, Secondary Containment Assessments, and Secondary Containment Capacity Analysis Reports for submittal to State and Federal Agencies.

Mr. Nigolian received a B.S. degree in Geology from St. Lawrence University.

This Research Summary identifies the products and services provided by Historical Information Gatherers, Inc. (HIG) for the above referenced site location. All products are provided as PDFs unless otherwise noted.

FIM+ Maps

The HIG Historical Map Collection and the United States Library of Congress Map Collection were searched for fire insurance maps (FIM), real estate atlases and similar maps for the site location and adjoining properties. Maps from the HIG Collection were used to create a multi-page file named FIM+Maps. The maps have title blocks that include the map publisher, year the map was created and, if applicable, the year the map was last updated. The years provided are:

1890, 1897, 1907, 1924, 1960, 1972

Disclaimer & Limitation of Liability

This Research Summary and the related documents and images provided by Historical Information Gatherers (hereafter referred to as the "Site Specific HIG Data") contain information obtained from a variety of public and private sources. Additional information for the site and surrounding properties may exist. Accordingly, there can be no guaranty or warranty that the information provided is complete for its particular intended purpose. No warranty expressed or implied, is made whatsoever in connection with the Site Specific HIG Data. Historical Information Gatherers specifically disclaims the making of any such warranties, including without limitation, merchantability or fitness for a particular purpose. Historical Information Gatherers, its officers, employees and independent contractors cannot be held liable to anyone for any loss or damage, whether arising out of errors or omissions, negligence, accident or any other cause, resulting directly or indirectly from any information provided or any information not provided in the Site Specific HIG Data. Any liability on the part of Historical Information Gatherers is strictly limited to a refund equal to the amount paid for the Site Specific HIG Data.

Envirosite's City Directory report is a screening tool designed to assist in evaluating a subject property and possible adjacent properties resulting from past activities. It includes a search and abstract of available city directories and cross reference directories at five year intervals or the closest available intervals. Public map sources are reviewed to determine possible adjoining properties to the front, back, left and right of the property.

The EDR Aerial Photo Decade Package

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. Site Description :

Location: The site is located at 18 East Cayuga Street and 83-87 East 1st Street, Oswego, Oswego County, NY. The site occupies about 1.86 acres, approximately 3,200 feet south of Lake Ontario and 470 feet east of the Oswego River. Site Features: The site is occupied by 76,000 SF and 62,000 SF buildings, surrounded by various paved surfaces. Current Zoning and Land Use: The site is currently underutilized and zoned for commercial use. Land use surrounding the site consists of commercial to the north, south and west, and mixed residential and commercial to the east. Past Use of the Site: The subject property was formerly used for various purposes, including a machine shop, filling station, multiple auto repair facilities, and potentially a photography studio. Site Geology and Hydrology:

Contaminants of Concern : N/R

Site Environmental Assessment : N/R

Site Health Assessment : As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

Caller Remark : Anonymous caller stated observed fuel truck delivering fuel to vessels from parking lot of Best Western Hotel at mouth of Oswego River. Occassionally a sheen is noted after refueling has occurred. Fuel truck is labeled Glider Oil. No sheen present today.

DEC Remark :

Spoke with Gary Shanley of Glider Oil, who stated that he does refuel large vessels using a fuel truck and the Best Western Parking Lot on request when vessel can accommodate a full tanker. Most recently, fueled a vessel with 4,000 gallons diesel at request of vessel owner when neighboring marina did not have sufficient fuel on hand. Shanley states that delivery driver would call in spill if present. Spill determined to be unfounded at this time.

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

Handler Activities Summary :

U.S. importer of hazardous waste : No
 Mixed waste (haz. and radioactive) : No
 Recycler of hazardous waste : No
 Transporter of hazardous waste : No
 Treater storer or disposer of HW : No
 Underground injection activity : No
 On-site burner exemption : No
 Furnace exemption : No
 Used oil fuel burner : No
 Used oil processor : No
 Used oil refiner : No
 Used oil fuel marketer to burner : No
 Used oil Specification marketer : No
 Used oil transfer facility : No
 Used oil transporter : No

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

RCRAInfo is EPA's comprehensive information system that supports the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984 through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA. RCRAInfo also supports generation of the National Hazardous Waste Biennial Report. All generators and treatment, storage, and disposal facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years to support creation of the Biennial Report.

Hazardous Waste Details

Waste Code :	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRIC
Quantity of Waste :	70
Units of Quantity :	Pounds
Number of Containers :	1
Type of Container :	Metal drums, barrels, kegs
Handling Method :	Incineration, heat recovery, burning
Specific Gravity :	01.00

Hazardous Waste Summary

Hazardous Waste Details

Waste Code :	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRIC
Quantity of Waste :	140
Units of Quantity :	Pounds
Number of Containers :	2
Type of Container :	Metal drums, barrels, kegs
Handling Method :	Incineration, heat recovery, burning
Specific Gravity :	01.00

Hazardous Waste Summary

Generator Shipped Date :	12/11/1990

Part A Received Date : 06/01/1989
Part B Received Date : 04/17/1989

Hazardous Waste Details

Waste Code : THE FOLLOWING SPENT HALOGENATED SOLVENTS:
TETRACHLOROETHYLENE, METHYLENE CHLORIDE,
TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE,
1,1,2-TRIC

Quantity of Waste : 60
Units of Quantity : Pounds
Number of Containers : 1
Type of Container : Metal drums, barrels, kegs
Handling Method : Material recovery of more than 75 percent of the total material
Specific Gravity : 100

Site Description :

Location: The site is located at 77-79 West First Street, Oswego, Oswego County, NY. The site occupies about 1.39 acres, approximately 1030 feet south of Lake Ontario and 180 feet west of the Oswego River. Site Features: The site is occupied by an 89 SF structure and 5,453 SF structure, surrounded mostly by a paved parking area. Current Zoning and Land Use: The site is currently inactive, recently used as a wall climbing facility. Prior use of the site was for various purposes. Petroleum contamination related to the use of underground storage tanks was identified during previous work at the site. Land use surrounding the site generally consists of mixed residential and commercial. Past Use of the Site: Site Geology and Hydrology:

Site Description :

Location: The site is located at 77-79 West First Street, Oswego, Oswego County, NY. The site occupies about 1.39 acres, approximately 1030 feet south of Lake Ontario and 180 feet west of the Oswego River. Site Features: The site is occupied by an 89 SF structure and 5,453 SF structure, surrounded mostly by a paved parking area. Current Zoning and Land Use: The site is currently inactive, recently used as a wall climbing facility. Prior use of the site was for various purposes. Petroleum contamination related to the use of underground storage tanks was identified during previous work at the site. Land use surrounding the site generally consists of mixed residential and commercial. Past Use of the Site: Site Geology and Hydrology:

Contaminants of Concern : N/R

Site Environmental Assessment : N/R

Site Health Assessment : As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Cleanup Start Date : 09/17/2009
Cleanup Completion Date : 09/30/2009
ACRES Cleaned Up : .04
Grant Recipient Name : Oswego County
Type of Brownfields Grant : Assessment
Type of Funding : Hazardous & Petroleum
Accomplishment Counted : 1
Cooperative Agreement Number : 98297903
Local Property Number(s) : 128.38-03-01
Property Size (acres) : 2
Ownership Entity : Government
Current Owner : City of Oswego, NY
Did Ownership Change : N
SFLLP fact into the ownership : N
Horizontal Collection Method : Address Matching-House Number
Source Map Scale : N/R
Reference Point : Entrance Point of a Facility or Station
Horizontal Reference Datum : North American Datum of 1983

Description/History : Two 2 acre site owned by City of Oswego with extensive history of industrial and commercial activity including but not limited to: lumber yard, gasket company, match company, machine works, railroad lines, steel company, and City of Oswego's department of public works garage. One known UST 10,000 gal with unknown content and 1 550 gallon kerosene AST on site.

Site Description :

This site is now in the BCP Program as Site# C738040. Location: The 68 West First Street site is located in an urban area of the City of Oswego, Oswego County. It covers approximately 1.8 acres and consists of the block bounded by West First Street to the east, West Second Street to the west, West Schuyler Street to the south, and a grassy area and West Van Buren street to the north. The site is owned by the City of Oswego and is also referred to as the former Flexo Wire site. Site Features: The northwestern portion of the site is covered by a one-story concrete slab-on-grade, steel-framed masonry building which covers approximately 20,900 square feet. There is also a one-story building that connects to, and extends east from, the northeastern corner of the main building. This smaller building covers approximately 780 square feet. The rest of the site is paved with the exception of a small grassy area on the northeastern corner of the site, which measures approximately 2000 square feet. There are two former sumps located in the buildings which were filled with concrete prior to the site entering a remedial program. There was formerly a 15,000-gallon underground storage tank located in the northeastern portion of the site. The tank was removed in September 2009. The tank was connected to at least one of the sumps by sub-surface utility lines which are still present. Current Zoning and Land Use: The site is currently utilized by the City of Oswego Department of Public Works (DPW), which operates a metal fabricating workshop, a woodworking shop and an automobile maintenance shop at the site. The DPW also utilizes the site for seasonal storage of equipment, trucks and supplies. The site is currently zoned for commercial use (B2 ? Central Business). The Oswego River is located approximately 390 feet to the east of the site, and flows north into Lake Ontario, which, at its nearest point, is located approximately 250 feet north of the site. The area to the west of the site is primarily residential. The area to the south contains a mixture of residential and commercial properties, and to the north there is a municipal parking area, a boat launch, a marina, a United States Coast Guard facility, and a marine museum located on property owned by the Oswego Port Authority. To the east and northeast are industrial properties, including a major oil storage facility, the City of Oswego West Side Excess Flow Management facility and a cement shipping terminal. Past Use of the Site: The site has been used for industrial purposes since at least 1880. Past industrial operations at the site include a tinware manufacturing facility, lumberyards, a planing mill, Oswego Casket Company, Global Match Company, machine shops and a wire manufacturing facility, which was owned and/or operated by the Flexo Wire Company in 1960 and the Copperweld Steel Company, Flexo Wire Division in 1972. Prior uses that appear to have led to site contamination include solvent usage and disposal, reportedly associated with the wire drawing operations; coal storage, usage and coal ash disposal; and metal working operations,

including machining and annealing. Operable Units: The site was divided into two operable units. An operable unit represents a portion of a remedial program for a site that for technical or administrative reasons can be addressed separately to investigate, eliminate or mitigate a release, threat of release or exposure pathway resulting from the site contamination. Operable Unit (OU) 1 is the on-site area. OU 2 is the off-site groundwater plume and off-site soil vapor contamination. Site Geology and Hydrogeology: Soil at the site consists of historic fill, which consists of a mixture of sand, silt, ash, wood, brick and other debris. Fill was present below the paving or concrete down to the top of bedrock. Bedrock was very shallow on the western side of the site (zero to two feet below the ground surface), and somewhat deeper on the east side of the site (four to ten feet below the ground surface). It was encountered at depths ranging from directly below the building slab, to a depth of approximately ten feet in the northeast corner of the site. The ground surface and bedrock surface slope down to the east-northeast. Groundwater was generally not encountered in the overburden. Groundwater flow is to the east-northeast towards the Oswego River in both the shallow bedrock groundwater and deeper bedrock groundwater. The shallow bedrock groundwater is located directly below the top of bedrock, up to fifteen feet below the bedrock surface, which is at a maximum of 18.5 feet below the ground surface. The deeper bedrock groundwater was monitored from approximately 30 to 35 feet below the ground surface.

Contaminants of Concern :	1,1 dichloroethene
	arsenic
	barium
	benzo(a)anthracene
	benzo(a)pyrene
	benzo(b)fluoranthene
	benzo[k]fluoranthene
	chromium
	chrysene
	cis-1,2-dichloroethene
	copper
	dibenz[a,h]anthracene
	indeno(1,2,3-CD)pyrene
	lead
	mercury
	tetrachloroethene (PCE)
	trans-1,2-dichloroethene
	trichloroethene (TCE)
	vinyl chloride

Site Environmental Assessment :

For OU 1: On-site Area The primary contaminants of concern (COCs) for OU 1 include several chlorinated volatile organic compounds (VOCs); specifically tetrachloroethene (PCE) and trichloroethene (TCE) and their degradation products, which include 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), and vinyl chloride (VC). Other COCs include several metals, including lead, mercury and others, as well as polycyclic organic hydrocarbons (PAHs). Soil ? PAHs and metals are present in soil across the site at concentrations greater than soil cleanup objectives (SCOs) for the protection of public health for restricted residential use. In general, the levels were only slightly greater than SCOs; however, a few isolated locations contained higher levels. Lead was detected in one location at 38,800 parts per million (ppm), compared to its restricted residential SCO for the protection of public health of 400 ppm; however, samples collected near this location had much lower levels of lead (maximum of 319 ppm), and the next highest lead concentration detected was 875 ppm. Mercury was detected at a maximum concentration of 52 ppm in one location, compared to its restricted residential SCO for the protection of public health of 0.81 ppm. Samples collected near this location had much lower levels of mercury, and the next highest level of mercury detected during the investigation was 4.5 ppm. Benzo(a)pyrene (a PAH) was detected at a maximum concentration of 4.9 ppm, compared to its restricted residential SCO of 1 ppm, and it exceeded 1 ppm in 7 out of 23 samples collected from OU 1. PCE, TCE and their degradation products in general were detected in soil at relatively low concentrations, but in some instances at

ERP - NY (*cont.*)

concentrations which exceed the SCOs for the protection of groundwater. The highest concentrations of VOCs were detected in samples collected to the east of the southern half of the on-site building, which is also east of the utility lines connecting the former sump and the former 15,000-gallon underground storage tank. Of the VOCs, TCE was present at the most significant concentrations; up to 1 ppm, compared to its SCO for the protection of groundwater of 0.47 ppm. cis-1,2-DCE was detected at concentrations up to 0.49 ppm, compared to its SCO for the protection of groundwater of 0.25 ppm. Other degradation products were detected at lower concentrations or not at all in soil. PCE was detected less frequently than TCE, at a maximum concentration of 0.022 ppm, compared to its SCO for the protection of groundwater of 1.3 ppm. Groundwater ? TCE was detected at concentrations exceeding its groundwater standard in every on-site well which yielded water; however, concentrations were much lower on the west and south side of the site than in wells located to the east of the building. Degradation products were present in all on-site wells at concentrations exceeding groundwater standards, except for the westernmost (upgradient) well. The highest concentrations of TCE detected on-site were in samples collected from monitoring wells east of the southern sump. This suggests the primary source of groundwater contamination is located in or near the southern portion of the building, most likely the southern sump, and the groundwater contamination extends east from that area. TCE and cis-1,2-DCE were present the most often and at the highest concentrations. When the other degradation products were detected, they were present at lower concentrations. When PCE was detected, it was present at concentrations orders of magnitudes lower than TCE. Total VOC contamination was higher in the deep bedrock well in OU 1, when compared to the adjacent shallow bedrock well. PCE was also detected in groundwater in OU 1; however, at concentrations less than its groundwater standard. Soil Vapor ? PCE, TCE and their degradation products were detected at elevated concentrations in soil vapor and sub-slab vapor in OU 1. TCE and PCE were detected in soil vapor and sub-slab vapor samples at concentrations up to 34,000 micrograms per cubic meter (ug/m3) and 590 ug/m3, respectively. Indoor air samples were not collected during the investigation. For OU 2: Off-site Groundwater and Soil Vapor Plumes The COCs for OU 2 are PCE, TCE and their degradation products, including the following: cis-1,2-DCE; trans-1,2-DCE; 1,1-DCE; and VC. Groundwater ? The COCs were detected in a groundwater plume to the east of the site at concentrations significantly greater than their groundwater standard. The COCs were detected at higher concentrations in the deeper bedrock wells, when compared to adjacent shallow bedrock wells, and were detected at higher concentrations in OU 2 than OU 1. The maximum concentrations of TCE and cis-1,2-DCE detected in groundwater in OU 2 were 10,000 parts per billion (ppb) for each. PCE was detected in groundwater to the east of the site at concentrations up to 180 ppb. Groundwater standards were exceeded in wells located approximately 190 feet east of the site. The Oswego River is located approximately 410 feet east of the site. Soil Vapor ? PCE was detected in soil vapor samples collected to the west of the site at concentrations up to 410 ug/m3; however, re-sampling at that location indicated a lower concentrations of PCE (21 ug/m3). TCE and its degradation products were not detected in those samples. TCE was detected in one soil vapor sample to the east of the site at a concentration of 220 ug/m3. PCE and TCE were detected in soil vapor samples to the north and northwest of the site at concentrations up to 5 ug/m3 and 23 ug/m3, respectively. Access could not be obtained during the remedial investigation to conduct indoor air sampling at off-site locations.

Site Health Assessment :

People are not drinking contaminated groundwater associated with the site because the area is served by a public water supply that obtains its water from a different source not affected by this contamination and private water supply wells are not permitted within the City of Oswego. People are not expected to come into contact with contaminated soil or groundwater unless they dig below the existing building or pavement that covers the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The on-site building is currently vacant; therefore, inhalation of site-related contaminants resulting from soil vapor intrusion is not a concern given the buildings current use. However, sampling indicates that exposures related to soil vapor intrusion would be a concern if the on-site building were to be occupied or if the site were to be redeveloped. Sampling also indicates that soil vapor intrusion may be a concern for off-site properties as well.

Of the VOCs, TCE was present at the most significant concentrations; up to 1 ppm, compared to its SCO for the protection of groundwater of 0.47 ppm. cis-1,2-DCE was detected at concentrations up to 0.49 ppm, compared to its SCO for the protection of groundwater of 0.25 ppm. Other degradation products were detected at lower concentrations or not at all in soil. PCE was detected less frequently than TCE, at a maximum concentration of 0.022 ppm, compared to its SCO for the protection of groundwater of 1.3 ppm. Groundwater ? TCE was detected at concentrations exceeding its groundwater standard in every on-site well which yielded water; however, concentrations were much lower on the west and south side of the site than in wells located to the east of the building. Degradation products were present in all on-site wells at concentrations exceeding groundwater standards, except for the westernmost (upgradient) well. The highest concentrations of TCE detected on-site were in samples collected from monitoring wells east of the southern sump. This suggests the primary source of groundwater contamination is located in or near the southern portion of the building, most likely the southern sump, and the groundwater contamination extends east from that area. TCE and cis-1,2-DCE were present the most often and at the highest concentrations. When the other degradation products were detected, they were present at lower concentrations. When PCE was detected, it was present at concentrations orders of magnitudes lower than TCE. Total VOC contamination was higher in the deep bedrock well in OU 1, when compared to the adjacent shallow bedrock well. PCE was also detected in groundwater in OU 1; however, at concentrations less than its groundwater standard. Soil Vapor ? PCE, TCE and their degradation products were detected at elevated concentrations in soil vapor and sub-slab vapor in OU 1. TCE and PCE were detected in soil vapor and sub-slab vapor samples at concentrations up to 34,000 micrograms per cubic meter (ug/m3) and 590 ug/m3, respectively. Indoor air samples were not collected during the investigation. For OU 2: Off-site Groundwater and Soil Vapor Plumes The COCs for OU 2 are PCE, TCE and their degradation products, including the following: cis-1,2-DCE; trans-1,2-DCE; 1,1-DCE; and VC. Groundwater ? The COCs were detected in a groundwater plume to the east of the site at concentrations significantly greater than their groundwater standard. The COCs were detected at higher concentrations in the deeper bedrock wells, when compared to adjacent shallow bedrock wells, and were detected at higher concentrations in OU 2 than OU 1. The maximum concentrations of TCE and cis-1,2-DCE detected in groundwater in OU 2 were 10,000 parts per billion (ppb) for each. PCE was detected in groundwater to the east of the site at concentrations up to 180 ppb. Groundwater standards were exceeded in wells located approximately 190 feet east of the site. The Oswego River is located approximately 410 feet east of the site. Soil Vapor ? PCE was detected in soil vapor samples collected to the west of the site at concentrations up to 410 ug/m3; however, re-sampling at that location indicated a lower concentrations of PCE (21 ug/m3). TCE and its degradation products were not detected in those samples. TCE was

detected in one soil vapor sample to the east of the site at a concentration of 220 ug/m3. PCE and TCE were detected in soil vapor samples to the north and northwest of the site at concentrations up to 5 ug/m3 and 23 ug/m3, respectively. Access could not be obtained during the remedial investigation to conduct indoor air sampling at off-site locations.

Site Health Assessment :

People are not drinking contaminated groundwater associated with the site because the area is served by a public water supply that obtains its water from a different source not affected by this contamination and private water supply wells are not permitted within the City of Oswego. People are not expected to come into contact with contaminated soil or groundwater unless they dig below the existing building or pavement that covers the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The on-site building is currently vacant; therefore, inhalation of site-related contaminants resulting from soil vapor intrusion is not a concern given the buildings current use. However, sampling indicates that exposures related to soil vapor intrusion would be a concern if the on-site building were to be occupied or if the site were to be redeveloped. Sampling also indicates that soil vapor intrusion may be a concern for off-site properties as well.

Site Description :

Location: The Harbor View Square site is located at 68 West First Street in an urban area of the City of Oswego, Oswego County. It covers approximately 2.4 acres and consists of the block bounded by West First Street to the east, West Second Street to the west, West Schuyler Street to the south, and Lake Street to the north. The site is owned by the City of Oswego and was investigated under the Environmental Restoration Program, as 68 West First Street, Site ID E738040. **Site Features:** The northern end of the site is covered by a grassy lawn area. Along the western boundary in the northern third of the site is a one-story concrete slab-on-grade, steel-framed masonry building which covers approximately 20,900 square feet. There is also a one-story building that connects to, and extends east from, the northeastern corner of the main building. This smaller building covers approximately 780 square feet. There are two former sumps located in the buildings which were filled with concrete prior to the site entering a remedial program. There was formerly a 15,000-gallon underground storage tank located in the northeastern portion of the site. The tank was removed in September 2009. The tank was connected to at least one of the sumps by sub-surface utility lines which are still present. **Current Zoning and Land Use:** The site is currently utilized by the City of Oswego Department of Public Works (DPW), which operates a metal fabricating workshop, a woodworking shop and an automobile maintenance shop at the site. The DPW also utilizes the site for seasonal storage of equipment, trucks and supplies. The site is currently zoned for commercial use (B2 ? Central Business). The Oswego River is located approximately 390 feet to the east of the site, and flows north into Lake Ontario, which, at its nearest point, is located approximately 100 feet north of the site. The area to the west of the site is primarily residential. The area to the south contains a mixture of residential and commercial properties, and to the north there is a municipal parking area, a boat launch, a marina, a United States Coast Guard facility, and a marine museum located on property owned by the Oswego Port Authority. To the east and northeast are industrial properties, including a major oil storage facility, the City of Oswego West Side Excess Flow Management facility and a cement shipping terminal. **Past Use of the Site:** The site has been used for industrial purposes since at least 1880. Past industrial operations at the site include a tinware manufacturing facility, lumberyards, a planing mill, Oswego Casket Company, Global Match Company, machine shops and a wire manufacturing facility, which was owned and/or operated by the Flexo Wire Company in 1960 and the Copperweld Steel Company, Flexo Wire Division in 1972. Prior uses that appear to have led to site contamination include solvent usage and disposal, reportedly associated with the wire drawing operations; coal storage, usage and coal ash disposal; and metal

working operations, including machining and annealing. Site Geology and Hydrogeology: Soil at the site consists of historic fill, which consists of a mixture of sand, silt, ash, wood, brick and other debris. Fill was present below the paving or concrete down to the top of bedrock. Bedrock was very shallow on the western side of the site (zero to two feet below the ground surface), and somewhat deeper on the east side of the site (four to ten feet below the ground surface). It was encountered at depths ranging from directly below the building slab, to a depth of approximately ten feet in the northeast corner of the site. The ground surface and bedrock surface slope down to the east-northeast. Groundwater was generally not encountered in the overburden. Groundwater flow is to the east-northeast towards the Oswego River in both the shallow bedrock groundwater and deeper bedrock groundwater. The shallow bedrock groundwater is located directly below the top of bedrock, up to fifteen feet below the bedrock surface, which is at a maximum of 18.5 feet below the ground surface. The deeper bedrock groundwater was monitored from approximately 30 to 35 feet below the ground surface.

Contaminants of Concern :

- 1,1-dichloroethene
- arsenic
- barium
- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo[k]fluoranthene
- chromium
- chrysene
- cis-1,2-dichloroethene
- copper
- dibenz[a,h]anthracene
- indeno(1,2,3-CD)pyrene
- lead
- mercury
- tetrachloroethene (PCE)
- trans-1,2-dichloroethene
- trichloroethene (TCE)
- vinyl chloride

Site Environmental Assessment :

The primary contaminants of concern (COCs) for the site include several chlorinated volatile organic compounds (VOCs); specifically tetrachloroethene (PCE) and trichloroethene (TCE) and their degradation products, which include 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), and vinyl chloride (VC). Other COCs include several metals, including lead, mercury and others, as well as polycyclic organic hydrocarbons (PAHs). Soil ? PAHs and metals are present in soil across the site at concentrations greater than soil cleanup objectives (SCOs) for the protection of public health for restricted residential use. In general, the levels were only slightly greater than SCOs; however, a few isolated locations contained higher levels. Lead was detected in one location at 38,800 parts per million (ppm), compared to its restricted residential SCO for the protection of public health of 400 ppm; however, samples collected near this location had much lower levels of lead (maximum of 319 ppm), and the next highest lead concentration detected was 875 ppm. Mercury was detected at a maximum concentration of 52 ppm in one location, compared to its restricted residential SCO for the protection of public health of 0.81 ppm. Samples collected near this location had much lower levels of mercury, and the next highest level of mercury detected during the investigation was 4.5 ppm. Benzo(a)pyrene (a PAH) was detected at a maximum concentration of 4.9 ppm, compared to its restricted residential SCO of 1 ppm, and it exceeded 1 ppm in 7 out of 23 samples collected from OU 1. PCE, TCE and their degradation products in general were detected in soil at relatively low concentrations, but in some instances at concentrations which exceed the SCOs for the protection of groundwater. The highest concentrations of VOCs were detected in samples collected to the east of the southern half of the on-site building, which is also east of the utility lines connecting the former sump and the former 15,000-gallon underground storage tank. Of the VOCs, TCE was present at the most

significant concentrations; up to 1 ppm, compared to its SCO for the protection of groundwater of 0.47 ppm. cis-1,2-DCE was detected at concentrations up to 0.49 ppm, compared to its SCO for the protection of groundwater of 0.25 ppm. Other degradation products were detected at lower concentrations or not at all in soil. PCE was detected less frequently than TCE, at a maximum concentration of 0.022 ppm, compared to its SCO for the protection of groundwater of 1.3 ppm. Groundwater ? TCE was detected at concentrations exceeding its groundwater standard in every on-site well which yielded water; however, concentrations were much lower on the west and south side of the site than in wells located to the east of the building. Degradation products were present in all on-site wells at concentrations exceeding groundwater standards, except for the westernmost (upgradient) well. The highest concentrations of TCE detected on-site were in samples collected from monitoring wells east of the southern sump. This suggests the primary source of groundwater contamination is located in or near the southern portion of the building, most likely the southern sump, and the groundwater contamination extends east from that area. TCE and cis-1,2-DCE were present the most often and at the highest concentrations. When the other degradation products were detected, they were present at lower concentrations. When PCE was detected, it was present at concentrations orders of magnitudes lower than TCE. Total VOC contamination was higher in the deep bedrock well on-site, when compared to the adjacent shallow bedrock well. PCE was also detected in groundwater on-site; however, at concentrations less than its groundwater standard. Soil Vapor ? PCE, TCE and their degradation products were detected at elevated concentrations in soil vapor and sub-slab vapor in OU 1. TCE and PCE were detected in soil vapor and sub-slab vapor samples at concentrations up to 34,000 micrograms per cubic meter (ug/m3) and 590 ug/m3, respectively. Indoor air samples were not collected during the investigation. Contamination is emanating from the site in groundwater and is present in off-site soil vapor. The COCs for the off-site area are PCE, TCE and their degradation products, including the following: cis-1,2-DCE; trans-1,2-DCE; 1,1-DCE; and VC. Off-site Groundwater ? The COCs were detected in a groundwater plume to the east of the site at concentrations significantly greater than their groundwater standard. The COCs were detected at higher concentrations in the deeper bedrock wells, when compared to adjacent shallow bedrock wells. The maximum concentrations of TCE and cis-1,2-DCE detected in groundwater off-site were 10,000 parts per billion (ppb) for each. PCE was detected in groundwater to the east of the site at concentrations up to 180 ppb. Groundwater standards were exceeded in wells located approximately 190 feet east of the site. The Oswego River is located approximately 410 feet east of the site. Off-site Soil Vapor ? PCE was detected in soil vapor samples collected to the west of the site at concentrations up to 410 ug/m3; however, re-sampling at that location indicated a lower concentrations of PCE (21 ug/m3). TCE and its degradation products were not detected in those samples. TCE was detected in one soil vapor sample to the east of the site at a concentration of 220 ug/m3. PCE and TCE were detected in soil vapor samples to the north and northwest of the site at concentrations up to 5 ug/m3 and 23 ug/m3, respectively. Access could not be obtained during the remedial investigation to conduct indoor air sampling at off-site locations.

Site Health Assessment :

People are not expected to come into contact with contaminated soil or groundwater unless they dig below the existing building, pavement, or landscaping that covers the site. People are not drinking the groundwater because the area is served by a public water supply that obtains its water from a source not affected by site contamination and private water supply wells are not permitted within the City of Oswego. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. There is a potential for on-site building occupants to inhale site contaminants in indoor air due to soil vapor intrusion. Sampling also indicates that soil vapor intrusion is a potential concern for off-site buildings.

polycyclic organic hydrocarbons (PAHs). Soil ? PAHs and metals are present in soil across the site at concentrations greater than soil cleanup objectives (SCOs) for the protection of public health for restricted residential use. In general, the levels were only slightly greater than SCOs; however, a few isolated locations contained higher levels. Lead was detected in one location at 38,800 parts per million (ppm), compared to its restricted residential SCO for the protection of public health of 400 ppm; however, samples collected near this location had much lower levels of lead (maximum of 319 ppm), and the next highest lead concentration detected was 875 ppm. Mercury was detected at a maximum concentration of 52 ppm in one location, compared to its restricted residential SCO for the protection of public health of 0.81 ppm. Samples collected near this location had much lower levels of mercury, and the next highest level of mercury detected during the investigation was 4.5 ppm. Benzo(a)pyrene (a PAH) was detected at a maximum concentration of 4.9 ppm, compared to its restricted residential SCO of 1 ppm, and it exceeded 1 ppm in 7 out of 23 samples collected from OU 1. PCE, TCE and their degradation products in general were detected in soil at relatively low concentrations, but in some instances at concentrations which exceed the SCOs for the protection of groundwater. The highest concentrations of VOCs were detected in samples collected to the east of the southern half of the on-site building, which is also east of the utility lines connecting the former sump and the former 15,000-gallon underground storage tank. Of the VOCs, TCE was present at the most significant concentrations; up to 1 ppm, compared to its SCO for the protection of groundwater of 0.47 ppm. cis-1,2-DCE was detected at concentrations up to 0.49 ppm, compared to its SCO for the protection of groundwater of 0.25 ppm. Other degradation products were detected at lower concentrations or not at all in soil. PCE was detected less frequently than TCE, at a maximum concentration of 0.022 ppm, compared to its SCO for the protection of groundwater of 1.3 ppm. Groundwater ? TCE was detected at concentrations exceeding its groundwater standard in every on-site well which yielded water; however, concentrations were much lower on the west and south side of the site than in wells located to the east of the building. Degradation products were present in all on-site wells at concentrations exceeding groundwater standards, except for the westernmost (upgradient) well. The highest concentrations of TCE detected on-site were in samples collected from monitoring wells east of the southern sump. This suggests the primary source of groundwater contamination is located in or near the southern portion of the building, most likely the southern sump, and the groundwater contamination extends east from that area. TCE and cis-1,2-DCE were present the most often and at the highest concentrations. When the other degradation products were detected, they were present at lower concentrations. When PCE was detected, it was present at concentrations orders of magnitudes lower than TCE. Total VOC contamination was higher in the deep bedrock well on-site, when compared to the adjacent shallow bedrock well. PCE was also detected in groundwater on-site; however, at concentrations less than its groundwater standard. Soil Vapor ? PCE, TCE and their degradation products were detected at elevated concentrations in soil vapor and sub-slab vapor in OU 1. TCE and PCE were detected in soil vapor and sub-slab vapor samples at concentrations up to 34,000 micrograms per cubic meter (ug/m3) and 590 ug/m3, respectively. Indoor air samples were not collected during the investigation. Contamination is emanating from the site in groundwater and is present in off-site soil vapor. The COCs for the off-site area are PCE, TCE and their degradation products, including the following: cis-1,2-DCE; trans-1,2-DCE; 1,1-DCE; and VC. Off-site Groundwater ? The COCs were detected in a groundwater plume to the east of the site at concentrations significantly greater than their groundwater standard. The COCs were detected at higher concentrations in the deeper bedrock wells, when compared to adjacent shallow bedrock wells. The maximum concentrations of TCE and cis-1,2-DCE detected in groundwater off-site were 10,000 parts per billion (ppb) for each. PCE was detected in groundwater to the east of the site at concentrations up to 180 ppb. Groundwater standards were exceeded in wells located approximately 190 feet east of the site. The Oswego River is located approximately 410 feet east of the site. Off-site Soil Vapor ? PCE was detected in soil vapor samples collected to the west of the site at concentrations up to 410 ug/m3; however, re-sampling at that location indicated a lower concentrations of PCE (21 ug/m3). TCE and its degradation products were not detected in those samples. TCE was detected in one soil vapor sample to the east of the site at a concentration of 220 ug/m3. PCE and TCE were detected in soil vapor samples to the north and northwest of the site at concentrations up to 5 ug/m3 and 23 ug/m3, respectively. Access could not be obtained during the remedial investigation to conduct indoor air sampling at off-site locations.

Site Health Assessment :

People are not expected to come into contact with contaminated soil or groundwater unless they dig below the existing building, pavement, or landscaping that covers the site. People are not drinking the groundwater because the area is served by a public water supply that obtains its water from a source not affected by site contamination and private water supply wells are not permitted within the City of Oswego. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. There is a potential for on-site building occupants to inhale site contaminants in indoor air due to soil vapor intrusion. Sampling also indicates that soil vapor intrusion is a potential concern for off-site buildings.

Site Description :

The area of concern subject to this work is considered off-site from BCP site C738040 Harbor View Square and reflects the investigation and possible remediation of contamination that may have migrated from that site. This work is being carried out as provided for under the Environmental Conservation Law Section 27-1411.5. Please see C738040 for further information regarding the status of the site in the Brownfield Cleanup program. Location: The Harbor View Square site is located at 68 West First Street in an urban area of the City of Oswego, Oswego County. It covers approximately 2.4 acres and consists of the block bounded by West First Street to the east, West Second Street to the west, West Schuyler Street to the south, and Lake Street to the north. The site is owned by the City of Oswego and was investigated under the Environmental Restoration Program, Site ID E738040. The Oswego River is located approximately 390 feet to the east of the site, and flows north into Lake Ontario, which, at its nearest point, is located approximately 100 feet north of the site. The area to the west of the site is primarily residential. The area to the south contains a mixture of residential and commercial properties, and to the north there is a municipal parking area, a boat launch, a marina, a United States Coast Guard facility, and a marine museum located on property owned by the Oswego Port Authority. To the east and northeast are industrial properties, including a major oil storage facility, the City of Oswego West Side Excess Flow Management facility and a cement shipping terminal. Site Features: The northern end of the site is covered by a grassy lawn area. Along the western boundary in the northern third of the site is a one-story concrete slab-on-grade, steel-framed masonry building which covers approximately 20,900 square feet. There is also a one-story building that connects to, and extends east from, the northeastern corner of the main building. This smaller building covers approximately 780 square feet. There are two former sumps located in the buildings which were filled with concrete prior to the site entering a remedial program. There was formerly a 15,000-gallon underground storage tank located in the northeastern portion of the site. The tank was removed in September 2009. The tank was connected to at least one of the sumps by sub-surface utility lines which are still present. Current Zoning and Land Use: The site is currently utilized by the City of Oswego Department of Public Works (DPW), which operates a metal fabricating workshop, a woodworking shop and an automobile maintenance shop at the site. The DPW also utilizes the site for seasonal storage of equipment, trucks and supplies. The site is currently zoned for commercial use (B2 ? Central Business), as are the areas south and southeast of the site. The areas north and east of the site are zoned Industrial, and the areas west of the site are zoned R3 ? Residential. Past Use of the Site: The site has been used for industrial purposes since at least 1880. Past industrial operations at the site include a tinware manufacturing facility, lumberyards, a planing mill, Oswego Casket Company, Global Match Company, machine shops and a wire manufacturing facility, which was owned and/or operated by the Flexo Wire Company in 1960 and the Copperweld Steel Company, Flexo Wire Division in 1972. Prior uses that appear to have led to site contamination include solvent usage and disposal, reportedly associated with the wire drawing operations; coal storage, usage and coal ash disposal; and metal working operations, including machining and annealing. Site Geology and Hydrogeology: Soil at the site consists of historic fill, which consists of a mixture of sand, silt, ash, wood, brick and other debris. Fill was present below the paving or concrete down to the top of bedrock. Bedrock was very shallow on the western side of the site (zero to two feet below the ground surface), and somewhat deeper on the east side of the site (four to ten feet below the ground surface). It was encountered at depths ranging from directly below the building slab, to a depth of approximately ten feet in the northeast corner of the site. The ground surface and bedrock surface slope down to the east-northeast. Groundwater was generally not encountered in the overburden. Groundwater flow is to the east-northeast towards the Oswego River in both the shallow bedrock groundwater and deeper bedrock groundwater. The shallow bedrock groundwater is located directly below the top of bedrock, up to fifteen feet below the bedrock surface, which is at a maximum of 18.5 feet below the ground surface. The deeper bedrock

groundwater was monitored from approximately 30 to 35 feet below the ground surface.

Contaminants of Concern : N/R

Site Environmental Assessment :

The primary contaminants of concern (COCs) for the off-site area include several chlorinated volatile organic compounds (VOCs); specifically tetrachloroethene (PCE) and trichloroethene (TCE) and their degradation products, which include 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), and vinyl chloride (VC). Off-site Groundwater ? TCE and other COCs were detected in a groundwater plume to the east of the site at concentrations significantly greater than their groundwater standard. The COCs were detected at higher concentrations in the deeper bedrock wells, when compared to adjacent shallow bedrock wells. The maximum concentrations of TCE and cis-1,2-DCE detected in groundwater off-site were 10,000 parts per billion (ppb) for each. PCE was detected in groundwater to the east of the site at concentrations up to 180 ppb. Groundwater standards were exceeded in wells located approximately 190 feet east of the site. The Oswego River is located approximately 410 feet east of the site. Off-site Soil Vapor ? PCE was detected in soil vapor samples collected to the west of the site at concentrations up to 410 micrograms per cubic meter (ug/m³); however, re-sampling at that location indicated a lower concentrations of PCE (21 ug/m³). TCE and its degradation products were not detected in those samples. TCE was detected in one soil vapor sample to the east of the site at a concentration of 220 ug/m³. PCE and TCE were detected in soil vapor samples to the north and northwest of the site at concentrations up to 5 ug/m³ and 23 ug/m³, respectively. Access could not be obtained during the remedial investigation to conduct indoor air sampling at off-site locations.

Site Health Assessment : Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Site Description :

Location: The Former Breneman Site is located at 8 East Utica Street (also referred to as 220 East First Street) in an urban area of the City of Oswego. It covers approximately 2.1 acres and is situated on the southwest corner of the intersection of East Utica Street and East First Street, which is also State Route 481. Site Features: The site is currently vacant. The eastern portion of the property, referred to as the upper portion, is grass-covered and is relatively flat. The western portion of the property is wooded and drops steeply to a property now owned by the City of Oswego and developed as a walkway along the east side of the Oswego Canal and River. Approximately one-third to one-half of the site is wooded. The Oswego Canal is located approximately 100 feet west of the site. The Oswego Canal is approximately 110 feet wide and is bounded on the west by bulkheads and the Oswego River. The Oswego Canal is connected to the Oswego River through a series of locks, located upstream and downstream of the Former Breneman Site. The Oswego River flows north into Lake Ontario, which is located approximately 5000 feet north of the site. Current Zoning and Land Use: The site is currently vacant and lies in the B3 Redevelopment zoning district, which allows for commercial uses and certain residential uses (condominiums, multi-family dwellings). The surrounding area consists primarily of residential properties, with some commercial properties along East First Street and East Utica Street. Past Use of the Site: The site was used for manufacturing purposes from approximately 1834 until 1981. The Brownfield Cleanup Program (BCP) site is a portion of the former manufacturing facility, which extended to the west of the site, covering approximately four to five acres. From 1834 through approximately 1954 the facility was used to manufacture fabric. From approximately 1954 through 1982 the site was owned by Breneman of Wisconsin, Inc., which manufactured window shades at the site until about 1981. It was reported that industrial wastes were formerly disposed of on the property. For a time the Breneman facility was divided by a canal which was referred to as the "hydraulic canal" and which was used for power generation. It was present on maps from 1890 through 1964, but it has since been filled. It appears a portion of the hydraulic canal extended onto the western portion of the BCP site. It was reported that wastes were formerly disposed of in the hydraulic canal. Several paints, dyes, oils, organic solvents and plasticizers were used in the manufacturing processes at the facility, including acetone, methyl ethyl ketone (MEK, also known as 2-

BROWNFIELDS - NY (cont.)

butanone), naphtha, polyvinyl chloride resin, and dioctyl phthalate. Chemical and petroleum storage tanks were formerly located on the BCP site including both aboveground storage tanks (ASTs) and underground storage tanks (USTs). At least two storage tanks were located outdoors on the BCP site, including an approximately 5,000 gallon acetone tank and an approximately 10,000 gallon MEK tank. There was also a 500 gallon UST used to store dioctyl phthalate, the location of which is unknown. An approximately 100 gallon tank containing heating oil was also identified in 1991 within a building on the BCP site. Other tanks identified inside of the buildings include: four 20,000 gallon tanks, three 10,000 gallon tanks, six 5000 gallon tanks, and four 2000 gallon tanks. There are no known tanks remaining on the site. A number of transformers were also present on the site, several of which contained polychlorinated biphenyls (PCBs) which were removed from the facility by the NYSDEC when responding to a spill of transformer oil. Three leaking transformers were located on the BCP site and at least eight transformers which contained oil with PCBs at concentrations greater than 50 ppm were removed from the facility and properly disposed of off-site. All of those PCB transformers were located on the BCP site. In addition, four 55-gallon drums of lube/hydraulic oil, two 55-gallon drums of a powdered material and one 55-gallon drum of solidified paint were removed and disposed of off-site as non-hazardous waste. The on-site buildings were demolished between 1996 and 1998 with some of the demolition debris disposed of on-site. Two fuel oil USTs and one solvent AST were reportedly removed during building demolition activities. Geology and Hydrogeology: Two geologic units were identified at the site: fill and glacial till. The fill varies in depth from a couple feet up to greater than 12 feet in the southern portion of the site. In the area of the former buildings the fill contained a high percentage of brick. In the southern portion of the site the fill contained debris, which was reportedly generated by road construction projects conducted by the City of Oswego. Debris encountered in that area included asphalt and stone material that appeared to be road curbs. The glacial till unit consisted of a very dense sandy silt and silty sand with some gravel. The till in this area is underlain by Oswego Sandstone bedrock. Groundwater was reported to be present at depths ranging from approximately five feet (near the base of the steep slope) to 22 feet below grade (on the upper portion of the site). Groundwater flow is towards the west/southwest towards the Oswego River.

Contaminants of Concern :

barium
 benzo(a)pyrene
 cyanides(soluble cyanide salts)
 ethylbenzene
 isopropylbenzene
 lead
 mercury
 n-propylbenzene
 polychlorinated biphenyls (PCB)
 toluene
 xylene (mixed)

Site Environmental Assessment :

Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, cyanide, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted to date, the primary contaminants of concern include: petroleum; VOCs (including, toluene, ethylbenzene, xylenes, isopropylbenzene and n-propylbenzene); cyanide; metals (including barium, lead and mercury); PCBs; and polycyclic aromatic hydrocarbons (PAHs). Soil ? Contaminants identified in surface soil (zero to two inches) include PAHs and PCBs. These contaminants are present in surface soils at concentrations slightly greater than unrestricted use soil cleanup objectives (SCOs), and in a very few instances at concentrations greater than commercial use SCOs. PCBs were detected at concentrations up to 2.0 ppm, compared to their commercial use SCO of 1.0 ppm. There is an area of gross soil contamination in the subsurface in the western portion of the site, where soil is impacted primarily by petroleum; however, other contaminants are also present within this area. The impacts, which were identified in the field through heavy staining of the soil, strong odors and elevated readings on a photoionization detector (up to 2,500 parts per million), are present at depths ranging from approximately 8 feet below grade to approximately 14 feet below grade. The impacts are present beneath the steep slope and extend to the western site boundary, which is the downgradient site boundary. The contamination

extends north from the main area of impact at lower concentrations, and may be present along the former hydraulic canal. It appears this northern extension of impacts does not extend to the northern site boundary and does not extend east, beneath the slope. The data indicate this area of contamination extends off the BCP site to the west. Several sampling locations within the area of gross contamination contained petroleum-related VOCs at concentrations greater than SCOs for the protection of groundwater, and VOCs exceeded their SCOs for the protection of public health for commercial use in one location. Xylenes were detected at concentrations up to 4,232 parts per million (ppm) in this area, compared to its SCO for the protection of groundwater of 1.6 ppm and its SCO for the protection of public health for commercial use of 500 ppm. PAHs were present in this area at concentrations less than unrestricted use SCOs or slightly greater than unrestricted use SCOs. Cyanide was detected at a concentration of 684 ppm at one location compared to its SCO for the protection of public health for commercial use of 27 ppm. Cyanide was detected at other locations within or near this area at concentrations less than its unrestricted use SCO, which is also 27 ppm. Barium, lead and mercury were detected in this area at concentrations up to 4,020 ppm, 7,700 ppm and 6.47 ppm, respectively, as compared to their respective commercial use SCOs of 400 ppm, 1,000 ppm and 2.8 ppm. Bis(2-ethylhexyl)phthalate was detected in this area at concentrations up to 228 ppm, compared to its SCO for the protection of public health for residential use of 50 ppm. There is not a commercial use SCO defined for this contaminant. PCBs exceeded their commercial use SCO at one location within this area, at a concentration of 1.77 ppm. Metals and PAHs were also detected in sub-surface soil at locations outside of the area of petroleum impacts at concentrations that exceeded their commercial use SCOs. Barium, lead and mercury were detected at concentrations up to 2,260 ppm, 9,020 ppm, and 13.1 ppm, respectively. Benzo(a) pyrene, a PAH, was detected in several locations at concentrations up to 3.86 ppm. Groundwater ? Groundwater is impacted by petroleum-related VOCs along the western edge of the site, which is the downgradient edge of the site. Ethylbenzene, isopropylbenzene, and xylene were detected at concentrations up to 41.4 parts per billion (ppb), 28.0 ppb, and 147 ppb, respectively, exceeding their groundwater standard, which is 5 ppb for each. Methylcyclohexane was also detected at elevated concentrations in this area; at concentrations up to 128 ppb. Lead was detected at concentrations up to 243 ppb in this area, which exceeds its groundwater standard of 25 ppb. It is likely the groundwater impacts extend off the BCP site to the west. Soil Vapor and Indoor Air ? VOCs are present in soil and groundwater at elevated levels in the western portion of the site. No sub-slab vapor or indoor air samples could be collected because there are no buildings on site. Special Resources Impacted/Threatened: No direct migration pathway from the site to the Oswego River and Canal west of the site have been identified.

Site Health Assessment :

The site is not fenced and persons who enter the site could contact contaminants in the soil by walking on the soil, digging or otherwise disturbing the soil. People are not drinking contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. Off-site soil vapor intrusion is not a concern.

Site Description :

Location: The Former Breneman Site is located at 8 East Utica Street (also referred to as 220 East First Street) in an urban area of the City of Oswego. It covers approximately 2.1 acres and is situated on the southwest corner of the intersection of East Utica Street and East First Street, which is also State Route 481. Site Features: The site is currently vacant. The eastern portion of the property, referred to as the upper portion, is grass-covered and is relatively flat. The western portion of the property is wooded and drops steeply to a property now owned by the City of Oswego and developed as a walkway along the east side of the Oswego Canal and River. Approximately one-third to one-half of the site is wooded. The Oswego Canal is located approximately 100 feet west of the site. The Oswego Canal is approximately 110 feet wide and is bounded on the west by bulkheads and the Oswego River. The Oswego Canal is connected to the Oswego River through a series of locks, located upstream and downstream of the Former Breneman Site. The Oswego River flows north into Lake Ontario, which is located approximately 5000 feet north of the site. Current Zoning and Land Use: The site is currently vacant and lies in the B3 Redevelopment zoning district, which allows for commercial uses and certain residential uses (condominiums, multi-family dwellings). The surrounding area consists primarily of residential properties, with some commercial properties along East First Street and East Utica Street. Past Use of the Site: The site was used for manufacturing purposes from approximately 1834 until 1981. The Brownfield Cleanup Program (BCP) site is a portion of the former manufacturing facility, which extended to the west of the site, covering approximately four to five acres. From

1834 through approximately 1954 the facility was used to manufacture fabric. From approximately 1954 through 1982 the site was owned by Breneman of Wisconsin, Inc., which manufactured window shades at the site until about 1981. It was reported that industrial wastes were formerly disposed of on the property. For a time the Breneman facility was divided by a canal which was referred to as the "hydraulic canal" and which was used for power generation. It was present on maps from 1890 through 1964, but it has since been filled. It appears a portion of the hydraulic canal extended onto the western portion of the BCP site. It was reported that wastes were formerly disposed of in the hydraulic canal. Several paints, dyes, oils, organic solvents and plasticizers were used in the manufacturing processes at the facility, including acetone, methyl ethyl ketone (MEK, also known as 2-butanone), naphtha, polyvinyl chloride resin, and dioctyl phthalate. Chemical and petroleum storage tanks were formerly located on the BCP site including both aboveground storage tanks (ASTs) and underground storage tanks (USTs). At least two storage tanks were located outdoors on the BCP site, including an approximately 5,000 gallon acetone tank and an approximately 10,000 gallon MEK tank. There was also a 500 gallon UST used to store dioctyl phthalate, the location of which is unknown. An approximately 100 gallon tank containing heating oil was also identified in 1991 within a building on the BCP site. Other tanks identified inside of the buildings include: four 20,000 gallon tanks, three 10,000 gallon tanks, six 5000 gallon tanks, and four 2000 gallon tanks. There are no known tanks remaining on the site. A number of transformers were also present on the site, several of which contained polychlorinated biphenyls (PCBs) which were removed from the facility by the NYSDEC when responding to a spill of transformer oil. Three leaking transformers were located on the BCP site and at least eight transformers which contained oil with PCBs at concentrations greater than 50 ppm were removed from the facility and properly disposed of off-site. All of those PCB transformers were located on the BCP site. In addition, four 55-gallon drums of lube/hydraulic oil, two 55-gallon drums of a powdered material and one 55-gallon drum of solidified paint were removed and disposed of off-site as non-hazardous waste. The on-site buildings were demolished between 1996 and 1998 with some of the demolition debris disposed of on-site. Two fuel oil USTs and one solvent AST were reportedly removed during building demolition activities. Geology and Hydrogeology: Two geologic units were identified at the site: fill and glacial till. The fill varies in depth from a couple feet up to greater than 12 feet in the southern portion of the site. In the area of the former buildings the fill contained a high percentage of brick. In the southern portion of the site the fill contained debris, which was reportedly generated by road construction projects conducted by the City of Oswego. Debris encountered in that area included asphalt and stone material that appeared to be road curbs. The glacial till unit consisted of a very dense sandy silt and silty sand with some gravel. The till in this area is underlain by Oswego Sandstone bedrock. Groundwater was reported to be present at depths ranging from approximately five feet (near the base of the steep slope) to 22 feet below grade (on the upper portion of the site). Groundwater flow is towards the west/southwest towards the Oswego River.

Contaminants of Concern :

barium
 benzo(a)pyrene
 cyanides(soluble cyanide salts)
 ethylbenzene
 isopropylbenzene
 lead
 mercury
 n-propylbenzene
 polychlorinated biphenyls (PCB)
 toluene
 xylene (mixed)

Site Environmental Assessment :

Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, cyanide, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations conducted to date, the primary contaminants of concern include: petroleum; VOCs (including, toluene, ethylbenzene, xylenes, isopropylbenzene and n-propylbenzene); cyanide; metals (including barium, lead and mercury); PCBs; and polycyclic aromatic hydrocarbons (PAHs). Soil ? Contaminants identified in surface soil (zero to two inches) include PAHs and PCBs. These contaminants are present in surface soils at concentrations slightly

greater than unrestricted use soil cleanup objectives (SCOs), and in a very few instances at concentrations greater than commercial use SCOs. PCBs were detected at concentrations up to 2.0 ppm, compared to their commercial use SCO of 1.0 ppm. There is an area of gross soil contamination in the subsurface in the western portion of the site, where soil is impacted primarily by petroleum; however, other contaminants are also present within this area. The impacts, which were identified in the field through heavy staining of the soil, strong odors and elevated readings on a photoionization detector (up to 2,500 parts per million), are present at depths ranging from approximately 8 feet below grade to approximately 14 feet below grade. The impacts are present beneath the steep slope and extend to the western site boundary, which is the downgradient site boundary. The contamination extends north from the main area of impact at lower concentrations, and may be present along the former hydraulic canal. It appears this northern extension of impacts does not extend to the northern site boundary and does not extend east, beneath the slope. The data indicate this area of contamination extends off the BCP site to the west. Several sampling locations within the area of gross contamination contained petroleum-related VOCs at concentrations greater than SCOs for the protection of groundwater, and VOCs exceeded their SCOs for the protection of public health for commercial use in one location. Xylenes were detected at concentrations up to 4,232 parts per million (ppm) in this area, compared to its SCO for the protection of groundwater of 1.6 ppm and its SCO for the protection of public health for commercial use of 500 ppm. PAHs were present in this area at concentrations less than unrestricted use SCOs or slightly greater than unrestricted use SCOs. Cyanide was detected at a concentration of 684 ppm at one location compared to its SCO for the protection of public health for commercial use of 27 ppm. Cyanide was detected at other locations within or near this area at concentrations less than its unrestricted use SCO, which is also 27 ppm. Barium, lead and mercury were detected in this area at concentrations up to 4,020 ppm, 7,700 ppm and 6.47 ppm, respectively, as compared to their respective commercial use SCOs of 400 ppm, 1,000 ppm and 2.8 ppm. Bis(2-ethylhexyl)phthalate was detected in this area at concentrations up to 228 ppm, compared to its SCO for the protection of public health for residential use of 50 ppm. There is not a commercial use SCO defined for this contaminant. PCBs exceeded their commercial use SCO at one location within this area, at a concentration of 1.77 ppm. Metals and PAHs were also detected in sub-surface soil at locations outside of the area of petroleum impacts at concentrations that exceeded their commercial use SCOs. Barium, lead and mercury were detected at concentrations up to 2,260 ppm, 9,020 ppm, and 13.1 ppm, respectively. Benzo(a) pyrene, a PAH, was detected in several locations at concentrations up to 3.86 ppm. Groundwater ? Groundwater is impacted by petroleum-related VOCs along the western edge of the site, which is the downgradient edge of the site. Ethylbenzene, isopropylbenzene, and xylene were detected at concentrations up to 41.4 parts per billion (ppb), 28.0 ppb, and 147 ppb, respectively, exceeding their groundwater standard, which is 5 ppb for each. Methylcyclohexane was also detected at elevated concentrations in this area; at concentrations up to 128 ppb. Lead was detected at concentrations up to 243 ppb in this area, which exceeds its groundwater standard of 25 ppb. It is likely the groundwater impacts extend off the BCP site to the west. Soil Vapor and Indoor Air ? VOCs are present in soil and groundwater at elevated levels in the western portion of the site. No sub-slab vapor or indoor air samples could be collected because there are no buildings on site. Special Resources Impacted/Threatened: No direct migration pathway from the site to the Oswego River and Canal west of the site have been identified.

Site Health Assessment :

The site is not fenced and persons who enter the site could contact contaminants in the soil by walking on the soil, digging or otherwise disturbing the soil. People are not drinking contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. Off-site soil vapor intrusion is not a concern.

Site Details

Superfund Site : POLLUTION ABATEMENT SERVICES OSWEGO, NY

Site Background :

The Pollution Abatement Services (PAS) site is located in Oswego, New York. The PAS facility, a high-temperature, liquid chemical waste, incineration facility, operated on the 15.5-acre property from 1970 to 1977. The facility experienced operational problems and was cited for numerous air and water quality violations by state and federal agencies. Because the incinerator never operated properly, more than 10,000 leaking and deteriorating accumulated on-site, more than a million gallons of oil and mixed hydrocarbons accumulated in three lagoons and contaminated waste oil accumulated in several aboveground and underground storage tanks. As a result, the site soil and groundwater were contaminated with volatile organic compounds (VOCs) and the sediments in the adjacent White and Wine Creeks, which flow into Lake Ontario, were contaminated with polychlorinated biphenyls (PCBs). The facility was closed in 1977 and the site has been remediated.

NPL (cont.)

Site Status :

The site was addressed in four stages: immediate removal actions and three long-term remedial phases focused on waste containment and the prevention of off-site migration of contaminated groundwater. The immediate and long-term cleanup actions undertaken at the site greatly reduced the threat to public health and the environment. These efforts include the treatment and discharge of more than one million gallons of contaminated water contained in on-site lagoons; the removal of more than 10,000 drums containing liquid waste; the construction of a waste containment system, consisting of a perimeter slurry wall, an impermeable cap and a leachate collection system; and the extraction and off-site treatment and disposal, to date, of about 3.7 million gallons of leachate. Groundwater and monitoring and leachate collection and treatment are ongoing. Under current site conditions, potential or actual human exposures are under control.

 Contaminated Media : Soil
 Area of Site Found (Operable Unit) : SOIL & GW (02)

CAS Number : 95-50-1
 Contaminant Name : 1,2-DICHLOROBENZENE
 Contaminated Media : Ground Water
 Area of Site Found (Operable Unit) : SOIL & GW (02)

CAS Number : 98-95-3
 Contaminant Name : NITROBENZENE
 Contaminated Media : Soil
 Area of Site Found (Operable Unit) : SOIL & GW (02)

Operable Units Information

OU ID : 00
 Name : SITEWIDE
 Types of Contaminants Present at ROD Completion: N/R
 Cleanup Technologies Selected in the Decision Document: N/R

OU ID : 01
 Name : SITEWIDE SOIL REMOVAL ACTION
 Types of Contaminants Present at ROD Completion: N/R
 Cleanup Technologies Selected in the Decision Document: N/R

OU ID : 02
 Name : SOIL & GW

Types of Contaminants Present at ROD Completion :

1,1,1-TRICHLOROETHANE; 1,1-DICHLOROETHANE; 1,2-DICHLOROBENZENE; 1,2-DICHLOROETHANE; 2,4-DIMETHYLPHENOL; 2-NITROPHENOL; ANTHRACENE; ARSENIC; BERYLLIUM; BIS(2-CHLOROETHYL)ETHER; BIS(2-ETHYLHEXYL)PHTHALATE; BUTYL BENZYL PHTHALATE; CHLOROFORM; CHROMIUM; COPPER; DI-N-BUTYL PHTHALATE; DI-N-OCTYL PHTHALATE; ETHYLBENZENE; LEAD; MERCURY; METHYLENE CHLORIDE; NAPHTHALENE; NICKEL; NITROBENZENE; PCB-1248; PHENANTHRENE; SELENIUM; TETRACHLOROETHYLENE; TOLUENE; TRANS-1,2-DICHLOROETHYLENE; TRICHLOROETHYLENE; XYLENES; ZINC

Cleanup Technologies Selected in the Decision Document :

Cap (engineered cap); Carbon Adsorption (liquid phase, P&T, exsitu); Clarification (sedimentation, P&T, exsitu); Discharge (other, NOS); Discharge (surface water/NPDES discharge); Disposal (offsite); Drainage/Erosion Control (other, NOS); Excavation; Filtration (P&T, exsitu); Hydraulic Control (for water table adjustment); Leachate Control; Monitoring; Neutralization (P&T, exsitu); Precipitation (P&T, exsitu); Treatment (other, NOS, exsitu, onsite); Vertical Engineered Barrier (slurry wall)

OU ID : 03
 Name : SITE EVAL/DISP

Types of Contaminants Present at ROD Completion:

1,1,1-TRICHLOROETHANE; 1,1-DICHLOROETHANE; 1,2-DICHLOROETHANE; 1,2-DICHLOROETHYLENE; 2,4-DIMETHYLPHENOL; 4-METHYLPHENOL (P-CRESOL); BARIUM; BENZENE; CHLOROBENZENE; CHLOROETHENE (VINYL CHLORIDE); CHROMIUM; DI-N-BUTYL PHTHALATE; ETHYLBENZENE; IRON; MAGNESIUM; MANGANESE; METHYLENE CHLORIDE; NICKEL; SODIUM; TOLUENE; TRICHLOROETHYLENE; XYLENE (MIXED ISOMERS)

Cleanup Technologies Selected in the Decision Document:

Cap (engineered cap); Discharge (POTW); Discharge (other, NOS); Discharge (surface water/NPDES discharge); Hydraulic Control (containment); Institutional Controls; Monitoring; Other (NOS); Treatment (other, NOS, exsitu, onsite); Vertical Engineered Barrier (slurry wall); Water Supply (temporary replacement, other, NOS)

OU ID : 04
 Name : SEDIMENTS

Types of Contaminants Present at ROD Completion:

PCBs

Cleanup Technologies Selected in the Decision Document:

Monitoring; No Further Action

Performance Measures Information

Human Exposure Under Control : Yes
 Groundwater Migration Under Control : Yes
 Construction Complete : Yes
 Sitewide Ready for Anticipated Use : Yes

NPL AOC

Description :

Areas of Concern related to existing NPL sites. These are derived from DOD and CDC Hazdat areas.

Site Description :

Location: The site is located at 23 Mercer Street, Oswego, Oswego County, NY. The site occupies about 12.90 acres, approximately 570 feet south of Lake Ontario and 2400 northeast of the Oswego River. Site Features: The site currently consists of paved and unpaved surface. There are no existing buildings on the site. Current Zoning and Land Use: The site is currently used for Port Authority storage and is zoned for industrial use. Land use surrounding the site generally consists of mixed residential and commercial to the south and east, and recreational use to the west. Past Use of the Site: The subject property was used as a boiler manufacturing facility from 1893 to the 1950s. The site consisted of several aboveground and underground storage tanks which documentation of removal is insufficient. Site Geology and Hydrology:

Contaminants of Concern : N/R

Site Environmental Assessment : N/R

Site Health Assessment : As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Site Description :

The 2.90 acre site is the location of a former manufactured gas storage facility, located at 490 West First Street in Oswego, New York. The site was never used for the manufacture of gas, only storage. A Preliminary Site Assessment (PSA) was completed between July 1998 and January 1999. The January 1999 Preliminary Site Assessment (PSA)/Interim Remedial Measures (IRM) Study report indicated no significant contamination at the Oswego site but recommended a focused IRM to remove visibly stained soil containing elevated Polycyclic Aromatic Hydrocarbons (PAHs) in an area approximately 30 ft by 30 ft within the northwest section of the site. Soil excavation and removal was performed in November 1999 with Department oversight. No further remediation is required, and the site was reclassified to a C.

Contaminants of Concern : coal tar

DEL SHWS - NY **(cont.)**

Site Environmental Assessment : An IRM was performed to remove a 30' by 30' area of visibly stained soils. The 1999 Preliminary Site Assessment determined that no contamination remains at the site, and no additional action is required to protect the environment.

Site Health Assessment : The site does not present any known completed pathways of exposure. Groundwater is not contaminated and public drinking water is supplied to the area. The site is covered by a building, pavement and clean soil therefore exposures to soil is not expected.

HYDROLOGIC UNIT

Hydrologic Unit Maps

USGS

The United States Geological Survey created a hierarchical system of hydrologic units originally called regions, sub-regions, accounting units, and cataloging units. Each unit was assigned a unique Hydrologic Unit Code (HUC). As first implemented the system had 21 regions, 221 subregions, 378 accounting units, and 2,264 cataloging units. Over time the system was changed and expanded. As of 2010 there are six levels in the hierarchy, represented by hydrologic unit codes from 2 to 12 digits long, called regions, subregions, basins, subbasins, watersheds, and subwatersheds. The table below describes the system's hydrologic unit levels and their characteristics, along with example names and codes.

Site Description

Location: The site is located at 18 East Cayuga Street and 83-87 East 1st Street, Oswego, Oswego County, NY. The site occupies about 1.86 acres, approximately 3,200 feet south of Lake Ontario and 470 feet east of the Oswego River. **Site Features:** The site is occupied by 76,000 SF and 62,000 SF buildings, surrounded by various paved surfaces. **Current Zoning and Land Use:** The site is currently underutilized and zoned for commercial use. Land use

surrounding the site consists of commercial to the north, south and west, and mixed residential and commercial to the east. Past Use of the Site: The subject property was formerly used for various purposes, including a machine shop, filling station, multiple auto repair facilities, and potentially a photography studio. Site Geology and Hydrology:

Site Health Assessment

As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

EMS Project No. 4414

Limited Phase II Environmental Site Assessment

MIDTOWN PLAZA PARKING GARAGE PROPERTY EAST CAYUGA STREET OSWEGO, NEW YORK

EMS Environmental, Inc., (EMS) has prepared this report for The Sutton Companies (Sutton) as a summary of recent Limited Phase II Environmental Site Assessment (ESA) activities at the Midtown Plaza Parking Garage Property (Subject Property) located at East Cayuga Street in Oswego, New York. EMS conducted a Historic Property Usage Survey in May 2012 on the Subject Property to fill data gaps noted in a Phase I Environmental Site Assessment (ESA) conducted on the property by PES Associates (PES), dated November 23, 2010. PES in the ESA noted that they could not identify the property usage prior to 1975. EMS' Historic Property Usage Survey identified potentially adverse or recognized environmental conditions at the Subject Property from historical usage. Based upon these findings EMS was contracted to perform a Limited Phase II ESA of the subject property.

The findings, recommendations, and conclusions contained in this report are based solely upon EMS' assessment and are subject to the limitations set forth in this report at the time it was prepared. Use of and/or reliance upon this report shall be subject to the Terms and Conditions under this report was provided to The Sutton Companies and such use or reliance shall only be authorized by EMS.

EXECUTIVE SUMMARY

Phase II Environmental Site Assessment Findings and Environmental Considerations

This Limited Phase II ESA investigated areas of the property that were determined through previous Phase I ESA and Historic Usage Survey, to have the potential to contain adverse environmental conditions.

A total of eight soil borings (SB-1 through SB-8) were advanced across the subject property under the supervision of an EMS geologist. Overburden soil deposits observed during drilling activities consisted of brown sand and gravel with clayey silt to depths ranging from of approximately 0.5 feet to twelve feet below ground surface (bgs). Groundwater analysis was not part of this Limited Phase II ESA.

Field screening of soil samples using a Photo-ionization Detector (PID) measured volatile organic compound (VOC) concentrations above background levels of 0.0 parts per million (ppm) at soil boring SB-1. The PID reading recorded at soil boring SB-1 was 65 ppm (6-7 ft. bgs).

Soil samples were collected from SB-1, SB-2, SB-3, and SB-5 were submitted for laboratory analysis. Soil from SB-1 was selected due to a positive PID response, soil from SB-2 and SB-5 was selected due their location in relation to SB-1. Soil from SB-3 was selected due its location to a former machine shop on the property.

Laboratory analysis indicated that VOC concentrations were all below method detection limits, and semi-volatile organic compounds (SVOC) concentrations were also below method detection limits, with the exception of the soil samples collected from soil borings SB-1 and SB-3. The SVOC concentrations in the soil samples from SB-1 and SB-3 were within the New York State Department of Environmental Conservation (NYSDEC) CP-51 Unrestricted Use Soil Cleanup Guidance Values.

The findings of this Limited Phase II ESA indicate SVOCs exist within the subsurface of the property at concentrations below NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values. The results warrant no further subsurface investigation at this time.

PHASE II ESA SITE EVALUATION METHODS

To determine if any petroleum hydrocarbons were present in the soil at the subject property from historic property use, EMS, on behalf of Sutton, conducted a limited subsurface investigation. Information obtained from the Historic Property Usage Survey and Phase I ESA activities was used to develop the investigation workplan. The scope of work included the advancement of eight (8) soil borings. Sampling and analyses were performed as detailed in the sections that follow.

Soil Boring Advancement

On March 26 - 28, 2013, soil borings (SB-1 through SB-8) were advanced using macro-core soil samplers by a Geoprobe® direct push rig under the supervision of an EMS geologist. Prior to advancement of each borehole a 10-inch diameter core was drilled through the 6-inch concrete floor of the garage. The Subsurface Logs for each boring are presented in Appendix A. The approximate locations of the soil borings are depicted on the Site Plan attached as Figure 1. These locations were selected on a bias toward known locations of historical areas of concern.

Soil Sampling

During the advancement of each borehole, EMS logged the sediment color, sediment type, moisture content, and organic vapor concentration. A Photoionization detector (PID) was used to perform soil headspace analysis and measure organic vapor concentration in the soil. Continuous soil sampling was conducted using a two-inch inside diameter three-foot long macro-core with acetate liners. Each sample was scanned with a calibrated PID using a sealed-bag headspace method.

Soil samples were retained for laboratory analyses from selected boreholes based on the highest PID reading, visual and/or olfactory observations. If no elevated PID responses, odors, or obvious evidence of hydrocarbon impact were noted, a soil sample from borings biased towards known locations of historical areas of concern were selected and the laboratory soil sample was collected from the soil/water table interface. Samples were jarred with minimal headspace, labeled, and placed in a cooler with ice to maintain 4° C.

Soil samples were collected from SB-1, SB-2, SB-3, and SB-5 were submitted for laboratory analysis. Soil from SB-1 was selected due to a positive PID response, soil from SB-2 and SB-5 was selected due their location in relation to SB-1. Soil from SB-3 was selected due its location to a former machine shop on the property. The samples were shipped under chain of custody procedures to Life Science Laboratories, Inc., East Syracuse, New York for analyses for NYSDEC STARS list VOCs by EPA method 8260 and NYSDEC STARS list semi-volatile organic compounds SVOCs by EPA Method 8270.

PHASE II ESA INVESTIGATIVE RESULTS

Geology / Hydrology

Overburden soil deposits observed during drilling activities consisted of brown sand and gravel with clayey silt to depths ranging from approximately 0.5 feet to twelve feet below ground surface (bgs). According to the boring logs groundwater depths ranged from approximately 3 to 10 ft bgs.

Topography of the subject property slopes to the north - northeast. Based on the slope of area topography and proximity to the Oswego River and Lake Ontario groundwater flow is likely towards those features to the north-northeast. Detailed Subsurface Logs are included as Appendix A. The boring locations are shown on Figure 1.

Soil Sampling Results

The soil samples collected during drilling activities were evaluated using a PID and the results have been summarized in the Subsurface Logs. Referring to the Subsurface Logs, the results of field screening showed VOC concentrations above background levels of 0.0 ppm only at soil boring SB-1 at 65 ppm (6-7 ft. bgs) just above the water table.

Soil analytical results were compared to NYSDEC CP-51 Soil Cleanup Guidance, issued on October 21, 2010. The CP-51 was developed to provide the determination of soil cleanup levels, and bases the guidance values on the potential use of the soil or present and/or future use of the subject property. Unrestricted Use Guidance allows the subject property owner the ability to use the soil or property however they choose. The Restricted Use Guidance offers the property owner values that have to be met based on the current or future use of the property.

Laboratory analytical results of the soil samples showed target list VOC concentrations below method detection limits from all the soil borings, therefore the soil meets the NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance for VOCs. The complete laboratory analytical report is included as Appendix B and is summarized in tabular form in Table 1 and illustrated on Figure 1.

The Laboratory analytical results exhibited target list SVOC concentrations ranging from none detected above method detection limits at SB-2, and SB-5 to a high of 3,480 parts per billion (ppb) at SB-3. SVOC concentrations were detected at SB-1 (590 ppb). The SVOC concentrations in SB-1 and SB-3 were below the NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance values. The complete laboratory analytical report is included as Appendix B and is summarized in tabular form in Table 2 and illustrated on Figure 1.

PHASE II ESA FINDINGS/RECOMENDATIONS

- Field screening of the soil samples using a PID indicated VOC concentrations above average background levels of 0.0 ppm at soil boring SB-1, with a PID reading 65 ppm at 6-7 ft. bgs).
- Laboratory analytical results of the soil samples indicated target list VOC concentrations were below method detection limits, therefore within NYSDEC CP-51 Soil Cleanup Unrestricted Use Guidance Values.
- Laboratory analytical results of the soil samples indicated target list SVOC concentrations ranging from none detected above method detection limits at SB-2, and SB-5 to a high of 3,480 parts per billion (ppb) at SB-3. SVOC concentrations were detected at SB-1 (590 ppb). The SVOC concentrations in SB-1 and SB-3 were below the NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance values.

This Limited Phase II ESA investigated areas of the property that were determined through a previous Phase I ESA and Historic Usage Survey, to have the potential to contain adverse environmental conditions. The findings of Limited Phase II ESA identified through laboratory analysis contaminants exists within the subsurface of the property at concentrations within NYSDEC CP-51 Unrestricted Use Soil Cleanup Guidance Values. The results warrant no further subsurface investigation at this time.

ASTM E 1528 TRANSACTION SCREEN QUESTIONNAIRE

Project Name: Midtown Plaza
 Subject Property Address 18 East Cayuga Street
Oswego, NY

1a. Is the *property* used for an industrial use?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

1b. Is any *adjoining property* used for an industrial use?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

2a. Did you observe evidence or do you have any prior knowledge that the *property* has been used for an industrial use in the past?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

2b. Did you observe evidence or do you have any prior knowledge that any *adjoining property* has been used for an industrial use in the past?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

3a. Is the *property* used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable identify which)?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

3b. Is any *adjoining property* used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable identify which)?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

4a. Did you observe evidence or do you have any prior knowledge that the *property* has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable identify which)?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

4b. Did you observe evidence or do you have any prior knowledge that any *adjoining property* has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable identify which)?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

5a. Are there currently any damaged or discarded automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers of greater than 5 gal (19L) in volume or 50 gal (190L) in the aggregate, stored on or used at the *property* or at the facility?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

5b. Did you observe evidence or do you have any prior knowledge that there have been previously any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of > 5 gal (19L) in volume or 50 gal (190L) in the aggregate, stored on or used at the *property* or at the facility?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

6a. Are there currently any industrial drums (typically 55 gal (208L)) or sacks of chemicals located on the *property* or the facility?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

6b. Did you observe evidence or do you have any prior knowledge that there have been previously any industrial drums (typically 55 gal (208L)) or sacks of chemicals located on the *property* or the facility?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

7a. Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the *property* that originated from a contaminated site?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

7b. Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the *property* that is of an unknown origin?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

8a. Are there currently any pits, ponds, or lagoons located on the *property* in connection with waste treatment or waste disposal?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

8b. Did you observe evidence or do you have any prior knowledge that there have been previously, any pits, ponds, or lagoons located on the *property* in connection with waste treatment or waste disposal?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

9a. Is there currently any stained soil on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

9b. Did you observe evidence or do you have any prior knowledge that there has been previously any stained soil on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

10a. Are there currently any registered or unregistered storage tanks (above or underground) located on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

10b. Did you observe evidence or do you have any prior knowledge that there have been previously any registered or unregistered storage tanks (above or underground) located on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

11a. Are there currently any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

11b. Did you observe evidence or do you have any prior knowledge that there have been previously any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No Unknown	Yes No Unknown	Yes ☒ No

12a. Is there currently evidence of leaks, spills or staining by substance other than water, or foul odors, associated with any flooring, drains, walls, ceilings, or exposed grounds on the property?

Owner Interview	Occupant Interview	Observed During Site Visit
Yes ☒ No ☐ Unknown	Yes No Unknown	Yes ☒ No ☐

The preparer of the transaction screen questionnaire must complete and sign the following.
(For definition of "preparer" and "user," see 5.3 or 3.3.28.)

The *Owner* questionnaire was completed by:

Name: LOUIS G. FOURNIER JR

Title: MANAGING MEMBER

Firm: SUTTON REAL ESTATE

Address: 525 PLUM ST. SYRACUSE, NY 13204

Phone number: 315-424-1111

Date: 2-1-18

Preparer's relationship to site: OWNER REPRESENTATIVE

Preparer's relationship to user (for example, principal, employee, agent, consultant)

The *Occupant* questionnaire was completed by:

Name: _____

Title: _____

Firm: _____

Address: _____

Phone number: _____

Date: _____

Preparer's relationship to site: _____

Preparer's relationship to user (for example, principal, employee, agent, consultant)

The *Site Visit* questionnaire was completed by:

Name: Rob Nigolian

Title: Sr. Project Manager

Firm: EMS Environmental, Inc.

Address: 7010 Fly Rd. E. Syr., NY 13057

Phone number: 315-214-4365

Date: 1/31/18

Preparer's relationship to site: CONSULTANT

Preparer's relationship to user (for example, principal, employee, agent, consultant)

CONSULTANT

The *Government Records* and *Historical Sources Inquiry* questionnaire was completed by:

Name: Rob Nigolian

Title: Sr. Project Manager

Firm: EMS Environmental, Inc.

Address: 7010 Fly Rd., E. Syr., NY 13057

Phone number: 315-214-4365

Date: 1/31/18

Preparer's relationship to site: Consultant

Preparer's relationship to user (for example, principal, employee, agent, consultant)

Consultant

User's relationship to the site (for example, owner, prospective purchaser, lender, etc.)

Owner

If the preparer(s) is different from the user, complete the following:

Name of User: Sutton Companies

User's address: 525 Plum St., Syr., NY 13204

User's phone number: 315-218-1102

Copies of the completed questionnaires have been filed at:

EMS Environmental, Inc.

Copies of the completed questionnaires have been mailed or delivered to:

Sutton Companies.

Preparer represents that to the best of the preparer's knowledge the above statements and facts are true and correct and to the best of the preparer's actual knowledge no material facts have been suppressed or misstated.
