Comments: Sample A8A59504 was digested at a reduced initial volume due to high reactivity with KMnO4.

The batch was digested using an additional 5mL (2x) potassium permanganate (KMnO4) due to high consumption by some samples.

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

GC/MS Volatile Data

For method 8260, the recoveries of Trichloroethene in sample MW-2 Matrix Spike and Matrix Spike Duplicate exceeded quality control limits. The Matrix Spike Blank recoveries are compliant.

Linear regression was used to calibrate analytes that were greater than 15% RSD in the initial calibrations A8I0000745-1, A8I0000734-1, A8I0000718-1 and A8I0000712-1.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

For method 8260, all samples were preserved to a pH less than 2 except for sample MW-9 which had a pH>2.

For method 8260, sample MW-9 exhibited a pH>2 at the time of analysis. The analysis was performed after the recommended 7 days for un-preserved samples, therefore all detected concentrations should be considered minimum values and the results estimated.

The analyte Methyl tert-butyl ether was detected in sample MW-9 at a concentration above the linear range of the initial calibration standard curve, requiring a dilution. Due to the high dilution dictated by the concentrations of Benzene and total Xylenes, Methyl tert-butyl ether was diluted out in sample MW-9.

GC/MS Semivolatile Data

The Matrix Spike Blank A8B2292801 exceeded quality control limits for analyte 4-Chloro-3-methylphenol. Since the samples were non-detect for these anlytes and all other recoveries are compliant there is no need for corrective action.

The Relative Percent Difference between the Matrix Spike Blank A8B2324801 and the Matrix Spike Blank Duplicate A8B2324802 exceeded quality control criteria for Pentachlorophenol, though all individual recoveries are compliant. No action required.

The spike recoveries for 4-Nitrophenol and Pentachlorophenol were below the laboratory quality control limits in sample MW-2 Matrix Spike and Matrix Spike Duplicate. Since the Matrix Spike Blank recoveries were compliant for these analytes, no corrective action was required.

Linear regression was used to calibrate analytes that were greater than 15% RSD in the initial calibrations A8I0000600, A8I0000697, A8I000700, A8I000705 and A8I000720.

Linear regression was used to calibrate analytes that were greater than 15% RSD in the initial calibrations A8I000720 and A8I0000722.

The continuing calibration verification standard A8C0002479 exhibited the percent Difference (%D) as greater than 20% on the Form VII for the analyte Pentachlorphenol. Since this analyte was calibrated using linear regression, the CCV must be evaluated using %Drift rather than %Difference. The CCV demonstrated %Drift of 15.1%. No corrective action was required (consistent with the laboratory Standard Operating Procedure (SOP), Section 13.5.2, which states that up to 4 analytes may have a %D or %Drift of greater than 20% but less than 40%).

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

The continuing calibration verification A8C0002500 exhibited the percent Difference (%D) as greater than 40% for the analyte 2,4-Dinitrophenol and greater than 20% for the analyte Pentachlorophenol on the Form VII. Since these analytes were calibrated using linear regression, the CCV must be evaluated using %Drift rather than %Difference. The CCV demonstrated %Drift of 25.36% for 2,4-Dinitrophenol and 16.14% for Pentachlorophenol. No corrective action was required.

Metals Data

The recoveries of sample MW-2 Matrix Spike exhibited a result below the quality control limits for Total Calcium and a result above the quality control limits for Soluble Calcium. The sample results are more than four times greater than the spike added. However, the LFB's were acceptable.

All volumes for Dissolved Metals received on 09/23/2008 were filtered and preserved in the TestAmerica Metals Digestion Laboratory on 09/24/2008. All volumes for Dissolved Metals received on 09/24/2008 were filtered and preserved in the TestAmerica Metals Digestion Laboratory on 09/25/2008. All volumes for Dissolved Metals received on 09/25/2008 were filtered and preserved in the TestAmerica Metals Digestion Laboratory on 09/26/2008. Each sample was filtered using a 0.45 micron Metricel Black Grid filter, Pall Life Sciences Lot #T82395. Each sample was then preserved to a pH <2 with 3.0 mL of Nitric Acid, J.T. Baker lot #G17027.

Wet Chemistry Data

No deviations from protocol were encountered during the analytical procedures.

"I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. The requested project specific reporting limits listed below were less than lab standard quantitation limits but greater than or equal to lab MDL. It must be noted that results reported below lab standard quantitation limit (PQL) may result in false positive/false negative values and less accurate quantitation. Routine laboratory procedures do not indicate corrective action for detections below the laboratory's PQL.

DATA QUALIFIER PAGE

These definitions are provided in the event the data in this report requires the use of one or more of the qualifiers. Not all qualifiers defined below are necessarily used in the accompanying data package.

ORGANIC DATA QUALIFIERS

ND or U	Indicates compound was analyzed for, but not detected.
J	Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
C	This flag applies to pesticide results where the identification has been confirmed by GC/MS.
B	This flag is used when the analyte is found in the associated blank, as well as in the sample.
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at the secondary dilution factor.
N	Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds, where the identification is based on the Mass Spectral library search. It is applied to all TIC results.
P	This flag is used for CLP methodology only. For Pesticide/Aroclor target analytes, when a difference for detected concentrations between the two GC columns is greater than 25%, the lower of the two values is reported on the data page and flagged with a "P".
A	This flag indicates that a TIC is a suspected aldol-condensation product.
1	Indicates coelution.
*	Indicates analysis is not within the quality control limits.

INORGANIC DATA QUALIFIERS

ND or U	Indicates element was analyzed for, but not detected. Report with the detection limit value.
J or B	Indicates a value greater than or equal to the instrument detection limit, but less than the quantitation limit.
N	Indicates spike sample recovery is not within the quality control limits.
S	Indicates value determined by the Method of Standard Addition.
E	Indicates a value estimated or not reported due to the presence of interferences.
H	Indicates analytical holding time exceedance. The value obtained should be considered an estimate.
G	Indicates a value greater than or equal to the project reporting limit but less than the laboratory quantitation limit
*	Indicates the spike or duplicate analysis is not within the quality control limits.
+	Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995.
