Date: March 2011 (Revised July 2011)

REMEDIAL INVESTIGATION/REMEDIAL ALTERNATIVES ANALYSIS REPORT

Anderson Cleaners Site
5 Hunt Road
Jamestown, New York

NYSDEC BCP Site Number: C907027

I Raymond L. Kampff certify that I am currently a Qualified Environmental Professional as defined in 6 NYCRR Part 375 and that this Report was prepared in accordance with applicable statutes and regulations and in substantial conformance with the *DER Technical Guidance for Site Investigation and Remediation (DER-10)* and that activities were performed in general accordance with the DER-approved work plan and approved modifications.

Raymond L. Kampff
Associate
Day Environmental, Inc.

1.0 INTRODUCTION

Anderson Cleaners, Inc. (Anderson Cleaners) and Mr. Michael K. Lyons entered the Brownfield Cleanup Program (BCP) administered by the New York State Department of Environmental Conservation (NYSDEC) in 2005.

Anderson Cleaners is located at 5 Hunt Road, Jamestown, New York (Site) and the Site is identified as BCP site #C907027. Anderson Cleaners retained Day Environmental, Inc. (DAY) to complete a Remedial Investigation (RI) and to develop Remedial Alternatives (RA) for the Site and to prepare this RI/Remedial Alternatives Analysis (RAA) report.

1.1 Purpose of Report

The purpose of this RI/RAA report is to present the findings of the studies completed as part of this RI to provide an understanding of the environmental conditions at the Site, which were the result of past activities. In addition, this report describes an Interim Remedial Measure (IRM) conducted to remove contaminated soil from the Site, actions conducted to remove Dense Non-Aqueous Phase Liquid (DNAPL), and bioremediation pilot testing completed to evaluate this potential remedial approach. The information obtained during the above activities was used to: evaluate the nature and extent of contamination; identify potential routes of exposure and potential receptors; and evaluate the fate and transport of contaminants. Finally, this report also provides an evaluation of remedial alternatives to address the remaining environmental impacts identified at the Site.

1.2 Site Description

The Site consists of approximately 2.4 acres located partially in the City of Jamestown and partially in the Town of Ellicott, New York. The Site is designated as Section Block and Lot numbers 504-01-001, 504-01-002, and 504-01-003 (Jamestown) and 32-1-1 and 32-1-11 (Ellicott). A Project Locus Map and a Site Plan with Utility Locations are appended as Figures 1 and 2, respectively.

The Site is currently improved by an approximate 11,400-square foot one-story brick and concrete block building. The building was constructed in phases with the southwest portion constructed in the 1930s; the south-central portion constructed in 1947; and the northern and eastern portion constructed in 1985.

1.3 Site History

The first record of development on the Site was a building constructed and used as a towel factory in the 1930s. By the mid-1940s, Anderson Cleaners occupied the Site and operated a dry cleaning business. The building was expanded over the years. In 1985, a fire destroyed the northern and eastern portions (approximately 8,000 square feet) of the building. This fire did not directly impact the portion of the building that housed the dry

cleaning operations; however, the heat from the fire may have damaged containers of dry cleaning fluid resulting in spillage. It is also possible that the water used to fight the fire flushed residual solvent that may have spilled onto the concrete floor into the subsurface. Following the fire, reconstruction/remodeling operations were undertaken resulting in the current structure.

In addition to dry cleaning operations, portions of the building were historically used for the following:

- 1957-late 1960s: Anderson Specialty Manufacturing Company (office area only-manufacturing operations were completed off-site)
- 1967- early 1990s: Jamestown Armored Car Service, Inc.
- early 1990s: Lutheran Brotherhood, Lyons Den (men's clothing-retail)

Anderson personnel report that Stoddard Solvent was used for dry cleaning operations from approximately 1947 to 1978. This material was stored in two underground storage tanks (USTs), each with a capacity of approximately 1,100 gallons. These USTs were located in the area that is now underneath a portion of the building used for cold storage (refer to Figure 2). Representatives of Anderson Cleaners reported that these USTs were removed some time before the re-construction of the building in 1985. Available information indicates that the tanks were installed at the time the south-central portion of the building was constructed (i.e., 1947). The use of Stoddard Solvent was discontinued in about 1978 when tetrachloroethene (also known as perchloroethene or PCE) was first used as the primary dry cleaning agent. In 2002, new dry cleaning equipment that used a hydrocarbon-based solvent, DF 2000, was installed and all use of PCE was discontinued.

1.4 Previous Studies

DAY completed a Phase I Environmental Site Assessment (Phase I ESA) of the Site in 1999. A copy of this Phase I ESA report is included in Appendix A. The Phase I ESA identified the following recognized environmental conditions (RECs):

- possible releases from historical dry cleaning practices;
- possible leaks or spills of dry cleaning solvents, petroleum products, hazardous materials, into the former floor drain system;
- possible leakage/spillage from the former underground Stoddard Solvent tanks; and
- possible use of waste oil for dust suppression.

The Phase I ESA also identified a minor amount of suspect asbestos-containing material in one of the buildings. The owners are managing this REC, and it was not evaluated as part of the studies described herein.

Between August and November 2003, DAY completed Phase II environmental studies at the Site to evaluate the RECs. This work included advancement of 27 test borings, conversion of eight of these test borings to monitoring wells; groundwater and soil sampling/analysis; and a groundwater elevation survey. The data generated as part of this

study are summarized in the *Site Evaluation Summary Report, Anderson Cleaners, Jamestown, New York* dated March 2004 presented in Appendix A. In addition, relevant data collected during the previous Phase II environmental studies (e.g., test boring logs, analytical laboratory results, etc.) are included as part of this report.

Relevant findings regarding contaminant types and distribution described in the March 2004 report are summarized below:

- The dry cleaning solvent PCE, and associated breakdown products trichloroethene (TCE), 1, 2-dichloroethene (1,2-DCE), and vinyl chloride (VC) were detected in soil and/or groundwater at the Site. PCE was the compound detected at the highest concentrations. The highest PCE concentration in groundwater was found beneath the Courtyard Area (81,800 ug/l or parts per billion-ppb) and beneath the southeastern portion of the building (53,300 ppb). The PCE concentrations measured in the groundwater were significantly lower in the two locations tested to the east and south of the building (70 and less than 2 ppb, respectively).

- Based on the distribution of PCE in soil and groundwater, it appears that a release of dry cleaning materials in or near the Courtyard Area and/or within the building was the primary source of contamination. However, the specific source (e.g.: a leaking drain/sewer, a spill incident, etc.) was not identified.

- Evidence of apparent Stoddard Solvent impact was not detected in test borings/monitoring wells positioned near the former UST locations.

- PCB analysis was conducted on two surficial soil samples to evaluate whether waste oil that was reportedly used for dust suppression may have contained PCBs. No PCBs were found in the two surficial soil samples analyzed.

Information obtained from Mr. Bob Ehmke (Ehmke Drilling) during a telephone interview conducted in May 2004 indicates that two water supply wells were installed at the Site in the early 1950s. [Note: A summary of DAY's interview with Ehmke Drilling, and copies of Ehmke's well logs, are presented in Appendix A.] The first well, installed in 1950, was reportedly 40 feet deep (33 feet of casing and 7 feet into rock). This well was apparently abandoned and its exact location is not known, but it is suspected to have been located in an area that is currently a parking lot on the east side of the building. The second well, installed in 1954, is reportedly 100 feet deep (31 feet of casing and 69 feet an uncased hole in the rock). This well (designated for purposes of this report as BR-01) is located within the rug washing area in the northern portion of the building at the Site (refer to Figure 2 and the discussion presented in Section 2.3 of this report). Currently this well is unused and it consists of an 8-inch diameter "open hole" that contains a steel casing through the overburden and into competent bedrock. Reportedly the well was formerly used to feed the boiler system in the 1950s through the mid-1960s. Mr. Ehmke also reported that a 1,828-foot deep gas well was installed at the Site (date not provided). Anderson Cleaners personnel report that no gas well is currently in use, and that they have no knowledge of the location of this well.

1.5 Report Organization

Sections 1.0 through 7.0 of this report are associated with the site investigation portion of this project. Sections 8.0 and 9.0 are associated with evaluation of remedial alternatives intended to address environmental impacts defined during the site investigation of the Site. The contents of Section 2.0 through Section 9.0 are summarized below.

Section 2.0 - Site Activities and Investigation Methods: This section of the report describes the methods used to evaluate environmental conditions at the Site. The work conducted included: an evaluation of current and historic storm and sanitary sewers located in proximity of the Site; completion of a site-wide soil gas survey; advancement of test borings and installation of groundwater monitoring wells at on-site and off-site locations; testing of soil and groundwater samples collected from various locations both on-site and off-site; and independent (third party) assessment of the suitability of the analytical laboratory data collected. In addition, this section describes the soil removal IRM, DNAPL removal efforts and bioremediation testing conducted.

Section 3.0 - Physical Characteristics of the Site: This section describes the physical characteristics of the Site including geologic and hydrogeologic conditions, and the demography and land use of the area surrounding the Site.

Section 4.0 - Nature and Extent of Impact: The findings of the work described in Section 2.0 are described in this section of the report.

Section 5.0 - Fate and Transport: Information pertaining to the fate and transport of contaminants identified in the environment of the Site are discussed in this section of the report. The information discussed includes potential routes of migration, contaminant persistence and contaminant migration.

Section 6.0 - Exposure Assessment: This section of the report summarizes the findings of a qualitative human health exposure assessment, and a fish and wildlife Resources Impact Analysis conducted as part of this project.

Section 7.0 – Conceptual Site Model: The findings of the work conducted as part of this project were used to develop a Conceptual Site Model for the Site, which identifies the geologic setting, groundwater conditions, contaminants of concern (COC), the distribution of COC within impacted media, and suspected transport mechanisms for the COC.

Section 8.0 - Identification and Development of Alternatives: This section discusses the identification and development of remedial alternatives to address the environmental impacts present at the Site. The constituents of interest and remediation goals are also identified in this section.

Section 9.0 - Detailed Evaluation of Alternatives: A detailed evaluation of the remedial alternatives described in Section 8.0 and the recommended alternative are discussed in this section.

A list of references used to develop this report is included in Section 10.0 and Section 11.0 provides a list of acronyms used in this report.

2.0 SITE ACTIVITES AND INVESTIGATION METHODS

This section describes the investigative work conducted and the methods used as part of this project. In addition, this section describes the soil removal IRM, the DNAPL removal efforts and the bioremediation testing conducted.

Selected samples collected as part of this project were delivered under chain-of-custody control to one of three New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified analytical laboratories. These include Paradigm Environmental Services, Inc. (Paradigm)-ELAP # 10958; Columbia Analytical Services (CAS)-ELAP # 10145 and Mitkem Corporation (Mitkem)-ELAP # 11522.

2.1 Storm/Sanitary Sewer Evaluation

According to the Ellicott Building Inspector, the Site is currently serviced by municipal (Jamestown) water and sewer systems. Anderson Cleaners personnel report that the building has been connected to a municipal sanitary sewer system since the time of building construction and that septic systems were never located on the property. Site plans dated 1985 and titled "Floor Plan" (Sheet A-1) and "Location and Grading Plan" (Sheet L-1) by Habiterra Associates confirm that the Jamestown sewer system serves the Site. Sewer lines exit the eastern and southern sides of the building, joining to one sewer line that discharge to a sanitary sewer manhole in Huxley Street. The Floor Plan also indicates that the Site was previously served by the Ellicott sanitary sewer system. The plan includes instructions to cut and abandon the Town of Ellicott sanitary sewer line, and to cap the existing Town of Ellicott line at Hunt Road. The full location of the Ellicott sewer line is not shown. [Note: Available information indicates that the change from the Ellicott system to the Jamestown system occurred in 1985 during the redevelopment of the Site.] The Floor Plan also indicates that five floor drains are present in the building. One drain is in each of the two truck garages (the northern-most truck garage is now used as the rug cleaning area); these drains discharge to the Jamestown sanitary sewer system. The trench drain in the laundry area discharges to the Jamestown sanitary sewer system. The discharge point of the floor drain in the current boiler room and the floor drain in the dry cleaning area are not shown, however dye testing conducted during this study indicates that these drains discharge to the sanitary sewer system.

According to the Location and Grading Plan, a storm sewer line traverses the Site from a catch basin in Hunt Road, to a catch basin northeast of the building, to a manhole in Huxley Street. Flow in this storm sewer is generally from the northwest to the southeast.

During studies to evaluate subsurface conditions within the Courtyard Area (refer to Section 2.4), a 6-inch diameter clay tile pipe was encountered in the approximate center of the Courtyard beginning a depth of approximately 2^{+} feet below the ground surface. This 6-inch diameter clay tile pipe was found to enter the foundation wall of a passageway at the northwestern end of the Courtyard that connects the Finishing Area and the Laundry/Dry Cleaning portions of the Anderson Cleaners building. The 6-inch

clay tile pipe was determined to extend the entire length of the Courtyard to the southeast, and to exit the Courtyard where the pipe changed direction and headed generally to the east. When the 6-inch clay tile pipe was initially identified it was determined that the pipe was apparently "plugged" with tree roots approximately 35 feet east of the Courtyard. Roto Rooter was retained to clean the pipe and they used an electronic snake to clear the roots and to trace the 6-inch clay tile pipe to its discharge location. This evaluation suggested that the 6-inch clay tile pipe discharged into a storm sewer located within a parking lot on the eastern side of the building at the Site. [Note: Prior to the construction of the buried storm sewer pipe in the eastern portion of the Site, a drainage swale reportedly traversed this area. It is believed that the 6-inch clay tile pipe originally discharged directly into this drainage swale and that the storm sewer was placed in the bottom of the swale and covered. The 6-inch clay tile pipe was likely connected to the storm sewer at that time. The date of the placement of the storm sewer pipe and the backfill of the drainage swale is not specifically known.].

The roof drain on the Finishing Area building located on the west side of the Courtyard was found to connect to the 6-inch diameter clay tile pipe at a distance of 23 feet from the passage way. The roof drain for the Laundry/Dry Cleaning portion of the building located on the east side of the Courtyard was found to connect to the 6-inch diameter clay tile pipe a distance of about 30 feet from the passageway. No other connections to the 6-inch clay tile pipe were identified.

The current and known historic location of buried utilities at the Site is presented on Figure 2.

2.2 Soil Gas Survey

On March 18, 2005, DAY installed fourteen passive soil gas samplers at the Site. The location of the soil gas survey points installed is depicted on the figure included in Appendix B. These soil gas samplers were obtained from Beacon Environmental Services, Inc. (Beacon) and each sampler consists of two hydrophobic absorbent cartridges in a glass sampler vial attached to a retrieval wire. At each sample location, an approximate 1-inch diameter by 1-foot deep hole was created by driving a stake into the ground or by using a hammer drill with a 1-inch bit. The hole was 'sleeved' by inserting a ¾-inch diameter by 1-foot long piece of copper pipe. The soil gas sampler (i.e., hydrophobic absorbent cartridges, glass vial, and retrieval wire) was placed approximately 3 to 4 inches into the top of the copper pipe. The top of the pipe was then capped by inserting a 'wad' of aluminum foil and subsequently the 1-inch diameter hole was backfilled with local soil (i.e., to 'seal' the sampler into the soil matrix). The retrieval wire was left above grade for subsequent collection. On March 24, 2005, a DAY representative retrieved the samplers and sent them to Beacon for analysis under chain-of-custody control.

The results of the soil gas survey are presented in an April 5, 2005 report prepared by Beacon titled *Passive Soil-Gas Survey, 5 Hunt Road, Jamestown, NY.* A copy of the Beacon report is included in Appendix B. This report includes a discussion of field

procedures used to collect the samples (including a schematic of the passive sampler), test results and Beacon's evaluation of the test results.

2.3 Evaluation of an Existing Bedrock Well

Existing bedrock well BR-01, which is located in the current "Rug Cleaning" area of the Anderson Cleaners facility, was evaluated by DAY on March 18, 2005. A Heron Oil/Water Interface Meter Model H.O1L was used to measure the depth of the well, the depth to water, and to evaluate the presence of non-aqueous phase liquid (NAPL). Water was measured at a depth of 1.52 feet below the concrete floor and the bottom of the well was measured to be 97.4 feet (ft.) below the concrete floor. No layers of NAPL were identified within the well.

2.4 Courtyard Evaluation

DAY retained SLC Environmental Services, Inc. (SLC) to excavate a series of test pits/trenches within the Courtyard Area using a mini-excavator. This work was completed on October 6, 2004 and the locations of these test pits/trenches are depicted on Figure 3. These test pits/trenches were advanced to a maximum depth of about 8.5 ft. below ground surface (bgs). During this work, a 6-inch diameter clay tile pipe (the pipe) was encountered in the approximate center of the Courtyard at a depth of approximately 2^{+} ft. bgs (refer to Section 2.1).

During the advancement of the test pits/trenches, an approximate 4-foot long section of the pipe was observed to be damaged (i.e., apparently crushed from above) beginning about 25 ft. from the northwestern end of the Courtyard. The pipe was not observed to be damaged in the other test pits/trenches excavated within the Courtyard. The soil below the damaged section of the pipe, and extending downward into the groundwater, was stained and emitted distinct VOC type odors. Peak PID readings in excess of 2,000 ppm were measured above samples of the impacted soil encountered beneath the broken pipe. The soil above the damaged pipe and within test pits/trenches excavated where the pipe was not broken did not exhibit similar staining or apparent VOC impact. However, in some of the test pits/trenches excavated where the pipe was not broken, evidence of impact was detected in proximity of the groundwater. This impact is likely due to migration within the groundwater as opposed to leakage from the pipe.

Three soil samples collected from the test pit/trench excavations were submitted to CAS for analytical laboratory testing. Two of these samples were tested for Target Compound List (TCL) VOC using United States Environmental Protection Agency (USEPA) Contract laboratory Procedure (CLP) Method OLM04.2 and one sample was tested for full TCL/TAL parameters using 2000 ASP CLP Methods OLM04.2 and ILM04.1. The results of this testing are summarized in Table 1 and a copy of the analytical laboratory report prepared by CAS and the executed chain-of-custody documentation are included in Appendix C.

The subsurface conditions encountered in the test pits/trenches excavated on October 6, 2004 are summarized on Figure 4.

Based upon the identification of the broken pipe and the impacted soils identified with the test pits/trenches advanced on October 6, 2004, an additional evaluation of the Courtyard was conducted on February 7, 2005 to delineate the source area and to characterize the soil for disposal purposes. To accomplish this work, DAY retained SLC to advance test borings (designated TB-100 through TB-114) in the Courtyard using a track-mounted Geoprobe Systems Model 54L-T drill rig. These test borings were generally advanced to depths of 8 ft. bgs with the exception of test boring TB-115 and TB-116, which were advanced to equipment refusal at depths of 11.8 ft. and 14.2 ft. bgs, respectively. The locations of test borings TB-100 through TB-117 are depicted on Figure 3 and copies of the test boring logs are included in Appendix D. Selected samples collected from test borings TB-100 through TB-117 were submitted to Paradigm for analytical laboratory testing. These samples include:

- Composite samples collected from test borings TB-100 through TB-111, tested for VOC halocarbons via USEPA Method 8260B; and

- Discrete samples TB-112 (4-6'), TB-113 (6-8') and TB-114 (6-8'), tested for VOC halocarbons via USEPA Method 8260B.

A summary of the detected VOC measured in the above samples is included in Table 2 and a copy of the analytical laboratory report prepared by Paradigm is included in Appendix C.

2.5 Test Borings

In addition to test borings TB-100 through TB-117 described above, test borings were advanced prior to and during this RI using various installation methods. Summaries of these test borings and the installation procedures utilized are discussed below and summarized in Table 3.

Test borings TB-1 through TB-9 were advanced on August 4, 2003 by DAY using hand-operated Geoprobe Systems sampling equipment. Test borings TB-1 through TB-5 were advanced through the concrete floor of the Laundry/Dry Cleaning portion of the Anderson Cleaners building and test boring TB-5 was advanced though the concrete floor of a garage area located in the southeastern portion of the Anderson Cleaners building. Prior to advancing these test borings, a coring device was used to core through the approximate 0.4-foot thick concrete floor in these locations. Test borings TB-6 through TB-9 were advanced in the parking lot east of the Anderson Cleaners building. Test borings TB-1 through TB-9 were advanced to depths of between 2.0 ft. (TB-5, TB-8 and TB-9) and 7.0 ft. (TB-4 and TB-4) bgs. Upon completion, each test boring was backfilled with the cuttings removed and sealed with concrete or asphalt patch, as appropriate.

Test borings TB-10 through TB-21 were advanced on September 3, 2003 and test borings TB-22 through TB-27 were advanced on November 13, 2003. DAY retained SLC to advance these test borings using a track-mounted Geoprobe Systems Model 54L-T drill rig. With the exception of test borings TB-25 and TB-26, which were advanced in the garage area located in the southeastern portion of the Anderson Cleaners building, and TB-27, which was advanced within the Finishing Area portion of the Anderson Cleaners building, these test borings were advanced in exterior locations of the Site. Each of the test borings TB-10 through TB-27 were advanced to equipment refusal, which was typically encountered at depths ranging between 7.7 ft. (TB-13 and TB-21) and 14.5 ft. (TB-10) bgs. The average depth of refusal encountered in test borings TB-10 through TB-27 was 11.1 ft. bgs. [Note: Shallow equipment refusal was encountered in test boring TB-20 at 1.4 ft. bgs and in test boring TB-25 at 2.8 ft. bgs. It is believed that refusal at these locations was due to buried concrete slabs or other obstructions. As such, the refusal depths in these test borings are not included in the above assessment.] Upon completion, test borings TB-10, TB-11, TB-14, TB-16, TB-18, TB-23, TB-26 and TB-27 were converted to 1-inch diameter monitoring wells (refer to Section 2.6) and the remaining test borings were backfilled with cuttings and capped with appropriate materials depending upon their location.

On October 13, 2004, test borings PW-2 and PW-3 were advanced within the Anderson Building to refusal depths of 15.3 ft. and 15.4 ft. below the concrete floor, respectively. DAY retained SLC to advance these test borings using a track-mounted Geoprobe Systems Model 54L-T drill rig. Test boring PW-2 was advanced inside the Boiler Room located in the southern portion of the Laundry/Dry Cleaning portion of the Anderson Cleaners building (i.e., approximately 8 ft. east of the Courtyard Area). Test boring PW-3 was advanced immediately west of the entrance of the current Cold Storage portion of the Anderson Cleaners building (i.e., the location of the former Stoddard Solvent underground storage tanks). SLC used a hammer drill attachment to their drill rig to advance through the concrete floor at these test boring locations. Test borings PW-2 and PW-3 were each completed as groundwater monitoring wells (refer to Section 2.6).

DAY retained SJB Services, Inc. (SJB) to advance test borings B-1 through B-7 using a truck-mounted Model CME 550 rotary drill rig. These test borings were advanced between May 2, 2005 and May 6, 2005. Each test boring was advanced to split spoon or auger refusal, which was encountered at depths ranging from 16.4 ft. (B-7) and 23.0 ft. (B-6) bgs. [Note: Test boring B-2 encountered split spoon refusal at a depth of 19.6 ft. bgs, however a roller bit was used to advance this test boring to 21.5 ft. bgs to facilitate the installation of a groundwater monitoring well.] With the exception of test boring B-7, each test boring was completed as a groundwater monitoring well (refer to Section 2.6). Following drilling, test boring B-7 was tremie grouted with a concrete and bentonite mixture.

Test borings B-8 through B-11 were advanced on May 23, 2005 via direct-push drilling methodologies. DAY retained Marcor Remediation, Inc. (Marcor) to advance these test borings using a truck-mounted Geoprobe Systems Model 5400 with a GH40 hammer. Test boring B-8 was advanced to equipment refusal at a depth of 15.5 ft. bgs and test

borings B-9 through B-11 were terminated at a depth of 12.0 ft. bgs. Groundwater monitoring wells were installed in test borings B-10 and B-11 and test borings B-8 and B-9 (refer to Section 2.6) were backfilled with a cement/bentonite mixture.

Six test borings (designated TB-200 through TB-205) were advanced by Marcor on April 6, 2006 using vehicle mounted direct push sampling equipment. These test borings were advanced at off-site hydraulically downgradient locations to depths ranging from 6.0 ft. bgs (TB-201) to 16.5 ft. bgs (TB-200). Test borings TB-200 and TB-203 were positioned in proximity to an 8-inch water line running below Huxley Street. Test borings TB-201 and TB-202 were positioned in proximity to a 21-inch storm sewer and a three-way sanitary sewer junction box (one 4-inch line from Anderson Cleaners, two 8-inch lines from Huxley Street and Kenmore Avenue). Test boring TB-204 was positioned in proximity to a storm sewer junction box (one 21-inch storm sewer line and one 4 ft. x 3½ ft. Arch Storm culvert). Test boring TB-205 was positioned south of a catch basin for the 21-inch storm sewer in proximity to a 6-inch gas line and an 8-inch water line running below Huxley Street. Test borings TB-200, TB-202 and TB-204 were completed as 1-inch diameter flush-coupled PVC groundwater monitoring wells designated MW-200, MW-201 and MW-202, respectively.

DAY representatives advanced test boring TB-206 to a depth of 14.0 ft. bgs using hand-held Geoprobe sampling equipment on June 26, 2006 and a 1-inch monitoring well designated MW-203 was subsequently installed. This test boring/monitoring well was positioned in a hydraulically downgradient location relative to MW-201.

Six test borings (designated TB-207 through TB-211) were advanced on December 27 – December 28, 2006 by SJB using a Model CME-75 rotary drill rig. These test borings were advanced to depths ranging from 14.0 ft. bgs (TB-209 and TB-209) to 18.8 ft. bgs (TB-207) and they were completed as 4-inch diameter groundwater monitoring wells designated MW-205 through MW-209, respectively.

Test borings for bedrock monitoring wells BR-02FR, BR-02R, and BR-03R were installed between November 12, 2009 and November 18, 2009. These test borings were advanced using rotary drilling techniques and in general accordance with the procedures outlined in the DAY document titled *Bedrock Groundwater Evaluation Work Plan, Anderson Cleaners Site, 5 Hunt Road, Jamestown, New York, BCP #C907027* dated September 2009 and revised October 7, 2009.

In the test borings advanced via direct push methods, samples were collected in consecutive 2-foot to 4-foot intervals using a new acetate liner for each sample. The test borings advanced by rotary methods used 4¼-inch or 6-inch inside diameter (ID) hollow stem augers to advance the test boring between sample points. Continuous spilt spoon samples were collected ahead of the augers using a 2-inch outside diameter (OD) split spoon sampler driven by a 140-pound hammer free falling 30-inches (i.e., in general accordance with ASTM 1586).

For test borings advanced into bedrock, hollow stem augers (HSA) were used to advance the boring through the overburden and into the underlying fractured bedrock with continuous split spoon sampling. Following the advancement of the HSA to refusal, flush-joint casing was installed, and a NQ core barrel was used to advance the boring through the fractured/weathered rock and into competent rock

A DAY representative observed the soil samples recovered from the test borings and rock cores recovered from bedrock borings in order to develop a stratigraphic description of the subsurface conditions encountered and to evaluate the recovered samples for evidence of suspect contamination (e.g., staining, unusual odors, etc.). Portions of the recovered soil samples were also screened with a PID. The DAY representative recorded pertinent information for each test boring and subsequently prepared test boring logs, copies of which are included in Appendix D.

Selected soil samples collected during the advancement of the test borings were submitted for analytical laboratory testing. These samples were delivered to either Paradigm or Mitkem under chain-of-custody protocols. The soil samples selected for analytical laboratory testing, and the date these samples were collected, are listed below.

- Samples collected 8-4-2003: TB-1 (2.0-4.0'), TB-2 (2.0-4.0'), TB-2 (4.0-6.0'), TB-3 (2.0-4.0'), TB-4 (4.0-7.0'), TB-6 (2.0-4.0'), TB-7 (0.0-2.0'), TB-9 (0.0-2.0')

- Samples collected 9-3-2003: TB-10 (8.0-10.0'), TB-13 (6.0-7.7'), TB-15 (8.0-10.0'), TB-17 (8.0-10.0'), TB-21 (6.0-7.7'), Sediment Sample

- Samples collected 10-6-2004: Trench-1, Trench-2, Trench-3

- Samples collected 2-7-2005: Composite Samples TB-100 (0.0-8.0'), TB-101 (0.0-8.0'), TB-102 (0.0-8.0'), TB-103 (0.0-8.0'), TB-104 (0.0-8.0'), TB-105 (0.0-8.0'), TB-106 (0.0-8.0'), TB-107 (0.0-8.0'), TB-108 (0.0-8.0'), TB-109 (0.0-8.0'), TB-110 (0.0-8.0'), TB-111 (0.0-8.0'); Discrete Samples; TB-108 (4.0-6.0'), TB-112 (4.0-6.0'), TB-113 (6.0-8.0'), TB-114 (6.0-8.0')

- Samples collected 5-2-2005 through 5-23-2005: B-1 (9.0'), B-3 (3.0'), B-3 (9.0'), B-4 (4.0'), B-6 (5.0'), B-7 (14.0'), B-8 (4.0'), B-11 (3.0')

- Samples collected 4-6-2006: TB-202 (10.0') and TB-205 (8.0')

- Samples collected 12-28-2006: TB-209 (14.0') and TB-211 (5')

The analytical laboratory testing program for each of the above samples is presented on Table 4. The analytical laboratory results are included in Appendix C and summarized on Tables 5A and 5B.

2.6 Groundwater Evaluation

During the various studies completed at the Site, groundwater monitoring wells and well points were installed including 1-inch diameter wells installed in direct-push test borings; 2-inch and 4-inch diameter wells installed within test borings advanced by rotary drilling methods; and a 4-inch diameter low carbon steel casing sealed in-place over open holes in competent rock. The locations of the monitoring wells installed at the Site are depicted on Figure 5.

1-inch Diameter Overburden Monitoring Wells

Sixteen test borings advanced by direct-push drilling techniques were subsequently completed as 1-inch diameter polyvinyl chloride (PVC) groundwater monitoring wells. These include:

- MW-1: installed in test boring TB-10 on 9/03/2003; located within the Courtyard Area [this monitoring well was subsequently abandoned]
- MW-2: installed in test boring TB-11 on 9/03/2003; located east of the exterior wall of the Anderson Building [this monitoring well was subsequently abandoned]
- MW-3: installed in test boring TB-16 on 9/03/2003; located near the southern property line of the Site [this monitoring well was subsequently abandoned]
- MW-4: installed in test boring TB-18 on 9/03/2003; located outside the southern wall of the current Boiler Room [this monitoring well was subsequently abandoned]
- MW-5: installed in test boring TB-14 on 9/03/2003; located within the parking lot on the east side of the Site [this monitoring well was subsequently abandoned]
- MW-6: installed in test boring TB-23 on 11/13/2003; located within the Courtyard Area
- MW-7: installed in test boring TB-26 on 11/13/2003; located within the Garage Area on the southeastern side of the Anderson Building [this monitoring well was subsequently abandoned and replaced with monitoring well MW-7.1]
- MW-8: installed in test boring TB-27 on 11/13/2003; located within the Finishing Area portion of the Anderson Building
- PW-2: installed in test boring PW-2 on 10/13/2004; located within the current Boiler Room
- PW-3: installed in test boring PW-3 on 10/13/2004; located immediately west of the entrance to the Cold Storage Area (i.e., the former location of the Stoddard Tanks)
- MW-07: installed in test boring B-10 on 5/23/2005; located along the eastern wall of the Anderson Building adjacent to MW-03 [Note: MW-07 is a “shallow” overburden well relative to MW-03.]
- MW-08: installed in test boring B-11 on 5/23/2005; located near the northern property line of the Site (i.e., in proximity to Hunt Road)
- MW-200: installed in test boring TB-200 on 4/6/2006 located in proximity to an 8-inch water line running below Huxley Street

- MW-201: installed in test boring TB-202 on 4/6/2006; located in proximity to a 21-inch storm sewer and a three-way sanitary sewer junction box.
- MW-202: installed in test boring TB-204 on 4/6/2006; located in proximity to a storm sewer junction box of one 21-inch storm sewer line and one 4 ft. x 3 ½ ft Arch Storm culvert.
- MW-203: installed in test boring TB-206 on 6/26/2006 approximately 27 ft. east (hydraulically downgradient) of monitoring well MW-202

The above monitoring wells were constructed of a pre-cleaned flush-coupled 1-inch ID No. 10 slot Schedule 40 PVC well screen with attached riser casing of the same material. To the extent possible, the well installations include a washed and graded sand pack surrounding the screen, and extending about 0.5 to 2.0 feet above the screen. In some monitoring well locations, the annulus filled with in-situ material (i.e., typically sand) prior to the placement of the washed and graded sand backfill. A minimum two-foot bentonite seal was placed above the sand pack and the remaining annulus was filled with cement/bentonite grout. Monitoring wells PW-2, PW-3, MW-200, MW-201, MW-202, and MW-203 were each completed with a protective curb box. The remaining 1-inch diameter monitoring wells do not contain a protective covering and these monitoring wells typically extend approximately 2 feet above the ground surface. Monitoring well installation diagrams are included in Appendix D.

2-inch Diameter Overburden Monitoring Wells

Seven test borings advanced using rotary drilling techniques were completed as 2-inch ID groundwater monitoring wells constructed of PVC screen and riser. [Note: Monitoring well MW-02 is located within a suspected source area containing elevated concentrations of VOC. As such, this monitoring well was constructed of stainless steel.] These include:

- MW-01: installed in test boring B-1 on 5/02/2005; located near the western property line of the Site
- MW-02: installed in test boring B-2 on 5/06/2005; located within the Courtyard Area [this monitoring well was subsequently abandoned]
- MW-03: installed in test boring B-3 on 5/05/2005; located in a parking lot immediately east of the Anderson Building
- MW-04: installed in test boring B-4 on 5/04/2005; located in the eastern exterior portion of the Site
- MW-05: installed in test boring B-5 on 5/03/2005; located in the eastern exterior portion of the Site
- MW-06: installed in test boring B-6 on 5/03/2005; located in the eastern exterior portion of the Site.

Monitoring wells MW-01 and MW-03 through MW-06 consist of a pre-cleaned five-foot long, 2-inch ID, threaded, flush-jointed, No. 10 slot, schedule 40 PVC screen with attached riser casing of the same material. The well screen was installed approximately 0.5 feet above the split spoon refusal depth encountered in each test boring. The well installation

included a washed and graded sand pack surrounding the screen and typically extending between about 0.5 feet below it, and between about one and two feet above the top of the screen. A bentonite seal was placed above the sand pack and the remaining annulus was filled with cement/bentonite grout. A protective curb box was cemented in place over each well. Monitoring well MW-02 is constructed of stainless steel screen and riser. This monitoring well was installed similarly to the other 2-inch diameter monitoring wells, except that it was fitted with a 2-foot long solid piece of stainless steel below the bottom of the well screen to act as a "sump". The intent of this sump was to collect DNAPL suspected to be present in this area of the Site. Monitoring well construction diagrams are presented in Appendix D.

Four-inch Diameter Overburden Wells

Six test borings advanced using rotary drilling techniques were completed as 4-inch ID groundwater monitoring wells constructed of PVC some, of which, contain stainless steel well screens.

- MW-204: installed on 7/5/2006; this monitoring well was installed to a depth of 15.35 ft. bgs within the Courtyard Area in a location near former monitoring well MW-02 to evaluate and collect DNAPL. On July 6, 2007, a stainless steel well point connected to nominal 2-inch diameter black steel riser pipe was driven through the bottom of this 4-inch PVC well to a depth of 17.0 ft. bgs in an attempt to collect additional DNAPL.
- MW-205: installed in TB-207 on 12/27/2006; this well has a stainless steel well screen and it is located on the south central side of the building.
- MW-206: installed in TB-208 on 12/27/2006; this well has a PVC screen and riser and it is located east of the garage area of the building.
- MW-207: installed in TB-209 on 12/28/2006; this well has a stainless steel well screen and it is located southeast of the garage area of the building.
- MW-208: installed in TB-210 on 12/28/2006; this well has a PVC well screen and riser and it is located on the southeastern portion of the property near Huxley Street.
- MW-209: installed in TB-211 on 12/28/2006; this well has a PVC well screen and riser and is located on the south central side of the building.

These 4-inch wells were installed similarly to the 2-inch diameter monitoring wells. Monitoring well construction diagrams are presented in Appendix D.

Well Points

In July and August 2007, three hand-driven stainless steel well points (designated WP-1, WP-2 and WP-3) were installed within the Anderson Cleaners building. Well points WP-1 and WP-2 were installed in the garage area and well point WP-3 was installed in the boiler room (refer to Figure 5). Each well point consists of a 2-foot long screen section attached to a 1.5 inch diameter galvanized steel riser pipe that extends from the top of the well screen and approximately 1 to 2 feet above the ground surface. The well points were advanced to

the following depths below the ground surface: WP-1/15.4 feet, WP-2/16.6 feet and WP-3/15.3 feet. The well points were installed in the area of suspected DNAPL to evaluate the presence/thickness and to collect DNAPL from these locations (if encountered).

Bedrock Monitoring Wells

As described in the document prepared by DAY titled, *Summary Report Bedrock Groundwater Evaluation, Anderson Cleaners Site, 5 Hunt Road, Jamestown, New York, BCP #C907027*, dated June 2010, three monitoring wells were installed within the bedrock underlying the Site. These monitoring wells include:

- BR-02FR: installed 11/18/09 within the fractured rock this 2-inch diameter monitoring well is constructed with a stainless steel well screen attached to PVC riser pipe. This monitoring well is located southeast of the garage area of the Anderson Cleaners building.
- BR-02R: installed 11/16/09 this monitoring consists of 4-inch ID black steel pipe installed and grouted through the fractured bedrock with an open hole within the competent bedrock. This monitoring well is located adjacent to BR-02FR.
- BR-03R: installed 11/17/09 this monitoring consists of 4-inch ID black steel pipe installed and grouted through the fractured bedrock with an open hole within the competent bedrock. This monitoring well is located near the eastern property line of the Site.

Monitoring well construction diagrams are presented in Appendix D.

Monitoring Well Development

Well development was performed utilizing dedicated polyethylene bailers and dedicated cord and/or a vacuum purge system with dedicated tubing. No fluids were added to the wells during development, and well development monitoring equipment was decontaminated prior to development of each well. In general, the well development procedure was as follows:

- Obtain pre-development static water level readings.
- Calculate water/sediment volume in the well.
- Obtain groundwater sample for field analysis using bailer.
- Select development method and set up equipment depending on method used.
- Begin pumping or bailing.
- Obtain initial field water quality measurements (e.g., pH, conductance, turbidity, temperature, and PID readings). Record water quantities and rates removed.
- Collect additional field water quality measurements for varying volume intervals of water removed.
- Stop development when water quality criteria are met.
- For bedrock wells in which water was used during coring, additional groundwater was purged.

- Document development procedures, measurements, quantities, etc.

Development continued until the following criteria was achieved:

- Monitoring parameters have stabilized (i.e., pH varies less than 0.1 unit; conductance, temperature, and other parameters vary less than 10%); and
- A minimum of three well volumes have been removed, or to dryness.

Well development logs are included in Appendix E.

Sampling and Analysis of Groundwater

Groundwater samples were collected from selected monitoring wells at various times as part of this project. The well sampling logs for these groundwater sampling events are included in Appendix E.

Generally, the groundwater samples were collected using a new three-foot long disposable bailer to purge groundwater from the wells. Following purging, the wells were allowed to recharge to a minimum of 90% of its static water level and samples were collected for testing. Sample containers provided by the analytical laboratory were then filled and additional samples were collected for field water quality measurements (e.g., pH, turbidity, conductivity, etc.). Prior and during purging, a Heron Oil/Water Interface Meter Model H.O1L was used to evaluate the groundwater within the monitoring wells for the presence of NAPL.

- Monitoring wells MW-1, MW-2, MW-3 and MW-5 were sampled on September 17, 2003 and submitted to Paradigm for analytical laboratory testing.
- Monitoring wells MW-4, MW-6, MW-7 and MW-8 were initially sampled on November 23, 2003. The samples collected from these monitoring wells were submitted to Paradigm.
- Monitoring wells PW-2, PW-3, MW-1 and MW-7 were sampled on October 21, 2004 and submitted to Paradigm for testing.
- Monitoring wells MW-01, MW-03, MW-04, MW-04, MW-05, MW-06, MW-07, MW-7 and PW-3 were sampled on May 25, 2005 and submitted to Mitkem for analytical laboratory testing.
- Monitoring wells PW-3 and MW-7 were sampled on August 18, 2005 and submitted to Paradigm for testing.
- Bedrock monitoring wells BR-02FR, BR-02R and BR-03R were sampled using passive diffusion samplers (PDS), on two occasions. For the first bedrock groundwater sampling round, PDS were placed in the monitoring wells on December 23, 2009 and retrieved on January 15, 2010. During the second bedrock groundwater sampling round, PDS were placed in the monitoring wells on April 16, 2010 and were retrieved on May 5, 2010. Groundwater samples from both rounds were submitted to Paradigm for testing.

The analytical laboratory testing program for these samples is shown on Table 4. The analytical laboratory results are presented in Appendix C and the test results are summarized in Table 6A and Table 6B.

Hydraulic Conductivity Testing

On August 18, 2005 in-situ hydraulic conductivity testing was completed at wells MW-01, MW-01, MW-05 and MW-06. The tests included the placement of a "Slug" into each well and its subsequent removal coupled with monitoring of the resulting variation in water level data. The information collected was used to calculate hydraulic conductivity using the SuperSlug computer model.

The effective radius (Re) of the wells was calculated using the following calculation:

$$Re = [r^2 (1-n) + nR^2]^{1/2}, \text{ where}$$

R = radius of borehole
r = radius of screen
n = porosity of sand pack = 0.35

The hydraulic conductivities were calculated using the "Bouwer and Rice" method for unconfined aquifers. The input and output data, other mathematical formulas used, well diagrams, and hydraulic conductivity logarithmic graphs for the slug tests performed on these wells are included in Appendix F. Table 7 summarizes the calculated hydraulic conductivities.

Potentiometric Groundwater Contour Maps

Michael J. Rodgers Land Surveyor, PC (Rodgers) was retained to survey the elevations of selected monitoring wells and structures associated with nearby utilities (e.g., catch basins, manhole inverts, etc.). DAY measured the elevations of select locations using a laser level and determined elevations by referencing the benchmarks established by Rodgers. Monitoring well locations were determined by a combination of tape measurement from existing site features and the use of a Trimble GeoXT GPS.

DAY measured static water levels and evaluated the presence of NAPL in the monitoring wells at various times during this study. The groundwater data and calculated groundwater elevations for selected monitoring events are summarized on Table 8. DAY developed potentiometric groundwater contour maps using water level measurements made on May 5, 2010 (Figure 6). The Surfer 8 software program by Golden Software, Inc. was used to assist in developing the maps.

2.7 QA/QC and Data Usability Summary Report

Quality Assurance/Quality Control (QA/QC)

Specific QA/QC measures implemented during this study are outlined below:

- During sampling activities, personnel used disposable latex gloves. Between collection of each sample, personnel performing the sampling discarded used latex gloves and put on new latex gloves to ensure no cross-contamination of the samples.
- Samples retained for testing were placed in new laboratory-grade sample containers. DAY collected samples with zero headspace when VOC analysis was to be performed. Efforts were made to obtain sufficient volume (i.e., as specified by the analytical laboratory) to ensure that the laboratory had adequate samples to perform the specified analyses.
- Samples that were collected as part of the project were handled using chain-of-custody control. Chain-of-custody documentation accompanied samples from their inception to their analysis, and copies of chain-of-custody documentation are included with the laboratory reports.
- The laboratory analyzed the samples using the lowest practical quantitation limits (PQL) possible. The laboratory that performed the analyses provided internal QA/QC data that are required by NYSDEC ASP protocol, such as analyses performed on method blanks, and surrogate recovery results.
- Sample holding times and preservation protocols were adhered to during this project. Soil samples were reported on a dry-weight basis.
- In order to provide control over the collection, analysis, review, and interpretation of analytical data, the following QA/QC samples were included as part of this investigation:

    - A trip blank accompanied each shipment that contained liquid samples that were analyzed for VOC using ASP Method OLM04.2.
    - One matrix spike/matrix spike duplicate (MS/MSD) was generally analyzed for each 20 samples of each matrix (i.e., soil, groundwater, etc.) that were shipped within each seven-day period. Specific parameters that MS/MSD samples were tested for depended upon the test parameters of the samples that were analyzed.
    - Equipment rinsate field blanks were analyzed for various parameters such as: full TCL/TAL, VOC, SVOC and TAL metals using ASP Methods OLM04.2 and ILM04.1.

Data Usability Summary Report (DUSR)

Data Check, Inc. (DCI) was retained by DAY to prepare a Data Usability Summary Report (DUSR) on analytical laboratory data generated by CAS and Mitkem for this project. DCI submitted a DUSR titled *Data Usability Summary Report Anderson Cleaners – Jamestown New York.* A copy of this report is included in Appendix G.

Complete copies of the DUSR originals are available upon request. The analytical laboratory summary tables included in this report have been revised to reflect the findings of the DUSR

2.8 Soil Removal Interim Remedial Measure

DAY prepared a document titled *Interim Remedial Measure Workplan, Anderson Cleaners Site, 5 Hunt Road, Jamestown, New York, BCP #C907027* dated February 2005 (the IRM Work Plan). Following review and approval by the NYSDEC, a soil removal interim remedial measure (IRM) was initiated in the Courtyard Area of the Site in general accordance with the provisions outlined in the IRM Work Plan.

The soil removal IRM was undertaken between July 25, 2005 and July 28, 2005. Prior to commencing the work, available test data for samples collected from the proposed removal area within the Courtyard Area were submitted to Waste Technology Services, Inc. (WTS) to assess disposal requirements. Based upon the concentrations of PCE present within the soil (i.e., in excess of 60 ppm), it was determined that the material required pre-treatment prior to disposal. As such, the Michigan Disposal Waste Treatment Plant in Belleville, Michigan (Michigan Disposal) was selected as the disposal destination of the soil removed during the IRM. Prior to the IRM, DAY submitted samples of the impacted soil collected from the Courtyard Area to Michigan Disposal for pre-treatment characterization testing. Following testing and acceptance of the waste stream, WTS prepared a waste profile sheet for authorization by Anderson Cleaners. A copy of the executed waste profile documentation is included in Appendix H.

Anderson Cleaners retained Marcor to complete the soil removal IRM, and WTS to dispose of the soil removed from the Courtyard Area. Marcor mobilized to the Site on July 25, 2005 with a 2-man crew, a mini-excavator and Bobcat to initiate the soil removal. In addition, Marcor staged pea stone, topsoil, and crusher run stone in the southeast parking lot for use in backfilling the excavated area and other areas disturbed by excavation activities. Price Trucking (Price) delivered two 20-ton capacity roll-offs and staged both of them on the small asphalt road to the south of the Courtyard Area.

As identified in the IRM Work Plan, the impacted portion of the Courtyard Area was divided into three cells and Marcor began excavation in the southern-most cell. During the excavation of soil, a DAY representative performed air monitoring in accordance with the requirements outlined in the site-specific health and safety plan (HASP) presented in the RI Work Plan using a miniRae PID and particulate using a real time air monitor. In the afternoon of July 25, 2005, equipment problems were encountered that halted work for the day. As such, the initial excavation was limited to approximately 8 ft. wide, 8 ft. long, and 6.5 ft. bgs. Soil removed from the excavation was screened with the PID and unacceptable soil was placed in the roll-off; clean soil was staged onsite for use as backfill. Following the excavation, a soil sample from location 1 (south sidewall) was collected and the excavation was backfilled with a combination of pea stone (i.e., typically the bottom 3 feet) and removed clean soil and pea stone.

On Tuesday July 26, 2005, Price removed the two roll-offs that were filled on July 25, 2005 and delivered a 20-ton roll-off, staging it on the small asphalt road to the south of the Courtyard Area. The removed roll-off was transported to the Michigan Disposal facility in Belleville, Michigan. Prior to beginning work, a mechanic repaired the damaged equipment and Marcor began excavation of the northern-most cell identified in the IRM Work Plan. Excavated soil was placed into a roll-off container. The excavation was approximately 12 ft. long, 9 ft. wide, and it extended to about 8 ft. bgs. Prior to backfilling the excavation with pea stone, Marcor installed a 4-inch diameter monitoring point, consisting of a 5-foot long screen PVC well screen and connecting riser pipe. The monitoring point (designated herein as IP-1) was installed to a depth of 8 ft. bgs and it has a stickup of approximately 3 ft. above ground surface. A DAY representative performed air monitoring and soil screening with a PID during the excavation process. Following the excavation and prior to backfilling operations, soil samples were collected from locations 2 (southwest sidewall), 3 (southeast sidewall), 4 (excavation bottom-south), and 8 (north sidewall).

During the excavation work on July 26, 2005, the roof drain connection from the Laundry/Dry Cleaning portion of the Anderson Cleaners building to the 6-inch diameter clay tile pipe within the Courtyard Area was identified. The connection to the 6-inch clay tile pipe was broken and the roof drain was repaired and re-routed out of the Courtyard Area through new piping and subsequently connected to a pipe that discharged to the storm sewer located on the east side of the Site.

At the end of the workday on July 26, 2005, thunderstorms with heavy rainfall occurred at the Site causing water to accumulate in low-lying areas within the Courtyard Area. On Wednesday July 27, 2005, Marcor attempted to pump the standing water out of the Courtyard Area and into the storm sewer, but their attempts to remove the water were not sufficient to allow additional excavation. Price delivered one 20-ton roll-off and staged it on the small asphalt road to the south of the Courtyard Area.

On Thursday July 28, 2005, Marcor placed soil generated as study derived waste into a roll-off. In addition, soil was excavated from an area approximately 8 ft. wide, 4 ft. long, and 6.5 ft. bgs (i.e., in the area of the central cell identified in the IRM Work Plan). Excavated soil was placed into a roll-off container. A DAY representative performed air monitoring and soil screening using a PID during the excavation process. Upon completion of the excavation, Marcor backfilled the excavation with a combination of pea stone and “clean” backfill materials removed during the excavation process. Price removed one 20-ton roll-off and transported it to the Michigan Disposal facility in Belleville, Michigan. Following the excavation and prior to backfill excavation, soil samples were collected from locations 5 (northwest sidewall), 6 (excavation bottom-north), and 7 (northeast sidewall).

On Friday July 29, 2005, Marcor finished grading the Site and placed topsoil where needed to fill in low spots and tire ruts caused by excavation activities. Price removed one 20-ton roll-off and transported it to the Michigan Disposal facility in Belleville, Michigan. A DAY representative was not present at the Site on July 29, 2005.

Disposal documentation for the soil removed from the Courtyard Area and study derived waste is included in Appendix H. The results of the testing completed following the soil removal IRM (i.e., sample locations 1 through 7) are summarized in Table 9.

2.9 Bioremediation Pilot Tests

On January 5, 2007, a bioremediation pilot test was initiated in a location downgradient of the identified source area at the Site. This test consisted of injecting a solution of CL-Out microbes (i.e., *Pseudomonas*, a patented strain of aerobic microbes manufactured by CL Solutions, Inc.) and dextrose (i.e., a nutrient source) into two locations (i.e., MW-206 and MW-208). [Note: CL-Out microbes are delivered freeze-dried and each unit has to be hydrated in 55-gallons of potable water 24 hours prior to inoculation. Immediately before the inoculation, 50 pounds of powdered dextrose is dissolved into the hydrated microbe solution. As such, each unit of CL-Out microbe solution consists of 55-gallons.] One "unit" of CL-Out solution was injected into MW-206 and one "unit" was injected into MW-208 during the January 5, 2007 inoculation. On January 6, 2007, a solution of ORC Advanced (i.e., created by dissolving 25 pounds of ORC Advanced in 55 gallons of potable water) was injected into MW-206 and MW-208 (i.e., approximately 25 gallons in each location) to increase dissolved oxygen levels and support microbe growth.

Prior to the January 5, 2007 inoculation, background samples were collected from monitoring wells MW-04, MW-06, MW-07 and MW-201 on January 4, 2007. These samples were tested for field indicator parameters (i.e., dissolved oxygen, ORP and pH) and submitted to an analytical laboratory for testing of halogenated VOC. To evaluate the effectiveness of the inoculation, samples were collected on February 13, 2007 and March 15, 2007 from monitoring wells MW-04, MW-06, MW-07 and MW-201 and tested for microbe populations and/or halogenated VOC. The microbe test results for the sample collected on February 13, 2007 indicated the presence of *Pseudomonas* microbe populations in each monitoring well, with the exception of MW-04. Although the microbe populations were lower than the target level of 1×10^{6} CFU/ml, the presence of the *Pseudomonas* microbes in these wells suggests that the microbes injected in MW-206 and MW-208 propagated and migrated to the downgradient wells in sufficient populations to promote biodegradation. The VOC test results measured as part of the bioremediation pilot test are included on Figure 7 and summarized in the following table.

Constituent	Sample Locations and Sample Dates											
	MW-04			MW-06			MW-07			MW-201		
	1/4/2007	2/13/2007	3/15/2007	1/4/2007	2/13/2007	3/15/2007	1/4/2007	2/13/2007	3/15/2007	1/4/2007	2/13/2007	3/15/2007
PCE	1,820	1,120	904	369	256	246	5,310	6,440	4,240	14,200	2,610	423
TCE	U (200)	U (200)	U (100)	U (4.0)	U (5.0)	U (5.0)	U (200)	U (200)	U (200)	U (200)	17,500	937
trans 1,2-DCE	U (200)	U (200)	U (100)	U (4.0)	U (5.0)	U (5.0)	U (200)	U (200)	U (200)	U (200)	1,290	94.4
cis 1,2-DCE	U (200)	U (200)	U (100)	U (4.0)	U (5.0)	U (5.0)	U (200)	U (200)	U (200)	U (200)	7,860	U (20)
VC	U (200)	U (200)	U (100)	U (4.0)	U (5.0)	U (5.0)	U (200)	U (200)	U (200)	U (200)	U (200)	U (20)
Total VOC	1,820	1,120	904	369	256	246	5,310	6,440	4,240	14,200	29,260	1,454

Notes:

All samples tested for halogenated VOC by USEPA Method 8260B and concentrations are shown in ug/L or parts per billion.

U (200) = Constituent not detected at the concentration shown in parenthesis.

PCE = tetrachloroethene

TCE = trichloroethene

trans 1,2-DCE = trans 1,2-dichloroethene

cis 1,2-DCE = cis 1,2-dichloroethene

VC = vinyl chloride

As shown in the above table, total VOC concentrations decreased in each monitoring well sample from the pre-test (background) measurements made on January 4, 2007 to the post-test measurements made on March 15, 2007. Based on this finding, the injection of CL-Out microbes is considered a viable option for remediation of groundwater impacts at the Site. However, while it appears that the injection of *Pseudomonas* (i.e., aerobic microbes) does reduce PCE concentrations it does not appear to be effective in the reduction of daughter compounds such as vinyl chloride. This is likely attributable to the difficulty in maintaining sufficient DO levels to promote the microbe populations. Therefore alternative treatment methods, such as the injection of anaerobic microbes (e.g., *Dehalococcoides* bacteria) and/or electron donors should be evaluated to address the residual impacts. It is anticipated that this will initially require bioassay testing followed by a pilot test to evaluate suitable microbes/electron donors and loadings. If deemed effective, full-scale treatment could be initiated.

2.10 DNAPL Removal

During the period of investigation of the Site, DNAPL has been encountered and removed from select monitoring wells installed at the Site. Prior to May 2008, the only locations at the Site where DNAPL was identified were monitoring wells MW-204 and MW-207 and well point WP-2 (refer to Figure 5 for locations). However, during groundwater level monitoring conducted on May 21, 2008, a significant amount of DNAPL was detected in monitoring well PW-3. This 1-inch diameter monitoring well is approximately 15 feet deep and it was installed on October 13, 2004. PW-3 is located inside the Anderson Cleaners facility (refer to Figure 5) and prior to May 21, 2008 DNAPL was not detected in this monitoring well. DNAPL was removed from the above locations on a routine basis using a portable vacuum purge system that consists of dedicated polyethylene tubing connected to a 5-gallon vacuum rated collection Carboy with a Rotary Vane Sampling Pump manufactured by Allegro Industries to create a vacuum to allow removal of DNAPL from the monitoring wells.

DNAPL Removal Logs for PW-3, MW-204, MW-207 and WP-3 are included in Appendix I of this document. The DNAPL removed was stored in a 55-gallon drum located in a waste accumulation area constructed within the Courtyard Area of the Site. During the removal of DNAPL, groundwater and associated sediments are also removed. Grossly contaminated groundwater (i.e., based upon physical evidence of impact and/or elevated PID readings) and soil are placed in a waste accumulation drum (i.e., separate from the DNAPL collection drum), which is also located in the Courtyard Area. Water that did not exhibit obvious environmental impact was placed in a 55-gallon drum filled with activated granular carbon. This drum is fitted with a bottom discharge valve and this valve is opened as needed to allow the treated water to discharge from the drum. Samples of the discharged water are routinely screened with a PID for evidence of impact to determine when the activated granular carbon needs to be replaced. The DNAPL collection drum was transported off-site for disposal when filled (refer to Section 2.11).

2.11 Study Derived Waste

Soil cuttings generated during the investigative work were placed in NYSDOT-approved 55-gallon drums that were labeled, staged on-site. The contents of these drums were placed in roll-off containers placed at the Site during the soil removal IRM. The study-derived waste was disposed of in conjunction with the waste generated during the soil removal IRM (refer to Appendix H). DNAPL removed from monitoring wells was placed within 55-gallon drums and when a sufficient quantity was generated Solvents and Petroleum Service, Inc removed and disposed a drum of the DNAPL collected on July 25, 2008.

3.0 PHYSICAL CHARACTERISTICS OF THE SITE

This section describes the physical characteristics of the Site including geologic and hydrogeologic conditions, and the demography and land use of the area surrounding the Site.

Stratigraphic cross sections developed based on the test borings advanced to date are presented as Figures 8 (a cross section that extends generally from west to east between monitoring well MW-1 and BR-03R; designated as Cross Section A-A'), and Figure 9 (a cross section that extends generally from north to south between monitoring well MW-08 and MW-06; designated as Cross Section B-B'). The locations/orientations of Cross Section A-A' and Cross Section B-B' are shown on the Site Plan included as Figure 5.

3.1 Topography

The Site is located at latitude (north) 42° 5' 34.1" and longitude (west) 79° 15' 59.8" and the ground surface elevation at the Site is approximately 1,427 feet above sea level (USGS Datum). The ground surface at the Site and the immediately surrounding area generally slopes down gently to the east. Approximately 1-mile south of the Site the ground surface is approximately elevation 1,546 feet above sea level and approximately 1-mile north of the Site the ground surface is approximately elevation 1,316 feet above sea level. The ground surface about 1-mile to the east of the Site is approximately 1,329 feet above sea level and the ground surface approximately 1-mile west of the Site is approximately 1,415 feet above sea level.

There are no surface water bodies on or adjoining the Site. The Chadokoin River (i.e., the nearest surface water body) is located approximately 3,800 feet northeast of the Site and an unnamed tributary of the Chadokoin River is located about 3,000 feet northwest of the Site. No state or federally listed wetlands are located within ½ mile of the Site; however, a small area of standing water containing "wetland land-type" growth is located in the southern-most portion of the Site. The Site is not located in the 100-year or 500-year flood zone as designated by the Federal Emergency Management Agency (FEMA).

3.2 Bedrock

According to a map entitled *New York State Geological Highway Map*, W.B Rogers et. al., 1990, bedrock underlying the overburden deposits present at the Site is mixed shale and fine sandstone/siltstone of the Conewango Group an Upper Devonian series sedimentary rock of the Paleozoic Era.

During this study, a weathered shale layer (i.e., attributable to glacial scour and groundwater movement) extending from the base of the glacial till until competent bedrock is encountered was encountered in some of the test borings. In the test boring to install BR-02FR, an approximate 5.6 ft. thick zone of fractured rock was encountered below the till layer. An approximate 5.8 ft. thick layer of fractured rock was encountered below the till layer in the test boring for BR-02R. The rock quality improves with depth,

and "competent bedrock" was encountered in the test boring for BR-02FR at a depth of about 28.4 ft. bgs, or elevation 69.55 ft. (i.e., measured to an arbitrary datum established for the Site). In the test boring advanced for monitoring well BR-02R, competent bedrock was encountered at a depth of about 28.0 ft. bgs, or elevation 69.9 ft. Based upon an evaluation of the test borings advanced during this study and assuming refusal depths are attributable to bedrock, the top or rock slopes downward to the south and southeast with apparent convergence in the vicinity of monitoring well BR-02FR.

3.3 Overburden

The United States Department of Agriculture's Soil Conservation Service (SCS) soil survey for Chautauqua County New York identifies the soil at the Site as "Urban Land" with a variable surface texture. This soil does not meet the requirements for a hydric soil and the depth to bedrock is in excess of 10 inches.

According to USGS Bulletin 58, *Ground-Water Resources of the Jamestown Area, New York* dated 1966 by Leslie J. Crain the Site is in an area "in which the surficial deposits were formed as glacial moraines. Sand, gravel, lake-laid silt and clay, and till are all present as irregular masses and layers. Sand and gravel are generally of minor importance." Additionally, the Site is in an area in which "water-bearing deposits consist of sand or interbedded layers of sand and of gravel overlain by silt and clay till (mixed deposits). The water bearing layers are generally only a few feet thick. Some of the layers are highly permeable. Water is confined under artesian conditions."

Based upon the test borings advanced at the Site during this study that penetrated the overburden, the Site is underlain by deposits that extend to depths of about 16.4 ft. bgs (B-7) to 22.8 ft. bgs (B-6).

In the test borings advanced during this study, the ground surface is covered by either an approximate 0.5-foot layer of topsoil and roots in lawn areas; a 0.1-foot thick layer of asphalt and up to 1.5 feet of sub-base material within paved areas or an approximate 0.4^{+} foot thick layer of concrete in interior locations. Generally, fill material typically comprised of silty sand and gravel often intermixed with pieces of bricks, concrete and wood was encountered below the surface coverings. These fill materials extend to depths of about 2^{+} ft. to 8 ft. bgs. In the Courtyard Area, the fill extended to a depth of about 2^{+} ft. bgs (i.e., to a depth below the invert of the 6-inch clay tile pipe that extends the length of the Courtyard

In some of the test borings, an approximate 0.5-foot layer of peat was encountered below the fill material. Glacial deposits consisting of interbedded mixtures of sandy silt and clayey silt often containing lesser amounts of sand, gravel and occasional cobble size material were encountered below the fill material. In some test borings, seams of sub-angular to rounded gravel and sand (i.e., likely deposited from glacial melt water) were encountered. The indigenous soil encountered during this study is typical of the ground moraine deposits common to the area surrounding the Site. The ground moraine deposits appear to overlay the remnants of a glacial till that was deposited as the glacier advanced

through the area. The glacial till layer extends to depths of about 16 ft. to 23 ft. bgs and in some locations it is winnowed with seams of permeable sand and gravel evident.

3.4 Hydrogeology

Monitoring wells installed with their screened section terminating at or near the top of the glacial till typically encounter groundwater at depths ranging from about 1 to 4 ft. bgs. Monitoring wells installed within fractured bedrock exhibit flowing artesian conditions with groundwater levels greater than 2 ft. above the ground surface (ags). The groundwater levels measured in monitoring wells installed within competent bedrock (i.e., BR-02R and BR-03R) also exhibit flowing artesian conditions, but the hydraulic head is less than that observed in monitoring wells screened within the fractured bedrock.

Monitoring well MW-207 is installed with its screened section extending upward from the top of the glacial till, BR-02FR is installed within the fractured bedrock zone, and BR-02R is installed as an open hole within the competent bedrock. Monitoring well MW-207 is located about 17 ft. west of monitoring well BR-02R and monitoring well BR-02FR is located less than 5 ft. south of monitoring well BR-02R. The vertical hydraulic gradients calculated based on groundwater level measurements made in these monitoring wells on May 5, 2010 are summarized below.

- BR-02FR to MW-207 = + 0.4 ft./ft. (upward hydraulic gradient)
- BR-02R to MW-207 = +0.2 ft./ft. (upward hydraulic gradient)
- BR-02FR to BR-02R = -0.06 ft./ft. (downward hydraulic gradient)

Groundwater contour maps developed using data collected on May 5, 2010 for the overburden zone (i.e., based on groundwater elevations measured in monitoring wells screened within or above the glacial till) and the fractured bedrock zone are included on Figure 6. As shown, groundwater in both zones generally flows to the east across the Site with a southeasterly component evident in the southern portion of the Site. During the May 5, 2010 monitoring event, an average horizontal gradient of 0.03 ft./ft. was calculated in the overburden zone monitoring wells, and an average hydraulic gradient of 0.012 ft./ft. was calculated for the fractured bedrock zone monitoring wells. An average hydraulic conductivity of 6.83×10^{-3} cm/sec was measured in monitoring wells MW-01 through MW-06 (i.e., monitoring wells that penetrate the fractured rock zone). The hydraulic conductivity was not tested in monitoring wells installed within the overburden zone, but based on the nature of the overburden material, a hydraulic conductivity of 1.0×10^{-4} cm/sec is estimated. Using the average values for horizontal gradient and hydraulic conductivity and an assumed porosity value of 0.35 to 0.50 for each zone, a horizontal groundwater velocity within the overburden zone was calculated to range between about 0.017 ft./day and 0.024 ft./day, and a horizontal groundwater velocity of 0.46 ft./day to 0.66 ft./day was calculated for the fractured rock zone.

3.5 Demography, Land Use and Water Use

The approximate 2.4-acre Site is located in Chautauqua County, New York and it is partially in the City of Jamestown and partially in the Town of Ellicott, New York. According the 2000 census, the population of Chautauqua County, New York was 139,750; the population of Jamestown, New York was 31,730 and the population of the Town of Ellicott, New York was 9,280. The Site is designated as Section Block and Lot numbers 504-01-001, 504-01-002, and 504-01-003 (Jamestown) and 32-1-1 and 32-1-11 (Ellicott). The Site is currently improved with an approximate 11,400-square foot one-story brick and concrete block building used as Laundry and dry cleaning facility and other smaller commercial-type operations.

The Site is in a mixed residential and commercial area. Adjoining properties are described below:

North: Hunt Road, with greenhouses and residential beyond.
East: Huxley Road, with a Seventh Day Adventist church beyond.
South: Electrical substation, with residential beyond.
West: Residential.

DAY found no record of groundwater use at the Site or in its vicinity. The Site buildings, and the Site vicinity, are served by the municipal (Jamestown) water supply. The on-site wells installed in the 1950s have not been used since the mid-1960s. According to Mr. Paul Snyder of the Chautauqua County Health Department, Division of Environmental Health, there are no documented public water supply sources within the vicinity of the Site. The closest water supply sources are two well fields in Ross Mills and Poland Center, which are the sources of the Jamestown water supply. The Ross Mills well field is approximately 5 miles north/northeast of the Site, and the Poland Center well field is approximately 8 miles east/northeast of the Site. DAY found no record of private water wells at adjoining properties in a review of municipal records. However, municipal officials indicated that the existence of private wells would not necessarily be recorded. According to the USGS National Water Inventory System, three wells are located within a 1-mile radius of the Site. These include: USGS0751473 (located ½ to 1 mile north-northeast), USGS0751468 (located ½ to 1 mile northeast) and USGS0751559 (located ½ to 1 mile north). The function of these wells is not known and based upon groundwater flow data collected during this study, these wells are located hydraulically cross gradient of the Site.

4.0 NATURE AND EXTENT OF IMPACT

This section of the report presents findings of the investigative work described in Section 2.0 relative to the nature and impact to the environmental media at the Site. CAS and Mitkem reported the analytical laboratory test results in NYSDEC ASP Category B deliverable reports. The analytical laboratory test results presented by Paradigm were reported as a standard data package. Copies of reports prepared by the analytical laboratory and executed chain-of-custody documentation for this data are included in Appendix C and detected compounds are summarized on various tables referenced previously. Where applicable, the tables include a comparison to the following standards, criteria and guidance (SCG):

- Soil Cleanup Objectives (SCO) for Unrestricted Use and Restricted Commercial Use, as referenced in NYSDEC regulations at 6 NYCRR Subpart 375 titled *Remedial Program Soil Cleanup Objectives*, effective December 14, 2006.
- Groundwater standards and guidance values as referenced in the NYSDEC Division of Water Technical and Operational Guidance Series 1.1.1 document titled "*Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations*" (TOGS 1.1.1) dated June 1998 (as amended by an April 2000 addendum).

4.1 Contaminants of Concern

The contaminants of concern (COC) in soil and groundwater were determined by initially reviewing the analytical laboratory data to identify the compounds detected at concentrations that exceed SCG, the range of concentrations measured and the frequency of detection. Based upon this review and the types of chemicals used at the Site in the past, the following COC were identified.

- tetrachloroethene (PCE)
- trichloroethene (TCE)
- 1,1-dichloroethene (1,1-DCE)
- trans-1, 2-dichloroethene (trans-1, 2-DCE)
- cis-1, 2-dichloroethene (cis-1,2-DCE)
- vinyl chloride (VC)

- DNAPL (refer to Section 4.2)

[Note: Several metals were measured at concentrations exceeding SCG, however the highest concentrations were measured in groundwater samples collected from the upgradient background location. As such, metals are not identified as COC for this Site.].

4.2 DNAPL

DNAPL provides a constant source of dissolved phase PCE and other COC in the groundwater. During this study, DNAPL has been detected at the surface of, and within, the glacial till in several test borings/monitoring wells in the central portion of the Site. It is

presumed that the DNAPL entered the subsurface from a near surface location (e.g., potentially through a broken pipe in the Courtyard Area that was remediated as part of the soil removal IRM, and/or other localized discharges that may have occurred during the 1985 fire at the Site), and due to its density, the DNAPL migrated downward and collected on and within the less permeable glacial till. It also appears that DNAPL migrates downslope along the surface of the glacial till. To date, more than 100 gallons of DNAPL has been removed from select monitoring wells at the Site. The presumed extent of DNAPL impact remaining at the Site is depicted on Figure 10.

4.3 Soil and Vadose Zone

This section provides a discussion of contaminant impacts measured within the soil and vadose zone at the Site and the extent of impact determined based upon the available data.

4.3.1 Soil Gas

The passive soil gas study (Appendix B) was conducted in exterior locations of the Site. The highest soil gas PCE concentration was measured in a location southeast of the Anderson Cleaners building. This area of the Site is also known to be in an area where the groundwater is impacted and the elevated soil gas reading is likely due to volatilization from the groundwater. The soil gas points positioned in the parking lot north of the Anderson Cleaners building and in proximity to Hunt Road contained PCE, but at lower concentrations than those detected in locations southeast of the building. Testing of a soil sample collected from a test boring positioned near the soil gas point north of the building exhibiting the highest PCE concentration did not contain VOC at concentrations that exceed SCG. Based upon the soil testing results and the apparent absence of impacted groundwater to the north of the Anderson Cleaners building, the soil gas readings in this area appear to be insignificant and additional study does not appear to be warranted.

4.3.2 Background Soil Test Results

An upgradient background soil sample, designated B-1 (9.0'), was tested for the following parameters: TCL VOC, TCL S-VOC, TAL metals plus cyanide, pesticides and PCBs. The constituents detected in this sample are summarized on Table 5A and Table 5B analytical laboratory results are presented in Appendix C. The test results for the background soil sample are summarized as follows:

<u>VOC</u>

One VOC (xylene) was detected at an estimated concentration of 2 ug/kg or ppb in the background soil sample. The remaining VOC were not detected above the reported analytical laboratory detection limit of 11 ug/kg. The xylene concentration measured in the background soil sample does not exceed SCG.

S-VOC

Two S-VOC were detected above the analytical laboratory detection limits in the background soil sample. These include: di-n-butylphthalate (estimated concentration of 38 ug/kg or ppb) and bis (2-ethylhexyl) phthalate (estimated concentration of 99 ug/kg or ppb). S-VOC tentatively identified compounds (TICs) were also detected in the background soil sample at a total estimated concentration of 2,480 ug/kg. The concentrations of the S-VOC detected in the background sample do not exceed SCG.

TAL Metals and Cyanide

TAL metals detected in the background soil sample include: aluminum, arsenic, barium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, vanadium, zinc and potentially beryllium, cadmium and sodium. The concentrations of the detected metals do not exceed SCG.

Cyanide was not detected above the reported analytical reporting limits in the background soil sample.

PCBs/Pesticides

The background soil sample tested did not contain PCBs. However, this sample contained the following pesticides: gamma-BHC (lindane), heptachlor, aldrin, dieldrin, endrin and 4, 4'-DDT. The concentrations measured in this sample did not exceed SCG.

4.3.3 Subsurface Soil Test Results

Subsurface soil samples were collected from test pit/trench and test boring locations and select samples were submitted for analytical laboratory testing. Subsurface soil samples were tested for one or more of the following parameters: (TCL, Halogens & Aromatics, and Halocarbons) VOC, TCL S-VOC, TAL metals plus cyanide, pesticides, PCBs. Copies of the analytical laboratory summary reports are included in Appendix C. The detected concentrations and comparison to corresponding SCG are summarized on Table 2, Table 6a and Table 6b. [Note: The soil in the Courtyard Area was disturbed during the excavation of the test pits/trenches and by the soil removal IRM. As such, the analytical laboratory results for the samples collected from test borings TB-100 through TB-114 and the data collected following the soil removal IRM may not be representative of current subsurface conditions. Therefore the data for these sample locations is not included in the discussion that follows.]

The test results for subsurface soil samples are summarized as follows:

VOC

VOC detected in one or more soil samples included: PCE, TCE, VC, cis-1,2-DCE, trans-1,2-DCE, toluene, xylene, methylcyclohexane, ethylbenzene, isopropylbenzene, acetone,

chlorobenzene, methylene chloride, 2-butanone, 1,1-dichloroethene, carbon disulfide, 1,1-dichloroethane, cyclohexane and 1,1,1-TCA. TICs, were detected in many of the subsurface soil samples tested (refer to Appendix C). The concentrations of specific VOC were compared to SCG. As shown on Table 5A, SCG for PCE, TCE, VC, trans-1,2-DCE, cis-1,2-DCE, and xylene were exceeded in some of the subsurface soil samples tested.

Two predominant areas of the Site exhibited concentrations of VOC in the soil that exceeded SCG. These include the Courtyard Area (particularly in the vicinity of the location where the broken 6-inch diameter clay tile pipe was identified) and on the east side of the Garage Area (i.e., in proximity to test boring B-3). The areal and vertical extent of impacted soil in proximity of test boring B-3 was not delineated during this study. In addition, although limited soil samples were tested VOC concentrations exceeding SCG are likely beneath the concrete floor in portions of the Anderson Cleaners building east of the Court Yard Area. [Note: Although some soil samples collected from the saturated zone also contained concentrations of VOC that exceeded SCG, it is likely that these concentrations are representative of impacted groundwater. The impacted soil samples in the Courtyard Area and in test boring B-3 were collected at relatively shallow depths (i.e., typically beginning at 2^{+} in the Courtyard Area and at a depth of 3 feet below the ground surface in test boring B-3).]

S-VOC

The S-VOC di-n-butylphthalate (estimated concentrations of 47 ug/kg and 55 ug/kg) and bis (2-ethylhexyl) phthalate (estimated concentrations of 74 ug/kg and 63 ug/kg) were detected in two of the three soil samples from the Site that were tested (i.e., in addition to the background soil sample). These samples also had total TIC concentrations of 2,480 ug/kg and 5,677 ug/kg, respectively. The detected S-VOC are commonly artifacts of sampling and analytical laboratory testing, and it is not suspected that these constituents are associated with the Site.

TAL Metals and Cyanide

TAL metals detected in the subsurface soil samples include: aluminum, arsenic, barium, calcium, cadmium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, sodium, thallium, vanadium, zinc and potentially beryllium, mercury and potassium. With the exception of the arsenic concentration of 13.8 ppm that slightly exceeded the Unrestricted Use SCO of 13 ppm, the metal concentrations detected did not exceed SCG.

PCBs/Pesticides

PCBs were not detected in any of the subsurface soil samples tested. The pesticides 4, 4'-DDT, 4,4'-DDE and 4,4'-DDD were detected in subsurface soil samples, but the concentrations were all below the SCG.

4.4 Groundwater Quality

The constituents detected in the groundwater samples tested during this study and the distribution of these constituents within the groundwater is summarized in the following sections.

Groundwater samples were collected from monitoring wells installed at various times during this study. Generally, monitoring wells installed within test borings advanced using direct-push sampling techniques (i.e., 1-inch diameter monitoring wells) extend to depths of about 10 ft. to 15 ft. bgs (i.e., designated herein as "shallow" monitoring wells). Many of the monitoring wells installed in test borings advanced via rotary drilling techniques (i.e., 2-inch and 4-inch diameter monitoring wells) were generally placed at the bottom of the overburden encountered at the Site and likely with a fractured/weathered rock zone. However, some 2-inch diameter monitoring wells were terminated within a glacial till layer that overlies the bedrock (e.g., MW- 206, MW-207, MW-208 and MW-209). In addition, two monitoring wells (designated MW-BR-02R and BR-03R) were advanced through the fractured/weathered rock zone; a steel casing was grouted in-place and the wells were advanced into the competent rock below. The constituents detected in groundwater samples collected from these monitoring wells are discussed below.

VOC

The VOC detected above SCG in the groundwater samples from the monitoring wells tested during this study include: PCE, TCE, 1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, VC, 1,1,1-TCA, 1,1-DCA, toluene, chlorobenzene, 1,1,2-TCA, ethylbenzene, and xylene. With the exception of xylene, toluene, chlorobenzene, 1,1-DCA 1,1,1-TCA, 1,1,2-TCA and ethylbenzene that were detected less frequently and/or at typically lower concentrations, the above VOC are identified as COC for the Site. The COC detected in groundwater samples collected and tested during this study are summarized on Table 6A. The distribution of VOC measured in the groundwater samples tested during this study is presented on Figure 7 and Figure 7A. A contour map prepared using total VOC concentrations for samples collected in 2008 and 2010 (i.e., the most-recent test results) for select overburden and top of rock monitoring wells is presented as Figure 7B. The presumed location of the current extent of DNAPL remaining at the Site is also shown on this figure.

As shown on Figure 7, Figure 7A, and Figure7B, the highest concentrations of VOC were detected in groundwater samples collected from monitoring wells located in the Courtyard Area and locations to the east/southeast (e.g., PW-2, PW-3, MW-7.1, MW-207 and BR-02FR). The VOC concentrations decrease as groundwater flow continues hydraulically downgradient to the east/southeast and some downgradient monitoring wells contain VOC concentrations that exceed SCG. Only one off-site monitoring well MW-201, which is positioned hydraulically downgradient of the Site, contained VOC concentrations that exceeded SCG. However, the extent of the VOC impact in MW-201 appears limited since monitoring wells MW-202 and MW-203, which are located

hydraulically downgradient of MW-201 do not contain concentrations of VOC that exceed SCG.

Based upon the results of this study, the groundwater within the fractured/weathered bedrock zone underlying the Site contains the highest concentrations of VOC. The results of the *Summary Report Bedrock Groundwater Evaluation, Anderson Cleaners Site, 5 Hunt Road, Jamestown, New York, BCP #C907027*, dated June 2010 indicate that the VOC concentrations detected in the fractured/weathered bedrock zone decrease with depth. As evidenced by the testing of samples collected on the same date from BR-02FR and BR-02R, which are positioned adjacent to each other, the total VOC concentrations in BR-02R were approximately an order of magnitude less than those measured in the samples collected from BR-02FR.

S-VOC

With the exception of TICs (i.e., total concentration of 860 ug/l) measured in the groundwater sample from MW-07, no S-VOC were detected in the four groundwater samples tested during this study.

Groundwater samples from monitoring wells MW-2, MW-5, PW-3 and MW-07 (i.e., positioned in proximity to the former Stoddard Solvent tanks) were tested at various times for total petroleum hydrocarbons (TPH). With the exception of a concentration of 860 ug/l in a sample from MW-07 (i.e., reported as kerosene or jet fuel) and a concentration of 1,100 ug/l in a sample from PW-3 (i.e., reportedly not a petroleum-related compound), TPH was "not detected" in any of the groundwater samples tested. These TPH results, coupled with the apparent absence of widespread xylene impact in soil and groundwater samples in the area of the former Stoddard Solvent tanks, suggests that leakage from these tanks is not an environmental concern at the Site. [Note: Xylene was detected at a concentration above the SCG in a soil sample collected from a depth of 4.0 feet in test boring B-4 (i.e., 1,800 ug/kg). Test boring B-4 is located approximately 750 feet east of the former Stoddard Tanks and it is not suspected that the xylene detected in this sample is related to the former Stoddard Tanks.]

TAL Metals and Cyanide

At least one of the samples collected from the monitoring wells tested contained detectable concentrations of each of the TAL metals except for mercury, selenium, and silver (refer to Table 6B). The concentrations of: antimony, arsenic, barium, chromium, iron, lead, magnesium, manganese, thallium, sodium and nickel in upgradient well MW-01; iron and sodium in downgradient well MW-06 and iron, sodium, magnesium and manganese in downgradient MW-07 exceeded SCG. However, in each case the concentrations measured in upgradient monitoring well MW-01 were higher than those detected in the downgradient monitoring wells. As such, metal impact to the groundwater is not judged to be attributable to the Site.

PCBs/Pesticides

The pesticides 4, 4'-DDE (0.065 ug/l) and 4, 4'-DDD (0.27 ug/l) were measured in the sample from monitoring well MW-07 (refer to Table 6B). However, the measured concentrations do not exceed SCG. The other monitoring wells did not contain detectable concentrations of pesticides, and PCBs were not detected in any of the groundwater samples.

5.0 FATE AND TRANSPORT

This section includes an evaluation of contaminant fate and transport for the Site including identifying potential routes of migration, contaminant persistence and identified contaminant migration patterns.

5.1 Potential Routes of Migration

Release and transport mechanisms for the COC include:

- soil leaching and impacting groundwater through precipitation or contact with groundwater;
- migrating in a dissolved groundwater plume;
- migrating as vapor in the unsaturated zone;
- volatilization to air if impacted media are disturbed;
- volatilization from groundwater or soil to indoor air; and
- transportation on construction equipment/workers if impacted media is disturbed.

5.2 Contaminant Persistence

The COC detected during this study are generally associated with dry cleaning products that were previously used at the Site (i.e., primarily chlorinated VOC consisting of PCE and associated breakdown products). Half-lives for the constituents commonly detected in soil and/or groundwater were referenced in the "Handbook of Environmental Degradation Rates", P.H. Howard. et. al, 1991. This reference suggests these VOC in an aqueous setting will biodegrade faster under aerobic conditions when compared to biodegradation rates under anaerobic conditions.

The range of specific half lives for the COC detected in the soil and/or groundwater at the Site are summarized below:

- Tetrachloroethene (PCE): Half-life in groundwater between 365 days and 730 days. Half-life in soil between 183 days 365 days

- Trichloroethene (TCE): Half-life in groundwater between 325 days and 1643 days. Half-life in soil between 183 days and 365 days.

- Vinyl Chloride (VC): Half-life in groundwater between 56 days and 2890 days. Half-life in soil between 28 days and 183 days

- 1,1-Dichloroethene (1,1-DCE): Half-life in groundwater between 56 days and 132 days. Half-life in soil between 28 days and 183 days

- 1,2-Dichloroethene (including cis-1,2-DCE and trans-1,2-DCE): Half-life in groundwater between 56 days and 2890 days. Half-life in soil between 28 days and 183 days.

The Agency for Toxic Substances and Disease Registry (www.atsdr.cdc.gov) was referenced to obtain information on the VOC detected at the Site. A summary of information for these VOC is provided below:

- Tetrachloroethene (PCE): can be emitted into the air from water and soil where it is broken down by sunlight and other chemicals. PCE in air can be brought back to the ground surface via rain or snow. It breaks down in water and soil via microorganisms and can pass through the soil into groundwater. PCE does not bioaccumulate.

- Trichloroethene (TCE): is slightly soluble in water and can remain in the groundwater for a time. TCE evaporates less easily from the soil than from surface water. TCE may stick to particles in water, which will cause it to eventually settle to the bottom sediment. TCE does not bioaccumulate.

- Vinyl Chloride (VC): in the liquid form evaporates easily. VC in water or soil evaporates rapidly if it is near the surface. VC in the air breaks down in a few days to other substances, some of which can be harmful. Small amounts of VC can dissolve in water. VC is unlikely to bioaccumulate.

- 1,1-Dichloroethene (1,1-DCE): evaporates very quickly from water and soil to the air where it readily breaks down. In soil, 1,1-DCE is slowly transformed to other less harmful chemicals. 1,1-DCE breaks down very slowly in water and does not bioaccumulate.

- 1,2-Dichloroehtene (1,2-DCE): evaporates rapidly into air where it breaks down quickly. Most 1,2-DCE in the soil surface or bodies of water will evaporate into air. 1,2-DCE can travel through soil or dissolve in water in the soil. It is possible that it can contaminate groundwater. There is a slight chance that 1,2-DCE will break down into vinyl chloride, which is a more toxic compound.

In addition to biodegradation, VOC concentrations in the groundwater decrease as the distance from the source area is increased due to processes such as advection, dispersion, sorption, diffusion, etc. In fact, the analytical laboratory test results for groundwater samples collected as part of this study indicate that the VOC concentrations decrease as the distance from the suspected source area (i.e., the Courtyard Area) is increased.

5.3 Contaminant Migration

COC are not present in test boring/monitoring well locations near the western property boundary of the Site (i.e., upgradient locations). The highest concentrations of COC in the soil and groundwater were detected in proximity of the Courtyard Area where a broken 6-inch diameter clay tile pipe was identified. In addition, soil impacted with COC and a DNAPL plume were detected beneath the concrete floor of the Anderson Cleaners building generally east of the Courtyard Area (refer to Figure 10). These locations are apparent source areas of the COC present at the Site. Migration of COC within the groundwater to the east/southeast away from the source areas resulted in a plume

consisting primarily of PCE and associated breakdown products (refer to Figure 6, Figure 7 and Figure 7A).

COC detected in the soil appear to have migrated downward into the groundwater and thereafter migrated via the groundwater. This is evident in the area of the broken clay pipe in the Courtyard Area where COC were detected within the soil beginning at a depth of 2^{+} feet below the ground surface (i.e., below the invert of the pipe) and the concentrations generally increased with depth until the groundwater was encountered (i.e. typically at a depth of about 8 feet below the ground surface). The COC concentrations in the soil are typically lower in locations away from the broken pipe, but the groundwater in these locations is impacted with COC.

The COC are typically denser than water (particularly DNAPL) and, as such, they tend to sink into the groundwater. The upward hydraulic gradient between the fractured/weathered rock groundwater zone and the shallow overburden groundwater zone at the Site appears to limit this downward migration to some extent (i.e., as evidenced by the variation in COC concentrations detected in adjacent monitoring well MW-07 and MW-03). Similarly, as discussed in Section 4.4, the upward hydraulic gradient between the competent bedrock and the fractured/weathered bedrock zone limits the downward migration of COC into the bedrock.

It is also likely that COC migrating within the groundwater plume will volatize, migrate upward into the vadose zone and collect beneath building slabs and similar confined spaces. As such, it is anticipated that the sub-slab beneath the laundry/dry cleaning area of the Anderson Cleaners building will contain elevated concentrations of COC. Based upon the groundwater flow pattern, similar impacts to the Finishing Area portion of the Anderson Cleaners building are not anticipated.

5.3.1 Factors Affecting Contaminant Migration

Factors affecting contaminant migration include: groundwater flow; advection; mechanical dispersion; molecular diffusion; partitioning between air, soil and groundwater; and adsorption of constituents onto soil particles or particles suspended in groundwater.

In general, the COC are soluble in water and tend to be mobile in the environment (e.g., migrating through the groundwater and vaporizing into the unsaturated zone). Due to the physical characteristics of the COC and physical/chemical factors of the subsurface media, COC typically migrate at a rate slower than the groundwater. As discussed in Section 3.4, it is estimated that groundwater in the fractured/weathered rock zone flows at a rate of about 0.46 ft/day to 0.66 ft/day. The slower rate of contaminant migration through the groundwater is expressed as a retardation factor. Assuming a 1% fraction of total organic carbon and a partition coefficient of 277 ml/g (i.e., consistent with values identified in TAGM 4046) and a bulk density of 2.64 g/cm^3 and a porosity range of 0.35-0.5 (i.e., consistent with the type of soil found at the Site), the retardation factor for PCE is calculated to be 1.2. As such, it is estimated that PCE will flow in the groundwater at a rate of less than 0.46 ft/day.

6.0 EXPOSURE ASSESSMENT

This section presents the results of the Qualitative Human Health Exposure Assessment and the Fish and Wildlife Resources Impact Analysis conducted for the Site based upon the data collected during this study.

6.1 Qualitative Human Health Exposure Assessment

A qualitative human health exposure assessment was conducted as part of this project in accordance with the guidelines referenced in the document titled "*New York State Department of Health Qualitative Human Health Exposure Assessment*" that is included as Appendix 3B of DER-10. The purpose of the qualitative human health exposure assessment was to identify the exposure setting and exposure pathways, and to evaluate the contaminant fate and transport in relation to human health exposure.

An exposure pathway is comprised of the following components:

1. a contaminant source;
2. contaminant release and transport mechanisms;
3. a point of exposure;
4. a route of exposure; and
5. a receptor population.

Contaminant Sources

Historically, the Site has been used for dry cleaning operations and PCE was previously used as the primary dry cleaning fluid. In the past, PCE discharged to the subsurface and the soil and groundwater at the Site (particularly beneath the current Laundry/dry cleaning portion of the Anderson Cleaners building) has been impacted by PCE and associated breakdown products. Specifically, the COC identified at the Site include: PCE, TCE, 1,1-DCE, cis-1, 2-DCE, trans-1, 2-DCE, VC, and DNAPL. Based on the current data, the COC impact is located on the Site (i.e., with the exception of a localized area in proximity of a sanitary sewer line) off-site migration has not been documented.

Contaminant Release and Transport Mechanisms

Release and transport mechanisms for the COC include:

- leaching from the soil and impacting groundwater through precipitation or contact with groundwater;
- migrating in a dissolved groundwater plume;
- migrating as a vapor in the unsaturated zone;
- volatilization from groundwater or soil to indoor air; and

- transportation on construction equipment/workers if impacted media is disturbed (i.e., future additions, repairing underground utilities, etc.)

Points of Exposure include

The locations where actual or potential human contact with COC may occur include:

- indoor air in the Laundry/dry cleaning facility on the Site; and
- direct contact with media impacted with COC during future Site improvements.

Routes of Exposure

The manner in which a COC enters or contacts the body include:

- Inhalation;
- Ingestion;
- Dermal contact;
- Eye contact; and
- Puncture/injection.

Receptor Populations

The receptor populations include:

- Employees and patrons of the laundry/dry cleaning facility on the Site; and
- Construction workers that need to disturb contaminated media.

Potential exposure pathways

The results of this human health exposure assessment have identified the following potential exposure pathways:

- COC present in the soil and groundwater at the Site that may volatilize and impact air quality inside the building. Employees and patrons of this building could be exposed to the VOC vapors through inhalation of indoor air.
- Construction workers could be exposed to COC that are present in the soil and groundwater at concentrations above SCG. Examples of such exposures could include:
  - Inhalation of vapors from the volatilization of COC from soil and/or groundwater; and
  - Direct contact with COC-impacted media may also occur, which could lead to other potential routes of exposure including ingestion, inhalation, dermal contact, eye contact, and puncture/injection.

- Future use of the groundwater at the Site (and surrounding area) could pose a potential exposure pathway to COC present in groundwater at concentrations above SCG. The primary potential route of exposure would be ingestion. However, other potential routes of exposure include inhalation, dermal contact, eye contact, and puncture/injections potentially exist.

The findings of the human health exposure assessment have been used to assist in the selection of the recommended remedial alternative for the Site as discussed in Section 9.0 of this report.

6.2 Fish and Wildlife Resources Impact Analysis

A copy of a completed Fish and Wildlife Resources Impact Analysis (FWRIA) Decision Key is included in Appendix J. The findings of the studies described herein, and the information provided above, were used to assist in completing the FWRIA Decision Key. The Site, which is predominately covered with a building and a paved parking lot/driveway, contains soil and groundwater impacted with COC. The Site does not contain fish or wildlife species that are endangered, threatened or of special concern. As a result, an FWRIA is not needed for this Site.

7.0 CONCEPTUAL SITE MODEL

The following sections summarize the conceptual site model developed as part of this BCP Remedial Investigation project.

Overburden Deposits

The Site is underlain by overburden deposits that extend to depths of about 16 ft. to 23 ft. bgs. Fill material typically comprised of silty sand and gravel often intermixed with pieces of bricks, concrete and wood is present below surface coverings that consist of lawn/landscape areas, asphalt pavement or buildings. The fill material extends to depths ranging from about 2^{+} ft. to 8 ft. bgs. In some of the test borings advanced at the Site, an approximate 0.5-foot layer of peat was encountered below the fill material. However, the fill materials typically overlay glacial deposits consisting of interbedded mixtures of sandy silt and clayey silt often containing lesser amounts of sand, gravel, and occasional cobble-size material. In some locations, the sandy silt and clayey silt deposits contain seams of sub-angular to rounded gravel and sand (i.e., likely deposited via glacial melt water). The sandy silt and clayey silt deposits are approximately 4 ft. to 12 ft. thick extending beneath the fill to the top of a glacial till deposit. The glacial till is typically medium dense gray-brown silty sand with lesser amounts of clay and rock fragments. The glacial till is approximately 3 ft. to 7 ft. thick extending to the top of fractured/weathered shale bedrock, and it is winnowed with seams of permeable sand and gravel evident in some locations. The indigenous soil is typical of the ground moraine deposits common in the area of the Site.

Bedrock

A fractured and weathered shale layer (i.e., attributable to glacial scour and groundwater movement) extends from the base of the glacial till until competent bedrock is encountered. During the advancement of the test boring to install BR-02FR, an approximate 5.6 ft. thick zone of fractured rock was encountered below the till layer. An approximate 5.8 ft. thick layer of fractured rock was encountered below the till layer in the test boring for BR-02R. The rock quality improves with depth, and "competent bedrock" was encountered in the test boring for BR-02FR at a depth of about 28.4 ft. bgs, or elevation 69.55 ft. (i.e., measured to an arbitrary datum established for the Site). In the test boring advanced for monitoring well BR-02R, competent bedrock was encountered at a depth of about 28.0 ft. bgs, or elevation 69.9 ft.

Stratigraphic Cross Sections

Stratigraphic cross sections developed based on the test borings advanced to date are presented as Figure 8 (a cross section that extends generally from west to east between monitoring well MW-1 and BR-03R; designated as Cross Section A-A'), and Figure 9 (a cross section that extends generally from north to south between monitoring well MW-08 and MW-06; designated as Cross Section B-B'). The locations/orientations of Cross Section A-A' and Cross Section B-B' are shown on the Site Plan included as Figure 5.

Groundwater Conditions

Monitoring wells installed with their screened section terminating at or near the top of the glacial till typically encounter groundwater at depths ranging from about 1 to 4 ft. bgs. Monitoring wells installed within fractured/weathered bedrock exhibit flowing artesian conditions with groundwater levels greater than 2 ft. above the ground surface (ags). The groundwater levels measured in monitoring wells installed within competent bedrock (i.e., BR-02R and BR-03R) also exhibit flowing artesian conditions, but the hydraulic head is less than that observed in monitoring wells screened within the fractured bedrock.

Monitoring well MW-207 is installed with its screened section extending upward from the top of the glacial till, BR-02FR is installed within the fractured bedrock zone, and BR-02R is installed as an open hole within the competent bedrock. Monitoring well MW-207 is located about 17 ft. west of monitoring well BR-02R and monitoring well BR-02FR is located less than 5 ft. south of monitoring well BR-02R. The vertical hydraulic gradients calculated based on groundwater level measurements made in these monitoring wells on May 5, 2010 are summarized below.

- BR-02FR to MW-207 = + 0.4 ft./ft. (upward hydraulic gradient)
- BR-02R to MW-207 = +0.2 ft./ft. (upward hydraulic gradient)
- BR-02FR to BR-02R = -0.06 ft./ft. (downward hydraulic gradient)

Groundwater contour maps developed using data collected on May 5, 2010 for the overburden zone (i.e., based on groundwater elevations measured in monitoring wells screened within or above the glacial till) and the fractured bedrock zone are included on Figure 6. As shown, groundwater in both zones generally flows to the east across the Site with a southeasterly component evident in the southern portion of the Site. During the May 5, 2010 monitoring event, an average horizontal gradient of 0.03 ft./ft. was calculated in the overburden zone monitoring wells, and an average hydraulic gradient of 0.012 ft./ft. was calculated for the fractured bedrock zone monitoring wells. An average hydraulic conductivity of 6.83×10^{-3} cm/sec was measured in monitoring wells MW-01 through MW-06 (i.e., monitoring wells that penetrate the fractured rock zone). The hydraulic conductivity was not tested in monitoring wells installed within the overburden zone, but based on the nature of the overburden material, a hydraulic conductivity of 1.0×10^{-4} cm/sec is estimated. Using the average values for horizontal gradient and hydraulic conductivity and an assumed porosity value of 0.35 to 0.50 for each zone, a horizontal groundwater velocity within the overburden zone was calculated to range between about 0.017 ft./day and 0.024 ft./day, and a horizontal groundwater velocity of 0.46 ft./day to 0.66 ft./day was calculated for the fractured rock zone.

Contaminants of Concern

The Site has been used for dry cleaning operations and PCE was previously used as the primary dry cleaning agent. In the past, PCE entered the subsurface, and this has resulted in PCE and associated breakdown products impacting the soil and groundwater. The COC identified in the soil and groundwater at the Site include:

- tetrachloroethene (PCE)

- trichloroethene (TCE)
- 1,1-dichloroethene (1,1-DCE)
- cis-1, 2-dichloroethene (cis-1, 2-DCE)
- trans-1, 2-dichloroethene (trans-1, 2-DCE)
- vinyl chloride (VC)
- Dense Non-Aqueous Phase Liquid (DNAPL)

Contaminant Distribution and Migration

The highest concentrations of COC were measured in soil and groundwater samples collected in proximity to the Courtyard Area of the Site and locations to the east/southeast (e.g., within monitoring wells PW-2, PW-3, MW-7.1, MW-207 and BR-02FR). COC, in the form of dissolved constituents, have migrated to the east/southeast through the groundwater. It is also possible that some preferential migration has occurred along the bedding of the 6-inch clay tile pipe formerly located in the Courtyard Area where the soil removal IRM was conducted, and potentially along other buried utilities crossing the Site.

DNAPL has been detected within the glacial till in several test borings/monitoring wells in the central portion of the Site. It is presumed that the DNAPL entered the subsurface from a near surface location (e.g., potentially through a broken pipe in the Courtyard Area that was remediated as part of the soil removal IRM, and/or other localized discharges that may have occurred during the 1985 fire at the Site), and due to its density, the DNAPL migrated downward and collected on and within the less permeable glacial till. Since July 2006, DNAPL has been observed and removed from various monitoring wells installed at the Site including: monitoring well MW-204 (located in the Courtyard Area in the vicinity of the break in clay tile pipe), monitoring well MW-207 (located near the southeastern corner of the building), PW-3 (located within the Laundry/dry cleaning area of the building) and WP-2 (located inside the building near the southeastern corner). To date, more than 100 gallons of DNAPL has been removed from the above monitoring wells using a combination of bailers and a portable vacuum purge system. [Note: DNAPL has not been detected in monitoring well MW-204 since May 21, 2008, and it appears that the removal efforts conducted to date have removed DNAPL from this monitoring well to the extent possible. Also, DNAPL was observed on the samples of glacial till collected during the advancement of the test boring for monitoring well BR-02FR, but through May 5, 2010, DNAPL has not been detected within the water in this monitoring well.]

The presumed extent of DNAPL impact remaining at the Site is depicted on Figure 10. In addition, the top of till and the top of rock elevations measured in select test borings is also presented on this figure. These elevations indicate that the top of the till and the top of rock slope downward generally to the south and southeast, with evidence of convergence into a lower area located in proximity of monitoring well BR-02FR. The elevation of the top of till and top of rock appears to have influenced the DNAPL distribution, whereby the DNAPL appears to have moved downward and collected on the till initially in the area of MW-204 and/or PW-3, thereafter following the slope of the till/bedrock towards BR-02FR.

The DNAPL provides a constant source of dissolved phase PCE and other COC in the groundwater. It is possible that some preferential dissolved contaminant flow could occur along buried utilities, and this appears to be supported by the concentrations of COC measured in samples collected from monitoring well MW-201, which is positioned adjacent to a 4-inch diameter sanitary sewer located in Huxley Street.

8.0 IDENTIFICATION AND DEVELOPMENT OF ALTERNATIVES

This section of the report presents the identification and development of remedial action objectives (RAO) and remedial alternatives (RA) for the Site.

8.1 Remedial Action Objectives

Based on the findings of the RI, the RAO are described below:

Soil

Protection of public health:

- Prevent ingestion and direct contact of soil impacted with COC.
- Prevent inhalation and exposure via volatilization of COC in soil.

Environmental protection:

- Prevent migration of COC that would result in impacts to surface water or groundwater.
- Prevent impacts to biota via ingestion or direct contact with soil impacted with COC that would result in toxic conditions or impacts from bioaccumulation through the terrestrial food chain.

Groundwater

Protection of public health:

- Prevent ingestion of groundwater impacted with COC at levels exceeding drinking water standards.
- Prevent contact with, or inhalation of vapors emitted by, groundwater impacted with COC.

Environmental protection:

- To the extent practicable, restore the groundwater aquifer to pre-release conditions.
- Prevent the discharge of COC to surface water.
- Remove the source of COC impact to the groundwater.

8.1.1 Contaminants of Interest

Based on the studies performed to date, the COC identified are primarily comprised of chlorinated VOC associated with dry cleaning products that were formerly used at the Site. Specifically, these COC are primarily related to PCE and associated breakdown products including:

- tetrachloroethene (PCE)
- trichloroethene (TCE)
- 1,1-dichloroethene (1,1-DCE)
- cis-1, 2-dichloroethene (cis-1, 2-DCE)
- trans-1, 2-dichloroethene (trans-1, 2-DCE)
- vinyl chloride (VC)
- DNAPL (i.e., as identified in the central portion of the Site)

8.1.2 Development of Remediation Criteria

In order to evaluate the effectiveness of remedial alternatives for this Site, the following general and site-specific remediation goals were evaluated in general accordance with the provisions set forth in DER-10:

- Overall Protectiveness of the Public Health and Environment. This criterion is an evaluation of the remedy's ability to protect public health and the environment, and how the remedy would eliminate, reduce or control through removal, treatment, containment, engineering controls or institutional controls existing or potential human exposures or environmental impacts identified by the RI.

- Compliance with Standards, Criteria and Guidance (SCG). Compliance with SCG addresses whether or not a remedy will meet applicable environmental laws, regulations, standards and guidance. The SCG for the Site are listed along with discussion of whether or not the remedy will achieve compliance.

- Short-Term Impacts and Effectiveness. The potential short-term adverse impacts and risks of the remedy upon community, the workers and the environment during its construction and/or its implementation are evaluated. A discussion of the identified adverse impacts and health risks to the community or workers at the Site, and how such issues will be controlled, and the effectiveness of said controls, is presented. A discussion of engineering controls that will be used to mitigate short-term impacts (e.g., dust control measures) is provided where applicable. The length of time needed to achieve the remedial objectives is also estimated.

- Long-Term Effectiveness and Permanence. This criterion evaluates the long-term effectiveness of the remedy after implementation. If wastes or treated residuals remain on-site after the selected remedy has been implemented, the following items are evaluated:

- the magnitude of the remaining risks (i.e. significant threats, exposure pathways, or risks to the community and environment from the remaining wastes or treated residuals);
- the adequacy of the engineering and institutional controls to limit the risk;
- the reliability of these controls; and,
- the ability of the remedy to continue to meet RAO in the future.

- Reduction of Toxicity, Mobility and Volume. The remedy's ability to reduce the toxicity, mobility or volume of the COC is evaluated. Preference is given to remedies that permanently and significantly reduce toxicity, mobility or volume of the wastes at the Site.

- Implementability. The technical and administrative feasibility of implementing the remedy is evaluated. Technical feasibility includes the differences associated with the construction and the ability to monitor the effectiveness of the remedy. For administrative feasibility, the availability of the necessary personnel and material is evaluated along with potential differences in obtaining specific operating approvals, access for construction, etc.

- Cost. Capital, operation, maintenance and monitoring costs are estimated for the remedy and presented on a present worth basis.

- Land Use. This criterion is intended to evaluate the remedy in relation to the current, intended and reasonably anticipated future use of the Site. Presently, it is anticipated that the future use of the Site would be the same as the past use - that being primarily a Laundry/dry cleaning facility.

- Community Acceptance. This criterion is intended to select a remedial alternative that is acceptable to the community. The public's comments, concerns and overall perception of the remedy are later evaluated in a format that responds to questions that are raised (i.e., responsiveness summary).

8.2 General Response Actions

During this study, soil in proximity of the ground surface that contains COC at concentrations exceeding SCG was detected in two localized areas. These locations include the Courtyard Area and an area immediately east of the current garage portion of the Anderson Cleaners building. In the Courtyard Area, impacted soil was encountered beginning at a depth of about 2^{+} feet below the ground surface (i.e., immediately below a 6-inch diameter clay tile pipe found to be broken in the Courtyard Area). East of the current garage area (i.e., in proximity to test boring B-3) impacted soil was identified beginning approximately 4 ft. bgs). In these areas, the soil impacted with COC extended to the top of the groundwater, which was encountered at a depth of about 8 ft. bgs during the soil removal IRM. Although the extent was not confirmed via testing, soil impacted with COC at concentrations exceeding SCG is also likely present in areas beneath the

concrete slab of the Anderson Cleaners building (i.e., generally in locations east of the Courtyard Area). During the soil removal IRM, approximately 46 tons of this impacted soil was removed from the Courtyard Area and transported off-site for disposal in accordance with applicable regulations.

During this study, groundwater was measured in "shallow" monitoring wells that terminate above, or at the top of, the glacial till at levels of about 1 ft. to 5 ft. bgs. Monitoring wells that penetrated the entire thickness of the overburden into the fractured rock encountered groundwater levels in excess of 2 ft. above the ground surface (i.e., flowing artesian conditions). The groundwater levels measured in monitoring wells installed within competent bedrock that is present below the fractured rock zone (i.e., BR-02R and BR-03R) also exhibited flowing artesian conditions, but the hydraulic head is less than that observed in monitoring wells screened within the fractured bedrock.

DNAPL has been detected at the surface of the glacial till in several test borings/monitoring wells in the central portion of the Site. It is presumed that the DNAPL entered the subsurface from a near surface location (e.g., potentially through a broken pipe in the Courtyard Area that was remediated as part of the soil removal IRM, and/or other localized discharges that may have occurred during the 1985 fire at the Site). Due to its density, the DNAPL migrated downward and accumulated on the glacial till and continued to migrate laterally in the direction of the till layer slope (i.e., generally to the south and southeast, with evidence of convergence into a lower area located in proximity of monitoring well BR-02FR). The presumed areal extent of DNAPL at the Site is depicted on Figure 10.

During this study, DNAPL has been removed from various monitoring wells installed at the Site including: monitoring well MW-204 (located in the Courtyard Area in the vicinity of the break in clay tile pipe), monitoring well MW-207 (located near the southeastern corner of the building), PW-3 (located within the laundry/dry cleaning area of the building) and WP-2 (located inside the building near the southeastern corner). To date, more than 100 gallons of DNAPL has been removed from the above monitoring wells using a combination of bailers and a portable vacuum purge system. [Note: DNAPL has not been detected in monitoring well MW-204 since May 21, 2008, and it appears that the extraction efforts conducted to date have removed DNAPL from this monitoring well to the extent possible. Also, DNAPL was observed on the samples of glacial till during the advancement of the test boring associated with monitoring well BR-02FR, but through May 5, 2010, DNAPL has not been detected within the water column of this monitoring well.]

DNAPL provides a source of dissolved phase PCE and other COC in the groundwater resulting in a contaminant plume located hydraulically downgradient of this source area (i.e., typically extending to the east/southeast from the central portion of the Site in the direction of groundwater flow). It also is possible that some preferential dissolved contaminant flow could occur along buried utilities, and this appears to be supported by the concentrations of COC measured in samples collected from monitoring well MW-201, which is positioned adjacent to a 4-inch diameter sanitary sewer located in Huxley Street.

In addition to the IRM soil removal discussed above, general response actions to address the impacted soil and groundwater include monitoring to evaluate the nature and extent of impact; treatment (i.e., DNAPL removal, bioremediation, excavation, extraction, etc), containment, disposal, environmental engineering controls and institutional controls. The response actions are primarily evaluated for application in addressing impacted groundwater containing COC concentrations that exceed SCG.

8.3 Development of Remediation Alternatives

The RA considered for this Site are intended to address the COC identified in the soil and groundwater at concentrations that exceed SCG.

Alternative #1: DNAPL recovery and Chemical Oxidation, Bioremediation, Collection and Treatment of Artesian Well Effluent, Maintenance of Existing Cap, Institutional Controls, Engineering Controls and Long-Term Monitoring Under this alternative, DNAPL would be removed using chemical resistant submersible pumps from locations in which extractable quantities of DNAPL have been observed. When the recoverable amount of DNAPL diminishes to non-extractable quantities, a chemical reagent capable of inducing a chemical reaction that would oxidize the residual saturated source zone COC would be added to the contaminated groundwater as a polishing measure. In locations hydraulically downgradient of the source zone, biological treatment (bioaugmentation and/or biostimulation) would be implemented by enhancing the populations of *Dehalococcoides* microbes currently present at the Site. In addition, the flowing artesian conditions exhibited within the fractured bedrock and upper competent bedrock will be utilized to provide a downgradient hydraulic barrier. The existing soil and asphalt cap at the Site would be maintained above the soil remaining at the Site that contains COC at concentrations exceeding SCG. Institutional controls and environmental engineering controls would be implemented to protect against exposure to contamination in the soil and groundwater. Long-term monitoring would be implemented to ensure that the treatment undertaken and natural attenuation is adequately controlling and remediating the residual COC impact within the groundwater.

Alternative #2: Restore to Pre-Existing Conditions to Allow Unrestricted Use of the Site: Excavation of Contaminated Soil with Off-Site Disposal, DNAPL recovery and Chemical Oxidation, Groundwater Extraction and Treatment and Long Term Monitoring Under this alternative, excavation and off-site disposal would be implemented to remediate soil contamination that exceeds SCG. An active pumping system would be implemented to recover DNAPL and chemical oxidation would be implemented as a polishing step when sufficient DNAPL recovery has been completed. Pump-and-Treat technology would be used as an in-situ groundwater containment and treatment measure. Long-term monitoring would be implemented to ensure that the excavation and in-situ remediation adequately remediated the contamination.

Alternative #3 - No Further Action: The no further action alternative is included as a baseline to evaluate other alternatives. Under this alternative, remedial activities beyond the IRM soil removal conducted in 2005 and the DNAPL removal that has been done to

date, additional monitoring of environmental impacts, as well as placement of institutional controls or engineering controls at the Site are not implemented. The Site would remain virtually as it is and change in use would not be limited.

9.0 DETAILED EVALUATION OF ALTERNATIVES

The selected alternatives identified in Section 8.3 are evaluated in this section relative to the remediation criteria presented in Section 8.1.2. For Alternative #1, it is assumed that the Site will continue to be operated as a Laundry/dry cleaning facility in the future. The development and implementation of a remedial work plan and HASP for each alternative is also included in the detailed evaluation.

9.1 Alternative #1

Alternative #1 consists of various technical and administrative actions that are intended to reduce exposure to COC and provide monitoring of groundwater to evaluate the effectiveness of the remedial program.

Under this alternative, remediation would proceed in a staged approach with the most aggressive and immediate measures implemented first. Initially, source zone removal actions will be implemented. This would include the removal of DNAPL in an approximate 10 ft. wide area extending approximately between existing monitoring wells PW-3 and BR-02FR (i.e., a distance of about 80 ft. from west to east). The presumed DNAPL source area to be treated is depicted on Figure 10. DNAPL has been identified on top of the glacial till layer in this area at a depth of about 12 ft. to 16 ft. bgs. DNAPL will be extracted via a compressed air operated fluid extraction system. Existing monitoring wells PW-3 and MW-207 and a new extraction well to be installed in proximity of existing monitoring well BR-02FR, will be utilized/converted to groundwater/DNAPL extraction wells by installing chemical resistant submersible pumps that discharge to a collection/treatment system. The groundwater treatment system will consist of a gravity separation train to remove DNAPL followed by activated carbon treatment of the supernatant liquid prior to discharge to the sanitary sewer system. In addition, a chemical oxidant (i.e., potassium permanganate, sodium permanganate, etc.) will be injected within the DNAPL source zone as a polishing step. The unsaturated soil within the source area will continue to be covered by asphalt/concrete or an approximate 2-foot thick clean soil cap that was constructed during the soil removal IRM. In addition, subsurface work within this area will be performed in accordance with the Site Management Plan (SMP) and HASP.

After the DNAPL treatment system is installed and operational, biological treatment will be initiated in an area downgradient of the source area to address dissolved COC that are present in the groundwater. It is assumed that the biological treatment area will extend approximately 40 ft. to the east from the eastern side of the Anderson Cleaners building and approximately 100 ft. to the south from a point approximately 30 ft. to the south of the northeastern corner of the Anderson Cleaners building (i.e., in proximity of at the location of existing well BR-01). This treatment will initially consist of the placement of hydrogen releasing materials (e.g., HRC manufactured by Regenisis and/or vegetable oil) to stimulate microbe growth (i.e., biostimulation events). Depending on interim testing results of microbe populations and COC concentrations, supplementary microbe populations may be added to select locations to augment the existing microbe population

(i.e., bioaugmentation event). Based on data collected to date, it appears three biostimulation events and one bioaugmentation event will be required. The initial biostimulation event will include the distribution of up to 1,850 pounds of HRC and/or vegetable oil into test borings advanced via direct-push drilling techniques (i.e., up to 30 locations) and existing monitoring wells BR-01, MW-03, MW-07, MW-206, BR-02R, and MW-208. During the second biostimulation event, it is anticipated that up to 1,125 pounds of HRC and/or vegetable oil will be distributed and that during the third biostimulation event up to 750 pounds of HRC and/or vegetable oil will be introduced into the subsurface. It is further assumed that during one of these events, two additional days will be allotted to distribute up to 48 liters of commercially produced *Dehaloccocides* microbes into the saturated zone.

In conjunction with the biological treatment, a series of twelve 4-inch diameter groundwater collection wells will be installed on the Site approximately 40 ft. to 50 ft. from the eastern/southeastern property line of the Site. Six wells would be installed to a depth of about 30 ft. bgs (i.e., in the fractured rock) and six wells would be installed to a depth of about 40 ft. bgs (i.e., nominal 3-inch open holes within the competent bedrock). These wells would be installed at an approximate 20 ft. spacing to create a continuous groundwater depression/collection zone approximately 120 ft. long extending generally from north to south. Wells installed within these zones will be under flowing artesian groundwater conditions, such that the groundwater rises to more than 2 ft. above the ground surface. As such, the wells would be connected to a piping network that would discharge the collected groundwater into a holding tank without the use of pumps. Prior to discharge the water in the holding tank would be treated using granular activated carbon. Depending on the amount of water collected and the sewer discharge requirements, the treated water would be discharged to the sanitary sewer system and/or injected into an upgradient location (e.g., BR-01).

It is anticipated that the institutional controls, which would be developed in conjunction with the DNAPL recovery system and source zone treatment would include the following elements:

- Development and implementation of a Site Management Plan (SMP) to address the characterization, handling and disposal/re-use of residual contaminated media (e.g., soil, fill, groundwater) that is disturbed during future Site activities. The SMP would also evaluate the potential for vapor intrusion into any future buildings to be constructed on the Site, including requirements to mitigate such potential vapor intrusions through use of environmental engineering controls. In addition, the SMP would identify use restrictions for the Site (e.g., property development and groundwater use restrictions, etc.).

- Annual certification by the property owner prepared by a professional engineer or environmental professional that is acceptable to the NYSDEC. The certification is intended to validate that the institutional controls and engineering controls implemented for the Site are unchanged from the previous certification and that no circumstances have occurred that impair the ability of the controls to protect

public health and the environment or constitute a violation or failure to comply with an operation and maintenance (O&M) plan or a SMP for the Site.

- Development and implementation of an environmental easement to require compliance with SMP; limit use of the Site to commercial and industrial applications; restrict use of groundwater as a source of potable water or process water, without necessary water quality treatment as determined by the NYSDOH; and require the property owner to complete and submit to the NYSDEC the annual certification described above.

A long-term monitoring program would be implemented as part of this alternative using the existing groundwater monitoring wells. This monitoring would continue for a period of up to ten years. It is assumed that the wells will be sampled on a bi-annual basis during the 1st and 2nd years, and on an annual basis for the 3rd through 10th years. During this monitoring, groundwater would be tested for parameters that evaluate the effectiveness of bioremediation and the concentration of COC. In addition, groundwater elevations would be determined and groundwater contour maps would be prepared for each monitoring event. It is anticipated that during each round of groundwater sampling, samples would be tested for VOC (ASP Method OLM04.2) and bioremediation parameters such as dissolved oxygen, oxidation-reduction potential, microbe content, ethane and pH. With approval from regulatory agencies, the duration and frequency of the groundwater monitoring may be adjusted based on the test results of samples collected during the first or second year of the monitoring program.

Spatial requirements for the implementation of this alternative are limited and conditions at the Site would not impede completion of this alternative. With the exception of groundwater injection and building permits that may be required for installing engineering controls, it is anticipated that there are no substantive technical permit requirements for this alternative.

Protection of Human Health: It is anticipated that Alternative #1 would be protective of human health and the environment under current conditions and planned future use of the Site. Risks associated with potential human health exposure pathways would be eliminated or adequately controlled. With the exception of restoring the groundwater aquifer to pre-disposal/pre-release conditions for environmental protection, RAO can readily be achieved. Institutional controls (e.g., SMP) including the maintenance of the existing asphalt/concrete and soil cap would protect on-site personnel against present and future exposures.

Compliance with SCG: Bioremediation and groundwater extraction would be used to remediate COC in groundwater and saturated soils located hydraulically downgradient of the source area to concentrations below chemical specific SCG. Soil in the unsaturated zone containing COC may remain untreated in localized areas under this alternative, although a reduction in COC concentrations with time is possible due to leaching of contaminants and attenuation factors such as dispersion, diffusion, etc. Action-specific and location-specific SCG are met for this Site.

Short-Term Impacts and Effectiveness: This alternative will likely result in a slight risk due to short-term impacts. It is anticipated that remediation workers will have an increased potential to be exposed to COC during the implementation of remedial activities and long-term groundwater monitoring; however, following the provisions presented in the SMP and a HASP (i.e., dust control, VOC control, etc.) would protect site remediation workers, on-site occupants/workers and the public from these short-term risks. It is anticipated that this alternative will not increase short-term risks to the surrounding community.

Long-Term Effectiveness: It is anticipated that this alternative will result in long-term effectiveness and permanence in relation to groundwater and saturated soil. It is also anticipated that the risk associated with unsaturated contamination that may be left in-place will be reduced by the existing asphalt/concrete and soil cap and institutional controls that are to be implemented. The magnitude of the unsaturated contamination soil left in place is relatively small and a maintained cap is a reliable control and would prevent viable exposure pathways. This remedial alternative is expected to meet RAO in the future.

Reduction in Toxicity, Mobility or Volume: DNAPL removal, chemical oxidation and bioremediation in the saturated zone will reduce the toxicity, mobility and volume of the contamination with time, and this remediation will be irreversible. Soil containing COC in the unsaturated zone in localized areas may remain untreated under this alternative, although a reduction in COC concentrations with time is possible due to leaching of contaminants and attenuation factors such as dispersion, diffusion, etc.

Implementability: This alternative is easily implemented in relation to the anticipated planned future use of the Site as a Laundry/dry cleaning facility.

Land Use: Based on the finding of studies performed to date, it is anticipated that this alternative would be acceptable in relation to the future use of the Site as a commercial business.

Cost: The costs for this alternative are summarized below.

Capital/Initial Cost	$301,589.06
Institutional/Operational/Maintenance/Annual/Closeout Cost	$88,250.00
Present Worth Costs with 25% contingency	$370,815.73

A breakdown of the estimated costs for Alternative #1 based upon currently available information and various assumptions is presented as Table 10.

9.2 Alternative #2

This alternative consists of various technical actions that are intended to perform extensive remediation of COC and provide adequate monitoring of groundwater to ensure the contamination is not migrating off-site. The intent of this alternative is to restore the

Site to pre-existing conditions, such that it is suitable for unrestricted use without the implementation of institutional or engineering controls.

This alternative includes the removal and treatment of DNAPL by the same methods outlined in Alternative #1.

This remedial option would also include the removal of an estimated 1,975 tons of soil impacted with COC at concentrations that exceed SCG. This would require the removal and replacement of concrete slabs from within the building, soil in proximity of the building and portions of the asphalt parking lot to allow excavation of soil impacted with COC. The removed soil would be transported and disposed of off-site at a NYSDEC-approved disposal facility. Water removed to dewater the excavation would be treated and discharged to the Jamestown, New York public sanitary sewer system or transported off-site for treatment and disposal. Confirmatory soil samples would be collected from the excavation. The excavation would be backfilled with NYSDEC-approved fill material (e.g., clean soil, crushed stone, etc.) and the surface restored to pre-existing conditions.

Once soil excavation and disposal is complete, a pump-and-treat system would be employed to capture the groundwater plume for treatment and disposal. The existing bedrock wells (i.e., BR-02FR, BR-02R, and BR-03R) would be used as pumping locations. In addition, up to thirty groundwater collection wells would be installed on the Site. The first series of six wells would consist of 4-inch diameter wells installed approximately 30 ft. into bedrock within the Courtyard Area. The second series of collection wells would consist of 4-inch diameter wells located approximately 20 ft. east of the eastern wall of the on-site building. The second series of wells would include six wells installed to a depth of about 30 ft. bgs (i.e., in the fractured rock) and six wells installed to a depth of about 40 ft. bgs (i.e., nominal 3-inch open holes within the competent bedrock). These wells would be installed at an approximate 20 ft. spacing to create a continuous groundwater depression/collection zone approximately 120 ft. long extending generally from north to south. The third a series of collection wells would consist of twelve 4-inch diameter wells installed approximately 40 ft. to 50 ft. from the eastern/southeastern property line of the Site. Six wells would be installed to a depth of about 30 ft. bgs (i.e., in the fractured rock) and six wells installed to a depth of about 40 ft. bgs (i.e., nominal 3-inch open holes within the competent bedrock). These wells would be installed at an approximate 20 ft. spacing to create a continuous groundwater depression/collection zone approximately 120 ft. long extending generally from north to south. Wells installed within artesian zones would be connected to a piping network that would discharge the collected groundwater into a holding tank without the use of pumps. Depending upon testing completed during the design phase, additional pumping wells may be required to capture the entire groundwater plume. It is anticipated that the collected water would be treated via activated carbon prior to discharge to the Jamestown, New York public sanitary sewer system.

The long-term groundwater monitoring program for this alternative is similar to that presented for Alternative #1 (i.e., except for bioremediation-type parameters).

Spatial requirements for the implementation of this alternative are significant and could impede its completion. Substantive technical permit requirements may be required through implementation of this alternative.

Compliance with SCG: This alternative should meet the chemical-specific SCG at the Site for the COC. Action-specific SCG and location-specific SCG for the Site are met as well.

Protection of Human Health and the Environment: It is anticipated that this alternative would ultimately be protective of human health and the environment. Risks associated with potential human health exposure pathways would be adequately controlled during remedial alternative implementation and ultimately these risks should be eliminated. This alternative adequately addresses RAO in relation to protection of human health and the environment for soil and groundwater.

Short-Term Impacts and Effectiveness: Compared to Alternative #1, this alternative will likely result in increased risk to short-term impacts. Subsurface materials impacted with elevated concentrations of COC would be excavated from interior and exterior locations at the Site and site workers and the community would have greater risk of exposure (i.e., nuisance odors, inhalation and contact with COC, etc.). However, implementation of the SMP and HASP should protect Site remediation workers, on-site occupants/workers and the nearby community from these short-term risks.

Long-Term Effectiveness: It is anticipated that this alternative will result in long-term effectiveness and permanence in relation to remediation of groundwater and soil with no residual waste remaining on the Site following remediation.

Reduction in Toxicity, Mobility, or Volume: The removal of contaminated soil and groundwater would result in significant reduction in toxicity mobility and volume. The effects of removing this contamination from the Site are irreversible.

Implementability: Implementation of this alternative is complicated by buried utilities on the Site and by factors associated with excavating in proximity to property boundaries and underneath the on-site building.

Land Use: Based on the finding of studies performed to date, it is anticipated that this alternative would be acceptable in relation to the future use of the Site as a commercial business.

Cost: The costs for this alternative are summarized below.

Capital/Initial	$1,956,175.00
Operational/Maintenance/Annual/Closeout Cost	$190,000.00
Present Worth Costs with 25% contingency	$2,183,979.97

A breakdown of the estimated costs for Alternative #2 based upon currently available information and various assumptions is presented as Table 11.

9.3 Alternative #3

Alternative #3 consists of the no action alternative. Under Alternative # 3, the Site remains virtually unaltered (i.e., with the exception of the IRM soil removal that was completed in 2005 and DNAPL collection activities completed to date), and future use and development of the Site would not be limited. This alternative contains no substantive technical permit requirements. In addition, remedial and monitoring activities as well as placement of institutional controls at the Site would not be implemented.

Protection of Human Health and the Environment: Alternative #3 may not be protective of human health and the environment. Risks associated with potential human health exposure pathways would not be eliminated, reduced (i.e., except with respect to the remedial efforts completed to date), or controlled. Overall RAOs for public health protection and environmental protection are not adequately addressed by this alternative.

Compliance with SCG Values: Alternative #3 does not provide adequate monitoring to evaluate compliance with chemical-specific SCG values. Location-specific SCG values are not met since the Site is located within a commercial use area and could adversely impact human health. Action specific SCG values are not applicable under the no action alternative.

Short-Term Impacts and Effectiveness: Since there is no additional remediation technology being implemented, there are no significant short-term risks to the community and/or environment that must be addressed by this alternative. However, if future activities compromise the existing cap (e.g., breaching the asphalt pavement in the parking area and the building floor), human exposure to contaminated subsurface soil and/or groundwater could occur.

Long-Term Effectiveness: There is no additional remediation technology being implemented, including engineering and institutional controls, therefore, the risks at the Site remain the same. The concentrations of COC in the soil and groundwater will essentially remain at the Site and future exposures are possible if the use of the Site changes or the Site is modified (i.e., construction at the Site). As such, this alternative is not effective in the long-term and not anticipated to meet RAO in the future.

Reduction in Toxicity, Mobility or Volume: It is likely that natural attenuation and other factors such as advection, dispersion, sorption, diffusion, etc. are occurring at the Site that would result in reduction of contaminant toxicity, mobility or volume over time. However, given the presence of residual DNAPL (i.e., COC source material) these factors would take a significant amount of time to reduce toxicity, mobility and/or volume of wastes at the Site.

Implementablility: Alternative #3 is easy to implement with no modifications necessary at the Site.

Land Use: Based on the finding of studies performed to date, it is anticipated that Alternative #3 may not be acceptable in relation to the future use of the Site as a commercial business.

Cost: The costs for this alternative are summarized below.

Capital/Initial	$0.00
Operational/Maintenance/Annual/Closeout Cost	$0.00
Present Worth Costs with 25% contingency	$0.00

A breakdown of the estimated costs for Alternative #3 is presented as Table 12.

9.4 Recommended Alternative

This presents the rationale for implementation of the recommended alternative. [Note: The costs provided for the implementation of the remedial alternatives presented are for comparative purposes. The actual costs will vary, based upon detailed design studies and pilot testing that may be required prior to implementation of this alternative.].

Based upon an evaluation of the remediation criteria established in Section 8.0, the intended future use of the Site as a Laundry/drycleaner and the fact that groundwater is not used as a potable source, Alternative #1 is the recommended alternative due to its ability to achieve RAO in a cost effective manner. This alternative will provide for the removal of COC, including DNAPL, from source areas thereby reducing on-going impacts to the hydraulically downgradient groundwater. The injection of electron donor (i.e., HRC, vegetable oil, etc.) should promote bioremediation and provide treatment of the groundwater and much of the impacted saturated overburden zone downgradient of the source zones. The effectiveness of the bioremediation will be evaluated by monitoring for various parameters including microbe populations and ORP to assess the need for additional biostimulation/bioaugmentation events. The artesian groundwater conditions at the Site will allow for a cost effective downgradient hydraulic barrier to the created, thereby inhibiting migration of COC. In addition, long-term groundwater monitoring will document the overall effectiveness of this remedial alternative. The maintenance of the existing asphalt/soil cap should serve to protect on-site occupants until COC concentrations are reduced to acceptable levels. The implementation of institutional controls will provide effective measures to assure on-site personnel are adequately protected during remedial alternative implementation. In addition, this alternative is flexible enough to allow the use of supplementary remedial approaches, if deemed necessary.

(1) = Soil Cleanup Objective are as referenced in 6 NYCRR Part 375-6, Remedial Program Cleanup Objectives, dated December 14, 2006.
* = Sample tested using USEPA Method 8021B.
** = Sample tested using USEPA Method 8260B.
*** = SCO is for mixed xylenes.
U = Not Detected at the concentration shown in parenthesis
E = Estimated Concentration.
NT = Compound not tested.
440 = Bold denotes a reported concentration that exceeds the Unrestricted Use SCO.

1,660,000 = yellow shading denotes a reported concentration that exceeds both the Unrestricted Use SCO and the Restricted Commercial Use SCO.

(1) = Soil Cleanup Objective are as referenced in 6 NYCRR Part 375-6, Remedial Program Cleanup Objectives, dated December 14, 2006.

NA = Not available.

TIC = Tentatively identified compound.

41,000 = Exceeds Unrestricted Use SCO.

1,000,000 = Exceeds Unrestricted Use SCO and Restricted Commercial Use SCO

J = Estimated value.

D = Compound identified in an analysis at a secondary dilution factor.

U = Not detected at concentration above reported analytical laboratory detection limit.

N= Indicates presumptive evidence of tentatively identified compound.

E = Compound concentration exceeded Calibration Range, however diluted sample was reported as not detected. Therefore, non-diluted sample result was reported

NE = Parameter was not Evaluated

Table 5B
ANDERSON CLEANERS
5 HUNT ROAD, JAMESTOWN, NEW YORK
BCP # C907027

Summary of Detected SVOCs and TPHs in ug/Kg or Parts per Billion (ppb)

Soil Samples Collected 5/2/05 through 5/5/05 and 5/23/05

Detected Compound	Part 375 Unrestricted Use SCO (PPB) (1)	Part 375 Restricted Commercial Use SCO (PPB) (1)	B-1 (9.0')		B-3 (9.0')		B-8 (4.0')	
Di-n-butyl phthalate	NA	NA	38	J	47	J	U	
bis (2-Ethylhexyl) phthalate	NA	NA	99	J	74	J	U	
TPH	NA	NA	U		U		250	

NA = Not available

(1) = SCOs are as referenced in 6 NYCRR Part 375-6, Remedial Program Soil Cleanup Objectives

J = Estimated value

U = Not detected at concentration above reported analytical laboratory detection limit

TPH = Total Petroleum Hydrocarbons Sample B-8 (4.0') best matches chromatograms for a mixture of three petroleum products, two being typical diesel fuel and motor oil. The third product has a boiling point in the range of gasoline, however the pattern of resolved and unresolved peaks has a pattern similar to keosene or jet fuel.

Table 5B Continued

Summary of Detected PCBs and Pesticides in ug/Kg or Parts per Billion ppb)

Soil Samples Collected 5/2/05 through 5/5/05 and 5/23/05

Detected Compound	Part 375 Unrestricted Use SCO (PPB) (1)	Part 375 Restricted Commercial Use SCO (PPB) (1)	B-1 (9.0')		B-3 (9.0')	
gamma-BHC (Lindane)	100	9,200	11		U

Sodium	NA	NA	78.6	B	108	B
Thallium	NA	NA	U		U	
Vanadium	NA	NA	13.1		12.2	
Zinc	109	10,000	64.2	J	58.0	
Cyanide	27	27	U		U	

(1) SCOs are as referenced in 6NYCRR Part 375-6, Remedial Program Soil Cleanup Objectives, dated December 14, 2006.

13.8 = Exceeds Unrestricted Use SCO

E = Reported value estimated due to interference

B= Reported value less than contract required detection limit, but greater than instrument detection limit

N = Spiked sample recovery not within control limits

* = Duplicate analysis not within control limits

U = Not detected at concentration above reported analytical laboratory detection limit

All samples tested for halogenated VOCs by USEPA Method 8260B and concentrations are shown in ug/L or parts per billion.

U (200) = constituent not detected at the concentration shown in parenthesis.

E = estimated concentration

PCE = tetrachloroethene

TCE = trichloroethene

trans 1,2-DCE = trans 1,2-dichloroethene

cis 1,2-DCE = cis 1,2-dichloroethene

VC = vinyl chloride

* Sample intervals are approximately 1.3 feet higher than shown during the7/24/2008 sample round.

SUMMARY OF SVOC, TPH, PESTICIDE, AND PCB RESULTS IN ug/L OR ppb

Groundwater Samples Collected 5/25/2005

Detected Compound	Groundwater Standard or Guidance Value	MW-01 (05/25/05)	MW-06 (05/25/05)	MW-07 (05/25/05)	PW-3 (05/25/05)
TOTAL SVOC*	NA	U	U	U	U
TPH	NA			0.86	1.1
4,4'DDE	0.2	U	U	0.065 J	NT
4,4'DDD	0.3	U	U	0.27	NT
Total Aroclors (PCBs)	0.09	U	U	U	NT

NA = Not available

NT = Sample not tested for this constituent

J = Estimated value

(1) = Groundwater standard or guidance value as referenced in NYSDEC TOGS 1.1.1dated June 1998 as amended by the NYSDEC's supplemental table dated April 2000.

100 = Exceeds groundwater standard or guidance value

U = Not detected at concentrations above reported analytical laboratory detection limits

* = Does not include constituents that were detected in associated blank as well as in the sample.

TPH = Total Petroleum Hydrocarbons (Sample BW-07) best matches chromatograms for kerosene or jet fuel. Sample PW-3 best matches chromatograms for a single chemical component rather than for a petroleum product.

(1) = Groundwater standard or guidance value as referenced in NYSDEC TOGS 1.1.1 dated June 1998 as amended by the NYSDEC's supplemental table dated April 2000

4.0 = Exceeds groundwater standard or guidance value

NA = No groundwater standard or guidance value

E = Reported value estimated due to interference

B = Reported value less than contract required detection limit, but greater than instrument detection limit

N = Spiked sample recovery not within control limits

U = Not detected at concentrations above reported analytical laboratory detection limits

J = Estimated Value.

Notes:

SWL - Static water level measured from monitoring point unless noted with "(g)" to indicate measurement was taken from the ground surface.

Stick-up - If negative value, the monitoring well is flush-mounted and the monitoring point is below grade.

*Well casing is removable (due to flowing artesian conditions). As such, stick-up may vary between monitoring events.

If a column is blank, no SWL was measured and/or time of reading was not recorded.

Notes:

SWL - Static water level measured from monitoring point unless noted with "(g)" to indicate measurement was taken from the ground surface.

Stick-up - If negative value, the monitoring well is flush-mounted and the monitoring point is below grade.

*Well casing is removable (due to flowing artesian conditions). As such, stick-up may vary between monitoring events.

If a column is blank, no SWL was measured and/or time of reading was not recorded.

Opinion of Probable Cost - Alternative 1

DNAPL Recovery, Chemical Oxidation, Bioremediation, Collect Artesian Well Effluent, Treat Ex-Situ Groundwater with Activated Carbon, Existing Cap Maintenance, Institutional Controls, Engineering Controls and Long-Term Monitoring

	U.S. Dollars
Capital/Initial Costs	
Design	$50,000.00
DNAPL Removal System	$21,790.00
Bioaugmentation/Biostimulation	$82,011.25
Groundwater Collection System	$44,970.00
Liquid Phase Carbon System	$10,000.00
Chemical Oxidation	$32,500.00
25% Contingency	$60,317.81
Total Capital/Initial Costs	**$301,589.06**
Institutional Controls	
Environmental Easements	$2,500.00
Site Management Plan	$2,500.00
Cap Maintenance	$2,000.00
25% Contingency	$1,250.00
Total Institutional Controls	**$8,250.00**
Operational/Maintenance/Annual Costs	
Years 1-2 Groundwater Monitoring ($4800 x 2years)	$9,600.00
Years 3-10 Groundwater Monitoring ($2500 x 8years)	$20,000.00
Years 1-2 Passive Pumping DNAPL Recovery ($1400 x 2 years)	$2,800.00
Years 3-10 Passive Pumping DNAPL Recovery ($700 x 8 years)	$5,600.00
Years 1-10 Liquid Phase Carbon Usage (800lbs/yr x $2/lbs x10 yrs)	$16,000.00
25% Contingency	$13,500.00
Total Operational/Maintenance/Annual Costs	**$67,500.00**
Closeout Costs	
Reports	$10,000.00
25% Contingency	$2,500.00
Total Closeout Costs	**$12,500.00**
Present Worth Costs	
Capital/Initial Costs	$301,589.06
Institutional Controls	$8,250.00
Years 1-2 Groundwater Monitoring (F=1.8594)	$11,156.40
Years 3-10 Groundwater Monitoring (F=7.7217-1.8594))	$18,319.69
Years 1-2 Passive Pumping DNAPL Recovery (F=1.8594)	$3,253.95
Years 3-10 Passive Pumping DNAPL Recovery (7.7217-1.8594)	$5,129.51
Years 1-10 Liquid Phase Carbon Usage (800lbs/yr x $2/lbs x10 yrs) (F=7.7217)	$15,443.40
Closeout Costs (F=0.6139)	$7,673.75
Total Present Worth Cost	**$370,815.76**

Assumptions:

-10 Years at 5% discount factor
-Design includes work plans, selecting and coordinating subcontractors, locating underground utilities and meetings with agencies
-Develop detailed remedial work plan for Site
-Develop and implement institutional controls and engineering controls
-F= Discount Factor of 5% at the n^{th} year of the project
-Conduct long-term groundwater monitoring for 10 years (biannually for 10 wells for years 1-2 annually for 10 wells for years 3-10)
-Develop and submit necessary reports to document work completed
-Liquid Phase Carbon Costs include new Carbon, transport and disposal of spent carbon and oversight
- Present Worth Operational/Maintenace/Annual Costs include a 25% Contingency

BR-02 FR	Groundwater Monitoring Well Installed In Fractured Rock November 12–18, 2009
BR-02 R	Groundwater Monitoring Well Installed In Competent Rock November 12–18, 2009
B — B'	Approximate Location of Geologic Cross Section

NOTES:

1. Site Plan produced from drawings by Habiterra Associates, Thorsell, Kennedy, Casker, Arnone & Hedin. P.C. entitled "Addition and Renovations, Anderson Cleaners, Inc", drawings A–1 Floor Plan dated October 22, 1985 and L–1 Grading Plan and from notes of site visits by representatives of Day Environmental, Inc.
2. Well locations MW–01, MW–02, MW–03, MW–04, MW–05, MW–06, MW–07 and MW–08 were obtained in the field by a Trimble GeoXT GPS. Other well and test boring locations were obtained by tape measurement from existing site structure. Locations should be considered accurate to the degree implied by the method used.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
REPORT

CLIENT

PREPARED FOR:	Anderson Cleaners 5 Hunt Road Jamestown, New York
CLIENT CONTACT:	Mr. Michael Lyons (716) 665-2473

PROPERTY INFORMATION

ADDRESS:	5 Hunt Road, vacant land on Hunt Road, and vacant land on Huxley Street
MUNICIPALITY:	Town of Ellicott and City of Jamestown
COUNTY/STATE:	Chautauqua County, New York
TAX ACCOUNT #:	32-1-1, 32-1-11, 504-1-1, 504-1-2, and 504-1-3
PARCEL SIZE:	Approximately 2.44 acres
IMPROVEMENTS:	An approximate 11,400-square foot, one-story building. Brick and block construction. Dates of construction: southwest (finishing) portion: 1930's; south-central (dry cleaning) portion: 1947; northern (office) portion and eastern (garages) portion: 1985
CURRENT USE:	Dry cleaning plant and retail
CURRENT OWNER:	Mr. Michael Lyons
PAST USE:	Towel factory
SITE CONTACT:	Mr. Michael Lyons (716) 665-2473
SITE LOCATION MAP:	Attached in Appendix A

SUMMARY OF ENVIRONMENTAL CONCERNS

ENVIRONMENTAL CONCERNS:	(X) Environmental Concern(s) Identified
	( ) Environmental Concern(s) Not Identified
FURTHER INVESTIGATION(S):	(X) Further Investigation(s) Recommended
	( ) Further Investigation(s) Not Recommended

ASSESSMENT SUMMARY

Notes:

1. An abstract of title was not provided to assist in determining prior property ownership and uses. Investigation of property history, and requesting environmental agency information concerning prior owners, are important elements of a Phase I Environmental Site Assessment (Phase I ESA). The conclusions in this report are subject to any state of facts which review of an abstract of title might show, directly or indirectly (refer to Section 1.1).

2. It was a reported that a fire occurred on the assessed property in 1985, and that the fire destroyed an office building and a garage on the assessed property. It was also reported that the fire did not directly affect the dry cleaning plant (south-central) portion of the assessed property, although the dry cleaning plant did suffer heat damage (refer to Sections 4.1 and 4.3). Since the fire did not directly affect the dry cleaning portion of the assessed property, investigation on the assessed property regarding the fire does not appear warranted at this time.

ENVIRONMENTAL STATUS OF PROPERTY:

Based on the investigations performed, further inquiry is needed to appropriately assess the environmental status of the assessed property. Listed below are the environmental concerns and recommended actions that have been identified:

1. **Former Underground Storage Tanks:** It was reported that underground storage tanks (USTs) that were used to contain stoddard solvent were formerly located on the assessed property. It was reported that the USTs were installed in 1947 in a location that is currently underneath the southernmost garage of the assessed building. It was also reported that the tanks were removed some time between 1978 and 1985 (refer to Sections 4.1, 4.2, and 4.4).

   Recommendations: It is recommended that a cursory subsurface study be conducted in the suspected former tank location area to evaluate the potential existence of contamination resulting from the past presence of USTs. If evidence of contamination is encountered in the soil and/or groundwater, further studies and/or remediation of soil and/or groundwater may be warranted.

2. **Historical Use/Historical Practices/Former Floor Drain:** It was reported that the assessed property has been used as a dry cleaning operation since 1947 (refer to Section 4.4). It was also reported that waste oil may have been used for dust suppression on areas of the assessed property (refer to Sections 4.1 and 4.4). Also, it was reported that at one time a floor drain was located in the dry cleaning area of the assessed property, and that this floor drain has been capped off (refer to Section 4.2). The discharge location of this former floor drain is unknown. (Note, if leaks or spills of dry cleaning solvents, petroleum products, hazardous materials, or other such materials were discharged into the floor drain, and the floor drain was not connected to the sanitary sewer (or if the integrity of these systems is poor), the potential exists for contamination of the environment).

ASSESSMENT SUMMARY (Cont.)

Recommendations: It is recommended that cursory subsurface studies be performed in areas historically used for storage or use of dry cleaning solvents and chemicals, in suspected waste oil application areas, and in the former floor drain area to evaluate the potential existence of contamination resulting from past discharges. If evidence of contamination is encountered in the soil and/or groundwater during these studies, further studies and/or remediation may be warranted.

3. **Suspect Asbestos-Containing Material (SACM):** Suspect asbestos-containing material (SACM) that was observed to be in damaged and/or friable condition is identified as follows (refer to Section 3.5):

   - Approximately 50 linear feet of pipe wrap insulation with nicks, gouges, and exposed ends on steam piping in the finishing area of the assessed building.

   Recommendations: Since the amount of damaged and/or friable SACM is minor, it is recommended that it be assumed that the SACM contains asbestos, and that the material be removed and disposed of by a licensed and accredited asbestos-abatement contractor in accordance with current applicable state and federal regulations.

No other environmental concerns have been identified.

OPERATIONAL CONCERN AND RECOMMENDATIONS:

Although beyond the scope of the routine environmental site assessment, the operational concern listed below has been identified. This operational concern is not considered to be a liability which should normally impact real estate or mortgage loan transactions. Rather, this concern is listed for informational purposes, and it is recommended that it be addressed for compliance with existing regulations and/or to minimize the potential for future environmental liabilities. Since identification of operational concerns is incidental to the purpose of this assessment, correction of this item may not necessarily result in full compliance with all applicable environmental regulations.

1. **Spillage of perchloroethylene:** A spill of perchloroethylene was observed near the southernmost dry cleaning machine in the dry cleaning area of the assessed building. This spill appeared to be the result of leakage from the dry cleaning machine (refer to Section 3.3).

   Recommendations: It is recommended that this area of spillage be cleaned up and disposed of in accordance with applicable regulations. It is also recommended that the dry cleaning machine be checked for leaks and repaired if necessary.

1.0 TITLE AND HISTORICAL DATA

1.1 ABSTRACT OF TITLE: See Footnote (1.1)

1.2 AERIAL PHOTOGRAPHS: Chautauqua County Soil Conservation Service
Photograph Dates: 1938, 1956, 1966, 1977, and 1990
See Footnote (1.2)

1.3 TOPOGRAPHIC MAP: Lakewood Quadrangle (map date 1954, photorevised 1979)

1.4 ATLAS OF CHAUTUQUA: Fenton History Center
Map Date: 1881
See Footnote (1.4)

1.5 DIRECTORIES: Fenton History Center
Directory Dates: 1946, 1950, 1957-58, 1967, 1977, 1985, and 1991
See Footnote (1.5)

1.6 FLOOR PLANS: Plan Date: 10/24/85
See Footnote (1.6)

1.7 SURVEY MAP: Map Date: 5/12/75
Attached in Appendix A

PERTINENT INFORMATION, REFERENCED TO ITS SOURCE, IS SUMMARIZED BELOW:

(1.1) An abstract of title was not provided to assist in determining prior property ownership and uses. Investigation of property history, and requesting environmental agency information concerning prior owners, are important elements of a Phase I ESA. The conclusions in this report are subject to any state of facts which review of an abstract of title might show, directly or indirectly.

(1.2) A review of the aerial photographs (listed above) did not identify environmental concerns on the assessed property. In the 1938 photograph, one building with two large sections and one smaller section appeared to be located on the assessed property. In the 1956 through 1977 photographs, one building with three large sections and one smaller section, in a different configuration than the 1938 photograph, appeared to be located on the assessed property. In 1990 photograph, one building in a different configuration, with what appeared to be four sections, appeared to be located on the assessed property.

(1.4) A review of the 1881 Atlas of Chautauqua indicated that the portion of the assessed property located in the Town of Ellicott (i.e., the portion of the assessed property currently containing the building) appeared to be part of a 42-acre parcel of land identified as being owned by Mrs. Bratt. The portion of the assessed property located in the City of Jamestown (i.e., the portion of the assessed property that is currently vacant) appeared to be part of a 25-acre parcel of property identified as being owned by E. & F. Hunt. No structures appeared to be located on the assessed property.

1.0 TITLE AND HISTORICAL DATA (Cont.)

(1.5) A review of Polk street directories indicated the following occupants of the assessed property:

- 1946: Anderson Cleaning Works
- 1950: Anderson Cleaners
- 1957-58: Anderson Cleaners, Anderson Specialty Manufacturing Company (clothing cleaning equipment)
- 1967: Anderson Cleaners, Anderson Specialty Manufacturing Company (cleaning equipment), Jamestown Armored Car Service, Inc.
- 1977: Anderson Cleaners, Jamestown Armored Car Service, Inc.
- 1985: Anderson Cleaners, Jamestown Armored Car Service, Inc.
- 1991: Anderson Cleaners, Jamestown Armored Car Service, Inc., Lutheran Brotherhood, Lyons Den (men's clothing-retail)

(1.6) A review of plans dated 10/24/85 indicated that one floor drain is located in each of the two garages on the assessed property, and that one floor drain is located in the bathroom located between the two garages on the assessed property. The plans also indicated that the floor drains discharge to the sanitary sewer system. The plans indicated that the building discharges to the City of Jamestown sanitary sewer system, and that the abandoned sanitary sewer line which previously discharged to the Town of Ellicott sanitary sewer system (and subsequently connected to the City of Jamestown sanitary sewer system) was capped.

2.0 PUBLIC INFORMATION/AGENCIES

2.1 NYSDEC FOIL:

2.9.3 ERNS List: Records Date: 2/98

Assessed Property: Not Listed.

2.0 PUBLIC INFORMATION/AGENCIES (Cont.)

PERTINENT INFORMATION, REFERENCED TO ITS SOURCE, IS SUMMARIZED BELOW.

(2.1) A Freedom of Information Law (FOIL) request was submitted to the New York State Department of Environmental Conservation (NYSDEC) for the assessed property. The response indicated that the NYSDEC has no files in relation to the assessed property.

(2.2) A Freedom of Information Law (FOIL) request was submitted to the Chautauqua County Department of Health (CCDOH) for the assessed property. The response indicated that the CCDOH has no files in relation to the assessed property.

(2.3) Mr. Davies, Town of Ellicott Building Inspector, indicated that he has no knowledge of environmental problems or fill at the assessed property. Mr. Davies indicated that the assessed property is serviced by the public water and public sewer systems.

(2.4) Mr. Bailey, Village of Celoron Fire Chief, indicated that he has no knowledge of spills, storage tanks, or environmental problems at the assessed property.

(2.8) A review of the NYSDEC spills database identified up to six closed spills within a 0.5-mile radius of the assessed property. A spill listed as closed normally indicates that investigations and/or remediation at the spill site have been completed.

One active spill was also identified within a 0.5-mile radius of the assessed property. The active spill site was listed as located approximately 0.5-miles east of the assessed property. The distance and location of this active spill site from the assessed property suggest no environmental impact upon the assessed property.

(2.9.2) The assessed facility has received a USEPA identification number (Code #NYD012774063). This listing indicates that hazardous waste is generated on the assessed property (i.e., perchloroethylene sludge, dry cleaning filter cartridges, etc).

3.0 SITE OBSERVATIONS

Date Of Site Visit:	3/17/99 and 6/14/99
Assessor(s):	Susan E. Robertson

3.1	**FILL:**	No Observations of Concern.
3.2	**DEBRIS/DUMPING:**	No Observations of Concern.
3.3	**SPILLAGE/STAINING:**	No Observations of Concern. See Footnote (3.3)
3.4	**UTILITIES:**	
	3.4.1 TRANSFORMERS:	No Observations of Concern.
	3.4.2 FLOOR DRAINS/SUMPS:	No Observations of Concern. See Footnote (3.4.2)
	3.4.3 SERVICES:	No Observations of Concern. See Footnote (3.4.3)
3.5	**ASBESTOS:**	Observations of Concern. See Footnote (3.5)
3.6	**OPERATIONS/EQUIPMENT:**	
	3.6.1 STORAGE TANKS:	No Observations of Concern
	3.6.2 MATERIALS STORAGE:	No Observations of Concern. See Footnote (3.6.2)
	3.6.3 MATERIALS USE:	No Observations of Concern
	3.6.4 SOLID WASTE:	No Observations of Concern. See Footnote (3.6.4)
	3.6.5 WASTEWATER:	No Observations of Concern.
	3.6.6 AIR EMISSIONS:	No Observations of Concern
	3.6.7 EQUIPMENT:	No Observations of Concern. See Footnote (3.6.7)
3.7	**TOPOGRAPHIC CONDITIONS:**	No Observations of Concern. See Footnote (3.7)
3.8	**ADJOINING PROPERTIES:**	No Observations of Concern.

North:	Hunt Road, with greenhouses and residential beyond.
East:	Huxley Road, with church beyond.
South:	Electrical substation, with residential beyond.
West:	Residential.

3.0 SITE OBSERVATIONS (Cont.)

PERTINENT INFORMATION, REFERENCED TO ITS SOURCE, IS SUMMARIZED BELOW

(3.3) A spill of perchloroethylene was observed near the southernmost dry cleaning machine in the dry cleaning area of the assessed building. This spill appeared to be the result of leakage from the dry cleaning machine. The spill was less than one square foot in size. This spill did not appear to represent an environmental concern.

(3.4.2) One floor drain was observed in each of the two garages on the assessed property. One floor drain was also observed in the restroom between the two garages on the assessed property. No signs of concern (e.g., sheen or odors) were observed in the vicinity of the floor drains on the assessed property.

(3.4.3) The assessed property is serviced by municipal water and sewer systems. It was reported that the assessed building was connected to the public sanitary sewer system at the time of building construction (refer to Sections 4.1 and 4.4). The assessed building, with the exception of the office area, is heated with a boiler system which is fueled with natural gas. The office area of the assessed building is heated with a forced-air furnace system which is fueled with natural gas.

(3.5) Suspect asbestos-containing material (SACM) that was observed to be in damaged and/or friable condition is identified as follows:

- Approximately 50 linear feet of pipe wrap insulation with nicks, gouges, and exposed ends on steam piping in the finishing area of the assessed building.

(3.6.2) Materials observed to be stored in the dry cleaning portion of the assessed building included:

- Two approximate 30-gallon containers of waste sludge;
- one 5-gallon container of waste lint;
- one approximate 40-gallon container of dry cleaning soap;
- two 5-gallon containers of paint; and
- one 1-gallon container of paint thinner.

Materials observed to be stored in the garage/standard laundry portion of the assessed building included:

- Four 5-gallon containers of bleach;
- two 5-gallon containers of alkaline detergent;
- two 5-gallon containers of sour soap rinse/remover;
- seven 5-gallon containers of various detergents;
- one 5-gallon container of color safe oxygen bleach;
- one 5-gallon container of sour rust-removing detergent;
- two 2-gallon containers of Wisk;

3.0 SITE OBSERVATIONS (Cont.)

- one 1-gallon container of Simple Green cleaner;
- three 1-gallon containers of citrus cleaner;
- four 1-gallon containers of spot remover;
- two 1-gallon containers of titanium stripper;
- one 1-gallon container of deodorizer;
- five 1-gallon containers of detergents;
- three 1-gallon containers of dry cleaning solvent spotting agent;
- one 1-gallon container of amyl acetate glue removal;
- one 1-gallon container of vinegar;
- two 1-gallon containers of Teflon water repellant;
- one 1-gallon container Wetspot blood remover;
- four 1-gallon containers of odor remover; and,
- one 1-gallon container of Murphy's Oil Soap.

Materials observed to be stored in the northernmost garage of the assessed building included:

- One 55-gallon drum of starch;
- seven 1-gallon containers of carpet cleaner; and,
- two 5-gallon containers of carpet cleaners.

Materials observed to be stored in the southernmost garage of the assessed building included:

- One 10-gallon container of car wash soap.

Materials observed to be stored in the boiler room of the assessed building included:

- Eleven 40-pound bags of salt for a water softener.

No signs of concern (e.g. spillage or staining) were observed in the vicinity of the materials stored on the assessed property.

(3.6.4) Solid waste generated on the assessed property is stored in a shed located on the southern portion of the assessed property. It was reported that solid waste is picked up for disposal off the assessed property by a local waste hauler (refer to Section 4.1).

(3.6.7) Equipment observed in the assessed building included:

- One electric and steam dryer located in the finishing area;
- 14 steam presses located in the finishing area;
- two dry cleaning machines located in the dry cleaning area;
- one water/perchloroethylene separator machine;
- one electric and steam dryer located in the dry cleaning area;
- one fur machine in the dry cleaning area;
- three standard washing machines located in the garage area;

3.0 SITE OBSERVATIONS (Cont.)

- three electric and steam dryers located in the garage/standard laundry area;
- one carpet cleaning machine located in the northernmost garage; and,
- two compressors located in the boiler room.

No signs of concern (e.g., spillage or staining) were observed in the vicinity of the equipment observed on the assessed property.

(3.7) The assessed property and surrounding area slope gently toward the east. There are no surface water bodies on the assessed property.

4.0 INTERVIEWS

4.1	Mr. Michael Lyons Property Owner Date of Interview: 3/17/99	Concern Identified. See Footnote (4.1)
4.2	Mr. Jack Bargar General Manager Anderson Cleaners Date of Interview: 3/17/99	Concern Identified. See Footnote (4.2)
4.3	Ms. Edith Woodward Plant Manager Anderson Cleaners Date of Interview: 3/17/99	No Concern Identified. See Footnote (4.3)
4.4	Mr. Burton Anderson Former Property Owner Date of Interview: 3/23/99	Concern Identified. See Footnote (4.4)

PERTINENT INFORMATION, REFERENCED TO ITS SOURCE, IS SUMMARIZED BELOW.

(4.1) Mr. Lyons indicated that he has no knowledge of current or past environmental liens against the assessed property, or knowledge of environmental concerns associated with the assessed property.

The following is a summary of information provided by Mr. Lyons:

- The assessed property has been a dry cleaning plant since the 1940s. During the time that the assessed property has been a dry cleaning plant, it has also housed a uniform rental business, an armored car business, and various offices. Prior to the use as a dry cleaning plant, the assessed property was used as a towel factory. Currently, the assessed property is used as a dry cleaning plant, a retail tuxedo shop, a retail novelty shop, and a computer software office.
- He has owned the assessed property since 1986. Previously, the assessed property was owned by Burton and Sydney Anderson, and prior to that, it was owned by their father, David Anderson. David Anderson purchased the assessed property in the mid-1940s.
- The assessed property consists of several parcels, some of which are in the Town of Ellicott, and some of which are in the City of Jamestown.
- A major fire occurred on the assessed property in 1985, destroying the former office building and a garage on the assessed property, which were approximately 8,000-square feet in size. The office building was a wooden two-story structure with an attic located on the northern portion of the assessed property, and the garage was a one-story building located to the east of the dry cleaning plant building. The fire was

4.0 INTERVIEWS (Cont.)

caused by a seize-up in a compressor located in the garage. After the fire, demolition materials were disposed of off-site.

- The fire engulfed the office and garage area of the assessed building; however, it did not directly affect the dry cleaning plant area or the finishing area.
- At the time of the fire, chemicals stored on site consisted of laundry soaps, spotting agents, and chloride powder.
- After the fire, a new one-story concrete block office building was built on the northern portion of the assessed property, and two garages were built adjoining the east end of the assessed building.
- The plumbing lines in the assessed building were reconfigured after the fire. Previously, the plumbing discharged to the Town of Ellicott sanitary sewer system. The plumbing was re-routed out the east side of the building into the City of Jamestown sanitary sewer system. The old sewer line was capped off.
- The assessed building has been connected to the public sanitary sewer since the time it was built.
- Floor drains are located in the garages in the assessed building and they are connected to the sanitary sewer system.
- The dry cleaning machines are a closed system. They are cooled by non-contact cooling water, which is discharged to the sanitary sewer system.
- The dry cleaning machines use perchloroethylene which is delivered directly to their machines by their supplier. The machines distill the solvent, re-using the distilled solvent, and collecting the waste material. The waste material is a sludge which consists of dirt and some solvent. Safety-Kleen picks up the sludge, lint from the dry cleaning machines, and filter cartridges from the dry cleaning machines for off-site processing and disposal.
- One unused but accessible well is located inside the assessed building. A spot in the parking lot of the assessed property where water naturally flows out of the ground may be the location of another old well.
- The portions of the assessed building constructed in 1985 are insulated with blown-in insulation. The roof is partially covered with a rubberized roofing material and partially covered with a slag roof.
- It is possible that waste oil was applied to the assessed property in the past for dust suppression.
- At some time in the past, tanks for stoddard solvent storage were located in an area which is now underneath the garage on the southeast end of the assessed building. These tanks were removed at some time before the current garage was built in 1985.
- Non-hazardous solid waste generated on the assessed building is stored in a shed on the southern portion of the assessed property. (It was reported that solid waste is picked up for off-site disposal by Bernie Jones, a local hauler [refer to Section 4.3]).

4.0 INTERVIEWS (Cont.)

- Removal of asbestos-containing pipe wrap was performed in the assessed building in the 1970s. The materials were disposed of in an off-site landfill.

(4.2) The following is a summary of information provided by Mr. Bargar:

- Mr. Bargar indicated that he has worked at Anderson Cleaners since 1977.
- Mr. Bargar indicated that Anderson Cleaners switched from stoddard solvent to perchloroethylene in 1978. The stoddard solvent was stored in underground storage tanks which were located in an area which is now underneath the garage on the southeast end of the assessed building. The tanks were removed some time before the garage was built in 1985. The tanks were originally installed at the time the dry cleaning (south-central) portion of the assessed building was built (i.e., 1947).
- Prior to the use of Safety-Kleen for the removal of waste sludge, lint, and filter cartridges, the practice was to dispose of waste from the dry cleaning distillation process with the other waste that went to the local landfill.
- Floor drains are located in the garages in the assessed building. No floor drains are currently located in the dry cleaning plant area of the building; however, at one time, a floor drain was located in the dry cleaning plant area. This floor drain was capped off in the past.
- Very little vehicle maintenance takes place on site. No oil changes are performed on site.
- Perchloroethylene is pumped directly into the dry cleaning machines by their supplier. Sludge from the distillation process in the dry cleaning machines is collected in approximately 30-gallon containers which are supplied by Safety-Kleen. Waste lint is combined with the waste sludge. The sludge mixture and filter cartridges are picked up by Safety-Kleen for off-site disposal one time per month.
- Mr. Bargar indicated that, to the best of his knowledge, there have not been any spills on-site since he started working at Anderson Cleaners in 1977.
- After the fire in 1985, most of the equipment on the assessed property was replaced.
- Solid waste generated on the assessed property is stored in a shed on the southern portion of the assessed property and is picked up for off-site landfill disposal by a local hauler.
- Asbestos-containing pipe wrap material was removed many years ago from the assessed property. The asbestos-containing material was disposed of off-site in a landfill.

(4.3) The following is a summary of information provided by Ms. Woodward:

- Moisture collected from dry cleaned clothing is placed into a machine that is located behind the dry cleaning machines. This machine separates water and perchloroethylene by evaporating the water fraction. Perchloroethylene recovered from this machine is returned to the dry cleaning machines.

4.0 INTERVIEWS (Cont.)

- The materials stored in the assessed building are used as part of the cleaning business on the assessed property.
- Anderson Cleaners has a dry cleaning service, a standard laundry service, and a carpet cleaning service.
- Solid waste is picked up off the assessed property for off-site disposal by Bernie Jones, a local hauler.
- The 1985 fire was located in the office and garage portions of the assessed building. Fire doors closed and saved the remaining portions of the assessed building; however, the dry cleaning portion of the assessed building suffered heat damage.

(4.4) The following is a summary of information provided by Mr. Anderson:

- Michael Lyons purchased the assessed property from him in 1986.
- The assessed property was formerly owned by his father, David G. Anderson.
- The dry cleaning plant area of the assessed building was built in 1947.
- The finishing plant portion of the assessed building was constructed during the 1930s.
- The assessed property was formerly a towel mill, known as Hall Towel Mills. During World War II, sleeping bags were manufactured on the assessed property.
- The assessed building has been connected to the public sanitary sewer system since the time it was built. At one time, it was part of the Town of Celoron Sewer District.
- Since the time that the assessed property has been used as Anderson Cleaners, no manufacturing has occurred on the assessed property.
- Waste oil for dust suppression may have been used for a short time in the 1940's on unpaved areas of the assessed property.
- To the best of his knowledge, no spills have occurred on the assessed property.
- Three approximate 1,100-gallon underground storage tanks were installed on the assessed property in 1947. They were located to the east of the dry cleaning portion of the assessed building, in an area which is currently under one of the garages on the assessed property. The tanks were removed sometime between 1978 and 1985. There is no documentation regarding the removal of these tanks.
- Waste sludge from the dry cleaning process was disposed of in an off-site landfill. No waste materials were dumped on-site.

REPORT EXPLANATION

PURPOSE OF AN ENVIRONMENTAL SITE ASSESSMENT:

The purpose of an environmental site assessment is to perform the appropriate inquiry into the environmental condition of a property to identify the potential CERCLA/SARA liability for the cleanup of hazardous substances, and to establish the defense for such liability.

SCOPE OF A PHASE I ENVIRONMENTAL SITE ASSESSMENT:

This Phase I Environmental Site Assessment has been performed in general conformance with the scope and limitations of ASTM Practice E1527. Exceptions to, and/or deletions from, this practice are described in the summary of this report.

A Phase I Environmental Site Assessment is the initial level of inquiry into the history, use and condition of a property and area, which establishes the reasonable presumption that environmental concerns do or do not exist. The Phase I Environmental Site Assessment consists of four (4) basic inquiry components:

1. Review of the title to the property and historical data to identify prior ownership and uses which represent a potential risk for contamination of the property.
2. Review of available public information and environmental records to identify site and area facilities, conditions, activities and substances of use of environmental concern that have been recorded by federal, state and local agencies.
3. Site reconnaissance of the property to identify conditions which indicate the presence or potential presence of hazardous substances and contamination.
4. Interviews with the owners, operators and persons familiar with the site and area to identify conditions and operations of environmental concern.

The Phase I Environmental Site Assessment will conclude that either (a) further inquiry into the environmental status of a property is not needed and appropriate inquiry has been performed or (b) further inquiry is needed to appropriately assess the environmental status of the property.

NON-CERCLA/SARA LIABILITIES:

There are risks associated with the environmental condition of a property which are not a potential CERCLA/SARA liability and are not subject to incurrence of response costs under CERCLA. Due to the frequency of occurrence, the scope of the Phase I Environmental Site Assessment has been expanded to include the identification of petroleum liabilities and friable asbestos. No other assessment of non-CERCLA/SARA liabilities has been performed unless specifically identified in the report narrative.

ASBESTOS:

Where apparent, damaged and/or friable SACM has been identified; however, a complete visual inspection and records review for SACM was not performed as part of this assessment. As a result, this facility may contain other SACM which is not identified in this report.

SACM is identified as a potential environmental concern when the observable condition (i.e., exposed, damaged and/or friable) suggests the release of debris and/or fibers under normal facility operations. If the SACM actually contains asbestos, the release of debris and/or fibers could pose an asbestos-exposure hazard. In order to determine if the SACM contains asbestos, the SACM must be sampled and analyzed.

Should any asbestos-containing material (ACM) at this facility be disturbed through abatement, removal, maintenance, renovation, demolition, etc., the handling and disposal of the ACM is subject to applicable state and federal regulations. Also, no representations are made regarding previous disturbance and/or removal of ACM at this facility.

OPERATIONAL CONCERNS:

Although beyond the scope of the routine environmental site assessment, operational concerns may be identified. Operational concerns are not considered to be liabilities which should impact real estate or mortgage loan transactions. Rather, operational concerns are listed for informational purposes, and it is recommended that they be addressed for compliance with existing regulations and/or to minimize the potential for further environmental liabilities. Since identification of operational concerns is incidental to the purpose of this assessment, correction of these items may not necessarily result in full compliance with all applicable environmental regulations.

NOTES:

NOTES are used in the Assessment Summary either to identify special property conditions, or to identify and explain conditions which might characteristically be a potential environmental concern, but where the assessment inquiry has not established the reasonable presumption that an environmental liability does exist.

DATA QUALIFICATION:

Environmental site assessment conclusions are made based on the data available for the dates identified. The conclusions are subject to any state of facts which would be identified by updated data. No assurances are made as the accuracy or completeness of data obtained from outside information sources. Also, it is possible that not all existing sites within the search radii specified in Section 2 of this report have been identified, due to factors such as urban density and potential insufficiencies in the databases.

SITE VISIT QUALIFICATION:

Where the site observations are limited to representative areas, or where facilities are inaccessible for observation, the environmental site assessment conclusions are subject to any statement of facts which access to those areas would have revealed.

ABBREVATIONS/ACRONYMS:

ASTM – American Society for Testing and Materials
CERCLA – Comprehensive Environmental Response, Compensation, and Liability Act

UST – Underground Storage Tank

SITE EVALUATION SUMMARY REPORT

MARCH 2004

Project Location (Site)

Anderson Cleaners
5 Hunt Road
Jamestown, New York

Property Description

The Site consists of approximately 2.4 acres of land currently improved by an approximate 11,400-square foot one-story brick and concrete block building. The building was constructed in phases with the southwest portion (i.e., used as a "finishing" area for folding and storing cleaned clothing and as retail space) constructed in the 1930s; the south-central (i.e., dry cleaning area) portion constructed in 1947 and the northern (offices) and eastern (garages) portion constructed in 1985. An exterior "courtyard/storage" area measuring approximately 10 feet by 60 feet separates the finishing area and the dry cleaning area. A project locus map (Figure 1) and site plan (Figure 2) are included with this submittal.

Background

A dry cleaning plant has operated at the Site since 1947 when the south-central portion of the current building was originally constructed. Between 1947 and 1978, Stoddard solvent was used as the primary cleaning fluid. In 1978, the method of cleaning was changed over to use tetrachloroethene (PCE) as the primary cleaning fluid. In 1985, a fire destroyed an approximate 8,000-square foot portion of the original building that housed offices and garages (i.e., the northern and eastern portions of the building, respectively). This fire did not directly impact the portion of the building that housed the dry cleaning operations. Following the fire, reconstruction/remodeling operations were undertaken resulting in the current structure.

Pursuant to the sale of the Site, Day Environmental, Inc. (DAY) initially completed a Phase I environmental site assessment (Phase I ESA) that identified the historic use of the Site as a recognized environmental condition (REC). Subsequently, DAY initiated a Phase II ESA to evaluate subsurface conditions and assess the impact of past dry cleaning operations.

Phase II ESA

The work completed to date as part of the Phase II ESA and the initial findings of this work are summarized in this section.

Test Borings/Monitoring Wells

- Twenty-seven (27) test borings (designated TB-1 through TB-27) have been advanced in interior and exterior locations of the Site using hand-operated and vehicle-mounted direct push soil sampling equipment. These test boring locations are depicted on Figure 2.
- Eight (8) test borings were converted into 1-inch diameter groundwater monitoring wells (designated MW-1 through MW-8). Refer to Figure 2 for monitoring well locations.
- A licensed land surveyor measured the elevation of monitoring wells MW-1 through MW-5 and groundwater depths were obtained to evaluate groundwater flow patterns.
- Eight (8) groundwater monitoring wells were developed and subsequently purged and sampled. Water quality readings (pH, conductivity, temperature, etc.) were collected during development and sampling.

Analytical Laboratory Testing

- Eight (8) soil samples were submitted for PCE analysis using (United States Environmental Protection Agency (USEPA) Method 8021B.
- Three (3) soil samples were submitted for halogen and aromatic volatile organic compounds (VOCs) analysis using USEPA Method 8021B.
- Two (2) soil samples were submitted for USEPA Target Compound List (TCL) VOCs analysis using USEPA Method 8260B.
- Two (2) soil samples were submitted for polychlorinated biphenyl (PCB) analysis using USEPA Method 8082.
- Four (4) soil samples were submitted for total petroleum hydrocarbon (TPH) analysis using NYSDOH Method 310.13.
- Eight (8) groundwater were samples submitted for halogenated VOCs analysis using USEPA Method 8021B.
- Two (2) groundwater samples were submitted for total petroleum hydrocarbon (TPH) analysis using NYSDOH Method 310.13.

Subsurface Conditions

The depth of equipment refusal encountered during the advancement of the direct push test borings ranged between about 10.3 feet and 14.5 feet below the ground surface. Typically fill materials (e.g., asphalt, concrete, crushed stone, reworked soil, etc.) extend

from the ground surface to a depth of about 2 to 4 feet. The indigenous soil immediately below the fill is generally characterized as clayey silt and this material extended to depths of about 7 to 9 feet below the ground surface. A sand to sand/gravel deposit was encountered in many of the test borings below the clayey silt deposit and this deposit generally extended to the bottom of the test borings (i.e., equipment refusal). In some test borings, an approximate 1-foot thick lens of sand and gravel was encountered within the clayey silt and the clayey silt extended to the bottom of the test borings.

Copies of the test boring/monitoring well installation logs for the work completed to date are included in Attachment A.

Groundwater was typically measured at depths of about 1 to 1.5 feet below the ground surface. As shown on the contour map included as Figure 3, groundwater flow is generally to the east/northeast across the property.

Analytical Laboratory Test Results

A brief summary of the analytical laboratory test results is presented below. VOC test results are summarized in the tables included in Attachment B.

- PCE concentrations in the soil samples analyzed ranged from below the reported analytical laboratory detection limit to 1,660,000 parts per billion (ppb).
- PCE breakdown products consisting of trichloroethene (TCE), cis/trans-1, 2-dichloroethene (1,2-DCE), and vinyl chloride (VC) were also detected in some of the soil samples tested.
- TCE concentrations in the soil samples analyzed ranged from below the reported analytical laboratory detection limit to 4,450 ppb.
- 1,2-DCE (cis and trans) concentrations in the soil samples analyzed ranged from below the reported analytical laboratory detection limit to 31,440 ppb (estimated).
- VC concentrations in the soil samples analyzed ranged from below the reported analytical laboratory detection limit to 692 ppb.
- TPH identified as mineral spirits was detected in soil samples TB-3 (2-4') at a concentration of 12,900 ppb and in sample TB-6 (2-4') at a concentration of 14,000 ppb.
- PCBs were not detected above the reported analytical laboratory detection limits in the two soil samples analyzed.
- PCE concentrations in the groundwater samples analyzed ranged from below the reported analytical laboratory detection limit to 81,800 ppb.
- PCE breakdown products consisting of TCE and VC were also detected in some of the groundwater samples tested. [Note: 1,2-DCE was not detected in the groundwater samples.]

- TCE was identified in groundwater samples MW-6 (49.4 ppb) and MW-8 (103 ppb).
- VC was identified in groundwater sample MW-8 (14.5 ppb).
- TPH was not detected above the reported analytical laboratory detection limits in the two groundwater samples analyzed (MW-2 and MW-5).

PCE Distribution

PCE concentrations measured in soil samples tested to date are shown on Figure 4 and PCE concentrations measured in the groundwater samples tested are shown on Figure 5.

Remediation and Additional Site Characterization

Remediation will be required to address the PCE (and associated breakdown products) detected in the soil and groundwater at the Site. Thus an interim remedial measure (IRM) is proposed to address the apparent source area with additional studies to further characterize subsurface conditions and determine if additional remediation is required.

Alternatives for an Interim Remedial Measure (IRM)

Based upon the location of the apparent source area (i.e., within the courtyard/storage area) and the PCE distribution pattern (i.e., predominately beneath the dry cleaning portion of the building), passive in-situ treatment schemes were identified and screened for the IRM. These treatment schemes included in-situ chemical oxidation using Fenton's reagent, injection of zero-valent iron, treatment via hydrogen release compound (HRC-X) and enhanced bioremediation using the product "CL-Out".

Preferred Interim Remedial Measure

DAY's review of potential remedial options suggests that the injection of CL-Out within and immediately around the source area is the preferred IRM. Prior to implementing a full-scale IRM, a pilot study is proposed to evaluate the effectiveness of using CL-Out at the Site and to assist in the determination of injection point spacing, evaluating the need for enhancing oxygen content, etc. It is anticipated that the pilot study will include the following:

- Initial testing of groundwater samples to measure dissolved oxygen, nitrogen, phosphorus and total plate count.

- Installation of two injection wells approximately 25 feet apart in the courtyard/storage area and two monitoring points approximately 10 and 30 feet downgradient of the injection points (in the boiler room).
- Collection and testing of groundwater samples from selected monitoring wells to establish background concentrations of VOCs (PCE, TCE, 1,2-DCE, and VC).
- Implementation of one "inoculation" consisting of injecting approximately 55-gallons of CL-Out into the two injection points.
- Collection of groundwater samples from the downgradient wells for testing of VOCs (PCE, TCE, 1,2-DCE, and VC), dissolved oxygen, nitrogen, phosphorus, and total plate count approximately 2 weeks and 4 weeks after the initial inoculation. [Note: Depending on the results of this testing, a second inoculation and subsequent analytical testing of groundwater samples may be necessary.]

Assuming that the pilot study determines CL-Out is an effective remedial option, a full scale IRM will be implemented. Prior to conducting the IRM, a workplan will be developed showing the location of injection/monitoring points, defining the inoculations required to conduct the IRM, identifying sampling/testing requirements, etc. In addition, the scope of additional studies that are required to complete the characterization of the Site will be defined (e.g., advancement of "deep" monitoring wells using rotary drilling techniques to assess the presence of DNAPL, installation of downgradient monitoring wells adjacent to the property line of the Site, etc.). Depending upon the effectiveness of the IRM and/or the results of the additional studies, subsequent remedial activities may be necessary at the Site.

EHMKE WELL DRILLING INFORMATION

DAY ENVIRONMENTAL

MEMORANDUM OF TELEPHONE CONVERSATION

PERSON CALLED/CALLING: Bob Ehmke

COMPANY OR AGENCY: Ehmke Well Drilling

TELEPHONE NUMBER: 716-934-2658

DATE: May 17, 2004 **TIME:**

1. **PROJECT:** Anderson Cleaners 3292S-03

REGARDING: On-site well information

NOTES:

Bob Ehmke was aware of 3 wells at the Anderson Cleaners site: 2 water wells and 1 gas well. Mr. Ehmke drilled the wells himself.

- 1950 – first water well installed. Total depth= 40 feet (33 feet of 6-inch casing and 7 feet into rock.)
- 1954 – second water well installed. Total depth = 100 feet (31 feet of 8-inch casing, then open hole in rock. In 1956, Ehmke installed new steel piping in the 88-inch well casing. This well yielded 35 gpm.
- Gas well installed (date not given). Total depth = 1828 feet.

Mr. Ehmke will fax or mail the logs to our office. He recalled that the geology consisted of shale bedrock (starting at about 31 feet). The shale is overlain by gravel, then a clay/gravel "hard pan," then "blue clay", then mixed fill (the fill is from the ground surface to about 10 feet).

Mr. Ehmke has no well location records.

PREPARED BY: Claire Quadri

BEACON Report No. EM1709

PASSIVE SOIL-GAS SURVEY
5 HUNT ROAD
JAMESTOWN, NY

Prepared for

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614

by

Beacon Environmental Services, Inc.
323 Williams Street

April 5, 2005

Applying Results from Soil-Gas Surveys

The utility of soil-gas surveys is directly proportional to their accuracy in reflecting and representing changes in the subsurface concentrations of source compounds. Passive soil-gas survey results are the mass collected from the vapor-phase emanating from the source. The vapor-phase is merely a fractional trace of the source, so, as a matter of convenience, the units used in reporting detection values from passive soil-gas surveys are smaller than those employed for source-compound concentrations.

The critical fact is that, whatever the relative concentrations of source and associated soil gas, best results are realized when the ratio of soil-gas measurements to actual subsurface concentrations remains as close to constant as the real world permits. It is the reliability and consistency of this ratio, not the particular units of mass (*e.g.*, nanograms) that determine usefulness. Thus, BEACON emphasizes the necessity of conducting — at minimum — follow-on intrusive sampling at one or two points that show relatively high soil-gas measurements to obtain corresponding concentrations of soil and groundwater contaminants. These correspondent values furnish the basis for approximating the required ratio. Once that ratio is established, it can be used in conjunction with the soil-gas measurements (regardless of the units adopted) to estimate subsurface contaminant concentrations across the survey field. It is important to keep in mind, however, that specific conditions at individual sample points, including soil porosity and permeability, depth to contamination, and perched ground water, can have significant impact on soil-gas measurements at those locations.

When passive soil-gas surveys are handled in this way, the data provide information that can yield substantial savings in drilling costs and in time. They furnish, among other things, a checklist of compounds expected at each survey location and help to determine how and where drilling budgets can most effectively be spent.

BEACON Report Number: EM1709

Passive Soil-Gas Survey
5 Hunt Road
Jamestown, NY

This Passive Soil-Gas Survey Report has been prepared for Day Environmental, Inc. (DAY) by Beacon Environmental Services, Inc. (BEACON) in accordance with the terms of Work Order No. 3563S-04/CCD3154, dated March 14, 2005. BEACON's principal technical contact at DAY for this project has been Mr. Chris Davidson. Passive soil-gas samples were collected following the protocols of the EMFLUX® Passive Soil-Gas Sampling System.

1. Objectives

Soil-gas samples were collected to determine the presence, identity, and relative strength of targeted contaminants in soil and/or ground water at the 5 Hunt Road site. Survey results will be used to delineate the lateral extent of known contamination at the site.

2. Target Compounds

This survey targeted the 12 compounds listed in **Table 1**, which supplies the resulting laboratory data in nanograms (ng) of specific compound per cartridge.

3. Survey Description

- No. of Field Sample Points: 14
- No. of Duplicate Field Samples: 1
- No. of Trip Blanks: 1
- Total No. of Samples: 16
- Field sample locations are shown on **Figure 1**.

4. Field Work

DAY was provided a Field Kit with the equipment needed to conduct a 14-point passive soil-gas survey. Samplers were deployed on March 18, 2005, and were retrieved on March 24, 2005. **Attachment 1** describes the field procedures used. Individual deployment and retrieval times will be found in the Field Deployment Report (**Attachment 2**).

5. Analysis and Reporting Dates

- BEACON's laboratory received 16 samples for analysis on March 25, 2005.
- Adsorbent cartridges from the passive samplers were thermally desorbed, then analyzed using gas chromatography/mass spectrometry (GC/MS) equipment, in accordance with EPA Method 8260B (Modified), as described in **Attachment 3**. BEACON's laboratory analyzed each cartridge for the targeted compounds.
- BEACON's laboratory completed the analysis on March 28, 2005. Following a laboratory review, results were provided to DAY on March 29, 2005.

6. Report Notes and Quality Assurance/Quality Control Factors

- **Table 1** provides survey results in nanograms per cartridge by sample-point number and compound name. The quantitation levels represent values above which quantitative laboratory results can be achieved within specified limits of precision and with a high degree of confidence. The quantitation level for each compound, therefore, provides a reliable basis for comparing the relative strength of any detection of that compound.

- **Data Compatibility**. It is important to note that when sample locations are covered with or near the edge of an artificial surface (*e.g.*, asphalt or concrete), sample measurements are often distorted (increased) significantly. Such distortion can be attributed to the fact that gas rising from sources beneath impermeable caps tends to reach equilibrium underneath the cap. Thus, a reading taken below or near an impermeable surface is much higher than it would be in the absence of such a cap.

- The **Chain-of-Custody** form, which was shipped with the samples for this survey, is supplied as **Attachment 4**.

- **Laboratory QA/QC procedures** included standards, surrogates, and blanks appropriate to EPA Method 8260 (Modified). Field work, analyses, and reporting were done in accordance with BEACON's Quality Assurance Program Plan.

- **QA/QC Contaminant Corrections**. Following EPA guidelines, laboratory data is not corrected for method blank or trip blank sample contamination values; any contamination detected on QA/QC samples is reported in **Table 1**.

- **Laboratory method blanks** are run each day with project samples to identify contamination present in the laboratory. If contamination is detected on a method blank, measurements of identical compounds on samples analyzed the same day are considered

to be suspect and are flagged in the laboratory report. The laboratory method blank analyzed in connection with the present samples revealed no contamination.

- The **trip blank** is a sampling cartridge prepared, transported, and analyzed with other samples but intentionally not exposed. Any target compounds identified on the trip blanks are reported in the laboratory data. The analysis of the trip blank (labeled Trip-1 in **Table 1**) reported none of the targeted compounds, indicating that the survey site itself is the source of detected contamination.

- **Duplicates**. BEACON's passive soil-gas samplers are prepared with two cartridges for subsequent duplicate or confirmatory sample analysis. At DAY's request, duplicate analysis was performed for sample SG-14, designated SG-14 D. Because of finite differences between the cartridges, and the random nature of diffusive particle movement, comparisons between duplicates and primary samples should be made on a qualitative basis, as quantitative results may be subject to random distortions. No target compounds were identified on sample SG-14 or SG-14 D.

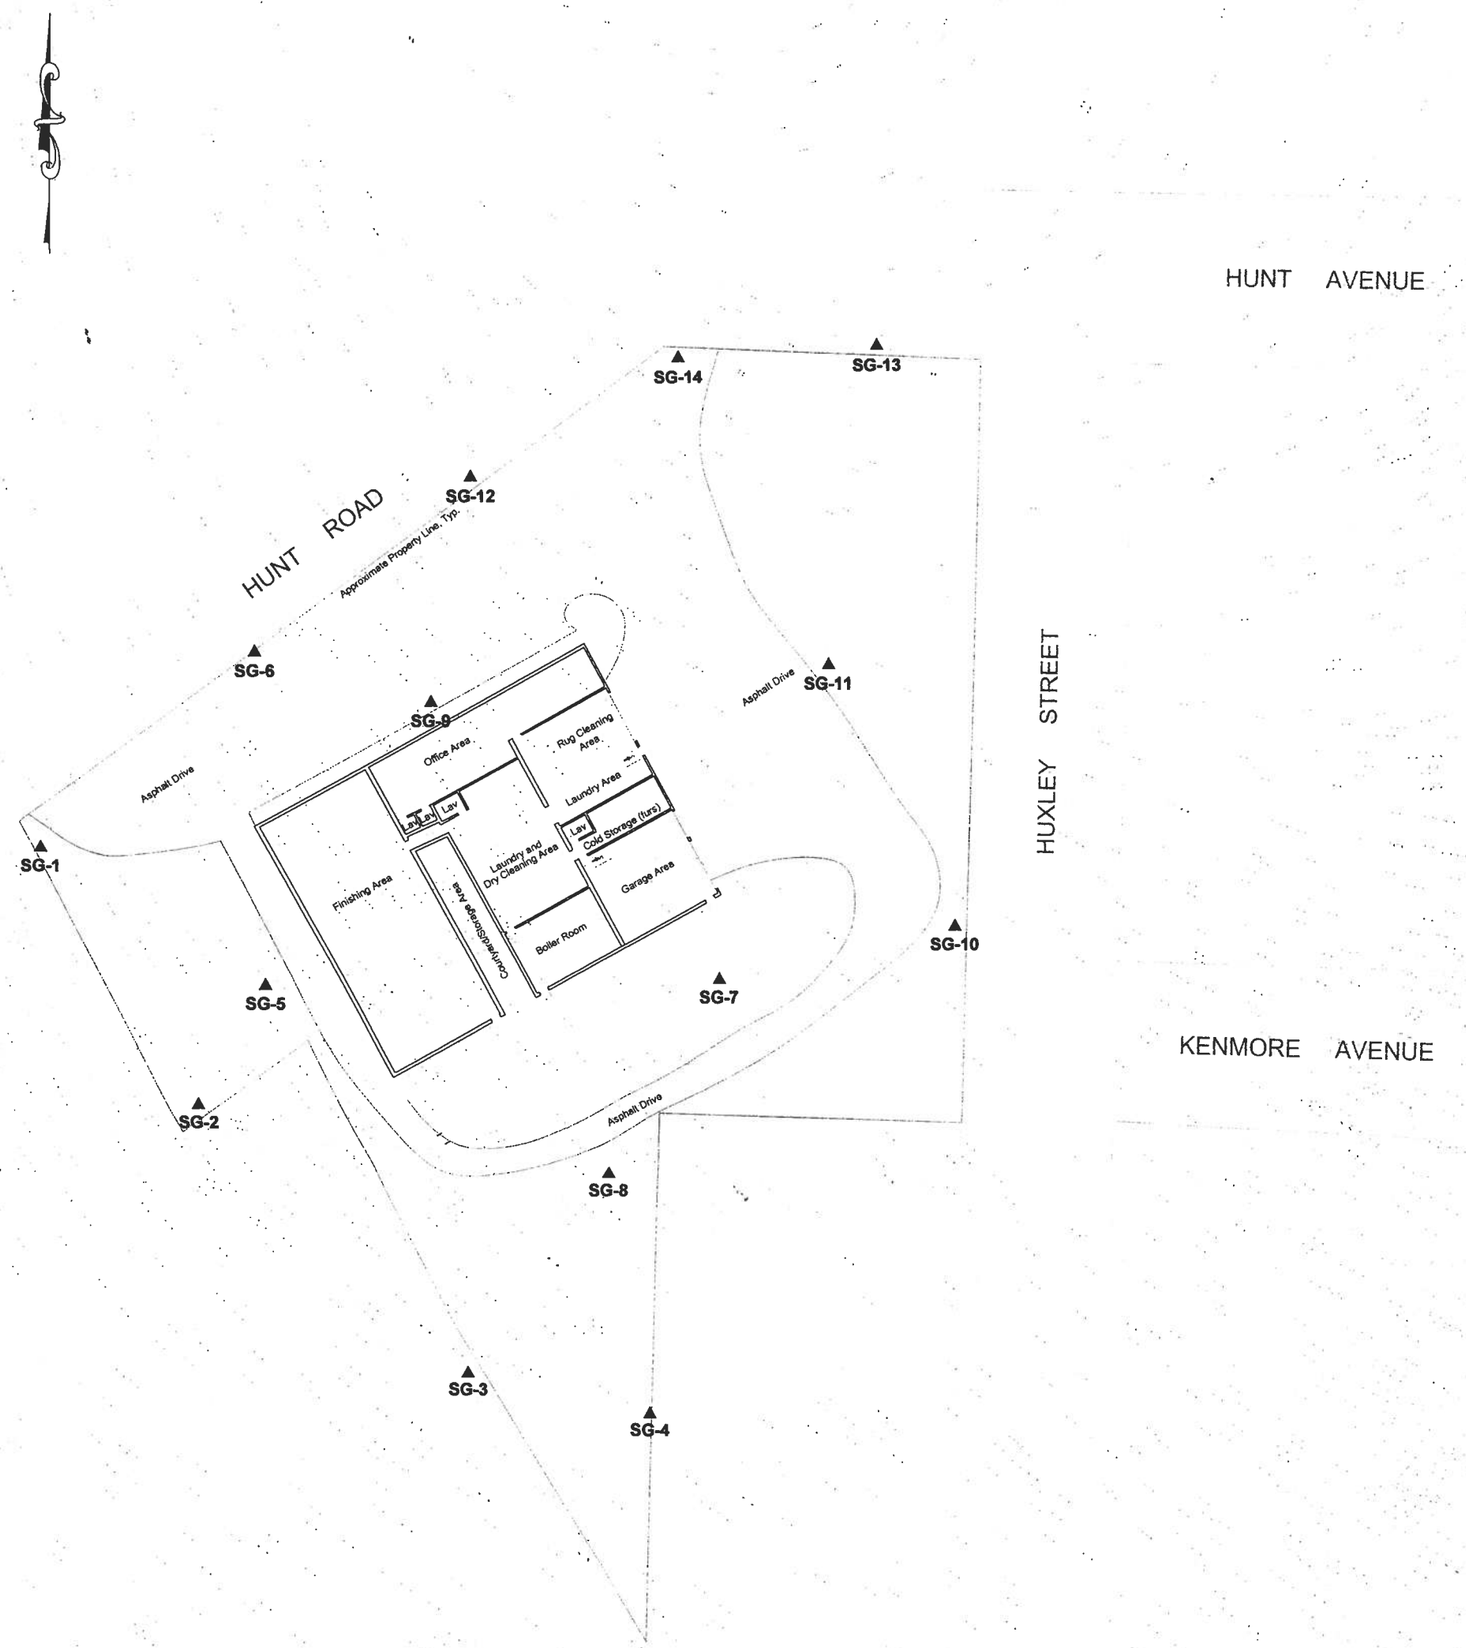
- **Survey findings** are relative exclusively to this project and should not routinely be compared with results of other BEACON Surveys. *To establish a relationship between reported soil-gas measurements and actual subsurface contaminant concentrations, which will indicate those detections representing significant subsurface contamination, BEACON recommends the guidelines on the inside front cover of this report.*

- Notes on the Chain-of-Custody form indicated that sample location SG-5 had water in the sampling hole. When soil moisture content is high for at least part of the survey period, as at location SG-5, the diffusion rate of gas through a column of soil is reduced; therefore, soil-gas measurements would be expected to be lower than if the soil was dry.

Figure 2 shows the distribution of Tetrachloroethene across the survey area.

- The following **Attachments** are included:

  -1- Field Procedures
  -2- Field Deployment Report
  -3- Laboratory Procedures
  -4- Chain-of-Custody Form



NOTES:

1. Site Plan produced from drawings by Habiterra Associates, Thorsell, Kennedy, Casker, Amone & Hedin. P.C. entitled "Addition and Renovations, Anderson Cleaners, Inc", drawings A-1 Floor Plan dated October 22, 1985 and L-1 Grading Plan and from notes of a site visit by a representative of Day Environmental, Inc. on 08-04-03.
2. Soil gas locations were obtained in the field by a Trimble GeoXT GPS or tape measurement from existing site structures and should be considered accurate to the degree implied by the method used.

NOTES:

1. Site Plan produced from drawings by Habiterra Associates, Thorsell, Kennedy, Casker, Arnone & Hedin. P.C. entitled "Addition and Renovations, Anderson Cleaners, Inc", drawings A-1 Floor Plan dated October 22, 1985 and L-1 Grading Plan and from notes of a site visit by a representative of Day Environmental, Inc. on 08-04-03.
2. Soil gas locations were obtained in the field by a Trimble GeoXT GPS or tape measurement from existing site structures and should be considered accurate to the degree implied by the method used.

FIELD PROCEDURES FOR PASSIVE SOIL-GAS SURVEYS

The following field procedures are routinely used during a BEACON Passive Soil-Gas Survey. Modifications can be and are incorporated from time to time in response to individual project requirements. In all instances, BEACON adheres to EPA-approved Quality Assurance and Quality Control practices.

A. Field personnel carry system components and support equipment to the site and deploy the passive samplers in a prearranged survey pattern. A passive sampler consists of a glass vial containing hydrophobic adsorbent cartridges with a length of wire attached to the vial for retrieval. Although samplers require only one person for emplacement and retrieval, the specific number of field personnel required depends upon the scope and schedule of the project. Each Sampler emplacement generally takes less than two minutes.

B. For those sample locations covered with soils or vegetation, a field technician clears vegetation and debris exposing the ground surface. Using a hammer and a ¾″-diameter pointed metal stake, the technician creates a hole approximately three inches deep. For those locations covered with an asphalt or concrete cap, the field technician drills a 1½″-diameter hole through the cap to the soils beneath. (If necessary, the sampler can be sleeved with a ¾″ i.d. copper pipe for either capped or uncapped locations).

C. The technician then removes the solid plastic cap from a sampler and replaces it with a Sampling Cap (a plastic cap with a hole covered by screen meshing). The technician inserts the sampler, with the Sampling Cap end facing down, into the hole (**see attached figure**). The sampler is then covered with either local soils for uncapped locations or, for capped locations, aluminum foil and a concrete patch. The sampler's location, time and date of emplacement, and other relevant information are recorded on the Field Deployment Form.

D. One or more trip blanks are included as part of the quality-control procedures.

E. Once all the passive samplers have been deployed, field personnel schedule sampler recovery and depart, taking all other equipment and materials with them.

F. Field personnel retrieve the samplers at the end of the exposure period. At each location, a field technician withdraws the sampler from its hole, removes the retrieval wire, and wipes the outside of the vial clean using gauze cloth; following removal of the Sampling Cap, the threads of the vial are also cleaned. A solid plastic cap is screwed onto the vial and the sample location number is written on the label. The technician then records sample-point location, date, time, etc. on the Field Deployment Form.

G. Sampling holes are refilled with soil, sand, or other suitable material. If Samplers have been installed through asphalt or concrete, the hole is filled to grade with a plug of cold patch or cement.

H. Following retrieval, field personnel ship or carry the passive samplers to BEACON's laboratory.

LABORATORY PROCEDURES FOR PASSIVE SOIL-GAS SAMPLES

Following are laboratory procedures used with BEACON Passive Soil-Gas Surveys, a screening technology for expedited site investigation. After exposure, adsorbent cartridges from the passive samplers are analyzed using U.S. EPA Method 8260B as described in the Solid Waste Manual (SW-846), a capillary gas chromatographic/mass spectrometric method, modified to accommodate high temperature thermal desorption of the adsorbent cartridges. This procedure is summarized as follows:

A. The adsorbent cartridges are loaded with internal standards and surrogates prior to loading the autosampler with the cartridges. The loaded cartridges are purged in a helium flow. Then the cartridges are thermally desorbed in a helium flow onto a focusing trap. Any analytes in the helium stream are adsorbed onto a focusing trap.

B. Following trap focusing, the trap is thermally desorbed onto a DB-VRX 60m, 0.25 mm ID, 1.40 micron filament thickness capillary column.

C. The GC/MS is scanned between 35 and 270 Atomic Mass Units (AMU) at 3.12 scans per second.

D. BFB tuning criteria and the initial five-point calibration procedures are those stated in method SW846-8260B. System performance and calibration check criteria are met prior to analysis of samples. A laboratory method blank is analyzed after the daily standard to determine that the system is contaminant-free.

E. The instrumentation used for these analyses includes:

- Agilent 6890-5973 Gas Chromatograph/Mass Spectrometer;
- Markes Unity thermal desorber;
- Markes UltrA autosampler; and
- Markes Mass Flow Controller Module.

TRENCH-3 (2.5')
RINSATE-1

CASE NARRATIVE

COMPANY: Day Environmental
Anderson Cleaners Wright 3292S-03
SUBMISSION #: R2423399

Day samples were collected on 10/06/04 and received at CAS on 10/08/04 in good condition.

INORGANICS

One soil sample and one water sample were analyzed for TAL inorganics plus pH by ASP methodology.

Site specific QC was performed on the Trench-1 (2.0'). All MS recoveries were within limits except Antimony, Copper and Zinc and have been flagged with an "N". All Blank spike recoveries were within limits. All RPD's were within limits.

Thallium for Trench-1 (2.0) has been flagged with a "W" due to the post digestion spike being outside control limits and the sample absorbance was less than 50% of the spike absorbance.

Mercury for Rinsate-1 was originally analyzed within the 26 day holding time from VTSR, however, due to QC considerations, the sample needed to be reanalyzed. Due to a laboratory error, the sample was not reanalyzed within holding time.

No other analytical or QC problems were encountered.

VOLATILE ORGANICS

Three soil samples, one water sample and one cooler blank were analyzed for the TCL list of Volatiles by Method OLM 4.2.

All the initial and continuing calibration criteria were met for all analytes.

All internal standard areas were within QC limits.

All surrogate standard recoveries were within QC limits.

Site specific QC was performed on Trench-1 (2.0). All MS/MSD and Reference spike recoveries were within limits. All RPD's were within limits.

Various compounds for Trench-2 (2.0) and Trench-3 (2.5) have been flagged with an "E" as being outside the calibration range of the instrument. The samples were repeated at dilutions and both sets of data have been reported out.

The Laboratory blanks associated with these samples were free of contamination.

All samples were analyzed within required holding times.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

One soil sample and one water sample were analyzed for TCL list of Semivolatiles by method OLM 4.2.

All the initial and continuing calibration criteria were met for all analytes.

All internal standard areas were within QC limits.

All surrogate standard recoveries were within limits except S4 for Trench-1 (2.0), Trench-1 (2.0)MS and Trench-1 (2.0)MSD and S5 for Trench-1 (2.0)MSD and have been flagged with an "*".

Site specific QC was performed on Trench-1 (2.0). Various MS/MSD and Blank spike recoveries were outside limits. No data was affected. All RPD's were within limits.

The Laboratory Blanks associated with these analyses were free of contamination except SBLK1 and SBLK2 contained a low level hit for Di-n-butylphthalate. All affected data has been flagged with a "B".

All samples were extracted and analyzed within holding times.

No other analytical or QC problems were encountered.

PESTICIDES/PCB's

One soil sample and one water sample were analyzed for the TCL list of Pesticides and PCB's by method OLM 4.2.

All the initial and continuing calibration criteria were met for all analytes.

Site specific QC was performed on Trench-1 (2.0). All MS/MSD and Blank spike recoveries were within limits. All RPD's were within limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

ORGANIC QUALIFIERS

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture.

J - Indicates an estimated value. The flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds, where the identification is based on a mass spectral library search.

P - This flag is used for a pesticide/Aroclor target analyte when there is a greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a "P".

C - This flag applies to pesticide results where the identification has been confirmed by GC/MS.

B - This flag is used when the analyte is found in the associated blank as well as in the sample.

E - This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and ALL concentration values reported on that Form I are flagged with the "D" flag.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

X - As specified in Case Narrative.

* - This flag identifies compounds associated with a quality control parameter which exceeds laboratory limits.

INORGANIC QUALIFIERS

C (Concentration) qualifier –

- B - if the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL) but was greater than or equal to the Instrument Detection Limit (IDL).
- U - if the analyte was analyzed for, but not detected

Q qualifier - Specified entries and their meanings are as follows:

- D - Spike was diluted out
- E - The reported value is estimated because of the presence of interference.
- J - Estimated Value
- M - Duplicate injection precision not met.
- N - Spiked sample recovery not within control limits.
- S - The reported value was determined by the Method of Standard Additions (MSA).
- W - Post-digestion spike for Furnace AA Analysis is out of control limits (85-115), while sample absorbance is less than 50% of spike absorbance.
- * - Duplicate analysis not within control limits.
- + - Correlation coefficient for the MSA is less than 0.995.

M (Method) qualifier:

- "P" for ICP
- "A" for Flame AA
- "F" for Furnace AA
- "PM" for ICP when Microwave Digestion is used
- "AM" for Flame AA when Microwave Digestion is used
- "FM" for Furnace M when Microwave Digestion is used
- "CV" for Manual Cold Vapor AA
- "AV" for Automated Cold Vapor AA
- "CA" for Midi-Distillation Spectrophotometric
- "AS" for Semi-Automated Spectrophotometric
- "C" for Manual Spectrophotometric
- "T" for Titrimetric
- " " where no data has been entered
- "NR" if the analyte is not required to be analyzed.

Dear Mr. Danzinger:

Enclosed please find the data report of the required analyses for the samples associated with the above referenced project.

If you have any questions regarding this report, please call me.

We appreciate your business.

Sincerely,

Agnes R. Ng

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0410

May 3, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Jeff Danzinger

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for seven aqueous samples that were received on April 8, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instrument V1: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

The aqueous sample was acid preserved, pH <2.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample BR311326. Spike recoveries were within the QC limits with the exception of trichlorocthene in both the matrix spike and matrix spike duplicate. Replicate RPDs were not within the QC limits. The spike recovery for trichloroethene could not be accuratcly determined due to its high concentration in the native sample.

Sample analysis: due to high concentration of target analytes, the following samples were re-analyzed at dilution: BR311326 (50x), BR417432 (80x), BR547562 (20x), BR677692 (3x) and BR807822 (4x). Please note that the initial analyses for these samples have potential carryover. The diluted analyses do not have carryover. No other unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Agnes Ng
CLP Project Manager

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0410

May 3, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Jeff Danzinger

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for seven aqueous samples that were received on April 8, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instrument V1: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

The aqueous sample was acid preserved, pH <2.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample BR311326. Spike recoveries were within the QC limits with the exception of trichloroethene in both the matrix spike and matrix spike duplicate. Replicate RPDs were not within the QC limits. The spike recovery for trichloroethene could not be accurately determined due to its high concentration in the native sample.

Sample analysis: due to high concentration of target analytes, the following samples were re-analyzed at dilution: BR311326 (50x), BR417432 (80x), BR547562 (20x), BR677692 (3x) and BR807822 (4x). Please note that the initial analyses for these samples have potential carryover. The diluted analyses do not have carryover. No other unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Agnes Ng
CLP Project Manager

Rochester, NY 14614
Attn: Mr. Chris Davidson

RE: Client Project: 5 Hunt Road, Jamestown, NY
Lab Work Order #: D0523

Dear Mr. Davidson:

Enclosed please find the data report of the required analyses for the samples associated with the above referenced project.

If you have any questions regarding this report, please call me.

We appreciate your business.

Sincerely,

Agnes R. Ng
CLP Project Manager

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0523

May 31, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Chris Davidson

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for four soil samples that were received on May 5, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instrument V5: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: due to high concentration of target analytes, sample B-440 was analyzed using 1g of sample. This is equivalent to 5x dilution. No other unusual observation was made for the analysis.

3. Semivolatile Analysis:

GC column: 30 m x 0.25 mm id (0.5 um film thickness) DB-5MS capillary column

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

4. Pesticides/PCB Analysis:

GC column used: 30 m x 0.53 mm id (0.5 um film thickness) CLPPest and 30 m x 0.53 mm id (0.42 um film thickness) CLPPestII megabore columns

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

5. Metals Analysis:

Mercury was analyzed using a Perkin Elmer Model 100 FIMS cold vapor atomic absorption analyzer. The other elements were analyzed using either a Perkin Elmer Model 3100XL Optima or a Perkin Elmer Model 4300DV ICAP.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: serial dilution was performed on sample B-190 with spike recoveries within the QC limits. No unusual observation was made for the analysis.

6. Cyanide Analysis:

The cyanide samples were prepared using minidistill apparatus by Kontes. The resultant distillates were analyzed using a Lachat QuikChem 8000 autoanalyzer.

Lab control sample: spike recovery was within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0523

May 31, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Chris Davidson

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for four soil samples that were received on May 5, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instrument V5: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: due to high concentration of target analytes, sample B-440 was analyzed using 1g of sample. This is equivalent to 5x dilution. No other unusual observation was made for the analysis.

3. Semivolatile Analysis:

GC column: 30 m x 0.25 mm id (0.5 um film thickness) DB-5MS capillary column

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

4. Pesticides/PCB Analysis:

GC column used: 30 m x 0.53 mm id (0.5 um film thickness) CLPPest and 30 m x 0.53 mm id (0.42 um film thickness) CLPPestII megabore columns

Surrogate recovery: recoveries were within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

5. Metals Analysis:

Mercury was analyzed using a Perkin Elmer Model 100 FIMS cold vapor atomic absorption analyzer. The other elements were analyzed using either a Perkin Elmer Model 3100XL Optima or a Perkin Elmer Model 4300DV ICAP.

Lab control sample: spike recoveries were within the QC limits.

Sample analysis: serial dilution was performed on sample B-190 with spike recoveries within the QC limits. No unusual observation was made for the analysis.

6. Cyanide Analysis:

The cyanide samples were prepared using minidistill apparatus by Kontes. The resultant distillates were analyzed using a Lachat QuikChem 8000 autoanalyzer.

Lab control sample: spike recovery was within the QC limits.

Sample analysis: no unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Method : \\AVOGADRO\ORGANICS\organic\voa\V5.i\050513.B\v5clp4h.m
Meth Date : 31-May-2005 10:42 mtl Quant Type: ISTD
Cal Date : 13-MAY-2005 10:09 Cal File: V5F9941.D
Als bottle: 7
Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: CLP4.sub
Target Version: 4.03
Processing Host: TARGET3

Concentration Formula: Amt * DF * Uf * 5/(Ws * (100 - M)/100)

Name	Value	Description
DF	1.000	Dilution Factor
Uf	1.000	ng unit correction factor
Ws	1.000	Weight of sample (g)
M	18.000	% Moisture (not decanted)

ISTD	RT	AREA	AMOUNT
* 42 Chlorobenzene-d5	9.201	5026908	50.000

PESTICIDE IDENTIFICATION SUMMARY
FOR SINGLE COMPONENT ANALYTES

EPA SAMPLE NO.

P4ELCS

Lab Name: MITKEM CORPORATION Contract: _____

Lab Code: MITKEM Case No.: _____ SAS No.: _____ SDG No.: D0523

Lab Sample ID: LCS-18108 Date(s) Analyzed: 05/26/05 05/26/05

Instrument ID (1): E4 Instrument ID (2): E4

GC Column(1): CLPPEST ID: 0.53 (mm) GC Column(2): CLPPESTII ID: 0.53 (mm)

ANALYTE	COL	RT	RT WINDOW FROM	RT WINDOW TO	CONCENTRATION	%D
gamma-BHC (Lindane)	1	10.49	10.44	10.54	11	
	2	13.92	13.87	13.97	11	0.0

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Chris Davidson

RE: Client Project: 5 Hunt Road, Jamestown, NY
Lab Work Order #: D0529

Dear Mr. Davidson:

Enclosed please find the data report of the required analyses for the samples associated with the above referenced project.

If you have any questions regarding this report, please call me.

We appreciate your business.

Sincerely,

Agnes R. Ng
CLP Project Manager

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0529

June 1, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Chris Davidson

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for one aqueous and two soil samples that were received on May 7, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instruments V5 and V6: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

The aqueous sample was acid preserved; pH <2.

Surrogate recovery: recoveries were within the QC limits with the exception of high recovery of bromofluorobenzene in sample B-330. The sample was re-analyzed at dilution with surrogate recoveries within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390 for both the low-level and medium-level analyses. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: sample B-330 was initially analyzed using 1g of sample. This is equivalent to a 5x dilution. Due to high concentration of target analytes, samples B-330 and B-390 were re-analyzed at dilution by medium-level analysis. In addition to the medium-level analysis, sample B-330 was further analyzed at 50x dilution. No other unusual observation was made for the analysis.

3. Semivolatile Analysis:

GC column: 30 m x 0.25 mm id (0.5 um film thickness) DB-5MS capillary column

Surrogate recovery: recoveries were within the QC limits.

Lab control sample/lab control sample duplicate: spike recoveries were within the QC limits with the exception of high recovery of 4-nitrophenol and pentachlorophenol in S1WLCS and high recovery of 4-nitrophenol in the duplicate. Replicate RPDs were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: no other unusual observation was made for the analysis.

4. Pesticides/PCB Analysis:

GC column used: 30 m x 0.53 mm id (0.5 um film thickness) CLPPest and 30 m x 0.53 mm id (0.42 um film thickness) CLPPestII megabore columns

Surrogate recovery: recoveries were within the QC limits with the exception of high recovery of tetrachloro-m-xylene in one column for sample RINSATE2.

Lab control sample/lab control sample duplicate: spike recoveries and replicate RPDs were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: no other unusual observation was made for the analysis.

5. Metals Analysis:

Mercury was analyzed using a Perkin Elmer Model 100 FIMS cold vapor atomic absorption analyzer. The other elements were analyzed using either a Perkin Elmer Model 3100XL Optima or a Perkin Elmer Model 4300DV ICAP.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike: matrix spike was performed on sample B-390. Spike recoveries were within the QC limits with the exception of antimony, selenium and silver. Antimony, selenium and silver are flagged with an "N" on the data report forms. A post digest spike was performed and reported for antimony and selenium. The percent recovery for manganese could not be accurately determined, as the sample concentration was significantly greater than the spike concentration. When the sample concentration is more than four times the spike concentration, it tends to obscure the relatively smaller spike amount; control limits do not apply in this circumstance.

Matrix duplicate: matrix duplicate was performed on sample B-390. Replicate RPDs were within the QC limits with the exception of arsenic, calcium, chromium, iron, magnesium and manganese. These elements are flagged with an "*" on the data report forms.

Sample analysis: serial dilution was performed on samples B-390 and RINSATE2 with spike recoveries within the QC limits with the exception of copper for sample B-390. Copper is flagged with an "E" on the data report forms. No other unusual observation was made for the analysis.

6. Cyanide Analysis:

The cyanide samples were prepared using minidistill apparatus by Kontes. The resultant distillates were analyzed using a Lachat QuikChem 8000 autoanalyzer.

Lab control sample: spike recovery was within the QC limits.

Matrix spike: matrix spike was performed on soil sample B-390 and aqueous sample RINSATE2. Spike recovery was within the QC limits for both samples.

Matrix duplicate: matrix duplicate was performed on soil sample B-390 and aqueous sample RINSATE2. Replicate RPD was within the QC limits for both samples.

Sample analysis: no unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Analytical Data Package for Day Environmental, Inc.

Client Project No.: 5 Hunt Road, Jamestown, NY

Mitkem Work Order ID: D0529

June 1, 2005

Prepared For:

Day Environmental, Inc.
40 Commercial Street
Rochester, NY 14614
Attn: Mr. Chris Davidson

Prepared By:

Mitkem Corporation
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Corporation submits the enclosed data package in response to Day Environmental Inc.'s 5 Hunt Road, Jamestown, NY project. Under this deliverable, analysis results are presented for one aqueous and two soil samples that were received on May 7, 2005. Analyses were performed per specifications in the project's contract and the chain of custody forms. Sample Identifications were shortened where necessary due to limitations in data reporting software. Following the narrative is a table of sample identifications for cross-referencing full client sample ID, shortened client sample ID and laboratory sample ID, along with the Mitkem Work Order.

The analyses were performed and reported per NYSDEC ASP (2000 update) requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall observation:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual integrations are coded to provide the data reviewer justification for such action. The codes are labeled on the ion chromatogram signal (GC/MS signal) and chromatogram for GC based analysis as follows:

- M1 peak tailing or fronting.
- M2 peak co-elution.
- M3 rising or falling baseline.
- M4 retention time shift.
- M5 miscellaneous – under this category, the justification is explained.

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Volatiles Analysis:

Trap used for instruments V5 and V6: OI Analytical #10 trap containing 8 cm each of Tenax, silica gel and carbon molecular sieve.

GC column used: 30 m x 0.25 mm id (1.4 um film thickness) DB-624 capillary column.

Alkanes were determined as part of TIC. The alkanes are reported in the Alkane Narrative Report following the SDG Narrative.

The aqueous sample was acid preserved; pH <2.

Surrogate recovery: recoveries were within the QC limits with the exception of high recovery of bromofluorobenzene in sample B-330. The sample was re-analyzed at dilution with surrogate recoveries within the QC limits.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390 for both the low-level and medium-level analyses. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: sample B-330 was initially analyzed using 1g of sample. This is equivalent to a 5x dilution. Due to high concentration of target analytes, samples B-330 and B-390 were re-analyzed at dilution by medium-level analysis. In addition to the medium-level analysis, sample B-330 was further analyzed at 50x dilution. No other unusual observation was made for the analysis.

3. Semivolatile Analysis:

GC column: 30 m x 0.25 mm id (0.5 um film thickness) DB-5MS capillary column

Surrogate recovery: recoveries were within the QC limits.

Lab control sample/lab control sample duplicate: spike recoveries were within the QC limits with the exception of high recovery of 4-nitrophenol and pentachlorophenol in S1WLCS and high recovery of 4-nitrophenol in the duplicate. Replicate RPDs were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: no other unusual observation was made for the analysis.

4. Pesticides/PCB Analysis:

GC column used: 30 m x 0.53 mm id (0.5 um film thickness) CLPPest and 30 m x 0.53 mm id (0.42 um film thickness) CLPPestII megabore columns

Surrogate recovery: recoveries were within the QC limits with the exception of high recovery of tetrachloro-m-xylene in one column for sample RINSATE2.

Lab control sample/lab control sample duplicate: spike recoveries and replicate RPDs were within the QC limits.

Matrix spike/matrix spike duplicate: duplicate matrix spikes were performed on sample B-390. Spike recoveries and replicate RPDs were within the QC limits.

Sample analysis: no other unusual observation was made for the analysis.

5. Metals Analysis:

Mercury was analyzed using a Perkin Elmer Model 100 FIMS cold vapor atomic absorption analyzer. The other elements were analyzed using either a Perkin Elmer Model 3100XL Optima or a Perkin Elmer Model 4300DV ICAP.

Lab control sample: spike recoveries were within the QC limits.

Matrix spike: matrix spike was performed on sample B-390. Spike recoveries were within the QC limits with the exception of antimony, selenium and silver. Antimony, selenium and silver are flagged with an "N" on the data report forms. A post digest spike was performed and reported for antimony and selenium. The percent recovery for manganese could not be accurately determined, as the sample concentration was significantly greater than the spike concentration. When the sample concentration is more than four times the spike concentration, it tends to obscure the relatively smaller spike amount; control limits do not apply in this circumstance.

Matrix duplicate: matrix duplicate was performed on sample B-390. Replicate RPDs were within the QC limits with the exception of arsenic, calcium, chromium, iron, magnesium and manganese. These elements are flagged with an "*" on the data report forms.

Sample analysis: serial dilution was performed on samples B-390 and RINSATE2 with spike recoveries within the QC limits with the exception of copper for sample B-390. Copper is flagged with an "E" on the data report forms. No other unusual observation was made for the analysis.

6. Cyanide Analysis:

The cyanide samples were prepared using minidistill apparatus by Kontes. The resultant distillates were analyzed using a Lachat QuikChem 8000 autoanalyzer.

Lab control sample: spike recovery was within the QC limits.

Matrix spike: matrix spike was performed on soil sample B-390 and aqueous sample RINSATE2. Spike recovery was within the QC limits for both samples.

Matrix duplicate: matrix duplicate was performed on soil sample B-390 and aqueous sample RINSATE2. Replicate RPD was within the QC limits for both samples.

Sample analysis: no unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.

Agnes Ng

MITKEM CORPORATION
Sample Condition Form

Received By: ARN | Reviewed By: [signature] | Date: 5/7/05 | MITKEM Project #: D0529

Client Project: Jamestown | Client: Day

Cooler Sealed (Yes) / No

1) Custody Seal(s) Present / (Absent)
(Coolers) / Bottles
Intact / Broken

2) Custody Seal Number(s)

3) Chain-of-Custody (Present) / Absent

4) Cooler Temperature 5°C
Coolant Condition Ice

5) Airbill(s) (Present) / Absent
Airbill Number(s) FedEx
8507647079 60

6) Sample Bottles (Intact)/Broken/Leakin

7) Date Received 5/7/05

8) Time Received 930

Preservative Name/Lot No:

Lab Sample ID		Preservation (pH) HNO_3	H_2SO_4	HCl	NaOH	VOA Matrix	Soil Headspace or Air Bubbles ≥ 1/4"
D0529	01					US	
↓	02					US	
D0529	03	<2			>12	U	

VOA Matrix Key:
US = Unpreserved Soil **A** = Air
UA = Unpreserved Aqueo **H** = HCl
M/N= MeOH & $NaHSO_4$ **E** = Encore
N = $NaHSO_4$ **M** =MeOH

See Sample Condition Notification/Corrective Action Form yes / no

QC Flag Legend

a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
